The new round of the union treaty negotiations began immediately after the collapse of the *coup d'état* but in a very unfavorable environment. Three Baltic states—Estonia, Latvia and Lithuania—peacefully withdrew from the Soviet Union in September 1991, undermining the viability of the USSR. Meanwhile, the remaining twelve members of the USSR continued intensive negotiations over the future of the Soviet Union. However, on December 8, 1991, leaders of the three founding states of the USSR—President Yeltsin of Russia, Shushkevich of Belorussia (Belarus), and Kravchuk of the Ukraine—unilaterally signed an agreement on the dissolution of the USSR and expressed the desire to establish a new type of interstate cooperation. This was in spite of a national referendum when the Soviet citizens voted, confirming their desire to retain the Union of Soviet Socialist Republics as the institutional unity of the fifteen republics. Moreover, the agreement signed on December 8, 1991, was not drafted as a legally correct document. In the end, the dissolution of the USSR and establishment of the CIS was formally endorsed on December 21, 1991, in Alma-Ata, as leaders of Azerbaijan, Armenia, Belarus, Kazakhstan, Kyrgyzstan, Moldova, the Russian Federation, Tajikistan, Turkmenistan, Uzbekistan, and Ukraine signed the Protocol to the Agreement on the Establishment of the Commonwealth of the Independent States.

The eleven states also unanimously adopted the Alma-Ata Declaration that signified the beginning of independence of the former Soviet Union Republics and established the major principles of dealing with the problems of post-Soviet development.

Although Azerbaijan signed the Protocol in Alma-Ata, the republic's legislature voted against its ratification. However, Azerbaijan ratified the Protocol to the Agreement and joined the CIS in September 1993. Georgia—who initially was also reluctant to join the CIS—did so in December 1993, thus bringing the number of the CIS member states to twelve.

The CIS Charter, adopted by the Council of the Heads of State on January 22, 1993, states that the Commonwealth of Independent States is based on

the equality of all its members. All the member states are independent and equal subjects of the international law. The Commonwealth serves to further development and strengthening of friendship, good neighborly relations, interethnic accord, trust, and mutual understanding and cooperation among its members.

## Structure

The CIS is an amorphous union of the former Soviet Republics. Unlike the former Soviet Union, the Commonwealth does not have a rigid centralized structure, and there is little coordination in internal and external affairs among the member states. According to the CIS Charter, the Commonwealth “is not a state and does not have any supranational powers.” All interaction among the member states of the CIS is conducted through its coordinating institutions. These bodies cover broad areas of common interests and cooperation in the fields of economic development, trade, banking and financing, foreign policy coordination, parliamentary cooperation, and defense and security policies.

- **Council of the Heads of State** is the supreme body of the Commonwealth of the Independent States. It mainly debates on the matters and solves the problems related to the common interests of the member states. Its decisions are adopted by consensus and are not binding. The council meets annually to discuss and decide on strategically important questions.
- **Council of the Heads of Government** coordinates cooperation between the executive powers of the member states in economic, social, and other spheres. Its decisions are adopted by consensus and are not binding.
- **Inter-Parliamentary Assembly** is a consultative institution of parliamentary cooperation created to coordinate constitutional reforms in all republics. The assembly is represented by parliamentary delegations of each member state.
- **Economic Court** of the CIS ensures implementation of economic commitments within the CIS. The court settles economic controversies and disputes among the member states.
- **Council of Foreign Ministers** is the main executive body of the CIS for cooperation in the foreign policy activities of the member states. Through this council, the member states attempt to formulate their common stand on such issues as a crisis in Bosnia and Herzegovina, a crisis on Kosovo, and wars in Afghanistan and Iraq. The council was one of the main bodies in establishing the CIS peacekeeping forces.
- **Council of Defense Ministers** is a body under the Council of the Heads of State. It coordinates military cooperation of the CIS members.
- **Economic Council** is the main executive body responsible for implementation of the decisions adopted by the Council of the Heads of State and the Council of the Heads of Government concerning the Agreement on Creation of Free Trade Zone and its Protocol.
- **Executive Committee** is the executive, administrative, and coordinating body of the CIS. It organizes all activities of the Council of the Heads of State, Council of the Heads of Government, Council of Foreign Ministers, Economic Council, and other bodies of the CIS.
- **Council of Border Troops Commander** is a body of the Council of the Heads of State. It is responsible for maintaining stable conditions on the outer borders of the CIS and for coordination activities of the border guards of the CIS.
- **Council of Collective Security** is the supreme political body of CIS member signatories of the Agreement on Collective Security of May 15, 1992. It coordinates joint activities of the state signatories of the agreement.
- **Interstate Bank** is an organ for organization and implementation of multilateral interstate settlements of financial transactions between the central (national) banks as well as for coordination of monetary policies of the member states. This institution was working on the idea of establishing a common ruble zone though this idea did not materialize.
- **Interstate Statistical Committee** was established to coordinate activities of statistical organizations of member states, develop and implement a standardized statistical methodology, facilitate information exchange among the member states, provide assistance to national statistical services, and create and maintain the common statistical database. Presently, there are more than sixty organs of sectoral cooperation in the CIS, such as the Consulting Council for Labor, Transport Coordination Conference, Migration and Social Security of Population, and Interstate Ecological Council.

## Activities

The Alma-Ata Declaration signed on December 21, 1991, officially announced that the USSR ceased to

exist. All former Soviet states immediately began a period of political and economic transition. The CIS was formally established to coordinate political and economic cooperation. The Agreement on Armed Forces and Border Troops and the Agreement on Strategic Forces were reached on December 30, 1991, for peaceful transformation of former Soviet Armed Forces. Since the disintegration of the former USSR was unexpected, many issues were being resolved at an *ad hoc* basis, and many states were changing their positions and attitudes according to their internal and external environments.

In 1992, there were numerous items on the agenda list of the meetings of the CIS leaders. Among them were the questions of the legal succession of the Soviet Union, strategic forces, security, and economic cooperation. At these meetings it was decided that all long-range nuclear and strategic weapons would come under the joint control of the President of the Russian Federation and the Chief of the CIS Armed Forces. In January 1992, Commissions on the Black Sea Fleet and the Caspian Flotilla were established. In addition, an agreement was signed on legislative cooperation at the Inter-Parliamentary Conference. In February, the Council of the Heads of State reached an agreement on free movement of goods between republics. Also in February, the CIS Council of Heads of State decided to retain Russian ruble as a common currency within CIS economic space. Another agreement was signed in February on a unified command for general-purpose armed forces for a transitional period of two years. However, Azerbaijan, Moldova, and Ukraine decided to establish independent armed forces. In March, an agreement was adopted on repayment of foreign debt of the former USSR. At the meeting of the Council of Heads of Government, also in March, all states with exception of Turkmenistan reached an agreement on settling interstate conflicts. At the same meeting, an agreement on status of border troops was signed by five states. In April, an agreement was signed on establishment of the Inter-Parliamentary Assembly by Armenia, Belarus, Kazakhstan, Kyrgyzstan, the Russian Federation, Tajikistan, and Uzbekistan. In May, the meeting of the Council of the Heads of Government issued an accord on repayment of interstate debt, and statements on the issue of the balance-of-payments were adopted. On May 15, 1992, the Treaty on Collective Security was signed by six members of the CIS for a five-year term. It was also agreed to establish CIS joint peacemaking forces to intervene in the CIS disputes. In July, the Economic Court was established in Minsk. The leaders of the newly independent states agreed to honor all international agreements signed and ratified by the former

USSR. It was also agreed that the Russian Federation was the legal successor of the USSR in the United Nations Security Council. The CIS republics were admitted as members of the United Nations in 1992. The leaders were also discussing the economic legislation of the CIS, a common monetary system (ruble zone), and visa-free travel of CIS citizens within the Commonwealth.

In 1993, the focus of the meetings of the CIS leaders was on the strengthening of the CIS. On January 22, 1993, the CIS Charter was adopted at the meeting of the heads of state in Minsk (Belarus). It was signed by seven out of ten members, with exception of Moldova, Turkmenistan, and Ukraine. Question of a common finance system was still on their agenda; the documents on the establishment of the Interstate Bank were endorsed by all ten members of the CIS. In February, a foreign economic council was established. In April, a proposal by Presidents of the Russian Federation and Kazakhstan was discussed in an extraordinary meeting of the heads of state in Minsk. The presidents were interested in further strengthening of the role of the CIS in security system, in economic cooperation and creation of a common market, and in coordination of foreign policy and human rights protection. As a result, a month later—in May 1993 at the meeting of the Council of the Heads of State held in Moscow—the member states, with exception of Turkmenistan, adopted a decision on establishment of the Economic Union. In June, the CIS defense ministers decided to abolish CIS joint military command, which was to be replaced on a provisional basis by a joint staff for coordination of military activity. In September, the Council of the Heads of State reached an agreement on establishment of a Bureau of Organized Crime with headquarters in Moscow. The Treaty on Establishment of the Economic Union was signed on the September 24, 1993, by the member states with exception of Turkmenistan and Ukraine. The treaty provided a framework for the economic union within the CIS, which included creation of currency union and gradual removal of tariffs. Later in December 1993, Turkmenistan was admitted as a full member of the Economic Union and Ukraine as an associate member in April 1994.

On April 15, 1994, the most important outcome of the meetings of the CIS leaders was signature by all member states of the Agreement on Establishment of Free Trade Zone. A draft framework for customs legislation in CIS countries to facilitate the establishment of the free trade zone was approved by all member states with exception of Turkmenistan. In January, the issue of illegal migration was discussed at the meeting of the Council of Border

Troop Commanders. In March, a plenary session of the Inter-Parliamentary Assembly established a commission for the conflict resolution in Nagorny Karabakh (Azerbaijan) and Abkhazia (Georgia) and endorsed the use of the CIS peacekeeping forces. In September, at the meeting of the Council of the Heads of Government, all member states, with exception of Turkmenistan, agreed to establish the Interstate Economic Committee to implement economic treaties adopted within the framework of the Economic Union. In October, the Convention on Rights of the Minorities was adopted at the meeting of the heads of state. At the first session of the Interstate Economic Committee in November, draft legislation on a customs union was approved. The Interstate Economic Committee was incorporated with other working bodies and sectional committees of the CIS into the CIS Executive Committee. In October, the Inter-Parliamentary Assembly adopted a resolution to send military observers to Nagorny Karabakh (Azerbaijan) and Abkhazia (Georgia). Direct negotiations for peaceful settlement of the conflicts were proposed by the Inter-Parliamentary Commission on the conflict in Abkhazia and Georgia. In December, the mandate of the commander of the CIS collective peacekeeping forces in Tajikistan was enlarged by the Council of Defense Ministers. In 1994, the CIS was granted an observer status with the United Nations. A cooperation accord was signed between the CIS and UNCTAD in May 1994.

In 1995, the leaders discussed the issue of the collective security and extended the mandate of the CIS peacemaking forces in Tajikistan and Abkhazia (Georgia). In February, the heads of state adopted a memorandum on maintenance of peace and stability. The memorandum called for refraining from exerting military, political, or economic pressure on another member state. It also urged for peaceful resolution of border disputes. In November, the Council of Defense Ministers announced establishment of the Joint Air Defense System to be coordinated mainly by the Russian Federation.

In 1996, the Council of the Heads of State considered the draft of the long-term plan for the integrated development of the Commonwealth in 1996 and 1997. In January, a decision was approved on formation of the Council of Ministers of Internal Affairs. In January, the meeting of the Council of Heads of State approved Georgia's proposal to impose sanctions against Abkhazia. In April, a program to counter the organized crime within the CIS was approved by the heads of government. A cooperation accord was signed between the CIS and the United Nations Economic Commission for Europe in June 1996. In September, there was a first meeting of the interstate

commission for military economic cooperation, and a draft agreement on export of military services and projects to third countries was approved. In August, the Council of Defense Ministers, with exception of the Ukrainian minister, condemned the political, military, and economic threat posed by the expansion of NATO. In October, an emergency meeting of the Council of Heads of State discussed the situation in Afghanistan and possible security threats in the region. In November, the plenary session of the Interstate Parliament issued a statement urging the NATO countries to abandon the plans of the NATO expansion. However, Russian and Ukraine states began strategic cooperation with NATO from mid-1990s onward.

In 1997, at the meetings of the CIS leaders, the long-term plan for the integrated development of the CIS was adopted, and the mandate of the CIS peacemaking forces in Tajikistan was extended. In March, development of the Customs Union was discussed at the meeting of the Council of the Heads of Government, and the need for the free trade regulations was endorsed by all member states, with the exception of Georgia. Also in March, the principles of the program for greater military and technical cooperation were approved by the Council of Defense Ministers. During the 1997 meetings, the leaders admitted that the CIS failed to ameliorate economic conditions of some member states. Russia was criticized for failing to implement CIS agreements. Russia, for its part, urged the member states to be more active in defining and implementing the CIS agreements. Nevertheless, support for the CIS institutions was expressed. In December, the Inter-Parliamentary Assembly adopted fourteen laws relating to banking, education, ecology, and charity.

In 1998, the discussions were centered on improvement of the activities of the CIS, on its restructuring, and on development of military cooperation among the CIS members. Reform of the CIS was on the agenda list of the Inter-Parliamentary Assembly meeting in June. In March, Russia, Belarus, Kazakhstan, and Kyrgyzstan signed an agreement on establishing the Customs Union with the aim to remove trade restrictions; to standardize trade and customs regulations; and integrate economic, monetary, and trade policies. In April, the Council of Defense Ministers proposed to draft a program for military and technical cooperation among the CIS member states. In April, at the request of the Russian President, Armenia and Azerbaijan signed a statement expressing their support for a political settlement of the conflict in Nagorny Karabakh. A document proposing the resolutions to Abkhazia conflict was prepared and adopted, but the resolutions were not accepted

by Abkhazia. In June, a number of documents were signed by the Council of Border Troops Commanders and at the meeting of the CIS interior ministers. The first meeting of a special forum took place also in June. It discussed issues of restructuring the CIS. It was agreed that a new institution needed to be created. Working groups were established to coordinate proposals and documents on the CIS reform. However, in October, the proposals of the reform were unanimously rejected as inadequate by all twelve members of the CIS. The Inter-Parliamentary Assembly approved a decision to sign the European Social Charter in June 1998. At the same meeting, it adopted ten model laws relating to social issues. A declaration of cooperation between the Inter-Parliamentary Assembly and the OSCE Parliamentary Assembly was also signed. In December, the Council of Defense Ministers approved the draft proposal on military information security.

In February 1999, Tajikistan became the fifth member of the Customs Union that was established in 1998. In April, the Council of State of the Commonwealth of Independent States adopted the Protocol to the Agreement on Establishment of a Free Trade Zone. According to the agreement and its protocol, the existing bilateral free trade regime should be replaced by a multilateral regime to create a favorable environment for free movement of commodities and services within the CIS, thus creating the prospect of establishing the CIS common market. The Council of the Heads of Government met in April and adopted guidelines for restructuring of the CIS and discussing the future development of the Commonwealth. Armenia, Belarus, Kazakhstan, Kyrgyzstan, Russia, and Tajikistan signed a protocol in April 1999 to extend the Treaty on Collective Security for another five years. In October, the heads of the five member states of the Customs Union approved a program to harmonize their national legislation to create a single economic zone.

The year 2000 meetings were mostly dedicated to antiterrorism campaigns and fights with organized crime. During a June 20–21 meeting, the Council of the Heads of State adopted the program of the CIS members on the fight against terrorism and other types of extremism and decided to establish the Anti-Terrorism Center. It also adopted the Decision on Realization of the Decision by Council of State of the Commonwealth of Independent States of April 2, 1999, on establishment of a Free Trade Zone. By a request from Tajikistan, CIS decided to withdraw collective peacemaking forces from Tajikistan. The mandate of the CIS collective peacemaking forces in Abkhazia (Georgia) was extended. During the Minsk summit, held November through December 2000, a

final decision on launching the CIS Anti-Terrorism Center was adopted. A Joint Declaration on Closing of the Chernobyl Atomic Power Station was adopted. In May, the five members of the Customs Union signed a treaty establishing the Eurasian Economic Community. Russian Federation withdrew from the visa-free travel agreement reached in 1992. In June, five members of the Customs Union signed an agreement for visa-free travel within the Customs Union. The Eurasian Economic Community with headquarters in Astana (Kazakhstan) was officially inaugurated in October. In May 2000, the states signatories of the Treaty on Collective Security called for strengthened military cooperation in view of the threat from the Taliban regime in Afghanistan. In October, the parties to the treaty signed the Agreement on the Status of Forces and Means of Collective Security Systems.

In March 2001, the interior ministers of the CIS discussed the issue of increasing transnational crime and drug trafficking. The issues of the economic cooperation, health, education, crime and terrorism, and military and technical cooperation were discussed in the May meeting of the Council of the Heads of Government. In a May meeting of the Council of Defense Ministers, the ministers approved the plan for military cooperation until 2005. The tenth anniversary of the Commonwealth was the center of an informal “jubilee” meeting in November. The summit adopted a statement on cooperation in social and economic development and integration at a global level. In October 2001, with the view of September terrorist attacks against the United States, the parties to the Treaty on Collective Security adopted a new antiterrorism plan. Combating international terrorism became the main priority of the Treaty on Collective Security.

Topics of economic cooperation, perspectives for the free trade zone development, and security and improvement of the working methods of CIS organs were discussed in an October 2002 meeting of the CIS leaders in Chisinou (Moldova). In February, Kazakhstan, Kyrgyzstan, Tajikistan, and Uzbekistan announced formation of a new regional security union: the Central Asian Cooperation Pact. Establishment of a regional division of the Anti-Terrorism Center was discussed at October CIS summit.

In 2003, the joint meeting of the Council of the Heads of State, Council of the Heads of Government, and Council of Foreign Ministers took place in Yalta (Russian Federation) on September 18–19. The main concerns of the meeting were the issues of further development of economic cooperation, establishment of the free trade zone that would eventually lead to a single economic space, as well as the questions of

social, humanitarian, and military cooperation. The meeting was addressed by the executive director of the United Nations Office on Drugs and Crime. Consequently, a decision on cooperation with the UN Office of Drugs and Crime was adopted.

In spite of numerous decisions adopted by the CIS supreme bodies and agreements signed by the member states, the goals of the CIS charter have not been fully implemented, and the agreements have not been ratified by the all of the member states. In 1993, for example, in spite of the decision on common currency zone (ruble zone), Kyrgyzstan decided to issue its own currency, called the som. This act spurred other CIS members to abandon the ruble zone and introduce their own currencies.

A trend also emerged that more and more CIS member states began to favor bilateral agreements and the formation of subregional groupings. In March 1996, Belarus, Kazakhstan, Kyrgyzstan, and the Russian Federation signed the Quadripartite Treaty for greater integration based on a common market and customs union. It was to be open for all CIS member states and the Baltic states. Consequently, these four states and Tajikistan founded the Eurasian Economic Community in October 2001. In April 1996, Belarus and the Russian Federation signed the Treaty on the Formation of the Community of Sovereign Republics that was aimed at extensive economic, political, and military cooperation. A year later, in April 1997, Belarus and Russia signed a further Treaty of Union and formulated the Charter of the Union, with an eventual goal of their voluntary unification. The charter was signed in May and ratified by Belarusian and Russian legislature in June. In December 2000, the presidents of Belarus and the Russian Federation signed an agreement for the Belarus adoption of Russian currency on January 1, 2005, and for the introduction of a new joint currency by January 1, 2008. The Central Asian states created their own economic community called the Central Asian Economic Union (CAEU) in 1994, which was later transformed into the Central Asian Forum. The GUAM (abbreviation of member states' names) Group united Georgia, Ukraine, Azerbaijan, and Moldova in the late 1990s in joint economic and transportation initiatives and in attempts to establish a subregional free trade zone. The group was later joined by Uzbekistan in April 1999, transforming GUAM into GUUAM. The heads of state of the group's members meet annually, and their ministers for foreign affairs meet twice a year. Another subregional grouping that unites the Russian Federation, Armenia, Azerbaijan, and Georgia meets regularly as the Caucasian Group of Four.

## COMMONWEALTH OF INDEPENDENT STATES: INTERNATIONAL RELATIONS

The dissolution of the Soviet Union in 1991 led to the creation of fifteen new independent countries. After the Russian revolution of 1917, the new Union of Soviet Socialist Republics (USSR) inherited the multinational Russian Empire in which more than one hundred nationalities lived. Josef Stalin, a Georgian (not a Russian), as commissar of nationalities devised a system that created a hierarchy of nationalities. The major ones were assigned union republics; at the second level were those of autonomous republics found inside several of the union republics, chiefly the Russian federation. At the third and fourth level were national and autonomous districts also located within union republics. The hierarchal system, which placed the Russian federation above the republics, led to the split between Stalin and Vladimir Lenin just before the latter's death. Stalin's system held as the Soviet Union grew in power. During and after World War II, the number of union republics grew to fifteen.

When the Soviet Union dissolved, however, Moscow let the union republics go with relatively little bloodshed. The other national entities, autonomous republics and districts, were maintained, and those that wished to separate, such as Chechnya and Dagestan, led to bloody and pernicious civil wars. Under the Soviet system, Moscow represented the whole USSR in foreign affairs with a minor exception that the Ukrainian SSR and Belorussian SSR had seats in the United Nations but invariably backed Soviet

votes. This resulted from a compromise that Moscow made with its former Western allies in establishing the United Nations in 1945. Instead of one ministry of foreign affairs, there were fifteen.

Out of the necessity of dealing with common problems, economic issues, and relations with the outside world, in 1992, twelve of the republics joined a new organization called the Commonwealth of Independent States (CIS). Three—Lithuania, Latvia, and Estonia—refused to join. These Baltic republics, which had been part of the Russian Empire since the eighteenth century and had a brief two-decade period of independence between the two world wars, were added to the Soviet Union through the infamous Hitler-Stalin pact of August 1938. Moldova, which also was added as a consequence of that treaty with some minor variation, also joined. The West designated the entire group of former union republics as the newly independent states (NIS). The CIS, thus, included Armenia, Azerbaijan, Belarus, Georgia, Moldova, Kazakhstan, Kyrgyzstan, the Russian Federation, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan.

The Commonwealth began on December 8, 1991, even before the end of the USSR, with an agreement among the presidents of Russia, Belarus, and Ukraine. The CIS formally started two weeks later on December 21, with eleven republics. Georgia joined later. In January 1992, administration began at the designated center, Minsk, the capital of Belarus. The CIS administration coordinated issues and policies of economics, foreign relations, defense, environment, immigration, and legal matters. The Commonwealth Council, consisting of the presidents and prime ministers of the member states, led the Commonwealth. Pertinent cabinet members from the member republics in the areas of the Commonwealth's concerns also aided the council. However, in practice, the coordinated effort has proved difficult as it often runs counter to the varying policies of the individual states. One example was the initial proposal to maintain a unified military and nuclear arms command; however, some of the European republics wished closer relations with NATO and the European Union. Another area of difficulty was in the move toward market economies and privatization.

One immediate question regarded the relationship of the CIS and the Baltic republics to the United Nations. They agreed that Russia would take the Soviet Union's seat on the Security Council. The twelve other countries who were not already members applied and were admitted as members in 1992. Estonia, Latvia, and Lithuania, but not any of the CIS states, joined NATO and the European Union. All of the NIS states are in form parliamentary

republics with an elected president, prime minister, and parliament.

Some of the states formed regional associations. Azerbaijan, Armenia, Georgia, Greece, Moldova, Russia, and Ukraine were members of the Black Sea Economic Organization. Estonia, Latvia, Lithuania, and Russia were on the Council of Baltic Sea States.

The CIS required independence of the states and respect for their borders. It promised joint cooperation on a unified nuclear policy. Russia claimed the Soviet property in Russia. Russia also took over the Soviet nuclear armament and held the greatest conventional military forces in the world. Soviet embassies and consulates, as well as the Soviet seat on the United Nations Security Council, fell to Russia. Russia, as the major power in the CIS, aroused the historic suspicions of Russian expansionist ambitions.

The republics argued over the division of Soviet assets, and within a few years, the CIS proved incapable of settling inter-republic disputes. The status of the Crimean peninsula inhabited by Russians but located in the Ukraine divided those republics. Kiev and Moscow also argued over the ownership of the Black Sea fleet. Moscow also leased Sebastopol and other Black Sea ports from Kiev. They settled the issue in 1995 with Russia getting 82% of the fleet, and two years later, Russia signed a ten-year friendship treaty. Ukraine and Belarus sent nuclear arms and missiles back to Russia. A collective security agreement introduced in 1992 did not include Moldova, Ukraine, or Turkmenistan, and in 1999, Azerbaijan, Georgia, and Uzbekistan refused to extend their participation. In 1999, Russia objected to the expansion of NATO into Eastern Europe and into the Yugoslav crisis. The Taliban in Afghanistan was also a concern of the confederation.

Trade began to recover after its decline from 1992 through 1994. The CIS established a customs union, although some republics, particularly the Ukraine and Turkmenistan, joined only reluctantly due to their fear of losing access to Western markets.

In 1999, Uzbekistan joined the GUAM group—Georgia, Ukraine, Azerbaijan, Moldova—formed in opposition to the CIS; the group then changed its acronym to GUUAM to include its new member state. However, CIS and Uzbekistan signed a bilateral agreement to fight Uzbeks Islamic rebels in Kyrgyzstan where CIS forces were helping them. The fighting spilled over into Tajikistan, and a treaty was created between Russia and Tajikistan to help end the civil war by stationing border guards.

Most of the CIS followed variations on a similar path to independence. In general, this occurred in two stages—a declaration of sovereignty within the USSR and then a declaration of independence. While some

republics announced their intentions of separation from the Soviet Union, in the future independence occurred in all cases after the failed *coup d'état* against Mikhail Gorbachev on August 19–21, 1991. Another catalyst for the national movements was the Soviet parliamentary elections in March 1989, the first contested elections since 1918.

In the Caucasus, Armenia in the 1980s formed the Armenian National Movement, which won the 1990 republic parliamentary elections. On August 23, the parliament declared Armenian sovereignty, and thirteen months later (September 23, 1991) independence was also declared. Armenia had been engaged in a war with neighboring Azerbaijan since February 1988 over the Nagorno-Karabakh region, an autonomous Armenian national district, and Sumqayit, another Armenian area, both in what was then the Azerbaijan SSR. Azerbaijanis killed thousands of Armenians, and thousands more left the enclave for the republic. The Azerbaijani blockaded access to Armenia, strangling its economy. Moscow sent troops to support the Armenians in 1990, and the Armenians occupied Azerbaijan territory connecting Nagorno-Karabakh to Armenia; they held on to the territory as political instability gripped Azerbaijan.

Although Azerbaijan declared its independence after the *coup d'état* against Mikhail Gorbachev, the Communist Party continued in power with its leader Ayaz Mutalibov elected president. In May 1992, the Azerbaijan Popular Front carried out a *coup* against Mutalibov and won new elections with Abulfaz Elchibey on a platform of withdrawing from the CIS and defeating the Armenians in Nagorno-Karabakh. However, the Communists carried out their own *coup d'état*, led by Heydar Aliyev in June 1993, and kept the republic in the confederation.

Georgia took advantage of Gorbachev's Glasnost policy to move toward independence even before the USSR collapsed. The nationalist opposition won the parliamentary elections of October 1990 and elected the political dissident Zviad Gamsakhurdia president after declaring the republic's independence in April 1991. Gamsakhurdia's opponents declared civil war, but the military deposed him in January 1992. They established a state council led by Eduard Shevardnadze, the former Soviet foreign minister and leader of the Georgian Communist Party. In new elections, the voters overwhelmingly elected Shevardnadze as the head of state of the republic. Opponents accused Shevardnadze of dictatorial methods, but because of his effectiveness, the public still supported him. Georgia joined the CIS in 1993 but also became an associate member of the European Union and a member of the Council of Europe and the World Trade Organization, as well as a partner of

NATO. The republic faced secessionist movements by the Ossetians and the Abkhazians, former nationalist districts when they were part of the Soviet Republic. Abkhazia declared its independence in 1992 and put its old (1925) constitution in effect. Thousands of Georgians fled the area. Shevardnadze refused to recognize the state, and warfare began.

The Soviet Union finally agreed to the independence of the all the Baltic countries on September 6, 1991. The Baltic states refused to join the CIS. In Latvia, glasnost led to mass protests over environmental pollution. The Latvian Popular Front won the 1990 elections and announced the eventual independence of the republic. Moscow responded by sending in the army, leading to clashes in Riga in January 1991. After the failure of the August *coup d'état*, the legislature declared its independence immediately. Latvia held elections restricted to persons who were citizens before the incorporation of the country into the Soviet Union in 1940 or their descendants. The elected parliament restored the constitution of 1922. The government tried to expel those who were not citizens, especially the many Russians living there, and moved closer to the West. Relations with Moscow were strained; however, through the 1990s, Riga attempted to amend its relationship with Moscow.

Similarly, in Lithuania during glasnost period, the Sajudis reform movement appeared. The 1990 election produced a nationalist legislature that declared the republic's independence on March 11. Moscow established an economic boycott, which had little effect. In January 1991, during the Desert Storm crisis in Iraq, Gorbachev sent in troops to reclaim the state. Despite the bloodshed, the effort failed, and Moscow recognized Lithuania's independence after the *coup d'état* of August. In the election of 1992, the Communists, now called the Lithuanian Democratic Labor Party (LDLP), won a slight majority, but LDLP continued the nationalist policies, including moving closer to the West and liberalizing the economy. Because of corruption and recession, a coalition of the Christian Democrats and the Centre Party won the 1996 elections; in 1998, Valdas Adamkus, who had been an American citizen, was elected president. His policy was to liberalize the economy, stop corruption, and attract foreign investment. Up to this time Vilnius depended on Moscow as an economic partner. Now it linked more to the West, dramatically reducing inflation (from more than 1000% at the beginning of independence to less than 10% at the end of the century).

In addition, a Popular Front emerged in 1988 in Estonia, and this front won republican elections, declaring independence recognized by Moscow in September 1991. Like Lithuania, Estonia restricted

the right of non-Estonians while recognizing as citizens those who had left after the Soviet Union and who had been incorporated the country. Estonia relied on Russia for trade but was able to ameliorate the strained relations over the citizen laws. Soviet forces left in 1994.

In Central Asia, native Kazakhs were a minority in the republic compared to the Russian inhabitants. The long time Communist leader Dinmukhamed Kunayev was a popular and imaginative leader who protected the interests of both groups. His dismissal in 1986 because of corruption caused riots of a magnitude not seen since the days before the dictatorship of Josef Stalin. Kazakhstan was also the site of many of the USSR's nuclear weapons. Kazakhstan announced sovereignty in October 1990 and independence on December 16, 1991. The republic elected Nursultan Nazarbayev as president, and he continued Kunayev's popular policies. Unlike in the Baltic states, relations between Russia and Kazakhstan remained good. Russia retained control over the nuclear facilities. Kazakhstan joined the United Nations and International Monetary Fund.

Kyrgyzstan of all the Central Asian Republics was the most anxious to break away from the USSR and declared its independence on August 31, 1991, right after the failed *coup d'état*. Askar Akayev was elected president; he was a reformer who instituted democratic institutions and looked more to the West than any of the five former Central Asian Republics. However, the emigration of Russian and German professionals brought about an economic recession. Turkmenistan has natural gas, which brought in foreign investors. It declared independence on October 27, 1991, but the dictatorial regime has done little to improve conditions in the republic.

In Tajikistan, independence came on September 9, 1991, but support for Russia and the Communist party was still strong. Anti-Communist and Islamic opposition led to civil war.

The opposition drove out the Communist President Rahman Nabiyeu. Russian troops helped bring down the opposition and put in power Imomali Rahmonov, who won the 1994 presidential elections and ruled with an iron hand. Thousands of Muslims fled to Afghanistan from where they launched attacks on the republic. Tens of thousands were killed in the fighting, and hundreds of thousands were displaced.

In Uzbekistan, Communists maintained tight control. They supported the *coup d'état* against Gorbachev, but after its failure, they declared independence. Islam Karimov was elected president. Despite lip service to democracy, the still ruling Communist leadership imposed authoritarian politics. Opposition parties were stopped at the polls and their

leaders attacked, and international human rights groups criticized the government. The state remained close to Russia and Communist China, but ethnic minorities left the republic as the government leaders wedded their authoritarian regime to Uzbek nationalism.

In Russia itself, the failure of the attempt to remove Gorbachev in August 1991 brought the end of the Soviet Union on December 1991, and Boris Yeltsin came to power in Russia. Russia did not recognize minorities that declared their independence and frequently the state used violence to suppress uprisings, most notably the Muslim Chechens. Economic difficulties led to a breakdown of relations between Yeltsin and the Russian parliament, and a new constitution was drafted, giving the president more power. In 1998, because of corruption and economic difficulties, Vladimir Putin replaced Yeltsin, and the former won the presidential election of 2002. His regime, while committed to democracy and a market economy, nevertheless was not adverse to use of authoritarian measures.

Chaos reigned as Moscow attempted to transform from a Communist-controlled state with economic central planning to a multiparty democracy with a market economy. Longstanding ethnic conflicts re-emerged, even though the major minorities were now separate countries in the CIS. The revived Orthodox Church and the Russian need for aid from the West were also political factors in the new Russia and the CIS. In 1997, Moscow signed a treaty that gave it observer status with NATO.

Belarus was less anxious to break away from the Soviet Union, although a nationalist spirit grew in the 1980s, especially since Belarius suffered greatly from the Chernobyl nuclear accident. Minsk declared sovereignty on July 27, 1990, and then full independence on August 25, 1991, but the Communists still dominated the government through the new elections. Belarius did not write a constitution until 1994. A complicated election system brought many independents and representatives from nonpolitical groups into the parliament. Aleksandr Lukashenko, who was elected president, supported Moscow. He then manipulated the government to rewrite the constitution and give him more power.

Moldova, the old Turkish and Romanian province of Bessarabia, was marked by its mixed ethnic character. The Moldovans themselves are closely identified with Romanians, but the Soviets tried to emphasize the differences, claiming that Moldovans were a distinct nationality. In the 1980s, however, the Moldovan national movement reappeared. The republic declared sovereignty in June 1990, and independence on August 27, 1991, right after the *coup d'état* in the Soviet Union. Moldovians debated whether

they should move toward union with Romania, which was still ruled by former Communists, and the Gagauz and Russian minorities declared their own separatist republics. The government was militarily unable to contend with the Russian separatists, and the country remained in a state of inertia. The elections of 1994 brought the Agrarian Democratic Party to power in the parliament over both the pro-Romanian and pro-Russian parties. The legislature introduced a new constitution that gave autonomy to both the Gagauz and the Russian minorities, easing the civil tension and moving the country toward reform. In 1994, Moldova and Russia signed an agreement to remove the Red Army within three years.

In the Ukraine, a national movement arose in the late 1980s when concern over Russification moved the Ukrainian leadership to address issues of language and culture, including history and religion. In addition, the leadership raised the issue of the economy and environmental pollution. In 1989, the Ukrainian parliament passed a law making Ukrainian the official language of the republic. Historical Ukrainian figures, such as Ivan Mazepa, who allied with the Swedes in the eighteenth century against Peter the Great, and Mykhailo Hrushevsky, the noted Ukrainian president who served briefly as president of independent Ukraine in 1918, were now celebrated.

The Ukrainian Uniate Church revived, leading to conflicts with the Ukrainian Orthodox Church over property, churches, and politics. The environmental movement Green World, led by author Yuri Scherbak, arose in the wake of the Chernobyl nuclear disaster and became a force in Ukrainian politics. Strikes and opposition to Moscow arose among the Donbas miners as their conditions worsened. In the critical years at the end of the 1980s, they joined the Ukrainian nationalists even though most of them were linguistically closer to Russians. In independent Ukraine, they moved away as a split developed between pro-West Ukraine centered on Kiev and pro-Moscow Ukraine centered on the Donbas. There were also class and religious aspects involved in the split—Uniate versus Orthodox and Kievan intellectuals versus proletarian miners.

In the spring of 1988, the Ukrainian Helsinki Union of released political prisoners, an outgrowth of the 1970s Helsinki Watch, appeared as an opposition party. As elsewhere, the parliamentary elections of 1989 and 1990 brought antigovernment, nationalist, and anti-Communist representatives to the national and republic parliaments. The republic declared sovereignty on July 16, 1990. In response to the national movements, the Soviet Union tried to negotiate a new relationship with the republics, giving

more autonomy but keeping control over foreign policy, the military, and Soviet finances.

In Ukraine, the Communists pushed for the support of the Gorbachev plan, while the opposition group *Rukh* demanded independence. After the August 1991 *coup d'état* failed, Ukraine immediately declared independence (August 24), which was ratified by overwhelming support from all ethnic groups in a plebiscite on December 1. Ukraine immediately started relations with other countries, although it joined the CIS at its founding. Kiev joined NATO's partnership for Peace in 1994 and the Council of Europe in 1995. In 1998, it became associated with the European Union.

Leonid Kravchuk was elected president and Leonid Kuchma prime minister. Both promised to move toward a Western orientation and market economy, but Kravchuk refused to implement the promises, and the Communist-controlled Supreme Council of State backed him. Kuchma resigned, and Kravchuk reintroduced central state control over the economy. In the elections of 1994, Kuchma defeated Kravchuk, but the council was still in the hands of the Communists, which hindered development. Kuchma arranged for foreign loans to no avail. Meanwhile, the division between East and West Ukraine intensified.

A new constitution in 1996 gave the president increased authority, but the country was in perpetual economic crisis with inflation and strikes by the miners. At the end of the decade, the economy improved. Kuchma was reelected in a hostile election in 1999. Kuchma was accused of massive corruption and involvement in the murder of a journalist. In another disputed election in 2004, the pro-Russian eastern candidate Viktor Yanukovich narrowly defeated Viktor Yushchenko, the pro-Kiev candidate. Accusations of fraud and even attempts to murder Yushchenko led to a division of the country. The East threatened to separate. In November 2004, the Supreme Court ordered new elections.

## COMMUNIST ECONOMIC MODEL

The Communist economic model, in the ideal sense of the term's theoretical conception, does not exist. In the idealist Communist society envisioned by Marx, the economy is operated on the principle of "from each according to one's ability and to each according to one's needs." In other words, workers contribute whatever they can to the society and get from the society whatever they need. In such an economic model, there will be no profit making, no value or commodity exchange, and no money.

To speak of the Communist economic model is to speak of an economic model that has been put into practice in the name of achieving this ideal. This

usually refers to an economy in a country run by a Communist party. The historical role of a Communist party is supposed to facilitate, by means of violent revolution and economic reconstruction, usually in that order, the achievement of the goal of communism. However, this usually requires qualification, as in the case of China, a country run by the largest Communist party in the world, which since the 1980s has operated on an economic model that is very different from what it was during the era of Mao (Mao Zedong) from 1950s to the 1970s. Moreover, because of different historical and political-cultural traditions, the Communist economic model has been implemented very differently in different countries. Therefore, the Communist economic model is an abstraction.

## Some Basic Features of Communist Economic System

The first, most salient and overriding feature of Communist economic model is that no private ownership of means of production (such as factories, lands, rivers, and natural resources) is allowed. The second most salient feature is that the most essential and majority of economic activities are carried out in accordance with top-to-bottom planning. This is called the "planned economy." Because economic plans are issued as governmental decrees, it is also called the "command economy." Thus, the central government may draw up a five-year plan for what to produce, including details on the priorities of production, raising revenue, and even on how much each citizen should spend. Both the former Soviet Union and China had five-year plans. Each five-year plan is further specified into a yearly plan. In such a planned economy, the prices of commodities do not fluctuate according to the supply and demand of the market but are fixed by the government. These plans are then issued to various administrative and bureaucratic levels for implementation. These administrator and bureaucrats may draw up their own plans to fulfill the targets, goal, or quotas of the central plans. The third feature of this system is that the bureaucrats and administrators who implement these plans are either ideologically committed or will obey the central government's command, willing or unwillingly. Bureaucrats and administrators in the system are usually members of the ruling Communist Party, and dissent is not allowed. The fourth feature of this system is that enterprise for public good may or may not be encouraged, but for private gains it is suppressed.

### Ideological Origin

The Communist economic model originated from Communist critique of capitalism. Premised on the evidence of exploitation of the working class in terms of working conditions, child labour, and subsistence pay, as well as the increasing polarization between the rich and poor during the development stage of capitalism (as what is happening in China in the twenty-first century), Marxist critiques argued that capitalism encouraged greed and was orientated to profit making, therefore alienating human life. Overcoming this capitalist logic and creating a new society of production should aim at improving human conditions and human needs. The logic of this argument is that society should pool all resources together to produce what is best for the public good rather than private gains and what is best for human needs rather than profit.

### A Case Study of China

Immediately after the Chinese Communist Party (CCP) took power in 1949, a revolutionary program of land reform was carried out. Land was confiscated from landlords and distributed equally to the rural residents on a per capita basis. However, to achieve better control and centralized planning and to avoid growth of private wealth and polarization, collectivization soon followed. In what was called the “commune system,” land and means of production were pooled together, and everyone became a member of the commune in which one worked as one was able, and staple grain was distributed equally on a per capita basis irrespective of labour contribution. During the beginning of the commune experiment, when there was no household economy and everyone ate in a public canteen, the ideological zeal led to disastrous famine. Since the 1960s, however, households have been allowed to own private plots, and a point system that rewarded work was implemented.

During the era of Mao, capital was accumulated by exploiting rural surplus under the state plan for rapid industrial development. For the purpose of industrialization, state planning had kept consumption to the minimum by rationing food and daily necessities. Urban residents were compensated by social and economic security, such as lifetime employment, generous pension, free education, free health care, and virtually free housing.

The economy reform policies that went into effect in the late 1970s have meant a gradual transformation of China from a command economy to a largely

market economy. China is now part of the world capitalist economy. Though China is still ruled by the CCP, its economy does not operate on the basis of a Communist economic model.

### Industrialization and Economic Growth

Until the 1980s, both the former Soviet Union and China made tremendous progress in industrialization, and the economic growth was higher than that of the capitalist economy in many countries.

Because of this rapid growth, Soviet Russia became one of the two superpowers during the Cold War, and China has pulled a large amount of people out of absolute poverty in three decades. In terms of literacy, health care, and life expectancy for the poor, China has done better than India, which has often claimed to be the largest democracy in the world. Even in terms of industrialization, China under the Communist economic model performed better than India.

### A Critique of Communist Economic Model

In countries where a version of the Communist economic model was run, shortages of food and daily necessities have been prevalent. Scarcity of commodities in the former Soviet Union, for instance, was legendary. Two basic problems with the command economic model led to this. First, though resources can be pooled together effectively and efficiently for a specific project, it is difficult to have an overall plan for an entire society. The second basic problem is related to the definition of human needs and who decides what is needed. Many Communist countries during the Cold War period concentrated on heavy industry and on military defense technology. As a result, daily necessities, such as socks and washing powder and even butter and bread, were considered secondary. The people in these countries were either implicitly or explicitly asked to sacrifice to compete with the capitalist system for the construction of a new society.

A final word of criticism concerning the Communist economic model is related to political oppression. Based on its very ideological orientation, the system not only demands individual sacrifices, but it also suppresses individual initiatives and creativity for private pursuits. For many, if not all, the lack of freedom of individual pursuit of “happiness” not only stamper economic prosperity but is also intrinsically unacceptable.

## COMOROS

The Comoros are a group of islands of volcanic origin in the western Indian Ocean. The three westernmost islands form the independent Union of Comoros; the fourth island, Mayotte, remains a French territory. The population of 760,000 is Islamic and ethnically and culturally homogeneous. Economically, Mayotte is highly dependent on subsidies from France, while the independent islands rely on foreign aid and remittances; vanilla, cloves, and perfume essences are the only significant exports. Gross national income (GNI) per capita in the independent islands was \$450 (US dollars) in 2003; real growth rates are generally positive but highly variable.

Relatively prosperous in the precolonial period due to their participation in regional trading networks, the islands' economies contracted following colonisation by France. The suppression of the slave trade and an almost complete lack of investment by the colonial power were accompanied by a severing of the islands from their natural socioeconomic environment—the East African coast—and orienting them toward Madagascar.

In 1975, the unilateral declaration of independence marked the end of six decades of colonial neglect. Independence prompted a French-backed revolution, but the lack of French support forced President Ali Soilihi to turn against his backers. Recognising the need for change, he embarked upon a radical Marxist-inspired program of social and economic reform. Soilihi's immediate objectives were achieving self-sufficiency in food production and educating the population; he dismantled colonial administrative structures and attacked the customary social order. Resistance to the latter, the tyranny of an increasingly

unrestrained youth militia, a volcanic eruption, and a massive influx of refugees following anti-Comorian riots in Madagascar led to social discord and hastened economic collapse. A decline in public support reflected Soilihi's increasing lack of control and finally provoked the mercenary-led restoration of a pro-French government in 1978.

Since the end of the Soilihi regime, approaches to development have been both unimaginative and unsuccessful; the political life of the country has been marked by a succession of *coup* attempts, several that were successful; in 1997, the island of Ndzواني (Anjouan) seceded. Despite an appeal to free market forces and the encouragement of investors (many of dubious competence), there has been no coherent policy of economic or social development beyond mendicity: an ongoing quest for donors. Despite the reestablishment of national unity of the three independent islands in 2002, chronic political instability and economic mismanagement discourages investors. The country remains highly dependent on the colonial power, and the development process is constrained by the continued French role in shaping policy and the subsequent difficulty of independent political action or economic policy.

A number of development organisations, bilateral and multilateral, operate in the country, but many projects are marked by failure. A small handful do succeed in achieving social acceptance, but the majority of lasting infrastructure projects, particularly on the largest island of Ngazidja, are financed by the emigrant community and not by outsiders.

Ali Soilihi's presidency was brief, but his policies left a lasting impression, particularly in view of the lack of real progress since his fall, and a critical re-evaluation of the period is currently benefiting from the perspective afforded by time. Although there is clearly an element of nostalgia in such retrospectives, there is also a recognition that the present political elite is not qualified to tackle the country's increasingly intractable economic woes. The country has no niche role—tourism suffers from a lack of air links, labour costs are high, and agricultural land is already overcrowded—and chronic corruption impedes all but the most persistent development initiatives.

## CONGO, DEMOCRATIC REPUBLIC OF THE

The Democratic Republic of the Congo, formerly known as Zaire, is located in Central and West Africa on both sides of the equator. The country has a small access to the Atlantic Ocean at its western border, but it is bounded on the west by Angola and the Republic of the Congo; to the north by the Central African Republic and Sudan; to the east by Uganda, Rwanda, Burundi, and Tanzania; and to the south by Zambia and Angola.

This region was first exploited by Europeans during the Portuguese exploration of Africa in the late 1400s. The taking of slaves from the region soon followed, with these being taken to the Americas. The slave trade continued into the nineteenth century, during which time King Leopold of Belgium established a colony of his own (not a colony of Belgium) in the region. This colony, the Congo Free State, had not been established in keeping with the other European colonies of the period, and the other European colonial powers objected to Leopold's personal rule. This resulted in the Belgian government taking control of the region in 1908, renaming it the Belgian Congo.

The purpose of European colonization was for economic gain, and the natural resources of the Belgian Congo (primarily copper, along with other minerals and natural products) were profitable. Profits dropped during the international depression of the 1930s, but resumed following World War II.

African movements for postwar independence met with mixed success in many areas, but in 1957, Belgium permitted limited home rule, and in 1960, full independence was achieved. The new government had a multiparty structure, like many European parliaments, with no group in clear control. Complicating the new independence was the fact that many Belgian military officers had held onto their positions of power. This led to local revolts and fragmentation of the country, and President Joseph Kasavubu had his prime minister, Patrice Lumumba, arrested.

Lumumba was assassinated, and civil unrest continued. At the invitation of the government, the United Nations sent in military forces to restore peace. Revolts continued for years until the Congolese army overthrew the civil government, and Colonel Joseph Mobutu declared himself president.

Five years of civil war had badly damaged the country's infrastructure, so Mobutu's first missions were to centralize power in the national government, end regional fighting and efforts at secession, and restore the economy. Unfortunately, just as production in the copper industry could resume, the world market price for copper dropped, and the price for oil increased.

From the time of independence in 1960, the economy and population of the Congo had changed dramatically. The people of the region had traditionally engaged in subsistence farming, with families providing essentially for themselves; with independence, however, a migration of the population to the cities began. This reduced overall food production, and Congo changed from being self-sufficient to a country requiring imports of essential materials. The potential mineral wealth (in addition to copper, some gold, silver, tin, manganese, and other minerals can be mined) made international credit easily available, and Congo became a major borrower. Only twenty years after independence, Congo (known as Zaire from 1971 to 1997) had a national debt of more than \$4 billion.

The performance of the economy of Congo/Zaire was inconsistent, even after civil order was restored. While agricultural output expanded between 1967 and 1983, exports dropped, and gross domestic product (GDP) fluctuated, with an overall decline.

One of the country's largest creditors was the United States, which saw Congo/Zaire as a Cold War regional ally against the Soviet Union. This led to a continuation of international loans, with the result that by 1980 the World Bank and International Monetary Fund stepped in to attempt to bring order to Zaire's finances. The United States continued to stand by President Mobutu as an ally through the 1980s, after his earlier intervention against a Cuban-supported government in Angola and against Chad in 1983. Mobutu was able to sustain his rule easily through the 1980s, but regional conflict in the early 1990s brought about his downfall.

The 1994 genocide in Rwanda sent large numbers of refugees into Zaire, and in the eastern regions, an armed rebellion against Mobutu began. Forces led by Laurent Kabila's *Alliance des Forces Démocratiques pour la Libération du Congo-Zaire* (AFDL) steadily worked their way westward until Mobutu fled the country in 1997. Kabila's revolutionary government was quickly recognized by countries in the region, and

he ruled the country (renamed the Democratic Republic of the Congo) until he was assassinated in January 2001. His son, Joseph Kabila, was named as his successor. The International Rescue Commission estimates that some 2.5 million people were killed in the civil war that led to Mobutu's overthrow.

Since the overthrow of President Mobutu, the Democratic Republic of the Congo has continued to import more than it exports, and its international debt in 2002 was more than \$8 billion. Because much of this is believed to have been diverted by Mobutu for his personal use, the government is attempting to trace those funds and alleviate its international obligations.

As of 2005, the Democratic Republic of the Congo's future holds more promise than it has in decades. The new Kabila government is widely recognized as legitimate, regional fighting has subsided, and the first elections since 1960 have been scheduled. This relatively secure environment offers the opportunity for the nation's mineral resources to be developed and for agricultural exports to be increased.

### CONGO, REPUBLIC OF THE

The Republic of the Congo is located in western equatorial Africa on the northwestern banks of the Congo and Ubangui rivers. It has a short, 3-mile/150-kilometer Atlantic coastline and is bordered by the Central African Republic, the Democratic Republic of the Congo, Cameroon, Gabon, and Angolan Cabinda. The Mayombe escarpment extends into the coastal regions of Congo, reaching a height of about 875 yards/800 meters. The low (650–750 yards/600–700 meters) Bateke plateau dominates the country's center, while the swampy forests of the Congo River basin dominate the north. The Niari valley in the south contains the country's best agricultural land. Congo's climate is generally equatorial but varies somewhat depending on altitude and proximity to

cold ocean currents off the coast. Pronounced rainy and dry seasons occur at different times of the year in the various regions.

From the sixteenth through the nineteenth centuries, three important African kingdoms occupied significant parts of the territory of contemporary Congo. These included the Loango kingdom along the Atlantic Coast, the Tio kingdom in the Plateau region of central Congo, and the Kongo kingdom extending into southeastern Congo. The belief in the supernatural powers of the kings served as an important ideological basis for power in all three. Their economies were based on agricultural production, with the slave trade becoming an important trading component in the sixteenth century. Pierre Savorgnan de Brazza was the first European to penetrate the Congo beyond the coastal region in 1875. In 1880, de Brazza gained the signature of the Makoko, King of Tio, on a treaty granting the French dominion in his territories, and a parallel signature from the King of Loango in 1883. These served as a legal pretext for French occupation of the territories over the coming two decades. In 1910, Congo became part of the federation of French Equatorial Africa (FEA), including the territories of Congo, Gabon, Chad, and Ubangui-Chari, with Brazzaville as the capital. From 1898 to 1930, Congo was under the dual administration of the French government and some forty "concessionary companies." These gained rights to exploit the natural and human resources of their individual concessions in return for rent and taxes, leading to horrible abuses but little lasting economic development. Between 1922 and 1934, the French constructed the Congo-Ocean railway connecting Brazzaville and Pointe Noire, at the cost of some fourteen thousand African lives. While per capita income in Congo has been bolstered since the 1970s by petroleum income, the economy remains largely unindustrialized and underdeveloped.

Following France's defeat in World War II, partisans of Free France and Vichy battled to control French Africa. After a Free French victory, thanks to the support of a key governor, Félix Éboué, Brazzaville became the headquarters of Free France in Africa during the war. In 1944, Charles de Gaulle chaired an important colonial conference in Brazzaville, at which time France promised political reform after the war. Congo's agricultural economy expanded during the war to meet increased allied demand for commodities. In 1946, France permitted the establishment of a territorial assembly and the election of two Africans to the French National Assembly. Felix Tchicaya, a Gabonese-born resident of Pointe Noire (Congo), was elected to represent the territory then known as "Moyen Congo." Until his

political eclipse in 1957, Tchicaya had one chief rival in politics named Jacques Opangault, an Mbochi from northern Congo. In 1953, the French opened a dam on the Djoué River that provided electricity to Brazzaville, stimulating increasing migration into the colonial capital.

The politics of the late colonial period were dominated by personality and ethnoregional loyalties. No strong basis for national identity emerged. In 1956, Félix Youlou became a significant political figure when he rallied the Lari people to his cause and was elected mayor of Brazzaville. Congo became an autonomous state in the Franco-African Union in 1958 before its proclamation of independence in 1960. In 1959, the National Assembly elected Youlou as president. Although Youlou had charisma, he followed conservative, pro-French economic and foreign policies until his overthrow in 1963. Beginning in the late colonial period, Congo's main source of export revenue was timber harvested in its southern forests, with annual production varying between five hundred thousand to eight hundred thousand cubic meters. Congo also produced tobacco, sugar, cocoa, bananas, and peanuts on a small scale for export and local consumption.

After Youlou's fall, Congo's government created a new, single party for the state, the *Mouvement Nationale de la Révolution*, and followed a vaguely Socialist path to development. Alphonse Massamba-Debat, a former assembly president, became Congo's second president. He ruled, without fully consolidating power or fundamentally altering the economy, until being overthrown in 1968.

Congo's next three presidents were all northern Mbochi army officers. The first, Marien Ngouabi, renamed the country People's Republic of Congo, created a new state party (the *Parti Congolais du Travail*), and adopted Marxism-Leninism as the state's official ideology. His regime coincided with large increases in oil production and prices in the early 1970s. The state took the leading role in the economy, nationalizing private enterprises (such as the Industrial and Agricultural Company of Niari, SIAN) and launching others (such as the Textile Printing Company of Congo, IMPRECO). After Ngouabi's assassination in 1977, Jacques Yhombi-Opango briefly served as president before being overthrown in a bloodless *coup d'état* in 1979. His successor, Denis Sassou-Nguesso, ruled Congo until the political transition of 1991. Oil revenues allowed substantial investments in Congo's state-dominated industrial sector, led by the Hydro-Congo petroleum product-marketing monopoly, during this period and caused massive urbanization of the country. Civil society was kept firmly under state control, however, following Marxist doctrine.

The revolution that overthrew Sassou was motivated by an economic crisis dating to the oil price collapse of 1985 and by the ideological shock of communism's collapse. Congo's leaders organized a "sovereign national conference" in 1991 and put in place a transitional government that drafted a new constitution. Multiparty elections in 1992 saw the election of Pascal Lissouba, a scientist and former prime minister from the 1960s, as president. Voting, again, exhibited an ethnoregional pattern. The revolution of 1991 led to the rebirth of a free press and of a nascent independent civil society. A political dispute at the end of 1992 led Lissouba to dissolve the assembly and organize new elections in 1993, which his party won by dubious means. Political protest, ethnic cleansing, and low-grade civil war between political militia groups ensued, leading to more than two thousand deaths.

The civil peace was restored during 1994, but political tension hung over Brazzaville and led up to the presidential elections scheduled for July 1997. The economy had performed poorly under Lissouba, with GDP *declining* by an average of 3.2% annually between 1993 and 1997. Annual inflation averaged more than 16% during the same years, owing mostly to the devaluation of the CFA franc in 1994. Civil society remained weak. Only weeks before the election, Lissouba attempted to arrest Sassou, who was to be a presidential candidate in the elections. This move precipitated another more deadly civil war between the political militia, ending with Sassou's victory in October. Some ten thousand Congolese died. Sassou owed his victory mostly to French support and Angolan intervention. As Sassou sought to consolidate his rule, yet another civil war broke out in December 1998, lasting a full year and killing fifty thousand. Relative peace returned to Congo by late 1999. Since then, some of the country's infrastructure has been rebuilt, but the economy remains utterly dependent on petroleum income and the civil society cowed by the threat of renewed war.

## CONSTITUTIONALISM, DEFINITION

Determining how state power should be used and limited is probably the oldest and most intractable political problem. The sudden independence of the European empires after World War II and the more recent disintegration of the Soviet bloc in Eastern Europe made that problem inescapable and worldwide. One of its most vexing aspects involves the legal establishment of new sovereign powers. The general recognition of popular sovereignty, a system of nation-states requiring legal order for recognition, and a global economic system requiring legal protections all militated in favor of the promulgation of constitutions. But the uses of constitutions, especially in the developing world, are more problematic than might appear at first glance.

Constitutions are power maps; they are, at the same time, proclamations of sovereignty, institutional guidelines for the power and staffing of government offices, and listings of limitations on government power (Duchacek 1973). This combination of aims makes the definition of constitutionalism difficult. The more common definitions of the term view constitutionalism as long-term, self-imposed, and procedural; the term refers to substantive limitations on majority decisions (Elster and Slagstad 1988). Drawing on classical liberal political and economic theory, these definitions emphasize acceptance of limited government and the rule of law. For this perspective, the most important features of constitutional orders are the establishment of responsible governments, regular elections, an independent court system, public order, and protection of individual rights, especially to property and to secure contracts (de Smith 1962). Another, more functionalist view of constitutionalism focuses instead on the establishment of sovereignty and the need for constitutions to adapt to social and economic environments to secure legitimacy (Friedrich 1967; Loewenstein 1963). Constitutionalism, then, is not so much a matter of limitations on government as of establishing government in the

first place. Constitutions that reinforce sovereignty through building national loyalties and adapting state power efficiently to other social and economic institutions are much more likely to succeed.

Both liberal and functionalist definitions of constitutionalism have some relevance to the problem of constitutionalism in developing countries, but both approaches have major weaknesses. Liberal definitions have pinpointed a major problem in developing countries. The new states have been characterized by authoritarian governments and accompanying deprivations against individual rights. Obviously, legal limitations on state power might help alleviate these difficulties. Just as obviously, however, this approach assumes what is, in fact, problematical in much of the developing world. The concerns about limitations on government that motivate theorists in this school presuppose a level of state power and legitimacy to which most developing countries can only aspire. Calls for the rule of law when governments cannot consistently claim authority twenty kilometers from their capital cities are likely to prove unconvincing as well. Further, the main elements of this view are problematic. Obviously, the need to assert popular sovereignty runs directly into the establishment of governmental limitations (Poggi 1992). Further, the components of the rule of law, such as public order, security of contracts, and protection of property rights, beg several important questions: what institutions will establish public order; what types of contracts will be secured; and which property rights will be protected?

Functional definitions are similarly flawed. In a mirror image of the liberal view, its emphasis on establishing sovereignty spots the immediate problem for most governments in the developing world. What this approach fails to show is how stable, legitimate political orders can be established if constitutions are seen as adaptable instruments. Also, if governments are increased in power, what is to stop those who hold it from authoritarian excesses? Finally, the predominant role given to the formation of national loyalties, while certainly not trivial, avoids the hard task of establishing the institutional powers and limits that can help build them.

The difficulty of establishing a valid and useful constitutional theory for developing countries should not deter thinkers on the subject. It is evident, however, that present definitions of constitutionalism must be rethought. This task can be addressed, as Seidman (1978) shows, by looking at the task of development itself. Development is concerned with changing established patterns of social, political, and economic behaviors to different and more productive pursuits. Its main tools in achieving these goals are

law and regulation. What both existing approaches to constitutionalism have avoided is how constitutions can be adapted to development purposes. The dominant liberal approach would achieve development goals by the rule of law and the institutions—an independent court system and strong security forces—to enforce it. The result would be an environment more conducive to capitalist development and, presumably, limited democracy. The functional approach would depend instead on increasing national integration to ensure that legal commands would be followed and development initiatives are achieved.

What both approaches avoid is that development involves a choice. Individuals in developing countries must take a sharp pencil to legal commands; their environment leaves little room for error. Only those laws and regulations that are clear and understandable in terms of that environment, which they have the opportunity and capacity to obey and which they perceive (at least) are in their interests, are likely to prove useful (Seidman 1978). One can assert the rule of law through nondemocratic institutions like independent court systems or call for loyalty to the new state and its ideologies to very little effect unless the legal order meets these criteria. And it is here that both definitions of constitutionalism fail. Both are based, de facto, on an elite controlled, top-down transmission of commands. Liberal constitutionalism seeks protection for urban, capitalist interests that cannot mobilize development initiatives through democratic institutions; functionalist constitutionalism seeks loyalty for national political leadership. The task, however, is to provide substantial communication concerning development laws and regulations between mass publics and legislatures and administrators. Hence “constitutionalism,” to be relevant to the developing world, must be defined as a participatory exercise providing the power map for the development process. For this purpose, parts of both perspectives examined in this discussion will prove useful, but not unless they are recast with the aim of providing institutions that foster the necessary input functions to make development work. This problem awaits further thought.

### CONTRAS

The Contras were a guerrilla army opposed to the Sandinista regime of Nicaragua during the 1980s and 1990s. Their attempt to defeat the Sandinista government badly damaged Nicaragua and helped to maintain the bitter divide between the Left and the Right, which has characterized much of that country’s history. The secret funding of the Contras by the United States government, without Congressional approval, led to the Iran-Contra Scandal that tarnished the second term of the Reagan presidency.

### Nicaragua

After becoming an independent nation in the nineteenth century, Nicaragua suffered under the rule of a succession of corrupt strongmen, often backed by the United States. These governments supported the interests of Nicaragua’s wealthy elite and foreign, generally American, corporations, at the expense of the country’s population of poor farmers.

In 1912, the US Marines intervened to protect American corporate interests and the presidency of Adolfo Diaz. The Marines stayed in Nicaragua until 1934, supporting a series of puppet presidents. They were opposed for much of their occupation by General Augusto Cesar Sandino, a political Liberal. Sandino was finally killed during a US-brokered peace negotiation, executed by order of General Anastasio Somoza Garcia, a US-trained leader of the Nicaraguan National Guard. After his death, Sandino became a folk hero among poor and left-wing Nicaraguans.

Somoza used his position as head of the National Guard—along with the support of the American government—to stage a *coup d’état* and seize power in 1937. He ruled until 1956, when he was replaced by his two sons, Luis and Anastasio Somoza, who ruled

either directly, with one of them as president, or as the real power behind a series of puppet presidents. Their rule was characterized by rampant corruption.

In the 1960s, radical opponents of the Somoza regime established the *Frente Sandinista de Liberación Nacional* (FSLN)—the National Sandinista Liberation Front—named after General Sandino. Brutally suppressed by the Somozas, the Sandinistas's success was limited at first, but Anastasio Somoza's attempts to maintain his own one-man rule (Luis died in 1967) alienated more mainstream elements in the population who allied themselves to the Sandinistas. In 1979, Somoza was finally convinced he could no longer hold on to power, and he went into a US-facilitated exile. Tens of thousands died in the war to remove him from power.

The new government was led by Sandinista leader Daniel Ortega. It put into place numerous reforms, including confiscating the Somoza's land holdings and imposing agrarian reforms. Some of these measures were too extreme for Ortega's more moderate, non-Sandinista allies, including Violeta Chamorro. Chamorro's family owned the paper *La Prensa* and had opposed Somoza but also disagreed with the more radical Sandinista policies.

The US government began funding opponents to the Sandinistas, including *La Prensa*. However, the most controversial of the US actions involved the creation and support of the military army known collectively as the Contras.

## The Contras

Immediately after Somoza's departure from Nicaragua, a number of his officers and men in the former Nicaraguan National Guard left the country and became involved in anti-Sandinista exile groups. Other Nicaraguans, including some ex-Sandinistas, opposed the regime because of specific policies, particularly its close ties with Cuba and its leader Fidel Castro. These anti-Sandinista forces were collectively called the "Contras," short for *contrarrevolucionarios* or counterrevolutionaries.

Generally, the Contras were right-wing in ideology but divided into several and not always friendly groups, and it therefore would be a mistake to lump them all together. For example, groups placed under the Contra label included Edén Pastora, a former Sandinista leader who, while not in agreement with more conservative Contras, opposed Sandinista leader Ortega's ties with Cuba. It was the more conservative Contra groups, however, particularly those whose roots lay in the dictator Somoza's

regime, which were the most prominent and the best funded.

In particular, the *Fuerza Democrática Nicaragüense* (FDN)—Nicaraguan Democratic Force—became the group most identified with the label "Contra." The FDN was made up of ex-Somoza officers and led by former National Guard leader Enrique Bermúdez. The FDN was based in Honduras, Nicaragua's northern neighbor, and was supported by that country's conservative government. Very quickly, also, the FDN began receiving extensive financial and logistical support from the United States.

It is possible that some Contra elements received funding from the United States Central Intelligence Agency (CIA) during 1979 and 1980, although this was not the official policy of the US government under President Jimmy Carter. In 1981, however, Ronald Reagan was elected president of the United States, and American policy became strongly anti-Sandinista and pro-Contra. President Ronald Reagan opposed the Sandinista regime and was willing to use military force to remove them from power.

In late 1981, Reagan signed the National Security Decision Directive 17 (NSDD 17), which authorized secretly funneling millions of dollars in military aid to the Contras. Reagan made it clear that it was his administration's goal to remove Ortega and the Sandinistas from power. Reagan justified this attempt to overthrow the government of an independent nation on the grounds that the Sandinista's ties to Cuba made them part of the general Soviet alliance and therefore a threat to US interests. More specifically, Reagan and other conservatives in the United States also accused the Sandinistas, probably correctly, of supporting left-wing guerillas in El Salvador.

The CIA, under NSDD 17 authorization, spent millions arming and training the Contras, which eventually became an army of perhaps five or six thousand men. The Contras, and for the most part this meant the FDN, carried out bombing attacks against Nicaraguan civilian and military targets. In 1983, the Contras began large-scale raids across the border from their bases in Honduras (and with support from the Honduran army) but with only limited success. Nicaragua's economy was disrupted, but local pro-Sandinista militias were able to defeat the invaders. In 1984, US forces placed mines in Nicaraguan ports in an attempt to further destabilize the Sandinista government, a move that received widespread attention and international condemnation. The Contras also used terrorist techniques, including assassination, against the Nicaraguan government. By 1984, international hostility to the US's pro-Contra position convinced the United States Congress, then

controlled by the Democratic Party, to temporarily end American funding of the Contras's military activities. The Boland Amendment, the amendment that ended the funding, was reluctantly signed into law by President Reagan on October 12, 1984.

Without US funding, the Contras, who lacked widespread popular support in Nicaragua, were unlikely to succeed in their efforts to overthrow the Sandinistas. Moreover, elections held in late 1984 gave the Sandinistas a strong majority in Nicaragua's National Assembly and elected Ortega president.

### **Iran-Contra Scandal**

President Reagan was reluctant to allow the Contras, whom he likened to the US's founding fathers, to fail. With Reagan's encouragement, National Security Advisor Robert McFarlane authorized his subordinate Oliver North to organize further aid to the Contras. North, using the National Security Council (NSC) as his base of operations, raised funds from sympathetic countries around the world as well as from private donors (some of whom received the reward of a photo with President Reagan). The NSC was also aided in its activities by the CIA. All this was done against the Bolland Amendment and therefore was illegal under US law. It was also done entirely without congressional knowledge and kept secret because North and his superiors (McFarlane and later his replacement, Admiral John Poindexter) knew that it was illegal.

This illegal funding of the Contras gradually began to become public after 1985, when a CIA-operated plane piloted by Eugene Hasenfus was shot down over Nicaragua. Hasenfus was captured, and his confession, along with captured documents, revealed the tip of the illegal activities of the CIA. In 1986, after government officials, including President Reagan, denied US involvement, a congressional investigation was opened. Congressional committees gradually unraveled parts of the Contra funding story, particularly the central role of Oliver North and John Poindexter.

The investigation also revealed that the US government had authorized selling weapons to Iran, then an enemy of the United States, in return for helping to obtain the release of American hostages being held in Lebanon. Much of the money gained in these arms sales, which were themselves illegal, was funneled by Oliver North to support the Contras. It was the discovery of this unique funding method that exploded into the Iran-Contra Scandal.

An independent counsel, Lawrence Walsh, was appointed in December 1986 to investigate the Iran-Contra affair. In the end, both Poindexter and North were convicted of violating US law, but their convictions were overturned on appeal (largely because they had previously been granted limited immunity by congressional committees). It was never proven that President Reagan knew of the illegal nature of his subordinates' activities, although it is clear that he was in sympathy with the policies they were advancing—the destabilization of the Nicaraguan government. Later, President Bush, who had been vice president during Iran-Contra, pardoned many of the major participants in the scandal, including Robert McFarlane.

### **End of the Contras**

The exposure of the Iran-Contra Scandal in the United States made further support of the Contras politically difficult. Furthermore, there was widespread hostility to the United States's pro-Contra policies in both Central America and in the larger international community. Well-documented reports of Contra atrocities reduced what limited popularity they once had, while the economic strain the conflict put on neighboring countries, such as El Salvador and Costa Rica, made ending the war seem a necessity.

Costa Rican President Oscar Arias put forward the Arias Peace Plan, which both demanded an end to outside intervention, as well as an agreement by the Sandinistas to hold new elections. President Ortega agreed but was rebuffed by the United States and the Contras, both still hoping for military success. In 1988, a Nicaraguan offensive against Contra forces still in Nicaragua led to further Contra defeats and a recognition that the war was failing.

The Bush administration, which came to power in 1989, ended the Reagan policy of military action and supported the idea of Nicaraguan elections, pushing strongly for the defeat of Ortega by helping to fund his opponents. The 1990 presidential election led to Ortega's defeat and the victory of Violeta Chamorro, candidate of the moderate Right.

Some Contra forces, unhappy with the Chamorro government's decision to keep some Sandinista elements within the Nicaraguan government, fought on until 1994, when the last Contra bands made their peace with the government.

The Contras had some roots in a genuine reaction by anti-Leftist elements within Nicaragua, but they

would have been impossible without extensive support and funding by the United States, funding obtained both within and outside the confines of US law. In the end, the elements must be viewed as an extension of US foreign policy, a policy that was opposed the Leftist pro-peasant policies of the Sandinista government.

Politically, the Contras achieved only limited success. They failed to oust the Sandinistas from power through military means. They did, however, put pressure on the Ortega government, and it may have been that pressure that eventually led to Ortega's defeat in 1990.

Economically and socially, the Contra War was a disaster for the people of Nicaragua. Nicaragua was forced to spend a large portion of its gross national product on troops and weapons, while much of Nicaragua's northern provinces were disrupted by Contra raids. The result was to make an already poor country poorer. The human cost of the Contra War is difficult to calculate but probably exceeds fifty thousand killed. To a country with a population of approximately 4 million, this was an immense loss.

## COPTIC CHURCH (COPTS)

The Coptic Orthodox Church is the indigenous church of Egypt, currently encompassing approximately 95% of the Christian population in that country. The Coptic Orthodox Church is the largest of the Oriental Orthodox Churches, distinct in its organization from the Eastern Orthodox and Roman Catholic Churches since the Ecumenical Council of Chalcedon in 451. Its independence from the rest of the world's

churches is signified by its recognition as an “autocephalus” church. The head of the church is its patriarch, known locally as the pope of the Coptic Orthodox Church. Individual adherents are known as “Copts.”

The term “Coptic” refers both to the church and to the Egyptian language in use in the first century when the church was founded, which has been retained as a liturgical language written in Greek characters. It is conjectured that the word is a derivative of a Greek term used for the nation of Egypt; thus, “Coptic” is synonymous with “Egyptian.”

According to tradition, the Coptic Church was established by St. Mark in the first century CE. To this day, the Coptic Holy See of Alexandria is known as the Holy See of St. Mark. Over the course of the following four centuries, Christianity grew to become the most influential religion in Egypt, and several important early Christian leaders came from the Coptic Church, including Origen of Alexandria, Athanasius, and Dioscorus, who led the church out of the mainstream of Christian orthodoxy in 451. The division of the church led to widespread religious conflict in Egypt that came to an end with the Muslim conquest in 640. During the Islamic period, Copts were tolerated, but the internal weakness of the church and restrictions and taxation imposed upon non-Muslims contributed to the gradual erosion of the Christian population; by the end of the Ottoman period, they were a small minority.

During the late colonial period, Copts were gradually emancipated from feudal-era restrictions that controlled their public activity. They were freed from an obligation to pay a special poll-tax (*jizya*) in 1855, admitted as equals to the Egyptian armed forces, and began to achieve greater prominence in the early nationalist administrations. Copts became prominent in business and in the administration. One Copt, Boutros Ghali, became prime minister in 1908, only to be assassinated two years later. The event signaled an increase in hostility toward the Coptic Church, which was perceived as a fifth column for colonial authorities even as those authorities sought to mollify local Muslim religious sentiments. From the 1930s, restrictions on church construction were intensified under a ministerial rescript. Following the Free Officers' Revolt of 1952 and a subsequent republican administration, the Coptic Church was significantly weakened through the confiscation and nationalization of personal and institutional properties. Increasing levels of emigration further decreased the number of Copts resident in Egypt.

The decline of the Church came to a halt in 1959 with the appointment of a reformist patriarch,

Kyrillos VI. The patriarch saw to an intensification of Christian education and to the empowerment of lay and clerical leadership, encouraging the rise of several like-minded bishops. Among these was Nazir Gayed, a charismatic youth leader, who was instrumental in the growth of a rigorous new catechetical Sunday school movement. Upon the death of Kyrillos VI in 1971, Gayed succeeded him as Pope Shenouda III. The present patriarch has overseen the further institutional resurrection of the church. In the late 1970s, he led a more activist approach toward the regime in response to the growing threat of Islamist radicalism toward Christians and church properties, a radicalism tacitly courted by the government of President Anwar al-Sadat. His opposition to the regime amid the riots and violence of Sadat's final days caused the government to charge him with treasonous activities and to force him into internal exile in 1981. Following the assassination of Sadat later that year, Shenouda sought reconciliation with the government and was reinstated in 1985. During the past two decades, the Coptic Church has sought to consolidate the gains made under the reformers and to maintain a cordial relationship with the government and conservative Islamist elements. Through the 1990s, the church suffered as a target of the radical Islamist *Gama'a al-Islamiya* terror organization, but government repression of the radicals and international attention to the plight of the church have bolstered its position. The church has effectively modernized, providing significant local social services, such as relief, educational, health, and rehabilitative programs. In spite of the patriarch's traditional title as Bishop of the See of Alexandria, the administrative offices of the church are situated in Cairo.

In the twenty-first century, Copts are found throughout Egypt and in diaspora communities throughout Europe, North America, and Australia, where they have established indigenous dioceses appointed by the patriarch. While Copts are found throughout Egypt, they are especially concentrated in Cairo and in Upper Egypt, particularly in the governorates of Asyut, Minya, and Sohag. Their numbers are a matter of significant controversy: Copts are said to compose anywhere between 4% and 10% of the Egyptian population.

In the third century, a Coptic ascetic, St. Anthony the Great, became the founder of the Christian monastic movement when he retreated to a spot in the Eastern Desert of Egypt not far from the Red Sea coast. He was followed by many imitators, who established monasteries in the deserts of Egypt, most notably in the salt water depression known as Wadi Natrun, south of Alexandria. Monasticism became a key feature of the Coptic Orthodox Church, so much

so that the modern hierarchy is drawn entirely from the ranks of anchorite monks from the many monasteries that are scattered throughout Egypt. Thus, while the hierarchs are celibate, individual priests may marry. Despite a prolonged period of decline, the monastic movement has seen a resurgence under the past two patriarchs, and the largest monasteries have been refurbished and developed into major centers of spiritual retreat.

## CORRUPTION, GOVERNMENTAL

Corruption, in one form or another, remains an important development constraint in virtually all developing societies. Unfortunately, it is difficult to define and measure, making it very challenging for researchers to empirically test for it.

### Defining Corruption

Traditionally, corruption is defined in terms of three basic models. First, corruption, as argued by Nye (1967:419), is “[b]ehavior which deviates from the normal duties of a public role” and hence is related to the performance of the duties of a public office. Second, it is related to the exchange concept, which is derived from the economic theory of the market. As argued by J. van Klaveren (1990:26), state custodians (civil servants and politicians) view their public offices as enterprises from which they can extract extralegal compensation. If a civil servant, for example, can generate for himself more resources from outside sources (such as through bribes) than from his regular employment, he may spend most of his time and

effort meeting the needs of the entrepreneurs who bribe him than performing the public duties for which he was hired. Finally, corruption is related to the concept of the public interest. According to Carl Friedrich (1990:15), the “pattern of corruption may therefore be said to exist whenever a power holder who is charged with doing certain things, that is a responsible functionary or office holder, is by monetary or other rewards, such as the expectation of a job in the future, induced to take actions which favor whoever provides the reward and thereby damage the group or organization to which the functionary belongs, more specifically the government.” Hence, the activities of opportunistic state custodians can severely damage public interest and must be considered important variables in the examination of corruption and its impact on society.

### Classifying Corruption

The development literature identifies four categories of corruption: (i) cost-reducing corruption; (ii) cost-enhancing corruption; (iii) benefit-enhancing corruption; and (iv) benefit-reducing corruption (Alam 1989). The first category, cost-reducing corruption, involves situations in which civil servants reduce the costs imposed on an enterprise by government regulations. For example, the regulator can exempt an enterprise from complying with certain government regulations or eliminate the taxes owed by that business to the government. The civil servant and the business owner share (based on a prearranged sharing formula) the savings generated by the bureaucrat’s actions.

In cost-enhancing corruption, the second category, civil servants who are placed in charge of public stocks of food and other public goods may extract rents by charging demanders a price that is higher than that allowed by law. In addition, bureaucrats whose job it is to grant licenses and permits, such as import licenses, for entrepreneurs to enter business sectors closed by government regulations can confiscate part of the monopoly profit associated with the licenses. Finally, the civil servant can illegally tax economic activity for his own benefit.

In the third category of benefit-enhancing corruption, civil servants transfer to citizens who are legally due public benefits more than the legal amount. In exchange, the recipient surrenders some of the benefits to the civil servant. Throughout developing countries, incumbent rulers use this mechanism to transfer resources to individuals and groups, such as military officers and labor unions, that have

developed enough violence potential to threaten regime security.

In the fourth and last type of corruption—benefit-reducing—civil servants illegally transfer to themselves benefits that belong to citizens. For example, the director of the country’s public pension plan may delay the transfer of retirement benefits to retirees and, subsequently, appropriate the interest earned by the delayed funds. This type of corruption is quite pervasive in developing countries given the fact that civil servants have more information about public benefits programs than ordinary citizens.

### Corruption and the Theory of Public Choice

Many economists, not satisfied with the explanations given for corruption in the development literature, have turned to the theory of public choice, which considers corruption as postconstitutional opportunism, designed to extract benefits for individuals or groups at the expense of the mass of the people. As argued by public choice theorists, the scope and extent of corruption in a society is determined by the society’s institutional arrangements. After the constitution has been compacted and adopted, there is an incentive for individuals and groups in the society to subvert the laws or rules to generate additional income for themselves. The subversion of rules, if it can be undertaken successfully, can enhance the ability of individuals and groups to extract benefits above and beyond what they would have secured otherwise. Such behavior can take place in both democratic and nondemocratic societies (Ostrom, Schroeder, and Wynne 1993).

Civil servants and politicians may use their public positions to maximize their private objectives instead of carrying out the duties for which they were appointed or elected. The desire by civil servants and politicians to engage in opportunism, such as corruption and rent seeking, and the effort by special interest groups to subvert society’s laws and generate benefits for themselves create opportunities for corrupt behavior. For example, a trader who wants to secure a lucrative import license may bribe a clerk at the trade ministry to easily secure the permit. The latter offers the trader opportunities to earn monopoly profit.

The regulatory activities of the government impose significant transaction costs on market participants and have a negative impact on firm profitability. To minimize these regulation-related costs and enhance firm profitability, some entrepreneurs may turn to the bureaucracy for help. The enterprise owner pays the

regulator a bribe so that her business is treated favorably and she can minimize the burden of government regulation on her economic activities. For example, in exchange for the bribe, the regulator can exempt a business from meeting various government mandates, such as providing wheelchair access to the business or meeting certain safety and environmental standards. As argued by public choice theorists, bureaucratic corruption is related directly to the scope and extent of government intervention in the markets. Hence, an effective and sustainable corruption control program must involve the modification of existing rules so as to change the incentive structures faced by participants in markets (Mbaku 2000; Rose-Ackerman 1999).

### The International Dimension of Corruption

Corruption is a universal problem. Although it affects both developed and developing countries, it does not have a uniform impact on each one of them. In recent years, many policy makers around the world have recognized corruption's global nature and have been attempting to coordinate their cleanup efforts. Corruption is no longer viewed as arising from the interaction of domestic entrepreneurs with their bureaucracies. Many politicians and civil servants, especially in Third World countries, are now arguing that the contributions of transnational corporations to the culture of corruption must be recognized to allow governments to more effectively deal with it.

Since the mid-1980s, many organizations have become interested in corruption cleanups. Some of the most important of these organizations include the United Nations (UN), the Organization of American States (OAS), the International Chamber of Commerce, Transparency International (TI), the World Economic Forum (WEF), the World Bank, Interpol, and the Organization for Economic Cooperation and Development (OECD).

Why is there renewed interest in corruption control? During the last two decades, there have been significant developments in the global political economy, which have changed the willingness of many people, especially in the developing countries, to tolerate venality and malfeasance in the public sector. In the late 1980s, many of these people took to the streets in demonstrations against incompetence, corruption, and inefficiency in the public sector and demanded institutional reforms to make their public sectors more efficient. Since then, the balance of power in many countries has been shifting in favor

of more open, transparent, and participatory forms of governance (Glynn, Kobrin, and Naím 1997).

Since the early 1990s, the world has become more economically interdependent. As a result, corruption in one country can easily spread to other parts of the world. Corruption distorts market incentives and makes it quite difficult for the market to serve as an effective and efficient tool for the allocation of resources. In many African countries, which have been engaged in privatization programs during the last several years, corruption has allowed many civil servants and politicians to mismanage the process and create windfalls for themselves. And, in Eastern Europe, corruption has so distorted the new capitalism that many of the poor are now actively calling for a return to the old system.

The new post-Cold War economic interdependence has helped internationalize corruption. According to Glynn, Kobrin, and Naím (1997), there are three changes that have contributed significantly to the globalization of corruption. First, increased levels of economic integration have made it much more likely that corruption in one region of the world will impact economic and political activities in another part of the world. For example, when the corrupt activities of the Bank of Credit and Commerce International (BCCI) forced it into insolvency in 1991, many of the world's economies, especially those in the Third World, were affected (Passas 1994).

Second, radical changes in information technology have had a tremendous impact on the international financial system and enhanced the ability of traders to behave opportunistically. For example, new, efficient, and fast systems of transferring funds electronically have made it quite difficult for national regulators to deal with corruption. Some anticorruption groups have argued that the ease with which funds can be moved from Africa to Europe or the Caribbean has meant that corrupt civil servants and politicians can easily and almost effortlessly hide their ill-gotten gains from the public, making it quite difficult for the government to recover these funds when and if the individuals are convicted of corruption. Law enforcement agencies in the West, however, continue to produce technological innovations that may actually make it possible to properly monitor these transnational transactions and gather the information needed to fight global corruption.

Third, since the Cold War ended, there has been a rise in the number of cooperative agreements between various economic units domestically and across borders. As argued by Glynn, Kobrin, and Naím (1997), although globalization exacerbates the problem of corruption, it also provides opportunities and instruments to fight against it.

Corruption is an important obstacle to the maintenance of a free, multilateral trading system. For a competitive international economy to function efficiently, participants must obey the rules and refrain from engaging in any form of opportunism. For example, countries that allow or encourage their businesses (for example, through favorite tax treatment) to pay bribes to foreign public officials place such firms at a competitive advantage over firms from countries where the paying of bribes to foreign civil servants and politicians has been criminalized. For many years, US multinational companies complained that they could not compete successfully with European firms for business contracts in developing countries because their counterparts were allowed and encouraged (until recently) by their national governments through favorable tax treatment to engage in corruption abroad.

### Corruption Cleanups

All countries, at one time or another, have developed and implemented anticorruption programs. Many of these programs have been designed to change the behavior of public servants and improve efficiency and minimize venality in the public sector. The development literature identifies four main strategies that have been employed at various times in the past and in various countries to deal with corruption. These have met with various degrees of success, and they are societal, legal, market, and political strategies (Gillespie and Okruhlik 1991).

According to the societal strategy to “clean up corruption,” the society is expected to define a common standard for judging morality and use it to determine if a given behavior qualifies as corrupt. Civil society must remain vigilant and seek out individuals who engage in corrupt behavior and report them to the police. Both the government and civil society organizations should educate the public about corruption and its negative impact on growth and development. Such an education program should enhance the ability of citizens to detect corrupt behavior and report it to the police for further action. The private media has an important role to play in this approach to corruption control. The media investigate and expose corruption, enhancing the ability of the police to further investigate and collect the evidence needed for the prosecution of offenders by the courts.

The legal approach works through the police, the judiciary, and the mass media. First, the law defines civil servants’ jobs and their responsibilities and places the appropriate constraints on them. Second,

the law defines corrupt behavior. Third, citizens are encouraged to watch out for and report incidents of corruption to the authorities. Fourth, the police are expected to investigate any reported incidents of corruption and gather the information needed for further action to be taken by the courts. Fifth, the judiciary system then uses the information provided by the police to prosecute and punish those found guilty of corruption. In cases where grand corruption is suspected or where high-ranking civil servants and politicians are involved, special prosecutors or commissions of enquiry may be convened to look into the situation.

While the police and the courts are very critical to the corruption cleanup process, one must note that unless these institutions are free of corruption, they cannot perform their jobs effectively. Hence, to perform their jobs well, the police and the judiciary must be effectively constrained by the law.

Throughout the developing world, low pay for public employees has been given as a factor contributing to high levels of venality and malfeasance in the public sector. Thus, as part of the effort to clean up corruption in these countries, it has been suggested that across-the-board wage increases should be granted to public workers to minimize the temptation to engage in opportunism. Higher pay, however, could simply force the civil servant to seek larger bribes to compensate for the probability of losing what is now a more lucrative public position. In fact, in most of Africa, a lot of the corruption that takes place in the public sector originates from high-ranking officials and not from low-level, poorly paid government workers, most of whom usually do not have any favors to sell to private-sector operators.

It has been suggested that any reforms in the public services must be accompanied by the provision of counteracting agencies, such as an independent judiciary or some type of independent review board, an ombudsman, or other investigative body (Rose-Ackerman 1978, 1997, 1999). It is important, however, to note that such institutions can become politicized (as is evident from many developing countries and used by the ruling coalition to punish the opposition and enhance its ability to continue to monopolize political power and the allocation of resources.

Those who subscribe to the market approach to corruption cleanups believe that there is a discernible relationship between the structure of the market and corruption. Government regulatory activities in the economy can distort market incentives and create opportunities for civil servants to extort bribes from entrepreneurs. Deregulation or decreased intervention is the solution usually recommended by scholars. This approach, however, has at least two problems.

First, it involves an effort to achieve certain outcomes within an existing incentive structure. Second, the problem is not with the market per se but with the existing incentive structures faced by traders. Of course, the incentive structure, as argued by Brennan and Buchanan (1985), determines the behavior of market participants and, hence, market outcomes. The most effective way to deal with corruption in this instance is to modify existing incentive structures (through rules reform). Reforming the rules, as indicated here, does not imply deregulation but reconstruction of the neocolonial state through a democratic constitution to provide institutional arrangements that adequately constrain state custodians.

Decentralization of state power is the heart of the political strategy to corruption cleanups. For many years, it has been argued that the concentration of power in the central government has made it possible for members of the ruling class to plunder the national economy and engage in corrupt behavior to enrich themselves. Thus, any reform that decentralizes power and brings the government closer to the people will improve accountability and civil service efficiency, as well as reduce corruption. It is also argued that part of the political strategy to deal with corruption should include increased transparency. These reforms, however, can easily be reversed through ordinary legislation by subsequent governments and power that is reconcentrated in the center.

Success of each anticorruption strategy enumerated in the previous paragraphs depends on the effectiveness and professionalism of the counteracting institutions (such as the judiciary, police, and mass media) that exist in a country. The assumption is that each one of these institutions is well constrained by the law and that those who serve in it are free of corruption. Unfortunately, this is not true. First, most developing countries do not have viable independent mass media that can investigate and expose corruption without the threat of censure or harm by the incumbent government. Second, many countries have judiciary systems that are not independent of the executive branch of government. In fact, throughout most of the Third World, the judiciary is under the complete control of the chief executive who has the power to appoint and dismiss judges. Third, public institutions are pervaded with corruption and, hence, cannot be expected to successfully carry out an anticorruption program. A viable, effective, and sustainable anticorruption program must begin with institutional reforms to select appropriate new rules, which (i) adequately constrain the state (and prevent its agents from engaging in corruption) and (ii) provide the foundation for the construction of new and

more effective counteracting agencies (an independent judiciary; a well-constrained police force; professional and neutral armed forces; a free press; an independent central bank; an efficient and representative parliament; and a professional civil service).

## Constitutionalism and Corruption Cleanups

Public choice theory argues that corruption is a “rules-related” problem. Thus, dealing effectively with it requires a thorough examination of the rules that regulate sociopolitical interaction in the society in question. Because rules determine the incentives that market participants face, one cannot adequately understand the nature of corruption in an economy without a thorough examination of the country’s laws and institutions.

In a study published in 1985, Brennan and Buchanan argued that rules (i) determine how individuals within a society interact with each other; (ii) arm the people with the means to peacefully resolve conflict; (iii) provide market participants with information, making it possible for them to anticipate the behavior of others in the market; and (iv) constrain the behavior of individuals as well as that of collectivities in the society. The police, for example, cannot function effectively as a check on corruption if it is not adequately constrained by the law.

Within each country, one can find both implicit (custom and tradition) and explicit (written constitution) rules. Corruption can be viewed as postconstitutional opportunism—that is, activities on the part of individuals designed to generate extralegal income for themselves, usually through subversion of existing laws. Hence, opportunism is defined as any behavior designed to improve the welfare of an individual or group at the expense of other members of society and includes such behaviors as shirking, corruption, adverse selection, moral hazard, and free riding (Ostrom, Schroeder, and Wynne 1993).

To design and execute an effective anticorruption program, then, requires that one begin by first thoroughly examining the country’s existing laws and institutions. This review can then be followed by reforms through democratic constitution that enable the selection of institutional arrangements that adequately constrain the state but enhance entrepreneurial activities. This approach has many benefits. First, the institutional arrangements selected are most likely to reflect the values of the relevant stakeholder groups, enhancing the chance that the people will consider such laws and institutions as legitimate

tools for the regulation of their sociopolitical interaction. When the people claim ownership of the rules that govern their interaction with each other and with the collectivity, compliance is significantly improved, thus minimizing the costs of policing. Second, this approach will allow the people to find ways to constitutionally constrain state custodians and prevent them from engaging in opportunistic behavior. Third, economic freedom can be entrenched constitutionally, enhancing entrepreneurship and maximizing wealth creation. Finally, the reforms can provide the economy with viable and effective structures for the management of ethnic diversity, resulting in significantly lower levels of intercommunal violence. Peaceful coexistence of groups should enhance wealth creation.

### COSTA RICA

The Republic of Costa Rica is situated on the Central American isthmus between Panama to the west and Nicaragua to the north as well as the Caribbean Sea and the Pacific Ocean. While the country is small (a little larger than West Virginia at 31,689 square miles or 51,000 square kilometers), it has considerable geographical diversity and biodiversity and a relatively large population of 4 million. Most Costa Ricans (who refer to themselves as *Ticos*) are *mestizo* (a mix of European and Indian heritage). It is estimated that 1% of the population is indigenous and 1% is Chinese; West Indians make up 3% of the population. More than 76% of the population profess Catholicism, which is the state religion. Other religious faiths, though, are protected by a constitutional guarantee of freedom of religion. Protestant churches have grown rapidly in the last two decades and currently include more than 15% of the population.

Despite its small size, Costa Rica's geography varies from rain and cloud forests to arid regions. There are two basic seasons: a dry season (December to April) and a rainy season (May to November). It also enjoys some of the most intense biodiversity in the world, with hundreds of species of birds, animals, and insects residing in the region. The country is subject to periodic earthquakes, flooding, landslides, and volcanic eruptions.

Although Costa Rica was Spain's poorest colony in the region, it currently enjoys the highest per capita income in Central America. Much of Costa Rica's economic and political success was a result of the country's economic development model that was gradually implemented after a short, bloody civil war in 1948.

Costa Rica's postwar development has produced impressive results in both economic and political terms. In socioeconomic terms, the country stands out in contrast to its neighboring republics and in Latin America generally. For example, life expectancy at birth is 78 years for Costa Ricans compared with 69 years for neighboring Nicaraguans. The Human Poverty Index (percentage of the population living in poverty) is 4.4% for Costa Rica compared with almost 23% for Guatemala, 18% for Nicaragua, and 17% for Honduras. Similarly, Costa Rica's historical emphasis on education is reflected in its illiteracy rate of 4.2%; Guatemala has a 30% illiteracy rate, Nicaragua has 23%, and El Salvador has almost 20%. Finally, the stark contrast with the region's other countries is revealed through the United Nations Human Development Index, a composite measure of human development, taking into account life expectancy,

health, education, and standard of living. Costa Rica ranks 45th in the world (above some “developed” countries), while the next highest Central American country is El Salvador at 103rd (El Salvador). The region’s other countries are ranked between 115th (Honduras) through 121st (Guatemala).

In terms of political development, Costa Rica again stands out from its neighbors. Costa Rica has one of the oldest and most respected democracies in the hemisphere. Elections regularly take place every four years and are completely transparent; the results have never been contested by any political party. With the end of the 1948 Civil War and the promulgation of the current constitution (1949), all aspects of the country’s electoral life have been in the hands of a nonpartisan elections tribunal. The members of this tribunal cannot be members of any political party and are selected by a majority vote of the Supreme Court. This body, the Supreme Elections Tribunal (TSE), is responsible for maintenance of the electoral register and all other related issues. It supervises the conduct of the electoral campaigns and the elections themselves. The final results of elections have never been challenged since its creation. Until the late 1990s, general election turnout was consistently above 80%. In 1998, it declined to 70% and then slightly further in 2002.

The 1949 constitution prohibition on the existence of a standing army has allowed successive Costa Rican governments to divert that money for social and economic programs, while other countries in the region have spent a significant proportion of their gross national product (GNP) on defense.

The end of the civil war also marked a turn in the economic development of the country. While exports were still seen as the engine of the country’s economy, successive governments (of both major parties) used the powers of the state to facilitate new industries and expand welfare provisions. This model, although introduced incrementally, was employed from 1949 through the early 1980s, when a major economic crisis and the rise of a neoliberal economic paradigm brought the gradual reform of the social democratic model. In 2002, the GDP per capita, taking into account purchasing power parity (PPP), stood at \$8,840 (US dollars), which was almost twice the GDP of the second most prosperous country in the region, El Salvador at \$4,890.

While the vast majority of the population still favors government intervention in the economy and the provision of social goods such as health care, insurance, and telecommunications, successive governments have reduced the role of the state in these areas.

In 1989, a constitutional amendment created a constitutional branch of the Supreme Court. This

court, *Sala Constitucional* or *Sala IV*, immediately ended the almost two hundred years of court inaction. The new court instead took a direct and active role in the country’s political life. Indeed, the number of cases reflects the increasing activity of the court. In 1990, the first full year of the court’s existence, it received 2296 cases to more than 14,000 in 2003. The court has addressed claims that affect every article of the constitution, including the rights of former presidents to seek reelection, AIDS patients to receive antiretroviral medications, and labor unions to strike.

The major areas of the economy are services, industry, and agriculture. Within these areas, tourism dominates the service sector, and microprocessors the industrial sector. In agriculture, which employs more than 20% of the work force but only produces 9% of GDP, has not kept up with the growth areas of the economy. Low world coffee prices in the past few years and world overproduction of bananas (the country’s two major agricultural products) have hurt this sector.

## COTE D’IVOIRE (REPUBLIC OF THE IVORY COAST)

The Republic of the Ivory Coast, or the Cote D’Ivoire, lies on the Gulf of Guinea and borders on Liberia and Guinea (west), Mali and Burkina Faso (north), and Ghana (east). Most of its about 16 million inhabitants live in the southern regions, more fertile than the semi-arid interior plains and

the mountainous northwest. The climate is hot, and dry seasons alternate with shorter wet ones.

Dense forests, heavy surf, and lack of natural deep harbors discouraged foreigners until after the Berlin Conference (1884–1885), when the French enforced their claim to the region. By 1895, the Ivory Coast was incorporated with neighboring colonies into the Federation of French West Africa (AOF). The French subjected Ivoirians to the *indigénat* and forced labor. The traditional elite disappeared, coerced into lower-level civil service or, if rebellious, eliminated. A small elite of cocoa and coffee planters arose. In the early 1940s, they organized opposition to French colonial policies by forming the African Agricultural Union (SAA) and later the Democratic Party of the Ivory Coast (PDCI), a local branch of the African Democratic Rally (RDA).

Under General Charles de Gaulle, members of the AOF gradually moved toward independence. The negotiations, which lasted from 1944 to 1960, brought to the forefront Félix Houphouët-Boigny, a founder and leader of the SAA, the PDCI, and the RDA; he was also a young doctor from a family of well-to-do Baule coffee planters. At independence, he was elected president of the new republic, and for thirty-three years he almost single-handedly determined its development; doing so, he acted as president, prime minister, head of the armed forces, and head of the PDCI. He remains a controversial figure: he is the founding father to some and to others a tyrant who sold out to French neo-colonialism and whose policies generated the country's current ills.

Houphouët-Boigny wished to make the nation prosperous and unify its sixty diverse ethnic groups. Under him, the Ivory Coast was technically a democracy. However, while the constitution allowed a multiparty system, the president successfully insisted on single-party rule, lest unity be threatened. He spent profusely on education to bring Ivoirians into the twentieth century. Results of his efforts were mixed; education remained essentially French and was never synchronized with local cultural perceptions and daily needs. He also attempted to introduce modern hygiene and medicine and succeeded in lowering infant mortality and bringing about an annual 4% population growth. But health services remained inadequate, and health education did not reach the masses.

Houphouët-Boigny based his plans for economic development on agriculture and on export of agricultural products. He concentrated on increasing production and improving the infrastructure to further expand exports. He attempted to diversify agricultural production to shield the country from the instability of world prices for its main exports of cocoa and coffee. He sponsored industrial development to

manufacture imported consumer goods locally. He encouraged Burkinabe and Malian immigration to enlarge the workforce. The government became the largest investor in the economy.

Growth and political stability attracted foreign investments. The Ivory Coast's cooperation with France became increasingly intimate. The South particularly prospered, not only because of the location of the capital, Abidjan, center of export activities, but also because the main cash crops required fertile land, rain, and shade provided by forest trees. Cash crops in turn caused growth of a service economy. The gross national product (GDP) of the Ivory Coast, alone among those of West African nations, rose almost steadily for twenty years. However, the policies that produced the "Ivoirian miracle" also contained the seeds of serious problems. Ivoirian prosperity was unevenly distributed. Uncontrolled migration of northern Muslims and urban growth created widespread unemployment and conflicts. Emphasis on cash crops for export caused food shortages.

The population protested and demanded "ivoirization" of jobs held by immigrants and by the French. Left-leaning students viewed the omnipresence of the French as neo-colonialism and demanded the end of one-party rule.

In the 1980s, the economy faltered, and payment on foreign debt was halted. The government was forced to trim expenditures and adopt structural adjustments mandated by the International Monetary Fund (IMF). Unrest mushroomed: corruption in the business community was blatant; unemployment, drug use, and violent crime accelerated; mandated economic austerity pitted ethnic groups against one another in competition for scarce resources; prisons were overcrowded; and security services were inadequate. Furthermore, protests arose against the president's self-glorification, which led him to extravagant expenditures to transform his birth place, Yamoussoukro, into a monument to himself. The president responded by liberalizing the political system and permitting open elections. Voters replaced three quarters of incumbents. Yet, because of his charisma, his conciliatory tone, and his apparent willingness to listen to all grievances, Houphouët-Boigny remained popular. By the late 1980s, however, his age and health were of concern. Party unity broke as its leaders competed to succeed him. Houphouët-Boigny died in December 1993, leaving the Ivory Coast in crisis.

In accordance with constitutional provisions, Henri Konan Bedié, president of the assembly, became president and had his appointment confirmed by elections (1995), questionable though they may have been. Bedié did little to resolve economic and social crises but concentrated instead on remaining in

power. To eliminate his strongest opponent, Alassane Ouattara, he promoted the concept of *ivoirité* and engineered a constitutional amendment requiring both parents of political candidates to be Ivoirian-born. He thereby legitimized latent xenophobia and ethnic rivalries.

Bedié was overthrown in 1999 by the first ever military *coup d'état* in the country's history, led by General Robert Guei. Countrywide strikes and demonstrations occurred. The IMF expressed disapproval. Guei promised a return to civilian rule and held elections (October 2000). Unexpectedly, Laurent Gbagbo, the only other candidate who had qualified for the ballot under the exclusionary laws upheld by Guei, won. Guei contested election results. Mass demonstrations followed. The army refused to support him, and Guei fled.

From the point of view of the economy, Gbagbo, president of the Second Republic of the Ivory Coast, appears to be leading the country on the way to recovery. Anxious to lure back foreign donors, his government paid back debt arrears. The IMF ended its freeze. But creditors demand reestablishment of political stability. In response, Gbagbo created a Forum of National Reconciliation and met with his main political competitors: Bedié, Guei, and Ouattara. However, the laws disenfranchising Ouattara are still on the books. The Forum of National Reconciliation is at work. Its efficacy and Gbagbo's commitment to abide by its recommendations are still in question.

## COUNTERINSURGENCY

### Counterinsurgency and National Security

“Counterinsurgency” is defined as the measures and strategies, both military and political, that a government employs to defeat an armed resistance from within society. Armed conflicts between a government and a domestic opposition group are commonly known as asymmetric or low-intensity warfare because the combatants possess an unequal level of capabilities. In actual practice, armies have utilized the techniques related to counterinsurgency for centuries. Yet, the concept of counterinsurgency as a major feature of national security policy was first introduced in 1961, when President John F. Kennedy initiated an effort within the United States defense establishment to develop a new strategic doctrine that would present an effective response to the threat posed by unconventional forces or guerilla armies. This was deemed necessary to contain the various revolutionary or “national liberation” movements that endangered regimes in the developing world that were friendly to US interests.

The intellectual precedent for this doctrine was to be found in the strategies employed by the British forces in Malaya and the Philippines during the period 1948 through 1956. These operations emphasized the notion of “limited warfare,” in which the application of military force played a minimal role, and political and economic reform programs were implemented to foster support for the government among the local population. In this manner, the British and local leaders were able to isolate the insurgents and occupy the “center of gravity,” or the basis of political legitimacy that rebel groups must capture to succeed.

However, in many developing countries, counterinsurgency has often been associated with political repression and violations of human rights. Governments in Third World countries that have been faced with a lack of broad popular support have frequently resorted to the use of force to suppress dissent, in which large numbers of regime opponents and suspected collaborators are imprisoned or killed. Such actions became a central feature of the “national security state” in many Asian and Latin American countries that experienced mass social unrest or radical opposition movements. The prominent role assigned to the security forces in some cases has given them a position of influence that has brought them into conflict with civilian authorities.

The application of counterinsurgency doctrine became especially prominent during US involvement in the Vietnam War, in which civilian administrators were deployed to organize the rural population against guerilla activities. However, the success of this program was limited due to the emphasis of US strategy on overwhelming enemy forces with conventional firepower rather than building support for the government of South Vietnam. Counterinsurgency as a central feature of national security strategy enjoyed a resurgence during the Reagan presidency, as the administration promoted a foreign policy doctrine of covert or indirect intervention against alleged Soviet-supported movements in Central America, such as the Farabundo Marti National Liberation Front (FMLN) in El Salvador. This policy ended with the resolution of Salvadoran civil war in the early 1990s.

### Counterinsurgency and Strategy

The circumstances for counterinsurgency arise as a result of problems that are frequently found in developing nations. These problems are often rooted in the gradual transition to modern social systems. In the initial stages of economic expansion, the process of industrialization and migration to urban centers replaces traditional forms of production such as subsistence agriculture. As certain segments of society benefit from economic growth before others, the resulting income inequality produces tensions between social classes. Many regimes in postcolonial nations have inherited weak institutions that are ill equipped to resolve disputes between competing interests. Therefore, discontent is often expressed outside of established political channels in the form of collective protests. More severe forms of internal uprisings take place where disenfranchised groups openly challenge the incumbent regime.

Insurgent movements in these countries are therefore fueled and motivated by political and economic conditions that seriously affect the quality of life of the average person in society. This assumes that a certain proportion of the population actively opposes the government and may be willing to take up arms to bring about a drastic change in the political system. Therefore, an effective counterinsurgency strategy must first attempt to determine the specific sources of popular discontent. The sole use of military force may reduce the immediate threat to stability but will not eliminate the primary causes of dissatisfaction that instigated the rebellion in the first place. Further,

an armed response may only reinforce resentment of the government's policies. Because the main goal of the insurgent group is to survive while garnering a social and material base of support, the regime is under increasing pressure to implement reform. On the other hand, if it pursues direct action against the insurgents without efforts toward improving the welfare of its citizens, it may only provoke a reaction that intensifies the conflict.

### The Future of Counterinsurgency

The importance of counterinsurgency in national security policy has declined significantly in the post-Cold War era, as the ideological struggles that inspired many insurgencies have gradually subsided and as numerous civil wars in the developing world have come to an end. In addition, the interventions and peacekeeping operations that took place during the 1990s typically did not involve insurgent movements. Yet, some domains of recent internal conflict have seen the persistence of counterinsurgency exercises, such as exemplified by offensives against the Revolutionary Armed Forces in Colombia, the Kurdish Worker's Party in Turkey, and the Maoists in Nepal. At the same time, combatants in different types of conflicts may resort to guerilla tactics even if they do not pursue the objectives of classical guerilla warfare. This describes the conditions presently faced by the coalition forces in postwar Iraq, in which opposition is directed at terrorizing citizens and officials of the interim administration rather than establishing a new government. The adaptation of counterinsurgency strategy to new types of warfare must include the investment of resources in the reconstruction of civil services to convince the Iraqi population that the new government represents its interests.

## COUNTERTRADE

"Countertrade" is a term that covers a wide variety of commercial methods to engage in reciprocal trade. One partner may supply goods, services, and technology of economic value to the other partner for a return exchange of an agreed amount of goods and other things of value. Bartering is probably the oldest and best known example of countertrade. A formal definition of countertrade is given by Burnett (1999). This term also means a relationship between two trading partners that "counters" any imbalance in trade undertaken by them.

Countertrade is sometimes used as a form of currency exchange, to collect a debt or a means of finance. For example, as a form of currency exchange, a multinational corporation (MNC) may wish to sell breeding cattle stock to a local buyer with ¥ currency since the local buyer may not have US dollars (USD). The MNC can now buy sugar using ¥ currency and then sell the sugar to a food manufacturer for USD.

As a means of collecting a debt, the local buyer may have no USD to pay the MNC. The MNC, however, may accept payment in ¥ currency and then with the ¥ currency buy foreign goods and resell these goods in the MNC's own market for USD. As a means of finance, a local buyer may require the MNC to buy local goods as an offset to reduce or restrict the flow of scarce USD out of the local buyer's country. At the same time, the retained funds are used to finance the local industry's growth and development.

### Forms of Countertrade

"Barter transactions" involve the direct exchange of goods or services between the MNC and local buyer, and normally no exchange of money or the use of third parties is involved. "Pure" or "true barter" is a simple exchange of goods, whereas "valued barter" refers to some value put on the exchanged goods because of the inequality of values of goods and services being exchanged. However, it is sometimes difficult to deal with two parties who may have similar "wants." Barter arrangements for which suppliers of homogeneous goods, such as oil, exchange those

goods for mineral ores to save transport costs are called "swaps." Swaps are also used by countries in which both the government and the private sector face large debt burdens. In such cases, the arrangement involves the swapping of debt for something else, such as other debt, equity, products, nature preservation, and education.

"Counterpurchase" is the most common form of countertrade in which an MNC provides goods in one contract and undertakes to purchase goods for export from a local buyer in a second contract. These are two independent contracts. This reciprocal purchase or supply of goods and services is linked by a "universal" agreement. Two contracts are necessary because the delivery performance may depend on some future event, such as a crop harvest. Therefore, it is useful to have the timing of the performance of each of the contracts "unlinked." Since the goods are often not of equal value, some amount of cash is usually involved.

"Compensation" denotes partial exchange. An MNC receives payment either in full or in part from the local buyer in the form of goods to make up for the shortfall in value. Thus, a "buyback" or "reverse compensation" involves an MNC that provides industrial machinery to a partner in a foreign country with the commitment to purchase the goods produced by these machines. For example, the American clothing manufacturer Levi-Strauss sold equipment and know-how to a plant in Hungary and also agreed to buy a share of the production as payment. When the plant came into full production, Levi-Strauss took 60% of the plant's output. The terms "offtake" and "industrial cooperation" also describe such agreements. Another example could be the sale of a turnkey oil refinery that is paid for by the resultant refined oil. The word "turnkey" means literally the handing over of the keys to the refinery's local owners, who then begin production at the turn of the key. Most buyback terms often contain a most favoured customer (MFC) clause explaining that the local buyer will grant the MNC the most favoured price for the same goods when compared to another purchaser.

Arrangements called "offsets" are usually found in defense-related industries where the sales are frequently of high-priced items, such as aircraft and armaments. The arrangement is designed to "offset" the negative effects of the large purchases from abroad. It is also a feature of these arrangements to require that certain parts of the purchased product be produced or assembled in the purchasing country, called a "direct offset." The offset is "indirect" when the MNC invests in unrelated business, and a "mixed arrangement" refers to when there is a combination of direct and indirect offsets.

“Mixed agreements” include transactions known as “switch trading” or “clearing accounts.” It is a two-country trade-and-payment agreement. The value of goods exported from country A to B is not actually paid for but is credited to A on a clearing account and vice versa as goods are shipped from B to A. An account is “cleared” when traders owe nothing to each other. Usually, outstanding balances and interest payments are cleared or settled at the end of each accounting year. Where the goods have a readily accessible commodity market, such as for oil, the exporter may engage a dealer to sell the goods on behalf of the exporter. However, where no commodity markets exist for the countertraded goods, the MNC may be unable to obtain payment from the local buyer. This is because the buying country may not permit the transfer of hard currency that it is lacking or because such funds are “blocked” by the government. However, the local buyer’s country may have a trade surplus with a third country on a country-to-country clearing agreement. Hence, this credit surplus may be used as a way of paying the MNC for the goods.

“Switch” occurs after deliveries of the products begin. With commodities having no ready markets, discounts of up to 40% are given to trading houses or switch dealers. These trading companies maintain their own private networks that offer a market for discounted countertraded products. In general, switch trading and bartering have been used as legal methods to avoid currency controls and take advantage of bilateral trade arrangements between two countries.

## Rationales and Experiences

The trend toward countertrade has been spurred on not only by the rise of high trade protection caused by a decline in confidence in the world trading system but also by a growing debt crisis among less developed countries (LDCs), contracting exports, a decline in foreign exchange earnings, and an inability to service foreign debt commitments. In addition, countries need to maintain existing market shares as well as penetrate new markets.

Among LDCs, while the objective of sustainable growth is a necessary one, that of earning “hard” stable currency seems to be a better way to foster growth as much as to reduce trade deficits. In this way, the economy will be able to maintain or even increase employment, reduce the technology gap, and stabilize prices of export commodities. For developed countries, however, condoning countertrade will mean

the maintenance of sales volumes, market shares, and profit levels in international trade. To prevent LDCs from defaulting on their debts, developed countries may also assist LDCs to trade their way out of their financial problems by engaging in countertrade.

The experience of practitioners in Asia has suggested that countertrade may be a useful market development tactic rather than a problem to be avoided. Countertrade may be the answer to both cheaper imports and increased exports. It is unclear whether countertrade has led to an increase in business among developing countries. Rather, it seems that economic conditions may encourage growth in South–South trade through countertrade. This method of trade offers opportunities to enter new markets and to consolidate positions in old markets.

Commentators, however, are unsure of the long-term benefits of countertrading. Countertrade may put off the need by LDCs to correct poor export performance and may delay internal microeconomic and macroeconomic reforms. Countertrade also does not expand trade between developed and developing countries or make the economies more dynamic. Countertrade is backward in its return to bilateralism disguised as a modern system, in restricting choice, and compartmentalising markets. Countertrade is an inefficient form of trade. Many industrialized countries have condemned countertrade as a deviation from the true principles of the World Trade Organization (WTO). The restrictive clauses and conditions in countertrade contracts do not give LDCs any better control of their trade. When confronted with compensation agreements, MNCs may refuse rather than make offers to accept contract terms they are unable to fulfill.

Countertrade may work against attempts to modernize the economies of LDCs. It distorts the comparative advantage of countries that practice it, but at the same time it sustains and perpetuates inefficient and uncompetitive industries in countries that would otherwise perish. In enforcing a countertrade deal, a local buyer may quote unrealistically high prices for local goods, offer poor quality goods, or foist goods on the trade partner that are difficult to sell.

In prospect, countertrade is likely to be a longer term phenomenon than initially expected and will persist over the next few decades. Variations in defining countertrade and the scarcity of published data make it difficult to estimate the volume of countertrade. The International Monetary Fund (IMF) and WTO estimate that only 5% of world trade comes within countertrade arrangements, whereas the Organization for Economic Cooperation and Development (OECD) puts it at 8% of world trade.

Whatever its commercial value, the upsurge in countertrade has not resulted from commercial advantage but rather as a pragmatic response of world commerce to the financial crises of LDCs. Importing activities may be sustained only by guaranteeing the replacement of hard currency within a relatively short time. Moreover, most LDCs use countertrade as a temporary means of protectionism.

### An Evaluation

Countertrade is a contradiction. Countertrade is in a state of evolution, and many governments are constantly reassessing their own programs. However, with the liquidity crisis in the world monetary system, the countertrade phenomenon may well continue into the twenty-first century given concerns over unemployment, poverty, and overpopulation. This form of trading seems to depend on the amount of natural resources that a country has at its disposal, its creditworthiness, nature of political system, and the policies of the government in using countertrade as a means of developing the country's economy.

It is recognised that countertrade may not be the most desirable form of international trade. Countertrade sits uneasily with the concept of an open, cash-based, and nondiscriminatory trading system that the WTO and OECD aim to promote. There are few laws in the United States that are specifically concerned with countertrade. The United Kingdom and Germany view countertrade as potentially distorting trade but have refrained from intervention in private sector decisions. On the other hand, France has actively intervened in countertrade.

The growth in international trade by way of barter and countertrade in the foreseeable future would depend on the price of major exports from LDCs and on the performance of the world economy. Where the price of LDCs major exports stabilize and there is growth in world trade, the consequent growth in foreign exchange reserves will enable many LDCs to return to their usual trading patterns. However, if the world economy were to be highly protected with continued recession and other adverse economic ills, then countertrade may expand. Whatever eventuates, countertrade will remain a permanent feature of international business transactions.

Countertrade is a deviation from the principles of the WTO system. This one-to-one trading is an antithesis to the multilateral (one-to-many) nondiscriminatory transaction of a free and liberalized trade regime. International trade based on most favoured nation (MFN) principles presumes a "level playing

field" in which parties trade on an equal footing. However, this principle is unworkable in the light of inherent inequalities in resources and economic development. Managed trade may be more realistic than simply relying on MFN principles. While countertrade may distort trade, it is used by developed and developing countries because its short-term benefits are more attractive than its long-term detriments. Countertrade, however, is not a solution to the systemic problems of international trade.

## COUP D'ÉTAT

### The Coup d'État in Third World Politics

A "coup d'état" is a term that refers to the sudden and illegal transfer of political power from one individual or group to another. Specifically, it is brought about by the abrupt intervention of the armed forces in politics and the takeover of government conduct and national institutions by military elites. While most modern states employ a segment of their societies to defend their security against foreign or domestic threats, in certain political settings, armies have often abandoned their customary protective role. The interference of the military in politics has been a most frequent occurrence in developing nations of Third World countries and is an especially common characteristic of the political history of Africa and Latin

America. In some regions, *coups d'état* continue to represent the ongoing crisis of political development. Between the mid-1980s and the year 2001, there were a total of forty-one attempted and twenty-one successful coups in the countries of Sub-Saharan Africa alone. Scholars who study military *coups d'état* seek to determine which factors lead to the transfer of political authority by force and under what circumstances military regimes endure or eventually return the reigns of government to civilian hands.

### Common Causes of the *Coup d'État*

Early studies that sought to identify the causes of *coups d'état* emphasized the characteristics of the military as an institution. This was based largely on the assumptions about Third World nations made by modernization theory. These authors argued that while the instruments of government in developing states were still in their primitive stages, militaries possessed a relatively high level of organization and efficiency that afforded greater degrees of influence and administrative capacity. Therefore, when formal political institutions were seen as weak or ineffectual in managing social and economic crises, military officers were provided with the necessary motivation to attempt to replace the civilian leadership. Some observers even suggested that *coups d'état* were a sign of progress, and they would take the place of traditional sources of authority and further the goals of development. However, subsequent analyses have demonstrated that the character or strength of the military alone does not adequately explain why *coups d'état* take place.

The causes of military coups have also been related to the overall political environments of countries. These theories have pointed to how the condition of a nation's political culture strongly influences the tendency of its military to challenge the existing order. This includes variables such as the degree of popular legitimacy enjoyed by the civilian regime, the size and scope of political parties, or the overall strength of civil society. Thus, the lower the level of stable representative government, the higher the likely incidence of successful *coups d'état*. Similarly, scholars have reasoned that political institutions in postcolonial societies are often unable to adequately channel or absorb the instability created by expanded participation and therefore require the resumption of strong centralized rule facilitated by the military.

More recent studies argue that despite their professional orientation, militaries possess corporate and pecuniary interests just as does any social

organization. The amount of pay or benefits received by the armed services give them a direct stake in decisions regarding budget allotments for defense and national security. Once in power, military regimes have often sought to increase salaries and spending for facilities and weapons procurement to enhance their prestige. At the same time, armies may possess different levels of influence over elite policy making that conditions their propensity to intervene in politics. Therefore, when the actions of the existing government threaten or impinge upon their basic needs or values, officers may seek to maneuver the outcome of political contests or interfere directly in the process to restore their position or status.

Above all, the single greatest precipitating factor for military intervention in the developing world has been prolonged economic downturn accompanied by inflation, widespread unemployment, and social unrest. In Latin America, mass opposition and the presence of the radical Left often instigated *coup d'état* attempts on the part of officers who feared the leveling of traditional society. In these circumstances, problems such as official corruption within civilian institutions or intense agitation by organized labor and dissident groups have presented military leaders with a justification to respond to their alleged threat to elite values or the national welfare.

### Political Development and Outcomes of *Coups d'État*

The primary concern in determining the impact of a *coup d'état* on a nation's political climate and economic welfare is whether militaries act as a moderating force in the service of traditional institutions or seek to entirely remake the social system. While some military regimes have successfully maintained their hold on power long after the conditions that inspired the coup have passed, other interventions have been short-lived, in which they simply facilitated a restoration of order through which civilian leaders quickly resumed control. The extent to which military regimes are able to govern effectively and the consequences for stability and economic development are dependent on both the goals and orientation of the military leaders. Officers who have led a *coup d'état* have often attempted to institutionalize their regimes over time by establishing an official political party and extending membership to the general population. These efforts at popular mobilization have also been accompanied by attempts at promoting an ideology that serves to legitimize their rule. Yet, the historical record indicates that

military leaderships often have a limited ability to effectively manage the tasks of government, particularly in the area of economic policy. While a few military regimes, such as in Chile, Indonesia, and South Korea, have presided over steady growth, the majority of African and Latin American *juntas* have failed to correct the economic ailments that they alleged to remedy. This is due not only because of the absence of technical expertise among the military leadership but also because of a general lack of experience with accommodation and compromise that is a necessary aspect of civilian administration. It is this problem that commonly leads to the eventual decision of *coup* leaders to step down and return to the barracks.

## CROATIA

### Location

The Republic of Croatia lies in southeastern Europe and stretches in a peculiar arc in the northwest corner of the Balkan Peninsula. Open to the Mediterranean Sea, Croatia serves as a gateway to Central Europe.

With a land area of 35,133 square miles (56,542 square kilometers), Croatia is bordered by Slovenia (north), Hungary (northeast), Serbia-Montenegro (east and south), and Bosnia-Herzegovina (south) and opens to the Adriatic Sea (west). The population of 4,496,869 (July 2004) consists of Croats (89.6%), Serbs (4.5%), Bosniaks (0.5%), and Hungarians

(0.4%). Other minorities include those who are Slovene, Czech, Roma, Albanian, and Montenegrin (5%). The capital city of Zagreb has a population of 779,145 (2001).

### Land and Climate

Croatia is a country of contrasts. In the northeast, the Pannonian plain is the main farming region. The Dinaric Alps, an area of densely wooded mountains and highlands, runs northwest-southeast through the center. Finally, Dalmatia, a rugged coastal region along the Adriatic shore, includes 1,185 islands. Approximately one-third of Croatia is forested; timber is a major export. Croatia's main rivers are the Sava, Drava, and Danube.

A continental climate prevails inland and around Zagreb, with hot summers and cold, snowy winters. A Mediterranean climate with mild winters characterizes the Adriatic coast.

### History Until 1945

The Croats descend from Slavic tribes who settled in the Roman province of Pannonia during the seventh century. Early in the tenth century, the Croats developed a powerful *Triune Kingdom* that included Croatia, Slavonia, Dalmatia, parts of Istria and Bosnia, and Hungary later in the century.

The Croatian territories were coveted by their powerful neighbors. In 1526, following the Battle of Mohacs, most of Croatia became Ottoman, while the northwestern part became Austrian. Following the treaties of Karlowitz (1699) and Passowitz (1718), the Habsburg established its sovereignty over the country. In 1868, one year after the establishment of the dual Austro-Hungarian monarchy, Croatia-Slavonia became an autonomous Hungarian crown land.

With the collapse of the Austrian-Hungarian Empire in 1918, the Croatian territories were united in the Kingdom of Serbs, Croats, and Slovenes, and that region became Yugoslavia (1929). Serbs ruled the state in a heavily centralized manner, ignoring the Croatian's request for federalism. In 1939, the Yugoslav government allowed the formation of an autonomous entity comprising Croatia, Dalmatia, and part of Bosnia-Herzegovina. In 1946, Croatia became one of the six republics that constituted the Federal People's Republic of Yugoslavia.

## Croatia's Developments After 1945

After 1945, Croatia was granted the status of a federal republic, and the Croatian people were recognized as one of the five constitutive peoples of the Yugoslav federation. Under Josip Broz Tito's leadership, the Yugoslav Communist Party ruled the country.

During the 1960s, two contradictory tendencies emerged as the Communist Party retained complete authority over the institutions while the Constitution of 1963 granted decentralization and economical reforms (self-management). Croatian intellectuals denounced the federal system as a centralized one in the hands of a single party. They also resented Serbia's decisive influence in the ruling of the state. In 1971, students organized a series of mass protests called the Croatian Spring. Intellectuals demanded recognition of a separate Croatian language and more control over Croatian affairs. Tito reacted firmly and ordered a crackdown.

At that time Croatia enjoyed a relative prosperity due to tourism along the Adriatic coast, a popular destination for travelers from all over Europe. However, around one-third of the Croatian state income was taken away to subsidize the development of the southern regions, such as in Macedonia and Kosovo. Furthermore, although 80% of Yugoslavia's foreign trade went through Croatian ports, Croatia itself received only a small share of this income.

The conjunction of relative wealth and frustrated national aspirations partly explain Croatia's leading role in the disintegration of Yugoslavia. In January 1990, the Croatian delegates followed the Slovenes and walked away from the Congress of the Communist Party, one of the pillars of the Yugoslav system. On June 25, 1991, Croatia proclaimed its independence. In 1992, it was recognized as independent by the European Union (EU) and was admitted to the United Nations (UN) the same year.

The development of Croatia since 1991 has been challenged by two issues. First, the authoritarian regime of Franco Tudjman (1990–1991) isolated and compromised Croatia. As former general and leader of the Croatian Democratic Union (HDZ), Tudjman was elected president in 1990 following multiparty elections. Strongly nationalist, he exalted Croatia's past and enacted constitutional measures against the 12% Serbs minority who, with the military assistance from Belgrade, aggravated the already tense situation.

Second, the transition toward democracy was accomplished through two brutal wars (1991–1995). The Yugoslav National Army, following instructions of President Milošević, supported the Serbs of Croatia (region of Krainija). In 1992, the UN's

intervention froze the front, but Croatia lost more than 30% of its territory to the Serbs. Then, as war erupted in neighboring Bosnia, Tudjman's regime encouraged Bosnian Croats. In 1995, Tudjman, along with Milošević and President Izetbegovic of Bosnia-Herzegovina, signed the Dayton Agreement under United States' supervision. In 1998, the last Serb-held lands were reunited with lands of Croatia.

Tudjman's death in 1999 and the election of a moderate government in 2000 gave Croatia the chance for a new start. First, under the leadership of President Stipe Mesic (reelected in 2005), structural reforms have been undertaken, the powers of the presidency have been curtailed, and the parliament assumes greater responsibility. Civil rights, freedom of speech, and independent media are respected.

Second, Croatian foreign policy is driven by a major objective: integration within the EU, which it joined in 2004. Croatia is also a NATO aspirant and member of the Adriatic Charter signed with Albania, Macedonia, and the United States in 2003. It has participated in UN activities, including contributing troops to UN operations in Sierra Leone, Ethiopia, and Kashmir. In 2001, it also sent a military police unit to Afghanistan, though Croatia refused to send troops to Iraq in 2003.

Croatia, however, has to undo the tragic legacy of the 1991–1995 wars. The key issue has been the implementation of the Dayton Agreement, which was stalled by Tudjman's regime. Since 2000, the questions of refugee's return, restitution of property, and negotiations with the war tribunal in La Hague have progressed although results remain inconclusive. Regional cooperation is growing as Bosnia-Herzegovina, Slovenia, and Serbia-Montenegro have reestablished close commercial ties, but borders issues remain unsolved.

## Current Economy

Croatia has an economy based on services (46.2% in 2002), while industry represents 25.4% and agriculture 13.2%. The country's major products include chemicals, petroleum, ships, and textiles, as well as cement and steel. Zagreb is the largest manufacturing center. The natural resources comprise oil, coal, and bauxite.

Like most post-Communist states, Croatia suffers from a "substantial gray economy" and corruption. The transition has been difficult and damaged by the wars (1991–1995). From 1989 to 1993, the gross domestic product (GDP) plunged 40.5%. After 1995, tourism, a key industry, rebounded and the economy

## CROATIA

briefly recovered, only to fall into a recession in 1999. A year later, the economy again rallied, growing 2.9% in 2000 to reach 5.2% in 2002. Industrial production shows a healthy growth of 3.9% (2004 est.) as does the GDP at 4.3% (2004 est.). Croatia's major trading partners are Italy, Germany, Austria, France, and Russia.

Croatia is facing several issues that include structural unemployment (19.5% in 2004) and an insufficient amount of economic reforms aggravated by public resistance from people who fear a cut of social benefits. The inefficient judiciary system also seems unable to resolve long-standing property rights issues. The main concern remains the country's rising foreign debt. Global debt at \$21.5 billion (US dollars) in November 2003 increased 40% from 2002 levels. The debt was expected to have further increased to \$23 billion for the end of 2004, equivalent to 75% of GDP.

Uneven economic growth and uncertainty about the future can explain why the nationalist Croatian Democratic Union won the November 2003 parliamentary elections. However, new Prime Minister Ivo Sanader claims that his party is now moderate and will pursue a policy of democratization and reforms.

## CUBAN REVOLUTION

One of the most significant events during the Cold War occurred ninety miles from the shores of the United States on the island of Cuba. In 1959, the Cuban Revolution threatened the ideological, political,

strategic, and economic hegemony of the United States in the Western Hemisphere by challenging the historical relationship existing between the island and the United States. This relationship primarily involved an economic nexus of dependent development that distorted the nation's internal political and social processes. The historical roots of this relationship for the twentieth century originated with the end of the Spanish–American War (1898).

After the war, US capital penetration of the lucrative sugar industry accelerated and intensified, continuing a process well underway by the end of the nineteenth century. Sugar became Cuba's primary export, with the US market its principal destination. Economic dependency on one export product not only contributed to the social dislocation experienced by Cuba's peasantry but also left the nation's political and social development exposed to the vagaries of the world market. Internal political, social, and economic development experienced frequent disruption coinciding with the boom/bust cycle of the dependent economy. The Platt Amendment, which was enacted in 1901 by the US Congress and subsequently incorporated into the first Cuban Constitution, allowed the United States to directly intervene militarily in the political life of the country to achieve stability and assure its citizens continued economic dominance.

While the Platt Amendment contributed to the development of Cuban nationalism, US capital penetration caused the Cuban elite to enter the political arena by frustrating their participation in the economy. Politics became a battleground for contending factions since the winners had access to government revenues. This situation contributed to instability, corruption, and repeated US interventions. The world depression of 1930 intensified the recurring internal political, social, and economic crises that the nation experienced since independence. While workers organized labor strikes that the government harshly repressed, the middle class and intellectuals also organized against the existing state of things. The government's inability to contain the increasing political instability and violence led to the loss of US support, which opened the door to the Revolution of 1933.

The revolutionary nationalist government quickly abrogated the Platt Amendment and instituted major political, social, and economic reforms for the benefit of the working class, peasants, women, and other previously neglected social groups. These measures not only alienated the entrenched conservative Cuban elite but, most importantly, its US political and economic allies. In 1934, the rapid unraveling of the revolutionary government created a power

vacuum that the military, led by Fulgencio Batista y Zaldívar, filled. Batista ruled the destiny of the island through puppet presidents from 1934 to 1940 and directly as president from 1940 to 1944. The United States, secure in its hegemony over the island, abrogated the Platt Amendment in 1934. In 1940, the government promulgated a new constitution that contained progressive political, social, and economic clauses that became standards for judging the performance of politicians and governments. The island's socioeconomic development continued to depend on sugar exports as World War II stimulated demand for the product. There was an uneven distribution of the wealth generated by sugar production and export as some sectors of the society benefited while others languished in poverty.

In 1944, Batista allowed elections to be held, which brought Dr. Ramón Grau San Martín and his *Auténtico* party to power. The *Auténtico* period, which lasted from 1944 to 1952, ushered in an episode of unparalleled political corruption. In 1947, the *Ortodoxo* party, which represented a radical nationalism and espoused a program of social and economic reform, emerged as a response to this corruption. Batista launched a *coup d'état* in 1952 against the *Auténticos*, which brought him to power a second time. Lacking popular support, various opposition groups emerged against his rule as corruption continued and the economy remained open to the vagaries of the boom/bust cycles associated with monoculture. In 1953, a young *Ortodoxo*, Fidel Castro, organized a revolt against the government. Although the raid on the Moncada Barracks on July 26 failed, it gave a name to the movement and brought Castro to national attention. His defense during his trial condemned the trajectory of Cuban national history and presented a reform program. In prison, Castro continued to plot the overthrow of Batista's government. Released during a general amnesty for all political prisoners in 1955, Castro left Cuba for Mexico and formally organized the July 26th Movement, which issued a manifesto calling for a revolution against Batista, and the Cuban Revolution was born.

In Mexico, Castro met Ernesto (Che) Guevara, with whom he planned the guerrilla struggle against Batista. Purchasing the yacht *Granma* in 1956, Castro, along with eighty-one men, left Mexico on November 25 to invade the island. On December 2, they landed in Oriente Province and, a few days later, had a disastrous encounter with the Cuban army in which all but twelve men were killed or captured. The small band headed for the Sierra Maestra, where they regrouped and organized the guerrilla movement. The numerous victories against government forces

bolstered the July 26th Movement's popularity as rural and urban opposition increased against Batista's rule. In February 1957, Castro had an important interview with Herbert Matthews, a *New York Times* reporter, which presented him to a US public while refuting the government's claim of his death. That same year, Batista had trouble maintaining power as junior naval officers revolted against him. He alienated the United States when he utilized US-supplied military equipment to crush the revolt.

In March 1958, the United States suspended arms shipments to the government. Batista lost the support of the middle class, and the Catholic Church called for a coalition government, but the general continued in his intransigence against the social forces engulfing the country. In April, a general strike called by the July 26th Movement failed, but the movement continued its success in the countryside. In May, Batista launched a general offensive against the guerrillas in the Sierra Maestra, which met with stiff opposition and successes by Castro's forces. The US government saw this situation with alarm as it feared a victory by the July 26th Movement, which would bring Castro to power. The US embassy negotiated with Batista in an attempt to stave off this outcome. By December, the rebels were on the outskirts of Havana, and on January 1, 1959, Batista and his allies abandoned the island, seeking refuge in Miami. Castro's entrance into the capital one week later ushered in a new page in Cuban history as the Cuban Revolution triumphed over the corrupt and discredited social, political, and economic elite that had ruled the country since independence.

The triumph of the revolution, with its radical nationalist ideology, soon alienated Cuba's historical patron, the United States, during a period of heightened Cold War fears of the spread of communism into the Western Hemisphere. The revolution's leadership sought to remedy the nation's underdevelopment by concentrating on a radical land reform policy, codified in the Agrarian Reform Law of 1959, which expropriated the large landed estates that belonged to the traditional elite, allies of US political and economic interests. In the Cold War environment, this policy appeared to be a step toward communism, a fear further heightened by the subsequent nationalization of the economy in 1960. Although this nationalization had popular support, as US economic penetration had angered many, it polarized the business elite and sectors of the middle class and came up against US economic interests. The one event that symbolized the growing radicalization of the revolution was when the Cuban government demanded that Russian oil should be processed by US-owned oil refineries. When they

refused, the government confiscated the US-owned oil companies, creating a rift with the US government, which suspended the sugar quota. The Cuban government retaliated by seizing all US property and continuing its radical nationalization of numerous national and foreign industries. The Soviet Union stepped into the vacuum of deteriorating trade relationships between the United States and Cuba when it signed a trade agreement with Cuba, which not only provided credit to the nation but also ensured a market for the nation's sugar exports. Subsequently, the Soviet Union provided military and technical assistance as well as cultural missions to Cuba, further heightening tensions between the island nation and the United States, ultimately leading to a break in diplomatic relations in January 1961.

The Cuban revolutionary nationalists sought an alternative egalitarian society free from cultural, political, and economic dependence on the United States. To achieve their goals, the revolutionary government instituted a series of measures and reforms in education, health, housing, and labor relations. Mass mobilization of workers, peasants, students, and women contributed to the implementation of these measures and reforms. Perhaps the most successful campaign was the Literacy Campaign of 1961 that sought to eliminate illiteracy in the Cuban population. The radical direction of the revolution influenced the decision by many of the wealthy upper class and sectors of the middle class to flee to Miami, Florida. With the support and financial assistance of the Central Intelligence Agency (CIA), this group of expatriates soon coalesced into an opposition force that, in April 1961, invaded Cuba and met defeat at the Bay of Pigs. This invasion demonstrated that in the name of anti-communism, the United States intended to overthrow the Cuban Revolution, restore the traditional elite, and roll back its social, political, and economic gains. In the Cold War atmosphere, the Soviet Union stepped in to defend Cuban socialism by providing missiles to the government, leading to the Cuban Missile Crisis of October 1962. Averting nuclear disaster, Nikita Khrushchev, the Soviet Premier, agreed to withdraw the missiles on the condition that the United States would not invade Cuba. President John F. Kennedy secretly agreed to this condition, but covert attacks against the revolution continued through the use of the exiled Cubans sponsored by the CIA.

With the continuation of the US trade embargo instituted by President Dwight Eisenhower, the Cuban government sought to diversify its economy and lessen its dependence on the monoculture production of sugar exports. In the initial years of the revolution, it took land out of sugar production

and turned it over to the production of previously imported agricultural commodities. The Cuban government also pursued a policy of industrialization during these early years. Both the attempts at agricultural diversification and industrialization ended in failure as a result of poor administration and the failure of central planning. Many skilled technocrats and workers had left Cuba during these years, and the revolutionaries had to improvise the transition to a socialist economy. In addition, for industrialization, the government needed foreign exchange earnings that only sugar exports could provide. By 1963, the government had abandoned its industrialization plans and shifted its focus on sugar production. It pledged a 10 million ton sugar harvest for 1970.

The Soviets had strongly advised the Cuban government to concentrate on its most lucrative export, sugar, and reverse its policy concerning industrialization. Although larger than the 1963 harvest of 3.8 million tons, the 1970 sugar harvest of 8.5 million tons proved to be disappointing for the nation and the government that had invested heavily in achieving this goal. Hoping to construct an alternative model to the competitive individualism that is the basis of capitalism, the revolution sought to create the "new socialist man," who was predicated on the creation of a new consciousness based on selfless dedication to the collective good. Although "Che" Guevara had resigned from his government position as a result of his failed economic and industrialization policy, his ideas continued to influence the direction of the Cuban Revolution during the 1960s.

In 1965, after resigning his Cuban citizenship, which was granted by the Cuban Council of Ministers after the revolution, "Che" traveled to Africa, Asia, and Latin America to promote revolution in these Third World countries, an idea supported by Castro and the revolutionary government. Hoping to foment revolution in Latin America, "Che" met his death in Bolivia on October 9, 1967, when he was captured by US-trained Bolivian Rangers. This event brought an end to the hope of exporting revolution abroad, a policy that the Soviet Union had never fully supported. Castro's support of the Soviet invasion of Czechoslovakia in 1968 signaled not only a rapprochement with the Soviet Union but also a return to revolutionary orthodoxy concerning the export of revolution to the Third World. Although Guevara's revolutionary internationalism was abandoned, the government continued proclaiming his revolutionary idealism and "Che's" selflessness in the name of revolution as a model for Cubans to follow in their construction of socialism and the "new socialist man."

The 1970s began with two major reversals for the Cuban Revolution, an abandonment of the policy of exporting revolution and the failure of reaching the 10 million ton sugar harvest, which contributed to a reassessment of revolutionary ideology and policy. After ten years, the revolution had not fulfilled many of the promises or satisfied the hopes of many Cubans. The immense emphasis on the 10 million ton target had drained other productive sectors of capital and labor, which caused a decline in consumer goods and basic agricultural products. There was also an increased economic dependence on the Soviet Union, which resembled the economic dependence that Cuba had with the United States in the past. Although the revolution demonstrated success in the areas of education, health, housing, nutrition, and literacy, even Castro had to admit that the revolution had failed the Cuban people.

On July 26, 1970, Castro admitted this failure and took full responsibility for it. His speech signaled a new direction for the Cuban Revolution. The initial revolutionary idealism gave way to revolutionary pragmatism as the government injected more orthodoxy into its economic policies. The increase in absenteeism during the 1960s caused the government to reevaluate its policy of preaching moral incentives to the workers to increase productivity. In a vast departure from the ideal of the "new socialist man," it reintroduced the profit motive and material incentives. In another reversal, it also abandoned the earlier policy of strict centralization in government planning. The 1970s was a period of new challenges as the Cuban Revolution reversed direction by attempting to follow the orthodox socialist model represented by the Soviet Union and Eastern Europe.

After the experimentation of the 1960s, the Cuban Revolution sought to institutionalize itself through the creation and reorganization of mass organizations. A trend toward personalism and autocracy had emerged after the Cuban Revolution as the Cuban Communist Party (PCC), as well as trade unions, had been severely weakened during the decade of experimentation. During Cuba's Revolutionary Offensive (1968–1969), Castro had invited numerous Marxist scholars to evaluate the direction of the revolution and make recommendations to remedy the ossification and bureaucratization of the revolution. They concluded that it was necessary to open the political process and institute a democratic and participatory type of socialism. The revolution's economic failure and its failed attempt to export revolution caused it to endorse these recommendations as evidenced by Castro's criticisms of the revolutionary process and proposals to correct the situation.

At the heart of the rectification of the revolutionary process were the continuation of the socialist path and the strengthening of the PCC. The PCC would be revitalized by allowing the politburo, secretariat, and central committee to meet regularly and increase the number of members that would represent more of a mass base. The PCC would be responsible for coordinating and supervising the administrative function. In a further move toward decentralization, the extreme diffusion that had characterized the relationship between the central administration, the party, and the army during the 1960s was rectified by prescribing a clear separation between these three important institutions. The number of military men in the party also decreased, while the number of workers increased. Although Castro had announced that a party congress was to be held in 1966 and 1969, this latter one was canceled on the grounds that all energies had to be focused on the 1970 sugar harvest; thus, the first party congress was held December 17–22, 1975, which demonstrated how far the Cuban Revolution had come to embrace Soviet orthodoxy by following the Soviet model to socialism.

The new direction of the Cuban Revolution in the 1970s also sought to champion the working class by revitalizing trade unions. During the 1960s, the trade union movement had declined as a result of the almost total identification of the unions and the government. In the late 1960s, a policy of concentrating on vanguard workers that embodied the self-sacrificing new socialist man diminished the number of workers in local unions. The unions had lost their ability to represent the workers' interests independently of government party policy. To rectify this situation, the Cuban Revolution pursued a policy of reconstituting the unions as mass organizations. With few members of the past reelected after elections based on a secret ballot (held November 9–December 9, 1970), the new membership represented the direction toward creating a mass base responsive to the defense of workers' rights. From 1970 to 1973, twenty-three new unions were also established in agriculture, industry, transportation, the military, and services. Although the government advocated a new direction for labor and Castro had announced in 1971 that the Thirteenth National Congress of the Central Organization of Cuban Trade Unions (CTC) would be held in 1972, the last Congress being held in 1966, the new trade union members caused some concern for the revolutionary leadership, so the government postponed the meeting until November 1973. The issues discussed revolved around the defense of workers' rights and how the unions could participate in the national decision-making process concerning productivity and labor discipline. With the abandonment of

the late 1960s' vanguardism, the revitalized trade union movement embraced its role as a mass organization through the 1970s and early 1980s under the direction of the Communist Party.

Since taking power, the Cuban Revolution had benefited previously neglected social groups, peasants, workers, and, especially, women. Since its inception, it has sought to incorporate women into all aspects of the revolutionary process. Passing legislation favorable to women's rights, especially regarding labor, education, and health, it exhorted women to defend the revolution and their place within it. The July 26th Movement had a women's affiliate organization, the Revolutionary Feminine Unity, that organized this mobilization during the early years of the revolution by including women in the agrarian reform and exhorting them to participate in the labor force. Women not only increased their numbers in production, especially during the late 1960s, but they were also incorporated into all levels of the educational system by the 1970s. Women working outside of the household created the need for child care centers that the government provided. In 1975, the government instituted a Family Code that emphasized gender equality at home and at work. The government also instituted reproductive policies favoring contraception, as well as making abortion readily available on demand during the first twelve weeks of pregnancy. This shift in the role of women as active participants in the revolution created tensions within the patriarchal household, which was captured in two important films, *Lucía* (1969) and *Retrato de Teresa* (1979), from the creative revolutionary Cuban cinema. Even with the revolutionary government taking a conscious active posture in promoting and improving women's position in society, many inequalities continued, such as in hiring practices and being underrepresented in administrative positions in government and state enterprises. The Federation of Cuban Women (FMC), created in 1960 to promote women's participation in the revolution, was another mass organization that contributed to the institutionalization of the revolution in the 1970s.

The Cuban Revolution's foreign policy shifted from actively promoting guerrilla warfare in Latin America to searching to extend fraternal ties with other Latin American nations during the 1970s. A thaw occurred in the icy relations that Cuba had with the rest of Latin America when Salvador Allende was elected president of Chile in 1970. With this election, Castro found an ally in Allende, who invited him to visit the country in 1971. By 1975, Cuba had reestablished diplomatic relations with eight nations of Latin America and the Caribbean. Cuba continued its international relations with the Third World

through the Nonaligned Movement, with Castro participating personally in the 1973 Fourth Nonaligned Movement Summit in Algeria. Cuba's socioeconomic and military commitments to liberation movements and nations in Africa and the Middle East increased throughout the 1970s. The most well-known episode of this internationalism is the sending of thirty-six thousand Cuban troops to support the Popular Movement for the Liberation of Angola (MPLA) in 1975 through 1976. In 1977, Cuba sent fifteen thousand troops to the aid of Ethiopia when Somalia invaded that country. Both of these African actions had the logistical support of the Soviet Union. Cuba also provided socioeconomic aid to other Third World nations in the form of doctors, technicians, agronomists, teachers, and construction workers. Foreign students from Latin America and Africa also came to the island to study in medical schools, universities, and technical schools. Cuba's relations with the United States were also improving by the mid-1970s; however, the sending of Cuban troops to Angola dampened these efforts at normalization. Although the United States looked askance at these efforts, especially the military ventures, the nations of the Nonaligned Movement approved of these actions as evidenced by the holding of the sixth summit in Havana in September 1979, with Castro serving as chair.

Cuba's position within the Nonaligned Movement soured with the Soviet invasion of Afghanistan, a member of the Nonaligned Movement, in December 1979. Beholden to the Soviet Union for its economic support, Cuba took a tepid response regarding the condemnation of the invasion in the United Nations. As Cuba's fortunes declined within the Nonaligned Movement, since it was perceived to be acting as an extension of Soviet policy, its regional influence increased at the beginning of the 1980s. The Sandinista victory in Nicaragua in 1979 and the emergence of Maurice Bishop's government in Grenada in 1980 created new allies for Cuba. It also cultivated ties to other Latin American countries by championing their aspirations, such as Cuba's support for Panamanian control of the canal and its backing Argentina in the Malvinas–Falklands War in 1982.

Cuban/US relations improved under the presidential administration of Jimmy Carter from 1976 to 1980 as interests section was opened in Havana and Washington in 1977, which facilitated dialogue between the two nations. In 1980, relations that were already strained from Cuba's intervention in the Ethiopian–Somalian War further deteriorated with the Mariel boatlift; a total of 125,000 Cubans left the island for the United States, which demonstrated a large level of discontent with the achievements of

the Cuban Revolution. Ironically, the thawing relations between Cuba and the United States contributed to this discontent and frustration with the Cuban Revolution when Castro allowed 100 thousand US relatives laden with consumer goods to visit the island in 1979. Ronald Reagan's election as US president in 1980 progressively worsened US/Cuban relations. In 1983, the overthrow of Bishop in Grenada and the subsequent US invasion of the island eliminated that nation as an ally. The civil wars in Central America also stiffened US rhetoric against Cuba, which was blamed for fomenting the popular struggles in the region. The Cuban government mobilized against the threat of a possible US invasion of the island. The Reagan administration also prohibited travel to the island by US citizens and began radio transmission to Cuba via Radio Martí in 1985, which scuttled a 1984 immigration agreement between the two nations.

Internally, the Cuban economy grew during the first half of the 1980s as a result of a liberalization policy instituted by the government, which sought to improve economic performance through stimulating private initiative by allowing free peasants' markets. The introduction of the free peasants' markets in May 1980 helped to supplement the government rationing system, but they soon came under attack by consumers who charged that prices were too high, that there was illegal profiteering, and that there was an emergence of a black market. In 1987, the introduction of the Rectification Program signaled a government reversal regarding the free peasants' markets. Castro initiated the "rectification" period in April 1986 during the Third Party Congress of the Cuban Communist Party, and this period lasted from 1986 to 1990. The initiation of this period was a reaction toward the heightened individualism exhibited during the introduction of market mechanisms in the economy. The government reintroduced the ideas of an earlier period concerning *conciencia* (consciousness) based on moral incentives and social obligations rather than on economic motives.

A major internal incident exemplifying this shift toward the reaffirmation of *conciencia* occurred in 1989 with the trial of Division General Arnaldo Ochoa Sánchez, a hero of the Angolan campaign, and other high-ranking military and security officers. Charged with corruption and drug trafficking, Ochoa and two other top officers were executed and the others given lengthy jail sentences. During this period, the United States had leveled charges that Cuba was involved in drug trafficking, so the government could not afford a showdown with the United States over the drug issue. Although some have characterized this incident as resulting from an internal power struggle,

the trial also demonstrated how no one, no matter his or her position, was above the law and that the revolution would not tolerate individualism and personal wealth acquisition that would threaten its existence and ideals.

The world economic crisis of the 1980s also affected Cuba by the end of the decade because there was a hard currency shortage caused by depressed sugar prices on the world market. The "rectification" period stressed a need for austerity, which meant reducing consumption and diverting economic production to exports for the acquiring of hard currency for the payment of foreign loans. Although the Soviet Union provided billions of dollars of aid and subsidies, Cuba also had borrowed heavily from the West. In 1986, Cuba defaulted on these loans. Cuba's trade relationship with the Soviet Union and the Council for Mutual Economic Assistance (CMEA) began to disintegrate in the late 1980s with the adoption of the policy of *perestroika* and *glasnost*, a policy that Cuba did not follow. Castro denounced *perestroika* and *glasnost* as being inapplicable to Cuba's situation because it was so close to the United States and that its brand of socialism had emerged from a social revolution. In 1989, Cuba also began its withdrawal from Angola, which it completed in 1991.

The fall of the Berlin Wall in 1989 and the subsequent collapse of the Soviet Union found Cuba increasingly isolated as it continued on the path toward socialism in the 1990s. To confront the economic crisis that emerged as a result of these international circumstances, Castro announced a "Special Period in a Time of Peace" in 1990 directed toward redoubling the nation's efforts to achieve socialism. Emergency austerity measures were introduced to counteract the disastrous economic consequences of the loss of the heavy subsidies that the Soviet Union had provided to Cuba. Imports of foodstuffs and fuel were heavily curtailed and a strict rationing system instituted. The government encouraged foreign investment and tourism to acquire hard currency for purchases on the world market. Economic reforms with a market orientation were also instituted, such as a policy of self-employment, the ability of citizens to hold dollars, the opening of "dollar stores," and the reintroduction of farmer's markets.

The United States decided to put economic pressure on Cuba during this period with the passage of the Cuban Democracy Act of 1992 (Torricelli Bill), which toughened the US embargo by punishing US subsidiaries in foreign countries trading with Cuba, along with Third World countries that traded with Cuba. This increased the economic hardship on Cuban citizens, many who left the island in 1994 when Castro allowed those who wanted to leave to

go, creating another migration problem for the United States. Subsequently, the United States and Cuba signed an immigration agreement to control the *balseros* (rafters or “boat people”) by allowing a legal immigration of twenty thousand Cubans per year. Cuban exiles continued engaging in hostile actions to discredit the Cuban Revolution, which led to a violent confrontation when Brothers to the Rescue, an anti-Cuban Revolution exile group, entered Cuban airspace in February 1996. The organization had previously been entering Cuban airspace to drop propaganda leaflets. Castro had warned Washington that deadly force would be used if these actions continued. The downing of two unarmed aircraft manned by the group led to a confrontation with the United States as President William Jefferson Clinton considered an air strike or a cruise-missile attack against Cuba. Dissuaded by his national security advisors from this course of action, Clinton sent a strongly worded secret missive warning Castro about a military retaliation if any more planes were shot down. The US Congress responded by passing the Helms-Burton Bill, which increased the sanctions against Cuba in a more aggressive manner by imposing US law on foreign nationals and companies trading with the island nation.

Although there was international condemnation of the Helms-Burton Bill, Cuba felt increasingly isolated by the end of the 1990s. In 1996, Cuba extended an invitation to Pope John Paul II to visit the island with the hope of getting a papal condemnation of the US embargo. During his visit to Cuba in January 1998, the pope not only resolutely condemned the US embargo but also criticized Castro by appealing for more political freedom, religious toleration, and concern for political prisoners. After the papal visit, Cuba released more than two hundred prisoners as a gesture of goodwill. The following year, in 1999, tensions increased again between the United States and Cuba over Elían Gonzáles, a young Cuban boy who became a cause célèbre for the exile anti-Cuban Revolution community in Miami. After his mother drowned when fleeing Cuba, the boy was adopted by his relatives in Miami. Elían became a symbol for both the exiled community and the Cuban Revolution as a heated confrontation exposing many old wounds played out in the law courts and in the media. In June 2000, the boy was returned to his father and became a symbol for the Cuban Revolution and its resistance against US imperialism. All of these events bolstered Castro’s support among the Cuban people for the revolution.

With the end of the Cold War, opinion began to change within the United States regarding the embargo among business and agricultural interests,

as well as among those Cubans who immigrated to United States in the 1980s and 1990s. This shift in public opinion was also reflected among public officials who criticized the embargo on medicine and food. In 2000, the embargo on the sale of food and medicine was lifted, but the law passed prohibited US government or private financing of such sales. Since 1991 the United Nations has also repeatedly condemned the US embargo on Cuba and called for its end.

President George W. Bush’s administration, starting in 2001, increased the pressure on the Cuban Revolution by declaring that it would continue the embargo regardless of growing calls for its relaxation or for ending it. Restrictions on US citizens traveling to Cuba were increased and those traveling through third countries would be especially targeted. Increased tensions between the United States and Cuba led to the arrest of Cuban dissidents in 2003. These dissidents were accused of working with US diplomats to undermine the Cuban Revolution. These arrests coincided with highly publicized hijackings of ships and aircrafts by Cubans attempting to leave the island for the United States. In 2003, President Bush announced the creation of a Commission for Assistance to a Free Cuba, which would outline the steps to help in the overthrow of the Cuban Revolution and contribute to the transition of a postrevolutionary Cuba. Presenting its five hundred-page report in May 2004, the commission’s conclusions included a restriction on the number of visits that Cuban Americans could make to the island, restricted the amount of dollars that a Cuban American could spend while on the island, and also curbed educational travel to Cuba. Cuban dissidents condemned the report, and the government saw it as a first step to a subsequent US military intervention to overthrow the Cuban Revolution. The US government instituted its new policy on Cuban Americans traveling to Cuba almost immediately, which divided the Cuban exile community between those who supported it by arguing that it deprived the revolution of vital tourist dollars and those who condemned it by stating that it would only hurt their family members on the island.

Castro continues to lead Cuba into a Socialist future and proudly proclaims the slogan of the Cuban Revolution: “Socialism or Death!” In comparison to other Latin American nations, the revolution has brought a level of education and health achievements that is not rivaled in the region. The Cuban people have access to free health and education. Literacy rates are higher than in many industrialized nations. The island’s medical schools and universities enroll students not only from Latin America but also from other developing countries. Cuba also

cooperates with other nations by exporting teachers and doctors for developmental goals. The Cuban Revolution's fortunes on the regional level have also improved with the election of Left-leaning presidents in Argentina, Brazil, and Venezuela. Venezuela has helped Cuba meet some of its energy needs by providing oil under preferential terms. The Cuban Revolution has met many of its social goals even though its economy has been under assault from the US embargo and the subsequent demise of the Soviet Union. It continues working toward creating a socialist Cuba in which all of its citizens will have a future free of the want that created the conditions for the revolution in the first place.

## CULTURAL PERCEPTIONS

### Culture and Development

There are three areas where the concept of culture is implicated in development. First, while predominantly associated with economic transition, the dominant development model and its associated policies and programs underpinned by modernization theory were specifically designed to induce change in every aspect of life. This includes the whole range of institutions, behaviors, and beliefs that constitute the culture of a community, including everyday practices, values, social organization and relationships, roles and rituals, knowledge and artistic production.

Second, theories of cultural imperialism argued that the development model itself was imbued with the cultural values and practices of the country from which it originated—mainly the United States or other Western powers. This led to claims that development was simply a continuation of colonialism. Last, local existing or surviving cultural practices and values are being used to underpin alternative discourses and projects in the development debate.

Processes of acculturation, that is, where elements of one culture are adopted, adapted, or assimilated into another, have occurred continuously throughout history as civilizations came into contact with one another through trade or conquest. Development, as a systematic process of inducing cultural change, is generally considered a post-World War II phenomenon, following the success of the US Marshall Plan in rebuilding Europe. Western states and international agencies embarked on a program to eradicate poverty worldwide, targeting Third World countries that had been designated as “underdeveloped,” that is, lacking a certain level of materialism. The point of comparison was the living standards of Western countries. There were also political imperatives as Cold War antagonists sought as much international influence as possible. Development aid became a potent political tool.

Consequently, it is argued that development was envisaged and constructed around beliefs and institutions that are valued in the West (Harrison 1988). The theoretical base for development is derived from two Western schools of thought: Socialist (centrally planned) and Capitalist (free market). It should be noted that these are broad definitions, and many differences exist between countries, in patterns of ownership, government regulation, and the scale of industrialization, for example.

Development under these circumstances is not homogeneous. However, there are important similarities. Both were ideologically driven with the end goal a “modern” society, industrial and urban, achieved through technological, financial, and administrative assistance. Progress was to be measured by economic growth. The nation-state became the unit for development, and it was necessary to ensure not only economic and political integration but also cultural integration, that is, the development of a single national identity.

With the end of the Cold War, it has been argued that only the Western model of development remains, overarched by cultural logics of mass production and mass consumption, individualism, and competition, together with the ideal liberal democratic state. This model was constructed from diverse sources: economic and political ideologies and sociological theories such as structural functionalism and systems theory. The idea was that as the systems and structures of the West were diffused into a traditional, generally agrarian, society, its progress would imitate the path of the West.

The classic concept of the modernization process that development policies attempted to replicate was that Third World societies could follow a linear path of change (Lerner 1958). The required economic, technical, and demographic conditions and appropriate social organization and value systems were outlined for agrarian societies to reach an economic “take off” point from which they could mature and enter an age of mass consumption (Rostow 1962).

What were deemed as deficiencies of a precolonial past were cited as the reason for initial economic failures. Those societies or producers that were deemed incapable of generating a flow of innovations or sustained economic growth were labeled “traditional,” which was now a pejorative, signaling stagnation. The traditional was viewed as inhibiting development. If Third World societies were to advance along the path taken by industrialized countries, attachments to these former cultural practices, values, and relationships had to be attenuated. The dichotomy of “developed and underdeveloped” was established during this period, growing out of a lack of recognition of what was positive in other cultures.

These theories have been critiqued since their dominance in the 1960s. It is doubtful that even economic change in the West occurred along the lines suggested. A major criticism of development, particularly from writers in the Third World, was that it established a cultural hegemony.

## Establishing Cultural Hegemony

Development in the form it was originally conceived, a universal cure for poverty and as a bulwark against communism, required a cultural hegemony in host countries to support the changes it proposed. During Europe’s period of rapid upheaval brought on by the industrial revolution, massive social dislocation occurred. Durkheim labeled the effect as *anomie*—the suspension of previously held beliefs or principles of certainty. The effect could also be put into a postmodern context with competing cultural values, with practices and relationships no longer providing a sense of security, certainty, or meaning.

A similar situation occurred with the implementation of development programs in the Third World. Critics argue that local cultures were often overwhelmed. Rather than a more evolutionary process, the frames of reference for everyday living were shifting in one generation with important stabilizing features, such as the system of governance, social organization, and religion completely removed or disregarded if these were seen as impeding the development process.

Societies had to integrate rapidly not only a new economic model but also an entirely new culture to sustain it, that is, a new set of values, practices, and social relationships. Crises instigated by increasing urbanization, bringing a population into a waged sector, rural migration and unemployment, the disruption of gender and family roles, and new forms of social differentiation, were exacerbated by a crisis of values as former cultural patterns were stigmatized as being of less value, even “backward.”

“Hegemony” can be defined as a form of domination whose legitimacy is based on a valued pattern of shared meanings (Friedman 1992). But it involves more than just physical coercion. It can be established in many ways, including the incorporation of oppositional ideas, the saturation of an ideology, or the control of material production matched by control over the production and dissemination of cultural symbols.

In the translocation of development models to the Third World, Western forms of knowledge were assuming preeminence to manage the conditions of the living. State and international agencies, bureaucracies, media, and academia attempted to establish a nexus between power and knowledge to influence indigenous institutions and attitudes (Foucault 1980). A regime of “truth” was created; that is, Western development was the only true model to follow if a country was to progress.

Wealthier countries not only had the resources and technology to secure their brand of progress internationally but also to dominate the research agenda, information flows, and even the language of the development discourse. Terms such as the gross national product (GNP), because of their association with, and emphasis on, economics and empirical formulae, are basic to the discourse of international bodies such as the International Money Fund (IMF), World Bank, and donor countries.

This internationally recognized vocabulary links development's administrative actors. Transnational corporations, diplomats, trade agencies, and international non-governmental organizations (NGOs) all operate and understand these lexicons. The dominance of this language is critiqued for excluding other dialogues that speak of development as something that should be more mutually inclusive of all cultural aspects of people, not just the economic aspects (Escobar 1995).

### **Alternative Culture-Based Perspectives on Development**

Analyses of development programs began to reveal that the aim of eradicating poverty by restructuring a society had failed to improve material living conditions for many in the countries that underwent these programs. In some regions, poverty had even been exacerbated. There was, and continues to be, resistance in host countries to programs that local populations consider detrimental (protests against the Narmada Dam in India is an example).

In hindsight, trying to establish a uniform pattern of change throughout all countries whose cultural systems differed greatly was unlikely to succeed. Governments and international agencies began to look at new ideas such as sustainable development. Basic needs approaches were developed, although this was still problematic regarding how to define what is a "need" as opposed to a "want." The United Nations Development Program produced a new tool for measurement, the Human Development Index, which looked at development not only in terms of economic growth but also in terms of literacy, mortality rates, gender equality, and other such factors.

However, some writers, particularly from the Third World, began to advocate more radical approaches using alternative models based on existing cultural relationships. This included the strategic use of traditions and local knowledge, whose validity did not depend on Western regimes of truth, and

integrating cultural, spiritual, social, and economic dimensions (Sivaraksa 1990). Rather than large-scale development projects, such as dams or paper mills, small grassroots, community-based projects were seen to be more effective in implementing changes desired by local populations.

Deconstructions of the meaning of key terms such as poverty, underdevelopment, and modernity have taken place. They have become regarded as contestable cultural constructs. The broad, general term of "development" is now being paired with the words "self-reliant," "human scale," or "endogenous." Local terms avoid the use of development altogether: in Sri Lanka, *Gam Pubuduwa* means "awakening of the village." Assumptions about the role of technology and the nation-state have been challenged and new ideas put forward about the use of cultural heritage in the restoration of subjugated peoples, guided by new objectives, in other words, seeking ways of balancing tradition and modernity.

In many ways, these ideas are also utopian, and it is argued that Western governments, academics, and international agencies continue to dominate the development debate (Crush 1994). While Western agencies made attempts to redress the balance in the United Nations Decade of Culture and Development, 1988–1998, the relationship between Western development and the Third World is still one of tension and resistance.

Using local culture as a basis for resistance can be problematic in that tradition is not a manifest or solidified frame of reference. It is mobile and evolving. Traditions change and provide an insubstantial or unreliable source for a new dialogue if they ignore aspects of modernity that are beneficial, such as education or health. Local cultures are also being increasingly reappropriated by transnational corporations. A global marketing strategy of localization prevails that wraps global products in local cultural icons and meanings to better establish their product in that particular overseas market.

In the current era of globalization, some oppositional movements have tapped into cultural networks to harness identity politics and garner support, relying on cultural connections to bind them (the *Hindutva* movement in India is an example). This opposition is still articulated in the language of cultural imperialism. The fear is that local cultures will once more be overwhelmed by a homogenous Westernization. But the relationship between culture and development has shifted. It is now not a simple imposition but a more complex interaction between local and regional cultures and the global cultures, assisted by increased transnational flows of

## CULTURAL PERCEPTIONS

goods, technology, finance, images, ideas, and people (Appadurai 1997).

## CURRENCY DEVALUATIONS

### Definition

Currency devaluation (revaluation) is the deliberate decrease (increase) in the value of a country's currency in relation to currencies of its trading partners. For example, if one unit of country A's currency exchanges for one unit of country B's currency, and country A decides to alter that rate so that two units of its currency exchanges for one unit of B's, then A's currency has been devalued. By definition, currency devaluation takes place in a "fixed exchange rate" regime. This means that the government of the country would have set the rate at which its currency would exchange for another country's currency: hence, the exchange rate is official (official exchange rate); it is set by the government.

When a government fixes an exchange rate, it indicates to the world that it will take all necessary actions to ensure that its currency will not change value in relation to other countries' currencies. Actions that governments take to maintain the value of their currencies include the purchase and sale of their own currencies, and the imposition of exchange controls (selective access and outright bans to foreign money). When a government is unable or unwilling to maintain the fixed exchange rate it has set, and decides to lower the rate of exchange, a devaluation is said to have taken place. There is an important distinction to draw between "currency devaluation or revaluation" and a closely related concept: "currency depreciation or appreciation." When a country's exchange rate is determined in a competitive market, without any explicit commitment by the government to maintain any fixed rate, the country is said to have a flexible or floating exchange rate regime. The value of the country's currency depends on the forces of the market. If the supply of the domestic currency exceeds the demand for it, the domestic currency will have to exchange at a lower rate—it *depreciates* in value. Conversely, if the demand for the domestic currency exceeds the supply of it, its value *appreciates*. Currency depreciation or appreciation is therefore the result of the forces of supply and demand, whereas currency devaluation or revaluation is a deliberate policy action. It should be mentioned, though, that it is common for governments to try and influence the exchange rate even in a flexible exchange regime.

Currency devaluation takes place to correct what is termed a persistent external imbalance, usually trade deficits. When a country's currency is overvalued (its price is high), imports are relatively cheaper, and the country's exports are relatively more expensive. This leads to external deficits. In theory, when the currency is devalued, it reverses the situation. It makes imports more expensive and exports less expensive, thus encouraging exports, discouraging imports, and improving the external imbalance or trade deficit.

### How Does Devaluation Work: The Marshall-Lerner Conditions

For devaluation to work in the manner described in the previous paragraphs, there are some conditions that must be fulfilled. Economists refer to these conditions as the Marshall-Lerner conditions. The fact that imports have become relatively more expensive (as a result of the devaluation) does not necessarily

mean that citizens will reduce the volume of imports sufficiently enough to decrease expenditure on them. If the volume of imports decreases sufficiently enough to reduce expenditure on them, then, everything else remaining the same, there will be an improvement in the external imbalance (or trade deficit). The same devaluation makes the country's exports relatively cheaper to foreigners. Again, the fact that exports have become relatively cheaper does not necessarily mean that foreigners are going to increase their total expenditures. If, however, the volume of exports increases sufficiently enough to increase the revenue derived from them, then, everything else remaining the same, there will be an improvement in the external imbalance (or trade deficit). These two conditions jointly determine whether a devaluation would improve or not improve the imbalance a country faces. In the technical language of economists, *the sum of the price elasticities of demand for exports and imports must be greater than one*. It is not necessary for both conditions to be met at the same time. Expenditure on imports need not decrease; but if it does not, export proceeds must increase sufficiently to make up for it. Similarly, it is not necessary for exports proceeds to increase; but if they do not, expenditure on imports must decrease enough to make up for it. Several studies suggest that most countries meet this condition in the long run. For example, a study by Marquez (1990) suggests that the only country that did not meet the Marshall-Lerner conditions was the United Kingdom. This means that for most countries, devaluation would remove the trade deficit or least ameliorate it.

A possibility exists that in the immediate aftermath of devaluation, a country's external deficit deteriorates rather than improves. The reasons are as follows. With the price of imports now higher than before, if residents of the devaluing country are unable to reduce their imports and/or are unable to find less expensive substitutes, then they are forced to spend a lot more on imports after devaluation than before. If, at the same time, it takes a while for the county to increase its exports, then export revenues will fall because each unit of exports sells for less abroad. In the long run, however, as domestic residents find less expensive substitutes and domestic producers respond to the increased demand for their products, the external imbalance gets better.

The different responses of external imbalance to devaluation in the short run and long run trace a time path that looks like a *J*; thus, economists refer to it as The *J* Curve. The longer the time span, the more likely it is that devaluation will improve the external imbalance. A slightly more technical way of discussing this idea makes use of "currency-contract

period" and the "pass-through period." The currency-contract period is the period immediately following devaluation when previously negotiated contracts come due at the prices in effect before the devaluation. What happens to the devaluing country's trade balance depends on the currency in which previous contracts were negotiated. Assume that a developing country such as Nigeria devalues its currency (called the naira) so that more nairas now have to be given to obtain a unit of foreign money, such as the dollar. If importers in Nigeria have already negotiated to purchase certain items from abroad and such purchase agreements were written in dollars (as is often the case), with no protection for currency fluctuations (such as hedging), then the import bill goes up as a result of the devaluation. This deterioration in the balance of trade is the "currency-contract period effect." It may go away when old contracts expire and new ones are written at the new exchange rates. Sometimes, as a result of the need to protect sales, importers and exporters may sacrifice profits by absorbing the effects of the devaluation: they do not pass the increase or decrease in prices to buyers or may delay passing them on. If importers and exporters do not pass the price changes to buyers, then the devaluation would not have the desired effect on the balance of trade. The time it takes for importers and exporters to pass the price changes on to buyers produces the "pass-through period effect." A study by Catherine Mann (1986), for example, suggests that between 1977 and 1980, when the dollar was depreciating, the prices of imported goods did not increase because exporters absorbed the effects by reducing their profit margins. Similarly, she concludes that between 1980 and 1985, when the dollar was appreciating in value, prices of imports did not fall; rather, profit margins for exporters to the United States went up.

### Effects of Devaluation

Devaluation could worsen the well-being of a country's citizens. It has already been mentioned that in the short run, as a result of the inability to find less expensive substitutes, the citizens of the devaluing country may be forced to continue buying the now more expensive imports. Since at the same time the value of their exports would have gone down, the devaluing country will in essence be getting less for each unit of its exports. In the economics literature, this is referred to as a worsening in the "terms of trade." For example, whereas before devaluation, one bag of coffee may have been enough to acquire a sack of flour from abroad, once the currency is

devalued, two bags of coffee may be needed to acquire the same bag of flour; “real purchasing power” has therefore been reduced. Much more output is required to attain the same level of income and to maintain the same level of well-being. This side effect of devaluation often leads to increased pressure on governments by workers and the alleviation of erosion in living standards by enacting policies such as increases in minimum wages and in subsidies, which can counteract the effects of devaluation. At least one *coup d'état* in Ghana (General Kutu Acheampong's in the 1970s) was attributed in part to the high cost of living that resulted from devaluation. Ironically, though, the subsequent military government was itself forced to devalue the currency.

Additional complications in developing countries often defeat the impact of devaluation. Where governments come between domestic producers and international markets, domestic producers are often insulated from the variation in prices, and, as a result, incentives are not passed on. For example, in Ghana, whose main exports are cocoa, The Cocoa Marketing Board insulated growers by being the sole buyer and exporter of the crop. Currency devaluation under such circumstances does not necessarily affect the output of the main export crop of cocoa because it requires a separate action by the government to increase the price paid to farmers. More often than not, the government kept a substantial portion of the increased revenue. The inability or unwillingness of governments to pass the effects of devaluation on to farmers in this case jeopardizes improvements in the balance of trade deficits that the devaluation was meant to rectify.

When a country devalues its currency, it is essentially trying to switch expenditures by its citizens and its trading partners. It does so by reducing the prices of its goods relative to its trading partners. If the trading partners do not respond by also reducing their prices (devaluing), then the devaluing country could see improvements in its trade deficit. If the country's trading partners, however, also respond by devaluing, then the country could lose whatever improvements it gained initially. What is worse, the volume of trade declines for both the country and its trading partners. This tit-for-tat or “beggar-my-neighbor policy” was evident during the 1997 currency crisis in East Asia. The devaluation of the Thai baht, Thailand's currency (Gerber 1999), put exports from competing neighboring countries, such as Malaysia, the Philippines, Indonesia, and South Korea, at a disadvantage, forcing them also to devalue; thus, the currency crisis spread to several other countries. Others date the crisis to the Chinese devaluation of 1994 that itself was a response to the depreciation in

the Japanese yen and that made Chinese exports less competitive. Regardless of where it started, the conclusion is quite clear: devaluation could produce a contagion that could affect the volume of trade and losses to all countries. Although the East Asian financial crisis is a perfect illustration of what could go wrong, some have argued that there were other problems that worsened the crisis.

If a government maintains a fixed exchange rate regime but pursues macroeconomic policies that lead speculators to believe that it cannot defend the currency, then the expectation of a devaluation could precipitate capital flight. The capital flight would make it even more difficult for the government to maintain the fixed exchange rate and would lead to the expected devaluation. Such were the cases in East Asia. For most of the small developing countries, a one-time devaluation to correct external imbalances is unlikely to produce such an impact.

### CURRENCY REGIMES

Developing countries have usually big shares of state property, their government spending is a high percentage of their gross national product (GDP), and their financial markets are subject to heavy official control and are also limited in size. Their inflation rates are usually high because their Central Banks print money to finance their outlays and also to index public sector wages and pensions. The

exchange rate is set by their government rather than the foreign capital market, and the government also limits currency outflow for certain purposes. These practices, the capital control, and the use of different exchange rates for different transactions make the country's currency regime extremely vulnerable, as the East Asian and the subsequent Russian and Latin American crises had shown.

The question of which currency regime may be the most suitable for a developing country is hard to answer. Most people advocate the fixed exchange rate regime, meaning that domestic currency is exchanged at a fixed rate with respect to other foreign currencies, most notably to convertible hard currencies. This is thought to be necessary to slow down inflation and achieve macroeconomic stabilization. The problem is that while exchange rates are kept fixed, the public is expecting devaluation in case of poor macroeconomic performance. Thus, people would be willing to sell domestic currency assets, which will lead in turn to a balance of payment crisis. As devaluation takes place, the normal step for a Central Bank would be to increase its domestic interest rates to hedge the loss of confidence in the home currency. Otherwise, the demand for foreign currency will increase leading to capital flight. To counteract this trend and keep exchange rates fixed, the Central Bank has to sell foreign currency from its reserves, thus shrinking domestic money supply as it withdraws home currency from circulation. In extreme cases, the introduction of a currency board may be necessary. In that case, the money supply has to be backed completely by foreign hard currency reserves and gold. The chosen currency is usually one with great trading and investment significance on the world market (US dollars or the euro) or on regional markets (like the former German mark in Europe, the French franc in former French colonial Africa, or the British pound in the British Commonwealth countries). Pegging the domestic currency exchange rate to a foreign one under a currency board arrangement includes the recent examples of Argentina to the US dollar, Senegal to the franc, and smaller Yugoslavia to the German mark (DM). The DM was the strongest currency in Europe due to its stability characterized also by the lowest inflation rate the German economy exhibited through long periods.

Pegging a currency's exchange rate to another could also be risky since this may import inflation and have a contagion effect on the importing country's economy. In other words, what is good for a big country's currency may not be the best for the developing country's currency, especially if the reference currency's exchange rate fluctuates.

To mitigate the risks of pegging one's currency to a single one, most developing nations peg their rather to a basket of hard currencies. This basket and their Central Bank portfolio of foreign reserves are created according to the relative weights of their international trade in the component currencies. Thus, many developing countries, having initially a predominantly US dollar-based basket, are shifting gradually to a predominantly euro-denominated basket as the euro appreciates strongly.

Countries that have very intensive mutual trade may hedge their trade-related exchange rate risks by forming optimum currency areas, ranging from exchange rate unions to monetary unions. Thus, countries linked together closely by their trade and factor mobility (labor or capital) will join a fixed exchange rate area if benefits of macroeconomic stabilisation and the microeconomic efficiency gain from joining it will outweigh the losses from losing monetary policy flexibility. The Europe and the European exchange rate mechanism is a good example where the partner currencies fixed their exchange rates while allowing fluctuation with respect to non-member states' currencies. By joining less-developed countries, such as Greece and Portugal that were benefiting from the system, tempering high inflation rates were experienced at home and were caused by the lack of domestic fiscal and monetary discipline. By forming a currency or monetary union, the transaction costs of trade are reduced, but this also curtails the domestic governments' playing field with currency exchange rates and interest rates, forcing them to abandon independent monetary policies.

Although there are some possible advantages in forming a currency union, when it involves a very small country forming a "union" with a very large one, the previous one inevitably accepts the monetary policy of the latter one. This could be beneficial if the small country exhibits a poor inflation management, but it would be disadvantageous when domestic monetary policy has been reasonable. Handing the sovereignty over monetary policy to a different state inevitably entails the risk that the interest and exchange rates that are suitable for the large country will be quite inappropriate for the small one, as it happened when Ireland joined the European Monetary Union.

Fixing exchange rates can go as far as the total rejection of the home currency, if necessary. A complete "dollarisation" can be a long-term effect with much deeper impact than a domestic currency reform, like the introduction of a new domestic currency.

Besides its advantages, the fixed exchange rate regimes present considerable dangers, most notably that they are particularly susceptible to crises unless

backed by very strong political and institutional rules, as it happens in the case of currency boards.

### Free-Float Regime

An alternative to the fixed exchange rate would be the floating exchange rate system used by developed countries. The floating regime may be a “free-float,” meaning financial market forces are forming the exchange rate without any direct government intervention. A free-float may turn into a “dirty-float” if the home government secretly intervenes.

In case of free-float, Central Banks would not need to intervene in the currency markets for fixing their exchange rates, and countries would not import inflation or deflation from abroad. The system would ensure symmetry for all the participants and eliminate foreseeable speculations; thus, exchange rates would act as automatic balance of payment and economic stabilizers. In spite of these advantages, free-float was and is considered to be very risky by most of the developed countries. Only a few countries dared to use it as New Zealand did during the mid-1980s.

Advocates of free-float argue that this regime is least vulnerable to crisis than the pegged regime. This is argued because the exchange rate can adjust more quickly and more smoothly to real shocks. During the 1997–1998 East Asian crisis, both South Pacific dollars (New Zealand and Australian) exchange rates had adjusted promptly to new market realities by depreciations; this occurred in response to falling demand for the countries’ commodity exports due to the weakness of their target markets’ (East-Asian) currencies.

A second reason why floating rate regimes are less susceptible to crises is that domestic banks tend to hedge the currency risk of the foreign borrowing they undertake. If this is overlooked, for example, an undiversified and only US dollar-denominated debt portfolio of a country may cause a sharp depreciation of the national currency. This depreciation was the case of Thailand’s baht. Ironically, the debt had increased and its portfolio was maintained due to the expectations of keeping “the dollar peg.”

In the case of adopting free-float, the sharp depreciation of the currency produces no damages because banks have hedged all of their foreign currency exposure because of the lack of compulsory prudential regulations. By this hedging, most of the exchange rate risk is being carried by retail investors from the developed world, those that have invested in that currency. Another benefit of the floating-rate regime is that domestic corporations, mainly the exporters,

have been either hedged or net beneficiaries of the currency depreciation.

Third, free-float has a low susceptibility to crisis because of the Central Bank’s commitment to refrain from intervening in the foreign exchange market; big speculative plays will be made more difficult. Any speculator betting for an increase of the exchange rate can also find others acting inversely. Such reliance on the conviction that the Central Bank would not let down the domestic currency is the guarantee for the provision of the necessary liquidity, which will enable it to get out of from a speculative position. Thus, the currency may exhibit lower volatility because the free-float allows markets to act freely, and short-term volatility is probably not a real danger.

Arguments against free-float also abound. One of them is the “serious misalignment” argument. Some argue that free-floating currency regimes are particularly susceptible to serious misalignment as countries adopting it do not experience growth, in comparison with those (like India) that manage their currency heavily and maintain strong capital controls.

Another argument states that speculation could lead to money market disturbances and destabilize the foreign exchange markets. Imprevisible floating would harm both traders and investors. Free-float opens up world currency markets to harmful practices, destroying the discipline imposed by the Bretton-Woods system and will lead to uncoordinated economic policies.

Other arguments add that free-floating exchange rates tend to appreciate strongly with capital inflow; thus, they will squeeze export sectors and lead to a large balance of payment deficits. On the contrary, this latter point is of no concern if that capital is absorbed by the private sector.

The last argument against free-float concerns it leaving only an illusion of independence or greater autonomy because Central Banks would be forced to intervene often, and such currency regime, instead of providing more economic policy freedom, will rather increase chaos.

International experience has shown that the regime is neither a panacea nor an evil toy in the hands of official and private speculators. To yield better results, policy coordination failures between restrictive/nonrestrictive home and foreign monetary policies have to be avoided.

The most common currency regime of the twenty-first century is that of “managed float,” which allows the currency value to fluctuate within a band around the “pegged exchange rate.” This can be seen as a combination of a free-float and a fixed exchange rate regime. Having a managed float, the Central Bank

sells foreign reserves, thus supplying the increasing home demand for foreign currency, tempering the devaluation pressure on the home currency, and keeping exchange rates within the band. The bank buys back foreign currency when the domestic currency appreciates, replenishing its reserves and stopping future depreciation of the domestic currency.

In the case of managed float, if domestic and foreign bonds are imperfect substitutes, the Central Bank can control the money supply and also the exchange rates through sterilized intervention, which cancels in aggregate the effect of an earlier intervention. The reserve currency country's monetary policy maneuvers influences output at home as well as abroad. This asymmetry comes from the fact that the resource center has no obligations of financing its own balance of payments; asymmetry could be overcome only if all the countries fix their exchange rates, say, in terms of the gold reserves they have.

In developing countries, the fragile financial markets make the Central Bank the major player, which sets up the conditions for private transactions of the foreign currencies. These transactions are regulated and limited around a reference exchange rate declared by the state, leading to the emergence of a black market.

## The Crawling Peg Regime

Developing countries usually suffer from high inflation, so they cannot maintain their exchange rates fixed for long periods, even when using currency board arrangements, as Argentina had shown in the 1980s. Thus, these countries make use of a combined regime that fixes the exchange rate initially but also allows domestic currency to depreciate continuously. Thus, the price of the foreign currency crawls upward over time as home currency is devaluated continuously at a constant devaluation rate.

The advocates of the "crawling peg regime" suggest that such a crawling band is the best option, but its opponents consider this heavily managed float as being inherently more susceptible to serious misalignment problems. Fixing a currency to a larger, but still floating, currency does not seem to be a way of safely avoiding serious misalignment, as the very strong 45% real appreciation of Hong Kong's dollar and the 109% appreciation of Argentina's peso illustrate, in spite of their peg to the US dollar. Such strong appreciation of the domestic currency exerts considerable pressure on the export sector and was and still is a major contributing factor to the balance of payments deficit.

Developed countries have had similar experiences but with less dramatic effects. Colombia's 49% and Ecuador's 65% real exchange rate appreciations show that these processes do not characterise a particular type of currency regime. This contradicts those who consider that the strong appreciation of the real exchange rate can be avoided by pegging to a major currency or by "dollarising." Some suggest that capital controls like Chile's attempt may have had a beneficial effect on slowing down capital inflow at times of appreciation (at a rate of 45% in the 1990s), but Chile had also experienced a similar current account deficit as a proportion of its gross domestic product, as a country without any capital control.

Finally, it is assumed that crawling-pegs, in contrast to free-float, can be used to maintain a competitive real exchange rate, to the benefit of the country's balance of payments and growth rate. In reality, choosing a proper currency regime has to take into account many macroeconomic as well as regime-linked factors, such as the regime's susceptibility to crisis, to volatility, and to serious misalignment.

**CYPRUS**

Cyprus is a small Mediterranean island, forty miles south of Turkey and some five hundred miles east of mainland Greece. Its population of 776,000 people is roughly 77% Greek and 18% Turkish, with Maronite Christians, Armenians, and other groups forming the remaining 5% .

Due to its strategic location, Cyprus was ruled by many successive empires throughout history. Most recent were the Venetians (up until 1571), the Ottomans (until 1878), and finally the British (until 1960). From 1930 onward, elements of the Greek Cypriot community began struggling against British rule and pushing for *enosis* (the union of Cyprus with Greece). The British responded with a colonial policy used effectively in most of their colonies: “divide and rule.” They turned to the Turkish Cypriot minority, many of whom were already nervous about *enosis*, for help. The Turkish Cypriots favoured either continued British rule or *Taksim* (partition of the island, handing over the halves to Greece and Turkey). Britain also encouraged Turkey to renew its claims on Cyprus, which it had abrogated in the 1923 Treaty of Lausanne. This would function as a counterweight to Greek claims upon the island.

The predictable outcome of such a climate in Cyprus was increasing tension and conflict between Turkish and Greek Cypriots, in addition to continuing anti-British agitation. By the late 1950s, the situation had become untenable for the British, and together with Greece and Turkey, the British negotiated independence for Cyprus. Three treaties resulted from the negotiations: the Treaty of Guarantee, the Treaty of Alliance, and the Treaty of Establishment. Among other things, the three treaties guaranteed the independence and sovereignty of Cyprus; forbade any actions that might lead to political or economic union with other states; pledged Britain, Turkey, and Greece to uphold the state of affairs on the island and intervene jointly or individually if necessary to uphold them; allowed Greece and Turkey to station 950 and 650 soldiers on the island, respectively; and created a *consociational* political structure, which is a system with many complex power-sharing arrangements between the two main Cypriot communities. This structure guaranteed a specific number of seats in the legislature, military, civil service, and other institutions to ethnic Greek and Turkish Cypriots.

Unfortunately, the bi-communal constitution of the new republic was so complex and riddled with power-sharing arrangements that the government soon found itself deadlocked. Greek Cypriots complained that Turkish Cypriots had been allotted a

proportion of government posts greater than their percentage of the population warranted and that they used their position to veto crucial government policies and programs. Turkish Cypriots in turn feared that the Greek majority still wanted to sideline them and either completely Hellenise or unite the island with Greece. In 1963, Greek Cypriot leaders attempted to change the constitutional power-sharing arrangement, at which time the Turkish Cypriots withdrew from the government and began establishing their own system in the mostly Turkish north of the island. This led to a period of intercommunal violence in which the more vulnerable Turkish minority fared much worse than the Greek majority. During this period, which lasted up until 1974, Greek and Turkish Cypriots who spoke out in favour of reconciliation between the two communities were often targeted by extremist groups from their own communities, the EOKA (Greek) and the TMT (Turkish).

In 1974, the situation came to a boiling point, when the military *junta* that ruled Greece engineered the overthrow of the Cypriot president, Archbishop Makarios III, and replaced him with Nicos Sampson, a virulently pro-*enosis* EOKA militant. Turkey invaded the island seven days later, invoking the Treaty of Guarantee to justify its action (the Treaty of Guarantee gave Turkey, Greece, and Britain the right to intervene in Cyprus under certain conditions). Turkish forces killed hundreds of Greek Cypriots, both armed and civilian. At the end of the campaign, the island was effectively partitioned—the Turks had the northern 37%, including a majority of the island’s productive resources (farmland, water, and industry). Missing persons amounted to 1,619 Greek Cypriots and 503 Turkish Cypriots. The southern part of the island absorbed 160,000 Greek refugees from the north, and the northern Turkish-controlled area absorbed forty-five thousand Turkish refugees from the south. Roughly thirty-five thousand Turkish and three thousand Greek troops remain stationed on the island.

United Nations (UN) peacekeepers, present since the intercommunal strife of 1964, still in the twenty-first century maintain a tense buffer zone between the northern and southern Cypriot communities (Australia took over the Cyprus peacekeeping mission from Canada in 1994). The Turkish north declared itself the independent Turkish Republic of Northern Cyprus (TRNC) in 1983 but was recognized only by Turkey. The TRNC continues to face international boycotts and is denied all the benefits of a recognized state, in contrast to the Greek Cypriots to the south (who continue to officially represent the

Republic of Cyprus). The TRNC is heavily dependent on Turkey, receiving \$100–\$200 million dollars of aid annually, in addition to military protection. In addition, approximately 100,000 settlers from Turkey have moved to the TRNC, altering the demographics of the island and even creating some tensions with Turkish Cypriots.

Lack of recognition by the international community has isolated northern Cyprus, preventing it from signing trade treaties, joining international institutions, receiving development aid (from countries other than Turkey), or having its citizens travel freely. By contrast, southern (or Greek) Cyprus, which continues to represent the entire island abroad as the Republic of Cyprus, has enjoyed more economic growth and development, especially due to tourism. Gross domestic product (GDP) per capita in the Greek part of the Island was \$19,200 in 2003, compared to just \$5,600 in the Turkish north of Cyprus.

Negotiations between the two Cypriot communities aimed at reunifying the island have been frequent and universally unsuccessful. In April 2004, a UN-brokered plan to unite the island just before the ascension of the Republic of Cyprus to the European Union was presented to the population of both sides of island in a referendum. Although the referendum proposal passed in the Turkish north, it was rejected in the Greek south. A divided Cyprus then entered the European Union in May 2004, wherein all Cypriots are now considered European citizens, but only Greek Cyprus enjoys direct trade and other links to Europe.

The Greek Cypriot government continues to oppose the establishment of any international trade, cultural, or political dealings with northern Cyprus, in the hope that Turkish Cypriots continue to feel pressure to reunite the island and address problems stemming from the 1974 Turkish invasion of Cyprus. Lack of foreign investment and aid (apart from that provided by Turkey) will therefore continue to bedevil northern Cyprus, and its economy can be expected to remain dependent on Turkey and much less developed than that of southern Cyprus. Because its quasi-state status removes it from most international treaties, regulations, and conventions, Turkish Cyprus also attracts an unusual amount of illegal economic activity, especially smuggling and money laundering. Greek Cyprus likewise suffers from underground market activity, including even piracy on occasion. The Greek Cypriot economy, although much more advanced than that of the north, nonetheless suffers from its vulnerability to external shocks, a problem shared by many small states dependent on

tourism and international trade. Cyprus's proximity to the Middle East also means that when political conditions there deteriorate, the tourism industry on the island also suffers. Insufficient fresh water resources throughout the island constitutes the most pressing environmental problem for Cyprus. Relative to most of the developing world, however, both northern and southern Cyprus score very high on indicators for literacy (above 95%), unemployment (3.4% in south Cyprus, 5.6% in north Cyprus), infant mortality rates (7.36 deaths per one thousand live births), and life expectancy (77.46 years).

### CZECH REPUBLIC

The Czech Republic is a land-locked country with a population of 10.4 million and consists of the Czech Lands of Bohemia and Moravia and part of Silesia. Located in the heart of Europe, the Czech Republic is bordered by Poland to the north, Germany to the west, Austria to the south, and Slovakia to the east. The Czech Republic's 18,933 square miles encompass both the mountain-rimmed Bohemian Plateau in the west and the Moravian Lowland in the east. There is little climatic variation across the country; summers are hot and humid, and winters are cold.

## Political History

Czech historical development is best understood in terms of several phases from medieval to modern times. The initial phase, spanning the sixteenth through the early twentieth centuries, was its incorporation into the Austro-Hungarian Empire. The second phase was the founding of an independent Republic of Czechoslovakia after World War I that lasted until World War II. Occupation by Nazi Germany constituted phase three. Phase four began with the Communist takeover shortly after World War II and lasted until the Velvet Revolution of late 1989. The fifth phase lasted from the transition from a restored free Czechoslovakian republic until the “velvet divorce” from Slovakia in 1992. The sixth, current phase is its integration into the parliamentary and pro-West European democracies.

After the fall of the Austro-Hungarian Empire in World War I, Czech philosopher Thomas G. Masaryk (1850–1937), who was married to an American and who identified with and was heavily influenced by the leadership model of Abraham Lincoln, visited the United States to proclaim the Republic of Czechoslovakia based on support from President Woodrow Wilson and the Allies. The new nation became the most industrialized and prosperous economy in Eastern Europe, tempting the ambitious Adolf Hitler after his rise to power in 1933.

Agitation in the Sudetenland, the area in northern Bohemia inhabited by about 3 million German-speaking people, offered Hitler an excuse to pressure the major European prime ministers to cede Czech land to him. At that time, Bohemia was the industrial center of the Austro-Hungarian Empire, due to rich coal deposits and a developed railway network. The remainder of Czechoslovakia was invaded in 1939, and the Nazis established a protectorate in Bohemia and Moravia. Thomas Masaryk’s son, Jan (1886–1948), served as the Czech government’s foreign minister from exile in London. After Nazi Germany’s defeat, the pre-1938 frontiers of Czechoslovakia were restored, and nearly all the German-speaking inhabitants were expelled.

Soon after World War II, the Communist Party gained control of Czechoslovakia, converting it into a rigid Stalinist state. After the death, in 1953, of Joseph Stalin, some political relaxation occurred, and in July 1960, it was renamed the Czechoslovak Socialist Republic. Post-Stalin moderation was evident by January 1968 when Alexander Dubcek (1921–1992) became secretary of the party. Soon after, however, the more independent and moderate policies adopted during the Prague Spring of 1968

were terminated after the invasion of Warsaw Pact military forces. Gustav Husak replaced Dubcek and was the last head of Czechoslovakia during the final twenty years of its demise as a Soviet satellite regime.

Only one Prague Spring reform was retained. In January 1969, the Czechoslovak unitary state was transformed into a federation, an arrangement that allowed the Czech and Slovak republics to have separate local governments. At the same time, a national federal government was instituted, and the legislature was restructured into a bicameral body. Implementation of this single Prague Spring reform may be explained, in part, by the fact that both Dubcek and Husak were Slovaks and were sensitive to the underlying, persistent tension between the urban, industrial Czechs and the rural, agricultural Slovaks.

Both the 1989 fall of the Communist regime and the 1992 “velvet divorce” between what became the Czech Republic and Slovakia were accomplished rapidly. Demonstrations against the Communist government, triggered by reforms in the Soviet Union, began in 1988. The Velvet Revolution took place from November 17 to November 28, 1989. It signaled a dramatic, but largely peaceful, political change. Within a month, Vaclav Havel replaced Husak as the president of Czechoslovakia. Dubcek, who had been expelled from the Communist Party in 1975, was elected chair of the national parliament; the Communist Party lost its majority.

## Confrontation of Two Inexperienced Political Leaders

Almost as soon as the old Communist regime fell, fissures developed between the two emerging political leaders: Vaclav Klaus in Prague and Vladimir Meciar from Bratislava. Klaus represented the dominant Czech party called the Civic Democratic Party (ODS), which favored anti-communism and economic reform. Meciar represented his Movement for a Democratic Slovakia (HZDS), which favored retention of much of the previous economic framework from the Communist regime and promoted nationalism. Due to the political inexperience of both leaders, the collision of these two forces led to a so-called “velvet divorce” even in the absence of general public support for the split.

Vaclav Klaus, a former minister of finance, was a 1963 graduate of Prague’s School of Economics and did his graduate work in economics both in Italy and the United States, where he attended Cornell University in 1969. He admired the United States’s Milton

Friedman and viewed himself as the Margaret Thatcher of the Danube. He had been elected head of the anti-Communist Civic Forum in 1990 after it had grown more conservative, and he became the architect of Czechoslovakia's neoliberal economic program. At the same time, Klaus quickly earned a reputation for arrogance and an inability to accept criticism. By 1991, he was chair of the Civic Democratic Party (ODS), a center-Right party advocating a free market economy and a limited role for the state.

If Klaus was the Margaret Thatcher of the Danube, then Meciar was its Huey Long. A former boxer, corporate lawyer, and an authoritarian populist, Meciar became the darling of the Slovak Nationalists and made it clear that he would not accept a federal state from Prague dictating political policies to Slovakia. Capitalizing on the persistent undercurrent of resentment and jealousy Slovaks felt for their more urban Czech rivals, Meciar escalated his populist demands to such a level that Klaus quickly decided to dissolve the Czechoslovakian state. In doing so, Klaus considered himself rid of what he saw as both a demagogue as well as the economic drain of the less well-off Slovaks.

### **Struggle Between the Prime Minister and the President**

No sooner had the velvet divorce been finalized that another internal struggle reemerged between the two Vaclavs: Vaclav Klaus, the first prime minister of the new Czech Republic from 1992–1997, and Vaclav Havel, the moral leader of the 1989 Velvet Revolution that had first freed Czechoslovakia from the Soviet bloc. Klaus, leader of one of the nation's two largest political parties, the ODS, began espousing a rapid change to free market economics, though advocating that the change be softened by major subsidies. Opposing his stance was Havel, the internationally renowned avant-garde playwright who was jailed repeatedly by the Communists in the 1970s and 1980s. Havel, born October 5, 1936, into an upper-middle class family, was instrumental in the proclamation of "Charter 77" that demanded respect of human rights. He became the best-known Czechoslovakian dissident against Communist repression, and in late 1989, Havel was selected as the president of Czechoslovakia. He was reconfirmed for another term in 1990, but he chose to resign his post two years later in an unsuccessful move to forestall the breakup of the seventy-four-year-old nation. Subsequently, on January 26, 1993, the new Czech

Republic parliament elected Havel as president. The occupant of that office, however, is not a member of a political party because the presidency is viewed as a ceremonial and moral role for the state that is above partisan political struggles. It was a fitting position for the dissident playwright who is a particular hero in the West.

Despite his ceremonial position, Havel has used the presidency as a platform to critique the materialistic values of Klaus. At the same time, he has championed greater regional representation, the new bicameral legislature, and a role for culture and religion in the Czech Republic. All are issues that continue to divide Havel from Klaus, who has attempted to undermine the constitutional position of the president. Havel also continues to be concerned with issues of human rights and justice. Like Thomas Masaryk, Havel quotes Abraham Lincoln. Like Lincoln, Havel has been willing to use the executive pardoning power, often acting contrary to public opinion. On January 20, 1998, Havel was reelected president. His term expired in 2003, at which time Vaclav Klaus replaced him on March 8, 2003.

### **A Contemporary Stalemate**

A campaign finance struggle within Vaclav Klaus's ODS in the late 1990s led to a minor party breach with dissidents splintering into new parties. Klaus was forced to resign as prime minister in late 1997 but continues as a dominant force in Czech politics. In 1998, he entered his party into a controversial "opposition agreement" with the other major party in the country, the Social Democratic Party (CSSD). The agreement allowed the CSSD to govern with support from the ODS in exchange for a key role in parliament along with policy concessions. This unusual but workable arrangement, intended to undermine the power of much smaller political parties, would be on the ballot in 2002.

While Klaus's power was being checked by campaign scandals, Havel suffered a decline in his health. Havel's popular wife, Oglá Havlova, died of cancer on January 27, 1996, and in December of that same year, Havel underwent surgery for removal of half of his right lung due to lung cancer. Havel had been a heavy smoker since his youth and statistically was at high risk for developing lung cancer since Czech males have the second highest rate for risk of death from lung cancer in the world. His eventual marriage to Dagmar Veskrnova, a Czech stage and screen actress seventeen years his junior, divided public opinion.

Despite these setbacks for Klaus and Havel, each continues in the early twenty-first century to exert leadership in the Czech Republic. A new generation of leaders has yet to emerge to challenge these dueling founders.

The new Czech government inherited a low level of external debt from the old Communist regime: a cushion of government subsidies facilitated the country's transition to a free economy. The economic slowdown since the 1990s notwithstanding, the Czech Republic enjoys one of the highest growth rates in the region, in part due to the high foreign and domestic investments that contributed to a 2.4% rise in the gross domestic product (GDP) in 2000. The combination of an educated workforce and its status as a regional high-tech zone contribute to the country's historic industrial and cultural tradition. It has a richer educational tradition than its neighbors. The first Czech Technical University, dating from the eighteenth century, is one of Europe's oldest. By the mid-nineteenth century, the Czechs had the highest literacy rate in Central Europe. In the twenty-first century, the republic has the second highest number of students enrolled in the sciences. A United Nations technology report ranks the Czech Republic as a "potential world leader" in applying technologic innovations. It enjoys one of the highest living standards in Europe.

The Czech Republic joined the European Union (EU) in 2004 while its GDP per capita was about 30% below the EU average. It is set to receive considerable funding from the EU from 2005 to 2013 (estimates range from \$16 billion to \$40 billion). Bilateral trade and foreign investment are expected to increase. Germany is its most important trading partner. Transparency International presently ranks the Czech Republic 54th out of 149 nations on its corruption index. Concerns about corruption should diminish as its laws are changed to EU standards.

The foreign affairs of the Czech Republic are similarly impressive. In 1999, it was among the first new Eastern European nations to become a full member of the North Atlantic Treaty Organization (NATO).

## **DAWN (DEVELOPMENT ALTERNATIVES WITH WOMEN FOR A NEW ERA)**

DAWN (Development Alternatives with Women for a New Era) is a network of women scholars and activists from the South who engage in feminist research and analysis and are committed to working for economic justice, gender justice, and democracy. DAWN works globally and regionally in Africa, Asia, the Caribbean, Latin America, and the Pacific on the following themes: the Political Economy of Globalization; Political Restructuring and Social Transformation; Sustainable Livelihoods; and Sexual and Reproductive Health and Rights. Its numerous partnerships with other global non-governmental organizations (NGOs) and networks have positioned DAWN as a central actor in feminist activism at the global level. In addition to women's organizations, DAWN also works in partnership with a number of development networks and organizations at both regional and global levels.

DAWN seeks to contribute to creating a world without inequality that is based on class, gender, and race, and where relationships among countries are founded on equal voice and respect. It considers basic needs to correspond to basic rights, and strives to find ways by which poverty and all forms of violence can be eliminated. To generate global change toward these goals, DAWN emphasizes the need to reorient the massive resources now used in the production of the “means of destruction” (arms and environmental pollution, among others) toward the areas where they can relieve oppression both inside and outside the home. This would mean, among other things, reforming institutions so that they become participatory democratic processes where women share in determining priorities and making decisions. This political environment would provide enabling social conditions that respect women's and men's physical integrity and the security of their persons in every dimension of their lives.

DAWN began in 1984, on the eve of the international conference marking the end of the UN Decade for Women launched in 1975. A group of feminists from the South with similar visions prepared a platform document for that event and held a number of workshops at the Forum of Non-Governmental Organizations, which took place in parallel to the United Nations' International Conference on Women, in Nairobi, Kenya. DAWN's platform document, entitled “Development, Crises and Alternative Visions: Third World Women's Perspectives” and written by Gita Sen and Caren Grown (1987), was a feminist

critique of three decades of development. It highlighted the impacts of four interlinked and systemic global crises—famine, debt, militarism, and fundamentalism—on poor women of the South, and offered alternative visions.

The document made a significant impact at Nairobi, and for the first time put macroeconomic issues firmly on the agenda of the global women's movement. Since then, DAWN has continued to influence global debates on development by offering holistic analyses from a feminist perspective that are both grounded in women's experience and inspired by women's collective strategies and visions. DAWN's work at the regional level connects with the priorities of women's and civil society organizations in each region, and helps strengthen capacity to deal with issues arising from the impacts of globalization. One of the ways by which DAWN influences feminist activism in the South is through its Training Institute on gender justice. The inaugural session of the Institute was held in Bangalore, India, in 2003 and graduated twenty-eight young feminists from the South.

Much of DAWN's global advocacy work involves calling for a reform of international institutions through significant critiques of current institutions and proposals for designing new ones; participating in United Nations international conferences and review processes; monitoring state actions, policies, and laws to ensure that they live up to the commitments made in international conferences; and developing guidelines to mainstream gender in non-governmental organizations' advocacy initiatives. Some of DAWN's past advocacy work includes the campaign "Peoples' Health Before Patents"; a campaign for the implementation of the Tobin Tax as part of DAWN's monitoring of the Financing for Development Process at the United Nations; chairing the External Gender Consultative Group of the World Bank; and participating in the ICPD +10 (review process after ten years of the International Conference on Population and Development) and Beijing +10 (International Conference on Women, held in Beijing in 1995) processes.

DAWN's work is supported by the Ford Foundation, HIVOS (Humanist Institute for Cooperation with Developing Countries), John D. and Catherine T. MacArthur Foundation, Swedish International Development Cooperation Agency, and United Nations Development Programme. At the regional level, DAWN relies on the support of a number of established networks, organizations, and institutions, including REPEM (Red de Educación Popular Entre Mujeres de América Latina y el Caribe) and ABIA (Associação Brasileira Interdisciplinar de AIDS) in

Latin America, Girl Power Initiative in Anglophone Africa, WAGI (Women and Gender Institute of the University of the Philippines) in Southeast Asia, IIMB (Indian Institute of Management Bangalore) in South Asia, and CAFRA (Caribbean Association for Feminist Research and Action) in the Caribbean.

DAWN's governing council is its Steering Committee, which is made up of the present and immediate past general coordinators, regional coordinators, and research coordinators. The Steering Committee meets once a year. DAWN also has a number of research/advocacy focal points who are scholars and activists whose expertise and knowledge can be drawn upon to inform DAWN's work and assist its research and regional work agendas.

DAWN's Secretariat was first located at the Institute of Social Studies Trust (ISST) in Bangalore, India, with Devaki Jain as the first general coordinator. In 1986, the Secretariat relocated to the Instituto Universitario de Pesquisas do Rio de Janeiro (IUPERJ) in Brazil, when Neuma Aguiar became the general coordinator. In 1990, the Secretariat moved to the Women and Development Unit (WAND) at the University of the West Indies in Barbados when Peggy Antrobus assumed the general coordinator's position. In 1998, it shifted to Fiji at the University of the South Pacific, with Claire Slatter as general coordinator. Bene Magunagu, former regional coordinator for Anglophone Africa, was appointed general coordinator in 2004. As of this writing, the General Secretariat has moved to Calabar, Nigeria.

DAWN's founding members are from a diversity of countries such as Brazil (Carmen Barroso), Pakistan (Zubeida Ahmad), Norway (Tone Bleie), Morocco (Fatima Mernissi), Kenya (Achola Pala Okeyo), Malaysia (Noeleen Heyzer), and the US (Katharine McKee), among others.

## DE KLERK, FREDERIK W.

To understand how the white minority population (approximately 13%) accommodated to the inevitable transition to South African majority rule with a one-person, one-vote government, headed by Nelson Mandela and his African National Congress (ANC) party in 1994, an explanation is required. One of the key considerations is the essence of political leadership within the Nationalist Party (NP), which formalized apartheid (separate development of races) when it came to power in 1948 and governed as the last minority party before transition to majority (black) rule. Two further explanations include the escalating stakes and risk of civil war in the country, and the perceived shifts in the international environment as significant influences on South African governmental actions.

F. W. de Klerk served as the last Afrikaner president of the Republic of South Africa. In most respects he was an unlikely figure to guide a process that most white South Africans knew would lead unmistakably to negotiating themselves out of power, position, and privilege.

White domination of what later became the South African state began when the Dutch East India Company established a refreshment station on the southern tip of Africa in 1652. This naval port of call proved useful for provision of fresh fruits and vegetables on the long voyage from Europe to Holland's premier source of raw materials in the East Indies. De Klerk's French Huguenot ancestors arrived in Capetown by ship in 1688, early forerunners of the white migration to this distant region. His family and political roots in the area are extensive. Three generations of Afrikaner family members were prominent in provincial and national politics. His great grandfather served five years in the Senate of the first Union of South Africa government in 1910. His namesake on his mother's side served on the Provincial Council of what was then known as the Orange Free State, one of two territories dominated by the Afrikaner people. His paternal grandfather twice ran for Parliament, unsuccessfully. An uncle served as prime minister. De Klerk's own father had been a veteran National Party organizer, served as general secretary of the

National Party in Transvaal Province, had stints as cabinet minister under three successive prime ministers, and culminated his political career as president of the Senate.

De Klerk was born March 8, 1936, in Johannesburg, South Africa. His family was deeply religious, adherents to the most conservative wing of the Dutch Reformed Church. His father had been a teacher, principal, and church elder, while he carried on most of his National Party work at night and on weekends, so he was often absent from the household. The family was of modest means, practiced an ethic of community service, and valued highly the intensity and inwardness of Afrikaner culture. A key part of this identity was acceptance of racial exclusivity, a cardinal tenet of Afrikaner culture since arriving in the region.

De Klerk graduated from the Hoerskool Monument secondary school in Krugersdorp and went on to pursue a conventional path for Afrikaner professionals. He went to Potchefstroom University for Christian Higher Education, an Afrikans university known for its conservatism, and in 1958 graduated with a combined degree in arts and law. Poorly skilled in athletics and music, he found his talents in student government and in the Nationalist Party Student Youth League, a training ground for young party comers. His first trip outside the country was a six-week fellowship to England, which included a small group of both Afrikans and English-speaking university students.

He practiced law for a period from 1961–1972 in Vereeniging, and simultaneously served in various local government posts. He was first elected as a member of Parliament in 1972. Appointment to the national cabinet followed as minister of posts and telecommunications, and later he held successive cabinet posts in multiple governmental sectors. By 1982, he became Transvaal leader of the National Party, a significant national pedestal, and his arrival came at a critical time for the increasingly besieged government of South Africa.

F. W. de Klerk's roots in Transvaal province, the most Afrikans part of South Africa, gave him great credibility among both Nationalist Party leadership and the rank and file. Philosophically, politically, and religiously conservative, he was skilled at negotiating with the opposition parties.

The long-term, extended pattern of state violence against its own people had brought on world condemnation, political and economic sanctions, an arms embargo, and prohibition from participation in virtually any international sports competitions. South Africa had become a pariah state among the community of nations.

By the early 1980s, internally South Africa also had become a repressive police state. The successive white governments firmly and with brutal force regularly suppressed internal black opposition, including the ANC, the Pan African Congress (PAC), and the Inkatha Freedom Party. By the late 1980s, it was clear to the more pragmatic white political leadership that change would have to come. A quiet and secret dialogue began between governmental representatives and key black influentials. The four-decade-old apartheid state had begun to corrode from within, with absolutely no prospect of salvation without radical political change.

When the previous president, P.W. Botha, still recovering from a stroke, proved unwilling to continue the largely secretive dialogue with the ANC opposition, he defiantly resigned. De Klerk had been elected National Party leader in February 1989, and with Botha's surprise resignation, that same year and with no opposition candidates, the Parliament unanimously elected him president of the Republic of South Africa.

An emergent political pragmatist and a centrist in the Nationalist Party, de Klerk took little time to inaugurate change. In a surprising policy speech in February 1990, he rescinded the ban on the ANC, the PAC, and the South African Communist Party; released most political prisoners; repealed all apartheid laws; and announced the release of Mandela after twenty-seven years in jail. Despite a volatile atmosphere of multiracial distrust and frequent outbreaks of civil violence, de Klerk and Mandela together kept the moderate white and black coalition elements together and formally opened negotiations for a new constitution.

In December 1991, the NP government and opposition parties convened a Convention for a Democratic South Africa (CODESA), following two years of hard bargaining. The draft constitution secured universal adult suffrage, a bill of rights, an independent judiciary, and abolition of the segregated homeland governments. It was the widest cross-section of opposition groups ever to assemble. The far right Conservative party, the extremist right white opposition party, the PAC, and Chief Mangosuthu Gatsha Buthelezi of the Zulus chose not to participate. However, Buthelezi's party, the Inkatha Freedom Party, did participate. The middle of the white and black political spectrum stayed engaged.

De Klerk's subsequent decision to hold a whites-only national referendum in February 1992, to approve his continued negotiation with the ANC and Mandela, secured his reform initiative. The result, with 85% of the white electorate voting, was that 68% approved continued negotiations with Mandela's

ANC and other opposition parties. Although one result of the referendum was that many Afrikaners in the NP viewed de Klerk as a traitor, he successfully isolated his right-wing party opposition.

By December 1993, all but two major political parties endorsed a power-sharing agreement and the Parliament ratified an interim constitution. With the pivotal election of Mandela in April 1994, in which he won nearly 63% of the vote, the political transition was complete. De Klerk drew the second-largest number of popular votes, but the gap between the number of votes he and Mandela received was expansive. Nevertheless, it was enough for de Klerk to be named second deputy president. After nearly fifty years, apartheid as official state policy had ended. Thereafter, Western governments removed economic sanctions and the British Commonwealth restored membership to South Africa. It would only be the beginning of a much longer process of racial reconciliation and governmental transformation, a work in progress.

In retrospect, external changes also played a decisive role. In the fall of 1989, every Eastern European communist government was removed from power. By December 1991, the USSR as a state and empire had ceased to exist. The NP posture of rigid anti-Communism and its role as protector against the spread of that ideology into southern Africa had lost its rationale. The once highly touted threat and fear of Communist penetration into the region, used by previous white South African governments for Western support, proved hollow. Moreover, successful black independence movements in the wider southern African region already had isolated the white minority government in Capetown. After a seven-year civil war, the last white regime in Rhodesia had collapsed in 1980. Both Mozambique and Angola had achieved formal independence in 1975 despite ongoing civil wars. Finally, South Africa surrendered its old League of Nations mandate over Southwest Africa, and subsequently, Namibia became independent in 1990.

The de Klerk government also halted the state's nuclear, biological, and chemical weapons programs, became a party to the Nuclear Non-Proliferation Treaty, and signed the Chemical Weapons Convention. By the close of his presidency, the state had reestablished itself as a credible participant in the wider international community.

De Klerk resigned from office in 1996, and retired from politics in 1997. He and Mandela were jointly awarded the Nobel Peace Prize in 1993 for their respective leading roles in bringing about the historic, and largely nonviolent, transition to universal suffrage. After his departure from politics, de Klerk

established a foundation in his name to work for peace in fractured societies.

Arguably, de Klerk's leadership of the NP may have gotten the best political prospect possible—permanent minority party status and opportunity for the white population to contribute as “backbenchers” to a multiracial political future. He tried to secure “group rights” for the white minority, but Mandela would have none of that. Politically, the drift toward one-man, one-vote rule appeared virtually inevitable, short of violent internal upheaval, which many critics thought likely. There was no credible nor viable alternative political strategy. The white minority was ultimately African and would try to make the best of their new circumstances. One could argue that heritage proved more compelling than race. F. W. de Klerk gradually, grudgingly, and skillfully moved his reluctant constituency to accept majority rule and the refashioning of the South African state after more than three centuries of white control and privilege.

## DEBT: IMPACT ON DEVELOPMENT

A large national debt, whether internal or external, is considered a major obstacle in achieving economic and subsequent social development. Many critics place the responsibility for the negative impacts of debt on the international financial institutions (IFIs), such as the International Monetary Fund (IMF) and World Bank (IBRD), led by the wealthier developed countries. The IFIs design structural adjustment programs (SAPs) intended to adapt the country's economy to the challenges of the globalized market. These SAPs are designed for achieving macroeconomic stability and subsequent debt relief, but

critics believe that they often do not fit the specific needs of the countries where they are implemented, and thus contribute to poverty and inequality. Local program mismanagement, embezzlement, lack of experience in implementation, and political dependency of the central banks also cause problems with SAPs.

Some critics view globalization as an obstacle toward local development, as it increases cross-country financial linkages that amplify the effects of various economic shocks and transmit them more quickly across national borders. However, many feel that economies of scale, which spill over national boundaries, as well as the free flow of capital and resources, yield a better international allocation of these factors of production and thus a more efficient global economy. Globalization's critics draw attention to international geopolitical interests that lead to unequal exchange, thereby perverting the democratization processes in the developing countries.

Between 1972 and 1982, the overall debt of developing nations rose from \$130 billion to \$600 billion, resulting in the first major debt crisis in 1982. However, the net gain of lending countries between 1982 and 1990 is estimated at \$418 billion.

## Debt and Growth

Large debt slows down or stops economic growth. The savings rates of the Developing Countries (DCs) generally fall, as they are unable to secure sufficient investment capital. Frequently, this forces developing nations to abandon their development plans in favor of building social safety nets. The neglect of the domestic savings, as a source of development finance, increases the country's debt-to-gross domestic product (GDP) ratio, increasing the country's economic dependence on foreign loans. High levels of foreign debt compared to GDP makes domestic economy vulnerable to debt crisis. This induces sovereign default on loan reimbursement and subsequent capital flight.

The first major debt crisis was caused by the recession in the developed world. Therefore, it became more profitable to invest the petrodollars in the West, then recycle it through western banks by lending to DCs. Thus the DCs' source of financing their development programs was drying out, but their debt service costs increased dramatically due to interest rates pegged to the London Inter-Bank Offered Rate (LIBOR). The LIBOR, the rate at which London banks borrow money from each other, is the most commonly used reference point for short-term interest rates. Fluctuations in the LIBOR have triggered massive default on debt repayments, also

with a boomerang effect, causing recession worldwide. This has caused a -4% to -11% annual decrease of GDP, from Mexico to Yugoslavia, fostered also by the transition processes of the former communist countries to market economies. High levels of short-term debt and debt-to-reserves ratio, like Mexico's 5.2, Korea's 2.073, and Indonesia's 1.724 in 1994, signal long-term economic insecurity; in the case of East Asia, these ratios led to the 1997 financial crisis. The foreign debt-to-GDP ratios rose to 28% in Thailand and 21% in the Philippines, while exports shrank. The debt crisis's contagion effects spilled over Russia and Eastern Europe in 1998 and Brazil a year later. These reflect the higher instability of the interlinked, once attractive emerging capital markets of the developing world.

### Debt and Trade

Trade liberalization, mainly the abolition and reduction of import duties, was prescribed for debtors as a prerequisite for qualifying for new IFI loans. To increase export earnings, a country has to increase its currency's real exchange rate; however, at the beginning a substantial initial nominal devaluation is recommended in order to make export price competitive. This free trade opens the markets of the developing world, even though developed countries continue to protect their own agricultural and basic commodity markets—the exact markets in which DCs could be more competitive.

Another recommendation for the debtors is domestic price liberalization, but this leads to high inflation in order to balance their existing fiscal deficits. As developing nations rarely have funds for technological research, they must purchase technology from developed nations, which serves to widen the existing technological gap. Developing countries, as debtors, are constrained to cheap large-scale exports of raw materials, which leads to resource depletion, while the decreased level of domestic transactions causes a multiplier effect in their own economy. This is a partial reason for dependency and poverty, since basic commodity prices are subject to heavy competition on world markets, which causes them to fluctuate and remain mostly depressed. For instance, the price of cotton has dropped by half since 1995, affecting 1 billion people worldwide. In spite of increased outputs, it has led to decreased revenues and severely declining terms of trade for the exporting country. More than fifty developing countries have undiversified export structure, depending on three or fewer commodities for more than half of their export earnings.

Twenty such “single-commodity” countries are dependent on one or few commodities export for more than 90% of their total foreign exchange earnings.

Early trade liberalization for socially and economically unstable DCs forces these economies into price wars, which may become, in fact, a spiralling race to the bottom. Often, much of the population is left poorer and at the mercy of obscure market forces, also causing debt overhang. Once a country has fallen into poverty, it becomes more difficult to obtain contracts from the mega-retailers dominating the world trade, without severely cutting costs. To cut costs, many manufacturers resort to illegal and unsafe business practices such as child labour, lack of overtime pay, quotas, and less expensive but unsafe manufacturing practices. These in turn expose them to further trade sanctions, which reduces their competitiveness even more.

Forcing exports and stopping imports, like Romania did in the 1980s, condemns the country to backward development. This method neglects domestic markets, leading to supply shortages and inflation and decreasing living standards. Forced exports often lead to dumping, or selling goods in foreign markets for either less than they cost in the country of manufacture or less than the cost of producing the goods. Dumping then attracts protectionist countermeasures by foreign markets, which squeeze out DC products. As a response, international financial institutions initiate rescue plans that impose market-based pricing. Unfortunately, these plans often lead to increases in food and utility costs within developing nations.

### Debt and Domestic Industries

In order to decrease dependency on imports, most developing countries have created import substitution industries, which requires heavy investment and increases the demand for foreign exchange. This leads to an overvalued exchange rate, which in turn diminishes exports, while the restrictions on imports cause growth prospects to worsen. Existing large amounts or ratios of debt leave no place for industrial diversification, exporting industries must be heavily subsidized, and agriculture often remains neglected. After prescribed privatization, domestic plants are often closed down by the foreign purchasers. Privatization carried out for the sake of efficiency has in some cases increased dependency on imports in the basic commodity sectors, wiping out domestic production. This affects economic sovereignty in the long run, encouraging corruption as politicians consider these sell-offs a source of commissions.

## Debt and Monetary Policy

To overcome default all countries have to achieve macroeconomic stability, and in order to stop financing government deficits with seignorage and inflation tax (for example, Bolivia, Argentina, Yugoslavia), governments are required to fix their exchange rates or peg to their greatest lenders' currencies. Keeping the exchange rates stable and in favor of the lenders is costly, due to the high interest rates and reduced spending on domestic consumption. Governments then need to increase exports just to keep their currencies stable, which may not be sustainable, or appreciate them, which worsens their export terms, leading to growing deficits. In order to stop capital flight, DCs must raise interest rates to high levels to convince investors to return; however, this also fuels inflation further and can even discourage investment.

As an example, Russia fixed the ruble's exchange rate to the US dollar, attracting speculative foreign capital through the high interest rates offered on US dollar loans. The debt accumulated, and when short-term debt reached maturity, its overall size caused the collapse of the ruble's exchange rate and suppressed domestic growth. This had a boomerang effect on lender countries, causing recession in Germany, which had tried to support the Russian economy in gratitude for its stance during the German reunification. The excessive international mobility of capital shook domestic currencies. The \$90 billion capital flight in Mexico between 1979 and 1983 was greater than the entire Mexican debt at that time. Brazil, as another example, wanted to freeze prices and wages to stop inflation caused mainly by high debt ratios. It opted to introduce a new currency, which led to short-run results; however, inflation doubled later, because of the loose fiscal and wage indexation policy.

## Debt Service

Debt service becomes a burden in itself, hampering the development of most of the developing countries. For some it would have been even more advantageous to default on payments, but this alternative would block further lending, triggering the seizure of the country's assets abroad and a reduction of gains from international trade. If foreign lending possibilities are exhausted, governments return to domestic borrowing to a point where interest service on domestic governmental debt, as in Mexico, reaches 15% of GNP. This has led to a 50% increase in money supply

for internal debt service purposes. In reality, complete country default on reimbursement is not allowed, because that may cause the worldwide collapse of the banking systems. Debt can be repaid through massive expenditure cuts and/or tax increases, but these are often politically infeasible and can be hard on a country's population, particularly if the country was impoverished to begin with.

## Debt and Food

Debt obligations have driven the reorientation of agricultural production from meeting local needs, to production for export in highly skewed regional and global markets. This focus on export has decreased the self sufficiency of these countries, and increased their dependency on other nations for their food supplies. As developing nations have undertaken forced industrialization, investment sources for agriculture have dried out. In the 1950s, half of a typical developing country's GNP came from agriculture and 70–80% of its population was employed in that sector. Due to increased industrial labor demand, the workforce has migrated into urban areas, leaving labor-intensive agriculture without proper human capital, and leaving developing nations unable to produce their own food.

In the long run, improper heavy industry development strategies will exhaust the foreign credit opportunities, while failing to become competitive. So debt has to be repaid with whatever is left—agricultural products and raw materials, since these primary products' quality does not depend so much on technology. As an example, Argentina, once a world-class food exporter, has become a troubled country due to failed industrialization and its accompanying debt service, which triggered inflation of 3,000% in 1991 and led to food riots. As another example, Romanian communist dictator Ceausescu exported food, badly needed at home, to repay the country's \$21 billion in external debt. He introduced food rationing, which was often carried out inequitably.

Heavily indebted poor countries (HIPCs) have sometimes turned to illegal drug production and trade, or have cut back their food subsidies. Moving toward exportable cash crops, land is diverted away from meeting local and immediate needs, which also affects the survival of millions.

Less developed countries and HIPCs cannot achieve self sufficiency in food as the first prerequisite for a sound economic development, without the large-scale use of pesticides. Debt's chain reactions and related effects are enormous. The restructuring

of agricultural policies has led to the overuse of land, soil erosion, pollution, and deforestation. Wide-scale deforestation for extensive agriculture- and timber-exporting purposes causes local climate changes, contributing to global warming, severe drought, crop failure, famine, and the impossibility of sustainable development.

### Debt and Living Standards

When countries first start to borrow, living standards may also rise, like in Hungary, where foreign loans were used for consumption, aimed at stopping popular discontent with the suppression of the 1956 anti-Soviet revolution. After becoming indebted, living standards have often fallen, even to poverty level as real wages declined, such as during the 1980s in Mexico, Argentina, and Peru, where wages dropped 50–70%. The value of labor decreased as world market prices were faced with planned economy wages. Additionally, the need to meet debt-servicing requirements led to a decrease in social spending. By the 1990s, most African countries were spending more on foreign debt service than on national health-care or education. Half of Africa's population lacks basic health care. In 1997, it was estimated that sub-Saharan African governments spent four to five times more for debt service than for health care. Debt affects education also, as spending for schools is decreased in order to pay off debt. Even if schools are available, economic conditions often force young children to work.

### Debt and Social Change

Large debt contributed substantially to the fall of communism, predominantly in Hungary, Romania, Bulgaria, and Poland. Austerity programs led to a wave of strikes in Poland and a bloody revolution in Romania. Draconian measures aiming at debt servicing were used to justify totalitarianism. With debt repayment of developing nations to developed countries at the current rate, many argue that the world's poor are subsidizing the rich.

## DEBT: RELIEF EFFORTS

Mounting debt problems and crises ask for immediate action and also for careful balancing in deciding what are the best policies for alleviating existing indebtedness and counteracting potential financial crises. In the case of private borrowers, as those benefiting from commercial credit, or in the case of a possible default on repayment, creditors might look first to achieving debt consolidation with the debtor company's government. Consolidation of such debt is disadvantageous for the indebted developing country as foreign lenders want these governments to absorb privately contracted external debt, conditioning them with publicly contracted loan rescheduling. Thus the conversion of a foreign currency-denominated loan into domestic-currency state loans at reduced exchange rates, would, in fact, be used to subsidize the private borrowers, instead of financing the needs of the poor.

One of the first steps in alleviating the foreign debt crisis is the common action of the large banks, the International Monetary Fund (IMF) and lender industrial country governments, called concerted lending. This provides for continuous lending, imposing the will of the major lenders on the smaller banks. The debtor country's government starts negotiating an agreement with an advisory committee of the largest banks that represent the cartel of lenders. The coordination of many instances of involuntary lending is necessary to force banks to contribute new funds in accordance with their loan exposure. This will be a framework that provides consistency and predictability to borrowing countries, as well as to those who invest in emerging-market debt. This has taken the forms of extension of credit or new loans to abridge the financing gap, or debt rescheduling, which means the transformation of short-term debt into a long-term one. This rescheduling postpones the

amortization of the principal, but additional interest charges may add up. In order to be able to repay maturing debt, first the country's current account deficit should be balanced with additional loans, in order to make possible a positive balance large enough to finance both interest and principal payment.

When an emerging-market country is threatened with a financial crisis, it faces the prospect of being forced to devalue its currency and default either on its government debt or on loans to the country's banks. There are two main options for avoiding these events: an IMF loan (a "bailout"), which, in fact, is also a creditor bailout, or debt restructuring (a "bail-in"). Even for restructuring purposes, countries borrow from the IMF and agree to its stabilization packages. Although the IMF loans are usually of a small size, they have a positive signaling effect for the international banking community.

Among the other goals of the IMF, it seeks to facilitate currency exchange in order to reach equilibrium for the whole economy. For that reason it established mechanisms to stabilize exchange rates. This was achieved by pegging a country's currency to the dollar and by the United States maintaining the dollar's full convertibility to gold on a fixed rate of \$35 per ounce. Countries joining the Fund have a quota of special drawing rights on the fund's resources, in accordance with their money contribution to the reserve pool. The IMF initially had a central role in coordinating bank lending, but starting from the Mexican crisis in 1982, the Fund conditioned the approval of its lending on the existence of a similar consensus among private lender banks, which in turn was seen as a solvency guaranty of the debtor.

Much of that vision, however, has never materialized. Instead the IMF took to offering loans based on strict conditions. These become known later as structural adjustment (SAP) or austerity measures, dictated largely by the most powerful member nations. The IMF loan conditions focus mostly on monetary and fiscal issues. They emphasize programs to tackle inflation and balance-of-payments problems, often requiring specific levels of cutbacks in total government spending levels. The IMF prescribes usually the same four-step programs aimed at the structural adjustment of the debtor's economy, namely monetary austerity, fiscal austerity, privatization, and domestic market liberalization.

The monetary austerity measure looks at tightening up the money supply, devaluation of the domestic currency, and increase of the internal interest rates to whatever heights are needed to stabilize the value of the currency. Devaluation, however, may decrease investor confidence and imposing capital controls may result in capital flight.

Fiscal austerity aims at increasing tax collections and reducing government spending dramatically. A decreasing fiscal deficit assumes that monetary contraction would follow, but this is also unfortunately procyclical in the case of a global slowdown in economic growth. Furthermore, this measure targets the reduction or elimination of subsidies, but this hampers foreign competitiveness, and trade imbalances occur in spite of the currency devaluation. Moreover, simultaneous devaluation by many competing countries will offset the benefits of a single action in one of them. Another goal is reducing spending targets by freezing public sector wages with the hope of causing the same effect in the private sector, although inflation rates remain high. Another consequence of this policy measure is that wage cuts would further decrease domestic demand, which would already be lowered in the foreign markets. Thus, falling domestic consumption accompanied by high inflation would accentuate the recession.

The privatization policy looks to increase state revenues through the sellout of public enterprises to the private sector. Accompanied by import restraints, a trade surplus may be achieved painfully as restructuring destroys much of the existing production capacity as well as social capital.

This forced export causes resource transfer, needed for debt servicing, which is equal to net inflows of capital minus interest payments. This has ranged from a +\$49.6 billion globally positive balance (+\$24.6 billion to Latin America) in 1981, to a globally negative one from 1983 onward with a negative peak of -\$59.1 billion in 1990. In Latin America the pattern of financing reversed even earlier, reaching -\$34.7 billion in 1985. Thus, capital formation at home ended with a debt crisis, and future growth prospects were decreased as investment funds were drained by the previous debt-dependent development strategy. Although debt-service ratio as a percentage of exports had fallen to 45% in 1987 with the outstanding interest-debt ratio falling from 72%, 6% of the continent's overall production was ceded to foreign creditors. Banks could have created reserves for dealing with debt defaults, but commercial banks instead had swapped debt into equity.

The fourth main issue is domestic liberalization, which imposes financial and price deregulations. Financial liberalization removes restrictions on the flow of international capital, as well as on the operations, purchasing, and ownership of foreign businesses including banks. Price liberalization introduces world-market prices and inevitably leads to high inflation. Experience shows that successful developing countries have relied more on economic and commercial planning than on chaotic domestic

half-free markets. Only when governments sign a “structural adjustment program” (SAP) agreement does the IMF agree to lend enough to prevent default on mature and unsustainable international loans. In addition, the IMF arranges a restructuring and rescheduling of the country’s debt among private international lenders that includes also a pledge of new loans.

In 1956, emerging debt problems in Argentina led to the establishment of the Paris Club as a forum for negotiations between debtor country officials and the country’s creditors under the supervision of a French treasury official. Paris Club principles impose equal treatment of all creditors during rescheduling talks. Prior to reaching an agreement, debtor countries sign an SAP conditional IMF loan contract aimed at enhancing the debtor’s balance of trade. Private lenders negotiate through the Club in order to reschedule the public debt of foreign countries.

Usually the IMF offers a “stand-by” agreement with a one-year upper limit for financing balance-of-payment deficits in the short run. In the 1970s, the IMF programs were criticized by leaders of developing nations and by dependency economists as causing recession and punishing debtor countries for trade shortages caused by external factors or those which were endemic to their development processes. Critics charged these policies with decimating social safety nets and worsening lax labor and environmental standards in developing countries.

In response, the Fund developed new special lending facilities dealing with the consequences of the external shocks (like the oil financing facility) and loosened its conditionality. In addition, it developed longer-term, Extended Fund facilities. In spite of these improvements, many developing nations still avoided the IMF, turning instead to private credit sources, thus avoiding adjustment as well as conditionality. Therefore, the fraction of Latin American countries operating under the IMF was two-thirds between 1966 and 1970, and at the turn of the decade, 1979–1981, it had dropped to one-third. As world liquidity rose due to petrodollar recycling, the role of the Fund declined, but this was reversed by the debt crisis of 1982. After the crisis, most of the Latin American countries fell under some IMF program, with increased conditionality, which imposed austerity, without concern for its political consequences.

Even before the debt crisis, private banks offered loans only after the approval of an IMF stabilization program, and even after such has been accepted they were reluctant to increase their debt exposure toward the developing countries. The IMF prevented the banks’ collective action in order to avoid a chain-default of the debtors. Thus, in the coming years, the

Fund organized a cartel of creditors to dictate macro-economic policy by conditioning its loan on other inflows of capital from international banks, becoming a “central planner” of the banking world. Unwittingly, the IMF crisis policy also enabled a class-oriented distribution toward local elites, because a high proportion (40% in Argentina and Mexico, 70% in Venezuela) of the interest payments to international financial institutions (IFIs) has returned to those elites as interest on earlier capital flight.

Another key international financial institution created for such scope is the World Bank (The International Bank for Reconstruction and Development, or IBRD), which was initially designed to fund the rebuilding of the infrastructure in nations ravaged by World War II. The bank turned away from Europe after the mid-1950s, and began funding massive industrialization in the developing world. Critics have accused the bank of aggressive dealings with debtor nations, exacerbating the debt crisis and devastating many local ecologies and indigenous communities in the developing world.

The adjustment programs of the World Bank have broader views and focus more on the long term. But similar to those of the IMF, they highlight market liberalization and public sector reforms, and consider the best way of achieving growth to be through the expansion of cash crop exports. Despite these differences, World Bank and IMF adjustment programs reinforce each other, meaning that a government’s plans must first be approved by the IMF before qualifying for an adjustment loan from the World Bank—this decision process is called a “cross-conditionality.”

At first, debt-relief strategies made use of concerted lending. The method was seen as a temporary measure at the end of which countries would return to voluntary lending and the debtors would pay back their debt in full. In spite of some recovery shown in the early 1980s, the indebted developing countries have not been able to pay off their debts. The rising protectionism in the developed world has been named as a cause. This caused fluctuations in their terms of trade and caused a growing inability to service their debts.

The debt fatigue of developing countries became more evident as some countries limited their repayments to a certain percentage of their export revenues (Peru) or announced default (Brazil in 1987). As the chances of being repaid became slim, a secondary market for developing country loans emerged, where the price discount to face value reached 50% in 1987 and almost 70% in 1989. This reduced banks’ willingness to offer more loans almost to zero, and was accompanied by an increase in bad loan reserves and

fall of profits. These made necessary the adopting of an international, intergovernmental plan for debt relief. The Brady Plan abandoned the assumption of full repayment and created commercial bank syndication agreements, in order to share the banks' claims and losses and try to settle them with the debtors by lowering interest rates or forgiving the principal. The IMF was asked to lend for debt service reduction by providing new loans following a cash buyback of the debt on the secondary market. The plan also asked the IMF to stop its loan conditionality on third-party lenders' lending commitments. The Brady Plan has had only limited effects, especially on larger debtors, where it has reduced the face value of debt by only 4.7% to 18.8%. The 12% reduction in the case of Mexico was achieved through debt conversion into long-term maturity (30-year) bonds, covering face value with lower than initial debt interest rate, or lower (65%) face value with the same rate.

Notable success was registered only in small economies such as 47.1% reduction in Costa Rica, reaching 100% in Niger, which made debt cancellation a desirable target for most African countries. The supporters assert that full cancellation would enable African countries to tackle their social development challenges properly, and additional resources provided by the IFIs to support health and education programs should be conceived as public investment, not as new loans. It has been stated that the IMF and World Bank have ample resources to cancel all of the nearly \$18 billion of the Highly Indebted Poor Countries' (HIPCs') debt owed to them, without jeopardizing their normal operations or cutting further grants to HIPC countries. Cancellation of the multilateral debt would be financed through contributions by rich countries and the revaluation of the IMF gold stocks. As another example, Malawi, Mozambique, Tanzania, and Uganda, between the years 2000 and 2015, would require about \$72 billion in financing, but they will only be able to raise \$12 billion domestically and therefore will depend on external sources, requiring that they pay more than \$3 billion in debt service. This amounts to 25% of the total domestic resources available to spend in order to meet the Millennium Development Goals (MDGs).

Total debt cancellation for HIPCs would release resources to fight poverty, hunger, and disease, but even combined with existing grant schemes will still not be enough to cover HIPCs' needs to meet contemporary goals. Therefore, additional grants will be needed, because new concession—or market—loans are not feasible options as they would lead to high debt-to-GDP ratios.

Debt cancellation poses the threat of existing debt revaluation and appreciation and therefore needs

intergovernmental coordination. Otherwise the incentives or coercion of collective action taken by the lenders is jeopardized, as individually no bank would voluntarily take the initiative when the possibility of cashing in the remaining debt by less generous lenders increases.

Debt relief can also be attained by trading the debt in the secondary market, where if sold it would mean a market-based reduction. If the debtor or a third party buys back its debt at a lower market rate, it runs the risk that the remaining debt will be overvalued by the market and thus the gains from the buyout would be outweighed by the costs, as happened in the case of Bolivia in 1988. The country had received a \$34 million rescue pack to pay back most of its \$53 million in debt. As a consequence of this transaction, the remaining debt of \$19 million was overvalued by the capital market to \$43.4 million, amidst growing investor confidence, thus the proceeds ended up in a large-fund giveaway to creditors.

In order to increase reaction efficiency to debt crises, it is debated that sovereign debt restructuring should be made less disorderly and costly by ranking debt according to a precise system of priorities, like in the case of non-sovereign debtors. This requires legal reforms, reducing the economic disruption that accompanies sovereign debt restructuring without upsetting the balance between the rights of creditors and debtors, in order to enable the sovereign debt market to work.

As of 2004, the external financing environment of the developing countries has improved, due to the continuous global growth experienced in 2003. As a result, prices for key commodities rose in general, especially that of oil in 2004, and financial markets have recovered, while interest rates in the developed world have remained at historically low levels. As a consequence, private capital flows to developing countries increased to \$200 billion—their highest level in the last five years, but much of the developing world still has difficulty accessing the international capital markets, many exhausting their bond-issuing capacities as well. International investment in developing-country infrastructure has declined dramatically since the financial crises of the late 1990s, and with the exception of trade finance, private capital flows remain heavily concentrated in specific emerging economies and regions. Former communist countries are still in a difficult position due to their great indebtedness and unfinished structural adjustment processes. Though the most developed have become EU members, many CIS countries struggle to achieve a functioning market economy status.

## DEFORESTATION

An ever-increasing demand for timber and land has led to a rapid and steady decline in the world's forest reserves. Almost half of the forests that once covered the Earth some 8,000 years ago have been lost. Deforestation, or the permanent loss of expansive areas of natural forest, occurs from the large-scale logging, burning, or damaging of trees. The world's remaining forested areas are evenly distributed between boreal and temperate-zone forests covering North America; Europe; the Commonwealth of Independent States and Central China; and tropical forests of South America, Africa, and Southeast Asia. This total area is estimated to be 3.6 billion hectares. However, the remaining total forest area does not fully convey the true nature of the world's forests. This measure includes plantations as well as fragmented, degraded, and restored forests of reduced ecological value. The destruction and degradation of

natural forests have enormous impact on both the local and global environment.

## Causes of Deforestation

Historically, forests have been cleared for agriculture, but with increasing world population the impact on forest reserves is no longer negligible. Forests are a renewable resource, but they are finite and rapidly diminishing under present conditions. Forests are cleared for farming and pastureland and logged, often illegally, for timber. Government policies have often worked to encourage the clearing of large areas of forest. Across the globe, agricultural subsidies have promoted land conversion and intensive farming. In South America, countries such as Brazil have rewarded city dwellers with negative interest rates in return for clearing Amazonian forests for farming and large-scale cattle ranching. In the United States, timber companies are compensated for road construction, reducing the cost of tree harvesting. In Asia, forests are cleared to establish large plantations of cash crops such as rubber and oil palm.

Timber is a highly valued commodity on both local and global markets. The substantial demand for wood and other forest products for construction material, paper, fuel, pulp, and other industrial uses drives commercial logging. This industry has the ability to rapidly clear large areas of forest using chainsaws and heavy machinery. Roads are cut into the forest for access, fragmenting adjacent forest and compacting and eroding the topsoil, making regeneration of the ecosystem difficult. After commercial logging has finished, patches of cleared land and abandoned access roads facilitate the migration of local farmers further into previously closed forest.

Subsistence shifting cultivation as traditionally practiced by indigenous forest dwellers in tropical forests was once sustainable. Small areas of trees are cut down and their trunks burnt, the released organic matter adding nutrients to the soil. This process is known as slash and burn. Crops are grown on this cleared land until the area is no longer viable, usually between three and five years. Soils in tropical forests are poor and the nutrients are rapidly depleted when used for intensive crop cultivation. The farmers then move on and the area is left fallow to regenerate naturally. However, increasing population and economic demands combined with the opening up of forests by logging, encourage new colonists into the forests. The fallow rotations are shortened and the forests have less time to recover. As a result, replacement, or secondary, forest

ecosystems are of a degraded quality, usually with less species diversity.

Fire sparked by lightning or spread from plantations and farms can be a crucial agent of deforestation. Forests can become degraded when only commercially viable trees are removed by selective logging. Secondary forests, forests fragmented by logging operations, and areas affected by agricultural expansion are more susceptible to fires than virgin forests. Wide gaps in the forest canopy open these forests up and they become more susceptible to drought. Flammable leaf litter on the forest floor provides fuel for fires that easily spread out of control. One example of fire-related deforestation was seen in the forest fires of Indonesia in 1997, where it is estimated that up to three hundred thousand hectares of primarily secondary forest were lost.

Another factor contributing to global deforestation is the rapid expansion of urban areas, particularly in South America, Africa, and Asia. Forests are cleared for cities and highways and flooded by reservoirs to supply drinking water. In the developed world, much of the deforestation associated with urbanisation occurred in the nineteenth and early twentieth centuries. In temperate zones, there has been a net increase in forest cover in recent years as a result of reforestation programs. Today, much of the forest degradation in North America and Europe is due to air pollution. Fossil fuels are burnt for energy and the process releases toxic chemicals such as sulphur dioxide and nitrogen oxides into the atmosphere. These chemicals combine with water moisture in the air to produce acid rain. Exposure to acid rain has seen the destruction of 50–75% of Europe's remaining forests as trees die back in response. Regeneration of native species is prevented by the subsequent acidification of the soils.

## Environmental Effects of Deforestation

Forests perform a number of ecological functions that help keep Earth habitable. Forest ecosystems contain the richest diversity of plant and animal species on Earth. As well as wood, forests offer shelter, habitat for game, fruit, forage, dyes, barks for tanning, and ingredients for medicines. However, deforestation has caused the mass extinction of many forest plants and animals. Habitats are lost too rapidly for animals to migrate to other areas, even when suitable areas exist. Genetic diversity within species decreases as the breeding pool is reduced. Animals become more susceptible to disease and less able to adapt to ecosystem changes caused by fire or declining habitat quality.

Extinctions can also occur under extended pressure from reduced animal numbers. Plant species diversity is so rich in tropical rain forests that many species are being lost before being identified or studied by scientists. As plant diversity is reduced, the integrity of the internal forest structure becomes degraded. This may mean a great loss in potential medicines and cures. Ultimately, such a forest is unsustainable, as it is vulnerable to diseases, pests, and fire.

Forests protect the topsoil, sheltering it from the effects of sun, rain, and wind. When exposed to direct sunlight, tropical soils become sterile. Without the tree roots to bind the particles together into a solid soil structure, individual particles are easily eroded by wind and rain. Without the protection of the forest canopy, intense rainfall can cause flash flooding and landslides in large cleared areas. The topsoil consists of nutrients and organic matter, and in tropical soils this surface layer is shallow. Once removed, natural regeneration of vegetation and crop cultivation is almost impossible. Deterioration of tropical soils in particular is in many respects irreversible.

Forests cleared for modern agriculture or cattle ranching are often impossible to regenerate. Intensive farming rapidly depletes the soil of nutrients, leaving it infertile. Intensive grazing rapidly weakens the soil, particularly tropical soils ill-suited to pastureland. The hooves of livestock crush the unprotected soil, reducing it to a fine dust that is easily eroded. This process is called desertification. Without a fertile, solid soil structure, natural forests cannot regenerate.

Forests influence local and global climates through the regulation of water supplies. Trees collect, store, filter, and recirculate water from the land to the atmosphere through *evapotranspiration*. Water moisture is released from the leaves in the transpiration phase of this process, increasing the humidity in forest areas and influencing local rainfall. Different trees transpire at different rates, requiring varying amounts of water. Native Australian Eucalyptus trees depend on groundwater stored in the soil for their survival. As large areas of forest have been cleared, groundwater levels have risen because of the reduction in water demand. Minerals and salts naturally contained deep in Australian soils have dissolved in the groundwater as it has risen and salinity is now increasingly affecting agricultural land, rendering it infertile. Conversely, Eucalyptus trees were planted in areas of India as part of a reforestation program. These areas have experienced a rapid draining of the groundwater due to the high water requirements of this species.

Globally, forests significantly reduce the Earth's temperature by reflecting incoming solar radiation. In addition, the burning of forests releases carbon

## DEFORESTATION

dioxide into the atmosphere. It is estimated that deforestation contributes 20–30% of carbon dioxide released into the atmosphere each year. Trees absorb carbon dioxide from the air and are considered to be carbon sinks. With the reduction in global forest reserves, less carbon dioxide can be absorbed. Potentially, the net effect of these processes is a significant increase in global warming and climate change.

### Movements to Counter Deforestation

Forests have aesthetic, recreational, spiritual, and intrinsic value and provide a home for many forest dwellers. The past several decades have seen many groups and organisations form, locally and globally, to oppose the ongoing destruction of forests. Non-governmental organisations such as Greenpeace, the World Wildlife Fund, and the Wilderness Society campaign to halt deforestation. These groups lobby governments to change legislation to protect more virgin forests and increase the use of plantation wood. They work to educate the public about the environmental effects of deforestation. They work with scientists and government agencies to improve understanding of forest functions, implement reforestation programs, and conserve old-growth and other endangered forests.

Other groups organise protests to physically halt the logging of trees. One example is the Chipko Movement. Created in 1973 in India to oppose deforestation of the Indian Himalayas and the devastating floods and landslides experienced as a result, local villagers protested by embracing trees to protect them from the saw. The word “Chipko” means “to hug.” A hunger strike in 1980 achieved a moratorium on the felling of green trees in the area. Importantly, this movement has had much success in their afforestation programs, achieving a sapling survival rate of up to 85% compared to the rate of 10–15% for government plantations.

Deforestation was formally recognised as an issue of international concern in 1992 at the United Nations Conference on Environment and Development in Brazil. The Convention on Biological Diversity and the Framework Convention on Climate Change were opened for signature at this conference. These two treaties recognise the importance of forests to the global environment. In 1990, the International Timber Organisation (ITTO) defined the criteria and indicators necessary to manage forests sustainably. Members are both timber-producing and -consuming countries. The ITTO set the goal

that all forest products are to come from sustainably managed forests by the year 2000. Whilst not fully achieved by 2000, the organisation has made considerable progress toward it. The Forest Stewardship Council is one nonprofit organisation that uses an internationally recognisable trademark so consumers can identify these products.

### The Economic and Political Debate

Collectively, countries in the developing world have amassed a foreign debt in excess of US\$1.3 trillion. The five countries containing the largest rainforest areas in the world are also those most heavily in debt. In order to finance debt repayments, developing countries cut and clear large areas of forests. In many cases, the money was originally borrowed from developed countries to finance environmentally destructive projects that can then only be repaid through further resource exploitation. The most productive land is devoted to earning export income through cash crops. Local subsistence farmers are forced onto marginal lands and into a cycle of land degradation and poverty.

In addition to international programs encouraging the sustainable management and trade of forest, there has also been recognition of the economic pressure on developing countries to log their remaining forests. The Kyoto Protocol to the United Nations Convention on Climate Change, in 1997, established the concept of emissions trading. Carbon credits may be allocated to carbon sinks such as plantations, reforestation of cleared forests, and afforestation of areas where forests have never existed. This may allow developed countries to continue emitting carbon dioxide by purchasing carbon credits from countries with significant remaining forests. This will provide an economic incentive for developing countries to protect their forest resources. As yet, there is much debate as to the definition and measurement of carbon sinks and the details of a potential trading system are yet to be established.

Unless there is significant public demand for change, governments have no real incentive to implement long-term policies for forest preservation and protection. The short-term monetary benefits and job generation from the timber industry provide economic incentive for many governments to continue sanctioning forest clearing. Until the environmental impacts are factored into the cost of timber and other forest products or demand decreases, unsustainable forest clearing will continue.

## DEMOCRATIZATION

The spread of, or transition to, democracy, or democratization, has been a seemingly unstoppable phenomenon, especially in the post-Cold War era. Many less developed and most former communist nations have been moving away from either right-wing authoritarian or left-wing totalitarian political regimes and moving toward embracing some form or degree of democracy, albeit at different speeds and under varying conditions. For instance, military dictatorships in Latin America have been replaced by elected civilian officials. Communism continues to be in retreat throughout most of Eastern Europe and the former Soviet Union. Many Caribbean and Pacific

Ocean nations have increased political freedom and civil liberties almost to the extent of the more developed nations. Some Arab and Islamic nations in North Africa, the Middle East, and Asia have begun to open and make more transparent their political systems. In addition, women have made some steps toward more political equality. Many African nations have moved away from military domination toward some semblance of civilian control over their polities. By and large, ethnic strife has diminished. Hence, democracy can be witnessed as the preferred form of government throughout most parts of the world regardless of national boundaries, levels of development, or cultures. The theoretical acceptance of democracy on a universal basis appears to be translated increasingly, although unevenly, into practice throughout the world.

Conceptual, theoretical, methodological, and practical issues surrounding democracy and democratization are ubiquitous throughout the social sciences. These issues are related to or intertwined with a litany of other concepts and practices: accountability, representativeness, legitimacy, independence, development, modernization, colonialism, imperialism, dependency, self-determination, civilization, civic and political culture, people empowerment, grassroots participation, localization, globalization, constitutional framework, individual rights, governmental restraints, regime type, party system, human rights, economic reform, ethnic conflict, militarism, terrorism, dictatorship, repression, statism, policy orientation, capitalism, liberalization, nationalism, regionalism, globalization, gender, race, and class, among others.

### Definition and Dimensions

The complexities and controversies involving democracy and democratization reflect the lack of intellectual or academic agreement as to their specific meanings. There is a general consensus, though, that democratization is a relative process leading to either a conditional or permanent state of democracy, thereby implying some goal or leading to some end point within or across societies. As such, democratization usually entails the incremental aggregation, articulation, and dissemination of democratic norms, rules, regimes, values, interests, institutions, processes, practices, and expectations in a society, regardless of national or cultural boundaries in the world. Furthermore, the amount of democracy necessary for a nation to be considered democratic is open to differing standards. In addition, the preference for a particular

type of democracy (for example, liberal, communitarian, social, popular, or majoritarian) varies according to divergent, even contending, value systems and ideological perspectives. Thus, there is no universally accepted ideal or typical model of democracy existing in the theoretical world of ideas. And, there is no unanimity as to the best empirical referents or examples that should be emulated by those societies wanting to democratize their polities within the perceptual world of the senses.

A liberal form or conception of democratization appears, however, to be the most widely accepted ideal throughout many parts of the world. At its core is the value of individual freedom and is the type of democracy preferred by more economically and politically developed nations, as well as by universities, organizations, and think-tanks based primarily within them. As such, liberal democratization is a process leading toward greater political freedom for more individuals in a society. A liberal political system might typically possess, at the minimum, an authoritative constitution, a legitimate state apparatus, limited governmental power, the promotion and protection of individual civil liberties and political rights, free and competitive elections with voting rights and multiple political parties, an open legislative process, and an independent judicial system. Although liberal democratization supports, in theory, a "one-person, one-vote" conception implying political equality, the latter is seldom a realistic goal in practice for any nation, regardless of the level of development. This is because an increase in political freedom does not always correspond with or generate an equal increase in political participation, especially among the majority of the masses who appear to be less informed, more apathetic, and very inconsistent when it comes even to voting in elections.

Democratization as a change-oriented process is related to other terms implying democratic movements: diffusions, transitions, consolidations, and, sometimes, revolutions. These movements can be reduced to two main empirical dimensions: (1) more extensive democratic growth or expansion across nations, and (2) more intensive democratic development or consolidation within nations. The first dimension has been more relevant for many developing and post-communist nations with little, if any, democratic experience. The second dimension has been more applicable to modern or more fully developed nations with some democratic tradition. The telescope versus microscope analogy might be a useful way in which to analyze these dimensions of democratization and democracy over time and space.

For certain, democratization has been an uneven developmental process, historically, implying waves

of expansion and contraction. Empirical research has produced contradictory results in assessing the causes, concomitants, and consequences of democracy. "Democratic deficits," "low-intensity democracy," lack of consolidation, and democratic reversals, all suggest that democratization is essentially a rather ambiguous and unpredictable phenomenon in a world of many nation-states, subnational and transnational regional organizations, and international institutions with varying ideological orientations and policy agendas.

### **Causes and Preconditions**

The causes of democratic transition, along with the necessary or sufficient preconditions to promote democratization, have been theorized and often supported by empirical research as being generic for all nations (that is, free-market capitalism, higher levels of economic development, growing wealth, a growing middle class with improved living standards, earlier date of independence, the existence of liberal cultural values, a Protestant religious orientation, and historical experiences including lessened political instability and violence, and civilian control over the military). Some studies have produced, however, evidence that indicates that the primary cause for democracy is specifically unique to each nation. And, that there is no guarantee that either national or global capitalism will, automatically or even eventually, produce a liberal society with an open, tolerant, and democratic political system in each and every nation, especially in the Third World.

### **Problems of Democratization**

Although the triumph of liberal capitalism over communism has apparently spurred democratization within and across these nations, evidence suggests that certain weaknesses in, and dilemmas confronting, contemporary democracy exist for many nations. That is, most of these democratizing nations possess relatively weak democratic institutions with very little democratic experience and stability. No doubt, democratic consolidation is a very complex and arduous task unless economic prosperity continues, ethnic conflict remains tempered, and interstate war is diverted. In addition, further democratization in the more developed nations does not appear to be forthcoming. In most instances, both the extension and the intensity of democracy in these nations have

come to a virtual standstill, if not eroded to some degree due to internal security problems, the failure of earlier political reforms, and, possibly, because the limits of liberal or procedural democracy may have been reached with what appears to be growing apathy and decreasing activism by citizens.

## Political Development

Political development is sometimes implied by democratization, a process of political change and, more explicitly, as the final part of the change process, namely democracy. Barrington Moore described and explained how a mode of production, when combined with unique historical experiences, could conceivably produce different modes of societal development, thereby determining social structure, political organization, and some forms of political behavior across societies. Therefore, economic and social development determines, in large measure, the degree and type of political development existing within societies. Seymour Martin Lipset suggested that economic wealth and political legitimacy would lead to democracy as a form of political development. Kenneth Bollen's quantitative analyses confirmed the hypothesis linking higher levels of economic development to democracy. O'Donnell found evidence to the contrary, such that higher levels of modernization, identified with liberalization and capitalism, tended to coincide with different types of authoritarianism in Latin America. He labeled this as "delayed dependent-development." Overall, contention revolves around defining which and at what levels nations should be considered politically developed, regardless of context.

## Concomitants and Consequences

Democratization as a form of political development is typically thought to bring forth a number of beneficial aspects to the citizens of a society. Democratization points to increased political participation, eventually leading to greater popular control, sovereignty, and self-determination. Democratization is also thought to possess important materialistic or utilitarian advantages via government social policies covering a larger number of citizens. Government benefits as well when it is legitimized by popular voting. Then, too, there are psychological benefits for the average citizen who feels more politically empowered through increased opportunities to participate in election and

legislative processes. It has also been suggested that democratization reduces class struggle and ethnic conflict, and may have a dampening effect on political violence and war. It may reflect the power of a larger and growing middle class exhibiting a higher quality of life. All in all, democratization is thought to lead to more personal freedom, psychological and material well-being, and peaceful relations.

## Democratization and Globalization

Over the course of centuries, democratic theory and theorists have taken the nation-state apparatus as an essential or generic given, assuming that democracies can only be understood within a heuristic framework of societal actors and forces that are defined, objectified, and restrained by land-based territorial boundaries. This assumption has been questioned by both proponents and opponents of liberal economic development, historically, and of capitalist globalization, currently. Today, any discussion on issues associated with democracy and democratization involves global economic concerns. More specifically, the nature of the relationship between democracy or democratization and economic liberalization or capitalism is open to discourse and research. The major research question confronting scholars here is: How and why do some societies make the transition away from autocracy, authoritarianism, or totalitarianism to democracy, or become more democratic through some democratization process? Underlying this question is an ideological contention among first those theorists who assert that both domestic and global capitalism produce greater democratization and second those theorists who postulate the opposite effect including authoritarianism, and third those theorists to be found somewhere in the middle, emphasizing low-level democracy or even reversing the direction of the causal relationship, from democratization to globalization.

## Clash of Civilizations

With the reunification of Germany, the freeing of Eastern Europe, and the dismantling of the Soviet Union, Samuel Huntington describes the "third wave" (that is, 1970–1990 and beyond) of democratization in the world during the late twentieth century. He defines a democratization wave as a group of highly diverse and ultra-complex transitions from non-democratic to democratic polities and regimes occurring within certain temporal and spatial parameters.

This wave is thought to be more dominant, both quantitatively and qualitatively, than transitions to non-democratic regimes and polities during the same time frame. His argument is that, although the first two waves (that is, 1828–1926 and 1943–1962) produced some reverse waves in which some regimes and polities digressed back to non-democratic practices, the third wave of democratization is likely to be different because of the intellectual influence of neoliberal ideas and the dynamic power of global capitalism. Such a bold prediction can be made due to the fact that these liberal capitalist causes or concomitants of democratization currently have very few, if any, challengers since fascism and communism have been defeated and are no longer viable threats to liberal democracy in the twenty-first century. In a later work, Huntington (1993) speculates about the increased probability for a “clash of civilization,” with world politics entering into a new phase where cultural differences will be the primary sources of international conflict, as was the case during the Crusades. According to Huntington, civilizations are differentiated from each other on the basis of culture including history, religion, language, and tradition. He posits that the new cleavages for conflict will be in the Middle East, the Balkans, and Central Asia because modern Western or Northern ideas and forces (for example, rationalism, secularism, materialism, capitalism, liberalism, and democracy) and traditional cultures or religions (for example, Islam and Confucianism) pointedly and rigidly intersect without much understanding and compromise, thus leading to competition and conflict.

### End of History

Francis Fukuyama posits the thesis that history and its internal spirit, represented by the long evolution of human endeavor with all its impediments, end with the creation of democracy as the final resting place for humankind. Modernization and modernity have reached their climatic zenith or finish with democracy as the essential part of the new human condition. Fukuyama goes on to establish a view that the triumph of liberal-capitalist democracy on a global level fulfills the human struggle or striving for a universal rational order. The end of the quest changes, once and for all, a substantial part of the human condition, possibly reducing many human afflictions, removing humans from the scourge of history and transmitting them to their future destiny within a single world, guided by a singular logic—global liberal capitalism.

### DENG XIAOPING

Deng Xiaoping (1904–1997) assumed leadership of the People’s Republic of China following the momentous Third Plenum of the Eleventh Central Committee of the Chinese Communist Party (CCP) in December 1978. He was the chief proponent of the policy of openness and reform (*gaige kaifang*) that stimulated rapid economic growth and social development in China throughout the 1980s and early

1990s. Until his death in 1997, Deng continued successfully to promote Chinese economic development, while at the same time preserving the political predominance of the CCP in the face of major challenges to its authority.

Born in the village of Paifang, Guang'an County, Sichuan Province, China, on August 22, 1904, Deng rose through the ranks of the CCP during the course of a lengthy career of dedicated service to the Communist cause. His involvement in revolutionary politics began in the early 1920s when he became a leading member of the Communist Youth League while studying in France under a work-study program sponsored by the French government. In 1926, he relocated to Moscow where he studied for a year at Eastern University, newly established by the Third Communist International (Comintern).

Following his return to China in 1927, Deng served in the upper ranks of the CCP in the aftermath of the "April Massacre," when the Party's united front with the Guomindang (Nationalist Party) led by Chiang Kai-shek was brought to an abrupt and violent end following the reunification of China in the Northern Expedition. In July 1931, Deng was dispatched to the Jiangxi Province where Mao Zedong and other members of the Communist leadership had established a rural soviet. During the Party's narrow escape from Guomindang forces in the "Long March" of 1934–1935, he became one of Mao's most competent and trusted advisors, serving in the top leadership of the CCP as it built a new base of power in the remote village of Yanan in Shaanxi Province.

During most of World War II, Deng served as political commissar for the 129th division of the Eighth Route Army during its heroic struggle against the Japanese occupation of northern China. In the CCP–Guomindang civil war that followed (1946–1949), he continued as a top political commissar in the People's Liberation Army and achieved great renown for his outstanding successes in defeating Chiang Kai-shek's Nationalist forces in northern China. In the years immediately following the establishment of the People's Republic of China in 1949, Deng led the Southwest China Bureau that consolidated Communist control over Sichuan and surrounding regions.

Transferred to the central government at Beijing in 1952, Deng assumed a number of official titles before rising to the eminent rank of general secretary of the Politburo in 1956. Following the disastrous Great Leap Forward (1958–1960) and Mao Zedong's subsequent retirement from the frontline leadership, Deng and Liu Shaoqi emerged as China's top officials. Throughout the early 1960s, these two

men strove with considerable success to restore the country's agricultural and industrial economies.

Mao's great displeasure with the "right opportunist line" of the CCP under the leadership of Deng and Liu prompted him to initiate the Great Proletarian Cultural Revolution in 1966. Banished from the capital by Mao's radical supporters in October 1969, Deng resided in Jiangxi Province until February 1973, when a series of bizarre shifts in Cultural Revolution politics led Mao to recommend his political rehabilitation. His return to the central leadership did not last long, however, and in April 1976, he once again ran afoul of the radicals and was forced from his position. But following the death of Mao in September 1976, and the subsequent arrest of Mao's wife, Jiang Qing, and the other extreme leftists that comprised the notorious "Gang of Four," he was welcomed once more into the ranks of the central leadership.

Following the Third Plenum of the Eleventh Central Committee of the CCP in December 1978, Deng emerged as the most powerful leader in the Communist hierarchy and moved quickly to bring reform-minded supporters such as Hu Yaobang and Zhao Ziyang into the ruling Politburo. Adopting the slogan "practice is the sole criterion of truth," Deng condemned the leftist radicalism of the Cultural Revolution and vigorously promoted the "Four Modernizations" in the areas of agriculture, industry, national defense, and science and technology.

Among the earliest innovations associated with the Four Modernizations was the establishment of "key universities" to train a new generation of scientists and technicians. In the countryside, peasants were permitted to engage in formerly forbidden "side-occupations," which included a wide range of private initiatives in growing, processing, and marketing agricultural commodities. The managers of state industries were allowed greater flexibility in rewarding individual productivity among their workers and in determining output on the basis of market considerations. In general, throughout China private incentives and market forces were allowed to function more freely as a stimulus to social and economic development.

Attention was also directed toward political reform, and major efforts were undertaken to combine "centralism" with "people's democracy," thus broadening the base of decision making within the ranks of the CCP. Measures were also taken to ensure judicial organizations greater independence and to reinforce the principle of equality of all people before the law. These political reforms and new legal protections did not, however, extend as far as many had hoped. Deng's harsh suppression of the Democracy Wall

movement in early 1979 following publicly posted appeals for a “fifth modernization,” or democracy, clearly demonstrated the limits of political change. While new freedoms would be allowed in the sphere of economic development, the Party led by Deng would tolerate no challenge to its political supremacy.

Throughout the 1980s, Deng’s policy of *gaige kaifang*, or “reform and openness,” was progressively expanded as new programs were implemented to stimulate growth in agriculture and industry. To promote foreign investment and develop China’s export industries, four “special economic zones” were created near major coastal cities. These zones served as the incubation quarters for a variety of new joint enterprises with foreign corporations. Improved political relations with Japan and the United States at this time opened the markets of these countries to Chinese goods, creating a favorable balance of trade and encouraging a greater flow of capital into China.

Unfortunately, the phenomenal economic growth of China in the 1980s also generated some negative consequences, such as high inflation, unemployment, and increased corruption among government officials. The hardships and uncertainty of the new economy, combined with a lack of democratic reform by the Communist government, led university students to take to the streets in protest, culminating in the tragic Tiananmen Square incident in the summer of 1989. Deng’s ruthless suppression of the mass demonstrations at Tiananmen effectively squashed political dissent and reasserted the authority of the CCP at a time when the Communist governments of the Soviet Union and Eastern Europe were rapidly collapsing.

Until his death in Beijing on February 19, 1997, Deng continued to promote modernization and economic expansion in China while handing the reins of political power over to a new generation of technocratic leadership represented by such men as Jiang Zemin (President, 1993–2004) and Zhu Rongji (Premier, 1998–2004). And while the CCP struggles to redefine its evolving ideology with slogans such as “socialism with Chinese characteristics,” the rapid emergence of China as an economic superpower in the 1990s provides abundant testimony to the effectiveness of Deng Xiaoping’s pragmatic, albeit authoritarian, political leadership.

## DESERTIFICATION

Desertification is the spread of desert-like conditions into previously nondesert areas. The process invariably impoverishes the terrestrial ecosystem and degrades the biological productivity of the soil, limiting its ability to support crops and livestock. Since the early 1970s, when the phenomenon gained attention in academic and public discourse, several other terms, including desertization, aridification, aridization, sahelization, and desert encroachment, have been proposed as substitutes for desertification. However, the latter has been much more utilized than any of its contenders over the years (Grainger 1990). Desertification is a broad concept, characterized by the degradation of soil and vegetation. It is neither drought nor soil erosion nor vegetation degradation, per se; it involves some combination of all these and much more (Verstraete 1986).

Deserts are situated in subtropical zones, mainly between latitudes 15° and 30° north and south of the equator, where the global wind circulation system limits rain-producing convection. While the places that are mostly affected are the desert margins, it is important to stress that, contrary to popular belief, the process can occur in any dryland area. Furthermore, desertification is not the desert expansion of popular imagination, for it does not proceed with a smooth, broad frontline; rather it develops like a subtle, insidious, patchy “rash,” and usually occurs far away from the desert fringes. However, as the random collection of desertified land grows and links up, it can eventually join with deserts, with the final result looking as though the desert itself had expanded.

Desertification is a primordial problem, but was brought into sharp public focus by the severe drought and famine that afflicted the Sahel region of Africa between 1968 and 1972. The Sahel is the semiarid

region lying just south of the Sahara. The drought resulted in about 250,000 human deaths, loss of millions of livestock, and the exodus of millions of people. This tragedy prompted the United Nations to organize a "Conference on the Human Environment" in Stockholm in 1972, culminating in the formation of the Committee for Drought Control in the Sahel; the Sahel Club; and the United Nations Saharo-Sahelian Office to coordinate combating strategies and aid to the drought-stricken countries. When the Sahelian drought reoccurred in 1975, the UN Conference on Desertification (UNCOD) was organized in Nairobi, Kenya, to explore ways to alleviate desertification. The United Nations Environment Programme (UNEP) was founded in Nairobi to implement UNCOD's Programme of Activities to Combat Desertification (PACD).

Against this backdrop the available literature asserts that desertification is routinely associated with drought, famine, and underdevelopment. While the impact of desertification is far more dramatic in developing countries, the phenomenon is not limited to them; the infamous Dust Bowl that swept across the Great Plains of the United States during the 1930s attests to this. Today, the regions facing intense desertification are those along the fringes of existing deserts, especially countries bordering the southern margins of the Sahara Desert, where the rate of encroachment is estimated at seven kilometers per annum. Other prime regions flank the Gobi in China, Thar in India and Pakistan, and the Atacama Desert in the South American countries of Chile and Peru. Other specific countries that are affected by desertification include Mali, Niger, Sudan, Ethiopia, Somalia, Mauritania, Algeria, Iraq, Jordan, Lebanon, India, Pakistan, Afghanistan, China, Australia, and the United States. Estimates of the global landmass impacted by desertification range from 20 million to 32 million square kilometers; some seventy thousand square kilometers of land (an area the size of Ireland) is desertified each year.

### Causes and Consequences

The causes of desertification are still in dispute. The relative importance of human activities vis-à-vis drought or climate change to the spread of desert-like conditions is still a matter of debate, mainly because of the acute lack of reliable scientific data on the phenomenon. Whereas some attribute desertification to short-term periods of intense drought, others believe it is caused by long-term climate change toward aridity. Some trace the phenomenon solely

to human activities, while others see it as a result of an intricate combination of poor land use and climate change. Presently, the favoured explanation among many scientists accords the causal primacy to human activities, with drought (or climate change) acting as a catalyst; thus, desertification can occur with or without drought, but it proceeds faster in the presence of drought (Grainger 1990).

Desertification is epitomized by the degradation of vegetation and soil, both of which are attributable to poor land use through processes such as overgrazing, overcultivation, deforestation, and poor irrigation. Even under the best of circumstances, cropping puts intense pressure on the land, as it normally requires the clearance of vegetation and the tilling of soil. With extensive fallow periods and innovative agricultural practices (such as, the use of mulches, manures, and fertilizers), soil capability is sustained over a protracted period. However, where overcropping is somehow necessitated by severe population pressure and a dire struggle for survival on marginal lands, soil degradation becomes inevitable.

Overgrazing is yet another practice that reduces the productive capacity of soil, as it exposes the land to climatic elements and ruins soil through intense stumping and trampling by livestock. As grazing animals pack the earth down with their hooves, it creates soil compaction, which, in turn, blocks the natural seepage of air and water through the soil. Under such circumstances, grass and other vegetation may be too disrupted to even reseed themselves. The eventual loss of vegetative cover renders the soil susceptible to erosion.

Trees play a crucial protective role in the dryland ecosystem, and their removal for timber and fuel supply increases the soil's vulnerability. However, the vast majority of people across the developing world still depend on wood as their main source of household fuel. In African countries such as Mali, Burkina Faso, and Chad, fuelwood accounts for more than 75% of the total national energy consumption. Traditionally, fuelwood has been gathered from dead wood, but due to population pressure, many people are resorting to the wholesale cutting of trees for fuelwood. In places such as India, Pakistan, and Bangladesh, the shortage of fuelwood has forced many to rely on animal dung for fuel. But this is also robbing the farmlands of nutrients and organic matter.

Undoubtedly, one of the most resourceful mechanisms for cropping in drylands is irrigation. Not surprisingly, many governments and development organizations have supported irrigation schemes over the years. However, soil salinization resulting from the poor management of irrigation projects has led to waterlogging and the formation of salt crust on

dryland surfaces in many countries in Southwest Asia, the Middle East, and North Africa. Recently, human activities such as industrial mining; uncontrolled tourism; and military actions, including troop manoeuvres, testing of nuclear and strategic weaponry, and the use of biological and chemical weapons, have all been implicated in desertification (Babaev 1999).

While poor land practices such as overgrazing, overcultivation, and deforestation are the main culprits for desertification in the developing world, it is important to stress that these variables are intricately interwoven with the quintessential problems of mass poverty, economic deprivation, illiteracy, population pressure, and misguided government policies. To increase the production of cash crops in the face of severe population pressure, marginal lands are routinely brought under cultivation in many developing countries, with little regard to their carrying capacity. Several governments in the developing world are also supporting agricultural practices that replace sustainable traditional farming systems with cash-crop production under ill-conceived plantation and mechanization schemes.

A crucial factor in the dynamics of desertification in the developing world is population pressure. High population densities have put enormous stress on farmlands, and extended cropping into unsustainable arid and semi-arid environments in places such as Pakistan, Bangladesh, Somalia, and Ethiopia. Yet, from the standpoint of many people in these countries, large families make splendid economic sense, as children are usually the prime source of farm labour and sometimes the only social security against old age and sickness. Indeed, high population, like desertification, is not only a result of underdevelopment, but also a potent explanatory variable of underdevelopment.

Desertification is a serious ecological hazard. Large parts of the dry areas of the world are being degraded, with serious consequences for the well-being of millions of people. While desertification anywhere has global repercussions, the human impact is by far the most damaging in and around drylands. Desertification is essentially a human problem, in the sense that both the main causes and effects are linked to humans. The most dramatic consequences of desertification are manifested in the economic hardships, land abandonment, famines, diseases, refugee crises, and premature deaths that are so common in the developing world. Apart from the physical hardships engendered by desertification, the process puts mammoth emotional stress on its victims. Those who are hard hit experience a deep sense of hopelessness, uncertainty, and apathy, stemming from

the customary loss of control and social status associated with the phenomenon.

### Combating Desertification

Over the years, several countries have embarked on programs to control desertification. In the Negev Desert of Israel, for instance, a desert reclamation program of tree planting and “drip or trickle irrigation,” involving the use of perforated plastic pipes to drip water into the soil directly, have been in place for years now. Similarly, in the United States an expensive system of subsurface irrigation, using perforated plastic, has been deployed extensively in California’s Imperial Valley. In both cases, the plastic acts as mulch to reduce evaporation, while the perforated holes drip precise amounts of water and fertilizer directly on plants to economise water and to alleviate salinization. Also, in the Australian arid outback, windbreaks of drought-resistant trees have been planted to slow the spread of desert. While some of these reclamation programs have been successful, others, especially in the developing world, have failed. For instance, China’s attempt to plant grasses and trees along the fringes of the Takla Makan and Gobi deserts proved a fiasco; so did efforts by African countries such as Algeria, Mauritania, and Mali to develop greenbelts along the Sahara. Libya’s attempt to halt the spread of sand dunes by spraying oil on them failed as well.

Limited financial resources and the lack of expertise and reliable data on desertification are among the key problems militating against desert reclamation programs worldwide. Remote sensing techniques such as satellite imagery and aerial photography are well-positioned to assist in this area. With the appropriate expertise and logistics, such tools can help monitor drylands to provide early warnings on the spread of desert-like conditions. The poor land practices that foster desertification are mediated by several socioeconomic factors, such as poverty and population pressure. Consequently, measures to combat desertification must not focus solely on technical, agricultural, environmental, and engineering approaches alone, but must also address the socioeconomic and cultural dimensions of the phenomenon. Moreover, because most of the farmers who till marginal lands tend to be poor, they usually have little or no choice but to make their living from such lands. Therefore, in addition to improving the agricultural practices of these farmers, combating policies should also include measures that favour low-income farmers.

More specifically, programs should be initiated to encourage the development and eventual substitution of other energy sources such as natural gas, electricity, and solar energy for fuelwood. Moreover, effort must be made to increase the productivity of rain-fed cropping on good land so as to limit the infiltration of farms into marginal lands. Tree planting and environmentally sound irrigation methods should be encouraged to restore the vegetative cover and to alleviate salinization, respectively. There is also the need to develop indigenous science and technology to monitor the spread of desert-like conditions in drylands. Finally, authorities need to expand local awareness of desertification and the skill with which to combat the phenomenon through mass educational campaigns. All the combating measures need to be contextual and flexible enough to encompass a wide range of local situations, as the affected areas vary in their environmental and socioeconomic settings. Desertification may be reversible, but the possibility and the speed of recovery will ultimately depend on the stage of deterioration reached, the regenerative power of the ecosystem, and the support of the local people.

### DE-STALINIZATION (1953–1956)

De-Stalinization is the term commonly applied to the hesitant efforts by J. V. Stalin’s successors in the Soviet Union, and their counterparts in some other Communist states, to dissociate themselves from the tyrannical aspects of Stalin’s rule after his death on March 5, 1953. They began by de-emphasizing Stalin’s much-acclaimed achievements and silently abandoning the previous practice of citing his writings as authoritative in virtually every context. What was called the “cult of the individual” (sometimes translated as “cult of personality”) was repudiated in favour of “collective leadership” by members of the party Presidium. Paradoxically, the widely feared security chief, Lavrentii Beria, led the way in introducing reforms. These included an amnesty for criminal offenders and an exoneration of the eminent physicians who, in January 1953, had been charged with conspiring to kill party and government leaders (“doctors’ plot”). A cautious start was made on releasing and rehabilitating prominent political prisoners, among them the wife of Foreign Affairs Minister Viacheslav M. Molotov. In foreign policy a “new course” was proclaimed that involved removing minor irritants to diplomatic relations with the Western powers and furthering an armistice to end the Korean War. In a symbolic gesture the Kremlin was opened to tourists. In affairs, Beria signaled a readiness to appoint non-Russians to leading posts, while Georgii M. Malenkov, as chairman of the Council of Ministers, hinted at greater solicitude toward consumers’ needs.

These “liberal”-looking policies were unwelcome to Nikita Khrushchev, who had taken control of the party machinery. In June 1953, he staged a dramatic confrontation with Beria, who was arrested at a party Presidium meeting and subsequently (December 1953) shot, along with six other senior

security officials, after Stalinist-style pseudo-judicial proceedings. The party leader then consolidated his power by charging Malenkov with “errors” in agricultural policy (February 1955) and forcing him to yield his post as head of government to a Khrushchev associate, Nikolai A. Bulganin. Some months later Molotov was publicly humiliated by being made to acknowledge an ideological transgression.

In foreign and defense policy Khrushchev took a “hawkish” line that appealed to the military lobby. This implied priority for heavy industry, especially armaments, at the expense of consumer goods. But, simultaneously, Khrushchev pushed forward major reforms in agriculture. Collective farmers were paid higher prices for the produce they delivered and had their obligatory quotas reduced. However, restrictions on household plots were maintained, since they were seen as reprehensible islands of “bourgeois” individualism in a collectivist society. Rural residents gained less than workers or state employees from introduction of a minimum wage (1956) and improved pensions. Urban dwellers, whose share of the population was rising fast, earned higher incomes and benefited from a more balanced diet and better social services (education, health), as well as a boom in housing construction. Even so, Soviet living standards still lagged behind those in Eastern, let alone Western, Europe and the lot of working women with families was particularly harsh.

By 1956, a secret investigation had disclosed the massive scale of repression under Stalin. The information may have genuinely shocked Khrushchev; in any case he realized that a limited publicizing of the record would discredit those of his associates more deeply implicated in these crimes than he had been. On February 24–25, 1956, at a restricted session of the twentieth party congress, he revealed selective evidence of Stalin’s misdeeds: the torture and murder of countless innocent citizens, his failings as war leader, and his fraudulent claims to ideological correctness and scientific expertise. Khrushchev’s report made a tremendous impact on his listeners, many of whom were privately glad that the guilt was conveniently placed on the deceased leader, leaving them free to function much as before; Khrushchev explicitly denied that Leninist single-party rule was at fault and called on the faithful, not to examine their consciences, but to work even harder at “building communism.”

This was to overestimate people’s gullibility. The disclosures shattered the party’s moral authority and exposed it to challenges at home and abroad. Within the USSR expressions of discontent could be quelled easily, but in some satellite countries, where

Communist power was shakier, the ruling parties faced open resistance. In October 1956, when Polish Communists installed a new leadership under the moderate Wladyslaw Gomulka, who had been persecuted under Stalin, Moscow reluctantly concurred with the change. In Hungary, revolution broke out. Soviet forces were withdrawn only to return in force a few days later: the reformist leader Imre Nagy was seized and later killed; there were twenty-one thousand casualties and ten times as many Hungarians fled to freedom. Westerners who had deemed communism “progressive” were disillusioned. De-Stalinization also widened the breach between the USSR and the Chinese People’s Republic, where Mao Zedong—a dictator cast in a Stalinist mold—objected to what he saw as Khrushchev’s naiveté and treachery.

The Soviet leader was temporarily forced on the defensive but rebounded in early 1957, having secured support for his reformist course among party cadres. This proved decisive in defeating a plot by his colleagues to depose him (June). The members of this so-called anti-party group were demoted but not physically liquidated in Stalinist style, for the political climate had become more civilized. This was Khrushchev’s achievement. He reformed the judicial system and largely dismantled the vast network of forced-labor camps and settlements (gulags): by January 1959, the number of inmates stood at less than 1 million, as against more than 5 million six years earlier. Those released received minimal compensation for their sufferings and could not mention them publicly; yet in human terms this was the most significant result of de-Stalinization.

## DEVELOPMENT HISTORY AND THEORY

### The Idea of Development

From prior to the time of recorded history to well into the Common Era (CE), ideas of development and progress did not play a salient role in peoples' lives. For the many generations of humans who lived as hunter-gathers, for instance, the rhythms of the earth and the pattern of life suggested recurrent cycles and constancy. Each generation expected to live much the same as their parents and grandparents. Even with the advent of agriculture some twelve thousand years ago and the rise of recorded history, this basic view of life was manifested in philosophical and religious thought. Agriculture certainly reinforced the notion that cycles were the norm, and religious ideas and rituals emphasized such natural patterns. The classical historians duly recorded that entire peoples and empires would rise and fall in time, with no hope of escaping life's ineluctable pattern.

Around the seventeenth century, however, certain modes of thought began to draw attention to the potential of the human intellect and the power of knowledge. Francis Bacon, Rene Descartes, Baruch Spinoza, and Isaac Newton, for example, fostered faith in the potential of science to unlock the mysteries of God's universe and a consequent pride in the achievements of human reason. As the world was explored and different, non-European peoples and cultures were encountered, there developed a greater openness to new ideas about the patterns of life.

By the eighteenth century, a host of powerful thinkers such as Locke, Montesquieu, Hume, Voltaire, Rousseau, and Kant had initiated a revolution in thought that would be labeled the Enlightenment. Increasingly, people began to believe that through the acquisition of knowledge and the application of Reason, an individual could expect improvement. Indeed, whole nations might progress in this manner. Ideas of progress and development began to take root and to flourish.

Among the first to apply these insights to the subject of development were economists Adam Smith, David Ricardo, Thomas Malthus, and Jean-Baptiste Say. In his seminal work, *The Wealth of Nations* (1776), Smith advocated a negative liberty for the individual ("freedom from" arbitrary government) and a minimum of restraints on the operations of the market. He viewed these as the keys to development as defined in economic terms. The state would provide only for national defense, for protection of

individual rights against invasion by other citizens, and for collective (public) goods, which could not be supplied through the autonomous workings of the market. The market would assign rewards and burdens according to the rules of supply and demand. This necessarily entailed inequality in the distribution of wealth, which was justified on the grounds that it reflected individual merit. That is, those were rewarded who displayed initiative and worked hard to efficiently satisfy consumer wants and demands.

An early emphasis on specifically material development was thus evident in the ideas of progress as elaborated by the classical political economists: production would contribute to the progress of society by generating abundance and wealth. This classical formulation gave rise to the doctrine of laissez faire economics while the emphasis on economic, or material, expansion would characterize much subsequent development thought. Economic historian Karl Polanyi's influential study, *The Great Transformation: The Political and Economic Origins of Our Time* (1944), detailed the process of industrialization followed by the European countries, and provided a model of economic growth for many subsequent economists. Though he offered a radical dissenting view, Karl Marx also assumed that development meant primarily industrialization and the accumulation of material wealth. Between Smith and Marx, a central dichotomy had been established in development theorizing: individual freedom defined in negative terms and reliance on the operations of the market to provide incentives for productivity and efficiency versus an active state embodying the collective will to promote equality and satisfy basic social needs.

Economists would not have a monopoly on development theory, however, in large part because the realities of development did not match the predictions. Soon voices representing various disciplines weighed in with their insights. Franz Boas, Margaret Mead, Ruth Benedict, and other anthropologists began to stress the cultural differences between countries, which they argued made each case distinct and different. The clear implication was that one model of development would not fit every country. Sociologists, including Max Weber, Talcott Parsons, and Seymour Martin Lipset, elaborated on the subtleties of different stages of development, factoring in modes of social operation previously overlooked by the economists. Parsons, for example, offered explanations for the ways in which religion, authority, leadership selection, organization of production, and community bonds functioned in traditional (underdeveloped) societies, as opposed to modern (industrialized) societies. Lipset and Karl Deutsch

illuminated the phenomenon of social mobilization. In sum, these thinkers suggested that sociocultural factors, rather than economic, drive development.

Political scientists would also challenge the assumption that economic development reflexively led to political development, usually meaning democratization. Samuel Huntington, Gabriel Almond, and others noted the failure of many states to develop politically in the wake of economic growth. They shifted their focus to political parties, interest groups, political socialization, public opinion, and the like. These, they reasoned, are the means through which policies of development are formulated and implemented. Between the economists, anthropologists, sociologists, and political scientists, the concept of development was enriched if not made more consistent. Theorists and practitioners would have to operate with more subtle notions about the relevant factors and relations of development: simplicity would yield to growing complexity.

### **The Post-Colonial Context of Development**

It is perhaps an historical irony that at mid-twentieth century the industrialized countries of Europe and the United States, having just waged two horrific wars unprecedented in their scope over access to resources and markets, still viewed themselves as the models for world development. Paternalistically, they turned attention to the development of nations in Asia, Africa, the Middle East, Latin America, and the Caribbean, which formerly they had colonized. Excepting the United States, their physical capital was largely exhausted after years of struggle. The former colonial powers (including Great Britain, France, Germany, Spain, Portugal, The Netherlands, Belgium, Italy, and Japan) therefore necessarily, if gradually, relinquished direct control over their colonies as a wave of independence movements swept across the globe after World War II.

South America had been colonized earlier than other areas; most of its countries emerged from colonial rule by the 1830s. Nevertheless, they continued to operate under the close scrutiny and extensive influence of the United States in what some have characterized as a neo-colonial relationship. For about one hundred years, they were suppliers of raw materials and cheap labor to European countries and the United States. The Great Depression drastically impacted these countries so that they began to consider alternatives to their export-oriented economies. In the 1930s, many South American countries began to pursue a strategy of development called Import

Substitution Industrialization (ISI). An active state would either establish industrial firms of its own or provide incentives to private firms to produce goods for the domestic market in order to obviate the need for imports. Industrialization was still seen as the goal of development, but state protectionism ideally would allow nations to create the means to satisfy their own demands and insulate themselves from the vagaries of the world market, freeing them from dependence on first-world markets.

In the 1950s, the theoretical rationale for this strategy was fashioned retrospectively by Raul Prebisch, an Argentine economist who headed the UN Economic Commission for Latin America, and others (like Hans Singer) who argued that the developing countries had been consigned to an inferior position in the scheme of world trade and development. As suppliers of primary materials for the industrialized countries, they could expect to see the terms of trade steadily deteriorate. Over time, capital tends to concentrate and larger firms in the developed nations assert growing control over their markets, reducing competition and securing larger profit margins. Meanwhile, the primary suppliers remain in competitive environments, subject to lower profits. Under such conditions, the gap between rich and poor countries would increase. Accordingly, they concluded that the obstacles to development faced by the countries of Latin America were sown into the structure of world trade. Prebisch and like-minded social scientists, labeled structuralists, determined that it would take state-sponsored industrialization to correct the situation.

For a while, the nations of Latin America experienced some progress toward industrialization pursuing ISI policies. Over the long term, however, the strategy proved deficient: The gap between those employed in state-protected industries and the urban and rural underemployed or unemployed grew dramatically. Millions of people were marginalized. Government policies frequently resulted in favoritism and inefficiencies and led to heavy debts. The critical agricultural sector was neglected, or even compelled to subsidize industrialization in the cities, leading to depressed conditions, rural flight, and a growing urban underclass. Social tensions often led to military interventions and even dominance, thwarting healthy political development. Nor did dependency cease, especially as technology and other inputs used in production often had to be imported; so foreign capital and its influence significantly increased. By 1970, the Organization for Economic Cooperation and Development (OECD) reported that ISI had negatively impacted those countries that adopted the strategy. The structuralist approach did not,

however, disappear, but would soon be reworked by dependency theorists.

After World War II, the sheer proliferation of states was bewildering. As a result primarily of decolonization over the several decades following the war, the total number of independent countries soared from about fifty to almost two hundred. Most countries in Asia, Africa, the Middle East, and the Caribbean were at some time colonized, with the exceptions of China, Iran, and Thailand. (Ethiopia avoided colonization until late in the process when it fell prey to Italy's Mussolini.) These newly independent states faced serious problems, many stemming from their colonial legacies. As the former colonial powers retreated, they left behind national boundaries that often disregarded the natural divisions between peoples: racial, ethnic, tribal, linguistic, religious, cultural, historical, geographic, and other. Additionally, in every case the colonial relationship had rested on a centralized, authoritarian system of politics, more or less harsh, and on the economic and psychological subordination of indigenous groups. That is, the subjects in these colonies had generally been inured to patterns of hierarchy and dominance.

Sociopolitical systems of these countries therefore tended to reflect their colonial experiences: Western legal and political ideals were awkwardly cobbled together with traditional, indigenous modes and customs. By the standards of the industrialized West, these newly formed states were deemed to be underdeveloped in numerous respects. They were often independent in name only, continuing, in fact, to be dependent economically, politically, and militarily. They remained internally fragmented due largely to their arbitrary boundaries. The level of development of domestic industries and markets was generally very low. Moreover, the social indicators of development were correspondingly poor: per capita incomes; literacy rates; infant mortality and death rates; access to food, potable water, sanitation, and health care; and the like. In many of these former colonies, women especially had suffered a decline in their social status and their control over the resources that traditionally had sustained families.

### **Developmentalism, or Modernization Theory**

Scholars and policy makers subsequently transferred their focus from development in Western Europe and North America to development in the newly created, post-colonial states. Several factors help to account for this shift. The many problems associated with emergent countries naturally drew the attention of

development theorists, especially since the industrialized Western nations continued to rely heavily on raw materials and resources from these countries. This fact necessitated a degree of stability and infrastructure that was absent or fragile in most developing countries. Additionally, the proliferation of post-colonial countries coincided with the rise of tensions between the Western capitalist nations, or First World (especially the United States), and the so-called Communist countries, or Second World (particularly the Soviet Union). The Cold War therefore placed these post-colonial states at the center of a struggle for world dominance. Consequently, development theorists labeled as Third World the countries of Asia, Africa, and Latin America, which were in the field of contest.

The urgency of development problems was therefore recognized immediately in the wake of the Second World War. The United States and its allies acted quickly to shore up the developed countries of Western Europe and Japan through such programs as the Marshall Plan and the Bretton Woods System, under the auspices of which were created the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (better known today as the World Bank). Authorized in 1944, these institutions aimed at stabilizing financial markets and exchange rates and at rebuilding infrastructures. In 1948, the General Agreement on Trade and Tariffs (GATT) was founded to augment them, with its goal of promoting trade. The World Trade Organization (WTO) supplanted GATT in 1995. Their institutional missions soon encompassed the post-colonial world. Additional programs to address social problems and to win hearts and minds in the developing countries were enacted in the 1960s, including the Peace Corps and the Agency for International Development (AID). The growing Western focus on the problems of this large group of developing countries, representing almost three-quarters of the world's people, was also manifested in an increase of programs in higher education and of funding for scholarly research including the Fulbright Program; Ford, Rockefeller, and McArthur foundations; and Asian, African, and Latin American studies associations.

W. W. Rostow proffered, in 1960, a capitalist alternative to Marx's version of economic development in *The Stages of Economic Growth: A Non-Communist Manifesto*. Yet his views shared with Marx some optimistic, basic assumptions: the fundamental equation of development with industrialization; a belief in the primacy of economic growth, which would then result in sociocultural development and political democratization; the belief that the European and US

experiences could serve as satisfactory models of development for all other countries; and the conviction that development flowed in a natural and rather orderly fashion from the accepted economic model. Dubbed modernization theory, Rostow and others, like Seymour Martin Lipset and Gabriel Almond, assumed that every underdeveloped country should emulate the Western-style industrial model. Given the organizational and other imperatives of industrialization, he thought this path would eventuate in a convergence of countries, economically, socially, culturally, politically, and ideologically. Increased trade and contact with the industrialized, Western nations would facilitate development in the poor, "backward" countries.

Modernization theory essentially defined the developing countries in terms of the elements they lacked, from the perspective of industrialized countries of the West. The peoples of Asia, Africa, and Latin America were generically classified as traditional, as opposed to modern: rural and agrarian rather than urban and industrial; clan-based, pre-literate, fatalistic, and religious as opposed to universalistic, literate, scientific, and secular in their outlooks. Modernization entailed overcoming these negative traits. Obviously, the poor countries faced a shortage of savings and capital, which an interventionist state in Keynesian-like fashion would correct. Worse, however, these countries were missing the cultural requisites of modern (Western) societies, like an achievement-oriented and entrepreneurial spirit. All these deficiencies would in time be remedied. Clearly, modernization theory equated development and modernization with industrialization and Westernization. Rostow posited five stages through which these societies would travel on their way to development, including the initial traditional stage. With the advance of science and technology, economic growth would become normal and social and political institutions would mature as measured by Western standards and values. Ultimately, these countries would become modern societies with mass consumption economies, as in the affluent West. Policy makers in the United States especially found Rostow's vision very appealing.

Scholars were less enamored. Harvard professor Samuel Huntington faulted modernization theorists for drawing upon a flawed, overly optimistic evolutionary tradition from sociology. Other critics claimed that Rostow's notion of traditional society was impoverished: It ignored elements of universalism, individualism, and orientation to achieve, which were indeed present in these countries. It thereby established a set of false dichotomies. In fact, the modernization development scenario failed to unfold

as predicted. The rich and poor countries did not converge over time, but rather the gap grew markedly. It became increasingly clear that development would entail neither an automatic nor a smooth process of transition. Subsequent global history has raised even more serious questions about the modernization thesis: Is there really any reason to believe that the advance of modernization goals (industrialization, literacy, secularization, and the like) results in democratization? Do such developments actually reduce conflicts based on religious or ethnic differences? Is there reason to think that they are linked to progress in social justice? That is, the facile linkage of development defined as modernization with democracy, social justice, and peace can no longer be assumed.

### Dependency Theory and Marxism

Largely in response to modernization theory as propounded mostly by Western and especially US scholars, theorists in the developing countries began to offer an alternative development analysis that would be labeled dependency theory. Many dependency theorists hailed from Latin America and had been influenced by the structuralist thought of Prebisch and Singer, and by strains of Marxist thought, sometimes commingled with Catholicism in the form of liberation theology, which focused on the needs of the poor and oppressed. Included in this group are (exceptional, neo-Marxist Westerners) Paul Baran and Paul Sweezy, Andre Gunder Frank, Fernando Cardoso, Theotonio Dos Santos, and Immanuel Wallerstein. Dependency theorists claimed that modernization theory was ethnocentric and insensitive to the variety of cultures and social arrangements manifested throughout the developing world and to their unique historical experiences. The critics charged that modernization theory was indeed ahistorical in that it failed even to consider the ways in which colonial experiences had affected these countries. It was the colonial experience, they asserted, that had instituted the fundamental, highly unfavorable conditions faced by developing countries. They observed that the global environment had changed since the Western countries underwent their process of development, so what worked before might not work under contemporary conditions. Rostow's stages thus displayed an inappropriate "one size fits all" assumption. In the opinion of some, such gross simplifications and misconceptions had led directly to the disastrous US policies culminating in the Vietnam War.

Dependency theorists vociferously denounced the growing gap in wealth, income, and power between rich and poor nations and chided modernization theorists for overlooking conditions of obvious exploitation inherent in the economic relations between the developed and underdeveloped countries—in trade, investment, and finance. Drawing on Marxist ideas of imperialism, class analysis, and economic surplus, Baran, Frank, and others distinguished between the *core*, rich and powerful capitalist countries of the West, and the *periphery*, so-called less developed countries (LDCs) from which resources, cheap labor, and wealth in general were being extracted by the core. Oligopoly control of markets by the multinational corporations (MNCs) of the core countries made this dominance possible, with the aid of compliant and corrupted local elites whose interests were married to those of the MNCs. These powerful corporations would bring in industry that crushed local businesses and reduced employment by replacing workers with technology, imposing highly unfavorable terms of trade (raw materials for manufactured goods) and repatriating their profits to the core. Baran viewed the world capitalist economy as a web entangling the countries of Asia, Africa, the Middle East, and Latin America in a relationship that systematically distorted their development. In his analysis it would take an interventionist, socialist state to implement policies in the interests of the masses and to correct this situation.

With Sweezy, Baran analyzed the irrational waste of economic surpluses in developing countries, which they maintained reflected an attempt by the capitalist system to deal with its principle, recurrent problem: stagnation. Extensive spending on the military was one strategy that was easy to justify without provoking many questions about the use of resources or social justice. Elites squandered resources on luxuries rather than permitting these resources to be invested in ways that were genuinely, socially productive. Frank likewise counted underdevelopment as the product of a long-term process of exploitation: The capitalist powers of the metropolitan core continuously took economic surpluses from the world's vast majority for the enrichment of a small minority. Underdevelopment was, in effect, the byproduct of so-called development in the core. The result was a polarization of countries between core and periphery. In West Africa, scholar Samir Amin arrived at similar conclusions. These theorists described what has been called neo-colonialism (or neo-imperialism), an exploitative, colonial-like relationship but without formal governance by a colonizer. Though indirectly, the peripheral states were being dominated economically, politically, culturally, and (when deemed necessary) militarily.

For this reason, suggested Wallerstein, theorists of development must focus on the global system rather than on individual nations. Higher-level economic activities like manufacturing and finance were jealously preserved by the core countries; left to the periphery were the less profitable activities such as supplying raw materials. Wallerstein distinguished a middle group of countries, which he designated the semi-periphery, that engaged in somewhat more profitable trade and manufacturing. One unfortunate consequence was that this fragmentation of the peripheral countries helped the core to maintain its control. Correspondingly, the core countries had developed strong states, but in the periphery, states were weak, which limited their ability to deal with outside forces or to develop internally. So as long as a peripheral country remained linked with the core, meaningful, national development and political independence were precluded.

Many dependency theorists called for the general implementation of ISS policies by the LDCs; and in this spirit a *Group of 77* (G-77) developing nations enunciated, in 1974, a set of twenty principles designed to promote development. The New International Economic Order (NIEO) called for extensive reforms of world trade, aid, and financial arrangements to secure for the world's poor a greater share of resources. However, like those for whom they attempted to speak, dependency theorists remained largely marginalized. Policy makers seldom openly adopted political agendas in their name, Chile under Allende and Jamaica under Manley being two very brief exceptions. NIEO demands withered in the face of resistance from the Western countries, themselves facing economic problems. The theory met with a scornful barrage of criticism from Western and especially US ideologues on the political right. Even in the 1980s as the debt crisis became acute and very unpalatable structural adjustment programs (SAPs) were being imposed on LDCs by Western governments and international institutions, dependency theory nevertheless came under increasing attack and declined in influence.

### **Neo-Classical Liberalism, or the Washington Consensus**

With the oil shocks, stagflation, and the demise of the Bretton Woods System, as the financial costs of the Vietnam War caught up with the United States in the 1970s, development theory was thrown into disarray, any social-democratic consensus evaporated, and faith in state-led development waned.

Into this vacuum strode an emboldened New Right, with their faith in a free-market panacea. Offering a neo-classical version of laissez faire economics, and with the help of the wave of conservatism that swept into office both Ronald Reagan in the United States and Margaret Thatcher in the United Kingdom, they seized the high ground of policy making in the 1980s. They rejected both the dominant Keynesianism of the modernization theorists and the more active, state-sponsored developmentalism espoused by dependency theorists. Their ideology, in fact, informed and guided the policies of the World Bank, the IMF, and the US State Department for at least a decade, which is why their policies have been labeled the Washington Consensus. With the end of the Cold War their confidence grew, and they expressed the view that liberalism and free-market capitalism had been established so securely that it amounted to the effective end of ideological debates.

Neo-classical liberals argued that LDCs were not being exploited by developed Western countries, but rather were victims of their own failings, including corrupt and inefficient governments and an inadequate commitment to market values and principles. In their estimation, economic development had been stunted in the LDCs due to an overextension of state authority: Disregarding comparative advantage and competitiveness, government subsidies, regulations, and controls had distorted markets, which led to an inefficient allocation of resources. State-sponsored developmentalism had permitted too much discretion, contributing to rampant corruption. Neo-classical liberals could also point to the 1970 report from the OECD, which concluded that ISI policies had overall negative economic consequences for the countries adopting them. As opposed to ISI, they advocated an export-oriented approach to development.

By reducing the role of government, claimed neo-classical liberals, LDCs could limit opportunities for corruption and mismanagement, and realize a more rational allocation of resources based on market forces. The mounting level of debt in the developing countries was used as leverage by Western policy makers to oblige these countries to adopt the elements of a neo-classical liberal agenda. Enforced through the World Bank, the IMF, and US State Department policies, SAPs usually entailed the following requirements: trade liberalization (reduction or elimination of tariffs, quotas, subsidies, and other barriers); privatization of government-run enterprises; a general deregulation of the economy, including labor and finance; devaluation of the currency (tight monetary policies to control inflation); opening domestic markets to entrepreneurs and investors and providing them incentives to stimulate an

entrepreneurial flourishing; and fiscal austerity with respect to social programs including education, subsidies for food and housing, and health care, which were deemed a drain on investments needed for private enterprise. Even falling wages due to labor deregulation, according to this view, would benefit society by attracting more investments and increasing the level of employment.

Again, the optimistic predictions of the theory proved to be overblown. Neo-classical liberals did not think in terms of the global conditions affecting development. Rather, as with modernization theory, they assumed that national economic growth and development would flow naturally from a proper application of the theory, in this case a free-market mantra. As well, they assumed that a fixed set of policies would fit all countries, whatever their situation. Not surprisingly, failure to consider the specific characteristics of each country undermined their goals. The posited rise of a dynamic entrepreneurial class did not materialize, as the theorists had underestimated the difficulty of cultivating such individuals. Corruption did not diminish, but took on new forms involving patronage and cronyism. Rather than improving, unemployment worsened; labor deregulation depressed wages and consumption, so domestic markets contracted. The gap between rich (those few who could take advantage of some of the policies) and poor (those who did not benefit) yawned dramatically. Cuts in social programs acutely affected the majority, and even future development was threatened by the withdrawal of investments in human capital. Nor had the theorists considered the possibility that some types of public spending might generate more economic activity than much of the private investment.

As the impacts of SAPs became more broadly recognized, they frequently met with widespread resistance or outright violence. Increasingly, many countries had to resort to military repression to implement the neo-classical liberal agenda. In many countries, years of development efforts were rolled back to the serious detriment of the general welfare. The harshest critics of neo-classical liberal theory have charged that it was little more than a veneer for the global aggrandizement of the MNCs and the elite minority that controls and benefits from them, and that it both undermined democratic institutions and sapped the strength and legitimacy of developing states. Whatever our assessment of the neo-classical liberal program, it indisputably recast the global development environment. Though it purported to remove government from the realm of economic planning, in fact, it selectively culled government programs and policies, leaving those that supported

corporate enterprise while deleting mostly the social commitments of states. Simultaneously, it removed from the sphere of public discourse many of the basic questions about the allocation of resources and transferred these to the private sphere (the marketplace where MNCs dominate) or to international organizations dominated by Western corporate capital, like the WTO.

### **Globalization and Trends in Development Theory**

Development theory has always been embedded contextually and simultaneously challenged by ongoing, complex changes. By its nature, then, it must be a dynamic theory. The vast intricacies of globalization, though, have presented theorists with perhaps more daunting challenges than ever before. With the demise of the Cold War, the Western sense of urgency about development in the LDCs has waned. In place of the previous bipolar dichotomy, we see a world system that is, depending on one's perspective, either unipolar (with a single superpower, the United States) or tripolar (with spheres of influence centered in the United States, Europe, and Pacific Asia). The last of these would include Japan, China and Hong Kong, the Asian Tigers (Taiwan, South Korea, and Singapore), Australia, and New Zealand.

The putative success of the Asian Tigers, originally including Hong Kong (which has been reabsorbed into China), drew much attention and raised hopes of development theorists. Neo-classical liberals sought to claim these newly industrialized countries (NICs) as examples of the success of market-oriented development policies; but in truth these countries had active, interventionist governments and supportive cultures, and they invested heavily in human capital. Moreover, they developed at a particularly favorable time in history, and may not therefore serve as suitable models for future development. Chalmers Johnson and others at the Institute of Development Studies (University of Sussex) have drawn lessons from the experiences of these NICs to create a model they call developmental state theory. An interventionist state would set development as its chief goal, and would encourage national savings while directing the flow of investments and spending heavily on human capital. The state would carefully regulate the economy and, though remaining committed to private property and markets, it would redistribute land, if expedient.

Clearly, altered global conditions demand new strategies. Diffuse strains of thought, not among the

more or less distinct schools identified so far and often dissenting from the mainstream views, have nevertheless enriched development theory and may be able to help us meet the challenges of the future. One unmistakable and hopeful trend in the theories has been a growing sensitivity to the definition of goals of development, and the use of measures more carefully tailored to those goals. Early economic thought, as previously noted, had fostered an emphasis on material measures. Critics complained that Gross National Product (GNP) and Gross Domestic Product (GDP), both measures of national outputs of goods and services, were too crude to really capture meaningful development. In response, and to get at issues of equity, the Gini index was developed. Then, in 1990, the United Nations (UN) adopted a more comprehensive gauge of development, the Human Development Index (HDI), which is a composite of measurements including life expectancy, real GDP per capita, literacy rates, access to education, and average years of schooling. Theorists had become aware that development is really about *human* development, and that beyond the basic needs, human flourishing requires access to things like education, employment, and participation in the life of a political community.

Equity and quality-of-life concerns have also been reflected in the growing body of literature focused on the plight and rights of women; and on the environment and sustainability. Half of the world's people, women, had been largely neglected in the mainstream theories of development. Without considering the place of women in society, it was increasingly obvious that the most critical global issues could not be effectively addressed: hunger and food production, health issues, pollution and the environment, population control, literacy and education, distribution of property, and human rights, among others. It had been widely assumed that the progress of industry would automatically entail an improvement in the situation of women. However, as with democracy, social justice, or peace and security, no such progressive evolution transpired. To improve the lot of women and, in turn, those who depend upon them—in effect, everyone else—women would have to be fully incorporated into any scheme of development. Such views have gained attention from the international community; for example, the 1995 *Beijing Declaration and Platform for Action* addressed women's issues and offered an action plan. Real progress, however, has so far been elusive.

Because women play the key role in developing countries in terms of providing for family health and nutrition, the plight of women is often intertwined in development thought with environmental issues, for

example, in ideas promulgated by physicist-turned-social-activist Vandana Shiva. Women in LDCs account for the majority of food production to meet family needs; the figure for Africa is about 70% of agricultural production. The condition of water, air, and soil therefore critically impacts women as chief stewards for the health and nutrition of their families and communities. In many cases, development defined as industrialization has eroded the quality of these essential life factors and made things harder for women while jeopardizing entire communities. Out of such concerns grew a focus on environmentalism and sustainability. Significantly, the UN-sponsored *Brundtland Report* (1987) posited a nexus between democratic participation and sustainable development. Some have been led to question both the feasibility and the moral-ethical desirability of global industrialization and development toward mass consumption-oriented societies (for example, E. F. Schumacher and Herman Daly). It is also noteworthy that one of the poorest states of India, Kerala, has achieved levels of human development surpassing those of many LDCs and some developed countries, but without a commensurate increase in GDP, industrialization, or consumption.

Sadly, despite the broad range of development thought and years of efforts, many LDCs are no better off today than they were at independence; and in some cases, most notably in the countries of Sub-Saharan Africa, the quality of life has actually deteriorated due to depletion of resources, increasing pollution, declining life expectancy and health (due especially to AIDS), growing economic and social disparities, and violence and strife. There is an urgent need to rethink development theory to address the grave problems affecting the peoples of the developing world and all humankind in our interwoven, global environment. Past experience suggests that no generally applicable development model is feasible. So there will be no shortage of challenges for development theorists in the years ahead.

### DEVELOPMENT, MEASURES OF

Development is both a complex, multidimensional process and a term laden with emotional connotations. Any attempt to define and measure development is likely to be both arbitrary and inadequate, if not outright ethnocentric and ideologically biased.

First-world or Global North views emphasizing modernization and developmental theories can be said to form the "mainstream" perspective on development. It advocates both free-market capitalism and liberal democracy as the ideals that third-world and former second-world nations should attempt to reach. Such values or objectives as individual freedom in both the marketplace and the polity, limited government, economic openness, political transparency, entrepreneurialism, efficiency, legitimacy, and the protection of private property rights, among others, best reflect the mainstream conception of development in the political economy within and across nations. The economic strategies emphasized to accomplish development have varied over time: from import-substitution industrialization in the 1950s and 1960s to export-led industrialization in the 1970s and 1980s as practiced by some Latin American and South Asian nations, to neo-liberal policies and practices related to capitalist globalization in the 1990s, to the present encouraging of all nations to find their niches in the global economy. Throughout

the last fifty years or so, these economic strategies have tended to coincide with certain political objectives: initially promoting modern state-building and legitimate political stability by ending civil strife, later replacing state repression with political openness and accountability through reforms, and now increasing individual political freedom and civil liberties in the process of liberal democratization. This overarching view is likely to support social scientific research employing cross-national designs, quantitative data, and measures from capitalist international institutions and think-tanks in order to assess the progress made toward modernization or development. In sum, empirical measures of development are dependent on the type and definition of development employed by varying ideological perspectives.

Some third-world or Global South dependency and neo-Marxist imperialist and world-system theories can be said to form much of the “critical” perspective on development and underdevelopment. This view highlights the negative effects on third-world nations of colonialism, imperialism, dependency, and neo-colonial globalization emanating from first-world practices and processes. Third-world integration into and conditioning by the capitalist world-system produce consequences such as: “economic stagnation” (that is, some economic growth experienced but no real or meaningful economic development attained, especially in Africa), or “distorted development” (that is, establishing artificial, not natural, processes of development throughout most less-developed nations), or “uneven development” (that is, much greater development in a foreign enclave sector than in the rest of the native economy as with, for example, India, China, Egypt, and many Caribbean nations), or “associated-dependent development” (that is, economic development but with loss of national political and economic freedom such as in Argentina, Brazil, and Chile), or “delayed development” (that is, preventing the earlier fulfillment of political self-determination or national independence as with most non-Latin American third-world nations), “the development of underdevelopment” (that is, the simultaneous development of first-world nations at the expense of third-world underdevelopment as posited for most third-world nations, especially in Latin America), or “techno-bureaucratic authoritarianism” (that is, promoting institutionalized government that is politically repressive through high-technology means, particularly in South America), or “special relationship development” (that is, nations that have special relationships with the United States and are getting certain economic advantages, including Taiwan, South Korea, and Israel), or “special resource development” (that is, the oil-producing and -exporting

nations or members of OPEC, especially in the Middle East).

Foreign trade, direct foreign investment, foreign aid, and foreign debt measures, among others, are used, through interpretation, as causal factors producing many third-world afflictions including underdevelopment, dependency, inequality, and repression. For example, a mainstream measure thought to promote development, such as direct foreign investment per capita by multinational corporations, is deemed by the critical view to be a measure of foreign capital penetration, a violative act reflecting a relationship of dominance and dependency. Assessments of these causal linkages including conditions, attributes, and contexts often require the use of more qualitative methodologies such as either for case-study analysis (that is, a relationship between a first-world nation or an international institution and a third-world colony or nation) or for broad relations of production within the capitalist world-system (that is, core-semiperiphery-periphery relations).

Placed more neutrally within an historical context, any sizeable movement away from being poor, backward, or underdeveloped, toward developing, appears to be a meaningful change, thereby reducing abject or absolute poverty within a society. To move from being less or least developed to being more or most developed would be considered a major developmental improvement, as a form of convergence, thus reducing relative inequality among societies. Probably the most neutral and widely used, albeit an imperfect, aggregate indicator to detect an improvement in the human condition over time, space, and ideology continues to be per capita income. This empirical measure requires dividing the national income by the population for each year. Its use facilitates the detection of any long-term trends or patterns. Another indicator often used in empirical studies is energy consumption per capita or its natural log, involving either electricity or coal usage. The interpretation is that the greater the amount used, the higher the level of economic development. Other indicators that can be used and interpreted in the same direction include those related to the value added to goods and services during the production or servicing stages, or to the number of personal computers or Internet linkages per capita, among others.

There are at least four major kinds of development deemed to be desirable within a society: economic, political, social/human, and sustained. Although these types of development are widely thought to be highly interrelated, the empirical indicators used for their measurement tend to be different. For certain, the meanings and measures of each of these forms of development vary depending on the type of historical

analysis employed, or ideological perspective taken, across research agendas. Quantitative cross-national analysis requires the collection of data for empirical indicators in order to make comparative national and regional assessments, thereby permitting the creation of broad generalization. Qualitative case-study analysis attempts to identify specialized attributes or factors in order to detect developmental trends within a society, thus allowing for a comparison of key forces and factors over time for a single society in the detection of developmental trends. Whereas quantitative analysis often employs economic, political, and social-empirical indicators, qualitative analysis emphasizes cultural, religious, and historical aspects.

### **Economic Development**

Economic development implies a structural, presumably progressive and preferred, change in the economy, emphasizing economic growth and increased consumption. Two dimensions of economic development that can be measured are rates of change and levels attained. For example, economic development can often be observed when nations have relatively higher economic growth rates over a sustained time, as well as with the creation of leading economic sectors and the decline of noncompetitive ones, and/or the more efficient flow of factors of production from one sector to another sector in the economy. Economic development is also a particular level that has been attained consisting of both quantitative and qualitative attributes. These rates of economic growth and levels of economic development are, in turn, quite dependent on greater access to natural resources, higher capital formation, improved technical expertise, instilled entrepreneurialism, and the removal of structural rigidities and impediments in the economy.

Basic empirical indicators or quantifiable measures of economic development usually include: gross national product (GNP) as the total value of goods and services produced plus or minus the foreign trade sector during a year, or GNP per capita as the total yearly production value divided by the population, or the gross domestic product (GDP) as the value of goods and services produced in a society without including the foreign trade sector, or GDP per capita where the total value of domestic production and services is divided by the population. These measures can be used either for single-year points or in creating estimates of average annual growth rates of GNP or GDP per capita covering different periods, anywhere from five to twenty years. The World Bank's annual *World Development Report* provides useful

data and information covering both the process and the conditional state of economic development on primarily a comparative national basis. It also aggregates nations on the basis of region and level of economic development. Or, nations can be stratified and then ranked on the basis of the level of economic development attained at a specific point in time. Although economic growth rates for a single national economy generally vary over time, most relative rankings of national economies with respect to the level of economic development attained have remained largely consistent and stable.

Other measures used to gauge economic development include the percentages of either production value or workers employed within certain economic sectors such as agriculture, manufacturing, industry, services, trade, and technology. It is commonly thought that if an economy moves its factors of production from one economic sector to the next, roughly in the order given above, thereby reflecting a different economic specialization over time, then it is likely reaching a qualitatively higher level of economic development. Still, an economy specializing predominately in neither industry nor high technology, with a relatively closed foreign trade sector, might be progressing toward greater economic development. For instance, if an economy is well-diversified and its sectors are highly integrated, then it might well represent a more desirable and secure balance across economic sectors, leaving a nation less vulnerable to the vicissitudes of domestic and world-market forces compared to one that is highly open and interdependent.

Economic development can also be witnessed when a smaller amount of the population or work force is involved in agriculture and, concomitantly, more people are involved in manufacturing, industry, services, trade, and high technology. Savings and investments are higher, stronger credit and marketing facilities and institutions exist, the infrastructure of the economy supports improved transportation and communication systems, and the satisfaction of basic human needs is almost assured.

### **Political Development**

Political development is both a process and an attained level presumed to be desirable and beneficial for individual nations or societies. One conception of political development is democratization leading to democracy. Empirical or quantifiable measures of (liberal) democracy often include the existence of a constitution with individual political rights and some

curb on governmental power; the continuous use of voting in competitive elections; maintenance of multiple parties; and the separation of powers in the form of the legislative, executive, and judicial branches of government, among other measures.

A liberal conception of political development, as the dominant paradigm of political economy in the post-Cold War era, includes the process of democratization leading eventually to some end state, democracy. From 1972 to the present, Freedom House has done an annual comparative survey rating the degree of freedom for nations in the international system. The status of freedom within nations is determined by two sets of indicators: political rights and civil liberties. Political rights include whether or not the chief executive and legislature are elected by meaningful popular processes; free and fair elections exist; the distribution of political power reflects voter preferences, multiple parties meaningfully compete, a transference of power takes place after a change-oriented election, opposition votes are significant, military or foreign influences interfere with civilian-controlled political processes, self-determination of peoples proceeds, societal and governmental powers are decentralized, and consensual and opposition powers are fairly balanced. Civil liberties are determined by having: media protection from political censorship, open and free public discourse on salient political issues, freedom of assembly and demonstrations, freedom to organize politically, nondiscriminate application of the rule of law, freedom from political terror and repression, free trade unions and business associations, free professional organizations and religious institutions, and the right to personal and social privacy.

Institutionalization is another conception of political development that recognizes state-building and infrastructure formation as functional institutional processes. Societal institutions including the political structures of the state become formally established and functional. Those legitimate institutions of the state are expected to possess elements of authority and sovereignty. Those institutions in the broader society become political vehicles with rights, obligations, and powers. When these institutions combine, they perform functions including political socialization and recruitment, interest aggregation and articulation, political organization and communication, law-making, law-enforcing, and law-adjudicating. Modern political systems are more able and willing than their counterparts to use power capabilities to produce policies that are distributive, regulatory, redistributive, or extractive, in order to function and respond well to societal demands. A higher level of political development will be demonstrated by political systems that

are more differentiated, autonomous, secular, and decentralized in nature.

The date of institutionalization can be used to determine the nature and duration of political development or maturity. The assumption is that the earlier the date, the greater the likelihood of higher forms of political development, including national autonomy or independence, self-determination, and higher forms of political development. Hence, longevity can be translated more easily into stable, workable government. Measures of longevity can include the date of effective institutionalized government, the date of declared independence, the date of formal independence, the date of entrance into the United Nations or other universal organization, the date of the last major constitutional change, the date of the last political regime change, the date of either unification or reunification, or the date of the last revolution.

## Human Development

Human development is a broader term than either economic or political development. It is a people-centered concept that emphasizes human choices intended to promote a higher quality of life for as many people as possible. Human development is more observable when there have been improvements in the following areas: reducing fertility and infant mortality rates; promoting nutrition, health, sanitation, and education; as well as other factors that enhance the quality of life for more people, especially for the poor, minorities, women, and children. The main objectives are to reduce abject poverty and gross inequalities.

The United Nations Development Programme's annual *Human Development Report* has the following concepts and indices for understanding and measuring human development: life expectancy at birth, adult literacy rate, combined gross first-through-third levels of educational enrollment, real GDP per capita, adjusted real GDP per capita, a life expectancy index, an educational index, a human development index (HDI), and the real GDP per capita rank minus the HDI rank.

Two closely related aspects of human development are gender empowerment and human poverty, both containing multiple indicators to form separate indexes. Gender empowerment consists of the overall rank on a gender empowerment (GEM) index, the percentage of seats in parliament held by women, the percentage of female administrators and managers, the percentage of female professional and technical workers, the percentage of women's share of earned income, and the raw score of GEM values. Human

poverty is measured by: the overall human poverty index (HPI), percentage of people not expected to survive to age forty, adult literacy, population without access to safe water, population without access to health services, population without access to sanitation, percentage of underweight children under age five, children not reaching grade five, refugees by country of asylum, population below income poverty line of \$1 per day, population below income poverty line making up national poverty, as well as the raw scores for both real GDP per capita for the poorest 20% and real GDP per capita for the richest 20% of the population. The computing methods to form these indices are outlined in each report.

Other indicators, in the form of either percentages or ratios, have also been used to assess a wider domain of human development: women's access to education, child survival, health profiles, food security, government expenditures on education, labor conditions and benefits, access to information and communications as indicators of quality of life, political life, and military expenditures and resource imbalances, urbanization and population trends, social stress and change, and acceptance of human rights instruments and laws.

## Sustainable Development

Sustainable development, the broadest term related to development, requires balancing the fulfilling of basic human needs; promoting economic growth; and protecting the environment from excessive population growth, natural resource depletion, and environmental degradation in order to protect current and future generations. Within either a World Bank or United Nations agenda, sustainable development is concerned with "intergenerational equity," whereby all future generations have the same chances as the present one of succeeding in their developmental efforts. It also supports more equitable development in terms of resource distribution and use between wealthier and poorer nations. One way to assess sustainable development is to measure the stock of all capital assets for a nation. The overall stock should increase in size over time. The types of capital assets include manufactured (such as, computers, tractors, roads, and airports), human (such as, knowledge, skills, work ethic, and entrepreneurialism), social (such as, individual, group, class, and institutional relationships), and environmental (such as, forests, mountains, rivers, waterways, and coral reefs).

As a holistic concept, sustainable development recognizes that the broader environment contains

interdependencies among the physical, biological, and socio-psychological worlds. By impacting upon one of these, you affect the others over time and space. Resource use and consumption should be efficient, equitable, intelligent, and compatible with protecting the environment. The World Bank's measures of sustainable (environmental) development relate to land and water uses, agricultural use, deforestation, protected areas, energy use, and emissions: percentage of land under permanent crops, percentage of irrigated cropland, arable land as hectares per capita, agricultural machinery as tractors-per-thousand agricultural workers, agricultural productivity as value added per agricultural worker, a food production index with a base year, freshwater resources as cubic meters per capita, annual freshwater withdrawals as percentage breakdowns in agricultural and industrial uses, annual deforestation in terms of square kilometers and average annual percentage change, nationally protected areas in terms of thousands of square kilometers and percentage of total land areas, commercial energy use as kilograms of oil equivalent and average annual percentage growth, GDP per unit of energy use as dollar per kilogram, and carbon dioxide emissions as a total in terms of metric tons and per capita in metric tons. Exact calculations for each measure are described in detail. Hence, sustainable development is concerned with capturing as many factors as possible in order to assess and promote the quality of life for both present and future generations of people, specifically outlining men, women, and children, as well as other species, across the planet.

## DICTATORSHIPS

Dictatorship is government without the consent of the governed. Dictatorships are established through military force or political manipulation. They dissolve or disempower elected assemblies, suspend elections, abolish political parties, or supplant independent legal systems. Dictatorships score low on the political freedom index (PFI) as calculated in 1994, based on the implementation of human rights and the likelihood of regular legitimate contests of ruling power. The developing nations of Cuba, Haiti, China, North Korea, Sudan, Zaire, Saudi Arabia, Syria, and Iraq were among the countries with the lowest PFI in 1994 (Haynes 1996). Dictatorships are often justified as short-term emergency governments, but many survive for a long time. Kim Il Sung (North Korea, 1948–1994) holds the modern record of forty-six years, but more than twenty twentieth-century dictatorships have lasted twenty-five years or more.

Models have been developed to analyse dictatorship, but although they apply to some instances, none seems to hold true for all (Smith 1996). This is because nations’ varying histories; institutions; resources; combinations of bureaucratic, capitalist, and military power; and international relationships all affect the emergence, style and longevity of their dictatorships.

Dictatorships can be political, military, religious, or pragmatic (interested only in power). Ideals that have motivated dictatorships include the communism of Fidel Castro (Cuba, 1959– ) and Mao Zedong (China, 1949–1976), the anti-communism of Ernesto Geisel (Brazil, 1974–1979) and Augusto Pinochet (Chile, 1973–1989), and the Islamic fundamentalism of Ruhollah Khomeini (Iran, 1979–1989) and Mohammad Omar (Afghanistan, 1996–2001). Pragmatic

seekers after power have included Rafael Trujillo (Dominica, 1930–1938, 1943–1961); Papa Doc Duvalier (Haiti, 1957–1971); Alfredo Stroessner (Paraguay, 1954–1989); Sese Seko Mobutu (Zaire, 1965–1997); Idi Amin (Uganda, 1971–1979); and the notorious Jean-Bedel Bokassa (Central Africa, 1965–1979), who participated in the murder of his opponents, indulged in ritual cannibalism, and declared himself emperor in 1977.

Different people judge dictatorships in different ways. Liberals and democrats view them as temporary and undesirable systems to be replaced by representative and responsible government as soon as possible. Zealots view them as evil if they impose someone else’s ideology and benevolent if they impose their own. Marxists view them as an instrument of class domination if they have capitalist leanings, or as a way of regulating the struggle between the classes if they are communist or socialist.

International situations can modify ideological positions. The Cold War led to US support for favoured dictatorships including Fulgencio Batista (Cuba, 1940–1944, 1952–1958), Chiang Kai-shek (Taiwan 1949–1975), Carlos Armas (Guatemala, 1954–1963), Alfredo Stroessner (Paraguay, 1954–1989), Ngo Dinh Diem (South Vietnam, 1955–1963), Ferdinand Marcos (The Philippines, 1965–1986), and Augusto Pinochet (Chile, 1973–1989). The United States has supported other dictatorships because they maintained order and supported modernisation. These include Reza Pahlavi (Iran, 1941–1979), Haile Selassie (Ethiopia 1930–1935, 1940–1974), and Sese Soko Mobutu (Zaire, 1960, 1965–1997). Ex-colonial powers have felt licensed to intervene in their ex-colonies to support. The British supported the conservative Hastings Banda (Malawi, 1966–1994) and France supported pro-French capitalist, Félix Houphouët-Boigny (Ivory Coast, 1960–1993), and even Jean-Bedel Bokassa (Central Africa, 1965–1979) until he became an embarrassment; then they contributed to his overthrow.

## The Making of Dictatorships

The support of the army is an essential ingredient in the making of dictatorships. Sometimes the military themselves form the government; sometimes they install or support a civilian government. In The Philippines and Thailand, the military have played decisive roles in changing governments. In Argentina, the army paved the way for the nationalist and populist regime of Juan Perón (1943–1955). In Zaire, Sese Soko Mobutu (1960, 1965–1997) returned power to civilian politicians after his first coup, but his second

coup made him president. In Indonesia, the military installed and supported Suharto (1967–1998), who gave them a formal political as well as military role. In Iran, Reza Pahlavi (1941–1979) used the military to suppress opposition in 1963 and in 1977–1979.

The military often claim to have the national interest at heart, but this is not always so. In Nigeria, the coup leaders of 1966 claimed to be motivated by a desire to end tribalism, but, in fact, the coup was led by and favoured the Ibos, and subsequent divisions along tribal lines deteriorated into civil war. In Uganda, Idi Amin (1971–1979) exploited tribal divisions to remain in power. In Syria, division within the military forced President Hafiz Al-Assad (1971– ) to depend on support from his own clan and village (Randall and Theobald 1998).

The political route from democracy to dictatorship usually involves banning opposition parties. One-party states merge leader, party, and state so that disloyalty to any one is disloyalty to the others; party credentials become essential for state positions and the party bureaucracy helps the state bureaucracy to maintain power. Communist countries operate this way, but there have also been non-communist one-party dictatorships including those of Kwame Nkrumah (Ghana, 1960–1966), Habib Bourguiba (Tunisia, 1963–1981), Julius Nyerere (Tanzania, 1962–1985), and Daniel Moi (Kenya, 1978– ).

Many dictatorships are consolidated in response to “emergencies.” Ferdinand Marcos (The Philippines, 1965–1986) imposed martial law in 1972 when faced with Communist insurgents, Muslim separatists, and an economic crisis. Habib Bourguiba (Tunisia, 1957–1987) responded to left-wing protests with increased repression in 1976, 1977, and 1980. Failed coups led to the outlawing of opposition by Daniel Moi (Kenya, 1978– ) in 1982 and by Geydar Aliyev (Azerbaijan, 1968–1989, 1993– ) in 1995.

Once dictatorships are established, new dictators may take over an existing position. Reza Pahlavi (Iran, 1941–1979) succeeded to a throne that had been seized in 1924; Saddam Hussein (Iraq, 1979–2003) succeeded President al-Bakr, who had taken power after a 1968 coup; and Jean-Claude “Baby Doc” Duvalier (Haiti, 1971–1986) inherited his dictatorship from his father.

### Factors Predisposing Developing Countries to Dictatorship

No single overriding factor predicts the emergence of a dictatorship. Poverty, absence of democratic experience, and political instability all play a role.

Of these, the absence of democratic experience may be the most significant. Stable parliamentary democracies, such as Botswana and Mauritius, have been built on sound economies, but also had experienced the working of Westminster-style constitutions. Botswana was a protectorate rather than a colony and had the advantage of British tutelage from 1885. Mauritius had eleven years of internal self-government before achieving full independence in 1968. It is also notable that India, which significantly engaged its indigenous people in political processes before independence, has not succumbed to post-colonial dictatorship. By contrast, in Madagascar and Ghana, the absence of established political institutions contributed to a series of emergency dictatorships.

In many ex-colonies, the years of colonial rule denied indigenous peoples access to legislatures, political parties, local councils, and other processes of accountable responsibility. Ingrained authoritarian habits resurfaced as many apparently democratic African ex-colonies transformed after only one election into personal or party dictatorships (Andreski 1992). In Tanzania the one-party state was seen as necessary for continued economic development, and in Kenya the people were said to be not yet ready for democracy (Smith 1996). In South America the absence of democratic tradition led to a series of dictatorships, briefly interrupted by democratic experiments. After initial post-colonial attempts to introduce constitutional government were thwarted by wealthy oligarchies, industrialisation created new industrial capitalist elites, who used established authoritarian patterns to curb post-war democratic and welfare experiments (Smith 1996; Andreski 1992). As a typical example, Guatemala, accustomed to brutal repression under Spanish colonisation, experienced only brief periods of liberalisation from 1944–1954 and from 1966–1970. Between 1964 and 1976, military dictatorships supplanted civilian governments in Brazil (Castelo Branco, 1964–1967), Uruguay (Juan Maria Bordaberry Arocena, 1972–1976; Aparicio Méndez Manfredini, 1976–1981), Chile (Augusto Pinochet, 1973–1989), and Argentina (Jorge Videla, 1976–1978; Roberto Viola, 1978–1981; Leopoldo Galtieri, 1981–1982).

People become accustomed to living under dictatorships and may even derive an odd sense of security from an authoritarian state. Revolutions often end up replacing one dictatorship with another, as was the case in Cuba where Fulgencio Batista (1940–1944, 1952–1958) was replaced by Fidel Castro (1959– ) and in Iran, where Reza Pahlavi (1941–1979) was replaced by Ruhollah Khomeini (1979–1989).

Instability, disunity, and poverty provide fertile ground for dictatorship. Because the boundaries of

developing countries were usually imposed by colonising powers, often disregarding ethnic and cultural distribution, they are prone to instability and fragmentation. Ethnic and religious fragmentation has had serious effects in Angola, Benin, Cameroon, Chad, Ivory Coast, Indonesia, Iran, Kenya, Liberia, Malawi, Mozambique, Nigeria, Sierra Leone, Tanzania, The Philippines, Uganda, and Zaire (Haynes 1996).

Disunity leads to the formation of rival armies, and poverty encourages young people to fight for very small rewards. Thus, power is arbitrated through military victories (Andreski 1992). Between 1960 and 1980, three-quarters of Latin America, half of Asia, and more than half of Africa experienced coups. Through the 1980s there was at least one coup or attempted coup in a developing country each year. In the first half of the 1990s there were coups or attempted coups in Chad, Togo, Peru, Sierra Leone, Haiti, Guatemala, Nigeria, and Gambia (Smith 1996). Dictatorship is a way of counteracting this, an attempt by post-colonial states to maintain territorial integrity and unify populations, either by force or by apportioning ethnic representation through the dominant party (Andreski 1992; Smith 1996). Tribal conflict contributed to the coup of Idi Amin (Uganda, 1971–1979); Robert Mugabe (Zimbabwe, 1980– ) justified bullying his opposition as preventing tribal fragmentation; Achmed Sukarno (Indonesia, 1945–1968) responded to fragmentation with an authoritarian constitution in 1957 and then in 1960 by establishing himself as dictator.

Mistrust of alternative groups that might gain power leads to widespread popular support for some military governments (Smith 1996). Sometimes “veto” coups (Randall and Theobald 1998) occur to prevent an unwanted government from even coming into power. In Pakistan an emerging middle class, threatened by the instability that followed partition, supported the coup that brought Ayub Khan to power in 1958. In Algeria the army established a military junta in 1992 to prevent the Islamic Salvation Front from winning an election.

One-party systems make countries less prone to military coups and often represent an attempt to provide stability and impose unity (Randall and Theobald 1998; Smith 1996). The strongest one-party governments occur where the party has a strong grass roots presence, as well as a national organisation. The resulting binding effect can be seen in the ideologically disparate examples of Kenya, Tanzania, and Cuba.

Pre-colonial political traditions also play a role in establishing dictatorships. Sukarno (Indonesia, 1945–1968) drew on the Javanese notion of consensus.

Leopold Senghor (Senegal, 1960–1980), and Julius Nyerere (Tanzania, 1962–1985) based one-party approaches on African traditions of consensus, unity, and egalitarianism. In China the regime rests its legitimacy on a strong tradition of centralised power and the Confucian doctrine of putting the national good above the interests of the individual (Sorensen 1991). In many nations, pre-colonial “clientelism,” meaning mutual obligation between the powerful and their dependents, contributes to the way dictatorships are sustained by rewarding loyal supporters through distribution of tasks and power (patrimonial bureaucracy). Armed forces that support and are supported by regimes rely upon patronage. Military dictatorships tend to arise when the absence of an influential and educated indigenous middle class makes the military the main source of organisational status and personal power, attracting politically ambitious people to military careers. One such person was Muammar Quaddafi (Libya, 1969– ), who led a bloodless coup against King Idris in 1969 and became virtual president of a one-party state.

In many developing countries, the impetus built up by fighting for independence gave individuals or organisations the momentum to carry them into dictatorial power. Marxist-Leninists took over after leading the independence movements of Indo-China, Angola, and Mozambique. Freedom fighters who became dictators include Kim Il Sung (North Korea, 1948–1994), Houari Boumédiène (Algeria, 1965–1978), Robert Mugabe (Zimbabwe, 1980– ), Félix Houphouët-Boigny (Ivory Coast, 1960–1993), and Achmed Sukarno (Indonesia, 1945–1968).

Although military dictatorships usually emerge in countries at peace (Andreski 1992), they can follow wars when military defeats are blamed on governments’ failure to modernise. Military action established the modernising dictatorships of Kemal Ataturk (Turkey, 1923–1938) and Gamal Abdel Nasser (Egypt, 1954–1970). Military dictatorships do not, however, always lead to modernisation in developing countries (Randall and Theobald 1998). The 1971 coup in Uganda resulted from the army opposing modernisation because it felt diminished by the power of the Westernised elite (Smith 1996).

## Development and Dictatorship

It is argued that strong dictatorship is good for economic development because it provides planning and political continuity, controls the strategic direction of investment, and suppresses opposition to foreign investment and the modernisation process (Andreski

1992; Sandschneider 1991; Smith 1996). These very qualities, however, mean that economic development under dictatorships often involves significant social and human cost (Sorensen 1991).

Socialist and Communist dictatorships manage the economy directly to encourage economic development. Public management also fills the vacuum in developing countries that lack significant privately owned capital, such as Tanzania (Smith 1996). Public management can be very effective. China's rate of post-war industrial growth, particularly since the 1970s, is among the highest in the developing world (Sorensen 1991).

Socialist and Communist dictatorships tend to combine economic with social goals, using authoritarian power to undermine existing elites and redistribute wealth (Sorensen 1991). In China social goals after the revolution extended to eliminating opium addiction, prostitution, and gambling, and taking steps toward the equality of women (Sorensen 1991). Deng Xiaoping (China, 1978–1997) even used his power to enforce environmental considerations. Subsequently, population control has been an area of concern and some success, although the one-child policy has affected the survival rate of female babies (Andreski 1992; Sorensen 1991).

The problem with centralist planned economies is that those in charge have no material incentive to promote efficiency or quality control, or to pursue innovation (Sorensen 1991). There is also a tendency to promote heavy rather than consumer industry, as there is no need to woo consumers. Furthermore, dictators' lack of accountability can mean economic devastation when a dictator gets a dysfunctional idea. In China two periods of economic improvement (1949–1956 and 1977– ) were interrupted by Mao's push for huge agro-industrial communes, which produced a famine that killed 20 million people. A similar catastrophe was perpetrated by Pol Pot (Cambodia, 1976–1978) when at least 15% of the population was wiped out in an attempt to achieve total collectivisation.

Capitalist dictatorships direct and control private-sector development. Through such initiatives, Chung Hee Park (South Korea, 1963–1979) achieved greater economic development than that achieved by the ideological dictatorship in China. Investors' greed is the incentive, but this also brings disadvantages. It is notable that the recent move toward capitalism in China has been accompanied by increasing corruption (Sorensen 1991). Capitalism without democracy has no incentive to pass on economic benefits to the people (Smith 1996). An exception is Taiwan. Perhaps because it has been dependent on, and shaped by, the support of the United States, it has

accompanied rapid capitalist industrial growth under dictatorship (Chiang Kai-shek, 1949–1975) with successful economic redistribution and improved welfare (Sorensen 1991).

Ultimately, dictatorships only enhance economic and social development if they want to do so. Some are ideologically opposed to development, others are too focused on personal aggrandisement. Islamic dictatorships, such as those of Ruhollah Khomeini (1979–1989) and Mohammad Omar and the Taliban (Afghanistan, 1996–2001), have reversed the process of modernisation and secularisation (Randall and Theobald 1998). "Predatory" dictatorships (Randall and Theobald 1998) damage rather than enhance national economic development through depleting resources to sustain their political position and to amass private wealth. Dictators such as Fulgencio Batista (Cuba, 1940–1944, 1952–1958) and Syngman Rhee (South Korea, 1948–1960) retard development through corruption and favouritism. Vast personal fortunes were amassed by Félix Houphouët-Boigny (Ivory Coast, 1960–1993), Hastings Banda (Malawi, 1966–1994), and Sese Soko Mobutu (Zaire, 1960, 1965–1997).

Development is also retarded when foreign aid is lost through dictatorships' policies. In the 1990s, both Britain and France made aid conditional on good records of democracy and human rights. Global aid agencies such as the World Bank have similarly tied aid to "good government." Dictatorships whose policies have stopped international aid include Saddam Hussein (Iraq, 1979–2003) and Mohammad Omar and the Taliban (Afghanistan, 1996–2001).

In the end, a dictatorship's success in promoting economic development depends upon intention, competence, resources, minimising internal disruption, and maintaining international support.

### Maintaining Dictatorships

Dictatorships depend on arbitrary use of power. When people do not know where the wrath or benevolence of the dictator will next descend, they become compliant through a mixture of fear and hope. Fear is generated through combinations of denial of human rights, suppression of women, environmental destruction, and ethnic and religious persecution. The same can also generate hope that one might be spared. In addition, corrupt practices can generate hopes of rewards for loyal supporters.

Maximum repression occurs where opposition is too weak or too oppressed to challenge the regime. Maintenance of dictatorship thus requires continual

suppression of opposition through outlawing political parties; repressing or co-opting trade unions; and purging, arresting, and/or executing leading citizens likely to oppose the regime. Kim Il Sung (North Korea, 1948–1994) established his power base by eliminating rival political factions. The 1993–1994 military regime in Nigeria purged the Provisional Ruling Council; imprisoned the president-elect (Abiola) for treason; arrested leading trade unionists, civil rights workers, and newspaper editors; and banned the courts from hearing cases that challenged its authority. Reza Pahlavi (Iran, 1941–1979) imprisoned opponents and abolished or suppressed hostile political parties. Hafez Al-Assad (Syria, 1971– ) ruthlessly repressed opposition, particularly religious extremism. Omar Hassan Ahmad al-Bashir (Sudan, 1989–1999) based his regime on disappearances, torture, and arbitrary executions. Thojib Suharto (Indonesia, 1967–1998) purged his supporters, detained thousands of political prisoners, and ruthlessly put down regional unrest. After the 1965 coup in Indonesia, at least half a million “communists” were exterminated by the military. Public demonstrations of opposition are brutally put down, as in Mexico in 1968, at Kwangju in South Korea in 1979, and on Tiananmen Square in China in 1989.

Dictatorships often justify repression of opposition by vilifying it as a “subversive” threat to the national good as defined by the dictatorship (revolution in China, Vietnam, and North Korea; modernisation in Mali, Ghana, and South Vietnam; religious tradition in Iran, Pakistan, and Afghanistan).

Institutions where debate thrives are controlled or closed down. In Chile, Augusto Pinochet (1973–1989) starved education of funds and curbed freedom of thought. In Kenya, Daniel Moi (1978– ) recognising the danger of a politicised educated class, censored the media, and closed the universities temporarily whenever opposition was voiced. Programs of mass education can also be used to shore up a regime, for example, as in the government-sponsored literacy program in Brazil in the 1970s.

Dictatorships either colonise or undermine constitutions. Haile Selassie (Ethiopia, 1930–1935, 1940–1974), Reza Pahlavi (Iran, 1941–1979), and Ruhollah Khomeini (Iran, 1979–1989) implemented constitutions that ensured continuity of their personal power. Daniel Moi (Kenya, 1978– ) ruled through control of parliament, the judiciary, and many social organisations. When under international pressure to hold an election in 1992, he made constitutional changes to ensure his reelection. Robert Mugabe (Zimbabwe, 1980– ) controlled a multi-party system until 1987 through bullying the opposition; he then became president and established one-party rule.

Alfredo Stroessner (Paraguay, 1954–1989) manipulated a parliament, political parties, and elections. Ferdinand Marcos (The Philippines, 1965–1986) and Thojib Suharto (Indonesia, 1967–1998) regularly won elections through fraud and intimidation.

Dictatorships often resort to state terror, in which the primary role of the police and the military is to coerce the civilian populations. Secret police, such as the “National Information Service” in Brazil or the “Security of the Revolution” in Sudan, with vast powers of interrogation and the right to torture, are put in place, loyal only to the regime, to which they owe their existence. Augusto Pinochet (Chile, 1973–1989) has been accused of two hundred thousand arrests and up to fifty thousand killings in his regime’s first ten years (Randall and Theobald 1998). Daniel Moi (Kenya, 1978– ) used security forces to enforce political detention without trial and implement systematic torture.

Personal dictatorships often build personality cults, which generate support through the symbolism of the father figure and rhetoric that claims unique wisdom and commitment to the nation’s welfare. Achmed Sukarno (Indonesia 1945–1967) expounded his “five principles” (*Pantjasila*) of nationalism, tolerance, democracy, social justice, and religious belief. Kim Il Sung (North Korea, 1948–1994) claimed that his genius was behind Korea’s economic miracle. Alfredo Stroessner (Paraguay, 1954–1989) took credit for “peace and progress.” Sese Soko Mobutu (Zaire, 1960, 1965–1997) launched a campaign of “African Authenticity,” even changing his country’s name from Congo to Zaire.

The attraction of a paternal protector is enhanced if he can claim to be protecting his people from an identifiable enemy. Kim Il Sung (North Korea, 1948–1994) had the US-backed South Korea as a permanent enemy. Saddam Hussein (Iraq, 1979–2003) has had a series of enemies from Iran in his early years to the United States and the West after the first Gulf War. Leopoldo Galtieri (Argentina, 1981–1982) attacked the Falklands in 1982 as a distraction from the deteriorating economy. Enemies are most effective if they are not actually engaged in battle. When military dictatorships fight wars, they tend to lose (Andreski 1992). Furthermore, the need to deploy troops at home against the civilian population means even sabre-rattling dictators prefer pacific foreign policies.

## Ending Dictatorships

When dictators cease to effectively contain, divert, or oppress opposition, they fall (Sandschneider 1991),

and personal dictators often come to violent ends on account of their lack of legitimacy (Colburn 1994). Some few such as Kim Il Sung (North Korea, 1948–1994) and Haiti’s Francois “Papa Doc” Duvalier (1957–1971) survive to die of natural causes. Some lose their effectiveness due to health reasons. Hastings Banda (Malawi, 1966–1994) lost power when he became senile and international pressure coupled with internal dissent forced multi-party elections. Most, however, come to violent ends.

Some dictators lose power through military overthrow or popular uprisings resulting from economic problems, social tension, or revelations of intolerable abuses of power, particularly squandering or misappropriating resources. Dictators displaced by military action include Stroessner (Paraguay, 1954–1989), Idi Amin (Uganda, 1971–1979), and Sese Soko Mobutu (Zaire, 1960, 1965–1997). Cases of civil rejection include Augusto Pinochet (Chile, 1973–1989), Ferdinand Marcos (The Philippines, 1965–1986), and Suharto (Indonesia, 1967–1998). Popular revolutions removed Fulgencio Batista (Cuba, 1940–1944, 1952–1958), Anastasio Somoza (Nicaragua, 1937–1947, 1950–1956), and Reza Pahlavi (Iran, 1941–1979). Assassination was the fate of Carlos Armas (Guatemala, 1954–1963), Ngo Dinh Diem (South Vietnam, 1955–1963), Haile Selassie (Ethiopia, 1930–1935, 1940–1974), Rafael Trujillo (Dominica, 1930–198, 1943–1961), and Chung Hee Park (South Korea, 1963–1979). Occasionally, legal processes bring dictators to justice. Jean-Bedel Bokassa (Central Africa, 1965–1979) was placed on trial and sentenced to death, but the sentence was commuted to life imprisonment.

Dictatorships may be modified through international pressure, as happened in Angola, Ghana, the Ivory Coast, Nepal, and Zambia, and some dictators themselves move toward constitutional rule. In Guatemala, General Mejia Victores’ 1983 coup led to liberalisation, a constitution, and elections. In the Ivory Coast, Félix Houphouët-Boigny (1960–1993) called multi-party elections when democratisation hit Africa in 1989.

A dictatorship can end in civil war because it legitimizes illegitimate access to power and frustrates those who would like power but have no access to it. Paradoxically, civil strife then weakens civil society, making recurrence of dictatorships likely, as can be seen in Afghanistan, Algeria, Angola, Burundi, Liberia, Mozambique, Somalia, and Zaire (Smith 1996).

Globalisation undermines dictatorships with the political intervention of powerful states or of international organisations such as the UN, NATO, or the European Union. Economically, major decisions are now made by transnational corporations.

Developments in communications technology make restriction of information and ideology increasingly difficult. Yet, even as dictatorships are undermined at the level of nation-states, there are growing possibilities for international dictatorships by powerful countries, international alliances, transnational corporations, or maverick groups and individuals.

**DISASTER RELIEF**

One measure of a country’s level of development is its ability to cope with the effects of disasters. Highly developed countries are as likely to experience natural disasters as less-developed ones, but they are much more likely to be able to cope with the effects of disasters. Droughts in North America and Europe do not lead to disastrous famines. They may lead to severe local or regional dislocations, but not to widespread starvation. Earthquakes, hurricanes, and floods strike in all parts of the world, but in wealthier countries property is widely insured and logistical capacities are much better developed. Rarely do wealthy countries need large amounts of outside help to cope with damage from such natural disasters. Of the approximately sixty disasters that took more than a thousand lives in various parts of the world in the last three decades of the twentieth century, fewer than a half dozen involved developed countries. The most deadly disasters occur in Latin America, Africa, and Asia. Disasters are often also associated with man-made phenomena, such as civil wars that disrupt

food production in developing countries. Political instability in the developing world thus exacerbates natural disasters when they do occur. International disaster assistance programs tend to be focused on disasters that occur in the developing world, while disasters that strike developed countries are normally addressed through their own national disaster response mechanisms.

## Disaster and Poverty

The association of disasters with poverty-stricken countries is significant. A distinction can be made between countries that are disaster-prone and those that are vulnerable to large loss of life. Disaster-prone countries, wealthy and poor alike, are situated in geographic or climatic zones where disasters such as earthquakes, various kinds of storms, or drought conditions are frequent occurrences. Poor countries are almost always more vulnerable to the effects of disasters than similarly situated wealthy countries. Poverty is closely related to loss of life in disasters for a number of reasons. First, in poor countries large percentages of the population settle in areas more prone to disasters, including low-land areas susceptible to floods and along mountainsides where poorly constructed housing is more susceptible to damage from earthquakes and mudslides. Second, food supplies in poor countries are often barely sufficient to meet domestic needs, even in normal times, and such countries subject to periodic drought are also highly vulnerable to famine. Third, poor countries generally lack the logistical and infrastructural capacity to respond effectively to disasters. Poor people generally cannot afford to locate and build residences that are safe, nor are they wealthy enough to ensure their property. These factors also contribute to the vulnerability of poor countries to disasters. Wealthier countries have sufficient resources to hedge against the most serious effects of disaster, and they are better able to weather them. By contrast, less-developed countries must often turn to the international community for assistance during times of natural disaster and national emergency. Fortunately, there are a number of governmental, intergovernmental, and non-governmental agencies that provide disaster aid.

## The International Disaster Assistance Network

When a country lacks the ability to provide for the medical, housing, and food needs of populations

adversely affected by disasters, it may turn to the wider international community for assistance and support. Many developed countries have governmental agencies tasked to respond to foreign disaster situations. Within the United States Agency for International Development (USAID), for instance, the Office of Foreign Disaster Assistance (OFDA) is charged with assessing and responding to the emergency needs of countries struck by disaster. Many donor countries have similar agencies charged with provision of emergency and humanitarian assistance. These bodies may respond with bilateral assistance or cooperate with international agencies in a multilateral response to an emergency. For many years, the United Nations Disaster Relief Organization (UNDRO) served as the focal point of international responses to disaster situations. In 1992, the UN reorganized its disaster aid structure, forming a Department of Humanitarian Affairs (DHA), which was charged with coordinating the wide variety of UN agencies that performed disaster assistance functions, including the UN High Commissioner for Refugees (UNHCR), which takes primary responsibility for provision of emergency assistance in refugee situations; the UN Development Program (UNDP), which coordinates emergency aid programs with the long-term development programming of host states; the UN Children's Fund (UNICEF), which supplies emergency aid for the benefit of children; and the World Food Program (WFP), which supplies emergency food aid, among others. The DHA was later succeeded by a new body called the UN Office for the Coordination of Humanitarian Affairs (UNOCHA), which now serves as the major coordinating body for international responses to disaster situations. UNOCHA is headed by the Emergency Relief Coordinator who also serves as the Under-Secretary-General for Humanitarian Affairs. The Inter-Agency Standing Committee (IASC) of UNOCHA coordinates emergency responses of UN agencies to emerging disasters, performs needs assessments, encourages the consolidation of agency financial appeals during disasters, and attempts to coordinate disaster assistance activities in affected countries.

In addition to governments and to a variety of UN agencies that supply emergency relief, there are large numbers of non-governmental organizations (NGOs) that are actively engaged in disaster-related assistance activities. The International Committee of the Red Cross (ICRC), which is the oldest disaster response organization in existence, coupled with its cousin, the International Federation of Red Cross and Red Crescent Societies (IFRC), has served the needs of populations caught in the cross-fire of

international and civil wars, which are often complicated by natural disasters, droughts, and famine. The ICRC is today charged with assistance and protection functions for civilian populations adversely affected by civil conflict. The IFRC is a coordinating body of various national chapters of the Red Cross, which routinely offer disaster assistance within their respective countries.

Dozens of additional NGOs that have consultative status with the United Nations are also actively involved in the provision of disaster or emergency assistance activities on behalf of displaced persons and refugees. Agencies such as Africare, Catholic Relief Services, CARE, Church World Service, Food for the Hungry, Doctors Without Borders, Lutheran World Federation, Oxfam, Salvation Army, Save the Children, and World Vision, to name but a few, are regular participants in the provision of disaster and emergency relief assistance throughout the world. In the United States, many NGOs are members of Interaction, an umbrella organization through which they maintain contact, communication, and collaboration in the assistance activities. The International Council of Voluntary Agencies (ICVA) provides another focal point for international NGO communication with the host of UN agencies headquartered in Geneva. In Europe, the European Union (EU) maintains ties with European NGOs through the European Community Humanitarian Office (ECHO) and a liaison office for NGOs. These bodies in turn deal with a consortium of European NGOs known as the Voluntary Organizations in Cooperation in Emergencies (VOICE).

The International Disaster Assistance network consists of a wide range of agencies and organizations. Efforts to coordinate this wide array of governmental, non-governmental, and intergovernmental agencies are complicated by the sheer number of bodies that take an interest in the provision of disaster aid, and by the often differing political and ideological motives such groups hold dear. Disaster aid is both about logistical efficiency and about politics. Coherence and efficiency are not easily achieved, but given the rather recent rise of such humanitarian bodies, largely in the latter half of the twentieth century, the system does offer hope and consolation and material assistance to people adversely affected by disasters throughout the world.

### **Early Warning**

Relief during disasters is essential. Food supplies, medicine, and shelter are often needed in large

amounts over short periods. Depending on the type of disaster, logistical support, search teams, and technical assistance may be needed in the aftermath of floods, hurricanes, and earthquakes. For creeping disasters, such as drought and famine, agricultural assistance, water supply, reforestation programs, and the like may be necessary. Whatever the circumstances of the disaster, there is a growing awareness that early warning of disasters is critical to minimizing the loss of life. Weather-related disasters can be mitigated through sharing of meteorological data. The World Meteorological Organization (WMO) tracks dangerous storms and disseminates weather information to governments so that preparations for evacuation of vulnerable coastal areas can be effected. The WMO's computer-based information network, or CLICOM, is linked into the UNOCHA's early warning system, which attempts to identify emerging disaster situations. UNOCHA maintains a Humanitarian Early Warning System, which is an extensive database that tracks a variety of factors likely to precipitate disasters in various countries. In addition to threats from disease and natural disasters, assessments are made pertaining to potential violent uprisings and conflict. Considered are such factors as genocide, human rights violations, regime failure, refugees, environmental crises, and food shortages. UNOCHA has also established a variety of regional bodies, including the Integrated Regional Information Network in Nairobi, Kenya, which tracks the Great Lakes region of Africa, and a similar program in Abidjan to monitor humanitarian emergencies in West Africa.

Good advance information and warning is critical to avoiding massive loss of life in disaster situations. However, ultimately, governments and agencies must be willing to act on the information received, by prepositioning logistical support and assistance or readying emergency relief mechanisms for swift action. This requires that governments be willing to risk stimulating flows of refugees and displaced persons by the very acts of prepositioning assistance. Countries are not always ready to risk precipitating population movements that might otherwise be avoided.

Disasters are mitigated not only by good data predicting potential disaster occurrences, but also by long-term policy responses by governments to enforce building codes in earthquake-prone areas, build up food storage capacities, improve basic transportation infrastructure, and develop a capacity within the government to manage disaster-relief activities. By developing disaster-planning abilities and taking steps to improve early warning, governments contribute to the development of their nations.

## Disasters and Development

The connection between disaster and development is a two-way street. Disasters hamper development and development mitigates disaster. Because of this reality, disaster-relief organizations and development agencies both need to take an interest in the work of their counterparts, so that disaster-relief agencies supply forms of disaster aid in ways that will foster rather than inhibit development. Similarly, development agencies must consider how a country's long-term development strategy can help to insulate a country's economy, its infrastructure, and its population from the most egregious and harmful effects of disasters. Good disaster-relief policy should enhance the ability of a country to recuperate and good development policy should help countries develop disaster prevention and mitigation strategies, so that future disasters can be weathered with fewer negative consequences for the country's long-term development situation.

Disaster-relief agencies need to consider how their emergency assistance activities can potentially harm long-term development policy in a country. This is especially true of droughts and famines, the "creeping disasters" that develop over time, often producing substantial population movements as starving populations stream into neighboring regions or even cross international boundaries. Clearly, it is necessary under such circumstances for food and medical assistance to be provided on a priority basis, just to preserve life. But the way the food is acquired and delivered makes a difference. If external food aid is dumped into a developing country's economy, local grain prices will drop with the sudden surge of supply in free grains. This gives local farmers in the affected country no incentive to increase production. If less grain is planted, domestic food production and supplies could be permanently depressed as the country comes to rely on external food aid, leading to an unhealthy dependency. However, if disaster-relief agencies first purchase local supplies of grain, reducing local stocks and only supplementing them with external assistance when local stocks are exhausted, incentives for further local food production can be sustained to the benefit of local peasant populations, and to the overall benefit of food self-reliance in the aid-receiving country, allowing it to spend precious foreign currency reserves on other national needs.

Disaster-relief agencies must also be careful about putting disaster victims, displaced persons, and refugees in situations of personal dependency on external charity. In all cases, the object should be to restore disaster victims to a condition of self-reliance. This means paying attention that aid be delivered to

disaster victims in such a way as to promote their attainment of work, of new skills, and of opportunities for settlement where their skills can be put to productive use. Foreign disaster-relief agencies also need to work with their domestic counterparts in such a way as to ensure that the latter, together with the larger beneficiary population, are involved in the emergency-assistance planning and implementation. The development of the local managerial capacity is a central feature to the healthy and long-term restoration of a society.

Development agencies have a part to play in this process, even though their outlook emphasizes long-term planning horizons, rather than the emergency aid approach that must by necessity focus on immediate needs. But just as disaster agencies need to be aware of how immediate needs can be addressed without compromising long-term development, so development agencies need to think about how the long-term development strategy addresses the ability of the beneficiary country to cope with disasters. For example, in countries prone to earthquakes or floods, is there a comprehensive national strategy regulating the placement and construction of buildings and neighborhoods? In countries prone to drought, is agricultural policy adequately focused on the establishment of self-sufficiency in the production of cereal grains and other foods for domestic consumption? Has the country developed adequate programs to minimize post-harvest loss of grain and to ensure adequate food storage facilities? Have the national transportation networks, especially the road networks in rural areas, been adequately maintained and developed to ensure better integration and supply from farm to market? Have drought mitigation strategies been adequately explored? Do adequate livestock and agricultural extension facilities exist in the country to promote a healthier rural economy? These are but a few examples of the many ways in which national development policy can be made to strengthen a country's capacity to cope with disasters and mount more effective domestic mechanisms for disaster response.

## Interdependence, Globalization, and Cooperation

Disasters in one part of the world inevitably have effects not only in the country immediately affected, but in neighboring countries and regions. Natural disasters cannot be eliminated. But governments can take steps to minimize the adverse effects of natural disasters. Disasters that are the result of civil war,

human interactions with the environment, and short-sighted national policies could, in a perfect world, be eliminated. Since it is unlikely that perfection will be attained by human political and social institutions, we can probably expect man-made disasters to continue, often alongside of their natural counterparts. Still, whether disasters take the form of natural or human-caused events, there is much that can be done to anticipate them, respond to them, and minimize their adverse effects.

This is first and foremost a matter of national and local policy making. But where countries lack the resources and capacities to develop strong disaster prevention, mitigation, and response programs, the international community is in a position to assist. A wide array of agencies and organizations, many of them already mentioned, have been established by governments to encourage swift and effective disaster responses throughout the world. Governments needing international assistance need only seek it. Developed countries have both humanitarian and economic motives for assisting countries in need. The increased economic interdependence and globalization that has marked the progress of the international economic relations in the latter half of the twentieth century, coupled with the speed of international communication and transportation, have made rapid disaster responses throughout the globe possible for the first time in human history. The effectiveness of international coordination to this end is not always perfect and is often fraught with difficulty, but the very existence of a global response capability must be accounted a major advance in a world where adverse effects of national disasters and instabilities are felt in neighboring countries and regions, attracting the concern of the wider international community. This increased global awareness guarantees that future attention to disasters and disaster-relief coordination will continue to be a matter of great and ongoing international concern.

### DJIBOUTI

The Republic of Djibouti (*Jumhuriyya Djibouti*) is a small East African country located on the Horn of Africa at the western end of the Gulf of Aden. The country is bordered to the west by Ethiopia, by Eritrea in the north, and by Somalia to the southeast. The northeast part of the country is the western boundary of the Bab al Mendeb waterway, which leads to the Red Sea; across from this is the country of Yemen, the southern tip of the Arabian Peninsula. The capital of Djibouti, also called Djibouti, is located on the mouth of the Bay of Tadjoura, approximately twenty kilometers from the border with Somalia.

Because of its lack of natural resources, the region had no independent identity until the partitioning of Africa by the Europeans. The city of Djibouti was built by the French to consolidate trading, and was identified as the region's capital in 1891. Prior to that time the regional capital had been the city of Obok (*Obok*).

Prior to adopting its present name, this region was known as French Somaliland until 1967, when it became the French Territory of the Afars and Issas until 1977. The Afar tribe is indigenous to modern-day Eritrea, Ethiopia, and Djibouti, while the Issa (*Esa*) clan exists primarily in northern Somalia. The Afars still make up more than half the population of Djibouti, while the Issa and other Somali clans make up about a third of the population. French and Arabic are recognized as the official languages of

Djibouti, with the traditional Afar and Somali languages used to a lesser extent.

France actually led the other European powers in its colonization of the Horn of Africa, before Great Britain and Italy established British Somaliland and Italian Somaliland, respectively. In 1862, a relative of the Sultan of Tadjoura ceded the city of Obock and surrounding coastal regions to France. This foothold in the region became substantially more important when the opening of the Suez Canal in 1869 brought shipping traffic from the Mediterranean into the region. In particular, the availability of a port in Djibouti enabled France to tend to its colonies in Southeast Asia.

While the late nineteenth century was marked by French and British competition in the region, the early years of the twentieth century brought competition between the colonial holdings of France and Italy in the Horn. A railroad from the city of Djibouti to Addis Ababa in Italian Ethiopia had been completed during World War I, expediting shipment of materials formerly carried by caravan, but Italy also established a railroad from Addis Ababa to the port of Assab in Eritrea, which would compete with the trade from Djibouti. The Italian government began pressuring France for concessions in its territories, and this competition for territory (along with the interruption of commerce it was causing) led French interests to reinforce the military garrisons in French Somaliland. This set the stage for the realignment of the European powers seen in World War II: France and Great Britain, the former competitors, were allied against the Axis powers, which included Italy.

The French capitulation to Germany in June 1940 put French Somaliland in the difficult position of formally being under the control of the Vichy government but not actually under Axis control, while many French in Djibouti still resented the idea of cooperation with the British. While the British were able to defeat the Italians to the north, Djibouti itself was blockaded until the governor surrendered to the British in December 1942, and French Somaliland came under control of the Free French.

Following World War II, the government of French Somaliland was changed, creating a council with two representative bodies, one made up of French citizens and the other chosen from the native population. Some degree of home rule (in minor matters) was permitted, and this council provided representation to the French Republican Assembly and the *Conseil de la République*. Local procedures differed from France's other African colonies, and in particular Muslim courts (*sha'ria* courts) were permitted.

Also following World War II, most of the French military presence was removed from the colony. By the 1960s the French Foreign Legion was brought in to keep the public order if necessary.

In 1967, the people of French Somaliland voted to remain a part of France, but on different terms. The government was reorganized to expand local rule, with five regional districts, or *cercles*, being established, of which Djibouti was the largest. However, the new government faced challenges including a terrorist kidnapping of a busload of school children by members of *le Front de la Libération de la Côte des Somalis* (FLCS) in February 1976. This precipitated a new view of the territory in the French government, and in May 1977, a vote on independence was permitted. The voters of the territory overwhelmingly chose independence and France lost its last colony in Africa.

The recent history of Djibouti is the result of decisions made decades ago. As was the case with many European colonies in Africa, the artificial boundaries established by the Europeans resulted in the groupings (and division) of tribes in the colonies. The result of such groupings and divisions leads to ethnic unrest, as evidenced by the division of Ethiopia (creating Eritrea) in the year 2000. In particular, the Afars and Issas were at odds because the Issas had been accused by their neighbors of intruding into regions used by the Afars for grazing their animals. The new leader of Djibouti chosen in 1977 was Hassan Gouled, an Issa, and he favored his own ethnic group over the Afars. This led to conflict between the groups in the 1990s, and a subsequent agreement on government gives the post of president to a member of the Issa clan while the prime minister is an Afar.

Djibouti's economy is based primarily on its location, its port facilities, and its status as a free trade zone. Other than commercial trade, very little local industry exists.

## DOCTORS WITHOUT BORDERS/ MÉDECINS SANS FRONTIÈRES

*Médecins Sans Frontières* (MSF) is a private, non-profit international humanitarian aid organisation that provides emergency medical assistance to populations in danger in the field, most of the time following a humanitarian crisis. MSF was born out of the exasperation of a group of French doctors working in desperate conditions in the Biafra War in Africa in the early seventies. One of the founders was Bernard Kouchner (who later had a political career in France and was health minister in 1993, and special representative of the secretary general of the United Nations/head of the United Nations mission in Kosovo in 1999–2001). This group of doctors believed that all people have the right to medical care regardless of race, religion, creed, or political affiliation and that the needs of these people supersede respect for national borders. They were determined to create a movement to deliver independent humanitarian aid wherever it was needed, particularly one that would speak out about the plight of the victims it helped. MSF was created in 1971, and started the movement of “French Doctors”—non-governmental organisations that provide humanitarian assistance on the ground in an impartial and independent manner. “French Doctors” refers to organisations such as *Médecins du Monde* (Doctors of the World), Handicap International, and *Action Contre la Faim* (Action Against Hunger). MSF was the first non-governmental organization to both provide emergency medical assistance and publicly bear witness to the plight of the populations they served. It remains the world’s largest independent international medical relief agency.

MSF has developed to its current position as an international humanitarian movement with offices in eighteen countries and ongoing activities in Africa, the Americas, Asia, Australia, and Europe. The success of MSF in France captured the imagination of other doctors across Europe. Operational “sections” of MSF sprang up in Belgium, Switzerland, the Netherlands, Luxembourg, and Spain. This expansion continued with the creation of support sections in Australia, Austria, Canada, Denmark, Hong Kong, Italy, Japan, Norway, Sweden, Germany, United Arab Emirates, the United States, and the UK. Each year, more than 2,500 volunteer doctors, nurses, other medical professionals, logistics experts, water/sanitation engineers, and administrators join fifteen thousand locally hired staff to provide medical aid in more than eighty countries.

To be able to speak and act freely, MSF remains independent of any political, religious, or economic

powers. The majority of all MSF activities are paid for with private donations. Other sources of funding are provided by the European Union (Office of Humanitarian Affairs), national governments, and international organisations such as the United Nations Office of the High Commissioner for Refugees. In 2002, the total income of *Médecins Sans Frontières*, for all its national sections, was estimated at 366 million Euros (approximately \$450 million USD), of which more than 80% was from private income.

The organisation intervenes in a variety of humanitarian crises such as armed conflicts, epidemics, and natural and man-made disasters. Interventions are also undertaken with populations that are particularly marginalised and vulnerable due to social or geographical isolation (such as inmates, women in prostitution, street children, ethnic minorities, and the elderly). The organisation brings health care to remote, isolated areas where resources and training are limited. The type of programmes run by MSF include assistance to people affected by armed conflicts, assistance for refugees and displaced population, medical assistance to victims of violence, and food and nutrition assistance. MSF works in the rehabilitation of hospitals and dispensaries, vaccination programmes, and water and sanitation projects. MSF is also active in remote health care centres and slum areas, and provides training of local personnel. In countries where health structures are insufficient or even nonexistent, MSF cooperates with authorities such as the Ministry of Health to provide assistance. MSF provides primary health care, performs surgery, rehabilitates hospitals and clinics, runs nutrition and sanitation programs, trains local medical personnel, and provides mental health care. Through longer-term programs, MSF treats chronic diseases such as tuberculosis, malaria, sleeping sickness, and AIDS. In 1999 *Médecins Sans Frontières* received the Nobel Peace Prize for its actions.

In carrying out humanitarian assistance, MSF seeks also to raise awareness of crisis situations; MSF acts as a witness and will speak out, either in private or in public, about the plight of populations in danger for whom MSF works.

MSF offices worldwide facilitate the organisation of gatherings for individuals and groups who want to speak in their home communities. MSF also mounts exhibitions and, from time to time, releases publications with the aim of raising awareness. In some instances MSF has decided to denounce abuses and misuse of humanitarian relief in the field, and has even withdrawn from countries when it considered that it could not provide assistance in situations that were satisfactory. In June 2004, following the murder

of five of its staff, *Médecins Sans Frontières* became the first major aid agency to quit Afghanistan since the fall of the Taliban. The reason for this withdrawal was that the Afghan government failed to act on evidence that local warlords were behind the murders and MSF considered that the framework for independent humanitarian action in Afghanistan had ceased to exist.

It is part of MSF's work to address any violations of basic human rights encountered by field teams, whether perpetrated or sustained by political actors. It does so by confronting the responsible actors themselves, by putting pressure on them through the mobilisation of the international community, and by issuing information publicly. In order to prevent compromise or manipulation of MSF's relief activities, MSF maintains neutrality and independence from individual governments.

### DOI MOI

During the late 1980s, the government of the Socialist Republic of Vietnam began to pursue *doi moi*, a development strategy that moved the country's economy away from a Soviet-style, centralized system toward one featuring decentralized markets. Three fundamental factors compelled Vietnam's leadership, including high-ranking officials in the Communist

Party of Vietnam, to choose a capitalist-oriented course of action even though many thought that it was ideologically distasteful to do so and that the approach was fraught with risks. First, during the 1980s, Vietnam's economic partners (the former Soviet Union, the former German Democratic Republic, the former Yugoslavia, and the former Czechoslovakia) were experiencing persistent economic failures and were facing national disintegration. With them Vietnam held membership in the progressively more dysfunctional Council for Mutual Economic Assistance (CMEA), and this meant isolating their economy from the broader global economy contacts. The Vietnamese dong remained convertible only into the *globally non-convertible* Soviet ruble and this further isolated the country's economy.

Second, Vietnam's Southeast Asian neighbors were experiencing widespread and rapid economic growth accompanied by political stability, and their collective response to Vietnam was to create the Association of Southeast Asian Nations (ASEAN) and bar the Vietnamese from participating in it. Third, Vietnam's economy was failing as per capita income was declining annually, incidences of poverty and deprivation were growing, the infrastructure was deteriorating, prices were soaring annually (including for rice and other agricultural output), and needed goods and services were in short supply. Capital stocks were eroding as annual private and public investments fell sharply, causing both production and employment levels to decline.

These factors convinced Vietnam's socialist planners, who were also members of the Communist Party, that clinging to the status quo was intolerable. They began to examine both Vietnam's economic failures and those of its CMEA partners, as well as the successes of its organized regional neighbors. The examination convinced both the National Assembly and the Office of the Prime Minister to escape ideological boundaries and seek practical ways of moving toward an economic structure that would be guided by socialist principles while the market system was introduced. The Sixth Party Congress of the Communist Party voted to accept the principles of *doi moi* at its 1987 meeting, thereby ending decades of isolation and beginning the road toward economic reform.

*Doi moi* not only introduced the market mechanism but it also legitimized private property, privatized state-owned enterprises (SOEs), and struggled to put into place a supportive legal system. Macroeconomic management was improved on both the monetary and fiscal fronts; reforms opened Vietnam to the outside world; and all of this spurred the development of basic legal, tax, and regulatory infrastructure changes. The reforms presented the country's

leadership with enormous administrative tasks and, consequently, *doi moi* proceeded slowly but without reversal. Externally, the dong was made convertible with the Singapore dollar, the Thai baht, the Japanese yen, and both the Australian and United States dollars. Internally, reforms began to relax legal and administrative impediments to trade, and then government took steps to welcome foreign investment and financial capital transfers.

The government's reform agenda was ambitious and unambiguous, and one of its key foci was on integration with the world economy by maintaining relationships to "big countries and neighboring countries" while giving special attention to "traditional ties and the non-aligned movement." Past associations would remain important, but the ultimate direction of the reform agenda would be Vietnam's integration with the global economic system. The government was determined to continue implementing open-door trading policies and has mapped out the road to honor its commitments to global and regional trading initiatives. The fact that this has meant making economic sectors more competitive is proving a major challenge as the country integrates into the global economy. Making economic sectors more competitive requires finding ways to blend the attributes of Vietnam's workforce and physical environment with physical and financial capital and industrial technology obtained from global markets and allocate them to the production of exports, import substitutes, and non-traded goods. This process could lead to a problem if gaining competitive edges creates economic enclaves that give rise to dysfunctional relations among Vietnamese who are separated by culture, ethnicity, and economic class. Exacerbating cleavages and inequalities among Vietnamese is a serious matter, and it's one that foreign economic interests may be neither willing nor able to understand and confront.

Externally, *doi moi* included membership in both ASEAN and the Asia-Pacific Economic Cooperation (APEC) because of four factors. First, external integration facilitates the development of comparative advantage, promotes the international division of labor, and enables participating countries to benefit from reasonable international resource allocations that harness the capacity of productive resources. Second, liberalization of trade in goods and services and investment, lower tariff barriers, simplification of procedures, and reduction of administrative controls combine to promote investment, raise output, reduce unemployment, and serve consumer interests. Third, global linkages create new investment opportunities, accelerate the flow of capital and industrial technology, and enhance efficiency that improves investment

climates by reducing the risk of commercial failure. Fourth, global integration, beyond promoting investment, leads to the transfer of management and other skills, as well as making available critically important knowledge and information about production and distribution processes.

Vietnam also assumed risks, and one was inherent in the persistent instability in world financial markets wherein unstable financial capital flows can adversely affect a country such as Vietnam. The reason centers on the main difference between direct foreign investment and financial capital. Direct foreign investors, once they have disbursed their funds to build factories and purchase equipment, cannot undo their investment quickly. But portfolio investors have more flexibility due to the high degree of transferability of security purchases and the short-term nature of bank loans. Financial capital is unequally distributed globally and centers in large industrial and financial countries. In good times, capital flows from these centers to developing countries such as Vietnam, but when signs of instability begin to emerge, that is, when the flow of financial capital begins to reverse, it quickly begins to be repatriated by capital centers domiciled in developed countries.

*Doi moi* has remained the intellectual cornerstone to post-war Vietnam's pursuit of economic growth and development. Despite the risks, government and party leaders remain convinced that the benefits derived from reform and reformation clearly outweigh them.

## DOMINICA

Dominica, an island of 750 square kilometers (290 sq. miles), is approximately the size of St. Louis, Missouri. Its population of more than seventy thousand people approximates that of Cheyenne, Wyoming. Its economy relies chiefly on the export of bananas and emerging tourism.

Dominica lies midway in an arc of islands known as the Lesser Antilles, facing eastward to the Atlantic Ocean and westward to the Caribbean Sea. It was under French control until the mid-eighteenth century, when it passed by treaty to the British. Therefore, three-fourths of the population is Roman Catholic, the remainder adhering to several Protestant sects. While English is the dominant language, much of the population also speaks a local patois or Creole version of French.

Dominica is a tropical island with a singularly rugged terrain marked by steep mountains reaching heights of well over a thousand meters (nearly four thousand feet). The island is riven with narrow valleys, gorges, and cliffs, and wrapped in thick tropical forest and hazy mists. Of volcanic origin, the island has sizable thermal lakes lying in dormant craters. Its features are more formidable than other islands in the Caribbean because it is of relatively more recent volcanic origin (some 25 million years ago); Dominica has not been as worn and smoothed down by time as the others.

The challenging physical dimensions of the island have directly affected its economic, social, and cultural character. Discovered by Christopher Columbus in 1493, the island was named "Dominica" since he set foot on it on a Sunday. The Carib Indians on the island successfully resisted Spanish occupation. They had reacted against the Spanish elsewhere among the islands but had been defeated. On Dominica, however, they had the advantage of a uniquely mountainous and forested terrain that provided abundant favorable locations for attack and defense. The profusion of tropical vegetation, rising and falling over Dominica's rich volcanic soil, has earned it the title, "Nature Island of the Caribbean."

For nearly two centuries no European power controlled Dominica, and it remained a surviving remnant of the original Carib inhabitants of the Caribbean. By the seventeenth century, however, due to repeated foreign incursions and diseases that devastated the indigenous population, the French began to settle on Dominica. The island did not have extensive flat land for large-scale agriculture. Where such a terrain did appear, however, the French laid out sugar plantations. For labor, they imported African slaves, establishing the large black and

mixed-blood population of the island today. Such a pattern of land occupation and labor employment recalled the French development of Haiti.

The broken, uneven terrain discouraged a dominant pattern of plantations controlled by large landowners. Therefore a small, anomalous pattern of peasant farmers emerged who cultivated fragments of land for subsistence and market farming. Although Dominica was not exceptional economically, the absence of an overwhelmingly dominant planter class was unusual. Unusual, too, was the survival of a portion of the native Carib population, which otherwise had disappeared throughout the rest of the Caribbean. Much of this population survived based on subsistence farming.

Together with the white planter group, there was a small, mixed white and black peasant class. The mass of inhabitants was the enslaved black population. The island had sufficient commercial activity to allow some slaves to acquire income from small-scale agricultural marketing. Accumulating sufficient funds to buy their freedom, some of these freedmen acquired plantations and slaves themselves.

By the end of the eighteenth century, the French ceded Dominica to the British. The most lasting consequence of French influence was the Roman Catholic religion to which most Dominicans adhere. The entry of the British continued the plantation agricultural focus of the Dominican economy. However, slavery was abolished at the beginning of the nineteenth century. A population of liberated slaves without property or education determined a pattern of low-wage labor, social unrest, and political disenfranchisement that long characterized the island.

Acquiring independence from Britain in 1978, the island only achieved a measure of political stability with the much-admired government of Prime Minister Maria Eugenia Charles. The first woman to govern a Caribbean nation, she was in office from 1980 to 1995. Although the island's primary source of export income is bananas, both the conditions and the market for this product are unstable. While agriculture is still the main area of employment, Dominica is steadily developing its services sector, which now produces most of its income. The gross domestic product (GDP) is slightly more than a third of a billion dollars. The per capita GDP amounts to approximately \$5,000 per year and the annual per capita income is just under \$3,000. A third of the population lives in poverty. Population growth is negative due to the rate of emigration. The median age of the population is just under thirty.

Tourism is the principal service activity, but it is not the typical Caribbean tourism. The island does not possess areas of wide beaches for luxury resorts.

## DOMINICA

Its special terrain and vegetation, however, allow it to offer ecotourism. For the ecologically conscious tourist it presents a breathtaking tropical environment. Dominica's Morne Trois Pitons National Park is a UNESCO World Heritage site.

Another objective for economic development is to establish Dominica as a center for offshore banking and financial operations. This, however, requires appropriate social capital. Dominicans have a high rate of literacy, more than 90%, but limited access to technical or higher education. Moreover, for foreign financial interests, the country does not have a long record of stable political and administrative continuity. An oil refinery base has also been considered, possibly on the model of the Dutch Caribbean island of Curaçao. However, this project must be carefully weighed in relation to the priorities for ecological and environmental balance.

## DOMINICAN REPUBLIC

The Dominican Republic occupies the eastern two-thirds of the island of Hispaniola. In 1821, Spanish-speaking colonists declared themselves independent, but they were conquered by neighboring Haiti in the following year and did not regain independence until 1844. From 1844 until 1930, the Dominican Republic experienced internal war, foreign intervention, and incompetent and corrupt governments.

In 1930, Rafael Leonidis Trujillo Molina, the leader of the US-created National Guard, overthrew the government and established an authoritarian dictatorship that lasted for over three decades. Ruthlessly suppressing all opposition to his regime, during the Great Depression Trujillo was faced with governing a poverty-stricken nation with an empty treasury, a huge foreign debt, and a capital city destroyed by a hurricane. Within two decades, Trujillo had paid off the nation's foreign debts, developed a national infrastructure, and laid the groundwork for economic development by promoting industrialization. Sugar exports accounted for the majority of government revenue. In the process, he accumulated a personal fortune worth almost \$1 billion (USD).

The cost of fiscal solvency during the Era of Trujillo was the complete loss of personal freedom of the Dominican people. Trujillo's seven intelligence agencies enabled the dictator to establish one of Latin America's most brutal authoritarian dictatorships. One of Trujillo's most notorious acts was the massacre of twelve thousand Haitians in the northern border region in 1937. To deflect criticism of his regime, Trujillo offered sanctuary to one hundred thousand Jewish refugees from Europe. By the end of the 1950s, Trujillo had managed to lose the support of the nation's elites, the Roman Catholic Church, and the US government. Trujillo's failed attempt to assassinate Venezuelan President Rómulo Betancourt in 1960 convinced the United States that continued support of the Trujillo dictatorship could damage US hegemony in the Caribbean region. The murder of three elite sisters—Minerva, Patria, and Maria Teresa Mirabal—on November 25, 1960, motivated the Dominican population to increase anti-Trujillo activities. On the evening of May 30, 1961, Trujillo was assassinated by a group of conspirators who had been both accomplices to and victims of the dictatorship. The conspirators, armed with weapons provided by the United States, assassinated Trujillo as he was preparing to visit one of his numerous mistresses. Attempts by Trujillo's son Ramfis to continue the dictatorship were futile and the entire Trujillo family fled the island by the end of 1961.

In December 1962, the Dominican people began their first experience with democratic government. In US-supervised elections, Juan Bosch, a chain-smoking poet who had lived in exile for most of the Era of Trujillo, was elected president with 60% of the vote. Initially hailed by the Kennedy administration as a potential showcase for democracy, the Bosch administration soon lost the support of the nation's military and the United States. When Bosch attempted to limit the power of the Dominican military, he was ousted from office in September 1963.

A new regime, dominated by Donald Reid Cabral, a former car salesman, lasted until April 1965 when pro-Bosch military officers, led by Francisco Caamaño Deñó, staged a revolt to return the exiled Bosch to power. As the death toll in the civil war mounted, and it became increasingly apparent that Caamaño Deñó's Constitutionals were taking control of the capital city of Santo Domingo, US President Lyndon Johnson ordered twenty-three thousand Marines to invade the Dominican Republic. Although the Organization of American States (OAS) eventually sanctioned the intervention by agreeing to send in additional troops, this was the first overt use of US military forces in Latin America since the Marines were withdrawn from Haiti in 1934. Ostensibly sent to protect lives and prevent the establishment of a pro-Castro government, the OAS forces supervised democratic elections in 1966, which were won by Joaquín Balaguer, who had been the titular president at the time of Trujillo's assassination. During Balaguer's tenure in office from 1966 to 1978, the Dominican Republic experienced the most spectacular growth of any Latin American nation during the 1970s. The nation's economic boom was made possible by political stability and a revitalized sugar industry.

High inflation and unemployment undermined Balaguer's hold on power during his third term. In 1978, Balaguer lost the presidential elections to the Partido Revolucionario Dominicano (PRD). Although Antonio Guzmán's administration implemented numerous health and education projects, by 1980, the economy had fallen into a recession. Plagued by the rising cost of oil imports, a sharp decline in the profits from sugar exports, and accusations that his daughter Sonia was involved in corrupt activities, Guzmán, a wealthy cattle rancher, decided not to run for reelection in 1982. The 1982 elections were won by PRD candidate Salvador Jorge Blanco. The day before he would have left office, President Guzmán committed suicide. Jorge Blanco's administration experienced a tremendous loss of popularity and legitimacy when it implemented International Monetary Fund (IMF) austerity measures in May of 1984. A series of violent riots broke out, which led to the death of dozens of Dominican citizens. Jorge Blanco was found guilty in a court of law of massive corruption and misappropriation of government funds and sentenced to twenty years in prison. Given the poor performance of the PRD governments, Balaguer returned to office in 1986. Balaguer won subsequent elections in 1990 and 1994. Acknowledging that there were voting irregularities in the 1994 election, Balaguer agreed to step down from the presidency in 1996 and hold new presidential elections.

The 1996 elections pitted José Francisco Peña Gómez (PRD) against Bosch protégé Leonel Fernández, who represented the Partido de Liberación Dominicana (PLD). Fernández, a young lawyer who had grown up in New York City, initiated a series of reforms designed to modernize the political economy and infrastructure. Sugar exports no longer represented a substantial component of Dominican revenue. Instead, tourism, mining (especially nickel), and remittances from Dominicans living abroad, primarily in the United States, accounted for the majority of Dominican revenue. Attempts were made to convert the sugar-growing lands to the production of other agricultural crops, such as pineapples, for export. Fernández was barred by the Constitution from running for reelection in 2000. PRD candidate Hipólito Mejía won the 2000 presidential elections. Mejía's administration has been characterized by excessive corruption, rising inflation, and a greatly devaluated national currency. The 2004 presidential elections were won by Fernández, who promised to reinvestigate the Dominican economy.

#### DOMINO THEORY

The domino theory, or domino effect, was made famous by US President Dwight D. Eisenhower (1953–1961), who, in order to justify US commitment to South Vietnam in 1954, compared the nations of Southeast Asia to a row of dominoes: if the Communist guerrillas were victorious in Vietnam, the rest of Indochina, and then the rest of Asia, would also eventually fall to Communism. The rapid advent of Communist regimes in Hungary, Poland, Czechoslovakia, Romania, Bulgaria, Albania, and

Yugoslavia following the end of World War II was used as evidence to support this premise.

By the same token, the demise of Communism in the Soviet Union would affect all Eastern European countries one after another, much like a chain reaction. It was hence popularly assumed to be a case of domino effect. This view overlooked that the Soviet bloc and its satellites represented a highly centralized system held together by an overarching ideology. Once the center and ideology could not hold, the periphery had no other choice but to loosen. Socialist countries were not so much independent entities prone to one another's influence, as parts of a single unified framework.

The metaphor evoked by the falling dominoes is used in both social and exact sciences, where several competing permutations can be found with slightly different meanings: chain reaction, forest fire models, avalanche dynamics, branching process, and so on. Moreover, the theoretical setup is based on medical-biological assumptions of "contagion," "disease," "viruses," and similar epidemiological jargon.

The concept reached its peak of influence during the Cold War, but continued to be applied to various international events in the aftermath of epochal changes. Even before the official end of the Cold War (marked by the fall of the Berlin Wall, in 1989), the concept was used to describe the possible spread of nationalism. The theory was adopted by both liberals and conservatives in the United States.

The concept's heuristic validity is complicated by its partisan political use. Indeed, the ghost of a domino effect has been used by various regimes in order to hamper broader democratic reform, while curtailing ethnic dissent. This was particularly the case among several developing countries during and after the Cold War. In the early 1990s, a long series of human rights violations by Asian states was dictated by fear of a hypothetical nationalist domino effect caused by the disintegration of the Soviet Union and Yugoslavia, including: China's stepping up of repression in Tibet and Sinkiang; Burma's refusal to allow democratic reforms in fear of civil war; Indonesia's uneasiness about revelations of mass slaughter in East Timor, Aceh, and West Papua; India's stranglehold on Assam, Punjab, Kashmir, and other restless areas; Pakistan's repression of the Sindh minority; Sri Lanka's offensive against Tamil separatism; Georgia's move to autocratic rule; Turkey's confrontation with the Kurdish insurgency; and Iran's resort to radicalism in the face of occasional tensions in border areas. In Africa, the fear of a domino effect was amplified by Eritrea's independence and the separation of northern Somaliland. In Zaire (now Democratic Republic of Congo), Mali, and Nigeria,

thousands died in ethnic clashes, often linked to the central governments' refusal to come to terms with ethnic demands. Finally, Iraq's decision to invade Kuwait in 1990 can be seen as a classic case of "externalization" of internal tensions resulting from a fear of contagion of both political Islam and ethno-national tensions.

All these cases were related to a worldwide concern about the inevitable dissolution of multinational states. The ghost of "balkanization" was raised as a tangible threat. Although threats from political opposition were sometimes tangible, they often became only a pretext to eliminate internal dissidence. Indeed, the same illiberal trend has pervaded the domestic and foreign policy of most multinational states, with the possible exceptions of federations like Canada and the European Union—the latter through the elasticity of Brussels' accommodating politics.

Although the theory had initially some strategic validity, the fear of a domino effect was, and will remain, at the roots of catastrophic choices in foreign policy. It was this fear that impelled Western elites to support Saddam Hussein's totalitarian regime in his war against Iran (1980–1988). The consequences of this decision, causing over a million deaths, will probably carry through for decades. The tragic blunder stemmed from the conviction that, following Iran's Islamic revolution, the fall of the Shah (1979) would be the first domino to tip other autocratic states in the Middle East toward Islamic rule. A panic-struck Western world reacted by supporting Iraq's Ba'athist regime with massive input of weapons and cash.

The danger of expanding Communism was certainly vivid in the aftermath of the Korean War (1950–1953). However, the theory's more recent adaptations rely mostly on a paranoid vision of the world and are rather characteristic of nationalist or imperial *geopolitics* (*Geopolitik* in German). The latter discipline was associated with the German geographer Friedrich Ratzel (1844–1904) and his theory of the organic nature of the State. Geopolitics was easily appropriated by the Nazi expansionist state, with its idea of *Lebensraum* ("Living space") as "essential" for the survival of the German race.

The domino theory has been particularly influential among US foreign policy and security experts, as an exemplification of what Richard Hofstadter called "*The Paranoid Style in American Politics*": "The exponents [of the] . . . paranoid style . . . regard a 'vast' or 'gigantic' conspiracy as the motive force in historical events. . . The paranoid spokesman sees the fate of this conspiracy in apocalyptic terms—he traffics in the birth and death of whole worlds, whole political orders, whole systems of human

values. He is always manning the barricades of civilization” (1996, p. 29).

A more “assertive,” less defensive, version of the theory was adopted by the interventionist hawks in President George W. Bush’s administration: They argued that Saddam Hussein’s fall would be followed by the quasi-automatic embrace of democracy by other Arab states in the region.

There is often some confusion between the factual image of falling dominoes and the ideological influence the theory may exert in action. The phrase “domino effect” refers to a movement of possible structural and international changes brought about by the emulation of successful political movements. It can be considered the subcategory of a more general demonstration effect: the latter refers to the reshaping of ideological orientation within political movements across frontiers as stimulated by international events. The domino effect is a more restricted concept, insofar as it is only a particular kind of demonstration effect with immediate implications in real political alignments: “domino” is about supposed or feared political change at the regime level, whereas “demonstration” is about ideologies and putative models at the grassroots level. Various assumptions underlie this approach, often defined as “ideological diffusionism,” mostly that ideologies spread in a parallel outward and top-down process. That is, ideas are disseminated horizontally from an ideological centre to the periphery, and vertically from the elites to the masses, both in a non-reciprocal way.

Given the domino theory’s incapacity to adequately explain, let alone predict, changes at the regime level, it remains at best an illusion, especially when accounting for non-institutionalized political movements. In particular, non-state nationalism and political Islam are often too vague, pervasive, malleable, and unpredictable a force to be prognosticated on the grounds of the diffusion of immanent forces.

### DRAFT DECLARATION ON THE RIGHTS OF INDIGENOUS PEOPLES

In an effort to specify and ensure greater respect for the rights of indigenous people to lands traditionally utilized by them, as well as to ensure their access to resources and the protection of their languages and cultures, the formation of a United Nations Declaration on the Rights of Indigenous Peoples was first proposed in 1985 by a series of resolutions submitted by the UN Sub-Commission on Prevention of Discrimination and Protection of Minorities. A Working Group on Indigenous Populations was formed to prepare the Draft Declaration, taking into account the comments and suggestions of participants in sessions composed of representatives of both indigenous peoples and governments. In July 1993, the Working Group agreed on a final text for the draft Declaration on the Rights of Indigenous Peoples and submitted it to the Sub-Commission. The Draft has been under review by the Inter-Sessional Working Group of the Commission on Human Rights, who hoped to have it approved by 2004, the close of the United Nations’ International Decade of the World’s Indigenous Populations.

Although the Working Group within the Commission on Human Rights held annual meetings with participation from government representatives and indigenous organizations each year between 1995 and 2004, no consensus was reached. Significant polarization between indigenous and state positions characterized the Working Group from the start, particularly surrounding the issues of self-determination, collective rights, and territorial rights. As the year 2004 came to a close, several drafts had been proposed but none had been agreed upon. Hunger strikes (called spiritual fasting) by indigenous peoples delegates and an Appeal of Indigenous Peoples at the United Nations Palais des Nations in Geneva, expressed the concern that the mandate of the Working Group would not be extended or that critical principles would be weakened in negotiations. The strike was ended when the Office of the Commission on Human Rights agreed to recommend to the General Assembly a second International Decade of the World’s Indigenous Peoples, to follow the conclusion of the present International Decade in December 2004.

Although disagreements remain between indigenous representatives and governments, and the amount of power to be accorded each in the process is still contested, the process of debate can be seen as contributing to awareness about indigenous rights within communities, among government representatives, and within supranational decision-making bodies. It has created a space for indigenous participation within the United Nations and altered some

of the fundamental regulations for participation in UN discourse by non-governmental parties. The ongoing initiatives of the Permanent Forum on Indigenous Peoples, the International Decade of Indigenous Peoples, and the deliberations within the Working Group to arrive at a Declaration on the Rights of Indigenous Peoples, have established cooperation between indigenous peoples and the United Nations. A Declaration on the Rights of Indigenous Peoples would be a substantial advance. The Declaration would be the first international instrument on human rights and fundamental freedoms to promote and protect the rights of indigenous peoples.

## DRUG TRADE

The term “drug trade” has two commonly understood meanings. The first is the focus of this article, but both will be briefly described.

The first concerns the illegal or illicit production, distribution, and trafficking (sale and profit-making) of drugs that are banned as narcotics internationally or nationally. It also describes the distribution and sale of drugs such as tobacco or alcohol, on which local taxes have not been paid (not really a significant problem in developing countries). The second meaning relates to the national and international production, distribution, sale, and prescription of medical drugs and pharmaceuticals. In both instances, the developing countries of the world are variously involved at all points in the cycle of supply and demand. The fact that both meanings exist in the English language often leads to confusion and misinterpretation. There is also an overlap between the two categories, when pharmaceutical, synthetic drugs such as amphetamines are sold for non-medical use.

In both instances, there have been significant economic and social effects from the existence of the drug trade, and the legislative, political, and even military efforts to eradicate or control supply in entire countries and sometimes continents. The related problems affect both developed and developing nations, but the impact of the drug trade itself and strategies to control it are not simple to assess. Indeed, they are at the heart of much controversy and global disagreement among governments, politicians, and professional and lay commentators.

## The War on Drugs

This concept of the world being engaged in a war against drugs in the last quarter of the twentieth

century and into the new millennium is a direct successor to the USA’s attempt at the internal prohibition of alcohol from 1920 to 1933. The contrary claims for and against strategies that are aimed at cutting off the supply of drugs and criminalizing the production, use, or trade in drugs, are now quite well-known and irreconcilable. The zero-tolerance prohibitionist stance is aimed at all elements in the drug trade: primary producers, traffickers and distributors, and drug users.

Prohibitionists argue that the drug trade causes:

- Potentially chronic health problems for users, and social and economic problems for themselves, their families, friends, and relatives;
- The escalation of violence, crime, and corruption linked to production and trade in illegal drugs;
- The deterioration of law and order and social functioning of communities, particularly in inner-urban areas, with resultant degeneracy and social decay;
- Many rural developing nations to become dependent upon drug crop income as primary producers;
- Other developing countries to become centres of drug-trafficking on the principal drug trade routes into the United States and Western Europe; and
- The creation of a criminal economy, with international money laundering based on the illicit income of violent gangs and drug traffickers.

Opponents of this view argue that ever-more stringent drugs-control strategies have already been shown to be a failure. There is a growing divide between drug experts in much of Europe and in the United States, with the Europeans stressing the need for a reevaluation of strategic policy on illegal drugs and to refocus resources on harm-reduction measures and demand reduction through education and treatment.

Opponents of the war on drugs argue that it has:

- Failed to decrease supply or production, while demand has if anything increased;
- Created an illegal international market worth US\$400 billion, and local illegal economies, which in turn have nurtured much of the associated violence and criminality;
- Criminalized producers and users; and
- Been a waste of money and resources as illegal drugs have tended to become cheaper and qualitatively purer.

The United Nations had traditionally occupied something of a middle ground between these points of view. The UN’s “balanced approach” to drugs

control shifted in 1998 following the appointment of Pino Arlacchi, who had previously worked against organized crime in Italy, to the Executive Directorship of the United Nations International Drug Control Programme (UNDCP). Arlacchi's uncompromising approach to target the countries where drugs are grown has proved popular with prohibitionists, but has led to abuses of human rights, such as the \$250 million the UNDCP pledged in 1997 to the Taliban regime in Afghanistan to stop opium production. The UNDCP has also attempted to change the types of crops grown by farmers in countries such as Bolivia and Colombia, where peasant farmers often cultivate the coca bush and opium poppies. However, in many instances the alternative crops do not produce the same revenue returns and often the farmers operate with the protection of rebel groups, such as FARC in Colombia, to continue growing illegal crops while accepting government handouts for the "new" crops. This is sometimes called "parallel development" rather than "alternative development."

For the farmers in developing countries to forgo the production of illegal cash crops requires that socioeconomic standards improve enough to guarantee economic stability for all, independently of drugs-control policies. This has occurred in Turkey and Thailand, but many commentators have argued that the drug trade in these countries moved to trafficking rather than production, which simply moved it to their neighbours, Iran and Burma.

## Legislation

As the total market value of illegal drugs matches oil or arms at about 8% of the entire world economy, international action against the drug trade has also become an increasingly global affair. The legislative base for these actions is primarily the United Nations. In 1961, the UN passed its first agreement among UN countries to work together to control illicit drugs. By 1988, psychotropic substances were added to the UN Convention Against Illicit Traffic in Narcotic Substances and Psychotropic Substances. This convention is still the bedrock of more recent UN-led actions such as the 1998 drug summit, with its ten-year plan proposed by Pino Arlacchi to "create a drug-free twenty-first century," with targets for all 150 member countries. The declaration adopted by the summit targeted money-laundering operations and illicit crop cultivation.

However, despite this legislative base, it is often pragmatism—the "carrots" (aid) and "sticks" (sanctions) of international cooperation—that determine

the actual operation of local policies on enforcement. Economic sanctions and international aid are two determinants of the degree to which countries work against the drug trade. Developing countries, with fragile agricultural economies and often unstable governance, are often insufficiently consulted regarding implementation of these international actions. For example, the use of aerial crop spraying of coca and opium with virulent herbicides such as tebuthiuron has had a negative impact on the land. In addition to the environmental impact, this does not inhibit production as crop growers in countries such as Colombia just move on from the denuded, sprayed land and grow crops somewhere else.

## Production

The figures and trends indicated in the *World Drug Report 2000* (UNDCP 2000) are treated optimistically by their authors, who suggest that significant progress has been made in controlling the production and trafficking of cocaine and heroin.

However, cannabis, which has been effectively de-criminalized in countries like the Netherlands, is grown in at least 112 countries, both developed and developing, and the UNDCP estimates that cannabis production adds up to about thirty thousand tonnes per year—perhaps ten times the total of coca and opium crop production taken together. Developing countries have also pointed to the fact that the eighteen main anti-drug trade operations of the 1990s have targeted the urban poor in the United States and the economically disadvantaged producers and traffickers, rather than the wealthy and well-armed networks and kingpins in the developing worlds. Comparatively, there has been little action taken against the producers and traffickers of drugs such as ecstasy (MDMA), amphetamines, and cannabis, which are spread much more widely across the world, with production and distribution centres in European countries such as the Netherlands, Belgium, and the UK. There are also moves toward legal cannabis production centers, such as the underground Sunless City of Flin Flon in Manitoba, Canada. There, three thousand plants are being cultivated under strict security, to be prescribed for Canadian citizens suffering from acute pain.

## Trafficking

The UNDCP defines trafficking as the distribution process for illicit drugs; therefore figures reflect the

## DRUG TRADE

rates for the apprehension of drugs. UNDCP perceives the success rate for the seizure/production of opiates to be 15% and 39% for cocaine, but others have estimated that interceptions may be as low or lower than 10% of the drugs actually being distributed. The UNDCP (2001) offers the following observations:

- Combined global heroin and morphine seizures amounted to 61 tonnes in 1999. Trafficking in those two substances continues to be concentrated in Asia (71% of all seizures in 1999);
- Trafficking increased in southwest Asia and declined in the southeast; and
- The seizures of synthetic drugs more than doubled in 1999 from a year earlier; seizures of cannabis herb rose by a third and opiates by 14%; cocaine seizures fell by 6%.

### Medicinal Drugs

Developing countries have often found it difficult to obtain affordable medicines for the treatment of disease and illness. One problem relates to patent laws that prevent cheap drugs being traded to these countries. These patent laws have been established World Trade Organization agreements, specifically the 1995 TRIPS (Trade-Related Aspects of Intellectual Property Rights) Agreement, which preserve the industrial patents for twenty years. There has been a recent movement, initiated with the Doha Declaration at the 2001 WTO ministerial conference, to relax or abandon altogether patent laws on drugs for diseases such as HIV/AIDS, which has reached epidemic proportions in Africa. Several countries, such as Zambia, South Africa, Guatemala, and Brazil, have repealed or defied their domestic patent laws, as well as international trade agreements, in order to produce generic versions of drugs necessary to combat major threats to public health; other countries with production capability, such as Canada, have amended their own laws in order to facilitate export of low-cost drugs to developing nations. Additionally, some organizations, such as Médecins Sans Frontières/Doctors Without Borders, have engaged in civil disobedience and illegally imported generic drugs to countries suffering from epidemics but whose patent laws prohibit the distribution of drugs by anyone except the company, usually the manufacturer, which holds the patent.

The World Health Organization (WHO) has identified that, “irrational prescribing, dispensing and consumption of medicines remains widespread” in

the developing countries. Since the 1985 WHO Conference on the Rational Use of Drugs, held in Nairobi, WHO has run annual courses in Asia and Africa for health professionals to try and deal with the problem. Meanwhile, poverty makes the purchasing of appropriate medicines acutely difficult, accentuated by improper prescribing based too often on drug promotion by pharmaceutical companies.

Two further problems are the dumping of medical drugs that are not licensed in the USA or Europe on the market in developing countries, and the growing resistance to common antibiotics such as penicillin in many developing countries, which makes diseases like meningitis, tuberculosis, and gonorrhoea far more serious and harder to treat effectively.

As the history of the drug trade, with its various facets, unfolds into the twenty-first century, it is uncertain whether international policy will continue to back the prohibitionist stance. Since much of the criminality surrounding drugs use is related to the trading of illicit drugs, many feel that freeing that market would be part of the solution. However, the international “jury” of policy makers and experts is still far from certain as to whether a gradual de-criminalizing or legalisation of drugs would be part of the answer.

## DRUG USE

The meaning of “drug” can be very different depending upon the cultural, social, and geographical context in which the term is being used. In reality there are many thousands of drugs available in the world. The taxonomy (classification) of a drug is problematic, so any list of drugs, description, or the use of the term may have an ideological and interpretive element. Similarly, the use of drugs and their effects is highly dependent upon *set* (the mood of the user) and the *setting* (where and with whom they are used).

Traditionally, the source of most drugs has been the plants, shrubs, and trees growing wild in the fields and forests of the world. However, with scientific and pharmaceutical preparation, many drugs are now synthesised—produced in some sort of laboratory—manufactured into medicines and treatments for illness, or for illegal use. Finally, there are a variety of drugs such as tobacco, alcohol, and caffeine-based drinks that are prepared for consumption by humans for relaxation or recreation. The legality or otherwise of specific drugs is a societally determined issue.

According to the United Nations International Drugs Control Program (2001), 180 million people worldwide—4.2% of people aged fifteen years and older—were consuming drugs in the late 1990s, including cannabis (144m), amphetamine-type stimulants (29m), cocaine (14m) and opiates (13.5m including 9m addicted to heroin). However, figures at a worldwide level are approximates, as many countries, especially in the developing world, do not collect drug use data. Also, much of what is known is based on the perceptions of authorities in the various countries and international organizations and will reflect such sources as police statistics, drug seizures, reports from social welfare organizations, and even media reportage.

The problems associated with drug use (or abuse) are given different prominence according to particular commentators' personal, political, or organisational convictions. These problems fall into a number of categories. Principally these are identified as:

- Health and social problems caused by use, especially when the user is a habitual or addicted user;
- Problems of criminality associated with the use of drugs, for instance, violent behaviour to others, self abuse, or theft and robbery; and
- Secondary problems such as those experienced in developing countries where intravenous use of drugs without an available needle exchange has abetted the spread of the number of people who have AIDs, hepatitis C, or who are HIV-positive.

There are also problems of corruption, intimidation, and extreme violence connected with the drug trade, particularly in predominantly peasant, agricultural economies where illegal drugs constitute the major cash crops and source of overseas income, such as Colombia and Bolivia (coca and opium) and Afghanistan and Iran (opium). This problem has also spread over into countries on the supply routes such as Jamaica, Nigeria, Cote d'Ivoire, and Turkey. In the past fifteen years, the specific countries involved in production and trafficking have continued

to change, usually in response to interventions by outside countries and international organisations.

Today, the world's politicians, criminologists, and drug and health experts are divided on how to respond to these problems and what policies regarding supply and demand are effective. These range from prohibition and zero tolerance to legalisation and harm minimisation.

## An Historical Perspective

During the evolution of mankind through the second millennium CE, most of the world's inhabitants lived close to nature. With an existence based on hunting and gathering, the indigenous inhabitants' knowledge and understanding of plants and natural preparations was far greater than currently exists. Indeed, many scientists and pharmacologists are only now beginning to collect and examine the properties of plants in the remaining rainforests of the world.

Historically, drug use has played a major part in everyday life, providing natural sources of food, a means of relaxation, mind-altering experiences, and medication. Ginseng is an Asian plant, which has an ancient history in Chinese medicine, but which has recently been rediscovered by the West as a drug made from ginseng roots for alleviating headaches, exhaustion, and possibly kidney disorders. Cannabis Sativa, now banned in many countries, was the main analgesic used in the United States in the nineteenth century and until 1937 was recommended in the American Pharmacopoeia as being useful in curing more than one hundred illnesses. Sigmund Freud called cocaine, extracted from coca leaves, a "wonder drug." It was used as an anti-depressant before amphetamines became widely available in the 1930s. Opium-based medicines were freely available even to children in nineteenth-century Europe and the United States, and laudanum—opium in an alcohol solution—was commonly prescribed as medication.

However, it must be noted that it is hard to generalise from any analysis of drugs made from fresh or dried plants, since each one has unique properties and potency, affected by soil conditions, propagation, location, sunlight, and many other variable factors. Similarly, it has been found in analysis that the active ingredient of a drug, usually an alkaloid, may weaken quickly or may not have much efficacy when separated from the rest of the plant's constituents. Synthetic drugs, on the other hand, can be standardized through manufacturing techniques.

Herbal drugs, which reached their height of popularity during the seventeenth century, were the

precursors of modern pharmacology, but their association with astrology, magic, and the arcane left their legacy largely discredited until recently. It is possible to trace drug use in different cultures and at different times through a pattern of use in magical rites, religion, science, hedonism, and recreation. These patterns of use are called “socially situated” or “socially created” realities, which must be seen in the context of specific societies, their ethnicity, beliefs, cultural lives, and often the age and gender of the users.

Many tribes throughout the world have used plant extracts as a means of intoxication. One of the most common is the chewing of betel nuts, which are actually the seeds of the areca palm. This habit is practised by up to a tenth of the world’s population, in a broad range of countries stretching from Tanzania across the Indian subcontinent to the western Pacific islands. Despite its common usage, the exact effects of the nine alkaloids present in the betel/lime mix are not precisely known, but they include creating a sense of well-being and euphoria, suppression of hunger, and in heavy users, some hallucinations. Arecoline is believed to be the most active alkaloid.

Other common drugs have a much stronger connection with ritual and initiation rights. Peyote and kava are two well-documented psychotropics. Ritual kava use was particularly widespread across Melanesia in the western Pacific, and especially in New Guinea. Kava is a species of pepper plant that grows up to four metres tall. Women and children traditionally chewed the roots and lower stems and spat the residue into a large bowl into which water was added. The resulting infusion was then drunk by elite men, the elders or initiates of the tribe, as part of their rites, usually in conjunction with a ritual regime of fasting, dancing, and chanting. It is still available by mail order in many parts of the developed world as a “legal high.” Peyote and the closely related mescal derived from cactus plants (*lophophora williamsii*) in Mexico and South America are, along with magic mushrooms (including *amanita muscaria*/fly agaric), probably the best known of the ritual hallucinogens used in the celebration of shamanistic religion and more recently as a route to mind-altering states in urban areas. The use of peyote in religious ritual amongst the Huichol Indians of Mexico, who believe that the plant has a soul, pre-dates the Spanish Inquisition’s arrival in Mexico in 1571. Members of the Native American Church can still legally use peyote in rituals in many American states. In the Andean region of South America, chewing coca leaves, again coated with a lime paste to release the active alkaloids, is used as a stimulant, and the average daily intake by the Indian population is estimated to be two ounces of dried leaves (about 0.5 grams). The use of

coca is seen as an essential part of the Andean cultural heritage, for social and medicinal purposes, not to be confused with the patterns of use of cocaine in Western nations.

The perception of different drugs and their uses continues to change with each century, especially in the new age of globalisation.

## The Legality and Use of Drugs

The earliest recorded prohibition of drugs was probably made by the prophet Mohammed in the seventh century CE, who forbade his followers to use alcohol, because of its centrality in Christianity, where wine represents the blood of Christ in the sacrament. This prohibition still exists in many Islamic states. In more recent times, Christian missionaries brought alcohol, along with a new religion, to many indigenous cultures including the Native Americans, the Aborigines of Australia, and the Maoris of New Zealand. Some indigenous religions did survive, such as the Bwiti cult around the Gabon in West Africa. They make ritual use of the iboga plant, whose active element is ibogaine, from the dogabne family. Iboga is an hallucinogenic that many doctors and others in the West believe possesses extraordinary medicinal properties.

The world’s developing nations are both consumers of a variety of drugs and the major producers/primary supply sources of many drugs—both those deemed illegal and legal. Industrialised nations have frequently looked to apportion the blame for the problem of drugs on producers, traffickers, and users. Inevitably this has meant that much of the “war” on drugs has been focused on the developing nations. It has also caused huge disparities of opinion over whether prohibition and regulation of drug use actually have a positive effect on the people of the world, either in terms of whole countries that may produce banned drugs as primary crops, or individuals who can be criminalized as well as potentially suffering from ill health through their use of drugs.

## Drug Use in Developing Countries

Developing countries that are involved in the production and trafficking of drugs are the most affected with the problems associated with illegal drug use. The World Bank (1997) has compiled a great deal of information about the prevalence of drug use in developing countries. There are some caveats to this data, as it comes from many sources over a period

of approximately ten years. It is likely that much of the data consists of estimates, as some countries have not undertaken research on issues such as the prevalence of injecting drug use. However, the World Bank data remains one of the best indicators for ascertaining the patterns of use in developing countries.

According to this source, injecting drug use has been spreading globally and is especially prevalent in Thailand, Argentina, Puerto Rico, Hong Kong, Malaysia, and some parts of India. Heroin is the main drug injected in Asia, and cocaine is the main drug in South America. The availability of cheap, relatively pure, refined heroin or cocaine in areas of primary production and along trafficking routes appears to coincide with centers of drug use. The move from smoking unrefined brown sugar heroin in India and China to injecting refined heroin again mirrors the changes in the production, though smoking is still more common in areas close to the poppy fields such as in Myanmar. It is also thought that because injection is a more efficient form of administration, this may have led poorer users to utilise the most economic means of use.

Law enforcement programs against drugs around the world have caused considerable displacements of both primary suppliers and traffic routes. Thailand began an aggressive law enforcement program against opium and heroin production, and initiated crop-replacement programs for farmers who relied on these as cash crops. Production took a corresponding downturn; trafficking, however, did not.

Drug users in the developing countries are typified as being more than 75% male and relatively young, mostly from twenty to forty years old. Information has mostly come from drug clinics in urban areas, therefore it may not reflect rural drug use. As might be expected, the social and economic characteristics of injecting drug users varies from country to country. In Manipur, India, more than 70% are employed, whereas users in Brazil are mostly classified as “deprived” and unemployed. In relation to the potential spread of AIDs through infected needles, there is evidence that 72% of the users in both Rio de Janeiro and Bangkok have shared needles.

## The Future

The European Monitoring Centre for Drugs and Drug Addiction, based in Lisbon, Portugal, has noted an increase in the use of more synthetic drugs such as ecstasy, LSD, ketamine, and amphetamines in the West. Meanwhile, cannabis is still the most used drug in developed countries. The popularity of

synthetic drugs in part reflects the rave culture of the 1990s and the subsequent move of many of its aspects, from music to dress to drugs, to the mainstream. But it has also probably resulted from shifts in production, since it is easier for laboratories to be set up close to demand centres. Most synthetic drugs are simple to produce, which has resulted in cheap supplies of such drugs, particularly in the Netherlands, Belgium, and the UK. Whether these drugs will also become the focus of production and use in the developing countries, it is too early to speculate.

## DRUZE

The term *Druze* refers to both an Islam-based sectarian belief system and its adherents. Within the global Islamic community, the Druze are not generally regarded as true Muslims. This attitude toward the Druze is directed at the faith’s divergence from the main body of Islam and many of its core beliefs.

## Druze Origins

The Druze faith was established during the eleventh century CE in Cairo under the reign of the Fatimid

Caliphate. It began as an Islamic reform movement. Among the reforms advocated were the abolition of both slavery and polygamy, as well as the introduction of a form of secularism in terms of religious and governmental separation. Other sectarian Islamic groups also adopted and instituted these ideas, while mainstream Islam did not.

The early history of the Druze faith centers around three figures in particular, the first of which is Hakim, the sixth caliph in the Fatimid succession and the individual regarded as the founder of the Druze faith. The second important figure is Hamza, a religious writer, teacher, and leader appointed by Caliph Hakim. Many of the Druze manuscripts and records of the teachings of Hakim are attributed to Hamza. The third figure is that of Darazi, from whom the faith takes its popular name, though most Druze prefer to be collectively known as *Muwahedin*, or monotheists. Darazi was an underling of Hamza who sought to rise through the ranks to surpass his master. Darazi began twisting the faith to help meet his ends and became branded as a heretic. He was most likely ordered put to death by Hakim and Hamza in 1019.

## Druze Beliefs

The belief system of the Druze is Islam-based, and also respects the traditions of Judaism and Christianity. The Druze find both metaphorical and literal messages in the Qur'an, the Bible, and the Torah. While the Druze regard the texts of the three Abrahamic faiths as messages from God, they have their own scriptures, in the form of various manuscripts, most of which were written between 1017 and 1043 CE.

The Druze believe that God is beyond the comprehension of the human mind. While the Druze faith is an offshoot of Islam, its beliefs deviate from Islam considerably. One such belief is that of reincarnation, which is not contained in any of the three Abrahamic faiths. The motivation behind this belief is that humans are imperfect; therefore, they cannot attain the level of equality to be united with God. Hence, humans are forced to repeat the cycle of life until reaching either Heaven or Hell. Reaching either destination, humans no longer endure the reincarnation process. According to Druze doctrine, God's presence is not limited to the caliph. Elements of God can also be found in a hierarchical system of leadership ranging from clerics down to community leaders. Another difference between the Druze faith and that of the Sunni and Shi'a is the place of religious observance. The Druze do have mosques, but they also

have the *khalwa*, which serves a purpose similar to that of a monastery. The *khalwa* is usually located on top of a hill outside a city, and serves as a place of seclusion for the learned of the Druze faith.

## Druze Society

The basic structure of Druze society is a division between the *uqqal*, or wise, and the *juhhal*, or ignorant. Both men and women may be initiated as *uqqal*. The *uqqal* are those members of the faith understanding its specifics and adhering to its doctrine and demonstrating piety, while the *juhhal* are the majority of the population and understand only the basics of the faith. A member of the *juhhal* is able to become *uqqal*. A further division exists within the *uqqal*. The best of the best are known as *ajawid*, and they are the decision makers and leaders within Druze society. Despite the divisions, a sense of communalism and unity prevails among the Druze. Family is also an important aspect of Druze society, with individuals often remaining close to their family members.

## The Druze in History

Upon the conquering of the Levant by the Ottoman Turks in 1516, the Druze were able to maintain their air of independence and resistance in their mountain strongholds, while the neighboring Arabs were forced to submit and become part of the Muslim empire.

Druze communities exist in Lebanon, Syria, Israel, and Jordan. The Druze have often been in conflict with their host governments, especially when control over Druze communities by the host governments has been strong. On the other hand, because the Druze have been excluded from the power structure in some countries, the Druze have enjoyed some autonomy in their isolation. The Druze have made their presence known to the outside world at various times in history. Conflict between the Druze and the Maronite Christians in Lebanon led to European intervention, on the part of France and England, during the 1800s. The Europeans helped the Ottomans restore order, but the Ottomans engaged in playing the Druze and Maronites against each other, which led to a major civil war in 1860. Over the course of four weeks, the Druze killed around twelve thousand Maronites, and the Maronites forced around one hundred thousand Druze from their villages. With an interest in protecting their fellow Christians, France and England landed troops at Beirut and invaded Damascus.

The two European powers then forced the Ottomans to establish the autonomous province of Mount Lebanon with Christian leadership.

At the end of the First World War, the Sykes-Picot Agreement between the British and the French, reinforced by the Treaty of Versailles and the League of Nations, allowed for the establishment of semi-independent Arab states in the Ottoman territories under French and British mandates. In effect, this was colonialism, and was not viewed with favor by the Druze communities falling under the new French administration. By 1925, the French had a Druze revolt on their hands in Syria, which took some effort to quell. The leaders of the revolt were arrested and exiled to Palmyra, in the northwestern part of Syria. The European mandates in the Near East lasted relatively briefly, with Iraq gaining its independence in 1932, Lebanon in 1943, Syria and Transjordan in 1946, and Palestine in 1948. At the end of the British Mandate in Palestine was the war for Israeli independence, which began immediately. When France relinquished Lebanon, they left it with a hierarchical power structure with the Christians at the top, then the Sunni, then Shi'a, with the other minority groups including the Druze in exclusion. Problems emerged in the power balance in 1958, and a civil war ensued only to be silenced months later. This was an attempt at wresting power from the hands of the Lebanese Christians to unite the country with the newly formed United Arab Republic, composed of Egypt and Syria.

Some of the Druze in Israel serve in the Israeli Defense Force (IDF), which has led to further resentment from much of the Islamic world. More Druze communities were added to Israeli jurisdiction in 1967, when Israel was able to seize the Golan Heights from Syria. Though these Druze were offered Israeli citizenship when Israel annexed the Golan Heights in 1981, many chose to resist. Some of these communities have rebelled against Israeli authority, but not to an extreme. Despite all the effects of warfare and changes in political geography, the Druze have been able to maintain their beliefs and sense of independence for more than one thousand years. The Druze of Lebanon experienced some difficulties in displacement and stability from the 1975–1990 civil war in that country.

Today, the Druze number more than six hundred thousand worldwide. The Druze communities remain somewhat isolated, although many within the various communities have abandoned subsistence agriculture in favor of capitalist ventures. The Druze are one of the least studied and most misunderstood groups in the Levant and the Near East.

### DUBCEK, ALEXANDER

Alexander Dubcek (1921–1992) was born in Uhrovec, Czechoslovakia (existed 1919–1992; now part of the Slovak Republic), on November 27, 1921. Both of his parents were dedicated communists. He grew up in Slovakia but moved to Kirghizia (today Kyrgyzstan) when his father answered the call of the Soviet Communist Party to "build socialism in one nation [Soviet Union]." The Dubcek family returned to Slovakia in the spring of 1938, and that summer Alexander formally joined the Slovak Communist Party (SCP), which was illegal at the time.

In September 1938, following the Munich Conference, Nazi German forces occupied the Sudetenland (western Czechoslovakia) and, the next spring, all of Czechoslovakia. Over the next six years, Dubcek fought German occupation forces both as a partisan soldier and as an underground political activist for the Slovak National Uprising.

Since the communists played a leading role in the resistance, they were in a strong political position within Czechoslovakia after the war. In 1948, they took power with Soviet support. Dubcek rose rapidly through the Party ranks, gaining membership on the Central Committee of the SCP in 1951. In 1955, SCP leaders sent him to the Moscow Political College, from where he graduated with honors in 1958. Upon his return he joined the Czechoslovak Communist Party (CCP) and by 1962, he had become a full member of the SCP and CCP Central Committees.

During the 1950s and early 1960s, the Czech economy, suffering from the ravages of World War II and

CCP mismanagement, languished. They lacked capital to rebuild the nation's business and industrial base as well as its infrastructure. In addition, Slovaks began to chafe at their second-class status in a nation run by Czechs from the old Bohemian capital of Prague. Perhaps most unsettling was the apparent easing of Soviet controls brought on by the de-Stalinization process begun by Soviet Communist Party First Secretary Nikita Khrushchev (1956–1964) in 1956. In spite of the Soviet repression of Hungarian and Polish reform movements, by the early 1960s, many Czech and Slovak Party intellectuals believed the time was ripe for liberal reforms in their parties and nation.

During a Central Committee meeting in October 1967, Party reformers, led by Dubcek, openly challenged the policies of First Party Secretary Antonin Novotny (1957–1967). Opposition to Soviet-style communism and the rise of an anti-Novotny coalition within the CCP led to the confrontation. In December 1967, the failure of the Soviet Party's First Secretary Leonid Brezhnev to support Novotny helped lead to the latter's fall from power. The resulting Party shakeup made Dubcek First Party Secretary of the CCP on January 5, 1968. The whole world waited to see what Dubcek would do and how the Warsaw Pact would react.

From March to August 1968 (known as the "Prague Spring") Dubcek attempted to "liberalize" and "democratize" both the Party and the state. Providing what he called "socialism with a human face," his political reforms made Czechs and Slovaks, communists and noncommunists, politically and legally equal. Economic reforms attempted to open the nation to Western trade and investment.

However, the Prague Spring caused great consternation among the Eastern Bloc states (mostly Poland and East Germany) and the Soviet Union. Throughout, Dubcek sought to reassure his communist brethren that his nation was still communist and loyal to Moscow. He argued that the reforms were an internal matter that should not affect Soviet–Czech relations. As tensions mounted, a series of meetings ensued, which Dubcek hoped would placate the Soviets. They did not!

On August 21, 1968, Soviet and Warsaw Pact tanks rolled into Prague. Dubcek and other reformers were seized and taken to Moscow where they were forced to rescind all their reforms and accede to Soviet demands to "fall into line." The citizenry resisted with large public nonviolent protests. They even renamed towns and villages names such as Dubcekovo ("belonging to Dubcek") to confuse the occupiers and demonstrate support for their leader. Their efforts failed. On August 27, with tears

streaming down his face, Dubcek told the nation that all their efforts at reform had been thwarted.

While Dubcek was temporarily allowed to stay in the government and the Party, slowly but surely his authority was eroded, at the behest of the Soviets. By April 1969, he had been expelled from all Central Committee posts. He served as ambassador to Turkey from 1969 to 1970, but was soon expelled from the CCP and sent into internal exile as a "forestry official." He was not permitted to speak to anyone outside of his family without government consent.

Dubcek survived, and when the Soviet Union began to fall apart and its grip on Eastern Europe relaxed, he returned to abet the so-called Velvet Revolution of November 1989. He made a stirring speech to a deliriously happy throng of Slovaks in Bratislava. Later, standing on the balcony of the Presidential Palace overlooking Wenceslas Square with newly elected President Vaclav Havel, he received cheers and accolades as a national hero from thousands of Czechs and Slovaks. On December 28, he was elected Chair of the National Assembly and was reelected a year later.

Dubcek also found time to write about his and his nation's struggle for independence and democracy. In November 1992, he published his memoirs, *Hope Dies Last*. Sadly, only one month later he died, on December 7, from massive injuries suffered in an automobile accident.

Dubcek's legacy is one of a national political, social, and economic reformer. In many ways, in 1968, his vision of his nation's future formed the foundation of relative prosperity, democracy, and freedom that both the Czech Republic and Slovak Republic enjoy today. In the 1990s, not only did both peoples prosper but they also demonstrated that even major disagreements can be peacefully settled. The best example of this was the dissolution of Czechoslovakia into the Czech Republic and Slovak Republic on December 31, 1992. Indeed, the two neighbors continue to enjoy good commercial relations and open political interaction. As such, one can reasonably say that Alexander Dubcek is the modern father of both nations.

## DUVALIER, FRANÇOIS

President of Haiti from 1957 to 1971 and sometimes known as Papa Doc, François Duvalier was born in the capital city of Port-au-Prince. One of his early teachers was Dumarsais Estimé, known as a champion of the underprivileged Black majority and later was to become president of Haiti. Another of his teachers was Jean Price-Mars, whose writings romanticized voodoo and the Haitian peasantry. Duvalier went on to medical school in Haiti, and later became involved in a successful campaign against malaria and yaws. He practiced medicine in a village just south of Port-au-Prince and would later claim to have gained an intimate knowledge of rural Haiti from his work there.

He developed the traditional color model of Haitian politics into the notion that all the progressive heroes, notably Estimé, were Black, and that the mulatto elite had always blocked reform.

In 1946, Estimé became president, and his government introduced many progressive reforms, leading to what some have called the Social Revolution of 1946. Duvalier saw himself as the intellectual and political heir to this revolution.

Four years later the army ousted Estimé, and a former colonel, Paul E. Magloire, became president. Enjoying the support of the mulatto elite, as well as the USA, Magloire tried to reverse the reforms of Estimé. Duvalier, who had risen through various government posts to become the secretary of Labor and Public Health, left public life to help organize the opposition to Magloire. In 1956, Magloire fled into exile, the army once again took over, and after several provisional governments, Duvalier emerged as the primary proponent of the Estimé social revolution and won the presidency.

Inaugurated on October 22, 1957, Duvalier promised to continue the social revolution by raising the standard of living primarily through stabilizing the economy and increasing the literacy rate. After facing several invasions and insurrections early in his presidency, however, he became obsessed with the perpetuation of his rule. His ruthless suppression of all opposition became legend. After an attempt on the life of his children in April 1963, he became increasingly isolated, never traveling outside Haiti and rarely leaving the National Palace. The Haitian treasury was treated as the family budget, and aid monies were funneled to the first family and Duvalier cronies. Meanwhile, political opponents were tortured and executed, professionals left the country in large numbers, the economy deteriorated, the Duvaliers invested their stolen monies abroad, and foreign investment evaporated. In 1963, US President John F. Kennedy canceled most of the aid from the United States. Over the years the government of Duvalier provided very few services to the general public, and agricultural development in what is essentially an agricultural country was almost totally ignored.

During the last years of Duvalier's life the economy was somewhat bolstered by the establishment of some small industries attracted by the cheap labor, but the living standard for most of the population remained immeasurably low.

During the night of April 21, 1971, Papa Doc Duvalier died, and his nineteen-year-old son Jean-Claude was proclaimed president-for-life the next day.

## **EAST AFRICA: HISTORY AND ECONOMIC DEVELOPMENT**

Conceivably one of the most diverse in Africa, the nucleus of this region is best viewed as consisting of the *East African Plateau* and the *Ethiopian Highlands*, which are both intersected by the *Great Rift Valley*. This spectacular geological fault that began forming approximately 20 million years ago was named by the nineteenth century Scottish explorer John Walter Gregory. Stretching approximately four thousand miles, it actually begins in Jordan and follows the course of the Jordan River into the Dead Sea. From there it passes through the Gulf of Aqabah and follows along the Red Sea entering Eritrea at the Danakil Depression. From there the valley slices through Ethiopia and splits near the Kenya border. The eastern branch enters Kenya at Lake Turkana and then proceeds southward into Tanzania at Lake Natron. The western branch of the valley follows the border between Uganda, Rwanda, Burundi, Tanzania, and Zaire and includes lakes Albert, Edward, Kivu, and Tanganyika. The two branches of the Rift Valley reunite at Lake Rukwa in Tanzania, where it continues through Malawi to the Indian Ocean coast near Beira in Mozambique.

Although most of the countries of this region are geographically heterogeneous, extensive portions of Ethiopia, Eritrea, Kenya, Rwanda, Burundi, Uganda, and Tanzania are comprised of highlands, whereas most of Somalia, Djibouti, and the Sudan tend to be relatively low. When the land on both sides of the Rift Valley erupted, a series of volcanic peaks were

created. These include Africa's highest mountain, Mt. Kilimanjaro in Tanzania (19,321 feet), as well as Mt. Kenya (17,007 feet), Mt. Meru in Tanzania (14,955 feet), Mt. Elgon in Kenya (14,152 feet), and the Virunga Volcanoes, comprised of eight mountains ranging from ten thousand to over fourteen thousand feet elevation on the border of Uganda, Rwanda, and Democratic Republic of Congo. The valley floor gradually sank into a low and flat plain which varies in width from thirty to forty miles and in elevation from 1,300 feet below sea level in the Dead Sea to about 6,000 feet above sea level in parts of Kenya.

East Africa's active geological processes have also generated a series of lakes. Though not technically in either branch of the Rift Valley, nonetheless *Lake Victoria*, which borders Kenya, Uganda, and Tanzania, is Africa's largest lake (26,830 square miles) and the world's second largest freshwater body. Its fisheries provide sustenance for millions of people in the three countries it borders. The ultimate source of the world's longest river, the Nile, is located in Jinja, Uganda, near Lake Victoria. The Rift Valley's western sector contains smaller lakes, such as Albert, Edward, and Kivu. It also holds *Lake Tanganyika*, on the borders of Tanzania, Democratic Republic of Congo, Zambia, and Burundi, which is Africa's second largest lake (12,471 square miles) and the world's second deepest (4,700 feet). *Lake Malawi*, which borders Malawi, Mozambique, and Tanzania, is Africa's third largest lake (2,471 square miles) and essentially lies at the end of the Rift Valley. *Lake Turkana* (2,703 square miles), on Kenya's northern border with

Ethiopia, has no outlet; hence water is lost mainly through evaporation and is therefore highly alkaline. It does manage to sustain ample stocks of both fish (especially Nile Perch and Tilapia) and crocodiles. In fact a number of smaller Rift Valley lakes tend to be shallow and have a high mineral content, specifically sodium carbonate, as the evaporation of water leaves these salts behind. This creates an ideal scenario for breeding blue-green algae, and these so-called “soda lakes”—Nakuru, Elementaita, Magadi, and Bogoria in Kenya, Natron, and Eyasi in Tanzania, and Ziway, Langanu, Abiyatta, and Shalla in Ethiopia—are famous for attracting a huge number of flamingoes.

If the African continent is the birthplace of humanity, then East Africa is surely the cradle of the human species, and a majority of paleoanthropologists believe that the Rift Valley holds most of the clues to our past. The earliest known *hominid*<sup>1</sup> fossils date from between four to five million years ago (MYA) and come from parts of the Rift Valley situated in what is now Ethiopia. These include specimens that presumably represent species such as *Ardipithecus ramidus* (4.4 MYA), *Australopithecus anamensis* (4 MYA), and *Australopithecus afarensis* (3.5 MYA). Certainly the most famous hominid fossil is *Lucy*, a 3.2-million-year-old example of *A. afarensis* found by Donald Johanson and Tim White in Hadar, Ethiopia, in 1974. This was where our ancestors took their first great strides—especially bipedal locomotion. The 3.4-million-year-old footprints found in Laetoli, Tanzania, by Mary Leakey and Tim White provided corroborating evidence of bipedalism around the same time period. Sometime between two and two and a half million years ago hominids named *Homo habilis* began making and using stone tools. In addition to their use as digging implements, these stone tools might have enabled *H. habilis* to scrape meat off scavenged carcasses and extract protein-rich marrow from animal bones. Ample evidence of tool manufacture was first uncovered by Louis and Mary Leakey at sites such as Olduvai Gorge in Tanzania. Tool making and fire use would later enable members of several subsequent species—*Homo erectus* and *Homo sapiens*—to emanate outward to other parts of Africa, as well as the Middle East, Asia, Europe, Australia, and eventually the New World. Every year ongoing discoveries by paleoanthropologists either push back the date for the earliest hominid or refine the proposed evolutionary sequence, but none alter the certainty that East Africa holds the ultimate key to understanding our species’ past.

Historically, two cultural factors—the Swahili language and the Islamic religion—have acted to partially integrate segments of this vast region. *Kiswahili*, the Swahili language, is spoken over a large part of East Africa, principally in Kenya and Tanzania, but also in portions of Uganda, Rwanda, and Burundi, although to lesser degrees. Kiswahili is an indigenous African language of the Bantu sub-family of the Niger-Congo language family, but it is also heavily infused with words borrowed from Arabic and Persian. It arose along the coastal portion of East Africa in a specific social niche where Arab traders mixed with Africans to create the *Swahili people*, language, and culture. In the eighth century, the Swahili and neighboring peoples adopted Islam along the coast. Many scholars think because it contributed to the atmosphere of trust and security that was necessary to sustain such a far-flung trading network with links not only to the Arabian peninsula but also the Indian sub-continent, Malaysia, Indonesia, and China. A Greek mariner’s account from the first century AD, known as the *Periplus of the Erythraean Sea*, refers to the well-established East African trading routes and export of commodities such as ivory, tortoise shell, coconut oil, and rhinoceros horn. For centuries a wide range of goods, including gold from the southern African kingdom of Great Zimbabwe as well as slaves taken from the interior, were exported and imported by the Swahili merchants, who acted as middlemen between the Arab traders who sailed *dhow*s (sailing vessels with unique triangular sails) down from the Arabian peninsula and then back according to the prevailing monsoon winds. The arrival of the Portuguese on the East African coast in the fifteenth century interrupted the hegemony of the independent Swahili city-states, of which there were perhaps as many as forty. In the late eighteenth and early nineteenth centuries, the Portuguese influence waned and the Swahili city-states came under the control of the Sultans of Oman. In 1840, Sayyid Said relocated his court from Muscat to Zanzibar island, off the coast of what is now Tanzania. His influence continued until the European intrusion in the late nineteenth century.

Most of the countries which constitute this region today, and indeed most of Africa, derive from the workings of European minds rather than from any types of indigenous political boundaries. This recognition is absolutely critical for understanding the roots of East Africa’s contemporary problems. Initial European contacts with Africa were chiefly commercial in nature and usually conducted by trading companies. For example, the German East Africa

<sup>1</sup> Modern humans and our immediate ancestral species.

Company and Imperial British East Africa Company were licensed by their home governments and, hence, were more or less given free reign. As Europeans began to discern the African continent's substantial economic potential, what came to be known as *the scramble for Africa* ensued. Economic competition was fueled by the inter-European political rivalries, particularly between the British and the French. In a conference sponsored by Chancellor Bismarck of Germany and held in Berlin from December 1884 to April 1885, European powers began the act of formally partitioning the African continent. In the process, East Africa was divided between Germany, France, Belgium, Italy, and Britain, although by far the latter exerted the strongest influence over the region. The mood of the time is embodied in the much quoted remark of King Leopold of Belgium, who declared at the Berlin Conference, "I am determined to get my share of this magnificent African cake."

The boundaries laid down over the ensuing decades have, by and large, remained untouched into the twenty-first century. By the end of World War I, when Germany's colonies were assumed by Britain, the political map of Africa was largely completed. When these nations, as well as all the other African states, gained their independence from their European colonial overlords, they consciously made decisions to retain the political borders drawn by outsiders. The ramifications have been enormous—members of some ethnic groups were divided artificially by political borders, while in other cases members of groups which have long been mutually hostile were forced into close proximity and association. Then there was the famous colonial strategy of divide and rule to consider, whereby Europeans deliberately accentuated "tribal" differences among Africans in order to play one group off against another. Many East African tribal amalgamations are in fact not primordial, but are rather the result of twentieth century colonial rule.

**Ethiopia** (471,776 square miles) was exceptional for being one of only two African countries—the other being Liberia—to escape colonization by European powers in the late nineteenth and early twentieth centuries. Both the Ethiopian monarchy and Orthodox Christianity have long and rich histories. Although it did manage to avoid initial colonization, Italian forces, from 1935 to 1941, occupied Ethiopia, along with part of Somalia. Many Pan-Africanists considered Italy's act of aggression to be highly inflammatory, and the Italian occupation of Ethiopia is widely considered to have been the major catalyst for the incipient nationalist movements around the continent. After returning to power Emperor Haile Selassie ruled until 1974 when he was ousted in a Marxist

coup d'état. **Eritrea** (46,718 square miles) was established as an Italian colony in 1890 and subsequently transferred to British control in 1941. It was henceforth incorporated into Ethiopia in 1962 and later attained independence in 1993 after a prolonged armed struggle between the Eritrean Peoples' Liberation Movement and the Ethiopian government. **Djibouti** (8,494 square miles), the smallest country in this region, evolved in 1977 out of the colony known as French Somaliland which itself was established out of France's desire to control the entrance to the Red Sea. **Somalia** (246,201 square miles) was declared a British Protectorate in 1886. Around the same time Italy had established a colony in southern regions, but this was relinquished to the British in 1941. From 1950 to 1960, Italian Somaliland was a United Nations Trust Territory. British Somaliland became independent in June 1960 and in July of the same year it united with Italian Somaliland to become the Somali Republic.

Most Americans are probably unaware that the *Cold War* was not fought just in Europe and Asia—it was also played out on African soil. Although the best-known examples come from southern Africa, for example Angola and Mozambique, of particular relevance for East Africa were Ethiopia and Somalia—both lying in the strategic Horn of Africa and the sea route between the Red Sea and the Gulf of Aden. The United States and the Soviet Union each sought an active presence in the region. Until 1974, the US backed Emperor Haile Selassie's government in Ethiopia, while the Soviets had provided military equipment and training to Somalia. After the Marxist coup in Ethiopia, the superpowers exchanged spheres of influence as the Soviet Union proceeded to back the regime of Major Mengistu Hailie Mariam, while the US supported the Somali strongman, Mohamed Siad Barre. With the demise of the Soviet Union in 1991, assistance to both countries dried up. This quickly led to major political changes: in the case of Somalia the government disintegrated as Mohamed Siad Barre fled while rival warlords fought for supremacy; in Ethiopia it meant another coup, this time with Mengistu being removed by the Ethiopian People's Revolutionary Democratic Front and EPRDF chairman Meles Zanawi.

**Sudan** (967,493 square miles) is Africa's largest country at over one quarter the size of the continental United States. It was once the Anglo-Egyptian Sudan, created by the Anglo-Egyptian Condominium of 1899. Prior to that date and for most of the nineteenth century, Egypt had actually exerted control over most of Sudan. In reality neither Egyptian nor British rule sought to do what was best for the Sudanese people nor heal the tremendous cultural and religious rifts

between the peoples of the northern and southern parts of this enormous country. In 1953, Britain and Egypt signed an agreement to grant independence to the Sudan, which came in 1956. Since then the country continues to be divided along cultural and religious lines, as the government has been dominated by the Muslim peoples of the north, who treat the Africans living in the south as second-class citizens. Forming the *Sudanese People's Liberation Army* (SPLA), these southerners, led by Colonel John Garang until his death in 2005, are mostly adherents of Christianity and animist religions. They have been waging a civil war against the northern-dominated government since 1972. Several rival rebel groups formed in the early 1990s. The *Intergovernmental Authority on Drought and Development* (IGAAD) was organized in 1993 under the chairmanship of President Daniel arap Moi of Kenya, comprising heads of state and ministers from other neighboring countries—Eritrea, Ethiopia, and Uganda. Under the assumption that the Sudanese civil war was a *regional* rather than national conflict, IGAAD began mediation efforts to try and find a framework for peace in Sudan. The civil war has most definitely impeded the Sudan's economic development and fostered political instability, thereby perpetuating a cycle of fragile military and civilian governments. Large oil fields that have recently been discovered in southern Sudan now complicate things even further.

In the early part of the twentieth century, **Kenya** (224,959 square miles) became a white settler colony largely as an afterthought. When it was declared a Protectorate in 1895 Britain's first priority was to build a railway to **Uganda**, which was coveted primarily to ensure control over the headwaters of the Nile. Only after completion of the railway did the British realize the agricultural potential of the central and western highlands of Kenya, thereby leading Lord Delamere, in 1905, to declare it "white man's country." White settlers came to these fertile highlands and displaced tens of thousands of Africans, mainly Kikuyu, for large coffee plantations. Of course this would later come back to haunt them as it was primarily Kikuyu, Kenya's largest ethnic group, who comprised the so-called *Mau Mau* (who actually called themselves the *Land and Freedom Movement*). Although the settlers and the colonial government assumed him to be the mastermind behind Mau Mau, Jomo Kenyatta was hardly involved in this violent guerilla resistance organization, which itself was widely misunderstood by whites. Nonetheless, Kenyatta was arrested and subsequently convicted of treason. After serving eight years in prison he was released and in 1963 went on to become independent Kenya's first prime minister, and then president. For

much of the 1960s and into the 1970s, Kenya was regarded as a miracle of free market capitalist development (Bates 1989). Moreover, the successive governments of Jomo Kenyatta (1963–1978) followed by Daniel arap Moi (1978–present), have been exceptionally stable for Africa as a whole and East Africa in particular. However, this political stability may have come at a high price, as both the Kenyatta and Moi governments were accused of massive human rights violations. Additionally, the economic growth has all but halted and corruption has become rampant in all levels of government. As with other African governments, the IMF has taken a firm stance with Kenya and withheld loans for much of the 1990s. In December 1991, Moi's government finally succumbed to pressure for the introduction of multi-party politics. Open elections were held in 1992 and 1997. The *Kenya African National Union* (KANU), the ruling party, won both times amid allegations of massive irregularities. Additionally, both times the process was preceded by ethnic clashes, which many observers claimed were government sponsored.

What was originally designated **Tanganyika**, and taken by Chancellor Bismarck at the Conference of Berlin, was later ceded to Britain after Germany's defeat in World War I. Unlike her northern neighbor, Kenya, Tanganyika never became as popular a destination for white settlers. Consequently, independence came much easier and without the bloody struggle of Mau Mau in Kenya. It attained independence in 1961 and in 1964 was united with the newly independent island of Zanzibar to become **Tanzania** (364,899 square miles). Under its first President, **Julius Nyerere**—affectionately referred to as *Mwalimu*, Kiswahili for "teacher"—Tanzania embarked on a very different course from her capitalist neighbor, Kenya. Nyerere's socialist policies aimed at wedding the best of traditional African values with the teachings of Marx. A major thrust of development was the creation of centralized villages, ostensibly to better facilitate provision of basic needs, such as health care and education. He collectivized village farmlands, carried out mass literacy campaigns and instituted free and universal education. He referred to these forced settlements as *ujamaa* ("familyhood") villages. Although later criticized for his overreliance on socialism, thereby leading to the failure of the Tanzanian economy, nevertheless Nyerere's *ujamaa* policy and his promotion of *Kiswahili* as a cultural and linguistic unifying force helped Tanzania avoid many of tribal/ethnic problems of her neighbors. Throughout the 1980s, it became clear that socialist economics was not working. In 1985, Nyerere succumbed to pressure and stepped down, paving the way for his two successors—first Ali Hassan Mwinyi and then the current President,

Benjamin Mkapa. Nyerere remained head of the ruling party until 1990. Over the course of the 1990s Tanzania's economic fortunes have moderately improved, and the country has held several multi-party elections, although *Chama Cha Mapinduzi*, the ruling party, won both.

**Uganda** (91,135 square miles), dubbed "the pearl of Africa" by Winston Churchill, comprises a number of indigenous states, such as Buganda, from which the country's name is derived. Others include Bunyoro, Basogo, Banyankore, Batoro, and Bagisu. The British declared Buganda a protectorate in 1894 and gradually extended control over the other areas by 1914. Unlike Kenya, however, Uganda never became popular with white settlers. Since independence in 1962, Uganda has been racked by political instability. Considerable strain emerged out of the federation of four autonomous regions—Buganda, Ankole, Bunyoro, and Toro—under Buganda King Mutesa II acting as non-executive president. In February 1966, Milton Obote staged a coup by suspending the constitution and deposing the president. Soon thereafter, in April 1966, Obote withdrew regional autonomy and introduced an executive presidency, filled by himself. The new constitution, adopted in September 1967, abolished traditional leadership and established a unitary republic. In 1971, Field Marshall Idi Amin Dada seized power while Obote was out of the country. The following year, 1972, Amin expelled all non-citizen Asians and seized British companies. Untold thousands of Ugandan civilians lost their lives under Amin's brutal regime in the 1970s. Amin's tyranny continued until 1979 when the Tanzanian army, aided by the *Ugandan National Liberation Army*, invaded and took Kampala in April. Troubles were far from over for the people of Uganda since in the 1980 elections the Uganda People's Congress won and thus Milton Obote was selected to serve a second term. Instability again took over as various guerilla factions sought to oust Obote, who spent the first half of the 1980s trying to subdue the rebels. In 1985, he was overthrown in a military coup, led by Brigadier General Okello. Rebel activity continued until January 1986 when the *National Resistance Movement* took Kampala. Yoweri Museveni became president and formed a *National Resistance Council* made up of both military and civilians. In spite of attempts at reconciliation, Museveni's government continues to be plagued by rebel activity in the north and west. On the other hand, as a result of agreeing to comply with the structural adjustment policies mandated by the IMF and World Bank, Museveni became a favorite of the IMF, much like former President Jerry Rawlings of Ghana. Both implemented many of the tough austerity policies required as conditions for

continued loans, and as a result, the economies of both nations grew substantially more than their neighbors in the 1990s. Additionally, Uganda under Museveni has made substantial progress in dealing with the AIDS epidemic, and the openness with which the Ugandan government has faced this challenge is unparalleled in Africa.

**Rwanda** (10,170 square miles) and **Burundi** (10,745 square miles) are nearly identical in physical size, ethnic composition of their populations, and tragic experiences. In many ways their situations illustrate the impact of the brief yet potent European colonial period, from the late nineteenth to mid twentieth centuries. They are two of the most densely populated countries in Africa, both about the size of Maryland and both are composed of about 85% Hutu, 14% Tutsi, and 1% Twa. Traditionally these people are said to have been farmers, pastoralists, and hunters, respectively. The Tutsi herders, supposedly of Hamitic origin, are said to have entered the region in the fifteenth century, establishing a monarchy headed by a king and a feudal hierarchy of Tutsi nobles and gentry, who dominated the serf-like Hutu farmers. These farmers were said to have made a contract to pledge their services and those of their descendants to a Tutsi lord in return for cattle loans and use of land for grazing and farming. Rene Lemarchand has seriously questioned this simplistic view. While certainly not denying the clientage that historically existed between Tutsi and Hutu, he asserts that the seeds of twentieth century conflicts between the Hutu and Tutsi were really sown by the Germans during their occupation and then the Belgians during their colonial tenure. Germany added Burundi and Rwanda to German East Africa in 1899, but both were turned over to Belgium under the League of Nations Mandate of 1916. Belgium continued the German approach of using indirect rule, favoring the Tutsi "elite" and thereby solidifying the ethnic cleavage between Hutu and Tutsi. Since independence was achieved in 1962 there have been a series of genocidal massacres, with Hutu and Tutsi exchanging roles as victims and perpetrators. Perhaps the most prominent was in Rwanda in 1994 when perhaps eight hundred thousand people were killed, primarily Tutsi by Hutu. The ensuing exodus of refugees into neighboring countries has contributed to their further destabilization, for example the rebels, based in the eastern provinces of the Democratic Republic of Congo. Today both Rwanda and Burundi remain in a tense state of existence as both governments battle rebels, while the United Nations tribunal in Arusha, Tanzania, tries to sort out responsibility for the genocidal attacks of the 1990s.

Thus, in the post-independence era, East Africa has clearly experienced some of the continent's worst

calamities. Partial regional interaction has always been present to some degree, and in the past several years the *East African Community* (EAC), comprising Kenya, Tanzania, and Uganda, has been resurrected. It will be interesting to see if the EAC will be able to follow the lead of the European Union (EU) in terms of regional economic integration. The numerous political and military setbacks have substantially delayed the course of economic development and the growth of civil society in East Africa. It is important to acknowledge that these have been primarily man-made disasters: the Ethiopian famine of 1984–1985; the recurring Hutu-Tutsi rivalry and genocidal outbursts in Rwanda and Burundi; the ongoing twenty-five-year-old civil war in Sudan; the war between Ethiopia and Eritrea; the dictatorial regimes of Idi Amin and Milton Obote in Uganda during the 1970s and early 1980s; and the steady disintegration of civil society in Somalia under Mohammed Siad Barre, culminating in the chaos of the 1990s. Once again, in order to fully comprehend the frequency and magnitude of these misfortunes, it is absolutely vital to situate these problems in the larger historical context of European colonial rule and its aftermath. Of course this does not absolve post independence African leadership of culpability but that, in fact, could be the subject of another entire essay.

## EAST AFRICA: INTERNATIONAL RELATIONS

### Defining East Africa

The area of East Africa or Eastern Africa is located in the eastern part of the African continent and comprises the *East Africa Zone*, the *Northeast Zone*, and a country, *Sudan*. The East Africa Zone includes the following countries: Burundi, Kenya, Uganda, Rwanda, and Tanzania and occupies a surface of 727,176 square miles with a population of about 97.3 million, of which 29% is urban. The Northeast Zone comprises Djibouti, Eritrea, Ethiopia, and Somalia, with a surface of 801,201 square miles and 75.2 million inhabitants, of which 21% are urban. The tenth state member of the area, Sudan, is the most extensive country, with a surface of 1,002,325 square miles and is often included within the Northern Africa or Central Africa countries. Sudan will be included among the Eastern Africa countries due to the strong and steady relations this country maintains with the rest of the eastern countries.

The East Africa area is mainly rural, as the East African countries' economies are all based on agriculture. Unlike Southern and Western Africa, the Eastern countries don't have great amounts of mineral resources. As for natural resources such as petroleum, chromium, zinc, and iron, Sudan is the wealthiest country. Tanzania has gold and platinum and Ethiopia also has gold. Kenya and Uganda have some zones rich in wood. Within this area is situated the Nile Basin, which is shared by several countries in arid or semi-arid areas.

This area presents very low living standards. All countries previously named, with the exception of Kenya, are listed among the poorest countries in the world, according to the Human Development Index established by the United Nations (UN).

Food shortages have reached alarming levels throughout the region. In Somalia, Uganda, Ethiopia, and Eritrea this situation is of extreme urgency. The climate conditions, the lack of means to develop agriculture, the displacements, refugees, and

acquired immunity deficiency syndrome (AIDS) are factors that contribute to worsen this situation.

The spread of human immunodeficiency virus (HIV) in the region is quite high. In addition to this, public health conditions are inadequate. Hospitals are lacking or non-existent and the public expenditure on health (percent of the GDP) is low.

Another of the problems that faces the region is the constant loss of biodiversity and the threat to the ecosystem and the environment. International organizations consider environmental conservation in East Africa as a high priority because of the outstanding richness in wildlife and the variety of ecosystems. Recently, the East African countries have begun to work together to maintain cooperation policies on environmental issues.

The distribution of East African territory among the colonial powers occurred during the twentieth century. As a consequence, during the 1960s, several new States emerged whose main characteristic, besides having little experience in the exercise of their sovereignty, was clear political instability. This has resulted in large numbers of refugees; displaced, deprived, and marginalized people; economic crises; famines; and disease.

The borders of many African states weren't originally established as borders between independent states, but as territorial dividing lines belonging to the great powers in the years of imperialism. Like in Central Asia, the borders of the countries were established in an artificial and arbitrary way, without regard for the demographics of ethnic or religious groups. The division of these groups into arbitrarily delineated territories and nations has given rise to territorial, ethnic, tribal, and religious disputes. Often ethnic identity and religious fanaticism are encouraged and exploited by political and military elites who want to monopolize the access to power and resources by excluding the members of other ethnicities or religions.

There are also several areas with potential conflicts due to natural-resource reserves. These disputes are usually described as ethnic wars or political rivalries, though the real interest is focused on the natural resources.

Two other factors tend to increase the internal climate of constant conflicts. The socioeconomic crisis, which is also a consequence of the wars, and the sale of weapons, which helps to maintain the existing conflicts or to create new ones in other countries, both lead to further conflicts. Additionally, these conflicts are not only the result of internal causes but also a consequence of the interaction between internal dynamics and external influences, which often worsen the internal factors.

## International Conflicts and Development

*Ethiopia–Eritrea Conflict:* Ethiopia is one of Africa's oldest countries. On the contrary, Eritrea is quite new, emerging from Italy's occupation. In 1952, an agreement was signed and both countries formed a federation. However, ten years later Ethiopia annexed Eritrea as one of her provinces, causing the beginning of a series of guerrilla wars. In 1991, a provisional government was established in Eritrea, accepted by the United States, with the condition of conducting a referendum on its independence in 1993. That same year Eritrea obtained regional and international recognition.

*Somalia–Eritrea Conflict:* Somalia used to claim the Ogaden region, inhabited in most parts by Somali ethnic groups. During the conflict with Eritrea, Ethiopia had controlled almost the whole of the Ogaden region. In 1988, after eleven years of constant confrontation, Ethiopia retired the troops of the border with Somalia, reestablished diplomatic relations and signed a peace treaty. Ethiopia and Somalia have always had aspirations over the territory of Djibouti, Ethiopia desiring access to the sea and Somalia the reunification of its territory.

*The Nile Basin:* the Nile River runs through nine states: Egypt, Burundi, Tanzania, Uganda, Sudan, Kenya, Rwanda, Ethiopia, and Congo. In spite of that, Egypt is the country that makes the most profit of its water flow. Recently, the countries through which the river flows have not been able to divert the water flow because of the constant conflicts. The shortage of and demand for fresh water in addition to the population increase in the region have become serious problems.

During the Cold War, many African political leaders resorted to American or Soviet aid. The Soviet Union helped Ethiopia during her conflict with Eritrea; Kenya became allied with the United States. In Somalia, Gen. Mohammed Siad Barre proclaimed his adhesion to the Soviet Union, but soon after breaking relations with this country, the United States began supporting Barre's government. But then, as Barre intended to normalize his relations with the Soviet Union, his government was frozen.

By the end of the Cold War era, the United States had a strong influence over the different countries, directly or through its several organizations and allied countries such as Uganda, Ethiopia, Eritrea, Rwanda, Burundi, and some factions in Sudan. The United States, together with Great Britain, France, and Belgium, exerted influence in African conflicts, providing the allied group's political, financing, and

military support to defend their economic, political, and strategic interests in the area. In East Africa several disputes arose, many of which still exist. The constant corruption and climate of insecurity and instability have been a major setback for investments and foreign capital flow. The short-term governments have been more concerned with maintaining power than improving people's living standards.

### **Economic Bloc Formation, Trade, and Development**

During the 1990s, the African countries abandoned their exclusive bilateral policy with the superpowers or former colonialist countries. However, this has also caused them to be more vulnerable. Despite their opposition to neo-colonialism and efforts to work as a bloc in the global market, these countries still depend economically on their relations with the Western world. They have opened their economies, and also agreements have been made to form regional organizations. Often these organizations have faced financial difficulties along with other conflicts derived from the region itself.

Kenya, Tanzania, and Uganda have formed the East African Community (EAC); Burundi and Rwanda are associated with the states of Central Africa in the Economic Community of Central African States (ECCAS) and also with the Southern African Development Coordination Conference (SADCC). Somalia, Djibouti, Eritrea, and Sudan are members of the Community of Sahel-Saharan States (CEN-SAD), established in 1998. Somalia, Sudan, and Djibouti belong to the Arab League.

Except Tanzania and Somalia, the rest of the states of East Africa belong to the Common Market for Eastern and Southern Africa (COMESA). All countries in this study belong to the African-Caribbean and Pacific (ACP) group, a trade agreement between African members and European Union countries, to the African Development Bank and also to the African Union. In spite of these efforts to improve their economies by forming blocs, the participation of these countries in the world economy remains marginal and dependent.

Most countries located in East Africa do not have commercial relations with each other or even with other African countries but with extra-continental countries instead. Uganda and Kenya constitute an exception, as these two countries maintain regular exchange trade relations. However, countries like Eritrea, Ethiopia, and Tanzania have trade relations

with countries like China, Saudi Arabia, the United States, Malaysia, and Italy, among others, but not with other African countries. Other nations such as Somalia, Rwanda, or Djibouti are more commercially connected with East Africa countries, although they also have trade with extra-continental nations.

This general trend of East Africa countries to be so dependent on trade with extra-African partners has not been helpful for the area's development, as most countries do not work together towards a shared objective but work alone. Therefore, in spite of the bloc they have formed, their economies still are very fragmented.

Lack of monetary resources has delayed development throughout East Africa. International financing organizations have demanded adjustment and budget-cut policies in the region. Kenya, for instance, has carried out a liberalization policy based on the decrease of public expenditure and the privatization of state companies, along with the disappearance of exchange control, with the purpose of attracting investors. These policies were rewarded with loans given by the World Bank and the International Monetary Fund (IMF).

Other countries followed these trends. Sudan and Tanzania adapted their government policies to the aims set by these international organizations. Although the IMF praised Tanzania, the country's social development hasn't improved. In Uganda, the government established similar measures. Though the number of foreign investments increased, the cuts in the budget worsened the situation of most people, who live in an alarming situation of poverty.

### **International Conflicts After the End of the Cold War**

The fall of the bipolar system destroyed the east-west alignments. The retirement of the Soviet Bloc began in December 1988 with the withdrawal of Cuban troops in Angola and later with the withdrawal of American troops from Somalia.

Although the continent seemed to lose strategic interest for the central superpowers, some conflicts remained and new ones arose. The countries found neighbouring countries who acted like partners, but also as rivals.

In 1991, relations between Uganda and Kenya, which had been tense since 1987, worsened. Kenya's and Sudan's governments accused each other of protecting rebel groups that operated in each neighbour's territory.

In Somalia, in 1991, Ali Mahdi Mohammed deposed the government, while the capital city, Mogadishu, was in the hands of Mohamed Farad Aidid, both belonging to different clans. The National Somali Movement formed its own government in the ancient territory of British Somalia, establishing the Republic of Somaliland. In 1992, the UN sent a group of observers, and soon the United States began a military operation in Somalia. However the arrival of a foreign army provoked further conflicts, and in response the UN Security Council approved the dispatch of UN forces to support American troops. It was the first time the UN used military intervention in the internal affairs of another state without that state's consent. Despite the interventions, hostilities continued, and in 1994 the United States announced the withdrawal of the troops, without any foreseen solution to the conflict. Somalia still lacked a central government, and a large part of its territory was subject to civil conflicts.

The fall of the Somali state caused a serious situation of regional and international insecurity together with a flow of refugees and internal displaced persons. In 1998, a new government was created in northeastern Somalia, Puntland.

In February 1999, tensions between Somalia and Ethiopia increased, and Ethiopia's troops invaded Somalia's frontier. This conflict ended in October 1999 when Ethiopia withdrew the troops from Somalia. However, in January 2001 relations between them got tense again.

In 1994, the governments of Sudan and Uganda accused each other of supporting rival guerrilla groups and in 1995 Uganda broke off diplomatic relations with its neighbour. Although negotiations to solve their differences began in 2001, Uganda deployed its troops in the north of the country.

In 1997, the relations between Ethiopia and Eritrea worsened after the latter adopted a new currency, which meant an economic downturn in both countries. In May 1998, war broke out between these two countries after each accused the other of encroaching on the country's territory. After several failures on behalf of international organizations and the Organization of African Unity (OAU) in June 2000, a peace treaty was signed, committing both countries to cease-fire and to accept a future demarcation of a security zone in the frontier of both countries established by the United Nations.

Relations between Eritrea and Sudan deteriorated in 1994 and diplomatic relations were broken off. In 1997, Sudan accused Eritrea of launching attacks against its troops in the frontiers.

In 1993 the United Nations sent a mission to Rwanda (MINUAR) with the purpose of decreasing

the violence, but did not engage in combat. Since the first interethnic violence outbreak, Rwanda has suffered continuous bursts of varying intensity.

The conflict in Sudan seems to be improving, as in January 2005 a peace treaty was signed. In Tanzania, in spite of internal instability, a peace agreement was celebrated in October 2001 between the two most influential political parties of Tanzania and Zanzibar.

### **East Africa: A New Strategic Location and Future Development Opportunities**

At the end of the Cold War, a new strategic geography arose. In the old formulation, conflicts had an ideological-political bias; now, however, control of resources was more important than ideologies. Therefore some countries that had not historically been attractive for the superpowers began to occupy a prominent place in the political and strategic planning of the United States and other European powers.

From 1997 on, in the G7 and Russia meeting in Denver, Colorado, the necessity of encouraging the integration of African countries in the world economy as well as the need to facilitate their social and political development was discussed. Several multinational companies have been permitted to interfere with reserves of African natural resources, in many cases taking advantage of the conflicts in the region. In East Africa these corporations have allied countries, some of which have benefited economically from the conflict in other countries. Rwanda and Uganda are countries important to the interests of companies settled in Africa. A 2002 United Nations Report charges both of these governments with obtaining profits from the war in the Democratic Republic of Congo. Both countries export diamonds and coltan—minerals that are imported from the Congo. Neither Rwanda nor Uganda have such minerals. Often the economic exploitation of these resources does not foster the countries and people's development, but instead only provides companies with large profits.

However, the strategic interest of the region is not only *economic* but also *military*. When the United States became the most important power in the global arena, the enemy was no longer communism but terrorism and the groups who support it.

The instability in East Africa has been to the advantage of terrorist organizations. Al Qaeda has concentrated its operations in East Africa. In 1998 Tanzania and Kenya suffered terrorist attacks, Sudan was accused of promoting international

terrorism, and the United States bombed installations in Sudan's capital.

The United States has created a special fund of about \$100 million to fight terrorism, intended to form security personnel in Djibouti, Kenya, Tanzania, and Uganda. After the attacks of September 11, 2001, the American concept of security changed completely and so did its strategy in foreign policy. Africa was designated as a confluence point for terrorist organizations, and the United States considers East Africa as the most dangerous region of the African continent.

Somalia has been described as the next US military target, after the Afghanistan operation, as it is believed to be a possible shelter for al Qaeda members. American troops have settled in Djibouti.

All this information suggests that in the forthcoming years East Africa will remain a conflict-ridden area and a source of profit for Western companies. The threats of terrorism, ethnic tensions, and other sources of conflict are likely to continue, furthering violence in the region. Until these conflicts are resolved, development will be made impossible.

### EAST AFRICAN COMMUNITY

In East Africa, the very first steps of sub-regional cooperation spread over a period of nearly fifty years, that is, from 1900 to 1947. In Uganda, Kenya, and Tanganyika (after 1914), the colonizing power was Britain. In order to effectively exploit the resources of these territories, in their interest, the British introduced services that accelerated the rate of this exploitation. These services included customs, civil aviation, income tax, posts, and telegraphy, etc. These services were under the umbrella of the East African Common Service Organisation.

After Tanzania, Uganda, and Kenya achieved their independence, their leaders, Julius Nyerere of Tanganyika (now Tanzania), Apolo Milton Obote of Uganda, and Jomo Kenyatta of Kenya signed the Treaty for East African Cooperation on June 6, 1967. The mission and goals of the East African Community (EAC) were the fostering and promotion of economic cooperation in the sub-region.

Because the EAC ushered a common market in East Africa with the goals of ensuring economic development in the sub-region, the numerous trade restrictions that had existed previously were lessened. In trade circles, two vital principles were cultivated, namely, maximum limits on tariffs and non-discrimination. The headquarters of the EAC organs were distributed, with Kenya retaining East African Airways and East African Railways. Uganda acquired East African Posts and Telecommunications and the East African Development Bank, while Tanzania took the EAC Headquarters and Harbours Corporation. In addition, Uganda and Tanzania were allowed to apply a predetermined transfer tax on certain Kenyan goods to foster location of new industries there. This is because Kenya was clearly more developed than both Uganda and Tanzania as the result of British colonial policies. Thus, one of the goals of the EAC was to foster even development in East Africa.

Despite the new effort by the post-colonial East African states to create an economic community, this effort lasted ten years only. By 1977, the common services had disintegrated. A multiplicity of factors contributed to the demise of the EAC. They are summarized under five headings. First, there was the polarization and perception of unequal

gains among the three states. Kenya, the most favoured by British colonialism, continued to gain more from the EAC arrangement. Uganda and Tanzania, the ready market for Kenyan products, had fewer and less efficient industries, and thus, could hardly compete with Kenya. Indeed, foreign companies continued to establish more and more industries in Kenya rather than in either Uganda or Tanzania. Such companies preferred Kenya because it already had a broad manufacturing base and a better infrastructure.

Both Tanzania and Uganda, but especially the latter, ran into serious trade deficits between 1967 and 1976; the share of manufactured goods in both countries' exports declined, while that of Kenya rose. The demise of the EAC was partly due to perceived and objective inequitable distribution of small benefits.

The second factor in the collapse of the EAC had to do with lack of effective compensatory and corrective measures. There were no measures for collecting and sharing of customs revenue in accordance with a pre-negotiated formula which favoured the disadvantaged; neither was there effective transfer tax which provided revenue and protected infant industries in both Uganda and Tanzania. Moreover, the principle of the free movement of goods within East Africa failed and the aim of discouraging duplication of inefficient industries in order to realize economies of scale was also lost partially.

Relocating the headquarters of common services, decentralizing some of its operations, and subsidizing different parts of the services and different areas—none of these worked effectively. Indeed, some services, such as the airways corporation, the railways corporation, and the road networks, became Kenyan-dominated.

The third factor was the problem of personalizing the decision-making process due to inadequate governmental institutions. The EAC lacked a relatively autonomous and a democratically established decision-making body. This increased the danger of instability and of transforming personal rivalries into national and intra-sub-regional conflicts. Personalization of power and the decision-making process enabled each head of state to determine the fate of the EAC. Nyerere's refusal to convene a meeting of the Authority due to his dislike of Idi Amin of Uganda can only be explained in such terms.

The fourth factor had to do with ideological differences and economic nationalism. By the time of the collapse of the EAC, there was an intense ideological rift among the partner-states. While the Kenyan leadership (the ruling and dominant class) became increasingly dominated by foreign monopoly capital,

the Tanzanian leadership became increasingly radical and the Ugandan leadership (before the Amin coup in 1971) became increasingly opposed to foreign domination. Whereas Kenya's stronger economic base and stable capitalist system enabled it to attract external investment and to exploit the opportunities which the EAC offered, Tanzania's weaker economic base and socialist system had the opposite effect.

The economic gap widened and domestic stresses were explained in ideological terms. As Tanzania ridiculed Kenya's growth as based on a "man-eat-man" philosophy, Kenya retaliated by labeling Tanzanian socialism as founded on the principle of "man-eat-nothing". Tanzania then took steps that were meant to prevent the intrusion of what it saw as Kenya's bourgeois capitalist values and decadence. It also sought to eliminate Kenyan exploitation of the Tanzania market. It took measures to protect its people from the affluence of the Kenyan bourgeoisie, which was already causing large-scale smuggling of currency, coffee, and other consumer items and thus jeopardizing its socialist programmes. In brief, the increasing degree of mutual hostility culminated in the border closure—a move that precipitated a series of reactions which were punctuated by the collapse of the EAC.

The final factor was external: A multiplicity of multinational corporations and their subsidiaries extracted generous concessions and further foreign investment and then made efforts to service the sub-regional market from plants in Kenya. There emerged close links with such foreign partners as Britain, the US, and West Germany. These relationships were far more lucrative than the EAC arrangements. Tanzania developed a relationship with the then Eastern bloc, especially with China, while simultaneously maintaining links with the Western bloc. Thus, competition developed for foreign partners and markets. This impeded the coordination and harmonization of national development plans vis-à-vis external resource procurement, which was vital for pan-African and sub-regional economic integration.

In 1977, the EAC disintegrated.

However, a new EAC was launched on January 15, 2001. In the new EAC, the three member-states are pursuing the same socio-economic policies. They are all market-led and emphasize private sector development, and all are working within the structural adjustment programmes negotiated within the framework of the Bretton Woods institutions. The goal is regional over national cooperation, and thus the new EAC depends on the three member-states' proven ability to coordinate security, taxation, foreign policies and diplomacy, conflict management, etc.

The old EAC collapsed without resistance from the public. The contemporary EAC, however, has seen positive public reaction to integration.

## EAST ASIA: HISTORY AND ECONOMIC DEVELOPMENT

For the purposes of this essay, East Asia comprises Hong Kong, Taiwan, South Korea, China, and North Korea. The post-war development of the region has generally been very successful, especially in the economic realm. With the exception of North Korea after the 1950s, the region has generated remarkable levels of economic growth, reductions in poverty and improvements in education, health, life expectancy, infant mortality, and most other indices of social development. Political development has been uneven. Democratization has taken remarkable strides in South Korea and Taiwan since the 1970s but North Korea and China remain one-party communist states. Hong Kong was a British colony until 1997, when it became a Special Administrative Region (SAR) within China; but as a SAR it retains substantial autonomy in many areas—the notable exceptions are foreign affairs and defence.

In terms of geography and population China has always been the giant of East Asia. Along with the other four countries of the region, it lies between 53° and 18° N and 73° and 134° E. China's landmass

is over 3.7 million square miles and the population is approaching 1.3 billion (of whom approximately 80% still live in rural areas and are engaged primarily in agricultural production). In China the climate of the populous south and southeast is generally temperate but the north is extremely cold in the winter. In the west and northwest, desert conditions inhibit development. The other four countries of the region are located along China's east coast. The Korean peninsula lies between the Yellow Sea and the Sea of Japan. The Yalu River marks North Korea's northern border with China. The island of Taiwan lies off the coast of China's Fujian province and Hong Kong is further south adjacent to Guangdong province. In terms of both landmass and population, all four are very small compared to China. East Asians other than the Chinese and to a lesser extent the North Koreans are now substantially urbanised, and only a minority engage in agriculture and fishing; in Hong Kong, this is a tiny minority. Hong Kong and Taiwan are densely populated with a small landmass and mountainous terrain; the mountains also make much of the land unsuitable for industrial or agricultural use. The harsh climate on the Korean peninsula, especially in the north, combined with a lack of arable land, means that large quantities of food have to be imported. Geographical proximity has long enhanced economic and other contacts between the countries of East Asia and also, most importantly, with Japan. However, political differences have at certain times severely curtailed these relations, especially those that arose out of the Cold War. Other factors that also contribute somewhat to the definition of the region are ethnicity and culture.

The ethnic composition of China and Hong Kong is predominantly Chinese, as were the anti-communists who fled the mainland for Taiwan after the 1949 Communist victory. This group came to dominate the politics and economy of the island, and it is only recently that native Taiwanese have started to take prominent political positions. In both North and South Korea over 99% of the people are ethnically Korean; there are tiny minorities of Chinese, Japanese, and other foreigners. Chinese characters are used and understood throughout most of the region, but in Korea governments have actively promoted the use of the Native Korean alphabet, *hangul*.

Of more significance than ethnicity *per se* have been the Confucian values and ideals that some scholars argue have functioned throughout the region as a fundamental spur to economic development in a way similar to the Protestant ethic in Western Europe after the Reformation.

## Features of Development

The East Asian region, with the exception of North Korea, has generally experienced remarkable levels of economic growth since 1945. The 1950s was essentially a decade of recovery from the ravages of war and preparation for modernization. However, even during the 1950s Taiwan and Hong Kong began to show tangible signs of economic vitality. The process was somewhat delayed in South Korea by the effects of the Korean War (1950–1953), but from the 1960s to the first half of the 1990s all three countries achieved annual gross domestic product (GDP) growth rates approaching 10%. For the region as a whole GDP growth during the four decades from 1960 averaged over 7%. The mid-1980s witnessed extraordinary growth rates. In 1986, for example, Taiwan's GDP grew by 18%, South Korea's by 13%, and Hong Kong's by 12%. However, there were marked disparities within the region. This can be illustrated most vividly by comparing North and South Korea.

The North Korean economy grew strongly during the 1950s due to vigorous industrial development, but its economy has generally stagnated since then, and especially since the early 1990s. South Korea depended heavily on American aid and technical assistance to recover from the devastation of the Pacific and Korean Wars. By 1960 the GDP of both North and South was less than \$5 billion. From the 1960s onwards, however, the North Korean performance faltered due to its inward-looking policies and excessive defence expenditure. Its problems were aggravated further by several severe floods and droughts in the mid-1990s that curtailed agricultural production and even resulted in large-scale famines. The end of the Soviet Union in the early 1990s was followed by reduced aid and trade. North Korea remains a poor country with low growth and a generally isolationist communist party which has taken only tentative steps in the direction of China's comprehensive economic reforms. In stark contrast, South Korea embarked on an ambitious export drive in the 1960s. High levels of American aid initially supported this, but in the following decades investment and technology from the USA and Japan and easy access to foreign markets, especially that of the United States, have accounted substantially for the rapid growth of the South Korean economy. In 1999, North Korea's GDP was \$22 billion, compared with \$625 billion in the South.

China's sustained economic boom began after the post-Mao reforms started to take effect in the late 1970s and early 1980s. The enormous potential of China was highlighted in 1984–1985 when GDP

growth rates approached 25%; they have averaged 10% over the last twenty-five years.

The pattern of regional post-war growth has broadly followed that set by Japan. The first stage involved the use of cheap labor in textile and simple manufactures, most of which were exported to the West, with the US being the major export market. This was followed by the development of heavy industries such as ship building and petrochemicals. Thirdly was the venture into more sophisticated manufacturing such as automobiles and complex machinery. Finally, there have most recently been moves into advanced areas like biotechnology, computers, and information technology. Of the East Asians, South Korea and Taiwan followed this model about a decade behind Japan and did so quite closely; Hong Kong has not been able to pursue the more ambitious industrial visions due to economies of scale; North Korea's abiding insularity has meant that its progress has been minimal and slow; and finally, China's opening up since the demise of Mao has been so profound and aggressive that all of these steps have been hastened and condensed such that there have been many achievements on all these fronts at the same time.

Hong Kong, Taiwan, and South Korea are the three capitalist countries in the region. In general, their economic, political, and social development began before China's and North Korea's and has generally been more consistently sustained. Nevertheless, within the capitalist and communist 'blocs' there are significant differences. Hong Kong remained a British colony until 1997 when sovereignty reverted to China but under a 'one country, two systems' formula according to which Hong Kong will retain a *laissez-faire* economy until 2047. The belated democratic reforms of the British in the early 1990s were reversed by Peking after July 1997, but the importance of Hong Kong as a financial center and entrepot suggest that the CCP will be reluctant to interfere with the island's economy. Taiwan and South Korea gained independence from Japanese colonialism shortly after the war and have remained pro-Western and capitalist since then. However, both had authoritarian right-wing governments until the 1980s; their strong economic growth from the 1960s onwards was accompanied by frequent abuses of human rights and the repression of political dissidents. China and North Korea became one-party communist states shortly after the Pacific War and remain so to this day. Challenges to the status quo such as the Hundred Flowers Campaign in 1956 and the mass protests in Tiananmen Square in 1989 were harshly suppressed.

With the exception of South Korea, the region was largely insulated from the effects of the 1997 Asian financial crisis. Nevertheless, it brought the regional

average growth rate for the 1990s down to 5%. The currency crisis that started in Thailand in July 1997 affected South Korea profoundly due to the combination of the following: exposure to high levels of very nervous short-term foreign debt, productive overcapacity, an overvalued currency that reduced the competitiveness of its exports, and a financial system that lacked transparency. This combination of factors existed in no other country in the region. China maintained controls on the outward movement of foreign capital and had not linked the *yuan* to the appreciating US dollar. China has continued with very strong growth, broadening and deepening its relations with the rest of the world especially in the areas of trade, investment, finance, technology, and education, and there has also been a modest degree of social liberalization. Capitalist East Asia has recently had good but not outstanding growth, substantial democratisation, and far-reaching regional and global integration. Along with the growth of the middle class and the end of cheap labor, these factors suggest that South Korea, Taiwan, and Hong Kong have become mature economies where sustained high growth can no longer be expected.

There has been significant social development throughout the region. Despite substantial population growth over the last fifty years, there have been large reductions in poverty levels. This has been especially notable in Hong Kong, Taiwan, and South Korea, and over the last two decades, in the vibrant coastal regions of southern China. The whole region has seen remarkable improvements in educational opportunities and attainments, including literacy and numeracy. Access to and success in higher education has also improved; these have enhanced the quality of life of individuals as well as contributing to overall economic development. Progress has also been made with population control. More educational and occupational opportunities for females have resulted in later marriage and lower fertility. The rights of women have been widely promoted although laws protecting these rights are often not adequately enforced.

The speed of the region's transformation has had negative side-effects. Modernisation, and especially industrialisation, required rapid urbanisation to bring workers from rural areas to the cities to work in factories and offices. This has been accompanied by many different forms of pollution, the breakdown of traditional support structures, and the *anomie* and stress characteristic of modern city life. Death from overwork has long been noted in Japan along with very severe psychological problems in increasing numbers of school children due to the competitive pressures to succeed. Some argue that these are the

inevitable costs of progress. Such problems have also started to appear throughout East Asia. For example, fifty-five hour working weeks are not at all unusual in South Korea. Although the burgeoning middle class has been important in demanding political reforms from the region's authoritarian governments, this class's high levels of consumption have aggravated problems of urban congestion and environmental pollution. This vignette illustrates the more general point that the great achievements of East Asian development have been accompanied by problems and dangers whose severity and incidence have been exacerbated by the very fast pace of economic development.

### Explaining East Asian Development

Understanding and explaining the successes and failures of East Asia has not been easy. Different scholars highlight different aspects of the East Asian experience and this leads to a host of divergent explanatory models. Some but by no means all of these aspects are the high quality of the political leadership, cooperation between government and business, commitment to free market economics and cultural features such as Confucianism, and the values and attitudes it has promoted. As each model has at least some merit, consideration will be given to all of these factors. Scholars will continue to dispute the relative weight of these factors.

The following discussion highlights the major factors but also the fact that their importance varied in different parts of the region. Moreover, there are often close connections between different kinds of factors. For example, the propensity to save, (arguably a Confucian value) rather than consume, was reinforced by government policies to encourage high levels of domestic saving. These funds were often made available at very low interest rates to firms—usually very large firms—that governments had decided to support. This example suggests how economics, politics, and culture have been closely interwoven in East Asian development.

The whole region suffered from the effects of colonialism and imperialism. The British colonised Hong Kong during the nineteenth century and Japan did the same in Taiwan (1895) and Korea (1910). From the demise of the Qing dynasty in 1911 until the end of the Pacific War, China was wracked by civil conflict and foreign intervention. After victory in the 1895 Sino-Japanese war, Japan increasingly exploited the Chinese. With the substantial exception of mainland China, the colonial legacy was mixed. In Hong

Kong the British promoted educational opportunities and trade and established systems of law and public administration that encouraged the emergence of a flourishing entrepot. The industrialization of Taiwan and the Korean peninsula began when they were colonies of the Japanese. For example, essential infrastructure including roads, railways, electricity, and irrigation systems were built and educational and work opportunities expanded. Japanese rule also destroyed the aura of both Western invincibility and of the indigenous, landed elites, and this paved the way for multi-faceted post-colonial changes. Although the British and Japanese rulers were the main beneficiaries of colonialism their contribution to the framework of postcolonial development was significant. The Pacific War itself (1941–1945) caused enormous damage and suffering, yet it also propitiously hastened the end of colonialism in East Asia.

North Korea inherited the vast bulk of the modern infrastructure built up during Japanese rule as well as most of the peninsula's mineral and energy resources. These benefits provided a solid foundation for its strong growth performance during the 1950s but they could not compensate in the long term for the institutional weaknesses and policy mistakes that increasingly afflicted the country from the 1970s onward.

In China, both Koreas, and Taiwan, radical land reform programs were implemented in the early post-war years. Broadly speaking this resulted in either expropriation of land or its purchase at low prices from the wealthy, traditional landlords. This broke the power of the backward-looking traditional elites, whose role was taken over by new rulers who aspired to achieve development through modernisation. These new governments were therefore much freer to pursue modernising programs. These reforms also led to more equitable distributions of wealth and income and this in turn contributed to the defusion of rural discontent and the legitimacy of the post-war authoritarian governments. The introduction of modern machinery and farming techniques reduced the demand for rural labor. This surplus labor could at least partly alleviate the labor shortages that soon arose with the incipient industrial boom in the large cities and urban centers.

Under the 1950 Agrarian Reform Law in China, land owned by the gentry and rich landlords was expropriated and distributed amongst poor peasants. Gains in productivity were marginal however as the average size of holdings of the 300 million peasants was one-third of an acre. The next step involved the collectivisation of agriculture; this proved to be a disaster. As there were no incentives for individuals to work hard, people chose to do the bare minimum

required and productivity plummeted as a result. In the early 1960s, collectivisation also resulted in terrible famines. Collectivisation was only reversed as a part of the post-Mao reforms, so that farmers can now grow produce and sell it on open markets after providing a certain amount to the state as taxation.

Land reform was associated with endeavours to increase the productivity of agricultural labor, through mechanisation for example. The drop in demand for rural labor meant that many peasants moved to the cities to work in the newly burgeoning factories where incomes were often higher and more reliable.

In the early post-war years low-cost labor gave East Asia a strong competitive advantage over many other countries. Cheap labor drew in investment capital from the US, Europe, and, later, Japan. However, not only was labor cheap, it was also highly disciplined, flexible, enthusiastic, and well-trained. It was really the combination of all of these factors and not just the low cost of labor that made East Asia successful in both industrial and post-industrial development but also made the region so attractive to foreign investors. This also meant that in the early stages priority was given to labor- rather than capital-intensive industries. As both government and private savings and capital increased, so did the capacity to purchase sophisticated technologies and machinery from abroad. These gradually came to contribute increasingly to the economic power of the region, a process that was encouraged by the energy and drive to succeed of workers, management, government, and investors. However, the development process resulted in wage rises—in both absolute and relative terms—so that now China alone clearly remains a low-wage country. The fact that regional productivity and competitiveness has been so strong has nevertheless substantially offset the effects of higher wages.

The Cold War was the overarching international conflict that provided the broad framework within which East Asian development occurred up to the 1970s, and in a more diluted sense, up to the end of the 1980s. The West, and most importantly the US, regarded Japan, South Korea, Taiwan, and Hong Kong as bulwarks in Asia against communist expansion. The colonial British government retained control of and responsibility for Hong Kong until 1997. On the other hand, the Soviet Union saw China and North Korea as bastions of communism in Asia.

The Americans tried to ensure that their allies in the region would not succumb to communist influence or force and various steps were taken to this end. Troops were stationed in South Korea and Taiwan to protect these countries from attack by communist aggressors; substantial amounts of foreign aid were

provided to South Korea and Taiwan during the 1950s; land reform was encouraged to defuse rural discontent and promote a fairer distribution of income and wealth; American markets were opened up to exports from the region; and American investment, technologies, and management skills were also readily made available. These measures collectively provided an enormous boost to capitalist East Asia, especially in the early post-war years. Most South Koreans, Taiwanese, and Hong Kong people were anti-communist, so they willingly accepted assistance from the West in the effort to contain communism. The Vietnam War provided a significant boost to East Asian industries as they provided many of the goods, materials, and services needed by the American military during that decade-long conflict.

Both China and North Korea were supported in different ways by the Soviet Union in the early post-war years. Soviet technicians and scientists were sent to China to help with heavy industrial projects and Chinese efforts to develop nuclear weapons. This support was substantially reduced due to the Sino-Soviet dispute of the early 1960s. Support from China and the USSR contributed to North Korea's good growth performance during the 1950s. However, the warming of relations between the US and China in the early 1970s, the reforms of the post-Mao era from the late 1970s, and especially the demise of the Soviet Union ten years later eroded the military, financial, and technical support provided to North Korea by the two communist giants.

Although North Korea and China have substantial natural resources that have contributed to their development, the opposite is true of the rest of the region. For this reason South Korea, Taiwan, and Hong Kong had to rely upon the skills, knowledge, initiative, and nous of their people as the keys to survival and growth. Huge sums of money were invested in education and training programs so that a skilled labor force was created that could supply goods and services to overseas markets to earn the money necessary to buy the food, raw materials, and energy that could not be produced domestically.

Strong political leadership and effective, intelligent bureaucrats have made important contributions to economic growth. This leadership has taken different forms. Until the 1980s, all of the East Asian governments were authoritarian at best and dictatorial at worst. In Hong Kong until 1997, the British colonial government ruled with little internal opposition and few demands for democratic reform from the commercially oriented population. Pro-Western military rulers dominated in South Korea until the 1980s and the right-wing Kuomintang dominated Taiwan's political scene for most of the post-war period. China's

communist party has retained a solid hold on political power since 1949 but it has presided over pro-Western and pro-market reforms since the late 1970s.

Development depends upon the existence of a reasonable level of political stability. In capitalist East Asia up to the late 1970s, this has been provided by authoritarian governments (or the British colonial government in the case of Hong Kong). Some scholars have argued that before these countries could aspire to achieve democracy and vibrant civil societies, a reasonably high level of economic development and welfare was essential. The apparent acquiescence of most of the public in these countries in the first three post-war decades supports this notion. East Asian authoritarian governments were not just strong. Unlike authoritarian governments in most of the developing world, the governments in East Asia were effective and remarkably free of corruption. The ever-present if usually latent threats from China and North Korea have also contributed to the apparent acceptance of authoritarian rule in capitalist East Asia.

A high level of co-operation between government and big business was apparent in most of East Asia; the partial exception to this was Hong Kong. South Korea, following the model set by Japan, created institutions in which planning and consultation for economic development were pursued jointly by government and business. This meant that time and effort were not wasted in the resolution of disputes between the two and that each was committed to a broad common vision as long as this did not conflict with the basic interests of each side. Consultation and discussion generally ensured that this common vision and co-incidence of interests was achieved. However, even though governments had the stronger hand in these institutions and often gently directed policy through 'administrative guidance' measures, politicians knew that taking a confrontational position in dealing with business could ultimately be to their own detriment as well as adversely affecting development generally. There were two distinguishing features of the East Asian situation. First, businesses were generally not protected from market forces, and in particular, they could not ignore international price signals. Second, in general governments did not allow or encourage the creation of monopolies. The main exception to this was if a vital national interest was seen to override the economic benefits of competition. Both of these features ensured that competitive pressures and market forces ensured the maintenance of efficiency, profitability, and productivity.

South Korea came to build up and rely on a small number of very large industrial conglomerates known

as *chaebols*. Political and business leaders realised that in many lucrative activities large size was essential to achieve economies of scale. As a result there was a high level of consultation and cooperation between government, the bureaucracy, and business in setting and achieving the goals involved in industrial development.

East Asian governments created meritocratic bureaucracies that were very effective in implementing government policies and plans. These bureaucracies had the considerable advantage of being largely insulated from public scrutiny and criticism and the demands of narrowly based interest groups. Unlike the situation in many Western countries, the civil service was highly respected and many of the top university graduates moved into its most powerful and important parts. Not only were these graduates socially respected and quite highly paid, they also saw themselves as important players in their countries' nation-building projects. For all of these reasons the selfless pursuit of the public interest was very common in East Asia, unlike much of the rest of the developing world, where corruption was rampant. Meritocracy also was the main principle in the education system.

However, the growth of the middle class and increasingly well-educated populations that had travelled abroad and witnessed the achievements of Europe and the US meant that the depoliticisation of the public could not be sustained in the long term. This is certainly the case in South Korea and Taiwan; the ruling communist parties in North Korea and China look very strong at present but the Tiananmen Square protests of 1989 show that challenges are possible.

Macroeconomic stability has been a significant factor in East Asian economic growth. The maintenance of low inflation and sustainable levels of debt, and especially foreign debt, have distinguished East Asia from most of the developing world. Taiwan, China, and Hong Kong have been the most successful in this; their large foreign exchange reserves helped to protect them from the worst effects of the 1997 Asian financial crisis. In contrast, South Korea had to be rescued by the IMF due to its inability to pay its foreign creditors when very large short-term loans were called in as the 'contagion' of the crisis began to spread. North Korea has been in states of stagnation or crisis over the last two decades partly because it has not been able to achieve the kind of macroeconomic stability that has characterised most of the region.

In the early post-war period, policies of import replacement and protection of local industry were implemented to nurture economies that were

recovering from war and civil turmoil and that were struggling to establish economic and political stability. South and North Korea and China relied heavily on such policies. The greater success of more open and less restricted countries such as Hong Kong and Taiwan led eventually to the phasing out of import replacement along with tariffs and quotas to protect local industry. The worst effect of the latter policies was that protection made improvements in competitiveness and productivity very hard to achieve, so that consumers often paid high prices by international standards for goods produced in protected sectors.

Export-led growth from the early 1960s followed the short period of import replacement after the war. South Korea, Taiwan, and Hong Kong took advantage of open foreign markets, especially that of the US. All had relatively small domestic markets and a paucity of natural resources—in order to buy essential imports a successful export strategy was vital. China also gave increasing attention to the importance of exports from the late 1970s, and its continuing commitment to open trade was indicated by its recent admission to the WTO.

Traditionally civil society and the protection of individual human rights have been weak compared with the power of the state in East Asia. This weakness was reflected in the priority given to social and group interests over those of individuals and the ready acceptance of and respect for social hierarchy and the structures of rule and subordination that these embodied. The emergence of a docile and obedient labor force during the post-war years was made much easier by strength of these values and mores. From the 1950s to the 1970s, the workforce was usually willing to endure comparatively low wages, poor work conditions, and long hours to ensure the success of businesses, the competitiveness of their products on world markets, and the promotion of the national interest. Thrift and financial prudence are also often regarded as Confucian values that have promoted the high domestic savings rates that characterise East Asian societies.

Scholars such as Peter Berger argue that Confucian values, including respect for authority, collective solidarity, diligence, thrift, respect for education and learning, and meritocracy, contributed to the remarkable successes of East Asian development. Berger argues that the region provides a *sui generis* developmental model that is quite distinct from the Western pattern. A contrasting argument is that institutional structures and good policymaking and implementation are far more significant than cultural values and norms. Furthermore, China's development was retarded by its adherence to collectivism and state

control until the late 1970s, and this remains the case in North Korea. Max Weber argued that Confucianism was backward looking and too contemptuous of trade and commerce to spur economic activity in a way similar to the Protestant ethic in the West. However, the significance of all cultural phenomena including bodies of thought like Confucianism changes over time. It is very likely that there was a substantial consonance between Confucian values and the institutions and policies that help to account for East Asia's successes. These values provided the motivation on both individual and social levels for many of the economic, social, and political achievements of East Asia. This remains the case even if the religious foundation for the values disintegrates or is combined with other sources. For example, Christianity became very influential in South Korea after the war but its people remained extremely hard-working and conscientious.

East Asia faces enormous challenges. Economic growth must be maintained to achieve reasonable living standards but it is also essential to protect the natural and human environment. Over the last fifty years the extent of environmental degradation of the air, rivers, seas, and land and the loss of biodiversity in the region indicates a lack of balance, planning, and comprehensive vision in the development process. The welfare of future generations within the region and beyond it depends upon the prompt and substantial rectification of these shortcomings.

## EAST ASIA: INTERNATIONAL RELATIONS

While economic interdependence can serve as a catalyst for reshaping international relations in East Asia, unresolved border disputes, confrontations on the Korean peninsula, fears of an arms race, national self-interests, lingering historical animosities, sharp inequalities, and a difference in economic systems are rendered obstacles to regional cooperation. At the same time the region increasingly grapples with such issues as environmental pollution, human rights abuses, and repression of ethnic minorities.

### Regional Order

In the Northeast Asian security complex comprising the United States, China, Russia, Japan, and a divided Korea and Taiwan, the interests of major powers have long been interwoven. The pendulum has swayed between good and poor relationships in the bilateral and multilateral interactions with elements of rivalry and cooperation. As cyclical patterns of amity and enmity forge new alliances within the region, relative power balances have been changing in the evolving international environment.

Whereas international relations in East Asia during the Cold War period were heavily influenced by the US-Soviet dynamic, the post-Cold War transformation has shifted towards intra-regional relations with reduction in the layering of conflict involving outside powers. Intra-regional tension has been focused on the Korean peninsula and China-Taiwan. Political complexity presented by two divided states affects political and strategic calculations of major powers.

Once the weight of US-Soviet rivalry was lifted, a more diversified set of cooperative and competitive relations shaped multidirectional patterns of North-east Asian geopolitics. The Sino-Russian border

demarcation process created a new environment for regional cooperation in 1991–1992 (following a series of high-level contacts, starting with the Sino-Russian summit). On the other hand, disputes over the Kuril Islands and adjacent territories still linger over Russo-Japanese relations, although they are mostly symbolic and historical, without much strategic and economic significance. Political relations in the sub-region are still viewed as volatile and unbalanced. Increasing Chinese military posture and force projection capabilities are seen as threats by other regional powers. The nationalist views of Japanese politicians and their military build-up provoke historic fears of Japanese militarism in East Asia.

In the absence of international peace agreements in the Korean peninsula, North Korea has been left out of diplomatic relations in Northeast Asia following the demise of the Soviet Union and Chinese recognition of South Korea without the reciprocal recognition of Pyongyang by the United States and Japan. Differences remain between North Korea and the United States on the issues of long-range missiles and nuclear weapons. North Korea's long-range missile development programs have become part of the Asia Pacific security equation since the August 1998 launching test of a three-stage Taepodong missile over Japan generated discussion about missile proliferation. The US/North Korean tension was somewhat eased with North Korea's agreement to dismantle its existing nuclear programs, but the agreement has to be implemented through the establishment of a formalized mechanism such as the Korean Peninsula Energy Development Organization.

The trans-Pacific axis has been complementing multidirectional intra-Asian relationships. American preparedness is affected by the shift in the balance of power in Northeast Asia brought about by a series of Chinese initiatives to modernize its military forces. A United States balancing role would be required because of the fear of dominant powers such as China and Russia along with high levels of conflict in the Korean peninsula and the Taiwan Strait.

With the presence of American military bases in Far East Asia, Japan maintains a strategic relationship with the United States while recasting priorities in exerting its influence in Asia. In the absence of any collective defense mechanism like the North Atlantic Treaty Organization, Japan and the Republic of Korea have maintained their respective bilateral alliances with the United States for the past five decades without developing trilateral alliance among the three. The dominance of the United States in the region obviated the need for multilateral military cooperation.

As the United States continues to remain involved in the region, Sino-American political relations can be complicated by various factors. A variety of outstanding political and economic disputes would not be solved in the year ahead despite the United States agreement with China's World Trade Organization (WTO) entry in November 1999. The question of human rights casts a dark cloud over the prospects for improved relations.

US/China relations can also be thought of in terms of their triangular relationships with Japan. The United States and Japan are cooperating for missile defense technology research and development despite being opposed by China. The debates in the United States to offer Taiwan more defense commitment increase tension in the China/US relationship. The emergence of a hegemonic alliance in Northeast Asia can generate Chinese fear of being isolated.

### The Strategic Environment

In uncertain alliance relationships, a strategic environment is beset by suspicion and distrust. The military build-up has been driven by uncertainty instead of concrete threats. Any increase in the military capabilities of one country is viewed as a potential threat by its neighbors and rivals, often prompting them to build up their own forces as well. The strategic environment in East Asia is complicated by a lack of regional arms control or disarmament pacts. We are witnessing the emergence of significant arms races in the Asia-Pacific region.

Despite the general relaxation of military tensions in many areas of the world with the end of the Cold War, military spending by East Asian countries has significantly increased across the board. Global military spending was falling from a peak of \$1.3 trillion in 1987 to \$840 billion in 1994; contrary to this trend, across the region of East Asia, military expenditures went up from an average of \$126 billion per year in the 1984–1988 period to \$142 billion annually in 1992–1994. These increased military allocations were devoted to strengthening and modernizing the existing armed forces and to acquiring new capabilities for power projection as well as building up domestic capabilities to manufacture modern weapons.

The rise in military spending in East Asia (made possible by increased wealth with success of their exports) is, in part, related to the persistence of regional disputes. These arms races could pose a substantial threat to both regional and international security. Promoting mutual security requires transparency measures such as provision of conventional

arms data, regular meetings of defense officials, and exchange of visits of military personnel.

East Asia lacks the deeply rooted security institutions (for example, the Organization for Security and Cooperation in Europe) which provide a multilateral framework to resolve regional disputes. Regional security can be undermined by disagreements over the control of offshore territories in the East and South China Seas. China and South Korea both claim a continental shelf with unresolved boundaries involving basins with good petroleum potential. There is a new need for rules, codes of conduct, and harmonization of domestic practices to deal with the sovereignty disputes over Exclusive Economic Zones (EEZs).

Northeast Asian countries have started a bilateral security dialogue at the fringes of the Asia-Pacific Economic Forum and other multilateral meetings. Despite the stress on broader regional dialogues at private levels, a complex web of bilateral alliances and diplomatic arrangements has not been aggregated into multilateral structures. China has been traditionally skeptical of multilateral approaches to security, preferring bilateral interaction with its neighbors which allows them to take an advantage of one-on-one negotiation. On the other hand, Russia is more enthusiastic with Northeast Asia multilateral security dialogues, being concerned about its exclusion from the Asia-Pacific security discourse.

Main impediments to sub-regional cooperation include nationalist jockeying for geopolitical advantage. Other forces involved in the division of the region encompass different political systems and levels of economic development as well as inadequate efforts to overcome the past legacy. A regional identity, shared senses of the past and future destiny, and transnational civil society have not yet emerged.

### **Economic Cooperation**

The region has exhibited an economic dynamism even with the experience of slow growth rates of recent years resulting from the Asian financial crisis of 1997–1999. National income has risen in recent decades as a result of their success in promoting economic growth through export-oriented industrialization. Economic interdependence has been a major trend in the post–Cold War Asia-Pacific region, with a dramatic increase in trade between China and Japan, and between Korea and Taiwan. While the United States serves as the biggest market for consumer goods manufactured in Asia, Japan has provided loans, technology, and investment. The region's economy has been dominated by Japan's trade surplus with other

countries in the region, far exceeding that with other countries.

Russia has been cultivating relations with China and South Korea, since Western aid has not been enough to draw Russia out of its economic slump. Hopes of fruitful integration of the periphery economies of the Far East region with the Pacific Rim arise from the opening of the Sino-Russian border to trade and investment. Russia retains control over natural resources and Soviet-era industries while depending on the East Asian Pacific Rim for food and consumer goods. Economic cooperation in the border areas of North Korea, Russia, and China was discussed through the Tumen River Area Development Plan (1992–1994) and its successor, the Tumen River Economic Development Area (1994).

Significance in the economic realm has an impact on the political dimensions of major power relations. Most Northeast Asian governments now accord a higher priority to maximizing wealth, and their increasing economic interdependence makes outright conflict too costly. Economic considerations (e.g., the operation of East Asian capitalist markets) can result in a more predictable and less antagonistic foreign policy behavior.

The sub-region has discussed numerous ideas for multilateral measures, including a regional development bank, an economic development zone, energy and environmental cooperation. While most people agree that the flourishing commerce in the region provides a further potential of growing into more formal cooperation in the future, Northeast Asia has not yet espoused economic and political integration comparable to the magnitude of the European Union and the creation of regional institutions and interactions along the Southeast Asia lines. Shared interests in regional cooperation have not been translated into reality due to political differences and a lack of infrastructure. Regionalism most strongly manifests in the economic realm with the decline of ideology offset by diverging values and perceptions along with the emerging nationalism.

### **China's Economic Rise**

The size of China's market and the rate of economic expansion put the country in a strong position to change the regional economic dynamics. China's development strategy combines market forces and an oppressive authoritarian government with the promise of private wealth. China has gone through transition from a socialist, planned economy to development of private economic sectors and markets.

High growth has been made possible by cheap docile labor and a high level of foreign investment. In competition for investments, China received the lion's share of the total investments poured into East Asia.

China has great advantages in labor-intensive exports through cheap labor with the repression of any attempts for organizing trade unions. China's low-cost production exerted a tremendous pressure on export industries of neighboring countries in an international market. Southeast Asian countries engaged in the garment-exporting industry and other light industries have steadily lost out in the competition. The competitive economic threat from China is expected to have an impact on more industrially advanced countries, in particular, Japan, South Korea, and Taiwan, as China plans to move beyond the exports of toys, clothes, and other low-tech products. Such products as electronics, cars, ships, chemicals, and steel can erode manufacturing bases of the neighboring countries. Countries which do not have technical prowess are, in particular, vulnerable to China, which is a much lower-cost producer. While China is regarded as a major competitor, it is also seen as a source of joint ventures and as a partner in regional growth. In a show of tripartite economic cooperation, Korea, China, and Japan developed formal forums for trade and finance ministers as well as a business forum to be attended by key business organizations and industrialists from the three countries. It deals with such issues as trade promotion and monetary and other macroeconomic policy coordination. China plans to expand its influence in Southeast Asia through creating a regional free trade area within the decade. As one of the largest trading countries, China entered the World Trade Organization (WTO) following fifteen years of participating in free trade negotiations. The difficult negotiations reflect concerns with its poor treatment of labor, including unpaid prison labor and forbidding organization of unions.

Since low wages and poor labor protection have driven China's surge as an export power, many countries regard poor treatment of Chinese labor as unfair advantage. Undertaking all the obligations to comply with WTO rules and disciplines means opening up China's market to international competition, lowering its industrial and agricultural tariffs, limiting subsidies, and liberalizing foreign investment norms in telecommunications, insurance, and banking services. There is a general hope that the labor standard would improve with the system of international regulations governing free trade. In addition, some argue that the onset of a domestic free market could release the momentum for the democratization of Chinese society as well as free economic entrepreneurship.

## Human Rights Conditions

The worst human rights conditions are reported in China and North Korea, which were accused of arbitrary detention, torture, and executions. The authorities in those countries have carried out a serious crackdown on peaceful dissent. According to various international human rights reports, arbitrary detention and torture of criminal suspects and convicted prisoners are common and widespread across the country. Most executions take place after sentencing rallies in front of massive crowds in sports stadiums and public squares. Prisoners are also paraded through the streets past thousands of people on the way to execution by firing squad in nearby fields or courtyards.

In the case of China, economic reform in China moved ahead without concurrent liberalization of a political process. Profound social and economic changes in the past twenty years have not made any impact on civil and political freedoms. Social divisions and alienation caused by continuing restrictions on basic rights stunt economic progress. Beijing signed two key international human rights conventions on political, civic, social, and economic rights in 1997 and 1998, but a broad range of people who seek their rights to freedom of expression or association were sentenced to long prison terms for subversion under sweeping national security provisions introduced in 1997.

Only a handful of tiny NGOs are allowed to exist, but they are kept on a tight rein. Ordinary citizens are not organized to provide any credible challenges to the government. The Chinese government routinely blocks websites of Western media outlets, human rights groups, Tibetan exiles, and other sources of information it deems politically sensitive or harmful. While promoting the Internet for commercial purposes, the government tries to control its political content.

There is no sign of any relaxation of the crackdown on fundamental freedoms nor a promise for improvement in the human rights situation, which has seriously deteriorated. Years have passed since the brutal killing of hundreds of unarmed citizens in Beijing who participated in the 1989 Tiananmen Square pro-democracy protests. The Chinese government still refers to the crackdown as a 'political incident' and argues (faced with the campaigns of the relatives of those killed for justice) that a 'counter-revolutionary riot' had to be crushed.

According to Amnesty International, the authorities have turned the clock backwards and created a new generation of prisoners of conscience, including

those who raised a new range of issues, such as labor, the environment, and religious freedom. Many individuals are currently imprisoned solely for organizing free trade unions or strikes and simply for speaking out for livelihood issues. Some have been sent for re-education through labor camps or forcibly detained in psychiatric hospitals. Officials must approve religious practice; otherwise it is considered counter-revolutionary. More people are executed every year in China than in the rest of the world put together. For those sentenced during the 'Strike Hard' campaign, punishment was swift and ruthless. It was justified to tackle the serious economic crime situation before entry to WTO and the challenge of globalization.

### **Minority Issues in China**

China includes fifty-five minority groups, amounting to 120 million inhabitants (almost ten percent of the population). Ethnic minorities, in particular, were subject to brutal suppression, with the common practice of torture and summary trials of political suspects. In particular, China's Islamic minorities have been almost invisible behind centuries of repression. Many political prisoners in the Xinjiang Uighur Autonomous Region have been executed, accused of separatism, religious activities, and a range of alleged violent crimes.

In Xinjiang, the Turkic-speaking Muslim Uighurs, identified strongly with their neighbors across the steppe, seek autonomy from Beijing. Since the region was annexed to China in 1950, it experienced ethnic brawling. Owing to its rich minerals, with one-third of China's oil resources, the government wanted to have a tight control over the region. Nuclear testing at Lop Nor, in 1964, by the Chinese government resulted in hundreds of thousands of deaths. For the recent years, the repression has been more severe, with the outlawing of Koranic schools since 1998.

The Beijing government has established a state of virtual apartheid; the industrial, bureaucratic, or top-level employment is overwhelmingly held by Han Chinese, while the Uighurs are concentrated in the agrarian sector. In addition, the state-sponsored policy for the relocation of Han Chinese into Xinjiang has dramatically changed the population mix, with the Uighur population shrinking from approximately 70% in 1950 to just 49% today. The situation is even bleaker with the planned migration of displaced Han Chinese after the Three Gorges Dam Project.

The international community has been silent about the crushing of Uighur independence aspirations due to Islamic association. The annual Shanghai

Five summit organized in 1996 by China, Russia, and three secular Central Asian states (Tajikistan, Kazakhstan, and Kyrgystan) supported Beijing's position on national separatism and religious movements in Xinjiang. Due to repression, the prospect of peace in Xinjiang looks less likely than ever. The international 'war on terrorism' provided some justification for Beijing's eight-year crackdown on separatist Muslim movements.

### **The Status of Tibet and Mongolia**

Chinese occupation of self-governing Tibet traces back to October 1950 with the dispatch of units of the Chinese army, but a complete control of Tibet by Beijing accompanied crushing the 1957 peaceful Tibetan revolt and flight of the Dalai Lama to India. Prior to the exile of the Tibetan leadership in Lhasa under the Dalai Lama, Beijing signed a seventeen-point agreement in May 1951. In the document, the Chinese leadership originally promised the preservation of the Buddhist religion, Tibetan lifestyles and traditional polity as well as its authorities, headed by the Dalai Lama and his Cabinet of Ministers. The past four decades observed the increasing integration of the territory and its people into Chinese political, economic, military, and demographic control with the influx of bureaucratic cadres, technical personnel, and troops along with Han Chinese settlers. In addition, Beijing closely regulates and monitors monastic activities and religious worship in Tibet. There is the real fear that Tibetan culture and religion will be obliterated by Chinese immigration.

In order to keep alive their hopes of returning to a freed homeland, Tibetans in exile, together with their Western supporters, have promoted the internationalization of the Chinese occupation of Tibet. These activities include lobbying, fund-raising events, concerts, and publication of books on Tibet and Tibetan Buddhism. Other activities involve the organization of meetings between the Dalai Lama and Western parliamentarians, as well as US presidents and congressional leaders.

While encouraging civil disobedience in response to oppression, the Tibetan government-in-exile has pursued political discussions with representatives of the Chinese government. The Dalai Lama already signaled his willingness to accept Chinese control over the defense and foreign relations of Tibet in exchange for a guarantee of basic human rights and genuine autonomy for the territory's people. The Chinese leadership did not respond to the proposal

for limited authority, insisting that it is not genuine but a strategy for seeking independence.

Mongolia was fortunate to avoid Chinese annexation since the end of World War II, and has been successful in its struggle to keep its independence. In order to attract Western recognition and support, Mongolia adopted a conscious strategy of promoting democracy and human welfare in the post-Cold War international order. The Mongolian government carried out the country's first free elections in April 1990 replacing the unraveling of the old communist system. Mongolia began to attend regional forums on political and confidence building measures as part of efforts to circumvent Beijing's growing diplomatic influence and represent its security interests.

Mongolia is also seeking extended relations with Japan and South Korea through trade, investment, and aid while strengthening cultural, educational, and economic ties with Taiwan. At the same time, it has cultivated military ties with the United States, while being careful to manage nonalignment and balanced relations with its two immediate neighbors, Russia and China. In addition, the encroachment of mainstream Chinese culture and its increasing materialism is counteracted by actively enhancing local, native consciousness through a revival of its traditional Tibetan Lamaist faith and reverence for Genghis Khan.

## Taiwanese Sovereignty

China-Taiwan remains a recurrent source of tension, international as well as domestic. Whereas most Taiwanese want to keep the statehood, China wants to pursue the path of the island's forcible integration into the mainland. Taiwan became a genuinely democratic country, surviving despite its diplomatic isolation. China regards Taiwan as an internal affair, but its attempts for coercive integration will provoke international legal, political, and moral opposition.

Although Taiwan's status in the international state system is ambiguous, it has been maintaining *de facto* statehood. Its international legal status was undermined with the successful diplomatic campaign of Beijing. Taiwan's diplomatic relations are limited to about thirty countries, mostly small states, although its cultural and economic relations are extensive. Taiwan began to lose its international status following Kissinger's grand strategic bargain to counterbalance the Soviet Union with mainland China in the early 1970s. During the Carter administration (more specifically, the end of 1978), the United States severed all formal diplomatic ties, "derecognizing" the

Taiwan-based government and accepting Beijing in its place as "the sole legal government of China."

Since then, Taiwan has embarked on the path of democratization to ameliorate political discontent in the middle class and help Taiwan break out of its increasing isolation after its exit from the United Nations (UN). In order to win international support needed to stand up to mainland China, Taiwan consolidated democratization through constitutional changes. Political liberalization not only enhanced the protection of human rights, but also guaranteed freedom of speech and press in Taiwan. Ethnic Taiwanese were actively recruited into the government and the Kuomintang Party, which used to be controlled mainly by those who fled from mainland Communist China in the late 1940s.

The cross-strait dialogue between Beijing and Taipei has not been easy, since the Taiwanese are not interested in unification with China in accordance with the One Country, Two Systems model insisted on by Beijing. The Chinese leadership has even threatened to invade Taiwan if the Taiwanese authorities continue to refuse to be reintegrated with the mainland and seek for the recognition of statehood. Beijing's determination has been supported by rising Chinese nationalism. The mainland grew increasingly aggressive in its efforts to force Taiwan to submit to its rule. In response to a visit by high-level politicians to the United States (such as the attendance of President Lee Teng-Hui at his graduate-school class reunion at Cornell University in 1995), Beijing reacted with furious denunciations followed by firing missiles into Taiwan's coastal waters. The same menacing gesture was also exhibited as the island's voters were preparing to go to the polls for the presidential election in the spring of 1996.

In response to the latter event, Washington was compelled to send two carrier battle groups as a token of United States disapproval and a warning against even more forceful Chinese action. The United States has helped the Taiwanese government develop a well-equipped military to reduce the gap with the mainland's largest standing army in the world. However, Taiwan's efforts to improve its relations with the United States were hampered by the Clinton administration's policy for a strategic partnership with Beijing.

In the foreseeable future, the isolation of Taiwan is likely to continue, and it would be difficult to regain *de jure* independence status. There are not enough votes in the UN to push for Taiwan's readmission in the world body. In spite of its occasional tiffs with China, the United States maintains a one-China policy by recognizing Beijing as the only government representing China and does not acknowledge Taiwan

as a separate political entity. On the other hand, it has expressed a desire to see the issue of Taiwan resolved peacefully.

Taiwan may search for various ways to coexist with the mainland government. Taiwanese might be open to the idea of a federal China comprising the mainland, Taiwan, Tibet, and Hong Kong in a democratic structure with some common foreign and defense policies, but with complete internal autonomy and separately elected governments. However, the Chinese government has not accepted diversity and considers itself an integrated state entity.

The political identity of the Taiwanese people has moved away from that of China's mainland populace with the election of President Chen Shui-Bian in March 2000. The election ended the fifty-year rule of the Kuomintang Party (KMT), whose principal identity has been associated with a unified China. While the new president made relatively conciliatory gestures toward the mainland in order to avert an immediate crisis, his Democratic Progressive Party charter contains a commitment to Taiwanese independence.

A campaign for independent identity is represented by the reconceptualization of Taiwanese culture as having its own "pluralist, indigenous, and international" characteristics. Teaching Chinese history as a foreign subject is advocated along with the increase in teaching local Taiwanese languages in elementary school. It is in total contrast with the suppression of Taiwanese consciousness with the prohibition of local and aboriginal languages in schools and the showing of movies in any language other than the official Mandarin Chinese during KMT rule following the 1947 massacre of Taiwanese demonstrators.

The mobilization of Taiwanese consciousness is reflected in such concept as the "New Taiwanese." Taiwan is searching for a common identity transcending the traditional divide between native Taiwanese and mainlanders by encouraging people to identify with Taiwan. More importantly, the "New Taiwanese" concept underlines the emergence of a Taiwan identity separate from that of China and closely associated with Taiwan's homegrown democratic system. The democratic system in Taiwan is not negotiable, as it is a fundamental part of Taiwan's identity.

### Japan's Legacy

Japan has not given serious thought to what can be done toward reconciliation with its neighbors while the resentment of Japan's past occupation lies deep

below the surface in formal relations. Japan has not fully apologized for mistreating the neighboring populations under their occupation prior to the end of World War II. Occasional diplomatic tension was created by Japanese justification of destruction of neighboring countries. Relations between Japan and South Korea (most seriously affected by Japanese war campaigns) are at the lowest ebb, with the Japanese government's approval of history textbooks that omitted any mention of war crimes committed against the Korean population as well as Prime Minister Junichiro Koizumi's visit to Yasukuni Shrine in Tokyo (a symbol of Japan's imperial past).

In particular, it remains an international issue to compensate and make an apology to the "comfort women" who were victims of the Japanese military's highly organized system of sexual slavery throughout its occupied territories in the 1930s and 1940s. Of the two hundred thousand so-called comfort women, only a quarter survived their ordeal; many died of injuries, disease, madness, and suicide soon after they were forced into sex with Japanese troops. For years the ones who survived stayed silent with their marginal lives. Beginning in 1991, however, hundreds of elderly women from Korea, China, Taiwan, and the Philippines came forward demanding the Japanese government's acknowledgment of its responsibility, an apology, and reparations.

Despite a vigorous campaign of international protest following mass demonstrations in Korea and Taiwan, Japan has not officially accepted the responsibility, though the Japanese prime minister offered unofficial apologies in 1995. A small fund to be financed on a voluntary basis by business was set up to help the women, but the Hiroshima high court overturned a modest award to three Korean women later. In addition, a popular comic-book history of Japan alleges that the comfort women were volunteers. Any mention of the government's role in the comfort-woman program has been widely ignored by the Japanese public.

### The Inter-Korean Talks

The relations between North and South Korea have been affected by the legacy of the Korean War. The country was originally divided by American and Russian troops occupying the peninsula following World War II. The situation on the Korean peninsula has been affected by the nature of bilateral relationships with neighboring powers. Currently, thirty-seven thousand United States military troops are stationed in South Korea to help thwart any possible military

action from the North. South Korea, Japan, and the United States have coordinated their policies toward North Korea.

The *Sunshine Policy* of reconciliation promoted by South Korean President Kim Dae-Jung represents efforts for a gradual easing of tensions with Pyongyang. South/North Korea relations have been improving following a historic visit of the South Korean President to the North in June 2000. Based on the Inter-Korean Joint Declaration, limited family visits were allowed, and there have been indications of more restrained military behavior from Pyongyang. In addition to further discussions about the reunion of divided families, meetings of the inter-Korean economic cooperation committee along with inter-Korean ministerial talks were held to search for closer economic ties.

The North-South Korean peace process produced a joint pledge to resume building a railway to join the two halves of the divided peninsula through the direct route across the 38th parallel, closed for fifty years. Work financed by the South will also start on an industrial zone in Kaesong near the South Korean border. Hyundai's tourism project involving ship cruises to the North's scenic Kumgang Mountains was encouraged by the government. The North also recently made a request for electricity needed to revive its crippled economy.

Such events as the inter-Korean summit of June 2000 clearly stimulated joint efforts for forward movement in the stalled inter-Korean relations. The younger generation of North Korean leadership following the death of Kim Il Sung has pursued more pragmatic approaches. However, Pyongyang is reluctant to quickly implement an early reunion for separated families at a certain permanent facility and free exchange of letters owing to concerns for their political implications. Inter-Korean talks for reconciliation and exchanges have not resulted in a dramatic breakthrough in the security arenas, and concrete actions have not been taken to replace the current armistice system on the Korean peninsula. Given lingering suspicion, North-South Korea talks have been slow, and a reciprocal visit to South Korea by the North Korean President has not been yet scheduled.

The conditions for reconciliation have further deteriorated due to the reluctance of the United States administration to be engaged in a dialogue with North Korea, reversing a high-level contact between the United States and North Korea during the Clinton administration. While a peaceful reunification is desirable, a sudden collapse of North Korea would place new financial and social strains on the country just when it has to concentrate on overcoming the global economic challenge.

## Future Challenges

East Asia is a part of the globe destined to shape the twenty-first century economically, politically, and strategically. In this coming decade, dramatic changes are expected with the re-establishment of the international order in East Asia. National economies have been integrated into international production networks and widely exposed to market trends abroad. While old borders come down with economic integration, social fragmentation creates new ones.

The Chinese leadership is not open yet to political reform which allows a peaceful transfer of power. In addition, Chinese leaders have to pursue structural reform, which has to be accompanied by its entry into WTO. The Chinese leadership will continue to confront the status of Taiwan, demands for autonomy by Muslims, Tibetans, and other minorities, and face criticisms against human rights abuses and environmental pollution.

Environmental problems have become acute recently. The phenomenal expansion over the past several years of the national economy has made China the largest producer of carbon dioxide among newly industrializing countries. Whereas the country is now responsible for about ten percent of all the greenhouse gas emissions directly contributing to heat waves and floods on the planet, China is expected to emit more carbon dioxide, at its current pace of development, by 2025 than the present total of North America and Japan combined.

Following its miraculous economic growth, Japan has been in deep recession since the early 1990s. The ruling Liberal Democrat Party failed to reverse years of economic stagnation despite spending tens of billions of dollars on public infrastructure. There is pressure on Japan to tackle structural weaknesses in the financial system, in particular, attributed to Japan's fragile banking system burdened by massive debts. The efforts to revive the economy have not yet produced any visible outcome.

The United States' role in East Asia will be determined by interpretations of the degree of preparedness by the American government to meet with the shift in balance of power in East Asia. In the short term, the terrorist attacks on the World Trade Center and Pentagon on September 11, 2001, have resulted in support for a United States-run international campaign. While South Korea and Japan provide logistical support for humanitarian operations in Afghanistan, North Korea joined treaties on anti-terrorism as a gesture to improve relations with the US government.

## EAST TIMOR

East Timor is the eastern half of the island of Timor, including the enclave of Oecussi surrounded by Indonesian West Timor. Similar to nearby Indonesian islands, its climate is dry, with a rainy season roughly from November to February. It is mountainous, although there are some plains and littoral regions. There are at least a dozen distinct languages native to East Timor, with dozens more dialects, although Tetum is a lingua franca, as is Indonesian, and some speak Portuguese and English. The population is predominantly Malay with sizable Austronesian and Melanesian populations, as well as ethnic Chinese and Arab populations, and a large mestiço population due to the Portuguese colonial period.

Portuguese traders and missionaries arrived in the early sixteenth century. The colonial period was marked by the "benign neglect" experienced by other Portuguese colonies; the Portuguese were interested mainly in the region's sandalwood. When the vast stands of sandalwood had been depleted by the early twentieth century, the Portuguese turned to coffee and copra production.

As it did most of Southeast Asia, Japan took over East Timor during World War II, and approximately sixty thousand East Timorese perished during the course of the war, representing over one-tenth of the population. As nationalist movements agitated for independence throughout Southeast Asia following the war, East Timor reverted back to colonial rule due to the lack of a strong, united nationalist front because of the low level of education in the region

(although sporadic small-scale rebellions against the Portuguese flared, usually easily and brutally repressed). A Catholic seminary was built in the 1950s in Dare in order to train an indigenous clergy and provide secondary education for elites. Nationalist leaders such as José Ramos Horta and Mari Alkatiri were educated there, and nationalists were often influenced during periods of exile in other Portuguese colonies with more developed movements, such as Mozambique.

Following the 1974 "Revolution of the Carnations" in Lisbon, Portuguese decolonization began throughout the Lusophone empire. Three main political parties emerged in East Timor, the Timorese Democratic Union, Revolutionary Front for Independent East Timor (FRETILIN), and the People's Democratic Association of East Timor. FRETILIN commanded the largest support by far. After months of Indonesian subterfuge in East Timor, including cross-border excursions, FRETILIN unilaterally declared independence on November 28, 1975, hoping for international recognition in order to prevent an invasion.

On December 7, 1975, Indonesia invaded, with approval from the West. Within a few months sixty thousand East Timorese had perished, and within five years that number had increased to approximately two hundred thousand, representing around one-third of the population. The Indonesian occupation was marked by widespread campaigns of terror, rape, forced sterilization, torture, and disappearances. The armed wing of FRETILIN, FALANTIL, maintained a guerrilla war, bolstered by popular support.

By the mid-1980s, after securing most of the territory, the Indonesian administration began development projects in East Timor, such as roads, telecommunications, electricity, and other infrastructure projects. Although this work aided the East Timorese economy, it also helped facilitate Indonesian consolidation of control. In 1986, the University of East Timor opened, with a focus on agriculture and vocational training. Much of the profit of development in East Timor went to the Indonesian military elite and bureaucrats stationed in East Timor; many industries, such as road construction and coffee, were monopolies owned by Indonesian generals. Throughout the occupation, East Timor remained one of the least developed regions in Indonesia, although the vast reserves of oil in the Timor Sea made it potentially one of its richest. During the occupation the conversion rate to Catholicism skyrocketed, as a reaction to the invaders' belief in Islam, and East Timor is around 95% nominally Catholic today.

The integration of East Timor was viewed by most as a *fait accompli*, yet following the Santa Cruz Massacre of November 11, 1991, caught on film and

broadcast globally, solidarity movements emerged worldwide calling for self-determination. The movement was heartened in 1996 when Bishop Carlos Ximenes Belo shared the Nobel Peace Prize with resistance leader Ramos Horta.

Following the 1998–1999 economic and political crisis that engulfed Indonesia, President Suharto's successor, B.J. Habibie, agreed to a referendum in the long-suffering territory. Despite widespread intimidation by militia groups supported by the Indonesian military, 98% of those registered voted, and 78.5% chose independence. After the results were announced on September 4, 1998, East Timor erupted in a militia-led spasm of violence. Within two weeks the unarmed UN force had evacuated, contrary to their guarantees, allowing the militias and Indonesian military to carry out their scorched earth campaign. When UN peacekeepers arrived on September 20, East Timor lay in ruins. Over seventy percent of all buildings were destroyed, water, electricity, and telephone services were dismantled, systematic killing and rape had occurred, and nearly half the population had been displaced, many sent at gunpoint to West Timor or other areas in Indonesia. The Indonesian military and militias retreated, and the task of rebuilding fell to the United Nations Transitional Authority for East Timor (UNTAET).

UNTAET faced a myriad of problems. Education under Indonesia was poor, and in the period before the referendum, almost all of the teachers, who were Indonesian, left. Schools and the university were destroyed. To stave off famine and disease, UNTAET and NGOs organized food relief, temporary housing, and medical facilities, and UNTAET engineers began rebuilding the shattered infrastructure. Few UNTAET jobs were filled by East Timorese, however, justified by a lack of English skills or training, and unemployment remained around eighty percent since the referendum, causing resentment. The UNTAET presence led to a clearly bifurcated economy, with UNTAET and most aid workers occupying the top tier, and most East Timorese stagnating in poverty. There has been surprisingly little violence, however, including toward returning former militia members, who are being reintegrated into society.

On May 20, 2002, East Timor was granted full independence, recognized by the United Nations, with former FALANTIL commander and Indonesian prisoner José Alexandre “Xanana” Gusmão becoming the country's first elected president. Ramos Horta became the country's Minister of State and Minister of Foreign Affairs, and Alkatiri Prime Minister. East Timor has begun establishing economic and diplomatic relations with its neighbors, including

Indonesia. Per capita income is around \$450 US dollars, unemployment remains high, and the country relies on foreign aid and profits from coffee exports. East Timor has not experienced economic growth; its growth rate was estimated at –3% in 2003. A windfall is expected as soon as the oil in the Timor Sea can be exploited; however, maritime boundaries and the rights to the oil remain in dispute between Australia and East Timor. Challenges that remain in East Timor include establishing a modern education system, rebuilding the shattered infrastructure, and establishing a viable economy that can alleviate the high rates of unemployment. Non-governmental organizations have spread and continue to add to a lively civil society, including continuing their calls for justice in the form of an international tribunal for those responsible for the tragedy of the Indonesian occupation. The East Timorese leadership, however, including Gusmão and Ramos Horta, have taken a more politically pragmatic approach, denying the need for a tribunal and citing the importance of strong political and economic ties to Indonesia, its major trading partner. An Indonesian tribunal with very limited scope exonerated most of those brought before the court, but was widely viewed as illegitimate by outside observers.

## ECONOMIC AND CUSTOMS UNION OF CENTRAL AFRICA (ECUCA)

Popularly identified by its French acronym, UDEAC (the Union Douanière et Economique de l'Afrique Centrale), ECUCA is a regional grouping that was meant to promote cooperation and integration among the Central African states with a view to fostering sub-regional development. This was to be done through the harmonization of its fiscal policy and customs duties, the coordination of its industrialization programs, and the free circulation of the factors of production as well as produce. It was created on December 8, 1964, and in 1974 the Treaty was revised, with the members pledging to work to form an economic union. Initially, it had five members: Cameroon, the Central African Republic (CAR), Chad, the Republic of the Congo, and Gabon. Chad and CAR withdrew in 1968, though CAR later rejoined that same year. Chad did not renew its membership until 1985, when Equatorial Guinea also became a member. Commonalities among them such as the French language (except for Equatorial Guinea, where the official language is Spanish) and a common currency, the CFA (Communautaire financière africaine, or the African Financial Community), as well as cultural affinities were expected to have a synergistic effect on the Union. Cumulatively, it covers a geographical area of 3,020,561 square kilometers, that is, about one and a half times the size of the European Community in 1990. The combined population of its six members was 22 million, that is, a tenth of the inhabitants of Europe (Mouafo 1991). As such the grouping began to provide an answer to the economies-of-scale problem that had dogged its individual members, who were considered micro-states. Other factors, however, could still decrease its attractiveness value to potential investors. In 1987, their total GDP was about \$18 million US dollars, that is, about a tenth that of Holland (Kitchen 1992). And this has fallen over time, causing most of the states to sign Structural Adjustment Programs with the World Bank. *Prima facie*, this can be seen as evidence of ECUCA's failure to provide a new impetus to development in the sub-region. The requisite political will was also in short supply among the contracting parties.

Though it was endowed with several instruments, the Common External Tariff (CET) stood out because it was trade driven, as well as its *Droit de Douane* (single custom duty), a Single Tax, and a *taxe complémentaire* (complementary tax [CT]). The CET applicable to non-member states comprises a common external customs duty, a *taxe d'entrée* (entry tax), and a *taxe sur le chiffre d'affaires à l'importation* (turnover tax). The CT, designed to compensate the states'

revenue losses suffered as a result of the application of the CET, is determined by the various member-states. Initially conceived to cover a transitional period of twenty-five years, it has become permanent because of its revenue generating capacity. The *Single Tax*, which seeks to promote *intra-UDEAC* trade in the manufacturing sector, is a preferential tax granted to companies upon application. Beneficiaries have a lighter tax burden than the CET plus the CT. However, its tendency to vary from state to state undermines both the CET and the principle of fair competition. The members shared a common central bank, the Banque des Etats de l'Afrique Centrale (BEAC), as well as a common development bank, the Banque de Développement des Etats de l'Afrique Centrale (BDEAC). Noteworthy, however, is the fact that powers of decision-making were vested in the Council of the Heads of State and Ministers that met once a year; its Secretary General had only administrative functions.

Despite the incentives, trade creation was negligible, as demonstrated by the sluggish growth in *intra-UDEAC* trade as a percentage of the overall volume of trade. It oscillated between 1.6% in 1960 and 2.0% in 1983 (the year in which the secretariat stopped collecting data) after hitting a high of 4.1% in 1980 (Kitchen, 1992). Most of its inter-African trade is carried out with the members of the Economic Community of West African States (ECOWAS). Historical trade patterns have continued, as France remains the principal trading partner of these countries. Granted, these figures were skewed by the high levels of contraband and unofficial trade in UDEAC. Two groups of products dominate official *intra-UDEAC* trade: energy products and manufactures. Trade in the latter is hindered because most of these economies have identical industries.

Trade in Single Tax products was largely to the benefit of the more developed states where most of these industries are located. To redress any prejudice that this may cause the poorer states, the redistribution of the proceeds of this tax was based on the level of a state's consumption of the Single Tax products. Because of this, the amounts varied, a trend that was exacerbated by the fact that variable rates were applied during a six-year transition period, and the 1974 treaty simply stipulated that the rates for the same products should be reduced progressively.

Confidence-building measures, such as the creation of regional industries with a view to fostering the deepening process, were aborted. Plans for creating the "Société Equatoriale de Raffinage" (Equatorial Refining Company) to refine crude oil suffered when states such as Gabon reneged on their initial

commitment to participate and withdrew their investments. This produced a domino effect. In the textile sector, for instance, a decision to locate a communal textile factory in Congo aborted as states simply built their own factories. It is noteworthy that the creation of forward and backward linkages was not a factor in the decision allocating these regional industries. Even BDEAC failed to devote up to 50% of its credit to the creation of regional industries as stipulated in the 1974 treaty. Rather, it was more exposed to the more developed states in the Union (Jua 1986). Against this backdrop, lesser developed UDEAC members saw payments from the Solidarity Fund as only budgetary compensations, which could not help to reduce the asymmetry in levels of development.

Though factors such as investment shortfalls and a historical bias to reinforce the umbilical cord between France and its member states account for UDEAC's mitigated results, a deficit, if not lack of political will among the various states, was also crucial. Its secretariat, tasked with implementing the agenda, was hobbled by a lack of funds as member states failed to pay their dues. Because leadership in the various states privileged national over a sub-regional focus, rhetoric diverged from reality. For example, despite the commitment to benefiting from the economies of scale as showcased in the regional agenda, constraints to free movement of people became stronger and nationals of other states were even expelled. Contradictions seem to abound for expulsions are being carried out simultaneously with the creation of instruments meant to foster integration. To this end, it has signed a protocol of understanding for transport, *Transport Inter-Etat des Pays d'Afrique Centrale* (TIPAC). To tear down barriers in other sectors, it created the Commission Bancaire d'Afrique Centrale (COBAC) in January 1993 that would adopt a common code for banking in the region and the Conférence Interafricaine des Marchés d'Assurance (CIMA) for insurance in July 1992 as well as the integration of their business laws under the auspices of l'Organisation pour l'harmonization en Afrique du Droits des Affaires of the Organization for Commercial Code Harmonization (OHADA) entered into by Francophone African countries, notably West African Economic and Monetary Union (the l'Union Economique et Monétaire Ouest Africaine (UEMOA)) in 1995.

Following this phase of "integration of regulations," the states committed themselves to adopting coherent macro-economic policies and common sectoral policies. This was achieved with the signing in 1994 of the treaty for the Central African Economic and Monetary Union (CEMAC), ratified in 1999. Replacing UDEAC, its objective was to promote

economic integration among its members. To this end, intra-regional trade would be regulated by the value added tax. Significantly, this reform brings about the end of most of the quantitative restrictions and simplifies most customs procedures. CEMAC also provided for the setting up of a Court of Justice which includes a judicial chamber (*chambre judiciaire*) and an auditing court (*chambre des comptes*) for the settlement of disputes arising as a result of these provisions. Cooperation from donors is also important in realizing integration. The World Bank and other developed countries assuaged the fears of the lesser developed states by pledging financial aid to compensate them for any financial prejudice they may suffer consequent to this reform. Under the Lomé IV Convention, the EU set aside ECU 84 million for Regional Indicative Programs. Some of this money has been given to the TIPAC project and is being used to develop a number of regional transit routes such as the Bertoua-Garoua-Boulai-Bangui road to link Cameroon and the CAR, and Garoua Boulai-Ngoundere with a view to facilitating transport between Cameroon and Chad. Similarly the World Bank, which identified the easing of transport regulations as one of the key objectives of its Regional Program, pledged financial aid of \$340,000 to help strengthen the Institutional Development facility. Disbursement of this fund was contingent on, *inter alia*, participants becoming more responsible for the maintenance of their road transport patrimony. Notable also is its contribution to other projects that have a federating impact such as the Chad-Cameroon pipeline, one of the biggest private investments undertaken in sub-Saharan Africa, which was inaugurated in October 2003. Consciousness raising in the World Bank vis-à-vis sub-regional projects was prompted by the UDEAC secretariat, which on the heels of its adoption of its "New Economic and Social Integration Strategy" noted the failure of SAPs to promote regional projects.

## ECONOMIC COMMISSION FOR AFRICA (ECA)

The Economic Commission for Africa (ECA) is the regional arm of the United Nations (UN) in Africa. It was established in 1958 with the mandate of fostering economic and social development of its fifty-three member states. Headquartered in Addis Ababa, Ethiopia, under the leadership of its Executive Secretary, the ECA is one of five such regional economic commissions created by the United Nations to serve different parts of the world. It reports to the UN Economic and Social Council (ECONOC) through the Joint Conference of African Finance, Planning, and Economic Development Ministers.

For administrative and operational purposes, ECA has divided Africa into five sub-regions, with each having its own head office, which caters to the needs of the countries under its jurisdiction and also provides vital links between the ECA headquarters, the various regional economic blocs, and the individual member states. These sub-regions include (a) Central Africa (head office in Yaoundé, Cameroon), with seven members: Cameroon, Chad, Congo, Equatorial Guinea, Central African Republic, Sao Tome, and Principe; (b) East Africa (head office in Kigali, Rwanda), with thirteen members: Burundi, Comoros, Democratic Republic of Congo, Djibouti, Ethiopia, Eritrea, Kenya, Madagascar, Rwanda, Seychelles, Somalia, Tanzania, and Uganda; (c) North Africa, (head office in Tangier, Morocco), with seven members: Algeria; Egypt, Libya, Mauritania, Morocco, Sudan, and Tunisia; (d) Southern Africa (head office in Lusaka, Zambia), with eleven members: Angola, Botswana, Lesotho, Malawi, Mauritius,

Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe; and (e) West Africa (head office in Niamey, Niger), with fifteen members: Burkina Faso, Benin, Cape-Verde, Côte d’Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, and Togo.

Informed by, and cognizant of, the limitations wrought by the acute lack of technical know-how on Africa’s development, the ECA for the most part pursues its mandate through the development and dissemination of culturally sensitive, research-based knowledge and best practices on such matters as good governance, poverty reduction, the empowerment of women, conflict prevention and resolution, and regional cooperation among African countries. Thus, research projects and publications, workshops and conferences, and the provision of library and technical information services—through CD-ROMs, audiovisual materials, printed media, and databases—constitute the bedrock of ECA’s development endeavors. Some of the noteworthy ECA publications are the *Economic Report on Africa* (an annual publication), which reviews the continent’s economic performance and short-term prospects; the *Africa Governance Report*, an annual publication first released in 2004, to identify the best practice in governance for peer learning, to identify gaps in theory and practices, and to make recommendations for improvement; and the *Cartographic and Remote Sensing Bulletin*, which provides valuable information on research, advocacy, and policy analysis on remote sensing technologies and spatial and mapping information pertaining to Africa. Other important publications of the ECA are the *Africa Statistical Yearbook*; *Compendium of Environmental Statistics*; *Compendium of Intra-African and Related Foreign Trade Statistics*; and *African Index*.

## Program Divisions

The ECA is organized around six main program divisions. First—not in any particular order, though—there is the Development and Policy Management Division (DPMD), whose goal is to enhance institutional capacity of African governments by establishing baseline measures on the nature and quality of institutions, by advising African governments on best practices, and by strengthening civil society organizations on the continent. This division is premised on the conviction that no meaningful social and economic development can be accomplished without effective, transparent, and accountable institutions. Secondly, the ECA has an Economic and Social

Policy Division (ESPD) which provides pertinent research on economic and social policies to African governments and non-governmental institutions. Its operations are generally focused on such themes as social and economic policy, trade and finance, and poverty reduction. The third major division is the Development Information Services Division (DISD), which publishes and disseminates ECA's research outputs to all of its members.

Another important ECA program division is the Gender and Development Division, which works in conjunction with the African Center for Gender and Development (ACGD), to promote gender equity, which invariably connotes the advancement or empowerment of women, given the high level of patriarchy across Africa. The ECA also has a Sustainable Development Division, with which it seeks to enhance African governments' capabilities in the use of scientific and technological innovations in achieving environmentally sustainable development; to improve their stewardship of the natural environment; and to strengthen their ability to design and implement development policies that reflect and reinforce the intricate, dialectical nexus between food security, population, and environment sustainability. Finally, the ECA has a Trade and Regional Integration Division (TRID), which promotes regional cooperation and economic integration across Africa, focusing mainly on policy issues and infrastructure development. This division also works to strengthen the capacity of African countries to engage in substantive trade negotiations in the global arena, especially within the context of the World Trade Organization (WTO) agreements and initiatives. In addition to the preceding six divisions, the ECA has a number of subsidiary organs or committees—e.g., Committees of Regional Integration; on Development Information; on Sustainable Development; on Women and Development; on Human Development and Civil Society; on Industry and Private Sector Development—which provide expertise in their respective areas in pursuance of the ECA's mandate.

## Accomplishments

The ECA has made remarkable, and, indeed, commendable, contribution to Africa's social and economic development over the nearly fifty years of its existence. Among other things, it has been instrumental in the establishment of several national, sub-regional, and regional development-related technical institutions, encompassing such fields as technology, remote sensing, finance and banking, and

planning and management. The African Development Bank, headquartered in Abidjan, Côte d'Ivoire; the Eastern and Southern African Management Institute (ESAMI), headquartered in Arusha, Tanzania; and the African Institute for Economic Development and Planning (IDEP) located in Dakar, Senegal, are just a handful of African institutions which owe much of their foundation to the efforts of the ECA.

Likewise, over the years, the ECA has facilitated the creation and sustenance of a number of sub-regional economic blocs in Africa. For instance, in 1965, it was the ECA that initiated the Lusaka meeting of the newly independent Eastern and Southern African states, which culminated in the formation of the Preferential Trade Area (PTA) in the sub-region, and ultimately led to the establishment of the Common Market for Eastern and Southern Africa (COMESA) in 1994. Similarly, the first major effort to bring Francophone and Anglophone West African nations toward the formation of the Economic Community of West African States (ECOWAS) was made by the ECA, through resolutions passed at its Seventh Session in Nairobi in February 1965. With its Trade and Regional Integration Division (TRID), the ECA continues to be instrumental in the operations of sub-regional blocs in Africa, providing them with technical support in such areas as multilateral trade promotion and negotiations and infrastructure development. The ECA sees sub-regional economic integration bodies as the building blocks for the eventual integration and self-sufficiency of Africa as a whole.

The ECA has been a major player in the negotiations and articulations of nearly all the major Pan-African development strategies, initiatives, and declarations, including the Monrovia Declaration of Commitment of the Heads of States and Governments of the Organization of African Unity (OAU), signed in 1979; the Lagos Plan of Action for the Economic Development of Africa and the Final Act of Lagos, signed in the second Extraordinary Session of the OAU in 1980; the African Charter for Popular Participation for Development, signed in 1990; the New Partnership for Africa's Development (NEPAD) formally adopted by the OAU in July 2001; and the recent negotiations that led to the transformation of the OAU into the African Union (AU) in July 2002.

As the African arm of the United Nations, ECA plays a significant role in advocating for Africa's development interest within the UN system, mostly by coordinating various national, sub-regional, and regional UN programs across Africa in furtherance of the continent's social and economic development goals. Of special importance here is the ECA's role

in the implementation of the UN System-wide Special Initiative on Africa, which was launched in March 1996 to help accomplish the UN's New Agenda for the Development of Africa, launched in 1991. Indeed, ECA routinely discusses strategies with, and advocates for, African governments in various global forums and trade, finance, and debt relief negotiations, especially those involving such multilateral organizations as the WTO and the Bretton Woods institutions. Also, ECA participates in, and follows up on, global initiatives and Conferences such as the UN International Conference on Population and Development in Cairo (1994); the 1995 Beijing Women's Conference; and the Washington DC-based Global Development Network's annual Global Development Conferences.

Given the acute dearth of reliable development-related data across Africa, it is hardly surprising that the ECA has put considerable energy into strengthening the capacity of African nations to collect, process, and analyze data in support of their respective development policies and programs. Through a number of workshops, conferences, and expert group meetings over the years, the ECA has identified and disseminated best practices in the development of macroeconomic-, poverty-, and gender-related indicators across Africa. The ECA's African Gender and Development Index (AGDI), launched in 2002, deserves a special mention in this regard. With this index, the ECA was able to compile (in 2003) gender profiles for all of its fifty-three member states, based on the following six indicators: women in decision-making positions; educational enrollment ratios; health and HIV/AIDS; women's access to credit; women's participation in the labour market; and human rights of women and girls. Plans are also under way at the ECA secretariat to develop similar indicators for measuring the extent of food sufficiency and security among African countries.

Working with a number of UN agencies and the African Development Bank, the ECA is also striving to improve access to safe drinking water and basic sanitation across Africa; a Pan-African Implementation and Partnership Conference on Water (PANAFCO) was held in Addis Ababa, Ethiopia, in 2003, under the auspices of the ECA and the African Ministerial Council on Water (AMCOW) to facilitate this process. The extent to which the lack of good sanitation and safe drinking water impacts the human condition in Africa arguably demands no further elucidation, not even to the most cursory observer of the continent's development imperatives.

To help bridge the infamous digital divide between Africa and the rest of the world, the ECA, with the support of the government of Canada, has recently set

up the African regional node of the Global Electronic Policy Resource Network (ePol-NET) to coordinate the demands of African institutions and governments seeking guidance and support on such matters as electronic commerce, Internet policies, and telecommunication regulations.

As the regional arm of the UN, the ECA, unlike many other regional development organizations in Africa, is not financially incapacitated. Additionally, the ECA has for the most part benefited from a very insightful and dedicated leadership, in the likes of the renowned Nigerian economist Adebayo Adedeji (who led the organization from 1975 to 1991) and the influential Ghanaian-born development economist K.Y. Amoako (the current executive secretary of ECA). Still, the organization faces a number of daunting problems, having to deal with African governments, many of whom lack the necessary technical personnel, political will, and, to some extent, insight and foresight to support many of the development initiatives of ECA, not to mention having to work on a continent gripped by perennial geopolitical conflicts and ethnic violence, extreme poverty, and the scourge of AIDS and many other devastating diseases.

## **ECONOMIC COMMUNITY OF CENTRAL AFRICAN STATES (ECCAS)**

The treaty instituting the Economic Community of Central African States (ECCAS) was signed on October 18, 1983, and came into force on January 1, 1985. It consists of eleven member states and was a fusion of Union Douanière des Etats de l'Afrique Centrale (UDEAC) (Cameroon, Central Africa, Chad, Congo, Equatorial Guinea and Gabon) and the Economic Community of the Great Lakes (CEPGL) (Burundi, Rwanda, and the then Zaire) as well as Sao Tome and Principe. Angola remained an observer until 1999, when it became a full member. Initially, it sought to "promote and strengthen harmonious cooperation and a balanced and self-sustained development in the industrial, transport and communications, energy, agricultural, and natural resource sectors." Though constituting one of the smaller sub-regions of the continent from the point of view of demographics, with only 68 million inhabitants, occupying circa 6.7 million square kilometers that spreads from the equatorial forests to the Sahel, it is endowed with many and varied natural resources. It has one of the remaining rain forests of the world while some of its members are world leaders in diamond production and almost all of them have large oil deposits. Seen from a regional level, ECCAS was to constitute one of the building blocks of the African Common Market envisaged in the 1980 Lagos Plan of Action. However, there was no formal contact between ECCAS and the African Economic Community until October 1999, when they signed the Protocol on Relations.

To contribute to the realization of this project, the Treaty created the following structures: the Conference of Heads of State and Government as its supreme organ, the Council of Ministers, the Secretariat General (one secretary-general elected for four years and three assistant secretaries-general), a Court of Justice, and a Consultative Commission. Confering all decision-making powers in the juridical division of powers on heads of state and government who cling to their political sovereignty in a regional integration scheme was counterintuitive and perforce had to be counterproductive. Unlike the Economic Community of West African States (ECOWAS) and the Southern African Development Community (SADC), it was not endowed with formal structures. Meetings at the technical and ministerial levels have been infrequent. The effect of this lacuna was exacerbated by what the secretary-general of ECCAS described in a June 1999 report as "the double language" of the officials who speak in favor of integration but avoid implementing the Community's

regulations. Palpable proof of this lack of political will was their failure to pay membership fees between 1992 and 1998, a situation that paralyzed and provoked the dormancy of ECCAS. Because of this, the timelines prescribed in the Treaty could not be met.

Its Article Six, for instance, provides that the Customs Union would be achieved after a twelve-year period or not more than twenty years from the date of the entry into force of the Treaty and would be preceded by two stages. The first stage, a study to determine the timetable for the progressive removal of tariffs and non-tariff barriers to intra-Community trade as well as for the increases or decreases in the customs tariffs of member states with a view to adopting a common external tariff. Stage two consists of the establishment of a free trade area by applying the timetable for the progressive elimination of tariff and non-tariff barriers to intra-Community trade. However, the likelihood of meeting these timelines were problematic because of the safeguard clauses and escape windows provided for in Article 34, which allows states to impose quantitative restrictions or non-tariff barriers per Article Two of Annex II on goods originating from other member states for the purpose of redressing their balance of payments and protecting strategic infant industries. Arguably, these derogations have stifled intra-Community trade, as shown by the fact that it ranks ninth out of thirteen groups studied by the Economic Commission for Africa.

Measures to reverse this trend, such as the freedom of movement of the factors of production contained in the Treaty, have not been respected. Article Two of Annex VII of the Treaty provided for the free movement of nationals of the member states four years after the Treaty entered into force, and workers could accept employment in any state and continue to reside there even after the end of the employment. The reality has been different. The Cameroonian Ministry of Foreign Affairs lists Gabon (and France) as the countries where the social integration of their nationals is most problematic, even after they have paid for the visas and acquired the residential permits, which cost circa \$450 US dollars each and are renewable after two years at \$200 US dollars. Chadians have similarly complained against "unfriendly treatment and the violation of diplomatic rules by Cameroonian forces." Expulsions, engendered by reciprocity considerations, are commonplace, and in some cases even workers are affected by these measures with "the confiscation of their property." Structural hurdles such as the lack of good roads already hamper social communication among ordinary citizens in the region.

The Community's Court of Justice is given the competence to settle questions of interpretation of the Treaty per Article 16. Though its decisions are binding on member states and institutions of the Community, it is hobbled by the fact that this is just an advisory opinion. Furthermore, only the Conference of the Heads of State and Government as the Council of Ministers can bring matters before this Court. The secretary-general, the Consultative Commission, the Technical Committees, and all above individuals who may suffer a prejudice or whose rights may be violated are not so empowered.

Despite these structural/textual deficiencies, the heads of state and government identify the lack of confidence engendered by tensions and conflicts as the main cause of the stagnation and paralysis of integration. Ideological competition in the sub-region early into the postcolonial era, exemplified by the Congo crisis served to promote local proxy wars. Apartheid South Africa exacerbated this situation as it recruited client states in the region in a bid to build its constellation of states with a view to protecting and promoting the white redoubt. Of course, prebendalism and other exclusionary practices and the tendency of intra-state conflict mutating into inter-state conflict also led to the normalization of war. Because of this, the region served as the theater for what has been dubbed Africa's First World War, and most of the states for variable periods of time have virtually failed. The end of conflicts has not ushered in peace as the region is awash with light weapons and small arms that have a long shelf life because of that require little maintenance. They are now used for social wars that blight these states.

To overcome this, they turned to the United Nations (UN), and on their initiative Resolution 46/37 B was adopted in December 1991, in implementation of which the secretary-general of the United Nations established the United Nations Standing Advisory Committee on Security Questions in Central Africa in May 1992. It seeks to assist the states to develop confidence-building measures, and in disarmament with a view to benefiting from the peace dividend. Thus, the Standing Advisory Committee has engaged in the development of preventive diplomacy, peace-making, and peace-building. To this end, it has been involved in training the personnel of its member states in peacekeeping activities. Above all, the Standing Committee prepared a non-aggression pact that was signed at the heads of state summit in July 1996 at Yaounde, Cameroon, by nine states. Significantly, Angola and Rwanda were not signatories. And at the February 1999 summit of the United Nations Standing Advisory Committee that was held in Yaounde, the member states decided to

create an organization for the promotion, maintenance, and consolidation of peace and security in Central Africa, which would be called Council for Peace and Security in Central Africa (COPAX). Coming on its heels, Gabon hosted a regional peacekeeping exercise, "Gabon 2000," whose goal was to increase the capacity of ECCAS states in the fields of peace keeping, conflict prevention, and management. This direction represented a direct application of the French RECAMP concept (reinforcement of African peacekeeping capacities).

Because of the premium that the heads of state and government placed on confidence building measures, COPAX was established at the June 1999 summit in Malabo, Equatorial Guinea, Cameroon. It was supposed to foster sub-regional cooperation in the realms of defense and security. Another pact for mutual assistance between the eleven member states was also signed. To enable the realization of these goals, the Summit provided for the creation of a Central African Multinational Force, a Central African early-warning mechanism, and the Defense and Security Commission. This skewed focus on peace and security has caused some to posit that the sole aim of COPAX is to "save heads of state in distress." Sustaining this assertion is regime instability that inheres from their status, in the words of the State Failure Task Force, as "partial democracies."

However, other measures that seek to empower the population of the sub-region have also been undertaken. Notable among them is the establishment of the Sub-regional Center for Human Rights and Democracy as well as the creation of a network of Central African parliamentarians, as a prelude to the establishment of a Community Parliament. Arguably, this should provide an opportunity for the conversion of the peoples of the sub-region into federators.

Measures were also taken with a view to giving a new impulse to integration. Notable among them was the establishment of an autonomous financing mechanism for ECCAS and integration activities. To enable this, a tax of 0.7% of custom duty on all goods imported from third parties was introduced. A Council of Ministers meeting also decided that all outstanding arrears in contributions from member states would be paid on a trimester basis over a two-year period by an automatic debit, and pledged in the future to guarantee all contributions are secured to ECCAS, even if this be by an automatic debiting of the accounts of member states in their respective central banks. A fund for development and sub-regional solidarity was also created. At the heads of state and government conference at Brazzaville, Congo, in January 2004, it was decided that all member states would levy a special tax for this purpose.

ECCAS failed to spur trade creation. Failure of macroeconomic harmonization was arguably due to the fact that the economies of its members are competitive rather than complementary. With a view to jump-starting this, a scheme for the liberalization of intra-Community trade and the free movement of persons and goods was to be launched per Decision No. 03/CCEG/VI/90. A recommendation for the studies on harmonization of customs and tax legislation was tabled only at the January 2003 meeting of Council of Ministers of Economy and Finance and is proof that ECCAS had failed dismally to meet the timelines prescribed in 1983 for sectoral integration in the realm of trade. It was only at the Brazzaville summit that it was finally conceded that a free trade zone would become operational in June 2004. A new consciousness also seemed to emerge on the need for partnership in this endeavor. Political will that was in short supply is now becoming more manifest, as demonstrated by a decision at the Brazzaville summit to grant the right of free circulation to businessmen, students, religious, tourists, researchers, and university professors. Several missing links mitigate the growth of intra-ECCAS trade. Notable among them is the lack of a viable road network. The only significant road link is between Kigali and Bujumbura. Inadequate infrastructure and physical integration helps to increase overhead costs, thereby adding to the high costs of doing business at the intra-ECCAS level. To begin to reverse this situation, ECCAS has adopted a realistic policy, as in accepting external actors such as the European Union to aid in the building of road infrastructure.

Whereas cooperation in sectors that are normally given priority in regional integration schemes has been slow, ECCAS has taken new initiatives in cooperating in new areas such as combating poverty and the anti-drug campaign. Though this may contribute to alleviate the quality of life of its population, it would not necessarily move the integration process forward. It is evidence of a lack of political will. Seemingly, this is more manifest in the Central African Economic and Monetary Community (CEMAC) that replaced UDEAC in 1994. Though the AEC confirmed the importance of ECCAS as the major community in Central Africa because of its comprehensive nature at the third preparatory meeting of its Economic and Social Council (ECOSOC) in June 1999, CEMAC still seems to be privileged in the sub-region. This may be attributable to the cultural affinity of its member states, which are all Francophone, use of a common currency, the franc CFA, and fear of the viral effect of conflict from the CEPGL zone. Admittedly, Equatorial Guinea, Sao Tome, and Principe (after the 2004 Brazzaville summit) have acceded to this organization. Plausibly, because of lack of confidence

ECCAS has caused the leaders to focus their attention in integration in CEMAC. Thus, despite COPAX, they signed a mutual non-aggression and solidarity pact at the January 2004 Brazzaville summit.

On the whole, even the functionalist approach to integration adopted by the ECCAS member states has had a limited payoff. Essentially, due to a lack of political will, this situation has not been challenged because integration was conceived by the leaders and has not been people-centered so far. Its failure to impact on the everyday life of the common man, for whom space remains bounded, preempts it from serving as a catalyst for integration. On the whole ECCAS remains a work in progress.

## ECONOMIC COMMUNITY OF WEST AFRICAN STATES (ECOWAS)

### Origin

The idea of regional integration has a long-standing history in West Africa. Indeed, many of the African

leaders who opposed Kwame Nkrumah's ambitious attempt to create a union of African states during the peak of the Pan-African movement in the late 1950s opted for various forms of integration at the sub-regional level. President William V. S. Tubman of Liberia, for instance, forged a free trade agreement between Liberia, Cote d'Ivoire, Guinea, and Sierra Leone in 1965. However, the scheme, like many others in West Africa at the time, failed primarily because of hesitations and power struggles among its members. Further, with the support of France, many francophone nations in West Africa established a variety of economic unions in the early post-independence period. Notable examples include the West African Custom Union or Union Douaniere de l'Afrique de l'Ouest (UDAO)—which was formed in 1959 and replaced in 1966 by the West African Economic Union or Union Douaniere et Economique de l'Africa de l'Ouest (UDEAO)—and the West African Economic Community or Communauté Economique de l'Afrique de l'Ouest (CEAO) formed in 1973.

Unlike their francophone counterparts, anglophone West African countries did not pursue much economic integration in the immediate post-independence era, as the British administrative structure accorded little sense of economic unity among its colonies. While most of the exclusively francophone unions were successful, the few attempts made to integrate francophone and anglophone nations, including the Burkina Faso–Ghana union and the Ghana-Guinea-Mali experiment failed, mainly because of the inability of most West African nations to break their colonial ties during the immediate post-independence period (Asante 1986).

The first major attempt towards the formation of an economic union embracing all West African nations was made by the Economic Commission for Africa (ECA) through two main resolutions, 142 (VIII) and 145 (VII), passed at its seventh session in Nairobi in February 1965 (Ezenwe 1983). Notwithstanding the enormous institutional and financial support given by the ECA, it took a decade for West African nations to finally come together to form ECOWAS in 1975. The indecisiveness that thwarted the ECA efforts stemmed from several factors, not the least of which were attempts by France, Britain, and Portugal to preserve their economic ties with their respective former colonies, through various incentives and preferential arrangements; the existence of several competing economic unions in the sub-region; and the uncertainties created by the 1967–1970 Biafra war in Nigeria.

A 1972 meeting in Lomé between General Yakubu Gowon of Nigeria and President Gnassingbé Eyadéma of Togo culminated in a communiqué which many analysts (e.g., Asante 1986; Ezenwe

1982; Onyemelukwe and Filani 1983) consider as the “embryo” of ECOWAS. A series of bilateral and multilateral meetings on the viability of an economic union, spearheaded by these two leaders, led to the signing of the ECOWAS treaty on May 28, 1975, in Lagos. The original signatories were fifteen West African nations: Benin, Burkina Faso, Code d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, and Togo. Cape Verde joined in 1977, bringing the membership to the current total of sixteen. A revised ECOWAS treaty, designed to accelerate economic integration and to increase political cooperation, was signed in July 1993.

## Objectives

The ECOWAS treaty has as its prime objective to:

[P]romote co-operation and integration, leading to the establishment of an economic union in West Africa in order to raise the living standards of its people, and to maintain and enhance economic stability, foster relations among Members States and contribute to the progress and development of the African Continent (Article 3).

To accomplish this broad objective, ECOWAS, *inter alia*, seeks to eliminate custom duties among member states; adopt a common external tariff and trade policies towards non-members; remove barrier to the movement of goods, services, and people; and harmonize trade, agricultural, energy, and environmental policies of its members. The treaty also makes provisions for the synchronization of investment codes and standards, and the establishment of a special fund for sub-regional cooperation and development, paying attention to the special needs of the ‘poor,’ landlocked, and small member states. The underlying values of ECOWAS, according to Article Four of the treaty, include adherence to the principles of equality, solidarity, accountability, non-aggression, maintenance of peace, and the promotion of democratic system of government in each member state. The Treaty permits ECOWAS members to join other regional and sub-regional associations, as long as such concurrent memberships do not conflict with the spirit and purpose of ECOWAS.

## Institutions

The official duties of ECOWAS are undertaken through its institutions, the most powerful of which

is the Authority of Heads of States and Governments. This supreme body, made up of all the leaders of the member states, meets at least once a year under a rotated chairpersonship. Next in importance is the Council of Ministers, which is responsible for monitoring the activities of ECOWAS, and for making recommendations to the Authority of Heads of States and Governments for the attainment of ECOWAS goals. This council comprises two ministers from each member state; it meets at least twice in a year. Another important institution is the Executive Secretariat, headed by the Executive Secretary, who performs the main administrative and executive duties of ECOWAS and coordinates the activities of all other institutions. The Executive Secretary is appointed by the Authority of Heads of States and Governments for a four-year term, renewable only once for another four years. Other notable ECOWAS institutions are the Community Parliament; the Economic and Social Council; the Community Court of Justice; and the Fund for Co-operation, Compensation and Development. ECOWAS has five main Specialized and Technical Commissions, including those of Trade, Customs, Immigration, Monetary and Payments; Transport, Telecommunication, and Energy; Agriculture and Natural Resources; Administration and Finance; and Social and Cultural Affairs. ECOWAS is headquartered in Abuja, Nigeria, where it has its own buildings and administrative staff.

### **Contributions to Development**

The main goal of ECOWAS is to enhance the collective self-sufficiency of West African nations, through economic integration and cooperation. The organization was founded on the premise that the domestic markets of the individual members were too small to be competitive in a global economy characterized by large trading blocks such as the European Union (EU) and the North American Free Trade Agreement (NAFTA). With a potential single market of about 210 million people, ECOWAS expects to promote specialization and large-scale industrialization; enhance job opportunities and wealth creation; and limit the sub-region's dependence on foreign market.

It bears stressing from the outset that the concrete achievements of ECOWAS to date are modest. Yet, given the wide ethno-cultural diversity in West Africa, the mere fact that these nations were able to come together is an epic feat; at the very least, ECOWAS has fostered intra-regional understanding and cooperation and alleviated the tensions and suspicions that characterized intergovernmental relations in

West Africa. More substantively, ECOWAS has facilitated the free movement of people within the region; improved transportation and telecommunication links between member states; and helped maintain peace and security in West Africa. It has also made remarkable advances in the agriculture and energy sectors, and forged reputable coalitions with international organizations such as the Organization of African Unity (OAU), the Economic Commission on Africa (ECA), and the World Bank. ECOWAS citizens can now enter and reside in any member state for ninety days without visas or entry permits, as long as they have valid passports or travel certificates and international vaccination certificates. ECOWAS has introduced its own travel certificate, which is currently in circulation in such countries as Burkina Faso, Ghana, Gambia, Guinea, Niger, Nigeria, and Sierra Leone. With this document, ECOWAS travelers are, in theory, exempted from filling out any immigration papers in member states; however, it is worth noting that, in practice, many countries still require ECOWAS travelers to fill immigration forms, and nearly all member states have road checkpoints at which police and immigration agents routinely subject travelers to harassment and extortion.

Through its Trade Liberalization Scheme, ECOWAS seeks to establish a custom union and to eliminate tariffs among its members; the original timeframe was to remove tariffs on unprocessed goods by 1990, and on industrial goods by 2000. While many members (e.g., Cote d'Ivoire, Burkina Faso, Gambia, Ghana, Niger, Nigeria, and Benin) have eliminated their tariffs on unprocessed goods, only Benin has so far lifted tariffs on industrial goods. The persistence of tariffs and other trade restrictions among members continue to undermine intra-ECOWAS trade, which now account for a mere 11% of members' total trade, valued at some \$3.6 billion US dollars.

Economic integration invariably entails easy access to each member's market, which, in turn, requires the development of adequate transportation and telecommunication systems. However, such systems are scanty, patchy, and poorly developed across West Africa. Further, while the bulk of the goods traded among ECOWAS members is transported by sea, most of the shipping companies in the sub-region are non-African. Likewise, most of the sub-regional air travel and telecommunication transactions are done through non-African companies. ECOWAS is currently building inter-state highways from Lagos to Nouakchott, Mauritania; and from Dakar, Senegal, to N'djamena, Chad, to improve spatial interaction among its members. ECOWAS also has proposals

under way to establish an airline company, ECOAIR; to strengthen the railway networks in the sub-region; and to improve the telecommunication facilities in the sub-region, through its INTELCOM I and INTELCOM II projects, initiated in 1979 and 1992, respectively.

In the energy front, ECOWAS has a master plan to develop hydroelectric power in several countries, including Ghana, Guinea, Sierra Leone, Mali, and Togo. Plans are also under way to develop about 5,600 kilometers of electricity lines connecting various segments of national grids; establish a “power pool” to facilitate the exchange of electrical energy between members; and diversify the energy capabilities of members into biomass, solar, and other renewable energy sources. Similarly, the organization has programs to improve the sub-region’s agriculture: In 1982, an Agricultural Development Strategy, which included plans for selecting seeds and cattle species and called for solidarity among members during international commodity negotiations, was adopted.

Concerns for peace and security have long been on ECOWAS’ radar screen: In 1978 ECOWAS adopted a non-aggression protocol. This was followed with a defence assistance protocol in 1981; the creation of an ECOWAS Cease-Fire Monitoring Group (ECOMOG) in 1990; and a declaration of democratic political principles in 1991—the latter condemns the seizure of power by force of arms in any member state. Perhaps, the most important accomplishment of ECOWAS regarding regional peace is the decisive role played by ECOMOG in ending the Liberian war.

Despite these achievements, ECOWAS continues to struggle with its primary objective of trade liberalization and market integration, mainly because of the limited potential that exist for trade between its members: Since they are all primary producers, with agriculture accounting for the bulk of their respective GDPs, the demand for their exports and the supply of their imports invariably emanate from advanced nations outside the sub-region. The existence of other rival integration schemes—e.g., the West African Economic Community (or the Communauté Economique de l’Afrique de l’Ouest (CEAO)) and the West African Economic and Monetary Union (the l’Union Economique et Monétaire Ouest Africaine (UEMOA))—also creates unhealthy competition, duplication, and conflicts of interest among some ECOWAS members. The limited financial resources of member states is yet another daunting drawback that undermines ECOWAS’ effectiveness. Indeed, several members are incapable of meeting their financial commitments to ECOWAS, forcing it to depend more and more on the financial support of foreign governments and organizations. Notwithstanding

these difficulties, recent trends in the sub-region point to a promising future for ECOWAS: Among these are the increasing prevalence of democratic governance; the move towards privatization and liberalization of national markets; and the increasing cooperation between ECOWAS and other international organizations such as the Organization of African Unity (OAU), the African Development Bank (ADB), and the European Union (EU). Still, for ECOWAS to thrive, the need for the unflinching support of political leaders and citizens of West Africa for its programs cannot be gainsaid.

## **ECONOMIC COOPERATION ORGANIZATION (ECO)**

Original roots of this group can be traced to 1964, when it was established as a regional political entity to promote greater political and military consultations and cooperation among its members. The Economic Cooperation Organization was established in its current form in 1985 with its headquarters in Tehran. Initially it included Iran, Pakistan, and Turkey.

In the new environment the ECO intended to promote regional economic cooperation especially in such fields as regional trade and development of regional transportation and communication infrastructure. In 1992, the newly independent Azerbaijan, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan were invited to join the organization. After expansion the member countries sought to promote intraregional trade and to gradually establish a common market or trade economic zone similar to the European Union (EU). They also planned to develop new transportation routes for Central Asian gas and oil and for their other natural resources to international markets. The Central Asian governments also hoped that trade with ECO partners would reduce their dependency on the Russian and Commonwealth of Independent States (CIS) markets. Almost immediately after the ECO membership grew to ten, the organization declared that it was "directed against no country or group of countries," since there were concerns expressed by India, Russia, and some other international players about the nature of the grouping.

At present the total population of the ECO members is about 340 million and their territories cover over six million square kilometers (twice the size of India). Its members control about 15% of the world's proven reserves of oil and about 10% of the world's proven reserves of natural gas as well as significant resources of the hydroelectric power. The ECO members also produce a significant proportion of cotton for exports to international market. The principle working bodies of the ECO are as follows: the Council of Ministers, the Regional Planning

Council, the Council of Permanent Representatives, and the Secretariat.

The Council of Ministers is the highest policy-making organ of the ECO and it consists of the Ministers of Foreign Affairs of the Member States. The Council meets at least once a year in different locations each year on a rotating basis. The Regional Planning Council consists of the Heads of the Planning Organization or the equivalent ministry of the Member States. Its members meet at least once a year prior to the annual meeting of the Council of Ministers. The Council of Permanent Representatives is composed of Ambassadors from the Member states and its members meet as often as needed.

The Secretariat of the ECO's permanent working institution initiates, coordinates, and monitors the implementation of ECO activities.

In addition the ECO created several other agencies that coordinate works in specific fields. The Directorate of Energy, Minerals, and Environment monitors and coordinates efficient utilization of regional natural resources and facilitates cooperation in environmental protection. The Directorate of Trade and Investment promotes intra-regional and supra-regional trade, trade liberalization. The Directorate of Agriculture, Industry, and Health promotes cooperation in the agricultural sector, including such issues as food safety, new technologies, and desertification. The Directorate of Transport and Communications promotes development of a regional road and railway networks in the region. The Directorate of Economic Research and Statistics assesses development projects, studies perspectives for the regional economic cooperation, and facilitates information and statistical exchange. The Directorate of Project Research focuses on inter-sectoral coordination among various departments of the ECO Secretariat, organizes meetings, and prepares reports and documents. The Coordination and International Relations plays a key role in facilitating relationships with major regional and international organizations including those within the United Nations (UN) system.

Since the 1990s, the ECO has organized regular meetings at ministerial level and discussed simplification of the cross-border transit of goods and investments, simplification, and unification of the taxation code and some other measures. The ECO adopted the Quetta Plan of Action (February 1993), the Istanbul Declaration (ECO Long Term Perspectives) (July 1993), the Almaty Outline Plan for the Development of the Transport Sector in the ECO Region (October 1993), the Ashgabat Declaration of 1997, the Program of Action for the ECO Decade of Transport and Communications (March 1998), and the Transit Transport Framework Agreement.

Among the major projects sponsored or supported by the ECO was the Tejen-Mashhad-Serakhs railway line (1996), which opened up railway traffic on the northern line of the Trans-Asian Railway of the "East-West" Transport Corridor, and on the "North-South" Transport Corridor linking Central Asian Republics with the ports of the Persian Gulf; and the development of an infrastructure for the "East-West" (including "Europe-Caucasus-Asia") and "North-South" Transport Corridors. According to ECO statistics, in 1998 there were a total of 52,882.2 kilometers of railways in the region compared with 48,496.6 kilometers in 1994. In 2002, the ECO members announced completion of several projects, including the opening of a container route Kazakhstan-Turkmenistan-Turkey (Istanbul) through the Trans-Asian Railway route, international passenger route Almaty-Tashkent-Tehran-Istanbul, and Almaty-Tashkent-Turkmenabat-Istanbul. In March 2004, the ECO Council of Heads of Customs Administrations (CHCA) discussed the establishment of a Data Bank on Smuggling and Customs Offenses; and the Transit Trade Committee discussed the Transit Trade Agreement. The experts discussed measures to simplify and harmonize customs procedures for the development of trade among ECO member states.

Memoranda of Understanding were signed between the ECO and following agencies: UNDP, UNODC, UNESCAP, UNIDO, UNFPA, FAO, UNESCO, UNICEF, UNECE, UNCTAD, UIC, ITC, OIC, IDB, OSJD, ICARDA, WCO, and Colombo Plan.

### ECOTOURISM

Ecotourism is tourism which: uses the natural environment as the primary attraction; is actively managed to minimise impacts on the natural environment; actively teaches tourists about the natural environment; and contributes to conservation of the natural environment. Cultural aspects, particularly indigenous cultures, may also be included. The term is sometimes misused to refer to nature-based tourism more broadly, irrespective of impacts, but this is a misnomer. Such misuse has caused extensive conflicts between tourism developers and operators, community and environmental groups, and government agencies in many countries. From a tourism market perspective, ecotourism is one component of the broader nature, eco, and adventure tourism (NEAT) sector. Ecotourism can be significant for developing countries because it can bring hard currencies from relatively wealthy tourists, both foreign and domestic, directly to relatively impoverished regions, communities, and national parks agencies; creating an industry sector which uses the plant, animal, scenic, and sometimes cultural wealth of developing nations with far less impact than primary industries such as logging, farming, or mining.

Ecotourism ventures can be either small- or medium-scale, and there are successful examples of each, though the former are currently more common. There do not as yet appear to be any examples of ecotourism at the scale of mega-resorts or holiday towns, but there are individual ecotourism enterprises which operate dozens of individual facilities across several developing countries, employ over one thousand people, and turn over many millions of dollars per year. Internationally, there are ecotourism companies which offer only a single product but generate annual revenue of over \$10 million US. Many of these rely on capital-intensive infrastructure, such as large ocean-going vessels. In most developing countries, however, the focus of ecotourism development is on large numbers of small developments. There has also been a strong emphasis on involving local communities, either as owner-operator of an ecotourism venture, or as partner and beneficiary. Whoever owns the company, local involvement avoids local antagonism. Equally, however, for financial viability, any ecotourism

venture needs skills in tourism management and marketing; and for an upmarket international clientele, an upmarket international standard of hospitality.

The economic and social significance of ecotourism can be considerable. For most developing nations, it is nature, culture, and adventure which are the primary tourism attractions: that is, the bulk of the country's tourism industry lies at least within the broader NEAT sector. For example, Kenya and Botswana each received over 1 million international visitors in 1997, and Zimbabwe over 1.5 million. Ecuador and Peru each received over half a million international visitors. For comparison the global total for that year was over 600 million, and over 50% were within Europe. Whilst globally, tourism accounts for a little over 10% of worldwide economic activity, in some smaller countries it can contribute a far higher proportion—up to 83% in the Maldives, for example. Much of this money, however, is used immediately to buy imports, in a pattern known as economic leakage (q.v.). In some countries, a significant proportion of tourism revenue is retained by central governments, either through direct taxes, through differential pricing for foreigners, or through foreign exchange conversion requirements and systems. At a national scale, very little of the tourist income generated by natural assets is reinvested in conserving those assets. In Costa Rica, a country which advertises itself internationally as a leader in ecotourism, the proportion is still only around 1%. The proportion is similar, incidentally, in developed nations such as Australia. Even where national parks and other public land management agencies collect fees from visitors or tour operators, the agency may not be allowed to keep the funds collected. Private ecotourism ventures in developing countries, therefore, often emphasise direct local reinvestment.

These social and economic issues are critical to the success of ecotourism in developing countries. If the ecotourism sector is small, it may have little significance, and may be swamped by mainstream tourism and other industry sectors. As it gets larger, its environmental and social impacts increase, and it may also lose market appeal. Unless it yields benefits to local communities it faces local antagonism which may lead to loss of land access; but unless it also provides gains to people with national political power, it may lose its natural assets to other industry sectors such as logging or agriculture.

Developing nations may have both advantages and disadvantages as ecotourism destinations. For all forms of tourism, their main advantages are that they are simply different, and therefore interesting; and that their currencies are often weaker than those of the countries where most international tourists

originate. The price advantage does not necessarily apply for the NEAT sector, especially for the low-volume high-yield product which many developed countries now aim for, and especially since many prices are now set in US dollars. Where developing countries have their principal competitive advantage is in the diversity of plants and animals, and the opportunity to watch them; i.e., specifically in the ecotourism sector. Comparable wildlife viewing opportunities in the developed world, for example, are generally available only in sparsely populated areas such as parts of Alaska, the Arctic, sub-Arctic and sub-Antarctic, and protected areas in North America, Australia, and Russia. Many developing nations also attract tourists through their scenery, climates, and cultures. These appeal to a broader market, but the comparative advantage is less than for animals and plants.

One of the principal distinguishing features of ecotourism is the deliberate attempt to minimise impacts on the natural and cultural environment, but even with such precautions, ecotourism can produce substantial impacts. Since many ecotourism destinations are in areas of high conservation significance, such as national parks or other pristine or protected areas where there is little human impact other than tourism, the ecological impacts of ecotourism are disproportionately significant. Some of these impacts are immediately apparent but usually quite localised, such as soil erosion and vegetation trampling along tracks, trails, and campsites. Others are less obvious but potentially much more significant ecologically, such as the introduction of weeds into national parks, contamination of water with pathogens, and disturbance to rare or endangered wildlife. Different activities produce different impacts in different ecosystems, and different management tools can be used to control them. Promoting tourism as a tool to protect the biological wealth of developing nations from other forms of exploitation always carries the risk of impacts from tourism itself, and ecotourism attempts to maximise the environmental benefits and minimise the environmental costs.

Similar considerations apply for cultural impacts. Where any indigenous or ethnic group uses traditional culture as part of a tourism product, then the more successful their tourism business, the more their culture will be changed. If the host culture changes too much, however, it will no longer be a tourist attraction. The usual outcome is so-called staged authenticity, where hosts carry out traditional activities using traditional artifacts solely for tourists, and no longer as part of their own day-to-day life. Strictly, this commoditisation of culture is associated with cultural tourism rather than ecotourism but in practice many holiday packages combine both.

Similarly, other commonplace social impacts, such as widening inequities between those members of a host community who benefit from tourism and those who do not, apply to all types of tourism. The same applies to the argument, sometimes made by politicians and social commentators, that tourism to developing countries is a form of cultural neo-imperialism. These issues are significant for ecotourism businesses in developing countries because they influence community attitudes, which in turn affect both land access and customer satisfaction. Ecotourism ventures worldwide have therefore tried a variety of community participation models. Different models are appropriate in different countries, depending on land tenure arrangements, social traditions of mutual assistance or individual entrepreneurship, and established structures for community leadership or group action.

Ecotourism has developed along different pathways in different continents and regions, reflecting their different environments, societies, infrastructures, and tourism development histories. Private game reserves, lodges, and safaris in southern and eastern Africa, for example, have made significant contributions to the conservation of endangered wildlife species and to local community development, as well as the tourism economies of the countries concerned. In central and south America, the mountain scenery of the Andes and the national parks of the far south have for many decades attracted trekkers and mountaineers, supporting a wide range of small-scale tourist accommodation, guides, and tour operators. Some of this is based in national parks and some at small privately owned lodges. In some areas there is also a cultural tourism industry based largely on ancient buildings; and an adventure tourism sector which includes, e.g., diving in the Caribbean, whitewater rafting and kayaking, and mountaineering on the high peaks of the Andes.

In the Himalayas, longstanding mountaineering and trekking tourism has been expanded in recent decades by a large whitewater industry, wildlife tours in limited areas, and most recently a high-altitude heliski operation. Throughout the larger developing nations of southern and eastern Asia, the emphasis historically has been primarily on cultural attractions, but tourists also visit nature-based attractions such as the deserts of the southwest and centre and the mountains and forests of the southeast and far north. Some of these areas have attracted travelers for many millennia, and the majority of their modern visitors are still domestic tourists. Similar growth in the NEAT sector has occurred in southeast Asia, with forests, wildlife, and adventure now increasingly important attractions for Western visitors. For tourists

from developed eastern nations, shopping and golf probably still remain paramount, but this may be changing with new generations. Finally, the small-island developing states (SIDS) of the Indo-Pacific region deserve particular mention as destinations for a growing marine ecotourism market.

In all these regions, ecotourism is at risk from other land uses and industry sectors, both legal and illegal. The whalewatching and marine mammal industry is threatened by commercial fishing practices, and the dive tourism sector by dynamite fishing. Ecotourism opportunities in developing countries worldwide are threatened by industrial logging and by clearance for industrial agricultural plantations. In many areas this is happening on a very large scale and at a very high rate, e. g., in Cameroon and Gabon in West Africa, Sumatra and the Solomon Islands in the Indo-Pacific, and in the Amazon basin in South America. In many of these areas there is also extensive clearance for small subsistence agriculture. Many of the larger animals which provide the mainstay for wildlife tourism are also subject to poaching, both for the illegal wildlife trade and for subsistence bush meat, or are killed when they move into agricultural areas. Well-known examples include elephant, rhino, and mountain gorilla in Africa; tiger, snowleopard, sunbear, and orangutan in Asia; and jaguar and many forest species in South America.

In some countries, ecotourism opportunities have been lost through water pollution from mining, manufacturing, pulp mills, processing, and power plants. Lake Baikal is a famous example, but there are many more throughout developing and indeed developed nations worldwide. Additionally, in developing countries, many large-scale industrial projects are financed by bilateral or multilateral aid funds. These same agencies or their subsidiaries may also finance small-scale ecotourism projects but rarely consider how these will be affected by other industries.

The potential advantages of ecotourism for economy, community, and environment in developing nations have been widely promoted, and there are indeed some outstanding examples of success. Equally, however, there are many examples where developing-country governments have given lip service to ecotourism whilst simultaneously promoting conflicting industry sectors or high-impact mass tourism developments. There are also many examples where despite hard work and the best of intentions, new ecotourism ventures have never grown large enough to have much effect.

To overcome these difficulties, ecotourism practitioners and proponents in many developing nations have now established local ecotourism associations.

Some developing-country governments have also prepared national ecotourism strategies, often with assistance from international non-government organisations such as the World Conservation Union (IUCN), the Worldwide Fund for Nature (WWF), and intergovernmental agencies such as the United Nations Environment Program and the World Tourism Organisation. The International Year of Ecotourism and World Ecotourism Summit in 2002 provided an opportunity to improve international cooperation between all these organisations.

## ECUADOR

Ecuador is a South American republic located on the west coast between Colombia on the north and Peru on the south and east; encompassing an area of 109,000 square miles with a population of approximately twelve million in 2001. Ecuador's ethnic makeup consists of indigenous 25%, mestizo 55%, caucasian 10%, and African 10%. A white elite dominated the political life of the country until the latter half of the twentieth century, when the mestizo population became more assertive. Recently the indigenous populations have formed coalitions and are participating more and more in the political life of the country. Although small in area, Ecuador has varied geographical features including lush tropical coastal lowlands, temperate highland valleys, rain forests, arid deserts, and numerous active volcanoes. The

famous Galápagos Islands are also part of Ecuador. Ecuador's exotic and rugged geographical features have inhibited its development throughout history. Until recently transportation has been difficult and many Ecuadorians seldom ventured beyond the immediate milieu of their villages and hamlets. The Andes separate the political and economic life of the nation into two competing zones: the Costa, centered at Guayaquil; the bustling, tropical, Pacific port; and the Sierra, dominated by Quito, the sedate colonial capital. Natural resources include petroleum, fish, shrimp, timber, and gold while the agricultural sector produces bananas, seafood, flowers, coffee, cacao, sugar, corn, rice, and livestock. The gross domestic product (GDP) in 2002 was \$24.3 billion. Ecuador's largest export market (41%) is the United States. Ecuador has made great strides in social development (literacy rate 90%, life expectancy 70.8 years, infant mortality 19 per 1,000) but still lags behind much of Latin America.

In the last three decades of the twentieth century Ecuador's most vexing international problem was a territorial dispute with Peru. In 1941, Ecuador was involved in a short but disastrous war with Peru that resulted in the temporary relinquishment of its claim to a vast territory in the Amazon. This "loss" of territory would also hinder Ecuador's development, as populists would use the issue to inflame public opinion, and the armed forces would demand a larger share of the budget in the name of national security. In January 1995, war again erupted in the disputed upper Cenapa Valley. A cease-fire brokered by Argentina, Brazil, Chile, and the United States led to serious negotiations. On October 16, 1998, a comprehensive agreement was reached, ending the dispute that began in 1830.

New petroleum fields were discovered in Ecuador's Oriente region in 1967. A surge in petroleum exports resulted in favorable foreign exchange earnings that climbed from \$43 million in 1971 to over \$350 million by 1974. The GDP increased at an annual rate of 9% in the period 1970–1977, raising Ecuador to the status of a lower-middle-income country. However, the oil boom proved to be a mixed blessing, as a period of inflation eroded many of the gains. Moreover, governments used oil earnings as collateral for international loans and the external debt soared from \$324 million in 1974 to \$4.5 billion by 1979. Inflation continued to plague the economy throughout the remaining decades of the twentieth century. In March 2000, Ecuador adopted the US dollar as its national currency in the hopes of curbing inflation.

During much of the oil boom, several military governments that attempted structural reforms ruled Ecuador. The first junta, headed by General

Guillermo Rodríguez Lara, took power in a bloodless coup on February 15, 1972, promising to boost development. This, and a subsequent military regime, did make infrastructure improvements, including highways, hydroelectric projects, oil refineries, and the establishment of the Ecuadorian State Petroleum Company (CEPE). In 1973, Ecuador joined the Organization of Petroleum Exporting Nations. However, oil exports did not keep pace with imports and inflation soon eroded many of the gains. Disillusioned with the difficulties of governing, the military returned the country to civilian rule in 1979.

For fifteen years Ecuador experienced relative political stability, alternating between moderate leftist-oriented governments (Jamie Roldós and Osvaldo Hurtado 1979–1984, Rodrigo Borja 1988–1992), and conservative neo-liberal administrations (León Febres Cordero 1984–1988, Sixto Durán Ballén 1992–1996). Despite constitutional rule, internal wrangling, corruption, and a 1995 war stalled Ecuador's development with Peru over the long-standing border dispute. In 1996, Abdalá Bucaram, a charismatic populist, won the presidency and promised economic and social policies that would end the power of the elite and redistribute the wealth of the nation to the masses. But Bucaram's administration was marred by corruption, and Congress removed him in February 1997. In 1998, Jamil Mahuad, the competent mayor of Quito, was elected president. Mahuad resolved Ecuador's vexing international problem by negotiating a peace agreement with Peru that was accepted by the Ecuadorian public as a just settlement. Unfortunately, Mahuad did not reap the reward of this peace dividend. His plan to replace Ecuador's currency, the sucre, with the US dollar met with opposition. Mahuad was forced to leave office after popular demonstrations against his economic proposals led to the military announcing plans to take over the country and establish a junta. In the end, Ecuador's vice president Gustavo Noboa assumed the presidency. Noboa was able to implement dollarization and obtained private funding for a much needed second oil pipeline. Noboa returned Ecuador to a measure of stability and in January 2003 turned over the government to the newly elected president, Lucio Gutiérrez, a former army colonel who had played a key role in Mahuad's ouster.

Gutiérrez's policies have proven to be surprisingly moderate, and he has negotiated with international lending and development agencies to restructure Ecuador's debt. As a result, foreign investment reached a record high, inflation was held to 6%, and the GDP grew by 2.7% in 2003. Ecuador's future development hinges on the resolution of the nation's historic problems of class and regional cleavages,

corruption, overreliance on one commodity, and episodes of political chaos, problems that are not easily remedied in the best of circumstances.

### EDUCATION

The provision of education in developing countries is essentially a political issue. It can serve the ruling classes or overthrow governments; build or undermine democracy; contribute to modernisation, conservation, or reactionary outcomes; serve the whole community or a dominant elite. Many questions must be addressed. Should the priority be political empowerment, economic development, or social improvement? Is it most effectively driven by international aid, government action, or community initiatives? Is the most effective elementary education achieved through schooling children or adult literacy campaigns? Are traditional Western schools the most appropriate institutions for third world needs? How should limited resources be distributed between elementary education and higher education? How can sufficient teaching resources be provided? Is technology a way of increasing access to teaching resources, or does it only increase the gap between rich and poor?

The West values the potential of education to contribute to the growth of democracy in developing countries. This led the United Nations (UN) to promulgate the right to an education "directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms" (Declaration of Human Rights article 26) and literacy to promote peace and security as the goal of the United Nations Educational Scientific and Cultural Organisation (UNESCO) founded in 1946. UNESCO launched the World Experimental Literacy Program in eight countries in 1963. This idea of education, however, runs counter to many nations' ideological positions. Education cannot promote human rights if the accompanying social and political climate is unfavourable. Where education

systems are affected by economic rationalism and/or right-wing politics, they are limited to providing utilitarian instruction, training, and/or indoctrination. The lower socio-economic groups get poorer schools and less qualified teachers; girls are much less likely than boys to receive formal education, particularly secondary and above; and discrimination rises at each level of the educational ladder.

Under the impact of economic rationalism, the West's vision of education as a contribution to modernisation becomes narrowly focused on the economic aspect of modernisation. International support for education increasingly focuses on 'development' as defined by international capital, the World Bank, and the International Monetary Fund (IMF), concerned with developing human resources for profit. Since the 1980s, the impact of economic rationalism, demanding reduced public sector spending, has harmed poor nations; both school attendance and adult literacy have fallen and have been predicted to fall further over the next decades (Welch 2000). In Jamaica IMF-induced economic restructuring meant spending on health and education declined by over a third (Hickling-Hudson 2000).

Conversely, when the social and political climate is favourable, education becomes a tool for social improvement. In Granada the socialist revolution of 1979 attempted to equalise access to education, including experiments in non-formal adult education, and in Chile the 1989 return of democracy led to the Program for the Improvement of Equity and Quality of Education. India, Malaysia, Indonesia, Korea, and the Philippines all use education programs to tackle their desperate need for fertility control, described as "among the most significant curriculum innovations of our time" (Bishop 1986).

Where education is provided and controlled by the state, its priority can become the political goal of promoting national unity. This idea is strong in ex-colonies which have inherited it from their erstwhile masters. In Malaysia, with at least ten different indigenous peoples, education is used to counteract cultural, religious, and linguistic diversity; a centrally administered system imposes the official language, Bahasa Malaysia, and behavioural conformity is encouraged through Muslim study of Islam and non-Muslim study of 'Moral Education'. In many countries, including Azerbaijan, China, Cuba, Georgia, Iran, Nicaragua, and Tajikistan, state education enforces the dominant ideology. To counter the dominance of ruling elites, non-government agencies such as trade unions, churches, or community groups run non-formal education programs for disadvantaged adults such as the 'popular education' movements in Latin America.

In addition to politics, a nation's wealth is an important factor in determining its levels of education; there is a strong correlation between the gross national product per head (GNP) and the adult literacy rate of a nation. Wealth is, however, also modified by politics; there has to be a strong national commitment to education. The GNPs of Djibouti, Liberia, Mauritania, Morocco, and Senegal are higher than in many developing countries, but adult literacy is below 50%. By way of contrast, Azerbaijan, Georgia, Tajikistan, and Vietnam have literacy rates above 90% in spite of a low GNP. In South Asia, primary school enrollment is much higher than it is in sub-Saharan Africa in spite of a lower GNP. In Malaysia, because schooling has been considered important, the adult literacy rates are better than in wealthier, similarly Islamic, countries of the Middle East and North Africa (UNICEF 1988).

Political stability is also an important element. In countries with stronger economies, political instability can jeopardise education. In Chile a right-wing coup in 1973 reduced the education budget from 4.3% of national income to 2.6% and education was increasingly privatised, including selling off state schools (Quinteros 1999); in Nicaragua the revolution in 1978 led to a drop in education and health expenditure from 50% of the national budget to 25%, and privatisation of education removed it further from the grasp of the poor (Arnové 2000; Hickling-Hudson 2000); in Bolivia expenditure on education declined by 42% over five years following the military coup of 1980 (Arnové 2000).

International aid is seen as a good way to encourage countries to invest in education, but external aid is not always tailored to the specific needs of a situation. The internationally recognised value of education has led international aid agencies to take a significant role in education programs in developing countries, but they may lack understanding of the needs of communities and can offer simplistic and technocratic solutions. Externally funded projects can fail through lack of maintenance and/or because they are placed in areas of great need, but with insufficient resources to maintain them (Bishop 1986). Programs can turn out to be one-off funded showcases without long-term benefits, such as the doomed instructional television station that UNESCO helped to build in Senegal, or the Niger instructional television project.

Government-sponsored programs are also seen to be effective, but they can also fail if they do not maintain momentum. In 1970, the Brazilian Government combined the federal administrative network and municipal involvement to set up the Movimento Brasileiro de Alfabetização (MOBRAL) literacy

foundation aimed at the fifteen to thirty-five age group (Bishop 1986). Although every municipality in the country was engaged, within a few years the enthusiasm disappeared. Ninety percent of the people who participated in the courses remained functionally illiterate in the long term (Luis 2001). MOBREAL ended in 1985, and subsequent projects to teach adults basic literacy have had little success, so resources have reverted to basic schooling of children.

Government-initiated programs are most likely to succeed where the stakeholders are involved in their creation and at least some authority is devolved to the communities and the schools involved (Ahlawat and Billeh 1997; Reimers 1997). An example is Project Impact, launched in the Philippines and Indonesia in 1974, which engaged the parents, community, and teachers. It added programmed self-instruction to traditional formal schooling and invited community members into the school to share their skills with the students. It was augmented by adult-oriented learning centres in the villages (Bishop 1986). Sometimes bottom-up action is effective. Also in the Philippines, communities themselves initiated action under the Barrio Village Education Movement, setting up local high schools by using available resources and facilities and enabling students to meet their school expenses through paid work in the community-centred and rurally oriented vocational school curriculum (Bishop 1986).

The strong correlation between literacy, GNP, and life expectancy suggests that mass literacy is both a means and a symbol of economic and social development. Mass education includes both traditional elementary schooling for children and literacy campaigns targeted at adults. Adult literacy campaigns have been favoured as cheaper than, but at least as effective as, school education for enhancing mass literacy and as promoting equality by reaching those who missed adequate schooling. In China and Cuba resources have been released for non-formal education, particularly of the rural poor, by allowing only those destined for professional careers to access more than ten years schooling.

Both measures of mass education are included in the Human Development Index devised by the United Nations Development Program in 1990: adult literacy (two-thirds weighting) and average years of schooling (one-third weighting). These are not, however, as simple as they seem. In the case of literacy, claims may not match realities. In Nicaragua a national literacy campaign in the 1980s was claimed to have reduced illiteracy from 50% to 13%, but a 1992 study by the University of Nicaragua found that one-third of five hundred women who claimed to be literate could not read or write a basic sentence (Arnové 2000). School

attendance is also an inadequate indicator, as quantity of schooling does not equate with quality. In Jamaica up to 50% of children who completed primary school were still functionally illiterate (Hickling-Hudson 2000). Jordan achieved rapid expansion of mass education between 1959 and 1993, but at the expense of quality (Ahlawat and Billeh 1997).

While spending more time at school does not necessarily increase learning, spending less time at school does not necessarily decrease learning. UNESCO has found that four years is sufficient for long term effectiveness, and that extending the number of school hours per day beyond a minimum (five hours a day three times a week) does not enhance student achievement. Indeed, smaller classes for shorter periods can be more effective than larger classes for longer periods (Bishop 1986).

National governments may legislate and provide for education, but they cannot ensure that appropriate institutions will be developed, that children will attend, or children will learn. Brazilian law provides for at least eight years basic education, but there are not enough programs for street children, and only 33% of students who enter first grade stay in school until the end of eighth grade (Welch 2000; Luis 2001). In Latin America and Africa more than 50% of students leave before they finish primary school (Bishop 1986). Child labour, which can contribute up to 30% of family income, interferes with schooling in countries as diverse as Brazil and Iran (Welch 2000).

Furthermore, Western-style schools may not be the most appropriate instruments for educating children in developing countries. The value of Western-style institutional schooling has been questioned from both right- and left-wing perspectives. From the right, with its focus on economic development, the World Bank reported in 1974 that Western-style education systems had been "irrelevant to the needs of developing countries for the past two decades" (cited in Bishop 1986). From the left, with a focus on social justice, Hickling-Hudson (2000) predicted that under such education systems "poverty and dependence are likely to increase rather than decrease."

Because of the problems inherent in the traditional Western model of schooling, some developing nations have extended or adapted it, often combining generalist with vocational education. The Basic Education and Life Skills (BELS) program, begun in 1993 by UNESCO and transferred to the University of the South Pacific in 1995, combined in-service of teachers, community involvement, planning, management, and agricultural curriculum development (Townsend and Vakaotia 1999). A number of African countries have experimented to make education more relevant to

indigenous needs, including vocational training and community involvement. Such experiments have included continuation schools in Ghana, the Brigade Movement in Botswana, rural primary schools in the Cameroons, the Bunumbu project in Sierra Leone, and the village polytechnic movement in Kenya (Bishop 1986).

The Western model is also unsuitable where families do not remain for long in the same place. Nomadic communities in places as diverse as Iran and Northern Kenya have a particular problem because education is offered in a fixed location. There are also increasing numbers of people affected by forced migration and asylum seeking. Attempts to establish mobile schools have been frustrated by the reluctance of trained teachers to take on a nomadic lifestyle. This was tackled in Iran in 1957 by the establishment of a Tribal Teacher Training School offering twelve months training to tribal youths, who would then return to their tribes. In 1976, this was augmented with a boarding school for tribal children who wanted to go on to secondary education (Bishop 1986).

Adequate provision of education requires not only mass elementary education, but also increased access to higher education produces indigenous technicians and professionals, who, unlike contracted foreign experts, bring cultural awareness, continuity, and commitment.

Politics determines how education budgets are distributed between elementary education and higher education, to what extent the provision of higher education comes at the expense of elementary education. The South East Asian Centre for Educational Innovation and Technology has suggested spreading resources by reducing the basic curriculum to an essential minimum (Bishop 1986). In South America and Africa, some countries, including Nicaragua, Nigeria, Zimbabwe, and Zaire have moved towards skilling the elite by reducing resourcing of mass education of the poor (Bacchus 1987; Arnove 2000). Others attempt an integrated balance. In the Cameroons, rural primary schools have offered the foundations for secondary education for an elite, while preparing the majority for rural and agricultural work. It is important to get the balance right for a nation's stage of development. In Sri Lanka increased access to higher education resulted in a highly educated unemployed and inflated qualifications for even basic jobs (Little 2000).

All attempts to extend education are dependent on adequate teaching resources. The cost and supply of teachers are major problems for developing nations. For governments on restricted budgets, reduction of teaching becomes a goal as teachers' salaries comprise

up to 90% of recurrent education budgets. Thus class sizes have been increased, with studies in Brazil, Chile, Puerto Rico, and Venezuela suggesting that variations between twenty and forty make little difference to outcomes (Bishop 1986). Multi-grade teaching has been tried in the Philippines (Miguel 1997). Programmed instruction, albeit often handicapped by lack of good instructional materials, has reduced demands on teachers in Korea, the Philippines, Singapore, Indonesia, India, Pakistan, and Sri Lanka (Bishop 1986; Lee 1997).

Teacher competence is as much of a problem as teacher costs. In developing countries, as few as half of the teachers are properly trained (Townsend and Vakaotia 1999). A variety of programs have addressed this. A Chilean Program for the Improvement of Equity and Quality of Education focused on new teaching methods and improving the training and status of teachers (Quinteros 1999). In Papua New Guinea teacher training was enhanced in the 1990s through government initiatives that engaged the Association for Teacher Education, the teachers' colleges, the Queensland University of Technology and the University of Papua New Guinea (Avalos 1997). Some countries, including India, Sri Lanka, and Botswana, have turned to correspondence education for teacher education. This overcomes problems of distance and allows teachers to be trained without removing them from their schools (Bishop 1986).

Correspondence programs are also more generally used to overcome the problems of higher education for dispersed populations. The University of the South Pacific and the University of the West Indies cater to archipelago nations through extensive correspondence education. Other developing countries draw on the resources of universities in the developed world through correspondence courses. These are often augmented by short periods of intensive face to face teaching by visiting lecturers.

Recently, technology has provided alternative teaching resources and been seen as an economic way to increase access to education. Radio programs for schools have been broadcast in countries as diverse as Thailand, Pakistan, Kenya, and Botswana. The Mauritius College of the Air has gone further, offering in-service to teachers, who then support children in correspondence and radio based education (Bishop 1986). Radio broadcasts have also offered community education for over half a century. Colombia began broadcasts offering basic education, life, and vocational skills in 1947. Radio Togo and Radio Sanata Maria in the Dominican Republic began radio literacy projects in 1964. In 1970, Tanzania instituted radio broadcasts for community development. In Guatemala the Basic Village Education

project has been offering agricultural education to farmers by radio since 1978. In Brazil regionally broadcast evening courses have reached over fifteen thousand village radio schools. Combinations of techniques include All-India Radio combining broadcasts with print and study groups, the Dominican Republic combining radio with work sheets and locally recruited mentors, and the Republic of Niger combining radio with visual stimuli.

Since 1970, UNESCO has also been promoting television as an educational tool. In the Ivory Coast television has been helping to reorient primary education towards rural development; in Niger it has been offering beginner instruction in a range of subjects; in Mexico and El Salvador it has been extending access to secondary education (Bishop 1986). Access to television is, however, more limited than access to radio in developing countries, because, while transistor radios are relatively widespread, television requires electricity and many developing countries do not have a stable power supply. Television also requires new attitudes to incorporate it in education. In Brazil equipment provided through a TV-school plan ended up unused due to lack of interest and training (Luis 2001).

More recently, computers have also been increasingly used to augment teaching resources. In 1984, Brazil began a national program to computerise education. Subsequently, the Education Ministry has invested \$480 million to put one hundred thousand computers into six thousand secondary schools and to train teachers to use the equipment (Luis 2001).

Connecting computers to the Internet is the latest technological aid to education. Since the 1990s, it has had an impact in many parts of the developing world, including the initiatives of the Chinese academic network (CERNET); the Red Hemisférica Inter-Universitaria de Información Científica y Tecnológica sponsored by the United States in Latin America; the Caribbean Academic Scientific and Technologic Network; the World Bank initiated African Virtual University; and the Association of African Universities.

The Internet, however, requires not only computers and electricity, but also a telephone connection. Eighty percent of the world's population has no telephone line; 70% of Africans live in remote, rural areas that need satellites for Internet services. Of the countries with full Internet connectivity, only six have local dial-up facilities outside the major cities and some capital cities do not have full connectivity. Even where the Internet is available, connection costs rule out access for the majority of people. Besides the issues of connection, computers and modems cost more of an average weekly wage in the

developing than in the industrialised world (World News 2001).

Another Internet issue is content. The Internet remains largely an English-language medium, dominated by the commercial interests of large Western service providers, with the information flow running from industrialised countries to developing countries. There is a need for more local, relevant content, such as produced through the InfoDev program creating secondary school material in South Africa, and for more initiatives that harness existing relevant resources, such as UNESCO's project of transferring printed material in African libraries onto the Net.

Information technology may turn out to be as much of a problem as it is a solution, because it increases the gap between rich and poor. In the developing world, mostly only private universities serving the rich minority can afford the necessary infrastructure. At the other end of the scale, Internet access is not an option for people who are not yet literate, too hungry or sick to learn, or in schools too poor to even afford books.

## EGYPT

Egypt is located in the northeast region of the African continent with a size of approximately one million square kilometers (or the landmass of the states of Arizona, New Mexico, Utah, and Colorado combined). The country is broken up into four major regions to include the Nile Valley and Delta, where about 99% of Egypt’s 76 million population resides; the Western Desert; the Eastern Desert; and the Sinai Peninsula.

The three most important aspects about Egypt are water, location, and history. Regarding water, Egypt is the northernmost country along the Nile River, the longest river in the world at 6,500 kilometers. Evidence of civilization along the Nile dates back over six thousand years. The river provides over 90% of Egypt’s water. Hence, Egypt has often been called “the gift of the Nile.” Because of the importance of the Nile to its very existence, Egypt has officially warned the states to the south not to affect the flow of the river in any way. Historically, summer monsoons in central Africa caused the Nile to flood every year bringing rich, dark soil to the valleys of Egypt and to the delta at the Mediterranean Sea. It was this soil and water from the Nile that allowed early civilizations to flourish. In the late 1950s, Egyptian President Gamal Abdul Nasser envisioned a dam near Aswan to control the annual flooding and provide a reservoir of water for national emergencies such as droughts. With the financial and technical assistance

of the Soviet Union, the Aswan High Dam ten-year national project was completed in 1970 and dedicated by President Anwar as Sadat.

The other water aspect of note for Egypt is the Suez Canal, which connects the Mediterranean Sea to the Red Sea, and subsequently to the Indian Ocean. The idea of a canal linking the Mediterranean Sea to the Indian Ocean dated back to ancient times. The first attempt at digging such a canal was in the sixth century BCE. After a period of time, the rudimentary canal fell into disrepair. It was neglected until Roman Emperor Trajan had it re-dug to promote Roman trade. It was once again abandoned with the discovery of the trade route around Africa. Finally, the French Emperor Napoleon revived the idea of a shorter trade route to India using the canal. After ten years of Egyptian labor and French expertise and financing, the 160-kilometer Suez Canal was again open to navigation in 1869. The Suez Canal is Egypt’s third major source of foreign exchange, bringing in well over \$1 billion US dollars every year from passage tolls (assessed at around 6.5% of a ship’s tonnage).

Egypt occupies a geographic focal point bridging Africa with the Middle East on land, and with Europe by sea. Unfortunately, this strategic location also made Egypt susceptible to numerous conquests, including those of the Romans, Greeks, Arabs, Ottomans, French, and British. The British granted Egypt partial independence in 1922, but only withdrew completely in 1954 as a result of an Egyptian military uprising led by Nassar. Of these foreign rules, the Arab Muslim rule had the greatest impact on Egyptian life and culture, to where today Egypt is considered both an Arab and an Islamic country (the vast majority of Egyptians are Sunni Muslim). Hence, Egypt is simultaneously an African, an Arab, and a Muslim nation. While it has the second most number of people on the African continent (see Nigeria) and the most in the Arab world, with around 75 million, it does not have the most Muslims living in it (see Indonesia).

With civilization along the Nile River dating back over six millennia and with so many foreign conquests of the area, Egypt has a very rich history to fashion its unique identity and culture. Egyptian ancient history is hard to date because the only accurate records kept consisted of tracking the rule of Egypt’s pharaohs. Unfortunately, some pharaohs fell into disrepute and were excised from history. As well, many of the existing pharaonic lists are in disrepair, hence, are missing names and dates. Finally, many of the pharaohs took several different names causing more uncertainty among Egyptian historians.

One of the most important historical events in Egyptian history was the unification of Upper and

Lower Egypt by King Menes sometime in the third millennium BCE. As a result, King Menes became the first Egyptian pharaoh ruling over the planet's first organized society. The Arab conquest by Amr ibn al-As in 641 CE was another important historical event as it spread Islam throughout the land as well as Arab language and culture (which endure to this day). It was during Arab rule that Cairo was established as the permanent capital of Egypt. Another significant historical event occurred in 1260 when the Egyptian ruler, Qutuz, and his forces stopped the Mogul advance across the Arab world in Palestine. In 1517, Egypt was conquered by Sultan Selim I and absorbed into the Ottoman Empire until 1882 when the British began its occupation of Egypt.

Egypt's pharaonic history, to include its numerous pyramids, temples, and tombs, draws in tourists from all over the world. They come primarily to see the three great pyramids at Giza (a suburb of Cairo) built over four thousand years ago. The Great Pyramid of Khufu is considered one of mankind's greatest structures, consisting of approximately two million blocks of stones, each weighing more than two tons. The Khufu Pyramid ranked as the tallest structure on Earth for more than forty-three centuries at 137 meters high. About 350 meters from this pyramid rests the Great Sphinx. It is seventy-three meters long and represents a lion with a human head to stand guard over the pyramids. Its worn appearance today reflects the effects of thousands of years of severe blowing sand and gravity.

Other significant tourist sites from Egypt's pharaonic past include the Karnak Temple at Luxor, the largest temple supported by columns and among the largest temples in size in the world. Luxor itself was known in the past as Thebes, the capital of the Egyptian Kingdom during the Memphis era. In the mountains near Luxor, there are many small valleys of which the Valley of the Kings is most famous. Many pharaohs, beginning with Tutmose I, decided to be buried there, secluded from possible poachers. However, the history of this valley is one long story of pillaging and plundering. Less than two kilometers away is the Valley of the Queens. Eighty tombs have been discovered there to date, all badly damaged. One queen not buried there was Queen Hatshepsut, daughter of Pharaoh Tutmose I. She had a funerary monument built for herself near Luxor. Unfortunately, it was the site of a mass terrorist attack in which sixty-eight tourists were gunned down on November 17, 1997. In Cairo, tourists often visit the Mohammad Ali Mosque and the National Museum, built by the French. The museum was opened in 1902 and consists of one hundred exhibition rooms occupying

two floors. It contains the impressive relics of King Tutankhamon's burial tomb, which was discovered in 1922. (In September 1997, nine tourists were killed by terrorists in front of this museum.) Finally, tourists often visit the large temple of Abu Simbel, 320 kilometers from Aswan in Nubia. This temple, consisting of four twenty-meter-high statues, was the source of one of the greatest monumental movements in history beginning in 1965, as the Aswan Dam when completed was projected to permanently flood the area where it stood.

Egypt receives most of its revenue not from tourism, which accounts for over \$3 billion US dollars each year, but from remittances sent back by Egyptians working in foreign countries. Before the US-led military operations against Iraq in 1991 and 2003, Egypt had over three million of its citizens working abroad and sending as much as \$18 billion US dollars back to Egypt every year. (It is difficult to estimate the exact amount of remittances because workers often remit earnings directly to their families and not through official banking channels.)

Petroleum and gas are the second highest source of income for the Egyptian economy. Crude oil production in 2001 was over eight hundred thousand barrels per day, with proven reserves estimated at over 3 billion barrels.

Because survival in this region required strict management of the Nile river water, Egypt has always had a strong ruler, beginning with the pharaohs and ending with the constitutional dictatorship in place today. The primary reason for a strong central authority in recent times is to overcome and counter foreign threats to Egypt's independence. As a result, all of Egypt's presidents since the 1952 Revolution have been military officers. Lieutenant Colonel Nasser led the nationalist-reform movement to finally overthrow British rule, and promptly instituted land reform, social welfare, and a nationalist foreign policy. He destroyed the political and economic power of the old feudal, landowning class. Women were encouraged to get an education and were given the right to vote. Nasser's government fixed the exchange rate of the Egyptian pound, began development planning, controlled foreign trade, and nationalized numerous foreign businesses, to include the Suez Canal. This property grab led to the Suez Canal Crisis of 1956 where British, French, and Israeli military forces moved on Egypt to secure the canal. The military operation failed due to lack of international political support led by the United States.

The 1956 and 1971 Egyptian constitutions largely reinforced authoritarian traditions, with the president at the center of power. Nasser was a charismatic leader who was able to balance off the elites

against each other while using his popular support to curb them as needed. Sadat did not have the charisma that Nasser had nor the support of the masses. He gained support from the elite through a tacit social contract in which he curbed the traditional presidential arbitrary use of power. Finally, President Hosni Mubarak has maintained the authoritarian presidency, although he is even less of a dominant figure than either Nasser or Sadat. Mubarak lacked the military comrades of Nasser and the upper-class patronage of Sadat. He never sought to reshape Egypt, only to maintain stability while making incremental changes. The Egyptian constitution calls for a vice president to become president following the death of the president, which occurred following the deaths of both Nasser and Sadat. To date, Mubarak has decided not to appoint a vice president due to concerns about a possible rival once a person was identified. As such, Egypt faces a succession crisis if something were to happen to President Mubarak.

Egypt was the leading Arab country in the numerous conflicts with Israel beginning in 1948 with its declaration of independence. In each of the four major conflicts fought involving Israel (1948, 1956, 1967, and 1973), Egypt ended up losing. Wanting to regain the Sinai Peninsula lost in the 1973 war and to quell domestic disturbances, Sadat decided to accept an invitation by Israel Prime Minister Menachem Begin to begin a road to peace. On November 19, 1977, Sadat flew to Jerusalem to address the Israeli Knesset. Once peace talks stalled in September 1978, US President Jimmy Carter invited both delegations to Camp David to work out the problems. The result was the Camp David Accords and the signing of the Egyptian–Israeli peace treaty on March 26, 1979. Israel then withdrew from the Sinai, while diplomatic and economic relations were established between the two countries, and Israeli ships were authorized to use the Suez Canal. Unfortunately, while Sadat was a hero in the West, he was vilified in the Arab world. The Camp David Accords brought peace to Egypt, but not prosperity, though the US has given over \$1 billion US dollars every year to Egypt since 1979 for signing the Accords. Eventually, Sadat paid for this brave and bold move with his life, when religious conspirators in the army assassinated him in 1981. However, without Egypt's military power and strategic location, no Arab state or combination of states could effectively confront Israel.

Finally, Egypt's Armed Forces consist of 448,000 personnel, most being draftees serving for three years, and four services—the army, navy, air force, and air defense force. The defense budget runs around 10% of Egypt's GNP. Egypt is one of the major military

powers in the Middle East, and its senior officers play an influential role in the nation's affairs.

## 807 INDUSTRIES

As used today, the term “807 industries” is an informal reference to a provision in the US tariff code that allows US goods, produced by certain industries, to be shipped to another country and returned with import taxes placed only on the value that has been added to the goods while out of the country. For the US firm, a major advantage of this process is access to lower labor rates for unskilled work in other countries.

Since the early 1980s, this provision has been used in combination with other US government programs, such as the Caribbean Basin Initiative, which are designed to promote economic growth in developing countries. Long-run strategic benefits include increased employment, political stability, and the development of markets for US products.

Technically, the term “807” refers to a classification found in the Tariff Schedule of the United States (TSUS), which was implemented in 1963 and replaced in January of 1989 by classification “9802” of the Harmonized Tariff Schedule of the United States (HTS). The HTS is administered by the US International Trade Commission (formerly the US Tariff Commission). The founding legislation for this provision is the Tariff Act of 1930 (Hawley–Smoot), which is currently included as Chapter 4 of Title 19 (Customs Duties) of the Code of the United States of America.

### Regional Impacts of the 807 (9802) Provision

Latin America and Asia are the most heavily affected by this trade provision, combining for approximately 68% of the dollar amounts of all imports under the 9802 HTS category in 2001. Mexico alone accounted for 23%, and Japan accounted for 29%.

Four other Latin American nations (Dominican Republic, Honduras, El Salvador, and Costa Rica) accounted for 8%, and four other Asian nations (Philippines, Malaysia, China, and Korea) also accounted for 8%. Sixty-two other nations accounted for the remaining 32% of all imports under the 9802 HTS classification. A second and more revealing statistic is the percent of US content contained in the imported goods. US imports from Mexico under HTS 9802 contained 50% US content, whereas US imports from Japan under HTS 9802 contained only 4% US content. Goods imported by four other Latin American nations (Dominican Republic, Honduras, El Salvador, and Costa Rica) contained 70% US content and imports from four other Asian nations (Philippines, Malaysia, China, and Korea) contained 25% US content. US imports from each of sixty-two other nations contained an average of 8% US content.

These statistics make clear that, in 2001, the amount of US imports from Latin America under HTS 9802 was disproportionately large in that, even though they accounted for 31% of the total amount of such imported goods, the content of those goods originated primarily from the US. This was not the case for other regions of the world. Since tariffs rates under HTS 9802 are based on the percentage of foreign content, the major beneficiaries of the 9802 provision have been the economies of Latin America and those US manufacturers of goods that are shipped to Latin America for assembly under the 9802 provision. Further, among Latin American nations, Mexico and the Dominican Republic were the largest exporters to the United States under the provision. The top twenty items imported under 9802 from Mexico in 2003 consisted of various types of clothing, electronic equipment, and medical equipment. Specifically, \$6.8 billion in customs value was imported under 9802 from Mexico: \$1.5 billion (men's and women's trousers, short stockings, t-shirts, and sweaters); \$1.5 billion (electronic connectors, motors, switches, wires, televisions, and other cathode-ray tube machines), and \$0.3 billion (medical instruments and appliances). The top twenty items imported under 9802 from the Dominican Republic in 2003 consisted of various types clothing, electronic equipment, medical equipment, plastics, and articles made from precious metals. Specifically, \$1.4 billion in customs value was imported under 9802 from the Dominican Republic: \$0.75 billion (men's and women's trousers, shorts stockings, t-shirts, underwear, coats and sweaters), \$0.15 billion (electronic circuit breakers, switches and connectors), \$0.07 billion (medical instruments and appliances), \$0.07 billion (plastics), and \$0.02 billion (articles made from precious metals).

## **The Caribbean Basin Initiative and the 807 (9802) Provision**

The 807 (9802) tariff code provision is one of three major duty-free or duty-reduction programs available for US imports from the Caribbean (Schoepfle 2002). The other two programs are the Generalized System of Preferences (GSP) and the Caribbean Basin Initiative (CBI). During a speech to congress on February 24, 1982, President Reagan described his vision for trade relations between the United States and the Caribbean that would provide for free or reduced tariffs on a wide range of goods. This general vision became known as the Caribbean Basin Initiative and has been implemented through time in the form of three federal statutes: The Caribbean Basin Economic Recovery Act of 1983 (CBERA), The Caribbean Basin Economic Recovery Expansion Act of 1990 (CBERA Expansion Act), and The US–Caribbean Basin Trade Partnership Act of 2000 (CBTPA).

The original political purpose of the CBI was to enable economic development of the Caribbean region, which, in turn, was to provide greater political stability and closer relationships with the United States. At the time, the region had recently witnessed a successful revolution in Nicaragua, active insurgencies in El Salvador and Guatemala, and coups in Grenada and Suriname. These events had resulted in the establishment of leftist regimes that were perceived as being opposed to the interests of the United States. These dramatic political changes, coupled with an international economic crisis characterized by high oil prices, unprecedented interest rates, and declining commodity prices, rekindled the interest of the United States policymakers in the region (Haggerty 1991). The hope was that economic assistance and closer business relationships with certain nations of the region would help to balance increased political antagonism of others.

In 1987, in an attempt to expand economic growth and US influence through “free trade and free markets” in the Caribbean region, President Reagan implemented a CBI companion program called the Special Access Program (SAP). The SAP had been drafted earlier by the American Caribbean Trade Association and focused on expanding Caribbean clothing assembly and exporting activity under TSUS 807. Specifically, the SAP resulted in the establishment of opportunities for Caribbean nations to enter into bilateral agreements with the United States for Guaranteed Access Levels (GALs). These GALs essentially consisted of unlimited quotas for textile products and were incorporated into the tariff code

under the special provision classification “807A.” This 807A provision, which was informally referred to as the “Super 807,” incorporated very specific rules of origin, that required that textile material used in manufacturing clothing in Caribbean factories had to have been “formed and cut” in the United States (Rosen 2002). Through the SAP, the 807 provision became closely aligned with the Caribbean Basin Initiative.

### **Controversial Aspects of the 807 (9802) Provision**

Surrounding the 807 (9802) provision and related programs are several controversial issues. These issues relate to consequences which critics argue are outside of the stated objectives of the provision and which have damaging effects on the Caribbean, the United States, and Asia. Three such issues have been hotly debated:

1. The development of undesirable “sweatshop” working conditions in the Caribbean;
2. Restriction on free trade with Japan and other Asian nations; and
3. The “exporting” of jobs held by US workers to other nations.

At the center of the criticisms stemming from these issues are the related beliefs that US firms have used the 807 provision to benefit their own profitability at the expense of Caribbean workers, US workers, and US consumers, and that the original objectives of fostering economic development of other nations and providing markets for US goods have not been met.

Concerning the first issue, a “sweatshop” is typically defined as working conditions that do not meet US standards such as those prescribed by the US Fair Labor Standards Act (FLSA) of 1938, as amended, and the US Occupational Health and Safety Act of 1970, as amended. These statutes cover such items as minimum wages, overtime pay, child labor restrictions, and safety and health standards. The general criticism aimed toward foreign firms that participate in the 807 program with US firms is that they do not meet these standards, and thus, US business and the policy itself are encouraging the violation of generally held ethical and moral workplace values. Concerning the second issue, while it was the intention to foster economic development in the Caribbean, especially through the 807A special access program, one clear consequence has been the reduction of US imports from Asia. As a response, Asian firms moved

operations to Latin America and gradually became the beneficiaries of the 807 trade program through the establishment of manufacturing firms that employed Caribbean workers, which in turn reduced employment opportunities for Asian workers. Concerning the third issue, a clear trend in the United States has been the growing gap between wages paid to skilled versus unskilled workers. One source of this gap has been the outsourcing of unskilled work to other nations, with the resulting painful unemployment and underemployment experienced by displaced workers.

Countering these positions are the following views:

1. While working conditions in Caribbean 807 firms are below those of the United States, they are generally higher than typical for Caribbean nations hence a net benefit to the foreign workers.
2. US and Japanese workers who have been displaced through the 807 and related programs are being retrained for more sophisticated jobs that provide higher wages (Feenstra, Hanson, and Swenson 2002).
3. US consumers enjoy a wide range of alternative products from Japan and other non-Caribbean nations, such as electronics and automobiles as well as products produced in the Caribbean by US and Japanese firms through the 807 (9802) provision.

## EL SALVADOR

El Salvador is located on the Pacific coast of Central America, nestled between Guatemala to the northwest, Honduras to the northeast, and the Gulf of Fonseca to the southeast. Lying on top of the infamous Ring of Fire of seismic and volcanic activity, the country has experienced disastrous earthquakes (four significant ones in 2001 alone), leading to thousands of deaths and billions of dollars in damage. The northeastern region of the country was devastated by Hurricane Mitch in 1998, as was most of Central America. Despite a number of beautiful lakes, volcanoes, and beaches, uncontrolled deforestation in the last two decades has led to a near collapse of the country's riverbeds, droughts, and overall water scarcity. Along with Haiti and Paraguay, El Salvador is one of three Latin American countries with no remaining large tracts of undisturbed, biologically-intact forests. The country's generally comfortable tropical climate ranges between 70°F and 80°F, its beaches becoming a regular destination for regional tourists. The smallest and most densely populated Central American nation, El Salvador's geography and topography have brought significant challenges for the country's development. More than any other natural resource, land has historically been at the center of struggles over development, growth, private profit, and the well-being of the majority. The official population estimate for 2001 was 6.3 million.

Following independence from Spain in 1821, El Salvador became part of the United Provinces of Central America from 1823 to 1839, thereafter becoming a fully independent political state. From the beginning export agriculture dominated economic life, with communally held indigenous lands also dotting large regions of the country. These communal holdings prioritized subsistence agriculture. When the world demand for indigo collapsed in the 1860s, coffee became the new dominant export cash crop, displacing traditional systems of food production. In 1882, three quarters of all land passed into the private ownership of a small elite class when the government abolished all common lands. This single

decree concentrated the country's most abundant natural resource in the hands of an estimated 2% of the population, and set in motion an historical and still ongoing battle over access to land. This tiny elite class, popularly known as the "Fourteen Families," held all control over the state, the land, and national capital. The country became an oligarchy despite formally proclaiming a constitutional republican government. With land, economy, and political life serving the private interests of these few, large segments of El Salvador's impoverished laboring class organized themselves into protest. Labor unrest and protest included the growth of the Communist Party in the 1920s, largely repressed through the infamous Hernández Martínez government massacre of roughly thirty thousand indigenous and mestizo peasants of 1932, known as *la matanza*.

El Salvador's economy did not develop significantly until after World War II, and especially with the creation of the Central American Common Market (CACM). Entrepreneurial capitalists, some national but mostly foreign, benefited from a growing industrialization in this period. The creation and expansion of a regional Central American internal market, the first of its kind in the hemisphere, was the single most important factor in the relative modernization of the country's industries. The construction of the country's first dam in 1950 on River Lempa increased geothermal and hydroelectric power, potentially lessening its dependence on imported petroleum. Along with coffee and cotton, sugar became another important export cash crop in the twentieth century. The commercial fishing industry too expanded following the war, and especially in the 1960s, along with manufacturing and the production of tobacco, textiles, and beverages. Despite relative economic growth, gross inequalities were evident throughout. The extreme polarity between a wealthy elite class and a poor, largely rural but increasingly urban majority grew further in the postwar period.

Those benefiting the most from the growth of Salvadoran manufacturing and industrialization after 1960 were foreigners, and those affiliated with them. Of the fifty-five foreign investments established in El Salvador after 1960, forty-one were joint ventures between foreigners and nationals. The CACM favored transnational corporations' interests in the region rather than the development of Central American productive forces. The profits from growth, thus, did not translate into overall national development. That which remained in the country went to the few elite, while the largest portion actually left the country. Those suffering the most from growing industrialization and economic activity were the laboring class. Between 1970 and 1980, the change in real

wages for workers in the manufacturing industry was a  $-7\%$ ; for those in agriculture it was a  $-15\%$ .

These labor and social conditions in the postwar period were at the root of growing 1970s protest and organizing among peasants, students, teachers, and workers. With increased political repression of this civil unrest, organized political and armed protest eventually took the form of a coalition of five guerrilla forces under the name of the FMLN (Farabundo Martí Front for National Liberation). With a 1979 military coup, an armed twelve-year-long civil war began, eventually claiming the lives of over eighty thousand civilians and combatants. An additional one-third of the country's population was displaced internally or forced into economic or political exile, having additional negative effects on the national economy. Despite population growth, the production of basic foodstuffs decreased between 1980 and 1993, a year after the signing of peace accords that brought the war to an end. More recently in the 1990s, the growth of *maquiladoras*, or large sweatshop garment industry plants, has led to creation of thousands of jobs, though offering economic wages insufficient for procuring a basic standard of living. Unfair wage practices and reports of abuse have also brought international attention to these mostly foreign-owned *maquiladoras*. Today, it is the transnational Salvadoran community that is most responsible for keeping the national economy from collapsing. There are critical economic ties between hundreds of thousands of Salvadorans in the United States and those remaining in El Salvador. It is estimated that in 2000, Salvadorans abroad sent over \$1.6 billion in remittances to their friends and families. Less a form of national development, this economic reality makes of El Salvador a truly transnational experiment dependent on the global traffic of workers and goods. That the US dollar became legal tender alongside the national *colón* effective January 1, 2001, marks further this tie to globalization.

## ELECTIONS

Elections are a procedure for selecting officials to fill decision-making positions in the political system, or to settle issues concerning policy. Elections are an important component of the overall process of decision making within the democratic political system.

### History of Elections

The earliest historical data about elections come from the ancient Greek polities in the fifth and sixth centuries BC. Local general assemblies that included free male citizens were widely used to approve appointments for public offices.

During the Middle Ages, the church preserved the tradition of elections. Passing through a complicated and controversial process of institutional development, national assemblies, or parliaments, gradually began to acquire more jurisdictions. Part of this process was extending the active participation in the process of decision making. A significant political advancement during the bourgeois revolutions of the seventeenth through nineteenth centuries was enforcement of the assumed powers of the parliaments, as well as putting their members up for elections. Initially, a very limited share of the population was eligible to vote and to be elected. The right of citizens to participate in elections was limited by a wide variety of prerequisites—property qualifications, and religious, sex, or age requirements. Equality of influence of the vote was additionally limited by diversity in the ratio of population to elect representatives in different constituencies. Other inequities resulted from some traditional patterns of representation—e.g., granting some persons more than one vote. Countries

dominated by estate interests kept traditional oral voting well into the twentieth century—Denmark until 1901, Prussia until 1918, and Hungary until the 1930s. The tendency since the nineteenth century has been toward broadening the suffrage, suspension of multiple voting, adjusting constituency representation ratios, and lowering the voting age. During the nineteenth and twentieth centuries, the evolution of electoral systems throughout most of the world was marked by three important trends: (1) expansion of the right to vote to nearly all mature population; (2) approximation of the foundations of representative government; and (3) adoption of standard electoral procedures.

This steady expansion of the electorate invoked some organizations to bring substantial numbers of voters at the constituency level to permit winning the elections. Most of the European countries as well as the overseas territories of France, Great Britain, Belgium, and the Netherlands had by the end of World War I more or less full males suffrage. Extension of the vote to women was delayed. The United States adopted universal female suffrage in 1920, and the Scandinavian countries between 1906 and 1921. British women were given limited voting rights in 1918, and completely in 1928; women in Russia could vote by the Revolution in 1917. Democratic countries that achieved independence after World War II generally provided for universal male and female suffrage.

Voter equality was also enhanced by the advancement toward greater uniformity in population–representation ratios. Equal districting in the United States was not enforced until after the 1962 Supreme Court decision of *Baker v. Carr*. Extensive redistricting thereafter brought the basis of electoral representation much closer to the principle of “one person, one vote.”

Increasing standardization of administrative procedures in all phases of the electoral process was the third major trend having great impact for shaping modern electoral systems. This includes registration, balloting, tabulation of votes, and corroboration of winners. Most of these measures became essential with the involvement in the elections of earlier-excluded social, economic, ethnic, racial, confessional, and gender groups. Among the crucial innovations was the secret ballot. By 1946, most countries had voting rights extended to all capable citizens beyond the age of twenty-one, and a trend toward lowering the voting age continued. Today most of the countries comply with eighteen years as the age of voting rights. The United States established this voting age for all elections by passage of the 1970 Voting Rights Act extension and the 26th Amendment (1971).

## Functions of Elections

Elections serve a variety of functions within the political system. This is the formal procedure to fill public offices or specific policy actions to be adopted. Elections decide the contest in the countries, where two or more candidates compete for the same office. As much as competing candidates may advocate substantial discrepancies in the policy options, elections may deeply affect the governmental public policy choices.

In many countries elections have also symbolic function. Participation in the selection of their governmental leaders involves citizens in the democratic governmental process. On the other hand, choosing of leaders through established and sanctioned election procedures definitely grants the government a base of support and legitimacy among the mass public.

The fundamental challenge for elections is whether there exists a working competition between opposing candidates. This is most often the case with the democratic countries, while under oppressive regimes such competition is absent. In countries with autocratic, totalitarian, and dictatorial regimes, elections are only a prevaricated pageant. Typically, 99%–100% of the votes are cast for the official party candidates. By contrast, in democratic countries, the allotment of the winning vote is normally less than 55% of the total.

Formally, elections in non-democratic countries comply with some of the above mentioned functions. They provide for the regular filling of public offices, and, through vast participation in voting (often obligatory or pending chastisement in case of abstention), they may serve as a proof for the regime popular support. Actually, in these countries elections never allow a genuine contest, or choice, between competing groups of office seekers. As a rule, in the communist, quasi-Marxist, and fascist-type regimes, the leader exercises power until his death, or until he is deposed in a *coup d'état*. Most other personal changes are decided in a narrow circle of senior cadre of the ruling party, while certain positions may be voted at party plenary sessions, congresses, or conventions.

The British pattern of parliamentary government is followed in the most countries of Western Europe and the Commonwealth of Nations. Some of the post-communist countries also adopted such a system. There, voters elect members of the legislative body, who, in turn, elect a prime minister—usually the leader of the majority in the legislature. The prime minister chooses his team to serve as ministers, and they all constitute the executive branch.

Under the congressional system of government in the United States, where terms are fixed, elections for the president and members of Congress are held in even-numbered years: every two years for all members of the House of Representatives and for one third of the Senate, and every four years for president (and vice president). In countries having a parliamentary system there is usually a requirement that legislative elections be held within a set period of time. A government may also be forced to call a general election if it loses a vote in parliament on a major issue.

## Types of Elections

There exist several different types of elections, depending on the office or policy issue that is to be settled.

### *General Elections*

Most often, a general election is actually the last stage of a number of elections, held simultaneously throughout a country, to make the final choice among candidates for all public offices that are pending for filling. In some cases, nominating procedures may require primary elections as a prerequisite to the general election. In some countries voters may also vote directly on policy issues or constitutional amendments at the time of the general election. However, in some countries a national general election may also be held to fill only the office of the chief executive.

### *Primary Elections*

Typical mainly in the United States, these are held prior to the general election in order to permit voters to directly select party candidates, who will then run for public office. Generally, the turnout in the primary is much lower than in the general election.

### *Run-off Elections*

Where no candidate in the general election secures a clear majority, a run-off election may be held between the two candidates (rarely three) who have received the most votes. Run-off elections are held in many countries both for legislative and presidential elections, while in the United States there is no provision for a run-off for president. If the electoral college fails

to produce a majority, the House of Representatives may arrange a vote for president.

### *Special Elections*

Where a public office is vacated by the incumbent before the term has expired through death or retirement, a special election may be held. In the United States this refers to the seats in the House of Representatives and state legislatures. In Britain, elections to fill vacated seats in Commons are called by-elections. Often in this case the turnout of voters in one and the same constituency is lower than when general elections are held.

### *Local Elections*

On the local level, elections are used for filling a wide variety of offices—mayors, governors (where they are elected and not appointed), members of local or municipal legislatures (councils), etc. Elections are held also to decide issues of local policy. Local elections may coincide with statewide or national elections or be called separately.

### *Direct and Indirect Elections*

In a direct election each member of the electorate votes directly for the candidate of his or her choice, and, depending on the appropriate rules, the candidate with a plurality or a majority of the popular vote is certified as the winner. Indirect elections are decided by vote of a special electoral body. In the Fifth French Republic an electoral college composed of members of the National Assembly, the members of the departmental assemblies, and representatives of the municipal councils elects members of the Senate. In the United States people vote for a special electoral college that in due time elects the president. The electoral college's power of independent judgment is, however, promptly restricted, after the political parties erect slates of electors bound explicitly to one or another presidential nominee.

## Election Procedures

The *initiative* is a procedure by which a legally designated number of eligible voters may induce a popular vote to be summoned on a draft legislation, amendment, enforcement, or other public policy question, or

## ELECTIONS

to force the legislators to ponder a certain action. The *referendum*, used most often in Switzerland, but also in many other countries, is a kind of election where an issue is submitted directly to a popular vote. In some countries—especially when majority vote is implemented—a number (designated by law) of eligible voters may initiate a removal of a public official, or a *recall* election, usually by petition and collection of signatures. In such cases, special, or partial, elections are held to replace the removed official.

### The Electoral Process

All procedures and rules for the conduct of elections are specified by law.

#### *Apportionment and Districting*

Apportionment is the way in which representation (i.e., the seats in the legislative body) is distributed among established territorial or other units vested with representation in a political jurisdiction. Districting is the process by which are established exact geographical boundaries of territorial constituencies. Some parties may enjoy the convenience of having their representatives elected by fewer votes than others.

#### *Single-Member and Multiple-Member Districts and Proportional Representation*

Additional factors that affect the nature of a country's electoral system are the type of district—single- or multiple-member—in which representatives are elected, and whether the system requires proportional representation or the plurality method of establishing the winning candidates. The United Kingdom and many of the countries in the Commonwealth use single-member constituencies, where the winner is the candidate who redeems the greatest number of votes. In the United States, both types of districts apply in the state legislatures' elections. In most of the world's democracies, including France, Germany, Italy, Sweden, Israel, and Japan, multiple-member constituencies with proportional representation are mostly the case. Under the common version of proportional representation, the list system, voters cast their ballots for a party rather than for specific candidates. Seats are assigned to the parties according to their proportion of the total vote. This system is criticized as strengthening the party leaders' dominance. Many experts argue that the single-member

constituency–plurality election system, where a minor party may get many popular votes but not enough to elect a candidate, tends to maintain the two-party system. However, miscellaneous other factors also contribute for the prevalence of two major parties. Further, proportional representation appears to foster certain minor parties by warranting their representation in the legislative body. In order to qualify for proportional representation, the party must transcend the required percentage of the total popular vote. Some countries combine both systems.

#### *Nominations*

A vital element in the total electoral process is the procedure by which candidates are nominated by political parties. In Britain and continental Europe this nominating function is frequently performed by a relatively small group of activists in individual constituencies, party conventions, or conferences, or by national political leaders. In the United States, nominating procedures have evolved to the party convention, which in turn gave way to the direct primary in many states by the early twentieth century. The convention system is still used to nominate presidential candidates, but states increasingly are selecting delegates by primary elections.

#### *Election Campaigns*

Political campaigns are ubiquitously conducted differently from country to country. In the totalitarian states, election campaigns are used as a propaganda venture to advertise ruling party's "monumental" successes. Some countries with competitive elections strive to promptly restrain campaign costs and media involvement. In the United States, campaign expenditures grow dramatically with each new election. Typical sources for funding of political parties, such as party dues and profits from party publications, have proved to be insufficient to meet these rising costs. Quite generous public subsidies are available in Germany, while public financing in the United States is restricted. Traditional techniques for campaigning—newspaper coverage, circulation of leaflets, rallies and social gatherings, lectures to civic groups, door-to-door solicitation—are still in use in developing countries with large uneducated and illiterate constituencies.

Campaigns differ also when an incumbent or a challenger is involved or the candidate is from the majority or minority party. Public opinion polls have an important role in political campaigning. Relying

on commissioned polls, candidates and their parties devise their strategy, checking categories of the electorate that support them, are against them, or hesitate in their attitudes. Media publicize opinion polls, and often the likely winner is known well in advance. This may induce some voters to refrain from going to the polling stations, considering their individual vote as making no difference. Observers differ in their surmise about the educative or manipulative significance of the polls, and some countries impose restrictions on conducting polls and publishing their results. Clearly, ratings of various parties and candidates attract or thwart financial support.

Administration and formal setting of elections relate to the requirements for registering and voting, the time of the year and day of the week when elections are assigned, the hours polling stations are open, the opportunities for absentee voting, and others. The administration of elections can be of significant impact on the turnout and even the outcomes.

In many countries elections are administered by a particularly designated body, an election commission; in others they are administered by a central or local government official.

### ***Registration***

The procedure of registration verifies that given person qualifies to vote. The list of eligible voters is displayed in advance of any election. In most cases this procedure does not demand any action from the prospective voter. In most states of the United States, however, the individual citizen usually must take the initiative. US Blacks as well as minority groups in other countries often need additional incentives to register.

### ***Casting Votes***

Most commonly, voting is exercised by paper ballot listing only candidates' names. In some countries ballots are different for each candidate—white or colored. In Turkey, India, and most of Africa parties use specific logos, for example, in the form of animals, to facilitate identification by illiterate or undereducated voters. A more sophisticated method is use of mechanical or digital voting machines, computer punch cards, or insertion of a marked ballot into an optical scanning device. Recent expansion of computer technology increases pressure for introducing distant voting, but especially in the underdeveloped countries this is curbed by the low availability of access to computers.

### ***Absentee Voting***

Provisions for absentee voting by mail have spread during the last decades, and the United States has the most advanced system. Most other countries provide voting places for their nationals abroad in the diplomatic missions.

### ***Observation and Monitoring of Elections***

In order to prevent abuses and forgery, political parties and independent organizations may provide observers in the polling stations to monitor the whole process, and especially tabulation of votes. In the new democracies opposition often invites foreign observers, including respected political figures, to further ensure fairness of the elections.

### ***Calculating, Reporting, and Verifying Outcomes***

Election officials at the precinct polling places, often in the presence of authorized party workers, usually count votes. In some countries ballot boxes are taken to a central place in each constituency for counting. In most of the cases local election officials report their official election figures to the regional or central designated officials. This process may take days or even weeks, especially in countries with poor infrastructure. Major election competitions attract extensive television and newspaper coverage, and they report unofficial vote totals early after closure of poll stations. By analyzing the results in sample constituencies, or through the exit-poll technique, expert pollsters forecast the probable distribution of seats.

Authorized public officials, or a special election board, certify election outcomes and winners. A recount may be demanded if the initial vote count is very close.

### ***Voter Turnout***

In Europe, Denmark and Germany demonstrate an especially high voter turnout, while the percentage of voter participation is lower in the United States than in Britain, the Commonwealth, and much of Europe (where the average is closer to 60%). On average, only half of all Americans eligible to vote are registered, and less than half of the registered participate in a given election.

## ENERGY: ALTERNATIVE DEVELOPMENT

### The Importance of Renewable Energy

Human society cannot survive without continuous use, and hence supply, of energy. Modern economies

are energy dependent, and one of the major problems for their existence and further development is the sufficient energy supply. The world's increasing energy demands and rapidly diminishing reserves of oil, natural gas, and coal have led to developing strategies and plans for using alternative energy sources. Dependence on fossil-fueled power plants to produce electricity has an adverse impact on public health and environment. Burning of coal or natural gas emits substantial amounts of sulfur dioxide and nitrogen oxides into the atmosphere. Sulfuric acids and nitric acids are formed when these gases combine with atmospheric water vapor. These acids form acidic precipitation which has an adverse effect on public health, flora and fauna, and building constructions. The combustion of fossil fuels also releases carbon dioxide. The content of this gas in the atmosphere has risen in the last century because of the high consumption of coal, oil, and natural gas. The Intergovernmental Panel on Climate Change (IPCC) identified emissions of carbon dioxide as the chief contributor to global warming. World scientists identify the threats of global warming as the greatest challenge to the future generations. It presents unprecedented hazards of rising oceans, flooding and inundation of coastal zones, agricultural disruption, loss of biodiversity, and climate changes. Global warming can be effectively addressed if significant steps are taken that reduce adverse environmental impacts and hazards. Overreliance on fossil-fuel electricity generation has also other negative impacts on consumers and economy. As fossil fuel reserves are increasingly depleted in the future, the price of fossil-fuel electricity will continue to grow up.

Alternative development of energy resources and efforts to find clean energy options are among the key issues not only in global warming discussions but also when suggesting sustainable development paths. Against the environmental and economic backdrop faced when there is reliance on fossil fuels, there are many compelling reasons for countries to seek to increase their use of renewable energy. Nowadays there are a lot of programs promoting renewable energy technologies with the objective to reduce fossil-fuel consumption. One of the most advanced technologies is based on fusion processes. In this reaction deuterium and tritium (hydrogen isotopes) are used as fuels. Deuterium is obtained from water, while tritium results in the processes run into the fusion reactor. It is considered that one gram of fusion fuel can produce as much energy as nine thousand liters of oil. Unlike fossil fuels, fusion does not cause environmental pollution. Herewith fusion will not be discussed further because of its complex character and way of operation. Rather it should be considered as an

advanced means for energy development and an alternative to nuclear energy and fossil fuels.

Renewable energy resources hold great promise for meeting the energy and development needs of countries throughout the world. Renewables include a considerable number of proven and emerging technologies, which permit the execution of needed tasks presently performed by use of fossil fuels. Renewable resources vary widely in technical and economic characteristics. They play a crucial role for developing countries. Some renewable resources, such as solar energy, wind, geothermal, biomass, and small hydroelectric energy are widely spread and accessible throughout the world. They offer both environmental and economic advantages. The present article will discuss the previously mentioned renewable resources, but it will exclude nuclear energy, large hydroelectric dams, and waste to energy power plants as alternatives to energy production. Nuclear energy is excluded because of the problems related to proliferation and nuclear waste disposal. Moreover, it requires high capital and operating costs. Large hydroelectric dams are not presently considered because of the environmental damages they can cause and expenses for their construction and maintenance. Waste to energy power plants is also excluded because it is highly polluting.

## Solar Energy

Solar energy presents great development opportunities. It is an attractive energy resource because of its nonpolluting character and inexhaustible supply opportunities. Solar energy is the radiation from the sun capable of producing heat, causing chemical reactions, or generating electricity. The sunlight that reaches the Earth consists of nearly 50% visible light, 45% infrared radiation, and the rest forms of ultraviolet light and other forms of electromagnetic radiation. Solar radiation can be converted to heat and mechanical or electrical power. The former conversion is easier to accomplish.

Solar energy is captured and converted by two main types of collectors: flat-plate collectors and concentrating collectors. Both types of collectors should have large area because of the low intensity of solar radiation reaching the Earth's surface. Flat-plate collectors are commonly used for hot-water heating and house heating. This system can supply a household with hot water drawn from an insulated storage tank, or it can provide space heating when warm water runs through tubes inserted in floors and/or ceilings. The temperatures that can be reached when flat-plate

collectors are used vary between 66°C and 93°C (150°F and 200°F). When higher temperatures are needed, then a concentrating collector is used.

Solar radiation can be converted into electricity by photovoltaic cells. Electrical voltage is generated when light strikes the junction between a metal and a semiconductor (for instance silicon) or a junction between two different semiconductors. Solar technologies provide environmentally clean options for energy production. Although based on an inexhaustible primary energy resource, the costs for solar energy production, collection, conservation, and storage limit its exploitation.

## Wind Energy

Wind energy is a pollution-free technology. It derives from wind turbines that can be situated either on-shore or off-shore. Wind electric systems have siting problems such as wind exposure, aesthetic impacts, danger to birds that fly into the blades, and noise. On-shore wind energy is extensively deployed and commercially developed technology. Off-shore wind is a less developed source, but potentially has a better future. It usually provides better exposure to wind resources and allows bigger turbines than those sited on shore. However, off-shore turbines are poorly accessible and require higher maintenance costs (e.g., linking to the power grid).

The utilization of wind energy systems grew in the last decade. In Europe, Denmark started the use of wind energy for electricity generation. The country is a leader in turbine technologies. Extensive wind applications are applied also in Germany and Spain. The successful experiences, combined with proper siting of wind turbines, can be a model for alternative energy resource for developing countries as well.

## Biomass

Biomass resources are used for deriving ethanol (ethyl alcohol, grain alcohol) and methanol, which are the two alcohols commonly considered for fuel use. Ethanol is produced by yeast fermentation of hexose sugars (such as those derived from cereal grains, sugar cane, or sugar bean) and subsequent separation from the aqueous solution by distillation. Methanol can be produced from cellulose products such as wood or crop residues by gasification.

Alcohol fuels can be used in different ways. The best-known fuel use for alcohol is as a substitute for

gasoline. They can also be used in heating and lighting, in simple wick lamps or heaters, or in pressure stoves and lanterns. They are clean and comparatively safe fuels, which unlike petroleum are miscible with water. The growth and conversion of various plant species to fuels can be an alternative to petroleum use in many countries worldwide, and especially those with favorable climate conditions. Brazil has pioneered the growth of biomass for producing alcohol fuels. In 1979, the country imported more than 80% of its petroleum. A combination of factors—availability of land and labor, favorable climate, a need for liquid fuels—has resulted in ambitious alcohol fuel programs. This led to halving country's oil imports. Argentina, Costa Rica, and the Philippines are among the countries where biomass is used on a large scale as an alternative energy resource.

A widely feared social consequence of large-scale alcohol fuel production is that it will limit food staples. This will have a negative impact especially in poor regions where the need for liquid fuels will be satisfied at the expense of food production. Another argument against large-scale alcohol fuel production is that it will lead to soil erosion and depletion, or that widespread monocultural crop production will make large areas vulnerable to pests or diseases. All of these limitations must be considered before applying large-scale activities for alcohol fuel production.

### Geothermal Energy

Geothermal energy is the energy generated and stored in the core, mantle, and crust of the Earth. However, this energy source can be tapped in relatively restricted zones, where heat can be extracted in the form of hot water or steam. It can be used for electricity generation, heating, drying, or freezing. Locating proper geothermal sources depends on finding a suitable heat source and the presence of a suitable medium for transferring the heat. Geothermal exploration is a complicated activity as it involves methods from geology, geophysics and geochemistry.

The geothermal fields used to produce electricity are associated with young igneous intrusions. The latter are situated on three types of plate boundaries: constructive, destructive, and transform faults. Constructive boundaries are those which occur where two plates move apart and a new plate is formed on the ocean floor. These types of boundaries are located in Iceland, the Gulf of California, and the Red Sea. Destructive boundaries are where two plates collide and one remains under the other (Japan, Indonesia,

New Zealand, and the Philippines). Transform faults occur where two plates slide past each other (for instance, California and Hawaii).

Geothermal energy has been known for centuries, but not until the beginning of the twentieth century was geothermal water used to heat houses in Iceland. In 1904 at Lardello, Italy first used it to produce electric power. Water and steam hotter than 356°F (180°C) are generally required for electric-power generation. Among the world's largest users of this alternative energy source are Japan, Iceland, Italy, the United States, Italy, and New Zealand. Other countries that are generating 10%–20% of their electricity through geothermal are Costa Rica, El Salvador, Kenya, and Nicaragua.

The development of geothermal resources has become increasingly attractive owing to the rising cost of petroleum and the nonpolluting character of geothermal energy production. However, it is arguable if geothermal energy constitutes a renewable energy resource. Generally, over time, the pressure in the fields where hot water or steam is found declines. The lifetime of a field can vary. One of the applied measures that ensure longer operations at the site is reinjection with geothermal fluid that can help to maintain the pressure.

### Tidal Power

Tidal power can be used also for electricity generation. This is achieved through turbines that are run by tidal flows. One of the plants that produce electricity using tidal power is the Rance power plant in the Gulf of Saint-Malo, Brittany, France. Another tidal plant was also constructed in 1969 in the ex-Soviet Union on the White Sea. Despite the large amounts of power available from the tides in favorable locations, this power is intermittent and varies with the seasons.

### Hydroelectricity Generation

One of the possible means of electricity generation is through generators driven by water turbines that convert the potential energy of falling water or fast-flowing water to mechanical energy. Hydroelectric power plants are usually placed in dams that impound rivers, thereby raising the water level behind the dam. Nowadays it is believed that large dams create environmental problems, as well as displacing people and agriculture. Because of this, small dams are

considered an environmentally harmful form of hydroelectric power production.

Falling water is one of the three principal sources of energy used to generate electric power; the other two being fossil fuels and nuclear fuels. It has advantages over the other two. It is constantly renewable owing to the recurring nature of the hydrologic cycle; and it does not produce either thermal or particulate pollution. Some countries, such as Sweden, Canada, and Norway, rely heavily on hydroelectricity.

## Hydrogen

Hydrogen is the most promising alternative fuel for the future. It currently is produced from photovoltaic or wind-powered electrolysis, from separating hydrogen from water, from some seawater algae, and from natural gas. Hydrogen is considered to be an alternative fuel that can power vehicles. Its combustion is pollution free (resulting in water). The challenges to wide use of hydrogen are to reduce the cost of hydrogen production and construct the proper infrastructure to transport the hydrogen.

## Conclusion

Despite the many advantages of renewable energy use, the renewable energy to produce electricity is extremely low, especially of renewable resources other than non-large hydro. There are a number of economic, regulatory, and political barriers to increase the percentage of applied renewable energy resources. These obstacles are tackled with various policy tools. The European Union has set a target of achieving 22% of renewables as part of Europe's electricity by 2010. India has proposed that 10% of annual additions to electric capacity come from renewables by 2012. The promising future of renewables is revealed by scenarios that point to 20%–50% of renewable energy supplies in the second half of the twenty-first century.

All of these policy measures are possible because renewable energy sources hold enormous potential. They enhance diversity in energy supply markets, sustain energy supplies, and reduce environmental pollution. They provide attractive options to meet specific needs for energy services, and this is particularly important for developing countries and rural areas. Most renewable technologies are still at an early stage of their development and implementation. This requires further research, development, and

public awareness for the benefits of the renewable resources.

## ENERGY: IMPACT ON DEVELOPMENT

Energy is arguably one of the most important aspects of developing a modern society. By nature, energy resources are unevenly distributed across the globe. Control of energy resources is therefore one of the most important strategic issues in international relations. Energy resources are at the heart of much of the conflict in the Middle East, a hotbed for conflict after World War II. The importance of the region for outside interests is directly tied to the preponderance of petroleum supplies there. For that reason, US, Japanese, and European foreign policy have historically been willing to overlook their democratic and human rights values in dealing with despotic regimes in the region. While most international trade and investment occur in the developed world, with the exception of China, the dependency on external supplies of fuel is the Achilles' heel of Western economies. This vulnerability has, in recent years, raised questions as to whether the heightened strength of oil exporters can change the dynamic of relations between the developed and developing world. Within countries, such as Nigeria, regions with energy

endowments have become the source of conflict, including issues such as levels of autonomy and fair and efficient distribution of the revenues from the resources.

Energy has also had profound effects upon the trajectories of developing countries. The key to energy is not only the existence or lack thereof of natural resources, but also the types and quality of resources that are available. For example, petroleum, as perhaps the most valuable energy commodity, is concentrated in some areas of the globe, leading to a situation of differing levels of development. While countries with such resources enjoy high standards of living, in some cases well above the average of Northern countries, other developing countries without such resources have been at a severe disadvantage in terms of their energy costs and vulnerability to outside economic shocks (sudden changes in energy prices). Moreover, because of the strategic importance of energy, developing country governments steadily increased control through expropriations, nationalizations, and the formation of state-owned enterprises through most of the latter part of the twentieth century.

Last but not least, energy has been at the center of discussions of “sustainable development.” Sustainable development is a broad concept often used to convey the idea that the development process should not create long-lasting or permanent damage to the natural environment. Since energy used as a fuel for transportation and manufacturing is one of the primary sources of pollution, finding ways to create sustainable energy sources and consumption systems has become a focal point for research and policy discussion. This conversation has also translated into North–South dimensions, in terms of the levels and types of responsibility polluters have at different levels of output and different stages of development.

### **Profile of Energy in Development: Energy Sources and Uses**

There are a few primary sources of energy, based on historical (technological) development and on the costs for producing energy. Historically, the modern machines of industry, transport, and household comforts grew hand-in-hand with the development of fossil fuel sources. Fossil fuels include coal, petroleum and its derivatives, and natural gas. More recently, hydroelectricity has become an important source of energy in countries endowed with fast moving and high volume water flows. We should note that having

some resources is considerably different from having abundant resources that can be extracted at a reasonable price.

The most primary fuel used may be wood. Burning wood is an obvious choice for ease of use and the low level of technology needed to use it for cooking or heating. While not all areas of the globe have forested areas, they tend to be relatively common. However, wood tends to burn energy fast, and creates high levels of pollutants. In addition, wood can not easily be stored, as it is heavy to transport and can rot over time if it becomes moist. Because of the ease of use, wood is still used in many poor rural areas in the developing world as a primary source of fuel. This has led to strong concerns about deforestation and soil erosion as rapid population growth have led to an “overuse” of forests. A related fuel source is biomass, which is essentially the burning of organic matter, such as animal waste. While the cost is relatively low, the fuel output of biomass is also relatively inefficient, and transportation and storage difficult. The growing use of biomass in the developing world and the health and environmental problems thereby created are growing concerns.

Coal is one of the most abundant energy sources naturally available and has a long history of use. Coal, in its various forms, is found naturally in often large mineral deposits in a wide variety of locations globally. Coal has long been used as a source of heating, and at the turn of the century, was an important fuel for transportation (fueling steam engines) and industrial uses as well. Because of its heavy weight, coal is often transported upon railway cars. In recent decades, coal has become less important as a fuel source because of growing awareness of the high levels of air pollution emissions. The consequences of coal-created emissions upon human and natural health, including “acid rain,” have led to policies designed to reduce its use.

Petroleum is also a fossil fuel that is naturally found, but abundant and easily accessible sources tend to be more concentrated geographically. Technology for finding, developing, and refining petroleum is capital-intensive and highly sophisticated. Petroleum exploration and drilling now occur offshore as well as in remote areas where it can be found. Unlike coal, petroleum can be transported through pipelines and so transportation costs tend to be considerably lower. Petroleum is also a fast burning fuel, ignitable at a low temperature, that delivers a very high energy output. In other words, petroleum is a very efficient energy source considering the costs of supply versus the energy output. Petroleum has a very wide variety of uses besides energy, including the creation of synthetic fibers and plastics

as well as lubricants and medicinal purposes, that reinforce its strategic importance. While diesel fuel derived from petroleum is sometimes used to make electricity, the most important use is as the source for almost all global vehicles' fuel, gasoline. However, in recent years, natural gas, a related fuel that is usually found along with petroleum, has become the fastest growing fuel of choice for both heating and electricity generation, because of its clean burning properties. For all these reasons, petroleum will remain an important part of developed and developing societies.

The other major energy source internationally is hydroelectricity, which is created by the natural movement of water from a higher place to a lower one. Some of the largest man-made projects are dams designed to capture this natural source of energy through turbines. While hydroelectricity is the most clean-burning fuel (as nothing is burned), it is not without its disadvantages. Hydroelectric fuel sources depend on the presence of strong and consistent volumes of strong water flow. These sources are not always close to population centers, and exist only in limited quantities globally. In addition, dams must be designed and located strategically both so that energy production is maximized and to ensure safe water supplies. Concerns about the flooding created by dams and the effects of dams on local fauna and flora have created strong resistance globally to large new projects. One of the few to have recently been created is the Three Gorges dam project in China, which sparked international controversy.

Finally, nuclear energy, based upon the energy released when radioactive atoms are split under pressure, remains an option for developing countries without abundant fossil fuels. Great concern surrounds the nuclear energy industry, however, for a number of reasons. The most obvious is that the nuclear energy industry can be used to develop nuclear weapons as well, which may increase its attractiveness for states interested in increasing their strategic power. Secondly, while nuclear energy is relatively

efficient and clean burning, the high levels of radioactivity from spent fuel, which can persist for thousands of years, in combination with the complex technical aspects of its operation, creates a major public health hazard. The question remains open as to where spent nuclear fuel can be safely stored. The near disaster of the Three Mile Island plant in the United States and the continuing health effects of the Chernobyl meltdown in Russia continue to haunt the industry. Activists in the North have been successful in slowing the spread of new nuclear reactors, and, in some cases, in shutting others down. Therefore, nuclear energy remains a small and stagnant portion of most developing countries' energy portfolio.

As previously discussed, there are several basic categories of energy use: heating, cooking, transportation, industrial, and electricity generation. Electricity, while it relies upon the fuel sources previously discussed, has all of the other uses of fuel sources. If we define development as the creation of an advanced industrial economy with standards of living comparable to those in Northern society today, we can see that the use of energy will continue to increase over time. In addition, the development of a Western lifestyle means the continual development of new technology and modes of consumption, so that even in the North, energy use is continuing to accelerate. This also suggests that the types of use for energy will change over time, with more fuel being used proportionally for services, including transportation and household appliances, as incomes rise.

As can be seen from Table 1, the North consumes the lion's share of total and relative amounts of energy consumed in the world. We also see some striking differences by region in terms of the types of energy used. In part, the differences reflect natural resource endowments, such as high oil usage in the Middle East, the fact that high quality coal in Latin America is scarce and abundant in Asia, and that Latin America has, by contrast, an abundance of hydroelectric sources. However, usage by fuel sources also reflects

Table 1: Energy usage by region and fuel type, 2001 (percent of world total)

Region	Energy usage	Crude oil production	Coal	Hydroelectricity	Nuclear
OECD	53.2	28.4	37.1	48.9	86.3

levels of internal conflict and state and technological capacity. Africa is much poorer in both relative and absolute levels of consumption in part for the inability to develop large local energy projects. Hydro projects, in particular, by their geographic nature, often require high levels of international cooperation. What is not highlighted in the table is the fact that developing countries have been rapidly increasing their relative share and absolute levels of energy consumption. However, the levels of increase tend to be quite unevenly distributed, with larger and more rapidly developing nations such as China and Mexico increasing their share while smaller nations have not, as reflected in Table 2.

Table 1 does not adequately demonstrate the huge levels of inequity in terms of access to modern energy sources. According to the International Energy Agency (IEA), about one fourth of the world's population does not have access to electricity. The majority of these are in Africa, and South and Southeast Asia. Moreover, even where available, basic energy tariffs remain well beyond the reach of large numbers of the poor.

## The Rise of OPEC

In the early 1970s, petroleum supply nations acted upon long-standing dreams and created an oil cartel for the first time. The Organization of Petroleum Exporting Countries, or OPEC (see entry for further details), created an important change in the international

history of energy. With OPEC, for the first time, the developing countries were able to act in concerted fashion to attempt to reshape the relations of international exchange between the North and the South. OPEC gave rise to a lively debate in the 1970s about these terms, leading the South to request a number of changes, capped by discussions of a New International Economic Order (NIEO) (see entry).

OPEC created a sense of optimism that other developing countries attempted to follow through the creation of cartels based on other commodities, such as coffee, nickel, and tin. However, the general optimism that OPEC marked created a turning point in North–South relations for the benefit of the latter, and the idea that a number of commodity cartels could be created to turn the North's supposed dependency on the South against it proved short-lived. There are a number of reasons for this, but our previous discussion suggests a few. The first is the strategic value and dependency on petroleum is much greater than for any other commodity. While demand continues to increase internationally for oil, supplies are both limited and concentrated. This brings us to the second point, which is that a commodity like rubber or coffee, as a plant-based product, can have an “elastic supply” function, meaning that if the price goes up, farmers can simply plant more. Given the costs and difficulties as well as the finite nature of petroleum, it is much harder for suppliers to respond to price increases in the short to medium term. Third, some of the largest concentrations of petroleum exporters are in the Middle East. Key producing states such as Saudi Arabia and Kuwait have had fairly low population bases, making it easier for them to lead cutbacks on supply in order to bolster prices. More importantly, developing countries that have a large population and seek development are also dependent upon fuel supplies. Thus, when OPEC raised oil prices, they directly slowed down the development of large importers, such as India and Egypt. In many cases, developing countries who were energy *importers* borrowed money in order to pay for this increase in prices, leading to the debt-recession spiral of the 1980s throughout the developing world.

For better or worse, 1979 appears to be the last year when OPEC was able to act in a concerted fashion to create a major oil price shock. While OPEC continues to work in a concerted fashion, its relative level of influence has dropped considerably from the heyday of the 1970s. The key reasons for this include the unexpected elasticity of supply, and political turmoil internationally. While there were major shortages in the North in the 1970s due to the oil price increases, by the early 1980s, the price increases

had actually spurred on the development of new petroleum suppliers, some of whom are not OPEC members, such as Mexico, the North Sea finds off the United Kingdom's coast, and Norway. In addition, major importing countries such as Brazil have been motivated to develop their own sources of petroleum and other fuels. Meanwhile the Iran–Iraq war of the 1980s in particular led to the breakdown of internal cohesion within OPEC. Later in the 1980s, the breakup of the Soviet Union led to Russia entering the international market as a major new supplier, along with its former colonies in the Caucasus and Central Asia. The re-taking of Kuwait in the 1990s Gulf War and the more recent invasion of Iraq by the United States are all related to the desire to ensure an abundant supply of petroleum. At the same time, the growing population base and needs of oil exporters such as Iran, Mexico, and Saudi Arabia have made supply cutbacks by key exporters difficult. In sum, while the demand side of the world energy has not really adjusted to reduce OPEC's power, a number of supply side factors have.

Even among the developing countries that have become active exporters, the results have often been less than hoped for. Terry Karl points out in her book *The Paradox of Plenty* that much of the development of Venezuela's vast oil wealth has been accompanied by the inability to diversify the economy and particularly exports; a growing consumptive lifestyle, including dependence on previously produced goods, such as food; and huge concentrations of wealth and corruption that do not raise the standards of large portions of the population. While there are some partial exceptions in the cases of Indonesia, which for a time was able to diversify its exports, and Libya, which has some basic social welfare services, many petro-states, such as Nigeria and Equatorial Guinea do seem to fall into the trap described by Karl. Karl points out that it is not just the concentration of revenue flows from the industry, but the fact that states that lack well-developed institutions, political cohesion, and long-term visions for their development will naturally have difficulty in handling a sudden gush of new revenues. As institutions and politics develop around the control of these resources, it becomes difficult to move back to a more egalitarian and merit-based form political and economic decision-making.

## Energy Markets

Given the strategic importance of fuels for the economy and national security, there has long been a high

level of state intervention in the energy sector. National and government-supported energy companies, such as Petro-Canada and British Petroleum were the norm for many years. While many of these companies have been privatized and energy sectors deregulated, energy remains an area where governments remain active. The reason goes beyond the overall importance of energy to the nature of the energy sector itself. Coal mining, like other types of mining enterprises, requires heavy doses of skilled labor. As a result, large coal mining states, such as Britain until recent decades, experienced important political influence from labor unions of miners. In some developing countries, such as Bolivia and Chile, miners have become key political actors in development decision-making. Petroleum and natural gas as well as large hydroelectric dams, meanwhile, require vast amounts of capital investment, and high levels of risk in developing potential new deposits and the flooding of areas respectively. In turn, they require a large number of readily available and technologically up-to-date engineers. Therefore, the state has an important role in terms of providing financial human capital and/or managing deals with foreign companies and governments who provide these resources in exchange for supplies and financial returns. As a result of these market characteristics, energy markets tend towards natural monopolies or oligopolies (markets in which there is only one or a few main suppliers). Moreover, since state defensive capabilities rely upon a stable source of fuel, governments see energy as a key sector that must be nurtured and protected.

For all these reasons, the recent turn towards deregulated and privatized energy markets has been accompanied by strong pressures towards state guidance, if not direct intervention. The move towards deregulation and privatization in the electricity sector the developing world began in the early 1980s, with Chile being one of the first to experiment internationally with creating a free market. From the 1980s until the present, the pace of privatization and deregulation has continued to spread across the developing world. The timing of this movement can be directly linked with the debt crisis of the 1980s and the rise of neoliberal thinking on economic development. Because of the debt crisis, developing country governments could no longer afford to hold on to state-owned enterprises, which in many cases were losing money due to large numbers of employees and corruption related to the company being run for political as well as economic and financial reasons. Even in the cases where state-owned enterprises were making money, the demographic explosion and rising incomes (at least in some segments of the population), have led to

increasing demands for energy consumption. These demands require heavy investments of capital at a time when local capital markets are generally weak, governments broke, and the local private sector lacks the financial and technological capability to undertake major new investments. Therefore, privatization and deregulation of the energy sector have been accompanied by a growing relationship and renewed dependence upon foreign multinational companies for new investment. In addition to the risks inherent in developing new sources of fuel, energy tends to be a “network” industry in terms of getting supplies to the consumer, whether that is through gas pipelines or electricity transmission lines. Therefore, deregulation designers have struggled with this “public good” aspect of the need for private producers to share the main transmission lines or pipelines while maintaining a healthy and fair competitive market. Secondly, designers have struggled in terms of finding funds and/or incentives to entice private companies to invest in remote, rural, and low income areas. The deregulatory and privatization process is being questioned internationally after recent fiascos such as the complete gridlock of the California power system and a major blackout in Eastern North America. In both cases, the lack of incentives for new investment figured prominently. In the developing world, these design problems have been accompanied both in energy and other basic services, such as water, with a more nationalistic reaction to maintain local control. While scandals of major international energy companies such as Enron in 2002 reflect a volatile market and some reasons for state intervention, critics have yet to propose an alternative method to procure the growing energy investment needs of developing countries.

### Energy and the Environment: Alternatives?

As seen in Table 2 on CO<sub>2</sub> emissions, the North also produces the lion’s share of world pollution, with the US economy certainly the largest producer. However, the table also demonstrates that large developing countries, such as India and China, have been rapidly increasing their pollution levels.

Public policy and activist groups have been concerned with the pollution created by energy development and consumption since at least the 1970s. Their efforts have led to important policy changes in the North, such as the requirements for the use of unleaded gasoline, coal emission limits, and the virtual stagnation of the nuclear energy industry, as discussed previously. Energy conservation programs

and incentives for alternative sources and ways to use fuel have also become an important part of policy experiments internationally. Of particular concern is the exponential increase in automobile usage internationally, particularly in rapidly developing countries. Given the devastating effects of the oil crisis upon importing countries as described previously, many countries began to look for alternative sources of fuel.

A number of alternative energy sources are parts of important experiments. These include the development of solar energy, windmills, tidal-based, and geo-thermal sources. In addition, major efforts have been made to develop non-gasoline-based cars to reduce emissions and dependency on foreign oil imports. Brazil has had some success in producing a sugar-cane-fired gasohol (mixture of sugar cane and gasoline) vehicle, for instance, and the attempt to develop natural gas-based and hydrogen-based (fuel cell) cars continues. However, so far none of these sources has proven either economically viable on a large-scale, which relates in part to the fact that our technology was developed with fossil fuels, or available in a form that would be acceptable for the modern middle- or upper-class consumer. Though there are significant variations by area, in general the modern consumer expects energy on demand at any time of day or night, without delay, and in a form that allows for individual consumption (i.e., such as a car as opposed to shared transportation). The most important technological hurdle has therefore been the lack of an adequate and economical technology for storing electricity. Because electricity cannot be economically stored, due to the present state of battery technology, even if economically viable, solar, tidal, and windmill energy would not be consistently available. Moreover, there is a cost in lost energy as well as expense to transport energy from one location to another. All of this has led a number of observers to wonder if the problem is not so much one of inadequate technology, but rather of unsustainable consumption choices.

## ENTREPRENEURSHIP

Entrepreneurship is the act of establishing a new business to take advantage of an opportunity identified for the first time. Although it is often thought to require an important innovation or invention, entrepreneurship can flourish even with very small changes or improvements to existing businesses. For example, opening a new food stall very similar to those already present in an area but located close to a new office block to meet new demand is an example of entrepreneurship, as too would be providing a bundle of goods or services together rather than individually (e.g., hamburgers and noodles in one shop). In economic thought, the role of the entrepreneur (or businessperson) was considered by the influential writer Joseph Schumpeter to be central to the growth of capital and hence economic development. He observed that the entrepreneur was often also directly responsible for the addition of technology to capital forming activities and that this was another critical activity determining overall growth. This has been hotly contested, and it is difficult to identify specifically in history exactly where and when entrepreneurial ability has represented a significant aspect of the wealth creation process. When something is difficult to measure, it is difficult to find the conditions necessary to replicate it. Certainly those organising the university courses that try to foster entrepreneurship in students have generally accepted that while some knowledge and skills can be taught, there is a fundamental aspect that seems to be either innately present or not within people. However, focusing on specifics such as innovation management can have practically applicable results.

### Implications of Entrepreneurship

Entrepreneurship may originally have developed from the practice of organising stage and theatre shows but it is now very closely linked with small and medium sized enterprises (SMEs), which generally have fewer significant investments in plant or machinery and so can more easily switch production or marketing methods. SMEs are considered crucial to an economy's health because they are the firms that

tend to adapt to new technology or opportunities first. SMEs are generally defined as being business enterprises with between 20 and 250 employees. However, many smaller businesses—known as micro-businesses—can also be crucial for the entrepreneurial ability of an economy. As the tendency for firms to have fewer core employees and more contracted freelancers and part-time or portfolio workers increases, then the more importance micro-businesses will have.

Entrepreneurship has a negative side in that it can also lead people into undesirable or ultimately unproductive activities, which nevertheless offer short-term profit. Selling individual cigarettes outside schools or illegal narcotics are examples of profitable but undesirable entrepreneurship. It is also true that most entrepreneurs fail far more often than they succeed: it is a frequently quoted statistic that 80% of all businesses fail within two years but it is essentially a true one and it means that even the world's most successful entrepreneurs (e.g., Bill Gates, Richard Branson, and Thaksin Shinawatra) can have a series of bankruptcies or other failures behind them. More successful entrepreneurs emerge from countries such as the United States, therefore, where the implications of bankruptcy are very minor, compared with those of the United Kingdom, where implications remain punitive. Failure can often result not from the inability of the entrepreneur or the business idea but rather poor timing, poor location, or just bad luck. It is reported that Colonel Sanders knocked on more than one hundred restaurant doors before he could find someone willing to try his fried chicken recipe and profit-sharing concept.

### Entrepreneurship in the Developing World

As a result of their general inability to gain maximum value from their existing assets, developing world entrepreneurs suffer particularly from the problems that beset SMEs and micro-businesses around the world: inability to obtain capital funding for investment, lack of managerial skills and knowledge, lack of time to develop human capital, and general lack of access to resources.

To overcome some of these difficulties, micro-finance schemes have been successfully established in some locations. Following the example of Bangladesh's Grameen Bank scheme, micro-finance schemes offer very small loans at preferential interest rates primarily to rural villagers but also to urban residents. The potential recipient is generally expected to demonstrate a potential entrepreneurial opportunity that is currently impossible to exploit because of

lack of capital. Eligible schemes include such ideas as buying a cow to provide milk and ultimately meat, purchase of a bicycle to make a food hawker stall become mobile, or paying an outside worker to enable a child to attend school. Experience suggests that these schemes are often of particular use to and benefit of women, who are considered more apt at identifying very small scale opportunities without becoming too ambitious and also more disciplined in using the funds for the purpose for which they are intended. However, like all stereotypes, this is a simplification of reality. Nevertheless, the model has spread with some success to countries in Africa, Latin America, and other parts of Asia.

However, important as empowering local people can be, a more powerful force for entrepreneurship in the modern world is the impact of globalisation—that is, the increased ability of individuals and firms to organise business activities around the world, taking if necessary only temporary advantage of cheaper inputs or other locational benefits. As a result, factories utilizing low-cost, low-skilled labour have been established in countries such as Indonesia, Vietnam, and China, exporting some manufacturing jobs from the developed world and creating some in the developing world. It is of great importance for hosting governments to ensure that any capital, skills, or competencies gained by the national labour market by means of such activities are retained and harnessed in the effort to establish home-owned businesses.

### Stimulating Entrepreneurship

Government attempts to stimulate entrepreneurial activity have generally received only mixed success. This is not just because of the opportunity for rent-seeking activities (i.e., cheating the system) but because not everyone has the desire or ability to become a successful entrepreneur and, just as importantly, often very small differences in circumstances can make the difference between success and failure. In a business with tiny profit margins, a short illness or a minor accident can represent a disaster. Similarly, many entrepreneurs profit from short-term trends and fashions which are almost impossible to predict or influence.

Nevertheless, it appears that some cultures or ethnic groups tend to display greater levels of entrepreneurial desire and ability than others. For example, immigrants from South Asia to the United Kingdom have demonstrated entrepreneurship in such fields as retailing and distribution, which have in turn led to large internationalised businesses. Entrepreneurial

ability can be stimulated by historical or cultural factors—for example, in much of pre-modern Europe Jewish people were forbidden to own land and so had to turn to finance to make a living. In other countries, such as China and some parts of Britain, entrepreneurial ability, just like all forms of commercial ability, was looked down upon and considered a lower-class act. While merchants might therefore obtain great wealth and popular prestige, they were generally precluded from participating in the highest levels of government, although they might from time to time be called upon to finance it. This situation changed to some extent during the twentieth century and, especially, its second half and in the developed world. While the United States had historically welcomed new blood into the ranks of decision-makers, this was not the case in more traditionally feudal-based societies such as many in Europe and also in Japan. There, the exhausting rigors of constant warfare and social change led to the often involuntary acceptance that entrepreneurs were representatives of a new social order in which possession of capital was deemed a social good no matter how it was obtained.

### Conclusion

Entrepreneurs offer great benefits to society insofar as their ability to recognise and exploit new business opportunities provides not just wealth for those individuals but also employment opportunities and the adoption and adaptation of valuable skills and knowledge. States can best stimulate this activity by providing a stable economic environment with good property rights, while also providing the highest possible quality of education and access to required capital and other inputs. They also need to provide a suitable information technology infrastructure to try to ensure that new skills and knowledge are available to everyone in the country.

## ENVIRONMENT: GOVERNMENT POLICIES

### The Environmental Division: Developed Versus Developing Countries

When considering environmental policies and the environmental degradation in developing countries, a series of variables and factors play an important role. Concern for the environment first appeared as a dichotomy between environment and development. After World War II, the term *development* was often used to refer to the process of growth and to the introduction of technological innovations as a whole. In the 1950s, the debate began on consumption patterns and the lifestyle of industrialized countries' inhabitants.

During the 1970s, the idea of development held two decades before was severely criticized, especially by many of the "third world" authors, that is, by authors whose nationality was not European, North American, or Russian. These social scientists of the "third world," with many Latin Americans among them like Fernando H. Cardoso, said that developing countries were not just going through a phase that would later lead to development but that, instead, that their situation as non-developed countries was structural and would remain so. This structural dependency situation was characterized like the Dependence Theory, disseminated by authors like Cardoso, André Gunder Frank, or more recently Brazilian Teodonio Dos Santos. During the 1970s, the idea was also put forth that low levels of development contributed to the degradation of the environment, an idea that has since been criticized from a number of angles.

In 1972, the Club of Rome, a Germany-based non-governmental organization (NGO) focused on global issues, released a report entitled *The Limits to Growth*. Known as the Meadows Report after its lead authors, it put forth the idea that the growth as a whole, but especially in a demographic sense, shouldn't be unlimited. The report claimed that by the year 2000, if

the growth rhythms weren't changed, the Earth would suffer a collapse. Although this report criticized the lavishing economies and the consumption culture of the western countries, the solution it proposed to avoid the collapse was the *zero growth*, that meant the annulment of any kind of growth, be it of population or economies. This conclusion was criticized by the *Bariloche Foundation*, an Argentina-based NGO focusing on climate change, which pointed out that the major troubles of the modern world were not physical, meaning about resources, but socio-political instead and based on the asymmetrical distribution of the power both in an international as well as in a national level. This perspective provoked a debate between developed and developing nations.

More recently, in 1987 the concept of sustainable development appeared linked with the satisfaction of present needs without compromising the capacity of future generations to satisfy their own. This concept first came into existence in 1987 by a report by the World Commission on Human Medium and Development titled "Our Common Future," also known as the Brundtland Report after the Commission's chair, Norwegian Prime Minister Gro Harlem Brundtland. The Brundtland Report constituted a groundbreaking contribution to the debate. It suggested a new kind of development, including a reorientation of the industrial nations and also an international reorganization of the north-south relations.

### Environmental Problems in Developing Countries

In the so-called third world countries, there are socio-economic pressures that affect the environment, namely the poverty, the income differences, the non-sustainable development of activities like agriculture, industry and tourism, and the population growth. The environmental degradation problems that face the whole world are similar but the social degradation problems are different between developed countries, where most of inhabitants satisfy their basic needs, and developing countries, where basic human needs are often not met.

One major difference between northern and southern countries is that, in spite of the fact that developing countries possess most of the natural resources reserves, they are not the ones who use and consume them most. It is most often the developed nations who consume such resources, often in non-sustainable ways. Latin America, the Caribbean area, Pacific Asia, and Africa possess most of the natural resources

reserves of the whole world. In the case of petroleum, Saudi Arabia and the Persian Gulf countries are also important. But despite their many natural resources and reserves, these countries continue to face severe environmental problems.

On the one hand, in most developing countries the utilization of natural resources is still characterized by a non-sustainable and overexploitation that leads in the long run to exhaustion of them. For instance, the vast areas of cultivable land that these countries possess are constantly threatened by desertification provoked by deforestation and the degradation of soil.

On the other hand, the intensification of agricultural activities has caused a noticeable increase in the toxicity levels of the environment due to the use of agrochemicals. The overexploitation of forests, mining, and fishing resources propels an increasing loss of species, vegetal cover and the deteriorations of marine and terrestrial ecosystems.

In spite of the fact that some developing countries have a great hydraulic potential, the water reserves in many African and Middle East countries have been reduced. Moreover, there are regions that have already exceeded their environmental limits and are consuming their underground aquifers.

Another of the major problems for developing countries is the fresh water shortage. The United Nations estimates that around fifty percent of the fresh water supply systems in developing countries is being lost due to an inadequate maintenance and the lack of investments.

At the same time, these countries are the ones that use less resources, while developed countries consume resources in excess. For instance, in Canada the average use of water for a typical family is of 91 gallons a day, in Europe the average is of around 42.9 gallons a day while in Africa is of around 5.2 gallons a day.

Another of the great environmental issues of developing countries is related to the urban environment. Especially in Latin America, most people live in huge cities where the air and the water are usually contaminated which becomes a permanent threat to their health. Developing countries have also historically lacked demographic planning that helps them distribute their populations in a more balanced way. This concentration of millions of persons in a large metropolis causes a great pressure on the environment and often the deterioration of metropolitan coastal areas (such as in Rio de Janeiro and New York City), together with a lowering of the water quality. Also, the lack of urban planning has permitted massive urban sprawl in the major cities of developing nations. The creation of these suburbs often lacks the provision of basic infrastructure such as water supply,

sewage, electricity, and exerts even more pressure on the environment. Another potential impact that affects these countries are the consequences of the climate change around the world.

### **International Environmental Institutions and Policies**

During the last decades, the concerns over environmental issues have caused the outburst of pressures to fight the environmental degradation process in the international and local levels. The cornerstones of these processes were the 1972 Stockholm Declaration over the Human Environment, the 1982 World Nature Letter, and the 1992 Rio Declaration on the Environment and the Development. In 1972, environmental problems were linked to underdevelopment, a fact that encouraged underdeveloped countries to develop themselves but taking into account the environment. Also environmental problems were associated with the industrialized countries, the industrialization and the technological development. In this same Declaration there was a general claim to obtain the so-called “shared responsibility” and the cooperation between nations.

In the 1992 Rio Convention, there was a strong advancement towards an international and national commitment to achieve a sustainable and balanced development. To accomplish that, the Declaration generated an Action Plan, the so-called Agenda XXI signed by a hundred and seventy countries, which then gave birth to the local Agenda XXI.

These forums and conventions encouraged the establishment of a series of global environmental institutions and multilateral agreements and also provided a new approach to the north–south relations. They have also contributed to the creation or modification of national laws related to environmental issues, to the creation of new institutions, and regional policies adopting in all cases the new sustainable development concept. Their role was also important in the generation of a new set of preventive regulations and rules as well as in the creation of territorial planning disposals, environmental impact evaluations, and diverse sanctions that have helped the strengthening of environmental policies. Important regional meetings play a fundamental role in the development of environmental regional policies and in the maintenance of common positions of the regions facing environmental issues in the international Agenda. National, regional, and local policies and programs have been carried out to protect the biodiversity in areas like the Amazonas, Asian, or African regions, which possess

the biggest biodiversity in the whole planet, and also to protect endangered species.

Governments and international organizations have also established policies against desertification and the misuse of soil, to improve the living standards of the population in relation with their sanitation conditions, their accessibility to fresh and potable water. Conservation and reforestation programs have been fulfilled in order to work as coal drains while the certification, environmental audits, and eco-labeling processes peak.

Regional and international organizations that collaborate with the national states perform most of these actions. The development of reports, evaluations, and studies over the state of the environment provide assistance to different organizations in the elaboration of politics, programs, and projects at all levels (international, regional, or local).

The establishment of such policies and programs have been performed with a series of instruments like the international technical cooperation through specific programs and funds destined exclusively for environmental issues. Technical cooperation includes the design and the strengthening of those institutions that are in charge of the formulation and execution of environmental policies. Bilateral cooperation relationships are common, among which we find the following agencies: the German GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit or German Society for the Technical Cooperation) or the Japan International Cooperation Agency (JICA). Besides, there are multilateral organizations like the United Nations, the Organization of American States (OAS), the United Nations Environment Programme (UNEP), the Inter-American Development Bank (IADB), among others. At its beginning the technological cooperation occurred in a vertical way, meaning that there was one steady direction: from rich countries to poor countries or from international organizations to developing countries. However, the new way combines the vertical way with a horizontal one in which local technologies and cultures are valued.

International cooperation is financed in several ways. In general, international finance institutions, such as the World Bank or the IADB, have the funds to do so. But as for environmental issues, we find the Global Environment Facility (GEF), the Multilateral Fund for the Implementation of the Montreal Protocol or the Fund of the Americas, financed by the United States.

Although many African countries are working to put into action new national and multilateral environmental policies, their effectiveness is often low due to lack of adequate staff, expertise, funds,

and equipment for implementation and enforcement. The same happens in many Latin American countries and Caribbean ones. In Africa environmental policies are mainly based on regulatory instruments but some countries have begun to consider a broader range, including economic incentives implemented through different tax systems. There is a growing recognition that national environmental policies are more likely to be effectively implemented if an informed and involved public supports them.

In most Asian countries the high densities of population are becoming a problem in the same way as the fresh water supply. In this sense domestic investment in environmental issues is increasing. Environment funds have also been established in many countries and have contributed to the prominent role that non-governmental organizations now play in environmental action. Many countries are in favor of public participation, and in some this is now required by law. However, education and awareness levels amongst the public are often low, and the environmental information base in the region is weak, the same as it happens in Latin America and mostly in the Caribbean region.

### **Present Environmental Situation as a Result of Environmental Policies**

In spite of the previously mentioned actions, policies, and the established changes, there still have not been considerable improvements in the environmental management of most developing countries. The policies and institutions created and performed in developing countries have encountered serious difficulties. By one or another reason they have always been left as a secondary mission instead of becoming a priority. The reasons are:

1. The lack of adequate financing to fulfil their projects and programs. It is estimated that developing countries would need US\$70 million in addition to the help they are receiving, to be able to afford new efficient environmental programs.
2. The absence of adequate technology, training, and personnel.
3. The lack of specific institutional structures.
4. The existence of inconsistent and/or inconclusive legal framework for environmental issues.
5. Difficulties in the transference of "clean" technologies from developed countries to developing ones.

6. The growth of the exporting sector and the entry of foreign capital are still a fundamental axis in the economic agenda of developing countries and go beyond the consequences for the environment. Therefore these economic policies do not take into account the environmental costs.
7. Although in the last decades new democratic governments have appeared in the international scene, militarism is still very much present in Latin America, Central America, Middle East, Africa, and Asia. This situation has catastrophic consequences for the society and the environment since a large part of the national budget goes to defense rather than social and environmental programs.
8. In most developing countries environmental problems are treated sectorially and not as a whole. Environmental policies lack strategic planning that enables governments to develop these policies as integrated ones. Besides, due to the large scale privatization and deregulation that occurred in the 1990s as a result of the transition to capitalism or conditionality of foreign aid, state environmental policies have lost some of their strength.
9. During the 1980s and 1990s, developing countries have become more and more dependant on international organizations due to their huge external debts. Many developing nations must use their economic resources to pay off debt rather than promote strategies of sustainable development.

### Recommendations to Overcome the Environmental Crisis

The environmental crisis the developing countries face is an eco-political one since it is connected with the institutional and power-related systems that control and regulate the property, distribution, and use of the resources. The environment is no longer just an “environmental problem” and becomes a problem concerned with the use and distribution of natural resources, with the way in which decisions are made, who take them and to the benefit of whom, who wins and who loses with political decisions. The possible solutions for this problem can only be found within the own social system since the development models are linked with the social organization ones. The governments of developing countries also face the

challenge of guaranteeing the existence of a transparent and participative process in decision-making.

### ENVIRONMENTALISM

In the period since the World War II, “environmentalism” has become the umbrella term used to describe the growing movement of green consciousness. However, environmentalism covers an almost unlimited range of meanings and nuances, particularly since it is used to describe the activities and lifestyle options taken by individuals: the actions and campaigns of non-governmental organisations such as Greenpeace, Friends of the Earth, and Earth First! to combat both localised and global environmental problems, and international and governmental initiatives that have attempted to take a lead in the conservation of the world’s environment.

The environment and environmentalism also have very different meanings for people in the Northern and the Southern hemispheres. In the largely industrialised North, large-scale environmental problems are frequently perceived as being located in Eastern Europe and the developing countries in the South: problems such as deforestation and desertification. More localized problems of the North are focused on issues such as genetically modified crops and traffic pollution. Combating environmental problems has therefore often become part of a new form of neo-colonialism, with the developed countries setting environmental policy targets for the developing nations without addressing the results of past industrialization and economic development. For people in the more rural South, such as India, environmental problems are perceived as global pollution and waste caused by the rich, developed countries. In developing countries, overcoming poverty and attaining a faster rate of economic development are the major objectives and their attainment can be contradictory to environmental protection.

### What Is the Environment?

In what he termed the “Gaia theory,” James Lovelock argued that we live on a complex ‘living planet’ and all our actions cause reactions. Environmentalism at its most holistic seeks to preserve and nurture these biosystems (also referred to as ecosystems) and to preserve the rich biodiversity of life forms on the planet. Gaia theory also presupposes that these biosystems are self-regulating, and will if necessary deal with the *problem of humans* by making us extinct.

Before looking at ways in which environmentalism is being actioned locally and globally, it is important to grasp the fact that environmentalism is not just concerned with the protection of the natural world. It is equally concerned with people’s cultural, economic, and social activities, and in developing an understanding of the nation, world, and universe which they inhabit. The environment also includes ‘us’—the way we live, issues such as commuting, the built environment, poverty and illiteracy, as well as global problems in the larger world, which can often be too abstract for many people to comprehend.

One model for seeing individual people and communities as part of the global environment was developed by the artist and eco-dwellings designer Friedensreich Hundertwasser. Hundertwasser developed a pictorial metaphor to describe every person’s power over, and relationship with, the other essential elements in the environment. He called these our five

skins, and maintained that people have a responsibility to show ecological commitment in the way that they ‘wear’ them. This picture of people as individuals actively choosing their identity through their body, their clothes, their dwelling, their friends or people with whom they interrelate, and their interaction with the global environment, provides us with a model depicting the ‘five skins’ of environmentalism.

### The Confusing State of Environmental Debate

Governments of developing nations are aware of the increase of global environmental problems, but they are often not prepared to delay or retard economic development to support what they see as interference by the energy guzzling, polluting developed countries of the world. The developing nations have their own forum at conferences held under the banner of the Group of 77 (G77), where there are now 133 countries represented. Together they are the largest coalition of what are often referred to as the “Third World” nation states.

In Delhi in 1989, the G77 concluded that they supported careful management of the atmosphere in principle, but that for their countries, development should have priority over environmental concerns. The Group of 8 (G8, which includes Canada, United States, Britain, France, Germany, Italy, Russia, and Japan), however, at their Genoa conference in 2001, concluded that they would continue progress towards providing debt relief for the poorest nations of the world, while cutting greenhouse emissions (largely carbon dioxide, methane, and nitrous oxide) in order to curb global warming. Historically, fossil fuels have been a major component of the economic development of the industrial countries. Private transport and waste are also major sources of pollution, particularly in Australia, the United States, and Canada. However, scientific speculation is intense and variable about the effects, location, and rate of change to temperature (perhaps a 1°C–3.5°C rise over the next one hundred years); drought and desertification; melting of the polar ice caps; and increased rainfall in some areas.

### The Recent History of World Environmentalism

In 1987, the first World Commission on the Environment and Development, chaired by the then

Norwegian prime minister, Mrs. Gro Harlem Brundtland, produced the influential Brundtland Report. This built on the work of the earlier environmentalists, including Rachel Carson (*Silent Spring*) and E.F. Schumacher whose book *Small is Beautiful* became one of the most important in raising people's consciousness about the environment and consumption. The Brundtland Report, published as *Our Common Future*, proclaimed sustainable development as the route away from global environmental catastrophe. It stated that sustainability offers "development that meets the needs of the future without compromising ability of future generations to meet their own needs." The United Nations (UN) Framework Convention on Climate Change was drawn up during the Earth Summit meeting that took place in Rio de Janeiro in 1992. That meeting has acted as a launch pad for much of the subsequent environmental activity, including the wide range of sustainable development activities for local and global action called Agenda 21 and Rio plus 10 in Johannesburg 2002.

It also led directly to the 1997 Kyoto Protocol which aimed to reduce the average emissions of greenhouse gases across the planet by 5% by the years 2008–2012. It attempted to get different countries to agree to differential targets, so while Portugal was allowed a 27% increase, Luxembourg was expected to reduce emissions by 28%. The developing nations of the world were expected to observe limits in the growth of their emissions, while the European Union as a whole was given a target of an 8% cut. However, the United States, one of the major producers of greenhouse gases, has refused to ratify the Kyoto Protocol, claiming that it would impede the nation's economic development. Additionally, many developing countries do not wish to use more expensive fuel technologies when fossil fuels, which may exist as native natural resources, are abundant and cheaper than alternatives. They see this as interference by the developed nations in their chances to industrialise and gain economic development. The protestors against globalization also see these mandates by the rich developed countries as the cornerstones of a form of new corporate colonialism. On the other side of the opposition, a number of scientists, particularly from industry, see environmentalism as a threat to future economic growth.

### Possible Action

Effective sustainable environmental action depends, among other things, upon the current world leaders

of the developed countries to take appropriate action on:

- Reducing emissions and other forms of pollution and waste;
- Giving developing countries appropriate financial and technological aid to assist their sustainable economic development;
- The development of sustainable agricultural policies and practices in developing countries;
- The development of alternative technologies and supporting their use in all countries;
- Proactive actions, such as supporting the planting of more trees, the reduction of deforestation and the protection of vulnerable habitats such as the wetlands and the oceans;
- Stabilising global population growth; and
- Reduction of the indebtedness of the developing countries.

Among the actions individuals may take to help preserve the environment are:

- Reducing consumption, especially of goods not sourced locally;
- Using public transport and car pools to reducing car use;
- Recycling waste materials and re-using materials;
- Energy efficiency in the home and consumption of less water and electricity;
- Living in homes which have a lower impact on and are more harmonious with the natural environment;
- Using sustainable energy sources such as wind, water, and solar power;
- Producing more of their own food, especially using organic principles; and
- Voting for policies and officials who support corporate accountability for environmental impact.

### The Problems Remain

Many developing nations feel that the industrialized countries became wealthy by doing precisely what the developing nations wish to do now—only now the industrialized nations are attempting to hold back other countries from taking these same steps towards development. Many in the developing world feel that it should be the responsibility of industrialized nations to provide the means for sustainable development, as it was the industrialized nations that contributed to the present environmental damage.

For many environmentalists, especially those of 'deep green' persuasion—those who use only plants indigenous to the region—even this is not at the heart of the matter. They point to what the Dalai Lama called the ethical responsibility of mankind to examine what we have inherited, what we are responsible for, and what we will pass on (Porritt 1991).

## EQUATORIAL GUINEA

At the end of the eighteenth century, Portugal ceded to Spain two islands in the Bay of Biafra in West Africa, and in the late nineteenth century Spain was able to acquire a small piece of the African mainland known as Rio Muni, between German Cameroon to the north and French Gabon to the south and east. The three areas then constituted Spanish Guinea, which was ruled from Santa Isabel (today Malabo) on the main island, Fernando Po. Lying close to the equator, both Fernando Po, which the local Bubi people knew as Bioko, and Rio Muni were extremely hot and malaria-plagued. Fang people from the mainland were used to help suppress Bubi resistance to Spanish rule, which was brutal and exploitative.

Cocoa was the main export; attempts to find commercially viable oil deposits were unsuccessful. After the nearby countries had become independent by the early 1960s, the Franco regime in Madrid decided to cut its losses and grant its colony first self-government and then independence. At independence on October 12, 1968, the country had no tertiary educational institution and social services were extremely rudimentary.

In elections held before independence the Fang leader, Francisco Macias Nguema, also known as El Glalo Rojo (the Red Rooster), won an overwhelming victory, but few Bubi participated and they remained alienated from the new government. Most Spaniards left soon after independence, and Macias Nguema then ruled the country in an extremely brutal and despotic manner. When his deputy president seemed to pose a challenge, he was murdered, as were tens of thousands of others. In this reign of terror, professional people and intellectuals were targeted, and those who were not killed fled the country. Cocoa production collapsed and Equatorial Guinea sank ever deeper into poverty, as such businesses were owned by the ruling clique.

In August 1979, Macias Nguema was overthrown in a palace revolution led by his nephew Teodoro Obiang Nguema Mbasongo, the commander-in-chief of the armed forces. After Macias Nguema was executed, Obiang Nguema was sworn in as president and de facto dictator. Using Moroccan guards for his personal security, he foiled a number of attempted coups in the decades that followed, and consolidated his grip on power. The international community largely forgot the country, though in 1985 the French African franc became its official currency and some Spanish investors returned to rehabilitate cocoa production. In 1989, Obiang Nguema was elected president unopposed, and from the early 1990s, in the new international climate after the Cold War, some pretence at competitive democracy was permitted, but Obiang Nguema so regulated the process in his favour that his political opponents rejected the elections that were held as neither free nor fair. In the 1996 presidential election, he received 99.2% of the vote; in December 2002, he received 97%. In the face of his brutal rule, many of his political opponents fled into exile, mainly to Spain. The most prominent of these was Severo Moto, who styled himself president-in-exile. In 2004, he denied being involved in an attempt to topple Nguema, but those who devised the plot intended to put him into power. They hoped to do this by using a detachment of mercenaries from South Africa, but news of the planned coup spread and the South African authorities warned their Equatorial Guinean counterparts. The

mercenaries were then arrested, some in Malabo and others when their plane landed in Harare, Zimbabwe, to pick up arms, before the coup attempt could be launched.

The fortunes of Equatorial Guinea had changed dramatically and fundamentally in 1996, when oil production began in the waters off Bioko Island. Until then, the country had been a decaying backwater: the production of cocoa, the main crop of Bioko, fell very sharply after independence and then stagnated, as did production of coffee, the country's third most important agricultural export. The most important was timber from the mainland province of Rio Muni, and by the mid-1990s the only new road to have been built since independence was from the interior to the port of Bata, though which the timber was exported. In the 1990s, the over-exploitation of the forest, especially close to easily accessible areas, gave rise to doubts about the sustainability of the industry, as the country began losing an ever-larger amount of forest. By then timber was no longer so important as an export earner, for thanks to oil the country had the potential to become the Kuwait of Africa. By the beginning of the twenty-first century, it had become Africa's fastest growing economy and the continent's third-largest oil producer after Nigeria and Libya. Production soared to four hundred thousand barrels a day and was expected to increase further when the vast oil reserves under the sea off the islands were tapped. United States companies led the way in exploiting the oil, and the United States, which reopened its embassy in Malabo in December 2001, saw Equatorial Guinea as a major new supplier. But the country's human rights record, which included routine extra-judicial punishments such as torture and summary executions, continued to be denounced by organisations such as Amnesty International. While most of the country's half million inhabitants continued to live in poverty, the president and his family arranged that most of the massive new revenues from oil revenues were paid into overseas bank accounts. In mid-2004 it was revealed that \$300 million of oil money had gone into a New York bank account controlled by Obiang Nguema. Yet it was then that the South African government announced that it was to open an embassy in Malabo, and Obiang Nguema paid a number of visits to South Africa before and after the mercenaries were arrested in Malabo and Harare, suggesting that a deal was being put together to allow South Africa to obtain a share of the oil. Meanwhile, the mercenaries arrested in Malabo were put on trial. Though the state asked for the death sentence for their leader, Nick du Toit, who was a former member of South Africa's Special Forces, was given a thirty-four-year prison sentence

instead. It emerged that funding for the attempted coup had come from a number of wealthy Britons, including Sir Mark Thatcher, son of the former British Prime Minister, but the Equatorial Guinea authorities were unable to secure the extradition of Thatcher from South Africa, where he had been arrested, or any of the others alleged to have been involved. There was some hope, however, that the international exposure brought by the attempted coup might help ameliorate some of the worst features of the Nguema regime.

## ERITREA

Eritrea, the newest independent country in Africa in 2004, lies along the western shores of the Red Sea in Northeast Africa. It is one of the five countries (the others are Djibouti, Ethiopia, Somalia, and Sudan) that constitute the region known as the Horn of Africa and has an area of approximately 121,000 square kilometers, slightly larger than the state of Pennsylvania. It borders Sudan on the west, Ethiopia on the south, Djibouti on the southeast, and the Red Sea on the East, with a coastline almost one thousand kilometers long. Like Ethiopia, its neighbor to the south, Eritrea is a land of extreme contrasts, both in terms of its topography and climate. Its mountains and highlands extend from north to south, with the lowlands on the western and eastern flanks. The lowlands in the west extend to Sudan and those in the east to the Red Sea. The highlands have a moderate climate with temperatures ranging from near freezing to as much as 30°C, while the temperature in the lowlands varies from 30°C to 50°C, occasionally reaching 60°C in the Danakil Depression.

The rainy season in the highlands extends from June to August, while the lowlands in western Eritrea

are semi-arid with much less rainfall. There is almost no rainfall in the eastern lowlands bordering the Red Sea, especially in Dankalia. The population of Eritrea was estimated at 4.14 million in 2000, almost half of which are Christians and the other half Muslims. The Christians live mostly in the highlands and are sedentary farmers, while the Muslims live mostly in the lowlands and are agro-pastoralists. Because of their common experience and struggle against outside powers, the cohesion of the various ethnic and religious groups has been remarkably strong.

Eritrea is the only country in Africa to successfully break away from another African country. It was part of Ethiopia for almost forty years and only became independent in 1993. Like Ethiopia, Eritrea has a long history and was part of the ancient Kingdom of Axum. In fact, located in Eritrea and now in ruins, Adulis served as the main seaport of the Kingdom. The Eritrean people, therefore, had established contacts with much of the Near East and the Greeks in the distant past. After the advent of Islam, parts of Eritrea, and especially the lowlands bordering the Red Sea and Sudan, had been occupied by the Turks and Egyptians, and towards the end of the nineteenth century, by the Italians. Present-day Eritrea, as a political unit, however, came with the advent of Italian colonialism in 1890. The Italians were defeated in 1941 and the British provisionally administered Eritrea until 1952, when, despite the wishes of the majority of its peoples, it was federated with Ethiopia. The status of Eritrea as a federal unit ended in 1962 after Ethiopia dissolved the federal system and absorbed Eritrea as one of its administrative units.

Appeals to the United Nations (UN) by various Eritrean groups to reverse the absorption did not succeed, and the Eritreans started a thirty-year-long armed struggle for self-determination in 1960. The independence movement, first started by the Eritrean Liberation Front (ELF), continued earnestly with Eritrean People's Liberation Front (EPLF), which became dominant in the latter half of the 1970s and the 1980s. The EPLF had split from the ELF around 1970 apparently because of the sectarian tendencies of the latter. Although both movements unquestionably stood for Eritrean independence, the ELF was seen as Muslim-dominated, Arab-influenced, and more sectarian compared with the EPLF, which was seen as uncompromisingly independent and autonomous, more secular and, in its early days, more Marxist-oriented. The war of independence waged by both groups against Ethiopia progressively became more intense, especially after Emperor Haile Selassie of Ethiopia was overthrown in 1974.

Consequently, much of the infrastructure laid during Italian colonization had been destroyed. Indeed,

the Italians had invested heavily in Eritrea in the early 1900s to help in their 1935 war against a much larger Ethiopia. However, Ethiopia, itself economically underdeveloped and politically under an absolute monarchist rule, was not in a position to undertake both economic and political development in Eritrea. On the contrary, with the conflict between Ethiopia and the two Eritrean nationalist movements escalating, the hitherto existing infrastructure had been destroyed, including the railway system that once ran from the seaport of Massawa to Akordat in western Eritrea. Massawa itself declined because most of Ethiopia's import-export trade passed through Assab on the southern tip of Eritrea. Thus, Eritrea regressed in the fifty years that preceded independence in 1993.

With relative peace since then, however, Eritrea has been able to register significant progress in terms of infrastructure development. Most of the roads, either neglected or destroyed during the thirty-year-long war, including the asphalted road linking Asmara, the capital city, and the port city of Massawa, have been rehabilitated; a new road between Asmara and Assab on the southern tip of the Red Sea has been constructed; a new medical school has been established, various bridges deliberately destroyed by the conflicting parties to disrupt the supply lines of the opponent have been rebuilt, and new water diversion schemes in western Eritrea have become operational. Despite these, Eritrea remains one of the least developed nations, with gross domestic product (GDP)—calculated in terms of the value of all final goods and services produced within Eritrea, and computed on the basis of purchasing power parity (PPP)—estimated at \$2.5 billion in 1998, and GDP per capita estimated at \$660.

In the political realm, Eritrea is a unitary state currently ruled by the victorious EPLF, now renamed People's Front for Democracy and Justice (PFDJ). Other political organizations remain illegal. However, the constitution, ratified in 1997, includes provisions for multi-party democracy. Despite this, the government has remained reluctant to implement the constitution and continues to insist that the time is not right for competitive party elections. Thus, although the PFDJ may still have significant popular support among the population, Eritrea remains as one of a few countries without an elected government and no legal political party except, of course, the PFDJ. Recently, however, there were calls from within the leadership of the PFDJ to open the political system and allow the opposition to compete.

Similarly, there are no independent civic organizations and the few that exist, such as women, youth, and labor organizations, are all government-affiliated. The few independent newspapers founded in the

early 1990s have closed, and there remain only government-owned and/or controlled news outlets. Recently, however, the government has come under enormous pressure to open the political system. Also, there are calls for the establishment of independent civic organizations in Eritrea, especially from the Diaspora, who have recently established various independent Eritrean civic organizations in their countries of residence. The government has so far resisted such demands on the grounds that the conflict with Ethiopia has to be comprehensively resolved first.

The recent Eritrean-Ethiopian conflict (1998–2000) has had a deep and negative impact on the remarkable unity of its people. With the end of the conflict and the impending demarcation of the border in 2004, hopes for a more open and transparent political system are running high.

### ERITREAN LIBERATION FRONT (ELF)

The Eritrean Liberation Front (ELF) is the smaller faction in the Eritrean struggle for independence from Ethiopia, overshadowed by the Eritrean People's Liberation Front (EPLF).

After the Second World War, the former Italian colony of Eritrea was under British occupation. Britain pressed for a partition of Eritrea between Ethiopia and Sudan, the so-called Bevin-Sforza Plan. The United States threw its support behind

Emperor Haile Selassie's ambitions to secure the whole of Eritrea and Ethiopian access to the Red Sea. For the United States, Christian Ethiopia represented a strategic ally on the edge of the oil-rich Muslim Middle East. The Eritreans were divided; many Christian Eritreans supported closed union with Ethiopia, while many Muslim Eritreans and the small western-educated elite favoured independence.

A United Nations (UN) commission of inquiry was divided. The United States opposed a referendum and used its influence in the UN to pass General Assembly Resolution 390-A(V) in 1950, federating Eritrea with Ethiopia. The Resolution called for 'full autonomy for the Eritrean government in all domestic affairs,' and 'a democratic regime in Eritrea with all its requisites and safeguards: respect for human rights and fundamental liberties, and government of the people by the people.' Emperor Haile Selassie opposed Eritrean autonomy as a threat to his autocracy and set out to undermine the elected Eritrean Assembly.

The ELF was founded in Cairo in 1960 by a loose confederation of Muslim Eritreans opposed to federation with Ethiopia. It was not the first Eritrean nationalist group: the clandestine Eritrean Liberation Movement (ELM) had been established some years earlier, hoping to undermine Ethiopian rule by plotting a police coup. The Islamic ELF viewed the secular, socialist ELM with suspicion. The ELM was unable to effectively counter ELF accusations of being both a communist front and unwilling to use 'armed struggle'. ELF denunciation exposed the ELM to the Ethiopian authorities, who repressed the ELM, banned trade union, and suppressed independent newspapers. Meanwhile the ELF successfully recruited former ELM sympathizers, including a number of key figures who had escaped the Ethiopian dragnet. In 1962, under Ethiopian armed coercion, the autonomous Eritrean Assembly voted itself out of existence and Eritrea was annexed as a province of Ethiopia.

The ELF built a network within Eritrea through the Islamic brotherhoods, and diplomatic contacts with Islamic states in the Middle East and Somalia, who supplied arms and training for the Eritrean Liberation Army (ELA). The major weaknesses of the ELF were its lack of organization, divisive personality politics, and sectarian and ethnic rivalries.

ELF president and former president of the Eritrean Assembly, Idris Adem, secretary Idris Galadewos and Osman Saleh Sabbe constituted a supreme council in Cairo, directing diplomatic activities but with loose control over the military operations in the field. The ELA was divided into regional, essentially ethnic and religious, 'zones,' with little coordination of command. There were tensions between the illiterate Muslim peasant soldiers and, following the demise

of the ELM, better-educated Christian recruits. The religiosity of Eritrean Orthodox Christians and their allegiance to Emperor Haile Selassie also led to attacks on Christian villagers by Muslim factions within the ELA. When the Christian Wolde Kahasi defected, Muslim soldiers murdered a number of Christian recruits.

When, in 1967, the so-called ESLAH reformed movement of younger officers tried to lessen ethnic and religious tensions in the ELA and introduce wider discussion within the ELF, they were blocked by Islamic hardliners and the supreme council, who saw such moves as a threat to their personal power.

A further attempt at reconciliation and reorganisation by ESLAH officers floundered in 1969, and was followed by renewed attacks on Christian recruits and the assassination of several prominent Christian ELF personalities, including Wolfe Ghiday and Kidane Kinfu. The ELF began to break up with numerous Christians defecting to an emergent radical sub-group linked to Osman Saleh Sabbe and led by Mohamed Nur and Isaias Afwerki. The majority of Muslim recruits remained loyal to Idris Adem.

In 1970, the Adem faction established urban guerrilla units and adopted hit-and-run tactics. They blew up bridges and trains in Eritrea, as well as attacks on Ethiopian Airline planes. While raising the ELF's international profile, such acts facilitated Emperor Haile Selassie declaring a state of emergency, abrogating the few remaining civil rights. Ethiopia also obtained increased military assistance from America and Israel, while Haile Selassie's personal diplomacy increasingly isolated the ELF from Middle Eastern leaders and even China's Mao Tse-tung. Thousands of Eritreans fled as refugees into the Sudan.

In 1971, the ELF held its first National Congress, ostensibly to restructure the political and military organisation, but it was a fragile coalition. Meanwhile the faction allied to Osman Saleh Sabbe joined with remnants of the ELM and former soldiers of the ELA Zone Three command to form the People's Liberation Front (PLF). From 1972, the liberation forces were locked in a civil war, as much as the struggle against Ethiopia. The ELF-PLF was formed in 1972 as a result of a merger of Sabbe's followers with several radical secular factions led the Mohammed Nur and Isaias Afwerki, in opposition to the old ELF. Gradually the radical reformers took over the ELF-PLF, sidelining Sabbe. The civil war, which erupted between the ELF and EPLF in 1972, ostensibly ended with a 1974 accord.

The Second ELF National Congress in 1975 saw the removal of Idris Adem and many older Muslim traditionalist, but Christians were barred from full membership. The new leadership struck a deal with

Sabbe, a conservative Muslim anti-communist, to bring the ELF-PLF back into the fold, but Sabbe was denounced by the field commanders who went on to form the EPLF.

At the time, the ELF was the larger force, but lacked discipline, organisation, and a clear set of policies, in contrast to the EPLF. Further purges of Christians within the ranks of the ELF in the late 1970s only led to increasing numbers joining the EPLF. The ELF also suffered the brunt of the Ethiopian offensive in 1978–1979.

The ELF leadership under Ahmed Nasser then tried to broker a deal with the Ethiopian Revolutionary Derg, through Arab and Soviet intermediaries, at the same time order ELF troops to withdraw into the Sudan. It was a military, political, and diplomatic disaster.

Whereas the ELF maintained a significant profile in the Islamic world, it was soon overshadowed on the domestic front and in the Western media by the propaganda of the EPLF. On the battlefield, the ELF was also eclipsed by the EPLF as a fighting force.

### EROSION, LAND

Land erosion is the natural process by which the Earth's surface is gradually worn away. Over millions of years, the weathering effects of wind and flowing water break down the Earth's rock surface and carry

away the resulting rock fragments and soil. Today's landscapes were created through the combination of these processes. Along the coast, the impact of ocean waves constantly hitting the shore slowly wears away the rock and collects loose particles. The slow but abrasive movement of glaciers detaches loose rocks in their path. Wind transports the sand of deserts and beaches to other areas.

Land, or more specifically soil erosion, has become an environmental concern because human manipulation of the environment has accelerated these processes. Current global loss of productive land due to soil erosion is estimated by the Food and Agriculture Organisation of the United Nations to be between 5 and 7 million hectares per year.

### Soil Composition and Erosion

Soils are formed from the broken down mineral material of rocks and the decomposition of organic matter. Their composition can vary greatly: from deep and fertile to shallow and unproductive. The mineral, or parent, material forms the skeleton structure of the soil and provides much of the nutrients required by plants for growth.

Nutrients are also provided by the decay of organic matter, such as leaf litter, in the topsoil. Humus, a by-product of this breakdown of plant tissue, can help protect the soil from erosion as it is cohesive and binds individual soil particles together. Clay particles, weathered from the parent material, can also group together to form larger particles. These strengthen the general soil structure and improve its resistance to erosion.

Material is continually lost from the soil profile and because the organic-rich topsoil layer is exposed, it is eroded first. Wind, or aeolian, erosion blows the smaller particles off the surface. Soil particles are scattered by the impact of raindrops, or rainsplash, falling onto the exposed soil surface. Soil particle displacement increases with the force of the rain. Water, or fluvial, erosion occurs through the movement of surface runoff, generated when the amount of rain falling on an area exceeds the total amount of water evaporated, intercepted by vegetation and infiltrated into the soil. Fluvial erosion occurs on a larger scale than rainsplash. Runoff tends to subdivide into rills, which are networks of shallow channels. Gullies are formed when these channels are deepened by further water erosion and a permanent drainage network is established. These three mechanisms funnel surface runoff, increasing the speed of water flow and thus increasing its ability to erode and transport soil particles.

### Factors Influencing Erosion

Increases in wind or water speed and slope increase the potential for soil erosion. However, the amount of soil eroded depends on the nature of particles present on the surface. Vegetation protects the soil by reducing the impacts of wind and rain. Complex vegetation stands of diverse plant species create a multi-story canopy and slow down the flow of wind and surface runoff. As the runoff is slowed, a greater proportion of it can infiltrate the soil surface, decreasing fluvial erosion. The canopy intercepts rainfall, reducing the force of individual raindrops. Plants also provide further structure to the soil because soil particles bind to their root systems. When vegetation is cleared, there is no longer a continuous supply of organic matter to the soil. The humus layer is no longer replenished, and eventually the mineral particles are exposed and are far more easily eroded. Vegetation around wetlands and along riverbanks acts as a buffer. Plants in these areas, such as reeds, have dense foliage and are low to the ground. Soil particles transported from eroded areas in surface runoff are therefore trapped before reaching the lake, stream, or river.

Soil erosion has been accelerated across the globe mainly through the large-scale clearing of trees and vegetation. Globally, it is estimated that 500 million hectares or more of land have been degraded since 1950. Protective vegetation cover has been lost through deforestation, agricultural clearing, mining, fire, and urbanisation. In addition, agricultural practices such as ploughing, tilling, irrigation, and grazing have caused the soil to lose its structure and cohesion. Other factors such as the planting of monoculture crops and the ploughing and farming of marginal lands unsuitable for crop cultivation allow the topsoil to be washed and blown away. As agricultural land becomes increasingly degraded, and less productive, farmers apply fertilisers to the soil to replace the nutrients lost to erosion. Subsequent intensive agriculture only causes further soil degradation. The dust storms experienced in the 1930s in the midwest of the United States, which then became known as the 'Dust Bowl,' are one of the most famous examples of the devastating impact of land erosion.

Overgrazing on fragile soils is a significant issue for one third of the world, which is now threatened by desertification. Erosion has affected 413 million hectares of land in Africa due to increases in livestock on productive land. This includes 65% of the sub-Saharan, which has been degraded by both wind and water erosion. In Asia, 663 million hectares of land have experienced erosion. One-third of the land in Latin America has been degraded, largely due to water

erosion. In South and Central America, the figures are 165 million hectares and 51 hectares of land degraded through erosion, respectively. Once the soil structure has been destroyed and the topsoil removed, agricultural land can no longer sustain crops or vegetation. Desertification is very difficult, often impossible, to reverse.

## Effects of Erosion

Erosion is a form of soil degradation. It changes and weakens soil structure, quality, and texture, in turn reducing its fertility and water-holding capacity. Drier soils are more susceptible to droughts and wind erosion. Wind erosion is the dominant form of erosion in arid zones of the world, causing 60% of land degradation. Particles picked up by the wind can remain suspended in the air and add to the atmospheric dust load. If severe enough, this dust pollution can decrease visibility and become a health hazard, particularly affecting people with respiratory diseases.

Water erosion is the dominant form of erosion in semi-arid and dry sub-humid regions of the world, contributing up to 51% of the land degradation. Soil lost to erosion can destabilise riverbanks and increase the potential for flash flooding and landslides. The disposal of the eroded material is also a serious issue. It may be dumped downslope, burying seeds and seedlings and lowering their survival rate. More likely, sediment deposits will be washed or blown into rivers and streams, reducing the water quality downstream, degrading aquatic wildlife habitats and fish spawning areas. In still waters, like reservoirs, silt can drop out of the water column and settle on the floor. In sufficient amounts, this sedimentation reduces the water storage capacity and life of the impoundment and eventually may lead to increased water treatment costs for drinking water. When sedimentation occurs in channels, expensive dredging may be required to keep the waterway deep enough for water and barge traffic. Suspended material in rivers and streams flows downstream and is eventually transported out to the ocean and lost.

Agricultural areas affected by topsoil erosion become less productive and more vulnerable to weeds. The loss of soil nutrients results in poor crop growth and a reduction in crop yield. Fertilisers are usually added to the soil to replace missing nutrients while poisons and pesticides are sprayed to combat weed infestation. These pesticides and fertilisers will be transported with any subsequent soil erosion and are often washed into waterways. Pesticides can be

poisonous to aquatic life and pose a health hazard for downstream drinking water sources. Excess nutrients in water bodies can exacerbate algal blooms.

## Combating Soil Erosion

Loss of topsoil and reduction in crop productivity has increased global awareness and concern for soil erosion. The impacts of erosion reach further than environmental degradation. Soil erosion can have grave effects on the economy, impacting sectors such as energy and water supply. Commercially, many developing countries rely heavily on the export income provided by cash crops. Ongoing land degradation translates to a significant economic loss of agricultural income. Perhaps more importantly, reduced crop productivity threatens the global food supply and security. Africa, for example, has become very reliant on food imports and aid. With an ever-increasing global population, there is a real incentive not only to conserve current fertile lands but also to increase crop yields.

Declining food per capita and increases in poverty have led to impacts on health in the developing world. For example, the number of undernourished people in Africa has doubled from the 1960s to 200 million in the late 1990s. In many developing countries the combined pressures of poverty, landlessness, and increasing population force local farmers to continue environmentally destructive farming practices. Population pressures force subsistence farmers to use illegally cleared forests and marginal lands to survive. Once an area is depleted of nutrients, they move on. Soil conservation techniques require time and energy. Many farmers in developing countries struggle with severe poverty and cannot afford the resources required to implement these measures. Often, there is no incentive for these farmers to conserve the topsoil because they do not own the land that they cultivate. Mismanagement of these areas leads to further degradation.

The problem of erosion is being tackled, to varying degrees, around the world. Progress is hampered by the lack of training, basic information, and funding for rehabilitation and land reclamation projects. However, an increasing number of countries in the developing world are making progress. Agricultural methods aimed specifically at soil conservation are increasingly being implemented. Techniques such as horizontal ploughing and hillside ditches slow and redirect surface runoff while planting hedgerows reduce the impact of wind. Planting cover crops provides a more complex system and protects the cash

crops below from the effects of wind and rain. Tilling crop residues into the soil replenishes nutrients through the addition of organic matter. Degraded land is being rehabilitated through the natural regeneration of trees and the planting of a rich diversity of other vegetation. In the Upper Niger River Valley Zone, farmers have begun to use fertilizer and improved seed varieties that have been engineered to grow in harsh conditions on fields that have been built up organic matter. In Niger's Majjia Valley, farmers are planting windbreaks of tall trees to combat the effects of wind on the soil. In Burkina Faso, farmers are using rocks and other debris as barriers along contours to reduce the intensity of surface runoff. In Thailand and the Philippines, farmers are planting tall, deep-rooted perennial grasses for the same effect. No-till farming, where the previous crop is left in the ground and seeds for the new crop are planted via holes in the ground made without ploughing, is gaining popularity across South America and Africa.

Forests are being replanted in Argentina and Mozambique, stimulating the economy by both employing jobless young people and generating income from forest products from previous degraded lands. Agroforestry is also being promoted in the developing world as another method of combating erosion. Plant and tree species are encouraged to be left or planted in fields as resources in their own right. In the Sahel region, selected trees are being grown amongst the crops and pastures. The trees lessen the effects of the wind and torrential rains on sandy soils as well as improving soil fertility and offer additional resources such as timber, firewood, leaf litter, seeds, oils, fruits, and gums. In China and Vietnam, land tenure reform has seen land reallocated to individuals and families. This has had a positive impact on land management, with production increases and more trees being planted than cut down.

The importance of soil conservation and the need to encourage and assist developing countries with this issue was internationally recognised at the Earth Summit, formally known as the United Nations Conference on Environment and Development, held in Rio de Janeiro in 1992. A plan of action concerning the planning and management of land resources, combating deforestation, and sustainable agriculture and rural development was agreed upon. Responsibility for the development and implementation of this plan was given to the Food and Agriculture Organisation. This organisation assists governments with advice for incentives to encourage and reward sustainable land use and continues to develop indicators and guidelines for sustainable agricultural practices.

Although topsoil is still being lost at an alarming rate, soil erosion is now accepted as a significant issue worldwide. Its potential to impact on food supply and export income in particular has caused many countries to implement specific environmental policies to regulate agriculture and land practices. However, while such policies are valuable, the real change in practice must occur at a grassroots level. The work of agencies, such as the Peacecorps and the Initiative for the Social Action and Renewal in Eurasia, with communities and local non-government organisations to educate and to improve land use practice may ultimately determine whether soil erosion can be managed effectively.

## ESTONIA

The Republic of Estonia is one of the Baltic Republics and a part of the former Soviet Union. Estonia borders Russia, Finland, Latvia, and the Baltic Sea. The total area of the country is 45,266 square kilometers and with its population of about 1.4 million Estonia is among the smallest European countries.

Estonia first gained its independence in 1918, but in 1940 was incorporated into the Soviet Union. The country gained its independence again in 1991 at the collapse of the Soviet Union. Estonia is a highly urbanized country and about three quarters of the population lives in towns and cities. Its capital is Tallinn, an old medieval city. The second largest city is Tartu, a significant academic center in Eastern Europe. Other cities are Narva and Pärnu. The native people of Estonia are Finno-Ugric. All ethnic groups include Estonian 65.3%, Russian 28.1%, Ukrainian 2.5%, Belarusian 1.5%, Finn 1%, and other 1.6%. The official language is Estonian (family of Baltic languages).

Generally, the terrain of the country is flat in the north and hilly in the south. There are about 1,500 small islands on the Baltic that remain Estonian territory. The region is boggy, and it contains swamps, rivers, wetlands, and more than one thousand lakes. Forests cover most of the country's area. The elevation is above sea level with the highest point Suur Munamägi reaching 317 meters above sea level. Because of the proximity of the sea, the climate of Estonia is milder than on the rest of the continent. The maritime climate provides wet moderate winters and cold summers. Because of the geographic location summer days are long and winter days last for only several hours. Nights are not very dark from May until July. The temperature in Estonia is unpredictable and might change within a day by about 20°C. Average summer temperature is 15°C–18°C, while average winter temperature is –4–5°C. Winters are usually snowy. Days are often cloudy and frequently rainy (annual precipitation is 750 millimeters).

The Estonian ecosystem also consists of several species of animals, among which the most numerous are large mammals like deer, elk, and boar, but also beaver, lynx, wolf, brown bear, and gray and ringed seals in coastal waters. There are about 333 species of

birds; among them are the black stork and eagle. About 10% of the country area is under environmental protection, namely seashore wetlands and some woodland areas. The Estonian ecosystem is not destroyed like in most of Europe.

Culturally, Estonia is divided into lowlands and highlands, and such division relates to the economic activities and accumulation of wealth. Highland people were predominantly agricultural while the lowland populations subsisted on fishing. Estonian prehistory is not well known, but the archaeological record confirms that the first inhabitants were foragers and fishermen of the Mesolithic period. The first farmers inhabited the region about four thousand years ago. Although some remarks on the region can be found in the Roman sources, or Scandinavian sagas, Estonian history starts in the twelfth century with the introduction of Christianity and feudalism. Several powers occupied the present-day Estonia in the past, among them Denmark, Sweden, Poland, and Russia. About 1170, the Holy See tried to establish its province there. The earliest historic source on the land is the Chronicle of Henry of Livonia which describes thirteenth century Estonia. In the beginning of the thirteenth century, German and Danish military expeditions entered the regions of present-day Estonia. First parishes were established in the beginning of the fourteenth century. Three significant periods in Estonian history shaped its culture: the introduction of Christianity, class society, and urbanization throughout the thirteenth century led by German and Danish rulers; the Reformation period when the Estonian language was introduced to liturgy, schooling, and administration; and modernization of the society after 1860 linked to the industrialization of the Baltic region. Estonia gained independence in 1918, but lost it in 1940 when it was incorporated into the Soviet Union. It regained independence on August 20, 1991, at the time of the collapse of the Soviet Union and that date was proclaimed as a national holiday. On March 29, 2004, Estonia joined North Atlantic Treaty Organization (NATO) and a month later, on May 1, 2004, it became a member of the European Union. Despite a long period of colonization, Estonian culture prevailed and the Estonian language is still spoken. It contains many words borrowed from other languages, namely German, Swedish, Russian, Finnish, but also French and English.

Estonia has limited natural resources, mostly oil, shale, peat, clay, limestone, and timber. Because of the lack of economically significant natural resources, the Estonian economy is based on services, like tourism, which attracts about 2–3 million people a year, trade, and banking. Various service-based

industries provide about 65% of Estonian gross domestic product (GDP). The rest is provided by light industries, like fishing, timber, paper, and textiles. Other branches of industry include: mechanical engineering, electronics, wood and wood products, textile industry, information technology, and telecommunications. The labor force by occupation includes: agriculture 11%, industry 20%, and services 69%. Forests are among the most significant natural resources providing timber for the paper industries. Electronics and engineering industries are developing. The chemical industry after difficult times during the 1990s is presently recuperating and developing. Tourism is one of the most significant economic sectors. Every year 2–3 million tourists visit Estonia (this includes shopping tourism from neighboring countries, especially Finland).

Estonian arable land covers 16.04% of the area. Agriculture employs only about five percent of the workforce and consists mostly of small farms and corporations. The main agricultural products are dairy products, poultry, meat (beef and pork), potatoes, and cereals. Many foodstuffs are organic. Agriculture also includes fisheries, cattle breeding, and honey bee keeping.

The Estonian economy is one of the best among countries that joined the European Union recently. The economy attracts many foreign investors with its fast and stable growth. Most significant trade partners are Finland and Sweden. Its export commodities include: machinery and equipment 33%, wood and paper 15%, textiles 14%, food products 8%, furniture 7%, metals, and chemical products. Its export partners include: Finland 21.9%, Sweden 12.5%, Russia 11.4%, Germany 8.4%, Latvia 7.4%, Lithuania 4% (2003). Its import commodities include: machinery and equipment 33.5%, chemical products 11.6%, textiles 10.3%, foodstuffs 9.4%, transportation equipment 8.9% (2001). Its import partners include: Finland 15.9%, Germany 11.1%, Russia 10.2%, Sweden 7.7%, Ukraine 4.3%, China 4.2%, Japan 4.1%.

The official Estonian currency is the kroon. Estonia, as a new member of the World Trade Organization, is steadily moving toward a modern market economy with increasing ties to the West, including the pegging of its currency to the euro. The economy benefits from strong electronics and telecommunications sectors. Estonia joined the European Union in May 2004. The economy is greatly influenced by developments in Finland, Sweden, Russia, and Germany, four major trading partners. The high current account deficit remains a concern. However, the state budget enjoyed a surplus of \$130 million in 2003.

Estonia is a parliamentary republic with a 101-seat parliament. The parliament selects a president for a

five-year term. The president can serve only two terms. The president is the head of state, and leader of the government. There are several political parties which have 5% votes, a condition to be represented in the Parliament. A party that collects the most votes has the right to form the government.

## ETHIOPIA

Situated in the region known as the Horn of Africa, Ethiopia has an area of approximately 1.27 million square kilometers, slightly smaller than twice the area of Texas. It borders Eritrea on the north and northeast, Djibouti on the east, Somalia on the east and southeast, Kenya on the south, and Sudan on the west. It occupies a significant portion of the Horn of Africa landmass and extends almost 1,640 kilometers from east to west and 1,580 kilometers from north to south. Ethiopia is a land of extreme contrasts, both in terms of its topography and climate. It is mountainous in the northern and central regions, some with elevations as high as 4,617 meters above sea level, and has vast stretches of lowlands in the eastern and southeastern regions, some of which lay as much as 116 meters below sea level. An important feature of the Ethiopian landscape is the Great Rift Valley, running roughly from north to south, essentially dividing the country into two.

The temperature in the highland areas runs from near freezing to as much as 30°C, and in the lowlands from 30°C–50°C, occasionally reaching 60°C. The rainy season in the highlands extends from June to August, while there is not much rain in the eastern lowland regions of the country. Most of the population, estimated in 2000 at 61 million, professes Christianity or Islam. In general, Christians, who constitute about 43% of the population, live in the highland areas and are sedentary farmers; the Moslems, who comprise nearly 48% of the population, live

in the lowlands and are generally agro-pastoralists. Although Ethiopia is associated more with the Tigray and Amhara national groups of the north and north-central parts of the country, the largest group, about 40% of the population, is the Oromo national group. This population group lives in the western, southern, and south-central parts of Ethiopia.

Ethiopia is one of the two countries in Africa (the other is Liberia) that was never colonized, or briefly colonized (1936–1941), by a European power. Ethiopians, or more appropriately Abyssinians, extend their history as a nation to pre-Christian times when the powerful Kingdom of Axum flourished in northern Ethiopia, circa 300 BC. The kings of Axum adopted Christianity as their official religion in the fourth century and this made the people one of the earliest to practice Christianity officially. The Kingdom of Axum, however, declined around the seventh century, and highland Ethiopians, unable to maintain trade and cultural links with the outside world, were cut off for about a millennium until the middle of the nineteenth century. With minimal outside contact, the economic, social, and cultural system had remained frozen in time. This is particularly true of the Ethiopian Tewahdo Orthodox Church, which still continues to practice elements of ancient Judaic traditions.

Ethiopia came out of its isolation around 1855, when Emperor Tewodros established a relatively unified but a much smaller Ethiopia as compared with the present. The emperors who followed him, including Yohannes IV, Menelik II, and Haile Selassie I, successively enlarged and established a more centralized Ethiopia. Thus, traditional Ethiopia, by incorporating the areas in the periphery, became a multi-cultural state whose peoples differed in religion, ethnicity, and psychological outlook. Although apparently successful in pacifying the peoples of the newly incorporated regions initially, the “question of nationalities” became an important variable in the political, economic, and social development of contemporary Ethiopia. This and issues related to poor governance and limits on the powers of the emperor are taken as causal factors for the attempted coup d’etat in 1960.

As a result of its history, the nature and foundation of the Ethiopian state became a hotly contested issue from the 1960s onward. Emperor Haile Selassie, the last of the Ethiopian monarchs, was unable to resolve the ethnic disputes and other issues of development, and was overthrown in 1974 by the military. The military government, which assumed power with the promise to resolve the problem of ethnicity, also failed in its endeavor. Consequently, various ethnic-based armed opposition movements in various parts

of the country emerged to press their demands for more communal rights. Unable to address communal grievances, both political and economic, the military government was likewise overthrown in 1991. For almost thirty years (1962–1991), therefore, Ethiopia had a disproportionate share of political violence, first in Eritrea and later in other parts of the country. Partly because of these issues and partly because of its long isolation, Ethiopia remained under-developed both politically and economically.

Politically, Ethiopia remained an absolute monarchy until 1974, and under a military dictatorship until 1991. Hence, Ethiopia had no tradition of a government accountable to the people, no peaceful competition for power by political parties, and no civil society to speak of. Since 1991, however, Ethiopia has been a federal republic of ethnic-based territories ruled by the Ethiopian Peoples’ Revolutionary Democratic Front (EPRDF). Similarly, EPRDF-allied parties control regional governments. There are also many opposition parties, some of which are legal. However, they have not been able to break the monopoly of the EPRDF, as the results of the elections held in 1995 and 2000 show. EPRDF handily won because many opposition parties had boycotted these elections. Among the illegal political movements are the Oromo Liberation Front and Ogaden National Liberation Front, both of which have resorted to arms to force the government to agree to a full measure of self-determination for Oromia and the Ogaden, respectively.

Although there is debate as to whether or not the present government is democratic, the political environment now is far more open compared with the pre-1991 period. Indeed, the present constitution gives ethnic groups the right to decide their future, and this theoretically includes the right to secession. The Ethiopian constitution is the only one in the world today that explicitly includes constitutional provisions for secession. Also, since 1991, independent civic organizations have flourished. They include, among others, the Ethiopian Teachers’ Association, the Ethiopian Women’s Lawyers Association, the Ethiopian Free Press Journalists Association and the Ethiopian Human Rights Council. Many independent civic organizations in the Diaspora are also actively involved in the political, social, and human rights issues affecting Ethiopia.

In the realm of economics, Ethiopia remains one of the least developed countries. The gross domestic product (GDP)—calculated in terms of the value of all final goods and services produced within Ethiopia, and computed on the basis of purchasing power parity (PPP)—is about \$33 billion, with GDP per capita of about \$560. Coffee accounts for about 60% of export earnings. With such an overwhelming

dependence on a single commodity and the inevitable fluctuations and ever-decreasing price of coffee, Ethiopia has a long way to go before experiencing sustained growth, especially because its economy is based on small-holder and rain-fed agriculture susceptible to the periodic drought the country faces. There were, however, positive signs in the last ten years. The economy grew by an average of 6% for most of the 1990s and early 2000s because of a combination of many factors. These include the adoption of market-oriented economy, the implementation of International Monetary Fund's Structural Adjustments Programs, and relative political stability. There are renewed hopes of a more accelerated economic growth.

### ETHNIC CONFLICTS: CARIBBEAN

The scenario of ethnic relations and conflicts in the Caribbean reflects the staggering complexity of the regional panorama of nationalities, languages, and religions. In addition to English, Spanish, and French, other major languages are spoken in the numerous islands that comprise the Greater and Lesser

Antilles, including Chinese, Hindi, and Arabic. There are also communities of worship for all major world religions as well as uniquely Caribbean religious traditions, like Santería in Cuba and Voodoo in Haiti.

The Antilles, to which the expeditions of Columbus and others arrived from Europe at the end of the fifteenth century, found an ethnically diversified native population, with various groups of Ciboney, Arawak, and Carib stock. The greatest part of this indigenous population disappeared after the ravages of war, disease, and forced labor and was soon being replaced by black Africans brought as slaves over the Atlantic.

Resting on the bedrock of the three institutions of the plantation, slavery system, and colonialism, the modern Caribbean is a scenario where ethnicity, that is the identification of a certain group with real or imagined cultural links to an ancestral past, with language and religion (Baronov and Yelvington 2003) is a crucial element. The historical background is important not only as a tool for a better understanding but also as a main element in the very constitution of this ethnicity. The distinctiveness of the Carib as an ethnic group, for instance, has much to do with the circumstances of early colonial rule, when resistance to Spanish hegemonism stimulated their militarism. Soon after, the Caribs found it convenient to make alliances and agreements with colonial powers of later arrival. In that manner, they obtained trade privileges, confirmation of authority, merchandise, and ceremonial staves from the Dutch, English, and French. Thus, trade and ethnic soldiering was an important factor in the establishment of solidarities, oppositions and adversarial identities. This insight corrects an earlier interpretation of the conflicts between Caribs and Arawaks that have been seen as the continuation of pre-Columbian rivalries (Whitehead 1990).

Today, there are some three thousand Caribs living in villages of what is called the Carib Territory on the East coast of Dominica. There are also descendants of Arawak and Carib Indians in the island of Aruba, where the population also includes groups of Dutch, Spanish, and African provenance.

The predominance of inhabitants with black ancestry reflects the massive proportions of the slave trade. Between 1662 and 1867, almost 10 million Africans were exported as slaves to America; Jamaica only received 662,400 (Mintz 1985).

This population brought along much of its culture, its religion, its means of expression. Orality had here a central significance and from the crucible of Afro-American orality, in the forced submission and pain of the plantation, rebellion transformed oral tradition into a folklore of fugitive rebels. Creole languages

that developed as a basic part of runaway slave culture facilitated communication. Escaped slaves coming together to form small communities had a need to create a common language that would overcome cultural diversity and resist isolation. Creole was a synthesis of West African languages, fused together with loaned words from English and Spanish. In the island of Aruba, the official language is Dutch but the common language used is Papiamentu, a Creole that evolved mainly from Portuguese, Spanish, and Dutch.

Later, with the end of slavery, indentured laborers were taken to the Caribbean in great quantities. More than 125,000 Chinese came to Cuba, Guyana, Jamaica, and Trinidad. More than 100,000 East Indians arrived to Jamaica, Guyana, and Trinidad. The end of slavery resulted then in the formation of one of the most ethnically diversified regions of the world (Baronov and Yelvington 2003).

Traditionally, ethnicity was anchored in the indigenous *bohio*, a hut with thatched roof. Today, ethnic identity can be said to be rooted in the private space of the urban tenement yard, and by the tenants themselves, the yardies. These ghettos, for instance in Kingston, Jamaica, are enclaves whose ethnicity is simply their poverty (Chevannes 2001). This intimacy of the household was translated into a carefully managed system of racial discrimination in the public sphere. In the late eighteenth century there were in the French colony of St. Domingue, today's Haiti, nine possible racial categories between a pure white and a pure black. Today, those harsh and clear-cut tokens of discrimination have been replaced, at least in more public arenas, by a code tinted with what Isar Godreau, for the case of Puerto Rico, calls a slippery semantics, *semántica fugitiva*, by which one refers to racial types by mentioning various degrees of rainfall (Baronov and Yelvington 2003).

This aspect of indeterminacy in the negotiation of notions of ethnic and racial identity stands in clear contrast to at least two ways of asserting an identity, one silent and exclusive, the other vociferous and inclusive. The first one can be seen in the sense of exclusiveness present in elite groups like the white Creole elite of Martinique. There, 150 patronymic names could in the 1970s trace their ancestry in such ways that race, class, and a sense of great historical role in the island formed the pillars of their ethnocentrism. The sacred duty of this group is then to maintain the purity of the stock by following the norms of endogamy (Maingot 1996). The second, and opposite, manner of assertiveness is the deeply felt sense of ethnic identification and urge of revindication that is characteristically expressed in popular music and lyrics throughout the region. In Cuba, the sacred drummers of Lucumí ancestry are the collective

sound of an African presence that refuses to disappear (Benkomo 2000). To the east, the songs of bitterness of the *bachata* are also known as the Dominican blues. Derived from the classic *bolero*, the *bachata* has become a form of protest Latin rock, combining Dominican folk motifs, Jamaican reggae, and layers of Zairian guitar. Also, the soul of Trinidad and Tobago can be summarised in the steel drum or pan, paraded in defiant street festivals. Originally, African skin drums were used until banned in the 1880s by the British authorities who feared that the drummers transmitted coded messages that could possibly lead to rebellion (Meschino 2002). Panorama, the annual steel band competition with its uproarious atmosphere, is one of the most anticipated events of Carnival.

The two constants of Caribbean Africanness, words and drums, and their common core, rhythm, are elements that remain essential in the emergence of a literature of cultural revindication. This can be seen in the poetry of Martinican Aimé Césaire (b. 1913) and of the Puerto Rican Luis Palés Matos (1898–1959), himself a white. In the poem *Black Majesty* by Palés Matos, the sense of defiant urgency expressed by the rows of Congo blacks dancing rumba and macumba to the rhythms of their bongo drums, while they follow their glorious queen *Temblandumba de la Quimbamba*, is expressed in the sound of the words themselves. In the poem *Ñañigo Al Cielo*, *The Ñañigo Comes to Heaven*, also by Palés Matos, a member of the *Ñañiga*, the Cuban secret society also known as *Abakuá*, confers to the celestial court his own brand of bandit blessing when he and God embrace in a smelly cloud of intoxicating Antillean rum.

Considering then that not even the most exalted realms seem to be beyond the scope of this sense of defiance it is perhaps not surprising that fear and suspicion is ever present throughout the region. It was this terror that in Jamaica led to the ruthless repression of the Morant Bay rebellion of 1867. Not only were five hundred blacks executed, self-government was also suspended and direct Crown Colony rule was implemented (Maingot 1996).

The basic premise seems to be “not another Haiti.” St. Domingue was by the time of the French Revolution the most prosperous colony in the Antilles, where a mere 32,000 whites owned 550,000 black slaves. The revolution in what was to become Haiti, a milestone in the history of the region, was in many ways precipitated by the agitation caused by the group of some thirty thousand black freedmen, *affranchis*, many of them slave owners themselves. Their demands were for a larger share in the benefits of plantation slavery and better access to the benefits of French culture

(Mintz 1974). The armed conflict began in August 1791 and ten years later the military leader Toussaint-Louverture, a former slave, became governor only to be imprisoned after coming to terms with a French expeditionary force sent by Napoleon to restore the old colonial regime. Finally, the forces of Jean-Jacques Dessalines and Henry Christophe defeated the French in November 3, 1803.

Haiti was far from unique. Slave revolts were numerous, and escaped slaves, known as maroons, were the living testimony that resistance to slavery was always a latent factor (Randall 2003). Thus, the specter of a new Haiti, known in Cuba as *El Gran Susto*, *the Great Fear*, has been an ever present menace. This was experienced most critically in 1844, when the serious rebellion of *La Escalera* occurred (Maingot 1996).

A precise assessment of many regional conflicts is often not an easy task. There is a long struggle, extending back to 1830, of the peasantry in Cuba fighting against the evictions and usurpations of expanding sugar-cane corporations. In the following generations, then are the Mambises, peasants fighting in the wars against Spain in 1868 and 1891. By 1905, after American intervention had increased noticeably, there were thirteen thousand American properties in Cuba, covering 10% of the total surface of the country. Many peasants had been evicted in the process, and as a result of this, massive mobilizations took place, like in Caujeri and Camagüey in 1923 (Huizer 1977). The question is, to what extent is this long story of peasant struggle in Cuba to be understood in terms of class or ethnic struggle? This and other cases are a reminder of the provisional character of our analytical constructs.

The ethnic African referent rooted in the past has its modern counterpart in the contemporary process of the Caribbean diaspora. By the last decade of the twentieth century, for instance, 43% of Puerto Ricans were living in the United States, 23% of the population of the Dutch Antilles in the Netherlands, and about 50% of Jamaicans in the United Kingdom and United States. Forging new identities in their adopted countries, these vast communities abroad often take on a heightened meaning of nationalism and ethnicity, while maintaining linkages with their homelands (Baronov and Yelvington 2003).

Also the original inhabitants of the Caribbean have been increasingly reasserting their presence, demanding recognition of their political and territorial rights. After being declared extinct centuries ago, it is now well known that thousands of Taino-Arawak descendants are alive and well, not only in Cuba but in the Dominican Republic and Haiti. Many are also living in Florida, in other parts of the United States,

and even Spain. Since 1997, Taino Indians have been reunited annually with their relatives of the diaspora at a conference held in Baracoa, eastern Cuba. The meetings have opened up to the world the reality of the continued existence of this group and although the Cuban government has not formally recognized them as an indigenous people, it has pledged support and protection. Other Taino living in the diaspora now visit their ancestral lands in Boriken, Puerto Rico.

It seems that in the multicultural societies of the Caribbean there is an integrative Creole model that in spite of all tensions and rivalries, allows for the relative absence of ethnic and racial violence in modern times (Hillman and Serbin 2003). When attempting a comprehensive understanding of this ever-changing scenario where, in a perennial combination of assertiveness and indeterminacy, notions of identity, class, and nationality are constantly being negotiated and contested, terms like “ethnic” and “racial,” even when confusing and misleading, seem still useful.

## ETHNIC CONFLICTS: CENTRAL AFRICA

### Cameroon

Although Cameroon has strong ethnic rivalries, particularly between the Muslim north and the Christian south, it has not faced the ethnic violence common to many of its neighbors. There are also political tensions between the French speaking and English speaking portions of the population. (Cameroon is a merger of two former colonies, one English and one French.)

### Central African Republic

Although divided into more than eighty ethnic groups, ethnic violence is not a major problem in the Central African Republic. The two largest ethnic groups, making up about 50% of the country's population, are the Baya and Banda.

### Chad

Chad, like its neighbor Sudan, has a north-south ethnic divide. Northern Chad identifies with the Arab Islamic world which it borders, even though intermarriage has led to a population not dissimilar in appearance to that of the south. Many northerners consider themselves Arab and speak Arabic as either a first or second language. Southern Chad is Christian and animist and is dominated by the ethnic groups Sara, Toubouri, and Masa.

In the early years after its independence, granted by the French in 1960, Chad was dominated by southerners, not surprising given the south's larger population. In 1965, however, a northern revolt backed by Libya attempted to change this. After seventeen years of fighting, a northerner, Hissène Habré, finally took power. Habré, despite his Muslim background, supported a fairly broadly based coalition. His main opposition, moreover, came from Libya, which had formerly supported him but which now had ambitions to annex part of northern Chad. Despite

his attempts to maintain alliances with southerners, Habré faced widespread resistance in the south and used violence against southerners to maintain himself in power. In late 1990, Idriss Deby, another northerner, replaced Habré.

Deby also targeted southerners who were perceived as resisting his regime with violence, and southerners have responded in kind. Nevertheless, compared with neighboring Sudan, a country with a similar north-south division, Chad is relatively peaceful. The numbers killed in ethnic conflicts remain in the thousands rather than in the tens or hundreds of thousands.

### Republic of Congo

The Republic of Congo is the Democratic Republic of Congo's far smaller neighbor, with a population of about 3 million. Congo is divided between three major ethnic groups, the Bakongo, who make up almost half the population, the Batéké, who make up 20%, and the M'Boshi, who constitute 15%.

Although the Batéké are the largest group, the M'Boshi have had a disproportionate influence on politics, dominated the countries post-independence leadership as well as its military. Ethnic tensions are fanned by the fact that all three major ethnic groups maintain their own militias in the country's capital.

### The Democratic Republic of Congo

With a population approaching 50 million, the Democratic Republic of Congo (formerly called Zaire) is the largest state in Central Africa and the one with the bloodiest history of conflict. Congo's modern history of ethnic conflicts begins with the Belgian conquest in the 1870s. Belgium's rule over Congo was one of the bloodiest in Africa's colonial history, leaving the country with a legacy of bitterness and misrule. (Some of the horror of this period is depicted in Joseph Conrad's fictional masterpiece, *Heart of Darkness*.) Belgian troops and administrators killed millions.

Independence was granted in 1960, but the situation in Congo did not improve. Belgium had trained almost no local administrators and upon independence essentially abandoned the country to its internal ethnic conflicts, which were many.

There are hundreds of ethnic groups in Congo and nothing had been done during Belgian's period of misrule to meld them into a single nation. Congo's first post-colonial ruler, Patrice Lumumba, fought a series of conflicts with regional strong-men who based their power on local ethnic groups. The most

powerful of these was Moise Tshombe based in Katanga province (since renamed Shaba).

Led by Tshombe, the Katangese fought for three years to maintain their independence. They were eventually defeated when a new strong-man, Joseph Mobutu, came to power. A United Nations (UN) force that intervened in his defense helped Mobutu. The UN supported a unified Congo and so opposed the desires of the Katangese. The Katangese were defeated and Mobutu ruled Congo (which he renamed Zaire) until 1996. However, he was only partially able to suppress ethnic unrest. Insurrections occurred in Shaba on a regular basis. Mobutu also faced ethnic in other parts of the country, particularly Upper Zaire. He responded by packing his administration with members of his own ethnic group, the Ngande.

The 1994 genocide in next-door Rwanda was the occasion for further ethnic conflict, as well as the partial cause of Mobutu's downfall. Ethnic Hutu in Rwanda had created a dictatorship that attempted to wipe out the ethnic Tutsi, Rwanda's main minority. When a Rwanda army based in Uganda was able to overthrow the Hutu regime, hundreds of thousands of Hutu fled from Rwanda into Zaire in the summer of 1994. Hutu refugee camps became bases from which Hutu extremists hoped to retake Rwanda. Hutu extremists also attacked ethnic Banyarwanda, who were ethnic cousins to the Tutsi.

To defend their borders, as well as aid the Banyarwanda of Zaire, Rwanda supported local Banyarwanda militias against the Hutu and the local Zairian military, which had supported the anti-Banyarwanda attacks. Mobutu responded by expelling some Banyarwanda from Kinhasa, the capital. Despite these efforts, or perhaps accelerated by them, Mobutu's corrupt regime quickly began to collapse and the local war became a general revolution. An alliance of anti-Mobutu groups was created, and, led by Laurent Kabila, was able to force Mobutu from the country and take power in 1997. Upon capturing Kinhasa, Kabila renamed the country Congo.

Kabila's accession to power did not end ethnic violence in Congo. Unable to maintain control over much of the country, and often using ethnic rivalries to his own advantage, Kabila was unable or unwilling to stop the fighting. Various ethnic groups continued to be supported by outside military intervention by Rwanda, Uganda, Burundi, Angola, and Zimbabwe. The widespread fighting has led to the deaths of millions as well as widespread rape, the use of child soldiers, and the creation of a refugee problem numbering in the millions. Kabila himself was assassinated in 2001 and replaced by his son, Joseph Kabila, who was equally unable to solve Congo's ethnic violence.

Although the original Rwandan intervention was in the name of self defense as well as defense of the Banyarwanda minority, most of the interventions, including Rwanda's, have since taken on the appearance of a power grab, with all parties intent on looting as much as they can of Congo's extensive natural resources. There have been widespread reports of massacres committed by all sides in Congo's many-sided conflict. Among those massacred are many Hutu refugees, and among those supporting their killing are the Tutsi who had been victims of massacres in neighboring Rwanda.

The result of this ongoing violence, some of the worst in Africa, is to leave most of the country impoverished. This despite the fact that Congo is extremely rich in natural resources ranging from diamonds to rubber. The total death toll of the conflict cannot be accurately stated but certainly numbers at least 3 million.

## Gabon

Gabon, a small country with a population of under 2 million, has more than fifty ethnic groups. The largest of these is the Fang, who make up some thirty percent of the population. Despite this plurality, the Fang have long been kept from power by coalitions of rival ethnic factions. President Omar Bongo, who has ruled the country since 1967, comes from the Batéké ethnic group and has favored this group in government jobs and patronage.

## ETHNIC CONFLICTS: CENTRAL AND EASTERN EUROPE

Ethnic conflict is an international experience. The elimination of colonial powers, the dissolution of strong central governments, and a multiplicity of other factors have all contributed to tensions and

outright conflicts between ethnic groups. Gurr and Harff, in their book *Ethnic Conflict in World Politics*, describe a typology of ethnic conflict that includes ethnonationalists who desire to establish or reestablish their own state, indigenous peoples who wish to preserve their traditional culture and environment, communal contenders interested in sharing political power among competing ethnic groups, and ethno-classes who want equal rights and opportunities to make up for past discrimination. In and around these five groups are religious minorities who define themselves in terms of their religious beliefs.

There are many reasons for the initiation or increase of ethnic conflict in a region. These involve actions and behaviors that include persisting cleavages between ethnic groups, the uneven treatment by elites of different ethnic groups within society, a history of elite reliance on suppression as a means of maintaining power, sudden political upheaval, and the targeting of a minority group as expendable or as the cause of recent upheaval or economic problems. In Central Europe the primary reasons for the current ethnic conflict are the historical persistence of ethnic cleavages and sudden political and economic upheaval.

Most of the ethnic groups within Central Europe fall in the communal contenders category, with some in the ethnonationalist category. The sudden collapse of the Soviet Union and its satellite communist systems overturned what were relatively stable social and political hierarchies. The dissolution of the imposed stability of the Soviet system provided an opening for various groups to begin asserting their rights as political and economic constituencies. Different ethnic groups found themselves in competition with each other for scarce economic and political resources. All of these groups are competing for a share of political power within their respective states. Most do not want to secede and form separate states but would rather share power with the current majority group. The multiplicity of ethnic groups in Central Europe includes Russians in the Baltics, Hungarians in Romania, Romanians in Hungary, Germans in the Czech Republic, Muslims in Bosnia, Roma (gypsies) in Hungary, Romania, and the Czech Republic, Poles in Lithuania, Germans in Poland, Turks in Bulgaria, and Jews in all states.

Ethnic conflict in Central Europe is not a new phenomenon. Central European history is replete with attempts by different groups to assert their control over other groups through language suppression, religious suppression, and/or legal discrimination against various ethnic and religious groups in society. European history in general is rife with wars started and fought on the grounds of ethnic superiority. The

post-1989 period of transition and democratic consolidation in Central Europe has often been compared to the post-World War I era. At the end of World War I, many states seized the opportunity to declare their independence from previous empires and dominant states. Free from the forced integration of the Austro-Hungarian empire, the Hohenzollern empire, and Russian domination, the political parties in the newly independent states emphasized the uniqueness of their language, culture, and nation. The concurrent rise in nationalism has been credited with the subsequent downfall of those independent states as they were unable to come together to resist Nazi and Russian aggression. At the end of the Cold War, these same states experienced a similar rise in nationalism and a similar birth of political parties with the same message of nationalism, and in some cases outright xenophobia.

### 1945–1989

Ethnicity was a dominant force in the rise of communism in Central Europe. It has been suggested that numerically weak groups with traditional or ethnic ties to Russia found a great deal of appeal in the communist ideology, while those groups with no ties to Russia, despite their numerical weakness, were less attracted to communism. Despite the egregious example of nationalism run amok found in Nazism, other groups had taken advantage of the chaos of war to attempt to create states based on single nationalities or ethnicities. Eastern European communists pointed to the Soviet claim that the USSR had successfully overcome ethnic divisions with the imposition of a communist political system. The implication was clear; Eastern Europe could solve its ethnic dilemmas if communism was embraced.

At the end of World War II, international borders were recreated according to the occupation zones of the Allied forces. This resulted in eastern parts of Germany being handed back to Poland, while western areas of Poland were given to the Soviet Union; these actions stranded many people in what was considered a foreign country. Cultural Germans found themselves in Poland and Poles found themselves now considered to be Russian in citizenship if not in culture. In addition, a large German minority became a part of Czechoslovakia, and parts of Romania became Hungarian. Over all of this were the difficulties faced by the small remaining Jewish population and the Roma (gypsy) population.

It is true that during the communist period, there was very little overt ethnic conflict in Central Europe.

This was less because all groups had embraced the ideology, and more because the communist governments moved to stamp out all forms of independent expression and non-state sponsored institutions. This resulted in the atomization of society to such a degree it appeared that all ethnic conflict in the region had finally been eliminated. The imposition of Soviet control over the Baltics resulted in a Russian suppression of Baltic cultures and languages. The official language in all three Baltic States was Russian; Estonian, Latvian, and Lithuanian were not taught in schools and were not utilized outside of private life. In the Balkans, Tito managed to suppress ages-old ethnic conflict by the simple expedient of using the Yugoslav army to crack down on any overt ethnic conflicts.

Soviet takeover of the Baltics led to the forced migration of thousands of Russians into the Baltics and the beginning of a program of Russification of the Baltic nationalities. As sovereign states within the Soviet sphere of influence, the other Central European states were not subject to this type of forced cultural assimilation, although many forms of cultural expression were illegal under communist control. Communism operated on the premise that national aspirations were to be secondary to the international interests of the proletarian state. Ethnic and national disputes within the Soviet bloc were not resolved but rather suppressed.

### *Jews Under Communism*

The imposition of communism and its ideology of atheism caused a great deal of trouble for what remained of the region's Jewish population. From over 5.5 million people, the Jewish population of Central Europe had been reduced to about 150,000. Those that did not emigrate to Israel or other western states found themselves caught between official party pressure to renounce Judaism and local anti-Semitism that blocked efforts to assimilate into the new communist society. Unlike the Soviet Union, the governments of the satellite states did not implement the practice of registering Jews as a separate nationality. Jews were free to define themselves as Czechs, Poles, etc.; however, any attempts to train children in language or culture immediately denied them entry to schools or party organizations. All of these state actions were compounded by the trauma of surviving the Holocaust and attempts to rebuild their lives.

Until 1950–1951, hundreds of thousands of Jews were allowed to leave the region, and did so, moving to Israel and the United States, but many preferred to remain. Romania was left with a large Jewish population that did not wish to emigrate, nor did it

wish to assimilate. In Hungary, many Jews embraced communist ideology or were deeply attached to the country and the culture. Those few Jews that remained in Poland were deeply committed to renouncing their heritage or were bent on establishing what Charles Hoffman terms a “Jewish Communist” culture based on Yiddish. In Bulgaria, a majority of Jews who survived the war departed en masse for Israel leaving behind only those who were committed to creating a “Jewish Communist” culture in that country.

### **1989–present**

The communist system had ignored ethnic differences in its quest to create the socialist citizen. The disintegration of the communist political system in 1989 left a political and ideological vacuum in Central Europe. The increased economic and political uncertainty led people to come together over what they did have in common, their ethnic identity. The sudden ability of nationalist ethnic groups (i.e., Lithuanians, Latvians, or Estonians) to define for themselves their state and its legal framework led to the Baltic opposite of the old Soviet Russification program. Ethnic Russians were denied citizenship in the newly independent states; language requirements were implemented for some jobs, etc. In Central Europe, minority ethnic groups began agitating for collective rights for their particular groups. Hungarians in Romania looked to the Hungarian government to press their case with the Romanian government while Romanians in Hungary pursued the same path with respect to their position.

It was expected that with the transition from communism to democracy, the old problems of nationalism and ethnicity could be controlled or avoided through rapid transitional political and economic reform programs. Once the lid of communist control was lifted, however, a rash of apparently long-simmering ethnic conflicts surfaced. Perhaps the most obvious conflict arose in Yugoslavia, with Serbian aggression into Bosnia-Herzegovina and the accompanying campaign of “ethnic cleansing” carried out in the name of regional stability. A large proportion of the population of Bosnia-Herzegovina is Muslim, a legacy of the domination of the Ottoman Empire, and the Yugoslav conflict had both ethnic and religious overtones.

By 1992 Czechoslovakia had undergone the “velvet divorce,” which was partly justified by the ethnic and national differences between Czechs and Slovaks. In Poland, a resurgence of anti-Semitism has been

particularly troubling, and there have been incidences of violence against the Roma, or gypsies, in all of the Central European countries. In addition, the Yugoslav conflicts have contributed to a rising number of refugees from the Balkans adding to the difficulties of controlling ethnic tensions. Finally, there have been tensions between Hungary and many of its neighbors over Hungarian minorities in Slovakia, Transylvania (Romania), Ukraine, and Vojvodina (Serbia).

The issue of Hungarian communities outside of Hungary has been one of the more problematic challenges facing Central Europe. The largest concentrations of Hungarians outside of Hungary reside in Transylvania, southern Slovakia, and Vojvodina. These clusters of Hungarians are a legacy of the collapse of the Austro-Hungarian Empire at the end of World War I. The 1920 Trianon Peace Treaty, by redrawing international boundaries, made one-third of the Hungarian population citizens of other countries. Almost immediately these minority groups became engaged in what would turn out to be a decades-long struggle to achieve educational and cultural rights in their new countries. With the end of the Cold War the Hungarian government began drawing the world's attention to these communities and began campaigns to formalize their rights within the CSCE and through bilateral agreements with the respective countries.

Throughout Central Europe tensions between majority groups and the Roma minority only recently became an item on the states' agendas. As a condition of their admission in 2004 to the European Union, the Central European states created and implemented policies designed to protect the rights of Roma citizens. The Roma have long been the target of ethnic violence and often legalized discrimination in jobs and housing.

The Holocaust and the questions of remaining anti-Semitism have troubled Central Europe for a long time. Increased anti-Semitism in the wake of the collapse of communism has raised the specter of a renewal of increased tensions in the region. Some states, like Poland, are experiencing very little public anti-Semitism primarily because the Polish Jewish population was among the hardest hit by the Holocaust.

Membership in the European Union, achieved in 2004, sped up the passage and implementation of anti-discrimination legislation in the Central European states. The argument has been made that the stability of the new democracies is jeopardized by continued ethnic conflict. However, despite gloomy predictions of a return to the extreme nationalism and ethnic conflicts that characterized the period between World Wars I and II, Central Europe

appears to be finding solutions to old and new sources of ethnic conflict.

### ETHNIC CONFLICTS: CENTRAL ASIA

Central Asia has long been a kaleidoscope of many religions, ethnicities, and national groups. As a result, national identification and ethnic boundaries among the people of Central Asia have always been fluid and manipulated by the state. In fact, one of the most salient features of contemporary Central Asia has been the expansion of the role of the state as an independent variable in shaping the balance of societal forces, including managing competing political, social, and economic claims of ethnic and nationality groups. Many Central Asian countries, which until recently had exercised at best spasmodic control over their own people, have now expanded the reach of the state in order to impose, *inter alia*, a rigid definition of their own "pure" national identities. At the same time, the range of governmental interference has expanded beyond the concern with raising revenues and maintaining order.

Furthermore, the challenge of globalization has accelerated the need to incorporate an ever-increasing number of citizenry, irrespective of one's ethnicity, into the labor pool. One unintended consequence of

globalization in Central Asia has been the rise of socioeconomic demands for ethnic equality and fairness. This, in part, has led to ethnic conflicts among sub-national groups and between the state and various nationalities in almost every country in Central Asia. However, we need to be cautious about overgeneralizing the dangers of ethnic conflicts and chaos in the post-Cold War Central Asia. Complicating the matter is the issue of overlapping identities which, for the most part, reflects the Soviet influence in the region. The Soviet Union traditionally promoted ethnic rivalries and even fostered primordial identities among Central Asia's diverse ethnic groups to advance Moscow's domestic and foreign policy objectives.

We can appreciate the complexities of the current inter- and intra-ethnic conflicts in Central Asia by analyzing some concrete examples. Today, almost 45% of the population of Tajikistan is under the age of fifteen and over 75% of the country's total population lives in rural areas. Since most European-descended residents of Tajikistan live in urban areas, buttressed by large numbers of Uzbek and Kyrgyz urban dwellers, the proportion of native Tajiks residing in rural areas exceeds 80%. According to the 1989 census, some 918,000 Tajiks lived in neighboring Uzbekistan and 72,000 resided in neighboring Kyrgyzstan. This fact alone has created a fluid cultural boundary between Tajiks, Uzbeks, and Kyrgyzs.

Furthermore, Tajikistan may be divided into five distinct regions in terms of socioeconomic development, topography, and to some extent, culture, religion, language, and ethnicity. The regional differences and loyalties have played a decisive role in political strife and regional turmoil in which the country has been involved. The most distinct region, the Gorno-Badakhshan Autonomous Oblast located in southeast Tajikistan in the Pamir mountain range, is, in many ways, the least developed area. Its inhabitants regard themselves as Pamirs, not Tajiks. They speak six languages or dialects belonging to the eastern Iranian linguistic family as distinct from the western Iranian variety spoken by most Tajiks. Unlike the Sunni Tajiks, the Pamirs generally belong to the Ismaili branch of Shia Islam.

The second region, the Leninabad or Khojand district, is the most developed area of Tajikistan and contains a significant Uzbek community. The Dushanbe region and its western Hissar area, the third geographic subdivision, are relatively developed and also contain some Uzbek people. The fourth part, the Garm valley northeast of Dushanbe, is mountainous and agricultural. Religiously, it is the most traditional part of Tajikistan and one of the most conservative

areas in Central Asia. The southern oblasts of Kulab and Kurgan-Teppe, now joined in the Khalton Oblast (the fifth region), are also traditionalists.

Given their configuration, Tajik ethnicity is not well defined. In recent years, some Western and Russian scholars have sought to construct a Tajik identity based on a combination of language and religion. According to this concept, a Tajik is any Sunni Muslim Persian speaker. This definition helps to distinguish Iran's predominantly Shia inhabitants from their Persian-speaking counterparts in Tajikistan, but it fails to pose a clear and cohesive definition of Tajik ethnic identity. Some 8 million people in Afghanistan fit this definition of Tajik identity but have shown little inclination to identify with their brethren to the north politically. Generally, the difficulty of establishing a Tajik identity is the principal obstacle to developing a strong sense of Tajik nationalism among Tajikistan's population. In many respects, this also explains the persistence of a strong regional loyalty that has bedeviled the nation-building process in post-Soviet Tajikistan and elsewhere in Central Asia.

In some respects, many groups in today's Central Asia are victims of Stalin's nationality policy that sought to create distinct ethnic groups based on a presumed common history, language, and territory. Stalin's nationality policy was designed to restructure age-old complex identities that had been formed in Central Asia in order to allow the state to manage conflict between Russian and non-Russian nationalities. Stalin ignored the fact that Central Asia was a multiethnic region with shared overlapping ethnic identities and common Turkic and Persian cultures, especially in literary, academic, and administrative domains. The vast majority of Central Asian people lacked a territorially-based national or ethnic identity. Stalin's policy of artificially creating this type of attachment failed in Tajikistan, partly because he deliberately excluded important parts of Persian-speaking and Tajik-inhabited areas from the Tajik Soviet Socialist Republic. Two important centers of Persian culture, the cities of Samarkand and Bukara, emerged as parts of Uzbekistan. The isolated capital city of Dushanbe, once the site of a small market, had little attraction for Tajik intellectuals whose absence severely hampered the subsequent development of Tajikistan and contributed to the Tajik-Uzbek tension for years to come.

On the other hand, Uzbeks constitute over 23% of Tajikistan's total population. Owing to a long history of miscegenation, many families have Tajik and Uzbek identities. It is common for some members of a nuclear family to identify themselves as Tajiks and others as Uzbeks. This partly explains the

sensitivities of Uzbekistan to political developments in Tajikistan, and why the Uzbek government has sought to create a friendly protectorate in Tajikistan. We see the same pattern of shifting identities in other places in Central Asia. In Kazakhstan, for example, the large Russian minority has intermingled with the local Kazakhs for decades leading to the creation of a dual Russian-Kazakh ethnicity. Of all the Central Asian countries, Uzbekistan has been the most active practitioner of using its ethnic brethren to advance its influence in other parts of the region. In the case of Kyrgyzstan, the government has provided incentives to its Russian-origin population to reverse their out-migration in order to balance the influence of Uzbek's population in the country.

Islam, especially political Islam, has also been a major source of ethnic conflict in Central Asia. Most Central Asians are Sunni Muslims with varying degrees of religiosity. Prior to the Bolshevik Revolution of 1917, more than twenty-five thousand mosques functioned in Central Asia. Beginning in 1928, the Soviet government destroyed the overwhelming majority of these mosques. World War II temporarily halted the Soviet destruction of mosques and other houses of worship. In fact, during the War, some mosques were allowed to reopen as Stalin sought to appease the Muslims of Central Asia. From 1959 to 1964, Stalin's successor, Nikita Khrushchev, launched the second major concerted assault against Islam in Soviet Central Asia. Despite its brief duration, this period left more devastation than the earlier attacks, as nearly all village mosques throughout the Soviet Union were eliminated. Beginning in 1978, a new rapprochement between the Soviet government and Islam resulted in new mosques being built and a certain revival of Islam permitted in Central Asia. Mikhail Gorbachev's accession meant the onset of *glasnost*, and religious revival as a form of the reassertion of cultural and ethnic identity received a new boost. Throughout these periods, Islam and Islamic identity remained vivid in Central Asia, especially in rural areas.

The vitality of Islam and its persistence as a part of people's identity in Central Asia was partly traceable to the existence of a "parallel" or "nonofficial Islam" in the region. In 1941, the Soviet Union installed an "official clergy" to control the religious activities of its Muslims and to formally recognize their spiritual needs. The disintegration of the Soviet Union led to the demise of the official religious hierarchy and institutions, and many of the Soviet era Muslim religious officials lost their authority. However, some members of the official clergy were able to reassert their authority and reinvent themselves as champions of their national or ethnic communities. For example,

Haji Akbar Turojonzade, the young *Qazi Kalan*, or Grand Qazi, in Dushanbe at the time of Gorbachev's *glasnost*, revived his source of authority independent of the state apparatus, and became one of the influential religious personages in Tajikistan. Turojonzade later emerged as an important member of the political opposition and led the United Tajik Opposition delegation in its negotiations with the government of Tajikistan from 1994 to 1997. Shortly after returning to Dushanbe in February 1998, Turojonzade joined the government as first vice prime minister in charge of Tajikistan's cooperation with the Commonwealth of Independent States, the loosely organized entity that binds the former union republics of the Soviet Union. Tajikistan represents a good example of how political Islam has served as a vehicle for ethnic conflict management by providing the country's diverse groups an inclusive umbrella to resolve their differences. Uzbekistan, on the contrary, has instituted an iron fist policy against the country's religious elements and has suppressed dissent. Thus, political Islam in Uzbekistan has been forced to operate underground and has become radicalized to the detriment of inter-ethnic harmony in the region.

Perhaps the unintended consequence of combating political Islam in Central Asia has been the revival of seemingly nonpolitical Islam in the region. A good example of this development is the popularity of the various Sufi mystical brotherhoods throughout contemporary Central Asia. Two Sufi *tariqa* (brotherhoods)—the Naqshbandi and Qadiri orders—dominated Soviet Islam in Central Asia and the Caucasus. The former was founded in Bukhara in the fourteenth century, while the latter was a twelfth century Baghdad-based order but became important in the Caucasus after the nineteenth century. The Naqshbandi *tariqa* had a long tradition of opposition to Soviet control, and the Sufi masters, or *murshids*, were highly revered by their followers and the general populace. Although these "parallel" Islamic movements are now generally apolitical and socially conservative, they nevertheless have a potential of developing into opponents of Central Asian governments, especially the most repressive ones. Also, since the base of support of these movements is regional, rather than being focused in one country, they can serve as a lightning rod for ethnically based political movements throughout Central Asia.

In general, Central Asia has fared better than many other parts of the so-called Soviet bloc in managing its ethnic conflicts. Notwithstanding its ethnic diversity, its regional rivalries, and its relative underdevelopment, various nationalities, and ethnic communities in the region have coexisted peacefully for the most part. This is largely due to the region's

common history, its tradition of accepting outsiders and outside influences, and accommodating them to their own unique circumstances.

## ETHNIC CONFLICTS: COMMONWEALTH OF INDEPENDENT STATES

Stalin's celebrated formula—nationalist in form, socialist in content—seemed to many of his followers (as well as to some who were not) a brilliantly successful solution to the problems posed by nationalities in conflict. In the USSR, Soviet identity came to take precedence over any other. This seemed true to such a

seamless degree that when Mikhail Gorbachev (1985–1991) initiated Perestroika he was genuinely taken aback by the irruption of nationalism which took place on home ground as well as in Eastern Europe. The evolution of socialist society had made such manifestations redundant, or so it was thought. Even more unexpected was the emergence of interethnic hatred, a phenomenon last witnessed during the Second World War.

To Gorbachev's astonishment it reappeared in February 1988. This is when the Armenians in High Karabakh (a mountainous enclave of less than two hundred thousand people inside Azerbaijan) declared its borders (drawn up artificially under Stalin) as invalid. Their intent to make the territory a part of Armenia was greeted by a fury of killings by both Azeris and Armenians, which began in the industrial town of Sumgait near the Caspian Sea. In the next two years, the bloodshed turned into something between an insurgency and war. Azerbaijan refused to surrender High Karabakh, and turned against Moscow too when Soviet troops fired on nationalist crowds in Baku early in 1990. Moscow was thought to favor the Armenians because they were fellow-Christians: Armenians for their part tended to believe that Moscow surreptitiously supported the Azeris because of their oil.

Georgians, although Orthodox Christian too, were also tempted to remember ancient wrongs, particularly the way in which the Red Army at Stalin's urging stamped out their independence at the end of the Civil War in 1921. In April 1989, strikes and demonstrations in Tbilisi, the Georgian capital, called for a return to the country's independent status and were promptly broken up with shovels wielded lethally by the security forces. More than a dozen Georgians were killed, their bodies being laid out on the capital's main street and covered solemnly with flowers.

In the same year, there were riots in Central Asia, when Uzbek gangs assaulted and killed Meshketian Turks of Georgia, who had been deported to Uzbekistan in 1944, the year in which Stalin had several nationalities in the Caucasus rounded up by Beria and Abakumov. In 1990, a massacre of Uzbeks by Kirgiz occurred in and near Osh, the second city of Kirgizia; but the Russia Federation's most serious locus of ethnic strife turned out to be Chechnya.

### The First Chechen War

The tiny Autonomous Republic of Chechnya-Ingushetia was formed in 1934, and by the 1990s had a population of about nine hundred thousand

indigenous people as well as about three hundred thousand Slavs, most of them Russians. Chechens could not forget or forgive the treatment they received at the hands of the NKVD (Soviet Secret Police) at the end of the Second World War. Accused of collaborating with the German occupying forces, male Chechens were dispatched in freight wagons to eastern islets of the Gulag Archipelago, where their courageous conduct in standing up to the brutality and indignities of the camp guards was praised by Alexander Solzhenitsyn in his famous book.

The moment for revenge dawned under the charismatic leadership of General Jokhar Dudaev (1949–1991), a Chechen who served in the Soviet strategic Air Command. While stationed in Estonia, Dudaev came to admire the Estonian struggle for independence, and in 1991–1992 he declared separation from the new Russia of Boris Yeltsin (1991–1999) as well as from Ingushetia. Dudaev's nationalism did not take the Baltic form. The street names in downtown Grozny, the Chechen capital, retained their Cyrillic nomenclature, but Dudaev did assert his new-found Islamic identity. So did most of his comrades who had previously been considered Soviet and therefore free of religious contagion.

Yeltsin for his part (when he ousted Gorbachev from power at the end of December 1991) had allowed the union republics to fall away from the USSR, inviting them in a generous moment, to help themselves to sovereignty. The Commonwealth of Independent States that replaced the Soviet Union was seen as a free association of ex-Soviet republics with few spelled out commitments; but Yeltsin's view of the Russian Federation over which he presided was very different. The 1992 Federation Treaty (which Chechnya and Tatarstan did not sign) bound together eighty-nine territorial units. Of these fifty-seven were largely Russian provinces and other units and thirty-two autonomous republics and regions.

Given this complex patchwork, Yeltsin feared an unraveling effect on the so-called autonomous republics within the Federation if he allowed Chechnya to secede. He sent in airborne units to quell separatism; and when this did not work, he tried negotiation and other tactics. In December 1994, the distrust and mutual provocations turned into the First Chechen War.

Forty thousand troops entered Chechnya through Ingushetia, and the bombing and battering received by the towns and villages reminded television viewers of the horrors of the Second World War. Although the capital was captured in January 1995, the "uprising" could not be crushed. Chechens fought a guerrilla war they believed in on familiar terrain. Russian troops, on the other hand, were largely conscripts

whose conventional tactics and poor pay and training resulted in the loss of some eighty thousand to one hundred thousand lives. This is four times the number of losses the USSR sustained in the Afghan war. What made the Chechen war even more bitter was the fact that the massacres and atrocities were not confined to Chechnya itself. In 1995 Chechens kidnapped about one hundred hostages in the south Russian town of Budennovsk. A Chechen raid on Russian-held Kizlyar followed this in 1996.

In light of all these reverses and casualties it is not surprising that the Duma passed a no-confidence motion on Yeltsin, and even officers who had earlier supported the war joined the anti-war chorus. On the Chechen side the greatest loss was the death of General Dudaev in April 1996, when a Russian missile homed in on his cell phone. In August General Alexander Lebed (who had supported Yeltsin during the attempted Communist coup three years earlier) was dramatically sent off to Chechnya to work out a peace treaty with Dudaev's feuding successors. It was finally agreed to postpone the insoluble issue of Chechen independence for another five years. But the legacy of hatred and suspicion failed to fade away, being kept alive in Moscow by the presence of Chechen crime gangs. In 1999, the war broke out anew, this time under the aegis of a young president in whose favor Boris Yeltsin had resigned at the end of that year.

## The Second Chechen War

The second Chechen war began in September, and it seemed at first to boost President Vladimir Putin's popularity. After an eight-week siege, Russian Federation forces were able to occupy the Chechen capital again, but in the process Grozny was largely destroyed. Among the casualties were the city's remaining Russian-speaking inhabitants who, unlike the Chechens, were unable to escape to the hills. Their timely evacuation was not—or could not be—considered. Putin's prosecution of the war (which he was told by his advisers would quickly end) had substantial backing. At the beginning of the year 2000, close to a quarter of the public supported it. But in the following year this slipped to 7%.

What seemed like a victorious war, won by impressive conventional onslaughts with artillery, tanks, and air power, soon came to remind the public of Afghanistan. There too a conventional Soviet war had turned into an insurgency which the Red Army was not trained to fight. President Putin's refusal to abandon Chechnya, however, is not difficult to

explain since it reflected Yeltsin's earlier fear of the "Yugoslavization" of Russia. With the flame of Moslem fundamentalism ignited in the Caucasus, it could catch fire on the Volga and pass on to Tatarstan, the worst-case scenario being the fragmentation of the Russian Federation into independent and belligerent republics of which Chechnya would be the first.

### **Chechnya and September 11, 2001**

Putin was convinced that the bombing of Moscow apartment houses in 1999 was carried out by Chechen terrorists (and not, as some Muscovites believed, by Russian security forces, doing their utmost to justify a new war). These convictions of Putin's were instrumental in shaping his attitude to the events of September 11, 2001. The Russian president was the first foreign leader to call President George W. Bush to express his sympathy and condolences. On September 22, he went further still by meeting the leaders of his armed forces on the Black Sea, where he won their support for America's war on terrorism. At Putin's behest Russian air space was opened to US airplanes in prosecuting that war, and he used Russian influence in the Central Asian republics to permit American use of the Russian Federation's facilities in pursuit of American anti-terrorist aims in Afghanistan.

As a result of all this, the Chechen war came to be seen in a different light in the United States. Putin had all along claimed that the Chechen conflict was inspired not by a quasi-legitimate national movement for independence (as most Europeans believed) but by traditional banditry and barbarism, sustained by Islamic fundamentalism and terrorism.

The US government, given its own experiences in the second war with Saddam Hussein's Iraq, came to be far more sympathetic to this view, as a result of which American media coverage of the conflict in the Caucasus (for the most part unfavorable to Moscow) changed. In fact, atrocities continued to be committed on both sides.

Nor did international organizations cease their criticism of Russian military and security forces for their human rights violations. Hostage taking, abductions, torture, executions of both civilians and military or quasi-military personnel as well as of journalists, and looting became regular features of the conflict, marked too by the daily disappearance of Chechens suspected by Russian officers of working with the terrorists. The election in October 2003 of Ahmed Kadyrov as Chechen president, who enjoyed Putin's backing and formed his own militia to protect

his supporters, did little to put a stop to this violence. Indeed, half a year later Kadyrov was assassinated in a bomb attack which demonstrated again that despite the detention camps and massive Russian outlays in munitions and armaments, not only was Chechnya ungovernable, but the insurgency had developed ties with Islamic terrorism which could not be controlled.

Some such realization first dawned on Muscovites in 2000 and 2001 when bombs were set off in a subway station and then in a pedestrian tunnel, killing eight people and injuring twenty. Then, in October 2002, at a Moscow theater staging a popular musical, a large group of Chechen men was joined by "black widows"—a female contingent who had come to avenge their missing relatives. The entire audience was taken hostage.

The Chechens promised to start killing their hostages at the end of three days. To prevent this, special forces surprised both the Chechens and the hostages by pumping a gas into the auditorium. This certainly disabled the Chechens, some of whom were finished off by commandos in gas masks who stormed the theatre. But due to the effects of the gas—the name of which was kept secret from the medical personnel called in to help—many more hostages died than Chechens, i.e., more than a hundred.

The horrors continued. In July 2003, also in Moscow, two "black widows" blew up seventeen young people at a rock concert (as well as themselves). At the end of the year, another "black widow" blew herself up in front of the National Hotel, which faces the Kremlin. Five other people were killed. In February 2004, there was a suicide bombing inside a crowded subway car. Some forty people were killed and more than a hundred injured.

The most savage killing occurred not far from Chechnya's borders in September 2004, at an Ossetian school in Beslan. With the help of an Ingush carpenter who had helped hide explosives inside the school during the summer, Chechen terrorists blew up the school gymnasium in response (so it was claimed) to an emotional incursion by fathers trying to save their sons and daughters. Of the more than three hundred and fifty people who died, more than half were children. Millions witnessed this particular horror. Television cameramen were at the scene from almost the beginning of the gruesome crisis.

Yet despite the atrocities of the Chechen conflict, the breakup of the Soviet Union, which resulted in the appearance of fifteen independent states, was surprisingly peaceful. The inter-republic wars many had predicted did not occur. Nor is it likely that Ukraine's Orange Revolution of January 2005 will bring that prospect closer. The Chechen wars, the roots of which

can be traced to tsarist colonial expansion in the nineteenth century, represent a struggle within the Russian Federation itself rather than one between the Federation and another newly created republic. It is also worth noting that Russian troops—except in the case of Chechnya—have not played a major role in any of the ethnic conflicts previously described. In the fighting between Armenia and Azerbaijan over Nagorno-Karabakh Gorbachev tried to be fair to both sides. Nor is the more recent (and successful) rebellion of the Abkhazians against Georgia one in which the presence of Russian troops decided the outcome. Russian interventions have been marginal and are in the future more likely to be economic in nature, rather than military (as in the Chechen case).

#### ETHNIC CONFLICTS: EAST AFRICA

East Africa is usually considered the area between the Indian ocean and Central Africa, bordering with Somalia, Ethiopia, and Sudan on the north, Great Lakes in the west, and Mozambique, Malawi, and Zambia on the south. There we see a variety of languages, cultures, and historical experiences. Probably

the only reliable criterion to detach the region is the spread of the Swahili (or Kiswahili—a form mixed with the Arab language) group of languages. Included within the linguistic rubric of Swahili is an entire diverse and heterogeneous region. Swahili is both the native tongue of a specific people—“the Swahili”—and a lingua franca spoken by more than 50 million people throughout the region. This language is one the few lingua francas among the more than one thousand languages spoken on the African continent, and therefore one of the most widely used. Countries that primarily make up the Swahili-speaking region are Kenya, Tanzania, Uganda, Rwanda, and Burundi. The Swahili-speaking area also extends into southern Somalia, eastern Democratic Republic of Congo, and parts of northern Mozambique as well as the Comoros Islands. Geographically, the region is prominent with its magnificent physical features—the two highest mountains in Africa, Mount Kilimanjaro and Mount Kenya, the biggest lake in Africa, Nyanza—also known as Lake Victoria—the source of the longest river in Africa—Nile. The region is also famous for its wildlife reserves, located at the Serengeti and Ngorongoro crater in Tanzania and Masai Mara in Kenya. Instability and clashes, however, not only reduces prospects for international tourism, but seriously endangers these natural treasures. Many anthropologists locate here one of the primary sources of the human civilization over 2 million years ago.

Pre-colonial East Africa has been politically important with the several large kingdoms dominating regional affairs. Two of them—the Kingdoms of Uganda, and of Rwanda—now constitute the core of the modern nation-states, respectively, of Uganda and Rwanda. The coastal regions' powerful city-states brokered trade between the interior and the Indian Ocean. Extensive trade networks penetrated the region and linked together various people, reaching deeply inside of Central Africa and eastward across ocean as far as India. At various times the esteemed trade items were gold, ivory, gems, slaves, salt, and foodstuffs, especially spices grown in Zanzibar. Swahili and Arabic-speaking merchants were interacting for at least one thousand years, and thus Islam was brought to the shores of East Africa. Politically, the region is known for its arrangements that generally prevented well known elsewhere in Africa military coups d'état and military regimes. Kenya and Tanzania created relatively stable polities that survived shakings following the departure of historical leaders such as Jomo Kenyatta and J. K. Nyerere. African socialism Ujamaa system created by Mwalimu Nyerere, the first president of Tanzania, avoided extremities and rigidity of the Soviet- and Maoist-based quasi communist regimes.

This region also became known for its hospitality to refugees and other politically deprived. It was known for its involvement in the fight against apartheid in South Africa and for providing refugee facilities for freedom fighters from Zimbabwe, South Africa, Mozambique, and Angola. More recently it has appreciated refugees from Rwanda, the Sudan, and Somalia.

In the same time East Africa was the stage of the one of largest-scale wars in the post-colonial Sub-Saharan Africa, that between Tanzania and Uganda. It was not spared of sparkling ethnic conflicts. Scarce and unequal access to natural resources and power, inadequate state structures, ethnic mistrust and ethnocentrism, border tensions and proliferation of illicit arms into the hands of tribal chiefs, warlords, and fellow tribesmen are among the causes of many other inter-ethnic conflicts in the region. Among the other, East Africa endured within less than a century change of several colonial powers—Belgian, British, German, as well as the Portuguese and Italian. As elsewhere in Africa, these colonial powers have settled borders between colonies—inherited later by the independent states there—without reference to the distribution of territory among local tribes and ethnicities. This left a potential for territorial disputes and clashes.

Cattle rustling and land clashes are the main, often underestimated, manifestation of conflicts in Kenya, Tanzania, and other countries in the region. In response to the cattle rustling menace that has ravaged the vast and rugged region, indigenous communities have elaborated and institutionalized mechanisms of resolving intra- and inter-community conflicts whether. The elders in the involved communities form a dominant component of these traditional mechanisms of conflict management. They command authority that makes them effective in maintaining peaceful relationships and community way of life. They control resources, marital relations, and networks that go beyond the clan boundaries, ethnic identity, and generations. The elders are believed to hold and control supernatural powers reinforced by belief in superstitions and witchcraft. This shapes basis of the legitimacy of traditional conflict resolution mechanisms amongst the pastoralists.

Such traditional structures are, however, considered as archaic, barbarian, and thus they lack a place in the modernity. As a result, governments fail to appreciate, collaborate, and complement the traditional methods of resolving conflicts. Instead, there should be enhanced collaboration and networking between the government and customary institutions of governance. Official authorities should recognize and support how customary courts enforce their

rulings. The elders should be trained in modern methods of arbitration and at minimum, traditional mechanisms of conflict management should be more sensitive to the universally accepted principles of human rights.

The regional problem of illicit arms that has scaled up the severity and frequency of cattle raids should be addressed by the governments in the region. These arms have also sneaked in the veiled aspect of commercialization of cattle raids in the region. Pastoralists are no longer raiding to replenish their stocks especially after periods of severe drought and animal diseases, but are increasingly raiding to enrich themselves by engaging in trade of stolen livestock. This aspect has overwhelmed traditional conflict resolution mechanisms and should be addressed.

This region already knows a relatively brief, but devastating war between Uganda and Tanzania in 1978–1979. During the eight years of his rule, Ugandan dictatorial president-for-life, Idi Amin, expelled all Asians, killed thousands of tribespeople and Christians, and excessively built up his army. As a result of defections and executions, by 1978 Amin's circle of close associates narrowed significantly. Hoping to divert attention from his internal troubles, in October 1978, Amin sent troops still loyal to him to invade Tanzanian territory. He accused his perennial enemy, Tanzanian President Julius K. Nyerere, of waging war against Uganda. President Nyerere reacted with sending an army, reinforced by Ugandan exiles who had fled their homeland to escape Amin's tyrannical rule, and united as the Uganda National Liberation Army (UNLA), across the border into Uganda. The Ugandan Army retreated steadily, expending much of its energy by looting along the way. Tanzania and the UNLA surrounded the Ugandan capital of Kampala, but were halted briefly by a three thousand-strong Libyan force that had come to fellow Muslim Amin's aid. Kampala was captured in April 1979, and Amin fled by air, first to Libya and later to a permanent exile at Jiddah, Saudi Arabia, leaving behind an impoverished Uganda and a brutalized people. The war cost Tanzania an estimated \$1 million US dollars per day.

The bloodiest among ethnic conflicts in the region is the one between the Tutsi (known also as Batutsi or Vatusi) and Hutu. Ethnic tension between the Hutu and Tutsi tribal groups has centuries old record. A pre-colonial feud between the Hutu and Tutsi was based principally on a basic contradiction between the agriculture and cattle-breeding, and social interchanges between the two groups remained uncongealed. The Hutu are generally shorter than the Tutsi, have darker skin and tend to be farmers, while the Tutsi are generally herdsmen. Both the German and Belgian colonial rulers favored the

Tutsis for positions of local power. This severely prompted processes of increasing ethnic distrust, anxiety, and hatred. The Hutu “revolt” of 1959 led to Rwandan independence in 1962, which, however, led to further divisions, ethnic segregation, and discrimination. Existing ethnic rifts were then exacerbated by such significant factors as the scarcity of land, the civil war, structural alignments, decline of the coffee prices at world markets, Rwanda’s position as a landlocked country with limited prospects for economic diversification, and an implicated and hostile governmental regime. Ethnic rivalries in the mountains of East Africa have claimed the lives of millions of Africans. When Rwanda’s and Burundi’s Presidents Juvenal Habyarimana and Cyprien Ntaryamira died in a plane crash in the skies above Kigali on April 6, 1994, this triggered violence that had clutched the country for the past more than three years. Many experts in the region now believe a Hutu extremist shot down the plane. A French investigation points at the current President of Rwanda, Paul Kagame, as directly involved in the plot. Between April and August of 1994, this accumulated tension turned into one of the most terrible acts of genocide of the twentieth century. More than 1 million people, primarily Tutsi, were killed, and 2 million forced into exile. The roots of this tragedy are exceptionally complicated, involving environmental scarcity, overpopulation, poverty, victimization, and ineffective, corrupt governmental policies. However, the inherited burden of severe ethnic cleavage and animosity certainly played a meaningful role. Ethnic tensions in the region continue, though most Hutu and Tutsis had returned to their homes by 1997.

One of the most important questions that has been asked frequently since the resultant genocide is, “Could this tragedy have been prevented?” Most atrocities seem impossible to imagine until they actually happen. Nevertheless, there might be warning signals that should be acknowledged and acted upon in the interests of preventing the eruption of similar conflicts and tragedies in the future.

Renewed fighting in 2004–2005 among various groups in eastern Democratic Republic of Congo in areas close to the border with Uganda, has triggered new influx of refugees. Fighting in eastern Democratic Republic of Congo is cleaving open a bloody front in a long-standing ethnic conflict in Africa’s Great Lakes region. The battle for Bukavu implicate politicised disputes over a national Congolese army formed under a peace deal to end one of Africa’s worst ever wars. The renewed fighting is essentially an extension of the ethnic struggle between Hutus and Tutsis. This conflict covers already four neighbor states—Congo, Rwanda, Burundi, and Uganda. The bitterest

national enmity is between Congo and Rwanda’s Tutsi-led government, which twice invaded its massive neighbor, in 1996 and 1998, accusing Congo of not doing enough to control Hutu militia known as Interahamwe who fled to eastern Congo’s mountains and jungles after leading the 1994 genocide. Years of warfare polarized the two governments on opposite sides of the Great Lakes ethnic fault line, with both supporting proxy fighting forces in the conflict in eastern Congo, where local ethnic Tutsis are known as Banyamulenge.

Rwanda backed Congo’s main rebel movement in a five-year war, leaving 3 million people dead, mainly from hunger and disease. Congolese President Joseph Kabila accused Rwanda of helping the renegades. Rwanda denied the accusation, but warned that it would “play its role in opposing genocide.” This recent fighting in North Kivu between former rebels-turned-government soldiers and former Mayi-Mayi militias, integrated into the Congolese national army, proved once again that tension in the region continues. Analysts say mineral riches, which include gold and diamonds, are a major draw for containing forces in the war, complicating any conflict in the area.

An additional aspect that proves to be a menace for the region are crucial aspects of political change, ethnic conflict, and conflict regulation in the larger region around the Horn of Africa, with the interplay of ethno-regionalism, religious identity, and elite power politics in the context of growing international or global pressures (political, economic, and cultural) furnishes such concomitant factor. It comes with another source of refugees from war-torn areas in southern Sudan, Ethiopia, Somalia, arms smuggling, and armed gangs’ proliferation. This complicates situation in Eastern Africa and puts under severe ordeal otherwise resource-poor capacity of the region to cope with challenges.

## ETHNIC CONFLICTS: EAST ASIA

### Historical Background

In terms of geopolitics, one of the most important developments in continental eastern Asia in recent centuries was the expansion of China at the expense of several other countries. During the last ethnically Chinese dynasty (the Ming, 1368–1644), China was confined to what we might call “China Proper,” that is the ethnic Han (Chinese) areas. When the Manchus swept down from their homeland north of Korea and overran China Proper in 1644, they then kept marching until several other countries were incorporated into their empire. The Republic of China (founded in 1912) laid claim to most of the old Manchu-controlled territories. However, it was able to directly control few of the non-Han lands, and was forced to give up its claim to Mongolia Proper (“Outer Mongolia”), retaining only Inner Mongolia.

### China Under Communism

The People’s Republic of China (PRC, established in 1949) was able to realize control over virtually all of the territory that the old Republic had claimed, except

Taiwan (where the Republic was perpetuated). The non-Han areas have been administered according to a variant version of Leninist ethnic principles. That is, the state is structured in such a way as to give these territories nominal autonomy, but the Chinese Communist Party (in which the real power usually resides) has been strictly centralized and dominated by Hans.

Altogether, on Mainland China there are fifty-four officially recognized minorities, with a population of over one hundred million people, occupying about 60% of the PRC. Sometimes, ethnic designations were created precisely to permit the Chinese to handle ethnic issues their way. Thus, China’s largest ethnic minority, the Zhuang, is essentially an artificial construct. Some minorities have never been officially recognized. In a few cases, the Chinese have practiced divide-and-rule. Thus, for example, more than half of ethnographic Tibet was carved off and assigned to various Chinese provinces. Although the Chinese have been able to hold all of this together, the system they created has given rise to tremendous tensions.

Depending on the political winds, ethnic groups are usually granted some *cultural* autonomy. (There is no meaningful *political* autonomy, and self-determination is out of the question.) But even cultural autonomy has its limits. Many of the ethnic groups are deeply religious, which sets up an immediate contradiction with the atheistic Communist rulers. Although certain “patriotic” religious groups are officially permitted, members of the Communist Party are required to eschew religion. In the case of devoutly Buddhist Tibet, during the Cultural Revolution (1966–1976) Red Guards and others ran roughshod, destroying the vast majority of temples, and killing many people. Today the Tibetans comprise an occupied nation, with virtually everyone longing for the return of their exiled leader, the Dalai Lama.

Ten of China’s ethnic groups adhere to Islam: Hui, Uyghur, Kazakh, Donxiang, Salar, Bonan, Kyrgyz, Tajik, Uzbek, and Tatar. Aside from the issue of religion, the Hui are closest to the Chinese in language and culture. Most speak Chinese and are scattered around the PRC; they often live in harmony with the Hans. However, the Hui comprise a complex mosaic, and ethnic conflicts are not uncommon. For example, in 2004, in Henan Province fighting, sparked by a motor vehicle accident, broke out between Hans and Hui, the latter soon aided by brethren from other parts of the country. Unofficial reports of the number killed ranged from a dozen to 150. Ten thousand anti-riot and military police were required to restore an uneasy peace. The event was widely reported abroad, but there was no mention of it in the Chinese media, which is tightly controlled, especially when it comes to sensitive ethnic issues.

Uyghur-Han relations are even more problematic. The Turkic Uyghurs occupy a discrete territory, the Xinjiang Uyghur Autonomous Region, which some would prefer to call Eastern Turkestan. Since 1949, there have been at least ten serious clashes, and more than a hundred minor ones. Those who would be rid of Han domination are deemed criminally subversive. In 1994, the authorities variously identified sixty counterrevolutionary Uyghur organizations, and in 1999, there were said to be sixty-eight underground organizations. When caught, such dissidents are subject to long prison terms and sometimes are executed. Some independence advocates have sought asylum abroad (especially in Turkey, Germany, North America, and the countries of the former Soviet Union), where they continue to press their cause. The “cause,” for moderates, means achieving genuine autonomy within, and for radicals it means to emulate the world’s other seven Turkic countries as a sovereign state, theirs to be based on Muslim law and traditions.

Even though birth control policies are somewhat more relaxed for ethnic minorities like the Uyghurs compared to Hans, demographics do not favor ethnic minorities such as the Uyghurs. Pursuant to China’s “Go West” campaign, there is a continuing influx of Hans into Xinjiang from other parts of the PRC. Uyghurs now comprise only 47% of Xinjiang’s population, down from about 90% in the 1940s. This is a trend that breeds considerable resentment. However, the international “war on terror” has provided China some cover in waging its own struggle against China’s Uyghurs and other Moslem militants.

The half of greater Mongolia that is not part of the Republic of Mongolia (the designation dates from 1992) is comprised of a truncated version of Inner Mongolia, known officially as the “Inner Mongolia Autonomous Region” of China. Although the area now appears relatively stable, during China’s Cultural Revolution it saw worse interracial carnage than any place else in the PRC. Inner Mongols were caught up in the conflict between China and the then pro-Soviet Mongol People’s Republic. Their loyalty was often doubted, and people were subject to systematic screening. By official reckoning, sixteen thousand Inner Mongols lost their lives. Following the Cultural Revolution, Han-Mongol conflict continued, and 1981 saw large-scale protests over such issues as Han immigration. Following the democratization of Outer Mongolia in 1990, several nationalist-democratic movements sprang up in Inner Mongolia, only to be repressed by the Chinese. With the recent conversion of “leagues” to “municipalities,” many Inner Mongols appear to be losing even nominal autonomy.

In the various ethnic regions, Hans, though usually a minority of the local population, occupies key

positions. Party secretaries have almost always been Han, though the government is sprinkled with token ethnics. Hans also tend to obtain the best jobs. For example, in the television station in Xinjiang’s capital, more than 90% of the employees have been Hans. Furthermore, upward mobility for indigenous peoples is generally dependent upon their proficiency in Mandarin. Local cultures tend to atrophy under such circumstances.

Most non-Hans do not receive a Chinese education, and those who do not tend to end up in poverty. Twenty of China’s twenty-five poorest counties are in Xinjiang. Much of Tibet is also impoverished, and child malnutrition is a serious problem. Often, these areas are rich in natural resources, but the locals derive little benefit from their exploitation. Furthermore, China’s notorious corruption is especially prevalent in non-Han areas; Hans appear to be the beneficiaries. All of these factors breed consternation and fuel inter-ethnic hostility.

The quality of life and people’s incomes have been adversely affected by environmental degradation. This is not entirely the fault of the Han, though they are the ones in a position to institute better stewardship of the land. In Inner Mongolia, grassland degradation has caused serious sandstorms and fodder shortages. The Chinese response has been to close numerous pastures so that they can recover ecologically. Hundreds of thousands of Mongol herders have been resettled in suburban areas, much to their resentment. In Xinjiang, Qinghai, and western Inner Mongolia, atomic weapons programs appear to have negatively impacted the health of the locals. The same may be true of China’s Xinjiang-based experiments in bacteriological weapons. Ethnic minorities resent these harmful activities, which they believe the Hans would never carry out in their own areas.

The history of these regions is usually written by Hans, who adhere closely to ethnocentric Chinese interpretations. According to this view, these were all backward peoples who were liberated by the Chinese around 1949, and any progress since is due to the Communist Party. Non-Han scholars and journalists suggest other interpretations at their peril. Many Uyghur books have been banned and destroyed. In Tibet, entry to the Tibetan Department of the main university was suspended for two years in 1995 so that all textbooks could be reissued with less emphasis on religion and especially on the Dalai Lama. Since 2002, several books, including a major encyclopedia of Tibetan history and culture, have been banned for such reasons as having failed to properly convey the Party’s policy on religion and nationalities, and overstating Tibet’s cultural distinctiveness.

Resistance in Xinjiang tends to be violent. An incident typically begins with a shooting or bombing, attributed to a Uyghur. Then there is a crackdown by the Chinese, with many arrests and some executions. For example, after one incident in 2004, fifty people were sentenced to death for “separatist” and “terrorist” activities. Sometimes retribution is even more swift, with indiscriminate shootings of demonstrators and bystanders, and extra-judicial executions.

By comparison, since the mid-1970s, resistance in Tibet has generally been non-violent. The Chinese reaction has been more targeted, with the arrest and long-term imprisonment of dissidents (usually monks and nuns). Resistance has often taken the form of political ritual (the “circle of protest” around the main temple in Lhasa), that earns it considerable legitimacy in the eyes of the international community, where the Tibetan diaspora calls attention to the Tibetans’ cause.

Still, it should be said that not all ethnic minorities are dissatisfied with their situation. The ethnic Koreans in the Northeast, for example, have a higher standard of living and education level than the Hans, and are hardly sorry that fate did not render them citizens of the Democratic People’s Republic of Korea (DPRK). To be sure, during the Cultural Revolution they often faced persecution (and some even fled to the DPRK). But today, the main Korean victims of Chinese repression are the undocumented refugees from North Korea.

### Taiwan, Korea, and Mongolia

Taiwan has an aboriginal minority (about 2% of the population) comprising twelve different tribes, all of Austronesian origin. They often live in the mountainous area of eastern Taiwan. The Hans themselves, depending on one’s interpretation of the situation, may be deemed to be comprised of different ethnic groups. The “native Taiwanese” (who came from China centuries ago but speak the language of southern Fujian province) are in the majority; they were once discriminated against, and sometimes brutally repressed, by the Mainlanders, who ruled the island after 1945. There has been a debate about whether the Taiwanese are the same ethnic group as the Hans, or whether cultural factors and the fact that many have some aboriginal blood make a difference. With the advent of democracy in the early 1990s, relations among the various groups have improved, but the Taiwanese and Mainlanders tend to vote for different parties. Among the indisputable Hans, there is a Hakka minority, who have had considerable success

in gaining recognition and legitimacy for their distinct culture. Virtually all islanders speak Mandarin in addition to any native tongues. Thus, Taiwan today enjoys reasonably harmonious inter-ethnic relations, except, of course, when it comes to the cross-straits relationship.

Korea is mono-ethnic. The tensions on the peninsula are between north and south, with ethnicity not a fundamental problem. Still, the thousands of North Korean refugees who have managed to immigrate to South Korea find themselves in an alien culture, and few are able to make the adjustment to life in the South. The even larger (but unknown) number of Korean Chinese there, though sometimes targets of discrimination, are somewhat more able to adjust. They are often in the country illegally, though there has been pressure from them and from many South Koreans to grant them citizenship. Unlike Korean Chinese, Koreans who left South Korea after 1948 (usually to go to the United States) have virtually the same rights as Korean citizens. The courts have ruled that this form of discrimination is unconstitutional. However, discrimination against Korean Chinese continues, and the legal distinction between older and newer migrants has yet to be resolved.

The Republic of Mongolia comprises only about half of Greater Mongolia. Greater Mongolia actually has numerous ethnic Mongol subgroups, mainly the Halh (who predominate in the Republic), Buryats and Kalmyks (in Russia), groups falling under the rubric of Övör Mongol (Inner Mongolia), and various other Oirat groups elsewhere in China (Xinjiang and Qinghai). To some extent these designations have long cultural roots, but to an even larger extent they have been defined by great-nation geopolitics and socialist experimentation. Although today these sub-ethnic distinctions have strong emotive force (centering on the issue of Mongolian authenticity), they give rise to little outright intra-Mongol conflict, as most Mongols are more concerned with protecting their identity as Mongols vis à vis the Russians or Chinese.

## ETHNIC CONFLICTS: MEXICO AND CENTRAL AMERICA

As a result of the Spanish Conquest in the sixteenth century, the Indian population of the Americas was greatly diminished: from 80 million in 1492 to 3.5 million in 1750. Genocide against Indians is continued today, e.g., in Paraguay, Guatemala, and Brazil. Indians were also subjected to slavery and forced submission.

Some Mexican Indian groups, mainly in the South, were able to maintain pre-conquest self-government. In Central America, where the subjugation was concentrated on the more accessible lands along the western coast, indigenous groups on the Caribbean side either remained out of reach for the Spanish colonizers or resisted them.

### Amerindian Struggles for Autonomy, Recognition, and Social Justice

There were several cases of armed ethnic conflict in Mexico and Central America: The Kuna in Panama in 1927, the Miskitu and Sumu in Nicaragua 1981–1987, the indigenous peoples of Chiapas beginning in 1994, the Popular Revolutionary Army EPR-EZLN in Guerrero and Oaxaca since June 1996, and the URNG (1960–1996). All of these groups attained some degree of autonomy, recognition, or political reforms.

The organic mixture of ethno-nationalist and Indian issues with left-wing politics is characteristic for most of these movements. The ethnic conflict of the Indian vs. Hispanic oligarchy and state is also a class conflict: the Indian population is synonymous with

the most impoverished and suppressed section of the population. The main aim of the EZLN, URNG, and EPR was to do away with the absolute power of the small class of (land) owners. The low level of support for the political and institutional system among the Indians reflects the humiliation and general neglect they continue to suffer.

### Root Causes of Conflict, Hybrid Identity, and Racism

The root cause of conflict is the (neo-) colonial mission of spreading *Hispanidad*, a hybrid European-type of civilization. It included the idea of centralizing power and aimed at erecting homogenous nation states, based on assimilation of non-Hispanic groups. But in reality there is no single homogenous nation-state existing in Central America. Recognizing multiplicity would consequently lead to a relationship of mutual respect between Ladinos, Indians, and Blacks in Latin America. But instead the endless search for a so-called “national identity” became the permanent project of the ruling classes in Latin America.

Structural and institutionalized racism in Central American states and in Mexico is based on a doctrine of Ladino superiority and “Indio” inferiority. The militarization of state and society was a strategic objective which was defined, planned, and executed institutionally by the security forces (in Guatemala) or jointly with paramilitary gangs (Mexico). In Guatemala indigenous populations suffered genocidal politics exercised by the small ruling oligarchy through the armed forces, regardless of the form of governance (military or civilian).

### Guatemalan Genocide Against the Mayans 1962–1996

Counter-insurgency against leftist guerrilla forces (EGP, Rebel Armed Forces [FAR], Revolutionary Organization of the People in Arms [ORPA], URNG) imposed “total war” on the Indian peoples. Mayan Indians made up a large part of the guerrilla force. In 1996, after internal armed conflict for thirty-six years, the guerrillas signed a peace accord after a long negotiation process. But the accomplishments of the accords remained very limited. Despite the documentation in the 1999 report of the Guatemalan Truth Commission of atrocities committed by the armed forces 1962–1996, the gravity of the abuses suffered by Indian people has yet to become part of

the national consciousness. Massacres eliminated entire Mayan rural communities as well as the urban political opposition; Ladinos were also oppressed, though to a lesser extent. During the final period, 1986–1996, repressive action affected the Mayan and Ladino population to a similar extent. One of the chief organizers of the Guatemalan genocide, general Rios Montt, became president of parliament and so far enjoys impunity.

### Minority and Majority Indian Populations at the Edge

Population numbers for non-Mestizos depend on who is counting them and based on what criteria. Governments tend to minimize numbers while some indigenous organizations inflate them. Mexico has by far the largest Amerindian population in the Americas, with forty-eight indigenous groups numbering 30 million of its total population of over 100 million.

Within the seven Central American states of Guatemala, Belize, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama are over fifty indigenous nations and nationalities with a population of 9 million people. In Guatemala, native nations (Maya-Quiché peoples) constitute a 50% majority of the 14-million population. The other five countries have a combined population of 25 million people of which 2 million are Amerindians and 1.5 million are Afro-Americans.

The majority of the Indian peoples of Mesoamerica are **Mayan**, who are mostly small-scale peasants. Their epicentre is Southern Mexico and the *altiplano* of Guatemala, but Mayan peoples live throughout Mexico and Guatemala as well as Belize, El Salvador, and Honduras. The single largest Indian group in Mexico is the Aztec in central and Southern Mexico, numbering 1.2 million people. Other major peoples include the Zapotec, Otomi, Mixtec, Totonac, and Mazatec, all numbering between two hundred thousand and five hundred thousand.

**Pipil** and **Lenca** (probably 20% of El Salvador's population) have suffered very high casualties in the war between Farabundo Martí National Liberation Front (FMLN) guerrilla and the US-supported regime. State security and death squads systematically caused "Peasant disappearances." Pipil lands were expropriated by "land reforms."

**Garifuna** (Black Caribs) were relocated by the British to the island of Roatán some three hundred years ago. They now live along the Caribbean in Creole-ruled Belize (40,000), Honduras (150,000), and Nicaragua (5,000). They have suffered racial

discrimination and were used as cheap labour force. In Honduras, the Garifuna, Tawahka Sumu, Miskitu, Petch (Payas), Sikakes (Stolopán), and Lenca recently formed the *Confederación de los Pueblos Autóctonos de Honduras* (CONPAH).

Arbitrary boundaries of today's American states often cut across the homelands of Indian peoples. The **Ngobe** or **Guaymies** (120,000) live in western Panama (2,500 in Coast Rica). The delimitations of the proposed autonomous area (*comarca*) are still under negotiation (since the 1980s); Latin settlers have invaded a part of their lands. Some Ngobe (Guaymi) work on banana plantations of United Brands, a US-based transnational corporation. The **Kuna** (70,000) live along the Caribbean of southeastern Panama. An armed uprising in 1925 forced the new state of Panama to recognize the first autonomous Indian area (*Comarca San Blas*) in Latin America. The state of Panama has developed a reasonably successful nationality policy for its indigenous peoples (15% of Panamá's population) since the 1960s and several more autonomous areas (*comarcas*) have been created.

### Afro-Americans Look to the Caribbean

Afro-Americans (Blacks and Creoles) live along the Caribbean from Belize to Columbia, with the largest numbers in Panama and Honduras. With a total population of 120 million (which includes 35 million in the United States), Afro-Americans are third largest ethnic group in the Americas, next to 360 million Ladinos, and 230 million white Europeans.

Afro-Americans dominate demographically and/or rule in twelve smaller states of the Caribbean region. Black rule exists mainly on the islands (Haiti, Jamaica, most Caribbean micro-states) rather than the continent (Belize, one of three Guyanas). Blacks have large numbers in a several Ladino-dominated states such as Brazil (over 40 million), Colombia, and Ecuador.

### White Rule in All but One Country—Indians Nowhere

Even though indigenous Americans are the majority of the citizens in four of twenty Latin American states, they rule nowhere. **European descendants** continue to exert almost total hegemony on the Americas; although Whites are only a majority in one Central American country (Costa Rica) they rule in all but tiny Belize.

Regionally, there has been some progress towards indigenous control: in May 1990, the very first Indian government took an oath in Bilwi, capital of Yapti Tasba, Eastern Nicaragua.

### **Autonomy and Self-Rule as Conflict Resolution**

Many Indian territories are rich in natural resources, and the states that contain them are reluctant to give them up. Issues of (collective) ownership of land by indigenous peoples and access to natural resources, were the subject of political debate in Nicaragua and also externally, within the framework of the international Indian movement. In the case of Mosquitia, the land issue was one of the factors that directly contributed to the outbreak of war. In the autonomy law issued in 1987, it has been agreed that revenues from natural resources will be distributed 'in just proportion.'

### **Nicaragua: Autonomy for the Caribbean Regions**

Nicaragua's scheme of regional autonomy for its two Caribbean areas (Región Autónoma Atlántico Norte: RAAN, and Región Autónoma Atlántico Sur: RAAS) embraces almost 50% of the national territory but only 9.5% of the population. The division into two regions precludes dominance by one ethnic group (the *Mestizos*). The two regions are multicultural in composition, comprising four indigenous communities, an African diaspora (mainly in RAAS), and a number of *Mestizos*. Autonomy in the two Caribbean regions has existed on paper since September 1987 and in concrete shape in a few pilot projects. The provisions delineate the indigenous settlement-areas but afford them no further legal protection against *Mestizo* immigrants. In practice, the agricultural border is being constantly shifted eastwards as a result of immigration by impoverished *campesinos*.

The rights and guarantees set out in Nicaragua are the confirmation of the multi-ethnic, pluricultural, and multilingual character of the *costeños* (coastal inhabitants) and stipulation of non-discrimination against them, with cultural rights (bilingualism in education and administration); the recognition of the communal property of the indigenous communities, including the land, waters, and forests; the establishment of two autonomous regions

independently administered by elected regional parliaments with elements of a presidential system, since not only a *junta ejecutiva* but also a *coordinador* is elected; and the right to self-identification. The system is based on a balancing and combination of demographic representation and the formal principle of equality. The aim was to reduce inter-ethnic tensions and protect the rights of the small ethnic groups (Sumu, Rama, and Garifuna) against the disproportionate influence of the Hispanic *Mestizos* in the West and the Afro-American Creoles in the South and the Miskitu Indians in the North.

The full implementation of the autonomy law was hampered by political conflicts from 1990 onwards. The political struggles between Sandinistas and the right parties in Managua are continuing in eastern Nicaragua. Conservatives in central government regard the autonomy arrangement as too drastic. The Indian movement has also suffered from internal conflicts.

The Nicaraguan autonomy law is undoubtedly imperfect, but qualitatively speaking it is the best so far produced in Latin America; how much influence it will have, however, depends on whether and to what extent it is ignored or dismantled by Managua. The weak-point lies in the area of regional council control over territory and resources: neither the respective competencies nor the share of revenues between regional and central government is clearly laid down.

### **Panama: the Comarca System**

Panama is regarded as progressive when it comes to recognition of certain Indian rights and the granting of cultural autonomy (though not bilingual education). Territorial self-governance existed for years for the Kuna and Emberá Choco, but not for the more numerous Ngobe (Guaymí) Indians, whose area—due to be designated a *comarca*—has been overrun by *Mestizo* settlers and banana companies.

The best-known area is Kuna Yala, the 'land of the Kuna' (official name Comarca San Blas), a territory extending from El Porvenir up to the Colombian border and including some four hundred Caribbean coral islands. In Kuna Yala, too, penetration by *Mestizo* settlers, loggers, and drug dealers (from Colombia) is difficult to halt. The Kuna largely manage their own affairs. However, the school system is currently run in Spanish. Thanks to their being relatively sealed off from the outside world, their socio-cultural community has survived. However, the economy is partly dependent on external factors, and unequal bartering goes on.

Native inhabitants have guaranteed representation in the Panamanian parliament; this applies to the Kuna and Ngobe (Guaymí). However, the *caciques/congreso* system of internal Indian organization has its shortcomings. Where necessary, it can be manipulated more easily by the authorities than can an elected representative body (such as those in Mosquitia in Nicaragua); on the other hand, it keeps traditions alive.

In the case of the Ngobe (Guaymí) Indians, the authorities have dragged their feet over autonomy negotiations in a series of protracted conflicts over land and administrative rights and roles. Contributing factors have included the size of the territory claimed, which extends over several provinces as well as the disunity, poor organization, and lack of militancy among the Ngobe. However, to combat the government's 'divide and rule' policy, the various Indian congresses in Panama formed a union.

### Mexico: Response to the 1994 Indian Revolt

In the Mexican state of Chiapas, cattle ranchers use an estimated 45% of the territory as pastureland. In contrast, a large number of campesinos work on small plots of generally unfertile land. The constitution of 1917 promised *ejidos*, pieces of the communal farming land, to the peasants, but in Chiapas much less land was redistributed than in the rest of the country. In the 1960s, the struggle for land became violent.

In 1994, the primarily indigenous Zapatista Army of National Liberation (EZLN) staged an armed uprising in Chiapas. Six municipalities around San Cristóbal de las Casas were taken by the rebels. After two weeks of heavy fighting with high casualties a cease-fire was declared. Direct talks between the EZLN and the federal government in January 1995, moderated by San Cristóbal's bishop, reached an agreement to twenty-four demands of the EZLN but excluded political issues on a national level. However, the following month, arrest warrants were issued for EZLN leaders, and the Mexican government launched a large military operation against the EZLN, which fled, along with some twenty thousand indigenous supporters, into the mountains. The Mexican government was never able to find the EZLN leaders, and in March 1995, the Mexican Congress approved dialogue with EZLN. From fall 1995, talks started in San Andrés Sacamch'en de los Pobres (Larrainzar), a Tzotzil Zapatista community in the highlands north of San Cristóbal, but were suspended in August 1996. Militarization

once again replaced dialogue. About 30% of the national army (sixty thousand soldiers) is based in Chiapas.

After winning the 2000 presidential election, Vicente Fox admitted international observers and ordered the withdrawal of Mexican Army. The EZLN accepted to resume negotiations for peace and indigenous rights. They reached some agreement on the rights of indigenous communities and in April 2001 the Mexican Congress approved a constitutional reform on indigenous rights and culture. However, the EZLN rejected the reform, saying it went behind the agreement reached in San Andrés and does not answer the demands of the Indian peoples.

EZLN raised the awareness of indigenous rights and culture throughout the country and internationally. It is noteworthy that the Zapatistas do not want independence from Mexico, but rather to be equal citizens without giving up their indigenous identity.

## ETHNIC CONFLICTS: MIDDLE EAST

According to J. Milton Yinger in *Ethnicity*, an ethnic group can be defined as one whose members share a common origin, whether real or perceived, and share a common culture, including, but not limited to, characteristics such as language, religion, race, and ancestral homeland. An ethnic group may be defined by the larger society around it, or by its own self-perception. All of these characteristics define ethnic, religious, and nationalist groups in the Middle East.

There are competing views of the importance of ethnic identity in creating conflict in the Middle East. Some view conflict to be driven by the deeply-entrenched, hereditary nature of ethnic, sectarian, and religious identities of communities. Others view political conditions to be a stronger factor in manipulating identity-based kinship networks. Identity only becomes politicized when access to resources or power is unevenly distributed between various groups, and membership in a particular group becomes a driving factor in determining that access to political power. Thus, while the Middle East is diverse and multiethnic, ethnic conflict is not inherently caused by this diversity.

Ethnic conflict in the Middle East encompasses ethnic, religious, and political groups engaged in nationalist struggles in the post-WWII era. For example, since the creation of the state of Israel in 1948, the ongoing Israeli-Palestinian conflict centers around competing claims for a separate national homeland for the Palestinian and Jewish peoples. Another case is that of Kurdish nationalists who are seeking political autonomy in the form of an independent Kurdistan in the area encompassing parts of Turkey, Iraq, Iran, and Syria. In Lebanon, competition for political power among Christian Maronites, Sunni, Shia, and Druze led to a breakdown of the political system and to civil war in 1975.

There are several different factors which have led to ethnic conflict in the Middle East. Primary among these is the impact of British and French colonialism

in the region. Colonial policies favored particular minority groups over others in an attempt to create ethnic or religious divisions within the local population and to weaken potential resistance to colonial power. The historical legacy of this divide and rule policy was political instability which erupted into outright conflict once the colonial power withdrew. Lebanon, Syria, and present-day Israel are examples of countries where colonial legacy has exacerbated political tensions between different ethnic groups.

The following subsections highlight the main conflicts in the region, demonstrating the interplay between colonial legacy, nationalist struggle, and ineffective political systems which resulted in competition for political power among the different ethnic religious groups.

### Israeli–Palestinian Conflict

The Israeli-Palestinian conflict has been ongoing for most of the twentieth century. The historical roots of the conflict can be traced back to the British Mandate over Palestine. Both the Arabs living in Palestine and Jewish Zionists seeking a national homeland wanted national independence and self-determination granted to them by the British colonial power. In 1948, the British withdrew from Palestine without resolving the ongoing civil conflict between the two groups. After the state of Israel was created in 1948, Israel annexed more surrounding territory in two subsequent Arab–Israeli wars in 1967 and 1973.

While religious identity is important in defining the foundation of the Jewish state, it is not the only factor in the current Israeli–Palestinian conflict. Primarily the issue is over ownership of territory, and the competing rights to national self-determination between the Palestinians and the Israelis.

One of the outcomes of this conflict is the massive displacement of the Palestinian population into refugee camps in surrounding Lebanon and Jordan, as well as the Israeli-occupied territories. Palestinians in Jordan and Lebanon have caused political tensions in those countries. In the Lebanese case, Palestinian presence exacerbated the Lebanese civil war in the early 1970s. After the second intifada of 2000, the relationship of Palestinians living in the West Bank and Gaza with Israel remains tense and violence-ridden.

### Alawis in Syria

In Syria, the French colonialists divided the country into separate administrative units, stressing the status

of two minority groups, the Alawi and the Druze, as distinct from the rest of the Sunni Muslim population by placing them each in their own administrative unit in opposite ends of Syria. In the meantime, the urban Sunni Muslim population in Damascus, Aleppo, Hama, and Homs became the class that forged nationalist policies and shaped the eventual political future of Syria.

When Syria became independent in 1946, the new political state had to contend with the outcome of these colonial policies. The Alawi made up about ten percent of the population. Post-independence, they inherited a marginalized status in Syrian society, which was dominated by Sunni Muslims. Many Alawi families sent their sons into the military for the opportunities it afforded them. One of these was the Syrian dictator, Hafez al-Assad, who ruled the country from 1963 to 1999. After he took power in 1963, he consolidated his regime by creating an inner circle of Baath party loyalists who shared the same Alawi background. A regime composed of a religious minority ruling over a majority Sunni population created tensions. The result of this was a stronger, authoritarian style of government which effectively suppressed any and all opposition.

### **Sectarian Politics in Lebanon**

French colonial policies of divide and rule in Lebanon are the roots of political conflict between ethnic and religious minorities after independence. French colonialists deliberately emphasized these differences within the local population in order to prevent them from banding together and effectively challenging French power. France favored the Christian (Catholic) Maronites of Mount Lebanon, on the grounds that it was part of France's religious and moral duty to protect Christian communities of the region. This preference alienated the Muslim majority, an alienation that intensified over time due to other political factors.

Confessional politics became a mainstay of the Lebanese political system after its independence in 1946. The 1932 census, in which Christian Maronites outnumbered Muslims six to five, became the basis of the National Pact of 1943. The pact set up a power-sharing arrangement between the four main communities, based on proportional representation on the basis of demographics. Since the Maronites were the majority in 1932, they took the presidency, a position elected by the Chamber of Deputies. The position of prime minister went to the Sunnis. The Shia community was underrepresented in the power structure, due

to their low numbers. In theory, the system prevented any single group from gaining a monopoly on power. In practice, the executive held more power than the parliament. Since the system was based on sectarian identity, this exacerbated any tensions within the government and the population.

Though the demographics of the population changed over the next few decades, the political system did not adapt in line with these realities. In particular, the Shia population outstripped the Christian Maronites in numbers, and yet the Shia remained the most underrepresented in the political structure. This grievance placed a strain on the confessional political structure, which was already beginning to feel pressure from other factors.

The rise of armed militias based on sectarian identity was a contributing factor to the Lebanese civil war. Among these militias were the Christian Maronite Phalange and the Lebanese National Movement, led by the Druze political leader Kamal Jumblatt. Militant Shia organizations, Amal and Hizballah, also joined the conflict.

The conflict lasted for fifteen years, from 1975 to 1990. In 1989, the Taif Accord succeeded in resolving this conflict by negotiating a more equitable system of representation in the political system, based on current population demographics instead of an outdated census.

### **Kurdish Nationalist Struggle**

The Kurds are the fourth largest ethnic group in the Middle East, after the Arabs, Turks, and Persians. They have their own cultural and linguistic identities. The Kurds reside in an area that encompasses portions of present-day Turkey, Iran, Iraq, and Syria. Although the Kurds are the largest stateless minority in the Middle East, their numbers are not concentrated in any single country among these four. Thus, their status as a minority remains precarious and subject to government policies of each country.

The Kurdish struggle for self-determination dates from the end of World War I. The Kurds were granted partial autonomy according to the Treaty of Sevres, but without the military or financial assistance of the Allies, Kurdistan never became a reality.

Since then, the Kurdish nationalist movement, represented by the Kurdistan Workers' Party (PKK), has called for the creation of an independent Kurdistan carved out of present-day Turkey, Iran, Iraq, and Syria. The PKK is known for engaging in guerilla tactics to further its goals. However, the Kurdish struggle for self-determination has been

challenged and suppressed by state power in each country.

Iraq and Turkey have seen the greatest violence and confrontation between the state and Kurdish nationalist groups. Turkey has historically refused to recognize Kurds as a distinct ethnic group and has actively suppressed them. In 1984, the PKK launched an attack on the Turkish military, and throughout much of the 1990s, there was active violence and conflict between the Turkish military and Kurdish nationalists. Turkey has since given limited recognition of their cultural and linguistic rights to the Kurds.

Kurds enjoyed limited autonomy in northern Iraq under Saddam Hussain's regime. However, they were also subject to military action by the government. In 1988, after the end of the Iran-Iraq war, the regime gassed the Kurdish village of Halabja, killing the entire population. A Kurdish revolt at the end of the Gulf War in 1991 also met with a similar violent reaction from the government. It was brutally repressed, and many Kurds fled as refugees to neighboring Turkey and Iran. After the war, a UN-protected zone was created for them in northern Iraq. After the fall of Saddam Hussain's regime in 2003, the future of the Kurdish communities in the north remains undecided.

The Kurds have also been used as pawns in regional conflicts. For example, during the Iran-Iraq war, which lasted from 1980 to 1988, the Kurds were used as pawns by both sides. Kurdish villages on both sides of the border were destroyed, and many killed. Kurdish resistance groups in each country were given clandestine support by the opposing side at various points during the war.

The current Kurdish drive for national self-determination needs to be viewed as a result of a historical demarcation of borders by European colonial powers. The division of land left the Kurds marginalized as a distinct ethnic community. While they have a historic connection to a particular territory, they remain stateless. Their minority status in each country has been exploited by regional governments, and continues to affect their struggle for political autonomy and self-determination today.

## Conclusion

The changing configurations of political power between various communities inevitably results in power imbalances between dominant and minority groups. Whether these groups are defined by ethnicity or religion, or combination of factors, it does not

matter as much as the fact that access to political power, or the lack thereof, is a contributing factor to political ethnic conflicts in the Middle East. In some cases, as previously demonstrated, British and French colonial policies exacerbated these identity-based differences and shaped the power structures that countries such as Lebanon and Syria inherited.

## ETHNIC CONFLICTS: NORTH AFRICA

### Ethnic Conflict in its North African Regional Context

North Africa is a geographic region comprising five independent states: Egypt, Libya, Tunisia, Algeria, and Morocco. The region may be viewed as having a predominantly Arabo-Islamic identity, but it is by no means homogeneous. Distinctions in spoken Arabic exist and while the population is overwhelmingly Sunni Muslim, religious diversity is manifested in the many religious brotherhoods and more recently, the resurgence of a militant fundamentalist Islamism reacting to the region's recent modernization and secularization.

Within the region, vestiges of ethnic groups exist that pre-date the Arab-Islamic dominance. These include the Christian Copts in Egypt, the Berbers in the Maghrib states, and Jewish communities in each of the states. Most of the Jewish population has emigrated to Israel or Europe. In contrast, significant Coptic and Berber populations are part of North

Africa today. While some cultural differences persist between Arabs and Berbers, centuries of acculturation, intermarriage, and socialization have blurred sharp distinctions.

The region has experienced two patterns of ethnic conflict since 1945. The first involved nationalist movements moving against European imperial domination and the second, ethnic tensions within the newly independent states. During the nineteenth and early part of the twentieth centuries, each of these countries was under some form of colonization. The year 1945 saw the end of World War II, the founding of the United Nations (UN), and the growth of indigenous nationalist stirrings on the Asian and African continents. In less than two decades, each of the North African states succeeded in emerging from foreign domination. Running through the process of independence is a basic ethnic clash between the indigenous Arabo-Muslim way of life and the modernizing force of Christian European culture.

### The Anti-Imperialist Phase of Ethnic Conflict

Egypt was nominally an independent constitutional monarchy since 1922, but through military treaty arrangements the country was under British hegemony. Anti-British nationalist agitation led to the formation of the Liberation Movement under the leadership of a small Free Officers Group. In 1952, it engineered a bloodless coup and dethroned the “puppet” King Farouk. Egypt emerged fully from under British domination in 1956 when President Gamal Abdul Nasser expelled the British from the Suez Canal. The ensuing Suez War of 1956 in which Egypt withstood the Anglo-French attack on its territory represents a distinct form of ethnic conflict—the resistance of an indigenous population to imperialist domination. Accentuating the ethnic character of the revolution was the declaration in the new constitution that Egypt was an Islamic Arab Republic, in contrast to the constitutional monarchy which followed the British monarchical structure.

Libya, an Italian colony, came under British administration during World War II following the defeat of the Axis in the Libyan Desert. The seeds of nationalist opposition to Italian rule and for independence were planted in the 1920s but it did not grow into a nationalist movement while the country was under military occupation. Independence came to Libya, not as a result of nationalist pressure within the country but by a United Nations resolution that came about because of pressure from the then small number of independent Muslim states in the General

Assembly. Their persistence and bargaining power constituted an exercise of *diplomatic ethnicity*.

The nationalist ethnic conflicts in the three states of French North Africa were more intense and bloodier. The conflicts between the nationalist movements to French rule in the Maghrib contain an important ethnic dimension, i.e., religion and culture—but as classic colonial situations they also contain class, economic, and political aspects. Most leaders of the nationalist movements were Westernized intellectual elites. They spoke and wrote in French. They were conversant with international ideological trends such as democracy, capitalism, socialism, and communism. At the same time, Islamic reformers emerged who deplored the French *mission civilisatrice*, which they associated with Christianity and the presence of French settlers, *colons*. Together, these two strands of nationalism built nationalist movements that challenged French policy over favoritism towards the *colons* and discriminatory practices towards the indigenous Maghrib populations. Islam became one of the most potent factors in the spread of nationalism in the Maghrib.

The post-World War II ethnic nationalist conflict in the Maghrib can be traced back to the beginnings of colonization, particularly in Algeria and Morocco where France met with armed resistance that took decades to overcome. Although the Algerian, Moroccan, and Tunisian nationalist movements share much in common, not the least of which were a common adversary, separate nationalist movements developed due to basic differences in historical background and political status. Algeria was juridically “an integral part of France” where the French *colons*, about a twelfth of the population, occupied a privileged position. Tunisia and Morocco, by contrast, were nominally sovereign states but were French protectorates. In the protectorates, the percentage of *colons* was smaller than in Algeria but they all but ran the country.

Nationalist pressure was first felt in the protectorates, Tunisia and Morocco. As the nationalists put forward demands for reform, aiming at eventual independence, they were met by counteractions by the *colon* element. French policy in both protectorates promoted a policy that would establish a permanent status for the *colons*, which was rejected by the nationalists. The *colons* were French citizens and as nationalist agitation mounted, the French authorities pushed hard to introduce co-sovereignty which would undermine the nationalists demands. Encouraged by the United Nations role in Libya, the nationalists appealed to the world body for support. The French staved off this effort but tension was mounting, marked by native boycotts of French products and

the outbreaks of mass demonstrations and violence. As part of their strategy, the French played a “Berber Card” in Morocco—a “divide and rule” tactic designed to undermine the nationalist movement. The Berber Dahir of 1931, whereby Berbers were to be governed by their traditional law rather than by Islamic law, the *Sharia*, represented the boldest effort of this policy. This policy proved to be a wake-up call for the Arabo-Islamic religious community. In 1951, the French artificially created a “Berber Revolt” against Sultan Mohammed V who was balking at the demand of the French government to denounce the *Istiqlal* (independence) Party, the leading nationalist party. Thousands of Berber tribesmen suddenly appeared in Rabat and surrounded the palace. Although the Sultan capitulated after two hours to an ultimatum, the tactic proved a fiasco and only further encouraged the nationalists. It drew attention to the *Istiqlal* and helped catapult the Sultan to the forefront of the struggle against French rule. The French embarked on a program to force the Sultan to share his sovereignty with them. Mohammed V refused to acquiesce to this demand and he was exiled to Madagascar in 1952 and a more amenable settler-controlled Sultan installed. This touched off a period of unrest. On the second anniversary of Mohammed V’s deposition, a chain of violence blazed across Morocco. Nearly two thousand persons lost their lives and scores of villages and towns were razed. Berber tribesmen were leading participants in the disturbances. The situation was finally resolved in 1957, when Mohammed V was restored to his throne and Morocco achieved independence the following year. A variation of this scenario was played out in Tunisia, where the local sovereign, Moncef Bey, also was deposed when he resisted French demands that he disavow the leading nationalist party, the *Neo-Destour* (Constitution). Intricate negotiations on reform and the creation of an elected legislature broke down over the issue of “co-sovereignty.” Tunisia also experienced provocative street demonstrations and intermittent low-level violence. The situation was diffused in July 1954, when French Premier Pierre Mendès-France granted Tunisia “internal autonomy.” Within two years, Tunisia was granted full independence.

Algeria’s war of national independence, 1954–1962, was the longest and most fiercely fought struggle in the era of post-war decolonization. The French invasion of Algeria in 1830 was met with dogged resistance, which lasted for several decades. This early rejection of French colonial rule provided a historical precursor for the ultimate emergence of Algerian nationalism. French colonial policy effectively undermined the traditional Algerian social

structure but a strong attachment to Islam persisted. At the same time strong assimilationist tendencies and flirtations with Marxism appeared and were reflected in the several Algerian nationalist parties that emerged between the end of World War I and 1954. On November 1, 1954, a group of younger dissidents calling themselves the *Front de Libération Nationale* (FLN) issued a proclamation calling Algerians to rebel, and launched an attack on French positions in five provinces. These initial steps of the Algerian revolution were hardly auspicious, as the guerrillas were small in number and poorly armed. Their most successful operation was in the Aurès mountains, a Kabyle (Algerian Berber) region. Within two years the insurrection gathered momentum, fueled in part by the repressive measures, including torture, taken by the French army and police. Ultimately, France committed some five hundred thousand troops, many of them conscripts, to the war. As the war dragged on, the fighting, which had been waged primarily in the hinterland and the mountain regions took on a new course when the FLN, in 1956, launched a clandestine network of terror in the Battle of Algiers. While the French military, resorting to torture, was succeeding in containing the urban terrorists, repercussions of these tactics created a groundswell in France for an end to the war, even if it meant granting independence to Algeria. This did not sit well with the *colons* or with certain elements of the French army. *Colon* extremists organized, with some disaffected French generals, the *Organisation armée secrète* (OAS) to carry out a putsch against the French government, headed by General Charles de Gaulle. Their failure was the last gasp of the ethnic conflict waged by the settlers. De Gaulle had signaled the end of the old regime in Algeria, gradually accommodating to the idea of Algerian independence by coming out in favor of an *Algérie algérien*, and an eventual Algerian Republic.

### Ethnic Conflicts After Independence

In the nationalist conflict with European imperialism, a broadly perceived Arabo-Islamic culture emerged, the product of Islamisation and Arabisation. The two are intimately interconnected but by no means identical. Thus, Egypt has been totally Arabicized, but not Islamicized, while the Maghrib states have been totally Islamicized but not Arabicized. Under the overarching North African Arabo-Islamic tent, there exists significant religious, linguistic, and cultural diversity. The constitution of each independent modern national North Africa state establishes Islam as its official religion and Arabic, its official language.

Despite this uniformity, local customs and traditions persisted and in many instances were reinvigorated. Relations between centralized authority and various ethnic groups were marked by fluidity and diversity. However, the states of North Africa are free of disintegrative tendencies, prevalent elsewhere among groups of ethnic minorities. Neither the Copts in Egypt nor the Berbers in Algeria and Morocco have pressed for political separateness or autonomy. Each in their own way seeks recognition and acceptance within their respective states. But the existence of these ethnic minorities constitutes a source of ever-present tensions which have the potential of local outbreaks of violence.

The Christian Copts, representing about 6% of the population, call themselves the "Original Egyptians." They are the vestiges of the Egyptian population that was not Islamicized following the Arab conquest of the seventh century. Though they do not tend to intermarry with Muslims, they are linguistically Arabicized. The Copts have always identified themselves with Egyptian nationalism, particularly its Arab dimension, but an ingrained religious antipathy exists between Muslims and Copts. Intermittent clashes between the two groups, sometimes leading to communal riots are part of the Egyptian political scene. The resurgence of Islamic militancy has exacerbated the situation. Anti-Coptic sentiments were spread by Muslim fundamentalists who were implicated in the bombing of Coptic Churches in Alexandria and anti-Coptic marches by thousands of Muslim militants in downtown Cairo. In 1981, President Anwar el-Sadat, under severe attack by the Islamic fundamentalists for his peace treaty with Israel, retaliated by conducting a purge to stifle religious dissent. In a strange twist, Sadat's crackdown also included deposing the Coptic patriarch, Pope Shenuda III. Some 1,500 Muslim clergyman, Coptic priests, journalists and academicians were arrested and charged with "sectarian sedition." The Copts have been caught in the power struggle over Islamic fundamentalism within the majority Egyptian community. Provocation by Islamic fundamentalists has usually evoked responses from Copts, fueling the tension between them.

The other manifestation of ethnic tension in independent North Africa concerns the Berbers in the Maghrib. Unlike the Copts in Egypt, they cannot be referred to as an ethnic minority, since the entire population of the Maghrib is of mixed Arab and Berber stock, yet the concept of "Berber ethnicity" exists, as does intra-ethnic tension between Berberism and Arabism. The tension is primarily over language and traditions. A Berber language is the mother tongue of many inhabitants of the Atlas mountains

of Morocco and the Algerian Aurès and Kabyle mountains. With the intent to displace French as the dominant language of education and literacy, the newly independent states of the Maghrib proclaimed Arabic as their official language. An unintended consequence was to undercut the use of Berber tongues, particularly in local assemblies, rural schools, and the mass media. This did not sit well with Berbers, whose resentment has led to demand changes that would help preserve Berber identity. The direction of ethnic conflict over Berberism is still unfolding. Berbers participated in the nationalist struggle against French colonialism and continue to participate in the contemporary body politic. There is no thought of secession or of "Berber Nationalism." There is no single Berber language, but a group of closely related spoken languages. The notion of "Berberland" is a most unlikely thought, since the Berber population does not live in a contiguous area. Berber enclaves exist in rural and mountainous regions, but a good portion is integrated urban dwellers. But, the potential for ethnic conflict exists, since an activist Berber segment of Moroccan and Algerian society is dedicated to the preservation of Berber uniqueness, and believes in countering "Arab colonialism" by pressing for the recognition of Tamazight, the main Berber language, as an official state language, its more prevalent use in media and communities, and the removal of discriminatory treatment of Berbers. The seeds for inter-ethnic conflict over Berberism exist but it must be considered within the context of broader challenges of Islamist fundamentalism and the chronic problems of economic and development facing the Maghrib states.

## ETHNIC CONFLICT IN OCEANIA

Oceania is a huge region that consists of the islands of Polynesia, Melanesia, and Micronesia, as well as New Zealand, Australia, and Hawaii. As a geographical entity, Oceania contains metropolitan states, colonial territories (e.g., New Caledonia and French Polynesia) and independent developing nations. Ethnic conflict takes place in all these social formations. This article focuses on major ethnic strife in the developing nations of Oceania, the island countries of the South Pacific. The viability of three Pacific Island states, Papua New Guinea, the Solomon Islands, and Fiji, has been seriously undermined by ethnic violence. Each country was a colonial creation, a cobbling together of disparate peoples, cultures, and traditional societies. The difficulties of building nations out of such colonies are always great. This is especially so when issues having to do with development reinforce ethnic differences as they have in these three cases.

The longest and most bloody fighting in contemporary Oceania occurred on the island of Bougainville, a province of Papua New Guinea. It is estimated that approximately ten thousand people died because of the conflict.

### Bougainville

Far from the rest of Papua New Guinea—about one thousand kilometres from the capital, Port

Moresby—the island of Bougainville is a short launch ride to the Solomon Islands. The island has an area of about 5,400 square miles and a population of 170,000. Like the rest of Melanesia, it is inhabited by a diverse group of people who live in small autonomous villages. Colonization and incorporation into Papua New Guinea sowed the seeds of a wider Bougainvillean identity. Bougainvilleans came to see themselves, and be seen by other Papua New Guineans to be more like their near neighbors than like people from the mainland. Known in the local vernacular as “Buka” (crows) because of their dark skin, they call other Papua New Guineans “Redskins”.

The development of a mining project at Panguna both accentuated this sense of difference and transformed it into one of grievance. Exploration in the 1960s uncovered large deposits of copper and gold. Open cast mining operations began in the early 1970s. The resultant alienation of land and damage to the environment greatly disrupted the lives of local people. The pit alone covered four hundred hectares and generated a billion metric tons of waste. People were generally unhappy with the amount of compensation they received. The uneven distribution of the costs and benefits from the project also led to disputes and divisions on the local level.

Revenue from the mine provided the central government with almost half its foreign exchange earnings. However, little of this came back to large parts of an island lacking economic and educational opportunities for its people. The need for labour at the mine site stimulated an influx of workers who migrated from other parts of Papua New Guinea. This influx of “foreign natives” brought with it problems of urbanization and attendant troubles with law and order that Bougainville had not seen before.

In 1988, young men from local groups attacked the mine, demanding its closure and adequate compensation for damage caused to local lands. The central government deployed forces to control the situation but their heavy-handedness caused the violence to escalate into a full-scale uprising. The mine ceased operations in 1989. Although the central government withdrew its troops as part of a cease-fire arrangement, the Bougainville Revolutionary Army declared independence in 1990. The Papua New Guinea government responded by imposing a blockade that had severe consequences. The embargo of medical supplies in particular caused a significant number of the overall casualties of the conflict. The control of tropical diseases broke down and other facilities, like schools and roads, deteriorated.

The situation inside Bougainville became increasingly violent and chaotic. The Bougainville Revolutionary Army was, in reality, a loose coalition of

groups of young men from heterogeneous societies who had a variety of agendas. With the mine shut down and the remaining non-Bougainvilleans brutalised, local elements began fighting amongst themselves. Leaders on small outlying islands requested government intervention. After establishing themselves on Buka, Papua New Guinean troops began to push onto the main island. After years of continued fighting, and failed cease-fires, the government hired mercenaries to assist its own troops in a final effort to defeat the rebels and occupy the mine. However, the commander of the Papua New Guinea Defence Force refused to work with the mercenaries, the mission was aborted and the Prime Minister resigned his post in 1997.

The situation today is much improved. Tired of war and unable to achieve their aims by violence the opposing forces began signaling a willingness to negotiate. New Zealand took on an essential role in facilitating a truce. Meetings near Christchurch in 1997 established a procedure for negotiations and the deployment of an unarmed Truce Monitoring Force. Questions of Bougainville's future status were subordinated to establishing a cease-fire and the withdrawal of Papua New Guinean forces. A peace agreement was signed in 2001 that promises Bougainville autonomy, development aid, and an eventual referendum on independence.

## The Solomon Islands

The Solomon Islands are a Melanesian Island chain—with a population of four hundred thousand—that lies just south of Bougainville. The main island, Guadalcanal, site of the capital city Honiara (population forty-nine thousand), has attracted a steady stream of migrants from other parts of the country, especially Malaita. As was the case in Bougainville, this influx created resentment amongst the indigenous population. The migrants were perceived as a threat to the people and culture of Guadalcanal, taking land and jobs in a declining economy. In late 1998, groups of men seized weapons from a police armoury. They attacked Malaitans living in rural areas. About one hundred people were killed and twenty thousand fled to Honiara or back to their home island. People from Guadalcanal began to leave Honiara for their home villages and the capital became a Malaitan stronghold cut off from the rest of the island.

In June 2000, Malaitan militants also stole weapons from a police post and successfully counter attacked Guadalcanal fighters. They staged a coup, seized the Prime Minister, and forced him to resign.

The formation of a new government and the arrival of naval vessels from Australia and New Zealand led to the signing of a peace treaty in Townsville, Australia, in October 2000. Unfortunately, the accord did not rectify the situation. Roving gangs continued to operate unopposed on Guadalcanal because the Solomon Islands had no national army that could deal effectively with them.

Sponsored by the United Nations, a group of people with extensive knowledge of the Solomons met in Brisbane Australia to suggest ways to effectively implement the peace treaty. Dr. John Roughan, of the Solomon Island Development Trust, noted that an economic downturn, urban-based development, and a large population of disaffected youth sparked the conflict. Undoubtedly, the Guadalcanal militants were also influenced by events in Bougainville, which had sent thousands of migrants to Guadalcanal. The similarities in culture and situation between the Bougainvilleans and people of Guadalcanal, and the fact that Bougainvilleans succeeded in driving out the foreigners, helped spark local actions.

The Brisbane meeting noted that restoring normalcy to the Solomons requires a series of fundamental changes. Development should be de-centralized and based on the rural activities that occupy most of the population. Benefits must be shared more equally, with a special emphasis on opportunities for young people and women. The country's economy and infrastructure needed rebuilding. Solomon Islanders also need to value their country's cultural diversity.

In July 2003, a force of over two thousand police and military personnel from Australia, New Zealand, Fiji, Tonga, Kiribati, and the Cook Islands arrived in the Solomons at the invitation of the government to restore order in the country. RAMSI, Regional Assistance Mission Solomon Islands, has been well received by the local population. It has arrested 2,800 individuals, disarmed militants, and re-established a large measure of security. Although these accomplishments are important milestones, stabilizing the Solomon Islands will require a great deal more work. The necessary improvements in communications, infrastructure, economic development, and political reform may prove more difficult to implement than peace and security. RAMSI has, however, established the conditions necessary to begin the task of constructing a viable Solomon Islands state.

## Fiji

Like Papua New Guinea and the Solomon Islands, Fiji (population 180,000) consists of many islands

scattered over a wide area. The country is also a former British colony. When the Colonial Sugar Refining Company originally set up operations it imported indentured laborers from India rather than local people to work the plantations. Fiji developed into a classic plural society with different cultural groups dominating separate spheres of the economy and having few social ties to each other.

Prior to independence in 1970, the British attempted to preserve what they saw as the traditional chiefly nature of Fijian society. In Fiji's constitution were clauses protecting native land and granting chiefs' special powers in regard to indigenous affairs. When their indenture period ended, Indian agricultural workers were prohibited from buying land, and could only lease it from Fijians. More Indians migrated to Fiji from Gujarat, settling in the cities where they dominate retail trade. Big businesses like banks and resorts tend to be controlled by Europeans.

When Fiji became independent, the indigenous population retained control of the political system and Indo-Fijian leaseholders were granted security of tenure. Public service jobs were shared between the two groups, but indigenous Fijians controlled the armed forces. This system of accommodation broke down by the 1980s. Native Fijians migrated to Suva and class differences developed among them. Tensions emerged between chiefs in the eastern and western parts of the country, and the Indo-Fijians came to outnumber indigenous people.

When a bipartisan labor coalition defeated the chiefly dominated Alliance Party, the military launched a coup to preserve indigenous political domination. New constitutional clauses guaranteed that an indigenous Prime Minister would head a government that controlled thirty-seven of the sixty-four seats in Parliament. Mobile Indo-Fijians left the country, taking their skills, businesses, and jobs with them.

Expulsion from the Commonwealth and other sanctions led to the adoption of a new non-racist constitution in 1997. The party of the coup leader, Sitiveni Rabuka, lost the next election to a coalition led by Mehendra Chaudhry, who became Fiji's first Prime Minister of Indian descent. In May 2000, his government was toppled by another coup led by a group of armed civilians. Although the Army generally controlled the ensuing civil unrest, nevertheless it proved very disruptive. Indo-Fijians were often intimidated by unruly elements. Another 4,500 people, mostly skilled, left the country. Tourism suffered, sugar production dropped by 30%, and thousands of jobs were lost in the textile industry.

The most recent election, held in August 2001, was characterised by voting along racial lines. Although the results were accepted as democratic, the British

Commonwealth and the New Zealand government will not yet remove their sanctions against Fiji because the new Prime Minister is violating the constitution by refusing to give cabinet posts to members of Chaudhry's Labour party. Indo-Fijians, who now make up 44% of the population, still face sporadic intimidation and an uncertain future.

## Conclusion

These three conflicts in Oceania provide examples of how ethnic differences become foci of violence when ethnicity becomes attached to issues such as land and economic inequality. In all three cases, armed indigenous groups acted to defend what they perceived to be their rights. Weak central governments were unable to respond to social change in a positive way and lacked effective institutions to control the violence. In Fiji, the site of the Pacific's only military coup, the Army was at least able to prevent the levels of bloodshed and disruption that emerged in the more anarchic situations on Bougainville and the Solomon Islands.

Relatively quiet at present, Papua New Guinea, the Solomon Islands, and Fiji have not solved the underlying problems that led to violent ethnic conflict. Each country faces several daunting tasks. They need to build stronger governments that can maintain order and promote national unity. They also require economies that can advance the legitimate aspirations of their heterogeneous, mobile, youthful populations. No doubt, they will require politicians of exceptional integrity and considerable external assistance to achieve these goals.

## ETHNIC CONFLICTS: SOUTHEAST ASIA

One of the legacies of European and American colonialism in Southeast Asia, as in other parts of the world such as Africa, Latin America, the Middle East, is the creation of borders, generally made through agreements between the colonizers, which often bisected ethnic groups (although Thailand was never formally colonized, its borders were as much a direct result of this as were those that were colonized). Prior to colonialism, Southeast Asia was for the most part ruled by local kings, rajas, sultans, etc., with the occasional empire emerging (such as Majapahit, Sri Vijaya, Angkor, Pagan, etc.) which controlled and consolidated large areas of land. Distinct borders, however, were non-existent, in part because they were viscous and constantly shifting in relation to the exercise of power, but also because the nation-state, and its requirement of sovereign territoriality, was still foreign to Southeast Asia. Furthermore, most minorities were little affected by the earlier indigenous rulers; power generally circulated outward from the center, and the farther one was from the center the less one felt the influence of a ruler. A distinction must be made among ethnic groups in Southeast Asia to clarify this point: most majority populations (Tai, Burman, Khmer, Lao, etc.) are lowland dwellers, occupying coastal lands and concentrated around river deltas or occupying fertile river valleys and plains in which rice cultivation allowed for the creation of surplus (and later capital), which in turn allowed for these communities to thrive and multiply. Most ethnic minorities, however, are upland dwellers; in Southeast Asia the vast majority of ethnic diversity is found in the hills and

hinterlands. Because of their location they remained, for the most part, outside the reach of the lowland kingdoms. Furthermore, their cultivation methods were (and are) generally swidden (slash and burn) agriculture, which meant that these minorities did not produce much surplus, and were much more spread out, as swidden agriculture requires large parcels of land in order to rotate areas of cultivation.

As colonialism advanced and firm borders were drawn up, little thought was given to these minority populations. Yet once these borders were established, all of those who fell within the boundaries became subjects first of the colony, and later citizens of the nation-state following independence, and the problem arose of how to consolidate the colony (and later nation-state) through the inclusion of these minorities. In the colonial period, colonizers were also interested in exploiting the resources of these upland or peripheral areas, including forest products, mineral, gems, and metals. They were also interested in proselytizing, which often served the functions of bringing minorities to the support of the colonizers, and allowing for the colonizers to use minorities in colonial armies (and in other capacities), often pitting ethnic groups against each other. Throughout the colonial period, however, many minorities were relatively untouched by these processes, as they required too much effort and expense. As the wave of decolonization following World War II spread throughout Southeast Asia, and colonies became nation-states, the inclusion, or consolidation, of these minorities became part of the nation-state building process.

Due to the histories of these minorities, and the attempts to include them, many ethnic minorities are suffering persecution or discrimination, and some are fighting the nation-state in which they have been subsumed. Similar to other regions in the world, ethnic conflict in Southeast Asia is inseparable from conflicts concerning religion, resources, and rights. One would be hard-pressed to find a purely ethnic conflict without one or more of the other elements.

The most explosive ethnic conflicts, which also have strong bases in religion, are Aceh and the Moluccas in Indonesia, the Karen of Burma, the Malays of southern Thailand, and the Moros of southern Philippines. Aceh, at the northern tip of Sumatra and an entrance to the Strait of Malacca, has a long history of independence and prominence dating back to the sixteenth century. Aceh has historically been a deeply Muslim area, and was known as the doorway to Mecca for pilgrims making the Haj from other parts of Southeast Asia. In the early nineteenth century, the Acehnese forged a trading alliance with the British, but as the Acehnese expanded their rule southward and the Dutch moved northward, the

two finally clashed. Britain ceded its claim to any part of Sumatra in the Anglo-Dutch Treaty of 1871, and the Acehnese perceived this a declaration of war. The Aceh War (1871–1913) was history’s longest colonial war, and perhaps most bloody, and although the Dutch gained control of the larger urban areas, resistance continued throughout the colonial period. Since Indonesian independence, Aceh has been considered a special autonomous region (except from 1950–1957) but there has always been conflict between the Acehnese and the central government, over religious issues (the Acehnese support Shariah Law, and were finally allowed to implement it in 2002), and over resources. Although Aceh is the site of some of the richest oil and natural gas fields in Indonesia, it is also among the poorest and least developed regions. Aceh supported the Darul Islam rebellion (1953–1957) against the central government, but widespread overt resistance to the central government ceased until the founding of the Free Aceh Movement (*Gerekan Aceh Merdeka*, or *GAM*) in the early 1970s. Since then, GAM has been fighting the central government as a separatist movement. Since 1999, Indonesia has granted some measure of autonomy, but development remains low, and the conflict has been escalating. In the Maluccas (or Maluku), conflict has raged between Christians and Muslims since 1999. The central government’s policy of transmigration, moving people from more populated islands such as Java, Bali, and Madura, to less populated ones has exacerbated tension by diluting the majority Christian population. There is much speculation as to how the violence was sparked and why, as the region had been relatively peaceful up until 1999, but following the outbreak of violence, both sides have recruited members from other regions, with the central government, and some sectors in the military, supporting the Muslims. The Southern Moluccas (Ambon) has a history of separatism that dates back to the founding of Indonesia, and is related to its colonial history. There, the Dutch converted much of the population to Christianity, and used Christian Ambonese in the colonial army to suppress rebellion elsewhere in the Indies. The Republic of the South Moluccas has had a government in exile, located in Holland, since 1949.

The Karen of Burma (Myanmar) are fighting a conflict in which a hill tribe minority, many of whom have been converted to Christianity, are fighting a Buddhist central government over rights and autonomy. Similar to the Moluccans, the Karen were drafted into the colonial army and fought the majority Burmans, most notably choosing the British side over the Japanese-allied Burmans during World War II. Promises of greater autonomy, such as those promised in the Panglong Agreement of 1947, have

never materialized. More recently, the Hmong of Laos have been facing persecution at the hands of the Lao central government for their role in aiding the United States against the communist Pathet Lao during the Vietnam conflict. In southern Thailand, Malays (who are Muslim) are fighting the Thai central government, with various goals that range from greater autonomy and development to full-fledged separatism. The four southernmost provinces, Songkhla, Pattani, Yala, and Narathiwat are, despite being large rice producers, comparatively underdeveloped and persecuted by the ethnic Tai and Buddhist majority. In southern Philippines, Muslims (Moros) have been fighting the Christian majority since Spanish colonialism and the mass conversion of the north. Southern Philippines is also home to vast natural resources, but is among the least developed regions of the Philippines.

Resources and rights are two other exacerbating factors in ethnic conflict in Southeast Asia. West Papua (formerly Irian Jaya), Indonesia, is an egregious example. West Papua was formally integrated into Indonesia in 1969 after eight years of occupation (and the ousting of the Dutch, who did not cede control of West Papua with the rest of the Indies in 1949) through the “act of Free Choice,” a United Nations referendum that was viewed at the time as a sham, a mere formality to give Indonesia’s seizure of the territory *de jure* recognition. Some eight hundred West Papuans, most of them hand-picked by the Indonesian government and under coercion, out of a population of around 1 million, voted unanimously to integrate with Indonesia. Cold War considerations must be taken into account (this was just four years after the Indonesian purge of communists began, President Suharto had firmly allied with the West, and the Vietnam conflict was raging). It was also known that West Papua held vast mineral deposits, as well as virgin tropical forest, oil, and natural gas. President Suharto had reopened Indonesia to foreign investment (after Soekarno had banned it) and one of the first to take advantage of the opening was Freeport McMoran, an American mining multinational corporation. West Papua is home to the largest gold reserve, and the mine is the second largest open pit copper mine in the world. Moving inhabitants off of their traditional land has facilitated mining operations, and the operation is responsible for tremendous environmental degradation. Since Indonesia’s annexation of the territory, the Free Papua Movement (*Organisasi Papua Merdeka*, or *OPM*) has been waging a low-level guerrilla war against the central government, with a goal of separation. West Papua is among the least developed regions in Indonesia, but among the richest in resources, and despite promises of autonomy, little

## ETHNIC CONFLICTS: SOUTHEAST ASIA

has been done to alleviate the terrible poverty and lack of rights of the West Papuans.

Another major area of ethnic conflict is ethnic Chinese (or overseas Chinese) in Southeast Asia. Every nation-state in Southeast Asia has an ethnic Chinese minority (except for Singapore, in which the majority of the population is ethnic Chinese), although their treatment varies widely from country to country. Most ethnic Chinese came to Southeast Asia in the twentieth century, generally as coolies for the European overseers and in an attempt to save money in order to return to China, but Chinese trade and settlement in Southeast Asia predates European colonialism. In some societies, ethnic Chinese have been incorporated without significant problems, including in Vietnam (long influenced by China), Laos, and Thailand. Ethnic Chinese are relatively well integrated into Philippine culture as well, but some resentment remains due to their disproportionate wealth. This resentment has led to a recent rash of kidnappings of ethnic Chinese, with the kidnappers often in league with Filipino police or military. In Malaysia, ethnic Chinese are not clearly integrated, retaining much of their Chinese culture. After serious ethnic conflict in the 1950s and 1960s, however, and perhaps due to the strong-handed influence of the central government in combination with affirmative action programs for ethnic Malays, there have been few incidents of serious violence against ethnic Chinese. In Indonesia, however, ethnic Chinese have been used as a scapegoat since independence. Similar to other countries in Southeast Asia, ethnic Chinese control a disproportionate amount of wealth, which fuels resentment. Ethnic Chinese are often scapegoated in order to draw attention away from other problems, the most recent manifestation of this being the anti-Chinese riots of May 1998, in the aftermath of widespread student demonstrations and the shooting of several student activists in Jakarta. Ethnic Chinese businesses in Jakarta were targeted for burning and looting, rape was committed against ethnic Chinese women, and acts of violence including murder were perpetrated against the ethnic Chinese community in general in Jakarta, and few perpetrators were prosecuted. Exacerbating the conflict is the fact that most ethnic Chinese are Christian or Buddhist, adding a religious element, and included in the turmoil of 1998–1999 was a rash of church burnings throughout Java.

## ETHNIC CONFLICTS: SOUTHERN AFRICA

Because ethnicity and race are pivotal within Southern Africa's social and economic framework, racial and ethnic struggles tend to be central drivers of the region's politics. The region's core racial markers originally evolved in the Cape Colony and Natal but were spread regionally by the British Empire's expansion. In Southern Africa skin colour tends to be a marker of 'race,' while home language is a marker of 'ethnicity.' Although both race and ethnicity have been the sources of conflict, inter-ethnic conflicts have been more common.

## Sources of Ethnic Conflict

Five key sources of ethnic conflict can be identified in Southern Africa.

*Political boundaries* are a colonial legacy. Colonial boundary-makers generally ignored existing ethnic boundaries. Hence, most Southern African states incorporate a number of different ethnic groups, often speaking mutually unintelligible languages. (South African's eleven languages, ranked from the most to

least spoken, are: Zulu, Xhosa, Afrikaans, Pedi, English, Tswana, Sotho, Tsonga, Swazi, Venda, and Ndebele). Often the groups placed into the same state were historically antagonistic towards one another. Only two Southern African states (Lesotho and Swaziland) are ethnically homogeneous. However, over 50% of Swazis and Sothos live outside Lesotho and Swaziland because of how the colonial boundaries were drawn.

*New racial and ethnic groups* were planted into the region during the colonial era. Dutch, Anglo, and Portuguese colonials settled in the region. In South Africa and Namibia, this European settlement has apparently created permanent white populations who have substantively indigenized themselves. This is especially true of the Afrikaner group. The colonial settlements (especially the Cape Colony) also produced mixed race populations called coloureds. South African and Namibian coloureds are a mix of Khoi (Hottentot), San (Bushmen), Dutch, Indonesian, and some black. In South Africa and Namibia most coloureds speak Afrikaans and share many cultural practices with white Afrikaners. The Angolan colonial period produced a *mestizos* population of mixed Portuguese/black ancestry and *assimilados* (Portuguesized-blacks). Further, the colonial period saw Indians brought to Natal as indentured labourers. Many Indians subsequently migrated to Johannesburg, Pretoria, and Zimbabwe. In a number of Southern African states, tension (and even conflict) has often characterized the relationships between the 'new' and indigenous groups.

Within Southern Africa the following definitions of 'race' have been normalized —'black' means someone of 'pure' (Bantu) African ancestry; 'white' someone of 'pure' European ancestry; 'coloured' someone of mixed ancestry. 'Indian' means someone of Indian or Pakistani ancestry. These four racial categories continue to be very powerful markers of status, life chances, identity, and conflict within Southern Africa.

A *racial-ranking system* was introduced into the region by the British. Donald Horowitz has called this race-ranking system 'positional psychology.' This colonial race/class system created an Empire-wide social hierarchy (to 'justify' English-rule over an Empire of lesser human-types). In Southern Africa the ranking from top/'advanced' to bottom/'backward' was: British-born Anglos, colonial-born Anglos, Afrikaners Indians, coloureds, Westernized-blacks, and traditional-blacks. Some black groups (e.g., Zulu) were ranked higher than others (e.g., Shona) because the British ascribed higher status to 'warrior groups' that fought back. Within this colonial race/class system, individual worth was ascribed according to the ethnic group one was born into. This

affected one's economic life chances, and one's perceived worth. Exclusion from the 'advanced' group produced feelings of envy, insecurity and deprivation, which were to have profound effects on subsequent socio-political developments in South Africa because it produced 'catch-up nationalism'—for example, Afrikaner nationalism and black nationalism were born of groups trying to re-rank themselves upwards.

*The use of majoritarianism against minority groups* has ensued. Post-colonial Southern African states have political systems based upon the principle of majoritarianism. This has generally meant larger ethnic groups secure a permanent (and unchallengeable?) position of dominance, e.g., Shona in Zimbabwe; Bemba in Zambia; and Ovambo in Namibia. For a number of Southern African minority groups majoritarianism has bred resentment because they believe themselves to be disadvantaged and disempowered, e.g., Matabele in Zimbabwe; whites, coloureds, and Indians in South Africa; Nama, Basters and San in Namibia; Shona in Mozambique; and San in Botswana.

*Historical animosities* born of past conflicts have often been carried into the present where they negatively impact on inter-group relations. Many Southern African ethnic groups have been involved in armed conflict, which has necessarily left legacies of animosity, mistrust, and resentment of 'old enemies.'

### South African Conflicts: Historical Legacies

The nineteenth century was an especially violent period in South Africa which left residues of inter-ethnic animosity that have subsequently negatively impacted upon inter-group relationships. Four sets of conflicts were especially important in this regard.

*The Mfecane* ("the great upheaval") in the early nineteenth century was a period of intense instability and conflict born of Shaka's violent expansion of his Zulu kingdom. This produced a chain reaction of conflict, conquest, and economic devastation across southeast Africa, with the Sotho tribes being especially badly affected. Most Sotho fled into the mountains of Lesotho (forming a new state); the mountains of the northern Transvaal; and to western Zambia. This emptied large areas of the Highveld and Natal of people. Waves of refugees also destabilized neighbouring areas. Regional instability worsened when some of Shaka's generals broke away and launched conquests of their own—Mzilikazi's conquered the Tswana and built a Matabele state on the Highveld. Soshangane conquered the Tsonga in Mozambique and built the Gaza state. Other Ngoni breakaway groups spread the *Mfecane* to Malawi and Tanzania.

The *Mfecane* left much bitterness towards the Zulu especially amongst the Sotho, Tswana, Pedi, and Xhosa. This bitterness was exacerbated by an ongoing Zulu's attitude of superiority born of their belief that their conquests under Shaka made them the natural rulers of the region.

The *Great Trek* of the 1830s saw Afrikaners migrate inland to escape British rule. (The British annexed the Cape Colony in 1806). Afrikaner *voortrekkers* moved to areas of the Highveld and Natal depopulated by the *Mfecane*, which created conflict with the Matabele and Zulus. When the Matabele were defeated most migrated northwards. This transferred hegemony over the Tswana, Pedi, and Sotho from the Matabele to Afrikaners. A series of wars established a border between the Boer republics and Moshoeshoe's Lesotho kingdom. Afrikaners enforced their Highveld hegemony through an alliance with Swazis. The Matabele eventually settled in western Zimbabwe, violently imposing their hegemony over the Shona. Defeating the Zulus transferred hegemony of much of southeast Africa from the Zulus to Afrikaners. However, the British, concerned at this expanding Afrikaner hegemony, annexed Natal.

The Great Trek saw an Afrikaner hegemony violently imposed over South Africa's Highveld interior. Subjugated black tribes became labourers within a neo-feudal agricultural economy (pastoralism and grain) geared to serve Afrikaner needs. This produced a legacy of black resentment towards Afrikaners (born of conquest and subjugation).

*British subjugation of black tribes* took place throughout the nineteenth century. The 1870s saw the British army defeat the Zulu, Pedi, and Xhosa, which effectively secured white hegemony over South Africa for the next century. As a result black people lost large swathes of their land and lost their traditional way of life/economy. Defeat saw black people forced into a labor market governed by the practices of racial-capitalism (wherein blacks were at the bottom of the race-ranking system). This necessarily produced resentments born of defeat, subjugation, and economic exploitation.

### ***The Boer War***

The end of the nineteenth century saw the British launch a war against Afrikaner Highveld states in order to seize the newly discovered Johannesburg goldfields. To defeat Afrikaner guerrillas, the British burned all Afrikaner farming-homesteads and crops and placed women and children into concentration camps. By 1902, the Afrikaners were defeated and British hegemony was extended over the whole of

South Africa. Defeat generated an Afrikaner lumpen-proletariate underclass of ex-farmers disposed after the war. A program of enforced Anglicization of Afrikaners was also attempted. Post-war poverty and the Anglicization program produced Afrikaner nationalism.

The Boer War generated a legacy of Afrikaner resentment towards Anglos, born of defeat, concentration camp memories, fear of Anglicization, and Afrikaner impoverishment within Anglo-run capitalism. For their part, Anglos generally stereotyped Afrikaners in ways reminiscent of Anglo attitudes towards the Irish. Hence, twentieth-century Anglo-Afrikaner relationships have often been characterized by a mutual antipathy.

### **Apartheid and Its Legacies**

Afrikaner nationalism (which grew out of the Boer War defeat) had two main objectives: to rank Afrikaners upwards (and overcome Afrikaner poverty); and create an "autonomous space" for Afrikaners where they would be culturally protected from both Anglicization and from being swamped by a black majority. Apartheid (called "separate development" by Afrikaner nationalists) aimed to create "separate spaces" for all ethnic groups along the lines of the Dutch *verzuiling* principle. In the process of implementing this policy, Afrikaners used violence to resettle blacks into separate ethnic territories and violence to maintain exploitative economic relations (which promoted Afrikaner welfare at the expense of black and coloured workers). This gave rise to a 1980s civil war between anti- and pro-apartheid forces. Both sides in this civil war drew supporters from every ethnic group in the country. However, the anti-apartheid side drew most support from urban blacks, coloureds, and Indians, while the pro-apartheid side attracted most support from Afrikaners and Anglos. However, anti-apartheid forces also found themselves opposed by Zulus led by Buthelezi.

Apartheid left a legacy of black resentments and the civil war a legacy of bitterness. As a consequence, the black nationalist-led post-apartheid government actively promotes "black empowerment" policies (aimed at re-ranking the old racial hierarchies), and insists on a strong unitary state that eschews the promotion of cultural distinctness (because granting too much latitude for ethnic groups to exercise 'cultural autonomy' is now equated with apartheid). This has produced a post-apartheid anti-government alliance of minorities (whites, coloureds, and Indians)

based upon a fear of 'black domination' and growing pressures towards cultural and economic 'Africanisation.' In Cape Town, Muslim coloureds launched a terror-war against the post-apartheid government.

### Zimbabwe: Ethnic Conflicts

Zimbabwe has experienced two sets of ethnic animosities. Tension between Shona and Matabele date back to the mid-nineteenth century when the Matabele fled South Africa. The Matabele settled in western Zimbabwe on land seized from the Shona and violently extended their hegemony over wide swathes of the Shona lands. The Shona were treated with contempt ("Shona" is derived from the Matabele word for 'dog'). When Zimbabwe became independent in 1980 the new Shona-rulers launched a genocidal campaign of state-terror against the Matabele and, until the present, the Matabele are regarded as foes of Zimbabwe's Shona-led government.

The second ethnic animosity is between blacks and whites. White (mostly Anglo) settlers violently subjugated the Shona and Matabele at the end of the nineteenth century. As a result black people lost large swathes of their land and were forced into an exploitative labor market wherein blacks were at the bottom of the race-ranking system. A 1970s civil war brought a Shona-dominated government to power. Black-white tensions reemerged at the start of the twenty-first century when the Zimbabwe-government encouraged its supporters to violently drive white settlers off their farms.

### Namibia: Ethnic Conflicts

Animosity between blacks and whites began with nineteenth century German colonial repression of black resistance (when the Herero were subjected to genocidal treatment). Afrikaner settlers arrived in the twentieth century, and black people lost large swathes of their land and were forced into an exploitative labor market wherein blacks were at the bottom of the race-ranking system. A 1970–1980s guerrilla war necessarily heightened black-white tensions. Namibian independence brought to power an Ovambo-dominated government. Since independence, ethnic groups—e.g., the San, Nama, and Basters—who were seen to have supported the white forces against the guerrillas, have faced government policies unsympathetic to their interests.

### Mozambique: Ethnic Conflicts

With the end of Portuguese rule, nearly all white settlers fled, removing the conditions for continued white-black ethnic tension inside Mozambique. At independence Mozambique was peopled by three main ethnic groups, namely the Makua-Lomwe (the largest ethnic group), Shona, and Tsonga. During the 1970–1980s, a guerrilla group drawing its support from the Shona (a minority group feeling excluded from power) launched a destructive war against the Mozambiquean government. They received support from Portuguese settlers who had migrated to Rhodesia and South Africa, as well as white Rhodesians and South Africans.

### Angola: Ethnic Conflicts

The end of Portuguese rule saw most white-settlers flee Angola. However, a large population of *mestizos* and *assimilados* remained in urban areas like Luanda. An on-going civil war has raged since the Portuguese left. On one side is the Luanda-based government dominated by *assimilados* and *mestizos* in alliance with the Mbundu, an ethnic group with a long history of contact with the Portuguese. On the other side is a guerrilla group operating in southeast and central Angola, which draws support from Angola's largest ethnic group, the Ovimbundu. The Ovimbundu are more rural and less Westernized, and regard their war as an 'African heroic' struggle against the 'less African' nature of their *assimilados/mestizos* opposition.

## ETHNIC CONFLICTS: SOUTHERN CONE (LATIN AMERICA)

Ethnic conflicts throughout South America are in part related to an increased level of ethnic awareness and in part the consequence of worsened living conditions among many indigenous groups. In other words, at the same time that these groups see themselves increasingly threatened by global processes they do not control, they are increasingly refusing to be "Victims of Progress" to use Bodley's expression (1990), and assuming an expanded role in market economies as well as the active management of their own political agendas.

The various theoretical perspectives of the concept of ethnicity notwithstanding and focusing on the Southern region of the continent, it seems useful to start with a definition of indigenous groups such as the one formulated by the Asociación Indígena de la República Argentina:

Indigenous is the original population of a certain place, that sharing a common past, present and future, are aware of being indigenous and speak or have spoken the language of their forebears. They preserve their values, norms and cultural heritage, and are recognised as such by other members of the group and by outsiders. (AIRA 1986)

In Brazil, the expansion of settlers, prospectors, loggers as well as missionary and government agents into the most remote regions of the Amazon has caused considerable disruption to tribal societies. The Amazonian basin has been the scene of major population displacements since early colonial times. Many of the so-called "primitive" tribes are descendants of groups that were forced to migrate as far away as possible from forced labor or outright persecution. While FUNAI, Brazil's National Indian Foundation, has on paper designated millions of hectares as Indigenous Areas, such as Jaú, Vale do Javari, Mundurucú and others, no serious effort has been made to prevent the invasion of these areas by local or multinational development interests. In 1952, for example, eighty-five thousand square kilometers in the state of Matto Grosso were designated off limits to colonisation. However, before the area had been properly delimited, the local government ceded 75% of it to land speculators. In Rio Grande do Sul,

tribal lands that in 1913 amounted to eighty-one thousand hectares, had by 1967 diminished to thirty-two thousand (Bodley 1990).

The protracted conflicts in the Yanomami area in the border with Venezuela, which contain the familiar elements such as loss of territory, epidemics, and a general loss of integrity, have received much international attention. Developments in the Kayapó Indigenous Area, in central Amazon, represent on the other hand a case in which a tribal group, in this case the Kayapó, has retained territorial and social integrity by using revenues obtained from timber and gold mining to employ modern equipment such as radios and airplanes. With these means, foreign encroachment has been largely avoided. In 1989, the Kayapó were also able to successfully oppose the projected building by the government of a series of hydroelectric dams along the Xingú River.

Contrary to popular belief, the indigenous population of Brazil, of about three hundred thousand, represent a mere 0.03% of the total population in the country. However, the Brazilian Amazon has been a testing ground for processes by which local and tribal groups have become connected to a greater world, establishing a significant political presence (Conklin 2002).

At the same time, ethnic conflicts are closely related to conflicts of race and social class. In Brazil, for many of the upper- and middle-classes, Indians, Blacks, and poor people are just different varieties of "problematic others" who bring about a variety of social evils. The envisaged solution to these perceived evils is assimilation or extinction, and not seldom, expressed in a jocular vein that veils deep-felt emotions, outright extermination (Scheper-Hughes 1992).

A striking feature in Argentina, a country with a predominantly white and mestizo population, is the growing movement of ethnic revivification present among an indigenous population that represents about 1.4% of a total population of 38 million inhabitants. There are approximately sixteen different ethnic groups in the country, from the Guaraní groups in the Chaco lowlands of the north to the Ona (Selknam) of Tierra del Fuego. In the face of nationally inspired projects of integration and assimilation, many of these small groups have to fight for the very recognition of their condition of indigenous peoples. Thus is particularly true for those who claim descent from seemingly assimilated groups, like the Kolla in the north, or supposedly extinct groups such as the Huarpe in Mendoza and the Ranquel in La Pampa (Gordillo and Hirsch 2003). There is often widespread dissension within these groups, reflecting the fact that in this ongoing process nobody has a final answer to the complex issues of policy, identity, and belonging.

In the northwest, Salta and Jujuy, the Guaraní people, along with other indigenous groups such as Toba and Wichí that also inhabit the region, are actively promoting the strengthening of communities and development of various economic projects. Through their uses of confrontational discourse in the political arena, they have established new relationships with the traditional centers of power, abandoning clientelism, and demanding the right to self-determination. A basic tenet for Guaraní leaders is that borders do not exist for them: they are one people from Brazil, Paraguay, Bolivia, and Argentina, who share in common a struggle against oppression and discrimination (Hirsch 2003).

About one quarter of the almost 1 million Mapuche of southern Chile and Argentina, live in rural settlements that cover no more than 7%–8% of the territory they possessed until the end of the nineteenth century. These Mapuche, in Rio Negro and Chubut provinces in Argentina, and in the Bio-Bio, Araucania, and Los Lagos regions in Chile, now feel the pressure from the increasing exploitation of minerals, water, oil, as well as tourism, forestry, and agroindustry.

This expansion has reduced to utter marginality the subsistence economies of most rural communities. All surveys made in Mapuche communities on both sides of the Andes show levels of income, health, and education that are below the national averages. This critical situation has led to the mobilisation of many Mapuche groups in Argentina and to an increased level of conflict in southern Chile, where some 250,000 Mapuche live in rural communities, cities, and towns. In many of these communities, forest plantations have drastically diminished water levels, leaving the local population destitute.

In response, many communities have retaliated with land occupation, attacks on employees of forest companies, and the burning of buildings, trucks, and other machinery. Many consider these violent incidents as the prelude to an explosive situation like Chiapas in Mexico. The state has treated these eruptions as a serious challenge to the established legal order and, under the influence of vested economic interests, has reacted with measures such as the Law of State Security, inherited from the period of military dictatorship (1973–1990). Special Forces of Carabineros, the semi-military Chilean police, conduct regular raids into Mapuche communities, breaking into homes with or without search warrants in search of individuals wanted by the courts. The courts have sentenced many Mapuche activists to long jail periods, but have not taken the same initiative to investigate and prosecute the documented excessive use of violence by police forces or the illegal covert actions

undertaken by forest companies and landowners. As a result, many Mapuche refuse to acknowledge a legal situation that involved the forceful appropriation of more than 90% of their territory and now operates with a manifest lack of equanimity.

The Andine Pewenche have been at the center of a protracted conflict related to the construction of several hydroelectric dams in their lands along Upper Bio-Bio river for years. Despite legal actions and protest, the second of these dams, at Ralco, was completed in 2004, after the relocation of dozens of Pewenche families. In another much publicised case in the early 1990s, the Pewenche community of Quinquen was on the verge of being evicted from their holdings after losing an appeal to the Supreme Court regarding land that had been inhabited by the same family for the past century but which was now being claimed by a forest company. The state finally resolved the case by purchasing the land in dispute.

In Chile, as in Argentina, the state has implemented a series of social, economic, and educational programmes in order to ameliorate the living conditions of ethnic minorities. However, these measures are only directed at individuals, families, or communities rather than on tribes or groups as a whole. While many organizations of ethnic groups have demanded various degrees of autonomy, these claims have often been ignored or denied. In Chile, indigenous groups are not constitutionally recognised as *pueblos*, peoples, because of the possible separatist connotations carried by the term.

While the national media in the Southern Cone countries has often called the ethnic unrest the action of militant factions, ethnic revindications like these in southern Chile are rather the result of increasingly self-conscious peoples or nations that, as emergent societies in their own right, reject the colonialist policies of the past and the worsening living conditions. For instance, some 95% of the Aymara population of northern Chile have abandoned their Andine villages and moved to cities due to a water shortage caused by the diversion of local water resources to the mines of the region. Traditionally a pastoralist and horticultural society, the Aymara were no longer able to practice agriculture or animal husbandry.

The regional ethnic struggles have much in common, in that they reach beyond demands for land and political rights. They also involve the reconstruction of extensive nets of collaboration across national borders and the recognition of the contribution of native societies to process of development. At the same time, these conflicts demonstrate the numerous factors that ethnic identity and conflicts include. In Brazil, many of the conflicts are a reaction against the expansion of modern society into lands hitherto inhabited by tribal

societies. In Argentina we witness a process of ethnification that includes small and even invisible groups. In Chile and Argentina, many conflicts result from a determined resistance against the consequences of economic processes that threaten the viability of indigenous communities.

This variety shows that ethnic groups are not backward-looking social groups, and neither can they be regarded as totally homogenous. While individuals or factions belonging to a certain ethnic group might be involved in a struggle as members of that precise group, others might feel uncomfortable with the ethnic label and choose to pursue their aims as private citizens of the dominant society.

As elsewhere, ethnic conflicts in the Southern Cone are the product of present discourse, experience, and interest enacted by collectives with a common past. They reflect the interests of groups that employ culture and history as both their claim and their weapon in the pursuit of political, economic, and social gains (Eller 1999). Ultimately, they are struggles for a renewed sense of belonging.

### ETHNIC CONFLICTS: WEST AFRICA

West Africa is composed of sixteen countries, most of them situated along the Atlantic coast on the western bulge of Africa: Benin, Cote d'Ivoire, The Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mauritania,

Nigeria, Togo, Senegal and Sierra Leone. Burkina Faso, Mali, and Niger are landlocked, while Cape Verde is a group of small islands off the coast of Senegal. With a population larger than any other sub-region of the continent, West Africa is also the most ethnically diverse. Among its hundreds of ethnic groups are the Akan (Ashante and Fante), Fulani, Hausa, Malinke, Wolof, and Yoruba. Because some of these groups, such as the Fulani, Hausa, and Malinke, have a long history of cross-border migration, they are scattered in more than one West African country. The languages of these dispersed peoples however unify them culturally.

West Africa's ethnic plurality varies from country to country and has some bearing on interethnic relations and conflicts in each country. Among the 250 or so ethnic groups in Nigeria, the largest—Hausa, Fulani, Yoruba, and Ibo—have dominated national politics since independence in 1960. In Ghana, the Ashante, Fante, Ga-Adangme, and Ewe are the main contenders for political power among thirty or more other groups with similar aspirations. In Liberia, by contrast, the minority Americo-Liberians (descendants of freed slaves repatriated from the United States) monopolized national leadership for more than a century until 1980, when a military coup toppled the government of President William Tolbert. One of the coup leaders, Master-Sergeant Samuel Kanyon Doe, a Krahn, became the first full-blooded indigenous Liberian president since independence in 1847. The Liberian civil war (1989–1996) was the climax of a fierce struggle to oust Doe from power as Americo-Liberians, Bassa, Kru, Mandingo, Mano, and Vai, among nine other groups, resisted a decade-long dictatorship.

In West Africa, as in other parts of the world, ethnic conflicts pose a major threat to regional security and stability. Scholars seeking an historical explanation for such conflicts in the sub-region often cite the balkanization of Africa sanctioned by the Berlin Conference (1884–1885) as a defining moment. At the conference, European colonial powers outlined the rules for partitioning Africa to avoid mutual conflict. Yet by grouping together different ethnic groups and splitting some haphazardly in demarcating colonial boundaries, critics argue, the colonial powers sowed the seeds of future ethnic rivalries and violent confrontations throughout Africa. Although European colonial practices in West Africa exacerbated ethnic divisions in numerous instances, however, it is historically inaccurate to suggest that such conflicts originated with European colonization. Pre-colonial West Africa experienced its fair share of ethnic conflicts, which on occasion resulted in warfare between rival groups. The disputes for the most part revolved

around control of territory, trade routes, scarce resources, and religious differences, especially with the spread of Islam across West Africa from about the tenth century CE on.

After gaining independence in the 1960s, most West African nation-states had to grapple with ethnic rivalries, some of which were manifest while others remained latent. Competition for political power at times turned violent when power-sharing arrangements between opposing ethnic groups proved intractable. The Nigerian civil war (1967–1970), for example, broke out because Ibo leaders of Biafra in southeastern Nigeria felt marginalized in a federal system of government dominated by Hausa and Fulani political leaders of northern Nigeria. Led by Lieutenant-colonel Emeka Ojukwu, Biafra decided to secede, a decision the Hausa-led government rejected by going to war in defense of the federation's integrity. Biafra only capitulated after four years of intense fighting.

By contrast, the secessionist movement spearheaded by the Movement of Democratic Forces of Senegal (MFDC) in the southern Casamance region of Senegal has sustained its insurgency intermittently since 1983. Although Casamance, like the rest of Senegal, has a predominantly Muslim population, its main city, Ziguinchor, has a sizeable Diola Christian community, which was exposed to Portuguese and Roman Catholic influences during the colonial period. By contrast, the country's largely islamized Wolof, Fulbe, Tukolor, Serer, and Malinke populace experienced strong French influence. The MFDC seeks autonomy, contending that Casamance is relatively undeveloped because the Senegalese government considers it peripheral in both its centralized administration and developmental schemes. Until its expulsion from Guinea-Bissau in 1997, the MFDC launched its attacks from the former Portuguese colony south of Senegal. The Economic Community of West African States (ECOWAS) has been mediating between the Senegalese government and the MFDC to end hostilities. A peace accord signed in March 2001 has been violated now and again, while the sporadic fighting has displaced an estimated thirty thousand refugees, a large number of them living in The Gambia and Guinea-Bissau.

Not all ethnic conflicts in West Africa arise from a yearning for secession or separatism, however. In some countries, because ethnic affiliation was a dominant factor in the formation of political parties in the early post-colonial phase, the potential for interethnic violence was particularly high. During the 1960s in Sierra Leone, for instance, the Mende (one of two major groups) dominated the ruling Sierra Leone's Peoples Party (SLPP) led by the country's first prime minister, Dr Milton Margai. In contrast, the

opposition party, the All Peoples Congress (APC), received support mainly from the Temne (the other main group). In subsequent years the polarization of national politics along ethnic lines would deepen, which compounded by other problems including corruption, mismanagement, and nepotism, set the stage for civil war in Sierra Leone (1991–2000). Led by an ex-corporal, Foday Sankoh, a Temne, the Revolutionary United Front (RUF), which took up arms against the then government of President Joseph Saidu Momoh, boosted its size by recruiting fighters, sometimes by forcible abduction, without consideration for ethnic background. The bulk of the fighters were unemployed youths in Freetown (capital), provincial towns, and villages, assisted by mercenaries from Liberia and Burkina Faso, for whom control over the diamond mines in eastern Sierra Leone was a major attraction.

North of Sierra Leone, in the Republic of Guinea, which gained independence from France in 1958, ethnic conflict would play out differently. The country's first president, Ahmed Sékou Touré, a union leader and head of the Democratic Party of Guinea (PDG), surrounded himself mostly with members of his Susu ethnic group, while he persecuted, jailed, and forced into exile his Malinke and Fula political opponents. Touré sustained his autocratic rule by ethnicizing politics, bankrolling the Guinean army, and severely punishing anyone opposed to his heavy-handed measures. Guinean prisons became torture chambers for those who dared to voice criticism against Touré's regime. Most of his exiled opponents returned to Guinea only after Touré died in March 1984 during a heart surgery in Cleveland, Ohio. While the country's future leadership was still in doubt following Touré's demise, Colonel Lansana Conté, also a Susu, usurped power in a military coup. Conté won successive presidential elections held in 1993 and 1998, which aroused a lot of criticism for their lack of transparency. Although large-scale ethnic clashes have been rare in Guinea, the continued hold on power by Conté's Susu-dominated government has not gone down well with other ethnic groups.

Ethnic conflicts in West Africa, as elsewhere worldwide, vary in their causes, potential for exacerbation, and prospects for long-term resolution. In northeastern Ghana, ethnic clashes between the Konkomba and the Dagomba, Nanumba, and Gonja, which broke out in February 1994, claimed about one thousand lives and displaced several thousands others. The clashes arose from lingering discontent over land ownership and the privileges of traditional chiefs. Although a military contingent restored peace a few months after the fighting erupted, the government did not rescind its state of emergency declared in

the region until August. Despite the tolerance characteristic of interethnic relations in Ghana, this violent episode signaled the existence of ethnic tension in the country. In a bid to curb ethnocentric politics, the Ghanaian government thereafter declared as unconstitutional the formation of political parties based mainly on ethnic affiliation.

To Ghana's north, in the Republic of Niger, before the signing of a peace accord in 1995, the nomadic Tuareg in the northern part of the country engaged in a five-year insurgency the government found difficult to suppress. The Tuareg insurgents accused the government of marginalizing them and attempting to change their nomadic lifestyle forcibly. Even though most Tuareg continue to live their traditional lifestyle, many others have moved into cities like Niamey (the capital), Maradi, and Zinder where they participate in mainstream politics and commercial activities.

Although some scholars and the Western media often oversimplify the wars in Liberia, Sierra Leone, and Cote d'Ivoire, like those elsewhere in Africa, as "tribal" or "ethnic" conflicts, the underlying causes of these hostilities are far more complex and scarcely parochial in most cases. In varying degrees, the politicization of ethnicity, poor governance, corruption, exploitation by multinational companies, dwindling resources, poverty, foreign interference, the proliferation of small firearms, and religious differences aggravate ethnic rivalries and fuel most wars in West Africa as well as the rest of the continent.

### **Impact of Ethnic Conflicts on Development**

In its extreme form, ethnic conflict provokes civil war, which in turn produces a debilitating effect on a country's economic development. As in Nigeria's case in the late 1960s, the protracted fighting in Liberia and Sierra Leone stifled economic activities in both countries, especially as most multinational and other investment companies found it difficult to operate productively and were obliged to pull out. During the Liberian war, the country's main export industries, iron ore and timber, registered losses not yet recovered to date. Similarly, the economy of Sierra Leone took a downturn during the 1990s, because multinational companies interested in diamonds, the country's major export, were reluctant to do business in the prevailing atmosphere of instability. In the absence of foreign investors, the pace of business activities in both the private and public sectors slowed down considerably. Moreover, the loss of foreign exchange earnings made it difficult for the governments of both countries to repay loans from the

International Monetary Fund (IMF) and World Bank, stimulate economic growth, and implement development plans.

The strain on national economies caused by recurrent armed conflicts in West Africa is evident in the declining standard of living, dwindling cross-border trade, increasing unemployment, and widespread poverty and disease (notably HIV/AIDS), especially in the "axis of conflict" encompassing Liberia, Sierra Leone, Cote d'Ivoire, and, to a lesser degree, Guinea. Furthermore, the majority of those killed in Liberia and Sierra Leone were young people, the core of the workforce in both countries. In Liberia, about 150,000 people were killed, roughly 5% of an estimated 3.3 million population. Likewise, in Sierra Leone, around seventy-five thousand people died out of an estimated 5 million inhabitants, while hundreds of thousands were injured, mutilated, and displaced. Consequently, the 2004 UNDP Human Development Report based on its human development index (HDI), which measures life expectancy, education, and gross domestic product per capita, ranks Sierra Leone the poorest country in the world.

Indeed developing economies like those in West Africa are particularly prone to the disruptive effects of violent confrontations. Nigeria, potentially one of the richest countries on Africa, is a case in point. During the last couple of decades, the proliferation of small firearms in the sub-region either has re-ignited or intensified conflict, especially in countries where ethnic tensions run high. Because the Nigerian government has been unable to control cross-border smuggling so far, small firearms are easily available from clandestine firearm dealers. In 2004 alone, the government announced the seizure of 112,000 illegal firearms. During various interethnic and religious clashes, between 1999 and 2004, notably in Ogun state, the central Plateau state, and the northern state of Kano, rival groups used sophisticated semi-automatic and automatic rifles in the indiscriminate shooting and killing of several hundred people. The communal violence involving Fulani, Hausa, Ibo, and Yoruba, among others, has forced many businesses in the states concerned to either relocate or shut down.

Even more disruptive for the Nigerian economy, since 1997, violence has escalated in the southern oil-rich Delta State, where armed Ijaw and Urhobo ethnic militias dealing in stolen crude oil use modern firearms and traditional spears and machetes in a standoff with their Itsekiri ethnic rivals, the government, and its multinational oil partners. The Ijaw have attacked Itsekiri villages and oil facilities in the Niger Delta repeatedly and disrupted oil production on several occasions. Not even military

intervention by the government in 1999 could stop the violence and pillage. Besides claiming the lives of hundreds of people, the ongoing violence has caused the displacement of thousands more and the destruction of properties worth millions of dollars. The damage to infrastructure has had a draining effect on Nigeria's oil production. Overall, ethnic conflicts and violence in West Africa weaken its fragile economy and undermine its prospects for economic development.

## ETHNICITY: IMPACT ON POLITICS AND SOCIETY

The post–World War II era, and in particular the post–Cold War era, has witnessed a dramatic increase in the number of “ethnic conflicts” around the world. There exists a widespread sentiment that ethnicity, as a socially and politically relevant variable, is experiencing a dramatic upsurge. This trend belies the predictions of many scholars, who argued within the liberal tradition that with the advent of modernization, ethnic, religious, and other prescriptive traditional values would give way to the ascriptive values of individualism, materialism, and “rationality.” Modernization theorists of the 1950s, 1960s, and 1970s in particular argued that as developing countries modernize, they would become more like Western industrial countries, and a civic, national

identity would come to supersede older, ethnic identities. Scholars of the Marxist school of thought likewise argued that ethnic based identities would recede as people recognized their true class interests.

### Definitions of Ethnicity

Understanding the nature and source of ethnic identity is central to examining ethnicity's social and political role. There exists no consensus on the meaning of the term, however, and entire books have been devoted to the subject. In the past, most scholars treated ethnicity as a given, typically consisting of deeply rooted historical experiences, a shared historical past, common language, a collective perception of being part of the same group of people, and in some cases biological and genetic traits held in common. Milton Esman describes this *primordialist* view: “Individuals are bonded early in life to their ethnic community and these bonds tend to be perpetuated intergenerationally as distinctive peoples, tribes, or nations” (Esman 1994:10). Anthropologists such as Clifford Gertz typified work coming out of this tradition of viewing ethnicity.

There are simply too many modern day examples of newly emergent identities and older identities that have declined to the point of insignificance, however, for the *primordialist* view to remain unchallenged. For example, Crawford Young notes that “In the Nigerian instance, we find at the vortex of conflict the crystallization of Ibohood, an identity pattern which became salient only in the twentieth century” (*The Politics of Cultural Pluralism* 1976:6). New ways of viewing ethnicity therefore argued that “ethnicity is not a historical given at all, but in fact a highly adaptive and malleable phenomenon. In response to changing conditions, the boundaries of an ethnic collectivity can expand or contract, individuals move in and out and even share membership in more than one community. The very content, symbols, and meaning of a particular collective identity can and do evolve. In effect, ethnicity is a dynamic, not fixed and immutable element of social and political relationships” (Esman 1994).

Ethnicity is not infinitely malleable, however. Historical, territorial, and social “realities” do exist, and depending on the context these serve to limit the range of possibilities for the expansion, contraction, and relevance of ethnic identities. Hence, although a Kurd may adopt the Turkish language and culture and become an “ethnic Turk” (or vice versa), a Chinese person cannot generally become an “ethnic

Malay” (or Kurd, for that matter). Some individuals of mixed parentage may enjoy more flexibility in choosing their ethnic identity, however. Context also plays a role in determining the meaning of ethnicity. Religion, for instance, may or may not be an important part of ethnic identity depending on the situation. In the Balkans, religion forms a central component of ethnicity—Catholic Croats share virtually the same language and are physically indistinguishable from Orthodox Serbs. Jews, especially since the founding of Israel, often see themselves as a people (i.e., an ethnic group with a shared language, history, and culture) as much as a religious denomination. Within the Jewish polity, however, people claiming ethnic identities ranging from Russian to Ethiopian exist. Likewise, an Arab may be Christian or Muslim (and until modern political conflicts between Israel and the Arab world made the identities somewhat mutually exclusive, Jewish as well). In short, the term ‘ethnicity’ contains within it many contradictions, overlapping aspects and irregular usages, most of which remain unresolved in literature and practice.

Depending on the context, ethnic identification may remain in the private realm of the individual and family, such as an Argentinian of German background (their German “roots” are a personal matter to them, rather than a factor that impacts strongly on their social or political role in society). Ethnicity may also, however, serve as the justification for political demands, such as Berbers demanding language and cultural rights in Algeria. Ethnic nationalism (a fairly recent ideological phenomena coming out of Europe) refers to cases wherein ethnicity forms the basis of demands for a state controlled by the group in question, such as Kurdish aspirations for a state of “Kurdistan,” or the Thai state of Thailand. The vast majority of states today, however, contain a plethora of ethnic groups (Thailand, for example, includes many non-Thai ethnic groups, while India includes hundreds of different cultural-linguistic ethnic groups). Many ethnic groups are likewise divided across several states.

### The Impact of Colonialism

In the developing world, European colonialism played a central role in both exporting the idea of ethnic nationalism and creating state borders that bear little or no relevance to ethnic boundaries and population distributions. Especially in Africa, but also in the Middle East, Latin America, and parts of Asia, state borders were drawn up according to

colonial interests—often in neat, straight lines that divided communities belonging to the same ethnic group and put very different, often competing ethnic groups within the same state boundaries. After the First World War ethnic Kurds, for instance, became a minority in the new Arab dominated and colonially created states of Iraq and Syria, as well as Turkey and Iran (states which were formed from the remnants of the Ottoman and Safavid empires rather than by colonial powers). Numbering around 25 million people or more today, Kurds are sometimes referred to as the “largest nation without a state.” In other colonial states such as South Africa, European “white” populations settled, creating various ethnic distinctions (“whites” in South Africa were predominantly Boer or English, while “blacks” included various groups such as the Zulu, Xosa, and “Bushmen,” and “coloured” functioned as a residual category that included various groups from the Indian subcontinent and others). Different categories became relevant depending on the context—while “Bushmen” might differentiate between themselves according to additional ethnic divisions (“San” or “Basarwa,” for instance), a Zulu would likely see them as “Bushmen” and a Boer would relate to them as “blacks.” Until the 1990s, *apartheid* state policy in South Africa relied heavily on ethnic divisions that were exacerbated precisely because of the focus and definition given to them. Ethnicity is always relative in some sense: ethnic groups are defined in relation to other groups, what they are *not* being at least as important as what they are. Post *apartheid* South Africa is now trying to move away from such ethnic distinctions, promoting an equal “South African” civic identity for all citizens irrespective of their ethnic backgrounds.

Colonial “divide and rule” policies also had the effect of fomenting ethnic conflict and sometimes even creating ethnic distinctions that did not previously exist. Belgium, for instance, distinguished between “ethnic Hutus” and “ethnic Tutsis” in the regions that became Rwanda and Burundi. These were largely fictional categories based primarily on physical appearance (Hutus being shorter and stockier, Tutsis taller and thinner—the groups speak the same language and share the same culture). They became very real categories of ethnic identification when the colonial rulers issued identity cards that specified ethnic identity (generally Hutu or Tutsi). Animosity arose between the new ethnic groups as Hutus observed Belgian colonial policies that favoured Tutsis. In general, colonial powers throughout the world usually recruited public servants and military levies disproportionately from one ethnic group over another.

## Ethnic Conflict and Development

Scholars such as Donald Horowitz (1985) have argued that just by virtue of living in proximity and differentiating between one another, ethnic groups risk falling into conflict. Many theories also posit that societal and political competition in multi-ethnic contexts breeds heightened conflict along ethnic lines. Modernization, with all its attendant changes, insecurities and dislocations, in turn exacerbated such competition. Finally, the colonial legacies previously described likewise exacerbated the risk of ethnic conflict, as different ethnic groups struggled for power in fragile, newly-independent states, or pursued secessionist and/or irredentist ambitions to forge new states that coincided more neatly with ethnic population distributions.

The logic of such accounts can typically be described as follows: During colonial rule, members of some ethnic groups felt disadvantaged as members of another group received a disproportionate number of privileges (jobs, commercial opportunities, government posts) from the colonial power. In a movement (or war) of national liberation, many ethnic groups united to oppose their colonial masters (although in some cases, some groups supported the colonial rulers until the end). Once the colonial power conceded independence to its former subjects and left, however, various ethnic groups (as well as economic classes) then began competing amongst themselves to control the newly independent state. Ethnic groups that had been favoured under colonialism were often better placed to win this internal struggle, or more at risk of vengeful actions by other groups seeking to redress the favouritism that had previously disadvantaged them. Especially in poor, weak states, the resulting political struggle sometimes became an “all or nothing” game—those who took the reigns of government power would use it to enrich and further empower themselves and their ethnic kin, at the expense of those who lost the political contest. In new “artificial” colonially created states, ethnicity thus often became a handy tool to mobilize and act collectively to secure one’s interests. This occurred to the detriment of an alternate civic identity encompassing all citizens of the new state, and the resulting civil wars (such as the extremely bloody one that led to the separation of Pakistan from India, or long enduring internal conflicts in states like Angola, Mozambique, the Congo, and Iraq) led to unimaginable levels of death and destruction. Just as it took European citizenries decades or centuries to develop a state-level national identity, many developing states still have populations who attach much more

importance to their ethnic identity than to the national entity listed on their passports (if they have a passport).

Even long after independence, however, modernization (and especially its attendant increasing levels of rural-urban migration) sometimes exacerbated ethnic conflict. In the previous example, as individuals of ethnic group ‘X’ lost their land and migrated to the city, they discovered a bewildering new world full of modern complexity and insecurity. Lost in the “urban jungle” and in search of employment and housing, they turned to any available support groups. In most cases, these turned out to be religious organizations, kin networks, and ethnic (or tribal) associations of group ‘X.’ Members of ethnic groups ‘Y’ and ‘Z’ would do likewise, and in a short time society and politics would become more divided along ethnic lines. If resources in the new modernizing state turned out to be particularly scarce, then the resulting intense competition to secure them would contain even more seeds of conflict.

Some notable cases of ethnic conflict in the developing world (often ascribed to the processes previously discussed) include: the 1994 genocide in Rwanda (Hutu militias used the colonial-issued identity cards to identify Tutsis at roadblocks and other locations), the Congo (where up to 3.8 million people have been killed), Nigeria from 1967–1970 (the so-called Biafran war of secession mainly pitting ethnic Ibo against Hausa-Fulari), Cyprus (the Greek and Turkish dominated parts of the island have been separated by UN Peace Keepers since 1974), Sudan (whether this conflict is primarily driven by rivalry amongst Sudan’s many ethnic groups, disagreement over Islam’s role in a country with a significant Christian minority, or simply competition over oil-wealth and power, more than twenty years of civil war in the country have led to more than a million deaths, between 2 million and 4 million refugees, and some 4 million people internally displaced persons), Ethiopia between 1974 and 1991 (the Eritrean federal region succeeded in breaking off to form an independent Eritrea in 1993), India (various conflicts including the secession of Pakistan, the war over Bangladesh, conflicts in the Punjab and Kashmir), and a plethora of Kurdish uprisings (against Turkish, Persian, and Arab dominated central governments).

Even if one accepts the contention of some observers that ethnicity merely served as a cover for contests over money and power in many or all of these conflicts, ethnic divisions nonetheless played a crucial role in the conflicts. Inter-state conflict also sometimes occurs when an ethnic group in one state acts to support their kin in a neighbouring one (the

Turkish invasion of Cyprus, Arab-Israeli wars, or the interventions of various states in the Congo, for instance). Diaspora communities may likewise provide important funding and other resources to rebel ethnic movements in their home countries, or ethnic conflicts may spread to the immigrants' new host countries in the form of terrorism or 'race riots.'

Additionally, ethnicity played a central role in many instances of discrimination and inter-communal violence in the developing world. In 1972, Ugandan dictator Idi Amin expelled all "Asian Ugandans" from the country and confiscated their property. A large proportion of the roughly seventy thousand deportees were Indians and Pakistanis who were born in Uganda, their family having immigrated there generations earlier. In Zimbabwe, Robert Mugabe's government in 2000 began violently confiscating 'white'-owned land as a strategy to shore up its flagging popularity amongst some of its 'black' supporters. In Latin America, many governments have persecuted indigenous populations. The Guatemalan government, for instance, identified the country's Mayan population as disproportionately supportive of leftist guerrillas and opposed to government attempts to propagate a Spanish Guatemalan identity. As recently as during the 1980s, the Guatemalan state conducted widespread massacres of Mayan communities. One of these, the Rio Negro massacre of 1982, occurred in order to help clear the way for the construction of a World Bank funded hydroelectric dam project (the Chixoy dam).

Different ethnic groups also often end up occupying different niches in politics, society, and the economy. In Syria, the Alawiis have controlled the levers of state power since the late 1960s. In Malaysia, the Chinese community play a disproportionately strong role in the economy, similar to that of Indians in parts of Africa (often, such a focus on economic activity occurs in part because of various obstacles preventing these groups from taking up government positions). Such ethnic segmentation can promote the emergence of stereotypes, and at times even "scapegoating," as in Uganda when Idi Amin deflected criticism of him onto the relatively wealthy Indian merchant class of the country, eventually expelling them and confiscating their property. The result of the Indian expulsions in Uganda, as well as Robert Mugabe's more recent seizures of white farmers' property in Zimbabwe, was a precipitous economic collapse, as these countries lost many of their most experienced, active, and productive businesspeople. Societal and governmental discrimination often emerges certain ethnic identities as prioritized or valued over others.

## Mitigating Potential Ethnic Tension

Various democratic strategies for power-sharing in multi-ethnic societies have been devised to mitigate ethnic strife, however. Different forms of *federalism* are perhaps the most well known of these. Most frequently adopted in states where ethnic groups are geographically concentrated in "home" regions, federalism attempts to remove the "all or nothing" element of political struggle or the risk of "dictatorship of the majority" by devolving significant powers of self-government to various regions. A well-known example of federalism in the developing world is India, the world's largest democracy. Critics of federalism most often point to the system's tendency to make it easier for some federal regions to secede. *Consociationalism* is another form of government that aims to guarantee power sharing, and hence peace, between different ethnic groups in a country. Consociationalism explicitly reserves a specified number of positions in government and the public services for members of each ethnic community, depending on their proportion of the overall population. Important government decisions are also typically subject to veto by the various ethnic groups. Examples of consociational political systems include pre-1974 Cyprus and Lebanon. The biggest liabilities of consociationalism are its difficulty in adjusting to changing population balances, the risk of gridlock when it comes to contentious government decisions, and its tendency to reify ethnicity. Finally, various electoral systems, such as requiring all political parties to field candidates throughout the country (rather than just within their ethnic strongholds), a minimum threshold of votes to elect representatives (which discourages small single-issue parties), and multiple vote systems (which require voters to choose more than one party at election time), exist to encourage ethnic harmony rather than strife.

In authoritarian systems, discouraging ethnic strife can involve something as simple as including important ethnic groups within the power system and sharing the fruits of power with them. Authoritarian governments also commonly seek to propagate an ideology that appeals to all citizens regardless of ethnic identity—in the multi-ethnic former Soviet Union, *communism* sought to unite all groups on the basis of class, whether they were ethnic Russians, Latvians, Georgians, Chechens, Uzbeks, or Tajiks. In the Islamic Republic of Iran, the theocratic government attempts to unite Persians, Azeris, Kurds, Baluchis, and Arabs under the banner of Islam. In some cases, however, attempts are made to assimilate minority ethnic groups to a dominant national ethnic identity.

Such attempts could range from mandatory education in the dominant group's language, history, and culture, to banning minority groups' language, changing place names that reflect the minority group's history, and even denying the existence of ethnic minorities. For instance, as late as 1991 Turkish state policy was to deny the existence of Kurds (some 20% of the population) in the country, or for that matter, any Muslim minorities (non-Muslims were recognized as a minority, but all Muslims were considered Turks). Turkish state policy advanced the principal that all citizens were equally Turkish, and on this basis free to advance to the highest socio-political levels. If any group made demands based on their ethnicity, however (such as language or education rights), these would until quite recently be severely suppressed.

In actuality, most states are indeed dominated by one ethnic group. The dominant group typically has its language made the official language of the state (and/or its religion). Ethnic conflict also often erupts over not only a struggle for power and wealth, but also over important symbols and demarcations of respect for an ethnic group. According to scholars such as Azar and Burton (1986), individuals often attach their own sense of value and worth to the status of groups they belong to, especially ethnic groups. Hence they are sometimes willing to fight ferociously for the relative status of a group, which is partly reflected in state policy recognizing and assigning importance to symbols of the group such as language, culture, historical figures, and other public references ("respect"). Because such symbols are not as negotiable as money or seats in the government, contests over them can become polarized and difficult to address. Some developing states also contain so many different ethnic groups with their own language or dialect that a colonial language (generally English, French, Spanish, or Portuguese) becomes one of the official languages (India, for example) or the only official language (the Congo).

### **Positive Aspects of Multi-Ethnic Societies**

Ethnic identification and differentiation need not only produce negative effects, however. Many people view ethnic differences as something to be celebrated—ethnic identity functions as a repository of culture, history, tradition, religion, and language. Modern liberal ideology in particular now celebrates a rich diversity in these things as an important part of humanity's heritage, a value in its own right. Post-modern thinkers, for instance, place great importance

on understanding the social world around us from a variety of perspectives, and a variety of different identities facilitate such an endeavour.

In some cases, multi-ethnic societies have also derived material advantages from the diversity of their populations. Mauritius, for example, is a small African island nation with a mixed population of Indian (67%), Creole (27%), Chinese (3%), and French (2%) ancestry. Hinduism, Christianity, and Islam are practiced by 53%, 28%, and 17% of the population, respectively. Instead of descending into sectarian conflict and authoritarianism, however, Mauritius has enjoyed a democratically elected consociational style government since the 1960s. Mauritius also used its ethnic diversity to increase diplomatic and economic linkages throughout the world: in addition to its membership in the Organization for African Unity, the country also became a member of both the British Commonwealth and La Francophonie. Indo-Mauritians, Sino-Mauritians, and Franco-Mauritians all excelled at attracting investments from and finding markets in South Asia, East Asia, and Europe, respectively. Hence, Mauritius has grown into a middle-income, diversified economy with a stable democratic society and government—in short, a 'success story' of ethnic diversity. South Africa likewise seems poised to become another example of success from ethnic diversity, as the country puts its past of ethnic discrimination behind it and adopts pluralistic, inclusive policies, reconciliation, and increasing international engagement.

International migration and globalization have also increased inter-cultural communication, as more and more ethnic groups come into contact with each other. Diaspora communities may maintain very important political, cultural, and economic links with their home country populations. In some cases, these links can foster democratization and development, as diaspora groups in Western industrial nations transfer ideas, investments, and skills back home. The reverse process can also occur, as immigrant groups bring these same things to their new host countries and energize their societies, economies, and political systems. Continuing movement back and forth between countries accelerates this process.

### **Development, International Aid, and Ethnicity**

With the correct combination of good governance and astute economic policies, many other multi-ethnic

states may be able to follow such a model of development. International donors must be careful to design aid and development projects that do not encourage ethnic strife, do not appear to favour one group over another, or play into state policies to crush dissident communities. Especially because ethnic groups appear extremely sensitive to their socio-economic status vis-à-vis neighbouring groups, any policy that disproportionately benefits one group over others contains within it the seeds for conflict. Especially projects that involve displacing local communities carry the danger of supporting government policies of repression, such as when the World Bank financed Chixoy dam project allowed the Guatemalan government to displace a Mayan population it suspected of rebel sympathies.

Private investors must likewise be made to consider the impact of their policies in host countries. In Latin America, corporations such as the United Fruit Company became implicated in states' repression of many indigenous and poor communities, as well as the overthrow of democratically elected governments. In countries such as Nigeria and Sudan, Western oil companies also invested in projects that displaced hundreds of thousands of people and fueled the military budgets of governments engaged in systematic repression of dissident ethnic communities. Because oil reserves are often found in the homeland regions of specific ethnic or religious communities (Ogoniland in Nigeria, non-Arab regions of the Sudan, Kurdish regions of Syria, Turkey and Iraq, Shiite areas of Eastern Saudi Arabia, and the coast of Moroccan-occupied Western Sahara, for instance), their exploitation includes a marked tendency to foster government repression and conflict, especially as local communities clamor for a share of the income derived from their region.

Finally, no policy can remain truly neutral in situations of ethnic conflict. Everything comes to be interpreted in terms of which group benefits from what. Hence, trade and development assistance to a state combating a domestic insurgency automatically benefits the state and harms the insurgents. For example, some Iraqi Kurdish groups have even discussed legal action against corporations and states that continued to do business with Saddam Hussein's Iraq after his regime's use of chemical weapons against Kurdish civilian communities in 1988.

Aid provided to insurgents, especially secessionist ethnic groups, also violates international legal norms that require states to respect each other's sovereignty. In such a context, even humanitarian aid provided to regions affected by the insurgency can become suspect, such as when the Sudanese government accused various NGOs of aiding the Sudanese People's

Liberation Army in the south of the country. In the wake of the 2004 Asian Tsunami disaster, international aid also had difficulty reaching many parts of Sri Lanka, as Tamil rebel groups and the Sinhalese government projected their conflict onto questions of humanitarian assistance. In short, everything becomes politicized in protracted conflicts, highly polarized societies, and ethnic strife.

## EUROCENTRISM

### Definition

The term "Eurocentrism" refers to views that present European cultural standards as universally valid. It is a pejorative term (hardly any author would declare himself/herself a Eurocentrist). Here "European" is used in the broad sense of the word—as a synonym of

“Western,” i.e., applying also to the countries and cultures of North America and Australia.

Eurocentrism signifies both a tendency to conceptualize ideas and events in terms of categories that are based on European cultural experience and to assume that this understanding is objectively valid rather than a subjective point of view. European cultural norms are regarded as a frame of reference for evaluation of all cultural achievements.

These views obviously imply that European civilization is of unique worth. Seen from the Eurocentrist perspective, it is superior not only due to its technological and economic dominance, but also because of its role in human progress. Its superiority is not merely registered as a fact. It is also justified in moral categories: European civilization does not dominate by force of circumstance but deserves its leading position because of its advanced level of cultural development. Conceptually, Eurocentrism is premised on cultural evolutionism.

## Origins

Eurocentrism is evolutionism in the broadest sense—a conception of historical processes in terms of development. Its roots may be traced back to the eschatological character of Christianity. Evolutionary concepts are involved also in the formation of the self-understanding of Modernity. Some prominent representatives of the Enlightenment, for instance, regarded history as development. Both Voltaire and Montesquieu wrote about a transition from savagery through barbarism to civilization. In the nineteenth century the idea of progress was associated with the names of thinkers such as Charles Darwin and Herbert Spencer. Formed against such a conceptual background, the science that is now most immediately concerned with the problems of cultural development, i.e., cultural anthropology, has been characterized by evolutionist dispositions since its very inception.

These are not simply notions that nature and society tend to evolve from a lower to a higher level of perfection. The “founding fathers” of cultural anthropology as, for example, L. H. Morgan and E. B. Tylor, adhere to the concept of the psychic unity of humankind (cf. Morgan 1976; Tylor 1993). In philosophical terms, this means to assume that there is a universal human nature. Hence it follows that evolution follows the same course throughout the world, but that in the different places it is at a different level. Precisely this last circumstance accounts for cultural differences.

In worldview terms, this concept is at the root of an unfounded self-esteem of the representatives of “more advanced” cultures, combined with a patronizing attitude to the “more backward” peoples. In social terms, cultural evolutionism offers arguments in favor of the so-called “cultural imperialism.” A detailed critique of these ideas is provided by anthropologists from the school of cultural relativism (cf. Boas 1948; Kroeber 1944). They recognize cultural development but argue that it does not occur as a global process. Every culture follows its own path of development, according to its priorities and values. The meaning of cultural traits can be properly understood only if they are seen in their genuine cultural context. In this sense, all cultures are of equal value.

In sociology and philosophy, Eurocentric views are consciously or unconsciously affirmed foremost by the interpretation of the relationship between modern and traditional cultures. It is assumed in an evolutionist spirit that sooner or later every traditional society will undergo modernization, and that the sooner this happens the better for everybody. Consequently, modern social order should serve as an example to traditional societies. And since the main distinctive feature of the West is precisely modernity, European civilization should be a guiding light in the development of all others.

Philosophical liberalism plays an impressive role in this respect. Leading liberal philosophers argue that establishing liberty, rationality, and justice as principles of the organization of modern society requires, so to speak, emancipation of reason from culture. People can rationally choose fair norms of social life only if they dissociate themselves from their own cultural environment (cf. Rawls 1971). However, the opposition between reason and body, between subject and object is widely regarded to be precisely a Western cultural trait.

## Criticism

The so-called “Western” values are approached from two opposite perspectives. Individualism, rationalism, liberty, equality, human rights, the rule of law, the separation of church and state, and the free market play an important role in the self-understanding of European-type cultures. Viewed from outside, however, the distinctive features of this value system appear to be different. Representatives of other cultures place more emphasis on the inclination of Western thinking to perceive the world in dichotomies, e.g., subject/object, reason/body, and culture/nature. This, in its turn, entails desubjectification of knowledge, and

hence pretensions to objectivity of science, as well as a relationship of exteriority to “nature” which clears the way for reckless treatment of the latter (cf. Alatas 2002).

The acceptance of European cultural standards as universal has far-reaching effects that may also be traced in two dimensions. On one hand, this is the Western “well-intended” aspiration to dominate “the developing world.” The formula “the white man’s burden” from Rudyard Kipling’s eponymous poem is emblematic in this respect (cf. Kipling 1899). On the other hand, the “interiorization” of those standards in non-Western cultures hinders the latter’s progress. The discrepancy between “imported” cultural norms and local cultural traditions generates tensions at both the social and intra-personal levels. Trying to achieve a self-understanding in terms that are foreign to your life-world is neither easy nor productive.

Eurocentrism has been criticized from many standpoints. Here we will mention only a few examples. In the struggle for racial equality in the USA, the idea of the so-called Afrocentrism has been advanced as an antithesis of Eurocentrism (cf. Asante 1999). The discourse through which the attitude to the East has been formed and perpetuated in Western societies is exposed as Eurocentric by Edward Said in his seminal book *Orientalism* (cf. Said 1978). Scholars from East and Southeast Asia have initiated a debate on the so-called Asian values. Contrary to the Eurocentric notions, they insist that there may also be a non-individualistic modernity in which there is a balance between individual rights and common good as well as between tradition and modernity (cf. Brems 2001).

Eurocentrism is debated on two levels. Some of the criticisms against it reveal its logical inconsistency. Indeed, Eurocentrism is premised on a pretension to universal validity of specific cultural norms. This cannot be justified by invoking the idea of total cultural evolution because that idea itself lacks empirical corroboration. Furthermore, mere technological and economic dominance cannot substantiate the claims of the West for a leading role as a civilization. The possibility of comparing different cultures by civilizational value is itself very problematic. Ultimately, the said pretension seems unjustifiable in principle.

Another type of criticism focuses on the fundamental issue of the relationship between cultural universalism and cultural relativism. If we presume that universalism cannot be based on an absolute validity of the European cultural norms, does this mean that it is impossible in principle? Should we accept that the only alternative to Eurocentrism is cultural relativism? Wouldn’t that pose obstacles to the progress of countries from the so-called developing world? (cf. Harrison and Huntington 2000). Thus it seems that

against all odds Eurocentrism may somehow be valuable—as a challenge for the development of social theory and practice.

## EUROPEAN BANK FOR RECONSTRUCTION AND DEVELOPMENT

The European Bank for Reconstruction and Development (EBRD) is a multilateral development bank (MDB) that began operations in 1991 with the goal of assisting the countries of Central and Eastern Europe (CEE) and the Commonwealth of Independent States (CIS) with the transition to democratic institutions and market-based economies, through promotion of private and entrepreneurial initiatives. The Bank is based in London.

The mandate of the European Bank for Reconstruction and Development (EBRD) is to promote development in twenty-seven countries in Central and Eastern Europe and the Former Soviet Union. The Bank extends a comprehensive range of financial instruments to advance restructuring, privatization, and liberalization in this region.

Though it is oriented toward the private sector, the EBRD is unique among regional development banks in that it is specifically engaged in promoting a political agenda: the advancement of democratic values in

former Communist countries. The EBRD expressly affirms the conjunction of economic and political reform. Political issues are significant when making loan decisions. The Bank's charter charges it with utilization of standards of multi-party democracy, pluralism, the rule of law, market economy, and human rights. It provides investments, loans, equity, and guarantees for private and public sector projects in areas of finance, infrastructure, industry and energy, and technical assistance and encourages co-financing and foreign direct investment from the public and private sectors. It has invested more than 21.6 billion EUR in the region since its establishment. The Bank is made up of shareholders from sixty countries and two intergovernmental institutions: the European Union (EU) and the European Investment Bank (EIB).

### **Transition Policy in Eastern Europe**

Economic and political transition in the East was not initiated to accentuate negotiating power in deliberations with the EU about adapting to varying economic resources. The aim instead was internal reform in order to allow world prices and foreign investors to ascertain the value of Eastern European capital. There was thus the trauma of sudden deregulation in the international division of labor. One of the original roles of the EBRD was to mitigate this trauma.

### **South East Europe (SEE)**

Part of the Bank's current focus is on the regional dimension. SEE is a diverse area with a population of 60 million, and an average per capita income extending from \$460 to \$4,640 US dollars. During the last decade, the countries of the region were plagued with military, political, and economic conflicts and crises. The SEE was left with a heritage of declining living standards. These traumas affected neighboring countries through disturbances in trade and transportation, the flow of refugees, and loss of investor confidence. But since the end of the Kosovo conflict in 1999, there has been significant improvement. A great deal of civil disturbance was mastered and a political balance achieved that facilitated economic recovery and more regional cooperation.

After the Kosovo crisis, the international community fortified the attempt to aid in rebuilding the war-torn countries of SEE and to assist them in striving for economic development and political stability.

More than 6 billion EUR was made accessible in annual commitments of official aid to the region, amounting to a per capita level of 100 EUR. The rebuilding efforts in Kosovo, Macedonia, Serbia, and Montenegro demanded special donor conferences with funds pledged and distributed against identified needs. A wide range of donor governments arranged these funds. In addition, high levels of aid were given by Multilateral and International Financial Institutions such as the EBRD, ordinarily arranged in the form of preferential loans.

The countries of the region are counted on to develop and execute reform programs rooted in national strategies that facilitate regional cooperation. The goal is to form regional outlooks on energy, trade, water resource management, and environment, which can provide political advantages and substantial welfare increases for all countries of the region. Moreover, a regional approach facilitates adequate prioritization of area infrastructure investments in SEE. The regional orientation and the necessity to improve regional cooperation is a foundation of the Stabilization and Association Process (SAP), as it is an essential element in the preparation for integration of the countries of SEE into European structures. The SAP is the EU policy context for relations with Albania, Bosnia and Herzegovina, Croatia, the Former Yugoslav Republic of Macedonia and Serbia and Montenegro. It is devised to assist domestic reform procedures which these countries initiated.

### **Commonwealth of Independent States (Central Asia)**

The geopolitics of the struggle against terrorists alerted the world to the prominence of successor states of the Soviet Union, Kazakhstan, Tajikistan, Turkmenistan, Uzbekistan, and the Kyrgyz Republic. These countries have attained strategic significance being nearby Afghanistan. Security and political risk could ensue from neglecting to extend improvements in living conditions to the inhabitants of Central Asia. For the maintenance of regional and even global stability, the EBRD maintains that Central Asia needs to expedite transition to democracy and market economies. The Bank has worked closely with the Central Asian republics in order to assist them in achieving their economic goals.

Each of the five countries of the region possesses a specific economic climate and faces formidable tasks. But there are shared factors that can supply a foundation for deliberating on the way in which Central Asia can best advance. These countries have been

independent in a post-communist atmosphere. They have dedicated themselves to the tenets of democracy, pluralism, and market economy, as exemplified by becoming part of EBRD. Yet success in accomplishing these goals has been inconsistent. The EBRD, nonetheless, persists in attempts to facilitate creation of micro- and small-enterprises in Central Asia. This effort acknowledges the connection between the furtherance of entrepreneurial enterprise at the community level and the subsequent appearance of civil society, which might buttress advancement toward effective economic and political reform.

## Environmental Policy

The EBRD is the first MDB to incorporate a definitive environmental mandate in its charter. The charter asserts that the Bank is to “promote in the full range of its activities environmentally sound and sustainable development.” Yet some of the Bank’s most severe critics are environmentalists. They maintain that the EBRD is in some ways even less progressive in its environmental procedures and policies than other international lending institutions. The Center for International Environmental Law (CIEL), an organization that assists NGOs in CEE in monitoring the EBRD, carried out an evaluation of particular projects. It documented deficiencies in the EBRD’s environmental policies and practices and maintains that the Bank was unsuccessful in fulfilling its mandate to promote environmentally sustainable development.

One project of concern to environmentalists is the Baku-Tbilisi-Ceyhan (BTC) pipeline Project, Azerbaijan/Georgia/Turkey. The pipeline will transport up to 1 million barrels of oil per day from an enlarged terminal at Sangachal on the Caspian Sea in Azerbaijan, through Georgia to the Mediterranean port city of Ceyhan, Turkey. But civil society concerns exist. Various local and international NGOs maintain that public financing should not be rendered to the project until the entire economic, environmental, social, and legal impacts are adequately evaluated, and until project sponsors make evident the actual development gains for the people of Azerbaijan, Georgia, and Turkey.

## Accession to the European Union

Accession to the EU is a significant element motivating political and economic reform enterprises in Central Europe. The Czech Republic, Estonia, Hungary,

Latvia, Lithuania, Poland, the Slovak Republic, and Slovenia became full members of the EU in May 2004. A roadmap has also been drawn up for the accession of Romania and Bulgaria, expected in 2007.

The EBRD, European Commission, and World Bank have signed a memorandum of understanding, which articulates fundamental standards for collaboration in assisting projects that will aid accession countries in fulfilling the requirements of the EU. Specifically, the accession countries confront particular obligations for investment in infrastructure to fulfill the conditions of the EU’s *acquis communautaire*, or register of EU standards and laws. The EBRD assists projects where its mandate and EU accession obligations overlap. The accession of the first group of candidate countries brought up significant issues regarding the operationalization of the interagency memorandum and its connection with the graduation policies of the EBRD and World Bank.

The countries which won accession to the EU in 2004 will have more access to EU financial assistance and consequently become less dependent on EBRD funds for their economic development. There still exists the predicament, though, of countries that may not become EU members in the immediate future, if ever, in the instance of the former republics of the Soviet Union, and some of the more eastern countries of the region. Consequently, a number of countries will lag behind and need even more capital from the EBRD in order to reach a transitional condition equivalent to that of the recently acceded countries. Yet, on account of the self-imposed conditions under which the EBRD Board of Governors functions, the profit requisite that merchant banks demand, and the requirements of other crisis and disadvantaged areas of the world sited on the IMF and World Bank, the EBRD may no longer have a function in sectors of Eastern Europe in which it is needed most.

Transition to market-based economies goes on in the majority of the EBRD’s countries of operation. The countries of CEE and CIS proceed toward these economies, though the incidence of reforms is currently mixed. Most transition economies are experiencing economic growth, demonstrating suppleness in situations of often demanding circumstances. Nearly all countries in the region persist in functioning competently in comparison with other emerging economies. The exception continues to be the more indigent countries in the CIS, where the reform process is delayed and unstable environments obstruct foreign and domestic investment.

After over fifteen years experience investing in the countries of Eastern Europe and the former Soviet Union, the EBRD has accumulated evidence of factors that can accelerate political and economic

transition in post-Soviet states. Economic and political reforms operate in tandem in building the security and stability that characterize stable societies. The most advanced countries are the Baltic states (CEB) and in Central Europe, where the political landmark of being invited to join the EU is an indication that the underlying transition has made strong, if not yet complete, progress.

At its annual meeting in 2004, the EBRD issued a positive evaluation of the economic prospects for the accession countries in CEE and the Baltic states. It maintained that growth in the region would average 4.3% for the year with the upturn drawing strength from the recovery of the Czech Republic from floods in 2002 and a cyclical recovery in Poland. The subject of *Transition Report 2004* is infrastructure, covering telecommunications, energy, transportation, and water supply.

### **The Future of Concessional Development Aid**

The EBRD, like other multinational institutions, fluctuates between the desire to manage and the necessity of cooperation. Political clashes take place between the EBRD's principal shareholders, the EU and the United States. This conflict over status and economic doctrine will persist in affecting CEE and its continuing capacity for transition. Any number of arguments employed by one set of states or the other are about wider ideological disagreements vis-à-vis the future economic and political nature of CEE. This is a struggle of a wider nature between Europe and the United States contested through the mechanisms of the EBRD. The construal of the role of the United States in the EBRD (\$20 billion US of capital) is important since the Bank plays an increasingly significant role in America's relationship with the developing world and since it is a seasoned institution called upon to adapt its role and manner of operating to a new political and financial climate.

Regional cooperation and international integration transformed the global economy over the last fifty years. These two processes have been more pronounced in their rapidity and extent in the transition countries more than anywhere else. These countries have come out of protracted periods of communism and autonomy within the Council for Mutual Economic Assistance (Comecon) CMEA. Their transition has entailed in most instances a dedication to liberalization of trade and a disposition toward foreign investment. The subsequent modifications in the direction and structure of trade and inflow of capital have been substantive.

Yet some economists argue that transition to a market economy needs to be more than economically proficient. The outcome should also be satisfactory to the community, if the reforms are to remain in place. Development consequently demands not only privatization but at the same time, programs to guarantee that civil society participates in the benefits. MDBs such as the EBRD, it is objected, neglect to follow their own recommendations for political and social stability. By stipulating that governments privatize rapidly, they disregard detrimental effects on the allocation of capital. By asking for austerity while requiring liberalization, they neglect fundamental social needs.

Pervasive worldwide tendencies require a reevaluation of the system of MDB aid such as that employed by the EBRD. A central question is the future role of concessional aid, extended in the form of loans at lower than market rates. A sound rationale still exists for its continuance. That rationale, though, only has credibility if a new orientation develops which adjusts the nature of assistance to what has been learned about the character of development in the recent past and to a rapidly changing global environment. Some of this knowledge has to do with greater accountability, distinct objectives, local proprietorship of programs, and measurable outcomes. Lacking these conditions, ongoing donor country relief should not be anticipated. It will be necessary to develop a new context for future decision-making of MDB funding, founded on an increase of MDB investments in regional and global problem solving; resolution of operational conditions obstructing increased efficiency in allocation of financial assistance; and reorganization in the governance structure of individual MDBs. Multilateral institutions such as the EBRD are necessary in the global economy, but they do not have to be money-lending institutions. There is some sentiment for transforming them into principally negotiating forums that permit countries to collaborate in order to reduce obstructions to investment and trade.

## EVANGELICAL PROTESTANTISM

*Euangelion*, the Greek word for evangel, means good tidings and is used by Christians to refer to redemption or salvation through the sacrificial death of Jesus. Early followers of Jesus adopted the word to mean the good news of his incarnation (birth), life and teachings, atoning death, and resurrection and ascent into heaven as described in the gospels and earlier precepts of Paul of Tarsus in the New Testament scriptures. The church, as it evolved before the sixteenth century, translated this evangel (gospel) into many languages and cultures of Africa, Asia, Europe, and the Americas, as missionary apostles made Christianity a more universal (catholic) religion under the direction of bishops of Rome and Constantinople.

But as is common with words, over time the meaning of "evangelical" changed as elements of the Christian community claimed it as their own. In Europe, after the Protestant Reformation in the early sixteenth century, evangelical began to mean Protestant

as opposed to Roman Catholic or Eastern Orthodox Christianity. This distinction continued in Germany and Switzerland to distinguish Lutheran and Calvinist and Reformed church traditions. In particular it referred to Christians who emphasized justification by faith in the atoning death of Christ as opposed to salvation by works, including the church's demand for financial gifts. This salvation was found in scripture rather than in church tradition or the dictates of a priest. It meant a priesthood of believers, lay people as much as ministers, and direct access to grace through prayer, without benefit of priestly intervention.

In England, the Evangelical Party of the Church of England, known as a "low church" element, followed such evangelists as John Wesley and George Whitefield. In the eighteenth and nineteenth centuries, evangelicals in England and America preached the need for a revival in the church. Such awakenings would come through confession of sin and experience of conversion (turning to Christ). The evangelicals' "high church" (Anglo-Catholic) adversaries emphasized the sacraments as a means of grace and on the priesthood that administered them. Evangelicals emphasized more emotional preaching and hymn singing to common tunes.

In the mid-nineteenth century, Evangelical Alliances formed in Britain and North America to counter what evangelicals termed the corruptions of "popery," desecration of the Lord's Day (Sabbatarianism), excess drinking, and a weakening of Protestantism in a great migration to cities. This movement produced a number of voluntary societies such as Boy Scouts, the YMCA and YWCA, and the Salvation Army, and new evangelists such as Dwight L. Moody.

It was mainly these evangelicals that propelled the missionary movement that carried a Protestant message to Latin America, Asia, Africa, and the expanding British Empire in the nineteenth to twentieth centuries, often by the ministries of lay persons as opposed to ordained clergy.

In the post-World War II era, most Christian denominations, evangelical and catholic, had not turned over control of their missions in Africa, Asia, and Latin America to indigenous church leaders. This in spite of the fact that colonies had declared their independence from the rule of the Western states. Most evangelical churches had entered the colonies of European nations in the wake of nineteenth century military conquests. On the heels of governmental or company armies came Christian missionaries, most often of the evangelical branches in Europe and North America. Enthusiastic over the opportunity to bring the "pagan" world to Christ and thus produce the millennial rule of Christ on earth, missionaries flooded the colonies.

Accepting land grants and monetary stipends for their work, missionaries began to introduce what became known as “Western Christian Civilization” in the colonies. Thus, by labeling European and North American civilization as Christian, they termed Asian, and particularly African civilizations as “pagan.” Thus the culture of language, as taught in mission schools, and the cultures of dance and dress, were rebaptized into Christian, Euro-American culture. Missions also rechristened native place names for cities and sacred landscapes with “Christian” Western names.

As the meaning of political liberation gradually dawned on Africans, Asians, and Latin Americans, so did the need for a religious liberation. As fervent as evangelicals were about their faith, it was hard for them to distinguish between faith and culture. In the 1950s, mission leaders began to hear a cry for “liberation” from their native co-religionists. As local leaders began to take charge of their churches, many missionaries took on roles as consultants and gave up their leadership posts to their former students.

Indigenous ministers, bishops, and lay people took their leadership roles seriously, although some were ill-prepared for the fast transition. With local church independence came a demand for financial self-support from denominational leaders in America and Europe. Native leaders began to look at western traditions that had wiped out local customs. Local custom demanded more use of vernacular scriptures, wedding ceremonies, dress, food, and music.

Perhaps most striking was the growth of Christianity in developing nations in the last three decades of the twentieth century into the twenty-first. As the number of evangelical Protestants in Europe and North America declined, those in Africa, Asia, and Latin America grew. Some growth was in mission churches, but much was in independent churches founded by indigenous leaders as strictly local ventures. Variety of theological distinctions may have been greater than that in western evangelicalism, with emphasis on gifts of the spirit (healing, speaking in tongues) and freedom of expression in worship with native songs and instruments. New denominations began in homes and kept their home-centered base.

The latest step for Christians of the developing world has been their muscle-flexing in international symposia. In world forums they appear to be showing a traditional theological stance in matters of homosexuality (single-gender marriage and homosexual clergy). Parent churches are being scolded by their children. And evangelicals in developing nations are sending missionaries to the West to develop churches that evangelize emigrants from their homelands as

well as Euro-Americans whom they see as in need of revival.

## EXPORT-ORIENTED ECONOMIES

No economy solely counts on its own resources and lives in complete autarky. International trade plays an important role for every country. This obvious statement already highlights an important factor: since all countries rely on international trade, what defines an “export-oriented economy,” and is there a level of exports that automatically qualifies a given economy as an export-oriented one?

This question, which is seldom raised by specialists, has yet to be addressed. However, a first definition can be drawn up: an export-oriented economy is an economy that relies, for its development, on exports of manufactured goods. But beyond this statement, the question remains, due to the large diversity of countries generally classified as export-oriented: from Hong Kong and Singapore, which export more than 100% of their gross domestic product (GDP) per year, to South Korea (its exports totaled about 40% of its GDP), Mexico (around 30%), and Brazil (less than 10%). These countries also differ in terms of economic organization, size, and even trade policies.

A related issue is nearly as old as economics itself: the advantages for countries to engage in trade have been discussed at length since Ricardo and Mills, but it is patent that with similar comparative advantages, some economies resort more readily to exports than others. This discussion found new life in the 1950s, when a long debate began between the proponents of an export-oriented policy and those who favored an import substitution. The debate has not been settled, and policies have constantly shifted from one strategy to one another.

Since the 1980s, with the impulse of the IMF and the World Bank, the pendulum has leaned toward export-oriented strategies, but nevertheless, the discussion is far from finished. For supporters of this policy, such as Anne Krueger or Bela Belassa, the two

strategies differ in terms of government intervention. (The advocates of import substitution, such as Raúl Prebisch, would easily agree with this statement.) Krueger noted that “economies that adopted import-substitution policies tend to rely on government controls ... and to suppress and regulate markets” (Krueger 1995: 27). Supporters of an export-oriented strategy generally impute the failure of this policy to a high level of government intervention, and the success of those economies practicing their strategy to a non-governmental and pro-market attitude.

Nevertheless, policies are seldom as clear cut as theories suggest. In other words, they need to be assessed in practice if export-oriented economies are not to rely on specific policies unrelated to *laissez-faire* ideology. The examination of the situation of the “Four Dragons” (Hong Kong, Singapore, Taiwan, and South Korea) will then be helpful in this respect. The “Four Dragons,” as the first economies to enact the policy, had not only assumed for years the leading position of manufactured exports from developing economies (more than 80% in 1990), but they have also had an important role in promoting the “model.”

Finally, two further points need to be made. First, while the economies of the first generation (the “Four Dragons”) were small, with few natural resources and small populations, the second wave of countries are middle-sized (Mexico, Thailand, etc.) or even big and endowed with large mineral resources (Brazil, China, etc.). Second, while manufacturing is still the dominant component in these countries’ economies, exports of services are also increasing rapidly.

### **The Birth of the Model and the Hong Kong Experience**

In the 1950s, most newly independent countries that were classified as developing were commodities producers. These countries, for historical and practical concerns, as well as for ideological reasons, engaged in exporting these commodities—mainly to their former colonial rulers, where they benefited from networks and markets established during the colonization era.

On the other hand, other economies set up very different policies. The model started in Hong Kong and spread to other East Asian economies. Hong Kong’s basic conditions were different from most developing countries: the then-British colony had almost no natural resources, nor an agricultural base, nor a population large enough to allow its policymakers to resort to import substitution. But Hong

Kong benefited from a vast network of overseas business relations, due to the location and quality of its port, and its historical importance as a trading centre. Its weak industrial base was transformed from the late 1940s onwards by the arrival of Shanghaiese industrialists. With limited government intervention, but with the help of an ambitious public housing program, wages were kept low, which gave a comparative advantage to the newborn industries in the first phase of Hong Kong’s development (Schiffer 1985).

### **The Experience of Three Other “Dragons” and the Difficulty of Definition**

The three other “dragons” shared somewhat similar characteristics with Hong Kong. As Little described, “The ‘four’ (...) are poor in minerals. (...) [They] are heavily dependent on imported energy. (...) Apart from a few city states (including Hong Kong and Singapore), Taiwan and Korea have also, together with Japan, the highest population density in relation to cultivated land” (1985: 25).

But the Four Dragons’ pattern of development also showed some distinctive features, as they engaged actively in export-oriented policies later than Hong Kong. South Korea—one of the poorest countries in the world in the 1950s—started its takeoff with an import-substitution policy before progressively moving to export promotion. The South Korean experience is also interesting because its commitment to increasing its exports of manufactured goods did not stop its government from protecting its infant industries and practicing a certain form of import-substitution—even as late as the 1960s and 1970s. In Taiwan, also, the experience was not straightforward: the phase of export promotion only began after a first period of import-substitution, which lasted from 1953 to 1957 (World Bank 1993).

Historical experiences, rather than strict definitions from professional economists, have brought to light the success of export-oriented economies, which was difficult to predict in the 1950s. Since historical experiences are diverse, it is difficult to build up a set of criteria in order to define precisely what an export-oriented economy is, and the discussions aimed at providing an explanation for the growth of these economies—growth described at times as a “miracle” (World Bank 1993)—are endless.

Miracle or not, none of the “Four Dragons” had a significant industrial base prior to the 1950s. How these economies were able to become powerful manufactured goods exporters, their success as models for other countries, and the main issues related to their

emergence as NICs (South Korea joined the OECD in 1996) are further examined.

### Market Forces and Government Intervention

Grilli and Riedel, in *Sustaining Export-Oriented Development: Ideas from Asia*, suggest that three policies are required for export-oriented growth: the national government must ensure economic stability, maintain the country's infrastructures, both economic and social, and keep export traffic flowing smoothly via a stable exchange rate and lack of import barriers. These policies have been widely used. Some have even argued that they have, at times, been overused: the pressure exerted by the American Government over the depreciation of the Japanese Yen or the Chinese Renminbi is a clear illustration of this phenomenon.

Nevertheless, these policies have been supplemented by even more interventionist ones (Amsden 2001; Wade 1990). Hong Kong, quite possibly the most liberal economy in the world, has practiced urban planning and provided indirect subsidies (in housing, food, and transportation), as well as an industrial land policy, to its people and companies. For other economies, policies have varied greatly from one economy to another. The most popular approaches have been a pro-active attitude to attract foreign direct investments (FDIs)—by offering tax exemptions, for example, export credits, import quotas on selected items (in Taiwan and South Korea), the creation of state-owned enterprises (in Singapore), the implementation of Export Economic Zones (in Taiwan first, but in most export-oriented economies afterwards), and support to infant industries that are exporting, even if at a loss (like in South Korea).

Even though the success or failure of these policies is subject to debate, there is no doubt that governments have interfered widely in order to promote export-oriented strategies—it is nonetheless true that, with the influence of the World Bank and the IMF, the second generation governments have become less interventionist.

### The Thesis of Dependency...

Some critics have observed that the “miracle” was boosted by a large inflow of foreign capital. But if foreign capital plays a leading role in the development of export-oriented economies, then two questions arise. The first one is linked to the reproducibility of

the model. The second is the degree of dependency of these economies on developed countries and/or to international capital, and their place in the international division of labor.

It is generally accepted that the “Four Dragons” have all benefited, to a certain extent, from favorable historical circumstances and an inflow of foreign capital. These economies started their development during the Cold War, and all had an important geographical, political, and strategic importance for the United States. Even though precise data is difficult to provide, South Korea and Taiwan received the largest direct inflow of capital from the United States. Some companies from these economies have also benefited from doing business with the US Military (whether in the form of contracts or retail purchases made by military personnel), so this factor has to be taken into account. This is especially true for South Korea, but also, to a certain extent, for the three other dragons.

More importantly, these economies have set up specific policies to attract foreign capital. South Korea heavily relied on external loans, but also on Japanese capital. “In 1974 Japanese conglomerates still controlled 40% of South Korea's foreign trade, and 56% of Taiwan's” (Lipietz 1987: 77). Singapore also set policies in order to attract multinational corporations. The role of foreign capital for Hong Kong is less obvious, since it relies on a number of small and medium enterprises. Nevertheless, numerous foreign companies, especially from the electronics industry, set up subsidiaries in territory during the 1960s and 1970s.

Therefore, “an explanation which stressed the primacy of external factors would argue that the growth that has occurred in these four countries [sic] has deepened their dependency status and contributed little to their capacity for autonomous and balanced growth in the future” (Lee 1985: 7). A more extreme explanation would go further and stresses that the export growth, far from provoking development, has reinforced the dependency pattern. According to this view, the production of manufactured goods, generally with limited technology and a large cheap labor force, corresponds only with a deconcentration of production in the periphery: instead of importing cheap labor from developing areas, multinational corporations now decentralize to these peripheral locations, employing the same dependency pattern that has not fundamentally changed since the 1960s.

In defense of this view, supporters have emphasized that Export Processing Zones, in which most of the production is exported and most inputs are imported, “labor costs constitute the only element of domestic value-added” (Lee 1985: 8).

While the financial importance of Hong Kong, the development of a technological base in Singapore, and technological improvements in Taiwan and South Korea have defied these pessimistic forecasts, the pessimists have found new ground with the emergence of a second wave of export-oriented economies.

In “Sustainable Industrial Development? The Performance of Mexico’s FDI-led Integration Strategy,” Gallagher and Zarsky argue that if an export sector is not interwoven with the other sectors of the nation’s economy (creating jobs, training a work force, making technological advancements whose effects can be spread around), the country’s economy will receive any long-term benefits from the exports. They framed their argument using Mexico as an example; however, the same arguments were also put forward for big countries like China, defined as the “Sweatshop of the World.” The fact that China is now the second largest recipient of FDIs in the world behind the United States boosts the argumentation one step further—especially since the goods manufactured there are mainly labor-intensive.

On the other side, the growing share of Chinese textile in the world’s market (in the context of the diminishing importance of the Multifiber Agreement) has raised concerns in developed, as well as developing, economies. For instance, in 2004, China’s share of quota-free apparel exported to the USA was 70%, up from 10% in 2001. In contrast, Thailand’s share decreased from 10% to 3%, and Mexico’s from 8% to 2% during the same period.

### ... Or the Validity as a Model?

The success of the “Four Dragons” makes it difficult to uphold the dependency theory. Some of them have caught up technologically, even though most enterprises (like Taiwan’s Acer) are still heavily dependent on subcontracts granted by multinational corporations (Hobday 1996). Companies from the “Four Dragons” have even been delocalizing their industries in China and Southeast Asia. Foreign capital is only one factor for this phenomenon.

The question of the reproducibility of an export-oriented policy for other economies can therefore be raised—and it has been addressed numerous times—while the first wave of “export-oriented economies” was followed by a second since the 1970s. If neoclassical economists have emphasized criteria, such as “uniform realistic exchange rate,” low government expenditures, and so on, it is necessary to go further and pinpoint two main differences between the first and the second wave.

First of all, the historical context is very different: the Cold War effectively ended in 1989, and newcomers could no longer count on American generosity. On the contrary, US companies now see countries like China as potential threats. Second, the first wave numbered only a few economies, which were generally small. The newcomers range from middle-sized to giants, and are much more numerous. Such differences have profound consequences.

Even an efficient export policy may be not enough to provoke a country’s development. The practice today is to concentrate production for export in designated economic zones, and then to build up backward linkages with the remainder of one’s economy. The examples of Mexico and China show that this strategy has only been partly efficient (China’s difficulty in stimulating development in its western provinces is a case in point). In addition, new “export-oriented” economies face competition from each other, especially in the labor-intensive segment, where their main comparative advantages lie—as demonstrated by changes in some countries’ market share in the quota-free apparel market in the United States.

These circumstances do not mean that the success of the first wave of “export-oriented economies” cannot be reproduced, but that the validity of the policy as a general model appears more limited (for example, if currency depreciation occurs in each economy that follows an export policy, then the effectiveness of the depreciation tends to be reduced). Among the newcomers, there will be winners and losers, as well as new analyses. Newcomers are conscious of the difficulties of being latecomers, and of the risk of market congestion for their lower-end products. In response, they have adopted several countermeasures.

First, they have relied on the expertise of developed countries and NIEs. At the beginning of the 1980s, China established Special Economic Zones at its border with Hong Kong and Macau in order to attract Hong Kong investment. In Mexico, *maquiladoras*, bordering the United States, also followed the same logic. In their most ideal form, such cooperation would lead to “borderless economies” or “growth triangles,” in which the comparative advantages of each economy complement and enhance the competitiveness of the other areas. The Johore/Riau/Singapore area is an institutional form of “growth triangle,” formalized by international agreements between Singapore, Indonesia, and Malaysia. The aim is not only to attract FDIs, but also to promote technology transfers. The results of the policy are mixed, with technology transfers slow, but not insignificant.

An important intended effect of these international arrangements is to boost the importance of the NICs, not only as manufacturing and export areas, but also

as service-oriented economies. Hong Kong and Singapore are now major international service centers, as demonstrated by their transport infrastructure (their ports are, respectively, the first and second in the world for containers) and their financial markets. This way, the appearance of new export-oriented economies has accelerated the transformation of the first wave economies, from industry to service providers and exporters.

Second, some export-oriented economies are trying to figure out how to complement, rather than compete with, their neighbors. In its most extreme form, this policy has manifested itself in the form of trade agreements (ASEAN, NAFTA, etc.). For example, in order to respond to concerns by Southeast Asian countries after it joined the WTO in 2001, China has promoted ASEAN-China cooperation.

A third strategy is to diversify production and escape from a too strong dependency on labor-intensive manufacturing, where competition is stiff. Some countries are now exporting services, and this trend will further develop in the future. American companies are now subcontracting to India some computer service jobs; the maintenance of Germany's Lufthansa fleet is now carried out in Shanghai. Examples are plentiful. Even though statistics are lacking, these services constitute a significant part of the newer export-oriented economies.

Therefore, export-oriented economies have become more diversified. The "Four Dragons" of the first generation, which have devoted resources to enhance their education and transportation systems, have become more balanced economies and societies with a larger part of their economies devoted to services. Their comparatively small economies helped accelerate this process, since labor shortages and increases in wages have led to the outsourcing of their labor-intensive jobs to places with cheaper labor. Thus, the pattern has been set for a second wave to eventually become export-oriented economies themselves. But competition has also pushed the original "dragons" to try to develop newer and more inventive solutions, while remaining, to a certain extent, dependent on labor-intensive activities.

LOUIS AUGUSTIN-JEAN

## EXTRACTIVE INDUSTRIES

Since its early stages the human kind has been exploiting the natural resources that the Earth provides such as fish, minerals, water, soil, or oil. But it was after the first Industrial Revolution and mainly during the nineteenth and twentieth centuries that the global demand for such resources increased at high speed and exploitations at large scale began.

Above all, the international demand for coal and later for oil increased at exponential rates as the industries multiplied. Altogether the demand for extractive industries (EI), which include the oil, gas, and mining sectors, increased rapidly to keep up with the growth primarily of the western economies. The coming of the World Wars accelerated the demand for these products in order to produce weapons and all the necessary equipments and machinery for the wars.

After the end of World War II in 1945, the development of the industrial sector was even faster and the expansion of industries based on the extractive industries was astonishing. Therefore the living standards of most western societies improved accordingly. As a consequence, during the 1940s, 1950s, and 1960s, it was believed that resource-rich states that were financially poor could change their economic and social situation with foreign capital investments, in the same way that Western developed countries had. Most economists believed that the extractive industries exports would bring about high growth rates with development for the inhabitants.

However, the analysis of many extractive industries cases during the last fifty years has proved that mineral and oil dependent states have low average living standards and haven't had much advance in their development. Recent studies performed by Oxfam America, an affiliate of Oxfam International, have shown that countries dependent on extractive industries, especially the African nations, still have high poverty rates, low overall living standards, high rates of infant mortality and malnutrition, income inequality, corruption, authoritarian governments, and civil wars (Ross 2001). This means that the exploitation of extractive industries do not necessarily engender the development of a society. Most of the richness generated by this sector is not well distributed among the country's inhabitants but instead is accumulated by small groups of local or international elites.

### Oil Extraction and Development

During the nineteenth and twentieth centuries, oil replaced coal and became the most important and necessary energy source to make our social and industrial organization function. Oil, or *petroleum*, also called *crude oil*, is a bituminous liquid composed of various organic chemicals. It is found in large quantities below the surface of Earth. Refined oil and its derivatives are used to produce hundreds of products in the chemical industry, to move the engines of most transport means, to produce electricity and heating, to make industry machines work, to manufacture medicines, weapons, fertilizers, plastics, foodstuffs, building materials, paints, cloth, make up, among other uses.

The oil market has been on the increase for the last centuries, promoting the exploration and discovery of new wells around the world. At the beginning of the twentieth century, the scientific discovery of underground petroleum reserves in many countries around the world was a crucial moment in the world economy.

Under the production model named *fordism* after Henry Ford, cheap oil was the fuel that pushed most of the industries in the developed countries. The motorcar industry and the transport industries as a whole played a leading role at demanding regularly large amounts of gasoline, fuel derived from oil. Every manufacture based its price on the regular supply of cheap oil, which accounted for the low prices of the products during the *golden age* between the end of the World War II and the middle 1970s crisis. Most developed countries were extracting and refining their own oil but as the demand grew, imports from non-developed countries became necessary.

Therefore exploration activities and the latter extraction of crude oil provoked the installment of many crude-oil extracting facilities in non-developed countries such as Saudi Arabia, Venezuela, Iraq, Iran, Kuwait, Libya, Nigeria, and Mexico among others, which by that time were considered to be poor countries. The discovery of underground petroleum reserves and the consequent exports of the oil caused a break in the economic history of these countries: the GDP largely increased and the newly incomes favoured the social and economic development of the society.

In that age, the previously mentioned exporting countries obtained large revenues from oil and based most of their economies on these exports. By means of such incomes public schools, hospitals, houses, roads, dams, telephone lines, gas pipelines, harbours, and more public infrastructure was built. Employment rates were high.

The 1973 (Yom Kippur War) and 1979 petroleum crisis and the rising of international petroleum prices affected these oil-dependent economies. However, they recovered, especially during the 1990s when the oil prices went up again.

However, although the common people's social conditions improved, poverty, unemployment, poor health, and education conditions still remain a problem in some oil dependent countries like Nigeria, Saudi Arabia, Angola, Kuwait, Yemen, Bahrain, or the United Arab Emirates, some of the highest oil dependent states worldwide (Ross 2001). This all means that, for the past decades, the exports of oil and a consequent high oil dependency rate hasn't caused these countries to develop or to improve the living standards of the common citizens as it could have with such high profits that the oil business generates. Wealthier and more powerful countries like the United States, the United Kingdom, and Canada were largely economically benefited from the extraction of oil.

The major oil extraction areas worldwide are the Middle East, the former Soviet Union, and the United

States. Saudi Arabia is the major export partner and world producer (with an estimate of around 8.7 million barrels per day in 2001), has the largest petroleum reserves and plays a leading role in the Organization of Petroleum Exporting Countries (OPEC) at forming international oil prices. Sixty percent of the world petroleum reserves are located in the countries of Middle East. Saudi Arabia had 25% of oil proved reserves worldwide in 2002, Iraq was second with 11%, then Kuwait and Iran with 9% each, and the United Arab Emirates with 7%.

The international trade patterns show that the major consumers import most of the refined oil: United States with imports of around 9.3 million barrels per day in 2001, Western Europe (Germany, France, Italy), China and then Asia and Oceania and Africa. On the other side, the major oil producers (supply) are not the same. The list is ordered as follows: OPEC as the major producer with around 30 million barrels per day in 2000, then the former Soviet Union, Saudi Arabia, United States, Iran, Norway, China, and Venezuela among others. Some countries base almost their entire economy on petroleum. Saudi Arabia's petroleum sector, for instance, accounts for roughly 75% of budget revenues, 45% of GDP, and 90% of export earnings.

### **The Gas Industry and Development**

Natural gas has become the second most important energy source worldwide. Natural gas is used for heating, cooling, as fuel for cars, for domestic and industrial purposes as well as for electricity production.

In the last twenty years the natural gas world reserves have doubled, having growth mostly in the former Union of Socialist Soviet Republics (USSR) and in the Middle East, Central and South America emerging countries. In 1999, important discoveries were made in Algeria and Egypt.

The United States and Saudi Arabia are the world major suppliers of natural gas, followed by the countries of the OPEC, Canada, Russia and Mexico. On the other side, the major consumers of natural gas are the United States in first place, then Russia, the countries of Western Europe, Canada, Ukraine, Iran and Japan among others. In 2002, the Russian Federation (33%) and Iran (15%) had around 48% of the world proved reserves of natural gas. Qatar possessed 10%, Saudi Arabia, the United Arab Emirate and the US only 3%.

The extraction and exports of natural gas have caused the development of infrastructure such as

harbours, roads, and gas pipelines from the inner part of the countries towards the shore where gas is shipped and transported by ship. It has also generated increases in the GDP, which have benefited the countries' economies and richest people. However, many times the exploitation of such resources hasn't benefited most of the population itself as the incomes have not been used to develop social infrastructure as hospitals, schools, decent salaries for teachers, doctors, or public employees. Besides, many times the exploitation of these resources are at the stake of private actors and the gas is not available for the population of the country as it is exported. This type of situation has provoked many rebellions, the latest being the Bolivian Crisis in October 2003 when the government was overthrown by a popular uprising demanding that the Bolivian gas wasn't exported but instead used to provide the Bolivians with affordable gas.

### **The Mining Industry and Development**

Humankind has been extracting different minerals from soil since the early appearance of man on earth. Mining, in its broadest sense, is the process of obtaining useful minerals from the earth's crust. An ore is a mineral or combination of minerals from which a useful substance can be extracted and later marketed at a price that will recover the costs of mining. The naturally occurring substances are usually divided into metalliferous ones, such as the ores of gold, iron, copper, lead, and manganese, and the nonmetalliferous minerals, such as coal, quartz, bauxite, borax, asbestos, talc, feldspar, and phosphate rock. Building and ornamental stones usually are considered to form a separate group and they include slate, marble, limestone, travertine, and granite.

During the early times of mankind extracted minerals were used to produce simple weapons or tools, then inventing more complex devices to produce swords, coins, hammers, or chains. During the different early stages of mankind (Copper Age, Bronze Age, Iron Age, Petroleum Age, Information Age) and even today, mining resources are crucial for all industrial and daily activities.

However, technology has significantly advanced and today the mining process includes excavations in underground mines and surface excavations in open-pit, or open-cut (strip) mines. In addition, recent technological developments may soon make the mining of metallic ores from the sea floor economically feasible.

Globally the industrial countries consume more than two thirds of the global and annual production of the most important minerals. The United States, Canada, Australia, Japan, and Western Europe, with around 15% of the world population, altogether consume most of the metals produced every year: approximately 61% of all the aluminium, 60% of the plumber, 59% of the copper, and 49% of the steel.

Although the mining sector is a very profitable one, it has not always encouraged the development of the countries where the ore deposits are mined. According to a recent Oxfam America report, the most mineral dependent states, Botswana, Sierra Leone, Zambia, United Arab Emirates, Mauritania, Papua New Guinea among others, rank among the worst ranked countries in the Human Development Index provided by the United Nations Development Program (UNDP) (Ross 2001; UNDP 2004). This is the result of a long-lasting tradition of using ore deposits as if they were territories separated from their surroundings—to consider ore deposits as treasures that can be found and exploited without generating beneficial effects for the people who live in the near zones and for the citizens of the country where the deposit is located. Often the minerals are extracted by companies that generate low positive impacts on the society and obtain large profits without reinvesting them in the development of the country. This tendency explains the existence of many resource-rich states that are extremely poor, with high external debts and low development index. These examples can be found presently in most mineral dependent African countries like the Democratic Republic of Congo (rich in diamonds and coltan) or South Africa, in South American countries like Brazil, Peru, or Bolivia as well as Asian countries.

### **Environmental Effects of Extractive Industries**

Extractive industries as previously depicted are highly risky and so far have caused several serious damages to the environment. One of the most recurrent and dangerous activities is the maritime transport of petroleum in oil tankers. In the last forty years, numerous accidents have occurred provoking disastrous ecological consequences on several ecosystems and in the fishing activities of the people who live upon that activity. The first accident occurred in 1967 with the *Torrey Canyon*, an oil tanker that crashed against a reef in southwest England and spilled more than

120,000 tons of petrol into the sea. As a result more than 200,000 birds died and the fishing industry was ruined for many months. Other major accidents were the *Polycommander* incident (1970), the *Metula* spill (1970), the *Amoco Cadiz* spill (1978), the *Exxon Valdez* spill in Alaska (1989), the intended spill of petroleum in the Persian Gulf by Iraq during the 1991 war, the *Nassia* incident (1994), the *Erica* oil tanker incident (1999), among others. All of them provoked irreparable and incalculable damages to the environment.

The mining sector is also another source contamination and several damages to the environment and human health, many times disregarding government regulations. The toxic smoke and powder released into the atmosphere in refinery facilities is very usual and can cause respiratory disorders to the people, plants, and animals. Another source of contamination are the toxic chemical wastes thrown to the rivers without any kind of treatment, which contaminate the precious resources of underground and superficial fresh water. Also in open-cast mines it is usual to have the emanations of toxic gases and steam, like sulphur dioxide, carbon dioxide and methane, gases that also contribute to the greenhouse effect worldwide. Mainly open cast mines are the most harmful because engineers use some heavy chemicals, like arsenic, mercury, and plumber, to separate minerals from the ore. These heavy chemicals contaminate underground water reserves and can easily reach the population, provoking high risk of serious diseases. Besides, most times these chemicals are drained to the near land and ruin it. These all means that the environmental and social costs are higher than the benefits for the population.

As for the gas industry, this one is the most environmental-friendly and safe of the three. Natural gas is considered one of the cleanest energies worldwide.

### **Sustainable Development and Extractive Industries**

The concept of sustainable development first appeared in 1987 when the World Commission on Environment and Development (the Brundtland Commission), agreed on a definition of sustainable development that is now generally recognised as the standard: “Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” Therefore this concept implies

economic, social, and environmental processes to be interlinked. Public and private agents alike cannot be permitted to act one-dimensionally and in isolation. Instead, their actions must take into account the interplay between the three dimensions of environment, economy, and society. Also, sustainable development calls for long-term structural change in our economic and social systems, with the aim of reducing the consumption of the environment and resources to a permanently affordable level, while maintaining economic output potential and social cohesion. Sustainable development aims to bring about a long-term improvement in the quality of life of the majority of the human race, which lives in bitter poverty and inhuman conditions. This means that sustainable development has to ensure economic growth, social benefits for the population combined with a respectful and conscious treatment of the environment. To accomplish such a goal, different social actors with different and opposed interests must discuss and reach an agreement; otherwise it does not seem possible to develop the economy of a country in a sustainable manner.

Although these aims have been clearly stated and are widely accepted, it seems more like a theoretical statement than a guidance-line for most companies. Some firms have strived to change their exploitation measures but many others still work only after benefits without regarding the damages on the environment and the future generations. And the extractive industries are a field where these principles are not always respected.

Mining is an activity that has received extensive criticism and legal denunciations for polluting water resources. On the other hand, mining activities and transnational mining companies many times have a great deal of responsibility in civil wars, dictatorships, foreign armed interventions, human rights violations, deforestation, pollution, and other unfavourable effects on human beings and the environment in developing countries, especially in African ones. Mining companies many times do not respect protected areas either.

Nowadays there are several examples of unsustainable development in African countries as well as in Latin American ones. For instance, in the Democratic Republic of Congo there are permanent civil wars to settle which group is going to exploit the tantalum and diamond reserves. The tantalum is used in the industry of cellular phones and also to build Pentium computers. Owing to the sudden increase in the international prices of this mineral, there are constant fights among Africans to determine which group will be able to mine the ores.

Another example is provided by the “coltan wars.” The name coltan is an abbreviation used only in parts of Africa for ‘columbo-tantalite,’ two minerals that combined form the coltan. Mineral concentrates containing tantalum are usually referred to as ‘tantalite.’ Columbite contains the element columbium, another name for niobium; tantalite contains tantalum. The coltan is used to produce mobile phones and game consoles. Many recognized international enterprises illegally finance these wars and extract loads of minerals by airplane from Congo or Rwanda to Europe or the United States.

In Argentina, a Latin American country, for instance, there are several conflicts with mining companies in the areas of Rio Negro and Esquel. These firms intend to use the cyanide method to separate valuable minerals from the ore in open cast mines, which would provoke serious ecological and health damages to the inhabitants. Therefore there have been popular movements who have rejected and temporarily stopped the beginning of the works.

Regarding the oil industry, there are also many examples that show how distant is this industry from achieving a sustainable development. An example is provided in Africa with conflict starring international petrol companies, the government, and other rebel groups in south Sudan. Since 1999, oil is exploited and civil wars are permanent. Some petrol companies support the military government that leads a war against the southern inhabitants of the country with weapons bought with petrodollars. Something similar takes place in Angola, where a civil war faces two groups: the rebels and the government. The first group obtains its financing from the control over the diamond mines and the latter obtains its incomes to finance the war from petroleum exports.

One final example of the African resources conflicts is the long-lasting dispute between the Royal Dutch Shell Company, the Nigerian military governments, and the Movement for the Survival of the Ogony People (MOSOP) in Nigeria, an oil-rich country in Western Africa. Shell has been accused of cooperating and collaborating with the different military dictatorships that ruled Nigeria from 1966 until 1999 and that killed hundreds of citizens who opposed them. Besides, the petroleum extractions have grown steadily over the years placing Nigeria as the major oil exporter in Africa while the poverty levels have doubled in the same period. Shell has also been accused of murdering a leader of the MOSOP, Ken Saro Wiwa, and also of causing a great destruction to the environment with the permanent oil spills of the pipelines due to lack of maintenance. Similar

examples that show strong collaborative relations between petrol companies and governments are provided in the history of Latin American countries like Bolivia and Nicaragua.

The gas industry has proved to be less troublesome but there are also some examples showing that it is not always sustainable, like the Bolivian example previously mentioned.

As all these examples prove, at least in many countries the extractive industries have not helped development but on the contrary have pushed development backward, causing damages to the environment, non-pacific atmospheres, destruction, insecurity, poverty, corruption, and instability in the country. Likewise oil producing and exporting countries like Nigeria and Sudan still have high rates of poverty and unemployment. Mineral exporting countries like the Democratic Republic of Congo or Rwanda suffer from the same civil wars, which have not encouraged development in any dimension in the country. These countries are often entitled as “poor” because of the impoverished social conditions in which most of the population live. However they are rich in terms of natural resources. Therefore the problem lies within the distribution of the incomes generated with those resources, which are often concentrated in few people. These incomes have often been used to build infrastructure to exploit them but very little to promote the development of the social conditions of the inhabitants.

These examples are extreme and there are others where the extractive industries have promoted development in a fairly sustainable way. For instance, ecotourism is a fairly extended option that has helped many natural reserves survive, obtain incomes, and protect the wild life and flora. Many reserves like these are located in Africa, but also in south Asia and South America, protect wild species like Tigers, Pandas, Rhinos, or Lions with their ecosystems in a sustainable manner.

Regarding International Financing Organizations, lots of controversy has lately appeared towards the role of the World Bank (WB) and its financing programs. The WB had been accused of awarding loans to firms who didn't regard the environment or the inhabitant's development and only used the funds to exploit the natural resources, many times in illegal ways. For instance, the WB has been accused of supporting the use of a controversial technique in Papua, New Guinea, through which the mining wastes were thrown into the water without any treatment.

To defend itself the WB has conducted some research projects and in its 2003 report the World Bank clearly stated its commitment to keep on financing

extractive industries projects but with some conditions. The report states that extractive industries can contribute to sustainable development *only* if the projects are carried out in the proper way, taking into account human rights, fighting against poverty, maintaining biodiversity, supporting mining activities on a small scale, encouraging the use of renewable energies, and the efficient use of energies to fight global climate change.

It also stated that the WB was committed to promote the sustainable development under a *selective approach*, regarding that the companies that had been awarded a credit should be transparent, establish projects that benefit the local inhabitants and have the support of the local community, protect the human rights, and mitigate the social and environmental risks (World Bank 2003).

In the near future extractive industries will probably keep on being more profitable for some companies than encouraging the development of the countries where the resources lay. However, the approach change mentioned on behalf of the World Bank should be an example of how extractive industries should function. The old approach should be forgotten and the different social actors should demand the implementation of an extractive industries sector that fights against poverty, respects the ecosystems and biodiversity, and supports the popular participation. Otherwise the firms and governments that operate the extractive industries will keep on with their business irrespective of development and improvement for all.

## **FAMILY PLANNING AND STRUCTURE**

### **Demographic Challenges and Family Planning**

The reproductive function of the family is just one of the factors that impact the demographic characteristics of a given country or region. The demographic explosion or the demographic slump correlates to a myriad other factors, of which the following stand out: political crisis and wars, the state of the economy, emigration, and a high mortality rate.

Conversely, each of these factors contains a multiplicity of triggers that determine the power of its effect. So, for example, the high mortality rate is defined by the existence of four underlying drivers— income levels, state of development of the health care system, living conditions, and the environment. The comprehensive interplay of the said factors, coupled with the reproductive function of the average statistical family defines the “demographic map” of every country, of every region of the world during the various stages in their development.

As a result, the twentieth century experienced interesting dynamics in demographic trends that may be illustrated by the following facts. In 1950, one-third of the world’s population was living in the developed countries, in 2000—less than one-fifth. While

in the early twentieth century Africa was sparsely populated, in the twenty-first century, the continent is well ahead of Europe by population figures. As a result of migration and primarily because of the intensity with which population reproduces in some parts of the world, the continents are ranked by population density in the early twenty-first century in the following order: Asia, Africa, Europe, Latin America, North America, and Oceania. The maximum natural population growth rate (3% per year) was registered in Afghanistan, Angola, and Uganda, whereas the maximum population loss is recorded by Bulgaria, the Czech Republic, Hungary, Romania, Russia, Ukraine, Latvia, and Belarus. The disparity in the average size of families in different regions is rather drastic: in Europe and America, it is three persons; in Asia and Africa, more than five; in Iraq, Algeria, and most of the African countries, more than seven; in Sweden, Norway, and Denmark, it stands at 2.3 persons. The imbalance that existed in the early twenty-first century in natural population growth in the different regions of the world has forced the governments of twenty countries to refocus their demographic policy on increasing the birth rate, while the governments of eighty-five countries have trained their policy on reducing the birth rate. Family planning has emerged as a tangible factor that plays a substantive role in balancing demographic processes and tempering the birth rate.

## The Nature of Family Planning

The term “family planning” appears in the official papers of several international organizations—the United Nations (UN), the UN Organization for Education, Science and Culture (UNESCO), the World Health Organization (WHO), etc. According to the official position of the UN, family planning is a blend of actions aimed at protecting the parents’ right to freely and responsibly discharge their reproductive function. Family planning encompasses activities that support parents in adequately exercising their reproductive functions and is conducive to the following results: preventing undesirable pregnancies, the delivery of wanted children, regulating interim periods between pregnancies, age control in childbearing, and control over the number of children in a family.

One of the major goals of family planning is associated with the avoidance of accidental or unplanned pregnancies. In practical terms, this means that to avoid unplanned pregnancies, the use of contraceptives has to be managed effectively, inclusive of the use of modern and reliable contraception methods. In order for parents to freely and responsibly exercise their reproductive functions, the following conditions ought to be met: effective and adequate legislation; a proper health insurance system; the presence of positive attitudes and willingness on the part of general practitioners to engage in the prevention of unwanted pregnancies; availability of information about the ways to prevent unwanted pregnancies; availability, accessibility, and reliability of means to prevent unwanted pregnancies; an operational sexual education system; and a system for marital and family counseling. The very essence of family planning is centered on providing all of the above conditions.

## The Ideological Aspect: Pros and Cons of Family Planning

This issue has been hotly debated since the early twentieth century. Advocates of family planning believe it is necessary in order to strictly regiment the birth rate and population growth in the world. A range of disconcerting facts are furnished in support of this premise. So, for instance, in the early twenty-first century, the world population reached 6 billion, and human population grows at the rate of almost 80 million people annually. If the pace is kept, the world will suffer from a deficit in resources to feed mankind by the year 2025. To avoid this scenario, the mean birth rate ratio (the average number of children

born by a single woman) that would ensure a stable population growth rate worldwide should be 2.1.

The case for family planning can be argued very strongly by pinpointing the growth in sexually transmitted infections, and first and foremost, of persons infected with AIDS. In the early twenty-first century, there were more than 40 million people infected with the immune deficiency virus, the majority of them in the developing world. An estimated 2.5 million AIDS victims are children under the age of fifteen. In 2003 alone, 3 million people died of AIDS and another 5 million were infected. The absence of family planning or its unsatisfactory state is believed to lead to the lack of use of contraception by women, resulting in abortions or the bearing of unwanted children. So, for example, empirical studies show that while people in the developing world need family planning, it has not yet reached a satisfactory state of advancement. In developing countries, over 100 million married women of reproductive age—an estimated one in five women outside China—has an “unmet need” for family planning. Unmet need, which is estimated from survey data, refers to married women who say that they would prefer to avoid or postpone childbearing but who are not using any method of contraception.

Family planning opponents support their position with three major ideological arguments. The first rests on the theory launched by Thomas Malthus in 1798—namely that population has an inherent tendency to uninhibited procreation that ultimately leads to economic deprivation, famine, war, and plagues. This invited the conclusion that if mankind desired prosperity, the birth rate ought to be contained artificially. The second argument relates to Charles Darwin’s theory of the origin of the species, published in 1859. According to family planning opponents, Darwin transposed the principles of natural selection and the survival struggle, intrinsic to the animal world, to human society, thereby pronouncing man an integral part of the animal kingdom and releasing him of moral obligations. The third argument relates to the science of eugenics that gained popularity in the late nineteenth century. Eugenics pursues the perfection of man’s biological nature by means of selection, something achieved in Germany and the USA in the 1920s and 1930s, primarily through the sterilization of inferior individuals. Serious historical facts also have been furnished, mainly in relation to the Bolsheviks in Russia and the Nazis in Germany, among which we could list the legitimization of abortions, sterilization of inferior persons, planned numbers of the Slav population in the occupied territories, and others. In the postmodern age, the opponents of family planning find correlations between the latter and euthanasia,

cloning, sex-change surgery, and the death penalty, to mention but a few. To them, it is an expression of bigotry and a refined means to kill people for the sake of personal comfort.

## Family Planning Structures

Family planning first appeared at the beginning of the twentieth century, and its structure evolved over the first fifty years of the century, mainly in the USA and Western Europe. In the USA it is associated with the first standard certificate of death issued in 1900 and above all with the name of Margaret Stanger, who broke the law in 1916, having set up the first family planning clinic in Brooklyn, N.Y. The following important events took place in the USA over the same period: in 1937 the American Medical Association endorsed birth control; in 1937, the first state (North Carolina) included birth control in a public health program; and in 1942, the Planned Parenthood Federation of America was established. In the first half of the twentieth century Nazis in Germany were the most active among Western Europeans to carry out family planning, associating its initiatives with the pure "Aryan race" and the need to sterilize inferior individuals.

Family planning also aroused vivid discussions as far back as the 1920s in the UK. Empirical research into family planning and the fertility of women in this country started in 1938, the first study being an opinion poll inquiring into the ideal number of children in a British family. Special attention also was paid to this issue in France—in 1947, the first study on issues of family planning and the reproductive behaviour of French women was carried out. Important operations and the intense development of international and national family planning structures, however, began in the second half of twentieth century after the establishment of the International Planned Parenthood Federation (IPPF). IPPF was founded in Bombay in 1952 by representatives of eight countries—India, Germany, Hong Kong, the Netherlands, Singapore, Sweden, the United Kingdom, and the United States.

From this point on, family planning became the focus of attention on a global scale, and in individual countries, the establishment of national autonomous Family Planning Associations (FPAs) began, their number being more than 180 as of the end of twentieth century. Additional structures also were set up to deal with control over reproductive family functions; a number of empirical studies were carried out, looking into the reproductive behaviour of women; a number of international forums on family planning

issues were held; legislation in individual countries was amended to legalize abortions and the use of contraceptive drugs; and various periodicals began publication, etc. The following facts relevant to the USA may be cited to illustrate the above occurrences: 1955, the first national fertility survey was conducted; 1960, the birth control pill was approved by the Food and Drug Administration (FDA); 1965, Supreme Court (*Griswold vs. Connecticut*) declared unconstitutional state laws prohibiting contraceptive use by married couples; 1972, Medicaid funding for family planning services was authorised; 1973, Supreme Court (*Roe vs. Wade*) legalized abortion; 1973, the first National Survey of Family Growth conducted; 1993, the female condom was approved by the FDA; 1997, the emergency use of oral contraceptive pills was approved by the FDA.

Over the same period, Western European countries also were extremely active in the field of family planning. It was a focus of attention in France, where the relevant legal foundations were laid down, the necessary organisational structures were set up, and a large number of sociological and social/psychological surveys also were carried out. For example, in 1954, 1956, and 1960 the *French Institut National d'Etudes Demographiques* (INED) began research on the ideal French family model. In 1966, a new study was carried out, delineating the specifics in the reproductive behaviour of French women and the formative mechanisms operating inside French families. Until 2000, INED implemented a number of studies in France, the outcomes of which served to complete the picture of the family planning situation in Europe. In the UK, in 1967, a second Family Intentions Survey was conducted, offering representative data about the ideal family according to the UK population. Parallel to it, public opinion polls were carried out in relation to contraceptive pills, abortions, etc.

The important contributions of Scandinavian countries and especially of the Netherlands need to be noted here. By the end of twentieth century, a solid family planning system was set up in all Western European countries, comprised of governmental and nongovernmental structures. Similar structures also were established (mainly after the political changes of 1989) in Central and Eastern European countries, including the following: the Russian Family Planning Association (RFPA), the Bulgarian Family Planning Association (BFPA), the Lithuanian Family Planning and Sexual Education Association (LFPSEA), the Albania Family Planning Association (AFPA), the Czech Society for Family Planning and Sex Education (CSFPSE), the Family Planning Association of Estonia (FPAE), and the Slovak Association for Family Planning and Parenthood Education

(SAFPPE), etc. Structures set up in individual countries and, as a rule, national family planning associations, are all IPPF members and work to further its objectives, both nationally and internationally.

### Family Planning Goals and Objectives

Family planning goals and objectives have been specified in IPPF official documents and in national autonomous Family Planning Associations' (FPAs) documentation. The main goals of family planning are as follows:

1. Meet the demand and unmet need for quality services;
2. Promote sexual and reproductive health for people;
3. Eliminate unsafe abortion;
4. Organize affirmative action to gain equity, equality and empowerment for women;
5. Help young people understand their sexuality and provide services that meet their demands; and
6. Maintain the highest standards of care in the countries all over the world throughout the IPPF.

The achievement of these goals requires the implementation of the following practical objectives:

1. Family planning structures need to actively work to impose standards of contraceptive safety, program management, service provision and gender equity.
2. All family planning structures need to campaign locally, regionally and internationally, through policymakers, opinion leaders, professionals, and the media, to increase support for reproductive health and family planning worldwide.
3. Individuals working for the family planning system defend women's reproductive rights, both at the national, advocacy level and, at the individual level, by focusing on quality of care in the provision of family planning services specifically designed to meet women's needs.
4. Individuals working for the family planning system make available reproductive health services, including counseling, information, and a choice of family planning methods and providers.
5. Family-planning system decision makers advocate before governments and policymakers to improve national health services.
6. Family planning structures work to prepare adolescents for responsible parenthood by

offering services, such as infertility treatment, premarital counseling, pregnancy testing, and breast and cervical cancer screening.

### Family Planning Methods

Family planning methods are mainly distinguished through the criterion of control over either conception or birth. There are, therefore, two main methods of family planning: contraception and abortion.

Contraception appears as a chief element in family planning, since it plays a significant role in protecting women's lives. It is a preliminary method for control over the process of conception, whereas abortion is a method for the artificial disruption of pregnancy.

The contraceptive method, in principle, does not give rise to any vivid discussions or harsh controversies. However, abortion makes the object of acute debate and controversial statements in individual countries. Even now, abortion is an illicit method in many countries across the world. In Europe, it was first legalized in Russia in 1920 and then in Germany in 1934. Subsequently, this method was legalized in a number of other countries: United Kingdom (1967), Finland (1970), the United States (1973), Denmark (1973), France (1975), Sweden (1975), Family Rights Group (FRG) (1976), Norway (1976), Italy (1978), Luxembourg (1978), The Netherlands (1984), Portugal (1984), Spain (1985), and Belgium (1990).

Important differences are observed in relation to family planning methods used in developed and in developing countries, as well as between Eastern and Western European countries. In developed countries, the emphasis is placed on taking contraceptive pills, whereas in Eastern Europe (former socialist countries, including Russia) and in developing countries, abortion is heavily relied upon. The following information about the use of contraceptives is available: in developed industrialized nations, 70%; in developing countries, 46%. The largest share of women using contraceptives is in the Netherlands, between the ages of fifteen and forty-four. According to researchers, the low level of contraceptive use in developing countries is attributed to its unavailability and high cost.

### Family Planning: General Trends in Developing Countries

Some general trends, but also important differences, are characteristic for family planning in developing countries. A general trend stems from reduced birth rates, and it is a globally valid one. Over the past few

decades, as fertility rates have fallen, world population growth has slowed. Population is growing at an annual rate of 1.3%, estimated in 1998, compared with 2.1% in the 1960s. Nevertheless, the world's population is growing by almost 80 million per year—about 1 billion every thirteen years. In the beginning of the twenty-first century, fertility fell to or below replacement level in sixty-one countries, thirteen of them in the developing world. In 123 countries, fertility is still above replacement level. In most countries, couples still have at least three children. About 1.7 billion people live in forty-seven countries, where fertility averages between three and five children per woman. Another 730 million people live in forty-four countries in which the average woman has five children or more.

Overall fertility declined by approximately one-third from the 1960s through the 1980s, from an average of six to four children per woman, with dramatic decreases occurring in some parts of the world (e.g., 24% decline in fertility in Asia and Latin America, approximately 50% in Thailand, and approximately 35% in Colombia, Jamaica, and Mexico). As fertility declined in developing countries, the infant mortality rate decreased from approximately one hundred fifty deaths per one thousand live births in the 1950s to approximately eighty per one thousand in the early 1990s. Among married women of reproductive age in developing countries, 53% plan the size of their families; 90% of these women report using modern birth control methods.

Many countries in Asia and the Pacific successfully implemented family planning programs. Their success is evidenced by data indicating a reduction in the fertility rate, increased life expectancy, lower infant death rate, and the delayed growth of the population. From 1960 to 1970, the general fertility rate in the region was 5.65 children per woman, life expectancy was 51.9 years, the infant death rate was 120.5 per 1,000 newborns, and the population growth was 2.29% per year. From 1970 to 1980, the general birth rate was 4.5 children per woman, life expectancy was 67.9 years, the infant death rate was ninety-four per one thousand newborns, and the population growth was 2.03% per year.

The birth rate in the region is decreasing, which is evidenced by a comparison of the following data sets: the general fertility rate in 1992 was 3.1 children per woman, which is an estimated 38% lower, compared with 5.0 children per woman during 1970–1975. This trend is even more apparent once data about individual countries, valid as of 1980 and 1991–1992, are compared: in India, the general fertility rate was 5.3 children per woman in 1980 vs. 3.9 in 1991. Almost half of couples use birth control. In Indonesia, the fertility

rate was 4.6 children per woman in 1980 vs. 3.0 in 1992. In the Philippines, the fertility rate was 5.0 children per woman in 1980 vs. 4.1 in 1991. The Catholic Church opposes family planning, and only 22% of couples use modern contraception. In Morocco, the fertility rate was 6.9 children per woman in 1980 vs. 4.2 in 1992. Nurses deliver contraceptives to secluded Muslim women. In Egypt, the fertility rate was 4.6 children per woman in 1965 vs. 4.4 in 1992. Egypt's population grows by a million people every year. In Saudi Arabia, the fertility rate was 7.2 children per woman in 1980 vs. 7.2 in 1991. The above data illustrate that success has been registered in reducing the birth rate in developing countries, which of course relates to the implementation of an overall family planning strategy, also aiming to popularize contraceptives. Their use in the region has grown, even though certain differences exist between individual countries. Data from 1989–1993 about the use of contraceptives is as follows: the use of contraceptives is higher in East and Southeast Asia. China, Hong Kong, the Republic of Korea, and Singapore achieved contraceptive prevalence levels of 70%–74%, while Sri Lanka and Thailand attained levels between 62% and 68%. Countries having prevalence levels of 43%–53% were India, Indonesia, Malaysia, the Philippines, and Vietnam. The remaining countries in the region had prevalence levels of 25% or less.

In most general terms, as of the end of the twentieth century, contraceptives have become an exceptionally popular regulator of the birth rate in developing countries. Statistical data indicate that in developing countries, the percentage of married couples using contraception has risen substantially, from less than 10% in the 1960s to 55% in 1998, and it continues to rise. Of course, the reduced birth rate in developing countries correlates to a reduction in the mortality rate. The country's maternal mortality rate has declined from 397 per 100,000 live births in 1994 to 307 in 2004, compared with Thailand, which has only 44 deaths per 100,000, the Philippines (200), Vietnam (130), Malaysia (41), and Singapore (30). Family planning programs have played a key role in this process.

### **Family Planning at the Beginning of Twenty-First Century**

In order to better understand family planning at the beginning of twenty-first century, it is necessary to outline in brief some statistical information about developing countries, including the countries with the largest populations, China and India.

In 2003, the population in China was 1.3 billion people, and the growth index was 0.6%. Life expectancy is 72.22 years (overall): 70.33 years for males and 74.28 years for females. Because China is the most populated country in the world, family planning is at an exceptionally high level of development. Based on scientific analyses, owing to its perfect family planning over the past two decades, China has managed to reduce its population by 300 million people. Government policy provides incentives for later marriages and for implementing the “one-child family” model, while, under favorable conditions, the two-child model is also allowed. There are plans for the number of population not to exceed 1.4 billion by 2010, assuming that by the middle of the twenty-first century, the population in this country will steady at 1.6 billion. A special government policy is implemented to this effect, to prevent high birth rates and to promote the use of contraceptives. Data from 1991 indicate that 88.85% of Chinese couples of reproductive age use contraceptives.

India is the second country in the world in terms of population numbers; however, forecasts indicate that in a few decades it will surpass China due to its high birth rate. If absolute population growth levels remain unchanged, which equaled 161 million people during 1981–1991, the population in this country will double every thirty years. That is why, in 1951, the National Family Welfare Programme was set up in India with the objective of reducing the birth rate to make it compatible with the constraints of national economy. In 2000, a new National Programme for Demographic Policy was issued, whose objective is to reach a fertility rate by 2010 complying with the simple replacement level of the population, and by 2045—to stabilize its number. In general terms, there is progress in reducing the birth rate, which in 1991 was 3.9 children per woman. This is attributable to the use of contraceptives, which in the 1990s was over 40%. Weaker outcomes of India’s demographic policy in comparison to China are due to social and economic factors: the existence of significant levels of poverty among the larger share of the population (one-third of Indians live below the poverty threshold), poor education (in 2000, the level of education among women was 54%, compared with 76% among men).

Special attention is being paid in Bangladesh to family planning, but birth rates remain high and there is strong resistance to the use of contraceptives. The unwillingness to use contraceptives is associated with the desire for more children, religious attitudes, the opposition shown by male spouses and mothers-in-law, and the fear of potential side effects. Almost 100% of deliveries are carried out at home, and only 5% of births are assisted by trained personnel. The

percentage of sexually transmitted infections is quite high. Young people have no or only limited access to information about sexual or reproductive health. *Essential statistic data:* Bangladesh is the most densely populated in the world—it has a total population of 133 million, with 36% aged ten to twenty-four years. Population growth is 2.2% per year. Human development index ranking for 2002 is: 145 out of 173 countries. Sociodemographic and health indicators are well below the South Asia average. Average life expectancy at birth is fifty-nine years. The infant mortality rates high at sixty-six per one thousand live births.

The maternal mortality rate is very high at six hundred per one hundred thousand live births. The contraceptive prevalence rate among married women (ages fifteen to forty-nine) is 54%. The number of women per one hundred men is ninety-four.

Individuals involved in family planning in Ghana have actively fought against AIDS and advocated for the use of contraceptives. An important number of the population define condoms as a form of protection against AIDS. Empirical research reported an increase in modern contraceptive use from 10.5% to 36.4%. The largest increase is among fifteen- to nineteen-year-olds. *Essential statistic data:* Population is 20.2 million, with 33% aged ten to twenty-four years. Human Development Index ranking: 129 out of 173 countries. Average life expectancy at birth is fifty-eight years. The infant mortality rate is fifty-six per one thousand live births. The maternal mortality rate is 590 per 100,000 live births. The total fertility rate is estimated at 4.3. Only 22% of married women aged fifteen to forty-nine years are included in the family planning. Only 44% of all births are assisted by trained personnel. The population living with HIV/AIDS (ages fifteen to forty-nine) was 3% at the end of 2001. The literacy rate among adults is 63% for women and 80% for men.

Special attention is paid in Ethiopia to the provision of information about family planning among young people. A large number of youth centers have been opened for them, where they can obtain family counseling or information about protection from AIDS, etc. *Essential statistic data:* The population is 67.7 million, with 32% aged ten to twenty-four years. Human Development Index ranking: 168 out of 173 countries. Average life expectancy at birth is fifty-two years. The infant mortality rate is very high at ninety-seven per one thousand live births. The maternal mortality rate is very high at 1,800 per 100,000 live births. The total fertility rate is estimated at 5.9, with only 8% of married women aged fifteen to forty-nine years practicing family planning. Only 10% of births are assisted by trained personnel. The population living with HIV/AIDS (ages fifteen to

forty-nine years) is 6.4%. The literacy rate among adults is low at 33% for women and 44% for men.

Before 1989, Kenya enjoyed the dubious distinction of having the highest fertility rate and, consequently, the highest population growth in the world. At its height, the population growth rate was 4%, and the total fertility rate was eight children. Research has revealed that since the late 1980s and early 1990s, the once-high fertility rate is declining, and Kenya is now among the nations that are experiencing fertility transitions. *Essential statistic data*: The population is 31.1 million, with 37% aged ten to twenty-four years. Human Development Index ranking: 134 out of 173 countries. The average life expectancy at birth is forty-eight years. The infant mortality rate is high at seventy-four per one thousand live births. The maternal mortality rate is very high at 1,300 per 100,000 live births. The total fertility rate is estimated at 4.4, with only 39% of married women aged fifteen to forty-nine years practicing family planning. Only 44% of all births are assisted by trained personnel. The population living with HIV/AIDS (aged fifteen to forty-nine years) is 15%. The literacy rate among adults is high at 76% for women and 89% for men.

The population of the Philippines is 81.6 million, with 32% aged ten to twenty-four years. Human Development Index ranking: eighty-five out of 175 countries. Average life expectancy at birth is seventy years. The infant mortality rate is twenty-six per one thousand live births. The maternal mortality rate is 240 per 100,000 live births. The total fertility rate is estimated at 3.5 with only 49% of married women aged fifteen to forty-nine practicing family planning. Only 56% of all births are assisted by trained personnel. The population living with HIV/AIDS (ages fifteen to forty-nine years) is 0.05%. The literacy rate among adults is high at 95% for women and 96% for men.

The population of Vietnam is 80.8 million, with 32% aged ten to twenty-four years. Human Development Index ranking: 109 out of 175 countries. Average life expectancy at birth is seventy-two years. The infant mortality rate is twenty-six per thousand live births. The maternal mortality rate is ninety-five per hundred thousand live births. The total fertility rate is estimated at 2.3 with 77% of married women aged fifteen to forty-nine practicing family planning. 77% of all births are assisted by trained personnel. Population living with HIV/AIDS (fifteen to forty-nine) is 0.3%. The literacy rate among adults is high at 91% for women and 96% for men.

The population of Sudan is 32.6 million, with 33% aged ten to twenty-four years. Human Development Index ranking: 139 out of 173 countries. Average life expectancy at birth is fifty-six years. The infant mortality rate is high at eighty-two per one thousand live

births. The maternal mortality rate is very high at 1,500 per 100,000 live births. The total fertility rate is estimated at 4.9, with only 10% of married women aged fifteen to forty-nine years practicing family planning. An estimated 86% of all births are assisted by trained personnel. The population living with HIV/AIDS (aged fifteen to forty-nine years) is 2.6%. The literacy rate among adults is 46% for women and 70% for men.

## FANON, FRANTZ

Frantz Fanon lived only thirty-six years, but he became widely known as an active revolutionary, a psychiatrist, and a political theorist. Fanon was embittered by racism, and he passionately supported anticolonial revolutions. He is best known for his ideological justification of revolutionary violence.

Fanon was born on July 20, 1925, in Fort-de-France, Martinique (then the French Antilles). His lifelong preoccupation with the psychological damage of racism may be traced to his home, where he was the most dark-skinned of eight children in a Caribbean household. His middle-class family made sure that he

received a good French education in Martinique, and he imagined himself as part of a universal French culture based on language, not race. He called himself a “Frenchman,” and at age eighteen, he joined Free French forces to fight the Germans in North Africa and France. But he found that white Frenchmen regarded him as inferior.

After World War II, Fanon studied medicine at the University of Lyon. He specialized in psychiatry and began to interpret European imperialism in terms of psychological dominance: the colonized (Algerians, Africans, Vietnamese, etc.) were crippled by their induced sense of racial inferiority and could only regain their psychological health by fighting their oppressors. Fanon’s first book, *Black Skin, White Masks* (1952) expressed his personal frustration with racism, yet in October of that year, he married Marie-Joséphine Dublé, a white Frenchwoman.

In 1953, having completed his medical training, Fanon was appointed chief of the psychiatric ward at a French government hospital in Algeria. The Algerian revolution began in 1954. Dr. Fanon secretly helped Algerian rebels of the Front de Libération Nationale (FLN) for the next two years. In 1956, he resigned from the French medical service and joined the FLN at their base in Tunis, editing the rebel newspaper *El Moudjahid* and later taking to the field.

The year 1959 marked a turning point in Fanon’s life. His analysis of the Algerian revolution, *Studies in a Dying Colonialism*, was published. He was severely wounded when his Jeep hit a landmine on the border of Algeria and Morocco. He was evacuated to Rome for medical treatment and there escaped two murder attempts, presumably orchestrated by French colonial gangs. Also, he was diagnosed with leukemia. These setbacks did not prevent him from assuming the post of ambassador to Ghana for the Algerian Provisional Government and making a 1,200-mile trek across the Sahara Desert in an effort to open up a southern supply route for the Algerian revolutionaries.

By 1961, Fanon was gravely ill. In an odd twist of Cold War politics, he was brought to the United States by a CIA agent, Ollie Iselin. Fanon died in Bethesda, Md., on December 6, 1961. Iselin accompanied his body back to FLN-controlled territory in eastern Algeria, where he was buried. His last book, *The Wretched of the Earth*, was published by his friend Jean-Paul Sartre. Algeria achieved full independence in 1962.

Fanon was a Marxist, but he emphasized psychological rather than economic factors in colonialism. His writings anticipated the ideas of Edward Said—that artificial racial and cultural concepts underlie imperialism. Fanon glorified violence, which he saw as a cleansing force, but he believed that after the

collective catharsis of revolution, a new and better society could be created.

### FARABUNDO MARTÍ NATIONAL LIBERATION FRONT (FMLN)

The history of the Farabundo Martí National Liberation Front (FMLN) is grounded in the life and death of Agustín Farabundo Martí. Martí was born in 1893 in the department of La Libertad, El Salvador, where he grew up among the rural poor. As a young man, he made contact with the Communist International in Mexico and became active in recruitment in Central America. Outraged at the military intervention of the United States in Nicaragua, he joined Augusto César Sandino’s Defending Army of the National Sovereignty of Nicaragua in June 1928. Sandino wanted Martí to recruit more foreign volunteers for his struggle for independence, but the Communist International expected him to draw Sandino closer to its ideological cause. This contradiction strained the relationship between the two men until they parted ways in early 1930. Martí then returned to El Salvador in the midst of a coffee depression. In 1932, he led a mass rebellion against plantation owners that culminated in the massacre of thirty thousand peasants and the subsequent public execution of Martí and several other peasant leaders. This tragic episode of Salvadoran history, known as the *matanza*, was merely the beginning of six decades of state repression and revolutionary resistance.

The emergence of the Popular Forces of Liberation “Farabundo Martí” in 1970 and the People’s Revolutionary Army in 1972 was the precursor of a political and armed struggle against the Salvadoran oligarchy and army. The Sandinista revolution in Nicaragua in July 1979 facilitated the unification of five separate guerrilla organizations in El Salvador. Shortly after Archbishop Oscar Romero was assassinated by military officers on March 24, 1980, the FMLN formed to carry out an insurrection against the governmental and military establishment. In January 1981, the FMLN launched a guerrilla strategy known as the

“final offensive” and called for a general strike that never materialized. The massacre of more than one thousand peasants at El Mozote in December 1981 marked the onset of a full-scale bloody civil war. The unprovoked attack on the village by the government’s Atlacatl Battalion, whose members trained at the School of the Americas in the United States, manifested a chilling counterinsurgency campaign. The United States government under the Reagan administration spent \$6 billion in an attempt to destroy the FMLN and prevent another Cuban-Soviet foothold in the Americas.

In late 1989, the FMLN launched a major offensive on San Salvador, occupying one-third of the capital including several wealthy neighborhoods and the heavily populated working class district of Santa Marta. The government bombed Santa Marta, causing the FMLN to retreat, but lost support from citizens in urban areas. On November 16, 1989, in retaliation for the FMLN attacks, military officers of the Atlacatl Battalion murdered six Jesuit priests, their housekeeper, and her daughter at the Central American University.

These events brought the antagonists under pressure to intensify negotiations for a peace agreement. The secretary-general of the United Nations received a formal request from the government of El Salvador in September 1989 to start talks with the FMLN. The first breakthrough was achieved in 1990 when the parties agreed to ensure respect for human rights. To verify this and future agreements, the Security Council established the United Nations Observer Mission in El Salvador (ONUSAL) in 1991.

Further intense negotiations were brokered by the representative of the UN Secretary General and culminated in a series of the peace accords on December 31, 1991, in New York. A formal signing ceremony was held on January 16, 1992, in Mexico City. The conflict claimed more than seventy-five thousand lives, disabled more than three hundred thousand people, and created five hundred thousand refugees. The FMLN cooperated with ONUSAL in an investigation of crimes against humanity and human rights violations. Many accused military officers and guerrillas were granted amnesty in 1993.

The FMLN became a legal political party, holding its first convention in early 1994. The national elections of March 1994 resulted in the FMLN’s defeat at the presidential level. However, the revolutionaries-cum-politicians secured sixty-two municipalities, fifteen mayoral posts, and twenty-one seats in the national legislature out of a total of eighty-four for an equivalent of 21.4% of the valid votes. In the wake of the transition to democracy and the 1994 polls, the FMLN developed political factions and ideological

tendencies that expressed different modes of thinking and caused serious disputes in the party leadership. This situation affected the party’s ability to coordinate an effective political strategy to compete in the 1999 elections. The electoral victory of conservative and neoliberal parties caused a permanent fracture in the FMLN’s structure along revolutionary socialist and social democratic lines. The main party apparatus is now controlled by a group of leaders known as the “renovators.”

While unable to win the presidency, the factions of the FMLN continue to garner support in legislative and municipal elections throughout the country. The March 2000 elections gave the FMLN block the largest single portion of the Legislative Assembly and control of eighty municipal councils in seven of the fourteen largest cities, including the greater San Salvador metropolitan area.

### FIJI

The Fiji Islands consist of approximately 300–350 islands (depending on high tide) in the South Pacific, of which approximately two hundred are inhabited. The total land area is 7,056 square miles, roughly the size of the state of New Jersey. It is located northeast of Australia and New Zealand, while slightly southwest of Hawaii in the Oceania region. Viti Levu, where the capital city Suva is located, and Vanua Levu are the two largest islands where most business activity occurs. Vanua Levu is primarily developed around a sugar mill, and the rest is hardwood forests, much sought after by Western economies. Viti Levu is cosmopolitan by comparison, with industry, commerce,

government, and agriculture. The economy is based on tourism, sugar, copra, apparel, gold, fishing, and lumber. The tropical climate is temperate year round, and the Fiji Islands have primarily developed their land in the old custom of “nothing taller than a coconut tree.” Coconuts and fish remain staples of the village economy, supplemented by tourism.

The ancestors of present-day Fijians were Austronesian-speaking explorers whose early civilizations have been dated at 3,200 years ago (Geraghty 1994). In 1874, the ruling Fijian chief, Cakobau, ceded the Fiji Islands to the British Crown in a political maneuver designed to quell opposition between European settlers and village tribes (Lotherington 1998). This move changed the ethnic makeup of Fiji in that the British colonial government recruited indentured laborers from the Indian subcontinent to do the hard work in the sugar cane fields. In 1970, Fiji achieved independence, although the country retains friendly relations with England. However, the almost century of colonial rule changed the islands from a network of tribal villages into a multiracial nation. Still, the village system is still firmly entrenched in the Fijian society today. The *Ratu* (village chief) and *vanua* (land owning with a common ancestor) are the focus of hereditary authority and decision-making (Tuimaleali’ifano 2000). The *Ratu* is the eldest in line and may be either a male or female. Traditional ceremonies occur regularly and educational values are passed on in community life through a strong oral tradition. Storytelling and singing are part of the fabric of village life (Lotherington 1995), along with *kava* (also known as *yaqona*), a brown nonalcoholic drink made of water and the crushed roots of a pepper plant. *Kava* is drunk from a coconut cup.

By most standards, Fiji is one of the most successful of the Pacific Island nations. The literacy rate is over 92%, although it was not until 1956 that Fijians other than the village chiefs were provided with secondary education. As of 1986, over 95% of the teachers were trained, reflecting the Fijian government’s efforts to professionalize its teaching force (Tavola 1991).

Medical care is available on the two main islands, but the outer islands have a shortage of clinics.

Fiji is an independent and multicultural republic, with English, Fijian, and Hindi spoken by the ethnic makeup of 51% Fijians, 44% Indo-Fijians, and 4% of mixed heritage (Vaughan 1995). The remaining populations are other Pacific Islanders, Europeans, Chinese, and people of mixed races. According to 2004 estimates, Fiji has approximately 880,000 inhabitants.

This mixture of indigenous Fijians and the Indians has led to racial stress and conflict over the past fifteen years. In 1987, the democratically elected multiracial government was overthrown in two coups, in

which the balance of power shifted back to the traditional Fijian hierarchy (Lotherington 1998). The coups stimulated a huge exodus of Indo-Fijians, many who migrated to Australia, New Zealand, Canada, and the USA. It was the professional people in top positions who could most easily migrate, thus resulting in a brain drain of the country.

In general, crime has been relatively low in Fiji. There is only one prison, which is located in the capital city of Suva. Currently, there is a small but active women’s rights movement. In 1997, the Constitution was amended to become more equitable. Women now enjoy equal rights; however, wage inequalities still exist—especially in the garment industry, where female workers are subject to a special minimum wage that is considerably lower than in other industries. In general, women in the Fijian community are more likely to rise to prominence in their own right than are women of Indian or Indo-Fijian descent.

In 2000, the people of Fiji endured an armed takeover of parliament and a hostage crisis lasting fifty-six days (Tarte 2001). Martial law was declared, and there was mutiny in the armed forces, which raised the specter of civil war and economic collapse and international ostracism. Again, this coup was based on the election of an Indian leader of the government being ousted. The group of rebels overthrowing the government were arrested after almost two months and charged with treason. An interim government was sworn in. The interim government was later elected democratically by popular vote and continues on its path to long-term recovery. Two coups in quick succession were disturbing to the neighbors of Fiji (Swarts 2000), and the political developments since the last elections had led to erosion of the commitment to build cross-community bridges (Chand 2001).

Tourism, which dropped off after the coup, is slowing drawing back people to the magic of the island. Some concern exists over global warming and its effects on the Fiji Islands.

## FOOD AND NUTRITION

### Some Preliminary Comments

Food serves three basic functions for most living beings. Firstly, food creates energy required in the absorption and translocation of nutrients necessary for growth, sustenance, and biological and physical activities of the organism. Secondly, food supplies reducing agents indispensable in synthetic processes inside of cells. Thirdly, food purveys the materials—structural and catalytic chemical components of living cells—that are built through anabolism. When one of these functions is absent, living organisms substitute the deficiency with the others.

Nutrition is the process through which food substances are absorbed and used by living organisms. Commencing with the act of feeding, the process continues with digestion, where proteins are broken down into aminoacids. Subsequently, intestines absorb nutrients, which once integrated, are then distributed throughout the body for assimilation and metabolic transformation within each cell. The last stage is excretion of waste and toxins.

Food and nutrition are often confused, since both are intertwined. It is the nourishment found in food that after consumption is assimilated through the process of nutrition, in order to sustain life. *Food* is a generic term to cognate vegetal and animal organisms as a whole, in parts or secretions: flowers, fruits, leaves, shoots, roots, sheaths, milk, eggs, and muscles and inner organs, such as liver or kidneys.

*Nutritional requirements of living organisms* that enable the proper functioning of cells, maintaining their structure and controlling their metabolism, are approximately one hundred substances found in the environment. Generally, nutrients are chemical compounds of heavy molecular weight (starch, proteins, sugars, fibers, salts). Nutrients travel via the blood's circulation, to be absorbed by cells.

Eating is a biological necessity, determining life quality and health status of human beings. However, eating is a holistic human experience, representing pleasure for the senses, culinary aesthetics,

communication and social cohesion tools, moral etiquette, core components of ceremonial and mourning rituals, and channels to strengthen *cultural and territorial identity*.

### A Brief Diagnosis of the World's Food Situation

Nutritional dietary requirements of each individual vary according to age, gender, height, body complexion, physical activities, physiological state (growth, pregnancy, breast-feeding), health, and genetic and climatic factors. Throughout the history of humanity, portentous changes have occurred. From a culture of hunting and gathering, consuming mainly raw food, the agricultural revolution triggered a culinary revolution. After the domestication of plants and animals in different regions, more complex alimentary patterns emerged, engendering various culinary traditions.

Food extraction, processing, and presentation relate to cultural, environmental, and epidemiological conditions, as well as to habits, income and access to markets. Adverse conditions or imbalances of essential nutrients, such as proteins, carbohydrates, vitamins, and minerals occasion *dietary deficiencies*, which result in malnutrition, diseases, and in extreme cases, death. *Overconsumption* of calories produces obesity.

*Malnutrition affects health* and well-being of more than one third of the world's population. Two billion people are anemic, 3.7 billion suffer from iron deficiencies, and 24,000 die daily from hunger (FAO 2000b). Around 80% of estimated *hunger* concentrates in rural areas, especially among women and children, where it is more frequent and severe. Complex malnutrition cases are recurrent within adolescent mothers, whose conditions negatively affect their health and that of the fetus. Similar adverse malnutrition befalls fertile mothers, becoming pregnant while still breast-feeding.

Developing countries are increasingly dependent on food importation, which increased from 28% to 37% during 1970 and 1997. In the poorest countries, food imports account for more than 50% of consumption. An estimated 55 million people are malnourished in Latin America. Hunger is linked to poverty and deficient job opportunities. Discontinued rural policies and increasing dependency on food imports push peasant populations out of their lands into urban slums.

In the Third World as a whole, urbanization processes, reduction in social spending, and poor

economic growth linked to high levels of population growth, have impeded improvement in living conditions. Latin America can be taken as an example for other developing countries. Periodic economic crises since the 1980s have produced two lost decades of development (CEPAL 2004). Poverty has increased in numbers and conditions defining this condition have worsened. Although food disposal has risen from 2,485 kcal to 2,570 kcal in twenty of the twenty-four countries belonging to the region, income inequalities translate to differential food conditions: Between 1990 and 2000, Haiti, Cuba, El Salvador, Venezuela, Guatemala, Mexico, and Argentina have increased their hunger rate. Guatemala, Honduras, Mexico, Haiti, Bolivia, Peru, Nicaragua, El Salvador, and Guyana are the countries with the highest chronic malnutrition and low economic growth.

Food production has improved during the last decades, but poverty, hunger, and preventable illnesses have simultaneously increased. Overall global consumption reached \$24 billion in 1998. In 1996, the daily ingestion of calories per person in high human developed countries was 3,347 (11.6% more compared with 1976), with 102.7g of proteins (13% more); in medium developed countries, it was 2,696 calories (26.9% more) with 69.6g of proteins (33.7% more); and in low developed countries, 2,145 calories (1% less) with 51.0 g of proteins (4.4% less). Another indicator of undernourishment is infant low birth weight, which was 7% in high, 17% in medium, and 20% in low developed countries (UNDP 1999).

The lowest income quintile met only 72% of the minimal nutritional requirements in sub-Saharan Africa, 78% in Latin America, and 80% in the new independent states. The gap in Asia and sub-Saharan Africa is predicted to deteriorate, and only the highest of five income groups is projected to meet minimal nutritional requirements, given present food policies.

Over the next decade, the food gap is expected to widen. In thirty-five poor countries, nutritional requirements will fall short, and forty-seven countries are projected to reduce per capita consumption. This means new subsidies for agricultural surplus production and greater food power for the USA compared with the rest of the world.

### **Food Sovereignty Versus Food Security**

Food sovereignty represents both a social and a personal right of individuals and communities to healthy, culturally appropriate food. Food security, on the other hand, means sufficient food for disposal by

individuals or nations, once subtracting unused food. At a national level, it represents the sum of domestic produced food and imported food minus nonconsumed food.

The first definition represents a basic human right and an obligation to states and world networks to provide it. The second definition is a technical one, as it gives no responsibility to governments at any level. Furthermore, food security is defined as the balanced daily intake of proteins, carbohydrates, vitamins, and minerals necessary to sustain a healthy life. Food safety is also linked to hygiene and the prevention of food-borne diseases. The World Health Organization has confirmed that bacteria are the greatest threat to food safety, occurring in professional and domestic food handling.

The US Department of Agriculture evaluates national food security by “measuring the gaps between actual food consumption (domestic production, plus commercial imports, minus unused food and consumption targets).” The nutritional gap also measures minimal daily nutritional requirements, in relation to age and activities.

Purchasing power exacerbates food insecurity within the sixty-six poorest countries, given resource-access differentials. The richest fifth of the world population today accounts for 86% of global consumption, compared with the poorest fifth left with 1.3%. This means also that the remaining 60% only consume 12.7%. Africa disposes today 20% less food than twenty-five years ago and per capita consumption in industrialized countries is still rising (United Nations Developing Program 1998–2001).

For this reason, food insecurity resulting from extreme poverty is better defined as perverse poverty (Oswald 1990). Perversity lies in the fact that infants are condemned to be second-class citizens before birth, given irreversible brain damages and low birth weight, caused by mother’s chronic undernourishment.

### **Causes of Food Insecurity in Developing Countries**

Hunger is not due to the gap between food production and population rates. Enough food is produced worldwide: 4.3 pounds of food per person a day; 2.5 pounds of grains, beans and nuts; about a pound of meat, milk, and eggs, and another pound of fruits and vegetables (Lappe 1998). Increasing food insecurity within countries and continents on the one hand, and greater production with fewer consumers on the other hand, are two sides of the same process: corporate agriculture.

Multinational companies (MNC) induce individual farmers to technological innovation and capital-intensive production processes, only feasible by undergoing heavy debts. As an example, an average poultry producer raises 240,000 birds each year. After paying its costs, “this prodigious (and inhumane) production earns the farmer only \$12,000, or five cents per bird” (Gorelick). Only bigger farms can survive under these conditions. Such corporations monopolize almost every stage of processing, distribution, trade, and inputs of food production (seeds, fertilizers, pesticides, medicines, equipment, processors, transportation, marketing, and banking), and increasingly control natural resources (water, gas and oil).

Corporate agriculture also affects human health and the environment. Not enough is known about the human health effects caused by ingestion of controversial genetically modified organisms (GMO food) or cattle fed with these grains. However, hormones are used extensively with livestock, such as Bovine Somatotropin, known to stimulate the hormone insulin-like growth factor 1. These hormones are linked to an increased incidence of breast cancer in premenopausal women and prostate cancer (180%) in men (Epstein), and greater vulnerability of the immune system.

The conjunction of these processes leads to an exclusive globalization, in economic, communicative and political terms, surpassing national borders and capacity of nation-states. The integration of regions into commercial blocks—the European Union, North American Free Trade Agreement (NAFTA), Mercado Común Sur (MERCOSUR), Asian-Pacific Economic Cooperation (APEC)—protects above all free circulation of commodities, intellectual property rights (TRIPS, an agreement on trade-related aspects of intellectual property rights, including trade in counterfeit goods, defended by the World Trade Organization [WTO]) and regulates potential commercial conflicts in favor of the industrialized nations. Additionally, the International Monetary Fund imposes structural adjustment policies in highly indebted countries, truncating agrarian reforms and substantially reducing subsidies and technological support for food production, given debt service payments. Cheap prices for food and primary products in world markets are artificially dropped, and most technological innovations are profit-driven rather than need-oriented.

In Third World countries, corporate agriculture reduces national food sovereignty and diminishes food security at local level, as well as pushing peasants off the land. Today in Latin America and North Africa, food imports represent around 40% of consumption. Food aid, increasing imports of

basic grains, substitution of food by export crops, and technology-linked agribusinesses destroy rural policies in the South. Countries are exposed to foreign food power, depending on international markets and prices. Unequal terms of trade—low raw material prices and high input costs—clearly prevent poor people from buying food.

Malnutrition and hunger are both part of a complex and interrelated system of social, agricultural, economic, political, and ecological realities. In poor countries, hunger is exacerbated by high indebtedness and debt servicing; the substitution of local foodstuffs with export commodities—vegetables, tropical fruits and flowers—in order to earn foreign currency to service debts; the raising of livestock instead of subsistence crops; the submission of local and regional markets to the interests of international monopolies; forced bankruptcy of small farmers and peasants facing high interest rates, constant increases in agrochemical and other products; and the falling prices of peasant’s agricultural products because of international artificial prices (dumping). In addition, natural disasters and global warming, as well as food aid to countries south of the Sahara, which prolongs their situation of dependency, turns peasants into migrants, furthers dependency, and generalizes a deficient transnational food culture.

Unless there is food sovereignty at the local and national level, no country in the world will be immune to food power and starvation. Food self-sufficiency is only possible when integrating private and public enterprises, economic, social, commercial, productive, political, and human ethics with gender and social equity, under a clear defined sustainable framework to overcome inequality.

## FOREIGN DIRECT INVESTMENT (FDI)

### Introduction

In the post–World War II era, foreign direct investment (FDI) by multinational (or transnational) corporations has increased greatly. During the colonial era, multinationals corporations (MNCs) from colonial powers had set up subsidiaries and factories, particularly in regions endowed with natural resources such as silver, gold, and, later on, oil and other minerals. The abundance and proximity of raw materials, coupled with cheap labor, meant high profits for parent companies. In those days, FDI consisted mainly of firms from colonial countries doing business in overseas colonies and territories. Thus, FDI was considered as a form of exploitation of developing—but resource-endowed—nations

In the modern era, FDI has, in general, been viewed more favorably. From the standpoint of transnational corporations, the focus is no longer exclusively on labor costs and raw materials. From the viewpoint of host countries, FDI is seen as a source of finance and a much-needed channel to access advanced technology. However, it was not until the early 1970s that policymakers began considering FDI as a potentially important contributor to economic development. In the 1970s and early 1980s, developing nations employed tax incentives (exemptions) and protectionary measures to attract FDI.

Many of the early projects targeted import substitution. In the late 1980s and early 1990s, most developing nations have come to realize that tax incentives were not sufficient long-term measures. Advised and/or pressured by international lending institutions such as the International Monetary Fund (IMF) and the World Bank, many developing countries have undertaken significant reforms including trade and financial liberalization. A number of countries have liberalized current and capital accounts and introduced flexible exchange rate regimes, with the view to attract more FDI. While the reforms have been viewed as factors that fostered inward FDI into these countries, the experiences of emerging countries in Southeast Asia and Latin America in the 1990s points to the potential dangers of increased openness to foreign capital.

FDI has increasingly been considered a major indicator of globalization. Yet, a number of scholars and policymakers still view the effects of inward FDI as a combination of positive and costly (if not negative) effects.

There are two major reasons for the growing interest in FDI in the last decade. First, the influence of MNCs has been increasing over the last three decades of the twentieth century. This influence was strengthened by the ability of MNCs to have large, integrated operations around the world. Second, the role of FDI as a source of capital and a major tool in the fight against poverty began to be emphasized due to the decline in official development aid. While FDI to developing countries has increased, official aid has been falling.

### Definition and Terminology

FDI—also called direct foreign investment (DFI)—refers to the acquisition and control of foreign assets. FDI includes activities that are organized and controlled by firms abroad; i.e., outside their country of origin (where their headquarters and their main decision-making centers are located). The extent of control or ownership may depend on the country. The World Trade Organization (WTO) defines FDI as follows: "[FDI] occurs when an investor based in one country (the home country) acquires an asset in another country (the host country) with the intent to manage the asset." Thus, FDI can be divided into three categories. The first is "equity capital," which is the value of the MNC's investment in the shares of an enterprise in a foreign country. The second comprises "reinvested earnings," which are the MNC's share of affiliate earnings not distributed as dividends or remitted to the MNC. The third category is labeled

“other capital” and includes short- or long-term borrowing and lending of funds between the MNC and the affiliate. The establishment of “new” production or distribution facilities in a foreign country is called Greenfield FDI. If the MNC acquires a foreign company (entirely or partially), it is referred to as FDI by acquisition. Currently, most FDI comprises mergers, acquisitions, or takeovers.

The US government defines FDI as “the ownership, or control of 10% or more of an enterprise’s voting securities, or the equivalent interest in an unincorporated business.” Some countries place an upper limit to foreign ownership of home businesses, but the 10% minimum is widely used around the world. The country where these activities are located is referred to as the host country, while the country of origin is referred to as home country. When FDI flows from one country to another, it is referred to as inward FDI for the host country and outward FDI (also called “direct investment abroad”) for the home country. The investor is typically referred to as the parent firm and the asset owned (totally or partially) abroad as the affiliate or subsidiary.

FDI can serve either as an export replacement (import substitution from the standpoint of the host country) or export platform; production in the host country is exported to other countries. FDI is one of the main components of the capital account of a country’s balance of payment. The United Nations Conference on Trade and Development (UNCTAD) is the principal source of data and commentary on the state and trends of world FDI. It produces an annual report, the World Investment Report (WIR), which includes figures, tables, and charts depicting the behavior of world FDI and often focuses its analysis on a specific topic. For example, WIR 2001 (“Promoting Linkages”) focused on the issue of linkages between foreign affiliates of multinational enterprises and local companies in developing countries; while WIR 1999 (“Foreign Direct Investment and the Challenge of Development”) emphasized the impact of FDI on key objectives of economic development. These effects included increasing financial resources for investment, enhancing technological capabilities, boosting export competitiveness, generating and upgrading employment, and protecting the environment.

The impact of FDI is often contrasted with the effect of foreign portfolio investment (FPI). FPI comprises the holding of financial assets but does not involve control or participation in management operations of the firm issuing the securities. The main motivations for FPI are risk diversification and high returns; whereas FDI is motivated by different

factors and is regarded as a less volatile, hence less destabilizing, form of foreign capital. FDI tends to be quite resilient during financial crises and thus may be a more desirable form of capital inflow to developing countries.

## Theories of FDI

### *Modernization School*

This school includes the neoclassical (perfect market approach), Ownership, Location, and Internalization (OLI) paradigm, and industrial organization theories (imperfect market approach). The neoclassical theory posits that free trade and free markets would lead to higher growth and increased FDI flows, and that developing countries will be able to grow through this channel by implementing the liberalization policies of developed countries (natural order of development stages). The neoclassical theory stresses the link between free trade and FDI. The industrial organization theory argues that market imperfections (such as the existence of oligopolies) lead to horizontal or vertical integration, and hence FDI is more likely to take place in oligopolies. The OLI paradigm (= O + L + I), developed by John Dunning, represents a mix of three distinct FDI theories. Each theory emphasizes a different focus. The “O” represents “ownership” advantages. These are firm specific advantages that address the question of “Why go abroad?” The “L” refers to “location” advantages and addresses the issue of “Where should the MNC locate?” Finally, the “I” refers to “internalization” advantages and focuses on the question of “How will the firm go abroad?” The OLI paradigm is an eclectic theory of FDI that focuses on FDI determinants from the perspective of the firm.

### *The Dependency School (Dependencia/Neo-Marxist and Structuralist Theories)*

The neo-Marxist theory postulates that the repatriation of profits from developing countries worsens these countries’ terms of trade; and the structuralist theory claims that countries or regions on the periphery are marginalized since their resources are being exploited by prosperous centers. Thus, dependency theories view FDI as a cause of increased spatial inequality in economic development within and across countries.

*The Integrative School (Institutional Theories)*

This school includes the bargaining theory, integrative theory, and “institutional FDI fitness” theory. The bargaining and integrative approaches focus on the determinants of FDI from the viewpoint of both host countries and foreign investors. The institutional fitness theory, formally outlined by Saskia K.S. Wilhelms (1998), is an integrative theory that emphasizes macro-, micro-, and meso-economic variables. Where the meso-economic variables include institutions linking the host economy and the foreign firm. This theory focuses on the public and private sector interaction. In general, institutional theories focus on FDI in developing economies and provide analyses useful to researchers of the topics of economic growth and development.

Another way to distinguish among theories is to group them into macro-level and micro-level approaches. At the macro level, early mainstream theories included the neoclassical and the dependency theories discussed above. The three early conventional micro-level theories used approaches that focused on different dimensions of the firm behavior. First, there was an emphasis on the ownership advantage and market structure (Hymer 1960). Hymer tried to solve the puzzle as to why firms would prefer FDI, which is more costly than exports or licensing, by highlighting the fact that MNCs do not operate in perfectly competitive industries. Then, the focus was directed to the location advantage (Vernon, 1966). Finally, there was an emphasis on the internalization advantage (Buckley and Casson 1976). These conventional approaches emphasized FDI from the viewpoint of the firm and examined the reasons firms invest in foreign countries. Additional theories focused on market structure (monopolistic or oligopolistic) and highlighted the rivalry aspects in global markets. Oligopolistic industries tend to undertake the bulk of FDI as they compete in the global market. The micro theories of FDI also include industrial organization theories and the OLI paradigm, which nicely combines the three conventional firm-focused theories.

A more recent strand of the literature emphasizes the issues from the standpoint of host countries, particularly developing nations. In general, three broad areas are examined. The first is whether developing nations should welcome FDI. The second area concerns the study of what host countries have to offer foreign investors. In other words, it focuses on the determinants of inward FDI, including sociopolitical and economic variables, and policy indicators (incentives, markets, and prices). The third area focuses on evaluating the effects of FDI on a wide range of

macroeconomic and microeconomic indicators in host countries.

**Determinants of FDI**

Until recently, most developing countries have had a negligible share of outward FDI. Thus, economists and policymakers tend to focus mainly on the effects of inward FDI on economic development and growth. To study the determinants of FDI, researchers first specify the dependent variable. FDI (as a dependent variable) may be net—inward minus outward FDI—or simply inward FDI flows. Second, depending on what we want to test, the focus may be on FDI flows or FDI stocks. Models examining the behavior of inward FDI to developing economies have used a wide spectrum of variables including market size, economic growth, human capital, physical capital, financial and trade reforms, geography, and institutions. Perhaps the most encompassing model is that studied by Wilhelms (1998), who developed an integrative model to test the determinants of net inflows of FDI in emerging economies. The model includes four main dimensions (concepts). The first concept represents government fitness, which in turn includes several variables. The variables included in this dimension are a measures of economic openness (parallel market exchange rate premium, export marketing board, and import quotas), and legal and administrative impartiality and transparency (country risk, rule of law, and corruption). The second dimension is market fitness. It includes “overall market fitness” that covers several variables. These variables are gross domestic product (GDP) to proxy for economic development, total population to proxy for market size, an indicator of rural infrastructure and linkages represented by population density in rural areas, trade volume, and tax revenues to measure taxation of the private sector. Market fitness also comprises “capital market fitness,” which includes domestic credit provided by the banking sector (relative to GDP). In addition, this dimension includes a measure of market linkages represented by an indicator for development of energy infrastructure. The third component is educational fitness, which covers indicators of basic education. The last dimension refers to sociocultural fitness. It includes a dummy variable for the region and a dummy for time changes. The empirical tests reveal that most of these variables are important determinants of FDI. Economic openness, a strong rule of law, and low corruption foster inward FDI. While FDI does not seem to respond to the level of per capita income,

implying that countries with low levels of economic development have succeeded in attracting FDI. As argued by Wilhelms, this is consistent with the fact that FDI tolerates low economic development while portfolio investment targets mainly developed countries. Taxes deter investors and hence have a negative effect on FDI; whereas the volume of trade, domestic credit provided by the banking sector, and market linkages fitness attract inward FDI. The sociocultural dimension also is a significant determinant of FDI.

Numerous other studies have focused on particular countries or regions. A study that examined the macroeconomic impact of FDI flows to China following the implementation of the “open-door policy” in late 1978 shows that FDI had significantly contributed to economic growth in China; through its contribution to domestic capital formation, export enhancement, and job creation. The findings also indicate that, thanks to its technology transfer component, export promoting and enabling of more intersectoral flows of capital and labor, inward FDI to China had improved the productive efficiency of domestic industries (Haishun Sun [1998], *Foreign Investment and Economic Development in China, 1979–1996*, Ashgate Publishing). In the same line of research, tests of the FDI-led growth hypothesis in Brazil, Chile, Colombia, Mexico, and Venezuela (these countries received most of the FDI to the region in 1970–1991) provide evidence that trade regimes and domestic policy variables are major determinants of FDI and economic growth (De Melo 1999). Some studies have investigated the role of corruption and non-transparency (Kaufman *et al.* 1999) on inward FDI. In general, the findings indicate that corruption and nontransparency deter FDI. The geography of international investments also has been examined by a number of studies. One important study found that, after adjusting for market share, a substantial share of FDI remains close to the home country. After adjusting for distance, the results show that the main determinant of FDI is market size. It also is shown that FDI is more geographically concentrated than exports or production as a whole (Schatz and Venables 2000).

In view of the diversity of the determinants of FDI, it had become necessary to have a simple index that can serve as a “rough-and-ready” indicator of the country’s ability to attract inward FDI. In 2001, United Nations Conference on Trade and Development (UNCTAD) introduced the inward FDI index (World Investment Report 2001). This index measures foreign direct investment relative to a country’s share of global GDP, exports, and employment. Index values exceeding unity indicate countries that are particularly attractive to foreign investors. As stated by the UNCTAD, the index “captures the

ability of countries to attract FDI after taking into account their size and competitiveness.” The index confirms the wide disparities among countries. For example, in 1998–2000, fifty-three countries had an inward FDI index higher than unity. Five countries had an inward FDI index value of one. On the other hand, more than half (seventy-nine) of the countries included in the study had an index lower than one. This comprised countries with negative indexes (for example, Yemen had an index equal to  $-0.8$ ). Belgium and Luxembourg had the highest index (17.3). However, while the index may serve as a tool of benchmarking country attractiveness of FDI, the UNCTAD warns that the index must be supplemented by other elements such as policy and economic variables.

In sum, although the empirical literature on the determinants of FDI does not always provide definite conclusions, it does tend to support the following claims. First, the impact of liberalization (trade openness and export orientation) as a determinant of FDI can be quite significant. Countries that have liberalized trade and markets tend to attract higher FDI. Second, to attract FDI into developing countries, economic growth is not a major determinant provided other indicators—such as transparency, rule of law human capital, and political stability—are strong. Third, market size is important (the case of China) when other elements are weak. Fourth, the influence of geography remains important. Fifth, cultural links and colonial heritage can play a major role. For example, in 1992–1994, the United Kingdom invested \$1.3 billion in South Africa and only \$90 million in Morocco, whereas France invested \$287 million in Morocco and only \$56 million in South Africa. It is important to remember that the list of the determinants of FDI can be large and vague and tends to change over time. In 1998, the UNCTAD dedicated a major part of the annual World Investment Report to the study of the determinants of inward FDI. It concluded that the main determinants are “the policy framework, business facilitation measures, and economic factors.” Obviously, this could involve more than a dozen variables.

### **FDI and Economic Development in the Host Country**

The theoretical literature on the influence of inward FDI on economic development suggests that there are significant benefits but also some potential costs. The benefits include positive effects on economic growth, exports, firm productivity, human capital, and other spillover effects to the economy of the host country.

The role of FDI as purveyor of technology, knowledge, and other intangible assets has been acknowledged by many scholars and policymakers. It is through this channel that FDI is thought to have the most significant effect on economic growth. Thanks to FDI, a developing country may be able to access advanced technology from industrialized countries, adopt this technology, and perhaps even adapt it to country-specific realities. At least in theory, the diffusion of advanced technologies could allow developing countries to leapfrog to a higher stage of economic development. After all, Japan's early stages of industrialization were not based on inventing new technologies but on adopting and adapting existing technologies from more industrially advanced countries. Some theoretical studies have found that licensing and joint ventures with local firms lead to technology transfer to the host country as this implies sharing of know-how and experiences. However, empirical evidence in support of this claim is rather weak. In addition, studies show that FDI will more likely benefit the host country if one or more of the following conditions are fulfilled. First, there is a large cost of communication between the headquarters and the production plant (located in the host country). Second, there are substantial intermediate goods in the final product being produced in the host country. Third, the variety of intermediate goods in home and host country is not very different. Host countries will more likely be harmed if reverse conditions prevailed (Rodriguez-Clare 1996).

The theoretical literature suggests that the potential costs include worsening of the balance of payments and negative effects on tax revenue collection due to transfer pricing. There may also exist adverse effects on domestic firms when the competition effect—domestic firms competing against foreign firms—is stronger than the technology effect. This may deprive the host country from the opportunity to develop its own (domestic) know-how and technologies. FDI may also cause a damaging effect to sociocultural values due to possible abuse of host country's traditions. In addition, governments tend to be concerned about the destabilizing effect of FDI when there is divestment. Though FDI is less volatile than portfolio investment, there are cases where divestment by MNCs exacerbated financial and macroeconomic crises. In addition, researchers and NGOs have recently begun to focus on the impact of FDI on labor standards (including the issue of child labor) and the environment in developing countries.

On the empirical side, many studies have examined the effects of FDI on economic growth and on the components of income or GDP. FDI contributes

assets such as capital to create new businesses or expand existing ones, and technology transfer. It also provides the host country with intangible assets such as know-how, managerial skills, and spillovers to other industries. Due to linkages and spillovers, other industries can benefit from new opportunities created in export sectors as a result of linking to foreign markets and MNCs. FDI can also promote research and development activities in the host countries. The indirect benefits to domestic firms, however, are not automatic. The positive effects on economic growth have been proclaimed by international institutions such as the UNCTAD and the World Bank. A comprehensive World Bank study (Klein *et al.* 2001) argues that FDI “remains among the most effective tools in the fight against poverty.” Another study that examined the impact of capital inflows on investment in fifty-eight developing nations for the 1978–1995 period has shown that a one-dollar increase in FDI leads to a one-dollar increase in domestic investment while portfolio inflows had only a negligible influence on domestic investment (Bosworth and Collins 1999).

Some empirical studies have focused on specific regions. Studies of the experiences of Indonesia, Malaysia, and the Philippines indicate that, although the experiences have varied, FDI constituted a vital ingredient in export-led growth. The role of foreign firms in the electronic sector—which was the fastest growing sector—was quite important. However, because FDI promotion was on a selective basis, other industries did not develop at the same pace. Thus, these countries could not take full advantage of spillovers from foreign firms to domestic firms. Other empirical work focused on specific projects. Encarnation and Wells (1986) analyzed the impact of fifty FDI projects on national income and have found that not all projects were income enhancing. Overall, 55%–75% of the projects had a positive effect on income, while 25%–45% had a negative effect on national income. The main reason for the negative impact was protectionist measures granted to the firms undertaking the FDI projects.

Consequently, it is not always wise to assume that there is an automatic positive effect of FDI on economic growth. Empirical findings indicate that human capital (education and other skills) as well as institutions are key ingredients to attract FDI and also to ensure a positive effect of FDI on income. A study that examined the way FDI affects economic growth (Borensztein *et al.* 1998) argues that the stock of human capital in the host country limits the absorptive capability of a developing country. Other researchers have found that the benefits are contingent upon certain features of the host country. In

particular, trade and financial liberalization are crucial. Additionally, domestic firms may be harmed by increased FDI inflows. For example, empirical research has found that inward FDI may have negative effects on productivity in domestic firms in Morocco. Similar findings were reported for firms in Venezuela. This suggests that when the negative competition effect dominates the positive technology effect, productivity in the domestic sector may fall.

A line of research that has been growing in the 1990s focuses on the impact of FDI on wages and labor standards in developing countries. While wages for skilled labor often increase as a result of higher FDI, the inequality between skilled and unskilled labor earnings has widened. FDI into China, for example, has contributed to the worsening of the environment, an increase in interregional inequality, and increased round-tripping of the capital of Chinese firms. Domestic firms would send funds outside China and bring them back as foreign capital to take advantage of FDI-promoting incentives (Sun 1998). Thus far, there has been no empirical finding in support of a relationship between FDI and worsening in labor standards in developing countries. Moreover, researchers at the World Bank as well as UNCTAD have investigated the effect of inward FDI on the environment. In general, empirical studies have found fairly weak support for the “pollution haven” hypothesis.

## Recent Trends

From an economic theory standpoint, we would expect to see countries with lower levels of capital, and hence higher marginal returns on capital, attract foreign capital. One of the channels through which FDI enhances growth is productivity and efficiency. Economic theory stipulates that capital would flow to where it is scarce: i.e., where there are higher marginal returns. This would enhance global efficiency. However, the facts are not in support of this assertion. Africa is quite rich in natural resources and low-cost labor. Capital tends to be scarce implying a higher marginal return on investment. Yet, Africa in general has not been very successful in attracting foreign capital. In fact, the data published by UNCTAD clearly show that Africa’s share of global FDI inflows has actually fallen over time.

The share of Africa in world FDI inflows fell from an average of 2.13% in the first half of the 1980s to 1.23% in the second half of the 1990s, while the shares of Asia and Latin have increased substantially (particularly emerging economies in Asia). In

addition, the share of industrial countries remained at an average of two-thirds of world inward FDI. Inward FDI going to developing countries nearly doubled in the early 1990s (1991–1993) relative to the second half of the 1980s (UNCTAD). While these surges of FDI inflows could indicate that developing countries can be successful in attracting FDI, the concentration of FDI remains regional. For most of the 1990s, Asia received the largest share of FDI, and Latin America received the second largest share, while Africa, has remained quite, marginalized. Thus, in terms of promoting economic growth and alleviating poverty in Africa, FDI is not a main contributor, as Africa receives very little amounts. On the other hand, inward FDI to some Asian and Latin American emerging countries was sizeable and is believed to have promoted human development and economic growth. Equally important is the concentration of FDI in specific sectors. In Africa, most FDI is concentrated in the exploitation of natural resources (raw materials). According to some researchers (including those at the World Bank), the effects of such foreign investment on the economy of the host country are not clear. In addition to the potential effect on the environment, the depletion of natural resources constitutes a cost to the developing country that is not properly incorporated in the computation of GDP and economic growth.

FDI outflows from developing economies in Asia doubled in 2000. This is a new trend that indicates a significant change in the origin of FDI, which in the past was almost exclusively from developed countries. It also suggests that countries receiving of FDI from developing countries may not be able to access advanced technology usually associated with FDI from industrial countries such as the G-7 countries. According to UNCTAD (2001), when comparing inward FDI in 2000 and 1985, we observe that in 2000, FDI reached more countries and involved higher amounts. In 2000, twenty-three developing countries received an average amount of FDI greater than \$1 billion each, compared with only six countries in 1985. Outward FDI experienced a similar trend. In 1985, only one developing country had outward FDI flows of more than \$1 billion. At the end of the 1990s, this number increased to thirteen countries.

Since the 1970s, world FDI flows have been growing and the share of developing countries has increased during recent years. In the 1980s and 1990s, FDI flows have risen in absolute terms and relative to trade and GDP. Between 1984 and 1987, FDI outflows have almost tripled, to surpass the growth rate of world GDP and world trade. While in the 1970s and 1980s, FDI had been mainly targeting developed countries; the flows to developing countries have

## FOREIGN DIRECT INVESTMENT (FDI)

grown to reach about 40% in 1996. Yet, the bulk of FDI flowing to developing countries is limited to a group of countries in Southeast Asia and Latin America.

In the 1970s, outward FDI came mainly from developed countries. But in the 1990s, there were significant amounts coming from developing countries. In 1970, 99% of world outward FDI came from developed countries, with about 91% from what became known as the G-7 countries, with the US leading the group in terms of the volume of FDI outflows (60% of the total). In 1993, the share of FDI originating from developed countries fell to 94%. Asian countries contributed the bulk of the remaining 6%. The US share fell from 60% in 1970 to about 30% in 1993. In 2000, the average share of Africa in total world FDI was 0.6%, much lower than its average share in the 1980s. The shares of developing Asian countries and Latin America were 11.3% and 6.8%, respectively. The share of industrial countries has been around two-thirds of total FDI for both periods the downward trend in the growth rate of FDI received by Africa is a disturbing phenomenon.

In 2000, the share of developed countries in world FDI inflows was slightly above 79%. China has had the lion's share of FDI inflows to developing countries. In 1978, China introduced the open-door policy to many coastal provinces, and the result has been a significant inflow of foreign capital and expansion of Chinese exports.

## FOX, VICENTE

Vicente Fox Quesada was born in Mexico City on July 2, 1942. While he was still a boy, his parents returned to the family ranch of his Irish-born grandfather. Raised in a comfortable, traditional rural environment and educated in private schools, he graduated in business administration from the Jesuit Iberoamericana University in 1964. His first job was with the American multinational corporation, Coca-Cola de Mexico.

Offered a promotion that would have required him to move to the US, he chose to remain in Mexico. Fox left Coca-Cola and returned to Guanajuato. He joined his family's agricultural and industrial enterprise, the Grupo Fox. A business and civic leader, he joined the Partido Acción Nacional (National Action Party, PAN). It was the traditional conservative opposition party to the Partido Revolucionario Institucional (Institutionalized Revolutionary Party, PRI). Firmly in power throughout the twentieth century, PRI considered itself the guardian of the Mexican

Revolution. At the beginning of the century that movement had overthrown repressive, elite political forces representing foreign economic and domestic cultural and religious interests.

PRI was committed to national development through government control. Nationalist and secular, it was hostile to business. This nationalist and nationalizing policy reached a height during 1970s and early 1980s. However, consequent debt, recession, and unemployment, together with chronic corruption and repression, brought PRI under severe criticism. It attempted to generate development and the growth of jobs through policies more open to foreign, private enterprises and investment. Thereby the appeal of PAN rose in this atmosphere more favorable to its ideology and goals.

In 1988, Fox successfully ran for Congress. In 1995, he was elected governor of Guanajuato and became a rising national political star. Eyeing the Mexican presidential race for 2000, he presented encouraging private enterprise and international investment. He focused on education and the provision of microloans to support widespread development of small businesses. He worked to prosecute political corruption, reforming the police and judicial systems.

In 2000, Fox became the first opposition party member to be elected president of Mexico in seventy-one years. His victory, in alliance with the Green Party of Mexico, was an extraordinary political and ideological reversal in Mexican history. However, his presidency has not seen unmitigated success. Unemployment continues to be high along with crime and corruption. The US even cut off the hope of employment through emigration as it further restricted its borders subsequent to the events of September 11, 2001. Worldwide recession during the first years of the twenty-first century reduced investment in Mexico. The PRI continues in power with a majority of state governorships and seats in Congress, blocking much of PAN's program of economic and government reforms.

## FRANCOPHONIE INSTITUTIONNELLE

The Francophonie Institutionnelle was established to enhance cooperation between the French language native-speaking and foreign learners and their countries. The Francophonie Institutionnelle is an intergovernmental organization with forty-nine members states in addition to four associated states and ten observer states. The institution is composed of nine main bodies and subsidiary organs: the Summit of Heads of States and Governments, Permanent Council for Francophonie, Ministerial Conference for Francophonie, Secretary General, International Governmental Agency for Francophonie, and Parliamentary Association for Francophonie. Subsidiary organs are: International Association for Francophonie specialists, Senghor University, TV5 Channel, and University Agency for Francophonie.

The secretary general is appointed by the foreign ministers conference for a period of four years. As the highest authority of the general secretariat and subsidiary organs, the secretary general is responsible for implementing the international policies of the institution and supporting multilateral cooperation. He is also responsible for carrying out action plans adopted by the institution and the secretary general, in addition to supervising the implementation of the resolutions and recommendations of the summits and the Francophonie conferences of foreign ministers.

The general secretary of the institution is Abdou Diouf, the former prime minister (1970–1981) and president (1981–2000) of Senegal. He succeeded Francophonie Institutionnelle's first general secretary, Boutros Boutros-Ghali. Francophonie Institutionnelle's six major fields of interests are: education, economics and development, cultural diversification, peace, democracy, and human rights.

Francophonie Institutionnelle is keen to cooperate with the major regional and international organizations in the world. For example, it cooperates with League of Arab States in the cultural and educational aspects as well as with the United Nations specialized organizations and agencies for crisis management and peacekeeping in the member states.

Francophonie Institutionnelle has four permanent missions to the United Nations headquarters in New York and Geneva, in addition to a mission to the

European Union in Belgium, the African Union, and the Economic Committee for Africa in Addis Ababa in Ethiopia.

## FREE MARKET ECONOMY

A free market economy is one in which individual economic agents make voluntary decisions based upon their own self-interest. Economic agents include consumers, taxpayers, firms, employers, employees, lobbies, trade unions, government workers, etc. Although agents freely make decisions based upon purely internal incentives, Adam Smith (1776) first demonstrated that such self-interested choices can, under plausible circumstances, guide the economy as if by an "invisible hand" to socially optimal production and consumption patterns.

### The Gains from Trade

Why does economic activity generate benefits? Consider an economy in which two agents produce and consume just two goods. If each individual possesses "absolute advantage" in producing a different good, meaning that each can produce one good using fewer resources than the other, the gains from specialized production and trade are clear. However, even if one individual has absolute advantage in the production of both goods, both individuals can still benefit from specialization and exchange. This reality obtains because even with absolute advantage in producing both goods, the production advantage is relatively larger in one good than in the other. Given limited time and energy, each individual must forgo producing some amount of one good, its "opportunity cost," in order to generate a unit of the other product. Opportunity costs of the two goods are reciprocals, so each agent has a lower opportunity cost in precisely one

of the goods—the "comparative advantage" product. Specialized production therefore maximizes aggregate output. Moreover, neither agent would accept less consumption with specialization vis-à-vis through self-sufficiency, each individual must be better off under specialization. Note that this analysis applies equally well to individuals, firms, and even nations. Nations that trade are better off than they could be in isolation.

One can, therefore, consider the free market economy to generate the same outcome as a benign social planner whose interest is solely in maximizing the well-being of the society. However, in order to accomplish this task, the social planner would have to know the incentive structure, abilities, resources, etc., of every economic agent in the society. The infeasibility of that requirement is the reason that alternative economic models that rely on social planning, such as socialism and communism, have failed to generate strong economies. Attaining the knowledge requisite for coordination of all economic activities is impossible.

The free market has its own way of achieving economic coordination—through market prices. The price of any good or service is determined by the interactions among relevant economic agents. The information contained in the price must therefore summarize all of the individual demand functions for all consumers, including relative valuations of similar and alternative goods or services and all information about producers of the good or service, including resource prices, transaction costs, technologies, etc. Furthermore, the free market summarizes this tremendous amount of information with a single number, the price, which consumers and producers compare with prices for other goods and service. From those comparisons, economic agents glean the information relevant to their decision-making processes without ever collecting or analyzing the (unknowable) raw data.

### Assumptions of the Model

Several assumptions are required to generate the socially optimal resource allocation described above. In order to understand the applicability of the model to economic development, it is critical to understand these assumptions, the validity of which varies significantly across countries. First, the rule of law must characterize the economy. Second, property rights must be well defined and enforceable. In particular, property ownership must be clear, and the owner must have the exclusive rights to develop and profit

from (or not) ownership and to transfer ownership to another agent. This pair of assumptions ensures that agents pay the costs and receive the benefits of their actions. Third, exchanges between economic agents must be voluntary. Thus, any exchange implies that both agents are better off than they had been before the exchange, so that each trade raises the welfare of the society by reallocating resources in a socially preferred manner.

Two types of problems can cause the free market economy to fail to deliver the socially optimal resource allocation. First, when making economic decisions, an economic agent considers only the costs and benefits of the choice to himself. However, some products (and services) generate spillover effects that accrue to those other than the two agents engaged in the transaction. These “externalities” may be either beneficial or costly to the society. For example, suppose that a farmer wished to build a road from his home to the nearest city. Although he would pay the entire cost of the roadway, others would benefit from the road’s existence. Roads generate social benefits beyond those private benefits that accrue to the builder. Since the builder weighs only private costs against private benefits in determining whether to build the road, the free market generates too few roads from a societal viewpoint. Alternatively, consuming the services of one’s automobile generates social costs in the form of increased pollution and traffic congestion. Since drivers ignore these costs when deciding whether to drive, the free market generates more driving than would a social planner.

Second, the benefits of the free market derive from the competition inherent among firms and among consumers, but some industries lack adequate competition, implying excessive market power for a few firms. This might be the result of either private sector issues (e.g., large capital outlays to enter the industry, technological threshold) or public sector sponsorship (e.g., patents, copyrights, trademarks, local utility monopolies). The lack of competition restricts the choices available to the consumer, whereas a social planner would also consider consumer welfare in determining production patterns.

### **A Role for Government Intervention in the Economy**

The problems of externalities and lack of competition are inherent in the incentive system of the free market. The economic agent capable of providing remedies is the government. With externalities, the traditional economic view was that governments should provide

or subsidize goods and services that exhibit social benefits in excess of private benefits. In transferring the social benefits from society at large to politicians, who reap the benefits of increased votes due to higher social welfare, the nation considers both social costs and benefits in determining output levels. The government provides more such goods than would the private sector acting alone. Analogously, the government can restrict, regulate, or tax the negative externalities in order to decrease the amount produced or consumed. Once again, the methodology equates private costs to social costs, so that the agent makes the socially optimal decision. The key is that the decision makers (politicians) internalize the social benefits, ensuring that they consider all costs and benefits, both private and social, just as the social planner would. The rather significant drawback of this approach is the same one that has destroyed all attempts at central planning: bureaucrats, being economic agents themselves, act according to their incentives as individuals, rather than as benign representatives of society, thereby recreating the original problem that decisions are not based on social costs and benefits.

More recently, economists have recommended the alternative solution proposed by 1991 Nobel Laureate Ronald Coase (1960), who recognized that the inequality of social and private benefits and costs derives from a lack of clearly defined and enforceable property rights. If the farmer could restrict access to his road, then those wishing to use the road would have to pay for the benefits they receive. Because he cannot do so, others use his road for free, reaping a benefit without paying for it. The problem of pollution is more complex, as pollution is a “bad” rather than a “good.” The producer should pay its cost, if pollution is to be kept to its socially optimal level. Coase’s solution is for the government to issue pollution vouchers, each valid for a maximum output of pollution, making illegal the production of pollution without adequate vouchers. Vouchers thus become the “good” for which polluters will be willing to pay in order to generate legally the “bad” of pollution. Once these property rights have been clearly defined by using the Coasean approach, the market determines their proper prices according to social costs and benefits. Thus, the Coasean solution to externalities is creating the appropriate property rights, then allowing the market to function unfettered by natural bureaucratic tendencies. Coasean solutions could also deal with excessive market power by creating a market for the rights to these lucrative markets, although regulatory efforts have typically been used in practice.

By allowing economic agents to make their own choices, the free market also gives them the right to succeed as well as the opportunity to fail. Moreover,

whether one succeeds or fails can often be due to factors beyond one's control, whether due to genetic makeup, environmental factors, or simple luck. The free market can generate misery. Therefore, another legitimate role of government is the redistribution of wealth. This can occur through taxation of income and wealth, subsidization of goods and services for the poor, unemployment compensation, and a host of other means. Diverse perspectives on the extent to which governments should be involved in such efforts have generated widely varying versions of the market economy across countries, each of which has advantages and disadvantages.

### Free Markets and Economic Development

Despite its potential problems, the empirical evidence on economic growth overwhelmingly supports the free market economic model. The wealthiest nations have had and still have the freest markets in the world. This can be no coincidence. Economic development in low- and middle-income nations often has been slow due to the lack of a truly free market. This section considers three factors that have contributed to the lack of free markets in such countries—corruption, a tilted playing field for trade, and the slow implementation of Coasean solutions.

Arguably, the most pervasive problem facing developing nations is that of corruption, which prevents them from fulfilling the assumptions necessary to generate a truly free market. Corrupt law enforcement institutions destroy the rule of law. The bribes often required by bureaucrats for providing services such as providing official documentation undermine property rights. Corruption that restricts business opportunities to the relatives or cronies of those with power steals the rights of others to make mutually beneficial exchanges in the marketplace, reducing social welfare. Therefore, when countries with endemic corruption have attempted to introduce market-oriented reforms and institutions, the result has typically been to sour the people's attitude toward free markets, because the market cannot work and individuals thus cannot reap its benefits under such regimes.

Rich countries also have implemented numerous policies that restrict the ability of developing nations to create free markets. The United States and Western Europe have virtually dictated trade rules, despite the multilateral mission of the World Trade Organization (WTO), under whose auspices such rules are negotiated. Indeed, the main benefits of the Uruguay Round (1986–1994) of global trade talks held by the

WTO's predecessor organization, the General Agreement on Tariffs and Trade (GATT), accrued in services, intellectual property, subsidization, and agriculture. The majority of developing nations are uncompetitive in these sectors. Worse, trade in those goods in which developing nations hold the strongest comparative advantages, including unskilled-labor-intensive production and agriculture, have long been kept outside the various rounds of international trade liberalization. Similarly, rules on international investment have been designed to benefit chiefly the donor nations, rather than the recipients. Although the developing world continues to be better off trading in this unfavorable environment than they would be if they abstained from trade, such rules and exceptions have deprived it of its best chances for engaging in mutually beneficial voluntary exchanges. India has taken a leadership role, supported by a large proportion of developing nations, in demanding that such issues be negotiated in good faith during the Doha Round of WTO negotiations, which were commencing at the time of this writing (2002).

Finally, pollution, insufficient economic infrastructure, and firms with significant market power are problematic in developing countries. Powerful environmental lobbies attempt to hold developing countries to standards to which rich nations never adhered during analogous stages of development. Coasean solutions exist for these problems. Some, like property rights for rain forest preservation, would likely be highly demanded by the world's wealthy, channeling additional resources for development. Unfortunately, developed countries have only begun to implement Coasean solutions. Developing nations will tarry even longer.

## FREE TRADE AREA OF THE AMERICAS (FTAA)

### Introduction

The Free Trade Area of the Americas (FTAA) agreement is an ambitious plan to create a free trade zone throughout the Western Hemisphere by 2005. The FTAA grew out of a statement by George H. W. Bush in 1990 of the Enterprise for the Americas Initiative (EAI) to create a hemispheric free trade zone in response to Latin American governments who felt left out of the 1992 North American Free Trade Agreement (NAFTA). The EAI was an important object of discussion throughout the 1990s.

The First Summit of the Americas was held in Miami in 1994, where a joint declaration was issued by the participating countries, at the instigation of the US Clinton administration. The declaration stated that the countries of the Western Hemisphere were dedicated to democracy, economic growth sustainable development, and wiping out poverty. It goes on to say that free flows of trade and investment are a "key to prosperity," economic growth. The declaration stated that negotiations for an FTAA would be concluded by 2005.

However, serious negotiations did not begin until 2001 under the Clinton administration. Like other trade treaties and globalization generally, the FTAA has sparked a great deal of opposition among student activists, labor organizations, and nongovernmental organizations. The closed nature of the negotiations; the lack of enforceable labour standards to ensure reasonably safe working conditions and basic collective bargaining rights, and of environmental safeguards; and concerns about local control over key economic issues are the issues put forward most often by opponents to such a treaty in the North

about free trade agreements everywhere. These issues were adopted as part of the platform of several Democratic candidates in the 2004 presidential election campaign. In Latin America, on the other hand, the more important issue seems to be a perceived failure of neoliberal economic policies, including free trade, on the one hand, and a continuing strong opposition to perceived US imperialism. For example, Cuba has been excluded in the negotiations. The FTAA is, therefore, seen by many in Latin America as the latest instrument of external dominance and exploitation. Latin American politicians have been able to take advantage of this sentiment; the issue was featured prominently in the 2002 Brazilian presidential campaign.

### Strategic Context

In discussing a potential FTAA, it is important to keep the general context of international trade in mind. First, almost all international trade and investment occurs among the US, Canada, the European Union (EU), and Japan. Second, the US economy is by far the largest in the world and dwarfs those of every other economy in the world with the exceptions of the EU and Japan. Third, among Latin American countries as well, there is a great deal of variety in terms of the overall size of the market, with Brazil and Mexico reaching a par in terms of gross domestic product with Canada (though still about one-quarter the size of the US economy), and Argentina as about half of the size of Brazil. Venezuela is fourth largest economy in the region and is about half the size of Argentina's. After that, the size of the economy varies from fairly small by world standards, such as Colombia, to tiny, if we consider some of the smaller islands of the Caribbean. Fourth, on the other hand, for most countries in Latin America, with the notable exceptions of the Southern Cone countries of Chile, Argentina, Uruguay, and Brazil, close to 90% of imports and exports are with the US. There is relatively little intra-Latin American trade. Moreover, key trading partners Canada and Mexico already have access to the US market through NAFTA, and so may wish to preserve this advantage. Fifth, almost every Latin American nation has a huge external debt (in some cases, as high as 70% of the value of annual exports) with recurring interest payments on the one hand, and an extremely weak financial and taxation system on the other. As a result, there is a strong thirst for external finance and investment. Sixth, both as a part of the conditions for international finance and as a result of current thinking in

economics, Latin American countries have moved towards rolling back the role of the state (see entry on neoliberalism) in the economy, including privatization of state-owned enterprises, and embracing foreign investment by multinational corporations.

From these facts, we can better understand the strategic context of the negotiations. We can conclude foremost that the FTAA is part of the global process of bargaining between the US and her major trading partners, the EU and Japan. It is extremely unlikely that the US would agree to an FTAA that compromised its position at the multilateral rounds of the General Agreement on Trade and Services Negotiations or the World Trade Organization. In fact, it might be better to say that the FTAA is one chip that the US is using in attempting to extract better terms from the EU.

We can also conclude that there are strong asymmetries in the negotiations. The desire to gain access to the US market and the generally dire economic circumstances of the region explain the willingness of Latin American governments and the private sectors to resist their historical tendency against imperialism and US interference. Similarly, among Latin American countries there is an asymmetry between the larger economies and the medium and small ones in the region. It is no surprise, therefore, that Brazil has emerged as the leader in terms of regional bargaining with the US. However, within the regional structure, there is potential for alliances, not just along lines of striking a stronger bargain with the US, but also within particular issue areas. For example, the petroleum exporters in the region, including Mexico, Ecuador, Venezuela, Colombia, and Trinidad and Tobago, will all surely pay close attention to provisions that affect that economic sector. On the other side, the US has stepped up its efforts to reduce a possible anti-US negotiating coalition by signing or putting in motion a number of bilateral agreements, including ones with Chile (2003) and Central America (in negotiations). In turn, the smaller economies of the Caribbean and Central America have attempted to create tighter free trade agreements within their respective subregions in order to approach the FTAA with a more unified position, but, because of internal differences and competition among their economies, have found negotiations difficult. Finally, both business proponents and opponents, and the aforementioned anti-free trade groups, have all attempted to develop cross-border alliance networks.

Finally, it is important to note that there is growing weariness of free trade not only in the US as a result of its current war, but throughout Latin America. A string of new leaders in the region, including Gutierrez

in Ecuador, Lula in Brazil, Chavez in Venezuela, and Kirchner in Argentina, were elected in good part because of their anti-imperialist credentials and statements. With the financial meltdown in Argentina and continued stagnation through much of the continent, the familiar onus of International Monetary Fund and US culpability has become part of a concerted public questioning of the neoliberal policies of market liberalization and free trade. Thus, it will be tough for these leaders to sell an FTAA at home unless they can extract some clear concessions from the US.

### Timeline of the Negotiations

There were several important organizing meetings among the countries in the 1990s. The first was the December 1994 Summit of the Americas meeting in Miami. At this meeting, the 2005 date was set as the target date for the signing of the treaty, as well as the important provision that the negotiations would be “a single undertaking.” By *single undertaking*, trade negotiators refer to the idea that compromises would be reached to produce one final document that could then be ratified or rejected by each member country. The advantage is that it may push compromises among countries that see a balance between overall gains and gains in one area and losses in another. The disadvantage could be that the potential bargaining power of smaller economies in one area, such as Ecuador in oil, could be dampened by the need to be included in the wider agreement. In 1995, the first ministerial meeting was held in Denver. This meeting created the main media for negotiations—ministerial and vice-ministerial meetings and working groups—and enlisted the Organization of American States, the Inter-American Development Bank, and the United Nations Economic Commission for Latin America for support. In addition, seven negotiating groups were set up along the following lines: market access, customs procedures and rules of origin, investment, standards and technical barriers to trade, sanitary and phytosanitary measures, subsidies, antidumping and countervailing duties, and smaller economies. The second ministerial meeting was held in Cartagena in March 1996. At this meeting, four additional working groups were started: government procurement, intellectual property rights, services, and competition policy. The third ministerial meeting in Belo Horizonte in May 1997 led to the development of a new working group on dispute settlement. These efforts culminated with the signing of the Declaration of San Jose at the fourth ministerial in Costa Rica in 1998. That meeting also set up three non-negotiating special committees:

the consultative group on smaller economies, the committee of government representatives on the participation of civil society, and a joint government–private sector committee of experts on electronic commerce. The meeting also set up an administrative secretariat to coordinate future summits. Although several other ministerials and a third Summit of the Americas have been held, the main formal progress was an agreement on business facilitation and information harmonization measures signed at the Toronto Ministerial in November 1999.

### Structure of the Negotiations

At least in formal terms, the FTAA negotiating process is fairly straightforward. The sites of the ministerials are rotated every eighteen months, with the host serving as the chair of negotiations for that particular round. The actual foreign trade ministers of each country therefore act as the top negotiators. Below them, the vice ministers form the trade negotiations committee and meet at least twice a year. In addition, there are the ongoing negotiating groups, as noted above, as well as an ad hoc business facilitation group. In practice, the probable functioning of the negotiations are for the ministers to come in and sign the final agreements that have been negotiated at lower levels, in many cases in an informal fashion in the working groups. As with other trade negotiations, this could raise considerable difficulties for smaller countries without the budget, personnel, or technical expertise to handle all of these issues simultaneously. They can rely upon the technical support agencies noted above, but it is still a disadvantage vis-à-vis the larger countries. In addition, while the committee for the participation of civil society has held a few meetings, it has hardly served to satisfy the demands for greater transparency and participation by civil society groups.

### Potential Obstacles and Prognosis

From the outset, there were major obstacles to actually creating free trade in the hemisphere that mirror those in the international arena. Besides the need to fit within a US strategy of interlocking trade agreements, and the ongoing opposition of civil society, labour, and environmental groups, there are important differences in terms of the potential economic gains and losses of domestic groups and nations. Although liberalizing agriculture could lead to enormous benefits

for Latin American producers, agriculture has been the most contentious sector for international trade negotiations. While Northern countries subsidize their agriculture industries to the tune of millions of dollars, for many developing countries, agricultural exports are their mainstay. Moreover, the EU and Japan have particularly strong domestic agricultural lobbies, which leads to a general reticence to agree to any major cuts in subsidies or protection. Secondly, developing countries generally have felt disappointed with the results of the last (Uruguay) multilateral trading round. They are, therefore, especially reluctant to further liberalize services and investment sectors, which are the main areas of US interest. Indeed, by 2004, Brazil has emerged as the opposition leader to the US in the FTAA negotiations. As in its stance in multilateral talks, Brazil is attempting to create a coalition of states that hold fast for US concessions in agriculture, and a reduction of US demands in terms of market and investment access. Thirdly, developing country governments, including those in Latin America, have steadfastly refused the demands for international labor and environmental standards, which they see as not only another external imposition, but also creating an unfair competitive advantage for Northern countries.

Another problem has been the unclear US position on the FTAA. President Clinton sent the Export Expansion and Reciprocal Trade Agreements Act of 1997 to the Congress for consideration, which included consideration of “fast track” authority for the FTAA. This is considered a vital element of negotiations because it allows the president to force to the Congress to pass or reject a whole trade agreement (without the possibility of amendment). However, fast track failed in the House. With the US declaration of a war on terrorism in 2001, a continuing severe recession in the US, and other developments, the whole international scenario for free trade shifted, creating considerable doubt as to whether there can be free trade in the Americas in the foreseeable future. The renewed emphasis on the Middle East and energy security have increased the United States’ interest in gaining secure access to oil suppliers within the hemisphere, particularly Canada, Mexico, Venezuela, Ecuador, and Colombia, though the possible restoration of Iraqi oil to the market might dampen it. President Bush was granted fast-track authority on 2002. The “trade promotion authority” included built-in trade adjustment assistance and notes that consultation with the Congress on sensitive sectors must take place. The sensitive sectors include agriculture, fishing, textiles, and apparel.

However, other than ongoing anti-guerrilla narco-trafficking support to the Colombian government

the Bush (Jr.) Administration seems to have largely forgotten about Latin America. In addition, the Argentine financial meltdown, continuing US protection of the steel industry against Brazilian imports, and devastation of the Mexican agricultural sector, all in 2001–2003, created considerable challenges for hemispheric economic relations. New presidents Lula in Brazil and Kirchner in Argentina, with leftist and populist support among their core constituencies, have pronounced their opposition to any “caving in” on US demands for an FTAA. Amid growing outsourcing of US professional jobs, including the key telecommunications and information technology sectors, it remains to be seen whether even the US still has a strong appetite for a substantial FTAA.

As a result, the FTAA negotiations, like multilateral talks on trade, seemed to be relatively stagnant. In recognition of the emergence of Brazil as the key leader of one bloc, Brazil and the US were made the joint chairs of the final round of negotiations. It remains to be seen whether Brazil can hold its alliance together to extract more concessions out of the US or whether the United States’ successful efforts to conclude separate agreements with other countries, including Chile and Central America, will melt away any opposition.

### FREI, EDUARDO

Eduardo Frei (1911–1982) was the president of Chile from 1964–1970. He was married to Maria Ruiz-Tagle in 1935, and had seven children, among them Eduardo Frei Ruiz-Tagle (president of Chile, 1994–2000) and Carmen Frei Ruiz-Tagle (senator of the Christian Democratic Party since 1990). Frei was a first-generation Chilean: his father was of Swiss-German origin. Frei obtained a law degree from the Universidad Católica de Chile in 1932. In 1938, dissatisfied with the Conservative Party—seen as too hierarchical and too doctrinaire in its views of poverty, injustice, and social concerns—Frei and his friends created the Falange Nacional. A meeting with the French philosopher Jacques Maritain had left a profound impression on the young Frei, and Maritain’s Social-Christian philosophy became a leading principle of Frei’s political thinking.

The final separation of the Falange from the Conservative party came about in the 1938 presidential election, when the Falange chose to rally behind the Popular Front candidate Pedro Aguirre Cerda, who went on to win the presidency. In 1945, Frei became Minister of Public Works under President Juan Antonio Ríos. In the parliamentary elections of 1949, Frei became the Falange’s first senator.

Frei’s (and the Falange’s) shifting allegiance from the Right to the Left indicates to what degree the new movement was caught up in a search for political identity. Frei saw the advantages of pragmatism as exemplified by his participation in governments that included Socialists and Communists.

Eduardo Frei provided the intellectual leadership during the 1950s to transform the Falange from a small, internally divided party to the Christian Democratic party that emerged in 1957. Barely one year later, the Christian Democrats managed to not

only replace the Radicals as the major center party, they had also become a viable “third option” to the political Right and Left.

Frei was able to exert sufficient influence to prevent the Falange from moving too close to the Left while at the same time allowing the Falange to identify with issues such as workers’ welfare and social legislation. However, beginning in the early 1950s, when internal divisions threatened the Falange’s future, Frei’s views prevailed. Radical thinkers in the Falange sought explicit worker and peasant support (e.g., Jacques Chonchol). Opposing such a move, Frei countered that capitalism, social reform, equality, justice, development, and democracy were compatible; he believed that workers and capitalists did not have to be “natural enemies.”

The other alternative to reform—revolution—was increasingly advocated by Latin America’s Left and thus contributed to the radicalization of Chilean politics, reaching its climax in the election of Socialist Salvador Allende and the rise to power of the Unidad Popular (1970–1973). Frei realized that if it ever wanted to seize political power, the Falange needed to grow, and for that, it was necessary to reach out to the moderate wing of the Conservative Party (the so-called Social Christians) who at the time were skeptical about a coalition with the Falange. However, the two groups joined in 1953, creating the Social Christian Federation. This paved the way for the creation of the Christian Democratic Party six years later. By 1957, Frei had become a national political figure and his influence over Chilean politics in general and over the moderate political Center in specific, was evident. Between his first presidential bid in 1958 and his successful election in 1964, Frei and the Christian Democratic Party continued to gain popular support as its leaders convinced the public that the new party was the best vehicle to deliver social reform and to avoid the risks of Communism.

Frei’s “Revolution in Liberty” was meant to be a gradual though profound change of Chilean society, brought about democratically. He hoped to gain enough electoral strength to implement his “Revolution” without the need for political concessions to other parties in Congress. Frei’s social programs were geared towards rural as well as urban populations. Early on in his tenure, he initiated “promoción popular” (popular promotion), an ambitious project to give the urban and marginal poor a greater voice by lending legal, technical as well as financial support. The program benefitted from the Christian Democratic Party’s proximity to the Catholic Church, but ultimately it was short-lived and failed in part because of an ineffective state bureaucracy.

Frei’s record with organized labor was mixed. Attempting to overcome a decades-old hostility between a largely Leftist labor movement and anything to the political Right of that, the Frei government was nonetheless known for its open hostility towards the national union federation Central Unitaria de Trabajo (CUT). Yet through his economic policies, Frei also sought to improve the standard of living of the working class. In addition, housing and health conditions improved for many. In education, the Frei government built schools, raised teacher salaries, increased student enrollment, and decreased the illiteracy rate.

The two outstanding projects of the Frei government were the agrarian reform, initiated in 1967, and the nationalization of copper. Frei pursued three interrelated goals with the reform: improve agricultural output and productivity, raise the standard of living of rural areas by giving land to peasants, and facilitate unionization of the countryside. Although the reform fell far short of the government’s as well as peasants’ expectations (out of an estimated one hundred thousand land titles, only about a tenth of that were actually granted), it did help establish the Christian Democratic Party in the countryside. Christian Democrat-controlled peasant unions remain a fixture in Chile. The idea to incrementally nationalize Chile’s copper—criticized by Left and Right alike—was perhaps Frei’s most ambitious project. The Chilean state did not expropriate foreign copper companies outright but instead purchased partial ownership, in some cases acquiring up to 51% (e.g., Kennecott). Ironically, this piecemeal approach to nationalization made it easier for Salvador Allende to propose complete national ownership later.

Frei was convinced that the state’s role in the economy and society needed to be modernized and reformed, but kept prominent. Frei’s “Revolution in Liberty” faced pressures from the Left and Right, as well as from within the Christian Democratic Party. He managed to hold the Center, though popular support was beginning to erode towards the end of his term. Overall, Frei’s economic record was mixed, and economic growth had stagnated and inflation increased, giving rise to frequent strikes. The country was polarizing as a Socialist president was about to gain control of the government.

Frei’s role in the rise of Christian Democracy in Chile and the influence of his party on Chilean politics is crucial for an understanding of twentieth century Chile. The social and economic impact of his programs and reforms were hampered by the party composition in Congress. Following the presidential election, the Christian Democratic Party was in the minority, but this changed in 1965 when they obtained a majority in the Chamber of Deputies,

though they still did not control the Senate. Hence, the need to compromise with the Left and Right. In the 1969 Congressional elections, the party lost dramatically, further evidencing that the Christian Democrats' ideas and policies were too little for the Left and perhaps too much for the Right. His wait-and-see attitude towards the Marxist Allende government ultimately gave way to an unyielding opposition that supported Pinochet's military coup of September 11, 1973. Frei would come to deeply regret this later in life, and his opposition to the dictator's 1980 plebiscite is evidence of that. Frei helped modernize Chile, and unwittingly directed a Nation onto the "socialist road" of Allende's Popular Unity.

### FRELIMO (FRONT FOR THE LIBERATION OF MOZAMBIQUE)

FRELIMO is the acronym of the principal movement for the independence of Mozambique from Portugal. Beginning in the sixteenth century, Mozambique became a crucial outpost for the Portuguese in their global empire. The Portuguese controlled the rich trade in this region for a century but later lost dominance to larger European countries. As Portugal's empire withered, the only significant colonies that remained for it were Angola and Mozambique. By mid-twentieth century, both of these were in ferment for independence.

After World War II, a wave of African colonies sought and achieved independence. Much of the political rhetoric and strategy for these movements occurred within a wider Cold War tension of communist and noncommunist states and of developed and developing nations. Portugal, through one of the longest surviving authoritarian regimes in Europe, fought desperately to hold on to its mineral rich African colonies. The dictatorship of Portuguese Prime Minister António de Oliveira Salazar lasted from 1928 until his death in 1968. His fascist regime continued after his death, using increasing military force to maintain control of its colonies.

This force had increased in response to the mounting organization of armed independence movements in Portuguese Africa. These were based on socialist ideology and encouraged by Soviet support. By 1962, three such movements joined, the União Democrática Nacional de Moçambique (UDENAMO, National Democratic Union of Mozambique), the União Nacional Africana para Moçambique Independente (National Democratic Union for an Independent Mozambique, UNAMI), and the Kenya-modeled Mozambique African National Union (MANU). They formed the Marxist-Leninist Frente de Libertação de Moçambique (FRELIMO, Mozambique Liberation Front). It was led by a Harvard Ph.D. in anthropology, Eduardo Chivambo Mondlane, and committed to armed struggle for independence. He succeeded in liberating the northern part of Mozambique, but because he was assassinated in 1969, he did not live to see the final and complete liberation of the country.

Samora Machel, head of FRELIMO's guerilla forces, assumed command of the movement. In 1974, a rebellion of the Portuguese armed forces overthrew the fascist regime in Portugal, and that country eventually assuming a socialist government. The following year, all remaining Portuguese colonies were granted independence. Samora Machel thereby became the first president of an independent Mozambique.

Mozambique's powerful capitalist, white-dominated neighbors, Rhodesia and South Africa, formed and financially backed an anti-Communist movement, the Resistência Nacional Moçambicana (RENAMO, Mozambican National Resistance). It was vigorously backed by US President Gerald Ford and Secretary of State Henry Kissinger. FRELIMO, meanwhile, received support from the Soviet Union.

RENAMO maneuvered against FRELIMO throughout Mozambique, attacking in the south and occupying strongholds in the highlands. FRELIMO held the capital in the south, and RENAMO raided there and in the north. The conflict assumed a north-south character. Everywhere, it left hundreds of

thousands dead, wounded, or displaced. Landmines left over from this conflict remain one of the war's deadliest legacies.

Conflict endured throughout the late 1970s and into the early 1990s, only ending as the forces backing each side collapsed. In 1980, the white-ruled government of Rhodesia fell, and the independent black government of Zimbabwe was declared. The Berlin Wall came down in 1989, and the Soviet Union ended two years later. By 1990, white dominance in South Africa began to unravel. A peace of exhaustion reconciled FRELIMO and RENAMO, officially recognized through accords finalized in Rome in 1992. Machel himself did not see this final peace. He was killed under suspicious circumstances in an airplane crash in 1986.

Joaquim Chissano, foreign minister in the Samora government, succeeded him as leader of FRELIMO and president of Mozambique. In national elections in 1994 and 1998, he continued as president, defeating the candidates of RENAMO, which became the official opposition party. Corruption and scandals so marred the Chissano government, however, that in 2004, it chose a different presidential candidate, Armando Guebuza, who had earlier negotiated the Rome Peace Accords.

With the collapse of the Soviet Union, it was Guebuza who perceived that Mozambique would have to redirect its policy for economic development to reflect a market focus, thereby obtaining the approval of world banking institutions. He fostered the idea of developing private ownership of property and a bourgeois class. By overseeing the privatization of government companies and resources, he himself became one of, if not, the largest holders of property and wealth in Mozambique.

## FRENCH GUIANA

After more than five centuries of European colonialism in the Americas, French Guiana, which lies between Brazil and Suriname, remains the only nonindependent state on the South American mainland. Over 90% of French Guiana's 91,000 square kilometers are covered by tropical forest. Most of French Guiana's two hundred thousand inhabitants live along the 378-km-long coastline. The majority of these inhabitants, who enjoy the economic benefits of the French social security system, are content to remain a part of France.

The original inhabitants of northern South America were the Carib and Arawak Indians. By 1650, the Dutch, British, and French had all established colonies in the region. The French had established Cayenne, the capital of French Guiana, at the mouth of the Cayenne River on a small island in 1634. Sugar and rainforest timber became the colony's economic mainstays. Slaves brought from Africa worked the sugar plantations, although their success was limited by tropical diseases and the hostility of the local Indians. By 1776, there were only 1,300 whites and 8,000 slaves in the colony. Thousands of slaves escaped into the interior of the colony and established runaway slave communities. The sugar plantations' output never matched that of Haiti and other French Caribbean colonies, and after the abolition of slavery in 1848, the sugar industry virtually collapsed.

At about the same time that slavery was abolished, Emperor Napoleon III decided that penal settlements in the colony would reduce the cost of prisons in France and contribute to the development of the colony. Between 1852 and 1938, over fifty-six thousand prisoners, including Alfred Dreyfus, were sent to Devil's Island. Prisoners sentenced to a term of less than eight years had to spend an equal period of time living in the colony after their release from prison. Prisoners whose sentence was more than eight years had to remain in the colony permanently. Regardless, since 90% of the prisoners died of disease and abuse, the prison population did little to augment the colony's struggling population. The most atrocious activities on Devil's Island occurred in the timber camps on the mainland. The underfed, naked convicts

were forced to work in water up to their waist. Although escape was arduous, and the punishment for a failed escape attempt quite severe, prisoners, such as Henri “Papillon” Charrière, frequently tried to escape. In 1938, the government ceased sending prisoners to Devil’s Island, and the penal settlement was eventually closed in 1945. Unfortunately, French Guiana has never fully escaped its negative image as a former penal colony with an unhealthy climate and an impenetrable hinterland.

In 1946, after more than three centuries as a French colony, French Guiana was transformed into an overseas department—*département d’outremer*—of France. Unlike the peoples of other European colonies in the Caribbean who loudly clamored for independence during the post-1945 era, the people of French Guiana wanted to remain part of the French nation. In theory, French Guiana was to be equal and identical to any other French department. As a result of their nonindependent status, the people of French Guiana enjoy a standard of living vastly superior to the people of the former Dutch and British Guianas. The people of French Guiana receive generous social security and medical benefits, wages are higher than in the rest of the Eastern Caribbean, and the infrastructure is vastly superior. With its mineral resources and potential for hydroelectric energy, especially the Petit-Saut dam project on the Sinnamary River, French Guiana has great potential to develop its economy.

During French President Charles De Gaulle’s Fourth Republic, the power of the *Préfet*—the local representative in French Guiana of the central government—was increased, giving him total responsibility for defense and security, as well as a central role in economic affairs. Thus, beginning in 1958, and culminating in the 1970’s, French Guiana underwent a significant economic transformation. The traditional agriculture-based productive economy of the colonial era was replaced by a skewed consumer-oriented economy based on massive cash infusions from France. By 2000, over three-fourths of the population was involved in the service sector. Between 1958 and 1978, food production declined by over 50%. As a result, today most foodstuffs are imported from France. Although cattle-raising and rice cultivation have been introduced, the most dynamic sector of French Guiana’s economy is the fishing industry. By 2000, shrimp exports represented 60% of French Guiana’s total exports. Gold, timber, and rice exports each account for about 10% of total exports. Regardless, exports remain minimal when compared with the substantial imports.

Since 1982, the French government has encouraged French immigration to the territory. Many

of these recent immigrants, who make up 25% of the population, are working for the European Space Agency, which launches its communication satellites from Kourou. At the same time, political parties supporting greater autonomy—such as the Parti Socialiste Guyanais (PSG)—began to attract more support. Since 1982, Marie-Claude Verdan’s PSG has dominated local politics. Since the 1980s, the French government has granted greater autonomy to the local government. The small but vocal independence movement led by Jean-Victor Castor has earned less than 5% of the vote in recent elections. Residents of French Guiana, who witnessed economic and political chaos in neighboring Suriname after independence from the Netherlands, are unwilling to give up their high standard of living based on generous subsidies from the French government.

### FUJIMORI, ALBERTO

Alberto Fujimori (1938– ) was the highly polarizing president of Peru from 1990 to 2000. His dramatic and controversial decade in power featured spectacular accomplishments in defeating murderous communist insurgents and taming hyperinflation. But the country paid a price. Fujimori trampled Peru’s democratic institutions while embezzling astronomical sums of money.

Fujimori’s father emigrated from Japan to Peru in 1920. He returned home to find a wife, whom he took to Peru 1934. Alberto was born in Lima on July 28, 1938. Although the parents kept their Japanese culture, they had their son baptized as a Catholic and sent him to a Catholic high school, from which he graduated as valedictorian. The youth earned a

bachelor's degree in agricultural engineering from Agricultural National University in Peru and a master's degree in mathematics from the University of Wisconsin (1969). During the 1970s, while Peru was ruled by military regimes, Fujimori rose in the academic ranks at La Molina National University.

In 1980, democracy returned to Peru, but in that same year, an obscure philosophy professor named Abimael Guzmán founded a revolutionary movement he named *Sendero Luminoso* (Shining Path). Guzmán believed that the Khmer Rouge had done things well in Cambodia, and he planned a similar future for Peru. Under the inept presidency of Fernando Belaunde (1980–1985), Peruvian poverty deepened, especially in the Indian villages in the Andes where the *Sendero* was quietly organizing its insurgency. Alan Garcia of the APRA (socialist) party followed Belaunde as president. During his term (1985–1990), Peru reached the verge of collapse. Real income had declined by 63% between 1988 and 1990. The government was printing money to pay its civil servants and soldiers. The inflation rate in 1990 was 7,650%. And the Shining Path controlled over half the territory of Peru.

Fujimori, who had become president of the National Commission of Peruvian University Rectors, is not known to have had political ambitions before he began hosting a television talk show, which gave him a chance to analyze politics in a direct way that appealed to the common people. In 1989, he formed his own political party, *Cambio 90* (Change 90), and campaigned for president on the simple slogan: "Honesty, technology, and work." Observers considered this political unknown a long shot against the famous author Mario Vargas Llosa, but Fujimori survived the first round and won the runoff. The Spanish-speaking urban elite opposed Fujimori, as did the Catholic Church. But Fujimori cheerfully accepted the (inaccurate) nickname *el chino* (the Chinaman), knowing that the Quechua- and Aymara-speaking Indians distrusted the light-skinned traditional politicians. In his campaign Fujimori presented himself as "a president like you." The diminutive son of Japanese immigrants was sworn in as president of Peru on his fifty-second birthday, July 28, 1990.

President Fujimori immediately implemented a program of severe austerity and privatization programs. This economic shock therapy hit the poor the hardest, but brought inflation down to 139% in 1991 and 57% in 1992. In 1999, Fujimori's last full year in power, inflation was only 3.7%. The free-market privatization programs raised an estimated \$9 billion, but it is not clear where all that money went.

Fujimori was even more successful in his war against the Shining Path, though here, too, his methods do not stand close scrutiny. The *Senderistas* financed their revolution by exporting coca leaves from the Huallaga Valley, where the Peruvian Army rarely ventured. They armed the peasants and taught them that Fujimori was a "genocidal hyena." Fujimori and his sinister henchman, Vladimiro Montesinos, organized death squads to eliminate *Senderistas* and their supporters. Arguing that the war against the communists was hindered by the apparatus of democracy, Fujimori, with army backing, mounted an *auto-golpe* (self-coup) on April 5, 1992. He put tanks around the parliament, dismissed thirteen of twenty-three Supreme Court justices, and suspended the constitution. These drastic moves met with much popular approval.

Fujimori's popularity reached new heights when Guzmán, the Shining Path leader, was arrested on September 12, 1992. Guzmán was dressed in prison stripes and publicly displayed in a cage before being sent to prison for life. Without his leadership, the *Sendero Luminoso* withered.

Gradually reintroducing democracy, Fujimori promulgated a new constitution and began preparing for reelection. His wife, Susan Higuchi, with whom he had four children, left him and threatened to run for president against him. Fujimori settled that problem by passing a law forbidding relatives of the president from running for office and refusing to divorce Higuchi until after the 1995 election. Fujimori easily defeated his opponent, Javier Pérez de Cuéllar, the former Secretary General of the United Nations.

Early in his second term, Fujimori faced a threat from a different guerrilla group, the Tupac Amaru. On December 17, 1996, Tupac guerrillas seized 452 hostages at a reception at the Japanese ambassador's home. There followed a four-month standoff during which most hostages were gradually released. On April 22, 1997, Peruvian special forces raided the building, freed the remaining seventy-two hostages, and killed all the Tupac Amaru guerrillas present.

With these triumphs, Fujimori began to float the idea of a third term, which his own constitution explicitly forbade. But Fujimori argued that his 1990 election had been under the old constitution and that therefore he should be eligible to run again in 2000. The Supreme Court disagreed until Fujimori dismissed three of its judges, and then changed its mind. Fujimori shut down an opposition TV station and gained control of the tabloid newspapers. The 2000 election was widely regarded as fraudulent. Fujimori's men were alleged to have forged over a million signatures. His main opponent, Alejandro Toledo, dropped out in disgust. Fujimori narrowly

won the May 28 election with 51% of the vote, against 18% for Toledo. Thirty-one percent of the voters spoiled their ballots. Only two other Latin American leaders attended his inauguration on July 28.

Within two months the Fujimori government came undone. The immediate catalyst was the broadcast of a one-hour videotape showing Montesinos bribing an opposition congressman to defect for \$15,000. Faced with a crisis of legitimacy, Fujimori offered to call a new election, but he was engulfed in a tidal wave of unpopularity. Demonstrations swept the country. Montesinos went into hiding, and Fujimori's failure to find him led Peruvians to conclude that Fujimori could no longer count on full control of the army. In November 2000, Fujimori attended a summit meeting of Asian and Pacific leaders in Brunei, and then flew on to Japan, where he was granted Japanese citizenship. Conveniently, Peru has no extradition treaty with Japan. Fujimori contemptuously faxed a letter of resignation to the Peruvian Congress on November 20, 2000. The Congress refused to accept the fax, and instead voted the next day by a margin of sixty-two to nine to declare Fujimori "permanently morally unfit" to govern.

In exile, Fujimori has opened his own web site, which justifies his every act in Spanish, English and Japanese. Interpol has issued two international arrest warrants for Fujimori, charging him with "crimes against humanity," but Fujimori still dreams of returning to lead Peru. He may have the wherewithal: Transparency International, a watchdog group, estimated that Fujimori had embezzled \$600 million during the decade he ruled Peru. In 2003, he launched a new political party, *Si Cumple* ("He keeps his word"), to prepare the ground for his comeback.

### FULBRIGHT PROGRAM

Signed into law on August 1, 1946, by President Harry S. Truman, the Fulbright Act merely provided that foreign credits from the sale of war material left overseas after World War II could be used for the educational exchange of teachers, students, professors, and research scholars between the United States and participating countries.

A Rhodes Scholar and president of the University of Arkansas before he entered politics, Senator Fulbright himself never referred to development as a purpose of the program that made his name familiar throughout the world. From its inception, the Fulbright Program focused on the exchange of academic persons, the mix of disciplines and ranks being determined through consultation between the United States and the host countries. To this end, nonprofit binational commissions or foundations (whichever term better suited the host country) were established in fifty-one nations; the program eventually operated in eighty-nine others directly out of the US embassy when there was no binational commission. At the American end, though funded through appropriations to the Department of State, the program's administration was delegated originally to two non-government agencies, the Institute of International Education (for students), the Council for the International Exchange of Scholars (for professors), and the government's own Office of Education (for teachers, and later certain categories of students and researchers). Later, other nongovernment bodies such as the Social Science Research Council and American Friends of the Middle East undertook the administration of appropriate portions of the program.

The earliest of the binational agreements was signed with China in 1947. Under it, the first American to profit from the program was Derk Bodde, a Sinologist at the University of Pennsylvania, who translated Chinese philosophical texts during his grant and on his return recounted his experiences in *Peking Diary: A Year of Revolution* (New York: Henry Schuman, 1950). Signed a month later the same year, the second binational agreement, with Burma, brought the first foreign participants to the United States, among them students from renowned "Burma Surgeon" Gordon Seagrave's hospital and nursing school.

As these early examples imply, the Fulbright Program could only develop people by means of educational exchange. Unlike government programs such as those of the United States Agency for International Development (USAID) or those in the private sector such as the Ford Foundation's, it never could contribute to physical infrastructure.

In 1948, Representative Karl E. Mundt (South Dakota) and Senator H. Alexander Smith (New Jersey) collaborated on legislation that became second only to Fulbright's in shaping the dimensions of America's involvement in international educational exchange. This was their P.L. 402, the so-called Smith-Mundt Act. For one thing, this legislation broadened the mandate of the program to include countries where there was no surplus property. For

another, it provided for the Congressional appropriation of dollar funds to maintain foreign participants in the United States where, because of currency controls in many of the developing countries, foreign funds could not support them. It also established for the first time an American propaganda organization, the United States Information Agency (USIA).

Throughout his long Senate career, Fulbright continued to defend the intellectual integrity of his program and maintain its level of funding. In 1952, in anticipation of the early exhaustion of overseas surplus property, he also got implemented an amendment that authorized the use of foreign currencies arising from *any* source. This was a particular boon for programs in South Asia, because by the 1950s the United States was making massive shipments of wheat to both India and Pakistan for which payment was accepted in nonconvertible rupees. The availability of these funds led to the Indian Fulbright program being the world's largest for a short time. However, the Rabaut Amendment to the appropriations act the next year required that such foreign currencies had to be "bought" with appropriated dollars from the US Treasury, with the result that an effective ceiling was placed on program growth in India and elsewhere.

In 1961, with Representative Wayne Hays (Ohio), Senator Fulbright sponsored legislation to further strengthen the program, which since has operated under this Fulbright-Hays Act. One section of the act, administered by the US Office of Education, provided overseas training in languages that had been little studied in the United States. Another section established a special visa category for foreign students coming to the United States, because there had been much concern at the time about the "brain drain" from developing countries. Even though holders of these visas were required to return to their home countries on completion of their studies and to remain there at least two years before applying for immigrant visas, the brain drain was little diminished by them. A study conducted in India in 1981 showed that 78% of Indian students in the United States managed to change their visa status to stay in the country.

There is no way to quantify the impact of the Fulbright Program on developing nations, but it may be noted that among the 146,000 people from foreign countries who participated during the first fifty years of its existence were such persons as those who later became a Moroccan Ambassador

(Mohamed Benaissa), President of Brazil (Fernando Cardoso), Prime Minister of Poland (Włodzisław Cimoszewicz), United Nations General Secretary (Boutros Boutros Ghali), Jordanian Minister of Education (Khalid Omari), Korean Minister of Trade (Jae Yoon Park), Prime Minister of Greece (Andreas Papandreou), Peruvian Minister of Education (Alberto Varilla), and Hungarian Minister of Foreign Affairs (Geza Jeszenszky). During the same period, among the eighty-eight thousand Americans receiving grants under the program were four people who became Nobel Laureates—in physics, medicine, and economics. Moreover, presidents of Harvard University, New York University, University of Chicago, and Georgetown University all had Fulbright grants early in their careers, as did the Librarian of Congress and four American ambassadors.

By fiscal year 2000, foreign governments, principally those in Western Europe, were making direct contributions of \$28 million to it, while several of the developing countries made contributions in kind, such as housing for visiting professors. In the same fiscal year the congressional appropriation amounted to \$105.7 million. However, in constant dollars, the Fulbright Program has suffered a 43% reduction in funding since 1994, when the congressional appropriation amounted to \$126 million.

## **GABON**

The Republic of Gabon lies on the Atlantic Ocean. It borders on Equatorial Guinea and Cameroon (north), and on the Republic of the Congo (east and south). The climate is tropical, hot, and humid, with little seasonal variation. Heavy rains fall from October to May.

The country is covered by dense forests, except for a narrow coastal zone. A geographic feature important for Gabon's development is the Ogooué River flowing through its eastern two-thirds into the Atlantic Ocean, near Port-Gentil. The river is navigable for 114 miles upstream all year and is used to ship goods, especially lumber, to the coast.

Gabon was populated first by Pygmies in the forest, then over centuries by forty diverse Bantu groups that migrated from the interior. Now, half of Gabon's 1.2 million inhabitants live in the two principal cities: Libreville, the administrative and commercial capital, and Port-Gentil, the center of wood and petroleum industries.

The first Europeans at the Gabon estuary bartered for hardwood and ivory along coastal rivers. Commercial trade turned into slave trade (1760–1840) as interior peoples sent their undesirables and war prisoners to the coastal Mpongwe and Orungu, who acted as slave brokers.

Gradually (1855–1880), the French took over along the coast and sent explorers into the interior. Subsequent occupation of the interior met with little opposition, but interference with the slave trade, imposition of head taxes, and forced labor aroused

substantial resistance. Unwilling to shoulder the expenditures required by development, the French divided the area into parcels, which they leased to private companies (1898). These parcels ruthlessly exploited both human and natural resources, devastating the Gabonese population. After failure of the concessionary system, France created the Federation of French Equatorial Africa, uniting Gabon with Congo-Brazzaville, Oubangui-Chari (Central African Republic), and Chad (1910). With ivory and rubber depleted, France neglected Gabon. After World War II, Gabon's progress towards independence (1960) paralleled that of other French sub-Saharan colonies.

At independence, Léon M'ba (1902–1967), head of the Gabonese Democratic Bloc, was elected president of the parliamentary republic of Gabon. He consolidated his personal power and limited freedom of speech and political assembly. In 1964, he provoked a military coup by decreeing a one-party system. He was overthrown and jailed, but was rescued and reinstated by French paratroopers. Under M'ba's rule, Gabon began prospecting for petroleum and exploiting its mineral resources, and further developed its lumber trade. French firms provided investment capital and, along with a small Gabonese elite, reaped most of the benefits. With French backing, M'ba remained president until his death.

Beginning in 1967 and up to the present, Gabon has been ruled by Omar Bongo. The original 1961 constitution was revised in 1991. It instituted political pluralism, but in reality, Bongo, who serves both as president of Gabon and secretary general of the

Gabonese Democratic Party (PDG)—offshoot of the Gabonese Democratic Bloc—rules autocratically. For thirty-five years, he has allowed just enough democracy to stay in power but has reverted to autocracy whenever he deemed it feasible.

He faced his greatest challenge when declining oil prices and a weakening US dollar produced a prolonged economic crisis (1986). Gabon was unable to service its foreign debt, and the International Monetary Fund forced it to implement austerity programs. The patronage system that had propped up Bongo's regime collapsed. Unemployment rose, affecting mainly the poor. Popular discontent erupted. Riots in Libreville and Port-Gentil led Bongo to call upon French troops to intervene. Then, in 1990, he reached a compromise with opposition leaders, only to resume harassing them as the 1993 presidential elections approached. Bongo's subsequent victory at the polls caused rioting to resume. Compromising once more, Bongo agreed to form a transitional coalition government, revise the electoral code, and schedule legislative elections for 1996. Divisions in the opposition enabled the PDG to win these elections and the presidential ones that followed (1998). As before, the losers denounced fraud and refused to serve in Bongo's government, but the regime survived.

Over the years, Bongo did improve social services, education, and public health. The country as a whole has a relatively high doctor-to-population ratio. Nonetheless, tropical diseases remain endemic, and infant mortality rates and life expectancy are about average for sub-Saharan Africa. Recently, AIDS has been spreading so rapidly that demographers' projections take into account the excess mortality it causes. Education is now compulsory between the ages of six and sixteen, and about 75% of this age group attend school. The literacy rate at 63.2% is high for the region. Bongo also has made investments in transportation—such as the Transgabonai Railroad—and in social service. Gabon is relatively stable. Inflation has dropped in recent years. Real GDP has continued to grow.

However, there are problems. Because oil exports still represent 60% of the government's total revenues, Gabon remains vulnerable to volatility in international oil markets. The apparent availability of better economic opportunity in cities has led to urban overcrowding and unemployment. Population growth outstrips job creation. Although the government attempts to diversify the economy by encouraging foreign investment in fisheries, light industry, and construction of port facilities, and although it has undertaken gradual privatization of key industries such as water and electricity and post and telecommunications, economic inequities persist unchanged.

Nor do plans to help the poorest seem to be in place. For instance, agriculture, which employs about two-fifths of the workforce, accounts for less than 10% of the GDP and is not attracting noticeable governmental attention, although subsistence farming is insufficient to meet domestic demand.

The IMF recently deemed Gabon's performance "broadly satisfactory" but required Gabon to continue diversification and privatization, implement anti-corruption laws, "improve the transparency of public finances," and adopt "a participatory poverty reduction strategy."

A much-discussed aspect of Gabon's current development is its environmental cost. Gabon's forests are threatened by powerful timber interests. Conservationists fear the extinction of forms of animal and plant life. Epidemiologists express concern that the stress to which the forest ecosystem is subjected and increasing human exposure to forest animals could unleash new infectious diseases. Meteorologists caution against the consequences of deforestation on climate.

#### GAMBIA, THE

The Republic of the Gambia, situated on the western coast of Africa, is the smallest nation on the continent. The country is a relatively flat strip of land fifteen to thirty miles wide on either side of the Gambia River, and almost two hundred miles long. Except for its small Atlantic coastline, the nation is entirely surrounded by the Republic of Senegal. The climate is tropical, with a rainy season lasting from June to

October, followed by a cool dry season. About forty inches of rain falls near the coast each year, whereas inland areas receive even less precipitation. Mangrove and scrub forest line the river banks, whereas sandy soil covers the rest of the country. The population is estimated at approximately 1.3 million, with an estimated annual growth rate of 3.5%. The capital, Banjul, known as Bathurst until 1973, is located where the Gambia River flows into the Atlantic Ocean and has a population of about seventy-five thousand.

The nation's peculiar shape and size are the result of territorial compromises made during the colonial period of the nineteenth century by Britain, which controlled the Gambia River, and France, which ruled the neighboring colony of Senegal. Prior to European colonial rule, the Gambia River region was dominated by a series of small Muslim Mande and Fulbe kingdoms. Agriculture and fishing dominated the local economy. The first Europeans to arrive in the area were the Portuguese in the 1440s, followed by the English, French, and Dutch, all of whom traded with the kingdoms on the river, seeking agricultural products and also slaves. By the eighteenth century, the British dominated trade that was centered on slave exports along the river. After the abolition of the slave trade in the early nineteenth century, the British encouraged the production and export of peanuts, which grew well in the local soils and climate. Peanut cultivation dominated the colonial economy of The Gambia, which was the poorest and smallest colony in British West Africa. Because of its small size and weak economy, moves toward self-rule in The Gambia lagged behind other West African nations, and independence was granted in February 1965. The Gambia became a republic in 1970, and Dawda Jawara, initially elected in 1965 as prime minister, became president. Jawara ruled until his ouster by a military coup in 1994. The military, headed by Yaha Abdul Jammeh, permitted elections in late 1996 and early 1997. Jammeh, who retired from the military to run for office, was elected president, and his political party, the Alliance for Patriotic Reorientation and Construction, won a slim majority in the national assembly. Opposition groups and some foreign observers accused the military government of fraud and intimidation to influence voters. Jammeh and his party won the most recent elections in 2001, again amidst allegations of intimidation.

The Gambian economy has consistently and overwhelmingly been based on the production and export of peanuts. During the 1970s and 1980s, the Gambian environment and economy were seriously affected by the Sahelian drought, which devastated much of Western Africa along the Sahara Desert, from which it has never completely recovered. Approximately

85% of residents make a living primarily from agriculture, with peanuts being the only significant cash crop. Farmers also grow millet and sorghum. The country continues to be highly dependent on imports of rice and other staple grains. Fisheries and tourism are also foreign exchange earners, although tourism as well as foreign aid declined precipitously after the 1994 military coup. Neither the Jawara or Jammeh regimes have made serious efforts to diversify the economy. The government submitted to International Monetary Fund pressure by cutting back its large civil service and drastically devaluing the local currency, but the efforts have done little to improve the nation's economic prospects. Per capita gross domestic product was \$1,170 in 2002, making the Gambia one of the poorest countries in the world, and 62% of the population lives at or below the poverty line. The country also has an overall trade deficit. Further, smuggling between The Gambia and Senegal remains a serious problem and attempts to curtail it have failed.

The Jawara regime was characterized by corruption, nepotism, and mismanagement. The country relied primarily on foreign assistance for survival. The Gambia did, however, have relatively strong respect for individual liberty and human rights until the military takeover in 1994. The Jammeh regime has imposed serious restrictions on freedom of speech and assembly. In recent years, the population of the capital, Banjul, has been augmented by refugees from the civil wars in Sierra Leone and Liberia, two other English-speaking nations in a largely francophone region. Senegal has periodically accused the Gambia of harboring separatists from the southern Senegalese region of the Casamance, heightening differences between the two countries. Historically, there have been no serious tensions in the country among the different ethnic groups. Over 90% of the population is Muslim, but no militant Islamic movement exists.

The Gambia has very little economic infrastructure. The river is the country's main transportation route. There are no bridges across the river, so passengers and goods passing from the river's northern and southern banks have to be ferried across the river on antiquated boats. There are no railroads and only one main airport, located near Banjul. The adult literacy rate is approximately 40% and, despite free elementary education, many children, especially girls, never attend school. There is no institution of higher learning. Beyond some primary health care, most Gambians do not have access to modern medical care. There are approximately two physicians and twenty-five nurses for every ten thousand people. Life expectancy for males is fifty-two years for males and fifty-six years for females. The population

growth rate (3.09% annually) and infant mortality (76.3 per 1,000 live births) are among the highest in the region. The government has continually promised improvements in education, health, transportation, and economic infrastructure yet most of the plans have yet to be realized. Unemployment, especially among secondary school graduates, is extremely high, and many secondary school graduates migrate overseas for employment.

### GANDHI, INDIRA

Indira Priyadarshini Gandhi (1917–1984) was the only child of Jawaharlal Nehru, the first prime minister of India. She was not related to Mohandas (Mahatma) Gandhi, but the Gandhi name had a halo effect in Indian elections, especially among the many illiterate rural voters. Schooled at home, she later attended Oxford University. After graduating in 1939, she worked as a volunteer for the Red Cross in Europe. After she returned to India in 1941, she married Feroze Gandhi (1913–1960) who also was politically active. Indira Gandhi and her husband were both put in prison by the British authorities for one year.

Since her mother had died earlier, she acted as her father's help and official hostess. In 1959, she was selected as President of the All India National Congress party (then the Congress party). After her father's death, she became Minister of Information and Broadcasting in Prime Minister Lal Bahadur Shastri's cabinet. In 1966, after Shastri's unexpected death of a heart attack, she was nominated by the party powerful for that position, because it was believed that she could be easily manipulated and

controlled. That was clearly a misjudgment on their part. She was sworn in as the third prime minister of India in 1966 and served the country in that capacity from 1966 to 1977, and again from 1980 to 1984. During her tenure in office, she consolidated her powers a great deal and continued the political dynasty begun by Nehru. Among her initiatives was the nationalization of banks and insurance companies in 1967.

In addition to the usual complex Indian political problems, she faced other problems during her first term of office that included famines for two years in a row and an influx of about 10 million refugees from East Bengal. Additionally, a split occurred in the Congress party in 1969; this would occur again in 1978. In 1971, the Third Indo-Pakistan War brought the defeat of the Pakistani army and the creation of Bangladesh via the secession of the Pakistani state of East Bengal. That event made Gandhi enormously popular and powerful in India. The explosion of a nuclear device in 1974 by the Indian government enhanced her popularity even more.

In 1975, the Allahabad High Court found her guilty of corrupt election practices on a technicality, and she was asked to step down from power and resign her seat. To avoid such a harsh outcome, she convinced the president of India to proclaim a national emergency. During the emergency rule, approximately one hundred thousand individuals, including well-known political opponents, were jailed, and the freedom of the Indian press was muzzled. The emergency was highly resented throughout India and resulted in her loss of a seat in the Loka Sabha in the next general election conducted after the emergency rule was lifted. She was sentenced to prison twice for short periods of time in 1977 and 1978 for the violation of election rules and for obstructing an official inquiry into one of the industrial projects of her second son. Nonetheless, she was sworn in again as prime minister in 1980, as her party won in the national general elections due to the overwhelming support from poor people and minorities, especially poor and illiterate women.

A group within the minority community of Sikhs in India demanded a separate independent state for the Sikhs to be named Khalistan and initiated terrorist activities toward the achievement of that goal. In June 1984, Indira Gandhi ordered a military attack on the Golden Temple, which is the holiest site of the Sikhs, as the terrorists had taken refuge there. The attack shocked and stunned the Sikh minority as well as the rest of the minorities. The raid on the Golden Temple proved to be the last major misjudgment of her career: two of her Sikh bodyguards assassinated her before the end of that year. Her son, Rajiv Gandhi was sworn in as prime minister that evening.

Toward the end of her career, Gandhi had been isolated from the party leaders and did not trust anyone completely except her family. During her administration, corruption and nepotism proliferated and spread into most sectors of the public arena on a large scale.

She was a charming person with highly developed diplomatic skills. She also continued to be one of the most important figures in the Third World movements throughout her life. She wielded great power in a highly patriarchal society. Unfortunately, many of her significant accomplishments have been overshadowed by the declaration of emergency and, later on, by her raid on the Golden Temple.

## GANDHI, MOHANDAS

Mohandas Karamchand Gandhi (1869–1948), also called *Mahatma*, which means “great soul,” was one of the most admired world leaders of the twentieth century. His popularity and sway over the Indian masses was unparalleled. Known as the father of the Indian freedom movement, he was its undisputed leader from 1920 onward. Although his major goal of freedom for India was achieved in 1947, Gandhi was saddened by the partition of India into India and Pakistan and the strife that ensued between Hindus and Muslims.

Gandhi was born in an affluent family in the state of Gujarat, India, in 1869. He was married in 1883. He sailed to England for legal studies and returned to India to practice law in 1891. He accepted a position in South Africa in 1893 and stayed there until 1914. He championed the causes of the Indian community there, protesting in particular the compulsory registration certificates policy directed against them. He

was imprisoned twice in South Africa, and his experiences there turned out to be a starting point for many of his ideas and actions such as the practice of nonviolence, noncooperation and civil disobedience.

He initiated and led three major political movements through the National Indian Congress party (called Congress party) against the British rule in India. The first, a mass anti-imperialist movement occurred in 1921, the first of its kind in India, but Gandhi called it off in 1922 because of mob violence. The next movement he led was in 1930 in protest to the colonial law that Indians could not produce their own salt and thus had to pay taxes on it. The movement picked up steam and spread all over India. Gandhi was jailed but was released in 1931 to attend a Round Table Conference wherein he made a pact with the administration and called off the civil disobedience movement. He attended a second conference in London later that year, yet it yielded mostly negative results. Gandhi decided to fast until death to stop the granting of separate electorates for the depressed classes. Gandhi broke his fast only after that provision was rescinded. India gradually started participating in a democratic process under the British rule, and Gandhi spent much of the 1930s engaged in activities aimed at the elimination of untouchability.

The third and last major movement launched by Gandhi was in 1942 during World War II and was called the “Quit India” movement, which demanded immediate withdrawal of the British from India. He was arrested again that year but released in 1944 on grounds of poor health. His wife died that same year while she was in detention. Off and on, Gandhi spent more than six years in jails and prisons.

Whenever Gandhi was out of jail, he was engaged in different types of social reforms and movements. These included the economic and educational uplift of members of the untouchable caste, empowerment of women, utilization of village handicrafts, and economic betterment of rural areas and boycotting of British goods. Between 1944 and 1947, he had ongoing talks with leaders of the Muslim league and the British Government to bring about unity between the Hindu and Muslim communities, but without much success. He toured Bihar state and fasted in Bengal to reduce the incidence and intensity of communal violence between the Hindu and Muslim communities.

The methods he used to achieve his political and social goals included, for example, *satyagraha* (holding on to truth or asserting truth), civil disobedience, nonviolent noncooperation, development of village handicrafts such as homespun clothing (*khadi*), and undertaking fasts. Particularly in that era, these strategies were quite unorthodox. His movements directed against the British also had at their core a

moral and spiritual essence; his philosophy and practice taught the people to rely on themselves and their own, moral, spiritual, economic, and political strengths.

Gandhi was a nondogmatic religious liberal and an activist reformer as well. He was open to the positive aspects of different religions and cultures. Gandhi was deeply affected by the Indian religious traditions and the Jain religious principles and practice of non-violence. Thinkers from other countries such as Leo Tolstoy, John Ruskin, and Henry David Thoreau also made a profound impression on his mind. He did not hate the British categorically and volunteered to help the British in the Boer War and World War I.

Despite his overwhelming successes in some arenas, he was not successful in either addressing the problems of the untouchables or maintaining peace between Hindus and Muslims. Many Indians today think of his visions as outdated, impractical, too idealistic, naive, and irrelevant in the modern world. Gandhi, however, left many positive and enduring legacies, not just for India, but also for other countries, applicable to other times and other contexts as well. Indian independence was a catalytic event on the colonial scene from 1947 onward, as it demonstrated that colonial rule could be overthrown nonviolently without traditional weapons and armor. Gandhi's legacy has left its mark on the anticolonial and minority struggles and movements spanning four continents—Asia, Africa, Europe and North America. His principles of nonviolence were a major influence on the American civil rights activist Martin Luther King, Jr. In 1948, a Hindu religious militant assassinated Gandhi, who was en route to a prayer meeting.

### GANDHI, RAJIV

Rajiv Gandhi (1944–1991) was a reluctant heir to the role of a politician. He was born in Bombay in 1944. His grandfather, Jawaharlal Nehru, was the first prime minister of India. His mother, Indira Gandhi, was the third prime minister of India. He studied engineering at Trinity College, Cambridge, but later transferred to Imperial College of London. In London, he met and married Sonia Maino who was an Italian citizen. They had two children. He also took flying lessons while he was in London, and upon his return to India in 1968 started an apprenticeship with Indian Airlines, where he became a pilot.

Rajiv Gandhi was drafted into politics in 1980 by his mother after the death of his brother. He resigned from his job as a pilot and was elected to the Lok Sabha (lower house of the Indian parliament) in 1981. He was sworn in as the sixth prime minister of India in 1984 after the assassination of his mother.

Rajiv Gandhi was young and energetic and had the reputation of being honest and noncorrupt. In 1985, he won his first national election with an unexpected landslide majority larger than his mother or grandfather had received. During the initial phase of his administration, he enjoyed great popularity, especially among the educated population. He opened the economy to foreign investments and bolstered India's technology, education, environmental policies, and agricultural production. He was comfortable with the leaders outside India and conducted successful diplomatic missions to the USSR and the People's Republic of China as well as negotiating treaties with Pakistan and improving relations with Sri Lanka.

On the other hand, riots among the Sikhs and Hindus broke out immediately after he assumed office. He had inherited the cabinet from his mother, and as problems kept surfacing, the cabinet kept being reshuffled. His party kept losing in the state elections, and Gandhi was not widely popular among the rural population.

Despite his initial reputation for honesty and transparency, he got muddled in the Borfous scandal starting in 1987 about purchase of arms from Sweden with the rights to manufacture them in India and later on the purchase of submarines from Germany. Many politicians from his party were involved in the kickbacks. Although he was cleared of the corruption charges later, it came too late to help him in the 1989 elections.

While in office, he succeeded in brokering a peace accord between the government of Sri Lanka and the Liberation Tigers of Tamil Elam. Indian troops were stationed in Sri Lanka as a peacekeeping force.

Unfortunately, many actions of the Indian military totally enraged the Tamil group, who felt betrayed. This resentment culminated in the assassination of Rajiv Gandhi during a comeback campaign in India.

## GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT)

At a meeting in 1947, the major powers of the world devised as a comprehensive plan to set up mechanisms to deal with international trade, investment, and foreign exchange. This “system” produced the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (IBRD, or the World Bank) and an International Trade Organization (ITO). The ITO however never materialized, and its intended functions were taken over by the General Agreement on Tariffs and Trade (GATT).

### The GATT/World Trade Organization (WTO)

In the following, the text refers to GATT for developments up till 1994 and to WTO after 1995 when the latter came into being. While originally intended only as an interim agreement to the ITO, GATT has become the dominant organization and body of rules dealing with intergovernmental trading relationships. The original agreement was signed on October 30, 1947. The signatories agreed to the application of GATT under a Protocol of Provisional Application from January 1, 1948.

GATT developed its institutional structure over time and found a permanent home in Geneva. Modifications of the Agreement are made through negotiated “rounds.” In general, the Agreement’s central principle is nondiscrimination, whereby contracting parties made mutual promises that any trading advantage offered to one country would be freely

available to all other contracting parties. There are exceptions in the area of customs unions and free trade areas and developing countries. The Agreement promoted tariffs as the only legitimate means of protection and encouraged tariff reductions. Import quotas and other nontariff barriers are proscribed. GATT also developed a dispute settlement function to adjudicate disputes.

### Background and Evolution

In February 1946, the United Nations (UN) Economic and Social Council (ECOSOC) called for an International Conference on Trade and Employment with a view to drafting an ITO. A UN Conference on Trade and Employment was held in Havana between November 1947 and March 1948, and a text was adopted known as the Havana Charter.

As work progressed to establish the ITO, some countries were anxious to immediately bring down trade barriers and sought to create an interim tariff reduction agreement. On October 30, 1947 the GATT Agreement was signed by twenty-three countries.

A Protocol of Provisional Application was signed at the same time, whereby signatories agreed that the GATT Agreement would be applied from January 1, 1948, on a provisional basis. As events proved, GATT developed into a permanent and central institution. How this came about stems from the protocol. A provision in the protocol stated that Part Two of GATT need only be applied “to the fullest extent not inconsistent with existing legislation.” Known as the “grandfather clause,” this allowed many signatories to maintain existing protectionist measures inconsistent with GATT Agreement. Subsequently, negotiations within GATT (“rounds”) involved attempts to have countries relinquish these measures.

As an interim device, GATT did not establish any institutional framework necessary for an ongoing international trade-regulating organisation. When the ITO failed to eventuate, GATT developed its institutional and dispute settlement elements.

### Operations of GATT

GATT worked on two levels—first, on a day-to-day level, where existing rules sought to circumscribe protectionist government activity, disputes were sought to be resolved, and discussions could be held on general issues. A second level involved negotiating “rounds,”

or lengthy multilateral trade negotiations aimed at improving liberalization and the general structure of the Agreement. Early rounds focused on the promotion of further tariff reductions on a reciprocal negotiating basis. Later rounds dealt with other trade rules and protectionist barriers beside tariff. The rounds were as follows: Geneva Round (1947), Ancey Round (1948), Torquay Round (1950), Geneva Round (1956), Dillon Round (1960–1961), Kennedy Round (1964–1967), Tokyo Round (1973–1979), and the Uruguay Round (1986–1994).

GATT Rounds: Summary Table

Round	Participating Countries	Result Summary
1947 Geneva	23	Agreement on 20 schedules covering 45,000 tariff concessions. Manufacturing tariff in industrialized countries dropped from average of 40% to 25% over a decade.
1948 Ancey	13	An additional 5,000 tariff concessions exchanged to continue the tariff cutting momentum.
1950 Torquay	38	8,700 tariff concessions exchanged.
1956 Geneva	26	About US\$2.5 billion worth of tariff reductions.
1960–1961 Dillon	26	4,400 tariff concessions covering US\$4.9 billion worth of trade.
1964–1967 Kennedy	62	Introduced across-the-board rather than product-by-product approach to cutting tariffs. Concessions covering US\$40 billion worth of trade. Antidumping rules introduced. By end of decade, industrial tariffs to average about 17%.
1973–1979 Tokyo	99	Tariff reductions covering US\$300 billion of trade. Preferential treatment for developing countries. Codes agreed on subsidies, countervailing measures and other nontariff-barriers. Progressive lowering of industrial tariffs to current level of 4.7%.
1986–1993 Uruguay	116	Changes to a range of trading areas: agriculture, services, intellectual property rights and investment. The GATT to become the WTO with revamped rules and dispute-setting machinery.

*The Uruguay Round*

The Uruguay Round is the most significant to date because it spawned the establishment of the WTO. However, there are many reasons why the Uruguay Round took place. Other than the perceived irrelevance of GATT to world trade relations and the need for significant modifications for the 1990s and beyond, the following reasons may be tabulated.

- The significant departures from the nondiscrimination principles of GATT to add to the exemptions, special rules for developing countries and free trade areas, and other side agreements.
- The development of three key “players”—the United States, the European Union, and Japan—and the inclusion of nonmarket economies into GATT system added to trade problems.
- The role of multinational corporations (MNCs) having immense economic power and control over trade but not subject to GATT.
- The growing attitude among some governments that managed trade as opposed to free trade can lead to significant benefits, which in turn lessens the promotion of GATT norms.
- The use of nontariff barriers in response to years of low growth and recession. Subsidies also were used to defend the competitiveness of local industries leading in some cases to overproduction and, in turn, to subsidising the export of surplus production. Another nontariff barrier is the voluntary export restraint—to prevent the threat of protectionist measures in an importing country. Arguably, these measures were deemed to be outside GATT and therefore permissible.
- Dispute resolution mainly stemming from procedural issues were rife.

The above issues prompted many countries to press for a new round of trade talks. There was a need to revitalize the organizational and dispute settlement functions and to broaden substantive rules. Further, the GATT Agreement only dealt with trade in goods, yet more than half of the workforce in industrialized countries was involved in the services sector.

The Uruguay Round was protracted for a number of reasons. First, a major recession was experienced during the trade talks, giving rise to higher levels of unemployment and calls for higher protectionism, thereby leading to a lesser likelihood of consensus among members. Second, major political events took higher priority—the collapse of the Soviet Union, the reunification of Germany, and the integration

of the European market in 1992 meant that it was extremely difficult to get key political leaders to focus on the immediate and more long-term needs. Further, changes in government in key European countries and the US meant that support from the leaders in these countries were not readily forthcoming.

### The GATT/WTO Agreement

It also is important to note that GATT is not a single agreement. It involves many primary documents, including the initial 1947 agreement, protocols, and accession agreements in which new countries joined GATT and the codes were negotiated during the Kennedy and Tokyo Rounds. To understand its rules and principles, it is necessary to consider the elements of the GATT Agreement and the related documents and modifications made in the Uruguay Round.

The WTO came into being on January 1, 1995. However, the basis of the multilateral trading system that governs the WTO was established in 1948. One of the agreements annexed to the WTO Agreement is GATT1994, which incorporates the basic principles of GATT1948.

Annex 1A to the WTO Agreement is a general interpretative note that gives a statement of an “understanding”—that is, how certain provisions are to be interpreted. Where there is a conflict between what was the old GATT and an agreement in Annex 1A, the new agreement prevails. In all other cases, the WTO is guided by the decisions, procedures, and customary practices followed under GATT1948. The new agreements on trade in services and trade-related aspects of intellectual property and transfer of technology are found in Annexes IB and IC—General Agreement on Trade in Services (GATS) and TRIPS, an agreement on trade-related aspects of intellectual property rights, including trade in counterfeit goods, respectively. Both have important implications for trade in both goods as well as services. There also are agreements that include trade-related investment measures (TRIMS), trade-related environmental management (TREM), and regional trade agreements (RTAs).

### GEORGIA

The Republic of Georgia is a Eurasian country located in the Caucasus region where the somewhat arbitrary line between Europe and Asia is drawn. Its total landmass is approximately 69,875 square kilometres (26,979 square miles), with the landscape being dominated by the Caucasus Mountains to the north and west and the remainder of the country primarily constituting lowland plains. Rivers and lakes are found throughout the country, and coniferous forests dominate roughly one-third of the landscape, leaving about 9% of the country available for agricultural purposes. Best described as having a mild alpine climate, Georgia only receives snowfall at the highest elevations, and the average annual rainfall is one thousand to two thousand millimetres per year, while temperature averages range from 5°C (41°F) during the winter to 22°C (72°F) during the summer. Georgia shares borders with the Russian Federation to the north, Turkey to the southwest, Armenia to the south, and Azerbaijan to the southeast, with the Black Sea comprising Georgia's western edge. According to a 2004 United Nations estimate, the population of Georgia is approximately 5 million and has been declining at a rate of –0.36% per year. Georgia's capital is Tblisi, and it also is the largest city with a population of over 1 million. The name Georgia, as used by the West, is derived from an ancient Persian term for the country, *Gurj*. The native Georgians refer to their country as *Sakartvelo*.

The population of Georgia is dominated by a variety of native Caucasian peoples and other groups. The Georgians, known as the *Kartvelebi* in Georgian, comprise the largest group with 70% of the population. Various ethnic minorities include Armenians (8%), Russians (roughly 6%), Azerbaijanis (6%), Ossetians (3%), Abkhazians (1.8%), and others including the Adjarians (whose language is virtually identical to Georgian), Ukrainians, Kurds, and other smaller

## GEORGIA

groups constitute the remainder (5.2%). Religion in Georgia displays a similar eclectic situation and includes Georgian Orthodox Christians (65%), Muslims (11%), Russian Orthodox Christians (10%), Armenian Apostolics (8%), and others (6%). The impact of official atheism, during the many decades of Soviet rule, also has had an impact upon the largely secular society of Georgia.

The Caucasus region is, in many ways, as fractured as the Balkans with overlapping peoples and, often, capricious borders being drawn by the ebb and flow of empires throughout history. Georgians are primarily descendents of Ibero-Caucasian peoples, who are believed to be the oldest natives of the Caucasus region. In fact, Georgian is part of a family of languages classified as a language isolate group that is not related to the Indo-European languages of the Russians, Armenians, and Ossetians (speakers of an Iranian language) or the Altaic tongue of Azeri Turkish. The Georgian language has borrowed many words and other characteristics from the aforementioned languages as well as Turkish and Farsi (Persian). Georgian is part of the South Caucasian branch of the Ibero-Caucasian family of languages (with its own unique script), whereas Abkhaz is part of the North Caucasian group.

The Caucasus region has been invaded on numerous occasions by the Greeks, Persians, Romans, Arabs, Mongols, Turks, and Russians, all of whom have left their impressions upon the local population in a variety of ways. In addition, Georgia has one of the oldest continuous Christian communities on earth, dating back to 317 CE. Christianity has managed to remain the predominant faith in spite of centuries of Islamic domination and the number of Georgians (such as the Adjarians) who have converted to Islam over the centuries. After centuries of Persian rule, modern Georgian history began with Russian annexation in 1801. During this period, Georgia became an integral part of the Russian Empire and attempts at russification were met with local resistance. An influx of Russians as well as Armenian merchants relegated the Georgian population to a secondary on their own lands. Georgian intellectuals increasingly mimicked Russian and Western European philosophical models, and Marxism gained a foothold among some local activists just as it was spreading in other parts of the Russian Empire. Russian reforms in 1905 had the same impact that they had in other parts of the empire as the Mensheviks gained prominence, but the Bolsheviks, led by the young Ioseb Jughashvili, a.k.a. Josef Stalin, agitated against them. Following Russia's involvement in World War I and the Russian Revolution, Georgia managed to gain independence for a

brief period under the rule of local Mensheviks in 1918. Georgian independence ended in 1921 with the invasion of the Red Army, which annexed Georgia into the newly formed Union of Soviet Socialist Republics. Josef Stalin, possibly Georgia's most well-known native son, gained control of the USSR several years after the death of Lenin. Georgia suffered along with the rest of the USSR during Stalin's reign, but did gain some cultural autonomy. Georgia would not regain independence until 1991 with the fall of communism. After independence, Georgia suffered from various internal struggles, including secessionist movements in the outer provinces of Abkhazia, South Ossetia, and Adjara. These regions remain somewhat problematic, and Russian intervention on behalf of the agitating provinces has prompted the Georgian government to seek closer ties with the United States.

Politically, Georgia has had democratic elections since independence and has managed to retain this democratic plurality with the peaceful changing of its leadership. Most notably, there was the ascension of former Soviet notable Eduard Shevardnadze in 1995, who then voluntarily resigned after allegations of fraudulent elections in 2003. This relatively bloodless passing of power, dubbed the Velvet Revolution of 2003, and continued elections have made Georgia politically stable in spite of regional civil strife. Unlike some parts of the former Soviet Union, Georgia is tolerant of its free press; however, journalists face dangers when covering Georgia's regional conflicts, corruption, and organized crime.

The economy has not met with the same success as the electoral process, and Georgia remains one of the poorest countries of the former Soviet Union. Early strikes, heightened defence spending, and civil conflict have ravaged Georgia's economic prospects throughout the 1990s. In addition, the economic downturn that has impacted the West has also had a ripple effect in Georgia, which has been exacerbated by incompetent leadership and economic mismanagement. Price controls were set by politicians to gain public support in the early 1990s but have been reversed in favor of market-oriented reforms. Tourism and agriculture (including a renowned viticulture industry) remain the most significant sources of income along with a limited manufacturing capacity. The abundance of rivers makes hydroelectricity plentiful but insufficient to compensate for the loss of energy resources that Georgia enjoyed during the Soviet era. Georgian leaders are optimistic that they will be able to benefit from an oil pipeline running from Baku in Azerbaijan to the port of Batumi in Adjara, but civil unrest there may prompt the pipeline to be diverted to Georgia's other main

port of Poti. In recent years, the Georgian government has done its part to curtail inflation (still hovering around 19%) and formulate a more stable free market-oriented economy. These measures have improved economic conditions, along with substantial guidance and assistance from the International Monetary Fund and the World Bank. Investments from the European Union and the United States also have helped local development, but it has not been enough to modernize Georgia's fledgling infrastructure or meet its energy needs. Georgia has cut its debt and deficit with great effort, but widespread tax evasion and rampant corruption have led to disappointing tax revenues. Per capita income has increased, but remains very low by European standards. According to the World Bank, the annual per capita income of Georgia is only \$2,300. The Georgian currency, introduced in 1998, is the *lari* and has remained relatively stable since its inception. However, with nearly 60% of Georgians living at or below the poverty line, there is much more work to be done. The unemployment rate has been reduced in recent years and tends to hover around 15%, but the quality of jobs has not met with the expectations of many Georgians. Future prospects look promising for Georgia if its internal turmoil and regional conflicts can be resolved. Otherwise, Georgia will continue to suffer from a population outflow as more and more young Georgians move to Russia, the EU, and the US in search of better prospects.

## GHANA

### Geography

Ghana, formerly Gold Coast, is situated along the Atlantic coast of West Africa. It is bordered by three Francophone nations: Côte d'Ivoire on the west, Togo on the east, and Burkina Faso on the north. Ghana is in close contact with both the equator and the prime meridian; the latter passes through the port city of Tema in the southeast. Ghana has a coastline of about 572 kilometers and extends some 840 kilometers in the north-south direction. With an estimated landmass of 238,533 square kilometers, Ghana is about the size of Great Britain. The nation is divided into ten administrative regions: Greater Accra, Central, Eastern, Western, Volta, Ashanti, Brong-Ahafo, Northern, Upper West, and Upper East.

Ghana has a network of streams and rivers; the largest river is the Volta, which starts from Burkina Faso and drains to the Gulf of Guinea. Other major rivers include the Pra, Tano, and Ankobra. Only the Volta, Ankobra, and Tano rivers are navigable by launches and lighters. Ghana's topography is mostly low plains, with the exception of the east where the Akwapim-Togo Ranges peak at 885 meters on Mt. Afadjato, the highest point in the country. Lowlands dominate the southern part of the country. To their immediate north are the Volta basin (to the east) and the Ashanti Uplands (to the west). Northern Ghana is dominated by dissected plateaus, which range between 150 and 460 meters in height.

Ghana has a warm tropical climate, with mean annual temperatures ranging between 26°C and 29°C. The weather is generally warm and dry in the southeast; warm and humid in the southwest; and hot and dry in the north. Ghana's climate is influenced by three main air masses: the hot and dry tropical continental winds (the *harmattan*), from the northeast; the cool and moist tropical maritime winds (the southwest monsoon), from the Gulf of Guinea; and the warm equatorial easterlies. The northern half of the country has one rainy season (May to October) and one dry season (November to April). Southern Ghana, however, has two rainy seasons and two dry seasons. The major rainy season is from May to June, whereas the minor is from September to November. The minor and major dry seasons last from July to August and from December to April, respectively. The heaviest rainfalls occur in the southwestern corner, where the mean annual rainfall reaches 2,230 millimeters. The amount of rainfall generally reduces northward.

## People and Ethnic Groups

Ghana has a population of 18.4 million people (2000 census). Like most tropical African nations, Ghana's population is predominantly Black, with enormous ethno-linguistic diversity. The major ethnic groups include Akan (44%), Mole-Dagomba (16%), Ewe (13%), Ga (8%), and others (0.2%); each of which has several subgroups. The Akans are predominant in southwestern and central Ghana, the Ewes and Gas are mostly in the southeast, and the Mole-Dagombas are mainly in the north. More than fifty different languages and dialects are spoken in Ghana, but the official language is English. Islam and Christianity are the main non-African religions in the north and south, respectively. With a high fertility rate (five pregnancies per woman), a high birth rate (forty-four births per one thousand), and a high infant mortality rate (eighty-four deaths per one thousand live births), Ghana's demographic characteristics are not much different from those of other West African countries. However, Ghanaians are relatively well-educated; the nation's literacy rate of about 65% is surpassed only by Cape Verde's, in the West African context.

Whereas the majority of Ghanaians live in rural areas, there has been an increase in urbanization in recent years. In 1948, the urban share of the nation's population of 4.4 million was only 13%. By 1960, the urban share of the national population of 6.7 million had reached 23%; by the 1990s, more than a third of Ghanaians live in cities (Chamlee-Wright 1997). The main cities include Accra, the national capital; Tema, Kumasi, Cape Coast, and Temale. Accra is a typical primate city with a population of about 1.2 million. It is home to nearly all national government ministries, all the regional administrative offices of the Accra Metropolitan Area, and almost all international organizations and embassies in Ghana.

## History and Politics

The ancestors of the people of Ghana are believed to have migrated from Mauritania and Mali in the thirteenth century. The work of James Anquandah (1982) suggests that by the end of the sixteenth century, most of the ethnic groups of contemporary Ghana had settled in their present location. Portuguese traders were the first Europeans to come to Ghana in the early 1470s; they named the area the Gold Coast because it was rich in minerals, particularly gold. The Portuguese established the first European fort at

Elmina in 1482 to assert control over the gold, ivory, and timber trade. The British arrived in 1553, followed by the Dutch in 1595, the Swedes and Danes in 1640, and the Germans in 1683. These imperial powers competed for control of the Gold Coast, until it became a British colony in the 1874. The British colonial administration ended on March 6, 1957, when the Gold Coast became the first Black African nation to gain independence under the leadership of Kwame Nkrumah and changed its name to Ghana. The nation became a republic in 1960.

Several development analysts, including David Apter (1972), Mohammed Huq (1989), and Kwadwo Konadu-Agyemang have noted that in the immediate years following Ghana's independence, her economy was among the richest in Africa, with a relatively high annual gross domestic product (GDP) growth rate of about 6%; a substantial foreign exchange reserve; a well-educated and skilled workforce; and a strong civil service. Also, Ghana was the world's leading producer and exporter of cocoa and exported some 10% of the world's gold by the early 1960s. Nkrumah's socialist government instituted a policy of free education and health care, initiated mass industrialization and electrification, and established several state corporations to compete with private and foreign enterprises. By 1964, Nkrumah had resorted to autocratic rule and moved Ghana into a one-party state, by consolidating power in his Convention People's Party (CPP). Human right abuses by the government, economic mismanagement, corruption, and the consequent economic decline led to massive anti-government demonstrations across the country and, ultimately, Nkrumah's overthrow in 1966.

Unfortunately, the fall of Nkrumah did little to improve the well-being of Ghanaians, as political instability and economic mismanagement continued unabated. By 2000, Ghana's postcolonial political pendulum had swung intermittently between four military dictatorships and four democratic governments. The National Liberation Council (NLC), which overthrew Nkrumah, was replaced by the democratic government of K. A. Busia and his Progress Party in 1969, only to be toppled by the National Redemption Council (NRC) in 1972. Jerry Rawlings and his Armed Forces Revolutionary Council (AFRC), in turn, overthrew the NRC in 1979. In 1979, Rawlings handed over power to the democratic government of Hilla Limann, only to come back with his Provincial National Defence Council (PNDC) in yet another coup in 1981. Rawlings ruled Ghana as an elected civilian president from 1992 until 1999, when his National Democratic Congress (NDC) party was defeated in a general election by the current New Patriotic Party (NPP) headed by J.A. Kuffour.

## Development Experience

Ghana's economy is dominated by agriculture, mining, and forestry. The leading exports are cocoa, timber, gold, bauxite, and diamonds. In the 1960s and 1970s, Ghana produced nearly a third of the world's cocoa, but in recent decades, cocoa output has declined as a result of factors such as increased drought and forest fire, lower producer prices, and increased smuggling to neighbouring Côte d'Ivoire. Since the early 1990s, gold has surpassed cocoa in export earnings, and diamond output also has increased significantly. Ghana currently produces about 10% of the world's gold and a substantial amount of diamond, bauxite, and hardwood. Ghana has ample supply of arable land and a favourable climate for farming and human settlement. The nation's education, health, transportation, and communication facilities are also among the best in Sub-Saharan Africa. Nonetheless, "by the time Ghana could celebrate the silver jubilee of its independence, the most promising economy in Sub-Saharan Africa had atrophied, with all the conventional socioeconomic indicators of well-being pointing down" (Dzorgbo 2001). Whereas exogenous factors, such as the OPEC crisis of the 1970s, rising interest rates on foreign loans, and unfavorable terms of trade contributed to Ghana's decline, the main explanatory factors are internal: bad governance characterized by corruption, political arbitrariness, and the lack of development vision.

During the early 1980s, Rawlings and his PNDC government plunged Ghana into political extremism. With the support of radical students, the PNDC engaged in what Dzorgbro (2001) calls "Robin Hood" politics, involving extortion, detention, confiscation of property, abduction, and sometimes murder of the "enemies" of the revolution—that is, the rich. The violence-soaked socialist revolution pushed Ghana into a virtual economic coma. By 1982, it was clear that the revolution only exacerbated the nation's economic woes, because chronic food shortages, mass poverty, and astronomical inflation were prevalent.

The situation worsened in 1982–1983 with Ghana's worst drought of the twentieth century, resulting in high incidences of bush fire and hunger. Worse still, in 1983, more than 1 million Ghanaians were repatriated from Nigeria, putting additional pressure on the nation's economy. Things got so bad that Rawlings and his socialist revolutionaries were compelled to turn to capitalist nations including the United States and the United Kingdom for food and medical aid. In 1983, with pressure from the IMF and the World Bank, the Rawlings' government adopted a

Structural Adjustment Program (SAP), locally dubbed the Economic Recovery Program (ERP). As with IMF/World Bank packages elsewhere, Ghana's SAP entailed trade liberalization; public-sector retrenchment; removal of subsidies on food, petrol, and social services, including health and education, increased taxes, privatization, adoption of flexible foreign exchange regime, and devaluation of the nation's currency—the *cedi*.

Ghana's SAP received mixed reviews in the available literature. The IMF and World Bank touted Ghana's SAP as a success because of Ghana's improved economic growth rates; resuscitated cocoa, mining, and forestry industries; and restored confidence of international financial institutions in the nation's economy. Official reports suggest that Ghana registered an average GDP growth rate of about 5% annually under the program. However, some observers, notably UNICEF (1986) and Konadu-Agyemang (2001), have criticized Ghana's SAP for increasing the nation's dependence on foreign aid and imposing significant economic hardships on vulnerable groups such as women, children, and the poor through higher taxation, public sector retrenchment, and the removal of subsidies. Critics also contend that Ghana's SAP was geared toward growth, as measured by quantitative yardsticks such as income per capita and GDP, rather than development which generally entails a qualitative improvement in human welfare.

In response to these criticisms, the government embarked on its Program of Action to Mitigate the Social Costs of Adjustment (PAMSCAD) in 1987, to reduce mass poverty by providing training, work, and income through community development projects for targeted groups such as retrenched workers, women, and poor households. Several community development projects (e.g., construction of roads, schools, and health centres) were undertaken under PAMSCAD. However, critics contend that the PAMSCAD did little to alleviate the economic hardships faced by the truly disadvantaged, notably women. It is argued that most of the resources, credit, and construction projects initiated under the PAMSCAD favoured men over women. Brydon and Legge (1996) note that the section of the PAMSCAD designed to enhance the opportunity for women in development (PAMSCAD WID) "was the last to get off the ground." Furthermore, most of the income-generating activities funded for women only reinforced women's traditional roles of cooking, child care, and petty trading, rather than empowering them in new and more lucrative sectors of the economy.

Since 1992, Ghana has become politically stable, enjoying its longest spell of democratic government

with no military intervention. The nation has embarked on several poverty-reduction programs under its Vision 2020 program, which seeks to alleviate poverty by 2020. Nonetheless, mass poverty, unemployment, corruption, and bureaucratic inefficiencies persist. If true development entails the mobilization of human and natural resources to achieve better living standards for all (Dzorgbo 2001), then what Ghana really needs is a clearly defined, culturally informed development goal as well as good governance, couched in efficiency, transparency, public safety, and a respect for property rights, the rule of law, and environmental sustainability.

### GLASNOST AND PERESTROIKA

The twin notions of *glasnost* and *perestroika*, associated most of all with the name of Mikhail Gorbachev, mark a crucial episode in the late twentieth century: the attempt at serious reform of the political, economic, and social system called the Soviet Union, with far-reaching effects both in the USSR and beyond. This episode started in 1986 and lasted until August 1991, when a half-hearted reactionary coup put an end to Gorbachev's power and yielded, with winner Boris Yeltsin, a situation of which the crushing of the power of the Communist Party of the Soviet Union (CPSU) and the dismantling of the Soviet empire were inevitable consequences.

As notions, *glasnost* and *perestroika* are not Gorbachev's inventions. *Perestroika* means rebuilding or reconstruction; *glasnost* means publicity or "being open to the public." While *perestroika* is really an ordinary word, *glasnost* has always had political connotations, and the call for more *glasnost* in Russia dates back to Vladimir Lenin and Alexander Herzen (Laqueur 1989). Gorbachev launched *perestroika* and *glasnost* in 1987, and he became immensely popular in the West when he gave up the very idea of the Soviet block: the arms race slowed down abruptly, Velvet and other "soft" revolutions took place, and Germany was reunified after the fall of the Berlin Wall in 1989. The call for independence grew louder in most Soviet republics, especially in the Baltic states, and one after another split off in years to come. Countries west of Russia quickly left the idea of state socialism, reformed or not: instead of *perestroika*, they opted—with the exception of Belarus—for liberal democracy, free market, and closer ties to Western Europe.

At home, Gorbachev was increasingly perceived as the person who "sold out" Soviet Russia to the West. *Glasnost* was a success, and a pluralistic free press was quickly established. But it proved a lot easier to point out what was wrong with a politically, economically, and socially bankrupt system than to lead the way to a better one. Reforms were started—for example, the acceptance of small private business, a relaxation of censorship, the introduction of real elections, rehabilitation of many figures from the Russian and Soviet past, increased academic freedom, and allowance for Russian citizens to travel abroad. But it is easier to lift

restrictions than it is to implement new policies such as the introduction of a “socialist market economy,” the establishment of rule of law, or the top-down creation of a “civil society.” As a popular Russian joke explained: “It is easy to turn an aquarium into a bowl of fish soup, but much more difficult to make an aquarium out of fish soup.”

Support for the new policy came from various sides. Within the party, there was widespread recognition of the fact that the Soviet system had to reform itself if it wanted to survive, and the *nomenklatura* feared for its own position. From within the economic establishment, so-called technocrats who knew that the system was highly inefficient supported Gorbachev’s policy of putting an end to fake statistics, “overfulfilling” of plans, corruption, and financial irresponsibility. From the side of the liberal-minded intelligentsia, there was a strong call for *glasnost*, academic freedom, and civil rights, many still cherishing the 1968 Dubček dream of a “socialism with a human face” (Scherrer 1996). Among the population at large, there was support from the victims of repression, in particular from relatives of people who had died in the Gulag. Finally, a strong impulse came from youth culture, which was interested in freedom rather than politics (Troitsky 1987).

Gorbachev’s major slogan was an essentially weak variant of the TINA argument: “There Is No Alternative” (Afanas’ev 1988). While it was obvious to everybody that things had to change, a clear idea of what had to be was absent, and lack of alternative is never a lasting motivation. Once academia and public opinion had been liberated, an intensive search for alternatives began (Chernyshev 1995), which stimulated a “renaissance” of Russian national consciousness and the search for a new “national idea.” Commentators have concluded, with the advantage of hindsight, that Gorbachev was too hesitant and inconsistent in his policies, and that he might have been more successful had he abolished, or at least left the Party at an early stage, and organized himself a populist platform—as Boris Yeltsin did with instant success in 1991.

Soviet-style communism was a twentieth century social experiment that failed (Furet 1995; Walicki 1995). This experiment included the attempt to create a New Man, the *Homo sovieticus* (Kharkhordin 1999). One of the burning questions for post-Soviet Russia still is whether *Homo post-sovieticus* is capable of forming the human material for a new, prosperous, and democratic Russia. The Russian word for experiment is *opyt*, which also means experience, and one thing is clear: all thinking about alternatives will have to take into account the Soviet *opyt*.

Ultimately, *perestroika* has lost its meaning because there no longer is a “system” that needs reform

in order to survive, but *glasnost* has not lost its political relevance.

## GLOBAL CLIMATE CHANGE

In 1988, climatologist James Hansen of the National Aeronautics and Space Administration’s Goddard Institute of Space Studies warned, in testimony before the US Senate, that human activities were altering the world’s climate. The statement ignited a scientific and policymaking controversy—not everyone agreed that humans were changing the climate, and even if humans were changing the climate, not everyone agreed that the change was such a bad thing.

What Hansen told the Senate was that combustion of fossil fuels, by increasing the concentration of the gas carbon dioxide in the Earth’s atmosphere, was creating a “greenhouse effect.” Greenhouses allow farmers and gardeners to grow plants through the cold months of the year by allowing sunlight to shine through the walls and ceiling to warm the contents, but then trapping the heat inside so that it cannot be lost to the outside environment.

The same thing happens in the greenhouse effect, except the effect is global—carbon dioxide and other “greenhouse” gases replace glass and plastic in trapping heat radiation that would otherwise be lost to space, thus raising the temperature of the Earth’s surface.

The science behind Hansen’s testimony was not new. Svante Arrhenius, a Swedish scientist who was awarded the Nobel Prize in Chemistry in 1903, began a side project in the 1890s investigating the cause of the ice ages, prolonged periods of below normal temperatures and extensive glaciation lasting

thousands—even millions—of years. In 1895, Arrhenius presented a paper at a meeting of the Stockholm Physical Society entitled “On the Influence of Carbonic Acid in the Air upon the Temperature of the Ground,” which explained how changes in atmospheric carbon dioxide concentrations affected the heat balance of the Earth.

### Change in the Wind

Arrhenius’s work focused on carbon dioxide, a major by-product of combustion of fossil fuels. But the suite of greenhouse gases includes naturally occurring compounds such as water vapor, methane (a major component of natural gas), nitrous oxide (also known as laughing gas), and ozone; and man-made compounds such as chlorofluorocarbons, fluorocarbons, and sulfur hexafluoride.

While the ozone layer at the top of the atmosphere is destroyed by chlorofluorocarbons, the fact is that human activities have increased the concentrations of carbon dioxide, nitrous oxide, and, of course, the man-made greenhouse gases. The concentrations of some of the naturally occurring greenhouse gases, such as water vapor and methane, may increase as the climate warms, for example, increasing the water holding capacity of the atmosphere or increasing release of methane from “cold” storage in wetland or marine sediments.

### Climate Changes

Based on fundamental physics, it is natural to predict that an increase in the concentration of greenhouse gases in the atmosphere would lead to warming at the Earth’s surface. And if the concentration of greenhouse gases was the only factor that changed, the prediction would likely be accurate.

But the Earth-ocean-atmosphere system is much more complicated. Many things affect global temperatures. Albedo (reflectivity) of the Earth’s surface can affect the amount of solar radiation absorbed or reflected—the more that is absorbed, the warmer the Earth’s surface, whereas the more that is reflected, the cooler. Warmer temperatures can lead to increased precipitation—more snow, particularly in the Arctic and Subarctic regions, may paradoxically increase albedo and lead to lower global temperatures overall!

Particulate matter in the atmosphere can reflect solar radiation away from the Earth’s surface, thus making the surface cooler. Volcanic eruptions, by spewing ash, dust, and small particulates into high

levels of the atmosphere, can cool the Earth’s climate. Mt. Pinatubo in the Philippines erupted in 1991 and cooled global temperatures by as much as 0.5°C (about 0.9°F). The 1815 eruption of Tambora, on the island of Sumbawa in what is now Indonesia, was one of the largest volcanic explosions in history, blasting fifty cubic kilometers (about eleven cubic miles) of material as high as forty-three kilometers (twenty-six miles) above the Earth’s surface. The average drop in global temperatures was 1°C (1.8°F). Changes in volcanic activity can thus affect global climate.

Higher concentrations of carbon dioxide can lead to greater plant growth, which in turn would slow the increase of carbon dioxide in the atmosphere. Likewise, the oceans can, and probably have, absorbed a lot of the excess carbon dioxide released into the atmosphere since the dawn of the Industrial Revolution. But warmer temperatures may lead to more fires, which would release more carbon dioxide into the atmosphere and possibly produce more surface warming.

If warmer global temperatures trigger massive melting of glaciers and the Arctic and Antarctic ice-caps, sea levels will rise. This would be disastrous for island nations and other regions that are barely above sea level now. Bangladesh, a densely populated, low-lying country that borders the Indian Ocean, is one of the most vulnerable to sea level rise. The average elevation of the nation is three meters (about ten feet) above sea level. Tropical cyclones (otherwise known as hurricanes or typhoons) periodically batter the country, and storm surges—walls of water pushed forward by storm winds—can inundate large swaths of the Ganges River Delta, where much of the country lies. In 1970, at least three hundred thousand people died when a twelve-meter (forty-foot) surge swept the country.

Major climate changes can occur relatively suddenly. Temperature changes as much as 10°C (about 18°F) may occur in as little as a couple of decades. Such abrupt changes would give human societies and plant and animal populations no warning and little time to respond, possibly triggering societal collapses and mass extinctions.

While the concern is over the deleterious effects of climate change, some regions may benefit. Growing seasons may lengthen in the middle and high latitudes, and some arid areas may receive more rainfall, thus increasing food production. Minimum daily temperatures are rising, which may reduce heating costs for human societies living in areas of strongly developed cold seasons.

But these beneficial effects are not without cost. Ecological systems adapted to cold conditions, such

as high-elevation forests and tundra communities, may disappear completely as they are replaced by species adapted to warmer conditions. Formerly arid areas that experience an increase in rainfall may be subjected to increased flooding and soil erosion. Warmer temperatures and longer growing seasons may affect fire frequency, which would lead to increased destruction of forests and grasslands. Also, longer growing seasons may increase the pressure to convert natural systems to agriculture, thus causing a net loss of available habitat for native plants and animals and driving some species to extinction.

## Past Extremes

The Earth has been through worse climate extremes in its history. For example, between about 550 million and 800 million years ago, the Earth experienced several prolonged cold snaps—so cold that land-based glaciers reached to within ten degrees latitude of the equator. During these “Snowball Earth” episodes, much of the ocean surface froze, although there is debate over whether the oceans were completely covered in ice or whether the oceans were more of a “slushball” than a “snowball.” During another significant glaciation that occurred about 450 million years ago, the Earth may have had atmospheric carbon dioxide concentrations ten times higher than those today.

The Earth has had its share of warm spells, too. One of the warmest periods in Earth’s history was between 50 million and 55 million years ago, when there was little or no ice at the Earth’s poles, and tropical conditions extended to midlatitude regions.

## Prognostication and Observation

The Intergovernmental Panel on Climate Change (IPCC) was established by the United Nations Environment Program (UNEP) and the World Meteorological Organization (WMO) in 1988 to coordinate international efforts to assess the likelihood and effects of climate change. The IPCC has issued several reports—the IPCC Third Assessment Report, the most recent at the time of publication of this encyclopedia, was released in 2001.

The IPCC, in its *Third Assessment Report*, concluded that the decade of the 1990s was the warmest since instrumental records began being systematically kept in the 1860s. The panel also concluded that human activity is responsible for most of the warming

that has been observed in the second half of the twentieth century.

The *Third Assessment Report* predicts that global temperatures will rise between 1.4° and 5.8°C (2.5–10°F) over the 1990 average by the year 2100. Sea levels are predicted to rise between 0.09 to 0.88 meters (0.3 to 2.9 feet) over 1990 levels by 2100.

Warming and sea level rises already have been observed the last few decades. But other changes in the Earth’s climate have been recorded. The extent of Arctic sea ice has decreased, and the ice cap has melted at the North Pole in the summer. Glaciers are receding worldwide, with mountain glaciers in the tropics and midlatitudes most seriously affected. Precipitation patterns have changed, with increases in some regions and decreases in others.

Changes have been observed in some cyclical climate phenomena. For example, El Niño episodes—in which a buildup of warm surface waters off the west coast of South America disrupts climate in the tropics, subtropics, and midlatitudes—appear to have grown more frequent and more intense since the 1970s.

## Regional Outlooks

Developing nations, already stressed to meet the needs of growing populations, will be hard-pressed to cope with the changing climate. All have limited resources and technological capability that will limit their ability to respond. What follows are predictions given in the IPCC *Third Assessment Report* for Africa, Asia, Latin America, the Polar Regions, and small island states.

- **Africa.** Africa will be especially vulnerable to climate change. Food production will decrease, and infectious disease outbreaks will increase. Many native plant and animal species will be pushed over the brink of extinction. Recurring droughts will be even more of a problem than they are today. Deserts will likely increase in extent in the subtropical portions of the continent. In the tropical, particularly the equatorial portion, larger and more frequent floods will result as rainfall patterns change. Also, along the coasts, higher sea levels and more intense storms will place coastal areas at greater risk.
- **Asia.** Developing nations in Asia have to face some of the same challenges faced by Africa in coping with climate change. Temperate and tropical regions have and will continue to be beset by more extreme climate events, ranging

from fires and droughts to floods and tropical storms. Low-lying countries, such as Bangladesh, will be hit hard by rising sea levels and resulting increase in the height of storm surges. The Asian monsoon will strengthen, increasing rainfall and flooding along the rivers draining into the Indian and Pacific Oceans. In addition, northern portions of Asia will warm, disrupting the boreal forest and tundra regions as well as the populations that depend on the resources of the far north.

- **Latin America.** Mexico and the Caribbean, and Central and South American states have rapidly growing populations but limited resources to fuel the growth needed to keep up with the increase. Many localities depend on Sierran and Andean mountain glaciers to supply their water, but with the observed retreat and loss of alpine glaciers, the dependability of the once-reliable source is questionable. Agriculture will suffer, as well as the diversity of the regions rich plant and animal communities. Extreme events, such as floods, droughts, and storms, will become even more extreme. Coastal and island states will be even more vulnerable to tropical storms than in the past.
- **Polar Regions.** Polar regions are just as likely to affect the global climate as be affected by it. Warming is shrinking the extent of glaciers as well as the thickness of sea-ice. Permafrost, a layer of ice in the soil that normally never melts, will do just that—melt. Polar and subpolar ecosystems will be disrupted as species migrate north with rising atmospheric temperatures. On the other hand, higher temperatures will force methane—a more powerful greenhouse gas than carbon dioxide—out of cold storage in wetland and marine sediments and into the atmosphere. This would trigger even more atmospheric warming. As glaciers and sea-ice melt, more fresh water will flow into the ocean. This influx of fresh water may disrupt ocean currents that moderate the climate, much as the Gulf Stream moderates the climate of eastern North America and western Europe, thus triggering abrupt climate changes.
- **Small Island States.** Most small island states lay in the tropical and subtropical Pacific Ocean, the Indian Ocean, and the Caribbean Sea. They have limited land surface—migration off the islands will be almost impossible for most plants and animals. People may be able to move, but in that case, many of the island populations affected will be forced off homelands their ancestors have occupied for centuries.

Rising sea levels and increasing storm frequency and intensity are a major problem for these nations. Water supplies may be disrupted, and vital ecological systems may be damaged. For example, coral bleaching—in which the animals that build up the coral reefs die—is largely caused by warm ocean temperatures. Fish stocks may decline, endangering the food supplies of these nations, many of which have few options for food and agricultural development.

## GLOBALIZATION: IMPACT ON DEVELOPMENT

From the early 1990s onward, globalization has become the central topic of debate in social science and in both developed and developing societies, due to the movement of money, goods, people, technology, and ideas across national borders at an accelerating pace. Globalization refers to the transformation of much of the world into a single-market economy where national borders are decreasingly serving as a barriers to the free flow of goods, services, information, and money. Globalization also refers to the relationships between nations and societies and the influences that developments in one society have on others. The driving idea behind globalization is free-market capitalism, meaning that the more market forces rule and the more open the economy to free trade and competition, the more efficient and flourishing the economy will be. Globalization means the spread of free-market capitalism to virtually every country in the world. It also has its own set of economic rules—rules that revolve around opening, deregulating, and privatizing your economy. The privatization of state-owned enterprises, the liberalization and deregulation of markets—especially for services—and the removal of a bevy of structural distortions, have all worked to stimulate cross-border corporate integration, both within transnational corporations and between independent firms or group of firms.

Globalization is more than the internationalization of commerce and manufacturing; it represents a new development paradigm that creates new links among corporations, international organizations, governments, communities, and families. As markets have spread, tying populations together, environmental, military, social, and political interdependence have increased proportionately. The forces of globalization—the relentless expansion of market forces and the constant search for greater economic efficiencies—influence everything from indigenous cultures to environmental and labor standards to patterns of productivity. Although globalization has been taking place for decades, if not centuries, the incorporation of the world into a single capitalist economic system began after the World War II. After the war, the General Agreement on Tariffs and Trade (GATT) was created by the international community, along

with the International Monetary Fund (IMF), the World Bank, and other international organizations.

Liberals had long believed that unhampered trade would result not only in maximum economic welfare for the participant states but also in more peaceful relations among states. Each state would benefit from such trade and have a vested interest in its continuance, uninterrupted by war. Based on the principles of multilateral cooperation, GATT had a mandate to roll back tariffs from their pre-war peaks and to gradually reduce them in the future. GATT was extremely successful in 1947 during the first Geneva Round in reducing tariffs by 35%. Successive rounds in the 1950s, 1960s, and 1970s, and the recent Uruguay Round have virtually eliminated tariffs on manufactured goods. In 1994, 117 nations agreed to the following: (1) reduce tariffs 38% for developed countries; (2) eliminate certain nontariff barriers and subsidies; (3) broaden GATT principles to areas such as trade in services, investment, and intellectual property rights; and (4) apply more effective disciplines to agricultural trade. Negotiators established long-term rules and reduced national policies that distorted and hindered access to the market. Nevertheless, agricultural subsidies remain obstacles to free trade; farmers in each of the developed countries wield too much political power to allow anything but minimal face-saving formulas to be reached.

By cutting tariffs substantially in successive rounds of negotiations, GATT could claim much of the credit for the postwar growth of the world trade and production. Its framework is based on the principle of reciprocity—that one state's lowering of trade barriers to another should be matched in return—and of nondiscrimination. The latter principle is embodied in the "most-favored nation" (MFN) concept, which says that trade restrictions imposed by a GATT member must be applied equally to all GATT members. That is, every member is entitled to the same treatment that a state gives its most-favored trading partner. If Australia applies a 20% tariff on auto parts imported from France, it is not supposed to apply a 40% tariff on auto parts from the United States. In this way, GATT does not remove barriers to trade altogether but equalizes them in global framework in order to create a level playing field for all member states. States are not prevented from protecting their own industries by a variety of means but cannot play favorites among their trading partners.

An exception to the MFN system is the Generalized System of Preference (GSP) through which industrialized states began in the 1970s to give trade concessions to third world states to help the latter's economic development. These preferences

amount to a promise by wealthy states to allow imports from less developed ones under even lower tariffs than those imposed under MFN.

In 1995, GATT members began to operate at a higher level of institutionalization, becoming the World Trade Organization (WTO). The WTO has enlarged its membership, and 135 countries that have agreed to adhere to its free-trade rules are spread across the globe.

Regional free-trade areas are also very important in the structure of world trade. In such areas, groups of neighboring states agree to clear away the entire structure of trade barriers within their area. The most important free-trade area is in Europe; it is connected with the European Union but with a somewhat larger membership. Europe contains a number of small industrialized states living close together, so the creation of a single integrated market allows states to gain economic advantages that come inherently to a large state such as the United States. In October 1992, the North American Free Trade Agreement (NAFTA) was signed between the United States, Canada, and Mexico. NAFTA, which went into effect on January 1, 1994, created a free-trade area of some 370 million consumers by linking the United States to its largest (Canada) and third-largest (Mexico) trading partners.

During the Cold War, the Soviet bloc maintained its own trading bloc, the Council for Mutual Economic Assistance (CMEA), also known as COMECON. After the Soviet Union collapsed, the members scrambled to join up with the world economy, from which they had been largely cut off.

## The Globalization of the Trade and Finance

Globalization has developed dramatically since the Cold War. It now encompasses economic interaction, ideas and information technology, culture, and even labor force. Distance ceases to be a decisive factor in the overall competition for market share. The worldwide movement of production, capital, and information has become easier and more widely used. Globalization can be seen most clearly in the quickening pace and scope of international commerce. Global exports as a share of global domestic product have increased from 14% in 1970 to 24% today, and the growth of trade has consistently outpaced growth in global output. In the United States, the ratio of two-way trade and investment income flows as a share of gross domestic product has roughly tripled since the 1960s. Annual global flows of

foreign direct investment surged to a record \$827 billion in 1999, with 25% directed to less developed countries (LDCs), up from 17% in 1990. Indeed, by 2005, international trade is expected to account for 40% of national output in industrial countries and more than 50% in developing countries. International financial flows, only \$20 billion per day fifteen years ago, are now more than \$1.5 trillion per day, or \$548 trillion a year; by 2015, they may reach \$30 trillion per day. About two-thirds of this moves through the banking centers in just four countries: Germany, Japan, the United Kingdom, and the United States. To accommodate the globalization of money, there has been a parallel globalization of banking and other financial services. In a relatively short period of time, banks have grown from hometown to national to multinational enterprises. One result of increased international trade and both financial and monetary interchange is that the subjects of national economic health and international economics have become increasingly enmeshed. Domestic economics, employment, inflation, and overall growth are heavily dependent on foreign markets, imports of resources, currency exchange rates, capital flows, and other international economic factors. The rise in trade is both a cause and a result of this increased international economic interdependence. The health of the United States economy depends increasingly on the prosperity of its trading partners and on the smooth flow of trade and finance across borders. For better or worse the trend toward global economic integration has gained enormous momentum.

The expansion of international trade and foreign investment has not been the result of some grand design imposed on the global economy. It has resulted from two developments of the 1980s: the collapse of global communism and the demise of the Third World's romance with import substitution. The fall of the Berlin Wall and the final disintegration of the Soviet empire two years later released 400 million people from the grip of centrally commanded and essentially closed economic systems. Meanwhile, the debt crisis of 1982 and the resulting "Lost Decade" of the 1980s imposed a painful hangover on many Third World nations that had tried and failed to reach prosperity by shunning foreign capital and by protecting and subsidizing domestic "infant" industries. Beginning with Chile in mid-1970s and China later that decade, LDC from Mexico and Argentina to India more recently have been opening their markets and welcoming foreign investment. The globalization of the last decade has not been the result of a blind faith in markets imposed from above, but of the utter exhaustion of any alternative vision.

## Global Communication

In addition to trade, globalization is also widely associated with the technological revolution in transport, communications and data processing. These developments have changed what is produced and how it is produced. In this light many observers have characterized the global economy as an informational, knowledge-based, postindustrial or service economy. The Internet is the most prominent and visible of networking technologies. It is credited with holding extravagant promise for the entire globe. An increasing body of research, as well as firsthand observations, suggest that the Internet has the capacity to change nearly every aspect of social, political, and economic life. In the business world, it is an enabling technology that makes possible new products and services and new ways of organizing markets, connecting with customers, managing relations with suppliers, structuring the corporation, and designing business processes.

The World Wide Web is a borderless world with access available to anyone, from anywhere, at any time. If one has Internet access, one suffers no limitation because of distance or location. The Internet was developed in the late 1960s at the initiative of the US Department of Defense. Its intent was to enable scientists and engineers working on military contracts to share computers, resources, and ideas. The popularity of the Internet spread slowly through the academic world, which by the mid-1980s was its principal user. In 1994, commercial companies surpassed universities as the leading users of the Internet. Today, the sharply plummeting price of personal computers has fueled the growth of Internet popularity. The boundary of the consumer's market space is the World Wide Web. Furthermore, for businesses, the value chain can be managed from anywhere in the world with the rich and deep exchange of information available with digital networks. Cellular phones are becoming available worldwide, enabling many in the world who have never before made a phone call to communicate instantly with others. The "wireless world" of cellular phones which uses radio waves rather than installed lines is growing by almost 50% yearly, allowing communication between rural areas in developing countries with wired developed countries where connected telephone lines are already abundant. According to the *The Economist*, "the death of distance as a determinant of the cost of communications will probably be the single most important economic force shaping society in the first half of the twenty-first century" (*The Economist* September 1995).

Communication technology set this era of globalization apart from any other. Communication technology has drastically transformed the way people communicate with each other.

## Globalization and Democracy

Such revolutionary changes in communication have invariably had profound effects on the quality and vitality of democracy. There is evidence that globalization can enhance democracy in the United States and abroad. For example, the globe-spanning Internet allows people everywhere to gain access to information that makes them more informed and gives them the tools to form alliances with people around the world who share similar interests and concerns, such as environmental protection and human rights. With imperfect control over the information that crosses their national borders, moreover, nondemocratic regimes become less stable as their people gain access to ideas about self-governance and individual rights. This assisted in toppling regimes in the Soviet Union and Eastern Europe and has threatened the Communist regime in China. Also, many nations that have successfully joined the burgeoning global market economy, including South Korea and Taiwan, have recently become more democratic. Scholars believe this comes about because of the fact that people in economically successful nations tend to become much more demanding of their governments, eventually insisting on better service and more citizen participation in decision making. Furthermore, by raising the general standard of living, free trade allows people to achieve higher levels of education and to gain access to alternative sources of information. It helps to create a larger and more independent minded middle class that can form the backbone of more representative forms of government. The wealth created from expanded trade can help to nurture and sustain civil institutions that can offer ideas and influence outside government. Involvement in the global economy exposes citizens to new arrangements.

In his book *Business as a Calling*, Michael Novak explains the linkage with what he calls the "wedge theory," wherein capitalism brings the ideals of free societies to repressive regimes, "wedg[ing] a democratic camel's nose under the authoritarian tent" (Novak 1996).

Globalization also poses some threats to democracy. Globalization has the potential to undermine the degree of political equality in society as it

alters the relative power of individuals, groups, and organizations. In a highly competitive, globalized economy, for instance, labor unions tend to lose political influence while large business enterprises gain it. Low-skilled manual workers, with little to offer global enterprises—such as the inner-city poor—suffer declining incomes and lose their ability to sway government officials. Also, economic globalization can undermine popular sovereignty to the extent that it decreases the ability of government to make and enforce policies that control the destinies of their jurisdictions or protect the well-being of their citizens. More broadly, many analysts have linked the growth of global relations to diminishing nation-state, the decline of the nation-state and retreat of state. Such assertions have triggered a host of rebuttals. For example, certain authors insist that globalization has done nothing to undermine sovereign statehood. According to this view, the increased flow of global communications may in some cases such as ecology—strengthen the state rather than undermine it.

### **Globalization and Its Impact on Developing Countries**

Does globalization benefit most people and most countries, or only a few? On that, the evidence is mixed. It is argued that for the poorer developing countries, most of which are far removed from the critical nodes of growth, the impact of globalization and alliance capitalism is likely to be marginal—except in so far as they may benefit from “trickle down” affect through some manners of subcontracting. The historical growth of trade, it is suggested, has not occurred evenly throughout the world. On the whole, the decreased importance of territorial geography has gone markedly further in North America, the Pacific Rim, and Western Europe than in Sub-Saharan Africa and Central Asia. Phenomena such as global companies and electronic mail have been primarily concentrated in the so-called North. Trade is overwhelmingly dominated by the countries of the Northern Hemisphere. These countries amass 67% of the merchandise exports and 76% of the exports in goods and services combined. The percentage of the world trade shared by LDCs is relatively small, especially in per capita figure. Only a small percentage of global commerce occurs among LDCs. The merchandise trade among LDCs in 1999 accounted for a scant 14% of the world total. Moreover, the handful of developed countries bought 54% of all LDC exports. The pattern of trade leaves the LDCs heavily dependent on the developed countries for export earning

and, thus, places them in a vulnerable position. Finally, it has been argued that developed countries predominantly export manufactured and processed products. LDCs export mostly primary products, such as food, fiber, fuels, and minerals. Developing countries also face the challenge of competing for what is called “foreign direct investment” (FDI) against the developed countries, which—possessing more advanced human and physical infrastructures—offer more attractive locations for international production. Indeed, the early signs of globalization brought forth warnings of a marginalization of developing countries. Analysts pointed to a concentration of investment in the triad of Europe, Japan, and the United States.

On the other hand, some analysts believe that LDCs have the most to gain from engaging in the global economy. First, they gain access to much larger markets, both for imports and exports. On the import side, consumers gain access to a dramatically larger range of goods and services, raising their real standard of living. Domestic producers gain access to a wider range and better quality of intermediate inputs at lower prices. On the export side, domestic industries can enjoy a quantum leap in economies of scale by serving global markets rather than a confined and underdeveloped domestic market only.

Second, LDCs that open themselves up to international trade and investment gain access to a much higher level of technology. This provides LDCs the most needed technology without bearing the cost of expensive, up-front research and development. Poor countries can import the technology off the shelf, much of it embodied in imported capital equipment—that is, machinery that raises the productive capacity of the country.

Third, engagement in the global economy provides capital to fuel future growth. Most LDCs are people rich and capital poor. In a few countries in Asia, the level of domestic savings has been high enough to finance domestic investment, but typically the domestic pool of savings in an LDC is inadequate. Global capital markets can fill the gap, allowing poor nations to accelerate their pace of growth.

Fourth, engagement in global economy encourages governments to follow more sensible economic policies. Sovereign nations remain free to follow whatever economic policies their government chooses, but globalization has raised the cost that must be paid for bad policies. With capital more mobile than ever, countries that insist on the following anti-market policies will find themselves being dealt out of the global competition for investment. As a consequence, nations have a greater incentive to choose policies that encourage foreign investment, and domestic, market-led growth.

Fifth, engagement in the global economy encourages governments to follow more sensible economic policies. Sovereign nations remain free to follow whatever economic policies their governments choose, but globalization has raised the cost that must be paid for bad policies (Griswold 2001).

History suggests that the probable winners are likely to be those developing countries which open their markets to trade and tend to be more prosperous than nations that are relatively closed. The wealthiest nations and regions of the world—Western Europe, the United States, Canada, Japan, Hong Kong, Taiwan, South Korea, Singapore—are all trade-oriented. Their producers, with a few notable exceptions, must compete against other multinational producers in the global marketplace. In contrast, the poorest regions of the world—the Indian subcontinent and Sub-Saharan Africa, for example remain the least friendly to foreign trade. Meanwhile, those countries that have moved decisively toward openness—Chile, China, and Poland, among others—have reaped tangible in their standard of living.

In practice, when states have relied on a policy of autarky (to avoid trading altogether and instead try to produce everything one needs by oneself) they have eventually lagged behind others. China's experience illustrates the problems with autarky. China's economic isolation in the 1950s and 1960s resulted from an economic embargo imposed by the United States and its allies and was deepened during its own Cultural Revolution in the late 1960s when it broke ties with the Soviet Union. In that period, all things foreign were rejected. For instance, Chinese computer programmers were not allowed to use foreign software such as AssemblerLanguage and Fortran—standards in the rest of the world. Instead, they had to create their own software; China would not depend on foreigners for goods, services, or technology. As a result, the computer industry lagged far behind, reinventing the wheel, as the world's computer industry sped ahead. When China opened up to the world economy in the 1980s, the pattern was reversed. The rapid expansion of trade, along with market-oriented reforms in its domestic economy, resulted in rapid economic growth, which continued into the mid-1990s.

Globalization is making it easier to transfer capital and technology across borders, thereby giving lower-wage developing countries access to improved production techniques and so strengthening their economies. Likewise, it is not unreasonable to expect that as productivity rises in developing countries, so too will wages or the real exchange rate. As this happens, those countries become significant markets for goods from more developed countries.

In order for every country to benefit from global markets, wealthier economies must assist the developing world to ride the wave of globalization. If the benefits are to be reaped, then domestic policy settings of developing nations need to encourage and sustain the development of an efficient and competitive economy. Furthermore, the international community must work to develop rules that are trade enhancing, which clear away trade distortions and restrictions including those behind the national borders, and which are consistent with imperatives of sustainable development. Only by working together can the international community address these issues of common interest.

## GOH CHOK TONG

Goh Chok Tong, Senior Minister of Singapore, was born on May 20, 1941, and graduated in 1964 from the University of Singapore with a bachelor's degree in Economics. He went on to pursue a master's degree in economics at Williams College in the United States. After returning to Singapore in 1967, he worked in the Ministry of Finance and served as an executive at several private transportation companies. His political career started in 1976 when he joined the People Action's Party and became a member of Parliament. From 1977 through 1985, Goh held various ministerial positions in the Singaporean government, and was appointed first deputy prime minister in 1985.

Due to Goh's less aggressive personality and weak communication skills in English, Prime Minister Lee Kuan Yew reluctantly chose Goh as his successor. However, Lee let his fellow cabinet members vote, and the unanimous vote was for Goh. On November 28, 1990, Goh was appointed as the prime minister of Singapore.

Although there was rumor that Goh was only the seat warmer for Lee Hsien Long (Lee Kuan Yew's son), Goh proved an effective leader in his own right. Under Goh's leadership, the Singapore economy recovered after the economic crisis and the severe acute respiratory syndrome (SARS) outbreak. Goh's other achievements include a high economic growth rate, education and medical initiatives, free trade agreements, stable labor relations within Singapore, and peaceful relationships with neighboring countries. Goh became the senior minister of Singapore when Lee Hsien Long, on Goh's advice, was appointed prime minister on August 12, 2004. As senior minister, Goh remains active in Singapore's economic and political leadership.

## GORBACHEV, MIKHAIL

Mikhail Sergeevich Gorbachev was born in 1931 in a Stavropol village in the foothills of the northern Caucasus. His father, a tractor driver, was arrested during collectivization but survived. Gorbachev owed his relatively unencumbered rise to power to his early connection with the Stavropol Young Communist League and the support he received to study law at Moscow University. After graduating in 1956 and witnessing the onset of Khrushchev's destalinisation campaign at the Twentieth Party Congress that year, Gorbachev returned home and after eight years as a party secretary was promoted to membership of the Central Committee. Thanks to the patronage of Yuri Andropov he became a member of the Politburo in 1980. After Chernenko's death in 1985, Gorbachev was chosen as general secretary.

### *Perestroika and Glasnost*

In April 1986, the thermonuclear accident in Chernobyl—and the irresponsible way Gorbachev appeared to handle it—added to the public disdain first felt for the new Soviet leader. But his image began to change radically with his release from exile at the end of that year of Andrei Sakharov, father of the Soviet H-bomb and Russia's best-known dissident, who had been deported on Brezhnev's orders six years earlier.

A year later, Gorbachev published his book *Perestroika and New Thinking for Russia and the Entire World*. It announced that people were "tired of tension and confrontation"; they wanted a world in which "everyone would preserve their own . . . way of life." To lead his *perestroika* campaign, Gorbachev unleashed the ideologically sophisticated Alexander Yakovlev. This strategy required a return to the road taken by Khrushchev—the hero of Gorbachev's youth—in again discrediting Stalin. With Khrushchev, this attempt ended with his defeat and disgrace. In the spring of 1988, it seemed to the public that *perestroika* was about to fizzle out in the same way.

However, at the Party's Nineteenth Conference in the summer, Gorbachev proposed a presidential system for the Soviet Union, a new parliament, an increase in the power of local Soviets at the expense of the Communist Party, and the removal of the Party from state economic management.

This was followed at the end of the year by Gorbachev's visit to the United Nations in New York, where he announced the unilateral reduction of half a million military personnel within two years as well as the withdrawal of six tank divisions from Eastern Europe, and called for a new world order based on the United Nations and the renunciation of force.

### *Annus Mirabilis*

During the summer of 1989, a few weeks after elections in Poland resulted in an overwhelming victory by Solidarity candidates over the Communists, the proceedings of the Congress of People's Deputies were televised live throughout the USSR. Gorbachev was elected chairman, and he and its members exchanged uncensored views about the country's present and future. Gorbachev declared that the Warsaw Pact countries were free to choose their own road to socialism.

In September, Hungary opened its borders with the West. Thousands of East Germans emigrated to West Germany. In October, Gorbachev came to East Berlin, where he was cheered as he told the German crowds that "life punishes those who fall behind." Erich Honecker, the German Democratic Republic (GDR) leader, fell from power, and the Berlin Wall was dismantled. This led in turn to a "Velvet Revolution" in Prague and the resignation of its Communist government at the end of the year.

In Romania, the rioting in Timisoara evoked a more bloody response—the execution of President Ceausescu and his wife. Astutely, Gorbachev would use such excesses to persuade reluctant Communists in Moscow to support the constitutional amendment which ended the Party's monopoly of power. On October 3, the two Germanies united with the support of Gorbachev, who was awarded the Nobel Peace Prize for 1990.

### **The Communist Coup**

The hard-line communists waited for their moment to strike back. It came the following year on August 18–21, while Gorbachev was on holiday with his family in

the Crimea. In March, he had organized a referendum that showed a majority in favor of a reformed and democratic Soviet Union. Gorbachev then began negotiations with republican leaders. In retaliation, the so-called "Gang of Eight" struck. Because they had widespread support within the cabinet, the secret police, and the military, it was widely assumed around the world and inside the Soviet Union that it would succeed.

At a hastily convened press conference the vice president of the USSR, Yanaev, announced that Gorbachev had suddenly been taken ill. It was therefore Yanaev's constitutional duty to take over. The plot began to unravel after the conspirators flew to the Crimea to get Gorbachev to resign. He refused despite threats. But the failure of the putsch was largely because of Yeltsin's leadership in Moscow where, as President of the Russian Federation, he also was in danger from the Gang of Eight. Yeltsin, standing theatrically on a tank next to the headquarters of the Russian republican government, summoned the capital's citizens to the defense of freedom.

When Gorbachev flew back to Moscow, he returned (as he memorably observed) to "a different country." Yeltsin was now powerful enough to compel Gorbachev to disband the Communist Party. Yeltsin then seized its republican assets and ousted the KGB from the Russian Federation. Two of the plot's leaders committed suicide, while the rest were placed under arrest.

Estonia, Latvia, and Lithuania, which the Soviet Union had annexed in 1939, declared their independence before the attempted putsch. Some dozen other republics making up the USSR were prepared, their leaders said, to negotiate the new union with Gorbachev. With the coup, this prospect vanished, and they followed Baltic states to independence.

### **Yeltsin's Plot and the End of the Soviet Union**

The Russian Republic's elected president, Yeltsin, had said all along that in principle he, too, was for the retention of a reformed Soviet Union. However, at the beginning of December, he met the leaders of Ukraine and Belarus, and on December 8 they declared that the USSR would be replaced by a Commonwealth of Independent States (CIS).

On Christmas Day 1991, a sad and somber-looking Gorbachev addressed the citizens of the USSR on television for the last time. On this occasion, his resignation as President of the Soviet Union was authentic. On December 31, the USSR formally ceased to exist.

## The Gorbachev Revolution

Gorbachev failed to foresee the pent-up forces released by *perestroika* and *glasnost*. Additionally, he was unwilling to take the drastic measures needed to transform or abolish a systemically underperforming centralized planned economy. Nor did Gorbachev anticipate the re-emergence of nationalism and inter-ethnic strife that dictatorship had kept under control.

But he did contribute mightily towards the democratization of a society, which before he came to power, did not tolerate religion, did not enjoy a free press or freedom of assembly, the right to travel abroad, genuine multiparty elections, or the right to private property. It also is to Gorbachev's credit that, following his recall of Soviet troops from Afghanistan, the USSR managed to avoid the kind of civil war that tore Yugoslavia apart. Indeed, Gorbachev was legally entitled to use force to crush Yeltsin's plot, but Gorbachev's reluctance to resort to violence marked the crucial distinction between him and earlier Soviet rulers. The change into a physically smaller but more civil and humane society—which is still going on—will be seen as the most significant outcome of what most Russian historians have now come to call the Gorbachev Revolution.

## GREAT LEAP FORWARD

In 1958, the Chinese Communist Party launched the Great Leap Forward (GLF) campaign, which

reflected Maoist radical thinking in social engineering and utopian revolutionary values. Its primary motive was to catapult China ahead of the western nations in a remarkably short time—in 1958, it was claimed that China, through the GLF, would be able to surpass Great Britain in steel production within fifteen years, effectively making up a hundred years of economic development.

One of the most important concepts behind the GLF was the idea of a move away from the Soviet centralized bureaucracy model to a decentralized, Chinese-specific mode of economic development. It was believed that a “red over expert” approach should be adopted. Although party leaders appeared generally satisfied with the accomplishments of the First Five-Year Plan, they believed that more could be achieved in the Second Five-Year Plan (1958–1962) if the mass could be ideologically aroused and if domestic resources could be utilized more efficiently for simultaneous development of industry and agriculture. The GLF was aimed at accomplishing the economic and technical development of the country at a vastly faster pace with greater results for China's transition from socialism to communism. The slogan “More, Better, Faster,” appeared throughout China. Another slogan that emerged through the GLF was “Walk on Two Legs.” Mao believed that if the people's ideological awareness was increased, resulting revolutionary fervor could transform social institutions. On an ideological level, collectivization would prevent the re-emergence of wealth inequality.

The GLF centered on a new socioeconomic and political system created in 1958 in the countryside and in a few urban areas—the people's communes. Each commune was placed in control of all the means of production and was to operate as the sole accounting unit; it was subdivided into production brigades and production teams. Each commune was planned as a self-supporting community for agriculture, small-scale local industry, marketing, security, education, administration, common kitchens, and childcare units. The system was based on the assumption that it would release additional manpower for development.

Problems soon emerged with many aspects of the GLF. First, many of the labor-intensive industries that were set up by the communes proved to be unable to meet the most basic needs of the communes. Many of the backyard furnaces, which used to produce iron and steel from thousands of small units, ended as a colossal waste of materials and labour.

More fundamentally, communization of the countryside did not go as planned. Many cadres showed themselves to be overzealous in communizing the countryside, simply choosing to forcibly confiscate

the property of the peasant's right down to the cookware and small farm tools. Across the nation, peasants responded to this initiative by slaughtering their animals to avoid handing them over to the collectives. More important was the lack of material rewards offered by the commune system, which proved to be a serious disincentive to many peasants—negating the advantages offered by the economy of scale.

The GLF ended in famine as exaggerated grain levels and decreased Soviet aid took their toll. Water conservancy programs and infrastructure construction were undertaken in terrible conditions. Drought turned into famine in both the cities and the countryside and took the lives of between 15 million and 20 million people in the three years from 1959 to 1961.

The GLF was no longer bringing China to modernization but further away, this thought was echoed by the party meeting in Lushan in August 1959, where the official acknowledgment of the GLF failure occurred. Following the failure of the GLF, the CCP was forced to reorientate its economic planning to include a great emphasis on agricultural growth which, although slowing the rate of industrialization, was a more sustainable policy.

However, GLF was not without its positives. The mass mobilization of people on projects such as irrigation, terracing, and construction opened up previously infertile regions, bringing increased prosperity. It was during this period that total arable land in China reached its peak. During the GLF, hundreds of thousands of folk tales and songs were collected which might otherwise have remained inaccessible and lost to the culture.

## GREEK ORTHODOX CHURCH

Greek Orthodox Church, originally Orthodox Catholic Church, usually (Eastern) Orthodox Church of Greece, Bulgaria, and so forth. Also, the state church

of Greece. Greek or Eastern Orthodoxy is one of the three institutionalized branches of Christianity. Its adherents live mostly in the Balkans, Russia, Ukraine, Belarus, Georgia, and the Middle East. The Orthodox Church of America unites many but not all English-speaking communities of Orthodox Christians in the United States. Some churches technically differ from Eastern Orthodoxy but nevertheless adopted the name.

Eastern Orthodoxy asserts its spiritual continuity with the original apostolic faith of Christianity (by contrast to heretical heterodoxy).

Historically, it is an offshoot of the Greek-speaking Byzantine imperial church, hence the common Western term Greek Orthodox Church. The introduction of Eastern Orthodoxy virtually orientated people toward the Byzantine cultural sphere. Three centers of Eastern Orthodox culture were dominant: Byzantium, with surviving Ecumenical patriarchate of Constantinople, from the sixth until the late nineteenth century; slavic Bulgaria (the initial cultural mediator) from the late ninth until the fourteenth century; and Russia. The latter has been the most influential, especially after the inauguration of the imperial doctrine *Moscow: The Third Rome* and of the patriarchate of Moscow and all Russia in the sixteenth century.

Eastern Orthodoxy formally is viewed as monolithic, preserving Byzantine heritage in theology, liturgy, sacraments, hierarchy and canon law, all basic festal rites and lists of saints, vestments, and architecture. Local vernacular has always been liturgical language.

## Relations with Christian West

After centuries of disputes (e.g., the notorious ninth-century "Photius schisms"), Greek Orthodox Church finally broke communion with Rome in 1014, when the dual procession of the Holy Spirit from God the Father and God the Son (*filioque*) rather than from the Father alone was introduced into the Western Creed. Rome was officially anathematized in 1054 (*Great Schism*). Despite a number of bilateral attempts to restore ecclesiastical union (1274, 1369, and 1439), in 1755, the Greek Orthodox Church proclaimed all Western baptismal rites invalid. In 1965, patriarch Athenagoras I and Pope Paul VI nullified the excommunications (reconciliation was reaffirmed in 2004). However, Eastern Orthodoxy remains isolated from Rome, emphasizing its full unity and holding that the Roman Catholic and Protestant Churches have seriously strayed from original Christianity. This issue strongly influences Greek Orthodox

Churches' external relations, including participation in the Ecumenical movement and reaction to the Pope's attempts to reunite all Christians. John Paul II visited two of traditionally Orthodox countries (Romania in 1999 and Bulgaria in 2002) for the first time in modern history on official governmental invitation and with a final consent of the local churches. In contrast to this, the all-Russian patriarch Alexis II in August 2004 emphasized once again that a Pope's visit to his country seemed meaningless.

### Origin, Evolution, and Teaching

The bipolar division of European Christendom has deep roots in the cultural, linguistic, and political history of the Western and Eastern Mediterranean world. Eastern Orthodoxy's specific history can be traced back mainly to the final split between Roman West and East (395), to the first Seven Ecumenical councils (325–787), Iconoclastic controversy (726–843), and to the period of the Byzantine cultural Commonwealth (after 1054–1204).

Despite forceful dogmatic and ecclesiological statements (e.g. condemnation of religious nationalism in 1872), Eastern Orthodoxy is a fellowship of national and/or territorial autocephalous churches. A patriarch, considered equal in rank to the Roman Pope and other patriarchs leads bigger (of Russia, Bulgaria, Romania, Serbia, etc.) or original (of Jerusalem, Antioch, etc.) church bodies. A metropolitan/archbishop leads lesser (of Cyprus, etc.) or national (of Athens and all Greece, etc.) bodies. Both are aided by an episcopal synod. The Ecumenical patriarch nowadays enjoys solely a primacy of honor. No patriarch or metropolitan/archbishop can claim infallibility or interfere with another church's affairs, but jurisdiction of lesser bodies in Eastern Orthodoxy is oftentimes controversial (the short but intensive dispute between the Church of Greece and the Ecumenical Patriarchate on archbishop appointments in 2004). Salient trait was *caesaropapism*, the duality of power of patriarch and king. The latter often prevailed in all matters, being considered the "preserver of Orthodoxy" (the "Orthodoxy, monarchy, nation" thesis in Russia).

Greek Orthodoxy differs from Western Christianity by acceptance of white (married) and black (celibate) priesthood (bishops are always celibate or widowed clerics), denial of Roman papal primacy, Mary's Immaculate Conception, and purgatory. The emphasis is on Jesus' Resurrection rather than His Crucifixion. God the Father is the sovereign and the sole source of both the Word and the Spirit. Original sin is an inherited frailty due to Adam's transgression,

rather than human's state of guilt. Thus, all nature is graceful, and man's choice is to strive for intimate personal encounter of God. Liturgy is centered upon Jesus' birth, Ministry and Resurrection and is the core and criterion of all religious life. Veneration of icons is Eastern Orthodoxy's strongest distinctive feature. Dogmatically, icon is a pictorial expression of faith. Only those who have lived bodily life can be depicted (Jesus, Mary, Apostles, and saints above all), and solely the prototype is really adored. Images of God the Father, the Holy Spirit, and bodiless creatures are widespread but have been proclaimed unsupported theologically, as intended solely for the laity's edification.

Theological and liturgical consistency with the past (i.e., Scripture, Tradition, liturgy, and the canons of the first seven ecumenical councils) is the measure of all.

In ethics, little stress is put on social involvement. Ascetics are not organized in orders and rather flee from the world to acquire individual contemplative experience than to educate, proselytize. Mount Athos monasteries, in Greece, are considered the ideal spiritual center of all Orthodoxy.

Eastern Orthodoxy, icon veneration, vernacular liturgy, and local (Greek, Armenian, Cyrillic, Georgian) alphabet often are viewed as signs of ethnicity in all "traditionally Orthodox" countries, which originates in medieval identification of religious affiliation with ethnic origin. Thus, in 2001, 83.8% of ethnic Bulgarians, including agnostics, claimed to be "traditionally Orthodox."

### The Greek Orthodox Church Prior to and After the Fall of Communist Totalitarianism

The Church in Greece has always remained a national and state institution. The former Communist regimes in the "traditionally" Eastern Orthodox countries differed as to their acceptance of the church: from deprivation of legal rights, rude intervention in internal affairs, and harsh persecutions (Soviet Russia till ca. 1943) to a loose political control with almost no intervention in internal church affairs (Romania). Some Communist regimes extensively used local Orthodoxy for nationalistic propaganda, severely controlling all church activity and portraying it as an important, but a mere cultural heritage from the past (e.g., in Bulgaria, the Orthodox Church was acclaimed as the basic preserver of national identity in the times of Ottoman domination). In return, it avoided all confrontation with the Communist government.

Since the early 1990s, some churches have been split as to the flock's acceptance of the acting patriarch, retaining yet a complete unity in doctrine and liturgy (schism). He is either silently accepted by the flock's majority or extensively criticized by dissidents for the former Communist government's uncanonical intervention in his election and for his collaboration with the regime. The split however seems to have also a financial flavor (e.g., legal disputes over management of profitable candle-producing facilities). Political and social involvement of Greek Orthodox Churches increases and a similar trend is observable in the new democratic governments' support of Eastern Orthodoxy: in July 2004, some two hundred Bulgarian "alternative" synod's churches were stormed by police and reassigned to the "traditional" patriarch's synod. Thus, the wish for a "better state law of religious communities" in all Orthodox countries seems logical.

## GREEN REVOLUTION

The term "Green Revolution" refers to the incorporation of scientific approaches in plant breeding to produce high-yielding varieties (HYVs) of rice, maize (corn), and wheat that increase yields considerably over indigenous varieties. The Green Revolution began in the 1940s when American agronomists financed by the Rockefeller Foundation introduced short-stemmed, disease-resistant wheat and maize varieties in Mexico that effectively converted fertiliser and controlled water inputs into high yields. The Mexican programme inspired similarly successful rice, sorghum, maize, cassava, and beans research efforts in many developing countries. By the mid-1970s, the HYVs had replaced the indigenous varieties previously used by farmers in Latin America, Asia, and Africa. The high-yielding hybrid rice grown in West Africa is an early maturing, drought- and disease-tolerant cross-breeding of Asian and African varieties that has increased yields by 150% over traditional varieties.

### Trends in Yields and Production

The impact of the Green Revolution is best demonstrated by changes in cereal production in developing countries, especially Mexico, Sri Lanka, Bangladesh, India, Pakistan, and the Philippines, where dramatic increases in yields per hectare of wheat, rice, and maize have been recorded. The Green Revolution enabled Mexico to shift from being a wheat-importing country to an exporter within twenty years. In 1944, Mexico was importing half its wheat; by 1956, it was self-sufficient in wheat production; and by 1964, it was exporting half a million tons of wheat.

In China, Pakistan, and India, the HYVs increased the opportunity for double cropping by making it possible for farmers to plant rice in summer and wheat in winter where previously they were only able to do so once a year because of the short growing season. Consequently, in India, where the new HYVs take up over 75% of the wheat acreage, production increased from 12 million tons in 1966 to 47 million tons in 1986. After importing 10 million tons of wheat annually in the mid-1960s, by the mid-1980s, the country had a surplus of several million tons. By the

early 1980s, the Green Revolution had contributed to the achievement of food security in several developing countries mainly by inducing a long-term decline in the price of food grains thereby making it possible for consumers to afford more of the cheaper food.

However, after two decades of impressive harvests, many countries began reporting crop failures. For example, long-term experiments indicate that yields and total-factor productivity of irrigated rice and maize have declined over time. For example, in sub-Saharan Africa, per capita food production declined by 14% during the same period. The general lack of success of the Green Revolution in Africa can be attributed to the continent's predominantly poor soils, erratic water resources, prevalence of pests and disease, and general environmental degradation.

Green Revolution critics, however, argue that it has created many socioeconomic and ecological problems in developing countries that have not been given adequate policy attention. Problems with the Green Revolution relate to specific practices and their adverse effects on the agroecosystem or other ecosystems.

### **Socioeconomic Impacts**

The Green Revolution has had mixed socioeconomic impacts. On the positive side, millions of farmers who have successfully grown the new wheat, rice, and maize varieties have greatly increased their income. The Green Revolution has stimulated the growth of agroindustry by increasing the demand for fertiliser, pumps, machinery, and other materials and services. Also, given the high productivity of the new technology, both land and labour have been released from crop production, and these have been reabsorbed in other sectors of the economy.

However, despite its success at increasing yields and augmenting aggregate food supplies, the Green Revolution, as a development approach, has not translated into benefits for the rural poor in terms of greater food security or greater economic opportunity and well-being. Despite three decades of rapidly expanding global food supplies, there were about 800 million hungry people in the world in the late 1990s. In India, despite the increased wheat and rice, five thousand children die from malnutrition every day. The fact that many people are still starving in developing countries brings to the fore a paradoxical situation whereby, despite its resounding success in terms of agricultural production, the Green Revolution has failed in its overall social objectives. Undernutrition and poverty are still prevalent, and the

distribution of food remains skewed, with families in landless, small-scale farming households and farm workers as high-risk groups. Also, in India, the Green Revolution has had mixed effects on women in small-cultivator households. For many, the adoption of the HYV package has either forced them to work as farm workers or to increase their work burden of farming activities in an effort to avoid the use of paid labourers.

In the late 1960s, Mexico began to export its Green Revolution wheat at a time when 80% of its rural population was malnourished. Also, the Green Revolution has had differential impacts on rural populations by both class and gender. The better-off strata of rural society have gained access to better incomes generated by the introduction of technology, whereas the poorest strata have lost incomes they previously enjoyed. Thus, the Green Revolution has helped to create a landscape of large commercial farms alongside fewer and smaller peasant plots.

Furthermore, the Green Revolution has had dis-equalizing effects on the bigger and smaller farmers within developing countries through increases in the amount of inputs purchased by the farmers, and thus sharply raises the cost of farming. Even in areas where the "Green Revolution" has been technologically successful, it has not benefited large numbers of hungry people who are unable to buy the newly produced food. However, it has benefited mainly the bigger and generally wealthy farmers who have better access to subsidised loans and foreign exchange required to buy the patented technical inputs.

As a result, the more commercialised farmers have tended to buy out small-scale producers and evict small tenants who are unable to buy inputs. Striking effects of labour-displacing machinery and the purchase of additional land by rich farmers include agricultural unemployment, increased landlessness, rural-urban migration, and increased malnutrition for those unable to purchase food produced by the Green Revolution.

### **Ecological Impacts**

While the Green Revolution was clearly an agricultural success, many argue that it is ecologically unsustainable and has been a social disaster. It depends on large-scale, monocrop farming that is ecologically unstable because of its chemical dependency. It also depends on controlled water supplies, which have been instrumental in increasing the incidence of human diseases such as malaria and schistosomiasis.

After the dramatic increases in the early stages of the technological transformation, yields subsequently began falling due to long-term soil degradation. The new strains need large quantities of chemical fertilisers, which are both expensive and polluting, and they also require frequent pesticide applications because they lack natural resistance to local plant diseases and insects. In Central Luzon, Philippines, rice yields increased by 13% during the 1980s, but this was achieved at a cost of a 21% increase in fertiliser use. Use of chemical fertilisers and pesticides pollutes the environment and harms wildlife. Also, use of HYVs causes genetic erosion and genetic vulnerability.

The large fertiliser and pesticide inputs cause problems with water quality when they run off into rivers or percolate into groundwater. The increasing use of agrochemical-based pest and weed control has adversely affected the surrounding environment through significant genetic erosion as well as human health. Widespread irrigation has resulted in increased salinization and acidification of the land.

The Green Revolution has resulted in farmers planting fewer crop varieties so that they can focus on use of high yielding varieties. In addition, the varieties that are planted have been bred to a high degree of genetic uniformity within each variety. There have been problems in India, Afghanistan, and Pakistan with epidemics in new HYVs of wheat. Annual fluctuations in yields have increased since the introduction of Green Revolution varieties because of their vulnerability to disease and climatic variations. The traditional varieties were not as high-yielding, but were less vulnerable to pathogens or climatic anomalies.

## Technological Impacts

A dramatic consequence of Green Revolution agriculture has been the loss of wage labor opportunities due to the introduction of technology. For example, the mechanisation of post-harvest practices has reduced the availability of wage work for women. The introduction of a subsidised scheme for motorised rice hullers in Java (Indonesia) is estimated to have resulted in employment for more than 1 million landless women, who were previously employed in the hand-pounding of rice.

The Green Revolution requires a large and rapid expansion in the irrigation services to be provided. Water control is difficult in the conditions which characterise the traditional rice-exporting countries of Southeast Asia, where the main crop is grown in

the wet season in flood plains and where it is not economical for the farmer to apply fertiliser because it will simply be washed away.

The new rice varieties offer a real opportunity for intensive use of available land by growing at least two crops a year instead of a single crop. This has necessitated changes in cropping patterns and harvesting methods. Mechanical drying and bigger storage facilities will be required for harvesting rice during the wet season. There is need for research on plant protection and diversified breeding to reduce the risks of large-scale crop failure through disease. However, in many developing countries the required political, social, and economic environments that encourage farmers to adopt improved practices and support their efforts to employ them in a sustainable way have not been adequate.

Green Revolution agriculture has had a narrow focus on production increasing technologies that have not adequately addressed the issue of food security in developing countries. Perhaps, what these countries need is a pro-poor alternative agriculture that is self-reliant, small-scale, and highly productive and yet environmentally friendly. The evolution of development thinking is now pointing to a post-Green Revolution phase characterised by “sustainable agriculture.”

**GRENADA**

The island of Grenada is located in the Caribbean Sea, north of Trinidad and Tobago. It consists of three islands: Grenada, Carriacou, and Petit Martinique. The climate is tropical, with a hurricane season from June to November. The population is 89,357 (CIA July 2004 estimate). The capital is St. George's, on Grenada, with a population of about 33,000. Originally inhabited by the Carib Indians, who resisted settlement by the Europeans, the island was eventually conquered by the French in the mid-1600s. Great Britain also had interests in the Caribbean. France gave up Grenada to Great Britain through the 1783 Treaty of Versailles.

Because of French support of the American cause during its revolution, the French settlers on Grenada, St. Vincent, and Dominica were denied many rights of citizenship, and properties on those islands held by the Catholic Church were confiscated. These actions led to rebellions by the French and native islanders against the British in 1795.

To stabilize the situation on the islands, the British government prosecuted many Frenchmen and non-British islanders. Great Britain also called for its soldiers in the islands to be returned for its wars in Europe and for the formation of a corps of natives for defense. This was met with objection by the British settlers, but was done nevertheless.

With the end of the war with France, trade from the British islands in the Caribbean dropped significantly, and property values dropped as well. This led the colonial legislatures there to push for reductions in British tariffs, and Grenada asked for permission to trade directly with America in 1823.

In 1833, Grenada joined St. Vincent, Tobago, and Barbados under the control of the Governor of the Windwards. Slavery was abolished in Grenada the next year. Barbados became its own colony in 1876, and in 1877, Grenada also became a Crown Colony. The island became an associate state of Great Britain in 1967, and gained full independence in 1974. The modern history of Grenada has every bit as much intrigue and excitement as its earlier years.

The first modern political leader of Grenada was Eric Gairy. Born in Grenada, he was active in politics and became the prime minister of Grenada when Grenada shed its Crown Colony status. He had been the leader of the Grenada Union Labor Party (GULP) since 1950. Other parties were in opposition to the GULP, the most significant of which were the Movement for the Assemblies of People (MAP) and the Movement for the Advance of Community (MACE). These parties joined with another opposition group, the Joint Endeavor for Welfare, Education, and

Liberation (JEWEL), to form the "New JEWEL Movement" in 1973. One of the opposition leaders was Maurice Bishop, a Grenadan who had returned from England after studying law there.

Prime Minister Gairy sought to hold on to power through a program often put into place by revolutionary governments, that of land redistribution. His "Land for the Landless" program did in fact provide small plots of land to some Grenadans, but these half-acre plots were too small for development as farms. A more successful effort was in developing Grenada as a tourist attraction; in 1973, the number of tourists increased and the average tourist stay doubled. Land prices for tourist development increased (even as land was being given to Grenadans), and the economic future for the island was promising. Unfortunately, political events would bring this to an end.

In 1973, Gairy was able to convince Great Britain to grant full independence, which was to take place in 1974. However, opposition parties, labor unions, and the Catholic Church in Grenada called for a general strike and protest march in January 1974, which was put down with violence. The father of Maurice Bishop was killed by government forces.

The path for Grenadan independence from Great Britain did continue nevertheless, and with its independence imminent, Grenada was eligible for membership in the Caribbean Free Trade Agreement (CARIFTA) organization, and with its independence, Grenada joined the organization, which had by that time been renamed the Caribbean Community and Common Market (CARICOM).

The first five years of independence were marked by corruption and violence. In March 1979, while Prime Minister Gairy was attending a United Nations conference, opposition leader Maurice Bishop seized power and brought order to the island. Bishop favored a policy of nonalignment, and instead of fully participating with the capitalist economies of the region, sought and gained support from Cuba. Bishop's People's Revolutionary Government (PRG) called for a "workers' government" and seemed to have all the components of a new socialist regime in the Caribbean. Bishop himself was overthrown and executed in October 1983.

This concerned its neighbors and more importantly, US President Ronald Reagan, who had begun his showdown with the Soviet Union, a confrontation which would end with the collapse of the Soviet bloc.

Two trends had emerged from the time of Bishop's seizure of power: the value of exports from Grenada dropped (which may have been due to a surplus of those products on the world market), and tourism fell as well. One response to the latter was that between

1980 and 1982, Grenada undertook a substantial program of construction, which included a major expansion for its airport at St. Georges. Because this was being done with funding and expertise from Cuba, the United States saw this as a potential military facility.

With the cooperation of the governments of Grenada's neighboring islands, the United States invaded Grenada on October 12, 1983, on the premise that American medical students there were at risk. The massive invasion did locate and protect the students, as well as free the governor-general of the island, who was being held by Grenadan forces at his residence. The invading forces also captured Cuban, Libyan, East German, North Korean, and Bulgarian forces as well as Grenadan military personnel.

With Bishop dead and the military government eliminated, the United States worked with the existing nonrevolutionary parties to establish a postrevolutionary government. The parties joined to form the New National Party, and Herbert Blaize was elected president. The NNP has been the dominant party since that time, and with the support of the US, Grenada's economy and tourist industry were steadily rebuilt. The deep-water harbors that had always been assets to shipping benefitted the tourist industry as well, and exports included textiles, food and beverages, and light industry products.

However, in September 2004, most of the island's buildings were damaged or destroyed when Hurricane Ivan hit the island, killing dozens of people. Recovery of the island's service infrastructure (electricity and water) was accomplished rapidly, but repair of public buildings, including churches, will take years.

### GROUP OF 77

The Group of 77 (G77) is an informal association of now more than 130 countries that was established following the first United Nations Conference on Trade and Development (UNCTAD 1) in 1964. The Group consisted of the developing nations of Africa, Asia, Latin America, and the Caribbean and has subsequently grown as more nations in those regions have joined. The purpose of the Group is to represent the interests of the Global South—that is, those nations that are among the least economically developed. The Group shares a general belief that the rules of world trade and investment are structurally and systematically unfair to the Global South and works to promote awareness of this in the developed world (that is, the Global North), while campaigning to change those rules. The Group also works to promote economic and social development within its member countries through sponsoring economic and technical cooperation among developing countries (Economic Cooperation for Developing Countries [ECDC]/Technical Cooperation for Developing Countries [TCDC]).

Its operations are closely tied to the workings of the United Nations (UN), and it makes use of networks created in that organisation. Chapters of the Group have been established in leading diplomatic capitals, and its activities are coordinated by the New York chapter. Contributions to the organisation are made by member governments to finance operations. Executive decisions are made at regular ministerial meetings.

The "Joint Declaration of 77 Developing States" was issued on June 15, 1964, and called, in part, for the establishment of a New International Economic Order. This call was influenced by the success in the early 1970s of oil-producing countries drastically to improve the terms of trade in their favour. The Group of 77 was unable to wield an equivalent level of economic power, but their campaign was successful in raising awareness of the situation that they faced and in modifying the ways in which international development assistance has flowed and is organised. The stable alliance of the Group of 77 countries in successive UNCTAD negotiations has proved an effective

tool in ensuring a number of small but definite improvements in the management of world trade.

The Group of 77, together with China, has subsequently adopted the “Charter of Algiers” in 1967 and the “Caracas Plan of Action” in 1997 (originally planned in 1981). This latter plan explicitly recognised the importance of liberalization and globalisation as forces in the world, as well as the increasing emergence of the information economy, which further negatively impacted upon the commodity trades upon which some members of the Global South continue to rely. The Group also has explicitly noted the importance of creating partnerships between the private and public sectors. The Caracas Declaration stated in part:

The creation of the Group of 77, 25 years ago, was the result of the collective perception of developing countries that their problems are shared and common and originate in the inherently inequitable pattern of international economic relations. It represented their resolve to remedy this situation through international co-operation based on a mutuality of interests. In its objectives, the Group of 77 reflected the principles and purposes of the Charter of the United Nations and the conviction that maintaining international peace and security requires the resolution of international economic social and humanitarian problems. The Group therefore reaffirms the validity and supreme necessity of restructuring international economic relations on a just and equitable basis. It shall continue to place abiding faith in multilateral co-operation in the forums of the United Nations.

With the informal joining of China to the Group of 77, a stable bloc of countries has coalesced desiring to work through the institutions of the UN and to reform rather than destroy those aspects that appear inequitable, such as the membership of the permanent Security Council. A commitment to multilateral negotiations means that agreements are more likely to be favorable rather than otherwise to Group of 77 nations but at the expense of increased transaction costs (i.e., the time and cost necessary to reach agreements).

Within the Group of 77, an initiative known as the Generalised System of Trade Preferences among Developing Nations (GSTP) has attracted the initial support of forty-four members and may achieve more in the future. The GSTP follows free trade models of development that attune Group of 77 members more closely to the current development model of the Western countries. Consequently, it represents something of a commitment to complying with existing rules of international trade, despite the wish to reform those rules.

With the breakdown of talks in the World Trade Organisation and the willingness of some leading Western countries to negotiate bilateral rather than

multilateral agreements, as well as the willingness of China to make common cause, the Group of 77 has become a more important organisation representing the interests of the poor. It represents perhaps the largest and most stable international grouping in the world economy and is a vital source of solidarity for the South. However, its achievements have been limited in scope and the nations within remain, internationally, tarred with a similar brush for being corrupt, driven by internal wars and schisms, and needlessly susceptible to diseases such as HIV/AIDS. Poverty and low levels of education preclude most people within the Group of 77 countries themselves from being able to understand and to participate in discourse or debate on those issues that have such a great impact on their lives.

#### GUADELOUPE

Guadeloupe is a French *département d'outre-mer* (overseas department) in the Caribbean. It is an archipelago of five principal islands—Basse-Terre, Grande-Terre, La Désirade, Les Saintes, and Marie Galante—in the Leeward Islands. Guadeloupe, which occupies 1,704 square kilometers of territory, is located between Montserrat to the north and Dominica to the south. A narrow channel divides Guadeloupe proper—Basse-Terre and Grande-Terre—into two islands. The resulting land mass is butterfly-shaped. The capital, Basseterre, is located on the western island of Basse-Terre, which is volcanic and mountainous. The largest city, Pointe-à-Pitre, is located on the eastern island of Grande-Terre, which is a limestone plateau surrounded by coral reefs. The highest

point in Guadeloupe, Soufrière de Guadeloupe, which is 1,484 meters high, is an active volcano on the island of Basse-Terre. Guadeloupe has abundant cultivable land and sandy beaches. Most of Guadeloupe's 445,000 people are French-speaking Roman Catholics of African descent.

Guadeloupe administers St. Martin and St. Barthélemy, which are located in the northern Leeward Islands. The French and Dutch divided the eighty-eight-square-kilometer island of St. Martin/St. Maarten in 1648. The northern part of the island is controlled by the French, whereas the southern part of the island is controlled by the Dutch. Tourism is the main economic activity. The twenty-square-kilometer island of St. Barthélemy, commonly called St. Barts, is the home to seven thousand people, but receives over two hundred thousand day visitors from cruise ships annually. Although St. Barts has been a French possession since 1648, it was occupied by Sweden from 1785 to 1878. Today, the island has a very pronounced US cultural footprint. In 2003, the people of both islands voted for secession from Guadeloupe. The majority of the people on both islands feel virtually no cultural affinity toward the people of Guadeloupe proper and resent the possibility of ever becoming a dependency of an independent Guadeloupe.

When Christopher Columbus discovered Guadeloupe in 1493, it was occupied by hostile Carib Indians. Spain's attempts to settle the island during the sixteenth century were frustrated by fierce resistance from the Indians. In 1635, a group of French entrepreneurs established the first permanent settlement on Guadeloupe at Basseterre. The French successfully removed the Indian population from the island and established a successful sugar-producing colony based on African slave labor. From 1759 to 1763, during the latter stages of the French and Indian War (1754–1763), the British occupied Guadeloupe. The British expanded the commercial importance of Pointe-à-Pitre, which had a natural harbor. The ability to trade with the thirteen British colonies in North America proved to be quite lucrative for the French colonists on the island.

In the Treaty of Paris (1763), which ended the French and Indian War, France agreed to surrender Canada to the British in return for the resumption of French control over Guadeloupe. In 1794, during the French Revolution, the British once again invaded Guadeloupe. Many of the wealthiest colonists were French royalists who supported the stability provided by British intervention. The revolutionary French government, however, sent a contingent of troops led by black nationalist Victor Hughes, who not only forced the British to flee, but also freed the slaves, killed hundreds of loyalists, and unleashed a

wave of violence that threatened to destroy the political economy. Once Napoleon Bonaparte came to power, French troops were sent to the island to end the black nationalist uprising and restore slavery. The British temporarily took control of Guadeloupe in 1810, but relinquished control to the Swedes in 1813, who ultimately returned the island to France in 1815. During the nineteenth century, after the loss of Haiti, Guadeloupe was France's most valuable sugar-producing colony in the Caribbean. Once slavery was abolished in 1848, plantation owners imported laborers from India to supplement the labor force.

In 1946, Guadeloupe, Martinique, and French Guiana officially became French overseas departments. Although the overwhelming majority of Guadeloupe's people prefer continued association with France, albeit for economic reasons, a small, violent secessionist movement has resorted to terrorism to make its viewpoint heard. As an overseas department of France, Guadeloupe is entitled to elect two representatives to the French Senate and four representatives to the French National Assembly. The French president, on the advice of the French Minister of Interior, appoints a governor, known as a prefect, to represent the interests of the French government in Guadeloupe. The power of the prefect—Paul Girod de Langlade since 2004—is largely ceremonial. Local power is vested in a General Council consisting of forty-two members and a Regional Council consisting of forty-one members. The presidents of the General and Regional Councils are elected by their respective members. Jacques Gillot was elected president of the General Council in 2001. Victorin Lurel was elected president of the Regional Council in 2004.

Agriculture is the single most important economic activity in Guadeloupe. Bananas, however, have replaced sugarcane as the most important crop. Over 50% of the revenue from agricultural exports comes from bananas. Revenue from tourism, which was enhanced from a large increase in the number of US cruise ships visiting Guadeloupe, was hurt by the tragic events of September 11, 2001. Hurricanes have had a negative impact on both agriculture and tourism. France continues to provide huge subsidies. Guadeloupe is still dependent on imported food, mostly from France.

## GUAM

The island of Guam is the largest and most southerly in the Marianas chain, located in the Pacific Ocean east of the Philippines and north of New Guinea. It is an unincorporated territory of the United States and falls under the management of the Department of the Interior's Office of Insular Affairs.

Prior to the arrival of Europeans, Guam was the most populous of the Marianas, with approximately half of the overall population of the indigenous people, the Chamorros, living there. The Chamorros had a typical Polynesian culture that included farming and fishing. Although some stone was used in construction, metals were unknown.

Europeans first came to the Marianas in 1521 with the voyage of Ferdinand Magellan. At the time of Magellan's visit, some of the islands were uninhabited, but records of his exploration note that a small boat from one of his ships was stolen, leading him to name the southernmost two of the islands as *Los Ladrones* (The Thieves). The Chamorros people were described by the early Spanish explorers as physically attractive but lacking in any but primitive weapons, and the first landing of Europeans on Guam was to reclaim the stolen boat, burn many houses, and kill several men.

Except for voyages of exploration, most ocean navigation at the time was accomplished through the technique of "parallel sailing," in which a ship would proceed along a line of latitude (which was relatively easy to determine through celestial navigation). For this reason, significant landmarks were important, and Guam's size made it an important point of navigation for Spanish ships making the voyage from western North America to the Philippines. Although Guam had been mapped, it was not necessary for ships to actually land there during the transits.

Although Magellan had mapped Guam and the Marianas, competition between Portugal and Spain limited travel through that part of the Pacific Ocean. Not until the Spanish consolidation of power in western North America would Spanish ships attempt to navigate the western Pacific, with the first expedition

departing from Mexico in late 1564. This expedition formally claimed Guam as a Spanish possession. Unfortunately, as with the Magellan expedition, conflict broke out between the natives and Spaniards, with one Spaniard and several natives being killed.

Spain had exclusive control over the Marianas from 1668 to 1898. Under Spanish control the native population was nearly eliminated, and by the end of the eighteenth century fewer than two thousand Chamorros remained on Guam.

The American acquisition of Guam came as a result of the American victory in the Spanish-American War, but was a continuation of American interest in the Pacific which by that time had led to the purchase of Alaska from Russia, the claiming of Midway Island in the Pacific, the initiation of relations with (and eventual annexation of) Hawaii, and the forced entry into Korea. The war with Spain resulted in America obtaining Guam and the Philippine Islands in this region.

At first there was no consensus within the government as to what to do with Guam. The Philippines had more territory, resources, and facilities than Guam, but technological advances in shipping and communications (the shift from sailing ships to propulsion by coal, and the development of the telegraph) did give Guam's location some utility to the Americans. The US Navy foresaw use of Guam as a coaling station and ship repair facility, but the natural harbor would need substantial improvements (including dredging), and fortifications would be needed. In the years between the Spanish-American War and World War I, however, the relatively small military budgets restricted development.

Technological developments continued to undermine Guam's usefulness to the Navy, as wireless radio reduced the need for underwater transoceanic cables and ship propulsion shifted from coal to oil, giving ships much longer ranges. Additionally, the availability of Hawaii as a major naval base was seen as more appealing than having to deal with the problems of pacifying the population of the Philippines.

A bigger problem for the Americans in the early twentieth century was the increasing power and presence of Japanese military forces in the Pacific. During Japan's military expansion in the years before and after World War I, it became apparent to American military commanders that the Philippines would be more vulnerable to a Japanese attack than Guam would be, so military development of Guam came back under consideration. This vulnerability proved true; following the Japanese attack on Pearl Harbor which involved America in the War in the Pacific, it was evident that Guam could not be defended for

long. As was the case with other American possessions, Guam, the Philippines, Wake Island, and Midway Island came under attack, and the larger islands were captured. The end of the war brought about a return to American control, and Guam became a strategic location for the basing of naval ships, submarines, and long-range bomber aircraft.

The current population of Guam, other than US military personnel and civilian government workers (and families), is descended at least in part from a mixture of the native Chamorro people, Spaniards, Japanese, and other island people. They are properly referred to as Guamanian. In 2004, the population was estimated by the US Census bureau to be 166,090, with moderate growth predicted for the next fifty years.

Guam's economy in the early years of the twenty-first century was undergoing a transition, with a reduction in US government personnel (military and civilian), and an increase in tourism. In the 1990s, approximately 90% of tourists came from Japan.

## GUATEMALA

The Republic of Guatemala is situated on the Central American isthmus between Mexico in the north, Belize and Honduras to the east, and El Salvador to the southeast. It has an extensive Pacific Ocean coast on the south and a very small Caribbean coastline in the Gulf of Honduras. At 108,890 square miles, Guatemala is the largest country in Central America (approximately the size of Ohio). It also has the largest population in the region with 14.3 million people; more than 2.5 million people live in the capital, Guatemala City. Over 50% of Guatemalans are descendants of the ancient Maya, the remaining population are *mestizo* (mixed Indian and European

heritage). Although Spanish is the official language, twenty-four indigenous languages also are spoken. Roman Catholicism is the dominant religion, but Guatemala has been the most receptive country in Central America for evangelical Protestantism, which is now practiced by more than 40% of the population.

As the rest of Central America, Guatemala received its independence from Spain in 1821 and joined the ill-fated Mexican Empire and then the violence-ridden United Provinces of Central America before it became a sovereign state in the early 1840s. In the post-independence period, Guatemalan history is replete with undemocratic, repressive governments that took power by force with only occasional periods of representative government. And although significant strides toward democratic governance have taken place since the 1980s, political violence has not been completely eradicated.

Guatemala's economy is dominated by the agro-export sector (coffee, sugar, bananas), which makes up 22% of gross domestic product (GDP) and 75% of all its exports. Exports are concentrated on two principal trading partners: 39% of Guatemalan exports go to the countries of the Central American Common Market (CACM), and another 30% to the United States. The country's industrial sector is relatively small (13% of GDP). Unlike many countries in Central America, Guatemala's economy has very little government involvement. According to the US State Department, the private sector accounts for more than 85% of GDP. In May 2004, Guatemala signed the CAFTA free trade agreement with the other Central American countries and the United States. The treaty has not yet been ratified by the US Congress.

Although the GDP is relatively large (\$23 billion in 2002), income distribution is among the most uneven in Latin America; the top 20% of income earners receive two-thirds of all income. A significant consequence of this inequality is the very high incidence of poverty in the country. It has been estimated that 80% of the population lives in poverty, while over 50% of the total population endures extreme poverty.

The failure of economic and social policy in Guatemala can be seen in two partially related measures. The first measure of the impact of social policy is life expectancy, which in Guatemala is approximately sixty-six years, the lowest in Central America. The next lowest life expectancy is a full three years higher (Honduras), which is still nine years lower than Costa Rica's seventy-eight years and five years lower than the Central American average. The second index reflecting the failure of social and economic development policy in Guatemala is the United Nations Development Program's Human Development Index (HDI)

rankings. The HDI is a composite measure of Human development taking into account life expectancy, health, education, and standard of living. Guatemala ranks lowest of all Central American countries at position 119th, which compares very unfavorably with Costa Rica, which earned the 42nd position in the world rankings.

Political life in Guatemala has been difficult, with its transition to democracy being fitful, late, and incomplete. Post-independence Guatemala was governed by a series of *caudillos* and military dictators. This use of violence for political ends was briefly broken in 1944 when the military dictatorship of General Jorge Ubico was overthrown by junior military officers. Following the democratic election of a civilian president in 1945, the new government implemented a series of social reforms. The subsequent democratic election of Jacobo Arbenz allowed the reforms to be continued and expanded. His attempt to implement land reform, though, caught the wrath of US banana companies that would lose land as a consequence of the reform. The political reforms that included permitting some communists to participate in the government caught the attention of the US embassy, which then fermented and fostered a military coup by Col. Carlos Castillo Armas in 1954. With Castillo Armas's assassination in 1958, General Miguel Ydígoras Fuentes took office.

The return of the military in 1954 led to a series of coups and counter-coups and military governance for more than thirty years until a civilian president was elected in 1986. A second important impact of the return of the military to government was the start of one of the longest and the bloodiest civil war in Latin America, which resulted in the deaths of over two hundred thousand people. In the early 1980s, after another military coup by junior officers designed to prevent yet another general from taking office, the level of state repression increased still further.

As a result of this coup, General José Efraín Ríos Montt, an evangelical lay preacher, became head of a military *junta*. He eventually dismissed the rest of the junta, became president, and unleashed a wave of repression against the rural, largely indigenous population of Guatemala. The general's counterinsurgency tactics militarized the country forcing indigenous peoples in the countryside to join self-defense militias. Ríos Montt's bloody repression was furthered by the existence of right-wing death squads, most notably the *Mano Blanca* (White Hand).

In the mid-1980s, a region-wide peace process, brokered by President Oscar Arias of Costa Rica, was signed by leaders of Central American republics calling for an end to the civil wars in Nicaragua, El Salvador, and Guatemala and the installation of

democratic governance. The human rights situation also was brought to international attention with the publication of Rigoberta Menchu's *testimonio*, *I Rigoberta* in 1983.

The Peace Process and a new constitution facilitated the return to democratic politics in the late 1980s and the 1990s. New governmental institutions were created or strengthened including the Supreme Court and a Human Rights Ombudsman's office. But even with most recent elected government, which took office in January 2004, the democracy remains incomplete. Crime and violence against human rights workers remain a persist problem for governance.

## GUERRILLA ARMY OF THE POOR (EGP)

The Guerrilla Army of the Poor (EGP) was founded on January 19, 1972, when a group of fifteen combatants entered the Guatemalan jungle area known as Ixcán. On February 7, 1982, it joined the other three major Guatemalan insurgency groups in forming the National Revolutionary Unity of Guatemala (URNG) but remained one separate military organization until the demobilization process of 1997 when URNG was transformed into a legitimate political party.

Like the other guerrilla formations in Guatemala in the 1970s, EGP represented a second phase of an

insurgency with roots in the 1960s and in an armed opposition to the CIA-monitored overthrow of President Jacobo Árbenz in 1954. The Guatemalan rebels of the second phase are best characterized by an ideological affinity for Cuba and Fidel Castro, and they designated the United States, not the Guatemalan government, as their principal enemy. The EGP drew their tactics from doctrines first formulated by its leader Rolando Morán, alias Ricardo Arnaldo Ramirez de Leon, in 1964, explicitly focusing on the poor segments of the population for a slow process of mobilization with the ultimate goal of defeating the national army and take national power. But it staged an insurgency that differed from its roots in the 1960s in that it rejected *foquismo* strategies of revolutionary warfare—that is, the idea that a few committed militants could become a catalyst for revolution, without the process of first organizing the population—and instead prepared for a prolonged war in the highlands. The geographical transition from the northeast to the northwest, brought about by the establishment of the EGP, also implied a movement from areas populated by Guatemala's nonindigenous minority to the Maya majority of the western highlands. By the early 1970s, the Ixcán jungle area had recently been colonized by an ethnic mix of landless peasants. As the slow process of mobilization gradually moved south and into the Maya-Quiché and Maya-Ixil inhabited highland regions of the country, the EGP confronted a more rooted local political system, more difficult to infiltrate than the settler cooperatives of Ixcán. The high extent to which people welcomed, voluntarily supported, and also joined the men in olive green uniforms testifies to a prior mobility of seasonal workers in the highland areas of Guatemala. Even though based in indigenous communities, many were already accustomed to trade union organizing on coastal plantations, peasant league formations among workers on local estates, and members of a politically radicalized Catholic Church influenced by the era's theology of liberation.

In its heydays prior to the military defeat of 1981 to 1983, EGP was organized in an hierarchical structure in which the governing body, *Dirección Nacional* (DN) ruled by assembling representatives of each of the different (four to eight) military divisions, known as *frentes*. The four most prominent ones were Frente Guerrillero comandante Ernesto Guevara of the Huehuetenango and Ixcán regions, Frente Guerrillero Ho Chi Minh of the Ixil and central Quiché regions, Frente Guerrillero Luis Augusto Turcios Lima of the provinces of the western pacific coast, and finally Frente Guerrillero Otto René Castillo of the metropolitan region. Each division, in turn, collaborated on the local level with local irregular forces (FIL) where

mobilized villagers served on and off depending on the war's level of intensity. Finally, also the nonarmed civilian population was politically organized into something called local clandestine committees (CCL) in an intricate system of intelligence, education, and health attendance.

While successful in tying large sectors of the rural population to its relatively small military core—the number of armed rebels reached a maximum of about four hundred in 1983—this system proved to be vulnerable to military setbacks, and with the defeat of the early 1980s, it never regained its former strength. Incidences of internal guerrilla violence and of guerrilla massacres have been attributed to the lack of control on behalf of the leadership in the DN when the goal of bridging the different levels of its organization could not be achieved.

EGP also made propagandistic efforts to gain the support of the international community, a front that it even claimed to be of equal importance to that of the local masses. While it is clear that this accounts for the endurance of the Guatemalan insurgency until the peace agreement of December 29, 1996, the extent to which the indigenous population actually supported the rebellion, and how to assess the nature of that support, is an ongoing controversy within social movements in Guatemala and among historiographers of its civil war.

The Accord on the Definitive Cease-Fire was signed on December 16, 1996. It set out the procedures for the concentration and disarming of the URNG under UN supervision. The reincorporation of former guerrillas involved the concentration and demobilization of ex-combatants in eight camps across the country. Due to the fear of registering under an original name, the attraction of economic compensation for surrendering arms and the long history of civil war, conflict emerged over the right to be recognized as a former rebel. The cease-fire entered into force on March 3, 1997—535,102 weapons and rounds of ammunition were handed over to MINUGUA, the UN verification mission to Guatemala. In all, 2,928 URNG combatants were demobilized and issued temporary identification cards in the spring of 1997.

In favor of the recomposition of the URNG in a single party structure, the EGP officially dissolved during the demobilization process of 1997. As a political party, the URNG has downplayed its previous emphasis on ideology, casting itself as a democratic representative of the nation's class and ethnic diversity. The compliance with the Peace Accords has replaced older doctrines.

EGP founder and chief commander Rolando Morán died from a heart attack on September 11,

## GUERRILLA ARMY OF THE POOR (EGP)

1998, then holding the post of secretary general of the URNG. Despite his efforts to present the insurgency of which he had been an integral part since 1964 in terms of an ethnic national struggle, just as important as the class-based revolution, it was primarily the voices of the indigenous movement in Guatemala that during the latter part of the 1990s and the beginning of the 2000s undermined the popular support of the URNG, claiming that its revolution was more akin to Western and racist ideology than to the culturally egalitarian vision of the new organizations of the Maya majority of Guatemala.

## GUERRILLA WARFARE

Guerrilla warfare is an ancient military strategy and/or tactic of fighting by irregular and autonomous armed forces that dates to millennia before Christ and persists in essentially the same form today. In contemporary insurgency cases guerrillas generally have represented nonstate or substate entities, such as freedom fighters or revolutionary insurgents, conducting an undeclared war or rebellion against an established government or state. As a tactic or strategy, however, regular or uniformed military forces of a state or states also may employ guerrilla fighting styles, such as in low-intensity conflict or

low-intensity warfare, in both a declared and conventional, as well as an undeclared and unconventional, war setting.

One of the earliest proponents of guerrilla war tactics is the Chinese master of warfare, Sun Tzu, whose *Art of War* is the source of many often quoted Chinese proverbs on terrorism and guerrilla struggle. Perhaps one of the best known dictums on guerrilla warfare is that of the twentieth century Chinese Marxist revolutionary, Mao Zedong: “The guerrilla is of the people as the fish is of the sea.” In other terms, support of the local population is critical to success in guerrilla warfare. Ho Chi Minh, the guerrilla strategist and father of the Marxist Vietnamese revolution, had a more prescient aphorism: “You will kill ten of our men, and we will kill one of yours, and in the end, it will be you who tire of it.” The basic military concept of guerrilla war, therefore, is the use of irregular troops or units to harass a powerful enemy in a “war of the flea,” until the enemy is exhausted or wiped out. Both quotations emphasize the two central tenets of twentieth-century guerrilla warfare—a protracted, popular, indigenous struggle against a foreign enemy and its domestic allies—our wars of national liberation.

In modern times, especially since the rise of urban guerrilla movements, it has become more difficult to distinguish classic, rural-based guerrilla warfare from terrorism. Historically, there has always been a close link between these two forms of limited and unconventional warfare, both in practice and in contemporary and nineteenth century manuals such as *On War* by Karl von Clausewitz, the noted German war theoretician. Some theorists have argued that terrorism intends to create a psychological state of despair and hopelessness among the civilian population and regime forces, as expressed in the popular Chinese maxim: “Kill one; frighten ten thousand.” Guerrilla war, on the other hand, is intended to induce a psychology of hope through successful armed struggle, that is, the belief that an armed popular and irregular force can defeat a professional army. According to military historians, guerrilla warfare has traditionally been seen as a people’s struggle against a more powerful enemy, often an occupying power. Among notable historical examples are the confrontations between the Romans and the Hebrews, and the Romans and the Gauls; the British and the American colonists; the US Army and the American Indians; and the Turkish Empire and T.E. Lawrence of Arabia. More contemporary examples include indigenous rebellions in Malaysia, the Philippines, Algeria, and East Timor.

The term *guerrilla warfare*, is derived from the Spanish word for war or *guerra*, and “guerilla” literally means “little war.” Military historians date the

use of the term to the popular insurgency by Spanish resistance forces against the invasion of Napoleon and his French troops in 1808. The subsequent usurpation of the Spanish throne launched both pro- and anti-royalist forces in Spain's colonies in the New World and ultimately culminated in a wave of independence revolts and guerrilla struggles in nineteenth century Latin America. This form of warfare not only has been closely linked to the rise of modern nationalism in Europe, but also nationalism's diffusion to the Third World developing nations as a reaction against European imperialism and colonialism. Thus, from the outset, guerrilla war has been understood as a people's war, peasant war, or war of national liberation and resistance. In addition to the fundamental component of nationalism, modern guerrilla war has been motivated by a struggle for social reform and/or revolutionary change. In this sense, guerrilla war combines both the elements of a war against external aggression and of a revolution against a domestic class enemy and/or repressive government.

War, especially guerrilla war, has always been intimately linked with politics. In the nineteenth century, for example, Clausewitz insisted that "war is not merely a political act, but also a political instrument." Indeed, most military historians note that while the military components of guerrilla warfare have remained the same for millennia, the most important contemporary contributions have been psychological and political. Perhaps among the most noteworthy contributors to the politicization of guerrilla warfare have been Mao Zedong, Ho Chi Minh, and Ernesto "Che" Guevara. In turn, contemporary counterinsurgency doctrine has had to devise effective political and psychological strategies to "win hearts and minds" and deny guerrilla movements the popular support essential to success.

Mao Zedong especially took the Clausewitzian maxim to heart when he founded the People's Liberation Army (or Red Army) and launched a protracted people's war that culminated in the Chinese Marxist revolution of 1949. Employing the phrase, "the party controls the gun," Mao emphasized the critical role of political education and indoctrination by his Chinese Communist Party in their war of national liberation against the Japanese invaders and the subsequent civil war against the "traitorous" Guomindang Nationalists. People's war, the central concept of Mao's form of guerrilla struggle and the basis for his peasant-based, rural, socialist revolution in China, had several key components. First was the importance of the peasantry as a base of widespread popular support as both combatants and noncombatants. Unlike classical Marxist and Leninist thought which had concluded that peasants were ignorant clods and

unreceptive to revolution, Mao argued that the peasant masses, and not the urban proletariat (of which feudal China had very few), could be energized into a popular revolutionary force by nationalism, Maoism, and the indoctrination of the communist party. Second was the creation of a politicized military force of peasants, the People's Liberation Army, which began as a small irregular guerrilla army living the ideals of the socialist revolution and diffusing these in everyday society. By 1945, however, the Red Army had grown into a large conventional force between a half and a million strong.

The Chinese model of guerrilla warfare was a rural model based in the countryside and its purpose was to encircle the cities—the bastions of government control—and force the class enemy's capitulation. Mao had rejected the Stalinist path to Marxist revolution in 1938 and was denounced as a heretic and fool. Nevertheless, Mao argued that China was different. It was "a semicolonial and semifeudal country" and not "an independent democratic state," where the communist party could join a united front of democratic and bourgeois forces, and carry out a protracted legal struggle. Unlike the Russian experience, it was necessary for Chinese communists' to take the opposite road and first seize the countryside and then the big cities.

Mao's guerrilla strategy was summarized in his dictum: "The enemy advances, we retreat; the enemy camps, we harass; the enemy tires, we attack; the enemy retreats, we pursue." Warfare had several strategic stages; the first was a defensive stage which focused on establishing a secure base area or liberated zone where the party cadres could safely engage in organization and political indoctrination. In the intermediate stage, guerrilla forces emphasized mobility, the creation of supply lines, winning popular support, and engaging in successful hit and run and ambush tactics. They sought to expand military control over the countryside and weaken government forces. In the final offensive stage, the guerrillas completely encircled and choked off the cities from the rest of the country. At this point, the insurrectionary force was powerful and large enough to operate as a regular army and to conduct a conventional war.

Mao also developed extensive rules of protracted guerrilla struggle which were studied and, in some cases, followed by later revolutionaries. One rule was to defeat the enemy through attrition and demoralization and to limit military confrontations to quick engagements that destroyed the government's fighting ability. Second, guerrilla units should emphasize mobility, avoid fixed battle lines, and develop self-sufficient intelligence and supply systems. Third, the army must never terrorize or plunder the local population: "Oppose bandit ways, and uphold strict

political discipline.” Finally, the party must control the military.

In Vietnam, the revolutionary Marxist leaders Ho Chi Minh and Vo Nguyen Giap systematized their theory of modern people’s war and the political-military rules for wars of national liberation. They established a similar political-military infrastructure and implemented Maoist strategies to mobilize and ensure peasant support, such as land reform and direct political control in local villages. Also, as in the Chinese Marxist case, the Vietnamese national liberation struggle was a revolutionary war, that is, an anti-colonial war against foreign imperialists, and a socialist revolution against internal class enemies. Thus, the Vietnamese also melded the ideologies of nationalism and Marxism into a powerful justification for protracted guerrilla warfare first against the French in the First Indochinese War (1946–1954), and then against the United States in the Second Indochinese War (1964–1975).

Ernesto “Che” Guevara realized that foreign intervention and the fusion of revolution and war were indispensable for successful guerrilla warfare. Guevara accepted the view of Mao and Ho that class conflict without a nationalist insurgency against foreign intervention could be insufficient to spark revolution. Therefore, Che Guevara and other guerrilla leaders of the 1960s and 1970s sought to provoke US intervention in Latin America and the Third World. Guevara and Fidel Castro’s writings on guerrilla warfare describe this strategy as one of creating “many Vietnams” in Latin America.

Their Latin model of guerrilla warfare also attempted to reconcile theoretical disputes over revolutionary strategy. Should revolution arise from above or below? Should it be by workers or by peasants? And is the rural or urban-based struggle primary? In his 1963 treatise, *Guerrilla War*, Guevara underlined the importance of guerrilla action as the “central axis of the struggle.” And like Castro, he ridiculed Latin revolutionaries who struggled in capital cities and underestimated the rural guerrilla movement. Distilling from the Cuban revolutionary experience (often incorrectly), Guevara rejected urban guerrilla warfare, and the urban insurrections, terrorism, student demonstrations and general strikes sweeping Latin America in the 1960s and 1970s. Marxist laborite, Peronist, and Tupamaro guerrilla movements in Venezuela, Brazil, Uruguay, and Argentina in particular viewed urban warfare as the right recipe for revolution. In most cases, however, urban guerrilla warfare failed and created or further entrenched existing military dictatorships.

In the urban setting guerrilla warfare was often indistinguishable from outright acts of terrorism.

For example, Carlos Marighella, a Brazilian communist militant who wrote the *Minimanual of the Urban Guerrilla*, held that “Terrorism is an arm the revolutionary can never relinquish.” In his view, rebellion originated in the cities and spread to the countryside. The urban guerrilla’s principal task is “to distract, to wear out, to demoralize” the military dictatorship and “to attack and destroy the wealth and property of the North Americans . . . and the Brazilian upper class.” In this way, the urban guerrilla supports the emergence and survival of rural guerrilla warfare. In the 1980s, Peru’s *Sendero Luminoso* or Shining Path guerrilla movement dispensed with these distinctions altogether and inflicted terrorism and guerrilla warfare on both city and countryside.

By and large, urban guerrilla movements failed, according to experts, because of the absence of outside support and/or a mortal internal crisis. In *The Urban Guerrilla* (1969 p. 95), Martin Oppenheimer concluded that paramilitary activities in urban areas would succeed “in overturning the established order only where that order is already so decayed that a mere push will suffice.” Nevertheless, urban guerrilla warfare and its close association with terrorism may have achieved a new lease on life in the chaos of the United States–Iraq War and Islamic–al Qaeda insurgencies in Samara and Fallujah.

Che Guevara developed the guerrilla *foco* theory of revolution, in which he favored rural-based insurgency because he believed that in the modern age the advanced military technology, firepower, and efficient counterinsurgency training of regime forces could easily crush an urban insurgency. At best, urban insurrection may serve as a distraction and tie up enemy soldiers, but it is subordinate to the fundamental struggle. Guevara also rejected the Stalinist united front strategy, the Leninist and Maoist emphasis on the communist party and the Maoist strategy of fixed base areas, arguing that one cannot slavishly imitate past revolutions. The conditions which favored these models were simply not present in the Americas. Instead, he proposed Cuba as the model for successful Latin American guerrilla warfare.

In 1961, Guevara published the article “Cuba: Exception or Vanguard?” wherein he argued that Latin America was ripe for revolution and that a guerrilla-led peasant struggle would begin in the countryside and spread to engulf the cities of the continent. Guevara believed that existing socioeconomic conditions favored revolution and that the introduction of a guerrilla force into the region would introduce important subjective conditions for revolution: “The most important is the consciousness of the possibility of victory by violent means in the face of the imperialist powers and their internal allies.” He developed this

theory further in his 1963 work, *Guerrilla Warfare*. The Cuban Revolution, he wrote, had made “three fundamental contributions to the laws of the revolutionary movement” in the Americas: the people’s forces could win a war against the army; revolutionary conditions can be created by insurrection; the battle-ground in the region’s underdeveloped countries was in the countryside.

In the 1967 treatise *Revolution in the Revolution?* the French revolutionary theorist Régis Debray presented Guevara’s guerrilla *foco* model as a revolution in revolutionary thought and a “third way” for Latin American revolutions. The guerrilla *foco* was described as a “center of guerrilla operations” and initially operated as a “mobile strategic force” and the “nucleus of a people’s army” in a future socialist state. Guerrilla warfare in this model progressed through three stages: establishment of an independent and clandestine guerrilla force, and its supply lines and exploration of the terrain; development and defensive engagement with the enemy; and the revolutionary offensive that included a political and military phase.

The central logic of the *foco* model was the political and psychological impact of armed propaganda (or the “consciousness of victory by violent means”), which was to occur between the second and the third stage. Politicization prior to this, especially by established Marxist-Leninist parties, Guevara considered dangerous. Action not speeches would shake the peasantry out of its repressed and “colonial” mentality. Only when the guerrilla force was able to demonstrate “that a soldier and a policeman are no more bulletproof than anyone else,” would the peasants be willing to support the guerrillas. Insurrectional activity, therefore, served as “the number one political activity.” Guevara and Debray also rejected the leadership or vanguard role of existing Marxist-Leninist parties. The guerrillas were the “fighting vanguard of the people.” And the true revolutionary party must arise out of the guerrilla movement and the future People’s Army (as occurred in Cuba); or in Debray’s words: “Essentially, the party is the army.”

In 1967, Che Guevara exported his *foco* model of guerrilla warfare to Bolivia, located in the heart of South America and bordering his homeland of Argentina. Guevara reasoned that the conditions were not only ripe in Bolivia, but that revolution in the Andes would spread, provoke US intervention and eventually create “many Vietnams” throughout the continent. Bolivia, in Guevara’s words, would be a “sacrificial lamb to be offered on the altar of continental revolution.” None of these assumptions proved correct. Bolivia’s revolution in 1952 made the population unreceptive to Guevara, and indeed his small band of Cuban guerrillas had few Bolivian

recruits. The *foco* itself was viewed as a form of foreign intervention, whereas the assistance of US Army Rangers in destroying the insurgency was welcomed by the Bolivian Army, government, and population generally.

Critiques would later conclude that Guevara was blinded by his idealization of the Cuban experience, overgeneralization of the Latin American condition, and a populist understanding of revolutionary causality. And, most important, he miscalculated the US response and misinterpreted the Bolivian situation. In short, the *foco* model of guerrilla warfare failed both in theory and practice. And although Central American revolutionaries in Nicaragua, El Salvador, and Guatemala would be inspired by Guevara’s guerrilla warfare theories, none would implement them as Guevara envisioned, and only the Sandinista National Liberation Movement in Nicaragua would achieve success through rural guerrilla warfare.

**GUEVARA, ERNESTO "CHE"**

Born June 14, 1928, into a blue-blooded aristocratic family in Argentina, Che Guevara became a communist leader and twentieth-century icon fighting in Cuba, Africa, and South America. Throughout his life, Guevara was racked by asthma, which contributed to his enormous will as well as to his desire to study medicine. He completed his studies at the University of Buenos Aires in three years (instead of the usual six), interspersed with extensive journeys around South America. These trips greatly influenced Che as he recognised how poverty was linked to the economic system that was greatly benefiting the United States. However, he only later linked this to a deep understanding of Marxism. While traveling in Guatemala, he witnessed the overthrow of Jacobo Arbenz's radical government by US-backed Castillo Armas. Guevara fled to Mexico, where he met Fidel Castro in 1954 and joined Castro's group of exiles planning for an invasion of Cuba. The group landed in 1956, and during two years of guerrilla warfare Che cemented his position as one of their leaders. His camps became a model of organisation, and he greatly reformed the areas under his control, by, for instance, creating schools, clinics, and hospitals. He also gave interviews to foreign journalists and gained a reputation as the most radical of the Cuban guerrillas. Once the guerrillas seized power, Che served in various economic positions in Castro's government and oversaw land redistribution and the nationalisation of most Cuban and foreign companies. He combined his economic work inside with extensive foreign travel visiting countries throughout the world.

Che led a Cuban delegation to the Punta del Este conference in Uruguay in August 1961, where the US government presented the details of President Kennedy's Progress for Alliance. The plan was a major change in US policy, but Che denounced it and the "weak and sycophantic" Latin American governments who welcomed it. He saw the plan as an attempt to stifle social revolutions in the region, and he instead presented a Third World agenda, a list of economic and trade reforms including lower tariffs and fixed prices. This more global perspective reflected how Che was beginning to hope to replicate the Cuban Revolution elsewhere in Latin America. However, his dreams were blocked by a lack of encouragement from the USSR and resistance among native Communist leaders. Instead, he continued developing theories about guerrilla warfare and writing pamphlets which inspired a later generation of revolutionaries.

Frustrated in Latin America, Che turned to Africa, which he saw as virgin soil not yet divided up into Cold War spheres of influence. He went on a

three-month tour of the continent starting in December 1964, during which time he decided to become actively involved in the civil war in the Congo. He arrived in April 1965, but by then the war was all but over as Belgian paratroopers and mercenaries from Rhodesia and South Africa, aided by American aeroplanes, had crushed the rebels. Che and his Cubans fought until November, but they achieved little and were forced to leave the country under fear of capture. Unwilling to return to Havana following an ideological break with Castro, Che instead went to Bolivia in 1966, which seemed the most promising country in South America for guerrilla warfare. He traveled in disguise to Bolivia and fought skirmishes with the Bolivian army. However, the Bolivian military overcame the poorly trained group he led into the country, and Guevara was captured and executed near Vallegrande, Bolivia, on October 8, 1967.

**GUINEA**

The Republic of Guinea is a coastal West African country, bordered by Senegal, Mali, Guinea-Bissau, Sierra Leone, Liberia, and Cote d'Ivoire (Ivory Coast). It has about 250 miles of Atlantic coastline. The country, sometimes called Guinea-Conkary to distinguish it from its much smaller neighbor, Guinea-Bissau, consists of a flat, largely swampy, coastal plain that rises to a hilly and mountainous interior. The Gambia, Niger, and Senegal Rivers have their sources in the Fouta Djallon highlands of interior Guinea, and there are numerous smaller rivers in the area. The climate is tropical, with annual rainfall averaging from seventy-five to one hundred inches, with coastal areas receiving the most precipitation.

Several ethnic groups, including Mande, Fulbe, and Sosso, inhabit Guinea which is 85% Muslim. French is the official language. The population is approximately 8 million, with an annual growth rate of 2.5%. About 1.6 million people live in the capital, Conakry, a port on the Atlantic coast. Agriculture, based on cereal crops and tropical fruit, dominates the economy. The country has considerable mineral deposits of bauxite, diamonds, and iron ore. Despite its economic potential and an annual gross domestic product growth rate of 3.3%, Guinea ranks as one of the poorest countries in the world, with an annual per capita income of \$1,900.

Prior to colonial rule, several peoples and kingdoms controlled various parts of the region. Coastal and interior peoples and states had little contact, especially after interior groups adopted Islam, whereas coastal peoples retained traditional religions. The Fulbe dominated the Futa Djallon highlands, forming the center of a powerful Islamic state in the eighteenth and nineteenth centuries, which incorporated much of the interior highlands. The coastal region experienced early but minimal trading contacts with Europeans. Because of its lack of good harbors and the presence of noncentralized, coastal peoples, the trans-Atlantic slave trade had little impact on the region, and trade was sporadic. French conquest of the region in the late nineteenth century met with serious resistance from local groups, especially the forces of the ruler Samori Toure in the interior, which resisted occupation for over twenty years. By 1900, the colony of French Guinea became part of the Federation of French West Africa. The French established rubber and tropical fruit plantations, worked by local forced labor, and also exploited the area's rich mineral deposits.

By the early 1950s, Sekou Toure, a labor organizer who claimed descent from Samori Toure, was calling for independence. Because of the harshness of colonial rule and the colony's grinding poverty, Toure's message appealed to most Guineans. In 1958, when President Charles de Gaulle of France called for a referendum on continued ties or immediate independence for the colonies in French West Africa, only Guinea, at the urging of Toure, voted for independence, which was granted on October 2, 1958. The French withdrew quickly, sabotaging much of the area's infrastructure, ending all economic and military aid, and completely severing diplomatic links. Toure defiantly turned to the Soviet Union and the Eastern bloc for assistance, further isolating Guinea from the West and its West African neighbors, especially Senegal and the Cote D'Ivoire (Ivory Coast), whose independent governments relied heavily on French aid and expertise. Toure blamed the country's

worsening economic woes on colonialism, the lack of Western aid, and purported French attempts to overthrow his regime. He crushed all dissent, and as many as 2 million people fled into exile. Thousands were imprisoned, and many disappeared in detention, as Toure became increasingly dictatorial and paranoid. In the early 1980s, Toure made some overtures to France and the West, but he died suddenly in March 1984, throwing the government into turmoil, until the military, headed by General Lansana Conte, seized power. Conte remains the president of Guinea.

Neither Conte nor his regime found an effective solution to Guinea's overwhelming economic woes. Overtures were made to France and to the West for assistance, especially after the collapse of the Soviet Union, but foreign donors were reluctant to help the repressive military government. Conte faced several coup attempts, all brutally crushed. Despite its rich deposits of bauxite, iron ore, and diamonds, and a harsh structural adjustment program imposed by foreign donors in the late 1980s, including devaluation of the currency, elimination of many civil service jobs, and a general dismantling of many of the socialist structures established by the previous government, the country experienced little economic improvement. Unlike its neighbors, the nation has good soils and climate for agriculture, but only 3% of land is cultivated. Blame for the poor agriculture performance rests largely on the Toure regime, which instituted a corrupt and highly inefficient state-controlled system of marketing and distribution. The Conte government has tried to dismantle the system, but with little success. Much of the mineral wealth was and continues to be smuggled out of the country. Corruption is rampant in Guinea, especially among the ruling military elite. Much of the country's paltry export revenue was used to pay interest on the country's massive foreign debt, estimated at \$3.5 billion. In the 1990s, more than half a million refugees from the civil wars in Sierra Leone and Liberia flooded into Guinea. Refugees have drained the country's scarce resources and there have been periodic clashes between Guineans and refugees. There have recently been serious border clashes between Guinea and Liberia, prompting fears that Guinea will be dragged into a wider regional conflict.

In 1992, the government did institute a program of multiparty politics, yet the 1993 and 2002 elections were marked by widespread fraud and intimidation. Periodically, sections of the military have rioted, and there has been serious unrest among the urban population, but all dissent is immediately and harshly crushed. Human rights abuses are rampant. The government faces constant threats of a military coup. Economic conditions have worsened in the past few

years with increased smuggling, influxes of refugees, and mismanagement. Inadequate transportation systems hinder economic development. Most of the country's roads are unpaved and in poor condition. The railroads linking the interior to the coast, built by the French for exploitation of mineral deposits, are in serious disrepair. Education and health services are sorely neglected, with an adult literacy rate of 36%. Infant mortality, at 127 per 1,000 live births, is among the highest in the world. Life expectancy for males is forty-three years and forty-eight years for females. The Guinea's political and economic future is uncertain at best.

### GUINEA-BISSAU

The Republic of Guinea-Bissau, situated on the northwestern coast of Africa between Senegal and Guinea, is one of the smallest nations on the continent, comprising about fourteen thousand square miles. The country is mostly a low coastal marsh-plain rising to savanna in the east, with a tropical climate consisting of a monsoonal rainy season from June to November and a hot dry season. More than 80% of the population is engaged in rice, cashew nut, bean, and cassava cultivation. With 217 miles of coastline, several small islands, and numerous meandering rivers and streams, fishing forms an important economic sector. The population is estimated at approximately 1.4 million, with an annual growth rate of 2.2%. The capital, Bissau, is located on the coast and had a population of anywhere between two hundred thousand and three hundred thousand in 2002 and 2003. The figure has varied widely in the last three years, owing to periodic influxes of rural refugees with unrest in the interior, and then considerable decreases when violence has engulfed the capital. Current

population figures are impossible to estimate. Portuguese is the official language, with numerous ethnic languages, including Krioko, widely spoken. Ethnic groups include the Balante, Fula, and Mandinka; religious affiliation is almost evenly divided between Muslims and indigenous religions, with about 5% Christian.

The area was long part of a series of largely decentralized kingdoms, and then, from the thirteenth century onwards, the Empire of Mali, centered in the Western Sudan. In the mid-fifteenth century, the Portuguese began exploring, trading, and fort-building in the region. Soon the area became a major slave exporter to Brazil. By the mid-seventeenth century, the Portuguese had established some administrative control over the coast and near interior to protect their slave trading from the French and British who were also active in slave trading nearby. Some Portuguese traders settled permanently in the Bissau area and intermarried with indigenous women, creating a highly influential and comparatively wealthy *metis* population that influenced local language, society, and culture. With the abolition of the Atlantic slave trade in the mid-nineteenth century, the area, known as the *Rios de Guine* (Rivers of Guinea), became a commercial center for the export of fish as well as agricultural and forest products.

At the Berlin Conference of 1885–1886, Portuguese Guinea, consisting of both the mainland and the Cape Verde islands, was formally recognized by the European colonial powers. Under colonial rule, the colony was neglected by the Portuguese in favor of their larger and richer possessions in Angola and Mozambique. In 1952, Portuguese Guinea, like other Portuguese controlled territories in Africa, officially became an overseas province of Portugal. This action soon led to an independence movement that in 1961, developed into a prolonged armed struggle, jointly waged by Cape Verde islanders and mainlanders. The insurgency was led by Amilcar Cabral, a Cape Verdian, who soon established control over most of the interior, whereas the coast and Bissau, remained under Portuguese control. The liberation war was brutal and costly to the colony's population and limited infrastructure, which was virtually destroyed in the fighting. Cabral was assassinated in early 1973, and in September 1974, Guinea-Bissau formally achieved its complete independence. Civilian rule was initially established but in 1980, General Joao Vieira, a mainlander, led a coup and installed a military regime. In 1981, the Cape Verde Islands renounced their mainland ties.

The change from civilian to military rule did little to improve the country's poor economic development. Amid growing unrest over an increasingly

authoritarian regime and lack of economic progress, a constitution was approved in 1984 that, with amendments, has remained in force. Vieira was elected in 1984 and again in 1989, surviving several coup attempts. A multiparty system was announced in 1991, but Vieira remained in power, indefinitely postponing presidential elections. In 1999, Vieira was driven into exile and replaced as head of state by General Ausmane Mane, who called for presidential elections in January 2000. Mane lost to Kumba Yala, who ruled until September 2003 when he was overthrown by the current military regime that promises elections and a return to civilian rule. No progress has been made in that regard because, the regime claims, continuing unrest and outside military intervention by neighboring Senegal threatens the country.

Guinea-Bissau's internal political unrest, which intensified in 2003 and 2004, is one factor in its dismal economic performance. Relations with neighboring Senegal and nearby Gambia have been marred since the early 1990s by disputes over offshore oil drilling and fishing rights, conflicting land border claims, military incursions, and reported external support for coup attempts. Refugees fled into the capital as well as from the country. Economic production was seriously disrupted by the continued turmoil and upheaval. Any infrastructure that existed in the 1990s has been destroyed. In addition, the lack of developed natural resources, little international aid, virtually no foreign investment, widespread corruption, systemic mismanagement, and considerable emigration have all contributed to Guinea-Bissau being consistently ranked as one of the world's ten poorest countries. A structural adjustment program, implemented in 1987, sought to move the country from a centrally planned economy, cut public spending, eliminate many civil servant positions, and accelerate privatization. It has not, however, significantly helped to improve economic performance. Substantial amounts of rice and other foodstuffs are now being imported. External debt in 2000 was estimated at \$950 million. Education has been sorely neglected, with an adult literacy rate of about 35% in 2003. Despite compulsory, free education, most children, especially girls, never attend schools, and there is no institution of higher learning. Beyond some primary health care and traditional medicine, most citizens have no access to modern medical care. The infant mortality rates has been estimated at 109 deaths per 1,000 live births; life expectancy for men is forty-five years; forty-eight years for women. The gross domestic product is approximately \$900, one of the lowest in the world. Both the political and economic situation of Guinea-Bissau remain perilous.

## GULF COOPERATION COUNCIL

Officially known as the Cooperation Council for the Arab States of the Gulf, the Gulf Cooperation Council (GCC) was officially established after a meeting held in Abu Dhabi on May 25, 1981. The GCC comprises Saudi Arabia, the United Arab Emirates, Kuwait, Oman, Bahrain, and Qatar. The objectives of the GCC, as encapsulated in its Charter, emphasize the desire of the member states to achieve commonality in a wide range of areas. These include common regulatory frameworks for finance, trade, and customs, as well as cooperative ventures in both private investment and scientific and technical ventures. The Supreme Council of the GCC comprises the heads of state of each of the member states, a Ministerial Council, a Secretariat, and an Advisory Commission for the Supreme Council.

Although the commencement of the Iran-Iraq war had prompted these nations to examine their relative vulnerabilities, security issues have by no means dominated the affairs of the Council. That having been said, a Comprehensive Security Strategy was approved by the member states, and a security agreement was concluded in 1994. The agreement sees each member of the GCC considering an attack on a member as an attack on all member states. The most concrete example of security cooperation has been the establishment of the Peninsula Shield Force, a

combined arms grouping from each of the member states that has a standing headquarters and exercises its forces a number of times a year.

In a region where the history of multilateral cooperation has not been encouraging, the GCC has stood out as a relative success story. While its security achievements have been relatively limited, it can point out a number of examples where long-term negotiations have led to the signing of binding multilateral agreements. In particular, the GCC has striven for cooperative arrangements in economic affairs. This has led to the freedom of labour movement of GCC nationals between member states (although some professions in some member states remain restricted to those nationals only). Effective January 1, 2003, a Customs Union introduced a standard tariff on all goods imported from outside the GCC and allowed freedom of movement within GCC countries once they had arrived. This had originally been planned for 2005 but was brought forward two years, illustrating the degree of cooperation that member states have been able to achieve. Joint institutions such as the Gulf Investment Authority and a Commercial Arbitration Centre for all GCC members have also been established. The GCC also has sought to institute a common GCC currency by the year 2010.

### GUS DUR

Well before becoming Indonesia's first democratically elected president in October 1999, Kiai Haji Abdurrahman Wahid's influence within Indonesian public life was felt in the spheres of religion, politics, civil society, and intellectual exchange. In the religious sphere, his influence was, and continues to be, unrivalled. Indeed, it is fair to say that during the fifteen years (1984–1999) that Wahid was the chairman of *Nahdlatul Ulama* (NU), he was one of the world's most important Islamic leaders. After all, with an estimated 35 million members and extensive grassroots support, NU is not only Indonesia's largest Islamic organization but also the largest in the world.

Similarly, in the political realm, as leader of NU, Wahid occupied a unique position; since taking up the

chairmanship of NU in 1984, he oversaw the official withdrawal of NU from party politics and the opening up of vigorous debate regarding many issues previously considered sacrosanct. In the 1990s, while no longer a political party NU arguably represented the single most politically important grouping of people outside of the government's party GOLKAR and the army. Moreover, Wahid now also headed Forum Demokrasi, a small but very important intellectual lobby group, which he established in 1990 to be an independent nonsectarian vehicle to lobby publicly for democratic reform.

Finally, in the arena of intellectual debate and the public exchange of ideas, Wahid was always a figure of no mean ability. An astute and highly influential public figure, Wahid is controversial but generally well-liked, particularly by the younger generation, as is evidenced by the universal preference for affectionately referring to him by his sobriquet "Gus Dur."

Despite his well-established position as a reform-minded liberal intellectual, Wahid's traditional Islamic credentials are thoroughly sound. Born in Jombang, East Java, in 1940, Wahid studied at a number of *pesantren*, traditional Islamic boarding schools, in Java before undertaking tertiary level studies at the Al-Azhar Islamic university in Cairo, Egypt in 1964. From Al-Azhar in 1966, he went on to further studies in the field of literature at the University of Baghdad in Iraq, graduating from there in 1970. Encouraged by news of interesting developments in the *pesantren* scene in Indonesia and unable to study in Europe, Wahid returned home in 1971. He immediately immersed himself in the *pesantren* world, holding a number of positions at various *pesantren*.

In 1989, he was resoundingly re-elected for a second term as NU Chairman despite considerable opposition from the Soeharto regime. He again emerged victorious in November 1994, having been elected to a third five-year term in the face of a concerted and vigorous campaign directed against him by Soeharto, who was angrier than ever at his outspoken dissent.

In late 1996, in the wake of Soeharto's dramatic ouster of Megawati Sukarnoputri from the leadership of the Democratic Party of Indonesia (PDI) when further opposition seemed futile, Wahid sought and achieved a rapprochement of sorts with Soeharto. But when the Asian Economic Crisis began to pummel the Indonesia economy a year later and calls for Soeharto's resignation grew steadily more strident, the public looked to Abdurrahman Wahid, Megawati Sukarnoputri and Amien Rais (leader of NU's counterpart, the 25-million-strong modernist Muslim organization Muhammadiyah) to lead the push to topple the Soeharto regime. Fearing bloody confrontation, all three leaders urged restraint. Then, in January 1998, Wahid

suffered a near-fatal stroke and the loss of what was left of his failing eyesight. He was still bedridden four months later when Soeharto finally resigned on May 21. By June, however, he recovered sufficient strength to oversee the formation of the National Awakening Party (PKB), a non-Islamist party formed to mobilize the NU masses for the June 7, 1999 elections, Indonesia's first free and fair elections since 1955. Despite the fact that PKB won less than 13% of the vote in the parliamentary elections, on October 20, 1999, the Peoples Consultative Assembly (MPR) Electoral College voted Wahid president. Megawati, whose party had achieved almost 34% of the vote, was elected vice president in the June elections. The relationship between the two leaders and their supporters, which had been deteriorating since mid-May, never recovered, and as a result, Wahid failed to gain the backing of parliament. His maverick leadership style and overly ambitious push for sweeping reforms on multiple fronts exacerbated antipathy towards him in the legislature, the bureaucracy, and the military; and the MPR finally ended his term on July 23, 2001, through moving what was effectively a vote of no-confidence against him.

The broadly based popularity and respect that he continues to enjoy, despite his tumultuous presidency, is hard-earned, but it can be attributed in part to his perceived spiritual lineage, something of great value in traditional Islamic circles where mystical power, often inherited, is more important than head knowledge. His grandfather, KH Hasyim Asy'ari, helped found NU in 1921, and his father, KH Wahid Hasyim, also led NU and was Minister of Religious Affairs in the early 1950s.

Today, Wahid stands together with other progressive Indonesian Islamic intellectuals such as Nurcholish Madjid as representing a new kind of *ulama* (Islamic scholar) and a new movement of thought, sometimes referred to as Neo-Modernism, which goes beyond both Islamic modernism and Islamic traditionalism, breaks the bounds of conventional jurisprudential reasoning, and brings together the core teachings of Islam and the insights of modern "western" scholarship.

Under the influence of a new generation of thinkers such as Wahid, Indonesian Islamic thought has become steadily more cosmopolitan and open, confidently embracing the pluralism of modern Indonesian society. The acceptance of a sophisticated position on the separation of "church" and state combined with a profound appreciation of the core values of Islam to enable, and indeed encourage, the growth of pluralist liberal thought as rich and broad as that found anywhere in the world. Abdurrahman is but one of a number of Islamic intellectuals who have contributed

to the emergence of what is now commonly referred to as Islamic liberalism. Without his contribution, however, this movement might not have developed the broad support it now enjoys within the youth of NU and mainstream Muslim society in Indonesia.

## GUYANA

Guyana, a country about the size of Idaho, is located above Brazil and east of Venezuela on the north coast of South America. The capital is Georgetown. Its population in 2004 was 705,803 and does not grow because so many of its residents immigrate to the United States, Canada, and other islands in the Caribbean. Guyana also has a very high mortality rate for infants and deaths due to AIDS.

"Guiana" was first visited by the English, but it was the Dutch who established the first fortified settlement on an island in the Essequibo River just off the coast of Guyana with Amerindian trading partners in 1616. After changing hands between the British and the Dutch several times, it was a British colony from 1803 until 1966, when it became an independent republic of the British Commonwealth. As a former British colony, the official language of Guyana is English, but most Guyanese speak Creole in informal communication. Amerindians maintain many dialects, and Hindi and Urdu also are spoken.

Except for the small number of Amerindian communities in the interior, the Guyanese population is largely urban and coastal. The people of Guyana are comprised of Indo-Guyanese (50%), Amerindians

(7%), Afro-Guyanese (6%), English, Dutch, Portuguese, Chinese, and other Asian immigrants of multiple national origins. There are many racially mixed Guyanese as well. Their primary religions are Christian, Hindu, and Muslim, in that order. They came as colonists, slaves, and indentured servants to manage and work on sugar cane plantations. Modern Guyanese are engaged in industry and commerce, agriculture, and public-sector service labor. The current economy slowed in 2003 as a result of a shortage of skilled labor and the underdevelopment of the infrastructure. The government also is plagued with the need to balance public investment and the unemployment of unskilled labor with high external debt payments.

Guyana has had racial strife, largely between its Indo-Guyanese and Afro-Guyanese populations. Due to the plantation labor history of Guyana, these conflicts were both racially motivated and class-based. As the new democracy emerged, these two dominant groups engaged in violent political rivalry. It was not until 1992 that Guyana's political elections were widely recognized as free and fair. The current democratic government defends human rights and supports the expansion of the private economic sector through global networks with other democracies. Despite the racial conflicts of their early national independence, the Guyanese are primarily peaceful people. Along with cricket, the Guyanese enjoy basketball, soccer, and volleyball, among other team sports.

With the collapse of the sugar market, which precipitated independence from Britain, Guyana's developing economy is based primarily on the extractive industries of fishing, logging, and mining. It exports bauxite, gold, diamonds, hardwoods, rum, rice, molasses, and shrimp. However, there is strong national desire and international support for the protection of Guyana's rain forest reserves.

The people of Guyana gave Iwokrama, a 1-million-acre preserve of virgin rainforest in the Amazonian region of the interior, to the people of the Commonwealth for scientific research and sustainable management. Funds from Great Britain, Canada, and the United Nations maintain a research camp visited by biologists, anthropologists, and other scholars from around the world. The Iwokrama Rain Forest works with local Amerindians and international partners to project local ecosystems and cultures. It is the homeland of the Makushi people, who work with anthropologists from the University of Guyana Amerindian Research Unit and the United States to develop ecotourism in the region. A local Makushi Research Unit is involved in collaborative ethnobotany research with international pharmaceutical development agencies.

The topography of Guyana is diverse. In addition to Iwokrama's rain forest, Guyana offers ecotourists and adventurers breathtaking pristine natural beauty. It features 450 miles of Atlantic coastline; millions of acres of rain forest; the Pakaraima Mountains; mighty rivers like the Essequibo, Demerara, Berbice, and the Potaro; and the Rupununi savannah in the south. Kaieteur Falls, accessible by private plane, drops four times the length of Niagara Falls. Visitors to the rain forest can see jaguars, caiman, the Harpy Eagle, Giant River Otter, and Arapaima freshwater fish. Including macaws, toucans, and parrots, there are more than seven hundred species of indigenous birds. The rich biodiversity of the rain forest also is home to exotic plants and butterflies.

In Georgetown, visitors will see St. George's Cathedral. Built in the 1800s of Guyana's indigenous hardwoods, it is the tallest wooden building in the world. Green heart and purple heart hardwoods also were used to build ships because of their resistance to moisture. They are still exported as luxury building and craft materials.

## **HAILE MARYAM, MENGISTU**

Mengistu Haile Maryam, a ruthless army officer with Marxist leanings, dominated Ethiopia from 1974 to 1991. He was born in 1937, but little else is publicly known about his background or his private life. His regime murdered thousands of political opponents and private citizens before he fled the country in 1991.

Ethiopia under Emperor Haile Selassie (1892–1975) was a feudal country in which the imperial family was estimated to have owned 42% of the land and the Coptic Church another 18%. Numerous ethno-linguistic groups in the provinces felt themselves exploited by Amhara-speakers who lived in and around the capital, Addis Ababa. Discontent turned into revolt after a great famine in 1973. On January 12, 1974 the army mutinied, led by the Dergue, a committee of 120 officers, including Major Mengistu. Seven months later the Dergue arrested the Emperor, suspended the constitution, and proclaimed a provisional military government.

The Dergue's nominal leader was executed on orders of Mengistu in November 1974. In December the Dergue proclaimed a socialist program for Ethiopia. Foreign businesses and banks were nationalized. Students and teachers were to be sent into the countryside to help collectivize farms. Mengistu promoted himself from major to lieutenant colonel in 1976. The next year he named himself head of state after another bloody internal purge of the officer corps.

All this was taking place in the context of Cold War rivalry that focused on the Horn of Africa. The United States had supported Ethiopia in its territorial

dispute with Somalia, which was armed by the Soviet Union. But after Mengistu proclaimed himself a Marxist the superpowers switched sides: Mengistu signed a treaty of friendship and cooperation with the USSR. East German security police and ten thousand Cuban troops were sent to help Mengistu control the situation. Washington, therefore, approved of Somalia's invasion of Ethiopia in July, 1977.

Col. Mengistu, fearing internal enemies, launched the so-called Red Terror in 1977. To show citizens what he wanted he called a huge rally in the capital at which he threw bottles filled with blood onto the pavement. The killing began in Addis Ababa, where the Dergue distributed weapons to neighborhood associations, which kept meticulous records of their executions. Bodies of victims were left in streets for three days as a warning to others, and relatives who wished to claim them had to pay for the bullets expended. At least five thousand people were killed in the initial phase of the terror. Many of these were students resisting forced conscription.

A far greater toll was exacted by the famine of 1984–1985 in Tigre Province, bordering Eritrea. Mengistu's solution was to forcibly relocate Tigreans to the distant south. As many as five hundred thousand of these internal refugees died. Internal opposition to Mengistu spread in the late 1980s, and the Ethiopian army grew demoralized. The new Soviet leader, Mikhail Gorbachev, warned Mengistu to negotiate an end to the ethnic wars.

With few options left, Mengistu fled Ethiopia on May 21, 1991, to live in a heavily-guarded mansion in

Harare, Zimbabwe. He is being tried *in absentia* on 209 counts of crimes against humanity.

## HAITI

### History and Economic Development

Haiti occupies the western third of the Caribbean island of Hispaniola and lies between 19° and 20° N and 72° and 74° W. Ninety kilometers southeast of Cuba, 187 kilometers northeast of Jamaica, and about one thousand kilometers from Florida, it contains 27,750 square kilometers (10,714 square miles). Haiti's topography ranges from flat, semiarid valleys to densely forested mountains, and about one third of its area reaches between two hundred and five hundred meters above sea level. The remaining two-thirds is divided into three mountain ranges with the highest elevation at about 2,680 meters (8,793 feet). The average daytime temperature usually remains between 24°C and 27°C. The main variation in temperature is due to elevation with three-quarters of a degree decrease for each one hundred-meter increase in elevation. The northern mountains receive about two hundred centimeters (eighty inches) of rain annually; the southern coast receives less than one hundred centimeters (forty inches) annually.

Demographic information is highly unreliable, but the total population is estimated to be 8.5 million with the capital of Port-au-Prince containing about 1.5 million people. According to various studies, the birth rate is probably around 35.5 per 100,000, and the annual growth rate somewhere just less than 2% per annum; the mortality per 1,000 is approximately 13; infant mortality per 1,000 is just less than 120; and life expectancy at birth is about 56 years.

Haitians speak a language that is usually referred to as Haitian Creole. For most of its history, however, the official language of government, business, and education has been French. Nevertheless, only about 8% of the population speaks French with any appreciable fluency. This educated elite has traditionally used the requirement of French to exclude the masses from competing for positions in government and business. Haitian Creole is currently becoming more widely accepted, and the prestige of French is rapidly declining in Haiti. Article Five of the 1987 constitution, which was distributed in both French and Creole, stated, “All Haitians are united through one common language: Creole. Creole and French are the official languages of the Republic.” Due to the recent flood of Haitian migrants to Florida, the international decline of the French language, and the economic and cultural trends in the Caribbean, English is increasingly learned and used by Haitians.

The second oldest independent nation in the Western Hemisphere, the Republic of Haiti is the only one with a French-Creole background as well as the only one with an overwhelmingly African culture. Also, large numbers of Haitians live outside Haiti, especially in the Dominican Republic, on other Caribbean islands, in the countries of Central America, northern South America, and in North America. After Port-au-Prince the second largest Haitian community is in New York City.

The economic life of much of Haiti can be understood as a product of various historical factors. After having defeated the colonial government of the French slave-owners in a bloody war ending in 1804 the newly independent nation faced the threat of a French army returning to re-enslave them. The government of the newly independent nation confiscated private land, imposed forced labor (which was unworkable and quickly abandoned), and attempted to develop an export agriculture to obtain the importation of war material. These actions led to the fragmentation of land holdings, the peasantization of Haiti, and the alienation of the masses from the government and the ruling elites. Haiti is, indeed, one of the most peasantified of all countries with about 65% of the labor force in agriculture. Currently 60% to 80% of the rural population owns their own land, though the plots are fragmented and small. A typical Haitian family feeds itself on beans, corn, rice, and yams. Despite the importance of agriculture, however, the countryside is about 95% deforested and about 25% of the soil is undergoing rapid erosion.

Coffee, sugar, rice, and cocoa are traditionally Haiti's primary export products. Shoes, soap, flour,

cement, and domestic oils comprise its light manufacturing products. Haiti also has a few cotton mills. Offshore industries have traditionally produced garments, toys, baseballs, and electronic goods for the US market, but due to the current chaotic political situation few offshore industries are functioning. The oil crises of 1973–1974 and 1980 were great shocks to the Haitian economy. In 1980, a horrific hurricane devastated the coffee industry. Many people engage in part-time craft work, particularly in the manufacture of small items and tools, but the annual per capita income is estimated at only \$380 US dollars.

Most of the internal economic activity occurs in open-air markets; in rural areas men generally handle the agricultural production and women handle the products of agriculture.

## International Relations

Haiti is closely tied to the United States with a majority of its exports coming to North America and a goodly portion of its economy dependent on government and non-government aid from the United States. October 2001 marked the seventh anniversary of President Jean-Bertrand Aristide's return to power after thirty-six months in exile following a 1991 military coup d'état. He was reinstated in 1994 through the military intervention of twenty-two thousand US soldiers, though his socialistic and anti-American rhetoric meant that influential sectors in the US government would continue to oppose his administration.

Since May 2000, when the party of twice-elected President Aristide won approximately 80% of the seats in a parliamentary election and the US-backed opposition front Democratic Convergence alleged that the election was rigged, Haiti has been in a political and economic crisis. Largely under pressure from the United States, over \$500 million US dollars in international aid has been frozen until the government and the opposition reach an agreement to hold new elections. In May 2002, when Aristide addressed the United Nations in New York City about the worldwide exploitation of children, a thousand or so people demonstrated against this decision by the international community, and especially by the United States, to withhold assistance to Haiti.

## HAMAS

HAMAS (the acronym for the Arabic *Harakat al-Muqawamah al-Islamiyya*, also meaning "zeal" or "bravery") is the Islamic Resistance Movement that developed in the Israeli-Occupied Palestinian Territories of the West Bank and Gaza Strip in late 1987 to early 1988 during the height of the first Palestinian *intifada*. The Movement is an offshoot of the Muslim Brotherhood. According to the HAMAS Covenant, the goals and objectives of this nationalist movement are to liberate Palestine through jihad, ridding it of all Zionist and other foreign non-Muslim influences. This entails, specifically, the need for all Believers to strive to destroy and then replace the State of Israel, the West Bank, and the Gaza Strip with a Palestinian State, which is to be governed by the precepts of *shariah* (Muslim) law.

The liberation ideology and theology of the Movement is based almost entirely upon a very strict interpretation of the teachings of the Qur'an. As such, the Movement takes its guidance, most especially with regard to relations with Jews, from the concept that Muslims can coexist peacefully with *dhimmi* communities (that is, Jews and Christians) so long as these communities live under the protective "wing" of Muslim governance. Within such a Qur'anic context, foreign rule of Muslim lands (*dar al-Islam*) by Jews or other non-Muslims cannot be tolerated.

In addition, classically anti-Semitic texts coming from pre-Holocaust Christian Europe, such as the *Protocols of the Elders of Zion*, also inform the ideals and philosophy of HAMAS members and their views of Jews and Judaism. Such texts mesh well with HAMAS ideology, further validating the insidious nature of the Zionist movement, and its desires to take over the entire world. Thus, HAMAS equates Zionism with Nazism and imperialism, and contends that any and all means of striving to rid the Muslim Middle East of what it sees as a “vicious,” invalid movement—if necessary, while losing one’s life in the process—are legitimate acts when the objective is the liberation of Palestine from Jewish control.

### A Brief History of HAMAS

HAMAS was founded in the late 1980s as an offshoot of the Muslim Brotherhood. Led by the blind paraplegic Sheikh Ahmad Yassin, the movement began to gather Palestinian followers immediately, as those discouraged and angered by years of an unsuccessful secular liberation movement headed by Yasser Arafat’s Palestine Liberation Organization (PLO) were offered renewed hope that the HAMAS alternative might succeed where others before them had failed.

During the first *intifada*, HAMAS’s military wing, the Izz ed-Din al-Qassam Brigades, were instrumental in attacking Israeli settlers and soldiers as a part of the armed struggle against the Zionist control of Palestine. The strategy of seeking out and attacking Israeli civilians, the Movement contends, began only after the mass murder of Muslim worshippers in Hebron by an Israeli West Bank settler, Baruch Goldstein, in early 1994. Thereafter, the Movement determined that *all* Zionists were acceptable targets in its efforts to liberate Palestine from non-Muslim control.

Although HAMAS has stated its support for the PLO and its President, Yasser Arafat, on numerous occasions, it has long opposed the PLO with regard to any sort of compromise with the Israeli/Zionist government. When, for example, Arafat signed the Oslo Accords with Israel effectively ending the Palestinian-Israeli conflict in 1993, HAMAS announced its refusal to accept the Accords, and its unwillingness to recognize any sort of agreement that would suggest an acceptance or recognition of Zionist claims in the region. That said, some HAMAS supporters ran as independents in the Palestinian elections held in 1996 that resulted from the Oslo agreements.

Since the onset of the *al-Aqsa intifada* in September 2000, HAMAS has played a central role in opposing

what the Movement perceives to be Israeli crimes against the Palestinian people. HAMAS views its suicide bombers, for example, not as terrorists but rather as martyrs who are employed to fight an incredibly powerful enemy for a just and righteous cause condoned—if not, required—by the tenets of Islam.

In response to the rise in suicide attacks throughout the West Bank, Gaza, and Israel, the Israeli authorities began to target the HAMAS leadership in March 2004. HAMAS leader and founder Sheikh Ahmad Yassin was the first to be assassinated by the Israeli authorities; his replacement, Abdel Aziz Rantisi, was assassinated in a similar fashion only a few weeks thereafter in April 2004. While the Israelis contend that the assassinations of these and other al-Qassam commanders thereafter are all legitimate in light of ongoing attacks against civilians and others by HAMAS operatives, the HAMAS leadership asserts that such killings of these significant individuals only strengthen the resolve of the Palestinian people as a whole. Moreover, they state that each killing simply encourages HAMAS leaders to call on its members to undertake further acts of revenge and retaliation, and not the surrender that the Israeli authorities seek to achieve.

### The Role of HAMAS as an Evolving Regional Player

Although viewed by the United States and West as a solely terrorist organization infamous for its numerous suicide attacks and other violent acts against Israel and its interests, HAMAS also successfully operates numerous charitable and community aid programs in mosques, community centers, schools, and health clinics throughout the Palestinian Territories. Increasingly, such programs serve to attract a broad political spectrum of Palestinian supporters, who contend that HAMAS has proven able to provide them with various basic services in areas where the Palestinian Authority has long failed.

Thus HAMAS, since its founding in the late 1980s, has begun to supplant the role of the Palestine Liberation Organization and its post-Oslo counterpart, the Palestinian Authority (PA), throughout the West Bank and Gaza Strip. As a viable alternative to the ineffectual PLO/PA, HAMAS offers the Palestinian people hope, while simultaneously challenging the PLO as the standard bearer of the Palestinian liberation movement through its violent acts of retribution against the Israeli government, military, and civilian interests.

## HASSAN II, KING (MOROCCO)

King Hassan II, full name Moulay Hassan Ben Mohammed, was born in Rabat, Morocco, on July 9, 1929, the son of King Mohammed V of the *Alaouite* dynasty. He received his education in Rabat and the extension school of the University of Bordeaux in Rabat, obtained a *diplôme des Etudes Supérieures* (equivalent to a master's degree) in public law in 1952. He was invested as crown prince and became commander in chief of the Moroccan army in 1957, served as minister of defense and vice premier from 1960 to February 26, 1961, when he was crowned as the king of Morocco upon his father's death.

Upon his crowning, King Hassan started building dams throughout most of the country, but the goal of helping provide water for farmers and urban areas in periods of drought remains only partly achieved. His politics emphasized market economy and capitalism but were relatively conservative. In the mid-1980s, he authorized the gradual liberalization of deposit interest rates in an attempt to increase private domestic savings. During the last decade of his reign he implemented several other reforms that are widely viewed as conducive to economic development. In 1991, he initiated a number of privatization programs. In 1993, he introduced partial convertibility of the local currency (the dirham) by allowing full convertibility of current accounts. In general, he maintained a good rapport with USAID, IMF, and World Bank. Hassan pursued the most Western friendly politics in North Africa, and tried to bring Arab countries and Israel closer to peace.

The Green March, which took place in 1975, remains the most important national event in the Reign of Hassan II. On November 6, 1975, 350,000 Moroccan volunteers crossed the artificial borders between the main land and the Sahara. On November 14, 1975, the Madrid Accords whereby Morocco restored its sovereignty over the Sahara were signed. During Hassan's reign, income and gender inequalities were high. The Ominium Nord African (ONA) which is owned mainly by the royal family is said to own about 20% of Morocco's gross domestic product (GDP). Women's rights were not addressed until the late 1980s and early 1990s. There has been no tangible advancement in this area, as the Dahir (law) that is intended to enhance women's right had not been signed when Hassan died.

Primarily due to a corrupt administration, this world leader's attempts to reduce poverty and illiteracy among Moroccans produced little results. Illiteracy and unemployment rates in Morocco were no lower in 2001 than when he became king in 1961. Frustrated groups often rioted against austere stabilization and structural adjustment programs and human rights abuses. However, many blamed the poor human rights record and economic problems on his long time minister of interior, Driss Basri.

King Hassan died in Rabat of a heart attack on July 23, 1999.

## HAVEL, VÁCLAV

Václav Havel was born in 1936 in Prague, in a free Czechoslovakia, but spent most of his life under dictatorships. Czechoslovakia had only been created in 1918 after the collapse of the old Austro-Hungarian Empire. A Nazi invasion in 1939 ended its freedom, and "liberation" by the Soviet Union in 1945 only placed Czechoslovakia under a different kind of oppression. The Soviets imposed a communist dictatorship on the country, backed by an occupying army.

Havel began his career working with Prague theater companies as a stagehand. He had been considered too “bourgeois” by the communist government to be allowed to get a university education, but he persevered on his own, working as a lab technician during the day while studying at night. By the 1960s, he was writing plays for Prague theaters. His plays were avant garde and surreal in conception, but from the beginning they were strongly critical of the Communist Party’s rule in Czechoslovakia. “The Memorandum,” for example, was about a government officials’ inability to obey a government memo because they could not understand its convoluted language. Havel became a more active dissident after the 1968 Czechoslovakian uprising against the Soviets, known as the Prague Spring.

In spite of government censorship, Havel continued to write plays critical of totalitarian governments in general and, by implication, his own government in particular. His plays during this period include “Audience” (1975) and “Protest” (1978). His anti-government activities increased after the 1977 government trial of a Czech rock band called “The Plastic People of the Universe.” Havel signed a document protesting against the unjust persecution of the Plastic People and other artists. This became the beginning of what was known as the Charter 77 Movement. For his resistance, he was sent to prison from 1979 to 1983.

The situation in Czechoslovakia, as in the rest of Communist Europe, began to shift with the coming to power of Mikhail Gorbachev, the new premier of the Soviet Union. Gorbachev believed that communism needed to be reformed with *Glasnost* (Openness) and *Perestroika* (Restructuring). Czechoslovakian dissidents believed that these ideas should be applied to their country as well and began to agitate more aggressively for change.

On January 15, 1989, thousands of demonstrators gathered in Prague to protest against Communist Party policies and oppression. The government reacted by arresting Havel and other dissidents. Havel was sentenced to nine months in prison. However, instead of backing the Czechoslovakian Communist government, Gorbachev began to withdraw Soviet troops from the country. Without the backing of Soviet soldiers, and with the citizenry rallying against them, the government’s position became increasingly untenable.

In May, Havel, along with other dissidents, was released from prison. He and others, including many artists, formed the Civic Forum, a political group opposed to Communist one-party rule. By mid-November 1989 tens of thousands of people were demonstrating in Prague, demanding the government’s overthrow.

Rather than face a possibly violent revolution, the Communist leaders of Czechoslovakia negotiated a peaceful transfer of power to the leaders of the Civic Forum, of whom Havel was the most prominent. On December 29, 1989, Havel was chosen to be President of new Czechoslovakian government.

As president, Havel successfully oversaw the dismantling of the old Communist system. With remarkable speed, he and his colleagues ended one-party rule and created a democratic society where freedom of speech was the law of the land. Some have criticized his leniency towards former government officials, but one of Havel’s primary goals was to avoid the bloodshed that had characterized transfers of power in countries like Romania. His success gave the transfer of power in Czechoslovakia the label “The Velvet Revolution.”

As leader of a free Czechoslovakia, Havel’s success was mixed. He was the most popular politician in the country, but by the time he stepped down his popularity had waned. Many saw him as an impractical dreamer who did not understand the realities of political office. His ambivalent attitude towards his own authority led some to criticize him for not being sufficiently presidential (to get around the long hallways of the presidential palace, for example, he sometimes used a child’s toy scooter). He was never a nationalist. For instance, on the occasion of the Czech hockey team’s victory in 1999, rather than lauding its victory Havel took the opportunity to lecture his fellow countrymen on the dangers of excessive nationalism. He also worked with limited success to reduce prejudice against the Rom (Gypsy) population of Czechoslovakia.

A lifelong opponent of communism, Havel was also a critic of Western-style capitalism. In his writings, he argued that capitalism’s emphasis on soulless consumption could be as dangerous as communist oppression. In spite of this criticism (or perhaps unaware of it), Havel was awarded the United States Presidential Medal of Freedom by President George W. Bush in 2003.

Havel’s greatest failure in his own eyes was the split of the Czechoslovakian state in 1992. Havel had opposed the split, but ethnic Czech nationalists allied themselves with ethnic Slovak nationalists and succeeded in tearing the country apart. Havel resigned as Czechoslovakia’s president only to be elected the first president of the new Czech Republic in 1993, serving until 2003.

## HAYA DE LA TORRE, VÍCTOR RAÚL

Víctor Raúl Haya de la Torre (1895–1979) was a charismatic Peruvian populist who led a native Indian movement that advocated and somewhat achieved wide ranging transformations in the politics of Spanish America. His indigenist ideas for national development and native cultures were rooted in numerous social and economic reforms.

He was born in the northern coastal Peruvian town of Trujillo on February 22, 1895. As he matured he witnessed significant socio-economic changes in his region. Foreign business interests were supplanting traditional landowners. He was from an established family that confronted uncertain economic prospects and status.

As a student in Lima, Haya de la Torre became a leader in the university reform movement, which had an agenda of broad educational and social changes. Spearheading demonstrations against the dictatorial government of President *Augusto Leguía*, Haya was exiled from Peru in 1923.

Going to Mexico, he witnessed the heady early days of the Mexican Revolution. The innovative Mexican education and cultural leader, José Vasconcelos, fostered during the 1920s many of the cultural goals of the indigenist movement. Haya de la Torre led a group of young Latin American reformers in founding a political party, the *Alianza Popular Revolucionaria Americana* (APRA = American Revolutionary Popular Alliance). They believed that the Indian races of the region and the mystical force of their history would be the basis for developing their countries. They referred to the region collectively as Indo America. They intended to establish APRA in all countries of Indo America.

The proud cultures of the Aztecs and Mayas in Mexico and Central America and of the Incas in the Andean countries had been defeated and marginalized in the sixteenth century by the invading Spanish conquistadors. Since then native peoples, their numbers decimated, had become impoverished and despised. The elites of European descent who ruled over them and their former territories considered the

native an inferior race. Haya de la Torre and the Aprista (adjective in Spanish for APRA) movement sought to re-assert the dignity and accomplishment of historic Indian cultures. They sought to strengthen the nations of Latin America by more fully integrating native populations into social, economic, and political life. Physically, Haya de la Torre bore Indian features and appeared himself to be of Inca descent.

The movement also believed an alliance of intellectuals, laborers, and peasants was necessary to oppose United States economic domination. It supported economic nationalization, unification of Latin America, and solidarity with all oppressed peoples. Living in various countries of Europe and the United States, he came to know many of the leading intellectual and cultural figures of his time. Travel in the Soviet Union made him conclude that communism would not be an adequate political system for the reforms he sought.

In 1930, Leguía was overthrown by a military uprising led by Luis M. Sánchez Cerro, and the following year Haya returned to Peru. Before his return, his followers organized APRA in Peru, designating it the Partido Aprista Peruano (PAP = Peruvian Aprista Party). Over the next half century, the party would elaborate a vast social system parallel to the government, organizing educational, cultural, and welfare programs into the furthest reaches of the country. In 1931, Haya ran as the Aprista presidential candidate against Sánchez Cerro but was defeated.

Followers of Haya believed he lost the election due to fraud. He advocated the overthrow of the traditional elite that had always ruled Peru and was arrested and sentenced to prison. An Aprista uprising occurred in Trujillo that culminated in the assassination of Sánchez Cerro. The new president, General Oscar Benevides, freed Haya and allowed the Apristas to resume political activity. Nonetheless, Benevides reverted to repression of the party, causing Haya to go into hiding until 1945.

In that year, the Aprista party became crucial in electing President José Luis Bustamante y Rivero and was able to manipulate Bustamante's government. The party supported a massive transfer of economic and political power from the wealthy to the native majority, advocating land reform that expropriated massive private estates. After the party provoked a military uprising in Callao, the port city of Lima, the new president once again suppressed it.

Haya entered into hiding, later obtaining asylum in the Colombian embassy in Lima, where he remained until 1954. He then went again into exile in Mexico and Europe until 1956. In 1962, the Aprista party, despite military opposition, nominated Haya as its candidate for the presidency. He did not obtain sufficient votes to be elected. Nonetheless, the armed

forces staged a coup to prevent negotiations that might lead to Aprista influence in a new government.

Presidential elections were again conducted in 1963, with Haya a candidate. However, with the electorate assuming the military would never allow him to assume office, he was defeated by Fernando Belaúnde Terry, who proceeded to carry out significant social and economic reforms based on the Aprista program. To better integrate Indians into national life, he inaugurated a networked system of roads and highways, thereby also facilitating marketing of agricultural produce from native lands. He also established basic education and training programs for Indians.

In 1968, a military coup led by Juan Velasco Alvarado overthrew Belaúnde and inaugurated a regime that, while once again proscribing the Aprista party, proceeded to carry out further parts of its reform program. He brought about land reform by expropriating large estates of the traditional landed elite.

The last public act of Haya before he died in 1979 was to preside over the constituent assembly that returned Peru to democratic government the following year. Never married, Haya was accompanied throughout his life by his secretary companion, Jorge Idiáquez.

Only in Peru did the party achieve political significance, operating extensive social, cultural, and educational programs. Frequently repressed during Haya's lifetime, it finally obtained power during the ill-fated presidency of Alan García Pérez (1985–1990). It has declined since then.

### HEALTH CARE

Health care in the developing world since World War II is not easy to treat under a single heading. It refers to many dimensions, notably to the health care services provided in times of mostly infectious diseases and in those of epidemiological transition. It also refers to the organizational structure and components of the systems delivering them, to socio-political choices, limited resources as well as to international cooperation and constraints. Considerable regional and local differences prevail; cultural traditions are numerous while geopolitical situations and socio-economic dependence, brought by economic crises and structural adjustment programs, vary in space and time. Many authors have recognized that health of both populations and individuals is bound up with development, although there is no simple correlation between 'more' development and better health. Developmental improvements are rather linked to 'different' health and changes in prevailing health patterns, from persistent infectious diseases to cancers, cardiovascular and chronic afflictions. They also mean environmental change, demographic ageing of the populations and more complex health issues. Longer average life expectancy brings with it other health and social care problems but also new demands for social support.

Health and health care figures still show tremendous inequality between developed and developing countries in terms of life expectancy at birth (80 years in Sweden against 40.7 years in Rwanda, 48.0 in Ethiopia, 48.6 in Chad, in 2001), under five mortality rate per 1,000 live births (4 in Sweden against 198 in Chad, in 1998), doctors per 100,000 people (299 in Sweden against 2 in Chad, 4 in Ethiopia and Tanzania, in 1993) and nurses per 100,000 people (1,048 in Sweden against 6 in Chad, 8 in Ethiopia, 46 in Tanzania, in 1993). In 1996, 30% of Chad's population had access to health care services, 42% in Tanzania, and 46% in Ethiopia.

Most authors agree that there is an association between a country's redistribution level of resources, the distribution of health services, and the accessibility of health care. "A common consensus in the redistribution debate is that, while economic growth is necessary for improvement of living standards and social services, countries emphasizing redistribution as a major development objective (and not only socialist countries) are characterized by better education,

lower infant mortality, and higher life expectancy than countries choosing growth alone” (Kloos p. 210). The poorest countries’ health care systems can be usefully presented using Roemer’s four tier typology, reaching from the entrepreneurial system to welfare-oriented, comprehensive, and socialist systems. In health care systems following entrepreneurial policies, most physicians work in private (urban) practice and medical schools as well as hospitals are predominantly private (examples are Kenya, Ghana, Zaire, Pakistan, Indonesia). Welfare oriented health care systems are part of a larger welfare state, offer better access to health care and egalitarian social services (for example the State of Kerala, India). In socialist systems finally, such as China, the role of the state is overwhelming, large numbers of auxiliary health personnel ascertain primary health care for the largest numbers and traditional health practices and practitioners are integrated into modern medical services.

Introduced during the colonial era, Western health services were originally operated by the colonial administrators and the missions. After independence, some newly established national health services continued in the same way, while more radical governments adopted socialist approaches. During the initial post-colonial period, urban curative systems expanded up to a certain point while rural areas lacked access to basic care. The health systems of the newly independent states were unable to attain objectives even close to those set for the colonial period. By the 1980s, many countries adopted systems based on the primary health care approach (PHC) proposed at the Alma-Ata conference in 1978 as a means to attain the World Health Organization’s “Health for All by the Year 2000” goal (see later discussion). But PHC has not produced the hoped for miracles and health care systems are still hesitating between dependency, accentuated by financial crises, and integration. The HIV/AIDS pandemic puts them under additional strain. Most of the poorest countries have pluralistic medical systems with elements of traditional healing systems, lay practice, household remedies, quacks, and Western biomedicine. Traditional medicine is widely used, and may even constitute the only health resource in some places, although it has not yet been integrated nor recognized by modern medicine, particularly in Africa. With a few exceptions, traditional birth attendants are still the only component of traditional medicine that is widely used and recognized in national health care systems.

After a general and chronological overview of the development of health care systems and the situation in Africa and Latin America, follows a brief discussion of the primary health care strategy adopted to reach WHO’s ambitious goal of “Health for All,” of

the role of traditional medical practices and their integration into modern medicine and of the attention given to women and health care.

## Development of Health Care Systems

Group consciousness for the need of health care can be traced back to earliest societies, from the high esteem in which medicine men or shamans were held in tribal societies, to the dietary and sanitary rules of the Hebrews and to the policy to appoint physicians for the poor in classical Greece or to attend to the slaves in Rome’s *latifundia*. In medieval Europe, the sick turned for help to the Church and its monasteries. The rise of universities in the growing cities and the training of physicians during the Renaissance established independent practitioners. Health care had a price and the guilds introduced the idea of insurance as a collective aid to the sick, before humanitarianism became a social doctrine with the beginning of industrialization and the first public health laws appeared in mid-nineteenth century. They brought gradual access to health care services but also increased sanitary control of individuals and populations.

Czarist Russia established the *Zemstvo* system by 1865, which offered health care to the peasant population and was financed through taxes, levied at the district level. In Bismarck’s Germany, compulsory insurance for medical care and disability for those on the labor market was introduced in 1883, a model followed by other countries and gradually extended towards social security and employer liability for industrial accidents. In Africa and Asia, the colonial medical systems created first for the European settlers and the military were later also directed either towards workers in particular fields or, at minimal expenditures, to the native populations.

At the time of World War I, the basic structure of health care services was in place. During the interwar period, the conception of a social responsibility for health care is reinforced by the International Labor Organization’s call for peace through social justice. Medical advances lead to increased specialization and the proliferation of hospitals. After the Great Depression, social insurance expanded in European countries. In the United States, the Social Security Act was adopted in 1935, accompanied by the Blue Cross movement for voluntary insurance.

After World War II, Britain’s Beveridge model, based on national taxes and intended to protect those in greatest need, led to complete health coverage for all and access to health care was considered a citizen’s right. France followed, although with a

different indemnity payment system, while Germany and other countries maintained the model of compulsory insurance through *Krankenkassen*, introduced by Bismarck. Australia and New Zealand adopted similar models and Canada went stepwise from compulsory insurance and special programs to universal hospital care coverage. The Eastern European countries slowly converted to the soviet model.

In the developing countries, India first considered public health coverage in 1946; but progress was slow except for insurance plans for certain workers in the urban centers of Bombay, Delhi, and Calcutta, while rural areas were left behind. In the post-war years, there were efforts in other parts of Asia and in Africa towards collective organization of health care. Physicians and other health personnel need to be trained, hospitals built, but resources are extremely scarce. In Latin America, health insurance for miners and certain groups of industrial workers covered during this period was only a small fraction of the population.

The creation of the World Health Organization (WHO) in 1948 was a major event. From the beginning, its mandate of “the attainment by all peoples of the highest possible level of health” marks a new era in international public health policy. The multiple functions related to WHO’s goal of preventing, controlling the spread, and curing disease follow a new conception of health. As outlined in its Constitution, health is not only the absence of disease or infirmity but depends on many interrelated social, economic, and environmental factors that have to be considered. WHO is a major player among the development agencies, notwithstanding frequent political controversies and funding problems with member states. Among many other activities, WHO offers technical assistance to governments in strengthening effective national health care services.

### Health Care Systems in Africa

Health indicators for Africa still show an alarming situation. After independence and during the 1960s, the eradication of epidemic and endemic diseases mobilizes WHO, UNICEF, and different nongovernmental organizations (NGOs) whose actions have a stimulating impact on health care development in most countries. Health care services become a political priority during election campaigns, a factor that amplifies the unequal distribution of health facilities left by the colonial administrations, in spite of egalitarian programs stated in national plans (Iyun). During the 1970s, promising developments such as the training of health care workers and the establishment

of new facilities are under way, with an emphasis on mother and child care. Several countries (Benin, Ghana, Nigeria, Sudan, and Zambia) provide for free health care for children and experiment with “flying doctors” to reach rural areas. The health care systems are however weak. They dramatically lack the needed resources and most of the allocated funds are used to cover salaries, leaving little for medicines and other essential material. By the end of the 1980s, faced with high population growth rates, African governments could not cope with the increasing health care demands and costs. At the same time, the structural adjustment programs imposed by the IMF and the World Bank forced African countries to reduce their public expenditures, which translated into even less funding for health care and other social programs. This context was far from favorable to implement WHO’s primary health care approach, even more so as the economic crisis causes a “brain drain” of qualified health personnel and the HIV/AIDS pandemic takes catastrophic proportions. The result is that “health care is in shambles in Africa” (Iyun 259).

### Health Care Systems in Latin America

Latin American countries such as Argentina, Brazil, Chile, and Uruguay have had social and health care services for specific groups since the 1920s. Under the pressure of labor unions and political movements, expensive privileges held by a few were gradually eliminated by the 1960s, the health care systems were unified and the health care coverage extended. Social security programs were also promoted as a factor of social stabilization. In Mexico, Columbia, Peru, and Venezuela, the health care systems were introduced during the 1940s, influenced by the British Beveridge model of universal coverage. Different types of health care systems can interact in Latin America. Private health care services, paid directly or by private insurance for those who can afford it, exist along with public health services financed by the state through taxes, for those who are not covered by the social security system. The social security health care approach, based on Bismarck’s model and financed by contributions from the state, employees and employers, is less adapted to the Latin American situation where most workers are independent or in agriculture. In Cuba, Nicaragua, Haiti, and the English speaking Caribbean, the public health care system prevails, while Argentina, Brazil, Costa Rica, Mexico, Panama, Uruguay, and Venezuela have work-related social security benefits for the majority.

Examples of countries with mixed systems are Bolivia, Colombia, Ecuador, El Salvador, Guatemala, Honduras, Paraguay, Peru and the Dominican Republic. In many countries, however, the financial stability of the health care systems is fragile, due to high unemployment or lack of political will. The economic crisis and the related reduction of public expenditures since the 1980s have affected the health care systems and the health of the populations. Noteworthy is a particularity of the Latin American health care situation: physicians outnumber nurses (Curta de Casas). The number of private hospitals increases continuously since the 1960s and expensive curative medicine and an excessive use of medicines predominate.

### **Health-for-All and the Primary Health Care Approach**

The joint WHO and UNICEF conference held at Alma-Ata (USSR) in 1978 established the principles of primary health care (PHC), which was adopted as the major strategy to achieve WHO's then called "Health for All by the Year 2000" goal. The time limit "by the year 2000" was obviously too ambitious, but the general policy of Health-for-All has been revised and reaffirmed by WHO in 1998. The proposed strategy was considered revolutionary as it recognized explicitly that health promotion could not be attained without improving socio-economic conditions and alleviating poverty. It enlarged the dominant medical perspective to environmental, social, political, and economic determinants of the health of individuals and populations. The PHC proposition was inspired by successful local and national initiatives such as in China, Cuba, and Kerala State, India. They were evidence that higher levels of health are achievable when political will is committed to egalitarian principles of social justice and equity rather than to economic growth alone. The Chinese model in particular showed the importance of preventive measures, community participation, and decentralized health care services, with the famous "bare foot doctors" bringing health care to rural communities.

PHC is neither the equivalent of primary medical care nor of health services for all. Its purpose is to reach every human being, particularly those in greatest need, by establishing a continuous relationship between the health sector, individuals, and families. The PHC approach, as adopted at Alma-Ata, aims at the equitable distribution of resources and access to essential care for everyone. It recognizes that in order

to attain the highest level of health, a concerted effort in all fields of human activity is needed. Health promotion and disease prevention are considered as essential as curative care, which has to be based on scientifically sound technology within the limits of the affordable. Individual and community participation in the local development of health care is a right as well as an obligation. Community development is viewed as both a management tool to reform health service delivery systems and a means of empowerment. Although the latter might seem rhetoric to some authors (see Asthana), numerous successful health promotion experiences and advocacy initiatives in developing countries are documented (see Dillon and Philip), supported by communities, the media, NGOs, university researchers, and the international organizations.

It is difficult to evaluate PHC and the Health-for-All strategy in general, as there are social, economic, ecological, political, biomedical, and management aspects relevant to many countries on the six continents with countless cultures and communities. The strategy has without doubt brought achievements and provoked fundamental changes if not a social revolution in health care development. Equity as its essential feature calls for positive developments in education, agriculture but also employment, environmental protection and absence of war and civil strife. Female education and increased autonomy in some places show the possible synergy between health care and education, although the overall illiteracy and poverty indicators are still alarming. In Latin America, the primary health care approach adopted also by the Pan-American Health Organization (PAHO) has led to the emergence of a new model of local health systems, *systemas locales de salud* (SILOS), where the community participates in planning, implementation and evaluation. SILOS are conceived for geographically defined populations. PHC in Latin America has however to cope with large indigenous populations distinguished by ethnic, religious, and economic differences (Curta de Casas). Another example is India, which preceded the Alma-Ata declaration with its 1975 Report on Health and Family Planning in which it rejected the Western medical perspective, because of its over-professionalization and excessive costs. India opted rather for a primary health care approach with locally chosen semi-professional community health workers and trained volunteers. Their numerical increase, from 67 in the 1950s, to 23,000 in the 1990s gives a measure of the impact of primary health care. But great differences still exist from state to state, with the state of Kerala often being singled out as the most successful example, despite economic difficulties.

It should also be noted that critiques addressed to the primary health care strategy—and they are numerous—have exposed the approach's condescendence as well as the emphasis placed on prevention, which leaves numerous unpreventable illnesses without necessary treatments.

### **Integrating Traditional Medicine**

The 1978 Alma-Ata declaration insisted on the essential contribution of traditional medical knowledge and practices to primary health care, but the debate about integrating traditional medicine and its practitioners into modern national health care systems is ongoing. The contemptuous colonial attitude towards traditional medical practices considered as unscientific is still perceptible, even if they are in many parts of the world the only affordable health care available. Medical schools continue to offer training oriented towards the scientific medical model in which cultural variations have little room. The result is that professional and political acceptability of traditional medicine goes from outright prohibition over some tolerance to exceptionally formal recognition with state support. This is the case for example in China and to a lesser degree in India. The Indian Congress party indeed recommended early on, in 1918, to secure the advantages of the traditional Ayurveda, Unani, and Siddha systems, but the preferences of Nehru for the Western scientific health care indicate that the official position was debated for some time. The primary health care approach adopted during the 1970s integrated a combination of allopathic and traditional Indian systems of medicine, based on Ayurveda, Unani, Siddha and homeopathy to provide affordable and culturally acceptable care in rural areas. The professional position of traditional practitioners stays nevertheless inferior. They are perceived by medical practitioners as auxiliaries to be supervised rather than as professionals, although they are trusted and esteemed in the communities they serve. In most countries, the two systems coexist and integration is limited to obstetrics. China is the best example of a real institutional integration of traditional and modern medicine through national health care services, with professionalization and training of practitioners in both fields. WHO has developed guidelines and principles covering a wide range of activities in order to better integrate traditional medicine, such as ways to improve the protection of patients from charlatans and encouraging research to assess the quality of traditional medicines and treatment.

### **Health Care and Women**

International policies about health care for women have traditionally been oriented towards reproductive health and maternal and child care and welfare, as expressed since 1946 in the Constitution of the World Health Organization. Many programs have been developed to reduce maternal and infant mortality and morbidity and such activities include family planning, training of traditional birth attendants, nutrition, and health education. WHO has dedicated the 2005 World Health Day to the theme "Make every mother and child count." The vulnerability of women during pregnancy and childbirth in developing countries is still a major preoccupation and cause of illness and death. Yet women also play a crucial role as health care providers in their families and communities and there is a growing awareness about the central contribution of women to economic development and environmental protection, beyond their reproductive lives. As such, women in the developing world are also exposed to hazards from working conditions in the formal and informal sectors where they try to make a living. They are confronted with domestic, traditional (female genital mutilation), sexual and political violence, migration, with sexually transmissible diseases, particularly HIV/AIDS, with changing family structures and "post-reproductive" or widowhood discrimination. The Fourth World Conference on Women in Beijing, in 1995, contributed to raise public awareness about health and health care problems of women in the developing world. Many authors suggest that research is needed to better understand women's multiple health related roles in developing countries.

### **Perspectives**

Health implies complex interactions between humans and their social, physical, and biological environment. The impacts of environmental changes as determinants of health have to be assessed. Health care systems in developing countries are not only challenged by the "pervasive factor of poverty" (Phillips and Verhasselt 310) due to the consequences of economic crises and structural adjustment programs. They also have to face threats from the resurgence of infectious diseases, aggravated by the HIV/AIDS pandemic, and the epidemiological transition to more chronic diseases. Children, women, the handicapped, the mentally ill, and the elderly continue to be the most vulnerable groups. Growing numbers of refugees or internally displaced persons and of victims of conflict or political

violence have particular health care needs. The international agencies have recognized the right to essential health care for all human beings and adopted strategies to attain this goal, with varying results.

## HELSINKI FINAL ACT ON HUMAN RIGHTS (1975)

The Helsinki Conference on European Security was signed on August 1, 1975, by the High Representatives of Austria, Belgium, Bulgaria, Canada, Cyprus,

former Czechoslovakia, Denmark, Finland, France, the former German Democratic Republic (GDR), the former Federal Republic of Germany, Greece, the Holy See, Hungary, Iceland, Ireland, Italy, Liechtenstein, Luxembourg, Malta, Monaco, the Netherlands, Norway, Poland, Portugal, Romania, San Marino, Spain, Sweden, Switzerland, Turkey, the former Union of Soviet Socialist Republics, the United Kingdom, the United States of America, and the former Yugoslavia.

Today, a total of fifty-four nations are signatories to the Final Act and as such are members of the Organization for Security & Cooperation in Europe (OSCE), a leading international organization promoting democracy and human rights, among them the Democratic and Popular Republic of Algeria, the Arab Republic of Egypt, Israel, the Kingdom of Morocco, the Syrian Arab Republic, and Tunisia.

The document was at the time considered a milestone of detente between the East and the West. It was perhaps the most influential international agreement since the establishment of the United Nations (UN), which continues to have an influence on international politics. Envisioned as a conference to recognize the existing borders and to institutionalize the peaceful coexistence then present in the world, the Conference's accomplishments included recognizing those borders, assuring the Soviet bloc that the West harboured no aggressive designs against them, establishing a mechanism to resolve disputes, and encouraging ongoing arms control talks. Perhaps the most significant of the accomplishments was the elevation of basic human rights to treaty status, thus placing human rights and fundamental freedoms on the international agenda and also creating a framework for bringing world attention on human rights abuses. In 1982, in order to maintain a control on the implementation of Human Rights, the representatives of a number of the Helsinki committees held an International Citizens Helsinki Watch Conference. These committees played an important role at defending the human rights in the communist countries, but haven't been active since the Berlin Wall was destroyed in 1989. This act has two main purposes: the achievement of peace and security.

The document establishes as a condition for all member-countries "the promotion of fundamental rights, economic and social progress and well-being for all people." The acts claims that peace cannot be achieved without increasing common and effective efforts towards the solution of major world economic problems such as food, energy, commodities, monetary and financial problems, and therefore emphasizes the need for promoting stable and equitable international economic relations, thus

contributing to the continuous and diversified economic development of all countries. If peace and security are the *ends*, then solidarity and cooperation are the *means*. This means to have a critical perspective upon competition and, fundamentally, the market as a means.

The Act's most significant objectives are:

- To respect each other's right to determine its laws and regulations, irrespective of their political, economic or social systems as well as of their size, geographical location or level of economic development;
- To settle disputes by peaceful means in such a manner that does not endanger international peace and security;
- To refrain from any intervention, direct or indirect, individual or collective, in the internal or external affairs falling within the domestic jurisdiction of another participating State, regardless of their mutual relations;
- To refrain from making each other's territory the object of military occupation or other direct or indirect measures of force. No such occupation or acquisition will be recognized as legal.
- To promote and to encourage the effective exercise of civil, political, economic, social, cultural and other rights and freedoms, all of which derive from the inherent dignity of the human person and are essential for his free and full development. This means that the member States have recognized their obligations to assure their inhabitants the right to receive health, education, decent housing, in sum, a human future.

The respect for the human rights is an essential factor to achieve peace, justice and well being. It is also necessary to ensure the development of friendly relations and cooperation *among the member States as well as among all States*. As a matter of fact, if human rights were, not only among the member States but worldwide respected, there would probably be no danger of wars. This is desirable and also possible as the Final Act established that the States commit themselves to constantly respect these rights and freedoms in their mutual relations and endeavour jointly and separately, including in co-operation with the UN, to promote universal and effective respect for them. The States that signed the Act realized that the benefits resulting from increased mutual knowledge and the achievements in the economic, scientific, technological, social, cultural, and humanitarian fields were not enough if they were not obtained worldwide. The authentic peace and security would only be accomplished whenever those benefits gained a worldwide

range. Therefore, the member States claimed that they would take steps to promote conditions favourable to making these benefits available to all and also that they would take into account the interest of all in the narrowing of differences in the levels of economic development, and in particular the interest of developing countries throughout the world.

The recognition that this is an obligation as for governments, institutions, organizations, and persons has a relevant and positive role to play in contributing towards the achievement of these aims for cooperation.

One of the most important results of this Act was its contribution to the strengthening of peace and security in the world by the treaties of *disarmament*. Leaving the conventional aspects of military security aside for the moment, the Final Act of Helsinki was then a unique document inasmuch as it featured issues relating to economic development, environmental and cultural affairs, specifically recognising that human rights and fundamental freedoms formed one of the core issues of the Act's comprehensive concept of European security. However, the environmental situation has worsened, wars still occur and take many innocent lives, human rights still suffer violations not only in non-developed countries. We therefore need to have the statements of declarations such as this one are effectively put into practice.

### HEZBOLLAH

An exact date for the emergence of Hezbollah (Party of God) is impossible to verify, however, its origins lie intellectually in the 1979 Iranian revolution and practically in the 1982 Israeli invasion of Lebanon. In

response to the latter event, a group of like-minded Shi'a coalesced around a nine-man committee of members from Islamic Amal (an Islamist faction of the parent Amal movement), the Da'wa party (an international Shi'a group that emerged from the legal schools of Najaf in the 1960s) and independent Shi'a jurists. The influence of Iran on the organisation was then, and remains, significant. Iranian Revolutionary Guards trained the original Hezbollah militia, has funded Hezbollah, and the party defers to the Iranian Supreme Leader on all matters of Islamic jurisprudence. Originally acting as an umbrella organisation for the founding Shi'a groups, Hezbollah did not officially announce its existence until the production of its political manifesto in February 1985. The manifesto stated that the organisation "was convinced of Islam as an ideology and a system and (we) call on everyone ... to adopt it as a religion and to abide by its teachings whether on the personal, political or community level." In addition to this, it denied the right of Israel to exist, and claimed that the United States was Israel's spearhead into the Islamic world.

Hezbollah's political outlook has evolved from its initial advocacy of the requirement for a revolutionary systemic change to create an Islamic state within Lebanon along Iranian lines, to a position today where it publicly acknowledges the unique social makeup of Lebanon and seeks a transition to an Islamic state by political evolution. Central to this pragmatic approach was the decision, following discussions with Iranian officials in Tehran in 1989, to begin a dialogue with the other Lebanese communal groups and to enter mainstream Lebanese politics. As a consequence, they contested the 1992 parliamentary elections and have done so ever since. Whilst electorally successful, in a parliament where political representation is distributed according to religious identity, their ability to capture the twenty-seven parliamentary seats on offer to the Shi'a community is limited by the fact that Syria directs them to run on joint electoral tickets with Amal, the other Shi'a sectarian political party.

Hezbollah is best known for its military wing, the Islamic Resistance, which was instrumental in forcing the withdrawal in 2000 of the Israeli forces occupying the south of Lebanon. The military wing has received generous financial and logistical assistance from Iran and general encouragement from Syria. The success of the Islamic Resistance was also assisted by the fact that, unlike the other party militias from the civil war era, Hezbollah was allowed to remain armed to continue the fight against Israeli forces. In the formative years of the organisation, Hezbollah was also linked to the kidnapping and detention of Western hostages,

a claim that the party denies. More recently, it has been accused of having links with a number of militant Palestinian movements.

Hezbollah's non-military operations include a wide range of welfare services for the poorer Shi'a areas, which may experience shortfalls in government services. Through its Islamic Health Committee it operates hospitals and clinics, and it also runs schools and supports agricultural enterprises amongst and for the Shi'a community. These social welfare initiatives, as well as providing practical benefits to its recipients, have also been a way of establishing a client base from amongst the larger Shi'a population. The party understands well the power of information and as a consequence it is also active in all forms of the media—it runs the *al-Manar* television station, the *al-Nour* radio station, as well as newspapers and magazines.

Despite Hezbollah's parliamentary performance, its support nationally is limited to the three areas where Shi'a dominate—the Bīqā' Valley, South Lebanon, and the southern suburbs of Beirut. Its limited geographic support base, as well as its Islamist character, provides the party with a dilemma in achieving wider popular political support.

Hezbollah represents an important step in the political development of the Shi'a Muslims of Lebanon. It has illustrated how a sectarian political party with allegiances outside the country can successfully transition from a purely military organisation to become a responsible domestic political player. In doing so it has ensured its long-term viability as a political entity by adopting a pragmatic political course of action, so that it can survive once the justification for its armed wing diminishes, or political pressure forces it to disband this element. Its avowedly sectarian composition, as well as its refusal to renounce totally its desire for an Islamic state, however, will continue to limit its popular appeal amongst Lebanese of all religious persuasion for the foreseeable future.

## HINDUISM

Hinduism is one of the major religions of the world and one of the oldest. It is speculated that the rudiments of the religion were introduced from migrants around 1500 BCE, it probably adopted and assimilated some features of the local religions and supplanted them. Hinduism later spread to other parts of South East Asia and significantly influenced their cultures. Later, during the British regime, many Hindus migrated to other colonies as indentured laborers and settled there permanently. Recently, some Hindus have migrated to the United States, United Kingdom, and other parts of the Western world. Many Hindus have migrated to India from Pakistan and Bangladesh as refugees. According to the Indian Census of 2001, 80% of the Indian population or 827 million were classified as Hindus. It is estimated that approximately an additional 30 million or so reside outside India.

Hinduism is often aptly described as a way of life rather than a religious doctrine. Of all the major religions of the world, Hinduism is the least prescriptive or demanding, though there are many injunctions, inter-caste marriage is one example. Hinduism is all-pervasive and a major influence in all facets of social and political life in India. Unlike other major religions, Hinduism is basically non-hierarchical and structurally flexible. It does not have a single religious text or an individual as the authoritative source on which the religion is based, thus giving rise to a high level of multiplicity and complexity of views. Unfortunately, there are many myths about the religion. Proselytizing is not one of its tenets, and there are few conversions to Hinduism.

The ancient Hindu religious literature was written in Sanskrit and includes the Vedas and Upanishads, probably dating from 1500–300 BCE, which are considered as divinely revealed. Interpretations and commentaries continue to be written on this literature pertaining to the nature of ultimate reality and nature of the *atman* (self or soul) and their confluence, with three major variant themes. The other segments of the religious literature include two epics, Ramayana and Mahabharata, which describe the life and adventures of divine heroes and *Puranas* and *Sutras* that contain religious mythologies and deal with social and religious issues.

Hinduism can be depicted as a polytheistic religion in practice because thousands of gods, goddesses, deities (divine beings), animate, inanimate sacred symbols, and even ancestors are offered prayers and homage, though some scholars argue that basically the religion is monotheistic. Creation and destruction are among the two major functions of the gods and deities.

There have been many efforts to reform or break away from Hinduism for three millennia and have resulted in the birth of new religions such as Buddhism, Jainism, and Sikhism. Many other social and religious reform movements are of much more recent origin. Often the new movements were incorporated within the fold of the Hindu religion as new sects, castes, or branches. Hinduism has withstood the conquests from Alexander, the Moguls, Portuguese, French, and the British, as well as influx of other religions such as Islam and Christianity and conversions to those religions. The religion has proved to be rather resilient in the face of many historical challenges from within and without and is also currently facing new and serious challenges and transformations because of urbanization, higher levels of education, secularization, democratic process of government, Westernization, globalization and technological developments in India and abroad. Consequently, ministers, governors, and presidents of India have been recruited from the ranks of women, lower castes, and other minorities.

Hinduism abounds with festivals or celebrations associated with different deities, saints (sometimes from a different religion), mythical or actual events, seasons, occupations, and regions. Though temples were scarce in the Vedic period, now there are a large number of temples or places of worship in India, from the very modest makeshifts to the most magnificent architectures. Hindus observe many *Sanskaras* or sacraments, which are rites of passage and marriage is considered the most important one. The essence of Hinduism is interpreted in various ways and it is generally agreed that there is more than one *marga* (road or path) to attain the religious goal of Moksha (liberation, salvation) from the cycle of birth and death as Hindu religion subscribes to the idea of rebirth or reincarnation. Soul is eternal and takes on different forms of life. Human beings are not born sinful but can commit *papa* (sin) and also accumulate *punya* (merit), thus, the higher the merit, the higher the level of rebirth in the order of life. Similarly, moral and spiritual values are emphasized throughout the Hindu religion. The Hindu cosmology and worldview are also quite varied and complex. The life cycle of the planet is usually divided into different *Yugas* (eons) and life renews itself anew from the destruction in each of the cycles.

Everyone is expected to abide by and uphold their Dharma (literally translated as religion), the term has broader connotations that include cosmic and spiritual laws that are enjoined. Karma (action or result of actions, preordained or otherwise) refers to the types of deeds that one is engaged in or accumulation of the

result of our deeds. The traditional Hindu social structure and the social order were based on the division of Hindus into four *varnas* and term *jati* (caste) is tantamount to a subdivision of the original *varnas*. The term *caste* is a European description of the Hindu social order. Caste is ascribed at birth and traditionally the lifelong occupations and expected duties of each individual are based on the caste into which one is born and is perpetuated by caste endogamy. The caste of an individual can be rarely changed and was rigidly adhered. Traditionally, someone from the upper castes was not supposed to accept food from the lowest caste members as it affected their purity.

The practice of Hinduism has significantly changed over the centuries. The British codified Hindu law in the nineteenth century. Missionary activities in India started from 1813 on and have been a major source of threat and friction, especially in tribal areas. Hindu religion is also gaining more importance and a political party affiliated with it has been in power in some states and at the federal level. The Hindus in India still have to overcome the social inequality between the two genders, face the egregiousness of the caste system in practice, injustices against the tribal groups, and surmount communal disharmony.

Hinduism has been basically tolerant of other religions and cultures because it is non-dogmatic, non-violent at the core, and based on moral and spiritual values. The impact of the religion is evident in all walks of Hindu life. Hinduism has provided a very rich heritage for humanity in many facets of life and learning in spite of its many drawbacks, and continues to do so.

### HIRSCHMAN, ALBERT

Albert Otto Hirschman's ideas on economic development in the Third World influenced generations of scholars, students, and policymakers in the post-World War II world. Hirschman argued that broad theories of economic development were not applicable to the nations in the developing world. Rather than applying conventional theories of economic development to the developing nations, Hirschman argued that economic development should be analyzed on a case-by-case basis.

Born in Berlin in 1915, Hirschman was educated at the University of Berlin (1932–1933), the Sorbonne (1933–1935), the London School of Economics (1935–1936), and the University of Trieste (1936–1938), where he was awarded his doctorate in economics. In 1940, Hirschman joined the French Army. In 1941, after the Germans defeated France, he fled to the United States. He was a research fellow in international economics at Berkeley from 1941 to 1943. In 1943, he joined the US Army. From 1946 to 1952 he was an economist for the Federal Reserve in Washington, DC. He served as an economic advisor and consultant in Bogotá, Colombia, from 1952 to 1956. After leaving Colombia, he taught at Yale (1956–1958), Columbia (1958–1964), Harvard (1964–1974), and Princeton (1974–1985). Since 1985, Hirschman has held emeritus status at Princeton.

In his first book, *National Power and the Structure of Foreign Trade* (1945), Hirschman explained the correlation between economic and political power. He argued that economic policy was often controlled by political exigencies. As such, his book caused many to question the implementation of the Marshall Plan in Europe. It was in Colombia, however, that Hirschman began to formulate his theories on Third World development. In *The Strategy of Development* (1958), Hirschman criticized previous theories of economic development that had been applied to Latin America. He argued that imposing broad economic development theories on the developing nations was inappropriate. Rather, developing nations should develop individual development strategies that utilize their own unique resources and structures. Hirschman also emphasized the importance of forward and backward linkages to national development strategies.

In recognition of his extensive scholarship and teaching, Hirschman has been granted honorary degrees from Rutgers (1978), University of Southern California (1986), University of Turin (1987), Free University of Berlin (1988), University of Paris (1989), University of Buenos Aires (1989), University of Campinas (1990), Georgetown (1990), Yale (1990), University of Tier (1990), Universidad Internacional

Menéndez Pelayo, Santander (1992), University of Coimbra (1993), University of Paris-Nanterre (1993), Williams College (1993), University of Naples (1999), University of Complutense (2001), and Harvard (2002). In addition, he has been awarded the Order of San Carlos from Colombia and the Order of the Southern Cross from Brazil.

### HIV/AIDS

The global spread of the human immunodeficiency virus (HIV), which causes a breakdown of the immune system, has increased to an alarming stage. In 2003 alone over 5 million people were newly infected with HIV worldwide. Of these 4.2 million were adults and 700,000 children below the age of 15 years. This brings the number of people living with HIV/AIDS around the world to over 40 million. In the same year, more than 3 million people died of AIDS worldwide. Out of these, half a million were children below the age of 15 years. All in all, after its classification in 1981, HIV/AIDS has killed over 20 million people worldwide. While HIV/AIDS is resident in humans in every region of the globe, infections are concentrated largely in countries least able to afford the care for infected people. More than 95% of people with HIV live in poor countries, and the World Health Organization (WHO) estimates that by the end of 2020 HIV will be responsible for 37% of all adult deaths from infectious diseases in the developing world.

While the number of people living with HIV/AIDS continues to increase across the globe, sub-Saharan Africa is still registering the highest prevalence. In 2003, an estimated 3 million people in the region became newly infected, 26.6 million in this region were living with the virus, and AIDS killed approximately 2.3 million. The estimated number of deaths by the end of the decade is 20 million. This region also has 50 million orphaned children, and more than a third will have lost one or both parent to AIDS.

The fastest and most recent epidemics are experienced in Asia, the Pacific, Eastern Europe and Central Asia, China, Indonesia, Papua New Guinea, Viet

Nam, as well as in several Central Asian Republics, the Baltic States, and North Africa. In Russia, which has a population of 145 million, there are millions of people infected and it has the world's fastest-growing infection rate. India has more than 5 million people living with the virus, and it will likely soon overtake South Africa as the country with the greatest number of cases in the world.

### HIV/AIDS and Development: Impact on Social Order, Economy, and Politics

HIV/AIDS has an impact not only on individuals and communities but also on politics and economy, and thus, on development as a whole. The AIDS pandemic is destroying the lives and livelihoods of millions of people around the world, and the situation is worst in regions and countries where poverty is extensive, gender inequality pervasive, and public services weak. Thus, HIV/AIDS threatens development achievements that local and donor governments, citizens, non-governmental organization, and international agencies have worked to achieve. In many sub-Saharan countries, AIDS has increased infant mortality and reduced life expectancy to levels not seen since the 1960s. Infant and child mortality are expected to double and even triple early in the next century. The AIDS pandemic overwhelms underfunded and inadequate health delivery systems in much of the developing world, and it could undo health, social, and economic gains by nations across the world. It also represents a significant increase in government costs. Its increased incidence among military populations threatens security, and its impact on the widening gap between "haves" and "have nots" (in local and global context, in first-world/third-world relations, and in gender relations) challenges the values of democracy as well as the principles of human rights, which are all inextricable elements of policy development and implementation.

Africa, for example, provides ample proof that AIDS impacts economics. The disease claims adults in their most productive working years. The price in lost productivity in training replacements and care provision once a worker falls sick is crippling. When tens of millions of working-age adults become sick and die, the economic outputs and productivity of many countries' suffer. Because HIV is still predominantly transmitted sexually, AIDS afflicts many people in their 20s, 30s, and 40s, during their childbearing as well as their most economically productive years. In Zambia and South Africa, income in households of

AIDS sufferers has declined by 66 to 80%. The International Monetary Fund (IMF) predicts that AIDS may exact an annual toll of as much as 2% on economic growth in sub-Saharan Africa. The World Bank cautions that South Africa's economy could collapse in a few generations if the AIDS crisis is not averted. AIDS could take a similarly heavy toll on China's economy as well as other Asian economies. Similarly grim economic outlooks are predicted for Eastern Europe. Regionally, a severe HIV/AIDS epidemic will worsen poverty and increase inequality because low-income households will be more adversely affected by an HIV/AIDS related illness and death. Decisions made at the household level to reallocate resources (such as time, labor, housing, and land) to meet costs related to the disease may alter the distribution of income in society and create new groups of poverty. AIDS also exacerbates poverty and inequality by increasing the number of children who lose one or both parents. Embattled populations are becoming progressively less productive and are burdened with increasing numbers of children orphaned by AIDS. As a result, development in these countries is adversely affected, and they will require an increase in economic and medical assistance from the community of developed nations and create additional pressures on transfers of resources, cooperation, and bilateral relations between developing and developed nations.

AIDS in Africa, Asia, and Eastern Europe is taking a center stage also in the global political arena as Western governments became increasingly concerned that the epidemic could lead to the emergence of radicalism and the undermining of newly adopted democratic systems. HIV/AIDS will breed suffering, want, and resentment that can lead into social and economic instability. In Africa, military HIV infections rates are much higher than in the civilian population and as the disease progresses, militaries will suffer from inability to meet their commitments and may be indifferent for their responsibilities. The epidemic may also threaten security in countries like Russia, China, and India, which all have nuclear weapons.

HIV/AIDS hinders development because it (as well as other infectious diseases) causes poverty, intrastate violence, and political insecurity, all of which have long-term negative effects on regional, and global economic, political, and social stability. Instability, for its part, damages international relations and hinders international political and economic cooperation and national development efforts particularly in the poor countries. HIV/AIDS has then most negative effects on social, economic, and political development in the third world countries. It not only decreases

economic productivity by impeding the formation and consolidation of human capita, and by chocking the households as well as the private sector and the public sector with the increase in morbidity and mortality rates, but it also leads into income inequalities by stigmatization and in general to marginalization of large segments of society. All this leads into a gradual erosion of social capacity of the poor nations. It also brings degeneration of the state capacity and even further increases poverty. This enforces the vicious circle of poverty and HIV/AIDS. The combination (lack of resources, malnutrition, vulnerability to other diseases, ignorance), for its part, contributes to increasing governance problems and social development in affected states and regions. In extreme cases it can contribute to political destabilization and thus, have even wider political impacts on human security. When disease takes over all aspects of our daily lives, and in the end our whole lives, when there is no effective treatment, cure, or care available, people lose their hope for life and for better future. People are more easily led into offences against humanity, when they have no expectations to live long enough to be brought before the law, to trial and punishment or compensation.

The spread of AIDS, particularly in poor societies, on the one hand, can lead to anarchy, but on the other hand, its control in the name of public health can sometimes be seen as paternalist and/or totalitarian manipulation of people's freedom. In relation to AIDS, there is still a tendency to isolate the infected and ill in order to protect the society as a whole, to avoid public panic, and to prioritize scarce resources available the danger is in wider inequality, discrimination, and violation of human rights. This brings problems particularly to the ability of transitional states to consolidate democratic and effective systems of governance needed to deal with the problems to start with. However, the same tendencies are also present in the international relations related to the issue of global, distributive justice.

### **HIV/AIDS, Human Rights, and Gender**

HIV/AIDS is probably the most challenging health problem of our time. In addition to the challenges posed by limited resources, the current scientific knowledge about HIV infection and AIDS is incomplete and many research findings are controversial and inconclusive. Moreover, lack of a vaccine and fully effective treatment, as well as the difficulties in preventing modes of transmission, have accentuated the magnitude and severity of the HIV/AIDS

epidemic. This epidemic has created not only difficult socio-economic and medical issues, but also ethical and legal questions in relation to global and local development and national and international issues of cooperation and social justice.

In general HIV/AIDS is related to the human rights issues in international development. Not only are the “right to life” and “right to health” violated by the infection, but also other human rights principles such as right to equality are affected. The main human rights principles relevant to HIV/AIDS epidemic are life; the highest attainable standard of physical and mental health; non-discrimination; equal protection and equality before the law; liberty and security of person; freedom of movement; privacy; freedom of opinion and expression and the right to freely receive and impart information; freedom of association; to work, marry, and found a family; an adequate standard of living; social security, assistance and welfare; to share in scientific advancement and its benefits; to participate in public and cultural life; to be free from torture and cruel, inhuman, or degrading treatment or punishment. While these principles should protect those infected by HIV/AIDS, many of them are violated particularly in the poor countries, which are hardest hit by the epidemic. The lack of respect for human rights in general continues to increase vulnerability of individuals as well as particular groups of people to the virus. Individuals or groups who suffer from discrimination to start with and whose rights are not protected are both more vulnerable to becoming infected and less able to cope with the burdens of HIV/AIDS. Refugees, migrants, prisoners, sex workers, and sexual minorities may be more vulnerable because in many parts of the world they often are unable to realize their civil, political, economic, social, and cultural rights. Gender inequalities spur on the spread of the epidemic and its disproportionate impact on women. Also the response to the HIV epidemic is hindered due to lack of enjoyment of freedom of speech and association, the right to information and education by infected and affected groups, and the civil society at large due to authoritarian and/or fundamentally religious governments.

From the point of view of development ethics, the moral and legal dilemmas related to HIV/AIDS and development can then be roughly grouped in two categories: (1) those which contain local and global resource allocation dimensions and are thus related to questions of distributive justice; and (2) those which deal with conflicting claims and rights in relation to our social responsibilities. Unresolved issues within the first group include the difficult issues of resource distribution between the competing

demands of prevention among the still-uninfected and medical treatment and support for those already infected and/or impacted by HIV. An additional angle in the relationship between HIV/AIDS and development is the question of the role of international donor agencies and governments. When these groups are called upon for financial support by recipient governments, to what extent is it legally and ethically appropriate for these agencies to dictate conditions, policies, and priorities for the resources, which they provide to the countries most severely hit by HIV/AIDS?

The ethical and legal dilemmas that emerge in the second group of conflicting claims, rights, and responsibilities include the important problem of balancing individual and collective rights, most specifically between one’s right to privacy and the public health imperative to control the spread of the disease. In relation to this, another difficult problem within this category deals with process—to what extent are affected governments obligated to include representation of people living with HIV/AIDS and vulnerable populations (women in general, but also including particularly orphans and widows) in the formulation and implementation of policies that strongly affect their lives?

The issues of human rights protection and democratic participation become most relevant in poor countries in relation to HIV/AIDS. This includes gender inequality, which had led to growing “feminization” of HIV/AIDS. The number of women infected is increasing yearly. Globally, nearly half of all persons infected between the ages of fifteen and forty-nine are women. In Africa, the proportion is reaching 60% and women are considerably at least 1.2 times more likely to be infected with HIV than men. Among young people aged fifteen to twenty-four this ratio is highest. These discrepancies have been attributed to several factors including the biological fact that HIV is more easily transmitted from men to women (than vice versa). As well, sexual activity tends to start earlier for women, and young women tend to have sex with much older partners. Frequently women also have less agency in regards with whom, when, and on what condition to have sex. In many cultures there are also socio-cultural traditions (such as female genital mutilation (FGM), polygamy, widow inheritance, conjugal bonds, and/or few social sanctions on premarital or extramarital sex) which all contribute further to the spread of HIV/AIDS, particularly among women. Because of gender inequality women have less influence in policies concerning HIV/AIDS and women living with HIV/AIDS often also experience greater stigma and discrimination.

## Global Response to HIV/AIDS

Since the HIV/AIDS endemic cannot be solved or even seriously tackled within the borders of one nation-state only, the discussion and action has to be in a global scope with local focus for implementation policies that work in combating AIDS. Most national policies are not or cannot be comprehensive enough, though they cover a variety of issues from gender inequality to prevention of prenatal transmission, employment, and HIV infection, and political/social empowerment. The biggest challenge for legislators is to adopt policies that can effectively limit the spread of HIV without undermining the rights and needs of an infected individual. Such a difficult balance can be achieved only in consultation with policymakers, professional ethicists, medical and health care professional, and representatives of communities that will be most heavily impacted by these policies.

Thus, combating HIV/AIDS in the world scale will require the combined effort of all those able to respond, namely; governments, donors, non-governmental organizations (NGOs), faith based organizations (FBOs), the private sector and the community groups already struggling on the forth line responses. However, initially the international response to HIV/AIDS has been slow and there was a lack of ethical response from the affluent countries with knowledge and resources. Instead the rich countries let the pharmaceutical companies block the access to medicine, and denied the scale of the problem. There was the question of who is the most responsible for the global HIV/AIDS crisis. What is the global responsibility and responsibility of the individual governments of the rich and the poor countries to deal with the epidemic? How to rationalize and prioritize the use of scarce resources available? How to extend the prevention and treatment programs to poor countries, where there may be no dispensaries, hospitals, clinics, professional health care personnel or even clean water?

Recently the United Nations system and partners have endorsed a framework of action to provide guidance to both donor nations and affected governments to respond to the urgent needs of those affected by the pandemic and the global response has expanded widely in the past few years. Domestic and external spending on HIV/AIDS programmes in low- and middle-income countries increased again in 2003, notably in sub-Saharan Africa. Dozens of national AIDS coordinating bodies are now in operation, and growing number of countries (many of them in Africa) have begun extending antiretroviral and other AIDS-related medications to their citizens (UNAIDS/

WHO 2003 and 2004). The cost of antiretroviral (ARV) drugs have fallen by 98% in the past few years, with the result that a life can be saved for less than a dollar a day. Simultaneously political commitment is growing stronger and grassroots mobilization is becoming more dynamic, and prevention efforts are being expanded locally, nationally, and internationally. Nevertheless, ARV treatment coverage remains dismal in sub-Saharan Africa overall, despite recent efforts in countries such as Botswana, Cameroon, Nigeria, and Uganda. The decision by pharmaceutical companies to withdraw their patent suit in South Africa after the mid-April 2001 world protests was an important step toward wider global access to HIV/AIDS treatment. Nevertheless, the drugs are still very expensive for most poor countries and do not reach most of those infected. Thus, WHO (World Health Organization)—the convening programme for HIV care in the UNAIDS, that is, the Joint United Nations programme (with partners such as UNICEF, WFP, UNDP, UNFPA, UNODC, ILO, UNESCO, WHO, World Bank)—is developing a comprehensive global strategy to bring antiretroviral treatment to 3 million people by 2005.

HIV/AIDS is not simply about mustering resources, technological know-how, and collective will to manage and eventually stop the spread of diseases. The political and economic reverberations of HIV/AIDS demand yet broader international and local responses. While the global response to HIV/AIDS is moving into a new phase, the current pace and scope of the world's response to HIV/AIDS falls far short of what is required. Increases in resources and political commitment (both international and those in hard-hit countries themselves) are needed to ensure equitable access to treatment that benefits the poor and marginalized section of societies, especially women. Alongside that huge challenge stands the urgent need to boost prevention programmes. Prevention and wider treatment have to go hand in hand with attempts to increase social justice and gender equality.

## HO CHI MINH

Ho Chi Minh (1890–1969) was the primary founder of the Vietnamese Communist Party and the first President of the Democratic Republic of Vietnam (DRV) (1945–1969). Most scholars credit Ho as being the father of the Vietnamese revolution and the most influential political figure in modern Viet Nam. The youngest of three children, the man who would become Ho Chi Minh was born Nguyen Sinh Cung on May 19, 1890, in a small village in the central Vietnamese province of Nghe Tinh. He was given the name Nguyen That Thanh at ten.

His father, Nguyen Sinh Sac, was a Confucian scholar who had served as an official in the Vietnamese imperial bureaucracy but resigned his post and became an itinerant teacher in protest against French occupation following the Treaty of Protectorate in 1884. Out of hatred for the French, Sac refused to learn French, but he had his son educated at the prestigious National Academy (Quoc Hoc) in Hue. Here Ho learned to speak French fluently. The area was indirectly ruled by the French through a puppet emperor. Its peasants led by traditional dissidents, actively opposed the French presence. In 1908, inheriting his father's rebellious spirit, Ho participated in a series of tax protests, acquiring a reputation as a rabble rouser. It was this experience that left him frustrated with a system that made him a second-class citizen in his own country.

Thoroughly imbued with the French ideals of liberty, equality, and fraternity he yearned to see them in practice in France. He also determined to find out why Western nations had become predominate in the world. He signed on as a cook's helper with a French steamship company and traveled to Europe. In 1911, he arrived in Marseilles as a galley boy aboard a passenger liner. Not long after he briefly took up residence in London. At the end of World

War I, he settled in Paris. He soon became caught up in the whirlwind of Socialist political activities coursing through post-war Europe. Assuming the pseudonym Nguyen Ai Quoc (Nguyen the Patriot), he gained credibility within the local Vietnamese community by coauthoring a petition sent to Allied leaders gathered at Versailles demanding self-determination for all colonial peoples. The rejection of the petition made Ho believe that Western "liberalism" was bankrupt and so, in 1920, he joined the French Communist Party as one of its founding members.

Ho soon gained the reputation as a gifted and hard-working party organizer and, in 1923, was invited to Moscow to be part of the Communist International (Comintern). When Chinese nationalist revolutionary Sun Yat-sen, formed an alliance with the Communist Chinese Party (CCP), Ho and others were sent to Sun's headquarters in Canton in late 1924. Ho received instructions to recruit members from Indochina to act as the basis for an Indochinese Marxist revolutionary party.

In 1925, Ho formed the Vietnamese Revolutionary Youth League comprised mainly of radical Indochinese nationals living in south China. The new group was to train members to be future communist leaders. The League reflected the Leninist strategy of first embracing national independence to gain power and then implementing Communist ideology. For three years, the League focused the Vietnamese revolution on demands for national independence and social justice. In 1925 Dr. Sun had died and two years later, Ho Chi Minh had been forced to flee China and return to the Union of Soviet Socialist Republics (USSR) in the aftermath of Chiang Kai-shek's purge of the CCP from the Kuo Min Tang (KMT) (Nationalist Party) in China. In 1928, the Comintern revised its policy to emphasize class struggle and Marxist proletarian leadership concepts. This split the League into two rival factions.

In 1930, Ho traveled to Hong Kong via Thailand. Here he unified the rival faction into the Vietnamese Communist Party (VCP). In October, Ho and others changed the name to Indochinese Communist Party (ICP) to reflect the Comintern view that small nations could only liberate themselves by banning together in larger alliances.

In June 1931, Ho was arrested by the British in Hong Kong. After languishing in jail for nearly two years, he was released on a legal technicality and soon fled to the USSR. In Moscow he came under suspicion from Soviet leader Joseph Stalin, who did not trust independent-minded communists. To survive, Ho spent most of the rest of the 1930s in obscurity hiding from the watchful eye of "Uncle Joe" and the West.

With the advent of the Sino-Japanese war in July 1937 and the retreat of Chiang Kai-shek's KMT forces into the western Chinese hinterland in 1938, Ho was allowed to return to China to resume his organizing activities. After several months serving with the CCP in central and south China, he reestablished contact with ICP leaders in Viet Nam. With the fall of France to German forces in June 1940 and the collaboration of the Vichy French government, the pro-fascist French colonial government allowed the Japanese access to important natural resources and military installations in Indochina. This angered most indigenous Indochinese and provided fuel to independence movements.

In May 1941, Ho and ICP led the formation of a broad-based nationalist alliance called the League for the Independence of Viet Nam better known as the Viet Minh. Much like the Youth League, the Viet Minh soft-peddled Marxist ideology and class struggle and disguised the ICP role in the Front. Instead, they focused on nationalist issues such as anti-imperialism, land reform, independence, social justice, and civil liberties. This soon won the general support of almost all political elements and social classes against French colonialism and Japanese occupation.

With no other real nationalist anti-Japanese force in place the Viet Minh became the main symbol of national resistance. General Vo Nguyen Giap soon built a well-trained partisan army. The Viet Minh's political and military headquarters were centered in the mountains north of the Red River Delta, near a region known as Viet Bac.

Ho constantly traveled between Viet Nam and China building up the Viet Minh base inside Viet Nam. Throughout the war, in China, the CCP and KMT maintained an uneasy anti-Japanese "United Front." During one trip, KMT authorities arrested Ho but later released him because his anti-Japanese activities were so effective. At the same time, he established contacts with US Office of Special Services (OSS) agents who supported him with some small arms and even life-saving medical supplies and treatment in turn for information on Japanese troop movements and operations in Indochina. During the war, the Viet Minh anti-Japanese activities proved highly successful.

Even as the Japanese announced their surrender on August 14, 1945, the Viet Minh marched into Ha Noi, where Ho announced Vietnamese independence and the establishment of the Democratic Republic of Viet Nam (DRV). It was during this time he adopted the name Ho Chi Minh or "he who enlightens." This was apparently an effort to calm moderate fears of the famous radical Nguyen Ai Quoc. Ho also placated Nationalist Chinese occupying forces in the north by

agreeing to guarantee at least seventy seats in the national assembly to his main rival party Viet Nam Quoc Dan Dang during the January 1946 elections.

Concurrently, he held delicate negotiations with the chief Free French representative in Indochina, Jean Saiteny, in an effort assure a peaceful resolution of disputes about the future of Viet Nam. In March 1946, the two came to a tentative agreement allowing Viet Nam to be a "free state" within the French Union. As part of the agreement, they agreed that the status of the colony of Cochinchina (a region in present-day Viet Nam) would be determined by a future plebiscite. Ho also agreed to assure the protection of French economic and cultural interests in Indochina. He also acceded to allow French troops to be stationed in the north.

That summer Ho went to Paris as an observer while representatives of the DRV negotiated with the newly elected conservative French government. When talks broke down, the official representatives returned to Ha Noi in protest. Ho stayed behind and worked out a compromise that called for further discussion to be held in January of 1947. Many DRV leaders were angered by Ho's interference but he convinced them the delay was necessary to prepare for war.

In the meantime, tensions between French and Viet Minh troops in northern Viet Nam reached a breaking point. In December, Vietnamese forces attacked French government installations and residence in Ha Noi. Unable to sustain open combat at this point, Ho and Giap removed the core of the Viet Minh to their mountain stronghold of Viet Bac, where they had resisted the Japanese. Once again embracing national liberation and submerging Marxist revolution, Ho formulated political policy and Giap carried out a guerilla campaign waiting for the right moment to strike. Supported with aid from the USSR and People's Republic of China (PRC) (founded in 1949), the Viet Minh finally cornered a major French unit in Dien Bien Phu and after weeks of siege forced their surrender. The defeat led to negotiation at Geneva in 1954. While Ho was again not an official representative, he was active behind the scenes and was instrumental in getting the DRV to accept a compromise peace and division of the country along the seventeenth parallel in July. With the restoration of the DRV government in Ha Noi in October, Ho returned to lead it and played a role in its move toward a socialist society. However, by the end of the decade his health had begun to deteriorate and such leaders as General Secretary Truong Chinh were making key domestic decisions.

Ho Chi Minh's position as president of the DRV was confirmed in the Constitution of 1959, but his

health was failing, and after the mid-1960s, his role in decision making became primarily ceremonial. He died on September 3, 1969. In a testament that he dictated during his final days, he asked to be cremated and asked that taxes be lowered to reduce the burden of the war on the people. Both requests were ignored. Instead, a mausoleum was erected on Ba Dinh Square in Ha Noi. After his death, Ho was officially bestowed the status of a revolutionary saint and hailed as the beloved “Uncle Ho” of the Vietnamese people.

Ho’s life and career have long been shrouded in controversy. To some, he was a heroic figure and the symbol of the struggle of the Vietnamese people for national independence and reunification. To others, he was a hardened revolutionary who disguised his commitment to proletarian internationalism behind a mask of patriotism. To this day many still wonder if he was primarily a nationalist or a communist. They ponder whether he was a secret moderate surrounded by militant radicals, as some have alleged and he himself often implied. The answers to these questions are not readily available from the evidence and, like the life of most “founding fathers,” are often obscured by legend and socio-political partisanship.

Most objective observers and mainstream scholars believe that Ho was both a true patriot and a dedicated Communist, who did not see a contradiction in these positions. Clearly, he was a man of great charm, and yet, also someone who sought his goals with ruthless determination. Whatever else, he was a talented leader who was a gifted administrator, strategist, negotiator, conciliator, and motivator who led Viet Nam to national independence.

## HONDURAS

The Republic of Honduras lies in the northwestern part of the Central American isthmus and borders

Guatemala (256 kilometers) to the northwest, El Salvador (342 kilometers) to the west, and Nicaragua (922 kilometers) to the south. This mountainous country has an extensive Caribbean coast and a very small Pacific coast on the Gulf of Fonseca nestled between El Salvador and Nicaragua. Its total landmass is 112,090 square kilometers, more than twice the size of Costa Rica (a similar area to Louisiana). Ninety percent of Honduras’s 6.8 million people are *mestizo* (a mix of European and Indian heritage); the remaining 10% are comprised of Arabs, Africans, Asians, and indigenous people. As in the rest of Central America, the vast majority of the population is Catholic, but Protestant church membership has grown significantly in the last thirty years.

Honduras, along with the rest of Central America, became independent of Spanish colonial rule in September 1821. Honduras initially joined the short-lived Mexican empire, and then the war torn United Provinces of Central America, before finally becoming a sovereign state in 1840. Central American unity, though, has remained an elusive goal of successive Honduran governments.

Honduras entered its independence period with no significant export product and a lack of domestic investment capital that would have been necessary to develop one. In response, the Honduran political elite actively sought foreign investment to revitalize a moribund mining industry and to develop the country’s infrastructure. As in Costa Rica, railroad building companies used their land-grants to plant and cultivate bananas as they built the railroads. By the start of the twentieth century, bananas had become Honduras’s principal export product, but it was dominated by US-owned companies rather than domestic interests. The banana companies controlled over two-thirds of the country’s territory and they tended to interfere in Honduran politics to advance their economic interests. By the late 1920s, the three dominant banana companies merged to form the United Fruit Company, which remained a powerful political and economic force in the country. Even with these high levels of foreign direct investment, the country remained one of the poorest countries in Latin America.

In the 1960s, following an Import Substitution Industrialization (ISI) strategy, Honduras joined with other Central American republics to create the Central American Common Market (CACM). The goal was to foster economic development and industrialization across the isthmus through a free trade area that would be protected from international competition by high tariff barriers. In practice, the benefits from the CACM were unevenly distributed and

tensions between the member states increased. These tensions culminated in a short war, commonly and disparagingly referred to as the “Soccer War” between Honduras and El Salvador in 1969.

As a result of these tensions and the rising tide of violence across the region, the CACM effectively ceased to exist by the late 1970s. In May 2004, the idea of a free trade zone was given new life when Honduras signed the CAFTA agreement with the US and other Central American countries, which is still waiting to be ratified by the US Congress.

Currently, Honduras remains the poorest country in Central America and while the traditional agricultural exports (bananas and coffee) have been in decline, non-traditional exports (farm-raised shrimp and fruits), and a maquila sector (textiles and clothing finishing), along with tourism, have become much more significant. Another major and growing sector of the economy is remittances from Hondurans working abroad. According to the US State Department, remittances from abroad will soon become the largest single source of revenue for the country, which is a reflection of the continued weakness of the economy.

Since the 1980s, Honduran political development has become increasingly democratic. For more than one hundred years, two political parties—Liberals and Nationals—have dominated the political life of the country. The existence of these established political parties, though, did not foster the establishment of a consolidated democracy. Instead, dictatorship, civil wars, and foreign intervention were the pattern of political life that continued until the election of a civilian president in 1981. An indication of the extent of the political turmoil during this period is the promulgation of twelve different constitutions from independence through 1982.

Honduras’s political development in the late 1970s and 1980s, though, began to diverge from that of its neighbors. While revolution swept much of the region during this period with civil wars and increasingly repressive regimes in Guatemala, El Salvador, and Nicaragua, Honduran political and military elites moved to deepen the country’s nascent democratization process.

For much of the 1980s, Honduras permitted the presence of US troops and counter-revolutionaries (Contras) from Nicaragua. The Contras used southern Honduras as a staging ground for attacks on Sandinista-controlled Nicaragua. The *quid pro quo* for supporting US regional foreign policy was extensive US sponsorship of major social and economic reform projects including the largest contingent of US Peace Corps workers in the world.

The ruling Liberal Party’s questionable reading of the country’s electoral law marked a second

presidential election in 1985. Because the Liberal party was unable to agree on a single presidential candidate, the party decided to run two candidates and ruled the two Liberal party candidates’ votes would be summed. Together the liberal candidates out-pollied the National Party candidate. The more popular of the two Liberal candidates, José Azcona Hoyo, took office in 1986. This election marked the first peaceful transfer of political power since the 1950s.

Another scheduled presidential election in 1988 further deepened the adherence to democratic norms. The new President, Carlos Roberto Flores, introduced sweeping reforms including the creation of an independent Supreme Court, putting the military under civilian control, and promulgating a series of anti-corruption measures. These measures were tested when Hurricane Mitch pummeled Honduras in 1998 killing more than 5,600 people, leaving over 1.5 million homeless, and \$2 billion in property damage. The government responded efficiently and without the high levels of corruption that had been expected.

The 1990s witnessed an increasing reliance on the ballot box to determine the political control of the country. There have now been six general elections and three peaceful transfers of power between the two major parties. Also, extra-parliamentary agencies have been created such as the Commissioner for the Protection of Human Rights (1992) to hold government officials accountable for their actions and the Constitution was also amended to place the military under civilian control to which the military acquiesced.

**HONG KONG**

Hong Kong (officially Hong Kong Special Administrative Region) is located in South East Asia. It is spread over the Lantau and Hong Kong Islands and about 200 other very small islands, and a small portion of mainland. It is bordered on the north by the territory of Guangdong Province of People's Republic of China (PRC) and bounded on the east, south, and west by the South China Sea. The country has a land area of 1,092 square kilometers (422 square miles), comparatively its territory about 1.5 times larger than the territory of New York City in the United States. The climate in Hong Kong is subtropical. The average July temperatures range between 26°C and 31°C (78°F and 87°F); and February temperatures range between 13°C and 17°C (55°F and 63°F). Heavy rains are quite common in summer and autumn and annual rainfall is about 2,159 millimeters (85 inches). Hot and humid summers last from May to September. The winters are cool and usually dry and they last from December to March.

The population of Hong Kong was 6,855,125 in 2004 (Central Intelligence Agency [CIA] estimate). This figure does not include a number of illegal migrants from the PRC who moved into Hong Kong in search of jobs and business opportunities. Hong Kong has a population growth rate of 0.65% and migration rate of 5.24 migrant(s) per 1,000 people (2004 CIA estimate). About 95% of the Hong Kong population is Chinese, who mostly speak Cantonese dialect. Others include people from Southeast Asia, Great Britain, and some other countries.

The British established their control over Hong Kong in 1842. They forced the Chinese government to cede Hong Kong Island to Britain after winning the First Opium War. During the next few decades Hong Kong became an important trading port and military outpost for the British Navy. The colony provided financial and trading services to many large and small enterprises in the region and it served as a trade and economic window to mainland China. The Chinese government viewed the colonial control of British over Hong Kong as temporary and demanded the British government to return the territory under the control of the PRC. After a series of intensive consultations, Britain and China signed the Sino-British Joint Declaration in 1984. It stipulated that Hong Kong would come under Chinese rule in 1997. The Communist government of China agreed to grant Hong Kong a special status of the Special Administrative Region (SAR) of China under "one country, two systems" arrangement. The Declaration and a Chinese legal act—called the Basic Law—regulated the governance of the SAR, and they will

be providing a high degree of economic autonomy for Hong Kong for next fifty years.

Hong Kong grew to its prominence during the twentieth century becoming one of the most important financial and trading centers in the world. Its economic development was facilitated by several factors. First, its economy was built around servicing commerce, trade, and shipping and therefore its government built most a favorable environment for free entrepreneurship, business, and trade. Second, it is located on the main shipping route in the western Pacific just in the midway between Japan and the Strait of Malacca, so Hong Kong established one of the most efficient seaport facilities in the world. For many decades its container terminals were among the largest in the world (by annual volumes). Third, it built the world's most efficient and sophisticated financial banking facilities that serviced trading needs of many countries in and outside of the region. Fourth, having a highly skilled and flexible workforce Hong Kong established a very competitive industrial sector that is specialized in skill-intensive manufacturing. It also became known as a tourist and shopping destination for wealthy Chinese and international tourists, businessmen, and travelers.

Hong Kong's services sector began its rapid development in the early twentieth century. The banking and trading services were established first, becoming cornerstones of the service sector in Hong Kong. They largely focus on services the international trade and commerce. For decades Hong Kong successfully re-exported products that were manufactured in other parts of China, in Japan, South Korea, Taiwan, and some other countries. That included clothing, textiles, telecommunications and recording equipment, electrical machinery and appliances, and footwear. The Heritage Foundation/*Wall Street Journal's* Index of Economic Freedom ranked Hong Kong among most open economies in the world in 2004. In the post-World War II period tourism became another important sector as a modern airport, international class hotels, conference and other facilities were built here. About 18 million tourists arrive in Hong Kong every year, making tourism one of the major sectors of the national economy, though the severe acute respiratory syndrome (SARS) negatively affected it in 2003–2004.

The manufacturing sector has developed rapidly since the 1950s, although it slowed down in the late 1990s. For decades Hong Kong was known as a producer of various consumer goods, including clothing, textiles, toys, plastics, electronics, watches, etc. However, since the mid-1990s the manufacturing sector has been switching to production of more

sophisticated goods, such as computer peripherals, high-end electronics and some categories of luxury goods. Meanwhile, a significant number of manufacturing facilities have been shifted to neighboring Guangdong Province of the PRC, where labor costs were much lower.

Hong Kong has a small but vibrant agricultural sector that supplies fresh vegetables, flowers, and meat to its population. Its fishermen have notable fishing fleet that supplies about two-thirds of the fresh fish to the city. Meat producers were hit hard in 2003–2004 by SARS, and had difficulties to recover their production to pre-SARS level.

China, the United States, Japan, Taiwan, and East Asian countries are Hong Kong's main trading partners, and the chief markets for its products. According to official statistics, Hong Kong's international trade grew rapidly throughout the post-World War II era. The consumer goods (electrical machinery and appliances, textiles, precious stones, etc.) and services remained the principal export products, while food-stuff, fuel, machinery and manufactured goods, transport equipment, raw materials and others remained the key import products. The primary trading partner is China, which accounts for about 42% of the total trade turnover (2004 estimate).

Hong Kong was affected by the Asian financial crisis of 1997 and by the global slowdown of 2001–2003, but recession was relatively mild. According to the World Bank's estimates the average annual growth stood at 6.4% between 1983 and 1993, but declined to 3.1% between 1993 and 2003 (2004 World Bank estimate). During last decade, the Hong Kong government maintained fiscal prudence and kept inflation under control. The Hong Kong dollar exchange rate has been fixed to the US dollar and remained stable for many years. In 2003–2004 the exchange rate of the US dollar against all major currencies was in decline boosting compositeness of the Hong Kong economy in the international market.

The population of Hong Kong enjoys relatively high living standards. However, during the last decade the inflow of illegal migrants and economic recession put significant pressures onto the labor market and there was growing social discontent among the people. Unemployment rate stood at about 6.8% in 2004. Nevertheless, Hong Kong managed to maintain high living standards among the population and remained one of the richest countries in South East Asia in terms of per capita income at the level of \$25,430 US dollars. However, the wealth was distributed unevenly and was concentrated in few hands. The educational system is very strong in Hong Kong and literacy rate stood at about 93.5% (2004 estimate). Life expectancy is 78.7 years for

males and 84.3 for females. In 2004, the United Nations Development Program (UNDP) Human Development Index (HDI) put Hong Kong in 23rd place out of 177, ahead of Greece, Singapore, and Portugal.

### HOUPHOUËT BOIGNY, FÉLIX

Born October 18, 1905, in Yamoussoukro, Ivory Coast, to a family of wealthy Baoule chiefs, Houphouët-Boigny grew up on his family's coffee-plantations and became a plantation owner himself. He thereby encountered the problems created by French colonial government for African planters. Determined to change French policies, he founded the African Agricultural Syndicate and devoted the rest of his long life to politics. In the 1940s and 1950s, he became prominent in the struggle for independence. At first he allied himself with the French Communist Party, which alone at the time opposed colonialism. However, when the left lost power in Paris and his Ivoirian supporters expressed distress at his militancy, he broke with the Communists and thereafter promoted General De Gaulle's policies.

Houphouët-Boigny attended the Ecole Normale William Ponty and Ecole de Médecine et de Pharmacie at Dakar, Senegal, and graduated in 1925, working afterwards as a bush doctor and as a coffee planter. He served as deputy to the French National Assembly from 1945–1959, founded the Rassemblement Démocratique Africain and its Ivoirian branch, the Parti Démocratique de la Côte d'Ivoire; and was elected to the French Constituent Assemblies in 1945 and 1946. He served as president of the Grand Council of French West Africa from 1957–1959 as well as serving as a French cabinet minister during this time. He served as president of the Constituent Assembly of the Ivory Coast from 1958–1959 and then as the head of Ivoirian government in 1959–1960.

He was elected the first president of the independent Ivory Coast (1960), while remaining secretary general of the ruling Democratic Party of the Ivory Coast. Though the Ivoirian constitution established a democratic republic and technically Houphouët-Boigny was re-elected president six times, in reality he imposed one-party government and controlled all developments. He maintained close ties with France. The number of French citizens working in the Ivory Coast doubled. Ivoirian exports and imports were centered on France. The French trained the Ivoirian military. Sons of the Ivoirian elite studied in France.

Houphouët-Boigny staked the country's economic future on the growth of agriculture for export. As the production of cash crops, mainly coffee and cocoa, increased he spent the additional revenues on improving infrastructure and education to promote further growth of exports. He also encouraged immigration from neighboring nations to enlarge the workforce. For years he was successful. Growth and political stability attracted foreign investments, and the annual gross national product rose steadily.

However, uneven distribution of incomes, droughts, and fluctuation of world prices for agricultural products endangered the economy and social problems mushroomed. Ethnic rivalries awakened as northern Ivoirian Muslims resented the ruling southern Christian elite which reaped most of the benefits from development. Internal mobility weakened family ties. Urban overcrowding increased misery, conflicts, and crime. Ivoirians objected to one-party rule and to the foreign presence, be it French or African. Protests against governmental action multiplied. There was also loud criticism of Houphouët-Boigny's enormous expenditures for personal glorification, which turned his native village into a modern national capital.

To maintain loyalty, Houphouët-Boigny gradually authorized political changes. He alternated repression with clemency; he exploited ethnic discord and political animosities and co-opted many by patronage. He

made ethnically balanced cabinet appointments, and replaced older trusted personnel with younger Ivoirian technocrats. He showed awareness of the yearnings of the middle and lower classes by holding public dialogues, reminiscent of traditional palavers, where people could air their grievances to their leader. He appointed study committees to recommend reforms. In the 1980s, he accepted multi-party elections. But in practice his tactics and charisma preserved his autocratic rule and governmental stability, though the economy continued to falter.

He died on December 7, 1993, in Yamoussoukro. Since his death the Ivory Coast has been victimized by unprecedented xenophobia and government overthrows. Houphouët-Boigny remains controversial. Some remember him nostalgically as “*le vieux*,” the father of their country; others accuse him of having been a dictator, a lackey to the French, and blame him for the country's current difficulties.

#### HOXHA, ENVER

Enver Hoxha (1908–1985) was the chief architect of the Albanian Communist Party, and subsequently of the postwar Albanian government, which he directed for forty-one years.

Born in Gjirokaster, southern Albania, in 1908, Hoxha graduated from French Lyceum in Korce in 1930. He pursued higher education in France at the Universities of Montpellier and Paris. He worked in the Albanian Consulate in Brussels before returning to Albania in 1936 to teach at the Lyceum. He lost his job during the Italian occupation of Albania in 1939 and moved to Tirana the next year to organize an anti-Fascist underground. In 1941, he helped found the Communist Party of Albania, and was elected general secretary in 1943. After the war, in 1946,

Hoxha was appointed president of the Council of Ministers.

## Foreign Policy

A subtle politician, Hoxha maneuvered to forge a succession of alliances with larger communist states, to obtain aid for development and buttress Albania's defense posture. The most important of these alliances was with the Soviet Union. For a dozen years, from 1948 to 1960, Moscow was the primary source of aid, credit, and technical assistance to Albania, without which it could not have made any meaningful progress toward development.

After the break of relations with the Soviet Union in 1961, ostensibly for ideological reasons, Hoxha allied Albania with China. In the 1960s and 1970s, China's economic and military aid not only furthered Albania's development, but very likely thwarted Moscow's political and economic blockade of the country, designed to overthrow Hoxha. When China severed its ties to Albania in 1978, Hoxha adopted an isolationist developmental policy.

## Domestic Politics

Hoxha sought to build a modern Albania, with a strong economy and an egalitarian society. But projects for development, called Five-Year Plans, generally fell short of expectations. Despite Hoxha's strong-handed rule, Albania did make significant progress in many directions: agriculture, industry, health care, education, science and technology, the arts, and culture. One area of progress related to women.

Hoxha was a strong advocate of equal rights for women. He deplored women's inferior status in Albanian society, and created conditions that enabled them to free themselves from economic dependence. By the 1990s, women had made significant progress in all areas of society. They obtained jobs in the professions, management, politics, manufacturing, engineering, and other fields.

## Support for Cultural Development

Hoxha also gave vigorous support to programs for the development of the arts and culture. Despite his limitations on free expression within the nation, he encouraged the cultivation of new art forms, and the creation of a vast network of cultural institutions.

On the other hand, he had a wavering or uncertain relationship with the intelligentsia, such as intellectuals, professional people, educators, writers, and artists. Hoxha realized that he needed the special talents of the intelligentsia, if plans for the development of the Albanian nation were to succeed. However, he believed intellectuals to be politically unstable, and a potential threat to his regime. Consequently, from time to time, he authorized campaigns to intimidate or punish various members of the intelligentsia, for alleged violations of Party norms and guidelines.
