A peculiar feature of Hoxha's reign was the so-called Cultural Revolution, which unfolded over a period of four years (1966–1969). The chief goal of the revolution was to stimulate development by removing obstacles to production and social emancipation, posed by incompetent administrators and backward customs. The radical measures that were implemented at this time included the complete collectivization of agriculture and the abolition of religion.

## Abolition of Religion

Enver Hoxha began to restrict the activities of religious bodies as early as the 1940s. In 1967, at the apex of the Cultural Revolution, he sanctioned the abolition of the religious establishment, on the grounds that religion was a medieval institution, rife with superstition, and a serious obstacle to development. Freedom of worship was restored in 1990.

As a matter of policy, Hoxha resorted periodically to the mechanism of the purge to achieve his ends. He regarded the purge as a necessary device for development, and for maintaining political power. His four-decades-long rule in Albania was marked by a series of purges of persons viewed as enemies of the regime. The latest and most sweeping of the purges, occurred in the 1970s and practically decimated the leaderships of the League of Writers and Artists, the army, and the top-ranking directors of the economy. The purges created a climate of terror in the country, and slowed down development.

Hoxha died in Tirana on April 11, 1985. He was a strong but flawed leader, bent on modernizing Albania.

## HUMAN RESOURCE DEVELOPMENT

### The Human Resource Development Concept

Society can function properly when it has the basic resources: *natural resources* (land, rivers, oil, coal, etc.), *capital resources* (buildings, tools, goods etc.), *technology* (information, knowledge and techniques employed in producing goods and services), and, of course, *human resources*. The latter include the number and composition of the population, its level of education, health status and the specific skills and habits the people have developed. In a society, all the resources are interrelated, but the human resources have a great influence on the development of all others. The production of coal, the functioning of plants, the production of goods, etc. all depend on the number of the population, its health status, and educational level. Thus, the proper management of human resources is of paramount importance for the effective functioning of a given society. When we are interested in the effective management of the human part of the social systems, we talk about *human resources management* (HRM). HRM is an integral part of management and has all the aspects of management related to the reproduction of the population within a given country.

Since the general theme of human resources management is related to their development, it has been established as a separate subject known as *human resources development* (HRD). HRD is also known among scientists as *strategic human resources development* (SHRD). It emphasises on the strategic development of human resources in a long run.

### The Content of Human Resources Development

*Two meanings* are implied when describing the developing approach toward human resources. The *first* meaning is related to the development of society as a

whole. It includes all the aspects related to the development of people living in a given country. General aspects of HRD are: *education, training, manpower planning, health care, unemployment, urban/rural settlements, mental health care, family planning, migration, birthright, mortality, women involvement*, and so on.

The individuals within a social system are functioning in various private and state organisations—production plants, schools, universities, hospitals, banks, etc. In order for a given organisation to be effective, the leaders and managers are highly interested in the development of the human resources it employs. In other words, small or big organisations also have a human development purpose. This is the *second* meaning used for HRD. It relates to the professional development of individuals working in a given organisation. In this respect, HRD includes: *training and development programs, employees' learning style, career development, recruitment process, selection process, performance evaluation, performance practices and models, strategic human resources planning, leadership styles, effectiveness*, etc. *Personnel development* is another term used when we talk about human resources development in organisations.

The development of human resources is a specific scientific area examining the previously mentioned statements. Besides, HRD includes a set of specific practices being used by managers, political, and state leaders. There are different institutions involved with the development of human resources in every country: research institutes, assessment centres, departments, governmental agencies, and ministries. They do expert assessments of the population and empirical examinations, assess employed staff, publish professional magazines and provide university master degrees in human resources development. International organisations provide different programs related to human resources, some of which are: United Nations Development Programme (UNDP), World Health Organization (WHO) human resources development programs, ASIA–Pacific Economic Cupertino (APEC) programs, and so forth.

### HRD Present Condition

Despite certain differences, HRD is characterised by stable tendencies and specifics in the developed Western countries. This is due to their high economic growth, technological development, high living standard, and the establishment of some new approaches, related to society management, new organisational concepts, and new theoretical models of the individual human being. Until the end of the nineteenth century

the stress was laid on economic and capital resources and technologies; not much attention was paid to the HRD. In the beginning of the twentieth century the so-called *scientific approach to the management* of industrial enterprises, taking into account production, the means of production, and the manufacturing instruments was introduced. It also put stress on the effectiveness of the human labour behaviour. During the 1930s, the so-called *humanitarian approach* was imposed. It accounted not only for the economic factors within the industrial sector, but also for the human factor—the human personality, its motivations, needs, interests, and so on. During the 1970s the concept of the organisation as a closed rational unit was put behind. The organisation was seen as *an open, dynamic social system*, which was constantly changing and developing. That would require a permanent change and development of its human resources. The *organic human model* was imposed, according to which the human being was considered to be a living, organised, growing, and developing organism. The result of all this is a stable social practice with respect to this phenomenon.

### Change and Development of Human Resources

The resources within a society represent a dynamic combination, which is constantly changing. For the natural resources, that means *depletion and deterioration*: arable land is decreased and polluted; forests, drinking water, oil, and other natural resources decrease. For the human resources, that means *increase and improvement*: increase in population, health care improvement, educational funds. For example, with the increase of population and technological development, the percentages of educated people increases, as well as the educational methods improve. With the increase of the population in the future, the so-called distance learning will be imposed via the Internet. In the future this form of education will dominate over the classical form.

The HR development is triggered by the following changes. *First*, there are global changes in *international relations*, leading to the withering away of states, creation of new states, change in geopolitical strategies of the great powers, and so on, which of course reflects on HRD. There are three peak moments for these changes in the twentieth century: the end of World War I, the end of World War II, and the end of the Cold War, marked with the Eastern European revolutions in 1989. *Second*, there are *market changes*

in national, regional, and world aspects, having a significant influence over HRD. *Third*, *internal political changes* in the countries (the imposition of communism in Russia with its concentration camps, the Cultural Revolution in China, the Pol Pot regime in Cambodia, etc.) also play their role on HRD. *Fourth*, *demographic changes* and the migration waves, urbanisation, etc. related to them are one more significant reason leading to change in HR. *Fifth*, *management changes* and specifically management styles of economic organisations, of small and big social entities and of whole societies have a significant impact on HRD. *Technological changes and outbreaks* (as the AIDS outbreak) may be classified in a different category of factors influencing HRD. *World terrorism* may be another factor impacting HRD in the future.

### HRD Specifics in the Developing World

Tendencies of change are typical of HR as a whole, but the dynamics of this change are different for different countries and regions. For example, in North America and Europe there is a tendency of decreasing birth rate and population ageing given the permanent increase in living standard, improvement in health care and education. On the other hand, in most developing countries there is the opposite tendency. Moreover, not only are there differences in HRD from region to region of states, but there are differences among states from the same region. Globally there is an extremely complicated picture of the condition and dynamics of HRD change. The HRD complexity arises from the world's differentiation in the political, economic, demographic, informational, and cultural aspects. As a result HRD has a different status in the western democracies, in the developing world, in the former socialist countries, in the countries of the rich North and the poor South. For example, one of the HR problems in the developing world is education and the lack of experts in the different social spheres. The situation in the former socialist countries is exactly the opposite—experts with university education create the major part of unemployment. Moreover, after the 1989 revolutions it was mostly people with university degrees that emigrated from those countries to Western democracies. Differences can be observed while comparing countries from the Asian region to Eastern-European countries. For example, during the 1990s there was a lack of experts with university degrees in South Korea. At the same time in Bulgaria, a country with extremely developed educational system, the situation was the opposite: due to the lack of

employment during this period, 10% of the Bulgarian population moved abroad—primarily people with university education, doctors of science, university professors. Further on during that decade, big differences in the educational system may be observed even in countries formerly belonging to the Eastern Bloc. For example, two of the tendencies describing the Hungarian educational system are related to fast legislative changes and the slow changes in educational curriculums and programs. In Bulgaria the situation was the opposite—slow legislative changes in the educational system and fast changes in the educational programs and curriculums. The differentiation in HRD is obvious when related to population growth: the Third World countries are facing a high birth rate problem, while in the Eastern European countries the problem is low birth rate and population ageing. There are big differences even in countries from the same region: for example Albania is described as the country with the highest population growth, that is, as the youngest nation in Europe. The negative population growth characterises Bulgaria as one of the ageing European nations. It is impossible to draw conclusions about HRD based on ideological and political criteria, because very often the condition of this phenomenon varies greatly in countries with the same political system. The countries from the former Eastern Bloc that shared the same ideology may provide an example for this. In countries like Poland, Hungary, the Czech Republic, and Bulgaria, some of the basic aspects of HRD as centralised planning, educational liberalisation, and economic freedom tend to change. The same cannot be claimed for some of the former Soviet republics. Therefore, it is not correct to analyse HRD on the basis of some geographical, economic, or political features. Complex factors affecting change must be used. The situation becomes much more complicated when we discuss HRD in economic organisations, and specifically personnel development. The analyses and conclusions must be drawn on the basis of specific economic, political, cultural, and social conditions, existing in each given country.

## HUMAN RIGHTS AS A FOREIGN POLICY ISSUE

Human rights and foreign policy are intimately connected. Human rights are those rights that all human beings should have just by being human. In international law, human rights are those rights agreed upon by nation-states in international fora applicable to all human beings. An important part of the conventions and treaties signed is the obligation to protect and promote human rights. Foreign policy therefore clearly involves working towards better protection of human rights in the world as a whole. However, in practice states who sign international human rights agreements and follow their dictums domestically are often reluctant to do the same in the realm of foreign policy. The reasons are mainly that sometimes the support of human rights abroad goes against its political and economic interests. For example, neither the United States nor the European Community wants to risk their trade relations with the Chinese government despite its record of human rights violations. And the big weapon manufacturing states do not want human rights considerations to get in the way of selling arms. Despite the proviso that no arms are sold to countries that use them against their own people, weapons as well as

instruments of torture are on the export lists of western European states.

Still, human rights are put firmly on the foreign policy agenda in the case of humanitarian intervention, sanctions, and conditional aid programmes. The dilemmas raised by supporting human rights while aiming to avoid harm (to another country's sovereignty, to foreign populations, or to economic self-interest) have been widely debated. Despite human rights being recognised by governments worldwide in conventions and declarations, the implications of those commitments are not always taken seriously. Although hardly anyone would argue that human rights are not part of a foreign policy agenda at all now, there are still many examples of where they take second place to other considerations in theory and in practice.

Here we want to give an overview of the development of the human rights agenda and argue that human rights are and should be an important part of foreign policy; not only in everyday diplomacy, but also in trade policy, aid policy and contributions to multilateral fora.

## Human Rights

Human rights are those rights to which all individuals are inherently entitled. They have been increasingly codified in international law. Their history can be traced back to the notion of citizenship in the Ancient Greek city-states and has been developed further in the works of John Locke and the debates surrounding the American Declaration of Independence (1776) and the French Revolution (1789) (Freeman in Smith and van den Anker 2005). The development of the current human rights documents developed further through the Geneva Conventions on humanitarian rules of war and warfare and the League of Nations convention on slavery amongst others.

After the Second World War, the victorious allies established the United Nations with the aim of preventing world war and advancing peace. The Charter of the United Nations included human rights as part of its goals. Since the Second World War, international human rights law have developed into a detailed and complex field (Baehr in Smith and van den Anker 2005).

In 1966, the two twin Covenants were agreed upon, although the Cold War made it necessary to split them into separate documents: one on civil and political rights and one on economic, social, and cultural rights. The principle of non-intervention was gradually interpreted as allowing involvement of the

international community with the human rights record of states. Dedicated conventions were established, a duty to report was developed and Special Rapporteurs were sent to assess the situation in specific countries. Recently, the International Criminal Court has been inaugurated which means that there is no longer impunity for crimes against humanity and other gross violations of human rights (Williams *et al.* in Smith and van den Anker 2005). Alongside the United Nations, other institutions have defended and codified international human rights law, like the International Labor Organization (ILO) and the regional human rights systems. The most effective is the European system which has a court and individual complaints procedures.

This development has not proceeded effortlessly; social movements and human rights lawyers fought hard for it (Gready 2004). Possibly the oldest human rights movement is the anti-slavery campaign. Generally trade unions, the anti-colonial nationalist movements and the women's rights movement resulted in further codification. Special campaigns on behalf of children's rights, minority, and indigenous peoples' rights led to the drafting of conventions. The Child Rights Convention is the most widely ratified convention in the world. Unfortunately the Draft Declaration on Indigenous Peoples of the United Nations has not yet been ratified.

Despite this enormous progress since 1945 and the renewed impetus after the end of the Cold War, nation-states still fight against outside interference with their human rights record. For a long time, states argued that how a government treated its citizens was a matter of domestic affairs. When gradually the idea of human rights as an international concern was accepted, states started to use arguments of cultural relativism instead. Especially with reference to Asian values, some states argue that although they do not reject human rights concerns, they claim the right to interpret international human rights according to their own culture (Svensson 2002). African leaders, too, have criticised the western conception of human rights. And Islamic states argue in favour of Islamic law governing Islamic states. Yet, in Vienna at the World Conference on Human Rights in 1993, human rights were accepted as universal. Although there is a way of tracing human rights back to Western concepts, there were several people from non-Western countries involved in the drawing up of the Universal Declaration; the values of human dignity and respect for all living beings can be found in many of the world's main religions and philosophies. Moreover, there are good philosophical arguments against relativism which leave respect for cultures in place (Caney and Jones 2000; Caney 2001).

Human rights have also been criticised from many other angles. Marxism holds that human rights are a bourgeois concept, protecting the interests of the property holding classes. However, Marx conceded that the rights of the citizen were a possible step forward, as they emphasised people's belonging in a political community and did not separate people from one another as property rights do (Waldron 1987). Utilitarians have famously called human rights "nonsense upon stilts" and argued that the overall happiness of a political community is more important than a set of rights (Bentham in Waldron 1987). Conservatives have argued against rights since the French Revolution; Edmund Burke, for example, thought that adopting a Declaration on the Rights of Man would lead to oppression due to revolutions always turning into oppressive forces once successful. In terms of the French Revolution he may have been accurately predicting, yet the question remains whether that is a reason to reject a basic set of human rights in favour of an organically developing society. Feminism, finally, has criticised human rights discourse for using a male perspective on what it means to be human and leaving out the concerns of women by focusing almost exclusively on the public realm. However, feminism has also supported women's rights as human rights and the Convention on the Elimination of All forms of Discrimination Against Women (CEDAW) has been instrumental in getting concerns like rape (in or outside marriage and as an instrument of ethnic cleansing in war time) and domestic violence on the international human rights agenda.

Mostly, human rights are a weapon for the struggle of oppressed people and campaigns against (former) dictators. However, human rights discourse is also used to justify wars, and many nations change their definitions of human rights when a threat to national security is perceived.

### **The History of Human Rights and Foreign Policy**

Human rights as a foreign policy issue has had a bumpy ride in history, too. From the early documented struggle between the Spartans and the Athenians in Thucydides' *Peloponnesian wars* we already know the division between those who hold that all human action and therefore the treatment of other societies should be based on justice and those who base their actions on power. This division can be found again in modern International Relations theory between Realism which holds that the self-interest of the state

should guide foreign policy and Liberal institutionalism which holds that human values like justice, peace and freedom should guide external affairs of states. Historically, the liberal institutionalists are supported by theories developed by Kant in the eighteenth century and earlier on by Grotius in the sixteenth century. Kant argued that all moral action should be based on the principle of universalizability and Grotius argued that the principle of sociability was the basis for international law (van den Anker 2000). World system theories of international relations are skeptical of normative accounts of international relations as their structuralist analysis fears human rights will be used as a mask for underlying interests at least in cases where the social struggle for human rights is left out of the account. In some ways this leaves world systems approaches in the Realist camp on the divide between empirically based theories and normative theories of international relations. However, world systems theory does share a critical approach to power in international relations and does therefore have a basis to support at least some role for human rights in foreign policy. This would be subject to conditions of the actors being free from corrupting concerns for their state's interests.

The contrast between these different theories of international relations plays out in political debates on human rights as an issue of foreign policy. Explicitly ethical foreign policies were designed by Robin Cook in the United Kingdom and Jan Kavan in the Czech Republic. One of the prominently pro-human rights foreign policies was also the former United States president Carter's; although with hindsight his record was mixed. Former United States secretary of state Albright claims in her autobiography that human rights was one of her main concerns; however, the United States did not intervene in the Rwandan genocide that took place during her term in office.

The role of human rights in foreign policy is thus a hotly contested issue and after contextualising it in the wider discussion of ethics and international relations we will now look in more detail in which areas of foreign policy human rights play a role, how this role has been viewed both in contemporary and historical debates and what its role should be.

### **Basic Diplomatic Relations**

The most well-known part of foreign policy is that of basic diplomatic relations. This area of foreign policy is directly related to human rights. For example should the United Kingdom cricket team play in Zimbabwe, where Robert Mugabe has been accused

of dictatorship and human rights violations? The answers to this type of question rely on the judgment of what, if any, actions can assist in supporting human rights protection abroad. In addition, human rights play and should play a role in policies on the recognition of new nation-states. Should the right to self-determination, which is well protected in international human rights law, be given priority in cases where the recognition of a newly established nation-state is offensive to the former territorial power?

### Humanitarian Intervention

The doctrine of humanitarian intervention holds that when fundamental human rights are persistently violated on a large scale, despite the Westphalian notion of self-determination as a basic value in international law, military intervention is a right of the international community. Moreover, in such cases there is not only a right to intervene, there is a duty on behalf of the affected population. This doctrine is a specific form of Just War which has been recognised in historical debates on international law. Humanitarian intervention can be defined as a military intervention to stop excessive human rights abuses in another sovereign state. The European Parliament defines humanitarian intervention as “the protection, including the threat or use of force, by a state or group of states of the basic human rights of persons who are subjects and/or residents of another state.” This definition is wider than strictly military intervention; it includes the threat of force.

Historically, intervention was seen as linked to self-determination not only by a government but by the citizens of that state. Both Kant and J.S. Mill viewed non-intervention as based on the principle of self-determination of citizens to determine their own way of life. In addition to this principled stance against intervention, Mill viewed the bad consequences of intervention as good reasons against it. According to him, people can't hold onto freedom given by intervention and after intervention either a foreign power would rule or it would provide heavy support for the “free” government or civil war would ensue. Mill's list of practical difficulties would also include the lack of transparency to establish who are authentic “freedom fighters” and the fear that “dirty hands” of violent means might turn into “dangerous hands.” In other words, lofty goals of intervention based on the right to self-determine the political power would mask imperialism by the intervening state (Doyle in Pogge 2001).

Historical arguments in favour of humanitarian intervention have included cosmopolitan arguments

holding that the right to freedom is valuable everywhere for all people and this should override the principle of non-intervention. Mill saw three other good reasons to override the non-intervention principle: (1) when non-intervention can neglect vital international sources of national security; (2) following a just war to remove “menace to peace”; and (3) when protracted civil war causes suffering for the non-combatant population. Walzer argues in favour of humanitarian intervention if national self-determination is undermined by domestic oppression. He recognises three cases: (1) when too many nations contest same territory; (2) when another power has intervened in a civil war; and (3) for humanitarian purposes in case of genocide, slavery, and so forth. These types of argument are also supported in the so-called doctrine of new interventionism. Doyle argues that this is due to both the revival of multilateralism in the early 1990s and the development of innovative forms of intervention like peacemaking, peacekeeping, peace-building, and peace-enforcing.

Generally, it is recognised that humanitarian intervention, just like other forms of just war, needs to be based on a set of criteria. Most lists have the following elements in common: proportionality of violence; last resort after negotiations; right reasons: impartiality; guided by international law and multilateral support. The questions that need to be answered in order to establish the limits of new interventionism are:

- When is it legitimate to intervene in another state?
- When, if at all, have humanitarian interventions ever produced good results and how, if at all, can they be safeguarded?
- Are there circumstances when the international community is required to intervene?

Simon Caney (2005) argues that humanitarian intervention can be justified on the basis of cosmopolitan principles, yet others argue for peaceful means of human rights protection, such as support for internal opposition. Humanitarian intervention remains a central part of the discussion on human rights and foreign policy and currently the consensus seems to be on some form of interventionism while the main threat seems to lie in the abuse of the human rights argument for wars based on geopolitical interests.

### Economic and Trade Policy

Another pressing question to establish the link between human rights and foreign policy is the following: does the need for employment in Western

countries outweigh the interests of people in East Timor suffering from weapons exported to Indonesia and people in Turkey from torture instruments imported from the West?

In contrast, should economic sanctions be implemented on states that have committed gross violations of human rights? It has been argued that when human rights are violated routinely, massively and seriously, sanctions are justified. In the case of South Africa, sanctions are thought to have had a positive impact on the time it took to dismantle apartheid. However, in the case of Iraq, sanctions were seen as harming the population, especially the Iraqi children. And Colombia has not been sanctioned, despite the civil wars and the disappearances and killings of trade unionists.

One of the main dilemmas in determining the balance between human rights and self-interested foreign policy lies in trade policy. The example of China shows this very accurately. United States president Clinton decided in 1994 to grant China Most Favoured Nation (MFN) status despite its human rights record; this was a move away from earlier policy which raised the issue of human rights in diplomatic and trade missions (Morris 2002). Some argue that economic development and integration in the world market will take care of China's human rights record. So where is China now that it has been partly integrated for some time? The scope for individual expression has widened. The living standard has gone up for most of the citizenry. Government transparency has increased. The press is less controllable. The harshest restrictions on freedom of movement have been weakened. Criminal, administrative, and civil law reforms have taken place. Experiments in local democracy have been extended and there is human rights education for law students. However, criminal sanctions are still being used against political dissidents. The death penalty is widely applied. The police still detain people without due process. The state exercises control over information. The government maintains a strict family planning policy. Discrimination on the basis of health status, especially for people who are infected with HIV/AIDS, still exists. There are still restrictions on freedoms of assembly, association, and religion. The most famous example is the suppression of the Falungong movement (Stearns in Smith and van den Anker 2005). And the occupation of Tibet remains severe.

What can be learned from the case of China is that foreign policy is one factor among others in promoting human rights; despite receiving MFN status without further discussion of the wide range of human rights violated in China, the country did move forward in terms of human rights. This may mean that a

hybrid model of different forms of pressure may be more useful than strict adherence only to an ethical foreign policy which includes the heaviest pressure from diplomats and trade missions (Fleay 2004).

### **Development Aid: Conditionality**

Historically, conditionality of development aid has been part of the agenda of good governance. It can be defined as the tying of aid by donors to conditions that must be fulfilled by recipients. Economic conditionality was a core element of the Structural Adjustment Programmes (SAPs) of the 1980s and 1990s. Some countries already included human rights and democracy in their aid policies in the 1970s although these policies were often more to strengthen local efforts than to make aid conditional. What donors demand varies, but despite the differences there are some common components: democracy and respect for human rights; some form of social justice and some emphasis on sustainable development to preserve the local environment.

Justifications for conditionality are usually based on either principles or predicted outcomes. Examples of justificatory principles are that democracy and human rights need to be protected around the globe and they are valid in their own terms, even if they do not bring about economic development directly. Justification in terms of results emphasises that political conditionality will bring about economic development, peace, stability, less migration to the West, more trading partners in the world economy and similar type of reasoning. Generally speaking the results are often supposed to be good for the receiving country as well as the donor country.

Conditionality has been criticised and in some cases has been withdrawn as a policy as a result. Widespread criticisms raise the question of whether political conditionality is successful in bringing about respect for human rights and democracy, whether or not democracy and human rights really aid economic development, and whether economic development is the real aim of political conditionality.

Here we would argue in addition that human rights and democracy are often mentioned as if they were basically the same thing in arguments for conditionality of aid. It makes sense to carefully distinguish between measures towards democratisation and measures to protect human rights. Although certain human rights violations are not compatible with democracies, others are not excluded from either the liberal democratic or the popular participation model of democracy.

Let us now assess whether the different parts of the argument for political conditionality work.

## **Human Rights and Development**

Human Rights are often interpreted as meaning civil and political rights only, with an emphasis on freedom of the press and the rule of law. Any social and economic rights are seen as of lower priority which is rather strange if the aim is development.

In the political conditionality discourse, respect for human rights leads to economic development. But often in the debate on human rights and development, human rights were thought to be a barrier to development. Economic development was thought to be a priority and respect for human rights would come second. This trade-off theory is not very plausible. There is no guarantee that the postponed needs, equalities and freedoms are going to be restored once development takes off. The trickle-down theory of wealth has not been proven at all in practice nor in theory and to rely on the expectation that with democratisation there will be an automatic restoration of human rights is both naive and dangerous.

Although the theory of trade offs has been shown to be highly problematic, it is not clear at all that there is an automatic link between respect for human rights and economic development. It depends on which human rights are going to be prioritised whether or not their implementation is helpful to economic development. And it depends on what kind of economic development one envisages. For example, if social and economic rights are prioritised some argue that development will be harmed, because they aim at economic growth as an indicator of development. However, someone else may see the improved access to health care and education as an indicator of development. The main point here is that without a proper definition of the type of rights to be prioritised and the kind of development aimed for, the assumptions of the political conditionality discourse are no more than empty rhetoric.

A second line of argument holds that political conditionality is based on a Western concept of human rights. The universal applicability of human rights is contested and it is claimed that different cultures have different underlying values they adhere to. The West has therefore no right to impose its own values on the rest of the world. This argument from the position of cultural relativism is often complemented by an argument against the hypocrisy of the West in its implementation of penalties for human rights abuse. The general claim that rights should be

different according to cultural values is plausible if what is meant is that the interpretation of the implementation of rights needs to be sensitive to cultural practices (Donnelly 1989). However, the list of rights that should be respected and enforced by any government cannot be open to cultural interpretation, since it would be unfair if a human being could be treated differently in terms of basic respect and dignity according to which place it was born.

Overwhelming evidence supports the argument about hypocrisy from the West. Strong and strategic countries like China, for example, can get away with literally murder, whereas small poor countries like Malawi will be criticised much more easily.

## **Democracy and Development**

Democracy can be seen as one of two major models: the popular participation and the liberal democratic model. Depending on which model one adheres to, different priorities in policy will be emphasised. Some actors in the international aid arena see liberal democracy as strongly linked to principles of free markets with minimal government intervention. The requirements of such a democracy are mainly free and fair multi-party elections and adherence of the government to the rule of law. Others argue for stronger participation from citizens and more government intervention into economic matters. Investment of the government in a welfare system is seen as supportive of a well-functioning democracy. These differences in conception of democracy are important omissions in the debate on political conditionality.

Second, there is no overwhelming evidence that democratic regimes bring about economic development. This is partly due to a weak definition of democracy. Some countries have formal systems of multi-party elections, but in fact the old clientelism still exists.

## **Does Political Conditionality Bring About Economic Development?**

There is no proper evaluation, but the conclusions are divided. Sometimes political conditionality is seen as having results, but these results are too superficial according to others. In terms of democracy it is said that only with a strong movement within the country itself the democratic regime is strong enough to make an impact on economic development.

## Is Economic Development the Real Aim of Political Conditionality?

Some forceful critics argue that political conditionality has nothing to do with the aim of promoting economic development. This analysis is in line with the arguments put forward that human rights are hijacked in order to win support for self-interested policies. However, it is more likely that there is at least some concern for human rights involved in the policy of conditionality.

In summary, political conditionality must be defined more clearly. It must define its aims and objectives more clearly in order to be properly evaluated. Political conditionality must be clear on its justifications: principled or based on results; it must show those results are actually linked to political conditionality. Political conditionality must overcome objections based on its interpretation of the links between human rights and development and democracy and development; it must address the critique from cultural relativism that it is nothing more than imperialism of Western ideas. It must show that there is a higher moral aim to overcome the principle of non-intervention. It must look into the possibilities of non-governmental organizations (NGOs) in assisting the development of human rights practices and democracy from the bottom up. Examples: Amnesty cooperating with development NGOs. However, it is clearly an area of foreign policy where human rights are and should be relevant.

## Conclusion

Historically, the theoretical division between ethical foreign policy and self-interest as the basis for external relations of states has made international politics a complex arena to assess for its morality. Although, with the development of international human rights law, human rights have taken up a place of growing importance in the actions of the international community, exactly how and to what extent they should be issues of foreign policy is still a matter of much political debate. Governments are still trying to balance their obligations under international law to protect and promote human rights everywhere in the world, with policies based on their economic and geo-strategical self-interest. These will not always clash but they may do sometimes.

In a time of globalisation, it is especially important to make the world's riches work for all and to confront the extreme poverty and deprivation for 47%

of the population living on less than two dollars a day. However, with human rights implementation instruments still prioritising civil and political rights, democracy and the rule of law over the provision for social economic and cultural rights the international community still has a long way to go. And despite regionalisation making clear that national interest can be overcome as the single motivating factor in external relations, cosmopolitan convictions to govern the world on humanitarian motives are not a reality yet.

Still, human rights are firmly believed to be a matter for the international community and with help from non-governmental organisations violations are legitimately raised at the highest levels in the United Nations.

We can't get away from the fact that HR are part of our dealings with other states and therefore of foreign policy in the widest sense. What foreign policy works best to implement human rights: economic sanctions, economic development, partnership and dialogue, support for dissidents, will depend on each specific case. With the current agendas of international terrorism and neo-liberal economic policies gaining ground, it remains (and increasingly so) true that human rights need to be fought for.

## HUMAN RIGHTS: DEFINITION AND VIOLATIONS

### Defining Human Rights

The concept of human rights as it is defined today did not exist in the past and is still denied by some political leaders in the present. Human rights advocates define human rights as legitimate claims that people can make on their societies or against their governments. The first modern, comprehensive statement on human rights was the Universal Declaration of Human Rights (UDHR) adopted by the United Nations (UN) General Assembly in 1948. According to the Declaration, the human rights to which all people are entitled because of their inherent human dignity include (but are not limited to): the rights to life, liberty, and security of person; freedom from torture and discrimination based on race, religion, ethnicity, or gender; freedom of thought, conscience, religion, opinion, speech, and press; the right to participate in the political system, to own property, to marry and have a family, to associate with others; freedom from arbitrary arrest and searches; the right to a fair trial, to confront prosecution witnesses, to put on witnesses and evidence in one's own defense; the right to work, to an education; and the right to maintain one's culture and native language.

The Declaration, however, is a legally non-binding, aspirational document that states may sign, but do not ratify. Subsequently, the UN General Assembly adopted numerous human rights conventions that states may ratify and thereby legally obligate themselves to protect the rights contained in the conventions.

Although the UDHR was not designed to be a legally binding document, more than 185 states have incorporated its principles into their constitutions. Therefore, some legal scholars now maintain that the UDHR has achieved the status of customary international law, meaning that it legally binds all governments, because it is a common standard of achievement for all people and all nations.

### The Natural Law Justification for Human Rights

The various UN human rights documents proclaim that the justification or source for universal human rights is the universal dignity of humankind. This justification derives from the natural law philosophies that Greek, Latin, Christian, Enlightenment, and other thinkers developed over the ages. The common ingredients of these philosophies consist in the beliefs that law is not humanly made in the first instance. It is inherent in nature or, according to theologians, created by god. Humans discover natural law through the application of their natural intellects and natural moral sense, and then fashion it into more particular rules of conduct.

This natural law justification for universal human rights was asserted eloquently in the American Declaration of Independence of July 4, 1776:

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their creator with certain inalienable rights, that among these are Life, Liberty and the pursuit of Happiness. That to secure these rights, governments are instituted among men, deriving just powers from the consent of the governed. That whenever any form of government becomes destructive of these ends, it is the right of the people to alter or abolish it, . . .

This writing was inspired by the seventeenth and eighteenth century English political philosopher, John Locke, who is often recognized as the father of human rights. Locke maintained that in nature people were equal and free, and that the ideal society was based on a social contract between the people and those who governed. Those who follow Locke's reasoning, argue that all humans are entitled to human rights because all people possess human dignity.

Locke's thinking also influenced the preamble to the 1948 Universal Declaration of Human Rights, which begins with these words: "Whereas recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world . . ."

### **The Positivist Justification for Human Rights**

Those jurisprudential scholars, known as legal positivists, reject natural law philosophies. They maintain that if human rights are to be conceived of as legal rights, that is, as something more than moral aspirations, then their source is in legal authority, not in god or nature. Legal positivists argue that unless and until the sovereign authority of a state grants human rights, they do not exist.

This idea of national sovereign authority originated in sixteenth and seventeenth century Europe as a counter to the theological basis of authority relied on by the Popes. It found support among the Machiavellian princes who wanted to carve up Europe into independent domains within which they could claim supreme authority unhindered in the treatment of their subjects by outside forces.

These princes located the ultimate source of sovereignty in their own persons. Hence, they called themselves sovereigns, and, according to such legal positivists as John Austin (1832), they were the ultimate source of law. Law, Austin wrote, is nothing more than the command of a sovereign person or group to subjects. Hence, human rights as legal rights were nothing more than the sovereign's law.

In the international arena, executive sovereignty meant that international law applied to relations between states exclusively. International law did not apply to human rights violations by sovereigns against their own subjects. That subject matter fell exclusively within the domestic jurisdiction of each state.

In order to counteract universalistic notions of brotherhood and sisterhood that might infringe on their prerogatives, sovereigns have promoted the ideology of ethnonationalism. This ideology claims that some population of humans is distinct from and superior to all others on the basis of some arbitrarily selected or artificially created set of biological and cultural criteria. This kind of thinking led to genocide in Europe during World War II, ethnic cleansing in Bosnia and Kosovo in the 1990s, and other grave human rights violations.

The counters to executive sovereignty and ethnocentric ethnonationalism are democracy and humanistic universalism. Democracy is the political philosophy that maintains that government is legitimate to the extent that its authority to rule is derived from the consent of the people. Humanistic universalism stands for the equal dignity of all persons regardless of their race, creed, class, sex, class, or political nationality.

### **Religion's Contribution to Human Rights**

Religions historically did not grant individuals inalienable rights; instead they imposed duties on people to god or the gods, who threaten to punish violators in this world or the next. As Elaine Pagels, professor of history and religion at Columbia University, writes, "the notion of human rights was absent from the legal conceptions of the Romans and Greeks; this seems to hold equally true of the Jewish, Chinese, and all other ancient civilizations that have since come to light" (Pagels 1979: 2).

The universal religions did, however, help lay the foundation for human rights by holding that all peoples were created by the same god and by promoting the golden rule: "Thou shall love thy neighbor as thy self" or "Do unto other as you would like others to do unto you." These ideas help promote the belief in the equal dignity of all people.

### **Human Rights and Human Nature**

The ultimate source of universal human rights may lay in the universal psycho-biological nature of humans, rather than in the abstract and idealized concept of natural law. Humans universally have magnificent brains that give them the ability to think, create, invent, imagine, manipulate abstract symbols, anticipate the future, and learn from the past. They have a complex vocal apparatus that enables the brain to express itself orally in the complex, highly developed communication systems we call language. Human bodies are, in part, self-regulating survival machines. Our nervous system tells us when we need nourishment, water, heat or cooling, rest or exercise. Our bodies naturally recoil from pain. We are naturally social beings who love others, bond with others, and develop mentally and emotionally through interaction with others.

Because of these natural endowments, humans naturally want and value the freedom to think, to express their thoughts, to bond with others, to be free from torture, to have an adequate diet, shelter, and clothing. They value and want to be free to learn and develop their mental abilities. Because of their shared psycho-biological nature, people universally do not want to be killed, tortured, enslaved, robbed of their vital possessions, starved, prevented from learning, thinking, communicating with others, or associating with their loved ones and friends, etc. These universal human wants and values have existed throughout human history. Consequently, whenever people were

in a position to do so, they endeavored to secure these wants and values for themselves from their rulers. It is only recently that these protections have become, for some people, legal human rights.

The process whereby human wants and values were transformed into legalized human rights was a slow one that involved demands made by subjugated peoples against their contemporary and future rulers. The process involved social and political revolutions. The three documents commonly named as historic stepping stones to contemporary human rights conventions are: Magna Carta (1215), the American Declaration of Independence (1776), and the French Declaration of the Rights of Man and of the Citizen (1789). All three of these documents were associated with political revolutions. In all three cases, a propertied class of men demanded rights for themselves and imposed corresponding duties on their sovereigns. In the case of the American colonies, these propertied men also established the seeds for a political democracy—a political system in which even common people can effectively strive to translate their universal human wants and values into rights for themselves and corresponding governmental duties. Democracy locates the source of sovereignty in the people themselves, not in their rulers. Hence, democracy replaces executive sovereignty with popular sovereignty.

Unfortunately, the early American promoters of democracy were not as universal as they should have been. Slavery existed legally in the United States until 1865 (Thirteenth Amendment) and the voting rights amendment for women was not passed until 1920 (Nineteenth Amendment). It took a civil war and volatile civil rights movements to address racial and gender inequities.

### **The United Nations and Human Rights**

Owing to the atrocities of World War II, governments committed themselves to creating the United Nations with the goal of securing peace by developing friendly relations among states and “respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion” (UN Charter Art. 1.3). Within the UN, the responsibility for promoting human rights falls mainly on the General Assembly, the Economic and Social Council (ECOSOC), Commission on Human Rights, and High Commissioner for Human Rights (UNHCHR).

The UN Commission on Human Rights, an inter-governmental subsidiary body of ECOSOC, serves as the UN’s central policy organ in the human rights field. It, along with other UN bodies such as the

International Labor Organization, the United Nations Educational, Scientific and Cultural Organization (UNESCO), and the UN Commission on the Status of Women, has drafted a number of international human rights declarations and conventions, which it presented to the General Assembly for its adoption and, in the case of conventions, subsequent ratification by member countries. Among the most important of these have been the Universal Declaration of Human Rights, The Convention on the Prevention and Punishment of the Crime of Genocide (1948), the International Covenant on Civil and Political Rights together with its Optional Protocols (1966; 1989), the International Covenant on Economic, Social and Cultural Rights (1966), International Convention on the Elimination of All Forms of Racial Discrimination (1965), the Convention on the Elimination of All Forms of Discrimination against Women (1979), the Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (1984), and the Convention on the Rights of the Child (1989).

### **The International Bill of Human Rights**

Because of their fundamental character, the 1948 Universal Declaration of Human Rights (UDHR), the International Covenant on Civil and Political Rights (ICCPR), and the International Covenant on Economic, Social and Cultural Rights (ICESCR) have together become known as “International Bill of Human Rights.” These three instruments provide the basis for interpreting the somewhat abstract human rights provisions of the UN Charter, and most of the subsequent human rights conventions elaborate on their articles.

The UN General Assembly unanimously adopted the UDHR on December 10, 1948, by forty-eight positive votes and eight abstentions. Owing to disagreements between capitalist countries that favored civil rights over economic ones, and the communist countries that favored the opposite, the UN Commission on Human Rights decided to divide the rights contained in the UDHR between two separate instruments. The result was two covenants. The UN General Assembly adopted both in 1966 and, after achieving the requisite number of ratifications, they came into force in 1976. As of January 1, 2002, 144 countries (including the United States) had ratified ICCPR and 142 countries (excluding the United States) had ratified ICESCR.

The ICCPR incorporates almost all of the civic and political rights contained in the UDHR. It adds, as

well, the right of peoples to self-determination and the right of ethnic, religious, and linguistic minorities to enjoy their own cultures, to practice their own religions, and to use their own languages. The covenant also calls for the establishment of a Human Rights Committee to study reports submitted by ratifying state parties on measures they have taken to give effect to the rights contained in the covenant.

Countries that become party to the covenant's First Optional Protocol also recognize the authority of the Human Rights Committee to consider and act upon communications from individuals claiming a state has violated one or more of their covenant rights. Countries ratifying the covenant's Second Optional Protocol agree to abolish the death penalty within their jurisdictions. This protocol, which came into force in 1991, has been favorably received by most western European and Latin American countries, but not by the United States.

The International Covenant on Economic, Social and Cultural Rights requires ratifying states to take steps toward progressively achieving the full realization of the rights recognized in the Covenant subject to the maximum of their available resources. Among its economic rights are the right to work, the right to just working conditions, trade union rights, the right to an adequate standard of living, and the right to social security. Its social and cultural rights include rights relating to the protection of the family, to health, to education, and to the preservation of one's culture. The covenant prohibits discrimination in the enjoyment of these rights on the basis of race, sex, language, religion, opinion, national or social origin, wealth, and birth or other status. State parties are required to report periodically to the UN Economic and Social Council on the steps they have taken and the progress they have made toward realizing these rights for peoples within their jurisdictions.

### **UN High Commissioner for Human Rights**

The UN High Commissioner for Human Rights is appointed by the Secretary General to serve for a term of four years with the possibility of one additional term. The General Assembly charges the high commissioner with promoting all civil, political, economic, social, and cultural rights; coordinating human rights promotion and protection activities throughout the UN system; providing human rights advisory services and financial assistance to requesting states; and supervising the UN's Center for Human Rights in Geneva, Switzerland.

### **Generational and Positive Versus Negative Rights**

The content and range of claimed human rights have progressively expanded through time, such that commentators often speak of three generations of rights, the first being civil and political rights (*liberté*); the second being of economic, social, and cultural rights (*égalité*); and the third being solidarity rights (*fraternité*).

The UN Covenant on Civil and Political Rights contains many of the first generation rights, while the Covenant on Economic, Social and Cultural Rights contains many of the second generation rights. Some commentators refer to first generation rights as negative rights, because, they claim, these require government non-interference in order for individuals to be able to freely exercise them. Typical first generation rights include the rights of free speech, press, religion, and thought. By contrast, some commentators have characterized second generation rights as positive, because they usually require government to act in order for individuals to enjoy them. For example, government action may be required in order for individuals to enjoy the right to social security, protection against unemployment, the worker's right to rest and leisure, including periodic holidays with pay; and the right to a standard of living adequate for health and well-being.

Third generation rights are often referred to as collective rights, in contrast to the mainly individual rights of generations one and two. Among the third generation rights are a people's right to political, economic, social, and cultural self-determination; the right of people to share the common heritage of humankind, including the mineral resources of the earth, the seas, and outer space; the right to benefit from science and other forms of human progress; the right to peace; and the right to a healthy and sustainable environment.

The conceptualization of three generations of rights, further divided into positive and negative ones, is more rhetorical than accurate. The rights associated with these three generations did not appear in neat chronological order. And many first generation rights do require governments to act positively to enable individuals to enjoy them. At a minimum, for example, government must act to prevent people from infringing on the rights of others to free speech, press, and religious practice. Finally, third generation rights are largely aspirational. By contrast to first and second generation rights, third generation rights are without widely accepted conventions supporting them.

## Hierarchy of Human Rights

The International Covenant on Civil and Political Rights and some other human rights conventions contain a clause which allows ratifying countries to derogate from (i.e., suspend their obligation to honor) some of the rights contained therein in times of public emergency which threaten the life of the nation. However, such derogation clauses do not allow ratifying states to derogate from the following rights even in times of national emergency: the right to life, the right to be free from torture and other cruel punishment, the right not to be held in slavery or involuntary servitude, the right not to be imprisoned for inability to fulfill a contractual obligation, the right not to be held guilty of an act that did not constitute a criminal offense when committed, the right to be recognized as a person before the law, and the right to freedom of thought, conscience, and religion.

Given the derogation clauses with their specific exceptions and given the disagreement between capitalist and communist countries over the relative importance of civic/political rights versus economic/social rights, some commentators have argued that there exists a hierarchy of human rights, i.e., that some rights are more important than others.

Human rights advocates regard this position as reactionary and dangerous to the progressive development of international human rights. Consequently, they were responsible for the following portion of the declaration that resulted from the 1993 United Nations Conference on Human Rights in Vienna.

All human rights are universal, indivisible and interdependent and interrelated. The international community must treat human rights globally in a fair and equal manner, on the same footing, and with the same emphasis. While the significance of national and regional particularities and various historical, cultural and religious backgrounds must be borne in mind, it is the duty of States, regardless of their political, economic and cultural systems, to promote and protect all human rights and fundamental freedoms.

## Universalism Versus Relativism

Proponents of universalism claim that international human rights, as delineated in the International Bill of Human Rights, are and must be the same for all peoples regardless of their cultures or political systems. By contrast, cultural relativists argue that morality, and therefore human rights, is culturally contingent and variable.

Some leaders of non-Western countries maintain, like cultural relativists, that some of alleged universal human rights really are Western ideals that do not fit well with the cultural traditions of their own countries. These leaders are often critical of those rights affecting women, children, and family relationships, which they claim are based on Western Christian values and contrary to some non-Western cultures. Other spokespersons from countries with authoritarian political systems reject some of the democratic political rights, claiming that they would hinder needed economic development and political stability in their countries.

Rarely, however, are these criticisms made by oppressed people who want to benefit from universal human rights standards. In all countries there are groups that struggle for women's rights and democratic political rights.

The dichotomy of opposing views is most probably exaggerated. The vast majority of rights contained in the various human rights conventions are stated in relatively abstract and general terms, thereby allowing for a fair amount of variation in their actual application. For example, the European Court of Human Rights has developed the principle known as the "margin of appreciation" which permits European countries a degree of variation in the application of the European Human Rights Convention so as to accommodate local cultural differences.

If human rights derive from those universal human values that ultimately result from the universal psychological nature of humankind (as previously described), then there exists a solid basis for developing human rights that are truly universal.

## Regional Developments

To greater or lesser degrees, the states of some of the world's regions have developed systems to promote and protect human rights in accordance with their own expansive or limited aspirations. Of these, the European human rights system, developed by the Council of Europe, is the most advanced.

In 1950, the West European countries that formed the Council of Europe adopted the European Convention for the Protection of Human Rights and Fundamental Freedoms. This convention, which entered into force in 1953, contains most of the human rights found in the UN International Covenant on Civil and Political Rights. For purposes of enforcement, the Convention originally created a European Commission of Human Rights and a European Court of Human Rights, both of which could hear human

rights complaints brought by individuals against Convention member states. In 1998, the Commission and Court were merged to create a single court. Through the years European citizens and non-citizen residents have brought thousands of petitions or complaints to the Court. State parties to the convention have generally honored the court's decisions, which are final and cannot be appealed.

In 1961, the Council of Europe also adopted the European Social Charter which resembles the UN Covenant on Economic, Social and Cultural Rights. The Council of Europe promotes the charter's provisions through the various committees and organs of the Council of Europe which accept and review periodic progress reports made to them by member states.

The Inter-American human rights system began in 1948, when the Ninth Pan-American Conference adopted the non-binding American Declaration on the Rights and Duties of Man, which sets out both the duties and rights of individual citizens. In 1959, the Ministers for Foreign Affairs of countries making up the Organization of American States (OAS) created the Inter-American Commission on Human Rights, which has undertaken the function of investigating human rights activities in the Americas. The OAS adopted the American Convention on Human Rights in 1969. This convention, which entered into force in 1978, established the Inter-American Court of Human Rights, which sits in San José, Costa Rica. In 1988, the OAS adopted the Additional Protocol to the American Convention on Human Rights in the Area of Economic, Social and Cultural Rights. The United States has neither recognized the jurisdiction of the Inter-American Court of Human Rights nor has it ratified the 1988 Additional Protocol.

The Organization of African Unity (OAU) adopted the African Charter on Human and Peoples' Rights in 1981. The great majority of African states subsequently ratified the Charter, which entered into force in 1986. The African Charter provides for civil and political rights as well as economic, social, and cultural rights. It recognizes the rights of groups, the family, women, and children, and grants special protections for the elderly and the infirm. Somewhat rhetorically, it also proclaims rights to national and international peace.

The African Charter provides for a human rights commission, which has both human rights promotional and protective functions. There is no restriction on who may file a complaint with it. The African Charter does not, however, call for a human rights court. Some African leaders claim that African tradition prefers mediation, conciliation, and consensus rather than the kind of adversarial court procedures that typify the West. But other leaders and many

African human rights advocates want a court, and they began planning for it in the 1990s.

The Council of the League of Arab States created the Permanent Arab Commission on Human Rights in September 1968. To date, this commission has focused primarily on Israel's human rights abuses against Palestinians living under Israeli occupation in the West Bank and Gaza. Arab intergovernmental and nongovernmental bodies have been responsible for the Universal Islamic Declaration of Human Rights (1981) and the Cairo Declaration on Human Rights in Islam (1990)—two non-binding documents.

The League of Arab States approved an Arab Charter on Human Rights in September 1994, but by 2002 not one Arab state had ratified it. The charter requires state parties to submit periodic reports to the league's Human Rights Committee. It also provides for an independent Committee of Experts to study reports and submit its own findings to the Human Rights Committee. However, the charter creates no court and contains no provisions for petitions by individuals.

Asia has no regional human rights regime. The governments of many Asian countries have been opposed to following the lead of the West in establishing regional human rights conventions, commissions, and courts. Many government leaders complain that human rights as commonly conceptualized are culture-bound Western creations with limited applicability to Asian cultures and societies. Many Asian people, however, have campaigned for more legal human rights protections. A group of Asia-Pacific NGOs (non-governmental organizations) adopted the Asia-Pacific Declaration of Human Rights in 1993 and the Asian Human Rights Charter in 1997. Both of these documents incorporated many universal human rights principles. But, Asian governments have not adopted either the declaration or the charter. However, governmental representatives of thirty Asian countries participating in a 1996 UN-sponsored workshop agreed to at least explore the possibility of establishing a regional human rights regime.

### Violations

Most cases of human rights violations are adjudicated in the domestic courts of countries. The vast majority of states have human rights protections written into their constitutions. In addition, states that ratify human rights treaties are obligated to create the domestic legislation necessary to implement them. Consequently, in those countries that respect the rule of law, persons who violate the human rights of others

can be prosecuted in domestic courts. This, of course, rarely happens in countries ruled by military juntas or dictators.

Despite the progress made in the ratification of human rights conventions by countries around the world, human rights abuses that violate those conventions are widespread. For example, in its 2001 annual report, Amnesty International (a non-governmental human rights advocacy organization) maintains that of the 149 countries covered in its survey, sixty-one of them had carried out extrajudicial executions (i.e., executions without trial) in 2000. Security forces, police, or other state authorities reportedly tortured or ill-treated persons in 125 countries. Confirmed or possible prisoners of conscience were held in sixty-three countries. People were arbitrarily arrested and detained, or held in detention without charge or trial in seventy-two countries. Armed opposition groups committed serious human rights abuses, such as deliberate and arbitrary killings of civilians, torture and hostage-taking in forty-two countries. Most of the countries with serious and widespread human rights violations were developing states located in Latin America, Africa, and Asia.

Widespread and systematic human rights violations are common during times of civil and international war. Historically, persons committing these violations have not faced trial and punishment, unless they were war losers. For example, at the end of World War II the victorious powers tried defeated German and Japanese military officers and officials for a variety of serious human rights violations. The post-World War II International Military Tribunal (IMT) at Nuremberg, for instance, prosecuted and punished German leaders for war crimes and crimes against humanity. War crimes consisted of: the murder and enslavement of civilians, the murder or ill treatment of prisoners of war, the killing of hostages, the plunder of public or private property, and the wanton destruction of cities. Crimes against humanity included murdering, enslaving, or committing other inhumane acts against a civilian population because of its political views, race, or religion.

In essence, the IMT stood for people's rights to life, freedom from torture and other cruel punishment, freedom of political thought and freedom of religion. Furthermore, it stood for the principle of universal jurisdiction—the claim that any state or combination of states has the legal authority to try persons allegedly responsible for grave violations of human rights (such as war crimes and crimes against humanity) regardless of the location of the crimes or the citizenship of the suspects or victims.

In 1993 and 1994, the UN Security Council invoked the principle of universal jurisdiction by

creating international tribunals to prosecute persons allegedly responsible for war crimes, crimes against humanity and genocide in the conflicts of the former Yugoslavia and Rwanda. In the former Yugoslavia, Serbs, Croats, and Muslims fought each other for control of territory following the breakup of Yugoslavia's multi-ethnic federated republic. Military as well as paramilitary forces targeted civilians and engaged in rape, torture, and murder. From 1991 to 1994, an estimated 250,000 people were killed and many thousands more were wounded, tortured, or raped. In Rwanda, the Hutu military, paramilitary, and many ordinary citizens engaged in a widespread massacre of Tutsi citizens. Within a three month period in 1994, they mutilated and raped thousands and murdered an estimated 750,000 people. By creating the international tribunals, the UN Security Council asserted that the international community need not tolerate such massive human rights violations. Under international law, the international community can intervene in the sovereign affairs of states for humanitarian purposes.

In July of 1998, 160 UN member states authorized the adoption of a statute to create a permanent International Criminal Court (ICC) to prosecute persons suspected of committing crimes against humanity, war crimes, crimes of genocide, and crimes of international aggression. The ICC will become a reality after sixty countries ratify its statute. Once it comes into existence, the ICC will most probably replace the international tribunals for Rwanda and the former Yugoslavia. It will be capable of exercising jurisdiction in those countries that have ratified its statute as well as in other countries that the UN Security Council may determine need the court's services.

## HUMANITARIAN RELIEF PROJECTS

Humanitarian relief projects are undertaken by governments, intergovernmental organizations (IGOs), and nongovernmental organizations (NGOs) in order to prevent starvation, disease, and other hardships among people who have experienced various kinds of disaster and displacement from their homes. Often humanitarian aid is provided in an emergency mode, where assistance agencies must act swiftly in order to prevent staggering losses of life. Although local or domestic aid providers may be the first to offer assistance, when humanitarian emergencies strike in developing countries, international humanitarian aid is often necessary to cope with the needs. Humanitarian emergencies are more likely to occur in developing nations than in developed ones because poorer countries are more vulnerable to disasters and less able to cope by themselves with their effects. Humanitarian relief projects in such cases can have a significant negative or positive affects on the economy and social infrastructure of beneficiary nations. Thus, while saving lives of distressed populations is the foremost objective in humanitarian relief projects, implementing agencies must also be sensitive to the long-term development impact of their emergency programs.

### Principles of Humanitarian Relief

Although political factors and national interests affect when, where, and how humanitarian relief is

undertaken, most of the players in the humanitarian assistance field, including IGOs and NGOs, as well as governments, understand that humanitarian aid should be fundamentally non-partisan. Wherever people are in distress owing to disasters, the international community should assist them. The primary motivation in provision of such assistance should be to alleviate human suffering. While the humanitarian principle should be kept foremost in mind, it is nonetheless true that no particular country is obliged to assist the disaster-stricken population of any other country. Financing of humanitarian aid is voluntary in nature. Countries friendly to a stricken nation are much more likely to act swiftly and generously to assist its afflicted population, whereas hostile governments are much less inclined to help if they help at all. IGOs and NGOs, on the other hand are more likely to behave in an impartial matter, although even these bodies may be driven by ideological or political motivations. Still most agencies active in the provision of humanitarian aid understand that such aid should be disbursed on the basis of need and not on partisan or political grounds.

In addition to the humanitarian principle, NGOs acknowledge several other principles in humanitarian aid projects, including nondiscrimination as regards race, religion, or nationality, and impartiality as regards assistance to contending political groups, and neutrality as regards belligerent groups. The International Red Cross and Red Crescent Movement and many other NGOs in a Code of Conduct have acknowledged several other principles of conduct. NGOs are especially concerned that they not be coerced into acting as instruments of government foreign policy. NGOs pledge in the Code of Conduct that they will respect local cultures and customs and build disaster responses cooperatively with local NGOs and institutions by incorporating program beneficiaries in the planning and implementation of projects. Relief aid and related projects should anticipate the reduction of vulnerabilities to disaster as they meet basic needs. NGOs recognize that they must be accountable both to charitable donors and to the recipient population, and that the latter should, even in the midst of terrible suffering be treated not as objects of pity but as persons deserving of dignity and respect.

While NGOs express high ideals in these principles, the political reality of humanitarian assistance is that governments dictate the pace and the provide most of the capacity for humanitarian assistance in times of disaster and conflict. Governments of disaster-affected countries determine when to seek assistance and from whom to seek assistance. They may turn to donor governments for the bulk of their needs. They

may also turn to IGOs within the UN system for humanitarian assistance. Such agencies might include, depending on the nature of the disaster, the United Nations High Commissioner for Refugees (UNHCR), the UN Children's Fund (UNICEF), the World Health Organization (WHO), or the World Food Program (WFP). In requesting the assistance of other governments or of various IGOs, the host country must grant the agencies sufficient autonomy to do their work. In most instances the donor governments and IGOs will seek to work with appropriate ministries within the disaster-stricken country. They also routinely rely on a number of NGOs as implementing partners. The receiving country has the sovereign right to approve or to deny entry to NGOs, as it does any other form of outside aid.

### **Forms of Humanitarian Assistance**

Meeting basic needs of disaster victims is the primary focus of humanitarian relief programs. Food aid is critical. When food needs can be met by local resources it is best to exhaust them first before relying on substantial imports so that local food prices do not artificially plummet, thus putting local producers at risk. However, when severe shortages occur, it may be necessary to rely of foreign sources of food aid. The United States, Australia, Canada, and numerous countries of Europe are the major food producing countries and the biggest donors. The WFP monitors food availability and coordinates international responses to humanitarian emergencies.

Access to potable water is another critical need for victims of disaster. Polluted water becomes a source of disease and, in all forms of disaster, access to clean water is often inhibited, thus putting disaster victims at risk. Sometimes clean water must be trucked into disaster areas, but in the long run assistance aimed at improving sanitation in disaster-stricken areas is essential for the establishment of adequate renewable sources of clean water. Among the UN bodies most frequently addressing clean water and sanitation issues is UNICEF.

Provision of health assistance is also a basic need of disaster victims. In cataclysmic disasters such as floods and earthquakes, emergency medical attention is often necessary, and in developing countries the scope of the need may quickly outpace the health infrastructure. In famines and refugee situations, treatment and prevention of infectious disease is critical, especially when inadequate housing, sanitation, and nutrition are available. Numerous agencies are involved in provision of such assistance, including

UNHCR, UNICEF, WHO, and numerous NGOs. Shelter is another basic need for refugees and displaced persons who have been forced to flee from their homes, or whose homes may have been destroyed by floods or earthquakes.

Special attention is paid to vulnerable groups in the provision of humanitarian assistance. Children, elderly persons, and pregnant and lactating mothers are in need of special nutritional requirements and medical assistance. Such groups are usually underrepresented among the politically active and in the traditional decision-making structures in many countries.

A major emphasis of humanitarian aid in recent decades has been to encourage self-reliance among the beneficiary populations. Self-reliance implies that the victims of disaster, the internally displaced and refugees, are employed in the task of their own recovery. WFP encourages this through implementation of food-for-work projects, such as rural road-building, reforestation, water development, and construction programs involving refugee housing, medical facilities, and schools. In this, WFP cooperates with the UN Development Program (UNDP) and with UNHCR where refugees are involved. These agencies also initiate vocational training programs and cottage industries in refugee and displaced persons camps.

### **Humanitarian Relief During Complex Emergencies**

During the 1990s, as the Cold War waned, the United Nations began fielding peace-keeping and peace-making forces in many regions of long-standing conflict and civil war. Coupled with political settlements and military intervention were sizable humanitarian operations in such countries as Cambodia, Mozambique, Somalia, and the former Yugoslavia and in such regions as Central America and the Great Lakes region of Africa. In Cambodia and Mozambique, peace agreements were agreed upon prior to deployment of substantial international peace-keeping forces. In these cases repatriation of refugees and reintegration of internally displaced persons were facilitated by humanitarian aid organizations, while opposing armies were demobilized and reconstituted. Assistance for repair and reconstruction of economic infrastructure was provided as preparations were made for elections. De-mining operations were commenced to provide greater safety and security to refugees and returnees so that they might resume agricultural pursuits. In both of these cases, the recreation of civil society under the watchful eye of the international

community produced relatively stable governments. Cambodia experienced later political upheavals, but eventually political stability was restored.

By contrast, in Somalia and the former Yugoslavia, the international community intervened with humanitarian assistance prior to the negotiation of peace agreements. UN forces were fielded to ensure the safety of humanitarian aid workers and the effective delivery of aid to those in need. In Somalia, where no effective central government existed, international forces which were deployed to provide security for the delivery of humanitarian aid prevented a massive famine, but when the UN forces attempted to disarm the local forces of Somali warlords, the situation deteriorated. The withdrawal of American forces and later those of other nations involved in the UN operation, signified the failure of the UN to establish a civil society in a country where general lawlessness prevailed. In the former Yugoslavia, the UNHCR provided humanitarian aid to besieged cities in Bosnia, but the UN forces sent to guard aid shipments, found themselves trapped in the cross-fire of an ongoing civil war.

The existence of peace plans enhanced international efforts to provide aid and to promote security and the emergence of civil society in Cambodia and Mozambique. In Bosnia and Somalia, the lack of such agreements hampered aid activities. Not until the Dayton Accords were promulgated did the situation in Bosnia improve, permitting repatriation and resettlement of displaced persons, and eventually the promotion of rehabilitation and reconstruction of the national economy.

A similar pattern can be discerned in contexts of complicated regional conflicts. In Central America, after years of negotiation, a peace agreement among contending parties was achieved. This was rapidly followed by deployment of UN observer forces, the repatriation and return of refugees and displaced persons, the demobilization of forces in Nicaragua, the preparation for and holding of national elections, and the application of development aid to enhance rural development through quick impact projects and longer term development assistance. This successful sequence of activities never materialized in the Great Lakes Region of Africa, where hundreds of thousands of Rwandan refugees adversely affected the economic situation in neighboring countries such as Zaire and Tanzania. In Rwanda, itself, genocide had taken a terrible toll among the Tutsi population and Hutus, fearful of retaliation, spilled into neighboring countries, where many died. The international community, slow to respond to the genocide, reacted fairly quickly in providing humanitarian aid to the Hutu refugees, but owing to the fact that the same

ruthless killers who had unleashed genocide dominated the Hutu refugee camps, provision of humanitarian aid was very difficult. The presence of such destabilizing elements led eventually to civil war and the overthrow of the government of Zaire. Instability and civil war in Zaire frustrated humanitarian relief efforts and left no room for consideration of longer term development aid.

Complex emergencies continue to offer the international community very difficult humanitarian assistance challenges, not the least of which, is how military forces are to be integrated with humanitarian agencies. The military may provide security for delivery of aid, but in the midst of a civil war, its primary task must be to bring force to bear against combatant elements, and this leaves humanitarian agencies in a very precarious and dangerous situation. Sometimes the military becomes the primary agent for delivery of humanitarian aid, as was demonstrated in Kosovo in 1998, and again in Afghanistan in 2001 when food packets were dropped by air in zones experiencing famine.

Ideally, international humanitarian aid gives way to longer term development, rehabilitation and reconstruction once peace has been reestablished in areas of conflict. That task requires the existence of governments committed to the maintenance of civil society. With the return of political stability and peace, resources can be shifted toward the goal of economic prosperity, and as such a transition unfolds, the humanitarian aid agencies and projects give way to projects aimed at fostering long-term economic development.

## HUN SEN

Born in Kampong Cham province, Cambodia, on August 5, 1952, Hun Sen was educated at Lycee Indra Devi, Phnom Penh. He graduated in 1969 and joined the Khmer Rouge in 1970. In 1977, however, he defected to Vietnam and joined troops fighting against the Khmer Rouge. He was a founding member of the United Front for the National Salvation of Kampuchea (UFNSK) in 1978 and returned to Cambodia to become minister of foreign affairs in the Vietnamese regime in 1979. He served as deputy Prime Minister and Foreign Minister from 1981–1985 and then as Prime Minister, 1985–1991. He participated in brokering the 1991 United Nations (UN) Paris Peace Agreement and was part of the coalition government for the next two years. Despite working with Prince Ranariddh of the National United Front for an Independent, Neutral, Peaceful and Cooperative Cambodia (FUNCINPEC) as First Prime Minister following UN supervised elections, he ousted Ranariddh in a violent 1997 coup. He became Prime Minister two more times following elections in 1998 and 2003.

Hun Sen seems to be a combination of contradictions: idealist and pragmatist, ruthless authoritarian and skilled negotiator. He initially joined the Khmer Rouge to free Cambodia from a government he felt was corrupt, but then defected when he experienced the excesses of Pol Pot's genocidal regime. When he achieved a position of political power with the help of the Vietnamese, he ruthlessly clung to his position. Supported by the army, he staged a violent coup in July 1997 during which Rannariddh fled Cambodia, calling Hun Sen a gangster. This action delayed Cambodia's acceptance into ASEAN until 1999, following elections in July 1998. The elections did not bring a clear victory for either major party and another brief period of violent unrest ensued. Eventually agreement was reached and Hun Sen became Prime Minister again in November although the inauguration ceremony was marred by a rocket attack outside the National Assembly. The CPP won the July 2003 elections, but a year passed before the National Assembly ratified the CPP-FUNCINPEC coalition

government for a third term, with Hun Sen as Prime Minister.

Regardless of how one views Hun Sen's tactics, it cannot be denied that Cambodia has enjoyed relative political stability in recent years. This has enabled the country, under Hun Sen's undeniably strong leadership, to begin to make small but significant development gains in many areas.

Hun Sen recognises Cambodia's need for outside assistance in order to develop. He also accepts that Cambodia's legal, financial, and governance systems need reform, not only to benefit the Cambodian people, but also to gain international acceptance. His government has instigated economic, taxation, and legal reforms; and is demobilizing the military and fighting corruption, especially in the forestry industry. These, and other, ongoing reforms have inspired cautious but increased investor and donor confidence.

Hun Sen is wary of foreign control of Cambodia's affairs, particularly from the United Nations. He walks a fine line, inviting outside assistance and advice, and accepting aid, but pragmatically only compromising as absolutely necessary to ensure Cambodia gets the help it requires, while maintaining the country's sovereignty and his own powerful position. A good example being the ongoing negotiations to construct a tribunal and legal system to try the remaining members of the Pol Pot regime for war crimes. While accepting input from the UN and various countries, including the US, Hun Sen still insists on a hybrid Cambodian justice system that allows foreign participation, but not dominance.

Statistics show many sectors of Cambodia's economy are developing and the standard of living is slowly improving. How much is due to political stability and how much to Hun Sen's strong leadership is unsure. Providing Hun Sen's government can sustain the momentum of reforms, Cambodia's growth and development should continue.

## HUNGARIAN CRISIS OF 1956

On October 23, 1956, Hungarian university students demonstrated in Budapest in solidarity with the Polish workers’ revolt in the city of Gdansk a few weeks before. After the demonstration, they marched to the national broadcasting studio of Hungarian radio, demanding that their twelve-point program be broadcast to the nation. Secret policemen, stationed inside, fired on the unarmed crowd. Regular policemen and soldiers then gave their weapons to the students who attacked and conquered the building. In another part of the city, at Heros’ Square, worker-demonstrators dismantled the giant statue of Stalin, leaving only his boots on the pedestal.

Erno Gero, the Communist Party chief, recently returned from Yugoslavia where he mended fences with Tito, ordered martial law and asked for Soviet troops stationed in Hungary. This turned the revolt into a national uprising against Soviet colonialism. In the next few days the fighting, mainly against the secret police, turned ferocious. The Soviet troops were withdrawn from Budapest after five days, but remained in the country. On October 28, a new government was formed, headed by Imre Nagy, a moderate national communist. Independent workers’ councils were established in factories and municipalities. The secret police was disbanded. A new multi-party government was established. General Péter Maléter was appointed minister of defense and he was invited to negotiate with Russian officials for the withdrawal of the Soviet troops from Hungary. General Béla Király became commander of the newly formed volunteer national guard.

By November 3, the government was in complete control of the country. However, the prominent communist, János Kádár, a member of the government, fled with Soviet help from Budapest. He declared that the “events” represented an uprising against socialism. He formed a new counter-revolutionary government under Soviet control. On November 4, the Hungarian delegation negotiating with Soviet representatives was treacherously arrested and huge Soviet forces attacked Budapest and other revolutionary centers. Fighting continued until December. By January 1957, two hundred thousand Hungarians fled the country.

Kádár’s counter-revolutionary government reestablished the Stalinist system in Hungary. In addition

to those who died in battle, hundreds of revolutionaries were executed with or without trial and tens of thousands were jailed. The new government organized a party-army, made up of die-hard communists, who became an instrument of terror. The secret police was also reassembled. Hungary became an international pariah and the “Hungarian case” remained on the agenda of the United Nations for years. Although the United States–sponsored Radio Free Europe encouraged the revolution, the US government did nothing to help the Hungarians. It used the revolution as a propaganda tool in the Cold War. Only in 1963 did Kádár’s regime feel secure enough to relax the terror, and gradually restore a semblance of normalcy in Hungary.

## HUNGARY

Hungary’s territory comprises 35,919 square miles. The country is in the Danubian River Basin in East-Central Europe. The population numbers about 10 million. Ethnicity: 89.9% Magyars, 4% Roma (Gypsies), 2.6% Germans, 2% Serbians, and even tinier minorities of Romanians and Slovaks. The capital city is Budapest. The center of the country consists of flatlands. The northeast and north are mountainous, the west and southwest are hilly. Hungary borders on Austria in the West, Slovakia and Carpatho-Ukraine in the north and northeast, Romania in the southeast and Croatia and Slovenia in the south. The climate is moderate.

During the last three hundred years, Hungary was part of the Habsburg Empire. When the empire collapsed after World War I, Hungary became an independent state. It was deprived of two-thirds of its former territory and one-third of its ethnically Hungarian population. Hungary had few economic

resources left; its roads and railroads were cut at the new borders. During the first third of the twentieth century, Hungary struggled economically. With Hitler in power, Hungary came under German influence, especially after she regained some territory from Romania and Czechoslovakia with Hitler's help. Hungary participated in the war against the Soviet Union and suffered large numbers of casualties. In 1944–1945, Hungary became a battleground between Soviet and German armed forces.

In March 1944, the Germans occupied the country. A radical right-wing “Arrow Cross” movement established a reign of terror under German auspices, shooting its enemies, especially Jews, into the Danube River. The war completely ruined the economy. Factory buildings were damaged; stocks and machinery had been stolen. The housing stock did not fare any better. Most bridges were destroyed. Animal stocks were carried away or killed. Public transport disappeared. Railroad tracks were uprooted and road surfaces were destroyed.

In December 1944, a new government was formed under Soviet auspices. Parties entered a so-called “national independence front,” including several communists returning to Hungary from Soviet exile.

In 1944 and thereafter, the Soviet Army and the Soviet secret police were arbiters of life and death in Hungary. There were hundreds of thousands of Hungarian “prisoners of war” in Soviet camps (some civilians “captured” by the Soviet army to serve as slave labor in the Soviet Union). Their return depended upon the behavior of the Hungarians at home. The amount of reparations demanded from Hungary also depended upon the good will of the Soviet dictator. Stalin forced the new Hungarian government to conclude trade agreements and establish joint Soviet-Hungarian companies. They were means for future exploitation of Hungary's resources.

The communist repatriates, including Mátyás Rákosi, Ern Ger, Mihály Farkas, and Zoltán Vas (the “Muscovites”), wanted to grab and hold power by any means.

Almost immediately after the war—in 1945—a new political (secret) police was established. It was under the control of the communist leaders who used it to suppress the opposition. Yet the first municipal elections, in October 1945, brought victory for the Smallholders Party, representing the opposition. In November, national elections were held with a similar outcome. The Communists and their allied Social Democratic Party received less than 30% of the vote. Nevertheless, Marshal Voroshilov, the Soviet representative of the Allied Control Commission, ordered the victors to form a coalition government with the communists. Soon the pressure of the Soviet

government resulted in the destruction of the victorious party and the establishment, in 1947, of a communist dictatorship.

By 1946, the entire police apparatus—including the secret police—was under the direction of a radical communist, László Rajk. The police openly participated in the campaign against opponents of the Communist Party. A series of show trials started against the opposition but, in time, prominent Hungarian communists were also persecuted. The charge in most cases was the “culprit's” and his/her associates' alleged conspiracy to overthrow the government.

In 1947, Hungary was included in a new Soviet empire. The Hungarian government, dominated by the Rákosi-led Communist Party, signed the peace treaty that confirmed the separation of Hungarian minorities in the former Successor states and Romania. Hungary was obliged to pay a huge reparation to the Soviet Union, Czechoslovakia, and Yugoslavia. In addition, Soviet troops were stationed in Hungary on a permanent basis. In 1955, Hungary became a member of the Warsaw Pact Alliance.

After the non-communist political parties were eliminated, the Roman Catholic church came next. Its cardinal, Joseph Mindszenty and several leading bishops were incarcerated on trumped-up charges. Religious orders were dissolved. Literature now consisted mainly of political propaganda. The arts were streamlined along lines of “socialist realism.” Newspapers and radio stations were mouthpieces of Soviet propaganda. Newspapers were copies of Soviet journals. All this was accomplished in an atmosphere of terror.

The Hungarian population, including some members of the Communist party, was demoralized. Education was augmented by large doses of Marxism-Leninism, and the study of the Russian language was required. Listening to foreign radio broadcasts was considered a crime. In 1949–1950, the peasantry was forced into Soviet-style collective farms, private landholding was abolished and compulsory delivery of foodstuff to the state was introduced. Factories, banks, and shops were nationalized.

The communist leaders introduced a process of forced industrialization. Hungary did not have natural resources to develop heavy industry. Yet industrialization was pursued with emphasis on heavy industry, serving Soviet military interests. Industrial production increased in a haphazard way and consumer industry and housing were neglected. Productivity stagnated; the chemical and electrical industrial capacity remained negligible.

By 1952, 210,000 Hungarian men were serving in the armed forces. In addition, the secret police had 140,000 officers. Thus, about 3.5% of the total population was under arms. The share of the military from

the state budget was enormous. Hungarians were overburdened and became impoverished. Only by maintaining a constant level of terror could such a system survive.

However, the Communist party was unable to earn respect from the population. Respect for laws in general also deteriorated. Cynicism, crime, and petty pilfering from factories and shops were common. There was an ever widening gap between reality and Marxist-Leninist ideology. Living standards plummeted, except for the party elite. But society was changing; forced industrialization and general education created a more complex social structure. To govern such a society, a minimal consensus was necessary. But even within the Communist Party there was no consensus. The ordinary members lost faith in Marxism-Leninism and realized that the party served Soviet interests.

After Stalin's death, his successors had not released control over Hungary. Some of the top echelons of the Hungarian Communist Party turned against the ruling Rákosi clique. They were headed by Imre Nagy. He wanted to halt forced industrialization, ease pressure on the peasants, and increase the production of consumer goods. The resistance of the Rákosi clique to reform resulted in revolution in October 1956. People wanted to remove the Soviet army from Hungary and the establishment of humane Socialism.

The Soviet leadership could not accept Hungary's independence. On November 4, 1956, they ordered the arrest of the Hungarian leadership. Two hundred thousand troops and two thousand tanks suppressed the revolution. The attack was indirectly helped by the preoccupation of the Western powers with the war over the Suez canal. Nikita Khrushchev named János Kádár Prime Minister of Hungary and he took terrible revenge. Imre Nagy, who fled to the Yugoslav embassy in Budapest, was enticed to leave and, despite promises to the contrary, was arrested and deported to Romania. In June 1958, he was executed. Kádár instituted a new wave of terror, taking thousands of victims. Approximately two hundred thousand Hungarians fled to the West.

The Communist Party, dissolved during the revolution, was reorganized. Its new name was Hungarian Socialist Workers Party. It attracted mostly cynical opportunists. Even party members no longer believed in its Marxist-Leninist ideology. By 1968, the regime was desperate for legitimacy. It introduced a set of economic reforms, originally proposed by Imre Nagy. The peasants could now own a private plot. They were permitted to sell their produce on the open market. However, the prices of essential consumer goods were still regulated. State monopolies over foreign trade were retained.

After the reforms, unprecedented economic activities began, as the peasants were given a certain measure of controlling their lives. Commerce with the Soviet Union and its satellites began to increase. Consumer goods, such as refrigerators and automobiles appeared, providing incentives for the population. Hungarians were permitted some travel abroad. The press was encouraged to criticize lower party officials. Kádár co-opted some intellectuals and permitted a little more freedom of speech. Yet the old taboos remained; no one could criticize the Soviet Union or the Hungarian communist leadership. In spite of the reforms, Kádár's Hungary was not even a semi-democratic state. The communist chief was an old-fashioned dictator whose word was final in all matters. Yet, Hungary began slowly to emerge from the terrible days of terror. Kádár was gradually accepted as "better than most" dictators. As long as life improved, the system was acceptable for most of the population.

However, instability continued. There was a conflict within the communist leadership over the application of Marxist-Leninist ideology. There were also reversals in economic reform. In the 1970s, the radicals in the leadership succeeded in reversing policies favoring the peasantry. Consequently, food production declined and supplies for the cities shrank. The course was, therefore, hastily reversed. The oil crisis of 1973, however, provided heavy blows to the Hungarian economy. Production costs increased, exports declined and Hungary had to borrow heavily abroad. Hungary's national debt reached the astronomical figure of \$20 billion. The leadership did not use the loans for the modernization of industry. Instead, products that could not be sold at competitive prices were subsidized. By the mid-1980s, the deterioration of economic conditions was obvious and the shaky legitimacy of the Kádár-regime came to an end.

The ascendance of Mikhail Gorbachev to power sent a signal that the old ways of politics were over. Intellectuals were emboldened to demand greater freedoms. Political dissidents appeared and underground publications multiplied. Marxist-Leninist interpretation of history lost all credibility.

The younger members of the communist leadership realized that Kádár became a liability. In March 1988, he was removed as prime minister. The party which he created could not survive without him. The murdered Imre Nagy and his followers were rehabilitated in May 1989. On the same day, János Kádár died.

A new government was formed under the premiership of Miklós Németh, a young, dynamic leader. His Minister of Education and Culture, Ferenc Glatz,

abolished the compulsory teaching of the Russian language and Marxism in the schools and universities.

In October 1989, the Hungarian Socialist Workers Party was dissolved. Two successors emerged, one the party of the reformers now called the Hungarian Socialist party, and the other retained the old name.

In the following free elections, a new party, the Hungarian Democratic Forum, emerged victorious; its closest rival, the Association of Free Democrats, and the revived Smallholders' party joined in a new coalition government. The Németh government decided to open the western borders to East German refugees, indirectly contributing to the collapse of the Honecker regime in East Germany. The East European Soviet empire disappeared. By July 1991, the last Russian troops left Hungary.

In May 1991, the Warsaw Pact was dissolved. A parliamentary democracy led by József Antall was formed in Hungary. It privatized most state-owned factories and the land. The media was freed of state-control. Unfortunately, problems of nationalism, anti-Semitism, and impatience with dissenters reemerged.

Ferenc Madl was elected president in June 2000; the next presidential election, which is held in the National Assembly, will be in June 2005. The National Assembly elected Ferenc Gyurcsany Prime Minister in September 2004.

Hungary's economy has become steadily stronger since the dissolution of the Soviet Bloc. Its growth rate is estimated at 2.9%, though its debt is estimated at 57% of its gross domestic product (GDP) (2003). Hungary joined NATO in 1999 and the European Union in 2004, and is a member of the World Bank and the IMF. Inflation has declined from 14% (1999) to 4.7% (2003). Unemployment remains steady at about 6%. Foreign investment is strong, with Germany as the country's largest economic partner.

### HUSSEIN, KING OF JORDAN

Hussein bin Talal, known to his people as “the humane king,” is considered the father of modern Jordan. He was born in Amman on November 14, 1935, into the Hashemite dynasty, and could trace his roots exactly forty-two generations directly back to the Prophet Mohammed. The Hashemites were natives of what became Saudi Arabia, but were rewarded by the British for their fight against the Ottoman Turks with control of the League of Nations Mandates over Iraq and Transjordan. Hussein's grandfather, King Abdallah, consolidated the synthetic monarchy by bringing Jordan's Bedouin tribes into the government and the army.

Hussein attended elementary school in Amman, and went on to a thoroughly British education at Victoria College in Egypt, the Harrow School in London, and the Royal Military Academy at Sandhurst. Hussein's entire life was shaped by the turbulent nature of Middle East politics in the 20th century. The boy was ten years old when Transjordan gained independence from Britain, twelve when the first Arab-Israeli war sent tens of thousands of Palestinian refugees into the kingdom, and sixteen when, on July 20, 1951, he witnessed his grandfather's assassination, at the hand of a Palestinian nationalist on the steps of the Al-Aqsa Mosque in Jerusalem. Hussein's father, Talal, assumed the throne, but as he was mentally ill, was soon declared unfit to rule. Hussein was proclaimed King on August 11, 1952. A regency council ruled on his behalf until he reached age eighteen (under the Islamic lunar calendar) on May 2, 1953.

The young king may not have realized at first how treacherous his political environment was, but after a 1957 coup attempt led by pro-Egyptian military officers he decisively asserted royal primacy, imposed

martial law, and banned political parties for the next thirty-five years. King Hussein had the last word on all important domestic and foreign policy decisions, yet brought elements of all political factions into his consultative process. He was often compared to a tightrope walker. He succeeded in creating the only moderate, relatively humane state in the Arab Middle East.

Never a warrior at heart, Hussein nevertheless joined Egypt and Syria in the Six Day War of June 1967. Israel quickly took control of the holy sites in Jerusalem and expelled the Jordanian Army from the West Bank. King Hussein endorsed United Nations Resolution 242 offering Israel peace in exchange for return of all land conquered in the war. Israel never accepted that offer, and Jordan was burdened with a massive new influx of Palestinian refugees whose loyalty to the kingdom was often secondary to their enthusiasm for the Palestine Liberation Organization (PLO). Events came to a head in September 1970 after two attempts by Palestinians on the king's life: Hussein's Bedouin army launched an all-out war against the PLO and drove them from the kingdom forever. He was thereafter judged by many Arabs to be an appeaser of the Israelis. According to some reports, Hussein gave Israeli Prime Minister Golda Meir advance warning of Egyptian and Syrian war plans in 1973.

In 1988, Hussein ceded authority over the West Bank to the PLO, demonstrating once again his skillful tactic of accommodating his most murderous enemies. When the Iraqi dictator Saddam Hussein (no relation) invaded Kuwait in 1990, King Hussein refused to join other states in the region in condemning that action. He probably did so with one eye on the restive Palestinians, who comprised more than 50% of the population of his kingdom. Saudi Arabia and other Gulf states suspended financial aid in retaliation, severely damaging the Jordanian economy.

In the 1990s, after being diagnosed with cancer, Hussein carefully steered Jordan toward the legacy he wished to leave—cautious democratization—while retaining his royal prerogatives. He lifted the ban on political parties and abolished martial law in 1992. Multi-party elections were held in 1993. In that same year, Hussein helped Israel and the PLO to negotiate a peace agreement, which unfortunately came undone five years later. On October 26, 1994, Jordan and Israel signed a treaty formally ending their forty-six-year state of war. Israeli leaders had come to trust him; indeed, many secretly slipped across the border to consult with Hussein in his palace in Amman. In 1995, Hussein attended the funeral of assassinated Israeli Prime Minister Yitzhak Rabin, whom he called his “partner in peace” and his “brother.” Other Arab

leaders denounced Hussein, but he promised his people that peace with Israel would bring economic growth and foreign investment. The actual results were disappointing, but the king adroitly maintained his balance by inviting into his cabinet critics of his own foreign policy.

Hussein publicly confirmed that he had lymphatic cancer in July 1998. In October of that year he checked himself out of the American hospital where he was being treated to appeal to the Israelis and the PLO to revive their sputtering peace process. But his time was running out. On January 24, 1999, he stunned his countrymen by designating his son Abdallah as heir to throne. His bypassed brother, Crown Prince Hasan, accepted the decision without public rancor. On February 5, Hussein flew home to Jordan from the US and two days later he passed away. He was the longest-serving head of state in the world. Mourners at his funeral included President Clinton, former presidents Bush, Carter, and Ford, Israeli Prime Minister Benyamin Netanyahu, PLO leader Yasser Arafat, Russian President Boris Yeltsin, and Syrian dictator Hafez Assad. His son took the throne as Abdallah II and promised to continue his father's legacy.

Hussein's private life was colorful. He married four times; one wife was an Englishwoman and one an American. He enjoyed auto racing, motorcycling, and flying his own jet plane. He loved tennis and water skiing. He wrote three books including one entitled *Uneasy Lies the Head*. His long reign is remembered for a relatively good human rights record and huge improvements in his country's living standards.

## HUSSEIN, SADDAM

Saddam Hussein reined Iraq for twenty-four years of absolute power (1979–2003). Often dismissed in the West as deranged, Saddam possessed a keen instinct for human weakness and shrewdly mastered the calculus of power. His personalized, secular dictatorship

was not truly totalitarian for it lacked a coherent ideology, but all Iraqis were kept in a state of terror.

Saddam Hussein al-Tikriti was born on April 28, 1937, into a landless peasant family in Tikrit District, about one hundred miles north of Baghdad. His father died either before or shortly after Saddam was born and his mother quickly re-married. Saddam ran away from his abusive stepfather to live with his maternal uncle, an anti-British nationalist and bigot who published a pamphlet the title of which foreshadowed Saddam's own views: "Three Whom God Should Not Have Created: Persians, Jews, and Flies."

Saddam's middle school education equipped him with little understanding of the West. He applied to Baghdad Military Academy but was rejected for poor grades. Revolutionary politics suited him better. Captivated by the pan-Arab rhetoric of Egyptian President Gamal Abdel Nasser, Saddam joined the Ba'ath (Renaissance) Party in 1956. Two years later Gen. Abdul Karim Kassem overthrew the Hashemite monarchy and Iraq became a republic. Saddam was part of a Ba'athist squad that tried to assassinate Kassem in 1959. Hussein was wounded in the shoot-out, but escaped to Syria and then to Egypt, where he remained until 1963. While ostensibly studying law, he collaborated with other Iraqi exiles. In February 1963, the Ba'athists finally succeeded in killing Kassem and Saddam returned home. He enrolled in Baghdad Law College and married his cousin Sajida. Saddam was arrested and imprisoned in 1964 for plotting to overthrow President Abdul Salem Aref, but he escaped in 1966.

Saddam's faction seized power in a coup (later termed a "revolution") on July 17, 1968. Saddam organized a secret police force whose first assignment was to purge Iraqi Jews. He was named Vice-President of the Revolutionary Command Council in November 1969 by his cousin, President Hassan al-Bakr, and for the next ten years gradually gathered power to himself. On July 16, 1979, al-Bakr resigned "for reasons of health," and Saddam became President. All potential rivals were swiftly eliminated in a wave of executions. To harden his teenage sons, Saddam made them witness these killings. Saddam trusted no one, and relied so heavily on his own clan that he outlawed the use of surnames to hide the fact that so many of his ministers were named "al-Tikriti" (indicating their origin in Saddam's home town).

Saddam modernized Iraq. Money flowed in after the Ba'athists nationalized the Iraq Petroleum Company (1972) and the Organization of Petroleum Exporting Countries (OPEC) quadrupled the price of crude oil. Saddam's government built roads and extended irrigation canals. Factories sprang up. Primary education was made compulsory and the

university system was expanded. The position of women was greatly improved.

These social and economic advances came at an appalling price in human rights. East Germans trained Saddam's secret police force, which eventually grew to one hundred thousand men. Saddam Hussein sought security by making the Iraqi people, especially those close to him, desperately insecure. He personally shot a general for urging military caution and is rumored to have dropped a dissident into a vat of acid with his own hands. He killed his own brother-in-law and forced officials to execute other officials. Sometimes executions were televised.

All Iraqi newspapers echoed the government line, as did radio and television stations. Photographs of Saddam adorned public buildings and even private homes. Bronze statues of the autocrat on horseback appeared in the cities. Saddam apparently considered himself a reincarnation of King Nebuchadnezzar (who destroyed Jerusalem in 587 BC). He dreamed of overrunning the entire Middle East, permanently eliminating Israel, and asserting Iraqi primacy over Syria and Egypt.

Saddam's grandiose ambitions led to strategic blunders. The first was his disastrous war against Iran. It was not unprovoked, for the Ayatollah Khomeini had tried to use Arab Shi'ites (63% of the Iraqi population) to overthrow Saddam's Sunni-dominated regime. In September 1980, the Iraqi army invaded Iran and captured the Shatt al-Arab waterway, where the Tigris and Euphrates rivers merge to flow into the Persian Gulf. Saddam expected a quick victory, and when it did not materialize he executed three hundred high-ranking officers. The eight-year Iran-Iraq war featured the first use of poison gas since World War I and missile attacks against cities. When a cease-fire was finally signed in 1988, Iraq found itself \$80 billion in debt, mostly to Kuwait and Saudi Arabia. This led to an even greater blunder—the Iraqi invasion of Kuwait.

Saddam's surprise attack of August 2, 1990, routed the Kuwaitis. He declared Kuwait the 19th province of Iraq and asserted that he had thereby redressed colonial injustice, but his main objective was to gain control of Kuwait's enormous oil reserves. Saddam evidently calculated that President George H.W. Bush would not react, for the American ambassador had told him that Washington had no position on territorial disputes "between Arabs and Arabs." Ignoring United Nations ultimatums, Saddam, who had never served in the army, promoted himself to the rank of field marshal and prepared his people for "the mother of all battles." The war began on January 16, 1991. After five weeks of aerial bombardment, Iraqi forces were so weakened that the ground war lasted only

four days. Before a cease-fire was signed (February 27, 1991) Iraqi troops set fire to Kuwait's oil wells and dumped thousands of gallons of crude oil into the Persian Gulf. Then he proclaimed his defeat to be a victory. Saddam tried to have the first President Bush assassinated, which may have been a factor in his own undoing at the hands of the second President Bush.

In the wake of the war, Saddam faced twin uprisings, one by the Kurdish people of northern Iraq and the other by Arab Shi'ites in the south. The Kurds achieved *de facto* independence under the umbrella of a northern "no-fly zone" enforced by British and American jet fighter-bombers. A similar "no-fly zone" in the south could not protect the Shi'ites from Saddam's wrath. He drained the southern marshes, burned villages, and randomly shelled Basra with heavy artillery. Some captured rebels were made to drink gasoline and then set on fire.

Saddam attempted to arrange a political succession under which power would be inherited by his younger son, Qusay (born 1967). Saddam evidently had concluded that his older son Uday (born 1964), who personally tortured Iraqi Olympic athletes, had become unbalanced after a 1996 assassination attempt. His son-in-law, Hussein Kamil, had at one time been in line to inherit power, but he defected to Jordan, was lured home with promises of forgiveness, and murdered.

Saddam clung tenaciously to power until 2003. United Nations weapons inspectors crippled his nuclear, biological, and chemical weapons programs, but were unable to certify the total elimination of such weapons. The inspectors were expelled in 1998, and comprehensive economic sanctions remained in place. Saddam blamed the West for the misery the trade embargo brought to his people. He used revenue from oil exports permitted under the "oil-for-food" program to build more palaces, a total of twenty-six by one count. Saddam Hussein applauded the terror

attacks of September 11, 2001. Influential members of the George W. Bush administration were already planning his overthrow. Saddam's final blunder was to refuse a Saudi offer of safe exile just before the American invasion of Iraq in 2003.

United States and coalition forces invaded Iraq in March 2003 and swiftly took Baghdad. Uday and Qusay were killed in a shootout in July. American infantrymen found Saddam on December 13, 2003, hiding in an underground vault near his home village. His captors faced a dilemma—how to try him for his crimes without allowing the cunning ex-dictator to portray himself to the world as a nationalist martyr. Saddam Hussein won a certain grudging respect from some Arabs who admired him for defying Israel and the West. In June 2004, Saddam and eleven other major defendants were handed into Iraqi custody with the return of sovereignty to the country.

## **IMPORT SUBSTITUTION INDUSTRIALIZATION**

Import substitution has been the dominant vehicle by which industrialization in large developing countries has proceeded. Many countries in Latin America, such as Argentina, Brazil, Chile, Colombia, and Mexico, have since the 1940s most vigorously pursued this strategy as their main growth-generating force. Other countries followed in the 1950s and 1960s. In the 1970s increasing disenchantment with this strategy emerged and an alternative approach, identified as outward (or export) oriented and associated with East Asian development, became more popular (Edwards 1993). However, remnants of the import substitution approach still persist in some Latin American countries and in Africa.

Import substitution is a process whereby a greater proportion of a country's total demand for goods is satisfied through its own domestic production. As the term implies, it involves substituting domestically made products for previously imported goods. By its nature, import substitution involves import restrictions such as tariffs, which are a tax on imports. These tariffs allow domestic producers to supply the product locally, and capture some or the entire market share, depending on how prohibitively high the tariff rate is set. Commonly, the protection package provided to fledgling local suppliers involved tariffs, quotas that restrict the quantity of imports of a product allowed into the country, and a favourable exchange rate.

All countries go through a process of "natural" import substitution. As average income rises, the

domestic manufacture of processed foods, beverages, textiles, clothing, and other simple commodities is undertaken in response to growing local demand. Import substitution industrialization, however, occurs as a matter of deliberate development policy consciously guided by governments.

### **Why Was Import Substitution Industrialization Promoted?**

Albert Hirschman (1971, p. 89) noted that

Wars and Depressions have historically no doubt been most important in bringing industries to countries of the 'periphery' which up to then had remained firmly remained in the nonindustrial category. The crucial role of the two world wars and the Great Depression in undermining acceptance of traditional ideas about the international division of labor between advanced and backward countries is well known.

During the war years, with the sudden deprivation of imports and foreign exchange, developing countries had no option but to become self-reliant and set up domestic import-replacing industries. Persistent balance of payments deficits in peacetime were a further inducement to restrict imports. However, what started out as a response to circumstances was soon rationalized as a strategy to transform the structure of the economy to achieve higher levels of economic prosperity. Many of these poor countries were agricultural and natural resource-based producers.

Richer countries were primarily industrial nations. Efforts to promote industrialization were seen as an essential prerequisite to achieving comparable living standards.

By creating a domestic industrial base, import substitution would accelerate the movement of resources out of the low-productivity rural sector and into higher-skilled manufacturing. Initially, local suppliers would have to be nurtured and protected from the competitive pressures applied by long-established foreign producers. Over time, domestic inefficiencies would decline as these “infants” learned from experience and were able to reduce costs of production. The end result would be a far more diversified and self-reliant economic structure that is less dependent on the vagaries of the international market price for a small number of primary products like sugar, rubber, or tin. Developing countries had long been suspicious that, in their trade of primary products for imported manufactured goods, the terms of trade had been steadily moving against them. They then had to export more and more of their resource-based products to pay for the same amount of the imported manufactured goods (Meier and Seers 1984).

### **Import Substitution in Practice**

The import substitution strategy has played a key role in the transformation of the economic structure of many developing countries. The process begins at the final stages of production where industries assemble parts and components and turn out finished consumer goods. By limiting the import of the final consumer good, but not the required inputs, an opportunity is created for producers to assemble the product locally. This phase appears to be very successful and tariff protection is provided for a wide range of final consumer goods production. Eventually, expansion of finished consumer goods capacity reaches the limit of the domestic market. There are then two options: expand the market through exports or deepen the process of import substitution through domestic production of the parts and components. The Latin American countries have mostly followed the latter path. A small number of East Asian countries began manufacturing for export and are pursuing an alternative development strategy.

Those countries that deepened their import substitution have done so by requiring their manufacturers to buy a certain percentage of their inputs locally and increasing the percentage progressively. The earlier consumption goods phase of import substitution was now being replaced with a capital and intermediate

goods phase, which requires more specialized and technically complex production processes. Domestic content regulations now placed increasing strains on local skills and capabilities.

Many of the problems associated with import substitution stem from this deepening process. Local producers need higher rates of protection to remain viable. The effective rate of protection is a concept economists use to measure the assistance that domestic producers receive. During the 1960s the average effective rate of protection on manufactured products in Brazil was 118% and Chile 182%. In India and Pakistan the rates were even higher (Little, Scitovsky, and Scott 1970). Often the infant industries remained as inefficient, high-cost producers selling their goods to the local population at grossly inflated prices. The increasing industrial complexity placed even more demands on overstretched government bureaucrats. In the quest for industrial planning there was a proliferation of administrative regulations and controls—differential taxation, import and investment licensing, tariffs, and quotas.

As the production processes became more capital-centred and technology driven, employment growth diminished. There was a shift away from labour-intensive industries such as textiles toward industries such as chemicals and metalworking that were more sophisticated and automated. A strong “urban bias” was another characteristic of this process. Resources were deliberately allocated to urban areas and the rural sectors were often neglected. Rural–urban migration and regional inequality were often consequences of this.

### **A Reconsideration**

Import substitution has been an essential component of industrialization in large developing countries. The experiences of Latin America are instructive here. Before the Great Depression, development in Latin American countries was stimulated by export-propelled growth. This phase ended by roughly 1949. The next phase of Latin American growth came via growth of the domestic market through import substitution and flourished particularly in the 1950s. During the 1960s the enthusiasm for this approach was waning not only in this developing region, but also in India and Pakistan (Hirschman 1971).

The problems that have arisen relate to the lack of selectivity in the industries supported and the faulty incentive mechanisms used. Governments need to find the right activities to promote, to support them in ways that minimize distortions and inefficiencies,

and provide appropriate incentives for firms to assimilate and improve technological capacity to achieve international best practice (Bruton 1998). Moreover, import substitution may be a transitional phase that eventually leads to an expansion of manufactured exports. Once the industrial base expands, as reflected in the scale and diversification of production and the availability of skilled personnel, industries initially producing for the home market move into export markets (Chenery, Robinson, and Syrquin 1986). This has happened in a number of countries and is one indicator of successful import substitution industrialization.

## INCOME DISTRIBUTION

Recent discussions on income distribution can be divided into three main debates, according to their focus. Initially, income distribution was a topic discussed in the context of social or distributive justice

within one society, mainly although not exclusively in Western societies. Secondly, the theories developed in this debate were then used as a basis for evaluating if we took the notion of global justice seriously, what model of income distribution should be used to establish global distributive justice. Recently, the first set of considerations on models of welfare systems and principles of justice has been used to look into social policy in developing countries, where additional models to the existing set are acknowledged to exist, in addition to a normative debate on which, if any, of the existing models should be emphasised in the international effort to establish good governance in the global south. Of course, these categories are not impermeable: work done on the capabilities approach fits partly into the categories of domestic and of global justice when it proposes capabilities as the currency of justice instead of welfare, rights, or duties (Nussbaum 2001; Sen 1991, 1997, and 1999). A second line of work on this approach is the measurement of development via indicators that would describe people's capabilities. This line would fit into the category of social policy in developing countries.

Some people would also make a distinction between work on models of welfare provision and theories of social justice; this is a refinement of the categories above that would lead us into too much detail for the present purposes. Here, we will therefore use the distinction among the three areas of debate as a guideline for discussion of the issue of income distribution. This allows us to separate out theories with a domestic focus on justice and welfare, theories with a focus on global principles of justice, and work on applying theories to developing countries, without complicating matters too much.

### Distributive Justice in One Society

The idea of redistribution through progressive taxation forms part of most liberal Western societies' social policy makeup. The design of welfare states started as early as the end of the nineteenth century with the call from newly formed labour unions for social security and especially sick pay and pensions. However, the main work on developing systems of social security and collective insurance against unemployment took place in the twentieth century. Arguments for social justice were initially made mainly in the context of political struggle, and the late US professor John Rawls is widely recognised as the instigator of contemporary theoretical debates on social justice. In 1971, after a long silence in political

philosophy on anything to do with ethics and morality, he started up the debate again with his book *A Theory of Justice*. Rawls tried to systematise the thinking about justice after a period in which the utilitarian approach of cost-benefit analysis and the intuitive approach to justice were most popular. He proposed to use a thought experiment to derive principles of justice that could be accepted by all under certain just circumstances and should therefore be accepted in real life as fair. Principles of justice in Rawlsian theories are developed by asking, “What would free and equal people choose under circumstances of impartiality?” In order to arrive at those principles, Rawls introduced what he called an “Original Position” where people deliberate on principles of justice without knowledge of their position in society, talents, or earning potential. This is called the “veil of ignorance.” Some additional criteria are that there is no envy, no risk taking, and generally a mutual disinterest: there are no special feelings toward anyone in the group. The principles that would be agreed to under those circumstances are, according to Rawls:

1. Equal liberty
2. a) Inequalities to the benefit of the worst off (Difference Principle)
- b) Positions open to all

These principles apply to the basic institutions of society that distribute the benefits and burdens of society. What is to be distributed fairly are the primary goods, i.e., goods that everyone needs in order to realise their conception of the good life: income, wealth, power, liberty, rights, and opportunities.

### Criticism of Rawls

Rawls received two types of criticism: internal criticism that proposed modifications and external criticism that proposed alternatives to his theory. It was felt that the “no envy restriction” was not realistic and if people were allowed to include envy, then this would lead to a more equal outcome. The same could be said for the mutual disinterest: if people were allowed to include their altruism, the outcome would also be more equal. The mixture of self-interest with impartiality was regarded by some as incoherent. Impartiality should be the only basis for deliberation and the outcome would then again be more equal. Also, it was thought to be unclear what would count as benefiting the worst off. If capitalist investment is always seen to benefit the worst off, then what is the difference between Rawls and a libertarian? All these

criticisms can be seen as respecting Rawls’ starting point but aiming for a more equal outcome by changing the circumstances under which the principles are chosen. This is why they are called internal criticisms.

External criticisms of Rawls were put forward by people who proposed alternatives to his theory. Robert Nozick, for example, developed a libertarian theory of justice in his *Anarchy State and Utopia* (1974). His main objection is that Rawlsian justice requires redistribution from the rich to the poor. Nozick holds that taxation of the rich infringes upon their property rights and he calls taxation “on a par with forced labour.” However, this objection can be countered by noticing that if you do not work, you do not pay tax and therefore taxation does not force you to work. Property rights do not necessarily have to be absolute and the entitlements to the property could be unfair in the first place.

A later external criticism of Rawls, and liberalism more generally, came from a group of theorists sometimes called communitarians. The main proponents are Michael Sandel, Alasdair MacIntyre, and Charles Taylor. Their objection is that Rawls’ contractarian approach assumes the individual to exist prior to society, whereas instead individuals are born into a society. This means that principles of justice should be found in the traditions of the community and not by abstract reasoning. Since individuals’ goals and ethical judgements are bound up with community life, justice requires respect for communities and the values associated with it. Rawls’ theory, according to communitarians, supports the divisive and over-individualistic tendencies in Western democracies.

However, a response to communitarian criticism of Rawls could argue that by taking the values of communities as given, their theory of justice cannot criticise existing practices. Moreover, it is not clear which community is most important: local, national, global? It is not clear who defines what the values of the community are. How are critics of the dominant group treated?

However, both libertarianism and communitarianism represent strongly held intuitions by large groups of people, and Rawlsian liberalism has responded by at least refining and making more explicit its position on the relevance of community and freedom. Rawls himself adopted a modified position in his *Political Liberalism* (1993) where he sets out that justice is not metaphysical but political, and there are no ultimate justifications but dialogue. Others have further pursued the original Rawlsian contractarian line, especially in the debate on Global justice, as we will see below.

Before we move on to the issue of global justice, we pay attention to two more external criticisms of

Rawlsian principles of social justice: feminism and Marxism.

Feminism is especially interesting because it has put forward both an internal and an external critique of Rawls' work. The main exponent of the internal criticism is the liberal feminist Susan Moller Okin (1989). Her main objections are that the Original Position only includes heads of households and they are assumed to be male; the family is not part of the basic structure to which principles of justice apply; sex is not included under the veil of ignorance; and finally, self-interest leads to a lack of benevolence. Okin, however, still finds Rawls' approach helpful: if these three aspects are changed, she argues, it would have radical consequences from a feminist point of view. In response Rawls could argue that heads of households could be women. Rawls has in fact argued that the family is in the basic structure of society, although he could also argue that gender is not relevant in the Original Position, since we all have knowledge of who are the worst off in society. Rawls could also argue that mutual disinterest is not egoism.

External critiques of Rawls by feminists have been put forward by Gilligan (1982), Nodding (1986), and Benhabib (1987), amongst others. Their main thesis is that liberalism leaves out women's voices. Gilligan claims that her research of moral judgments shows that women have a different perception of morality than men. The "different voice" is referred to as a perspective of care rather than a perspective of justice. A perspective of care differs from a perspective of justice in that it emphasises social relationships rather than rules and it is geared toward conflict resolution, and this means that justice is too abstract; it views individuals as separate and isolated; it focuses on the public domain; it advocates an impartial point of view, which ignores special ties; and it advocates one moral principle for all situations. The proposed alternative of feminist ethics holds that actual experience should inform moral theory; theory should be directly applicable in real life; real persons, related to others, should be the focus; the private should be included, with friendship as the model; and, finally, different ethics for different domains should be developed. Nodding, too, proposes the ethics of care as an alternative to justice. Benhabib views feminism as a critique that would lead to a different perspective on the world and therefore on justice based on gender inequality.

The external criticism of Rawlsian justice as put forward by Marxism is often also labelled as an egalitarian approach to justice, although not all egalitarians have a Marxist analysis. Here we give three prior warnings: (1) Marx's work is not the same as

Marxism; (2) Marx's view of justice (and even whether he had one) is contested; and (3) Marx wrote before Rawls, so to say he criticised Rawls is an anachronism. Having put these warnings in place, we can safely say that Marx himself was critical of human rights, as he viewed them as divisive—especially the right to private property, but also the right to individual freedom as it was primarily based on keeping others out of one's sphere of autonomy. As an alternative, Marx proposed his famous principle, "from each according to capacity, to each according to needs."

Later expressions of egalitarianism criticised the Rawlsian approach for allowing the assessment of whether or not the worst off are better off with more inequality to include the idea of compensation for less income by employment opportunities, and they question what is used as the baseline of comparison. Less inequality can be more attractive than the status quo, yet proper equality can be even better. This type of critique leads into the discussion of what needs to be distributed fairly. Since we are discussing income distribution, it needs to be clear that egalitarians may not argue for complete inequality without attention to the overall level of income; yet, egalitarians would argue that Rawls' argument on incentives for the "talented" making some inequality more attractive for the worst off should be curbed, for example, by a maximum ratio of inequality between the highest and the lowest incomes.

Now we will look at how this debate on just principles of income distribution has affected thinking about global justice and about social policy models in developing countries.

## Global Distributive Justice

The end of the Cold War and the process of globalisation could be seen as factors contributing to the growth in literature on global justice. The growing gap between rich and poor and the persistence of dramatic poverty, as well as deaths from preventable diseases, increasingly raise questions of responsibility beyond national borders. The changing economic order has instigated a discussion on fair rules of the game in world trade and duties of redistribution to guarantee the welfare rights of poor people wherever they are in the world. In other words, income distribution worldwide has become a major subject of discussion. Current debates range from proposals for a global progressive tax system to arguments for the satisfaction of basic needs through international institutions.

Cosmopolitanism's early roots lie in the works of the ancient Greeks and the philosophers of the

Enlightenment, especially Kant. The main source for Kant's cosmopolitanism is his Categorical Imperative: "Act only in such a way that I can also will that my maxim should become a universal law" (Kant 1991, p. 67). Contemporary cosmopolitanism can be seen as a continuation of the Rawlsian debate on justice. In 1993 Rawls argued for the basic rules of international law in his Amnesty Lecture, "The Law of Peoples" (Rawls 1993), but he did not argue for the globalisation of the Difference Principle. The Difference Principle was not applicable to international justice, according to Rawls, since persons' adverse fate is more often to be born into a distorted and corrupt political culture than into a country lacking resources. The only principle that does away with that misfortune "is to make the political traditions and culture of all peoples reasonable and able to sustain just political and social institutions that secure political and social institutions that secure human rights... distributive justice for this purpose" (Rawls 1993, footnote 52).

Others took up the theme of international justice and extended Rawls' original theory of justice as fairness (Beitz 1979; Pogge 1987). This tradition in political philosophy is now well established. In recent years, this tradition has also been seen as a valuable contribution to new approaches within international relations theory (Brown 1997; Beitz 1999).

### **Moral Duties Based on Global Interdependence: The Role of Globalisation**

An important question for cosmopolitans is whether rich nations have duties to redistribute wealth to poor nations based on the interdependence created by economic and cultural globalisation, or whether they have these duties simply because they are rich. Or is it a duty based on historic injustice such as slavery and colonialism?

The main proponent of a moral theory based explicitly on growing interdependence is Beitz (1979). Although he altered his argument (Beitz 1983), many people share the intuition that globalisation causes a shift in the moral duties toward people across boundaries. In a historical period where we know of the existence of others and have intensive interaction with them, morality and obligations are denied only by outright moral sceptics. The form global interaction has taken, according to Beitz (1979), leads to a strong argument for global duties of redistribution. Since nation-states are no longer self-contained, justice becomes a global matter and cannot be coherently theorised within models of one society.

However, this position can be criticised for relying on empirical facts which can be disputed and moreover it can be rejected on the basis that normative positions should not be derived from them. A recently suggested alternative takes globalisation seriously as an element in the increasing demand for moral reasoning while not relying on it. O'Neill avoids the question "What are the obligations from one person to others in the world?" and asks instead, "What are our obligations in the present time?" (O'Neill 1996). In her argument for global justice she acknowledges that in today's world, theories of justice for a wider scope than national societies are unavoidable: "Today questions of global distributive justice will arise whether or not we can find the theoretical possibilities to handle them. Modern technical and institutional possibilities make far wider intervention not only possible but unavoidable" (O'Neill 1991, p. 277). This means that income distribution can no longer be an issue for single nation-states only. Her approach holds that when we interact with others across borders, we make quite complicated assumptions about the agents and subjects we deal with. It would be incoherent to deny those agents or subjects moral standing while clearly assuming their complexities when we interact.

Since in our world action, which is globally institutionalised, is a reality, O'Neill's approach shows that a more or less cosmopolitan view of moral standing is contingently appropriate. O'Neill concludes therefore that "[i]f we owe justice to those whose moral standing we acknowledge [by our actions] we will owe it to strangers as well as to neighbours and to distant strangers as well as to those who are relatively near at hand" (O'Neill 1995).

Some have argued that O'Neill's approach lacks a list of precise duties, for example, on global income redistribution. O'Neill can also be criticised for relying on a notion of human agency that, although it is a minimal one, is grounded in metaphysics. And if this is the case, then one may as well be explicit about one's metaphysical assumptions and bring them into the debate (Flikschuh 2000).

An alternative approach is to argue that rich countries are responsible for poverty as they are benefiting from the unequal trading rules (Pogge 2001). Whichever argument one opts for, it is clear that there are strong calls for global redistribution that would result in a more equal income distribution between rich and poor countries. Even global institutions like the United Nations Development Program (UNDP) and International Labor Organization (ILO) have called for global justice and fair globalisation (van den Anker 2005).

### INDIA

The Republic of India is situated in southern Asia and occupies approximately 1.27 million square miles, which makes it roughly one-third the size of the United States. Geographically, India is split into three regions: the Indo-Gangetic Plain and the Himalayas, known together as North India, and South India. India is bordered by Pakistan in the Northwest and by China, Nepal, Bhutan, Burma, and Bangladesh in the Northeast and has approximately 4,400 miles of seacoast. The terrain varies from mountainous to flat and the climate varies from subtropical monsoon in the South to the more temperate in the North. The population is estimated at 1.05 billion with an estimated annual growth rate of 1.6%. The capital, New Delhi, is located in Northern India and has a population of 12.8 million.

India's present geographical boundaries were the result of British partitioning in 1947. Fueled by increasing hostility between Hindus and Muslims, the British decided to partition India. Consequently, this created an East and West Pakistan, whose populations were predominantly Muslim. East Pakistan would later become Bangladesh. Prior to British colonial rule, India was governed by a vast array of kingdoms, dating as far back as the Mauryan Empire (326–184 BC). While the Mauryan Empire was the first imperial kingdom, Indian civilization itself dates as far back as 2500 BC. Known as Harrapan culture (2500–1600 BC), remnants found at the two ancient cities of Mohenjo-daro and Harappa reveal a civilization with an advanced writing system, art, commerce, and sophisticated engineering. Harrapan culture was eventually displaced by invaders from the Northwest, the Indo-Aryans. The Aryans brought with them their own pantheistic religion, language system, familial structures, and social order.

The first Europeans to arrive in India were the Portuguese. In 1498, the voyager Vasco da Gama arrived in Calicut and claimed sovereignty of the Indian seas. He immediately came into conflict with the ruler of Calicut and was forced to withdraw, eventually making an establishment at Cochin. While the Portuguese never established an Indian empire, they were instrumental in establishing a thriving commercial trade as part of India's economic structure. After the Europeans defeated the Spanish Armada, it became increasingly clear that Portuguese domination of the Indian Ocean was subject to challenge.

British government interests in India were primarily economic. The British government initially did not run or control India, nor did they intend to, but rather organizations such as the British East India

Company (1603) did. Over time, commercial activities became increasingly involved in the political landscape of India. This entailed, among other things, being involved with local political rivalries between various rulers that often interfered with commerce. As the size of the Company grew, it found itself an Indian power in its own right. Often the Company found itself collecting taxes and running the affairs of other local rulers. The British government did not want commercial concerns to interfere in the affairs of foreign lands without its supervision and subsequently took steps to bring the activities of the Company under its control. The first step it took was the passage of the Regulating Act of 1773. Eventually, the British government realized that India could not be effectively run as a commercial enterprise. In 1858, India became the possession of the British Crown. India was a British colony until its independence in 1947.

Mohandas Karamchand Gandhi (1869–1948) was instrumental in securing popular support for an independent India. Armed with a law degree from England, his civil activist career started out unassuming enough. But his gentle nature, positive attitude, and persevering character would soon enthrall the whole of India. He was assassinated on January 30, 1948 on his way to an evening prayer.

When the British relinquished their claim to sovereignty over India, there were approximately 562 princely states. Each of the states was given the option of joining one of two countries, India or Pakistan. The subsequent partitioning had disastrous effects on India. Untold numbers of people lost their lives and property. There were numerous conflicts over the demarcation of boundaries, assets, and the equitable sharing of water. The control of Kashmir has been a particularly troublesome aspect of partitioning. Kashmir was predominantly Muslim and during partitioning it remained uncommitted to joining India. On October 27, 1947, however, after forceful induction by armed tribesmen and some regular troops from Pakistan, Kashmir was forced to sign an Instrument of Succession to India. The Pakistani government did not recognize the legality of the Instrument of Succession and war ensued. Kashmir remains a violently disputed territory to this day.

On August 15, 1947, India became independent. The British left India in very poor condition. India emerged from World War II with a deteriorating scientific and industrial base and a rapidly expanding population. Most people lived in small villages and were divided by severe inequalities in the distribution of wealth and basic services. Food production was disastrously low, which was exacerbated by a steady population growth rate of 5 million a year. It was the

task of India's first prime minister, Jawaharlal Nehru, to rectify these problems of inequality.

Jawaharlal Nehru was prime minister of India from 1947 to 1964. He was from a wealthy Kashmiri Brahman family and was educated at Oxford. Nehru's first order of business as prime minister was to initiate land tenure reform, modernization of the agricultural system, and the development of irrigation facilities. Nehru abolished uneconomic land ownership, which historically consisted of intermediary parties controlling government-owned land that was cultivated by peasants. The abolishment of these policies created an impetus to the peasant in the cultivation of land. Modernization of the irrigation system brought millions of acres of previously uncultivated land into use. During this period the production of food grains increased by approximately 80%. Secondly, Nehru was also keenly aware that massive improvement in the nation's industrial base would be essential to improve the lives of the citizenry. To that end, he initiated broad-based programs designed to create a highly industrialized India. Initially, the government managed and organized the base industries (steel, heavy chemicals, machinery) that were made possible by financial assistance from the United States, Britain, and the Soviet Union. Industrialization brought with it the need for scientifically and technically trained personnel. Nehru was instrumental in restructuring the Indian educational system from the humanities-based system established by the British to one in which science and technology would take the fore. The third achievement of the Nehru administration was the transformation of Indian rural life. Historically, the rural populations that were concentrated in villages still retained the customs, social mores, craft-based economy, and primitive agricultural practices of the past. Nehru was able to initiate their modernization by consolidating any given eighty or ninety villages into one sizable community. Through consolidation it was easier to provide better sanitation, education, and housing. The objective was to create an environment wherein local leadership would develop, embrace the program of modernization, and thereby increase the quality of lives of rural Indians. The more far-reaching aspect of this program was the creation of self-governing democratic communities, known as *panchayati raj*. Community-elected officials, known as *panchas*, are entrusted with a large degree of self-government. Nehru's policies were effective. At independence, more than 80% of the population was illiterate and university admissions were only at three hundred thousand. After implementation of his modernization programs, the government sent nearly 80% of India's children to schools, with compulsory education for all

children between six and eleven. Moreover, the number of universities doubled and enrollment exceeded 1 million. Nehru also removed barriers that held back Indian women. Through a series of legislative enactments, women were given the right to vote, to sue for divorce, to inherit property on equal terms with males, and to adopt children. In 1961 dowry was made illegal.

While Nehru enjoyed overall success with his domestic policies, the close of the 1950s beset his administration with a variety of problems, domestic and foreign. Domestically, food production began to stagnate and eventually declined. Nehru's foreign policy with respect to the Cold War was one of non-alignment. He sought to project India as a mediator between the superpowers in much the same manner as did Mao's China and Sukarno's Indonesia. However, the Sino-Indian friendship deteriorated when the Chinese invaded Tibet in 1959. The relationship of mutual respect embodied by the five principles of peace (*Panch Shila*) collapsed altogether when the Chinese invaded Ladakh and Assam in 1962. China's objective was the acquisition of territory necessary to control a road from Sinkiang through the Karakoram Pass to Tibet. The invasion in Assam was merely a diversion. Nonetheless, Nehru's policy of non-alignment was dealt a severe blow and revealed India's military vulnerability in the North. Nehru suffered a stroke and died in office in May of 1964.

Nehru's successor was Lal Bahadur Shastri (1964–1966). During his short tenure in office he was beset with a number of problems: widespread food shortages, violent anti-Hindi demonstrations in Madras, and the second war with Pakistan over Kashmir. The center of anti-Hindi violence was the Tamilnadu who were recalcitrant to subordinate their mother tongue to Hindi. Their fighting tactics were at times desperate and in some cases involved self-immolation. In the end, a compromise was struck that established English as the associate language for interregional communication. The war over Kashmir was short-lived as India and Pakistan received their arms and munitions from foreign manufacturers, which in an attempt to quell the violence withheld their sale. Finally, a cease-fire was achieved under the auspices of the United Nations. In January 1966, both parties met at Tashkent, the capital of the Soviet Republic of Uzbekistan, where Soviet leader Leonid Brezhnev brokered a settlement. Shastri died of a heart attack in Tashkent in 1966.

Indira Priyadarshani Gandhi (1966–1977), Nehru's daughter and no relation to Mohandas Gandhi, succeeded Lal Bahadur Shastri in 1966. Gandhi's administration was beset with many of the same problems as Shastri's. A drought in 1966 brought about a 19%

decline in food production. Fearing famine, India sought assistance from the United States, which provided enough grain to avert the disaster. From that point forward, Gandhi made increased agricultural modernization a key part of her administration. Part of this modernization process involved devaluing the rupee to increase aid from the United States. It also involved the dissemination of new seed varieties from Mexico and the Philippines that when combined with chemical fertilizers and enhanced irrigation would increase crop yields. The resulting "green revolution" was tremendously successful. In 1967–1968 agricultural production increased by 26% and national incomes rose by 9%, despite a burgeoning population growth of 2% a year. By 1970, agricultural production reached a peak of 100 million tons. That figure, however, was not reached in the five subsequent years, as production began to decline. Moreover, while production did increase, it was unevenly distributed. The new varieties of grain were often harvested on large farms with assured irrigation systems. These new varieties were therefore more likely than rice, planted on smaller, more scattered plots of land, to produce higher yields. Gandhi's agricultural policy also left wide social disparities. The new inputs were well suited to large-scale farming operations that required strong entrepreneurial skills and access to credit to which only the elite had access. Farming revenues were not taxed nor redistributed in any fashion. The small villager, while being marginally better off, remained comparatively worse off. Alleviating the sense of deprivation felt by the underprivileged would be the cornerstone of Gandhi's political activity in the 1970s.

Gandhi won the 1971 election. Her party, the Congress Party, gained 352 seats in Parliament, which allowed her to push through legislation that might otherwise have been denied. She was successful at passing a constitutional amendment that restricted the fundamental right to ownership of private property. Insurance companies and coalmines were nationalized. She brokered an alliance with the Soviet Union that had a deleterious affect on India's relationship with the United States. Gandhi's greatest achievement, however, was in the manner in which she handled the war with Pakistan. By 1971, Bengalis were increasingly and openly rebellious toward the Punjabis that dominated the state. Yahya Khan, Pakistan's president, sought to curb the rebellion by military force. India sided with the Bengalis originally by offering covert aid but later with a full-scale invasion. The result was a total collapse of Pakistani authority in the East, which in combination with the emergence of the independent country of Bangladesh confined Pakistan to the West and

decisively confirmed India's pre-eminence on the subcontinent. On June 12, 1975, the high court found Gandhi's election in 1971 wrought with corruption. In response, Gandhi claimed a state of emergency. The emergency regulations suspended civil liberties, applied press censorship, and banned opposition political parties. In March of 1977, Gandhi called for elections in which she sought approval and legitimacy for her emergency regime. She was promptly swept from office.

Morarji Desai (1977–1979) succeeded Gandhi as prime minister. Desai's focus was on increasing investment away from industrial centers and into the agricultural system. While food grain production did reach a record of 126 million tons in 1977–1978 and 131 million in 1978–1979, political squabbling amongst his party elite could not be ameliorated. He was forced to resign in 1979.

Charan Singh (1979) was India's first non-Brahman prime minister. However, his tenure in office was cut short by his failure to muster a majority in parliament. He left office after only one month.

Indira Priyadarshani Gandhi (1980–1984) was again elected as prime minister. Most critical in her second tenure was use of force against Sikhs at the Golden Temple in Amritsar. The Sikhs, with support from the Sikh diasporas in Canada and the United States, were calling for the creation of their own state, Khalistan. To that end, the prominent Sikh preacher, Sant Jarnail Singh Bhindranwale, and his followers blockaded themselves at the temple and would not leave until the creation of an independent Sikh state. Gandhi sent troops (Operation Bluestar) and killed Bhindranwale and thousands of Sikhs congregated on the temple grounds. Sikhs throughout India were enraged. On October 31, 1984, two of Gandhi's Sikh bodyguards killed her. The public was outraged and violence soon followed. Sikhs were the target of their anger. Over a thousand Sikhs were killed in New Delhi alone.

Rajiv Gandhi (1984–1991) succeeded his mother as prime minister. With a reputation for honesty and integrity, he had many friends in India and abroad. His task was to reduce violence in the Punjab and restore vitality to a sagging Indian economy. Rajiv achieved the first by accommodating demands for more regional contracts in the Punjab. He revitalized the economy by opening India's doors to capitalism. This included private investment incentives and a reduction in tax rates and licensing requirements.

Rajiv's honest image was tarnished by two poorly handled affairs. First, his handling of the 1983 Sinhalese-Tamil conflict in Sri Lanka was disastrous. The Sinhalese sought the forcible removal of the

Tamil population. The Tamils (Tamil Tigers) responded with a guerilla-styled war. Originally, Rajiv covertly supported the Tamils. The Sri Lankan president, however, requested that India send troops to disarm the guerillas so elections could be held. India complied, intense fighting ensued, and many lives were lost. India soon lost the respect of both sides and extricated itself from the conflict. Second, the Bofors affair, in which Rajiv allegedly took kickbacks from a Swedish munitions firm in exchange for defense contracts. In response to the allegations, Rajiv terminated his finance minister, V. P. Singh, who then joined an opposition party. In May of 1991, while campaigning in Tamil, Rajiv was approached by a woman who detonated a bomb attached to her person, killing herself, Rajiv, and twelve others. She was believed to be a member of the Tamil Tigers terrorist group.

The 1990s were dominated by many short-term leaders. The first, Vishwanath Pratap Singh (1989–1990), succeeded Rajiv Gandhi. His decision to reserve civil service jobs for lower Hindu castes cost him the support of middle- and upper-class Hindus. He was replaced by Chandra Shekhar (1990–1991) who ruled only briefly. P. V. Narasimha Rao (1991–1996) succeeded Shekhar. Rao continued programs of modernization and economic liberalization. However, several political corruption scandals ended his career in 1996. Atal Bihari Vajpayee (1996) replaced Rao but was in office for only thirteen days. H. D. Deve Gowda (1996) replaced Vajpayee but his tenure was less than one year. Kumar Gujral (1997) replaced Gowda but his tenure was less than one year as well. Atal Bihari Vajpayee (1998–2004) was again prime minister. It was under his tenure that India detonated its first atomic bomb. Dr. Manmohan Singh became prime minister in 2004.

The Indian economy has progressed tremendously since its independence in 1947. In 1950, agriculture, forestry, and fishing accounted for 58.9% of the GDP while manufacturing accounted for 10%. Employment was primarily concentrated in the agricultural, forestry, and fishing industries. However, Indian leaders have continually sought to advance the Indian economy. By the 1970s, the economy had transitioned to heavy industry, telecommunications, and transportation. During the 1980s, the economy grew at an annual rate of 5.5%. Since the 1990s it has had an annual growth rate of 6%. By 2003, agriculture employed 60% of the labor force, industry 17%, and services 23%. As a percentage of GDP (2002 est.), these numbers translate to agriculture, 23.6%; industry, 28.4%; and services, 48%. Per capita GDP was \$2,900 (2003 est.) and 25% of the population lives at or below the poverty line. India has a literacy rate of 59.5%. The infant mortality rate is 57.92 per 1,000. The life

expectancy for males is 63.25 years and for females is 64.77 years.

## INDIAN–PAKISTANI WARS

The partitioning of India in 1947 to provide a homeland for the Indian Muslims left several unresolved issues. One of them has caused two wars, while the unusual geographical configuration of Pakistan has caused a third war. Minor clashes also have resulted from the same issues.

The partition plan drawn up by the British granted to Pakistan the Muslim-majority areas of the North–West Frontier Province, Balochistan, Sindh, and the contiguous Muslim-majority districts of the Punjab, along with Muslim-majority East Bengal, making a bifurcated country whose two parts were separated by 1,500 miles (2,400 kilometers) of what soon became hostile territory. Delineated with much urgency because of spreading ethnic strife throughout the subcontinent, the plan left undecided the fate of the 562 semi-autonomous princely states. Most of these quickly acceded either to India or to Pakistan. Leaders of three of them hesitated because of the geographical anomaly of their states. Located entirely within India's own territory, both Junagadh and Hyderabad had Hindu majorities but Muslim rulers. Believed to be the birthplace of Lord Krishna, Junagadh was prized by India's Hindus. The Nizam of Hyderabad, Mir Osman Ali Khan, would have preferred independence for his largest of the princely states. Hyderabad's court had long been a seat of Urdu culture that was precious to many of Pakistan's Muslims. But both Hyderabad and Junagadh were forcibly incorporated into India by military action.

Jammu and Kashmir (the princely state commonly referred to as Kashmir) had the unique problem of bordering both India and Pakistan and having a Muslim majority ruled by a Hindu, Maharaja Hari

Singh. The maharaja, also hoping to remain independent, procrastinated in making a decision, but a decision was forced upon him when some two thousand armed Pathan tribesmen from Pakistan crossed into Kashmir and on the morning of October 22, 1947, seized the border town of Muzaffarbad. To prevent their advancing on Srinagar, the state capital, the maharaja hastily agreed to accede to India. The legality of the instrument of accession he signed has never been acknowledged by Pakistan, yet Pakistan has always insisted that its provision for a plebiscite be carried out—which India has refused to permit.

It appears that the government of Pakistan neither opposed nor assisted the marauding tribesmen, but when India airlifted troops into Srinagar, Pakistan became committed to the “liberation” of Kashmir. Although neither side made a formal declaration of war, an Indian infantry brigade quickly drove back the tribesmen; then, because of logistic problems of supply, the Indians were forced to retreat from border areas in November. Pakistan's troops had been guarding strategic locations only within Pakistan to prevent an attack, but when the Indian side mounted an offensive in the spring of 1948 to retake lost ground, the Pakistani army became directly engaged, bringing into Kashmir its mountain guns, two regiments of field artillery, a medium artillery battery, and a parachute brigade to assault the long Indian communications line. Since neither side wished to invade the other's territory, they accepted UN mediation. This brought the war to an end on January 1, 1949, and teams of UN observers were put in place to monitor the cease-fire line that now divided Kashmir into two unequal parts. Azad (free) Kashmir, as Pakistan called the portion under its control, was a narrow strip opposite its own border and the mountainous area to the northwest. All the rest (“Occupied Kashmir,” in Pakistan's view) remained with India and contained three-fourths of the population and most of the arable land.

This longest of the three conflicts, the First Kashmir War (1947–1949) was least costly in human and material losses. It has been estimated that there were about 1,500 battle deaths, and India lost approximately five thousand square miles of territory. It was almost entirely a ground war; air power was minimal and there were no naval engagements; the terrain was not favorable for tank combat. The lasting effect of the war was the bitter animosity between India and Pakistan that has soured their relationships in most respects ever since.

Because of this animosity and the continuing effort of each country to probe weak spots of the other, a conflict occurred in the Rann of Kutch in January 1965 when each country claimed that patrols from the other side had intruded into its territory. The Rann of

Kutch adjoins the Indus delta, and when not under water is a salt desert where searing winds make human life insufferable. It has neither strategic nor economic value (unless, as some believe, there might be oil beneath its surface); but what mattered in this squabble was the lack of clear demarcation of the region when India was partitioned. After several inconclusive skirmishes, a cease-fire was put into effect on June 30, 1965.

Hostility, however, continued to smolder. Again, there was no formal declaration of war, but it is generally believed (though not acknowledged by Pakistan) that early in August 1965 guerrillas under Pakistan's control entered India's Kashmir to harass its troops stationed there. The first direct engagement between the armed forces of the two countries took place on August 14, 1965. The next day, after an artillery barrage, India captured important positions in the northern mountains. When Pakistan counterattacked later in the month, Indian forces thrust into Azad Kashmir and did not stop until they had penetrated several miles into Pakistan itself. In September, Pakistan turned hostilities southward and took a village inside Indian territory. Now, for the first time, war had come to the soil of both countries.

India's response was a powerful two-prong attack through the Punjab, aimed to take the city of Lahore, with a diversionary thrust toward Sialkot. Lahore was saved when the Pakistani army created a moat on its eastern flank by blowing up seventy bridges that crossed an irrigation canal. The defense of Sialkot resulted in the greatest tank battle on the plains of the Punjab since those of World War II in North Africa. During these engagements, both sides used air cover for their ground operations but each refrained from bombing the other's cities. There was naval action as well, on Pakistan's part the successful endeavor to prevent the shelling of its southern coast.

The war ended in stalemate with the acceptance of the UN's September 20 cease-fire resolution and was far more costly than the first Kashmir War. Pakistan lost 3,800 men, more than 700 square miles of territory, 200 tanks, and 20 aircraft. India lost 3,000 men, 300 square miles of territory, at least 175 tanks, and 60 to 75 aircraft.

The third armed conflict began as a civil war when the Awami League of East Pakistan won an overwhelming majority in the 1970 election that the government in West Pakistan was unwilling to accept. Negotiations dragged on for months until a Bengali liberation force (the Mukti Bahini) clashed with the army in East Pakistan. India sided with the Mukti Bahini and began amassing troops on its border with East Pakistan. In return, on December 3, 1971, the Pakistan air force made a preemptive attack against

military targets in north India. India retaliated by mounting a coordinated ground, air, and navel assault on East Pakistan, by attacking the Pakistan Air Force headquarters in Peshawar in West Pakistan, and by bombarding the port facilities at Karachi. Pakistan tried to divert Indian attention away from East Pakistan by opening a series of engagements on India's western border; these ran from Kashmir to the Rann of Kutch. Once again a tank battle raged east of Sialkot. Farther south, the penetration of Rajasthan by a Pakistani armored regiment was countered by an Indian thrust into Sindh. But the Pakistan army's thirty-five infantry battalions along with support units and thirty-five thousand armed *razakars* recruited from the Urdu-speaking Biharis were no match for the six divisions India had thrown into East Pakistan when they converged on Dacca, along with their Mukti Bahini allies. After fourteen days the war ended in a cease-fire on December 17, and the sovereign state of Bangladesh became a reality.

Pakistan suffered about 9,000 deaths, India only 2,500. Pakistan lost two hundred tanks and seventy-five aircraft; India's losses were eighty and forty-five, respectively. India destroyed a Pakistani submarine in the Bay of Bengal; Pakistan sank an Indian frigate in the Arabian Sea. Ninety thousand Pakistani prisoners of war were left stranded in Bangladesh for months, and what remained of Pakistan was wracked by violent demonstrations when news of the defeat reached there.

Despite—or perhaps because of—these inconclusive wars, military adventurism has continued from both sides, and every perceived aggressive action is met tit for tat. In 1984, India moved troops into the region of the Saichen glacier to dispute the possession of land at an elevation of twenty thousand feet (six thousand meters), where it is almost impossible to exist, much less fight. In 1999, Pakistani troops occupied an area in the Kargil region of Kashmir claimed by India. In both cases skirmishing continued for months, with the loss of untold hundreds of lives.

Since the wars have escalated in violence, most unnerving were the five nuclear tests carried out by India at Pokhran in 1998, only 90 miles (150 kilometers) from Pakistan's border. Within two weeks, Pakistan responded with five nuclear tests of its own—thus removing any doubt about the nuclear capability of the two quarrelsome powers in the Indian subcontinent that, over fifty years, have found no means of peaceful coexistence.

## INDIGENOUS MEDICAL PRACTICES

Indigenous or native medical systems and practices refer to those found throughout the world among pre-modern, or so-called traditional, societies. Many of these systems are found in small-scale societies and are based on oral tradition, others are heirs to medical knowledge that originated within major civilisations, such as China, South Asia, Mesoamerica, and the Andean region in South America.

The distinction between native medicine and Western or scientific medicine is far from unproblematic. From the rationalist standpoint of modern medicine, a recognized disease retains its identity wherever it occurs, regardless of the cultural context. However, as people actually experience disease indirectly and as culturally constructed illnesses, in practice this is often a matter of compromise and adjustment to local conditions. In native medical systems, concepts of disease are often inextricably linked to cultural classifications of adversity, natural or otherwise (Lieban 1974). Thus, the specialist considers the nature of illness the self-evident point of departure and the determinant factor as to how to proceed in the subsequent empirical treatment.

It is futile to attempt a delimitation of what is properly "medical" in native systems, where almost any performed ritual, communal or individual, is in

some sense "medicinal." "Ritual" here means the manipulation of the inherent vital power, the soul, believed to be possessed by any person, place, thing, or event. The purpose of ritual is then to maintain the balance or restore the presence of this vital power (Herrick 1983). Embedded as it is in a cultural matrix, the discourse of native medicine has an essential mythic dimension. An example are the medical practices found among the Maya Indians in Guatemala, who retain to this day elements from pre-Columbian times, when medicine, myth, and advanced astronomical science formed an integrated whole.

### Causes of Illness

Even if there is a great variation in medical systems throughout the world, when it comes to establishing the causes of illness and disease, an important distinction is between those illnesses with natural causes or those caused by witchcraft or supernatural agents. Many minor and sporadic ailments can be deemed as natural to begin with and be treated at home or routinely by an herbalist. However, the diagnosis can change if certain symptoms, such as the slow healing of a wound, are observed. In that case, the disease is usually attributed to human agency, the effect of witchcraft or sorcery. In those cases, a so-called witch-doctor or a shaman must be consulted. This is related to the ambivalent nature of spiritual power, which means that the same agent or material, human or spiritual, can either cause or cure disease. Such was for instance the ambivalent role of certain sacred objects called *minkisi* by the Kongo (a Bantu people in Congo Kinshasa), also found in many other African traditions and known generically as *fetiches* (Westerlund 1989).

Nature spirits and ancestor spirits are also agents of disease, for instance as a result of the breaking of taboos or norms. Whatever the cause established according to the local model of etiology, native systems employ disease terminologies of considerable precision. The sophistication sometimes achieved can be illustrated with the Hausa-Fulani in northern Nigeria, who distinguish 808 diseases and employ 637 plants to cure them, among them 32 different plants used to treat malaria (Etkin and Ross 1983)

Even deities may, through the inducement of illness, indicate demands on an individual or a group (Westerlund 1989). Among the Mapuche in South America, anguished dreams called *perimontun* may be an indication to someone that she or he is being called to become a shaman.

## Specialists

Native medicine specialists differ in the methods and illnesses they treat. Often, the most important is the herbal practitioner who employs a variety of plants and drugs obtained from them throughout the world, many of proven efficacy such as quinine, sage, opium, coca, cinchona, curare, chalmogra oil, ephedrine, and rauwolfia. Methods employed include infusions, plasters, enemas, suppositories, massages, sweating, thermal baths, and diets.

Among the reputed herbalists of the Andean Kallawalla, the use of a certain medicine chosen from a vast repertoire refers specifically to a certain part or function of the body. It is vital for the body to maintain a balanced flow of air, blood, feces, milk, phlegm, semen, sweat, and urine. As elsewhere, the intrinsic power of drugs must be enhanced by the proper ritual. For the Kallawalla herbalist, this means that it is indispensable to establish the proper relation between the patient and what can be called the cosmographic context. The view is that bodily processes are analogous to the flow of rain and wind observed in surrounding mountains and valleys (Bastien 1987). This can be seen as a special case of a principle of general validity in native South American medicinal thinking, the complementary concepts of intrusion and extraction.

The spiritual dimension of illness is treated by the shaman, who employs ecstatic trance as a means to achieve communication with spiritual forces and thus act as an efficient diviner and healer. Among the Waiká in Venezuela, the shaman inhales the powder of ebena (from the species *Virola*), that in a matter of minutes induces powerful hallucinations.

In many places, the prevalence of indigenous medical practices and beliefs has not prevented the utilization of modern Western medicine. In such intercultural settings, people tend to place illnesses in two broad categories: those more likely to respond to the treatment of a healer and those more likely to be cured by a physician. This creates a series of intercultural situations in which native and modern medicine both compete and cooperate with each other. Most illnesses eventually end in spontaneous recovery. When this occurs and the patients have been treated by local healers, confidence in indigenous medicine may be enhanced. When therapy for an illness is sought from both a physician and a healer, the combined efforts of both may cure the patient but only one of them may get the credit. In these cases, intercultural competence and familiarity is an integral part of effective health programs.

## INDONESIA

Indonesia, the world's fourth-largest nation, with a population of 210 million, straddles the equator between mainland Southeast Asia and Australia extending 3,198 miles (5,150 km) with a total land area of over 767,000 square miles (1,986,500 sq. km). It consists of over 13,000 islands (6,000 inhabited) with five main islands (Sumatra, Java, Kalimantan [Borneo], Sulawesi, and Irian Jaya) and two major archipelagos (Nusa Tenggara and the Maluku Islands). Many of the islands are mountainous, with peaks reaching 3,800 meters above sea level in western islands and as high as 5,000 meters in Irian Jaya. Because of the region's tectonic instability, there are 400 volcanoes, of which 100 are active.

The climate is tropical with a rainy season from November to March and a dry season from June to October. In coastal areas mean temperatures vary only slightly throughout the year 78°F–82°F (25°C–28°C). The temperatures in upland communities can be considerably cooler.

The official language is Bahasa Indonesia, which is based on Malay. There are over five hundred other

mutually unintelligible languages and dialects. The major languages (those with 1 million or more speakers) include: Javanese, Sundanese, Malay, Madurese, Minangkabau, Balinese, Bugisnese, Acehnese, Toba Batak, Makassarese, Banjarese, Sasak, Lampung, and Rejang.

The capital of Indonesia is Jakarta, on the north-west end of Java. Java is also the home of over 60% of Indonesia's population. Hence, the Javanese are the most dominant ethnic group in Indonesia. Other major ethnic groups include the Sundanese (Java), the Madurese (Java/Madura), the Balinese, the Ache-nese (Sumatra), the Minangkabau (Sumatra), and various Dayak groups (Kalimantan).

## History

The archipelago has long had state-level societies. A long succession of first Hindu, then Islamic states, which sometimes competed with each other, preceded European contact with the islands. The Dutch presence began when the first Dutch ships landed in Java in 1596. Except for a brief period of British rule (1811–1815), the Dutch ruled what became Indonesia for nearly 350 years.

As a backdrop for modern Indonesia, it is useful to briefly review major colonial policies, namely the Landrent System, the Cultivation System, and the Liberal Phase. The Landrent System operated on the assumption that the government was owner of all lands and the peasants, therefore, were renters who then paid a percentage of the estimated productivity of each crop as rent. Formally this system was in force from 1811 until 1830, however, government collection of rent for agricultural land was part of the revenue system until the end of Dutch colonialism. The Cultivation System, which was in full operation by 1840, was designed to encourage the cultivation of cash crops by requiring Javanese peasants to devote up to one-fifth of their arable land and one-fifth of their labor (sixty-six days per year) to the cultivation of coffee, indigo, and sugar. With the cash payments the peasants were supposed to receive, they were expected to settle their landrent debts (Boomgaard 1989).

The end of the nineteenth century and the beginning of the twentieth century were marked by increasingly liberal economic and social policies, which restored most pre-1800 landrights. The Liberal Period saw the slow transition from compulsory labor to a “free” labor market. Another feature of this period was an increasing amount of education available for the native population.

The Dutch lost control of the Indies for a second time when the Japanese army landed in Batavia (Jakarta) on March 1, 1942. Initially, many Indonesians welcomed the Japanese Occupation. However, in time the Japanese presence was resented by many. Unlike the Dutch, the Japanese were interested in exporting rice. The Japanese also conscripted over 4 million people for economic development and defense construction. These practice and the confiscation of other foods and necessities made the Japanese exceedingly unpopular. The Japanese period ended when the British military arrived in Jakarta in September of 1945. Shortly afterwards, the Netherlands reclaimed control of Indonesia.

Under Japanese Occupation, the nascent nationalist movement solidified. At the very least, the Japanese occupation disproved the myth of Dutch superiority. Under the Japanese, Malay started to become a national language. There were committees formed to standardize what became Bahasa Indonesia. The Japanese also encouraged the further development of modern Indonesian literature. Indonesians were allowed to participate in politics, administration, and the military. Although some Japanese collaborators were latter killed in retaliation for the harshness of Japanese policies in the closing years of the war, other collaborators, like Soekarno and Hatta, later the first president and vice president, worked to set the ground work for Indonesian independence.

Indonesia declared its independence on August 17, 1945. The Indonesian forces were a combination of national forces and Islamic militias. Independence was not easily gained. Toward the end, the Republican Army controlled only the palace of Yogyakarta. Shifting international opinion about colonialism forced the Dutch to abandon their claim and recognize Indonesian independence on December 27, 1949 (Kahin 1952)

Following independence, Indonesia was governed by Sukarno, the primary signatory to the Declaration of Independence. The first years of the post-independence Sukarno regime have been called the “Liberal Democracy” period or the “Democratic Experiment.” 1957 marked the beginning of the “Guided Democracy” period, which was dominated by the personality of Sukarno, although army leadership played an important role.

In 1965, Guided Democracy ended abruptly. In the early morning of October 1, 1965, a number of generals in the Indonesian army were murdered. These murders were blamed on the PKI (*Partai Komunis Indonesia*; Indonesian Communist Party), which was at the time the largest communist party in the world (McVey 1965). What followed was a bloodbath of epic proportions, in which up to a half million people were

killed or disappeared. In the aftermath of these events, Suharto emerged as the president of Indonesia.

Suharto served as president until May 1998, when he stepped down following student protests in the wake of a severe economic crisis, that as of 2004 still wracks the nation. Suharto was succeeded by his recently named vice president, Bachruddin Jusuf Habibie. Submitting to popular demand, Habibie held general elections on an accelerated schedule. With the Suharto-era limitations on political parties lifted, forty-eight parties competed in the 1999 parliamentary elections. Out of this process Abdurrahman Wahid was elected president. Megawatti Sukarnoputri, the daughter of Sukarno, who had been widely favored to become president, was named vice president. President Abdurrahman was also a Muslim cleric. His presidency was as controversial as it was short and it ended in July 2001. Megawatti finally followed in her father's footsteps. Whether Indonesia will complete its transformation into a democratic state remains to be seen. One positive sign was the emergence of direct presidential elections in 2004, which elected Susilo Bambang Yudhoyono as Indonesia's sixth president. However, his background in the military has concerned some observers.

### World's Largest Islamic Country

Today, Indonesia is the world's largest Islamic country, although it is not an Islamic state. Throughout the Indonesian Republic's existence, the ongoing question for the Islamic community has been how to create a strong, pious, and faithful Islamic society in the context of a modernizing, globalizing, and secular state. There are two major variants of Sunni Islam in Indonesia, which are generally referred to as the Traditionalists and the Reformists.

The Traditionalists, who are affiliated with pesantren (Islamic boarding schools) and the organization Nahdlatul Ulama (NU; trans., "Renaissance of Islamic Scholars"), practice and maintain Traditional Islam, which is strongly associated with the theologics, considered opinions, legal theories and findings, and mystical theories of Medieval Islam found in texts called *kitab kuning* (classical texts; literally, yellow books) (Dhofier 1999). The pesantren community holds them to be of high importance in determining how to live as good Muslims in a globalizing and modernizing world.

Reformists, who are affiliated with the organization Muhammadiyah, seek to reform Indonesian Islam so that it draws primarily on scriptural sources. Muhammadiyah takes a position that the basis of

Islamic Law (*shariah*) is the Qur'an, *Hadith* (the sayings and actions attributed to the Prophet), and personal interpretation. Traditionalists are slightly more numerous than the Reformists (Peacock 1978).

Both NU and Muhammadiyah sponsor schools, hospitals, and universities in keeping with their primary charter as social-religious organizations. However, prior to 1977, both functioned as political parties and after 1998, both sponsored new political parties.

Despite being considered by many observers to be an example of Liberal Islam, Indonesia has seen the emergence of terrorist groups and terrorist activities in recent years. Radical Islamist groups like Laskar Jihad and Jemaah Islamiyah comprise a small percentage of Indonesian Muslims; however, they have been responsible for a number of significant acts of violence.

### Other Religions and Ideologies

Prior to 2000, the Indonesian government required all citizens to declare one of five religions: Islam (87% of the total population), Protestantism (6%), Catholicism (3%), Hinduism (3%), or Buddhism (1%). Followers of indigenous animist traditions either nominally converted to one of the major religions (often one of the forms of Christianity because they allow the consumption of pork) (George 1996) or redefined their traditional religion as a form of Hinduism and have worked long and hard to have it recognized as such (Schiller 1997).

Until the end of the Suharto regime in May 1998, all organizations had to claim as their basic ideology the *Pancasila*, or five principles: belief in one supreme God; humanitarianism; nationalism expressed in the unity of Indonesia; consultative democracy; and social justice.

### Form of Government

Indonesia is a unitary republic with a high degree of centralization. There are thirty-two regional provinces that have their government appointed from Jakarta. Sometimes governors are not from the region they govern, which can lead to strife. As late as 1999, the police were a branch of the military and organized along these lines with a central command in Jakarta. There is a slow effort to put police powers in increasingly local hands.

The 1945 constitution establishes three branches of government: executive, judicial, and legislative,

but has until recently favored the president. The president is elected every five years. Up through the 1999 election, the president was elected through a parliamentary-type system. Starting with the 2004 election, Indonesians elect their president directly.

Indonesia is a member of United Nations (UN), Association of Southeast Asian Nations (ASEAN), Nonaligned Movement (chair 1992–1995), and numerous other international organizations. It bases its relations with all major nations on principles of nonalignment.

## Education

Indonesia has an adult literacy rate of 83.7%, which is defined in terms of the Roman alphabet. This rate does not reflect an older population that is literate only in the Arabic alphabet. Indonesia has a twelve-year primary and secondary education system. Prior to 1995, only six years of school were required for all citizens, but now nine years are required. Today, there are two basic government-recognized curricula: the National System, which is mostly secular, and the *Madrasah* System. The *Madrasah* System was originally established because many Muslim parents were leery of the mostly secular national schools and would not send their children to them. Private schools that wish to have government recognition must follow one of these two curricula.

In addition to these schools are the *pesantren*, Islamic boarding schools. Prior to the twentieth century, *pesantren* were the only formal education institutions found in Java and in most of what is now Indonesia. They taught an almost exclusively religious curriculum to a mix of students including future religious leaders, court poets, and members of the ruling class. First the Dutch, then the Nationalists, and later the Republic of Indonesia promoted an educational system focused on science, math, and other “secular” subjects (Anderson 1990, pp. 132, 243). In response to the demand for this type of education, as early as the 1930s many *pesantren* added government-recognized curricula. Starting in the 1970s, these new curricula became an important part of the *pesantren* community’s strategy for negotiating modernity (Dhofier 1999; Lukens-Bull 2005).

## Outlook

As of 2004, the future of Indonesia is uncertain because of a number of key issues. Despite the inauguration

of the first directly elected president in 2004, some observers are concerned that the reformation movement may have stalled out. An important component of democratization will be reducing widespread corruption in all levels of government and bringing to trial corrupters from previous administrations. Another issue concerns regional autonomy and separatist movements in North Sumatra and Papua. Key issues for the next decade will be whether Indonesia will be able to continue as a united republic and how efforts to keep the nation unified will impact democratization.

The recovery of the Indonesian economy seems to be dependent on a number of factors including the restructuring of banking systems, the reduction of corruption, the restoration of political stability, the control of terrorism, and the return of international investors.

The December 26, 2004, earthquake and tsunami off the coast of Sumatra may have some impact on these processes. However, the long-term effects of this event remain unpredictable. That said, a few things seem clear. The area hardest hit was Banda Aceh, which was the center of the separatist movement in North Sumatra. The Indonesian government could use this tragedy as an opportunity to either sway public opinion or crush the rebellion. Likewise, the Free Aceh Movement may use these events as an opportunity to garner support. In terms of Indonesia–United States relationships, the images of US troops cradling scared and injured Indonesian children has gone a long way to counter the impact of the images coming out of the Abu Ghraib prison scandal. There is also a possibility of the end of the military embargo by the United States.

## INDUSTRIALIZATION

### Defining Industrialization

Generally, industrialization represents a process of intense development of industrial activity. If at the beginning industrialization was just an effect of economic development, it became more and more a process of conscious orientation of forces and resources toward the develop of industrial activity, seen as the base of the general development of the society.

Industrialization is a process of social and economic change whereby a human society is transformed from a pre-industrial stage to an industrial one. Pre-industrial economies often rely on sustenance standards of living, in which large portions of the population focus their collective resources on producing only what can be consumed by them, though there have also been quite a few pre-industrial economies with trade and commerce as a significant factor, enjoying wealth far beyond a sustenance standard of living.

Sometimes industrialization might also be termed an “industrial revolution,” but only two or three times in history, when the industrial landscape radically changed due to the scientific and technological leaps. There is still an ongoing debate whether the Industrial Revolution was a revolution or just an evolution, whether industrialization was a radical change or an inevitable development in the context of the continuing social and political changes, agricultural innovations, accumulation of capital, and expansion of trade that had taken place in the seventeenth century and earlier.

Industrialization as social and economic change is closely intertwined with technological innovation, particularly the development of large-scale energy production and metallurgy. Industrialization is also related to some form of philosophical change, or to a different attitude in the perception of nature, though whether these philosophical changes are caused by industrialization or vice versa is subject to debate.

### Industry and Industrialization

In its broadest sense, industry is any work that is undertaken for economic gain and that promotes employment. An industry refers to an area of economic production and involves large amounts of capital investment before any profit can be realized. The word may be applied to a wide range of activities, from farming to nuclear activity. It encompasses production at any scale, from the local, sometimes known as cottage industry, to the multinational or transnational.

In a more restricted sense, industry refers to the production of goods, especially when that production is accomplished with machines. It is this limited definition of industry that is embodied by the notion of industrialization: the transition to an economy based on the large-scale, machine-assisted production of goods by a concentrated, usually urban, population of workers. Manufacturing, which literally means “making by hand,” has come to describe mechanical production in factories, mills, and other industrial plants.

Industry became a key sector of production in European and North American countries during the Industrial Revolution, which upset previous mercantile and feudal economies through many successive rapid advances in technology, such as the development of steam engines, power looms, and advances in a large-scale steel and coal production. Industrial countries then assumed a capitalist economic policy. Following the Industrial Revolution, perhaps a third of the world’s economic output was derived from industry—more than agriculture’s share, but subsequently less than that of the service sector.

An industry is usually classified as belonging to one of the following four groups: primarily, secondary, tertiary, and quaternary. Primary industries, which collect or extract raw materials, are located where the resources are found. Secondary industries are those that process or convert the raw materials into finished products. Some of these manufacturing industries must be situated close to the raw materials they use, others are tied to their largest markets, and still

others—independent of both resources and markets—are often located wherever it is cheapest at the time.

Tertiary industries are the service industries. These include retailing, wholesaling, transport, public administration, and the professions, such as law. Finally, quaternary industries comprise activities that provide expertise and information. Consultancy services and research organizations belong to this category. These are generally market oriented, but since today's electronic communication permits swift contact and the easy transmission of data, they may be located almost anywhere.

### Science, Technological Innovation, and Industrialization

From the beginning, the industrialization and the industrial revolutions were intimately linked to the scientific and technological progress. In 18th-century England, the individual inventors increased the efficiency of the individual steps of spinning so that the supply of yarn fed a weaving industry that itself was advancing with improvements to shuttles and the loom or frame.

In 1733, John Kay patented the first of the great machines, the flying shuttle, and, in 1764, James Hargreaves, a weaver and carpenter, created the spinning jenny, a mechanical spinning wheel that allowed the spinners to keep up with the weavers. Four years later, Richard Arkwright built the water frame, a cotton-spinning roller that made it possible to spin many threads into yarn at the same time.

Edmund Cartwright invented the power loom in 1785 and it mechanized the weaving process. Mechanization was associated with the development of the factory system, and strict discipline of the workers and what had once been a home-based craft became an industry. American inventor Eli Whitney (1765–1825), among others, devised the cotton gin, a machine that enabled a worker to clean more than fifty times as much cotton a day. Unfortunately, it is considered that this device played a major role in the perpetuation of slavery in the United States.

Finally, the textile industry became so large that it outgrew the possibilities of its power source: water power. In the first part of the eighteenth century, Thomas Newcomen made an “atmospheric engine” in which a piston was raised by injected steam. Newcomen's device was used to pump water out of mines and, later, it was improved by James Watt. His steam engine of 1769, and particularly its adaptation to produce rotary motion, allowed the rapid and wholesale use of steam power in industry.

By 1720 the English iron industry was in trouble, owing to lack of wood to make charcoal; half the country's iron at this time was imported. In 1784 Henry Cort's puddling process allowed ironmasters to produce wrought iron from pig iron using coal. Further developments were enabled by James Watt's steam engine, which was used to create blast; by the hot blast inventions developed in 1828 by James Neilson; and by James Nasmyth, who developed a steam hammer to work wrought iron and steel in 1839. The iron industry grew rapidly and became a key element in industrialization.

In steel casting, Henry Bessemer invented, in 1856, the process that bears his name and, in 1861, William Siemens invented the open-hearth process. These new methods allowed the production of large amounts of mild steel from non-phosphoric ores, and in 1879 Sidney Gilchrist-Thomas learned how to use phosphoric ores by lining the converter with dolomite limestone. Steel was stronger and more malleable than cast iron, and rapidly replaced it as the main metal of the Industrial Revolution.

By the end of the nineteenth century, the United States had surpassed Great Britain in the production of iron and steel. The abundance of raw materials, a rapidly growing population, and the adoption of innovations such as the telegraph, the telephone, the electric light, and the refrigerator, along with petroleum products, provided the basis for a boom in American manufacturing.

The main contribution to world manufacturing made by the US in the late nineteenth and early twentieth centuries was the increase in the scale of production. Beginning in 1913, Henry Ford pioneered mass-production methods in his vehicle plants. From this time until the 1960s, the US excelled in the techniques of mass production and led the world in productivity. In recent years, however, the Ford approach has become discredited for its lack of flexibility and for diminishing the skills of the labor force. It has been replaced by more flexible and responsive systems of production, especially within Japanese companies.

Nowadays, the introduction of mass-production techniques and robotics has resulted in the growth of component industries. These supply parts to other industries that are devoted to assembling the finished product. The motor-vehicle industry, which has been greatly refined by the Japanese, employs “just-in-time” production methods to ensure that components arrive at car factories as they are needed, rather than accumulating in large, wasteful, and expensive stockpiles. This approach makes vehicle production more responsive to the market, and therefore more competitive.

The global industrialization view emerging to dominate information science research, envisages continued industrialization, national and global information infrastructures, and the transformation of less-developed countries (LDCs) to industrialized economies. Some research has already begun to explore the dimensions of sustainable information technologies within the global industrialization paradigm. Current information science research has been primarily concerned with facilitating all aspects of global industrialization.

Industrialization has brought increasing specialization, complexity, and individualization. Computer technology and information services have evolved to support industrialization. Libraries and information services have developed with industrialization to satisfy human information needs and continue to assume greater importance with LDCs' industrialization.

### **De-industrialization**

De-industrialization describes the decline in the contribution made by manufacturing industry to a nation's overall economic prosperity. The process might be also named re-industrialization, because the shift is not away from industry altogether, but from secondary to tertiary and quaternary industry. In other words, a de-industrializing economy moves away from the manufacture of goods and toward the provision of services.

Those countries that industrialized first—the UK, France, the United States—are now undergoing de-industrialization. The ascendancy of the service economy in the context of the post-industrial society is characterized by a number of apparently negative features, such as a decline in manufacturing employment and a dependence on imports across a wide range of sectors. Although the loss of the manufacturing base is likely to create unemployment at first, it may not be an adverse development in the long term. Paradoxically, de-industrialization in the three countries mentioned above has been accompanied by a growth in the high-tech industries in different well-known areas. The long-term impact of de-industrialization has yet to be felt. It may be the speed of the process, rather than the process itself, that needs careful management.

Within the global industrialization view, permanent or temporary de-industrialization occurs in local and regional communities, and is regarded as a normal consequence of shifts in global industrialization and adjustments of a marketplace economy. De-industrialization is studied as the process of

decline and eventual closure of industries supporting local, regional, and national communities within a marketplace economy. Cases of de-industrialization have been documented in specific towns, cities, and regions in many parts of the world, within different countries.

De-industrialization often results from periods of economic restructuring by transnational corporations; changing labor markets; political and economic change; or relocating industries due to global, national, or regional competition. De-industrialization has been found to permanently or temporarily affect many aspects of a community and engender many specific social and economic problems.

### **Soviet-Inspired and State-Sponsored Industrialization**

The countries from the former communist camp, starting with the former USSR, introduced a special theory and experience of industrialization. The communist power needed a strong and rapid industrialization due to two main reasons. First, the industry was seen as the most efficient method of development of the country and secondly, to make the absolute communist power stronger and everlasting. Communist power is based on the proletariat, at least from the ideological point of view, but in USSR and all the countries who followed Soviet leadership, the working class was less developed due to the reduced level of the industrial sector. One of the struggles of the communist powers was to restrain the number of people working in agriculture and to increase the proletariat.

The communist state owns all the means of production and only a few private possessions are allowed. The major economic decisions are made by command from above in accordance with planners and plan's demands. The prices are set by the state as is the direction of economic activities because there is a command, centralized, and plan-oriented economy.

Because for almost four decades, the USSR was the only communist state, excepting Mongolia, the communist precepts were experienced here before being implemented in the countries where the regime was imposed after the Second World War. In the USSR, Joseph Stalin forced a rapid industrialization with an emphasis on heavy industry in the years before World War II with the famous Five-Year Plans.

Stalin's aims were to erase all traces of capitalism and to transform the Soviet Union into an industrialized

and completely socialist state. The first Five-Year Plan also called for transforming Soviet agriculture from predominantly individual farms into a system of large state collective farms. The Communist regime believed that collectivization would improve agricultural productivity and would produce grain reserves sufficiently large to feed the growing urban labor force. Collectivization was further expected to free many peasants for industrial work in the cities and to enable the party to extend its political dominance over the remaining peasantry. The main goal of Soviet policy makers, however, was to promote industrial, not agricultural, growth. Collectivization gave an initial impulse to industrialization, orienting the agricultural surplus income and manpower out of the countryside and towards the city. Finally, the anticipated surplus was to pay for industrialization.

The Soviet economic model and the emphasis on industrialization at any price was followed or rather imposed in the Central and Eastern European countries that entered the communist camp, after 1945. The centralization and state-controlled economy were copied also in parts of Asia, Africa, and Latin American that experienced socialist development. The European former Communist Party renounced this model at the beginning of 1990 and jumped into the transition from communism to capitalism—a totally new and sometime traumatic social, economic, and political experience for those nations. One of the most difficult situations these countries have to cope with is the problem of the socialist industry that they built, the enormous productive capacity they put into action, huge and not-so-modern plants that they have to privatize, to make them efficient, or just close them down.

The shift in focus on industrial development in the former communist countries is also seen as a manifestation of the phenomenon of de-industrialization. In the 1980s and early 1990s, more and more economies underwent market-oriented reforms.

## Industrialization and Development

Many analysts have made the case that industrialization brings “development.” The implicit assumption is that industrialization improves a nation’s well-being along a number of dimensions, including education quality and attainment. At the same time, people have warned of the potential downside of industrialization, including increased pollution, growing inequality, and lower social cohesion.

It is no longer necessary for the newly industrialized countries to repeat the steps followed by the first

industrialized countries in world history. With the technology and know-how available today, it has been only a question of national will and money to industrialize a country since the end of the 20th century. Most countries regard industrialization as a positive evolution fit to generate rapid economic growth, revitalize run-down areas, and confer influence in world affairs. Most also now recognize the need for a diversified industrial base to safeguard their economies from fluctuations in the market price for their own specialized product. The negative consequences of industrialization are sometimes more apparent in developing countries than in countries with established industrial structures, where the social dislocation and environmental problems that often accompany development began long ago.

In 1960 the economic historian W. W. Rostow hypothesized a model of the “stages of economic growth.” Starting from a traditional agricultural society, Rostow suggested a long period in which the preconditions for takeoff were created—notably the creation of an agricultural surplus that could finance industrial development, and the development of suitable trading and governmental institutions. The takeoff is impelled by “leading sectors.” Once these leading sectors begin to grow, a process of self-sustaining growth occurs and the economic development is underway. In eighteenth-century England the growth was based on certain staple industries, particularly textiles, coal, and iron. Once takeoff had begun, growth in one industry provoked growth in others by way of a complex set of interdependencies and led to associated developments in organization, power, and engineering. The countries had their takeoff moments in different periods—England in the eighteenth century, the US around 1850, and the Asian Tigers in the twentieth century.

Since the end of World War II, the relative significance of manufacturing in the economies of Europe and the US has declined, and its importance in the economies of East Asia has risen. Japanese manufacturing, in particular, has had a worldwide impact in a very short time, and other Asian economies have followed Japan’s lead. The renewal of its industrial plants after World War II gave Japan the advantage of modern production facilities. Since the mid-1950s, Japanese industrial output has grown at an annual rate of at least 6%. Japan’s manufactured goods are noted for their high quality, which is due to the use of advanced technology in the production process.

Theories of accumulation are closely allied to those of industrialization. For many development economists, particularly those in the developing world, industrialization is almost synonymous with economic development. Looking across the developing world at

the beginning of the twenty-first century, there is a huge range of national experiences. The most prosperous newly industrialized countries are the successful economies of East Asia, such as China and South Korea; Southeast Asia, such as Thailand and Singapore; some oil-rich countries of the Middle East; and some Latin American countries. In the mid-1990s it appeared that much of Asia and Latin America was set on a more effective development path than before. But the failure of development in much of sub-Saharan Africa gave economists cause for concern.

The success of the East Asian and Southeast Asian economies has been a powerful influence on thinking since the 1970s and 1980s. These countries did not accept the pessimism about exports that most of the developing world did. Despite the protective barriers erected by industrial countries, these countries managed to generate rapid expansion of manufacturing exports by skillfully selecting products and markets. With this came fast economic growth, first for the “four tigers”—Hong Kong, South Korea, Singapore, and Taiwan—and followed by others such as Indonesia, Malaysia, and Thailand.

Far from developing rapidly, economies with large-scale government intervention, trade protection, and inward-looking development were looking very sick by the end of the 1980s. Recession in the world economy exposed their weakness. An unsustainable balance of payments, domestic deficits, rapid inflation, international debt, and low growth or even economic decline reached the point where it was widely acknowledged that things had to change. The fact that socialist economies too were beginning to throw off the rigidities of the command economy and move into varying degrees of reliance on free-market economy was influential.

A worldwide consensus began to arise that greater reliance on market forces was essential for speeding up development where it was lagging, although how far governments should be involved in the development process remained, and remains, controversial. The East Asian and Southeast Asian experience for some was a triumph of the marketplace; but for others it demonstrated the power of combining market forces with skillful government intervention.

### The Tigers of Industrialization

The East Asian Tigers, sometimes also referred to as Asia’s Four Little Dragons, refers to the economies of Taiwan, Hong Kong, South Korea, and Singapore. These nations were noted for maintaining high

growth rates and rapid industrialization between the early 1960s and the 1990s.

The East Asian Tigers pursued an export-driven model of economic development. These nations focused on developing goods for export to highly industrialized nations. Domestic consumption was discouraged through government policies such as high tariffs. The common characteristics of the East Asian Tigers were: focus on exports to rich industrialized nations, sustained rate of double-digit growth for decades, non-democratic and relatively authoritarian political systems during the early years, high tariffs on imports, undervalued national currencies, trade surplus, and a high savings rate. The current criticism of the East Asian Tigers is that these economies focus exclusively on export-demand, at the cost of import-demand. Thus, these economies are heavily reliant on the economic health of their targeted export nations.

Many economists have pointed out that the governments of the tigers were quite active in their economies. East Asian Tigers all practiced aggressive land reform and made large investments in public health and elementary education. In addition, while the tigers relied on export markets to develop their economies, they also put in place high trade barriers, which protected local industries from foreign competition.

The East Asian Tigers were able to move from third-world status to first-world status in a few decades and were able to progress past other developing areas, particularly Latin America and sub-Saharan Africa. Until the mid-1970s it was not clear that the East Asian Tigers were a particular area of fast growth and that the Tiger development model produced superior results to either neoliberal, US-backed policies; the Soviet model; or import substitution development models. Because of the success of the initial Tigers, many nations have followed similar development models. In part, this led to the Asian Economic Crisis in the 1990s.

Over time, the economic term Tiger has become synonymous with nations that achieve high growth by pursuing an export-driven trade strategy. More recently, Indonesia, The Philippines, and Thailand have often been considered Tigers but the term is not limited to Asian nations. In Europe, Ireland has been called the Celtic Tiger for its rapid growth in the 1990s, while Estonia is known as the Baltic Tiger for its high growth rates.

## INFANT MORTALITY

Infant mortality is measured as deaths in the first year of life per thousand population, called the infant mortality rate (IMR). Its reduction requires clean water, nutrition, sanitation, education, and health care. It is highest in Afghanistan, Angola, Niger, and Sierra Leone, countries without surplus wealth, where the wealth is unevenly distributed, where there is little social capital and/or where there are cultural obstacles to equity. It is lowest in Finland, Japan, Singapore, and Sweden, democracies that value social capital. (Reliable IMR statistics can be hard to collect. Unless otherwise indicated, all statistical data is from the UNICEF Report for 1998.)

Wealth in terms of gross national product per capita (GNP) is a strong indicator of IMR, but allocation of resources is also significant. Improving the internal transfer of wealth and providing resources to the poor significantly lowered the IMRs in the latter half of the twentieth century in such countries as Peru, Indonesia, Sri Lanka, Costa Rica, and Zimbabwe. In Latin America, the Caribbean, and Tanzania, transfer of resources to the poor has

resulted in much better IMRs than suggested by their GNPs. By contrast, in the USA, inequitable distribution of resources and consequently high IMRs for the Black non-Hispanic community, Native Americans, and Puerto Ricans result in a worse IMR ranking than would be suggested by its GNP. Unequal distribution of wealth also helps to account for relatively high IMRs in the oil-rich states of the Middle East.

Combating infant mortality requires giving priority to domestic humanitarian needs. For example, in a world where more than 1.1 billion people lack safe water (UNDP 1997), it requires placing domestic access to clean drinking water and basic sanitation above the demands of industry and power generation (Jackson 1990). It requires placing human life above economic rationalism. UNICEF has calculated that half a million children per year die as a result of the developing countries' burdens of debt, because governments cut their health and education budgets in order to meet escalating associated interest payments. Acute international economic crises also raise IMRs in many developing countries (Jackson 1990).

In some countries, gender discrimination is a major contributor to the IMR. In China, the preference for male offspring and the one child policy makes it the only country where the IMR for girls is actually higher than that for boys (by about 20%). In many other countries, however, gender discrimination raises the IMR by denying female access to education. Studies suggest that female literacy is second only to household income as an indicator of IMR (Caldwell 1993). By propagating knowledge about contraception, breastfeeding, and nutrition, female education reduces malnutrition in pregnant women and infants, which is a cause of over half of all child deaths in developing countries. Traditional restrictions on the education of Muslim women contribute to relatively high IMRs in Afghanistan, Algeria, Iran, Iraq, Libya, Oman, Pakistan, Saudi Arabia, and Yemen. By contrast, in Thailand, where women have very high literacy, high participation in the labour force, and a strong decision-making role, infant mortality has improved remarkably (103 in 1960 to thirty-one in 1996).

Level of health care is also a factor affecting the IMR, although this is less significant than GNP or maternal literacy because these are factors that contribute to maintaining the health of the child, whereas level of health care only becomes relevant once the child is already sick or malnourished (Caldwell 1993). In as many as thirty-five of the poorest countries, 30%–50% of the population have no access to health services (UNDP 1997).

## Efforts to Correct the Problems

Survival is the most fundamental human right. The 1989 United Nations' Convention on the Rights of the Child has been ratified by every country in the world except two (USA and Somalia, both of which have signalled an intention to ratify by formally signing it). Article 24 of the Convention requires governments to take "appropriate measures" to reduce infant mortality. This has involved developing research-based national policies and programs that are supported by advances in medical science, technology, and disease control, although more research is needed to improve programs and determine their effectiveness. Immunisation programs have been particularly effective; by 1996 over 90% immunisation coverage had been achieved in eighty-nine countries and over 80% in another forty countries (D'Souza 1989). Other significant programs have contributed to improved nutrition through increased food production, fortification of staple foods, and improved household access to food.

National initiatives are enhanced by both international action and local operations. International action has included global aid programs and initiatives designed to help nations to help themselves. The 1996 Heavily Indebted Poor Countries Debt Initiative assists countries that implement reforms and channel resources to basic services. UNICEF's 20-20 Initiative involves donating matching funding when governments allocate at least 20% of spending to basic social services. Breastfeeding, which plays a particular role in reducing infant mortality, has been supported since 1981 by the World Health Organization's International Code to regulate marketing practices and the labelling of breast milk substitutes.

Breastfeeding has also been targeted by community-based programs. In this, as in many other areas, local involvement ensures community ownership of changes, that programs build upon existing good practice, and that innovations are accepted and adopted. The International Baby Food Action Network (IBFAN) was formed in 1979 to promote breastfeeding and now involves more than 150 citizen groups in ninety-four countries. In 1991 USAID and Wellstart International established the Expanded Promotion of Breastfeeding (EPB) Program; it has supported community programs promoting breastfeeding in Bolivia, Dominican Republic, Guatemala, Honduras, Mexico, and Nicaragua. In 1992 the World Health Organization (WHO) and UNICEF launched a Baby-Friendly Hospital Initiative to promote breast feeding. It has been implemented in over 170 countries.

Community initiatives have also been effective in promoting other aspects of infant health. In

Africa, the Bamako Initiative of 1987 moved the management of health services into local communities. Similar measures are now operating in other regions. They ensure access to basic medical services and promote preventive activities. In Guinea, for example, prenatal care coverage went from less than 5% before the initiative to almost 80% in the mid-1990s.

A combination of strategies is often the most effective. Thus simultaneous attention to one or more of the key factors of maternal health care, women's education, promotion of breast feeding, provision of clean water, promotion of sanitation, and hygiene, can be enhanced by programs that target particular nutritional needs. Salt iodisation has been enhanced by consumer advocacy and legislative change at the local and national levels. By 2000, twenty-nine countries were using adequately iodized salt and salt iodization was protecting 70% of the world's population from iodine deficiency and the accompanying problems of poor growth and developmental delay, which in turn affect the economic health of nations (UNICEF 2000). Another specific measure, vitamin A supplementation, was endorsed globally as a strategy to reduce IMRs, but its application has depended greatly on existing health measures and community involvement.

From 1950 to 1996 the global IMR dropped from 139 (Horiuch, 1989) to 60 (UNICEF 1998), a trend that was reflected in all developing regions, but it has not been uniform. Political stability affects all the factors that govern infant mortality. Wars and displacement of people will always cause spikes in the IMR statistics. To continue to reduce infant mortality, the developed countries must promote world peace and must both assist and empower the developing countries; and every nation must both assist and empower its most disadvantaged people.

## INFANTICIDE

Infanticide has a long global record as a pragmatic practice. It has been hypothesised that in Europe the motivation for female infanticide was the need to space the time between bearing children, with the theory that removing female infants as potential child bearers was more effective than eliminating males. In some eras and societies laws have required that deformed infants be put to death, in others infanticide has been promoted as a regular institution of an ideal state. Minimal attempts in Europe to limit the extensive killing of infants were made until the latter half of the nineteenth century. Although infanticide was a crime, few perpetrators were brought to trial.

In contrast to European practices, it has been argued that female infanticide was part of a population strategy in traditional China and it formed part of the economy of kinship. It had a necessary connection with the kinship system through the status of women and the nature of dowry. The *Taiping Jing*, a second-century Chinese text, rails against female infanticide. It notes the real scarcity of women and fears the cosmological implications of a weakening of female yin. Despite complex repercussions, infanticide has been practiced on every continent and in most cultures because it has satisfied significant family, economic, and social requirements.

In some societies the scarcity of women has been explained by denigrating attitudes towards female children and their consequent socioeconomic disadvantage. Direct infanticide is compounded by comparative neglect where male children are better nourished and enjoy access to family resources. Where children are viewed as being important to social reproduction, in terms of transmitting social values from one generation to the next and the means by which families perpetuate themselves, female children can be placed under threat. If daughters are not heirs, but serve mainly as brides in another family or clan lineage, their social role is less straightforward than that of sons, for boys are seen to reproduce their father's patriline.

Girls can be characterised as dangerous to the stability of an impoverished family and the stability

of society. In many poorer countries an infant girl represents not just an economic, but a spiritual problem to a family with limited resources. If she is killed, the repercussions of the act of violence can be felt in the familial, public, and cosmic spheres. If she survives and marries above her station, she carries the potential to disrupt social order. The birth of an infant girl is therefore perceived as having the potential to precipitate crises that may end in her death.

A range of texts debate what acts constitute infanticide. Defined as the deliberate killing of a child in its infancy, the majority of cases are up to two years of age. Yet a blurred line also exists between deliberate killing and neglect that causes an infant's death.

Because abortion techniques in non-industrial societies are either relatively ineffective or dangerous, infanticide is sometimes the most dependable method to control family size. Infanticide is safer than abortion for a woman, who is a more valuable member of society than a newborn infant. Deliberate killing also allows a family or society to preselect infants of the preferred sex. Indeed, in societies with an ideology that supports fertility, there may be concomitant discussions that condone or sanction the eradication of infants. Authors suggest that taking the life of a newborn is explained within many societies as a caring act. It may be done to save the life of an older sibling not yet weaned but already cherished as a community member. Within some societies a child is not believed to be fully human until several years after birth, when they are named, or initiated as a member of the broader social group. Given that the most common methods are suffocation, abandonment, or exposure, and are enacted by the mother or a female kin or clan member, the emotional anguish of the killing is eased by not acknowledging their fully human status until later in the life cycle.

Yet children should not be constructed as a universal nuisance, to be kept in the world only when conditions suggest they will survive. In Africa, for example, society and population are shaped by pastoral life. Numerous children in a family become economic assets as pastoral work includes tasks that small children can perform, such as herding and field work. Consequently, small children's labour has social and economic value. Observers also poignantly propose that offspring are considered desirable due to the historical losses of people to the slave trade in Africa. The recent decimation of populations due to sexually transmitted disease also validates children's social presence and labour. In regions where infant mortality is extreme, large numbers of children help to ensure that some will reach adulthood.

Although few texts examine in detail the ways that targeted killing of infants by an enemy during war is a

## INFANTICIDE

horrifying yet real aspect of infanticide, it is an important consideration, as the events in Rwanda in the late twentieth century exemplify. Few also consider the ways that increasing capitalism is shaping perceptions of the family, of children's economic worth, and which sex is preferable and profitable in economies that are driven by profit. Nonetheless, infanticide as an extensive practice throughout human history and within so many different cultures attests to its acceptance as an effective method of population control. Most infanticides continue to be performed to limit family and society size within the changing constraints of environmental and economic circumstances.

## INFECTIOUS DISEASES

As the 1960s came to a close, the medical establishment was riding a wave of optimism. Vaccines were being employed to eradicate some of humanity's worst scourges. Antibiotics were saving millions from bacterial infections. The scope of the impending victory seemed so complete that the US Surgeon General, William H. Stewart, declared victory over infectious diseases in testimony before Congress.

### Success Stories

#### *Smallpox*

Smallpox, a highly infectious disease caused by the *Variola* virus that killed as many as 30% of its victims and scarred most of its survivors, is the only major infectious agent that has been eradicated in the wild. Smallpox was eliminated by a sustained, global vaccination campaign.

#### *Polio*

Another highly infectious viral disease, polio can cause irreversible paralysis. The disease was targeted for eradication by the 41st World Health Assembly in 1988. According to World Health Organization (WHO) statistics, the number of cases has dropped from 350,000 the year the eradication campaign was launched to fewer than 800 in 2003. Those cases were concentrated in sub-Saharan Africa and the Indian subcontinent.

#### *Leprosy*

Leprosy, also known as Hansen's disease, is a chronic disease caused by the bacteria *Mycobacteria leprae*—a close relative of the bacteria that causes tuberculosis. Leprosy attacks the skin and nerves and severely disfigured its victims. The WHO proposed treatment of leprosy with three drugs at once over a period of six months to a year. The strategy has reduced the incidence worldwide from about 12 million cases in the 1980s to about 1 million cases in 2003. Most of the new cases are in a handful of countries in Southeast Asia, Africa, and the Americas.

#### *Guinea Worm Disease*

A parasitic worm, *Dracunculus medinensis*, causes Guinea worm disease. The disease is found in areas of sub-Saharan Africa where supplies of clean water are limited. The worm migrates in the tissue just below the skin, causing severe pain and swelling in its patients. While it does not kill its victims, it debilitates them and limits their efforts to feed themselves or otherwise maintain a decent quality of life. While there is no known treatment, the disease can be eliminated by providing clean drinking water. Guinea worm afflicted millions in the 1970s. The number of victims has dropped to fewer than one hundred thousand in 2000.

#### *Chagas Disease*

Chagas disease is caused by a single-celled animal parasite, *Trypanosoma cruzi*. The disease is typically transmitted by bloodsucking insects known as assassin bugs. While the initial course of the infection may be fatal—especially in young children—if the victim survives, the parasites remain in the body, invading many organs and debilitating the victims as systemic damage accumulates. Eradication efforts have focused

on controlling the insect host by improving living standards in Latin America where the disease is endemic. Fewer than 20 million people have the disease, but, since the eradication campaign began, incidence rates have decreased by about 70% in the “Southern Cone” of South America—Argentina, Brazil, Chile, Paraguay, and Uruguay.

### ***Tetanus***

Neonatal tetanus, the disease commonly called “lock-jaw,” is caused by a toxin produced by the bacteria *Clostridium tetani*. The bacteria grow in wounds, or in the case of neonatal tetanus, in the umbilical cord following delivery. More than 95% of infants die without treatment. Tetanus can be prevented by vaccinating women of childbearing age and by clean delivery practices and neonatal care. According to United Nations Children’s Fund (UNICEF) figures, the number of deaths has dropped from eight hundred thousand in the 1980s to 180,000 in 2002. The disease is still widespread throughout Africa and Asia.

## **Unending Challenges**

High population densities, poverty, environmental degradation, and limited resources—especially clean water—have helped the spread of new diseases, and some old diseases are resurging after adapting to the weapons used against them.

In 2004, infectious and parasitic diseases and respiratory infections killed nearly 15 million people worldwide. The top ten infectious disease killers (as of 2002) were: (1) lower respiratory infections (3.9 million deaths); (2) HIV/AIDS (2.8 million deaths); (3) diarrheal diseases (1.8 million deaths); (4) tuberculosis (1.6 million deaths); (5) malaria (1.3 million deaths); (6) measles (610,000 deaths); (7) pertussis (whooping cough; 290,000 deaths); (8) tetanus (210,000 deaths); (9) meningitis (170,000 deaths); and (10) syphilis (160,000 deaths).

## **Disease Outlook**

### ***Lower Respiratory Infections***

Lower respiratory infections primarily affect the lungs, bronchi, and trachea (or windpipe). They take an especially heavy toll on children. The main agents

responsible for acute respiratory infections in children include *Streptococcus pneumoniae*, *Haemophilus influenzae*, respiratory syncytial virus, and parainfluenza virus type 3. *Streptococcus* and *Haemophilus* are bacteria—*Streptococcus* is a major cause of pneumonia, meningitis, and middle-ear infections, while *Haemophilus* causes Hib disease, which presents symptoms similar to meningitis. Respiratory syncytial virus is the largest cause of respiratory infections in infants and children, infecting 64 million and killing 160,000 each year.

### ***Diarrheal Diseases***

Diarrheal diseases include bacterial diseases such as shigellosis, typhoid and paratyphoid fevers, cholera, and salmonellosis; and viral diseases such as rotavirus. They may also be caused by toxins in food. Diarrheal diseases—especially if they cause dysentery, or bloody diarrhea—may cause massive fluid loss leading to severe dehydration and death if left untreated. Children under five years of age are most susceptible to severe illness and death from diarrheal diseases. Many can be relatively easily prevented by clean drinking water supplies, improved sanitation and wastewater treatment, and sanitary food handling and preparation. Vaccines may provide protection against some of these diseases as well.

Shigellosis, caused by several species of *Shigella*, a group of closely related bacteria, infects about 163 million people in developing countries and another 1 million in developed countries each year. Of those infected, about 1 million die. Shigellosis is spread by person-to-person contact. Outbreaks often follow in the wake of war and natural disasters.

Typhoid and paratyphoid fevers are caused by related bacteria, *Salmonella typhi* and *S. paratyphi*, respectively. Both are primarily water-borne—most infection occurs after consumption of contaminated water—but contaminated food is also a source of infection. About 16 million cases of typhoid are reported each year, and six hundred thousand deaths per year are attributed to it.

Cholera, one of the oldest epidemic-prone diseases known, is caused by the bacteria *Vibrio cholerae*. The source of infection is typically contaminated water or food. The seventh pandemic, or worldwide outbreak, of cholera began in 1961 in Indonesia and spread rapidly through Asia and Africa. It reached South America in 1991 and spread throughout that continent and into Central America. Cholera epidemics can arise suddenly and kill many of its victims in a short time. Cholera outbreaks killed nearly 40 million in India alone between 1817 and 1917.

Under International Health Regulations, cholera is one of three diseases (along with plague and yellow fever) that WHO member states are obligated to report. The organization estimates that only 5% to 10% of actual cholera cases are reported, however, because many WHO member states fear economic and other consequences, such as lost tourism.

Food-borne bacterial illnesses affect millions around the world, as well. In addition to some of the bacterial species already discussed, the major culprits include *Salmonella* (cousins of the typhoid and paratyphoid bacteria), *Listeria monocytogenes*, *Escherichia coli* serotype O157:H7, and *Campylobacter*.

Rotavirus is the leading cause of severe diarrhea and dehydration in infants worldwide. A 2003 study in the journal *Emerging Infectious Diseases* estimated that rotavirus infects nearly 140 million children annually, with 2 million hospitalizations and more than four hundred thousand deaths. Eighty-two percent of the deaths occur in the poorest countries. A vaccine, Rotashield, was introduced in 1998, but it was pulled from the market and production halted the following year because of complications.

### ***Tuberculosis***

One-third of the Earth's population is infected with the bacteria that causes tuberculosis, *Mycobacterium tuberculosis*, making tuberculosis the most widespread major infectious disease. It is airborne, but people infected with *M. tuberculosis* are not always infectious. The immune system can wall the bacteria up in nodules—tubercles—in tissues such as the lungs, thus giving the disease its name. The disease can be cured by a regimen of antibiotic treatment, but misuse of antibiotics and a lack of diligence in following treatment guidelines have helped spur the evolution of drug-resistant strains. The WHO estimated nearly 9 million active cases of tuberculosis in 2002.

### ***Malaria***

Malaria, or “bad air,” is one of the most widespread and devastating parasitic diseases in the world. It is spread by infected *Anopheles* mosquitoes. Malaria causes flu-like systems—fever, headache, and vomiting—and destroys red blood cells, thus clogging blood vessels that supply the brain and other vital organs. Left untreated, symptoms can recur over time. It causes 300 million acute illnesses and kills 1 million annually.

### ***Measles***

Measles, a viral disease characterized by a rash, high fever, and flu-like symptoms, is a highly contagious but preventable disease that is the leading cause of blindness throughout the world. Measles, caused by *Morbillivirus*, is listed by the WHO as the direct cause of more than 610,000 deaths in 2002, but the disease, through complications from pneumonia, diarrhea, and malnutrition, may be the leading cause of death among children worldwide. Vaccination can prevent the disease, and the WHO has targeted measles for eradication.

### ***Pertussis***

The childhood disease whooping cough, or pertussis, is caused by a bacteria, *Bordetella pertussis*. It is characterized by intense coughing that culminates in a prolonged intake of breath—the “whoop.” Pertussis can strike any age, but the effects are worse for the very young. The disease affects 20 million to 40 million each year and kills two hundred thousand to four hundred thousand. Ninety percent of cases are in the developing world. The disease is preventable via vaccination.

### ***Meningitis***

Bacterial meningitis is a contagious bacterial airborne disease caused by *Neisseria meningitide*. Infection manifests itself as pneumonia, septicemia (blood poisoning), or meningitis. Septicemia occurs when the bacteria spread through the bloodstream. It is very deadly and is characterized by circulatory failure and hemorrhagic rash. Meningitis is indicated by intense headache, fever, nausea, vomiting, light sensitivity, and a stiff neck, among other symptoms. Even with prompt treatment, the disease is fatal in up to 10% of cases, which averages about 170,000 deaths per year. Permanent neurological symptoms—including hearing and speech disorders, mental impairment, and paralysis—afflict as many as 20% of survivors. Overcrowding contributes to the spread of the bacteria, as do arid conditions in the tropical and subtropical regions and cold conditions in temperate regions.

### ***Syphilis***

While primarily thought of as a sexually transmitted disease, syphilis, caused by bacteria called *Treponema pallidum*, can also be transmitted person-to-person

under unhygienic conditions. It can also be transmitted from mother to child. Initial symptoms are ulcers at the site of original infection. After a few weeks, the bacteria hide in other organs and the infected person may remain asymptomatic for years. In late stages of the disease, the nervous system, cardiovascular system, skin, or skeleton may be affected. Syphilis in the mother is a major cause of stillbirth as well as death of infants in their first year.

## Regional Patterns

In 2002, lower respiratory infections took an especially heavy toll in Southeast Asia (1.5 million deaths) and Saharan and sub-Saharan Africa (1.1 million deaths), followed by the Western Pacific and East Asia (500,000 deaths), and the Mediterranean and West Asia (350,000 deaths). The highest death toll from diarrheal diseases was in Saharan and sub-Saharan Africa (710,000 deaths), Southeast Asia (600,000 deaths), the Mediterranean and West Asia (260,000 deaths), and the Western Pacific and East Asia (150,000 deaths).

Tuberculosis claimed 600,000 victims in Southeast Asia in 2002. In Saharan and sub-Saharan Africa, 350,000 patients died from the disease, followed by 370,000 in the Western Pacific and East Asia, and 140,000 in the Mediterranean and West Asia. Africa bears the brunt of the death toll from malaria. In 2002, more than 1.1 million died from the disease in Saharan and sub-Saharan Africa alone.

## A New Threat

In 1978 something new appeared in gay men from Sweden and the United States and heterosexual men in Haiti and Tanzania. Four years later, in 1981, the US Centers for Disease Control and Prevention reported on an unusual suite of symptoms in gay and bisexual men. The suite of symptoms was named *acquired immune deficiency syndrome* (AIDS) in 1982, and in 1983 the virus that caused it, human immunodeficiency virus (HIV), was identified.

In AIDS, the virus attacks and destroys the body's immune system. Over time, AIDS patients succumb to a number of other diseases, such as Kaposi's sarcoma—a type of cancer—and pneumonia caused by *Pneumocystis carinii*.

HIV is primarily spread by sexual contact, although it can also be spread via blood transfusions and by sharing of needles used for injecting intravenous

drugs. The virus first appeared among homosexuals in developed nations such as the United States. The early association with “taboo” sexual practices has, to some extent, hindered adoption of measures to stem the spread of the virus. Also, rumors that HIV does not cause AIDS have likewise hindered efforts to slow the pandemic.

Nearly 40 million people are living with the virus, and the number is growing. Twenty million have died since the first diagnosis of what came to be known as AIDS in 1981. According to the Joint United Nations Programme on HIV/AIDS (UNAIDS), 5 million new HIV infections occurred in 2003 and 3 million died of AIDS that year.

HIV is having serious effects on social stability in areas where infection is widespread. A high proportion of adults aged fifteen to forty-nine is affected—this is the age group that drives the economy, raises children, and takes care of older adults. (Nearly all new infections are in the fifteen to twenty-four age group.) Sub-Saharan Africa has 12 million AIDS orphans—children who have lost parents because of AIDS—and the emotional scars of those children may have long-lasting effects on societies in the future.

Africa has the greatest number of HIV infections—25 million people, or nearly two-thirds of HIV patients worldwide—live in sub-Saharan Africa. Asia is next hardest hit, with 7.4 million infections, or about 20% of the world's total. The HIV infection rates are on the rise in Asia, too, with rapid rises in the number of cases in China, Indonesia, and Vietnam.

## INTELLECTUAL PROPERTY RIGHTS

Intellectual property can be defined as creations of the labors of the human mind, which maybe incorporated in creative and inventive works. These may include literary works, paintings, inventions, designs, musical works, and trademarks. The legal entitlement conferred on such intellectual property creates a number of rights, which could vary in scope and duration in each case. With the conferment of such rights (which follow registration), the rights holder is in a position to control and regulate unauthorized use of his or her property and also to grant permission (known as licensing) for its use, including setting the terms for its use.

The various forms of protection of intellectual property rights may be classified as copyrights, trademarks, geographical indications, industrial designs, product patents, process patents, layout designs of integrated circuits, undisclosed information, and trade secrets. All of them are included in the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). Even before this agreement the criteria of novelty, non-obviousness, and industrial utility applied before a patent would be granted. According to Article 30 of the TRIPS Agreement, the duration for grant of a patent is twenty years, after which it comes into the public domain. In the case of intellectual property rights such as trademarks and trade secrets, the rights generally extend to an

indefinite period. Patents are the most sought-after category of individual property rights (IPRs).

While rights relating to intellectual property have been in existence since the period prior to the Industrial Revolution, the term has become universally familiar only in recent years, and particularly since the Uruguay Round of the General Agreement on Trade and Tariffs (GATT) brought forth the TRIPS Agreement in 1995.

Before the TRIPS Agreement the most important instruments that dealt with the protection of intellectual property rights were the Paris Convention (1967), the Berne Convention (1971), the Rome Convention (1961), the International Union for the Protection of New Varieties of Plants (UPOV), the Teaching, Learning and Technology Group (TLT), and the Budapest Treaty. The TRIPS Agreement, however, is the most comprehensive treaty dealing with the subject. It is also the most far reaching in so far as its implementation is likely to impinge on the time-honored sovereignty of nations, in particular impacting their domestic laws, as well as their economic systems and development priorities. It is the first time that IPR has been made a part of a trade regime. Additionally, since life forms may also be patented now, a radical departure has been made.

The countries that signed the TRIPS Agreement were given a time frame to make their domestic laws compliant with TRIPS provisions. All members were given one year—until January 1996. The developing countries were given four more years—until January 2000—and the least-developed countries ten years (i.e., until 2006). There is a reviewing procedure (a ministerial review to be held every two years) and a dispute settlement mechanism provided for in the TRIPS Agreement.

Examined from an historical perspective, the issue of intellectual property rights should probably not be a matter of great controversy between nations. The history of humankind shows that successive generations have built upon the inventiveness and the technological achievements of previous generations of humankind as a whole. It is as hard to imagine the invention of the motor car in the West without the invention of the wheel by some intelligent mechanical mind in Asia, as it is to visualize the granting of copyright for a book had paper not been invented in China. To extend the thesis further, inventions and technological progress must serve society's purpose, and in an increasingly globalized society with many common problems including infectious diseases and environmental emergencies like global warming, thought must be collectively given to the ways and means of tackling these problems rather than a strictly proprietary interest in the means to do so.

The proponents of legal protection for intellectual property rights state that a person has a natural right to the product of his or her brain. In addition, to the extent that he or she has produced something it finds useful, society must reward the person for it. The economic argument for protection of these rights is that it stimulates innovative and technological creativity and thus adds to society's resource of ideas. This in turn leads to economic growth.

Others challenge this view and point out that while the first patent was granted in 1449 by the king of England, the spate of inventive activity, which led to the Industrial Revolution, took place much later. They deny that instruments like patents contribute to encouraging creativity and inventiveness and point out that this view is based on an artificial and unrealistic construction of knowledge and innovation.

Before the TRIPS Agreement, the protection of intellectual property rights had existed at various levels and had been of several kinds. There had also existed, on the whole, a tacit understanding among countries that as incentive and reward for innovation, payment for particular patents was in order. But public interest was also given consideration, and toward this end, an attempt was made to have patented products, in particular medicines, be available to the public at affordable prices. Many countries passed laws relating to patents that provided for compulsory licensing for working of patents—in other words, for the local manufacture of the patented product. Patents were also used as a means for transfer as well as local development of technology.

By the early 1980s the US government and industry as well had begun to be increasingly vocal about greater intellectual property protection. The 1984 amendment to Section 301 of the US Trade Act authorized the US president to take corrective action in a situation where there was inadequate protection of intellectual property rights of US citizens in other countries. Soon after, in 1985, the US took action against the Republic of Korea under this amendment, resulting in Korea strengthening its copyright law and enforcement and also introducing patenting for medicines and chemicals.

The reason for the US wanting a strict protection system was that it perceived that the developing countries were demonstrating high efficiency in absorbing and replicating new technologies and thereby providing competition for US goods. The US trade deficit in the 1980s was \$150 billion. The US felt that by enforcing US-type patent laws in the rest of the world, it could reduce its trade deficit. This, however, was one among the many reasons why the US and other developed countries wanted a stricter intellectual property regime.

At the time the US was pressing for inclusion of several areas of intellectual property in the proposed round of trade negotiations, several developing countries had put up a strong opposition. Among them Brazil and India took the view that the World Intellectual Property Organization, rather than any other forum, was competent to discuss the subject of intellectual property rights. The developing countries, despite their strong reservations on the matter, did not present a united opposition. Korea and the ASEAN countries had not been vocal regarding their opposition to the proposals of the developing countries. A review of the Uruguay Round of negotiations would certainly be of great help in getting information about the complex motivations, intentions, and apprehensions of the various participating countries regarding protection of intellectual property rights.

The developed countries—the US, the countries of Europe, and Japan—presented on the whole a consistent and united stand, insisting on higher levels of intellectual property protection from developing countries. It remains true, however, that there were differences among them, which the developing countries could have exploited. They did not do so, and also were not able at that crucial stage to provide alternate proposals to that of the US, with the result that the TRIPS Agreement went through.

It was clear by the end of the Uruguay Round of negotiations that even though a number of countries agreed to sign the TRIPS Agreement, its implementation would be a difficult and contentious process.

In 1967, the World Intellectual Property Organization (WIPO), under the United Nations, was the primary organization for protection of intellectual property rights in relations between nations. Since the WTO came into existence as a result of the Uruguay Round, it has been at the center of discussions and meetings relating to implementation of intellectual property rights. But different opinions on the matter do exist. While the mandate given to the WTO in the context of world trade is a strong one, certainly stronger than its predecessor GATT, the developing countries have frequently pressed for a greater role for WIPO. They perceive that the WTO is more a forum of the developed countries and they are able to push forward their own agenda in that organization.

It is clear from the Preamble to the TRIPS Agreement as well as the WTO Agreement that the protection of intellectual property rights has to be considered in the larger context of reducing barriers to trade and so ensure that enforcement of intellectual property rights does not result in “distortions and impediments to international trade.”

## INTELLECTUAL PROPERTY RIGHTS

The Preamble to the WTO Agreement also states that in view of the fact that the nations of the world are at different stages of development, there is need to support the “underdeveloped countries” to promote their technological and economic development by providing differential treatment, certain concessions, and special measures.

Therefore the TRIPS Agreement itself, while providing greater protection to intellectual property rights, also appears to set some limits to them. It will now depend upon the developing countries as to how they utilize these provisions to best achieve their interests, though the matter is not as simple as this in the case of all categories of rights.

Among the developing countries there does exist a perception that the protection of intellectual property rights as provided for in the TRIPS Agreement is an attempt by the developed countries, whose governments invariably support their transnational corporations, to coerce the developing countries, who are often not in a position to drive a hard bargain themselves, into accepting rules that do not really benefit them. At the same time they try through propaganda to make them believe that giving protection to intellectual property rights would encourage investment in particular foreign direct investment, as well as research and innovation. The WTO rules—which apply equally in the context of intellectual property rights, such as the supremacy of the principle of free trade, the “most favored nation” principle, and the principle that foreign nationals must have the same rights and privileges as the host country’s citizens—are seen as institutionalizing the current system of global economic inequality.

It has been argued in the recent past, particularly by transnational corporations, that intellectual property rights confer exclusive rights. But if this were so, such rights would act to inhibit trade, which the WTO seeks above all to avoid.

While Article 28 of the TRIPS Agreement does confer “exclusive rights” on rights holders during the term of patent to prevent “third parties” from “making, using, offering for sale, selling, or importing” for these purposes that product, the TRIPS Agreement also provides, in Article 30, for “legitimate interests of third parties” and “use” by them; and in Article 31, for “other uses” by the government or authorized third parties “without authorization of the right holder.” The “third parties” may include—in the case of pharmaceuticals, for instance—the generic pharmaceutical companies who may be interested in making the product in the period after the expiration date of the patent, consumers of patented medicines in a given country, and WTO member governments themselves. The affirmation of a third

party’s rights to use the patented invention during the patent term is provided in Article 31. Similarly, Article 40 gives to the patentee the right to license and also protects the licensee against anti-competitive practices or exploitation by patent holders. Thus public interest has been addressed by the TRIPS Agreement.

An important aspect of IPRs relates to their effective domestic enforcement in various countries. Part III of the TRIPS Agreement includes, unlike previous treaties, a comprehensive list of procedures for enforcement of IPRs by domestic authorities. These will apply both at the border and inside the country. The implications for many countries will be to change their existing procedures, which could mean changes in the way their judicial and administrative systems operate. Article 41.5 states that there is no obligation on the part of member countries to put in place a judicial system for the enforcement of IPRs distinct from the enforcement of law in general, which does imply that remedies provided for the infringement of IPRs would be in accordance with the legal context and system of each separate country. Article 41.2 has provided that procedures for enforcement should not be unduly complicated or costly.

Diverse new issues will most likely come up as the debate on intellectual property rights proceeds in the developed world and between the developed and developing countries. Technological developments such as the increased use of the Internet have already given rise to questions relating to expanding the definition of copyright.

Biodiversity and the uses it has been put to in the area of genetic engineering is an emerging controversial field. Patents on life forms, for instance, have far-reaching economic and ecological implications, apart from ethical problems. In this sort of genetic engineering, the scientist merely moves the genes around—he or she does not create life. Such genetic engineering finds a fertile field in the biological diversity of the Third World, which multinational corporations are already laying claims to. This biological diversity has traditionally provided the base of much of the food, medicine, and even clothing in the developing countries. From an ecological standpoint, patents related to biological resources will have huge repercussions for the conservation of biodiversity and the way it is utilized. The patent holders in this case will virtually oversee and collect rent for the seeds sown by farmers and the medicines made with nature’s bounty. This would inevitably throw already marginalized peoples of the Third World into an ever-more-desperate situation. India and several other developing countries recognize that the farmers who constitute the majority of their populations will in

particular be adversely affected. Until recently, the biodiversity in Third World countries had been utilized by the community as a whole and in accordance with communal norms. To apply the principle of private property to a community resource and enable, through an intellectual property rights system, only corporations to have a legal personality and rights in relation to it, would be to jeopardize a way of life that has existed for centuries.

Those speaking for indigenous cultures, like the scientist and environmentalist Vandana Shiva, point out that indigenous knowledge often provides the leads for the useful traits in biological organisms. These are then transferred to Western knowledge systems and treated as an innovation. Legal rights (in the form of patents) are then claimed by corporate capital while introducing into the market what has already been there as indigenous wisdom in traditional cultures. This process has been referred to as *biopiracy*. There are numerous examples of this phenomenon. The *neem* tree of India has been known for centuries to have exceptional medicinal and purifying qualities and poor villagers have been able to access it for curing many ailments. The situation is set to change now as Western manufacturers in the past few years have “discovered” these properties of the tree and have taken out patents for various products made from it. In this process they have imported huge quantities of seed of *neem* leading to a scarcity in its land of origin and unavailability to the common person in India.

The TRIPS Agreement has moved in the opposite direction from the draft code of conduct on Transfer of Technology negotiated in the United Nations Conference on Trade and Development (UNCTAD) and the draft code of conduct for Transnational Corporations negotiated at the United Nations. Both of these had aimed at the transfer of technology from transnational companies to developing countries and also required them to act in accordance with the developmental requirements and goals of the host countries.

Despite a great deal of difference in the vantage points from which the developed countries and the underdeveloped countries view IPRs, the latter more readily accepts certain categories. Trademarks, requiring protection, are a subject that has been the least controversial, and trademarks had been recognized by the national laws of both developed and developing countries prior to TRIPS. Protection of trademarks had been fairly detailed in the Paris Convention, though the means of such protection had been left to individual countries.

The developing countries had used this freedom in implementation to restrict foreign trademarks so that prices for certain commodities including

pharmaceuticals remained reasonably priced. This, however, has had to change under the principle of equal treatment to foreigners and nationals under TRIPS.

TRIPS has also provided a clear definition of trademark for the first time. It is defined as “any sign or any combination of signs capable of distinguishing the goods and services of one undertaking from those of other undertakings.” These trademarks must then be registered. In the case of trademarks, unlike patents, local business has an interest in making sure of protection.

In addition to trademarks, certain products are closely connected with a geographical area—such as Darjeeling for tea from that area in India and Champagne from that district in France—and these indicators or signs represent the fund of goodwill and reputation built up over a period of time by a brand that connects it to the consumers. If a particular group has nurtured such a category of product through investment and other means, it would not like another group to use it to increase its sales.

Since the area of IPRs is one of fluid developments, one cannot conclude that these rights are fixed and unchanging. On the contrary, recent discussions and developments in particular at the Seattle and Cancun Ministerial would give rise to the understanding that there are several ways of implementing the provision of this Agreement, indeed that there are several ways of interpreting these provisions.

A noteworthy development is the emergence of what some observers have called the global civil society. Large sections of society in developed countries and NGOs have expressed skepticism regarding many provisions of the TRIPS Agreement. They have also offered active support to the developing countries to interpret TRIPS more flexibly so that they may continue to retain their developmental priorities, in particular those relating to public health and social security.

## **INTER-AMERICAN DEVELOPMENT BANK (IDB)**

Nineteen Latin American and Caribbean countries and the United States founded the Inter-American Development Bank in December of 1959. The Bank's historical origins can be traced back to a resolution calling for the creation of a development institution at the First Inter-American Conference, held in Washington, DC, in 1890. For more than half a century prior to its official inception, the countries of Latin America and the Caribbean worked to establish an official financial institution to address the economic, social, cultural, and political realities of the region. In 1958, Brazilian president Juscelino Kubitschek proposed that the heads of state initiate formal cooperation to promote economic and social development in the Western Hemisphere. A special committee of the Organization of American States, founded in 1948, drafted the Articles of Agreement that were then passed unanimously in a resolution before the General Assembly. With its headquarters in Washington, DC, the IDB was the first regional development bank to complement the Bretton Woods institutions made up of the International Bank of Reconstruction and Development (World Bank), the International Monetary Fund (IMF), and the General Agreement on Tariffs and Trade (GATT).

The Charter of the Inter-American Development Bank states that its principal functions are to utilize its own capital to finance the development of borrowing countries; to supplement private investment when private capital is not available on reasonable terms and conditions; and to provide technical assistance for the implementation of development plans and projects. The Bank's financial resources are in the form of ordinary capital raised in financial markets and the Funds in Administration that come from member contributions. The primary objectives are to foster the welfare of and maintain the solidarity among its forty-six member states that consist of twenty-six borrowing countries in Latin America and the Caribbean; twenty non-borrowing countries, including the United States, Canada, and Japan; sixteen European countries; and Israel. Each country's voting power is based on its subscription to the Bank's capital stock. Latin America and the Caribbean represent 50% of the voting power; the United States has 30%; Japan has 5%; Canada has 4%; and other non-borrowing countries have 11%.

The organization of the IDB reflects an identity closely tied to the cultural and managerial style of the Latin American and Caribbean countries. This regional character gives the Bank a key comparative advantage over other international financial institutions in

understanding national and regional priorities, and in adjusting to new regional challenges of development. The longstanding political commitment to regional integration enables the Bank to tailor effectively policies and lending programs in response to local conditions. Early efforts toward integration entailed the financing of infrastructure projects such as ports, transportation, and power grids, and the collection and the broad dissemination of data on regional uses and flows of intellectual, commercial, financial, technological, and human resources. The Charter emphasizes the financing of specific projects, but also promotes an understanding of development that requires a balanced approach across multiple sectors. In the 1960s and 1970s, lending was channeled into social issues, particularly education and health, income generation, and job creation through micro-enterprise and small-scale farming projects, and basic infrastructure, such as roads, water, and sanitation. Technical cooperation complemented these lending programs by conveying knowledge to borrowing countries and strengthening institutional capacity. Technical assistance was made available to public institutions, regional and sub-regional organizations, and non-governmental organizations.

The rapid expansion of the Bank's bureaucratic apparatus resulted in a propensity toward formal approval procedures, multiple and overlapping oversight on expenditures, and extensive ex-post auditing. Although sometimes decried as overly rigid, this procedural focus emphasized fairness and transparency as essential components of project finance in the public sector. But, the political interplay between borrowers, non-borrowers, and private capital markets encouraged a proclivity for rules and procedures, a need for consensus and compromise, and a culture of public service and pragmatism among its staff and employees. The incorporation of additional non-borrowing members broadened the capital base and introduced alternative perspectives on the meaning of development over time. These institutional attributes were intended to maintain a neutral approach to individual countries.

As Latin America and the Caribbean confronted the polarizing effects of the Cold War and the difficulties of social and environmental decay during the 1980s, the excessive concentration on project approvals neglected the urgency for a new approach to multilateral regional governance. The debt crisis and inflation spiral of the 1980s caused a dramatic change in the philosophy of the IDB with regard to the limits of project finance. This change inspired a debate within the institution about the need to combine financial assistance with the adoption of policy changes

driven by the so-called “Washington Consensus” that advocated fiscal austerity and monetary stability. The Bank sought an appropriate mix of “policy-based” and “investment” lending that moved the attention of both the Bank and its borrowers away from the internal technical details of projects and onto the transfer of resources in a more efficient and flexible manner. The Bank made serious efforts to reconcile the goals of policy reform with investments intended to enhance productivity.

The global economic recession of the early 1990s altered the conditions under which the Bank pursued its mission and policy priorities. Economic decline inspired a more consensual approach to governance in which member countries and executive and administrative bodies reassessed problems associated with periodic capital replenishments and sustainable levels of lending, the impact of increased volatility of private capital markets on sources of external finance to the region, the acceleration of the pace of technological change, and the rising demands for expertise and technical assistance. Out of this self-reexamination emerged a greater emphasis on social-sector reform and state modernization and the use of bilateral and non-governmental resources in partnership with the Bank’s own funds. The capital replenishment of 1994 was the largest increase in resources in the history of the IDB. At the annual meeting in Guadalajara, Mexico, member countries approved a \$40 billion replenishment aimed primarily at reducing poverty and promoting social equity in the region. The Eighth General Increase reflected the common desire of the IDB president, Enrique Iglesias (1988–), the Board Governors, and the Board of Executive Directors to reach a political compromise in which all shareholders would make financial commitments to new lending priorities and development objectives.

The gathering of officials from a variety of multilateral institutions; government delegations from Latin America, North America, and Europe; representatives of non-governmental and non-profit organizations; policy observers; and academics at the Conference on Strengthening Civil Society in September 1994 introduced an ambitious agenda for the coordination of state reform and economic adjustment with effective programs to alleviate poverty and to build democratic institutions. The conference generated intellectual and financial contributions from the Organization of American States, the United Nations Development Program, and the United States Agency for International Development. The distribution of IDB loans shifted accordingly over the next five years. By 1999, 29.1% of all lending went to social sectors in health and sanitation, urban

development, education, social investment funds, the environment, and micro-enterprise; 28.1% went to infrastructure in energy, transportation, and communications; 22.2% went to productive sectors in agriculture and fisheries, industry, mining and tourism, and science and technology; 15.6% went to the modernization of the state; and 5.1% went to export financing (IDB 2000, p. 9).

As most Latin American and Caribbean governments pursued the consolidation of democracy and the privatization of state assets in the 1990s, the Bank’s lending for public-sector efficiency, decentralization of administrative responsibilities, and training programs to improve accountability and transparency increased dramatically. Such programs built on the economic stabilization and restructuring efforts associated with the Washington Consensus. For example, Brazil received a \$300 million loan in 1999 to modernize tax collection, upgrade human resources, and improve information technology at the municipal level. In the same year, El Salvador used an \$8.8 million loan to implement an ethics code in the Legislative Assembly and reduce procurement irregularities.

Furthermore, the IDB aimed to equip “the citizenry, the sum total of individuals and organizations that exist apart from government-groups of micro-entrepreneurs or environmentalists, civic and trade associations, political parties, philanthropic organizations, churches, indigenous communities, organized labor and women’s and youth groups” (IDB 1995, p. 12). Most projects devoted to strengthening and broadening the participation of civil society in decision-making processes deliver financial and technical support to non-governmental organizations that advocate the demands of the urban laborers and rural workers, disabled veterans, illiterate women, underprivileged students, and indigenous groups. These projects are carried out through a host of collaborative activities and entities. The Inter-American Institute for Social Development conducts research on poverty alleviation; the Micro-Enterprise and Small Projects division finances lending to small and medium-size businesses; Women in Development addresses health and employment problems faced especially by single mothers; the Indigenous Populations and Human Resettlement section treats refugee, migrant, and land issues; and the Multilateral Investment Fund provides “start-up” capital and the integration of displaced workers, students, and single mothers into the formal private economy. These endeavors appeal to philanthropy, good will, and entrepreneurial initiative as key ingredients to eliminate poverty and achieve popular democratic participation and borrow significantly from the development strategy advanced by the

Kennedy administration's Alliance for Progress in the 1960s.

The ratification of the General Agreement on Tariffs and Trade (GATT) by Latin American and Caribbean countries in 1994 and 1995 elevated the IDB to new heights as an advocate of economic integration and free trade in the Western Hemisphere. At the First Summit of the Americas, held in Miami, Florida, in December 1994, the thirty-four heads of states agreed to establish the Free Trade Area of the Americas (FTAA) by the year 2005. The FTAA would be the world's largest integrated market, with approximately 850 million people with a combined gross national product of over \$13 trillion. The Summit Implementation Review Group assigned the IDB the task of coordinating sub-regional trade and integration arrangements with the objectives of the FTAA. The Integration, Trade, and Hemispheric Issues Division offers technical assistance toward the policy harmonization of the North American Free Trade Agreement (NAFTA) between the United States, Canada, and Mexico, and the South American Common Market (MERCOSUR), the Caribbean Community (CARICOM), the Central American Common Market (CACM), and Andean Group trade groups.

The IDB recognizes that the complexities of regional integration and the challenges of development in the twenty-first century require political will, innovative projects, and strategic planning based on its distinct relationship with borrowing countries. Latin America and the Caribbean continue to be affected adversely by financial crises, severe inequality, rising crime and violence, volatile commodity prices, and rapidly rising expectations. These pressures call for what are referred to as "second-generation reforms" that go beyond the mandates of private markets and minimalist states to generate broad-based equitable growth. Consequently, the ability of the Bank to represent the region's diverse states and peoples depends heavily on the adoption of new initiatives arising from neighborhoods, communities, municipalities, and provinces across the Western Hemisphere.

### INTERNATIONAL AIR TRANSPORT ASSOCIATION (IATA)

In the post-World War II world, international air transport has been one of the most dynamic and fast-changing industries in the world. The International Air Transport Association (IATA), headquartered in Montreal, Canada, is an association of airlines founded in 1945 by airline corporations seeking to promote safe, regular, and economical air transport. IATA's objectives are to enable people, freight, and mail to move more efficiently throughout the world and to ensure that IATA member aircraft can operate safely and efficiently under clearly defined and understood rules. To facilitate this process, IATA assigns three-letter IATA airport codes and two-letter IATA airline designators. IATA also regulates the shipping of dangerous goods and publishes the *Dangerous Goods Regulations* manual, a reference source for airlines shipping hazardous materials. Many low-cost carriers who are not IATA members, however, have accused the association of being a cartel.

In early 2005, IATA had 262 members. More than half of the member airlines are based in the developing world. Sixty-nine member airlines are based in Asia. Members include Air China Limited, Air Macao, Asiana Airlines, Bangkok Airways, Cathay Pacific Airways, China Southern Airlines, Indian Airlines, Philippine Airlines, Royal Brunei Airlines, and Xiamen Airlines. Forty member airlines are based in Africa. Members include Aero Zambia, Air Botswana, Air Malawi, Air Namibia, Air Zimbabwe, Egypt Air, Ethiopian Airlines, Ghana Airways, Kenya Airways, and Royal Air Maroc. Thirty member airlines are based in Latin America. Members include Aerolíneas Argentinas, Aeromexico, Air Jamaica, Avianca, Cubana de Aviación, Lan Chile, Lan Ecuador, Lan Peru, Grupo Taca, and Varig. Twenty-six member airlines are based in the Middle East, the fastest-growing region in airline travel. Members include Ariana Afghan Airlines, El Al Israeli Airlines, Emirates,

Gulf Air Company, Iran Air, Kish Airlines, Kuwait Airlines, Qatar Airways, Royal Jordanian Airlines, and Saudi Arabian Airlines.

Flights by member airlines comprise more than 95% of all international scheduled air traffic. For air passengers and shipping customers, IATA simplifies the travel and shipping process. By helping to regulate airline costs, IATA facilitates cheaper tickets and shipping costs. Individual passengers can make one telephone call or one Internet visit to reserve a ticket, pay in one currency, and then use the ticket on several airlines to travel to several countries on different airlines. Despite differences in language, currency, law, and national customs, international airlines are able to coordinate individual networks into a single worldwide system.

## INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA)

The International Atomic Energy Agency (IAEA) is the world center of decision making and implementation on international cooperation on peaceful use of nuclear energy. The Agency engages mainly in three areas: Nuclear Safety and Security, Nuclear Science and Technology, and Safeguards and Verification.

The Agency was established as a result of the US nuclear policy transformation occurring in the mid-1950s. The United States abandoned a policy of strict denial of nuclear technology transfer and intended to seek a liberal regimen for a worldwide cooperation on peaceful use of nuclear energy. However, this policy transformation was not without condition: peaceful nuclear technology should not be diverted to military ends. This idea, promulgated by US president Eisenhower in his “Atoms for Peace” address to the General Assembly of the United Nations on December 8, 1953, gained endorsement from the United States’ nuclear rival, the Soviet Union. The two nuclear giants initiated the negotiation of the IAEA Statute immediately and took the leadership in it. In September 1956, the Conference on the Statute convened at the headquarters of the United Nations.

(The United Nations only hosted the negotiation; it was not a sponsor.) On October 26, 1956, through the efforts of the “Twelve Nations Group,” including members from Western and Eastern blocs who were led by the United States and the USSR, respectively, the Statute was drafted and open for signature. Eighty nations signed the treaty within ninety days and the IAEA Statute took effect on July 20, 1957. The IAEA Secretariat is now headquartered in Vienna, Austria, and has 137 member states.

The IAEA is an independent intergovernmental organization in the United Nations family. However, it is not a Specialized Agency under Article 57 of the Charter of the United Nations. The relation of the IAEA to the United Nations is unique: it is independent from the United Nations but may submit reports and questions to the United Nations Security Council directly (IAEA Statute Article III.B.4).

The IAEA consists of three statutory organs: the General Conference, the Board of Governors, and the Secretariat. The IAEA secretariat is the agency’s headquarters in Vienna, Austria. It has a staff of 2,200 multi-disciplinary professional and support staff from more than ninety countries. The General Conference includes each member state; the Board of Governors is composed only of member states with advanced nuclear technology. The Board of Governors is vested a near plenary power in carrying out the Agency’s function. In contrast, the power of the General Conference is limited to requesting reports and making proposals on any matter relating to the functions of the Agency (IAEA Statute Article V.F.2). The Director General and staff of the IAEA are under the authority of and subject to the control of the Board of Governors (IAEA Statute Article VII.B).

Through its various programs, the Agency promotes the use of peaceful nuclear technology for global welfare while working to prevent the use of nuclear technology for military purposes. Developing countries are primarily interested in the assistance programs that aid them in building nuclear technology and facilities; developed countries, especially under the leadership of the United States and the USSR in the aftermath of the 1962 Cuban missile crisis, have begun seeking to enhance measures in safeguarding peaceful nuclear activities. These two major programs interact at the political level and sometimes at more concrete financial and operational levels.

The founders of the Agency intended that the Agency’s main function should be assisting in the research and application of nuclear energy. In the 1956 Statute, the founders proposed a modest nuclear safeguarding program: the Agency is only authorized to apply the safeguards to the extent of the Agency’s supplies or at the request of the member states (IAEA

Statute Article III.A.5). However, the Treaty of Tlatelolco of 1967 and the Non-Proliferation Treaty of 1968 both vested the Agency with the power of safeguarding nuclear activities of Party States. Safeguards and Verification became the most important activities of the Agency. The history of the Agency's budget distribution evidenced such an evolution: while it was only 3.4% of the regular budget in 1962, the budget for Safeguards and Verification rose to 24.1% in 1981 and reached US\$102,278,000 in the year 2004, exceeding the combined budgets for programs in Nuclear Safety and Security as well as Nuclear Science and Technology (US\$76,085,000).

Some have accused the Board of Governors of using the strict membership requirements to shift the focus of the Agency tasks from assistance to safeguarding. Though the article overseeing the Board of Governors (Article VI of the Statute) restricts the size of the Board, its membership criteria are more favorable to developed nations. As a result, developed countries have prevailed in the Board of Governors. However, the subsequent amendments to Article VI of the Statute enlarged the Board of Governors (from twenty-three in 1957 to thirty-five in 2005) and consequently more and more developing countries participate in the IAEA decision-making process.

Despite the increasing number of developing nations with seats in the Board of Governors, the IAEA continues to strengthen its safeguards system, particularly with regard to improving the Agency's ability to detect undeclared nuclear activities. For instance, in May 1997, a strengthened safeguards system, known as the Model Protocol Additional to IAEA Safeguards agreements (INFCIRC/540), was approved by the IAEA Board of Governors. It shows that the Agency's efforts in enhancing the safeguards program have gained widespread support from its members, including the developing member states.

In the field of Nuclear Safety and Security, the Agency codifies and publishes standards, guides, and recommendations. Though not binding on member states, these international standards have substantial influence on national nuclear legislation governing radiation protection and nuclear reactor safety.

In addition to these activities, the Agency has initiated and sponsored an impressive list of treaties to resolve the international problems arising from the peaceful use of nuclear energy. The treaties cover issues such as the liability of nuclear operations, early notification of and assistance in nuclear accidents, and so forth.

Today the IAEA is an important organization in international relations. While it has shifted away from its primary objective of "accelerat[ing] and enlarg[ing] the contribution of atomic energy to peace, health

and prosperity throughout the world" (Article II), it continues to work to prevent the destructive use of nuclear technology and to improve nuclear safety.

## INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT (IBRD) (WORLD BANK)

### Founding

During the closing days of World War II, Allied governments planned for the post-war economy, determined to prevent the interwar era's trade dislocations and monetary disasters. A major part of this was the July 1944 conference held in Bretton Woods, New Hampshire. Delegates from forty-four states gathered to create an institutional structure for the international economy. One piece of the Bretton Woods system was the International Monetary Fund (IMF), developed to manage the monetary system, especially a fixed exchange-rate regime. Its sister institution, the

International Bank of Reconstruction and Development (IBRD), initially focused on rebuilding war-ravaged European states, and, later, turned to development. Founders envisioned the IBRD, or World Bank, complementing the IMF's work. While the IMF supported economy-wide programmatic changes, the Bank focused on smaller, more specific projects. The Bank often lent for infrastructure activities deemed necessary for economic development—building roads and ports for export, or hydroelectric ventures to provide energy for industrial production, for example.

The United States and Britain had competing visions for the Bank. Britain's representative to Bretton Woods, John Maynard Keynes, called for stronger states to help weaker ones. Further, he proposed a Bank with substantial resources. Its funds, he argued, should come from states with balance-of-payments surpluses. The IBRD could use its capital for "soft" or "concessional" terms, i.e., loans at below market rates. Harry Dexter White, who led the US delegation, represented the sole surplus state at the talks. Moreover, it was the only state likely to enjoy that position in the near term. Thus, under Keynes' plan the United States would have primary responsibility for Bank funding. Washington refused to take on that obligation, arguing that states in surplus had no duty to change their own economic policies. This greatly affected the Bank's capacities.

Thus, the Bank created at Bretton Woods had limited resources. Rather than using its own inadequate funds for loans, the Bank raised money on commercial markets, which it then lent. It used repayments to cover its own financial obligations. This meant that the Bank had a conservative bias, as its reputation depended on debtors honoring their commitments. As a result, the IBRD's lending was limited in scale and scope, as it could offer loans to only the most creditworthy states.

## Institutions

The World Bank is a specialized agency of the United Nations (UN). Its nearly two hundred member states make decisions about loans, including financing, terms, and conditions. Members hold "shares," based on the size of their economies. Unlike the UN's General Assembly in which every member has an equal vote, the Bank uses weighted voting, with the United States having the largest vote and thus, the loudest voice. By tradition, the Bank's president is from the United States.

The Bank employs about ten thousand professional staff, including economists, social scientists, specialists

on particular economic sectors, and policy analysts. Many staffers work from the Washington, DC, headquarters, but the Bank also maintains more than one hundred international offices. Despite this, many criticize the Bank, charging that employees spend inadequate time in borrowing states and thus, have incomplete knowledge of countries' particular conditions. They charge that Bank personnel have limited in-country contacts, often only high officials in economic- and finance-related ministries, which restricts the views they consider in making recommendations.

Since its inception, the Bank has evolved so that now it is common to refer to the "World Bank Group," made up of five institutions, described below. The original IBRD and the International Development Association (IDA) make up the "World Bank." Created in 1945, the IBRD has a twenty-four member Executive Board that handles day-to-day operations for the Board of Governors, on which all member states sit. The IBRD provides loan guarantees as well as loans to the Bank's wealthier members. In 2004, the IBRD made about \$11 billion worth of new loans.

These loans are not concessional, as the IBRD itself borrows the funds on the commercial market through its AAA-rated bonds and notes, which obliges it to make payments to buyers on a set schedule. Essentially, the Bank, with its outstanding credit record, borrows at a cost far lower than the state that ultimately receives the money could secure. A borrower's default could jeopardize the Bank meeting its financial obligations. If the Bank lost its excellent credit rating, it could not obtain relatively cheap loans for its members. These loans do have longer repayment periods than commercial banks would offer. Generally, they have terms of fifteen to twenty years, with a grace period requiring no repayment for the loan's first three to five years. In response to criticism about its limited lending, in 1960, the Bank founded the IDA.

In contrast to the IBRD, the IDA makes highly concessional loans to the poorest member states, those that could not qualify for an IBRD loan. The IDA also grants some project support for undertakings considered vital for economic development. Along with funds, the IDA provides technical economic advice. Altogether, it seeks to help to implement poverty-reduction strategies. These include improving governance, providing for basic needs, opening recipients' markets, and increasing economic productivity.

IDA lending accounts for about one-quarter of Bank operations. Loans typically have a ten-year grace period, and borrowers have thirty-five to forty years for repayment. It could not use commercial

funds for these loans. Instead, the Bank's richer members donate money every four years. In 2002, forty states contributed about \$9 billion and the Bank itself donated more than \$6 billion. Donor states agreed that a major lending focus should be the HIV/AIDS crisis and other issues that so severely affect numerous, extremely poor states. To focus on the neediest states, once a country reaches a certain economic level, it no longer qualifies for the IDA.

Together with the IBRD and IDA, three other bodies complete the World Bank Group. These agencies extend the Bank's resources in different ways. In each case, however, they encourage and facilitate using private capital for economic development.

In 1956, members created the International Finance Corporation (IFC) to encourage private investment in undercapitalized markets. The Corporation, together with private investors, makes equity investments (buys stakes) in businesses in less developed states. The IFC puts money into projects it considers economically viable, that investors have passed over because of location, lack of awareness, or the small size of the state's domestic capital pool. Neo-liberals have pushed vigorously for IFC growth as a means of increasing private-sector involvement in development.

Following World War II, foreign investment opportunities grew as states rebuilt and modernized, and former colonial states in Asia, Africa, and the Middle East developed sovereign economies. To facilitate investment, which it saw as enhancing economic development, the Bank created the International Centre for Settlement of Investment Disputes (ICSID). Beginning operations in 1966, it replaced the somewhat ad hoc practice of the Bank's president, or members of the president's staff, of personally intervening in disputes between investors and foreign governments. The Bank meant for the ICSID to encourage foreign investment by developing resolution mechanisms. The ICSID offers conciliation and arbitration facilities. Many investment agreements reference use of the ICSID in the event of disagreement. All states ratifying the Convention on the ICSID agree to recognize and enforce its arbitration decisions.

Finally, the Multilateral Investment Guarantee Agency (MIGA) dates to 1988. The MIGA "stretches" Bank resources by guaranteeing private direct investment in developing states, rather than providing such funds itself. It insures investors against "noncommercial" or "political" risks, that is, hazards beyond ordinary market operations. These include host states' expropriation of resources, war, or currency inconvertibility. Also, MIGA mediates disagreements between investors and borrowers. Finally, it provides technical assistance to countries

seeking foreign investment and alerts international investors about unfamiliar business opportunities.

## Operations

Initially, the Bank focused on European states' recovery from World War II, and on helping them to modernize and industrialize. Thus, the Bank's first loan was to France, which received \$250 million for rebuilding. Given the IBRD's limited resources (initial US contribution about \$570 million), however, the \$12 billion in Marshall Funds that the United States gave to European states swamped the Bank's offerings. Thus, in its initial years of operation, the Bank was not particularly active.

The colonies of these European states began to gain independence after the war. Thus, in the 1950s and 1960s the international economy in which the Bank operated came to include a number of newly sovereign, but often economically weak, states. During this period, the Bank was famous (some argue "infamous") for lending for large, often dramatic infrastructure expansion in less developed states. Loans were not concessional, however, and went only to the most creditworthy (usually not the neediest) countries. Unhappy both with the low level of lending and with the loans' "hard" terms, members pushed for the 1960 creation of the IDA.

As the Bank involved itself fully in development, it sought to change the composition of borrowing states' economies. It recommended expanding production that took advantage of existing comparative advantages, often-abundant cheap but unskilled labor useful in agriculture, or usable quantities of some scarce mineral or metal with international demand. Production based on comparative advantage, classically trained economists at the Bank reasoned, meant lower prices and thus, a competitive export position. This would allow states to sell internationally, strengthening their economies, correcting economic imbalances—including balance-of-payments deficits—and enabling them to repay their debts. The Bank committed to long-term loans for infrastructure projects meant to fix structural problems. The Bank envisioned market-based solutions to economic underdevelopment.

Many borrowers traced underdevelopment to a different cause. They blamed the uneven terms of trade that favored (few) industrial producers relative to (many) agricultural producers. Many less developed states had comparative advantages in production of the same or similar goods. They chased the same buyers and had few tools, other than lower

prices, with which to compete. The greater bargaining power of industrial producers meant they always benefited more from trade.

Rather than accept this status quo, many borrowers sought to create comparative advantages where they did not exist, especially developing industrial capacity in primarily agricultural states. Only in this way, they reasoned, could they “even” the terms of trade and gain equal benefits. Thus, many less developed states implemented Import Substitution Industrialization to develop national industrial bases. This usually required significant international borrowing.

In 1964, the first meeting of the UN’s Conference on Trade and Development gave less developed states a forum for working together to develop and promote a common agenda for international economic change. They formed the Group of 77, which conceptualized and pressed for a New International Economic Order (NIEO). The NIEO called for redistribution of resources and power in the international system to make it more equitable, including technology transfer for industrial development in less developed states, debt relief, and restructured voting rights in the Bank to give borrowers a greater voice. While power did not shift, the Bank did give greater emphasis to basic social needs funding, for education, health care, and other development needs.

In response to world political events, the Organization of the Petroleum Exporting Countries (OPEC) raised oil prices sharply in 1973 and 1979. Enormous price hikes, for a vital industrial component, meant a huge inflow of US dollars for oil-producing states (regardless of nationality, parties generally bought and sold oil in dollars). The extreme price increases forced oil-importing states either to reduce oil consumption or to find money to cover now-quadrupled oil bills. The first option meant reduced economic production and the political problem of dropping living standards. The second option generally meant loans from banks holding OPEC dollar deposits. States had few choices that did not threaten economic development, either then, or in the future when loans came due. Exacerbating the situation, a global economic slowdown meant falling commodity prices for many exports, making loan repayment problematic.

The system collapsed abruptly in 1982, when Mexico, an oil producer that had borrowed assuming continued high energy prices, defaulted on its foreign debt when oil prices fell. The international banking community virtually stopped new lending as it sought to reduce exposure to default. The lending boycott by private banks, together with domestic conditions, put many borrowers in an impossible economic position. Both states that produced to existing comparative

advantage and those that sought to create new industrial sectors experienced decreasing revenues as international prices fell and competition increased. In neither case could states generate enough foreign currency for debt repayment. Additionally, many infrastructure projects for which states borrowed were profitable—generating funds for debt repayment—only with growing exports. Finally, some loans went to corrupt authoritarian regimes that diverted at least a portion of funds for private use, which generated no means of repayment.

States and international financial institutions, such as the World Bank, stepped in to restructure loan packages, extending repayment to give debtors a better chance at full payment. The crisis meant that World Bank and IMF loans were many states’ only option besides default (which bore reputational penalties and ended access to new money). The Bank’s Structural Adjustment Loans (SALs) came with specific conditions that it argued included vital reforms of states’ economic structures for future success. The SALs’ conditions reflected the neo-liberal “Washington Consensus,” so-called because it mirrored the preferences of the United States and its allies. The Consensus included macroeconomic policies leading to a return to production based on existing comparative advantage, reduction of the role of the state in the economy, opening of internal markets to international trade and investment, and curtailment of state regulations. The Bank argued that these conditions allowed more efficient market allocation of states’ scarce resources. As well, it noted that reducing states’ involvement both allowed in market forces and reduced opportunities for corruption. Finally, by opening economies to international forces, states gain access to goods, technologies, and capital far beyond national resources. This reasoning colored Bank lending, so SAL conditionality was fairly standard and predictable.

States had few options that did not include these conditions. Often, prior agreement with the Bank was a precondition to negotiating an IMF package, so-called “cross-conditionality.” As well, the World Bank served as a major source of information (see annual *World Bank Development Reports*, for example) about states and their economies. Its involvement in an economy gave its “seal of approval,” which went far to convincing others, including national aid agencies, to make additional loans or grants.

However, these conditions had significant economic and political implications that were extremely difficult for debtor states. While the Bank hewed to the notion that states (and citizens) had to accept short-term pain for long-term economic gains, many charged that its policies often were inappropriate

and had devastating repercussions—degrading the environment, increasing poverty, and worsening conditions of life for the most vulnerable in societies—without solving underlying economic problems. In the 1990s, growing criticism, both internal and external, caused the Bank to reexamine its practices and led to some policy changes.

### Answering Its Critics

In the 1990s, the Bank committed to poverty alleviation and enhancing good governance. The UN's Millennium Development Goals, which set specific targets and deadlines, have informed new Bank programs. For example, the Bank's poverty alleviation program goes beyond aggregate economic development to focus on social development, including equitable development of resources with regard to gender, vulnerable social groups, and environmental protection.

In 1996, to help the poorest debtor states, those that cannot possibly meet their foreign obligations based on debt-to-export or debt-to-government-revenue ratios, the World Bank and the IMF jointly developed the Heavily Indebted Poor Countries Initiative (HIPC). Participating states must meet a number of conditions, and must be eligible for IDA assistance. Also, they must have an ongoing commitment to, and record of, reform, as outlined in a Poverty Reduction Strategy Paper (PRSP). Debtor states wanting to participate go through various stages before qualifying for permanent debt cancellation. Not all eligible states have been able to complete the process and gain permanent debt reduction.

The Bretton Woods agencies conceived of HIPC as a way of bringing together public and private lenders, to work out agreements to cancel a significant portion of sovereign debt. The Bank committed to debt relief mainly through cancellation of IDA debt. While several states have agreed to cancel bilateral debt, few commercial lenders are participating in the HIPC process, limiting its effect. Further, many critics call for full and unconditional debt cancellation for all, not a small subset, of less developed states.

To address critics of the prescriptions attached to SALs, in 1999, the Bank moved to Poverty Reduction Strategy Papers, which borrowing states develop. These outline macroeconomic, structural, and social policies and programs to which borrowers commit, in return for international help. PRSPs are an enhancement, the Bank noted, as they are country-driven, comprehensive, long-term, and they force states to think through and to develop measurable goals.

Critics charge that PRSP development moves too quickly. This, they argue, leads to significant Bank influence on the final product, meaning that, as with SALs, PRSPs reflect elite, neo-liberal assumptions. Further, many agree that the PRSP process excludes the voices of the political opposition, women, vulnerable groups, and the poor. Critics point out that governments often commit to actions these groups directly oppose: ending food subsidies or closing state-subsidized medical clinics, for example. In 2004, the Bank began Development Policy Lending to give borrowers greater “ownership” of their programs and to enhance civil society participation in the drafting of national plans.

Addressing assessments that lenders, too, bear responsibility for their loans, in 2004, the Bank and the IMF introduced the Debt Sustainability Framework in Low-Income Countries. It seeks to link more closely borrowing and ability to repay. The Bank promotes the program as “proactive,” and notes that it shifts some responsibility for sustainable debt levels to lenders. This could begin to address such issues as responsibility for “odious” debt, that is, loans incurred by dictators, which citizens must repay, and “moral hazard,” the notion that banks make risky loans, knowing the Bank and IMF will secure repayment. Further, the Bank has begun to work more closely with non-state borrowers. It has involved itself with micro-credit lending, and has brought Non-Governmental Organizations into the lending process.

Still, many remain dissatisfied, seeing the neo-liberal, market-reliant philosophy that underpins the Bank's work as fundamentally inequitable. At the heart of this criticism, the questions of its founding remain: Who bears responsible for easing underdevelopment and encouraging development?

## INTERNATIONAL CENTER FOR THE SETTLEMENT OF INVESTMENT DISPUTES (ICSID)

In the 1960s and during the era of decolonisation, there was mass nationalization of foreign direct investment in their territories as a means of reasserting sovereignty over national wealth and resources. This caused conflicts between the investors and national governments. The International Bank for Reconstruction and Development (IBRD), the World Bank, thus set up an international institution to protect foreign investors against the risk of nationalization and to ensure that disputes were settled in an objective and apolitical manner. The Convention on the Settlement of International Investment Disputes Between States and Nationals of Other States—the *ICSID Convention 1966*—established an international forum that offers a legal framework for the settlement of investment disputes independent of any political considerations.

The ICSID is administered by the World Bank. It is an international legal entity authorized to enter into agreements and be party to legal proceedings. There are some special privileges and immunities granted to its staff to enable them to perform their tasks satisfactorily. The headquarters are in the World Bank in Washington, DC.

### ICSID Jurisdiction

Both private investors and host countries that are parties to an investment agreement can lodge a dispute

with the ICSID. The jurisdiction of the ICSID is governed by three conditions: that the dispute is a legal one arising from the investment agreement; that the dispute is between a member state and a national of another member state; and that the parties have consented in writing to submit the dispute to ICSID for a settlement.

The various articles of the Convention spell out the scope of the legal investment dispute, the requirements for membership of the Convention, consent of the parties to submit to the jurisdiction of the ICSID, and the effect of consent. There are also conciliation processes and provision for arbitration in terms of the conduct of the proceedings, its awards, and grounds for an annulment of awards.

### Dispute Resolution Systems

Understanding a dispute resolution system helps to define more clearly the respective rights and obligations of the parties engaged in international trade. In *mediation* and *conciliation* there may simply be negotiations between the parties themselves. A neutral third party, the mediator assists the parties to a dispute to negotiate their own resolution of the problem. The term mediation is often used interchangeably with the term conciliation. An even more complex process is to go to *arbitration*. The arbitrator is a neutral third party, who may be authorized to resolve the dispute by issuing a binding determination or "award" and who assists the parties in settling the disputes themselves. In the United States there is a form of dispute resolution known as the *mini-trial*, in which there is a panel of people representing both parties together with a neutral facilitator who collectively have authority to settle the dispute. No third party has authority to issue a binding determination; the parties settle the dispute themselves.

*Arbitration* and *litigation* involve a binding determination by a third party—the arbitrator or judge. The arbitrator obtains his or her jurisdiction through the original agreement of the parties where they refer disputes to arbitration. Arbitrators do not exercise judicial authority and the composition of the arbitral tribunal is determined by agreement of the parties. This is an adversarial system made up of a judge who presides over the proceedings. The parties are generally represented by legal counsel who present their client's case. The outcome of the litigation process is a judgment in which one party is found to have a better claim than the other.

*Facilitation* is where a neutral third party meets with the parties in order to assist in finding a common

course of action to resolve their dispute. The facilitator is an impartial third party with no pecuniary or other interest in the case. The facilitator also is there to bring into perspective an objective view of the situation to enable the parties to determine the best course of action in terms of resolving the dispute. In *expert appraisal*, the facts and questions in the dispute are put through an objective and independent determination by an expert. Similar to mediation, the parties themselves determine what the outcome will be and whether it is binding and final.

Private investors have often lacked *locus standi* before international fora. The term *locus standi* means a place of standing, the right to be heard in court or other proceedings. It is a legal term that is used by courts and other dispute settlement systems to identify those that have a right to come before that body to be heard. In the ICSID Convention the issue of non-standing is resolved by according international legal status to private investors. Thus, private investors, as opposed to those of governments and quasi-government bodies such as state-owned enterprises (SOEs), are able to bypass problematic national dispute settlement and protection of host states and gain direct access to an impartial third party for resolution of an investment dispute.

To date, however, ICSID services have been largely underutilized. As convention in international law dictates, signatories to any international convention have to return to their home parliaments and pass the necessary legislation in order to implement these as domestic law. Thus, for example, Australia enacted the *ICSID Implementation Act* 1990 (Commonwealth) to give effect to the Convention. This Act is embodied in Schedule Three of the *International Arbitration Act* 1974 (Commonwealth). Australia became the ninety-third party to the Convention in 1991. Australia has shown a preference to use ICSID mechanisms where possible. One example is the bilateral Investment Protection Agreement (IPA) in which both parties consent that a dispute be submitted to the ICSID for resolution in accordance with the terms on which the states are party to the Convention.

## INTERNATIONAL COCOA ORGANIZATION (ICCO)

The International Cocoa Organization (ICCO) was created in London in 1973 with the implementation of the first International Cocoa Agreement (ICCA) signed in 1972, after sixteen years of negotiations. Cocoa is a key export commodity for a small number of countries in tropical Africa, Asia, and Latin America. Production of the beans is quite variable, based on yield and weather, whereas consumption remains quite stable over time. Production overall has increased from 1 million tons in 1960 to 3 million tons in 2004. Approximately 70% of cocoa is produced by small farmers on less than ten hectares of land.

The goals of the first International Cocoa Agreement and thus of the ICCO were to: prevent significant fluctuations in cocoa prices; stabilize or increase the export earnings from cocoa-producing countries; and consider the interests of consuming countries. The main economic features of this first agreement were annual export quotas, buffer stocks of 250,000 metric tons of cocoa, and a minimum price range of twenty-three to thirty-two cents per pound.

The decision-making body for the organization is the Cocoa Council, representing all members of the organization. It is responsible for carrying out the goals and spirit of the agreements but is limited in its powers. The exporting members together have one thousand votes and the importing members together have one thousand votes. The number of votes given to each individual member depends on that member's significance in the cocoa economy. However, no one member shall have more than four hundred votes.

In the second ICCA, dated 1976, the desirable price range for cocoa beans was increased to thirty-nine to fifty-five cents per pound. Throughout the years of this agreement, cocoa prices continued to rise and were close to \$1.72 per pound. During the first and second agreements (1973–1980), the economic clauses of the agreements never went into effect because of high world cocoa prices.

During the negotiations and tenure of the third ICCA (1980), cocoa prices were on a downward slope and leveled off at seventy-five cents. The Cocoa Council was given authority to expand the buffer stocks if necessary from 250,000 tons to 350,000 tons. The mention of a price-stabilization scheme and an acceptable price range were absent from the 1980 agreement. Producing and consuming countries were unhappy with the ICCA and looked for ways to better the situation. To that end, the producing countries created the Abidjan Group to advocate for their interests.

During the negotiations for the 1986 ICCA, the International Cocoa Organization and the European Community suggested a scheme in which producing countries were required to withhold cocoa from the world market at their own expense when prices were low. Producers accepted this idea because they preferred this agreement over no agreement. This replaced the price-stabilization scheme and buffer stocks. By the end of the 1980s, there were 1.4 million tons in cocoa stocks and prices stayed low.

The 1993 International Cocoa Agreement tried to deal with this oversupply of cocoa and contribute to the stability of the commodity by creating a production-management plan. It would provide target production figures per country and would make the countries responsible for the national implementation of the plan. The details of this plan, however, were not worked out until 1998. At that time, the cited goal was to reduce production by 257,000 tons but the plan never went into effect. In the meantime, with the elimination of the economic clauses in the agreement, the buffer stocks were liquidated starting in 1993 and ending in 1998.

In 2000, the International Cocoa Organization stated its disagreement with the European Union's new "chocolate directive," which would allow up to 5% of vegetable fats (instead of cocoa butter) in European chocolate. The ICCO believed that this would result in a decrease in cocoa demand. It is not clear yet what the impact has been.

Not surprisingly, the Sixth International Coffee Agreement of 2001 does not include any economic clauses and focuses instead on a sustainable cocoa economy. It created a consultative board on the cocoa economy and encourages greater private-sector

participation in the reaching of its goals. It encourages international cooperation in the world cocoa economy and serves as the repository for statistics and studies on cocoa.

The United States was never particularly interested in the International Cocoa Organization and the agreements, even though it is the most significant consumer of chocolate in the world. It participated in some of the negotiations but did not sign the agreements. It viewed cocoa as a primarily African commodity, which would be of greater interest to European countries. The United States is not currently a member of the International Cocoa Organization.

As of this writing, the International Cocoa Organization has thirty members. The exporting members are: Brazil, Cameroon, Cote d'Ivoire, Dominican Republic, Ecuador, Gabon, Ghana, Malaysia, Nigeria, Papua New Guinea, Togo, and Trinidad and Tobago. The importing members are: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, the Russian Federation, the Slovak Republic, Spain, Sweden, Switzerland, the United Kingdom. These countries represent 80% of production and 60% of consumption, respectively.

In 2002, a decision was made at the twenty-fifth Special Session of the Council to relocate the headquarters of the organization to Abidjan, Cote d'Ivoire. This was expected to strengthen the financial situation of the organization. Cote d'Ivoire alone currently produces just above 40% of the world's cocoa. As a result, economic and political events in Cote d'Ivoire have a significant impact on the world cocoa economy as a whole. The current unrest in the country has not helped the world cocoa economy and has delayed the move.

## INTERNATIONAL COFFEE ORGANIZATION (ICO)

The International Coffee Organization (ICO) was created in London in 1963 following the signature of the first International Coffee Agreement (ICA) in 1962 to assist with the production, pricing, and distribution of coffee. Coffee is a key export commodity for at least sixty countries throughout Africa, Asia, and Latin America and it provides a livelihood for approximately 100 million people. As with many export crops, coffee prices fluctuate with weather conditions, quality concerns, and annual production totals, thus making it difficult for producing countries to plan their economic development primarily around coffee exports.

The first ICA was the result of several related trends in the international community. During World War II, the United States engineered an international coffee agreement because of shipping shortages and the need to provide monies to developing nations. Later, following the end of World War II, there was significant interest among Western countries to increase international trade overall and specifically of agricultural products. In this spirit, the International Tin Agreement and the International Sugar Agreement were both signed in the early 1950s. The coffee-producing countries themselves had been working since the early 1930s to control the prices and availability of the caffeinated bean. Brazil in particular, as the world's largest coffee-producing country, was known for limiting its exports in order to raise coffee prices. Third, there was growing genuine interest on the part of large coffee-consuming nations in North America and Europe to assist Latin American and African coffee-producing countries in their economic development. The United States clearly changed its position on coffee in 1958, because of a growing fear that poor economic conditions in Latin America would give the Soviets an opportunity to get involved there. The US then provided much impetus for the negotiation of the first ICA.

The general goals of the first four International Coffee Agreements (1962, 1968, 1976, 1983) and therefore of the ICO during that time were thus: to achieve reasonable balance between the supply and demand of the various types of coffee (Arabica and Robusta), to contribute to the economic development of producer countries, to maintain reasonable coffee prices, to encourage coffee consumption throughout the world, and to foster cooperation on issues related to coffee production. The ICO was set up by Article Seven of the first ICA to administer the clauses of the agreement and supervise the mechanisms put in place.

The decision-making body of the ICO is the Coffee Council, which is made up of all the members of the organization. It approves the budget and annual program of activities for the organization; it admits and suspends members; it settles disputes; and it hosts agreement negotiations. Until 1986, it approved export quotas for the producing members. To pass a resolution, two-thirds of the members must be in favor of it. The votes of the exporting and importing members are weighed, so that each side has a total of one thousand votes, with no one country holding more than four hundred. The Council generally meets twice a year, in May and September.

Four significant issues that would regularly burden the ICO and its members came to the forefront during the tenure of the first International Coffee Agreement: the determination of acceptable price ranges for all parties and Arabica and Robusta coffee, the rules governing the quotas, rising national production levels, and the enforcement mechanisms put in place. At the beginning of the first ICA, it was clear that acceptable prices for coffee had not been agreed upon by the members. There would be more agreement on this after several years. Members argued regularly about how export quotas were set and changed throughout the year. The enforcement of the quota system lay in the hands of the consuming countries. They were responsible for a log of all coffee imports to be provided to the ICO.

Despite the best efforts of the organization and the agreements, coffee prices were still very dependent on weather and specifically frost in the largest coffee-producing country, Brazil. Prices rose significantly because of this in the late 1960s and mid-1970s as less coffee was available on the world market. The second agreement, which had begun to address some of the key issues facing the ICO, collapsed one year before its conclusion due to the high prices of the bean. Despite meetings in London in 1973 and 1974, it was not until 1975 that the simpler, third agreement was negotiated. In this 1976 agreement, quotas would only become effective when coffee prices were at 77 cents per pound or less. Also, national quota calculations became more standard; they were to be determined at 70% by the country's exports over the previous four years and at 30% by the country's coffee stocks. Coffee prices reached their all-time high in the spring of 1977, with the beans selling at \$3.40 per pound, benefitting large coffee producers such as Colombia and Côte d'Ivoire. Brazil returned to pre-frost production levels in 1979 and the clauses of the third agreement finally went into effect. However, another Brazilian frost in late 1985 interrupted the economic clauses of the 1983 International Coffee

Agreement and was the beginning of difficult times for the International Coffee Organization, coffee-producing countries, and the ICAs.

Coffee markets had changed substantially since the creation of the International Coffee Organization in 1963. This change was exemplified in the membership of the International Coffee Organization. In 1985, European and North American members represented 95% of annual coffee consumption and producer countries not members of the ICO produced less than one hundred thousand bags of coffee each year (Bates and Lien 1985). The majority of the producing countries' members of the ICO in the mid-1980s were African and Asian countries, while in 1962, the majority had been Latin American countries with only a few African states. However, the membership of the ICO would continue to change over the next several years, with the key withdrawal of the United States from the International Coffee Organization in 1993. Following the end of the Cold War and the impetus for globalization, the US, which represents 40% of world coffee consumption, no longer saw the need for International Coffee Agreements.

Since 1993, the International Coffee Organization has survived, but with a significant change in its direction. Instead of monitoring the economic clauses of the ICAs, it is now primarily an intergovernmental organization, collecting and disseminating information about coffee and fostering cooperation among coffee-producing and coffee-consuming nations. It is a repository for statistics, studies, and information relating to coffee. It continues to host coffee-related conferences and has produced two additional International Coffee Agreements, simply stating its new mission and goals.

## INTERNATIONAL COMMITTEE OF THE RED CROSS (ICRC)

The International Committee of the Red Cross (ICRC) is the world's oldest non-governmental organization devoted to the promotion of humanitarian principles during times of international war and domestic civil conflict. Adopting principles of neutrality and impartiality, it has become one of the premier emergency humanitarian aid agencies, focussing on the needs of the wounded and others in desperate need of basic food and medical assistance to assure survival in the midst of war and natural disaster.

### Origins of the ICRC

The ICRC came into being in 1862, being the brainchild of the Swiss businessman Henri Dunant and of a committee of philanthropists who sought to ensure greater attention to the needs of the wounded and dying in time of war. Gustave Moynier was the organization genius who fostered the development of the ICRC, and who guided its growth as a humanitarian body dedicated to promoting the development of national Red Cross organizations, which in turn addressed the needs of the wounded and prisoners of war in times of armed conflict. Growing out of the ICRC was the League of Red Cross Societies, now known as the International Federation of Red Cross and Red Crescent Societies (IFRC), which coordinated the work of national Red Cross and Red Crescent chapters in responding not only to war but also domestic natural disasters. The ICRC oversees the implementation of various Geneva Red Cross Conventions aimed at ameliorating the condition of the wounded, prisoners of war, and civilian populations caught in civil conflict. It also promotes the dissemination of international humanitarian law, traces and fosters communication with political prisoners, and provides humanitarian aid to populations experiencing civil discord. It is in this latter capacity that the work of the ICRC most closely touches on the development situation in countries of assistance.

## Development-Related Activities of the ICRC

The ICRC seeks and receives from numerous donor countries contributions towards its programs of assistance in dozens of countries throughout the world that are experiencing various levels of civil discord. Because of its strict reputation for neutrality and impartiality, the ICRC is able to negotiate a presence in many of the most intractable and fierce civil war situations throughout the globe. Specializing in the provision of medical and food aid to peoples caught in the cross-fires of civil war, the ICRC is usually able to negotiate access into war zones so that it can offer humanitarian aid to both sides engaged in conflict. Although the aid provided by the ICRC aims at meeting immediate emergency needs, it works closely with other aid-giving agencies to promote a humanitarian climate and eventually a situation amenable of peaceful resolution after which rehabilitation and reconstruction become feasible. The ICRC sits on the Interagency Standing Committee of the UN Office for the Coordination of Humanitarian Affairs, along with development agencies of the UN system. In this capacity it can make fruitful recommendations on the application of both emergency aid and on the longer-term development potential of a region.

## INTERNATIONAL CRIMINAL POLICE ORGANIZATION (INTERPOL)

Interpol is a global police organization. The second largest international organization behind the United Nations, it addresses transnational and organized crime by connecting the police forces of its 182 member countries. Interpol's efforts to identify the best police practices and raise awareness of crime helps developing nations create a secure environment necessary for social and economic advancement.

Criminals do not necessarily limit their activities to one country or one region. In the belief that human

rights, public safety, and the fight against ordinary crimes are the concerns of both the developed and the developing world, countries at all stages of advancement have joined Interpol. Upon gaining independence, many developing countries joined Interpol as one of their first actions as sovereign nations.

Begun in 1923, Interpol seeks to halt crime that has occurred or is projected to occur in multiple countries. Each member state maintains and staffs a National Central Bureau (NCB) to direct Interpol intelligence while local authorities investigate and prosecute criminals according to national laws. Interpol's actions are limited to receiving requests for assistance, analyzing criminal activities that are not of a political, military, religious, or racial character, and disseminating notices published in four languages (English, French, Spanish, and Arabic) to its members. Despite popular belief, Interpol maintains no police force of its own.

Although headquartered in France, no country dominates the group and its funding is provided by a sliding scale membership fee that is based upon each country's gross national product (GNP). The organization's policies are set by a vote of its member countries while the governors on its Executive Committee are required to be drawn from different continents. The Secretary General, elected every five years by two-thirds of the members attending the annual General Assembly, is Interpol's chief executive and senior full-time official. Daily activities are conducted at the General Secretariat in Lyons with a staff of 384 who represent 54 different countries. National Central Bureaus (NCB) in member countries ferry Interpol information to appropriate local authorities who bear responsibility for apprehending and extraditing suspected criminals. Five NCBs also act as Regional Stations with Lyon covering Europe, North America, and the Middle East; Nairobi, Kenya responsible for Central Africa; Abidjan, Ivory Coast focusing on West Africa; Buenos Aires, Argentina addressing South America; and Bangkok, Thailand transmitting to Asia.

Interpol's interests change according to crime patterns. It currently focuses upon public safety and terrorism, including bio-terrorism; organized crime; illegal drug production and smuggling; weapons dealing; trafficking in human beings; sexual abuse of children; money laundering; cyber-crime; theft of intellectual property; and financial and high technology wrongdoing.

No nation is required to respond to an Interpol request. Some countries, notably the United States in the years leading up to World War II, have declined to fully cooperate with Interpol for fear that its files may be misused for the prosecution of political

criminals. In 1956, the organization agreed to forbid any activities of a political, military, religious, or racial character but concerns remain that countries may ignore these guidelines. The chief fear of many member countries is that classified information may fall into the hands of terrorists since the distribution of intelligence cannot be restricted once it enters the Interpol system. Although this worry has reduced the amount of classified information flowing through Interpol, the organization has experienced a steady increase in information traffic. In 2000, Interpol transmitted 2.5 million messages, placed 15,116 notices of criminal activity in circulation, and projected that 1,400 people would be arrested or located as the result of Interpol intelligence.

Interpol notices are coded into ten different colors that represent different purposes. The red wanted notices are the most common and this type of communication requests the arrest of subjects for whom an arrest warrant has been issued and extradition will be sought. The other notices are: seeking the identity and location of subjects who have committed or witnessed criminal offenses (blue); providing warning about career criminals who have committed offenses in several countries (green); seeking missing or lost people, especially children abducted by parents (yellow); seeking the identification of corpses (black); warning of unusual modus operandi (purple); sharing knowledge of organized crime groups (gray); and advising of criminal activity with international ramifications that does not involve a specific person or group (orange). Stolen property notices are also distributed but are not coded.

Crime undermines the stability of governments and makes international investors hesitant to sponsor development projects. Since crime affects all aspects of life, effective policing is a chief concern of developing countries. Interpol offers the knowledge and expertise to fight crime. It addresses both the external and internal policing factors that permit criminal activities.

## INTERNATIONAL DEVELOPMENT ASSOCIATION (IDA)

The International Development Association (IDA) is the soft loan division of the World Bank, or the International Bank for Reconstruction and Development (IBRD). The IDA was set up in 1960 to provide loans on much easier terms than regular World Bank loans to the world's poorest and least developed countries for which private financing is not available on reasonable terms. IDA loans go to the eighty-one poorest World Bank member countries whose per capita income is less than \$895 (2004 figure). About 2.5 billion people live in these countries, which is about half the developing world and approximately 1.5 billion of these live on less than two dollars a day. IDA loans are long-term loans, from twenty to thirty-five or even forty years for repayment with a ten-year grace period before any repayment is required, and IDA loans are interest free, although there is a small 0.75% service charge. Since 2002 at the suggestion of United States President George W. Bush in 2001, the IDA now provides a proportion of its aid in the form of grants. In 2004 grants were 19% of IDA aid; this is set to increase to 30% over the next three years. Unlike loans, which do have to be repaid, grants do not need to be repaid.

Since 1960, IDA has lent over \$142 billion to 108 countries. Currently, the IDA lends about \$7.4 billion a year. Most loans address basic needs, such as primary education, basic health services, and clean water and sanitation. IDA also funds projects to preserve the environment, encourage private business, build infrastructure, support liberal economic reforms, and strengthen state institutions. HIV/AIDS prevention, post-conflict (post-war) stabilization, gender equality, and debt relief are also high-priority projects. IDA projects are intended to pave the way toward economic growth, job creation, higher incomes, and better living conditions. Funds are allocated to the borrowing countries in relation to their income levels and record of success in managing their economies and their ongoing IDA projects. New commitments for IDA loans and grants in FY03 consisted of 141 new operations in fifty-six countries. Fifty-one percent of new commitments went to sub-Saharan Africa, 28% to South Asia, 8% to East Asia and the Pacific, 8% to Eastern Europe and Central Asia (ECA), and the remainder to North Africa and Latin America. The top IDA borrowers in FY03 are listed in Table 1.

The IDA is funded by contributions from the wealthier member countries every three years. They have donated over \$118.9 billion since the inception of the association. The largest donations are made

Table 1: Top ten IDA borrowers

Top ten IDA borrowers, FY 2003	\$ Millions
India	686
Bangladesh	554
Congo Democratic Republic	454
Uganda	407
Ethiopia	404
Vietnam	368
Pakistan	297
Tanzania	251
Sri Lanka	233
Nigeria	230

by the United States, Japan, Germany, the United Kingdom, France, Canada, and Italy. Combined, these countries account for about 70% of donor contributions. Nevertheless, there are thirty-nine donors, including some less well-off countries such as Argentina, Brazil, Mexico, Russia, and Turkey. The donors and borrowers meet every three years to negotiate their contributions. Each of these series of negotiations is known as a replenishment. In 2005, the members were concluding the negotiations for Replenishment 14. Replenishment 13 resulted in pledges to donate \$23 billion to the IDA. Other funds, nearly 40%, for the IDA came from the repayments of earlier IDA loans. However, the World Bank has also forgiven \$9 billion of IDA debt, which will affect future IDA income from repayments.

Since the 1980s, the United States has occasionally balked at paying its allocated share. Initially the United States provided 42% of IDA funds, far more than any other country. This percentage was equal to the relative share of the US economy in the world. With the third replenishment, the United States' share declined somewhat to 39% but still remained slightly higher than the relative size of the US economy to the world economy. The US allocation has shrunk to about 20% with the 13th replenishment. During the early 1980s the US Congress pushed to lower the US contribution and added conditions on US contributions. The United States insisted that no IDA credits go to Vietnam and threatened to withhold its payments until the United States won its concession. Again in the mid-1990s the US Congress withheld payments, which forced the World Bank to empanel an independent inspection team. US leverage over the IDA is strengthened by the fact that other members often prorate their own contributions to those of the United States. The United Kingdom's share has also been reduced, from 17% in

1960 to 10% in 2001–2004. Other wealthy countries whose economies boomed in the 1970s onward have increased their shares. For example, Japan's share was only 4% in 1960 and increased to 16% in 2001–2004, and Germany's share in 1960 was 7% and is now 10%.

The IDA counts among its successes some thirty-two countries that have graduated from the IDA. Their per capita incomes have increased beyond those allowed by the IDA, largely due to IDA loans and grants. The first graduate was Chile in 1961, and the latest graduate is Macedonia (FYR). The following are contemporary examples of IDA projects. In India, the National AIDS Control Project supported training of 52,500 physicians and 60% of nursing staff in HIV/AIDS management topics. In Yemen, the Taiz Flood Disaster Prevention and Municipal Development Project prevented serious damage from the 1996 floods, benefiting twenty-one thousand households directly and over half a million people indirectly. In Africa, more than 5 million textbooks (mostly locally developed and produced) were supplied to primary schools. In Asia, over 6,700 health care facilities were constructed or upgraded, then equipped and staffed to provide basic health care to rural populations. And in Latin America, projects under the social investment fund reach some 9.5 million beneficiaries. Activities supported by these projects generate almost a million person-months of employment.

## INTERNATIONAL MARITIME ORGANIZATION (IMO)

The International Maritime Organization (IMO) is the agency of the United Nations (UN) responsible for improving the safety and security of international shipping and the prevention of marine pollution from ships. One of the smallest UN agencies, with less than three hundred employees, the IMO was established at a UN-sponsored international convention held in Geneva, Switzerland, on March 17, 1948. The IMO Convention went into effect in 1958 and the new organization met for the first time in 1959. As of 2004, there were 164 member states in the organization.

The IMO, which has its headquarters in London, does not implement legislation. The IMO was established to adopt legislation. Member nations are responsible for implementing the more than forty conventions sponsored by the IMO. The IMO, therefore, seeks to ensure that its conventions are ratified by as many countries as possible. Currently, IMO conventions cover more than 98% of the world's merchant shipping. The IMO also attempts to ensure that these conventions are properly implemented by the countries that have accepted them. The IMO has had considerable success in achieving its aim of safer shipping and cleaner seas.

When the IMO first began operations, its chief concern was to develop international treaties and other legislation concerning marine safety and pollution prevention. In 1960, the IMO's first action was to adopt a new version of the International Convention for the Safety of Life at Sea (SOLAS), an important treaty concerning maritime safety. Although safety was the IMO's most important responsibility, the amount of oil being transported by oil tankers was also of great concern. The IMO introduced a series of measures designed to prevent tanker accidents and to minimize their consequences. It also investigated the environmental threat caused by the cleaning of the cargo tanks. In 1973, the IMO introduced the International Convention for the Prevention of Pollution from Ships, which regulated accidental and operational oil pollution as well as pollution by chemicals, sewage, and garbage. In 1992, the Global Maritime Distress and Safety System (GMDSS) was launched. By 1999, the GMDSS was completely operational, so that any ship that is in distress anywhere in the world

can be virtually guaranteed assistance, even if the ship's crew does not have time to radio for help.

When the IMO began operations in 1959, international shipping was dominated by a few developed nations. During the last decades of the twentieth century, however, nations in the developing world have acquired a greater share of international shipping. Operation costs are shared among the member states in proportion to the size of each nation's fleet of merchant ships. The biggest fleets in the world are operated by Panama, Liberia, the Bahamas, Greece, the United Kingdom, Japan, Malta, the United States, Cyprus, and Norway.

## INTERNATIONAL MONETARY FUND (IMF)

### Founding

Allied leaders, planning for the post-World War II era, wanted to ensure that the economic crises of the 1920s and 1930s, which contributed to subsequent hostilities, did not recur. They worried that the end of hostilities and subsequent decline in demand would cause another depression. They also considered the dismal outcome of economic policies in the interwar period. For example, the international economy degenerated into exclusionary trading blocs and insurmountable tariff barriers, with significant contractions in trade volume. Additionally, the monetary system collapsed as states abandoned the gold standard and practiced competitive currency devaluations—beggar-thy-neighbor policies—as each sought to export more than it imported.

Further, they acknowledged the gold standard's flaws. It limited creation of money to an amount equal to gold mined, instead of linking it to an economy's efficiency and total production. Thus, if any state imported more goods than it exported, the gold standard required that it export gold to its creditors to bring accounts into balance. Since states printed

money in proportion to their gold supply, reducing gold stock required withdrawal of an equal proportion of its currency from the economy. Gold transfers limited credit and investments, and it slowed growth. Artificially low money stocks created by slow growth in the world's gold supply often meant that maintaining the gold standard forced states to deflate their economies for reasons unrelated to strength or productivity. Creation of additional liquidity, from non-gold-backed money, depended on perceptions of the creditworthiness of the issuer. Many, for example, accepted British pounds sterling even once Britain printed paper bills exceeding its precious metal stocks, due to belief in its economy's soundness.

The failure of states' unilateral policies encouraged multilateral management of the international economy. In July 1944, at a meeting in New Hampshire, representatives of forty-four countries agreed to the Bretton Woods System of economic management, creating organizations to supervise international monetary relations (the International Monetary Fund, IMF) and reconstruction and development (International Bank of Reconstruction and Development, IBRD; also known as the World Bank).

To restart trade, states had to agree on relative values of their currencies, known as parities, or par values. Essentially, these gave the price of one currency in terms of another one. Thus, in 1946, sterling's par was about £1 = \$4.03. This parity overvalued the pound, making it difficult to sell (overpriced) British exports abroad. Further, it forced the government to spend too much shoring up the value of the currency. This reduced funds for domestic programs. Therefore, in 1949, the government dropped parity to about £1 = \$2.80.

The Fund helped states maintain their par values in order to create a stable currency system. The example of British sterling highlights another important lesson from the interwar period: when states had to choose between competing international and domestic commitments, inevitably they sacrificed external for internal concerns. Therefore, planners sought to help states to reconcile rival demands, through provision of temporary loans to ease short-term currency shortfalls, which ensured some policy flexibility.

Those meeting at Bretton Woods disagreed about how to accomplish this. They debated two institutional "blueprints." The first, presented by British representative, John Maynard Keynes, reflected a significantly different architecture than that proposed by US representative, Henry Dexter White. It is noteworthy that discussion centered on plans offered by these two hegemonic states. Today, many less developed states argue that the Bretton Woods System is inappropriate

for their needs, given their different relative positions in the world economy.

Keynes called for an International Clearing Union (ICU), which gave priority to states' domestic preferences. It guarded states' economic sovereignty zealously, so they could enact policies appropriate to their domestic needs (in the case of Britain, full employment). States could change parity values up to 5% without Union approval. Also, Keynes called for creation of an international currency, the *bancor*, which states could use to settle their outstanding balances. The *bancor* would create additional liquidity, beyond gold and the British pound. Further, members would pay a quota, based on share of international trade. Keynes envisioned ICU resources equal to about \$30 billion. States that bought more than they sold, and thus had shortfalls, could borrow up to one-half their quotas, without conditions. For additional funds, the ICU's governing board could recommend policies to borrowers, could insist they limit capital flows across their borders, could call for currency devaluations, or could require additional collateral. Finally, if two currencies moved out of parity, under Keynes' plan, both governments bore an obligation to fix the imbalance.

Responsibility for currency values accounted for only one of the major differences between the British and US plans. White put the full burden of currency imbalance on the deficit state. Moreover, he was less protective of sovereignty, calling for direct intervention in states' economic policies. This greater (and earlier) intercession authority meant the organization required fewer resources, as it addressed less acute problems. Thus, White called for resources of only about \$5 billion. His plan further limited sovereignty by requiring permission for changes of more than 1% of par value. Of course, with the world's most powerful economy, US negotiators had little fear for national autonomy. Many in Congress, however, bridled at the possible loss of control.

The IMF, ultimately, reflected a compromise, one grounded in a commitment to liberalism and domestic responsibility for maintenance of the international system. By giving the body no immediate right of interventions, it preserved autonomy. However, the low funding, about \$8.8 billion, meant members could draw on only limited resources. Further, the Fund placed full responsibility on deficit states, so-called asymmetrical adjustment.

As well, the IMF rejected the gold standard and created a "fixed but adjustable" system, pegged to the US dollar. Washington valued its currency at an undeviating \$35 per ounce of gold. Internationally, it was convertible—dollars were exchangeable for gold. (However, to preserve gold reserves, the

United States restricted citizens' ownership.) As the country then possessed about 70% of the world's gold and created about 40% of its industrial output, this rate seemed solid and sustainable. Other IMF currencies then set a par value relative to the dollar.

Given this fixed relationship, if any currency were out of alignment with the dollar, it had to devalue (decrease) or revalue (increase) to return to par. States maintained parity within narrow margins, no more than 1% of par, and they could adjust values only minimally without IMF approval. This ensured orderly and non-predatory realignments. Unlike the gold standard, here members with balance-of-payment deficits did not have to devalue to bring external balances into alignment. Through the IMF, they could obtain short-term loans to cover deficits while preserving parity, as well as domestic spending and growth.

## Institutions

The IMF is responsible to its members, but, as reflected in its institutions, states enjoy different degrees of influence. The main bodies are the Board of Governors, the Executive Board, and the International Monetary and Financial Committee. A bureaucracy of nearly 3,000 employees, from more than 140 countries, supports them. The majority of staff serves at Fund headquarters in Washington, DC, with additional offices in New York, Paris, Tokyo, and Geneva.

Officials from 180-plus member states comprise the Board of Governors. The Board meets annually to decide broadly on policy. Generally, states send finance ministers or central bank governors. An appointed managing director, traditionally a European, chairs meetings, assisted by three deputy managing directors. The IMF runs similarly to a public corporation: Governors hold voting rights proportional to their investment or shareholdings, called "quotas." The United States has the largest quota, about 17.5%, while Palau pays the smallest, about 0.001% of the total. The ten states with the highest quotas are the United States, Japan, Germany, France, the United Kingdom, Italy, Saudi Arabia, Canada, China, and the Russian Federation. Every five years, the Fund recalculates quotas to reflect states' relative share of the world economy. In addition to policy and quotas, the Board admits new members and allocates funds.

While the Board of Governors sets general policies, the Executive Board implements that agenda, carries

out daily operations, approves specific programs, and conducts surveillance on borrowers. The twenty-four-member Board includes representatives of the five largest shareholders, as well as Saudi Arabia, China, and the Russian Federation. The remaining executive directorships go to those elected by the remaining members, geographically divided into "constituencies." Winners hold office for two years.

Finally, the twenty-four-member International Monetary and Financial Committee (IMFC) advises the Board of Governors. It convenes twice yearly, generally in fall before the Board's Annual Meeting and again in spring. It reports to and counsels governors on matters related to management of the international system. States with Executive Board appointment power each have a representative on the IMFC, as does each constituency that elects a member to the Executive Board. The Committee allows different international institutions, including the World Bank, to observe its meetings.

Weighted voting and unequal appointment prerogatives show that members wield different levels of influence. Many less developed states argue the Fund should equalize voting rights, giving them greater voice and representation, to democratize the organization, and to make it more responsive. States holding greater power note that they represent a larger share of the world's economy and that decision making should reflect that. In addition, as the largest contributors, they argue they have the right to direct use of their resources. Institutional (re)form and (re)distribution of power, with their concomitant implications for policy change, provide some of the Fund's most contentious debates.

## Operations

As noted above, the IMF provides loans to members. Most funds come from state quotas. Members must provide a quarter of their quota in a widely accepted currency, such as the dollar or euro, or Special Drawing Rights (explained below). This is the gold tranche, so called because members originally had to provide gold. Generally, they pay remaining tranches in national currencies. Depending on the loan type, states may borrow some multiple of their quota, in any currency, with increasing restrictions the more they borrow. Given the limited size of many states' quotas, this represents a very small credit facility.

Initially, most international transactions were in US dollars or gold, so members borrowed dollars from the Fund. Given the US economy's size, it could generate enough currency for domestic spending

and still provide sufficient liquidity externally. Over time, however, the United States printed so many dollars that some feared a loss in value and sought another reserve currency. To remove artificial limits set by gold, and to reduce pressure on the dollar, in 1969, the Fund developed Special Drawing Rights (SDRs).

These international reserve assets have no physical form; they simply represent a bookkeeping entry in members' accounts in proportion to their quotas. States may use SDRs to settle accounts bilaterally and with some international institutions. SDRs are a "basket currency"—a mix of the European Union's euro, the British pound, the Japanese yen, and the US dollar. Because it is not traded, the IMF determines its value based on daily market prices for constituent currencies. Every five years, the IMF reviews its composition to ensure it represents international currency usage.

Over time, the Fund developed several types of loans, or "facilities." These include Stand-By Arrangements, tied to the Fund's original mission—supporting states through short-term, balance-of-payment deficits. They usually last one to one-and-a-half years. In 1963, the IMF established a Compensatory Financing Facility to help cushion producers and consumers of cereals against price fluctuations. Its terms are similar to those of Stand-By Arrangements. The Fund created a new facility, the Extended Fund Facility, in 1974, to help members with problems beyond short-term balance-of-payment challenges. These loans extend up to three years. Finally, in 1997, the IMF created the Supplemental Reserve Facility to make large-scale, short-term loans to restore market confidence. None of these are concessional, that is, borrowers pay market interest rates, and in some cases, a surcharge, or lending fee. The IMF also provides loans on an emergency basis to members that have suffered natural disaster or armed conflict. These may have subsidized interest rates, and borrowers have five years, at the most, to repay them.

The above differ from loans made under the Poverty Reduction and Growth Facility (PRGF), available to nearly eighty low-per-capita-income members. These have interest rates of 0.5%, and generally extend to between five and ten years. Borrowers must prepare Poverty Reduction Strategy Papers that outline concrete steps and reforms to which they commit, to achieve the goals agreed upon with the IMF. According to the Fund, this process ensures country "ownership" of the plan and facilitates broad public participation, which privileges the state's own priorities. Finally, the IMF notes that these Papers strengthen governance, transparency, accountability, and management of public resources. As well, they

consider the plan's impact on society and poverty, generally. As discussed below, conditions attached to IMF loans are extremely controversial.

In addition to the loans based on quotas, the IMF may borrow, if it finds its own resources inadequate. In 1962, it founded the General Arrangements to Borrow (GAB), with eleven participants, including Switzerland, a non-IMF member (Saudi Arabia also has an associated arrangement). The IMF borrows from GAB members at market rates. Originally, only GAB states could borrow GAB funds, but that no longer holds. Still, GAB states must approve these loans. Additionally, in 1997, the IMF set up the New Arrangements to Borrow (NAB) with twenty-six participants. NAB funds are for alleviation of extraordinary threats to the international system, beyond what IMF resources alone can handle. While quotas provide a lending base of about \$311 billion, these arrangements give the IMF access to another \$50 billion.

## Evolution

As states gained independence in the post-war period, Fund membership came to reflect vastly different levels of economic development. Rather than temporary deficits, many members suffered long-term shortfalls. Thus, the IMF shifted focus from short-term liquidity to structural changes that address chronic balance-of-payments problems.

In the late 1960s, the exchange rate system came under pressure. Some states, especially France, doubting the dollar's future value, began demanding gold. The "dollar overhang," more dollars than gold to back them, led Washington unilaterally to end convertibility and devalue the dollar, in 1971. This disrupted the fixed value of many currencies.

This, together with oil price shocks in 1973 and 1979, strained the international system. Price hikes meant a dramatic increase in dollar flows, as usually oil was dollar-denominated. It also meant non-oil-producing states scrambled to purchase this vital resource. Often, producers' dollars ended up in US banks, which then lent them to non-producing states to buy oil. Even some producer states borrowed heavily, anticipating continued high oil prices and thus, easy repayment.

Prices of oil, as well as other commodities, fell in the early 1980s, leaving debtors in an untenable situation. In 1982, Mexico informed Washington it could not service its foreign debt; technically, it defaulted. Mexico was the first of many less developed states caught in the "debt trap."

Commercial banks sought to reduce their exposure. They rushed to minimize exposure by ending new loans, which plummeted in the 1980s. The withdrawal of private capital forced debtors to turn to public lenders, including the IMF and the World Bank. The Fund responded with loans and restructuring programs that often mandated conditions including economic reform. These Structural Adjustment Programs (SAPs) usually required that borrowers enact neo-liberal economic policies, including reduction of state involvement and regulation of the economy, especially removal of obstacles to foreign trade and investment.

As noted above, the IMF defends these conditions as necessary for economic health, and as safeguards to ensure loan repayment. While the Fund praises “country ownership,” of the Letters of Intent that precede loans, others criticize the commitments required as formulaic. They argue requirements reflect the Washington Consensus (i.e., preferences of the United States and its allies) rather than the particular needs of borrowers. Further, they condemn the agreements as IMF-crafted, with limited input from citizens of borrowing states, which denies voice to the population affected by conditionality. They also point to significant social costs from governmental spending reductions. Critics argue that cuts affect health, education, and nutrition programs, which limits future development. As well, public protests against the social, political, and economic costs of SAPs often make them difficult to implement.

The debt crisis prompts other concerns. The IMF now acknowledges that some indebted states never will be able to make repayments. Rather than a process of debt rescheduling and failure, the World Bank, together with the IMF, launched the Heavily Indebted Poor Countries Initiative (HIPC). This brings together public and private lenders with governments of the poorest states, to work out agreements to cancel a portion of debt, in exchange for state fulfillment of certain conditions. These include the usual neo-liberal requirements of reducing the size of the state sector, opening the state’s economy to foreign goods and capital, and reducing regulations. As well, states in the program must reform economies and governments to make them more transparent, less open to corruption. An additional provision, meant to address ingrained poverty, is that funds that would have gone to debt servicing and repayment go to social spending instead. HIPC has a number of pre-conditions before debtors may begin negotiations for debt cancellation. These requirements have been difficult for many potentially eligible states to meet. As a result, not all candidate states have been able to complete the process of qualifying.

Debtor states with greater resources may work through the Sovereign Debt Restructuring Mechanism (SDRM), created in 2002. This gathers a debtor’s multiple creditors and organizes “orderly” restructuring encompassing all foreign liabilities. The SDRM eases negotiations, preventing a single minority creditor from stopping a deal acceptable to the majority. Borrowing states want to see debt cancellation, as well as restructuring, included in these negotiations. Many argue that the citizens of debtor states, who ultimately repay the loans, deserve representation in the SDRM.

A coalition of religious groups, development Non-Governmental Organizations, and labor groups—organized as Jubilee 2000—took up the borrowing states’ cause. They pushed for international debt forgiveness. Citing Leviticus 25, they reiterated the Biblical call for remission of all obligations, every fifty years. People from more than one hundred countries have signed petitions supporting debt cancellation. Jubilee 2000 argues that debt rescheduling, reduction, and conditionality cannot guarantee social justice, especially the disproportionate burden repayment places on the poor. Its “Breaking the Chains of Debt” campaign has helped publicize this issue.

Jubilee 2000 and others also have raised the matter of “odious” debt, that is, loans to dictators (e.g., Saddam Hussein), used for their private benefit. Many ask, why hold the citizenry, who neither borrowed the money, nor benefited from it, responsible for repayment? Many argue for the, at least, shared responsibility of lenders, maintaining they have a moral and ethical obligation to lend only to legitimate governments.

Such issues, together with the IMF’s failures in addressing the Asian currency crisis of 1997, the Russian Federation’s 1998 default, and Argentina’s 2001 economic crisis, ensure continuation of this debate. Moreover, larger globalization discussions integrate these concerns. Sharp divides over the IMF among states, leaders, international institutions, and activists remain, with little resolution in sight.

## INTERNATIONAL ORGANIZATION FOR MIGRATION (IOM)

The International Organization for Migration (IOM) was initially founded in 1951 as an outgrowth of the International Migration Conference sponsored by the United States and Belgium at Brussels. This conference initially focused on the study of migration movements in Europe, and the permanent organization established to study and to address these movements was known as the Intergovernmental Committee for European Migration (ICEM). ICEM's work gradually began to include study of migration issues and program activities beyond the scope of Europe. Accordingly, in 1980 ICEM changed its name to the Intergovernmental Committee for Migration (ICM) to more accurately reflect the increasingly global nature of its operations. In 1989 its name was changed once again to its current designation, the International Organization for Migration. The work of the IOM includes response to migration and refugee emergencies as well as the relationship between development and migration.

### Refugee Resettlement to Development

In its first decade ICEM focused primarily on the processing of refugees, displaced persons, and economic migrants from Europe to other countries. In the aftermath of World War II, Europe was inundated by displaced persons owing to the devastation and disruption of the war. The emergence of the Cold War led to further refugee and migration flows from Eastern into Western Europe, notably during the 1956 Hungarian Revolution. ICEM worked to find countries of resettlement for such refugees, provided

medical attention, processed international documents, and arranged for transportation of hundreds of thousands of refugees and displaced persons so that they might find permanent settlement in other countries. In its first decade of existence it assisted more than a million migrants. In this work, ICEM closely cooperated with the UN High Commissioner for Refugees (UNHCR), other UN agencies, and non-governmental organizations (NGOs).

Although the focus of ICEM's work continued to be Europe, its involvement with refugee resettlement programs brought it into contact with governments throughout the world, and the impact of migration on development arose as a matter of concern. In 1964, ICEM initiated a program in Latin America designed to recruit and place highly qualified European migrants in Latin American countries needing their specialized expertise. As a matter of policy, ICEM saw the importance of matching migrants with professional skills with developing countries in need of such skills to enhance their economic development. As many more developing countries gained their independence in the 1960s and 1970s, ICEM expanded its Migration for Development Program, adding a special Return of Talent Program for Latin America, which encouraged talented Latin American citizens to return to the region, thereby strengthening to pool of talent so desperately needed in several Latin American countries. These Migration for Development Programs, including the Return of Talent Program, were subsequently extended to Africa in 1983 and Asia in 1985. In the early 1980s, ICEM, now known as ICM, participated in the first and second International Conference on Assistance to Refugees in Africa (ICARA I and II), at which the impact of refugee and returnee movements on the development of receiving countries was discussed. In 1990, when ICM became the IOM, it operated programs in Europe, Latin America, Africa, South Asia, and Indochina with assistance reaching 5 million people.

### Contemporary Activities

In keeping with its traditional two-pronged focus on emergency assistance to migrants in special need, IOM continues to offer essential services to migrants fleeing from civil conflict, disasters, and general economic hardship. In 1990–1991, for instance, it returned migrants displaced by Iraq's invasion of Kuwait, and in the aftermath of the Persian Gulf War, it assisted about eight hundred thousand displaced Kurds. With the political disruptions in Yugoslavia and former states of the Soviet Union, IOM participated in special

emergency programs to reunify families separated by the events in Yugoslavia, and it offered assistance to former Soviet Republics that faced widespread and large migration movements owing to the changes of government and to complicated demographic realities related to minority populations. In Africa, IOM successfully repatriated half a million refugees in Mozambique in 1993 and it assisted a quarter of a million Rwandan refugees in 1994. In subsequent years, its programs assisted Chechnyans, victims of Hurricane Mitch in Honduras, refugees from Kosovo, and displaced persons in East Timor. Its work extended to victims of earthquakes in India, internally displaced persons in Afghanistan, and refugees returning to Sierra Leone. By 2000, IOM assistance to migrants exceeded 11 million people.

While emergency situations continue to draw the attention of IOM, the organization continues to be mindful of how economic development issues stimulate migration, and how migration affects development. This work includes promotion of the study of migration. To this end, IOM publishes numerous journals and reports. Its journal *International Migration* is a leading publication in the academic study of migration and it also publishes a quarterly journal, *Migration*, on its work, as well as *IOM News*, in an effort to promote wider understanding of migration issues. It also issues reports and publishes books on a wide variety of migration issues. IOM works with governments to train officials responsible for dealing with migrants and refugees. It promotes the study and facilitation of labor migration programs, including the ongoing operation of its Return of Talent Program. It promotes the effective reintegration of refugees and returnees to their countries of origin in post-emergency settings. It helps governments to develop appropriate border control, including counter-trafficking and counter-smuggling policies. IOM programs, then, are aimed first and foremost at the welfare of migrants themselves, but the organization works with governments to explore ways in which migration can be channeled to enhance the prosperity and development of the countries of migration.

Although not formally part of the UN system, IOM is headquartered in Geneva, where it works closely with UN agencies dedicated to humanitarian, human rights, and development-related programs. Migration in all of its forms has become a major issue in international relations, and IOM serves as an important venue where governments, international agencies, NGOs, and academics can share knowledge and information for the benefit of migrants and of nations.

## INTERNATIONAL PLANNED PARENTHOOD FEDERATION (IPPF)

The International Planned Parenthood Federation (IPPF) was established at the Third International Conference on Planned Parenthood in Bombay, India, in 1952. National family planning associations from India, Hong Kong, the Netherlands, Singapore, Sweden, the United Kingdom, the United States, and West Germany were determined to create a global federation that would have the strength to combat cultures, traditions, laws, and religious attitudes that inhibited a woman's right to control her own fertility. The result is a non-governmental agency that seeks to increase access to quality reproductive health services for under-served populations worldwide.

Starting with just eight member organizations, by 2005 the IPPF included 149 member associations in every region of the world. The IPPF also works in sixteen countries—Equatorial Guinea, Malawi, Seychelles, Sao Tome and Principe, Zimbabwe, Oman, Somalia, Cook Islands, Kiribati, Myanmar, Papua New Guinea, Tuvalu, Serbia and Montenegro, Tajikistan, Macedonia, and Afghanistan—where there is no local planned parenthood organization. Millions of IPPF volunteers, particularly in the developing world, have assisted IPPF employees in five priority areas: adolescents, HIV/AIDS, abortion, access, and advocacy. IPPF activists attempt to enable people to make informed choices about their sexual lives and to receive care, counseling, diagnosis, and treatment. IPPF maintains forty thousand service outlets that provide counseling, gynecological care, HIV/AIDS-related services, diagnosis and treatment of sexually transmitted infections, mother and child health, and abortion-related services.

Planned Parenthood health centers offer a wide range of services that include family planning counseling and birth control; pregnancy testing and counseling; gynecological care, Pap tests, and breast exams; emergency contraception; HIV testing and counseling; medically accurate sexuality education; screening and treatment for sexually transmitted infections; infertility screening and counseling voluntary

sterilization for women and men; reproductive medical exams for men; safer sex counseling; abortions or abortion referrals; adoption referrals; and referrals for specialized care. Planned Parenthood health centers also offer a wide range of programs that include programs for parents and teens designed to enhance learning about sexuality within the family; presentations on sexual and reproductive health issues at schools, places of worship, and community centers; and workshops and training seminars for teachers, physicians, nurse practitioners, social workers, and other health care professionals. In addition, Planned Parenthood health centers offer a wide range of information resources such as pamphlets, books, newsletters, and videotapes on a variety of topics.

Rapid population growth and highly populated communities contribute to the destruction of forests, misuse of agricultural land, expanding deserts, pollution, and the depletion of non-renewable resources. According to IPPF officials, providing people with access to the information and services they need to regulate their own fertility can help reduce population growth and thus help ease the pressure on the environment.

The IPPF, which is based in London, England, is divided into six geographical associations: the Western Hemisphere; Europe; the Arab World; Africa; South Asia; and Oceania, Southeast Asia, and East Asia. The International Planned Parenthood Federation's Western Hemisphere Region (IPPF/WHR), which was established in 1954, is the only region of the IPPF that is a separately incorporated entity. IPPF/WHR works primarily through a network of forty-six member associations in North America, Latin America, and the Caribbean. Each member association is a private organization established to supply family planning and other related health services according to local needs, customs, traditions, and laws. The Planned Parenthood Federation of America (PPFA), founded by birth control advocate Margaret Sanger in 1916, is the IPPF/WHR member association in the United States. The PPFA is the largest member association and is a separately incorporated entity. The PPFA does not receive funds from IPPF/WHR and is the only member of the IPPF/WHR that has its own international program for family planning.

The Planned Parenthood Federation of America—International (PPFA International) provides family planning education and services in the developing world. PPFA International's Global Partners program brings US-based Planned Parenthood associations together with family planning associations in the developing world in professional partnerships to share expertise, experience, and ideas. As of 2005,

PPFA International had projects in the following countries: Albania, Barbados, Belize, Benin, Bolivia, Botswana, Cameroon, Costa Rica, Dominican Republic, Ecuador, El Salvador, Ethiopia, Guatemala, Guyana, India, Ireland, Jamaica, Kenya, Latvia, Malawi, Mexico, Myanmar, Namibia, Nepal, Nicaragua, Nigeria, Peru, the Philippines, Puerto Rico, Russia, Senegal, Somalia, Sudan, Thailand, Trinidad and Tobago, Turkey, Uganda, Vietnam, and Zambia.

## INTERNATIONAL RICE RESEARCH INSTITUTE (IRRI)

The International Rice Research Institute (IRRI) (<http://www.irri.org>) at Los Baños, Philippines, is a nonprofit research and training institution dedicated to the sustainable development of rice cultivation. The IRRI's research aims at increasing rice yields per acre while protecting the environment and preserving natural resources. The centre was established in 1960 by the Ford and Rockefeller Foundations in cooperation with the government of the Philippines and took up its research work in 1962 under founding director, Robert F. Chandler. The institute's headquarters, including its laboratories and training facilities on a 250-hectare experimental farm, are situated on the main campus of the University of the Philippines Los Baños about sixty km south of Manila. Additionally, the IRRI maintains regional offices in more than ten countries around the globe. The IRRI is one of sixteen nonprofit research institutes making up the Consultative Group on International Agricultural Research (CGIAR). The centre receives funding from twenty-one different countries and

organisations such as the World Bank, the Asian Development Bank, the Food and Agricultural Organization (FAO), and the European Commission.

According to recent studies conducted by the FAO for the International Year of Rice 2004, rice is the staple crop for more than 3 billion people. Today, China, India, and Indonesia are the largest producers of rice, harvesting 166, 134, and 52 million metric tons of rice, respectively, in the year 2003. Rice is the predominant staple food for seventeen countries in Asia, nine countries in the Americas, and eight countries in Africa, providing about 20% of the world's dietary energy supply (compared to 19% provided by wheat and 5% by maize) (source: FAO). Following the centre's mission statement, it is the IRRI's prime goal to "improve the well-being of present and future generations of rice farmers and consumers, particularly those with low incomes." The institute seeks to achieve this primarily by breeding improved rice varieties with higher yields per acre. Furthermore, the IRRI is dedicated to the collection and preservation of information related to rice and rice cultivation. The centre has composed the comprehensive and frequently amended International *Bibliography of Rice Research*; maintains the Rice Knowledge Bank (<http://www.knowledgebank.irri.org>) and RiceWeb (<http://www.riceweb.org>); and publishes major research results, news, and its annual report in its biannual journal, *Rice Today*.

During the 1950s, the world community started to become aware of the ongoing "population explosion" and the food supply problem connected to the demographic development. The Rockefeller Foundation had already invested in agricultural research in Mexico during the 1940s and had succeeded in considerably increasing the local wheat and maize yield. Inspired by the Mexican success story, Warren Weaver and J. George Harrar submitted a paper to the Rockefeller Foundation in 1954 suggesting the establishment of an international rice research institute in Asia. Delayed due to the lack of additional investors, the IRRI was established in 1960 by the Rockefeller Foundation together with the Ford Foundation and the government of the Philippines. Three years later, the Ford and Rockefeller Foundations established the *Centro Internacional de Mejoramiento de Maiz y Trigo* (CIMMYT) in Mexico based on the earlier research in the region. Together, the IRRI and the CIMMYT became the most important carriers of the Green Revolution of the 1960s and 1970s. When research commenced at the IRRI in 1961–1962, the first goal was the breeding of a new variety of rice with a higher yield per acre that is more resistant against pests and more susceptible to artificial fertilizers. IRRI scientists developed an efficient method of rice cross-breeding

and presented the high-yielding rice variety IR8 in 1965. The improved varieties IR5 and IR20 were released in 1967 and 1969, respectively. In cooperation with national agricultural programs, the IRRI managed to spread the first high-yielding varieties (HYV) among Asian rice cultivators and thus brought the Green Revolution to Asia. Together with an expansion of the cultivated area, the introduction of the HYVs led to an increase of Asian rice production from 240 million tons in 1966 to 530 million tons in 1999. Since the mid-1980s the IRRI has been actively involved in genetic engineering and tries to improve the yield and pest resistance of rice by genetically modifying the plant.

In the 1980s the IRRI began its research on rice cultivation and sustainable development. IRRI started to invest in research on organic fertilisers and natural pest control with the help of insects and spiders. Today, integrated pest control (without the use of insecticides), organic fertilising, and the general sustainable development of rice cultivation rank high on IRRI's agenda. However, Green Revolution critics frequently accuse the IRRI of having worsened the situation of rice farmers and the ecosystem with the promotion of high-yielding varieties. The early HYVs in particular demanded a large supply of water and a constant input of chemical fertilisers and pesticides. Thus critics identify the agrochemical industry, large petrochemical companies, and large landowners as the main beneficiaries of the Green Revolution. The IRRI's involvement in genetic engineering since the mid-1980s is similarly criticised. The centre is accused of reducing the genetic diversity of rice and advocating the monoculture of hybrid rice varieties. Since the centre's inauguration, multinational chemical corporations have been among the chief donors to the IRRI. Critics accuse the institute of supporting the genetic patent policy of these major agrochemical companies.

## INTERNATIONAL

### TELECOMMUNICATION UNION (ITU)

The International Telecommunication Union (ITU), the world's oldest international organization, has been a specialized agency of the United Nations (UN) since 1947. It is a forum within which governments and the private sector can work together to coordinate the operation of telecommunication networks and services and advance the development of communications technology. Membership in the ITU is open to governments, that may join as member states, and private organizations, such as carriers, equipment manufacturers, and regional and international telecommunication organizations, that can join as sector members. The ITU's membership includes virtually all the world's nations and over 650 sector members.

The telecommunication age began in 1844 when Samuel Morse sent his first message over a telegraph line between Baltimore and Washington, DC. Within a decade, telegraphy was available to the general public, but since each country used a different system, telegraph lines did not cross national borders. Messages had to be transcribed and translated at frontiers and then re-sent over the telegraph network of the neighboring country. In 1865, to simplify the process, twenty European nations signed the first International Telegraph Convention in Paris, which resulted in the International Telegraph Union (ITU). Following the invention of wireless telegraphy in 1896, the first International Radiotelegraph Conference was held in 1906 in Berlin, which resulted in the first International Radiotelegraph Convention (IRC). By 1927, the IRC was monitoring the allocation of frequency bands to the radio services in existence at the time. In 1932, the ITU and the IRC merged to form the International Telecommunication Union (ITU), which was responsible for monitoring all forms of wire and wireless communication. In 1947, after the Second World War, the ITU, with the aim of modernizing the organization, became a specialized agency of the UN. In 1948, the ITU's headquarters were moved from Bern to Geneva, Switzerland.

In 1989, at the ITU conference held in Nice, ITU officials vocalized the importance of providing

technical assistance to the developing world. To achieve this goal, the ITU established the Telecommunication Development Bureau to improve communications in the developing regions of the world. To meet the challenges of the rapidly expanding world of information exchange on the World Wide Web, the ITU insisted on the need for Internet domain names that reflect the geographical and functional nature of the Internet. The ITU has sought to make the Internet available to all people on a nondiscriminatory basis, especially in the Third World. The role of the ITU in the standardization of emerging technologies becomes more important as the world becomes more reliant on telecommunication technologies for communication, commerce, and access to information.

## INTER-RELIGIOUS RELATIONS

The period of the eighteenth century Enlightenment saw faith in God challenged by faith in reason and rationality. The rise of urban civilisation and the development of science was linked with the collapse of traditional religious ideas. In Europe, secularism became the dominant world view, marginalising religion, increasingly rendering it a private affair. In the rest of the world, colonialism took with it missionaries who declared other faiths as superstition and placed Christianity as the apotheosis of civilised society. Post-World War II development policies saw religious practice as something to be removed if it hindered progress. Now, in the age of globalisation, there is a rise of religious nationalism and a public seeking of spiritual fulfillment. New religious communities have grown as international communication and migration create culturally diverse centres in which sacred space and practice need to be negotiated. Modernity's associated doctrine of plurality has introduced a new phase of inter-religious relations.

### Defining Religion

Human history is in part a record of the quest for religious truth and certainty. Religions and religious

rites have emerged in all cultures in history. This is no surprise, for the religious, spiritual dimension is part of our makeup as human beings (Cook 1994, p. 408).

There is an inherent difficulty in defining religion: it has an aspect of revelation and an aspect of interpretation within every culture. But generally it can be argued that its function is to provide a sense of meaning and order; to provide boundaries to what is ultimately “good” and “true” as points of reference for human action. Religion provides answers for questions about our origins and the reasons for universal dilemmas such as suffering, death, and love. Most religions provide a means for people to deal with their mortality through notions of a non-physical continuity or renewal. Religion provides both limits and plausibility structures, that is, the social reinforcement of particular boundaries, and the knowledge and practices that are possible within them (Berger 1969). Religion has a sacred element, which Madan (1992) defines as particular phenomena, a kind of knowledge, everyday practices, and a typology of social roles, and it can also be linked to the political sphere around questions of legitimacy and authority.

Religion exists in a social milieu. It is a tacit marker of community and consensus about the right way to act. From the point of view of western philosophy, religion has been identified as a projection of needs (Feuerbach); Marx called it the opium of the people, that is, a sign of oppression; Kierkegaard argued that it is passionate, an individual discovering his or her real existential platform from which to make a leap of faith. Two of the most influential writers in European thought on the role of religion in social life were Emile Durkheim and Max Weber.

Durkheim (1965) believed that inevitably social organisation results in the expression of its underlying aspirations or ideal elements in religious symbols. A society’s notion of itself necessitates a particular idea or form of God, and religion therefore is a social manifestation of the sacred. He felt that religion is a set of practices rather than a set of beliefs—the belief only makes sense through ritual, which reinforces collective sentiment and social integration. Society is the source for such common practices and therefore is the source of religion. Durkheim takes a very functionalist view, that is, only looking at religion’s function in society and not substantively examining some of the associated effects of religiosity such as faith. His prediction that science would eventually overtake religion has never really come to pass despite a much-heralded faith in science in the modern world, perhaps because humanity has never fulfilled his requirement of providing science with a moral base.

Weber also emphasised the essential relationship of religion to society—there was no society without religion. His famous thesis, *The Protestant Ethic and the Spirit of Capitalism* (1958), drew the conclusion that Protestant doctrine underpinned the development of capitalist economics by sanctioning new behaviour, including investment, money lending, and the deferral of gratification.

The key to the link between Protestant ethics and the development of capitalism was in rationalising existing (Catholic) religious practice, that is, removing some of what were considered superstitious elements, and developing what was considered a rational theology, system of ideas, and practices. Weber suggested that the Reformation began this process of the rationalisation of ethical life, which then spread out into the economic sphere. The motivating force acting on the Protestant community was religious in nature but the offshoot was economic activity. The Protestant (Calvinist) would plan the activities of the day to ensure his or her life was a model of good actions.

Weber’s ideas have been critiqued over time. There were other transformations occurring in Europe such as the establishment of accounting systems that supported economic development. He is also widely regarded as being too Euro-centric. Amin (1989) argues that the idea that capitalism could only have developed out of a Christian movement is a myth designed to support colonialism. According to Amin, some of the Arabic states were beginning to develop sophisticated economies but their development was hindered by European intervention.

In the case of China, the belief that Confucianism permeated every aspect of Chinese life and obstructed its capitalist development has been questioned by researchers such as Lufrano (1997). He suggested that merchants, retailers, and small business owners from the sixteenth century began to shrug off the hegemony of a Confucian elite and reappropriate Confucian values in their own way, while still accepting the role of loyal, stable citizens. This argument is the basis for recent analysis of the rapid economic development of the industrial Tigers in East Asia, and the thesis that there are in fact Asian values that can underpin economic activity in this region.

The contradiction associated with Weber’s trajectory of economic development today is that once capitalism had become established it no longer needed religion as a motivating force. Once the spirit of capitalism had permeated other areas of life and had in turn rationalised and established practical structures and institutions, then religion was no longer needed. This is the heart of Bell’s (1976) cultural contradiction of capitalism. The early European capitalists were not interested in wealth per se but in leading a good life.

They became rich as a consequence of abstinence, discipline, control, and good investment. In contemporary society, capitalism encourages debt, consumption, and loss of control. Weber himself was very pessimistic about the impact of rationality in European society. He spoke of an “iron cage” of bureaucracy and a feeling of “disenchantment.”

Later twentieth-century writers speak of religion becoming invisible, emigrating from churches, which are now only relics, to new social forms. Personal identification diverges more and more from institutionalised religion, to become something more private and personal. Bellah (1965) speaks of the development of a civil religion, that is, great traditions remain but the religion that plays a public role in society is a diluted, generalised set of tenets without any particular consequences.

This removal of religion from the public to the private sphere is also described as secularisation. This process, linked with rationalisation, was a major foundation stone of development policies that were translocated to the Majority World, including countries with vastly different religious systems.

### **Religion and Development**

The effect of the spread of development and global religions such as Christianity on small-scale societies ranges from the denigration and virtual replacement of local religions, to their syncretic hybridisation, to a resurgence, as shall be seen later in this essay, to combat the ill-effects of development and globalisation. The contact between European traders and military forces from the nineteenth century even led to the creation of new religions such as the Cargo Cults found in Melanesia. Adherents believed that in the new millennium the spirits of their ancestors would return to distribute cargoes of modern goods.

In many cultures, and subsets of cultures, prior to the introduction of systematic modernisation, systems of religious order were integral to everyday life. For example, research into the peasant economy in a Malay village showed a link between economic and social units within structurally defined groups of kin and community affiliations or through other institutions such as religion. These units were in other ways autonomous, ad hoc, informal, and invisible, often forgotten in the development debate. Generally, single-purpose, small-scale, and confined to rural areas to deal with the uncertainties of peasant life, they could include informal lending institutions sometimes based in temples or other religious institutions (Scott 1977).

The impact of first colonialism and later development on processes of rationalisation and denigration

of local religions, and subsequently the dislocation of social organisation, is highlighted if the links between social practice and religion are emphasised. Ways of communication, perceptions of the individual and his or her relationship to the collective, economic and political relationships, time and space, defining boundaries of morality and permissible and non-permissible behaviours, limits and regulations on consumption and production, concepts of justice and punishment, and the use of technology and knowledge can be determined, influenced and reinforced by religious practice and edict.

The process of modernisation saw the reorientation of these boundaries, including boundaries of the sacred, and what is and isn't market inalienable with regard to religious iconography. Development founded on rationality and the renunciation of the metaphysical placed religion outside the field of legitimation of the social order. It proposed an ending that was based entirely on material progression and excluded the spiritual dimension. This linear, monochronic concept of time opposed the polychronic circular understandings of Buddhist and Hindu philosophy, for example.

Development involved a rationalisation of goal setting and goal attainment, and the reexamination of cultural symbols, which in traditional societies tended to have strong religious affiliations (Bellah 1965). In particular, modernism shifted the centre of authority to the individual. The increase in control over the environment included the inner environment of the self, which was also at odds with the communal nature of many religious practices and beliefs. Buddhism is posed with a serious dilemma when faced with a modernity that is based on the “I” as the centre of the social world. Buddhist philosophy suggests that there is no self, no soul. A separate individual is only an intellectual idea.

Secularisation saw the increased removal of religion from the public to the private sphere. In Western society, foundational systems such as politics, economics, and justice do not have overtly religious underpinnings, although it can be argued that justice in particular is founded on Christian moral codes. This is a contentious issue for jurisprudence in contemporary multicultural societies where religious law comes into conflict with civil law, or for human rights activists in countries where religious law opposes the universal declaration of human rights. When codes governing state authority have been secularised, religion no longer functions as a supporter of state decisions, but it still functions as a supporter of the existing identity of an individual claiming exemption from a civil law. Truth, once associated with religion, now became associated with the state and its machinery, and with the idea of development.

Industrialisation, urbanisation, and social plurality have increased the process of secularisation. Highly differentiated compartments for work, social, and religious practices have developed. Some writers declare that time, and even capitalism itself, have become the new gods, and work the new basis for authority and identity. The individual becomes responsible for moral decision making, increasing the regard for the worth and the rights of the individual, and increasing the importance given to concepts such as civil justice to replace communal faith.

As Durkheim predicted to some degree, faith has shifted to science and reason. Development was regarded as a *soteriology*—a doctrine of salvation. According to Bellah (1965), for historic religion to maximise its contribution to modernisation there was a need to:

- Rephrase religious symbols to give meaning to worldly pursuits;
- Channel motivation from religious discipline into worldly pursuits;
- Contribute to national integration but not dominate or sanction as an ultimate;
- Give positive meaning and highly value, that is, sanction, long-term social development as a goal;
- Contribute to the idea of the responsible and disciplined person; and
- Adopt a new role to balance secularism—but in a private, voluntaristic form.

If modernisation was to be successful, religion had to make this transition, or withdraw and allow secular ideologies to take over.

Berger (1969) argues that the decline in religious belief comes about not so much because of scientific rationality and secularism but because of rising plurality, that is, rising challenges and subsequent doubts about existing structures. Modernisation brought with it a plethora of ideas, institutions, and of gods even. The church or temple became just one ideology among others and as an institution it had to justify its existence even in Western countries. Globalisation has heightened this sense of diversity.

A major theoretical response to plurality has been post-modernity; the argument that there is no meta-narrative, no universal or overarching truth. This can engender extreme cultural relativism, that is, what is true and valued is only relevant in a particular cultural context. It can also engender extreme fundamentalism as a search for meaning turns people back to (neo) traditions. Other responses to modernity, none of which are mutually exclusive, include the construction of a reformist vision of traditional religion, compatible with modernity, or the use of modern methods to

defend traditional values, on the grounds of rationalising of means not goals (Bellah 1965). For example, the rise of the Hindu political party, the Bharatiya Janata Parishad (the Indian People's Party, BJP), to power in India meant that they had to reversion some of the language of their rhetoric when faced with the realities of global economics.

There is a tension between spiritual values and economic development even in the West. It is what Bell (1976) describes as a crisis of the self as religious beliefs and values are eroded. Bell claims that a post-industrial society cannot provide a transcendent ethic, therefore there is a need for the resurrection of traditional faith and the restoration of continuity, humility, and compassion for others. This is perhaps a utopian view, although the numbers of Westerners seeking solace in Eastern religion and new sects is probably an indication of the human need for a spiritual dimension (there will be an estimated 67% growth in new religions between 1993 and 2006). Bell has been accused of being a neo-conservative and nostalgic, however his ideas that traditional religious symbols be resurrected is apparent in Majority World countries as a means to reclaim control over the development process.

### **Inter-Religious Relations in the Global Era**

Globalisation (in particular the elements of international communication and migration) has brought religions increasingly in contact with each other. On one hand, there is a movement to use religion as a means to revitalise societies that have been decimated by rationality. This includes western societies. Berger (2001) argues there is a process of "Easternisation" occurring, a movement from East to West. The spread of Buddhism, the growth of communities based on Hindu teachings, the adoption of Islam by marginalised communities particularly in urban centres in the West, pose a challenge to the established Christian church. These cross-cultural challenges also feed into a hardening of boundaries. In the melange of globalisation, identity politics has gained an ascendancy, and religion and religious symbols have played a part in defining nationalist, at times extreme, opposition to the West and the processes of globalisation.

### **Religious Nationalism**

The theorist Samuel Huntington predicted increasing clashes between civilisations, which he delineated by

using, among other elements, their major belief systems. Oppositional movements against westernisation have taken the form of religious nationalism or oppositional movements against central bureaucratic forms such as the state or targets associated with globalisation such as transnational corporations. Examples of such movements include the Khalistani (Sikh) movement in India in the 1980s, the rise of Islamic fundamentalism in the Middle East and South Asia, Jewish fundamentalism in Israel, the rise to power of the BJP in India (the political wing of the Hindu right), and the rise of Christian fundamentalists in the United States. There is an increased importance of links with the global diasporic community in many of these examples. Religious nationalism does not know boundaries in the same way as the state, and new communication technology means that a global community based on religio-cultural affiliations is possible.

Juergensmeyer (1993) documents the rise of religious nationalism in response to what is perceived as a degradation of values and beliefs by the imposition of the westernised state. The modern state is the ultimate secular body and all other markers of identity were expected to be subsumed by it. Nationalism, like religion, is an expression of faith, identity, and loyalty to a larger community, exuding moral legitimacy, that is, a source of values, beliefs, and behaviours (Juergensmeyer 1993). But the state and religion are in fact competing ideologies of order. They both define a “right way” of being in the world and orientate individuals to social organisation that is not always synonymous. It is a dilemma for the state that it must find a way to reappropriate or accommodate religion while still being secular. In many cases, the rhetoric of religious nationalism is of waging a struggle against neocolonialism, with the aim of reinstating a religious order.

With its often confrontational approach to the United States, fundamentalism in the Islamic community is the focus of much debate in terms of poor relations and misunderstanding between religious ideologies and practices. Fundamentalism itself is a loaded term, a western concept, whereas according to Juergensmeyer’s research, for some Islamic religious nationalists there is no clear distinction between religion and politics. Islam is regarded by its proponents in this scenario as a “culturally liberating force.”

The characteristics of religious nationalism include: rejection of secular nationalism and perceptions of Western neocolonialism; the use of religious ideology; and the offering of a religious alternative. The relevance of religion to everyday life and the moral and communal identity of a nation is usually stressed. The underlying reasons for conflict often

involves changes in economic and social order brought about in many cases by modernisation policies, leading to frustrated expectations. The Iranian revolution in the late 1970s that overthrew the more westernised Shah and brought Ayatollah Khomeini to power, is a prime example of this trend.

This opposition is a form of defensiveness, restraining the secularisation of the West, and revitalising local culture by reappropriating religious symbols in new contexts. This reappropriation of culture has also become a mark of localisation in the marketing of global goods, which are now packaged in local frames to be more palatable for consumers. While localisation is critiqued as an extension of the market, the use of religious symbols is to some extent still market inalienable, and therefore these are still powerful when used by religious-based movements.

### **The Revitalisation of Religion**

Bell suggested in the 1970s a return to the unity of the sacred and the secular, in which spirituality will play an integral part in defining “the existential predicaments, the awareness in men [sic] of their finiteness and the inexorable limits to their power . . . and the consequent effort to find a coherent answer to reconcile them to the human condition” (Bell 1976, p. xxix). This again is an idealistic view as it is difficult to assert that even in “traditional” societies the sacred and secular were so united. However, there are religious-based movements currently attempting to at least redress the imbalance between the secular and the spiritual.

While a form of Christianity is said to have played a role in the establishment of capitalism, as noted earlier, its role as a motivating force has become marginalised. Now a full circle appears to have been turned, with Christianity taking on a more radical and syncretic role, again becoming a motivating force this time to undo the damage of maldevelopment. Founded by Gustavo Gutierrez, who rejected the term “development,” the ideas of Liberation Theology have been used throughout Latin America in particular in the 1970s, but also in Africa, Asia, and in the Black community in the US. Gutierrez advocated communities undertake socioeconomic analysis before embarking on critical reflection; liberating the tradition of the Bible that Gutierrez saw as a subversive book; and taking a preferential option for the poor.

The basic idea is that theology can become a corrective. Rather than just a theology of the political order or a new version of a Christian social ethic, it is conceived in the public sphere and becomes a social

medium. It is necessarily political and is an ethic of change rather than order. Liberation theory should rise out of practice, that is, theory should only be verified by its social functions.

Buddhist writers have also used their system of religion to counter what they feel are the ill effects of development. Sulak Sivaraksa has lobbied for the revitalisation of religious institutions such as the temple in Thailand. He argues that larger cultural groupings, such as the religious community, can become a focus for political life. Sivaraksa's translation of development cites four aspects that need to be integrated if it is to be authentic: the culture, spirituality, and the social and economic dimensions of a nation (Sivaraksa 1990). These elements are not mutually exclusive but must be ordered according to a country's particular priorities.

India provides a rich tradition of thought with regard to inter-religious relations and the utilisation of religious resources. It is the birthplace of two of the largest faith systems (Buddhism and Hinduism). It is home to ancient and more recent religions (Jains, Zoroastrians, and Sikhs). It has a Muslim minority that remained after the Islamic Moghal rulers of the Middle Ages departed. And it also has minority populations of Jewish and Christian communities.

With the passing of time there has been evidence of syncreticism—the sight of Shiva lingams in Catholic churches, for example. But there is also a growing voice of dissent from religious extremists opposed to the secular state since its inception in 1947, and to the more recent influx of transnational corporations and western cultural products following economic liberalisation in 1991. The rhetoric of Hindu nationalists increasingly has been one of superiority over what is considered an amoral if not immoral West, particularly represented by the United States, using spiritual and religious behaviour as the yard stick.

The 1990s and early twenty-first century in India have been marred by communal violence and some argue that secularism has failed to make any headway at all (Madan 1992). The rise to power of a Hindu nationalist political party would appear to be linked with people's need for certainty in a period of rapid change, which the state was unable to provide in its secular rhetoric. Much of the rhetoric of Hindu nationalism is in opposition to westernisation or globalisation, again centred on the notion of Hindu values that focus on the family and regulating consumption, as opposed to what is perceived as the materialism and subsequent dysfunction of the West.

As a counterbalance to these more militant voices there are those that wish to rejuvenate India using the cultural resources available to them. The work of Indian writer S. Kappen (1995) outlined his solution

to what he regards as the cultural decay and undermining of identity that has come with modern development. His writings portrayed the position of the divine in contemporary society as an “ungod” because of the role of religion in recolonisation and the monotheism of capital. As a remedy he examined the narratives of dissent in Indian religious traditions, including Buddhism and the medieval Bhakti movement. Kappen stated that there was a need for redefining a sense of the divine more in tune with a true collective vision in which existence could be anchored.

However, like many of the advocates of neo-traditionalism, the vision is idealistic, often relying on ideas of tradition that no longer exist, and not fully encompassing the differences between the philosophy of religion and its practices. Hinduism, for example, is practiced diversely throughout India, with a fundamental impulse to worship, not theorise (Berger 1969). The caste system is problematic as it maintains a social order that ensures a particular sector of society is considered lowly simply by fate. In using cultural resources such as religious symbols in a contemporary context, the distance of time can easily blur the past.

## Conclusion

From the one extreme of cultural imposition has emerged a polarisation: the absolute truth of western modernisation now faces challenges from the absolutism of differently focused religio-cultural claims. The rise of identity politics and a new bout of religious nationalism has seen increased impetus in the twentieth and twenty-first centuries for a genuine ecumenical movement to improve inter-religious understanding. The ecumenical movement is emphasising an interdependence between all things and is often linked with new ideas in the environmental movement that emphasise a kind of eco-spiritualism.

Eck (1993) believes there are three social and political responses to religious diversity: exclusivism (there is no authentic religion but mine), inclusivism (there are other religions but mine is the authoritative one), and pluralism. The first two are implicated in the formation of religious nationalism, and the latter in the formation of real engagement between religions. In each scenario, interpretations will have social and political ramifications.

The search for new terms for a modernity that is not westernisation but is imbued with local religious values as part of the cultural sphere is also part of the task of nationalists and neo-traditionalists. Juergensmeyer (1993) suggests that new forms of the nation-state are

emerging as the state and religion reassess their relationship. His examples include Sri Lanka, India, Iran, Egypt, Algeria, Central Asia, and Eastern Europe. Although vague on how these case studies are different from the modern nation-state, he believes they are creating something new in a synthesis between religion and the secular state, merging cultural identity and the legitimacy of former religiously sanctioned monarchies, and the democratic and organisational structures of contemporary industrial society.

Writers and academics from the Majority World are increasing the available knowledge within development discourse by questioning the motives, methods, and purpose of globalisation. Self-reliance and empowerment programs rooted in religious institutions are representative of the new thoughts and alternatives being devised. New knowledge articulated outside the confines of a monocultural interpretation, using other systems of religious representation and myth, will reinforce the detachment of the power of truth from current global standards.

### INTIFADA

The Arabic term *intifada* is typically translated into English as "uprising." The word refers specifically to the Palestinian uprising against Israeli military occupation of the regions known as the West Bank and the Gaza Strip, an occupation that began following the 1967 Six-Day War. The actual translation of the term comes closer to the idea of the "shaking off" or removing of the occupation from these regions.

### The First Intifada (1987–1993) and the Israeli Response

The first *intifada* began in early December 1987 as a spontaneous, grass-roots movement by the Palestinian residents of the West Bank and Gaza Strip against the twenty-year-old Israeli military occupation. Until this point, the occupation had rendered the Palestinian community economically and politically powerless. A lack of citizens' rights, domination by the Israeli political apparatus, and general social malaise well describe the living conditions of the Palestinians during this time.

During the occupation, the political branch of the Palestinian liberation movement was centered outside of western Palestine, first in Jordan, and later Lebanon, and then Tunisia. Thus, while in time, the Palestine Liberation Organization began to play a significant role in the coordination and development of the uprising, most would argue that what made the *intifada* unique was that it represented, for the very first time, a complete and full Palestinian rejection of the Israeli military occupation from *inside* the territories that Israel had conquered and occupied during the 1967 Six-Day War.

Other aspects of the uprising were also unique. The most active Palestinian participants in the *intifada* were young, that is, the *shebab* or Palestinian youth. Moreover, the tactics of the participants were limited primarily to rock throwing, tire burning, and other acts of

protest. Civil disobedience was also employed. While the *intifada* cannot be construed as totally non-violent, the acts by and large were of a non-threatening nature to the Israeli state. Rather, the protesters saw themselves as freedom-fighters fighting against the occupation of their land by outside forces. Their use of rocks, sticks, bottles, and other non-lethal weapons was a result of expedience, and was also symbolic of the “David vs. Goliath” nature of their struggle against the massive strength of the Israeli military forces.

In addition to the use of street protests and repeated confrontations with Israeli soldiers, the *intifada* was also carried out through economic means. The refusal to pay taxes to the Israeli authorities, the holding of general strikes during which Palestinian shops remained closed and shuttered, and the boycotting of Israeli goods (such as *Time* cigarettes, for example) were all used in an attempt to draw attention to the concerns of the Palestinian people living under Israeli military control and economic domination.

The Israeli military response to the Palestinian *intifada* was severe, and disproportionate to the Palestinians’ activities. For example, then Minister of Defense Yitzhak Rabin suggested during the early days of the uprising that one way of bringing a halt to rock throwing by the Palestinian youth would be to “break their bones.” Such an extreme policy, it was believed, would serve to eventually snuff out any hints of Palestinian resistance; the more severe the punishments meted out, the sooner the *intifada* could be nullified and ultimately extinguished.

Such policies were largely ineffective, however. World public opinion increasingly viewed the Palestinians as underdogs in a conflict in which, historically, Israel had been seen in such a light. Media coverage played a key role in revealing the harsh and at times inhumane treatment of Palestinian youth at the hands of Israeli soldiers. As public opinion began to shift, so too were the Palestinians emboldened to continue their struggle despite the personal risks involved.

The Palestinian *intifada* was not able to sustain itself at the same high level of intensity for long. By the early 1990s, the regularity of the “cat-and-mouse” game played out by young Palestinian rock-throwers and similarly young Israeli soldiers had run its course. At the same time, however, the image of Israel and of the ongoing occupation of the Palestinian territories was severely damaged. It was in this context that a conference was held in Madrid in October 1991 in an effort to bring the Arab and Israeli sides together and, under US auspices, develop a genuine peace process to finally resolve the conflict.

The Madrid meeting led to still further meetings between the two sides, which were arranged secretly in Oslo, Norway. These meetings resulted in the signing

of the Oslo Accords by Israeli Prime Minister Yitzhak Rabin and Palestinian leader Yasser Arafat, witnessed by US President Bill Clinton, on September 13, 1993, effectively bringing the *intifada* to an end.

It is these Accords that were to have provided a foundation for the eventual end to the Israeli occupation of the West Bank and Gaza Strip. From the outset, however, the Oslo Accords were viewed as flawed. While the creation of a Palestinian Authority and the staged withdrawal of Israeli forces from the primary population centers of the West Bank and Gaza did provide the Palestinians with limited autonomy and suggested the eventual creation of a permanent solution to the Palestinian problem—namely the creation of a Palestinian state—the Accords provided only a limited structure within which Palestinian independence might be achieved. In truth, Oslo offered a starting point for independence, but failed to explicitly map out how to move from Israeli occupation to complete Palestinian sovereignty and statehood.

Chief among the obstacles that Oslo failed to resolve were the final status of the disputed city of Jerusalem, the right of Palestinian refugees to return to what is today Israel, the future status of Jewish settlements in the occupied territories following Palestinian independence, and so on. It was these issues that were discussed at length by President Clinton, Israeli Prime Minister Ehud Barak, and Arafat in the summer of 2000. Camp David II, as this set of meetings came to be known, again failed to resolve any of these issues in a manner that satisfied both sides. This opened the door to yet another uprising, the *al-Aqsa intifada*.

## The al-Aqsa Intifada (2000– )

The *al-Aqsa intifada* derived its name from what was seen as a provocative action by then Minister of Defense Ariel Sharon who, on September 28, 2000, took a well-guarded political contingent to the Temple Mount/al-Haram ash-Sharif where the al-Aqsa mosque is located in a show of Israeli dominance and power. Palestinian riots erupted in Jerusalem in response to this act, and soon spilled over throughout the West Bank and Gaza in a manner similar to the outbreak of the 1987 uprising.

However, the *al-Aqsa intifada* differed from its predecessor in a number of ways. First, this uprising used terror—especially suicide bombings—as its primary tactic. Moreover, most (though certainly not all) such attacks were carried out within Israel itself, not within the occupied Palestinian territories. Perhaps the

most notorious of such actions took place March 27, 2002, with an attack at a Passover *seder* holiday meal in Netanya. Some twenty-two were killed and 140 injured in the attack. Although later attacks at clubs, on buses, and in other public places killed as many or more, this particular attack received a great deal of media attention due to its gruesome nature and timing.

Second, the *al-Aqsa intifada* often took on religious, rather than nationalistic, undertones. Whereas the first *intifada* was fought with the expressed goal of seeking national sovereignty and Palestinian independence, the *al-Aqsa intifada* was often seen to be fought on religious grounds, where the elimination of the foreign, non-Muslim Israeli state from the heart of the Muslim realm (*Dar al-Islam*) was at the center of the new Palestinian struggle. Those who died as a result of suicide bombings during the *al-Aqsa intifada* were seen as *shaheeds*, Muslim martyrs who are to be honored and praised for the sacrifice they have made in striving to cleanse the land of Zionist forces.

As was the case during the first *intifada*, the Israeli response to the second uprising was again severe. Houses throughout the West Bank and Gaza were razed, mass arrests were frequent, and communal punishment was implemented with regularity. And yet, unlike the first *intifada*, world sympathies again shifted to the Israeli side. Suicide attacks against Israel were increasingly viewed as but part and parcel of Arab Muslim terror globally; the September 11, 2001, attacks, and the deposition of Iraqi President Saddam Hussein—a strong supporter of suicide bombings in Israel—served to largely mitigate any hopes or expectations that the *al-Aqsa intifada* would produce any substantive results in the long term.

## Looking to the Future

Today, the *al-Aqsa intifada* appears to have run its course. This is not to say that resistance to the Israeli occupation of some parts of the West Bank and Gaza, and the failure to resolve key disputes regarding Jerusalem, the refugees, and similar issues, do not remain central to the Palestinian–Israeli conflict. But the uprising is no longer seen as providing any hope of moving the situation forward—if indeed it ever had been viewed in such a light.

This is also not to suggest that future Palestinian uprisings, civil disobedience, and terror on the order of the first and second *intifadas* may not continue to occur. So long as the Palestinian people lack a fully sovereign and independent state, frustration, anger, and resentment will continue to plague the cities and towns of the West Bank and Gaza—the very

ingredients that helped spark the first and second Palestinian *intifadas*.

## IRAN

Iran is a country of 1.65 million square kilometers and a population of 69,018,924 (July 2004 est.), in Southwest Asia, bordering Iraq, Turkey, Russia, Afghanistan, Pakistan, the Indian Ocean, and the Persian Gulf, with rugged terrain, marked by mountains and deserts, less than 10% of which is arable. With a GDP in 2003 of roughly \$480 billion, Iran produces about 4 million barrels of oil per day, of which slightly more than 2 million are exported, comprising 80% of its exports.

Iran has a long imperial tradition and national history, carried into the modern era by the Safavid (1501–1722), Qajar (1793–1925), and Pahlavi (1925–1979) dynasties, and the Islamic Republic, declared in 1979. Shah Ismail (1494–1524) and Shah Abbas I (1587–1629), the two most powerful rulers of the Safavid period, built a centralized state on the pillars of Shi'i Islam and a gunpowder-based standing army of converted Christian slaves, or *ghulam*. At its height, Safavid rule extended across Iran into Iraq and Afghanistan, also increasing trade in porcelain,

silk and wool textiles, and other products designed for the growing European market.

Following the overthrow of the Safavids in 1722, and an extended period of internal conflict between competing tribal alliances, Fath Ali Shah (1794–1834) established the Qajar dynasty in 1794. Qajar rule was less centralized and more dependent on tribal leaders than Safavid rule had been, and during the 19th century, *mujtahids*, scholars of Muslim doctrine, emerged as powerful arbiters of political legitimacy, asserted control over the educational and judicial systems, and established strong ties to Iran's urban merchant class, the *bazaaris*. Growing Russian and British competition in Asia increased external political and economic influence in Iran. In 1857, Nasir al-Din Shah (1848–1896) signed a commercial agreement giving British traders advantages similar to those already enjoyed by Russians in Iranian markets, insuring that Iran remained an exporter of raw materials like cotton, silk, and wheat. As indigenous industries declined, carpet weaving was one industry that did grow in the nineteenth century, to meet Western demand for high-quality hand-woven rugs.

Nasir al-Din Shah also launched administrative reforms, expanded state-run education, and created the Cossack Brigade, trained and led by Russian officers, to expand his power over tribal leaders, landowners, and the *ulama*, which in Islam means Council of Learned Men. The reforms had their greatest impact in the cities, while agricultural techniques and productivity remained largely unchanged outside regions cultivating cash crops. Lacking funds for industrial development, Nasir al-Din Shah turned to Europeans for investment and expertise, as with the 1872 Reuters Concession, granting a monopoly to build and operate railroads, along with mineral rights to pay for expenses. Russian pressure, along with popular protest, forced cancellation of the Reuters Concession, and Iran had virtually no railroads until the Trans-Iranian rail was built after World War I.

Opposition to the Reuters Concession came from a coalition of urban groups—*ulama*, *bazaaris*, and an emerging urban professional class. In 1890 another concession gave a British company a fifty-year monopoly over Iranian tobacco. A popular boycott of tobacco, led by the coalition, forced Nasir al-Din Shah both to quit smoking and to cancel the tobacco concession. During the Constitutional Revolution of 1906–1911, the coalition of religious, commercial, and intellectual elites mobilized the people to demand a constitution and an elected parliament. Muzaffer al-Din Shah (1896–1907) eventually agreed to a new parliament, or *Majlis*, and a constitution, but Muhammad Ali Shah (1907–1909) was openly hostile to the constitution and interfered with the *Majlis*.

After he was deposed in 1909, the *Majlis* split between conservatives tied to the *ulama* and landowners, and reformers favoring secularization, expansion of state-run education, and land reform.

In 1911, a financial advisor from the United States, W. Morgan Schuster, was hired to organize the state's finances, increase tax collection, control spending by the royal family, and increase the effectiveness of revenues from oil royalties. Fearing a strong Iranian state, the Russians sent an ultimatum to force Schuster's dismissal. Chief among British concerns was Iran's petroleum, controlled by the Anglo-Persian Oil Company, formed in 1908, and taken over by the British government in 1914. Through World War I, Iran faced an increasingly chaotic situation, with an ineffective *Majlis* and a weak ruler, Ahmad Shah (1909–1924), and Russian and British domination of the economy and large amounts of territory.

After World War I ended, Iran was independent and free of foreign occupation, but with virtually no central authority, no trade, and in total financial ruin. Into this situation rode Reza Khan, commander of the Cossack Brigade, who declared himself Reza Shah Pahlavi (1925–1941), and implemented another series of political, economic, institutional, and cultural reforms to strengthen the power of the Shah, and Iran's military and central state, against the *ulama*, landowners, tribal leaders, ethnic minorities, and the Russians and British. Another US advisor, Arthur Millspaugh, was appointed in 1922. In 1935, Tehran University opened, and women were admitted in 1937. Reza Shah also outlawed the veil in urban areas in 1936, and squads patrolled city streets, harassing those not in compliance. Unveiling went along with new styles of clothing, music, and social interaction. The major economic force in Iran continued to be the Anglo-Persian (Anglo-Iranian after 1935) Oil Company, which controlled all of Iran's exports, paying a minor share of profits directly into the Shah's treasury, a practice that made the Shah wealthy, but promoted more corruption than economic development.

During the 1930s Reza Shah sought better relations with Germany, but after the German invasion of Russia in 1941, the British and Soviets jointly occupied Iran, deposed Reza Shah, and with the United States took over the Trans-Iranian Railway to carry supplies, which caused shortages, inflation, and famine in the countryside. The replacement of Reza Shah with his young son Muhammad Reza Shah (1941–1979) allowed the tribal leaders, *ulama*, and the *Majlis* to reassert some autonomy, and following the war, Muhammad Mosaddeq (1882–1967) united a coalition of *ulama*, urban professionals, nationalists, and parties in the *Majlis*, which nationalized Iranian oil in 1951. Fearing a communist takeover, and Soviet

control of the oil, the US CIA and British MI6 sponsored a coup in August 1953 to remove Mosaddeq, and restore Muhammad Reza Shah's power.

Oil revenues, which rose from less than \$300 million in 1960 to \$12 billion in 1974, to \$49 billion in 1978, fueled the Shah's autocratic rule and grand development projects like his "White Revolution." The White Revolution promised land reform and agricultural development, literacy and education, modernization of institutions and economic development, and changes in the status of women. Ayatollah Ruhollah Khomeini (1902–1989) denounced official corruption and oppression, portraying the Shah as an enemy of religion and a puppet of foreign interests. Khomeini's arrest and exile set off a wave of strikes and protests in Tehran and other cities, which the police and military suppressed with force.

Over the period 1963–1978, Iran's GDP increased an average of 12% per year, fueled by increasing oil revenues and state-sponsored economic programs. The Shah also increased military spending, and US advisors helped train the military and SAVAK, the secret police. Most development during this period came in urban areas, especially Tehran, which more than doubled its population between 1963 and 1978. Expenditure of oil revenues on the military, on large-scale industrial complexes, and on the royal family, meant the people suffered the burdens but saw little direct benefit.

By the mid-1970s, increasingly dependent on his military and secret police, and US support, to maintain his legitimacy, the Shah had alienated a wide spectrum of the Iranian population, including ulama, *bazaaris*, ethnic and religious minorities, and the urban middle class. Since moderate reforms were blocked by the Shah, more radical solutions gained rapid support, in particular communism and Islamism. Jalal Al-e Ahmad wrote of "Westoxication," the poisoning of Iran by Western culture and materialism, while Ali Shariati, who had been educated in France, proposed combining Marxist and Shi'i principles in a revolution for equality and social justice. Shariati advocated emulating Husayn, the martyred grandson of Muhammad, to devote one's life to replacing the corrupt, oppressive regime with one based on authentic Iranian Shi'i civilization.

From exile in Iraq, Ayatollah Khomeini reemerged as the spokesperson of a wide spectrum of opponents of the regime, calling for the overthrow of the Shah in favor of *vilayet-i faqih*, "governance of the jurist," in which parliament and popular sovereignty would be overseen by *mujtahids*, acting in the name of the vanished twelfth Imam. When Khomeini supporters protested in January 1978, security forces opened fire. The deaths set off more protests that grew throughout the

year, and the Shah responded ambivalently, knowing that he was dying of cancer, but uncertain of US support, due to President Jimmy Carter's calls to display greater respect for human rights. The protests of 1978 brought together religious opponents, the Westernized urban middle class, ethnic minorities, and merchants in a coalition similar to that of the 1906–1911 Constitutional Revolution. With the economy crippled, and unsure of the loyalty of his own military, the Shah left Iran on January 16, 1979.

Ayatollah Khomeini returned on February 1 to create an Islamic Republic, a hybrid form of parliamentary government with a Council of Guardians, made up of *mujtahids*, whose duty was to ensure that all legislation passed by the Majlis complied with Islamic doctrine and practices. As Supreme Islamic Jurist for life, Ayatollah Khomeini controlled the Council of Guardians. Khomeini supporters faced violent opposition to their control over Iran. The Revolutionary Guards—the military wing of the Islamic revolution—revolutionary courts, and vigilante groups imprisoned, tortured, and executed opponents, suppressing internal opposition. Women were pushed out of the workforce, while new laws enforced dress codes and segregation of the sexes.

The United States recognized the new government and continued diplomatic relations until November 1979, when students took US citizens hostage following the Shah's admission into the United States for medical care. Fifty-three hostages spent 444 days in captivity, being released only on the day the new US president, Ronald Reagan, was inaugurated.

In September 1980 Iraq invaded Iran, setting off a devastating eight-year-long war that caused about five hundred thousand Iranian casualties and billions of dollars in damage. The end of the war in 1988, and the death of Khomeini in 1989, led to some moderation of revolutionary zeal, and more concentration on economic development during the presidency of Ali Akbar Hashemi Rafsanjani.

Under the Islamic Republic, Iran's economy has remained dependent on oil revenues, but more effort has been devoted to priorities largely ignored by the Shah, including support for the poor and war widows and orphans, investment in agriculture, rural development, and construction of housing. The demand for labor, and loss of men in the war, also allowed women to rejoin the workforce, and female students now comprise about half of Iran's university students.

Still, inflation, shortages, unemployment and underemployment, embargoes, mass emigration of Iran's technical elite, military spending, and the war have all impeded the development of the Islamic Republic. In the presidential elections of 1997 and 2001, Muhammad Khatami, a reformist candidate, won

nearly 70% of the vote, especially from women and young voters who had grown up in the Islamic Republic on a platform of reform and opening to the West, although religious conservatives have shown their own continuing power.

At the beginning of the twenty-first century, it appears that two major forces will shape Iran's development in the coming decades: an authoritarian political system, confronting challenges from reform-minded groups seeking restrictions on the power of the supreme leader; and Iran's dependence on the export of petroleum. Thus, the same issues that dominated Iran's development in the twentieth century will continue to shape internal political dynamics and economic development, and Iran's regional and international relations.

### IRAN–IRAQ WAR, 1980–1988

The Iran–Iraq War was the most destructive conflict between two neighboring Third World countries in the

twentieth century. The cost of the war for Iran amounted to \$75–90 billion and for Iraq, \$95–112 billion. These figures do not include the cost of military imports, which ranged from \$10–12 billion for Iran and \$40–50 billion for Iraq. The total casualties of the war (dead and injured) reached 8 million people. The war began on September 22, 1980, when Saddam Hussein's army invaded Iran, and ended, inconclusively, on August 20, 1988. Neither country lost much territory after the termination of the war. In effect, the *status quo ante* was established after eight years of fighting.

The Iranian Revolution of 1978–1979 brought about profound transformations in Iran's domestic and international politics. The new Islamic government in Iran was perceived by Iraq as a threat to its secularist regime. Ayatollah Ruhollah Khomeini's triumphant return to Iran in February 1979 coincided with an upsurge of Shia political activism in Iraq. Numerous anti-Saddam Hussein demonstrations in Iraq's holy cities of Najaf and Karbala were reported in early 1979. Anti-regime demonstrations had even spread to Saddam City (now called Sadr City), the poor Shia neighborhood in Baghdad. The genesis of these demonstrations was purely local as they were organized under the aegis of the Iraqi opposition party *al-Da'wa* (The Call). However, many demonstrators carried pictures of Khomeini, along with banners containing slogans such as "Yes to Islam, no to Saddam." Moreover, an eminent Shia scholar and the spiritual guide of *al-Da'wa*, Ayatollah Mohammad Baqir al-Sadr, began to publicly support the goals of the Iranian Revolution and expressed hope that similar ideas would take root in Iraq.

In the months preceding the Iraqi invasion of Iran, both countries routinely charged each other with border violations. Such incidents had been common along the Iran–Iraq border regions even before the advent of the Islamic Republic in Iran, and had never been viewed by either side as a *casus belli*. On September 17, 1980, Iraqi leader Saddam Hussein gave a clear signal of what was to follow by denouncing the Algiers Agreement and tearing up a copy of it on television. Ironically, it was Saddam Hussein who had signed that Algiers Agreement in 1975 with the Shah of Iran agreeing to accept the *thalweg* (mid-channel) as the maritime boundary with Iran along the Shatt al-Arab waterway. After unilaterally abrogating the Algiers Agreement, Saddam Hussein proceeded to invade Iran in order to, *inter alia*, conquer Iranian territory, and bring the Shatt al-Arab under total Iraqi control and sovereignty.

During the initial phase of the war, Iraq was able to advance on several fronts into Iranian territory and bomb Iranian military and economic targets. On

September 28, 1980, the UN Security Council passed Resolution 479 urging both sides to declare a cease-fire. Iraq immediately offered to comply if Iran accepted Iraq's complete sovereignty over Shatt al-Arab. Iran, on the other hand, rejected the terms of this resolution so long as the Iraqi forces were in control of Iranian territory. By mid-November, Iraq had captured several major cities, such as Khorramshahr, in the oil-rich Iranian province of Khuzestan. Beginning in April 1981, the newly reinvigorated Iranian army and irregular forces succeeded in preventing the Iraqi forces from any further advancement into Iran, but they failed to evict the occupying forces. Iraq's successful siege of the city of Abadan, which contained the world's largest refinery, deprived Iran of much-needed revenue from its petroleum resources.

Between March and June 1982, Iran recovered its lost territory as the Iranian forces pushed back the Iraqis across the border. For the first time since the war started, the Iranians were able to inflict heavy casualties on the retreating Iraqi forces. On June 9, 1982, Iraq announced its readiness to accept a cease-fire, but Iran refused to accept the offer unless Saddam Hussein was removed from office. Iran then sought to conquer the southern Iraqi city of Basra in July of that year. The battle for Basra required the deployment of nine full divisions and involved the largest infantry combat since World War II. Throughout the course of the war, Iran tried to reach the strategic Basra–Baghdad highway, but it failed to accomplish this important task. By late February, Iran's most significant military victory came in the battles in the Haur al-Hawizeh marshes and the seizure of Iraq's oil-rich Majnoon Islands.

As the Iranians began to achieve some military victories, the United States decided to support Iraq in order to prevent an Iranian victory that, according to Washington's thinking, would have frightened the United States' client states in the region. The first sign of US tilt toward Iraq came in 1982 when the State Department removed Iraq from the list of countries supporting "international terrorism." This allowed the US to extend some \$2 billion in credits to Saddam Hussein's regime, thereby alleviating financial pressures that were pushing Iraq to the edge of bankruptcy. The Reagan administration further extended over \$500 million in loans (through the Export–Import Bank and private corporations) to assist Iraq in the construction of an oil pipeline through Jordan.

In 1983, the Reagan administration dispatched Donald Rumsfeld to Baghdad as its personal emissary to meet with Saddam Hussein and cement the burgeoning US–Iraqi ties and to reassure Saddam Hussein of America's continuing support of his war efforts against Iran. The US–Iraqi military ties were

strengthened after the November 1984 resumption of diplomatic relations between Washington and Baghdad, which had been severed since the 1967 Arab–Israeli war. From the Iranian perspective, the most disturbing aspect of the US tilt toward Iraq was Washington's indirect encouragement of Iraqi attacks on Iran-bound oil tankers in the Persian Gulf. The Reagan administration also offered naval escorts to tankers in the southern part of the Gulf but not to ships approaching Iran's main oil terminal at Kharg Island.

As the Iran–Iraq War continued to escalate, Kuwait became increasingly aligned with Iraq and Iraqi war efforts. Despite Kuwait's declared neutrality in the Iran–Iraq War, it became evident that Kuwait was not only involved in direct financing of the Iraqi war efforts, but it was also a major transshipment point for Iraqi-bound materials. Furthermore, Kuwaiti, as well as Saudi oil refineries, were providing Iraq's energy needs in its war with Iran. Consequently, the Iranian leadership began to view Kuwait as an active ally of Iraq. Iran's warning to Kuwait to desist from aiding the Iraqi war efforts went unheeded. As Iraq initiated and later escalated the so-called "tanker war" in 1984 by attacking Iran-bound commercial ships, Iran's Supreme Defense Council adopted a policy of responding in kind to every Iraqi attack on Iranian ships. Unable, or unwilling, to dissociate itself from the Iraqi war efforts, Kuwait instead sought protection for its ships from outside powers, especially the United States.

The American decision to reflag (re-register) Kuwaiti ships followed the May 17, 1987, incident in the Persian Gulf when the American frigate USS *Stark* was hit by Iraqi Exocet missiles, killing thirty-seven American sailors. In a memorial service for the dead sailors, President Reagan publicly accepted Iraq's apology for this "inadvertent" attack while blaming Iran as the real villain. In his press conference of May 27, 1987, President Reagan called upon the "barbaric country" of Iran to not interfere with Gulf shipping. The Reagan administration's gratuitous verbal attacks on Iran for Iraq's missile attack on USS *Stark* puzzled the Iranian leadership.

The tension between Iran and Iraq reached new heights in the spring of 1988 in a series of simultaneous Iraqi and US attacks on Iranian targets. By that time, the United States was heavily involved in providing intelligence and logistical support to the Iraqi forces and had become an active belligerent in the war against Iran. On April 18, 1988, American naval forces in the Persian Gulf mounted an air and sea attack on Iranian frigates and oil platforms in response to damage inflicted a few days earlier on a US ship by a mine allegedly laid by Iran. Direct US–Iranian military confrontations in the Gulf boosted Iran's political

and diplomatic position by portraying Washington as a direct participant in the Iran–Iraq War, thus damaging US claims of neutrality in the Gulf. Moreover, since the aforementioned US–Iranian clashes coincided with a major Iraqi attack to recapture the Faw peninsula, Iran was convinced that the United States had coordinated its actions with Iraqi forces in order to distract Iran. The Iranian government further accused the United States of providing air support to the Iraqis in their drive toward Faw.

The event that had a profound impact on the course of the Iran–Iraq War was the shooting down of Iran Air flight 655 by the cruiser USS *Vincennes* on July 3, 1988, killing 290 passengers. The United States claimed that the USS *Vincennes* mistook the Airbus jetliner for an F-14 fighter. Furthermore, Washington contended that since hostilities had broken out earlier in the day between US and Iranian forces in the Gulf, the USS *Vincennes* was still in combat mode, and its captain thought that the Iranian passenger airliner was an attacking plane when it failed to respond to warnings issued by the US cruiser. Although the United States expressed regrets about the loss of innocent civilian lives, it began to issue self-serving statements praising the “heroic” US forces in the Gulf. President Reagan called the shooting down of the Iranian passenger jetliner an “understandable accident” because the ship’s crew thought they were under attack.

For many Iranians, the shooting down of the unarmed passenger plane was tantamount to “premeditated murder” and demonstrated the immense difficulty of prosecuting the war against Iraq under excruciatingly adverse conditions. The Iranian government contended that Iran Air flight 655 was a regular flight from the Iranian port city of Bandar Abbas to Dubai. The plane was in the usual air corridor, the same route it traversed five times every week in its regularly scheduled flight path. Its schedule was published and available to all parties, including the US forces and USS *Vincennes*.

Furthermore, Iran rejected the US claim that the jetliner should not have been in a war zone. The only declared war zone in the Persian Gulf was the northeast corner of the Gulf. As a self-proclaimed neutral and non-belligerent party in the Iran–Iraq War, the US had no legal right to unilaterally designate war zones in the Persian Gulf. Besides, the air traffic was normally heavy in the Strait of Hormuz, some seven hundred flights having passed over the area in the ten-day period preceding the destruction of the Iranian jetliner.

Given Iran’s predicament, it became clear that Tehran was finally going to accept the UN Security Council Resolution 598, which had been passed on

July 20, 1987. This resolution called for an immediate cease-fire between Iran and Iraq, a return to internationally recognized boundaries, exchange of prisoners of war, and the establishment of a commission to investigate responsibility for the initiation of the war. Except for the last item, the other provisions of the resolution were identical to the demands of the Iraqi regime. At the time of the passage of Resolution 598, Iraq was on the defensive, its military situation was deteriorating, and Iran was in possession of Iraqi territories along the border areas. But by 1988, conditions had changed, and the tragedy of Iran Air flight 655 had left a profound mark on the Iranian psyche.

Ensuing events, such as Iranian tactical military setbacks, the loss of Iraqi territories held by Iran, worsening economic conditions in Iran, the struggle between the regular armed forces and the Revolutionary Guards over the conduct of the war, and jockeying for power among various factions of the clerical leadership in view of Khomeini’s deteriorating health, all led to a major reassessment of Iran’s tactics and international posture. On July 18, 1988, Iran formally accepted UN Resolution 598 and a month later the Iran–Iraq War came to an end.

## IRAQ

Iraq, a country of 437,072 square kilometers in Southwest Asia, borders Turkey, Iran, the Persian Gulf, Kuwait, Saudi Arabia, Jordan, and Syria. Its population of 25,374,691 (July 2004 est.) is 75%–80% Arab, 15%–20% Kurdish, and about 5% Turkmen, Assyrian, and other ethnic minorities. About 60%–65% of Iraqis are Shi’i Muslims, and 32%–37% are Sunni.

Before World War I, most of current-day Iraq was ruled by the Ottoman Empire as three separate

provinces, Mosul, Baghdad, and Basra. Through the wartime Sykes-Picot Agreement, the British and French agreed to divide the Arab lands between them, and by 1918 the British occupied all of Iraq. To extend control over the northern provinces, the RAF asked Winston Churchill, Lord of the Admiralty, for permission to experiment with chemical weapons against “recalcitrant” Arabs, to which he replied, “I am strongly in favor of using poisonous gas against uncivilized tribes.” With a mandate granted by the League of Nations, the British suppressed a 1920 popular uprising demanding independence, resulting in about ten thousand Iraqi casualties. Convinced that direct rule would be too costly, the British installed Faysal, son of the Hashemite Sherif Hussain of Mecca, and leader of the Arab revolt during the war, as king of Iraq, founding a Hashemite dynasty that lasted until the revolution in 1958.

Under the terms of a 1922 treaty, the British continued to rule Iraq indirectly, controlling finances and the military. The British-controlled Iraq Petroleum Company, which had discovered oil before the war, paid royalties of about 15%, but retained all control. In 1932 Iraq gained independence, and a seat at the League of Nations, but British influence remained predominant. Iraqi politics was dominated by the British, the Hashemite kings, and advisors who had risen from modest backgrounds through careers in the Ottoman military before and during the war. The most prominent was Nuri al-Said (1943–1958), who served several terms as prime minister. Sunni Muslims, less than half of the population, held the vast majority of cabinet offices, while Shi'i Muslims and Kurds were underrepresented in political office. In 1923, Shi'i *mujtahids* led protests, while Kurds revolted against central authority periodically throughout the 1920s and 1930s. The military also played an increasingly important role in Iraqi politics. In 1936, General Bakr Sidqi, famous for the 1933 massacre of Assyrian Christians in northern Iraq, led the first of a series of military coups that shaped the Iraqi state in the twentieth century.

Pro-German officers staged a coup on April 1, 1941, but a British force invaded to depose the government of Rashid Ali al-Gaylani, and bring the solidly pro-British Nuri al-Said back to power. From 1941 to 1958, pro-British regimes remained in power, and in 1955, Iraq joined Turkey, Pakistan, and Iran in a western-sponsored, anti-Soviet, joint defense scheme known as the Baghdad Pact. But memories of British interference in “sovereign” Iraq’s affairs, combined with the Arab states’ poor performance in the 1948–1949 Arab–Israeli War, shaped Iraqi politics in the post-war period.

By the 1950s military officers were secretly organizing to bring about radical change. These officers, generally born after 1918, were inspired by the Egyptian Free Officers’ Movement, and saw the Hashemite monarchy as illegitimate. Moreover, in 1958, some 80% of population was landless sharecropping peasants. About 1% of the landowners owned 55% of all private land, while Iraq’s tremendous oil wealth remained in the hands of foreign companies until nationalization in 1972.

In July 1958, a coup ended the Hashemite monarchy, with the execution of Faysal II (1939–1958) and Nuri al-Said. The Revolutionary Command Council (RCC) became the center of power as General Abd al-Karim Qasim (1958–1963), son of a small farmer, emerged as the dominant figure in the new government. Qasim began a program of land reform, withdrew from the Baghdad Pact, and established ties with the Soviet Union. Qasim used Iraqi communist support to balance the influence of pan-Arabists, who sought union with Egypt under the leadership of Gamal Abdul Nasser.

Qasim was killed in a coup in 1963, and another coup in 1968 firmly established the power of the Ba’ath (Resurgence) Party. The Ba’ath Party called for Arab unity, the end of western domination, secularism, land reform, expansion of education, women’s rights, and state-led economic development, fueled by oil revenues, which reached \$476 million in 1968 and \$26 billion in 1979.

With the 1968 coup, Ahmad Hasan al-Bakr (1968–1979), chair of the Ba’ath Party, became president, prime minister, and chair of the RCC. His relative and protégé, Saddam Hussein (1979–2001), became vice-chair of the RCC. Saddam Hussein, born in 1937 to landless peasants in the village of Tikrit, had joined the Ba’ath Party in 1957. In 1966, al-Bakr appointed Saddam Hussein secretary general of the party, and from 1968 to 1979 al-Bakr and Hussein established ever-tighter control of the party and state apparatus, purging non-Ba’athists, executing scores of opponents, and promoting relatives and fellow Tikritis to positions of power. Al-Bakr’s retirement in 1979 made Hussein president of Iraq, secretary general of the Ba’ath Party, chair of the RCC, and commander-in-chief of the armed forces.

Saddam Hussein’s rise to absolute power coincided with the Iranian Revolution, which coincided with revolts by Kurds in the north and Shi’i Muslims in the south. Since World War I, Kurds had revolted periodically against British and Hashemite rule. Mustafa al-Barzani led revolts in the 1960s, and in 1974–1975 with Iranian support. After the revolt ended in 1975, Hussein combined policies of granting the Kurds limited

autonomy in northern provinces, while also forcibly resettling about 250,000 Kurds in the Arab south, and manipulating conflicts between Barzani and Jalal Talabani, another Kurdish leader. By the late 1970s Kurds had risen up again, with support from the Islamic Republic of Iran. In 1977 a revolt of Shi'a in the south began, and was one factor in Hussein's decision to invade Iran on September 22, 1980.

Iranian resistance proved stronger than anticipated, and Iranians rallied to stop the Iraqi advance, then pushed the war back into Iraq, before their offensive also bogged down. A war of attrition dragged on until 1988, resulting in about five hundred thousand Iraqi casualties, and about \$100 billion in damages. During a final offensive in 1988, the Iraqi air force dropped chemical weapons on the town of Halabja in the northeast, killing about five thousand Kurdish civilians. In 1984, the Iraqis had begun attacking Iranian oil tankers, and Iran retaliated against Kuwaiti and Saudi tankers carrying Iraqi oil. Kuwait and Saudi Arabia loaned Iraq \$50–60 billion during the war, and the United States openly sided with Iraq, by reflagging tankers in the final year of the conflict, but also by selling Iraq weapons and supplies of anthrax and other materials needed to build chemical weapons.

Deeply in debt at the end of the war, the Iraqis faced the immediate problem of rebuilding infrastructure and the military, a problem exacerbated by a global oil crash in 1986. Kuwait, which had loaned Iraq money during the war, had also increased its oil production beyond its OPEC quota, thus keeping prices down. Saddam Hussein also accused the Kuwaitis of illegally extracting oil from an oilfield straddling the Iraq–Kuwait border, which added to the fact that Iraq had never recognized the sovereignty of Kuwait. On August 2, 1990, Iraqi forces invaded and occupied Kuwait.

The United States reacted immediately, and strongly, to the invasion and the possibility of an Iraqi invasion of Saudi Arabia, which would mean Iraqi control of about half the planet's petroleum. The United Nations imposed sanctions and a boycott, while the George H. W. Bush administration constructed an international coalition, including nearly all of the Arab states, and more than five hundred thousand US troops, for Operation Desert Shield (the protection of Saudi oilfields), and Desert Storm (the liberation of Kuwaiti oilfields). Saddam Hussein tried to tie the liberation of Kuwait to the liberation of the West Bank and Gaza Strip from Israeli occupation, and during the war, Iraq launched missiles at Israeli cities, in hopes of pulling Arab states away from the coalition.

Less than a day after the UN deadline for withdrawal, the US began the largest aerial assault in history, with six weeks of around-the-clock bombing

of military as well as civilian infrastructural targets in Kuwait and Iraq. By the time the ground assault began on February 24, Iraq had virtually no defenses, and the Iraqi military retreated piecemeal up the “highway of death.” After one hundred hours, Bush declared Kuwait liberated and the war over, choosing not to continue with an invasion of Iraq.

As the war ended, Shi'a in south and central Iraq and Kurds in the north revolted against the Ba'athist regime. The Iraqi military moved to crush the rebellions, and as troops moved northward, nearly 1.5 million Kurds fled into the mountains, hoping to cross the Iranian or Turkish borders, which remained closed. The US and British governments then imposed “no-fly zones” in the north and south, to protect the rebels and curtail Iraqi sovereignty.

UN sanctions remained in place as inspectors searched Iraq for weapons of mass destruction, and the Ba'athist government tried to obstruct the inspectors and protect its secrets. Under the sanctions, importation of a long list of military and “dual-use” materials, including chlorine, was prohibited. As Saddam Hussein continued to refuse to cooperate with weapons inspectors, the sanctions regime took a huge toll on the Iraqi population. The UN estimated that between 1990 and 2000, more than six hundred thousand people, mostly elderly and children, died as a result of poor hygienic conditions or lack of medicine due to the sanctions. In 1996 the UN agreed to the “oil-for-food” program, which allowed Iraq to begin selling oil in exchange for food and medicine. The oil-for-food program did little to help the Iraqi people, but it did allow the United States to purchase most of the Iraqi oil at below-market prices, and it strengthened Saddam Hussein's position, allowing him to use scarce resources as rewards for loyalty to the regime.

In January 2002, George W. Bush declared Iraq a member of an “Axis of Evil,” and claimed the Iraqis could soon deploy nuclear weapons. When the UN and US allies failed to act with sufficient alacrity, the United States and Britain went ahead and invaded Iraq in March 2003, along with a token number of troops and advisors from countries like Japan and Bulgaria. Within weeks of the invasion, the Iraqi government had fallen and Saddam Hussein had fled into hiding. The Coalition Provisional Authority was set up, and on May 1, George Bush landed on an aircraft carrier to announce, famously, “mission accomplished,” although “insurgents” opposed to the US-led invasion continued to harass and kill occupation troops, civilian contractors, and Iraqis working with the occupation forces, sometimes kidnapping and beheading their captives.

In June 2004 a new interim government came into being, led by acting Prime Minister Iyad Allawi. In

January 2005 Iraqis went to the polls to elect slates of candidates to form a constitutional assembly, charged with writing a new constitution and overseeing elections to form a new elected government. A slate backed by Ayatollah Ali al-Sistani garnered 48% of the popular vote, not enough for a majority in the assembly, while Kurdish voters in the north overwhelmingly supported the concept of autonomy, and Sunni Arab voters stayed away in large numbers.

Throughout much of the twentieth century, three major challenges confronted Iraq: establishing a viable state, a national identity, and popular loyalty; building political institutions and developing the economy; and ending foreign domination and establishing a sovereign position in the region. With the demise of the Ba'athist government and foreign occupation, Iraq has entered the twenty-first century in much the same situation.

## IRRIGATION

Irrigation is the application of water to the field by any artificial method enabling it to meet the water requirement of a crop at a given time of its vegetative

cycle so as to ensure that the crop/plant grows even when there is little or no rainfall. The irrigation water can be supplied from surface water resources such as lakes, rivers, or streams, or from groundwater abstracted from open wells or tubewells.

Water requirement for irrigation is dependent on the type of crops and climatic conditions under which the crops are grown. The latest technology ensures scientific determination of the crop water requirements factoring agronomic and meteorological parameters. Traditionally, China, Egypt, and India (including Sri Lanka) have been practicing irrigated agriculture for several thousands of years.

The methods of irrigation can be broadly classified as:

- Surface irrigation, in which the entire or most crop area is flooded;
- Sprinkler irrigation, which simulates rainfall;
- Drip irrigation, in which water is dripped on to the soil above the root zone only;
- Underground irrigation of the root zone by means of porous pots or pipes placed in the soil; and
- Sub-irrigation, in which the groundwater level is raised sufficiently to dampen the root zone.

Rainfed agriculture refers to the practice of cultivation on land with water input only from the available rainfall (having its vagaries of variation in space and time in certain cases, especially in arid and semi-arid areas). Area suitable for cultivation (whether rainfed or irrigated) is termed as "arable" or "culturable" area. Presently, total cultivated area on Earth is about 1,500 million hectares (Mha), that is, about 12% of total land area. Globally, rainfed agriculture is practised on about 83% of cultivated land, and supplies about 60% of the world's food. In other words, from only about 17% of the area that is irrigated, over 40% of the food is produced. In water-scarce tropical regions such as the Sahelian countries, rainfed agriculture is practised on more than 95% of cropland. The risks of crop reduction from rainfed agriculture, however, are more on account of droughts and dry spells. To reduce such risk, the option of supplementary irrigation has proved better.

Globally, while an annual increase of 4 to 5 million hectares of irrigated area was recorded between 1950 and 1980, this fell to just around 2 million hectares per year in the 1990s and later. Reasons for this include rising capital cost to reclaim lands that are relatively more difficult for irrigation, impacts of commodity prices resulting in low returns on investment, problems of operation and maintenance, low efficiency of water use, low level of

water charges and hence revenues, increase in soil salinity levels, siltation, and so forth. To a sizeable extent, donor funding for works launched in developing countries was curtailed after 1990. However, it is being realized that food security would be feasible only with interventions in and support to appropriate irrigated agriculture.

Irrigated agriculture produces 4 to 8 times higher yields than rainfed, besides playing a major role in providing food sufficiency and security as well as in poverty alleviation. It also helps to protect the rainfed crops of the rural people from natural disasters such as droughts and famines. The poor landless people find employment opportunities in construction and maintenance works of irrigation schemes, while the increased agricultural yields mostly from irrigated areas and overall infrastructural improvements help to attract investments in rural agro-based industries. The World Food Summit, 1996, estimated that 60% of additional food required to sustain the world population in the future must come from irrigated agriculture, which needs more investments and sustained efforts at expansion and improvement. For arid and semi-arid areas, irrigation is an essential input for farming, even during the rainy season. Provision of irrigation facilities and watershed development in rainfed areas together can make the agriculture in a river basin sustainable and more productive.

About 70% of freshwater resources are being used globally by the agriculture sector, which nevertheless generates food for the ever-increasing population, especially in the developing countries in the African and Asian continents. However a competition is

growing from the “people” and “environment” sectors for more water allocations. Techniques for increasing the efficiency of water use in irrigation to generate “more crop per drop” are therefore currently being devised. Projections, however, indicate that even with optimistic views about productivity growth, efficiency, and the expansion of irrigated area, 14% more water will be needed for irrigated agriculture in the developing countries by 2030 to cope up with the needs of increasing population by that time. This will require some 220 billion cubic meters of extra storage.

Presently, a total of about 272 million hectares of land are being irrigated throughout the world. The growth of irrigation in India and China has been exceptional. These two countries are the world leaders in irrigated agriculture and together form over 40% of the world’s total irrigated area. The table below presents some salient irrigation- and drainage-related figures for prominent agricultural countries.

Drainage of irrigated lands is an important activity that should receive more attention in the coming decades in order to ensure consolidation of the gains of productivity both from irrigated and rainfed cultivable areas. Not all the irrigated areas are presently covered by adequate drainage, affecting the sustainability of agriculture by way of loss of land due to waterlogging, salinity, and so forth. The International Commission on Irrigation and Drainage (ICID) has focussed particular attention on promoting the best practices regarding irrigation and drainage by water management and water savings, besides measures to improve drainage (including bio-drainage), in recent times.

Table 2: Agricultural statistics for ten countries with largest irrigated and drained area

Country	Population (millions)	% of population economically active in agriculture	Total area (million ha)	Arable land (million ha)	Irrigated area (million ha)	Drained area (million ha)
India	1,050	59	329	170	55	5.8
China	1,288	66	960	136	54	20
USA	287	2	963	179	22	48
Pakistan	144	47	80	22	18	6
Iran	66	26	165	16	8	0.04
Mexico	102	21	196	27	7	5.2
Thailand	63	56	51	18	5	0.15
Indonesia	217	48	190	34	5	0.27
Russia	144	10	1,708	127	5	7.4
Turkey	67	46	78	27	5	3.14
Total	3,426		4,718	755	184	96
World	6,215		13,425	1,497	272	190

## IRRIGATION

The status of water management systems (supply infrastructure, drainage, irrigation) in agricultural cultivation in different continents is seen in the table below.

While water is an essential input for agriculture, it also needs other inputs like fertilisers, pesticides, seeds, cold-storage facilities, animal/mechanical power, animal husbandry services, market, transportation, electric power, credit, agricultural implements, and services for maintenance.

The establishment of Water Users Associations (WUAs) and transferring responsibility for operation and maintenance of irrigation systems to the associations has been considered a desirable intervention to promote local management of irrigation systems with a strong emphasis on farmers' participation. The participatory irrigation management (PIM) refers to the involvement of irrigation users in all aspects and at all levels of irrigation management. This includes planning, design, construction, maintenance, and financing for the main irrigation system and all subsystems.

Though India has a large irrigated area, the contribution from the irrigated area to the food basket is placed at 52%; the remaining 48% is attributable to rainfed area. Effective water management in irrigated agriculture has assumed significance for the last two decades as water is becoming a scarce commodity and has divergent claimants from various other sectors. The requirements of environment (nature sector) can be aptly addressed if the irrigation water requirement for food security could be reduced with better management practices, thereby sparing water for other purposes like the Nature and People sectors. This is

all the more important for the developing world where the present level of managerial efficiencies is low and water management must have a broader scope. Every country needs to set up its own policies and institutional structures to deal with water in the wider context of national welfare.

The Earth Summit Declaration adopted by 178 participating countries at Rio de Janeiro in June 1992 had addressed the need for ensuring adequate food and water for all people on this globe. Among other requirements, crop production must increase by 3%–4% per annum, mainly by increasing the productivity of irrigated lands. Demands for available freshwater have increased due to growth of population and improved lifestyle. Irrigation requirements for the food sector are largely consumptive. Larger increases are projected in the developing countries in order to meet food security as most of the food produced in these countries is consumed locally. Countries like India and China pursue a policy of self-sufficiency in food.

The water diversions for irrigated agriculture and their significant use for irrigation have been viewed in some quarters to be in conflict with the requirements of environmental protection. In fact, in the hydrological cycle, water unused by plants returns back to surface water runoff or infiltrates to augment groundwater. The water used by the plant also returns mostly to the atmosphere by the process of evapotranspiration or remains as a part of the biomass. ICID endeavours to promote the best practices in irrigation and drainage as well as activities for water saving to ensure more crop per drop of water used in irrigation.

Table 3: Status of water management in agricultural cultivation practices in different continents and categories of countries

Continent	Total area in 10 <sup>6</sup> ha	Arable land in 10 <sup>6</sup> ha	Total population in millions	Water management practice in % of the arable land		
				No system	Drainage <sup>1</sup>	Irrigation <sup>2</sup>
Asia	3,339	547	3,765	56	10	35
Africa	3,031	201	840	92	2	6
Europe	2,299	307	732	77	15	8
Americas	4,016	384	850	72	17	11
Oceania	856	55	31	91	4	5
World	13,425	1,497	6,215	69	13	18
Developed countries	3,877	445	1,137	67	22	11
Developing countries	7,231	903	4,332	69	8	23
Least developed countries	2,433	145	750	87	2	12

From International Commission on Irrigation and Drainage, 2004

<sup>1</sup> In total about 130 million hectares of rainfed areas and 60 million hectares of irrigated areas have drainage.

<sup>2</sup> Irrigation may include drainage as well.

## Country-Specific Issues of Development and Management in Irrigation

### India

India is a large country in South Asia that ranks second in the world in population, next to China, and ranks seventh in the world in land area. The total geographical area of the country is 328.73 million hectares. Agriculture provides about a third of India's national income. Compared with the total geographical area of 328.73 million hectares, the net sown area is 142.5 million hectares (about 77% of the cultivable area in the country). The rainfall in India is confined to three to four months in a year in the form of a monsoon season and varies from ten centimeters in the western parts of Rajasthan to over one thousand centimeters in Cherrapunji in Meghalaya. The principal water resources used in India come from surface waters through rivers and streams, and groundwater. It has been estimated that out of the total precipitation of about 400 million hectare meters (Mham), the water availability is about 186.9 Mham. The average yearly utilisable water resource is estimated at 690 billion cubic meters (BCM). Ninety percent of the groundwater assessed at 432 BCM, is considered for exploitation for irrigation, drinking, and other uses.

Since 1947 when India became independent from British colonial rule, rapid strides in irrigation have taken place with the planned development adopted by India. The initial successive plans assigned a major investment for this purpose until the 1990s. Irrigation development in India has a judicious mix of major, medium, and minor irrigation schemes depending on project location, economic viability, and environmental consideration for equitable and sustainable development. This classification is based on size of projects with major, medium, and minor projects covering irrigated areas of over ten thousand hectares (ha), between two thousand and ten thousand ha, or less than two thousand ha, respectively. As a result of this development, irrigation potential has been planned to go up to about 101 million hectare (Mha) as compared with 22.6 Mha at the time of independence. Food grain production, which was a meager 51 million tonnes (MT) at that time, has increased four fold to about 212 MT at this writing. This has made the country not only self-sufficient, but also an exporter of the food grains. It has been estimated that as much as 52% of the rise in food grain production has been solely on account of an increase in irrigated area.

India has created a total live storage capacity of about 177 BCM. Dams to create additional live storage of 75 BCM are under various stages of construction.

The dams under formulation/consideration will provide an additional live storage of 132 BCM. The present and projected pattern of water utilisation is shown below:

Table 4: Water Utilisation Patterns

Purpose	Present Utilisation (1997)	Future Utilisation (2025)
Irrigation	501	611
Domestic	30	62
Industry	20	67
Energy	20	33
Others	34	70
Total	605	843

All values in the table are in billion cubic meters.

The ultimate irrigation potential in the country is estimated to be 139.9 Mha of which 58.48 Mha, have been developed. The gross irrigated area is 120 Mha and the gross irrigated area under food and non-food crops is 90 Mha. The rainfed area in the country is 110 Mha of which the gross area under food crops is 72 Mha. During the period 2003–2004, the food grain production was 216 million tonnes. The demand for food in the future (year 2025) is estimated to be on an average 345 million tonnes. The country has a comprehensive National Water Policy, April 2002, which among other things addresses all aspects pertaining to irrigation, while the National Agriculture Policy and National Environmental Policy address areas of pertinent interest that affect them.

### China

The People's Republic of China is a country in Eastern Asia with the world's largest population. The rainfall in China varies greatly. The deserts of Xinjian and inner Mongolia receive less than 100 mm of rainfall. Southern China receives 1,000 mm of annual rainfall, while the rainfall is 630 mm in Beijing. Agriculture production is the backbone of China's economy. China can be divided into three zones (not counting Qingzang cold plateau, which has no agricultural production)—the perennial irrigation zone where the average precipitation is less than 400 mm, the unsteady irrigation zone where the average annual precipitation is between 400 mm and 1,000 mm, and the supplementary irrigation zone where the average annual precipitation is more than 1,000 mm. The total internal water resources of China are estimated to be about 2800 BCM, out of which 460 BCM are withdrawn. The irrigated area of the country

stands at 54 Mha. Of this area, 51.16 Mha are farmland, 2.31 Mha are forest and orchard irrigation area, 0.81 Mha are grazing land irrigation area, and 0.467 Mha are for other purposes. The number of reservoirs in the country is 84,905, with a total capacity of 457.1 BCM. Out of these reservoirs, 394 are large reservoirs with storage of 72.4 BCM and 81,893 are small reservoirs with storage of 58.6 BCM. There are more than five thousand large and medium-sized irrigation districts in China, which are the main production areas for commodity food and cash crops. In China, irrigation is managed according to the “Regulations for Irrigation Area Management” stipulated by the Ministry of Water Resources.

The Fourth Session of the Eighth National People’s Congress of China approved the Ninth Five-Year Plan for National Economic and Social Development and the long-range objectives up to the year 2010. The reform in the water sector in China is focussed on the establishment of five management systems, namely:

- Multi-channel, multi-level investment system;
- Scientific and complete water assets operation and management system;
- Rational and complete pricing system;
- Complete and effective legal and regulation system; and
- High-quality and efficient service system.

### *Pakistan*

Pakistan is a nation in southern Asia that has India, China, Afghanistan, and Iran as its neighbours. The present population of Pakistan is 145 million (2001 est.). The total geographical area of Pakistan is 79.61 Mha. Punjab and Sind are the two provinces in which the real agricultural wealth of Pakistan lies. These areas fall in the Indus Basin. Pakistan has agricultural land potential of about 28.39 Mha. Rainfalls in the country vary spatially—less than ten cm in some parts and more than 50 cm in the other parts. Most of the rainfall occurs during the monsoon period (July to September). The contribution of rain to crops in the irrigated areas of the Indus Basin has been estimated at about 7.4 BCM. The flows of the Indus rivers system constitute the major surface water resources of Pakistan. The average runoff of these rivers is about 199 BCM. The estimated usable groundwater potential in the country is 66.6 BCM. About 95% of the country’s water resources are used for agriculture. The total cropped area in the country is 23.04 million hectares. The present irrigation system comprises three storage reservoirs, twenty-one barrages or

headworks, twelve inter-river long canals, two major siphons, and forty-five main canals. The annual water withdrawn from canals for irrigation is presently about 140 BCM. To stagger the peak flows, three surface reservoirs have been constructed in the past. These are the Mangla reservoir constructed in 1967 on River Jhelum with a live storage capacity of 6.6 BCM, Chashma reservoir on the Indus constructed in 1971 with a capacity of 0.6 BCM, and Tarbela on the Indus constructed in 1975 with a capacity of 11.5 BCM.

The chemical quality of water from the rivers is excellent for irrigation. The quality of groundwater is highly variable in various parts of the country, ranging from completely fresh to extremely saline. In total, 60% of the Indus plain is underlain by useable groundwater. In order to achieve the envisaged growth target in agriculture, irrigation water requirements as estimated for the year 2000 and 2013 would be 176.5 and 254.6 BCM (143.1 and 206.4 Ministry of Agriculture and Forestry [MAF]), respectively. With the three major dams completed, the water availability for the future has been estimated to be 156.2 BCM (126.6 MAF) in the year 2025.

### *Iran*

The Islamic Republic of Iran is situated in the middle-east region of southwestern Asia. The population of Iran is about 71 million (2001). The estimated population for the years 2008, 2021, and 2050 is likely to be 83.5 million, 100 million, and 129.5 million, respectively. About 52% of the country consists of mountains and deserts. Out of the total land area of 165 Mha, 51 Mha are cultivable. The Caspian Sea Coast is Iran’s only region of abundant rainfall at 1600 mm per year. The average rainfall in the country is 250 mm. Agriculture accounts for about 12% of the country’s GNP and employs about 36% of the workers. Only about 12% of the land can be farmed. Wheat and barley are grown on about 75% of the cultivated land. Internal renewable water resources of Iran are estimated at 128.5 km<sup>3</sup> per year. Surface runoff represents a total of 97.3 km<sup>3</sup> per year and groundwater recharge is estimated at about 49.3 km<sup>3</sup> per year. The water withdrawal from surface area is in the order of 38.3 km<sup>3</sup> per year, while that from groundwater is 43.3 km<sup>3</sup> per year.

Based on a comprehensive water study for Iran (Jamab 1996), with proven sources of water that can be extracted using the country’s present technology in the main water basins, it is estimated that an amount of 121 km<sup>3</sup>/year of water can be supplied by the year 2021. Of this, 46.5 km<sup>3</sup>/year will consist of groundwater and the remaining 74.5 km<sup>3</sup>/year of surface water.

This forms 88% of the total renewable water resources of the country, which can be considered as the ultimate development of these resources. Presently, an area of 8.84 Mha in Iran is irrigated while 9.66 Mha is rainfed. The agricultural land availability is not a constraint in the development of irrigated agriculture. The irrigable land is estimated at more than 12 Mha. The policy of the Islamic Republic of Iran is that agriculture should become the center and pivot of all development activities. The main qualitative objectives of the water sector in the five-year plans are:

- Securing the water requirements of the various sectoral users of water;
- Increased efficiency in water resource use; and
- Strengthening decision making and management capability in the water sector.

## ISLAM

### Basic Facts

With a 2004 estimate of 1.48 billion followers, Islam is the religion of roughly 23% of the world's population (based on CIA Fact Sheet 2004). Most Muslims live in the region that extends from North Africa to Southeast Asia, but Muslim minorities across Europe and the Americas are the second- or third-largest religious communities (Esposito 1999, p. 690). Islam comprises people from almost every ethnicity, including Arabs (19%), Turks (4%), Indians/Pakistanis (24%), Africans (17%), and Southeast Asians (15%). The largest Muslim population is in Indonesia (194 million), and the largest number of Muslim minorities live in India (150 million), China (38 million), Russia (28 million), France (6 million), and the United States (6 million). Most Muslims in non-western countries are indigenous nationals who belong to the local ethnicity and culture. However, the majority of Muslims living in the West are educated immigrants who migrated for various reasons related to the phenomenon of "brain drain" from their original countries.

Muslims believe in the absolute oneness of God, the prophethood of Muhammad (570–632 CE), and the Qur'an as the final message from God to humankind as revealed to Muhammad (The Holy Qur'an, Chapter 33: Verse 40). Muslims grew from a small and oppressed group in Mecca, now in western Saudi Arabia, at the beginning of the seventh century to an established "Islamic State" that overpowered both the Roman and Persian empires by the end of the same century. Islam, then, became the religion of a variety of cultures and a flourishing civilization that spanned over the medieval centuries. The early post-prophetic era, however, witnessed violent tribal disputes in Arabia, which eventually led to the formation of a few politico-religious sects within Islam in addition to the Sunni mainstream (92% of Muslims),

namely, Shia or Twelvers (now 5.8% of Muslims, mainly in Iran, Iraq, and Lebanon), Ibaddis or Kharijites (now 1% of Muslims, mainly in Oman), Zaidis (now 1% of Muslims, mainly in Yemen), and Alawites (now 0.1% of Muslims, mainly in Syria). Eventually, the Islamic State's internal problems, especially political dictatorship, patriarchy, and racial disputes, led to severe deterioration, colonization from outside powers, and ultimate disintegration by the late nineteenth century. The second half of the twentieth century witnessed widespread political liberalization and initiation of modern processes of development across the Muslim world (Esposito 1999, p. 643).

### Islam and Development

According to the 2004 United Nations Development Program (UNDP) report, most Islamic countries (i.e., countries with a Muslim majority) rank within the "medium" range of the comprehensive Human Development Index (HDI), which is calculated using indexes of life expectancy, enrollment in education, and standard of living. However, some Islamic countries, specifically the oil-rich Arab states, rank comparatively much higher in terms of income per capita and much lower in terms of female literacy and Gender Empowerment Measure (GEM), which includes women's political participation, economic participation, and power over resources (UNDP 2004, p. 221). In addition to Muslim minorities who live in developed countries, countries with Muslim majorities that were ranked under "high human development" are Brunei, Bahrain, Kuwait, Qatar, and United Arab Emirates (which collectively represent less than 1% of Muslims). The bottom of the HDI list includes Yemen, Nigeria, Mauritania, Djibouti, Gambia, Senegal, Guinea, Ivory Coast, Mali, and Niger (which collectively represent around 10% of Muslims).

Islam is both a belief system and a comprehensive way of life that governs Muslims as individuals, families, and societies. Islamic principles in the form of prescribed "good deeds" and forbidden immoralities play a constructive role, from a development perspective. However, historical interpretations of Islamic scripts that evolved into established traditions in some predominantly Muslim countries do impede development, especially in the areas of politics and women's rights. Nevertheless, modern Islamic scholarship seeks reform through novel reinterpretation theories. Numerous Islamic organizations embrace these theories and work on the ground to materialize reform. However, there is a need for more theoretical

investigation of the concept of development itself in non-western Islamic contexts. The following paragraphs will elaborate on these topics.

### Principles Conducive to Human Development

The Qur'an views humankind as vicegerents on Earth, whose mission is "betterment and reform" (for example, Qur'an 11:88, 26:152). The Qur'an also states, "let there be no compulsion in religion," "the noblest of humankind is the best in conduct," "no bearer of burdens can bear the burden of another," "stand out firmly for justice, even as against yourselves, or your parents, or your kin, and whether it be against rich or poor," "male or female: you are members, one of another," "if the enemy inclines toward peace, do you also incline toward peace, and trust in God," and that dialogue is "the means that is best" (Qur'an 2:256, 49:13, 17:15, 4:135, 3:195, 8:61, 29:46, respectively). Based on these verses and others, a Universal Islamic Declaration of Human Rights was announced in 1981 by a large number of scholars who represented various Islamic entities at the United Nations Educational, Scientific, and Cultural Organization (UNESCO). Supported by a number of Islamic scripts mentioned in its references section, the declaration contains all basic rights declared in the Universal Declaration of Human Rights (UDHR), such as rights to life, freedom, equality, justice, fair trial, protection against torture, asylum, freedom of belief and speech, free association, education, and freedom of movement (Bora Laskin Law Library 2004). However, since 1981, a debate is still alive, especially in the United Nations High Commission for Human Rights (UNHCHR), on whether this Islamic declaration "gravely threatens the inter-cultural consensus on which the international human rights instruments were based" or whether Islam "adds new positive dimensions to human rights, since, unlike international instruments, it attributes them to a divine source thereby adding a new moral motivation for complying with them" (UNHCHR 2003).

On the practical level, there are specific "acts of worship" that Islam prescribes that could contribute to human development. These are, for example, seeking and teaching knowledge, spending and consuming moderately, sponsoring orphans, forgiving debts, assisting the disabled, ensuring hygiene, helping one's relatives and neighbors, treating prisoners of wars kindly, avoiding transgression, being "kind and just" to those of a different religion, and annual donating up to 10% of every Muslim's wealth, which is given to the needy in society and

other social causes (for example, Qur'an 2:177–179, 17:23–38).

Additionally, all forms of corruption are considered “major sins” in Islam, such as bribery, conflict of interest, fraud, and the use of one’s political power for personal gains. The prophet Muhammad was reported to have judged whether an employee has a right to accept a certain gift by asking whether that employee would still have been offered the gift if he or she had never been employed.

### **Historical Interpretations Impeding Development**

Despite the strong moral ideals of the Qur'an listed above, some verses of the Qur'an had been interpreted in ways that serve certain agendas of dictatorship, patriarchy, or violence. For example, the Qur'an states: “To those against whom war is made, permission is given to fight, because they are wronged; and verily, God is most powerful for their aid. They are those who have been expelled from their homes unjustly” (Qur'an 22:39–40). These verses and similar ones had been interpreted a millennium ago to mean that the entire world is divided into two exclusive zones, the “land of Islam” and the “land of war,” which are expressions mentioned nowhere in the scripts themselves. Other verses that encouraged Muslims to fight “for the sake of the oppressed” (Qur'an 4:75) are claimed to have abrogated (i.e., legally annulled) all other verses that advocated mercy, cooperation, and dialogue with any non-Muslim. These binary classifications of the world are still endorsed by some violent political groups.

Certain verses of the Qur'an that encourage Muslims to respect and cooperate with their leaders in addition to verses that mention “security” as a blessing from God are repeatedly interpreted to mean that loyalty to de facto rulers is an Islamic obligation, regardless of their conduct. Therefore, seeking to change unjust leaders, even through peaceful means, is considered an act of deviance that “jeopardizes the blessing of security.” Similar interpretations, historically popularized by the Abbasid dynasty (758–1258 CE), sanction tribal monarchies as the only form of acceptable Islamic regimes and go further to claim that a Muslim ruler should be only from “noble Arab lineages.” Based on these interpretations, resources in some Muslim countries are distributed over citizens based on their lineages, and “noble” rulers have the right to make dictatorial decisions. “Mutual consultation” (Qur'an 42:38), which is a clear Islamic instruction, is interpreted to mean that the ruler should

consult the ruled, but without being under any obligation to follow what they choose.

Other verses, which specifically advised Prophet Muhammad’s female followers to take certain precautions during Medina’s revolts, around 624 CE, to protect themselves from assaults (Qur'an 33:59), are often taken out of their historic context to entail that all women are to be “protected” by isolating them from places of work and even mosques. Such interpretations further render women incapable of making political, legal, financial, or personal choices, or even driving cars. Examples of Muslim groups that have subscribed to such opinions are the Taliban, former rulers of Afghanistan, and the Wahhabis, an extreme Sunni trend influential in Saudi Arabia.

### **Modern Interpretations and Reform**

An Islamic reform movement has been initiated that rejects extreme traditional interpretations, redefining many basic Islamic concepts, and modernizing the Islamic law itself. Fazlur-Rahman, for example, criticized medieval Islamic thought for not producing “a single work of ethics squarely based upon the Qur'an, although there are numerous works based on Greek philosophy” (Fazlur-Rahman 1979:257). He called for a contemporary interpretation of the Qur'an based on ethics and reform of the Islamic law to emphasize “purposes” rather than “quantified actions.” Abdul-Karim Soroush supported new interpretations of the Qur'an that differentiated between verses that are “functions of a cultural, social and historical environment” and other verses that are universal (Kurzman 1998:248). Contemporary Islamic reform started across the Islamic world one century ago with “modernist” Islamic scholars, as will be explained next.

In the first half of the twentieth century, a number of Islamic reformists “sought to reconcile Islamic faith and modern values, such as constitutionalism, as well as cultural revival, nationalism, freedom of religious interpretation, scientific investigation, modern-style education, women’s rights, and a bundle of other themes” (Kurzman 2002, p. 4). Two key pioneers of modern Islamic reform are Mohammad Abduh (1849–1905), the Chief Egyptian Mufti at his time, educated in both Al-Azhar and France, and Mohammad Iqbal (1877–1938), an Indian poet-lawyer-philosopher educated in England and Germany. Both scholars, from both geographical sides of the Islamic world, integrated their Islamic and western education into proposals for Islamic reform. A common theme in both proposals was the reinterpretation and reconstruction of

Islamic thought. Iqbal distinguished between universal principles of Islam, on one hand, and their relative interpretation in practical life, on the other. Abduh wrote a Qur'anic exegesis based on a direct understanding of the Qur'an's Arabic language and without quoting any previous exegete for the first time in Islamic scholarship history.

Through new interpretations of the Qur'an, Abduh and his student, Qassim Amin (1863–1908), promoted education of girls and women, restriction of polygamy, and granting Muslim women divorce rights (Kurzman 2002, p. 61). Their writings eventually influenced Egyptian laws and many other Muslim legal systems. Qasim Amin's book, *Liberation of Women*, published in 1899, initiated women's liberation literature in the Arab world as well as Iran, after its translation into Persian in 1900. Interestingly, women's rights movements in Iran also started due to the works of modernist Islamic (male) scholars. For example, Ahmad Kasravi Tabrizi (1880–1946), originally from Azerbaijan, called for academic and political freedoms and the equality of women and men in education. At present, women's rights activists in the Muslim world are typically women in both Islamic and secular establishments, who promote more advanced forms of social and political equality and development (Krause 2005).

Whether Islam is a "religion that has a political character" is a question posed in 1925 by Ali Abdel-Raziq (1888–1966), an Azhari judge and Oxford graduate, and the topic has sparked heated debates since. In a strong reinterpretation style, Abdel-Raziq quoted numerous Quranic verses and prophetic traditions to prove that Prophet Muhammad had only had "authority as a prophet and not dominion as king, caliph or sultan" (Kurzman 2002, p. 32). Abdel-Raziq's view was that the Islamic law is neutral about political systems; hence, Muslim societies are free to choose any political system they deem suitable, without making any political system an "Islamic obligation." These new interpretations opened up possibilities for Islamic scholars after Abdel-Raziq to call for changing dominant monarchical systems throughout the Islamic world, which have been supported by traditional Islamic interpretations.

Present-day popular Muslim politicians, such as Mohammad Khatami, Iran's fifth president; Benazir Bhutto, former president of Pakistan and the first Muslim female president in modern history; Rachid Ghannouchi, founder of the Tunisian Renaissance Islamic Party; and several others, all have supported democracy and democratic practices based on new interpretations of the Islamic scripts (Khatami 1998; Kurzman 1998). Abdulaziz Sachedina, an Islamic

scholar from the University of Virginia, recently explored the "Islamic roots of democratic pluralism" in the Qur'an and evidences of "civil society" in the early Muslim community that Prophet Muhammad formed in order to "legitimize modern secular ideas of citizenship in the Muslim political culture" (Sachedina 2001, p. 132)

## Islamic Organizations that Contribute to Development

The above Islamic principles of justice and charity and modern interpretations of social equality and political reform inspire numerous Islamic organizations across the Muslim world. These organizations, in effect, contribute to the process of human development in the Muslim world even though they might not have specific agendas for development per se. Organizations are thereby categorized as Islamic if they are attached to mosques or announce mission statements or projects that signify religious Islamic goals. Examples of such organizations are given below.

A large number of organizations across the developing world operate through local mosques in order to offer literacy programs, basic health care, orphan-sponsoring projects, and charity collection and distribution programs. Besides contributing to human well-being, these organizations are indirectly contributing to the process of political liberalization, civil society expansion, and "democratization from below" (Krause 2005). Moreover, several organizations directly promote democracy, minority rights, and cross-cultural dialogue in the Muslim world on an Islamic basis, through academic publications, public lectures, activist awards, and research workshops. Specifically active is the Washington-based think-tank, Centre for the Study of Islam and Democracy (CSID), the National Endowment for Democracy (NED), and the Ibn Khaldun Center for Development Studies.

Muslim women's organizations also contribute to the process of social reform. An important example is Women Living Under Muslim Laws (WLUML), an international solidarity organization that rejects unjust laws and customs resulting from different interpretations of Islamic religious texts and the political use of Islam. Another example is the Sisterhood Is Global Institute (SGI), in Jordan, which led a campaign to outlaw honor killing as un-Islamic. Its founder, Jordanian lawyer Asma Khader, was acknowledged by an award from the United Nations Development Program in 2003.

## Theoretical Considerations for Development

The concept of development is a product of western modernism and has been shaped over the past five centuries by the European and American models. Muslim scholars and politicians have dealt with this concept in a spectrum of ways, although two extreme and rather popular positions can be identified. Traditional Islamic scholars and extreme Islamic political groups reject the concept of development altogether based on its western origin and “centricity” (i.e., self-projection), a critique interestingly similar to the western postmodernist critique. On the other hand, several modern reformers and politicians in the Islamic world, in addition to some western politicians, invite Muslims to give up their heritage and follow the modern western development model as the only way to achieve prosperity and solve their problems. As popular as they are, neither of the two positions has been able to achieve a balance between development values, which has attained an undisputed success in the West, and the Islamic heritage, which represents the core religious and cultural identity of Muslims. Muslim countries cannot prosper if they continue to view the world through medieval eyes and ignore the valuable experience of western development. On the other hand, asking Muslims to dissolve into another’s cultural paradigm is ethnocentric, unsympathetic, and unrealistic. There is a need for Muslim thinkers and politicians to absorb the western experience and integrate its lessons of development into their Islamic heritage and identity. The concept of “human development,” as proposed by the United Nations, could be a basis for this much-needed middle ground. Human development, the 2004 UNDP report states, is about “rejecting claims that cultural differences necessarily lead to social, economic and political conflict” (UNDP 2004, p. v). Human development is about realizing basic human rights, for which Islam called fourteen centuries ago.

## ISLAMIC FUNDAMENTALISM

Islamic fundamentalism is a vague term that describes in modern vocabulary the militant ideology of contemporary Islamic movements in the various parts of the Muslim world. However, the term Islamic fundamentalism refers to a group of those Muslims who adhere to the traditional Islamic way of life, accept the traditional Islamic values, and maintain the traditional Islamic worldview. They include reformists (*salafīyya*), conservatives (*usūlīyya*), and the so-called militant Islamists. One important characteristic that is common among them is their rejection of secularism and modernity in all their manifestations, which is a hallmark of the West. This serves to highlight their fundamentalist construct of going back to the basic teachings of the religion of Islam and the *sharī’a* law (Islamic law).

Thus, in order to view correctly the phenomenon of Islamic fundamentalism and place it in its proper perspective, we need to analyze it by examining how it came to appear in the Muslim world in parallel to what took place in the Western world. It forms a pattern of interaction between the Muslim world and the Western world as it is a reaction against the secularism, which is the outcome of Western modernity, and a resistance to colonial powers at the turn of the twentieth century. As a result, the phenomenon of Islamic fundamentalism in the Muslim world can be

explained by analyzing the two tendencies that are its characteristic features. The first tendency is featured among the reformists (*salafīyya*) who initially began the movement to achieve independence from the colonial powers and at the same time reform the Muslim society by advocating the return to the Islamic model of society that existed in the glorious past of Islam. Hence, they tended to conceive of the *sharī'a* law as a universal framework in which the Muslim conduct of life must be incorporated and adapted to the consideration of the needs and necessities of modern times. They favored acquiring knowledge of Western sciences and technology and also tried to implement them. Failing to see any success, the conservatives (*usūlīyya*) advocated going back to the roots and basic principles of the *sharī'a* law, rejecting modernity, secularism, and any kind of Westernization. But finding the penetration of the Western mode of secularization in the Muslim world and thwarted by the intrusion of the Western powers therein, some conservatives from among these fundamentalists, whom we have called militant Islamists, may sometimes react radically and take extreme measures of violence.

Both of these tendencies are manifest in today's Muslim world, and, obviously, these Islamic fundamentalists are not successful in realizing their goal. This raises the question of what is the cause of their failure. To find an explanation, one needs to look at the paradigm of modernity and secularism that reigns in every aspect of Western society and operates on all levels of modern life in the Western world. The basic mistake of Muslim reformists was to think that it was possible to borrow scientific knowledge and technology from the West without adapting to the secularization of Western modernity. The Muslim reformists thought that they would restrict modernity by utilizing the achievements of modern Western sciences and knowledge of technology, not realizing that modernity is a Western project that began in the period of Enlightenment. And it claims, as Kant says, to release humankind from past tutelage and makes it rely on reason, knowledge, and autonomy of man. It is true that Islam encourages the pursuit of knowledge and research, but it should be subservient to and in accordance with the Qur'ānic values and ethics. From this one can discern the basic fallacy of thinking of Muslim reformists and the reason for the failure of their movements. Thus, the militant Islamists from among the fundamentalists find themselves at odds when they are unable to keep pace with Western modernity; its rapid progress and developments in science, technology, industry; and its organizational skills in political, social, ethical, cultural, and economic institutions. They feel their failure is due to the Western

intrusion in the affairs of the Muslim world and not knowing better what to do, they resort to violence. It is in this sense that Islamic fundamentalism is a reaction against the West. One can say that there is a sense of urgency on the part of the Western world to be alarmed in the face of this perceived threat from militant Islam, which directs its attacks on the values of secularism as embodied in the West and its path of development. The danger to the Western world is that this trend of violence, due to the religious movement of militant Islam, may spill into it and become a fertile territory for terrorist activities and a constant source of disturbance.

However, even after such a shocking event that the entire world witnessed on September 11, 2001, the extreme form of fundamentalism that manifests itself in militant Islam cannot be characterized as terrorism. Such activities are simply the outcome of desperation on the part of militant Islam. They certainly do not translate into religious revival or reformation, or bring any changes into the society that Islamic fundamentalism intend to achieve.

In short, there has not yet been an emergence of any spontaneity of thought in these Islamic movements after the colonial period that synthesizes various elements of modernity, transforms them from the perspectives of Islamic religious orientation, and constructs them according to the Muslim legacy, traditions, and worldview.

### ISRAEL

The State of Israel is located on the eastern Mediterranean Sea, on a land bridge that connects Asia with the

African continent. In general, the country experiences long, hot summers, and brief, wet winters. Climate varies, however; in the mountainous Galilee region in the north, summers are considerably cooler than in the Negev Desert of the south, a desert that comprises roughly 60% of Israel's land mass. Tel Aviv, on the Mediterranean, is known for a hot, humid climate, while Jerusalem, only sixty kilometers inland, is located in the Judaeen Mountains, and often experiences light snow in the winter. Thus, despite the country's small size, a variety of topographies and climates may be found.

Some observers see the creation of the modern State of Israel in 1948 as nothing short of miraculous, while for others, it was the beginning of a long hard struggle against a new form of colonialism that seems to have no imminent ending. What is certain is that the country was born in conflict, and has experienced political strife from that moment onward. For while it is true that the birth of the State of Israel was the ultimate realization of the Zionist dream, Israeli independence is seen from the Palestinian perspective as *al-Nakba*, that is, the catastrophic destruction of Arab Palestine. Israel's entire society, culture, political structure, and economy are, in many ways, directly impacted by the country's ongoing efforts to resolve this inherent contradiction.

## Israel's Raison d'être

The foundation of Israel's creation in the Middle East following the British decolonization of Palestine was premised upon the ideology of Zionism, that is, Jewish nationalism. Developed in western Europe, the early Zionist movement sought to (re)create a Jewish presence in Palestine, and to reconstitute the Jewish commonwealth, destroyed two millennia earlier (68–70 CE). This was to be achieved primarily through *aliyah*, that is, mass Jewish immigration to the land of Palestine. The Zionist motto, “a land without a people for a people without a land,” well explains this ideology. What most early Zionists failed to recognize, however, was that the land of Palestine was not empty at all, but was home to a long-established Palestinian Arab community.

Thus, the founding of the State of Israel on May 14, 1948, following the end of the British Mandatory period (1917–1947), was viewed by the Jewish Zionists as the fulfillment of a dream. The subsequent attack by five Arab states on the following day, and the bloody war that ensued, were ultimately overcome by the young Jewish army, and the State was preserved. That said, the war well established the fact

that the Arab world could not and would not accept the existence of what they saw as a colonialist, imperialist State in its midst, and would do everything in its power to, in time, eliminate it and restore Palestine to rightful Arab rule. The outflow of Palestinian refugees from Palestine and into many of the neighboring Arab states only further emphasized to these countries the injustice that the creation of Israel had brought upon the Arab people.

Therefore, the early goals of the State of Israel were twofold. The first priority was the effective absorption of Jewish refugees, primarily from Holocaust-torn Europe and later, in the 1950s and 1960s, from the Arab/Muslim Middle East and North Africa. The second priority was security, insofar as the 1949 armistice with the Arab combatant states did not at all protect the fledgling State of Israel from future military incursions.

Absorption of Jewish immigrants, many coming to the new state with only the shirts on their backs, demanded a huge economic investment. Communal farms, known as *kibbutzim* and *moshavim*, played one key role in the new state. Initiated in the early part of the twentieth century during the Ottoman period (the first *kibbutz* was created in 1910), the movement exemplified the Zionist spirit and mythos of “draining the swamps,” “sowing the fields,” and ultimately, “making the desert bloom.” Moreover, it was typical that these farms be strategically placed, serving not only as agrarian communities, but also as a first line of defense against the Arabs' ability to threaten the young Jewish community, known prior to statehood as the *Yishuv*.

Given the European roots of Israel's founding fathers and mothers, a strong, centralized economy evolved throughout the 1950s as well. Based upon socialist principles, the Israeli political and economic systems relied directly upon planning as the centerpiece of its ideology. Thus, a system of absorption centers was developed very early on (*mercaze klitah*) through which thousands of immigrants, especially those from the Middle East and North Africa, passed prior to taking up permanent residence in the country. Planned new communities, known as “development towns,” were also created throughout the country, designed both to serve as centers of immigrant absorption, as well as to create a de-centralized urban system of “facts on the ground.” Thus, these towns performed multiple functions by establishing a permanent Jewish presence in the country outside of the Tel Aviv conurbation, which helped the Israelis to further lay claim to, as well as to defend, the new state.

Clearly then, the goals of security and absorption often overlapped. The political environment of the

1950s also demanded the development of a strong and prepared military, composed in part of newcomers who typically spoke no Modern Hebrew (*Ivrit*), and who had limited military experience. *Zahal*, the Israeli Defense Force, thus served both to protect the new state from threat, as well as to help absorb new immigrants socially and culturally.

The role of the military was not limited to external defense, however. Internally, the Israeli government also sought to control and pacify the Palestinian Arab community that, as a result of the Independence War, now lived under Israeli sovereignty. While Israeli citizenship was conferred upon these Arabs in 1951, the community remained under military administration until the mid-1960s, largely viewed by the Israeli establishment as the enemy within.

### The Role of the Arab–Israeli Conflict in Israel’s Development

The history of the State of Israel from its establishment in 1948 to the present day has been punctuated regularly by war, guerrilla terror, and communal uprisings. This conflict has played a key role in the State’s economic, political, and social development, and is central to an understanding of Israel’s positioning in regional affairs. It is significant to point out, however, that though the “Arab–Israeli” conflict and the “Palestinian–Israeli” conflict share much in common, the two should not be conflated into a single issue.

On the Arab–Israeli front, Israel was at war with her Arab state neighbors from the inception of the creation of the state. The primary combatant was Egypt, which, under Gamal Abdul Nasser, sought throughout the 1950s to disrupt the Zionist presence in Palestine by allowing *fedayeen* raids to be conducted from Egyptian territory. Israel’s response to these incursions, as well as to the growing sense that an Egyptian-led pan-Arab coalition against Israel’s security had grown to a viable threat against the state, led to the Sinai Campaign of 1956. Sharing the desire to topple Nasser, the British and French assisted Israel in its move against Egypt. Ultimately though, the Eisenhower Administration stepped in, and Israel was forced to withdrawal to the 1949 armistice lines.

The Six-Day War of 1967 may be seen as the most significant war ever fought between Israel and her Arab neighbors. The war was a watershed in Israel–Arab relations, ultimately fostering a split in the Arab–Israeli and Palestinian–Israeli conflicts. Conquering the Sinai peninsula and Gaza Strip from Egypt, the

Golan Heights from Syria, and the West Bank and East Jerusalem from Jordan, Israel was able in six days to effectively annihilate any threat against her future survival. The Arab states were understandably devastated; Nasser offered to resign from the Egyptian presidency as a result and, though the Egyptian people refused his offer, he died a clearly weakened leader only three years later.

As for Israel, these conquests in many ways were considerable, yet potentially damaging to her future development. Having moved on the world stage from the role of “David” to that of “Goliath,” Israel now had the unenviable responsibility of governing over 1 million additional Palestinian Arabs who, unlike the Arabs of Israel, were not offered citizenship, and who would remain under military occupation for decades.

Elated and euphoric with a newly found sense of power, the Israeli government began the process anew of settling the conquered lands through the use of “facts on the ground.” Settlements were built, mostly in the West Bank, some in Gaza, and a handful in the Sinai and the Golan. While the ideology behind building settlements in Gaza, the Sinai, and Golan was largely military and defensive, settlement of the West Bank had an altogether different meaning. Known by Jews as “Judaea and Samaria,” this territory comprised much of the Jewish heartland of the Hebrew bible, lands with far greater historic and religious significance than, ironically, those lands upon which the State itself had been established.

Seeking to redress the travesty of the 1967 War as well as to establish himself as a legitimate heir to Nasser, Egyptian President Anwar as-Sadat led an attack against Israel on October 6, 1973, the beginning of the Yom Kippur/Ramadan War. Though no land was acquired through this war and the Palestinian plight remained unresolved, the war succeeded insofar as it helped to establish el-Sadat as a strong Arab leader willing to stand up to the by-now formidable Israeli Defense Forces. Having proven himself in war, as-Sadat then offered peace. In November 1977, he traveled to Jerusalem where, in front of the Israeli *Knesset* (Parliament), he offered to make peace with the Israeli State.

The subsequent peace treaty, the Camp David Accords, was signed in 1979 by as-Sadat, Israeli Prime Minister Menachem Begin, and US President Jimmy Carter. In return for Israeli withdrawal from its occupation of the Sinai Peninsula, Egypt offered Israel a permanent peace. The treaty effectively ended the Arab–Israeli conflict though not, despite some minor verbiage in the Accords to the contrary, Israel’s ever-festering conflict with the Palestinian people.

## The Role of the Palestinian Occupation in Israel's Political and Social Development

As refugees or people under occupation, the Palestinian community refused to accept Israel's existence. The creation of the State was known as *al-Nakba*, the catastrophe, which effectively destroyed Arab Palestine as it had been known before the end of the British Mandate.

Thus the Palestinian refusal to accept Israel as a reality was translated primarily into acts of what Israel saw as unacceptable violence and terror. Much of this terror was formalized in the late 1960s, following the creation of the Palestine Liberation Organization in 1964. Often directed at non-combatants, this reign of terror came to a head when, at the Olympic Games held in Munich, West Germany, in the summer of 1972, Palestinian guerrillas took Israeli athletes and trainers hostage. A rescue attempt was foiled, and eleven Israelis died in the aftermath.

The constant fear of terror, both inside Israel as well as wherever Israelis might travel, took its toll on Israeli society. A "siege mentality" began to develop whereby Israelis felt that, though not actively at war, the terror that the Palestinians carried out against them made security increasingly paramount. This was most clearly seen following the conquest of the West Bank and Gaza Strip, where civil liberties expected in a democratic state such as Israel suffered under the strain of the need to maintain security. The end result was a military occupation of these Palestinian territories that was heavy-handed and at times, quite brutal. Thus, the occupation of these lands served to damage the development of civil society within the Palestinian community, while at the same time, jeopardized the very nature of the State of Israel as the "only true democracy" in the Middle East region.

The Palestinian uprising (*intifada*) against the military occupation of the West Bank and Gaza (1987–1993) was a turning point in Palestinian–Israeli relations and indeed, as a result, in Israel's political and economic development as a whole. Armed primarily with stones, the Palestinian protesters (typically young boys) squared off against Israeli tanks in a demonstration of unprecedented defiance. Israel's response was a policy of harsh military actions (shootings with live ammunition, tear gassings, and the like). The nature of the Palestinian *intifada* movement as a grassroots protest against the injustices of the occupation found sympathy worldwide, and brought about pressure upon the Israeli State to finally help resolve the Palestinian problem.

The Oslo Peace Accords, secretly negotiated at Oslo, Norway, and signed by Palestinian leader Yasser

Arafat, Israeli Prime Minister Yitzhak Rabin, and US President Bill Clinton in 1993, appeared to clear the way for the resolution of Israel's conflict with the Palestinians. Following the "land for peace" formula, Israel committed to a staged withdrawal from the West Bank and Gaza similar to its withdrawal from the Sinai. In return, the Palestinians offered peace, and the renunciation of future claims to the part of historic Palestine that was now Israel.

At the same time, the resolution of the Palestinian problem allowed Jordan to sign a peace treaty with the Israelis in 1994, and other Arab states to similarly move toward formally recognizing Israel and accepting her into the Arab neighborhood. An Arab boycott against corporations dealing with Israel was lifted, allowing for an unprecedented influx of new direct foreign investment into the Israeli economy. The likes of Intel and other large high-technology firms came to Israel to establish bases in southwest Asia.

Israeli Prime Minister Benjamin Netanyahu was one of a number of Israeli architects of this new economy. Throughout the 1990s, he and others helped foster an era of privatization and movement away from Israel's historic roots as a socialist state. *Kibbutzim* and *moshavim* abandoned their communally oriented ideologies for a more individually based capitalistic economic orientation. With ceasing hostilities with her Arab neighbors and with a newly found emphasis on free enterprise, the Israeli economy boomed.

Significantly, this boom coincided with a major influx of Jewish refugees now free to relocate from the former Soviet Union. Over 1 million new immigrants relocated from the region during the 1990s. Two significant though smaller waves of immigrants from Ethiopia relocated to Israel during the late 1980s and 1990s as well. Socially, politically, and economically, the decade proved to be a particularly successful period of development for the Israeli state.

## Israel in the Twenty-First Century

The outbreak of the *al-Aqsa intifada* (uprising) in September of 2000 once again altered the Israeli political landscape. Now armed with machine guns instead of stones, the Palestinian combatants of the new uprising bore little resemblance to their predecessors of nearly a decade earlier. The Israeli response to this uprising was similar, however, in that once again, Israel followed a policy of disproportionality. Simply put, for every action (roadside attack, killing, assassination) on the Palestinian side, Israel responded with an even greater action—"two eyes for an eye," one

could say. Such a policy was intended to serve as a deterrent to Palestinian activism; in actuality, it did not appear to work, but did apparently serve to further escalate the conflict. The process toward Palestinian statehood and Israeli “normalcy” begun under Oslo in 1993 thus proved to be an excruciatingly slow one.

The death of Yasser Arafat, president of the Palestinian Authority, in late 2004 signaled a possible improvement in Palestinian–Israeli and Arab–Israeli relations. Labeled by the Israeli Government as an “irrelevant” obstacle to peace during the height of the *al-Aqsa intifada*, Arafat remained a symbol of tenacious Palestinian resistance to Israeli interests and demands throughout his seventy-five years. His passing ushered in a new period of reconciliation between Israel and her Arab neighbors that offered new opportunities for the country to finally find a recognized place within a neighborhood that had for so long denied her very existence or legitimacy.

And yet, while the conflict with the Palestinians showed some signs of subsiding in the early part of the twenty-first century, a number of economic and social concerns in Israel not connected directly to the conflict are equally relevant. As Israel has developed economically, the land available for growth has been rapidly shrinking. Resource limitation, most especially fresh water and arable land, continue to plague the country. As Israel urbanizes, these limitations are even more acute. Over 90% of the Israeli population lives on 40% of the land; excluding the desert, Israel is one of the most densely populated countries in the world. Though the desert remains largely ignored, the future development of the state will likely rely in part upon its more effective use.

Socially, the future role of two minority populations in Israel is also likely to be significant. First among these is the religious Jewish community, whose population is rapidly growing. This community has placed demands and expectations on the State which, throughout the 1980s and 1990s, put it at odds with secular Israel. The imposition of certain *halachic* (Jewish legal) regulations has created considerable conflict between and among the majority of Israelis, who do not embrace these rules. The prohibition against the national air carrier El Al flying on Saturdays, the ability of drivers to use certain roads during the Sabbath, the sale of pork and other non-kosher products in the country (increasingly relevant since the arrival of the immigrants from the former USSR), and so on have all proven to be potentially explosive areas of national debate.

Lastly, the role of Israel’s Palestinian citizen minority cannot be ignored. The community has consistently comprised nearly 20% of the population throughout the 1990s and early 2000s. Were it not

for the Soviet Jewish immigration, this percentage would by now be far higher. And yet, this community continually argues that it is largely neglected by the State, and is often ignored altogether. It is apparent in all sectors—education, health care, and public services of all kinds—that the Arab community is underserved. Recent politicization of the community and a marked movement toward an association with the Islamic political parties suggest that ignoring this community and treating Arab Israelis unequally may, in the long run, backfire if policies are not altered significantly.

Thus, resolution of the Palestinian–Israeli conflict, though central to Israel’s political and economic interests, is but one of many concerns that the State of Israel will continue to contend with in coming years. Born in conflict, the State remains a land of contradictions and uncertainties. That said, it is likely that the early Zionists, were they able to see the modern, high-tech society that has been developed in Israel over the past several decades, might marvel at how their fantastic dream is now an existing, albeit constantly evolving, reality.

## ITAIPÚ DAM

Itaipú Dam, located on the upper Paraná River that forms the border between Paraguay and Brazil, is the world's largest-capacity hydroelectric plant, although it will lose the honor to China's Three Gorges Dam when that project is completed. Construction on Itaipú began in 1975, and electricity production began in May 1984. Installed capacity reached 12,600 MW when the last of the planned eighteen generators came online in 1991. Two additional generators brought installed capacity to 14,000 MW in 2004. In 2000, actual production peaked at 93.4 billion kWh, providing 95% of Paraguay's electricity consumption and 24% of Brazilian demand. Itaipú Binacional, the binational state corporation that owns the project, estimates that annual production could exceed 100 billion kWh in favorable years.

Brazil began pre-feasibility studies of the hydroelectric potential of the upper Paraná River in 1956. A territorial dispute with Paraguay in the area of the Guairá Falls was resolved with the Act of Yguazú in 1966, in which Paraguay and Brazil agreed to joint and equal ownership of the hydroelectric energy of the river and to study the utilization of the resource. Importantly, the Act also opened up the Paraguayan side of the border to Brazilian colonists, some three hundred thousand of whom entered the region by 1980.

Argentina was also interested in exploiting the potential electric production of the upper Paraná River. In 1973, Paraguay signed the Itaipú Treaty with Brazil and an agreement with Argentina to construct a major dam at Yacyretá. However, construction at Yacyretá would not begin until 1985, after Itaipú was already producing electricity. Rivalry between Brazil and Argentina had long been reflected in their policies towards Paraguay, and Brazil's greater capacity to sustain financing of the Itaipú project gave it the advantage. However, critics have argued that this "pseudo-rivalry," to use Osny Duarte Pereira's term, masked what was actually collusion between the two powers to gain control of Paraguay's share of this resource.

Construction of Itaipú had significant environmental, economic, and political implications, especially for Paraguay. Creation of the reservoir behind the

dam submerged Guairá Falls, the world's largest waterfalls. Peasant farmers, large agribusiness enterprises, and a growing number of towns moved into the isolated region of the reservoir, home to threatened wildlife and indigenous peoples. The Brazilian "economic miracle" of the 1960s and 1970s helped finance the project. The massive investments in Itaipú helped to generate the Paraguayan "economic miracle," a period of high rates of economic growth fueled by construction and agricultural exports. Paraguay's GDP per capita grew at an average annual rate of 5.07% between 1971 and 1981. Many authors attribute the poor economic performance over the rest of the 1980s (average annual GDP per capita growth at -0.66%) to the conclusion of major civil works at Itaipú. The decline of resources for patronage undoubtedly contributed to the collapse of the regime of Alfredo Stroessner in 1989.

Contracts for civil works, and the associated corruption in the bidding process, created new wealth for well-connected Paraguayan businessmen, who came to be known as the "Barons of Itaipú." Foremost of these was Juan Carlos Wasmosy, President of the National Consortium of Paraguayan Firms, a major contractor. Wasmosy, a member of the long-ruling Colorado Party, won a controversial election to become President of the Republic for the term 1993–1998.

By 1991, when Itaipú was at full production, Paraguay consumed just 1.9% of the total output, but depended on Itaipú-generated royalties and compensations for 35% of the central government's revenue. Royalties paid to both Brazil and Paraguay attracted the attention of local governments on both sides of the river. Brazil passed a royalties law in 1991, calling for distribution of royalties from Itaipú directly to the affected states (Paraná and Mato Grosso do Sul) and municipalities. Departmental and municipal governments in Paraguay successfully pushed a bill through Congress in 1998 for the distribution of royalties to all local governments, but favoring those districts most affected by Itaipú and Yacyretá. These payments are distributed by the Paraguayan central government, not Itaipú.

Nationalists in Paraguay, such as Domingo Laíno, three-time opposition candidate for president, have long called for the renegotiation of the Itaipú Treaty, a proposal Brazil has firmly resisted. The terms of the treaty do not permit renegotiation for fifty years, or until 2023. The treaty requires the parties to sell excess shares of electricity only to the other party, and only at production costs rather than the opportunity cost for alternative sources of energy. Payments for the sale of excess shares are called compensations. In practice, of course, only Paraguay

has excess energy to sell. Brazil has been able to use energy from other sources, made available by the enormous capacity of Itaipú, to sell to Argentina during periods when Argentina suffers energy shortages. Argentina, with a similar arrangement with Paraguay regarding Yacyretá, has been able to return the favor to Brazil thanks to Paraguay's inability to consume its share of the Paraná's hydro-electric production. The prominent critic Ricardo Canese points to this arrangement, and the opposition from Brazil and Argentina to proposals that would allow transfer of energy between the two dams on Paraguayan territory, as evidence of collusion on the part of the regional powers.

The Itaipú Binacional is a state corporation with twelve councilors, two general directors, and a twelve-person Executive Directorate. The posts are evenly divided between Brazilians and Paraguayans. The Binacional is charged with the administration of the dam and with Itaipú's related projects. Not only is Itaipú expected to transfer royalties to the two governments, but it is also expected to generate its own development projects in its zone of influence. Again, it is on the Paraguayan side that the impact is the greatest. In 2004, Itaipú Binacional reported spending US \$15 million in Paraguay to help alleviate problems in the rural sector, spending on education, health, police, road construction, potable water, and even

assisting peasant cooperatives and micro-industries. This is in addition to the monthly payments of over US\$20 million in royalties and compensations.

## **JAGAN, CHEDDI**

Since 1945, politics in Guyana, characterized by ethnic and racial divisions between the Indo-Guyanese and the Afro-Guyanese, have been dominated by two politicians: Cheddi Jagan (1918–1997) and Linden Forbes Burnham. An integral part in Guyana's struggle for independence from the British, in 1950 Jagan formed the People's Progressive Party (PPP). To broaden support for the PPP, Jagan invited Burnham, who came from an upper middle class Afro-Guyanese family, to join the party. Burnham became the party chairman, while Jagan led the PPP's parliamentary group. Jagan was the prime minister of British Guiana from 1961 to 1964 and the president of Guyana from 1992 until his death in 1997.

Jagan, the son of ethnic Indian plantation workers, was born in British Guiana on March 22, 1918. In 1943, after earning a degree in dentistry from Northwestern University and marrying Janet Rosenberg, a Jewish woman from Chicago, Jagan returned to Guyana and immersed himself in politics. In 1946, Jagan was elected to the colony's legislative body. By establishing the PPP, Jagan hoped to increase the pace of the decolonization process in Guyana. Guyana's ethnic conflict, a result of British Guiana's colonial past when European planters imported vast numbers of African slaves and indentured servants from India to work on the sugar plantations, however, threatened to slow the process of decolonization. The PPP, therefore, was initially a coalition of lower-class Afro-Guyanese and rural Indo-Guyanese. During the 1953 elections, campaigning on a center-left platform,

the PPP won eighteen of twenty-four seats in the Legislative Assembly, a new institution created by the Waddington Constitution that granted a limited degree of local autonomy to the Guyanese people. The PPP's introduction of the Labour Relations Act, however, sparked a confrontation with the British, who saw the legislation as a threat to order and stability. On October 9, 1953, the day after the act was passed, the British government suspended the colony's constitution. The PPP had only been in office for 133 days.

By the time the British scheduled new elections in 1957, an open split had developed between Jagan and Burnham. Regardless, Jagan's faction of the PPP won the 1957 elections. Jagan and his supporters in the new government pushed for more rice land, improved union representation in the sugar industry, and more government posts for Indo-Guyanese. Jagan's veto of British Guyana's participation in the West Indies Federation resulted in the total loss of Afro-Guyanese support. In the 1961 elections, under the new Internal Self-Government Constitution, the PPP won twenty of the thirty-five seats in the Legislative Assembly and Jagan was named prime minister. Jagan's government, however, was quite friendly with Fidel Castro's government, refused to observe the US economic embargo on Cuba, and signed trade agreements with Hungary and East Germany. In 1962, Jagan admitted that he was a communist. Concerned about his Marxist ideology, the United States and the United Kingdom conspired to remove Jagan from office. In 1964, new electoral policies facilitated Jagan's removal from

power. A constant presence in the Guyanese political arena, Jagan won the 1992 presidential elections. By this time, however, he had abandoned his socialist philosophy and began to move Guyana toward a free-market capitalist system. He was dedicated to neo-liberal economic policies and privatization of the state-run industries. Within four years of taking power, Jagan reduced the nation's inflation rate from over 100% to less than 5% a year. He lured foreign investors to Guyana's agricultural, mining, and timber sectors. Before his term was finished, however, Jagan died in the Walter Reed Army Medical Center in Washington, DC.

## JAMAICA

Jamaica, the third largest of the four islands known as the Greater Antilles, forms the northern boundary of the Caribbean Sea. It is located between Cayman Trench and Jamaica Channel, the main sea-lanes for the Panama Canal. Known by the Arawak Indians as "Xaymaca" or land of wood and water, Jamaica has long been noted for its natural beauty. The island, with its capital at Kingston, is 146 miles (235 kilometers) long, varying in width from 22 miles (35 kilometers) to 51 miles (82 kilometers). It is actually the tip of a submerged mountain with its topography marked by valleys and mountains. Two-thirds of Jamaica is covered with sedimentary rock, primarily white limestone. The hot and humid climate is tropical, with temperate patches found inland. The population is estimated at 2,713,130 with 91% descended from African slaves and 1.3% descended from Indian indentured servants. Nearly 20% of Jamaicans live below the poverty line with this percentage expected to grow in future years. The Jamaican economy is heavily dependent on services, which now account

for 70% of the gross domestic product (GDP). The country continues to derive most of its foreign exchange from tourism, remittances, and bauxite/alumina.

Jamaica became a Spanish colony when Christopher Columbus stopped at Discovery Bay in 1494 in search of gold. The Spanish never found much in the way of mineral wealth and almost abandoned the colony in 1513 before focusing on agriculture. Agricultural goods would become the mainstay of the Jamaican economy until the twentieth century. The Spanish focused on cattle raising. When the British invaded in 1655, they began using African slaves to produce sugar. Jamaica soon became the most productive of the British sugar colonies and the one most notorious for extreme brutality against slaves. The island is famed as the world's first commercial producer of rum, a derivative of sugar, and this Jamaican national drink remains a major export. Sugarcane remains a major agricultural product in the twenty-first century along with bananas, coffee, citrus, yams, vegetables, poultry, goats, milk, crustaceans, and mollusks.

Gradual dissatisfaction with direct rule from London in the 1930s prompted Jamaicans to protest against being a British Crown Colony. Labor leaders pushed for increased wages as well as political reform, linking the labor movement closely with politics from its inception. In 1944, Jamaica received a new constitution that provided for the full adult suffrage that labor leaders had demanded and gave more power to local elected officials. Two political parties, the Jamaica Labor Party and the People's National Party, formed to vie for control of the government. On August 6, 1962, Jamaica became independent from Great Britain.

The boom in consumer goods and tourism that followed World War II proved to be a bonanza for Jamaica. The Jamaican government, with the support of Great Britain, made a concerted effort to move the economy from its historical focus on agricultural products and heavy reliance on imported goods. The manufacture of cement, utilizing the large limestone deposits in the hills east of Kingston, began in 1952. Jamaica's abundance of sea and sunshine attracted tourists to Montego Bay, Port Antonio, Kingston, and Ocho Rios. The rise of postwar spending on consumer goods, automobiles, and aircraft led to an increase in the demand for aluminum. Jamaica's limestone contains huge bauxite deposits, especially in St. Ann, Manchester, St. Elizabeth, and Clarendon. Bauxite, composed chiefly of hydrous aluminum oxides and aluminum hydroxides, is the principal ore of aluminum. North American companies invested millions of dollars to establish Jamaican bauxite

mining and to refine the ore to the intermediate stage of alumina. By the early 1960s, Jamaica had become the world's largest producer and exporter of bauxite and alumina. The mining, processing, and export of the mineral have remained mainstays of the Jamaican government with Jamaicans holding jobs at all levels of the bauxite industry. Other major industries included textiles, wearing apparel, light manufactures, paper, chemical products, and telecommunications.

The Jamaican economy began to sour in the late 1960s because of structural faults and a deterioration of living standards as well as political missteps. This decline has continued. The expansion in light manufacturing, food processing, and chemicals had slowed by the end of the 1960s. The Jamaican sugar industry collapsed in the 1970s from slow production and low prices. Kingston, a metropolis of over a million residents with thousands commuting from nearby towns to city jobs, experienced infrastructure problems because of sudden massive growth. Jamaica's population grew faster than available resources. As unemployment rose, economically disadvantaged Jamaicans used an increasing number of illegal guns to commit violent crimes. Depressed economic conditions also led to gang violence fueled by the drug trade. The violence badly damaged the tourism industry and prompted rising numbers of Jamaicans to flee the island. Environmental woes also contributed to Jamaica's tourism decline with heavy rates of deforestation, coastal waters polluted by industrial waste and sewage, and damage to coral reefs.

Jamaica had always been closely aligned with Western countries. During the Cold War, the People's National Party government of Michael Manley sought to better Jamaica's ties to communist Cuba. Manley's actions, in the 1970s, scared both wealthy Jamaicans and investors from the United States who feared a communist takeover of Jamaica. The Manley government also began nationalizing financial institutions and tourism properties to protect jobs. Prosperous Jamaicans emigrated and disinvested. The illegal export of capital, estimated to amount to several hundred million dollars, forced the government to seek other sources of capital.

Jamaica is now heavily in debt. In the 1980s, the government engaged in massive borrowing from multilateral lending agencies, primarily the World Bank, Inter-American Development Bank, and the International Monetary Fund. Jamaica's national debt doubled in less than a decade, with little money now available for government projects. The lending agencies now dictate Jamaican economic policy. Inflation is expected to remain in the double digits.

The Jamaican economy faces serious long-term problems. Unemployment is large-scale and crime

continues to hamper economic growth. Interest rates are high. While foreign competition is increasing, the trade deficit grows. The Jamaican government has to maintain its debt payments and resolve these challenging problems.

### JARUZELSKI, WOJCIECH

Wojciech Witold Jaruzelski (born July 6, 1923 in Kurow, Poland) was a Polish army general and politician, premier of Poland from 1981 to 1985 and first secretary of the Polish United Workers (Communist) Party from 1981 to 1990; council of state from 1985 to 1989, and president of Poland from July 1989 to December 1990.

The German-Soviet invasion of 1939 trapped Jaruzelski and his family. Jaruzelski, captured by the Soviets, was transferred to work in a coal mine in Kazakhstan. In 1943, he joined the Polish army led by the Soviet Union and trained in the Soviet cadet school, Ryazan. After his training, he fought in the battle that liberated Warsaw from the Germans. After the war (1947), he formally joined the Polish Communist Party and reached the rank of brigadier general at the age of thirty-three (1956).

In 1960, he became deputy minister of defense. In 1964, he became a member of the Central Committee and was elected the deputy minister of defense. In 1968, he became the minister of defense. Jaruzelski rose to political leadership due to the troubles experienced by the Solidarity movement in the 1970s. The Soviet Union placed pressure on the Polish communist party to contain the striking workers in Gdansk and other key industrial cities. Jaruzelski was widely respected in the Kremlin and in Warsaw. Many viewed him as the only leader who could best

represent Polish interests but also still maintain a strong relationship with Moscow.

In 1981, facing a national crisis and believing that he had no choice to avoid a Soviet invasion, Jaruzelski authorized martial law. The effort was designed to crush the Solidarity movement and to restore political and economic stability. As a result of his action, he became unpopular with many workers and was viewed as a Soviet puppet who was more interested in Moscow's interests than the Polish people. In 1985, he changed his position to Council of State, which still did not bring much success. Jaruzelski defended his actions as necessary and ones that favored Poland. Years later, he wrote in his defense that he felt that he had no choice but to declare martial law or else fall under direct Soviet control. For example, Kremlin documents indicate that Soviet authorities deployed many divisions of combat-ready troops around Poland's borders and in the western USSR. The Soviet Union also conducted a long series of Warsaw Pact military exercises within Poland.

Jaruzelski's administration ultimately failed to suppress the Solidarity movement and the Polish people who sought a more democratic, multi-party form of government. In April 1989, in the first open election allowed, Solidarity won every open seat in the upper house. Due to the limited number of seats available, the communist party managed to keep control by one seat. The new elections resulted in Jaruzelski becoming president in July 1989. However, by September, Jaruzelski's shaky Communist coalition was forced to agree to a Solidarity prime minister. In December 1990, Lech Walesa succeeded Jaruzelski as the first president of post-communist Poland.

Jaruzelski's views were conservative communism, essentially maintaining the status quo. In 1993, Jaruzelski was charged with criminal conduct for allegedly ordering soldiers to fire on striking workers in 1970, but the motions were dropped in 1996 due to jurisdictional issues. After the collapse of communism in Poland, Jaruzelski, like other former communist leaders, became more moderate in his ideology. For example, in 1998, he stated that the 1968 Soviet invasion of Czechoslovakia (which Poland had a minor role in) was a political and moral mistake.

#### JIANG ZEMIN

Jiang Zemin served as general secretary of the Communist Party of China (CPC) from 1989 through 2003. Although semi-retired, he still holds the most powerful position of Chairman of the CPC's Central Military Commission. During his thirteen-year tenure as CPC's top leader, he managed to maintain the momentum of China's economic reform engineered by Deng Xiaoping in later 1970s, and brought about one of the most remarkable period of economic growth in China's recent history.

Born in Jiangsu Province in 1926 to an intellectual family, Jiang joined the Communist Party of China (CPC) in 1946 and participated in the communist underground movement in Shanghai while a college student. He received his college degree in electrical engineering and received some technical training in the former Soviet Union in mid-1950s. Before the Cultural Revolution (1966–1976), Jiang worked for many years as a low-ranking factory manager, served several times as a party leader, and acted as chief of a number of research institutes. Little is known about his role in the Cultural Revolution. His rapid ascendance within the party started in 1980 when he was given a position as vice-chairman of the State Commission on Imports and Exports. He later worked for the State Commission on Foreign Investment, and was believed to play certain roles in the creation of the special economic zones (SEZ) in China's coastal provinces. One of the SEZs, Shenzhen, later became a showcase for China success in market-oriented reform. He was appointed as mayor of Shanghai, China's largest industrial city, and later as secretary of the Shanghai Municipal Party Committee.

Jiang's political career took a dramatic turn in 1989 when a major political turmoil erupted in Beijing over the death of the former party general secretary Hu Yaobang. Hu was believed to be unfairly removed by the party's conservative old guards in 1987. Jiang, because of his peaceful handling of the similar turmoil in Shanghai, was hand-picked by Deng Xiaoping to become the party's new general secretary, replacing the more liberal Zhao Ziyang. Lacking political charisma and experience, Jiang was overshadowed by the

still powerful Deng Xiaoping until Deng's death in 1993, when Jiang was appointed president of the PRC.

Under Jiang's leadership, Mainland China has gone through a process of depoliticalization where economic development took precedent over anything else. His era has been characterized as a period of relative political stability and sustained economic growth. China maintained an average gross domestic product (GDP) growth at 8% annually and fulfilled its goal of quadrupling the nation's total GDP. Jiang's other achievement included the peaceful return of Hong Kong and Macao, China's acceptance into the World Trade Organization (WTO), and China's selection as host city for the 2008 Summer Olympics. Jiang also attempted to leave behind a theoretical legacy which has been codified as the Theory of the Three Represents. The theory emphasizes the need for the CPC to adapt to the changing economic and political environment. The new theory laid some ground work for future party and political reform.

However, Jiang was also known for his poor handling of the Falungong, a popular semi-religious group that emerged in the 1990s, and his conservative attitude towards political reform. At the sixteenth Party Congress in 2003, he helped to engineer the first formal, peaceful power transfer within the CPC, and relinquished most of his power to the younger leader Hu Jintao.

## JIHĀD

The subject of *jihād* is widely misunderstood in the West in the past as well as in the present. Equally, it

has been misused in the Muslim world in the past for political power by Muslim rulers in the name of the religion of Islam. At other times, it was used by Muslims against the Christian world in the past and came to be called "holy war," the phrase being coined during the times of the Crusades. Therefore, it should not be confused with the real meaning of the word *jihād*.

*Jihād* is an Arabic word. It comes from the verb *jahada* and means to strive, struggle, and exert efforts. In the Qur'ān, the word *jihād* is frequently followed by the phrase *fī sabīl allah* (in the path or cause of God). One can strive by serving God in several ways and one of the ways is fighting against the enemy and thereby the association of the word *jihād* with the military connotation. It is true that in the Qur'ān, one finds verses that call for *jihād* and there are also verses which ask for peace. Therefore, one needs to examine the context in which the specific issue is addressed and also how and in what context the idea of *jihād* as just war and war for the cause of religion developed in the formation of *sharī'a* law (Islamic law).

It should be made clear from the very outset that the word *jihād*, which is usually translated as a holy war, is not correct. There is no adjective attached to the word *jihād*. It simply means war. *Jihād* is considered holy because God commanded it and when it is fought in the cause of God. When the Qur'ān provides a direct command to Muslims to fight when they are done wrong, it uses the word fighting (*qitāl*) and not striving (*jihād*). Thus *jihād* in defense of one's life, religion, property and land is a defensive war and is considered a just war. In such a case, Islam does allow the use of force and military action, when all possibilities of reconciliation (*sulha*) are exhausted. Hence, the term fighting (*qitāl*) and its derivatives are employed for the practice of war. Outside the Qur'ān itself, the concepts of *jihād* and *qitāl* came to be associated with one another in the Islamic tradition, but we must keep in mind the implication of the distinction that is ascribed to the prophet Muhammad between the "lesser *jihād*," namely, fighting (*qitāl*) and the "greater *jihād*," namely, striving in the cause of God and not just for the military expansion of the territory of Islam (*dār al-Islām*) or any other such motives.

The classical notion of *jihād*, though it entails the idea of warfare (*qitāl*), has an overwhelming emphasis on the spiritual striving to spread faith and establish peace and order by means of self-discipline and example. Thus the core meaning of *jihād* is inner spiritual striving and purification. It refers to the inner and spiritual striving an individual goes through in fighting against his inclinations, selfishness, and pride. It is an inner and major battle while the fighting and military expeditions are an outward and minor battle.

This becomes evident from the narration of the prophet Muhammad when he returned from a military expedition and said to his companions (*ashāb*, sing., *sahābī*): “This day we have returned from a minor *jihād* (military expedition) to the major *jihād* (self control).

In the *sharī'a* law, *jihād* is considered a collective responsibility (*fard kifāya*) as against an individual responsibility (*fard 'ayn*) unless of course the enemy attacks the territory of Islam or threatens the Muslim community (*umma*). In such a case, it becomes an individual responsibility of a Muslim. It is considered a just war and in that case every Muslim is obligated to participate in it. This war is limited to defensive warfare. For offensive warfare, that is, war for the expansion of the territory of Islam (*dār al-Islām*) and the conquest of non-Muslim territory (*dār al-harb*), the individual members are not obligated to take part in it. Thus the distinction between defensive and offensive *jihād*, namely, just war and war in the cause of religion revolves around the religious obligations of a Muslim in his individual capacity and as a member of the Muslim community (*umma*). This means that *jihād* as just war is the primary and essential obligation incumbent upon every Muslim as an individual and, therefore, sometimes it is called the sixth pillar of Islam. *Jihād* as a offensive combat upon an enemy territory carries not a great priority and, as a matter of fact, is of secondary importance and, as such, depends upon the context in which it is carried out and also in consideration of war ethics as it came to be formulated later in the *sharī'a* law during the time of 'Abbasids.

The notion of *jihād* as war in the cause of religion developed in the *sharī'a* law in a context and in circumstances wherein different factors came into play. The Muslim jurists in the formation of the *sharī'a* law and its regulations had to take into account these factors and accommodate them in construing the *sharī'a* law. The context in which the term *jihād* as a war came into use was in connection with the expansion of the territory of Islam (*dār al-islām*) by the conquest of the non-Muslims (*dār al-harb*) during the time of 'Abbasids. The terms *dār al-Islām* and *dār al-harb* do not occur in the Qur'ān. They were coined later during the 'Abbasid time when there occurred a vast expansion of the territory of Islam. Thus the notion of *jihād* as a war to increase the territory of Islam originated only later. Only the Sunnite jurists considered *jihād* in the sense of offensive war as a collective duty of Muslims in consideration of maintaining mutual relations of the Muslim community with other nations. But the Shi'ite scholars differed in their view because of the context and other political reasons.

Thus the notion of *jihād* as a just war understood as war in defense of religion as it emerges from the Qur'ān does not become an issue for Western modernity, since every nation-state has the right to defend itself and safeguard the rights of its citizens. The problem lies with the *jihād* as an offensive war. But as already explained, it was the political context during the period of 'Abbasids that the *sharī'a* law was formally developing thus forcing Muslim jurists to accommodate the changing conditions that occurred due to the expansion of the territory of Islam so that the Muslim community (*umma*) could maintain its mutual relations (*mu'āmalāt*) and regulate the sanctions concerning worldly affairs (*ahkām al-dunya*) with different religious communities and people.

On the whole, it can be said that *jihād*, as an offensive war, is no more relevant to the Muslim world in the modern context due to the changing conditions that have occurred due to modernity.

### JORDAN

The most important aspect of the Hashemite Kingdom of Jordan is its location. It is a small country (about the size of the state of Indiana) strategically positioned along what have been the major trade routes in the Middle East during most of the first two millennia of the Common Era. Early on, this area served as a buffer zone between regional tribes, countries, and empires. The British made a deal with Emir Abdullah I of the powerful Hashemite family

that if he successfully led the Arabs to revolt against the Ottoman Empire during World War II (known as the “Arab Revolt”), that the British would reward him. With the demise of the Ottoman Empire at the end of World War I, Britain acquired protectorate status over what is today Palestine, Jordan, and Iraq. With the Treaty of London in March 1946, Jordan became a kingdom sharing a common border with Iraq as both countries were to be ruled by brothers of the Hashemite family. So that Jordan would not be landlocked, its border was extended to the Gulf of Aqaba where it created the port city of Aqaba along its twenty-six-kilometer coast. Today, Jordan is surrounded by Israel to the west, Syria to the north, Iraq to the east, and Saudi Arabia to the east and south.

Its location has been both a burden and a blessing. The land has few natural resources except for some phosphates and potash located in the Dead Sea region. It has no oil, no natural gas, and inadequate water resources. It receives almost all of its oil from Iraq at reduced rates. It shares a long border with Israel, which has caused Jordan to be drawn into three Arab wars. Although the Jordanian armed forces performed admirably against the Israeli military, they were still defeated, resulting in lost land and hundreds of thousands of fleeing Palestinian refugees. Jordan also borders Iraq, which, during the reign of Saddam Hussein, forced Jordan to make strategic choices about whether to side with the United States-led coalition against Iraq in 1991 (Operation Desert Storm) and again in 2003 (Operation Iraqi Freedom). King Hussein decided to remain neutral in 1991 due to his concern about unrest among Jordan’s majority Palestinian population if he sided with the West against an Arab nation. As a result of Jordan’s lack of support, the Gulf countries expelled most immigrant workers back to Jordan, causing a significant strain on its economy. King Abdullah II decided to side with the West in 2003, and was rewarded with a significant increase in the annual economic and military foreign aid provided by the United States.

On the other hand, because of its location along the historic regional trade routes, the area was developed by successive empires from the Assyrian, to the Roman, and ending with the Ottoman. It also witnessed some of the historic Crusader campaigns during the turn of the first millennium. As such, there are numerous historic forts, castles, and cities within Jordan that are world-class tourist sites, including the famous Nabatean red-rock city of Petra. The natural beauty of the Dead Sea, residing on the lowest point on the Earth’s surface at 1,224 feet below sea level, draws tourists from around the world.

Much of Jordan is located on a desert plateau. Its capital, Amman, sits at 3,500 feet above sea level,

which minimizes humidity. The temperature is moderate year-round, with lots of sun and little rain. As a result, the only area where agriculture can be effectively cultivated is around the Jordan River (which serves as its border with Israel) to the west and northwest.

The population of Jordan is over 5.5 million, with around 3 million people living in and around the capital city of Amman. Over 60% of the population is Palestinian, most with ties to the West Bank and Israel. Over 35% of Jordan’s population is under fifteen years of age. The median age of the population is only twenty-two years old. King Abdullah II, in his early 40s, is older than over 60% of the population. Most Jordanians are Sunni Muslims.

The education system is British-based and comprehensive. King Abdullah II decided to capitalize on his citizens, the country’s most valuable resource, by focusing his country on information technology (Jordan holds the Guinness World Record for most internet cafes on a city block—in Irbid). The government employs more than 40% of the population; nevertheless, Jordan’s unemployment rate hovers around 30%, which is a continuing source of instability. On the other hand, Jordanian expatriates working in other Arab countries send back remittances exceeding US\$1 billion every year, constituting Jordan’s leading source of income.

Although Jordan is a constitutional monarchy, the king maintains extensive legal powers, including the power to appoint the prime minister, other cabinet ministers, all of the military commanders, and all members of the Senate. He even has the power to dismiss the National Assembly, consisting of the Senate and House of Representatives, and rule by decree. The Prophet Mohammed was also a member of the Hashemite family. Hence, the King of Jordan is one of only two kings in the Arab world able to claim direct lineage to the Prophet (the other being Morocco).

Jordan’s Armed Forces are among the best trained in the Arab world. The JAF consists of around 110,000 people serving mostly in the Army followed by the Air Force, Special Forces, and the Navy. King Abdullah II was the Commander of the Special Forces before he was selected to be king by his father, King Hussein. King Abdullah’s full brother, Prince Feisal, became Commander of the Royal Jordanian Air Force in 2002.

Finally, Jordan prides itself on being the peacemakers of the Arab world. It concluded a formal peace treaty with Israel in 1994. King Hussein, although stricken with cancer, was instrumental in the successful conclusion of the Wye Plantation Arab-Israeli summit in 1998. King Abdullah II continues the effort leading Arab states in the global war against terrorism.

## JUDAISM

Judaism is the religion of the Jewish people and one of the earliest recorded monotheistic faiths. The history and foundations of Judaism constitute the historical roots of other monotheistic religions, such as Christianity and Islam.

Jews understand Judaism in terms of its four thousand-year history. During this period Jews experienced slavery, self-government, conquest, occupation, and exile. Ancient Egyptian, Babylonian, Persian, and Hellenic cultures as well as more modern movements such as the Enlightenment and the rise of Nationalism have influenced them. Thus, it transcends recognized boundaries.

### Historical View

Historians assert that Judaism can be distinguished from other religions that were prevalent when it developed by two characteristics. The first is monotheism. The significance of this belief lies in that Judaism holds that God created people and cares about them. In polytheistic religions, in contrast, humankind is oftentimes created by accident, and the Gods are primarily concerned with their relations with other Gods, not with people.

The second characteristic is the laws that the Torah instructed the Children of Israel to follow. Other religions at the time had temples in which priests would worship their Gods through sacrifice. The Children of Israel, in contrast, worshipped God through everyday actions.

By the Hellenic period, most Jews came to believe that their God was the only God, and so the God of everyone, and that the record of His revelation (the Torah) contained within it universal truths. Jews

began to struggle with the tension between the particularism of their claim that only they were required to obey the Torah, and the universalism of their claim that the Torah contained universal truths.

The outcome of this tension is a set of beliefs and practices concerning identity, ethics, one's relation to nature, and one's relation to God. The subject of the Hebrew Bible is an account of the Israelites' relationship with God since the beginning of time until the building of the Second Temple (approximately 350 BCE).

### Rabbinical View

According to religious Jews, Abraham was the first Jew. Rabbinic literature asserts that he was the first to take on the world and proclaim the folly of worship. As a result, God promised he would have children, starting with Isaac, who would inherit the Land of Israel (then called Canaan) after having been exiled and redeemed. According to the Bible, God gave Isaac's son Jacob the name Israel, meaning "he who struggles with God," and dedicated his descendants to be his nation.

God sent Jacob and his children to Egypt, after they eventually became enslaved, God sent Moses to redeem the Israelites from slavery. After the Exodus from Egypt, God led them to Mount Sinai and gave them the Torah, and eventually brought them to the Land of Israel.

The Torah given on Mount Sinai was summarized in the five books of Moses and together with the books of the prophets is called the Written Torah. The details which are called the Oral Torah were to remain unwritten. However, along the years, as Jews faced persecutions, some of these details were recorded in the Mishna, the Talmud, as well as other holy books.

According to Jewish Law, someone is considered to be a Jew if he or she was born to a Jewish mother or converted in accordance with Jewish Law. A Jew who ceases to practice Judaism is still considered a Jew, as is a Jew who does not accept Jewish principles of faith and becomes an agnostic or an atheist, so too with a Jew who converts to another religion. However, in the latter case, the person loses standing as a member of the (practicing) Jewish community and becomes known as an apostate in said community, though this might not affect his standing with non-practicing Jews.

The basis of Jewish Law and tradition (*Halakha*) is the *Torah* (the five books of Moses). According to rabbinic tradition there are 613 commandments in

the Torah. Some of these laws are directed only to men or to women; some only to Kohanim or Leviyim (members of the tribe of Levi), and many laws were only applicable when the Temple in Jerusalem existed. Less than three hundred of these commandments are still applicable today.

*Halakha*, the rabbinic Jewish way of life, is based on a combined reading of the *Torah*, and the oral tradition—the *Mishnah*, the halakhic *Midrash*, the *Talmud* and its commentaries. The *Halakha* has developed slowly, through a precedent-based system. The literature of questions to rabbis, and their answers is referred to as a practice (in Hebrew, *Sheelot U-Teshuvot*). Over time, as practices develop, codes of Jewish Law are written, the most important one being the *Shulkhan Arukh*, which determines Jewish religious practice until today.

## Jewish Denominations

Judaism today is commonly divided into the following denominations:

1. Orthodox Judaism (includes Hassidic Judaism, Haredi [or Ultra Orthodox] Judaism and Modern Orthodox Judaism)—this denomination holds that God and Moses wrote the Torah, and that the original laws within it are binding and unchanging. While Orthodox Judaism is in many senses what Judaism has been since the Middle Ages, its formation as a movement was a direct response to the formation of Reform Judaism.
2. Reform Judaism (outside of the United States also known as Progressive Judaism, and in the UK as Liberal Judaism) originally formed in Germany as a reaction to traditional Judaism, stresses integration with society and a personal interpretation of the Torah. The original intent was to keep Jews “in the fold” who might otherwise leave the religion and community.
3. Conservative Judaism—outside of the United States is it known as Masorti (Hebrew for “Traditional”) Judaism. “Masorti” is its official title in the State of Israel as well, though most Israelis use the word in a more general sense. According to Conservative Jews, the Torah, while unchanging, is subject to interpretation.
4. Reconstructionist Judaism started as a stream of philosophy by a rabbi within Conservative Judaism, and later became an independent movement.

## Jewish Identity in Modern Israel

Israelis tend to classify Jewish Identity in ways that are very different than diaspora Jewry. Most Jewish Israelis classify themselves as “secular” (*hiloni*) or as “traditional” (*masorti*). “Secular” is more popular among Israeli families of Western (European) origin, whose Jewish identity may be a very powerful force in their lives, but who see it as largely independent of traditional religious belief and practice.

The term *masorti* is most common among Israeli families of “Eastern” origin (Middle East, Central Asia, and North Africa). This term, as commonly used, has nothing to do with the official “Masorti” (Conservative) movement in the State of Israel. There is a great deal of overlap between the two and they cover an extremely wide range in terms of ideology and religious observance.

What would be called “Orthodox” in the diaspora includes what is commonly called *dati* (religious) or *haredi* (ultra-Orthodox) in Israel. The former term includes what is called “Religious Zionism” or the “National Religious” community, as well as what has become known over the past decade or so as *haredi-leumi* (nationalist *haredi*), which combines a largely *haredi* lifestyle with nationalist ideology. *Haredi* applies to a population that can be roughly divided into three separate groups along both ethnic and ideological lines: Lithuanian (non-Hassidic) *haredim* of Ashkenazi origin, Hassidic *haredim* of Ashkenazi origin, and Sephardic *haredim*.

## **KASHMIR DISPUTE**

The Kashmir Dispute is a conflict between India and Pakistan over the possession of the state of Jammu and Kashmir in the northwest part of India. Kashmir has been part of India since October 26, 1947, when the state, according to India, acceded to India. No official Instrument of Accession, however, has ever been publicly shown by the Indian government. Pakistan claims the state properly belongs to Pakistan. It has been the source of innumerable incidents and three wars between the two sovereign nations. Under the rubric of “national security,” the Pakistani military expends a great deal of time, money, and manpower in the attempt at controlling Jammu and Kashmir. The Indian government, which sees itself in competition with China rather than Pakistan, states that there is no Kashmir issue to discuss. Nonetheless, the Kashmir issue is the most serious threat to peace in South Asia.

The state of Jammu and Kashmir was created by the British on March 16, 1847, with the signing of the Treaty of Amritsar. It was a state with an overwhelming majority of Muslim citizens ruled by a Hindu maharaja. From 1925 until 1947 the state was ruled by Mahararaja Hari Singh (1895–1961), a Hindu Dogra Rajput. He acceded to India rather than Pakistan in spite of the fact that Kashmir was over 75% Muslim and in some areas over 90%.

Kashmir became part of India, rather than Pakistan, because of the role of the last Viceroy of British India, Louis Mountbatten (1900–1947). He became Viceroy in March 1947. On June 23, 1947, he announced that India would become independent and would be partitioned between India and Pakistan.

The formerly quasi-independent Indian states, some six hundred of them including Kashmir, would accede either to India or Pakistan. It was expected that Kashmir, because of its overwhelming Muslim population, would join Pakistan.

To delineate the border between India and Pakistan, Boundary Commissions for the Punjab and Bengal were appointed and chaired by British judge, Cyril Radcliffe (1899–1977). If Kashmir was to be connected with India the territory south of Kashmir, especially the districts of Gurdespur and Batala, would need to become part of Indian territory. Radcliffe initially awarded them to Pakistan but then Mountbatten intervened with Radcliffe who reversed himself and awarded them, as well as four other Muslim-majority districts, to India. This gave India access by land to Kashmir.

The Maharaja of Kashmir, however, delayed acceding to either India or Pakistan until Pakistani tribesmen from the northwest frontier spontaneously invaded Kashmir on October 22, 1947, to seize the territory for Pakistan, although Indian troops had been infiltrated into Kashmir long prior to this date. This unorganized foray into Kashmir by Pakistani tribesmen was supported by independent action by officers of the regular Pakistan Army. Accession to India on October 26 by the Maharaja, led to military intervention by India, organized by Mountbatten, who had been appointed the first Governor-General of India, and India was able to secure Kashmir for India with its capital at Srinagar. Pakistan, however, was able to keep the western part of Kashmir, Azad (Free) Kashmir, with its capital at Muzaffarabad.

## KASHMIR DISPUTE

This initial conflict between India and Pakistan led to the first war between India and Pakistan as Indian troops expelled the Pakistanis from Kashmir. On July 18, 1948, the Karachi Agreement established a Line of Control, which has been under observation ever since by nearly forty United Nations observers. A ceasefire took effect on January 1, 1949.

In 1957, Kashmir was incorporated into the Indian union under a new constitution. In 1962, China invaded India in the northeast and many in the Pakistan army believed Pakistan was ready to capture Kashmir. It was not until March 1965, however, when a skirmish developed between India and Pakistan in the Rann of Kutch on the Arabian Sea, that the Pakistan Army believed it was ready to defeat the Indian Army. Demonstrations in Kashmir against the Indian government led to unrest in Pakistani cities and a war atmosphere developed in Pakistan. This was led by Foreign Minister Zulfikar Ali Bhutto (1927–1979) and his Kashmir Committee. On August 8, 1965, Pakistan launched the clandestine “Operation Gibraltar” against the Indian Army in Kashmir. Four Pakistani soldiers were captured and the operation failed almost immediately. To save Pakistani forces in the area the Pakistan Army then initiated “Operation Grand Slam,” which was launched on August 30, 1965, met heavy Indian resistance, and collapsed in three days. In response, India, on September 6, attacked all along the Pakistani border with the city of Lahore as its main target. India could not break through but it was a debacle for Pakistan as the United States withheld provisions and by September 15, Pakistan had almost completely run out of military supplies. The United Nations Security Council became involved and a ceasefire was signed, the Tashkent Agreement, between Indian Prime Minister, Lal Bahadur Shastri (1904–1966) and Pakistan President Ayub Khan (1907–1974) on January 10, 1966, at Tashkent, USSR.

Five years later, when civil war broke out in East Pakistan over the issue of the independence of East Pakistan, India intervened and invaded East Pakistan on December 5, 1971. India easily defeated the Pakistani forces who were cut off from supplies in West Pakistan. India also saw this as an opportunity to destroy Pakistan’s military might and attacked Pakistan all along the West Pakistani border. In a massive, carefully planned attack, military and communications centers and oil and industrial sites were destroyed by Indian naval and air forces. This attack also included Kashmir as India invaded Azad Kashmir and created a new line of control.

Totally defeated, Pakistan’s only real battleground was the United Nation’s Security Council. Debate began on December 8, 1971, when Pakistan was

represented by Zulfikar Ali Bhutto. On December 16, 1971, the Pakistani Army surrendered to the Indian Army in Dacca. This led to the creation of the state of Bangladesh and a new ceasefire agreement, the Simla Agreement, signed between Bhutto and Indian Prime Minister, Indira Gandhi (1917–1984) on July 2, 1972. The Simla Agreement committed India and Pakistan to respect the new line of control in Kashmir of December 1971.

At the end of 1989, Kashmiris began to arm themselves to resist what they called Indian occupation. The state government was dissolved and Kashmir was governed by the central government of India. India reinforced its forces in Kashmir accusing Islamabad of fomenting disorder. Declaring that it would not be cowed, Pakistan responded by massing its forces on the ceasefire line and by declaring a national state of emergency citing the infiltration of Indian forces into Azad Kashmir. In the 1990s, the insurgency in Kashmir, aided and abetted by Pakistan, led to the death of some fifty thousand people. Both Hindus and Muslims have either fled, or been forced to flee their homes, and refugee camps exist on both the Indian and Pakistani sides of the ceasefire line. Skirmishes between Indian and Pakistani forces in Kashmir continue.

The Kashmir dispute took on new dimensions with the development of India and Pakistan’s nuclear weapons program. India detonated its first nuclear test at Pokharon in 1987; Pakistan responded very quickly with its own nuclear tests and the development of nuclear weapons and rockets to deliver those weapons. By the beginning of the new millennium, both countries were believed to have numerous nuclear bombs and the means to deliver them.

In 1999, a “glacier” war developed over the Kargil glacier, Point 5353, a 17,397 foot peak in Indian territory, 127 miles north of Kashmir. The Pakistanis captured the glacier but the battle continued for eleven weeks and cost some 1,200 lives. Pakistan eventually withdrew. In October 1999, General Pervez Musharraf came to power in Pakistan in a military coup. The glacier war led to a two-year freeze in official contacts between the two countries. Both sides exchanged artillery fire in Kargil on July 20, 2001, and the area remained a site of conflict as local people exited the area en masse and the state government built hundreds of underground shelters.

Tensions between the two countries continued to remain high and a full-scale war seemed a distinct possibility following the terrorist attack on the Indian parliament in New Delhi on December 13, 2001. Six gunmen stormed into the parliament house with grenades, automatic rifles, and a suicide bomb initiating a ninety-minute battle with security forces. All six terrorists were killed, seven Indians were also killed,

and nearly twenty people hospitalized. The attack bore similarities to a raid on the Kashmir state assembly on October 1, 2001, when thirty-eight people were killed. India blamed Pakistan for the attack on the parliament. Pakistani President Pervez Musharraf immediately condemned the attack as did the All Parties Hurriyat Conference, an umbrella group of two dozen groups in Kashmir demanding self-determination for Kashmir. Nonetheless, the Indian Army went on high alert all along the Pakistani border and the Pakistani Army responded in a similar manner.

The Indian government blamed the Lashkar-e-Taiba (Army of the Pure), one of the most extremist Muslim separatist groups, for the attack of December 13 and demanded that Pakistani arrest members of the group along with leaders of Jaish-e-Mohammad (Army of Mohammad), another militant group, and seize their financial assets. Pakistan refused to be dictated to by India and relations reached a critical stage as India recalled its High Commissioner to Islamabad on December 21, cut travel links between India and Pakistan, and both armies mobilized for war. Missiles were moved to the Kashmir border with India stating that the missiles were “in position” and Pakistan responding that their missiles were “on alert.” Indian planes flew near the Pakistani border every few minutes and frontier forces exchanged gunfire.

At the end of December 2001, Pakistan gave signs that it was willing to crack down on Islamic militants and thus brake the stalemate between the two countries. On December 24, Pakistani President Pervez Musharraf froze the bank assets of the Lashka-e-Taiba and the Jaish-e-Mohammad. In addition, in a speech given on December 25, Musharraf stated that Pakistan had become a “nightmare” because, in part, of the militants. This was a profound change in Pakistani politics, as Islamic militants had almost never been criticized in Pakistan before. It was in line, however, with the September 11, 2001, attacks by Islamic fundamentalists and the American-led war against Osama bin Laden and the Taliban in Afghanistan. Musharraf had aided and abetted the American response and Musharraf’s attack on Pakistani militants was viewed within the worldwide war on extremists. Indian Prime Minister Atal Behari Vajpayee, however, stated that the two countries were moving closer to war.

A turning point in the crisis occurred on January 12, 2002, when President Musharraf gave a sixty-two-minute televised address to the nation with the rest of the world listening eagerly. He announced that a number of Islamic extremist organizations had been banned and that strict action would be taken against anyone engaging in terrorism, even in behalf of the

freedom of Kashmir. He promised to end the use of Pakistan as a base for terrorism in Kashmir. In future all madrassas (religious schools) and mosques would be registered and controlled by the government. While he reiterated Pakistan’s position that negotiations should be held with India over Kashmir, and refused to hand over the twenty or more Pakistani citizens wanted by India, the speech was a highly conciliatory one for a Pakistani president and was viewed as nothing less than a breakthrough in the stalemate.

It was hailed as the most important speech given in three decades by a Pakistani leader as it reversed thirty years of state-supported militancy among religious groups. The Pakistani press hailed Musharraf as the savior of the nation. Over five hundred extremists were arrested and five religious groups banned. By the end of January 2002, the threat of war seemed to have passed although tensions remained high and no one believed that the Kashmir issue would cease to bedevil India-Pakistan relations and be the cause of tension, skirmishes, and perhaps even war in the future.

#### KAUNDA, KENNETH

Kenneth Kaunda is one of Africa’s pre-eminent statesmen. He led Zambia (formerly Northern Rhodesia)

to independence in 1964 and served as that country's first president until 1991. In 1953, Kaunda's fierce resistance to the British imposition of the Federation of Central Africa—what became the Federation of Rhodesia (now Zimbabwe) and Nyasaland (now Malawi)—culminated in the formation of the African National Congress (ANC). In 1958, he broke from the ANC to form the Zambia African National Congress, of which he was the president until his imprisonment, from May 1959 to January 1960, for inciting political agitation. Kaunda used his time in prison to develop his political philosophy, the *Zambian Humanism*, with which he sought to redefine the main values of Zambian society.

Upon his release, Kaunda became the president of the United National Independence Party (UNIP). Working with Dr. Banda's Malawi Congress Party in Nyasaland, Kaunda achieved the dissolution of the Federation of Rhodesia and Nyasaland in 1963. With the advent of Zambia's first black government in 1962, when the UNIP won fourteen seats in the Legislative Assembly, Kaunda became the Minister of Local Government and Social Welfare. He was elected the prime minister of Northern Rhodesia, from January until October 1964, when he assumed the presidency of independent Zambia. In addition to these internal accomplishments, Kaunda was at the forefront of Pan-Africanism, together with such notables as Kwame Nkrumah, Julius Nyerere, and Leopold Sédhor.

### **Kaunda's Political Philosophy: Zambian Humanism**

In a number of speeches and books, Kaunda promoted his philosophy of humanism—a human-centered doctrine couched in a high valuation of egalitarianism, communalism, racial equality, and non-violence in political life. First promulgated in 1967, Kaunda's humanism is not much different from the African socialism popularized in the 1960s, and even beyond, by African leaders such as Ghana's Nkrumah and Tanzania's Nyerere with his notion of *Ujamaa* (or familyhood). What sets Kaunda's humanism apart from the others is the primacy it accords to human dignity, Christian ethics, and the principle of non-violence. Kaunda latter equivocated on his position on violence, at the zenith of the Rhodesian liberation struggle, with the realization that the issue of violence can hardly be conceptualized in “either/or” terms. As he puts it in *Kaunda on Violence*, “It does not always follow that the way of non-violence is the more perilous. There may be times when it is the only sane

course of action. Nor is armed struggle always the guarantor of national security” (p. 29). Like other versions of African socialism, Kaunda's humanism derives much of its insights from African traditions. At the same time, Kaunda was pragmatic enough to embrace ideas not only from modern Zambia, but also from the economic and political systems of the East and the West. We thus find Fola Soremeku, once likening Kaunda's humanism, in an article in the *Times of Zambia* (February 12, 1971) to Janus—the Roman god of gates, with one face looking back and another looking forward.

### **Contribution to National and International Development**

With judicious reliance on both private and public sector enterprises, Kaunda made a remarkable contribution to Zambia's post-independence development, especially in the areas of education, health care, manufacturing, and electrification, and also helped alleviate the forms of institutional and individual racism that were so prevalent in Zambian society. Zambia had no more than one hundred university graduates and 1,200 people with secondary education when it became independent, and Kaunda saw education as the first major problem to be tackled if Zambians were to be truly independent. Within eighteen months of the nation's transitional Development-Plan, instituted after independence, the number of secondary school students was doubled; and by the time the first full Development-Plan was completed in 1970, there were more than five times many students in secondary schools as in 1964. Meanwhile, the nation's first university, University of Zambia, established in 1965–1966, had more than one thousand undergraduate students by 1970.

Aided by the high prices of copper (the leading export) throughout the 1960s, Kaunda developed infrastructure across the country: An oil pipeline was extended from Dar es Salaam, Tanzania, to Zambia in 1969; the Great North and Great East Roads were expanded and tarred; and electricity was extended to many parts of the country. Drawing on his humanist philosophy, Kaunda increased the size and role of the public sector and boosted local control of the Zambian economy, which was dominated by foreigners at the time of independence. To limit personal aggrandizement among politicians and senior civil servants, Kaunda instituted a code of leadership in 1970, a move that caused intense apprehension among the elites. Individual liberties were for the most part respected during the reign of Kaunda, notwithstanding

occasional internal political and ethnic tensions, as well as threats from Zambia's white minority-ruled neighbors. In 1972, faced with increasing opposition, Kaunda made Zambia one party state, banning all parties except his UNIP—quite an ironic, if not unfortunate, move for a leader who advocated for human rights with his humanist philosophy.

In addition to these achievements within Zambia, Kaunda served as the President of the Pan-African Freedom Movement and as the Chairman of the Front Line States. At a great political and material cost, Kaunda offered his country as a base for liberation movements from countries such as Angola, Mozambique, and Rhodesia. Kaunda was instrumental, with the likes of Desmond Tutu and Julius Nyerere, in the release of Nelson Mandela in 1990. Also, Kaunda was actively involved in the Nonaligned Movement, having served as its Chairman in the early 1970s. In 1991, intense pressure compelled Kaunda to return Zambia to multi-party elections in which his UNIP lost to the Movement of Multiparty Democracy, led by Frederic Chiluba. Kaunda handed over power to Chiluba, who amended the Zambian constitution to prevent Kaunda from contesting in the nation's next election. Kaunda retired from politics in 2000, devoting much of his time to peace and conflict resolution in Africa, through the Kenneth Kaunda Peace Foundation.

## KAZAKHSTAN

Lying at the conjunction of Europe and Asia, landlocked Kazakhstan shares borders with Russia to the north, China to the east, and Turkmenistan, Uzbekistan, and Kyrgyzstan along its southern margin. The

country is the ninth largest in the world in area, but contains a population of only about 17 million. Most of this massive state is either arid steppe land or true desert, although the eastern borderlands intersect the Tien Shan and Altai ranges, and Khan Tengri, a peak that lies on the Kazakh-Chinese border, approaches 23,000 feet in elevation. Three large lakes punctuate the dry landscape from west to east: the Caspian Sea, the Aral Sea, and Lake Balkash. Kazakhstan is dominated by a dry variant of continental climate, with lengthy cold winters and relatively short warm summers. Winter temperatures in the northern section of the country average only around 0°F, while summer highs in the south sometimes reach near 100°F.

The foundation of Kazakh ethnicity dates from the Mongol invasions of the thirteenth century, when Mongol and Tatar elements intermingled with nomadic Turkic peoples occupying this section of the Eurasian steppe. An emergent identity was reinforced through the establishment of the Kazakh Khanate in the early 1500s, which eventually led to the formation of three divisions, or *hordes*: the Great Horde, whose territory lay in eastern Kazakhstan, the Middle Horde which occupied the central and northern steppe, and the Small Horde, living in the lands adjacent to the Caspian in the west. From the late 1600s to the early 1700s, the Kazakh state was nearly overrun by an invasion of the Kalmyks, an Asiatic people from Siberia. This threat forced the Kazakhs to seek assistance from Russia, a request that paved the way for eventual absorption of the Kazakh steppe lands into the Russian Empire. Under Soviet rule, in 1936 Kazakhstan was granted the status of an SSR (Soviet Socialist Republic) until declaring independence in 1991. During the period of collectivization under the Soviets (1929–1938), it is likely that at least 1 million Kazakhs starved to death, and the number of livestock in the republic declined dramatically.

Kazakhstan is well endowed with natural resources, and possesses abundant land for crop cultivation and animal husbandry. Wheat is a major crop in the northern reaches of the country, while irrigated cotton, rice, and specialty crops dominate in the south. Much acreage is devoted to pasture, particularly in the drier regions. Large coal deposits are found near the city of Qaraghandy (Karaganda), and significant quantities of valuable ores (gold, silver, chrome, tungsten, zinc, copper, iron) are present throughout the country. Most significantly for the country's future, large deposits of petroleum have been discovered in the west, along the littoral of the Caspian Sea. The industrial base of Kazakhstan is concentrated in the northern half of the country and in Almaty, the former capital and largest city. Industrial output

## KAZAKHSTAN

emphasizes the production of steel, petrochemicals, machine tools, and agricultural equipment.

Significant petroleum deposits were discovered in western Kazakhstan in the late 1960s, and by the late 1980s some 6 billion barrels worth of proven reserves had been identified in the Tenghiz field, lying roughly between the Ural River and the Aral Sea. Foreign oil companies have shown considerable interest in these resources, particularly Chevron, which in the mid-1990s had committed to investing nearly \$20 billion in the region.

A major obstacle to the development of Kazakhstan's oil resources has been the country's geographic isolation and distance from global markets. Several pipeline routes have been proposed that would allow Kazakh oil to reach ports in nearby countries, and when completed will allow for the exportation of possibly seven hundred thousand barrels per day. Kazakhstan's oil, industrial capacity, and relative stability have enabled it to attract a greater amount of foreign investment than any other Central Asian state. Some additional income is collected through a leasing agreement with Russia, which allows the Russian space agency to continue to use the Baikonur Cosmodrome, the main launch site for the Soviet space program.

Environmental damage from the Soviet period continues to plague independent Kazakhstan. Two regions in particular were devastated under the Soviets: the Aral Sea and its environs, and the city of Semey (Semipalatinsk), which is located near the main nuclear testing site used by the Soviet military. Hundreds of atmospheric and underground nuclear tests were conducted in Kazakhstan between the late 1940s and late 1980s, and near Semey high rates for birth defects, certain cancers, and infant mortality have been linked to testing during the Soviet regime. The Aral Sea has undergone an unprecedented decline in recent decades, as the rivers supplying it with fresh water were overused by cotton producers in Uzbekistan and Kazakhstan.

The ethnic geography of Kazakhstan compounds the challenge of constructing a civil society. At independence, Russians accounted for approximately 38% of the population, with Kazakhs holding almost the same percentage, at about 40%. Although the percentage of Russians may have dropped since the early 1990s, several of the northern regions contain either a Russian majority or plurality. The divide between Kazakh and Russian culture has made the effort to create the apparatus of a "Kazakh" state more problematical, as many in the Russian minority resent efforts to make Kazakh a national language and view any movement to reinvigorate Kazakh society's Muslim roots as an attempt to "Islamicize" the country.

The development of democratic institutions has been slow to materialize. Although certainly more democratic than most of its neighbors, even by late 2001 the Kazakh administration continued to operate in an authoritarian mode, limiting the activities of unofficial media and opposition parties, with the greater part of political power concentrated in the hands of President Nursultan Nazarbaev. On the other hand, Kazakhstan has avoided the instability that has troubled some other Central Asian states, and shown the capability to capture badly needed foreign investment. Given its great size, vital resources, and strategic position, Kazakhstan is poised to become a major regional and international player on the global stage.

## KENYA

The Republic of Kenya is located in the eastern region of Africa. It borders the Republic of Uganda to the west; the Republic of Tanzania to the south; the Indian Ocean to the southeast; the Republic of Somalia to the east; the Republic of Ethiopia to the north; and the Republic of Sudan to the northwest. Bisected by the equator, it lies between approximately 4° N and 4° S and 34° E and 41° E. It has a total area of 580,370 square kilometers, including 13,369 square kilometers of permanent water surface. Kenya's topography is characterized by erosional plains that rise from the Indian Ocean towards the highlands in the central region, forming their base at about 1,500

meters above sea level. The highlands have isolated extinct volcanoes, including Mount Kenya (5,200 meters) in the central region and Mount Elgon (4,321 meters) on the western border of the country. The Great Rift Valley cuts across the country from north to south through the highlands, where it measures 65 kilometers wide and bounded by escarpments of 600–900 meters high. The plains generally incline westwards to Lake Victoria on the southwestern border of the country.

About 84% of Kenya's area has arid and semi-arid climatic conditions. This vast area in the northern, northeastern, and parts of the eastern regions of the country receive unreliable rainfall of less than 760 millimeters annually. Only 16% of the country receives adequate rainfall for cultivation. This agriculturally high potential area is found in the highlands, the Lake Victoria basin and along the coastal strip of the Indian Ocean. The settlement pattern has seen 80% of Kenya's population of 29 million (as per the 1999 population census) concentrated in the agriculturally high potential regions while the rest is found in the marginal areas. Whereas the arid and semi-arid regions are the least populated with a density of three persons per square kilometer, the density in the high potential regions is over 230 persons per square kilometer.

The boundaries of Kenya were drawn up during the colonial period. When the British government took over its formal administrative responsibility in June 1895, the territory was named the East Africa Protectorate. To facilitate communication between the Indian Ocean and Uganda, where they had also established their "sphere of influence," the British started the construction of the Kenya–Uganda railway, which reached Kisumu (then known as Port Florence) on the shores of Lake Victoria in 1902.

Initially, the British did not have immediate plans on what to do with the territory other than securing a way to Uganda from the Indian Ocean. It happened that the Kenya–Uganda railway cut across some of the country's best agricultural land. It was on this land that the British started to experiment with the possibility of establishing commercial farming. A policy decision was subsequently made to embark on large-scale plantation agriculture by white farmers to produce coffee, tea, sisal, and pyrethrum for export. This required large tracts of land for exclusive white settlement. It was made available through the alienation of agriculturally high potential land in the highlands from the indigenous Africans, who were henceforth relocated to agriculturally marginal lands that were labeled "reserves."

This settlement arrangement was accompanied by a racial approach to the development process where

European settled areas were developed at the expense of the "reserves." Africans were barred from growing lucrative cash crops like coffee and tea in order to ensure that they remained poor in order to supply cheap labor on European farms at a minimum wage. They were also restricted to their unproductive "reserves" by introducing identification cards (*Kipande* in *Kiswahili*) that were used to monitor their movement and labor provision. Medical, educational, and other social services were organized on strict racial lines, with Africans getting the worst or none at all, yet they were heavily taxed to fund the provision of the services. This lopsided development formed the basis of the rise of African nationalist movements to fight for independence. Besides the various political organizations that were formed after World War II, the *Mau Mau* rebellion of 1952 was the most effective in the struggle for independence. Though the rebellion was militarily defeated in 1953, the British responded to the uprising by initiating economic, social, and political reforms between 1953 and 1960, culminating in the granting of independence to Kenya in 1963. Jomo Kenyatta, who led the Kenya African National Union (KANU) to beat its archrival, the Kenya African Democratic Union (KADU), during the independence elections, became the first president of the country.

At independence, the KANU government inherited the colonial regime's capitalist approach to socio-economic development. In 1965, it moved to adopt African Socialism as its development ideology through Sessional Paper No. Ten on "African Socialism and its Application to Planning in Kenya." This ideology aimed at reviving traditional African society in the midst of a modern monetary economy. Social egalitarianism, mutual responsibility, social justice, equal opportunities for all, human dignity, and the elimination of the exploitation of man by man were some of the objectives of African socialism. They were to be realized through a mixed economy that would combine capitalist and traditional African society ideals. While foreign investment and private ownership of property were to be allowed, there would be control against excessive personal accumulation; provision of social welfare services by the state; and substantial participation of the state and the co-operative movement in the economy. Nevertheless, the structural means to realize these were not put in place, such that the private sector became a leading actor in the economy and provision of social services. Indeed, capitalism formed the basis for the transfer of land in the former "white highlands" to indigenous ownership in order to Africanize agriculture. Land was made available to anyone who had the ability and capacity to purchase without any limits on

accumulation. Co-operative savings and credit schemes were started to enable groups and individuals to raise funds for the purpose. Further private land ownership reforms, including land adjudication, consolidation and registration, were initiated in the early period of independence. These efforts in land reform partly contributed to the predominance of agriculture in the Kenyan economy, despite attempts to industrialize and a flourishing tourist trade.

Kenyan's record of socio-economic development since independence has generally been on a downward trend. Between 1964 and 1973, the country achieved commendable economic growth that translated into improved living conditions of the people. gross domestic product (GDP) grew on average by 6.6%. With per capita income growth rate of 2.6% per year and a steady growth in the provision of social services by both the state and the private sector, the majority of Kenyans were able to satisfy most of their basic needs. During this period, Kenya was referred to as the "African miracle" due to the exemplary economic and general development performance. This good performance was, however, not sustained.

From 1974, the growth rate of GDP declined throughout the remainder of that decade. This was due to the poor linkage between agriculture and industry, especially the reliance on imported intermediate inputs and machinery in the manufacturing sector that could not fuel agricultural productivity; rising oil prices following the first international oil crisis of 1973; recurrent drought; global economic recession; and worsening terms of trade at the international market. By the early 1980s, the rate of economic growth could not keep pace with the rate of population growth, culminating in a tremendous decline in per capita income. This situation reversed the steady and continuous gains in the standard of living that most of the citizens had enjoyed. This downturn in economic performance and the general development process compelled the government to adopt the World Bank and the International Monetary Fund (IMF) prescribed Structural Adjustment Programs (SAPs) in the early 1980s. Nevertheless, the implementation of SAPs did not help much as the rate of economic growth continued to decline. People's living conditions deteriorated with the average growth rate of per capita income falling to 0.4% by 1989.

In 1991, Kenya was hit hard following the suspension of development aid by bilateral and multilateral donors due to bad governance and the violation of human rights by President Moi's regime. This saw the GDP growth rate decline to 2.3% while per capital

income fell to its lowest level of -2.0%. In 1992 and 1993, the GDP growth rate further declined to 0.5 and 0.2%, respectively. This decline in economic performance was reflected in the deterioration of people's livelihoods. The introduction of "cost-sharing" in the provision of social services as prescribed by SAPs, in the midst of increasing unemployment and rising inflation rate, worsened people's living conditions. Most Kenyans became unable to meet medical and educational expense. On its part, the government could not afford to maintain or develop the socio-economic infrastructure.

There were signs of economic recovery in the mid-1990s when economic performance picked up relative to the early years of the decade. The country recorded improved GDP growth rates of 4.8 and 4.6% in 1995 and 1996, respectively. However, this rate dropped once again to 2.3% in 1997 following the suspension of aid by donors, citing corruption and bad governance. Since then, the annual growth rate of GDP has been on the decline. Whereas this rate stood at only 1.8% in 1998, it had declined to 1.4 in 1999. Economic performance in the year 2000 even worsened following the long draught that culminated into the worst shortage of electricity and water in the country. These commodities had to be rationed for consumers, resulting into a sharp drop in the manufacturing sector. The GDP growth rate fell to its lowest ebb of -0.3%. The economy, however, started picking up in 2003 when the GDP growth rate rose to 1.3%.

As in the previous decades, the worsening economic performance from the mid-1990s was accompanied by an increase in the level of poverty. The national overall poverty level stood as 52.6% in 1997. Whereas 53.1% of the population in the rural areas was absolutely poor, 50.1% of the urban dwellers were living below the poverty line. It was estimated that 54% and 56% of Kenya's population were absolutely poor in 2000 and 2002, respectively. The implication is that the level of poverty in Kenya has been rising over the years, but more so in the 1990s decade.

There has been an interesting correlation between the trend of socio-economic development and the growth of civil liberty in Kenya. During the first decade of independence when the country recorded commendable achievements in socio-economic development, there was a relatively competitive political environment that afforded citizens the liberty to participate in the political process as a result of Kenyatta's "princely" style of personal rule. The "prince," unlike the autocrat, does not seek to destroy politicians who represent potential challenge to his power, but plays them off against each other while seeking to bring them into ever-closer dependence on

him. He is a manipulator who avoids committing himself to any course of action, but rather moves with the consensus that he manipulates competing factions to achieve. Thus, Kenyatta created and manipulated various patronage factions to achieve his ends. The competition that ensued among these factions to get Kenyatta's favors, coupled with a semi-competitive parliamentary electoral system, contributed to the evolution of a relatively pluralist political environment that tolerated civic participation in the political system.

Nevertheless, the rising criticisms against the state from the mid-1970s saw Kenyatta change his governance style to autocratic personal rule in order to stamp out critics and assert his authority. It is during this era of increased authoritarianism, when civic liberties were curtailed, that the pace of socio-economic development started to slacken. This worsened during the Moi era following the death of Kenyatta in 1978. Former President Daniel arap Moi's regime was essentially an autocratic personal rule that extended authoritarianism beyond the level Kenyatta had left it. Moi curtailed civic liberty by establishing himself as the master of the political stage and went on to dominate as well as direct all centers of political power, including civil society organizations. Kenya's development record worsened in the meantime. Though increased authoritarianism contributed to the emergence of more civic organizations to demand for political pluralism, culminating into the adoption of a multi-party political system in 1991, democratic governance remained an illusion throughout the Moi era.

A united opposition coalition eventually brought to an end four decades of KANU rule in the December 2002 general elections. In the run-up to the elections, fourteen of the hitherto weak and fragmented opposition political parties formed the National Rainbow Coalition (NARC) to challenge KANU and went on to win the election. The NARC government has adopted a laissez faire approach to administration where the president, unlike his predecessor who strode the entire political scene, has given his ministers room to run their ministries without interference. There is remarkable freedom of expression as evidenced by more liberal and critical electronic and print media. The government is also in the process of completing the review of the country's constitution that has been the source of authoritarianism. In the economic field, the government is putting in place structures to revive the economy and there are prospects for improved economic performance and socio-economic development relative to the previous regime.

## KENYATTA, JOMO

The first president of Kenya, Jomo Kenyatta (1863–1918) was a member of Kenya's largest tribe, the *Kikuyu*. Respectfully referred to as *Mzee*, a deferential term meaning "wise elder," Kenyatta's life was intricately intertwined with the relatively short yet immensely influential era of British colonial rule in Kenya. His tenure as head of state from 1963 to 1978 reflected the incongruity between the initial optimism that enveloped liberation and the difficult realities of governing newly independent, multiethnic nation-states in the twentieth century.

Born Kamau wa Ngengi in Kiambu District, Kenya, in 1893 (date unconfirmed), Kenyatta attended the Church of Scotland Missionary School, where he received primary education and carpentry training. Later, he was employed by Nairobi City Council as water meter reader and stores clerk. He

became active in the *Kikuyu Central Association* (KCA) and in 1929 was sent to London to present the Kikuyu case of grievance for land dispossession to the British Colonial Office. He ended up spending over fifteen years of his life in Europe, in the process taking both a Master's degree and a British wife. While there he adopted his name—*Jomo* means “burning spear” and *Kinyata* a type of beaded belt he favored—and used it to publish *Facing Mount Kenya*. Though ostensibly an ethnographic account of Kikuyu culture, written as his MA thesis under the tutelage of eminent anthropologist Bronislaw Malinowski, in reality this was a highly symbolic political statement. Here was a major scholarly work on the internal workings of an indigenous African society written by a member of that group. The cover featured Kenyatta dressed in a traditional animal skin cape while fingering the point of a spear.

After his return to Kenya in 1946, organized the World Trade Union Conference and co-founded *Pan-African Federation*. In 1947, he was elected President of the *Kenya African Union*, an incipient political organization thinly cloaked as a trade/labor union. Kenyatta spent the next few years urging his fellow Africans to work hard, shun idleness and alcohol while simultaneously lobbying the colonial government to return Kikuyu land that had been given to white settlers. For both settlers and the colonial administration Kenyatta became symbolic of *Mau Mau*—a guerilla movement based in the Mount Kenya forests. Paradoxically, Kenyatta was not involved in active resistance. Indeed he went to great lengths to disassociate himself from this movement, whose members referred to themselves as the *Land and Freedom Army* and were led by figures such as Dedan Kimathi. Nonetheless, Kenyatta, an articulate and charismatic public figure, was perceived as a threat. Consequently he and five colleagues were arrested, tried, and convicted of treason. They were imprisoned in a remote region of northwest Kenya from 1953 to 1961.

After release from prison, and just prior to Kenya's independence, in a masterfully crafted speech delivered in Nakuru, on August 12, 1963, Kenyatta convincingly reassured three hundred white settler farmers that they had little to fear from him and that their interests would be well represented in his government. To the chagrin of many freedom fighters, his prophesy turned out to be accurate.

He was appointed prime minister of Kenya on December 12, 1963, and elected president exactly a year later. He would be re-elected twice, in 1969 and 1974. Under his slogan *harambee*—“let's all pull together”—the first years of Kenyatta's leadership reflected the euphoria that pervaded post-independence

Africa. While Tanzania to the south took a more socialistic approach to development called *ujamaa* or “familyhood,” based upon the vision of President Julius Nyerere, Kenya under Kenyatta took an unbridled capitalistic tack (Barkan 1984). National income doubled as coffee and tea exports did well on world markets. Schools based upon the *harambee* principle flourished, establishing a basis for universal primary education. Conversely, wealth disparities between rich and poor grew alongside nepotism and political patronage. Ultimately a new label—*wabenzi* (literally “people of the Mercedes Benz”)—came to describe those who profited from Kenyatta's rule.

Kenyatta's first administration also witnessed the coming of one party rule, beginning with the merger of the *Kenya African National Union* (KANU) with the *Kenya African Democratic Union* (KADU) in 1964. This effectively ushered in a pattern of *single party politics*—first *de facto* then *de jure* after 1982—that continued until the end of 1991. Kenyatta's government quickly became highly intolerant of dissent. In 1966, the country's first vice president, Oginga Odinga, resigned and left KANU. He was later arrested and imprisoned over his attempt to found the opposition *Kenya People's Union* (KPU). In 1969, the Minister for Economic Planning, Tom Mboya—like Odinga, a Luo—was assassinated, arousing inter-ethnic tensions between Luo and Kikuyu. A lone Kikuyu youth was later executed for the murder. J.M. Kariuki, an outspoken member of parliament whose slogan was “Kenya has become a nation of ten millionaires and ten million beggars,” was found dead under mysterious circumstances in 1975. No suspects were ever caught. Kariuki was a Kikuyu and a former Mau Mau detainee, but by this time class based politics had come to outweigh both ethnicity as well as sacrifices made during the independence struggle.

Kenyatta died in his sleep of natural causes on August 22, 1978. He was succeeded by Daniel arap Moi, a Kalenjin, who despite the slogan *nyayo*, “foot-steps,” has continued much of the class-related conflict that occurred under Kenyatta's rule.

## **KHAMA, SIR SERETSE**

Seretse Khama was born in 1921 in the village of Serowe in the British protectorate of Bechuanaland. His father Sekgoma Khama was the son of Kgosi Khama III who ruled the central region of the protectorate. Young Seretse's father died when he was four and Seretse's uncle Tshekedi Khama was made his guardian. Tshekedi sent Seretse to boarding school in South Africa and to Fort Hare University College where he obtained a BA degree in 1944. In 1945, he was sent to England to study law and after a year at Balliol College at Oxford he began legal studies at the Inner Temple in London.

In 1947, he met and soon after married Ruth Williams, an act that infuriated Tshekedi who ordered Seretse to return to Botswana and divorce his wife. Seretse did return to his homeland, but his wife accompanied him and he began speaking to the local people. He won their political support and personal loyalty and when the people turned against his uncle, Tshekedi went into voluntary exile.

The prospect of having an African chief with a white wife enraged neighboring South Africans whose Afrikaner nationalist government successfully persuaded the British government to bar Seretse from his birthright, his chieftainship in Bechuanaland. Britain did so because it wanted South Africa's gold and uranium. The British government suppressed a 1951 report that declared Seretse able to rule, and instead declared him unfit. On the basis of this deception it forced both Seretse and Ruth Khama to return to England. In 1952, the new Conservative government made the exile permanent but its treatment of the Khamas received international press coverage and outrage over the racist behavior of the British in their treatment of Seretse Khama. In 1956, British leadership began to separate itself from South Africa's racist government and policies, and Seretse's official exile was lifted. He returned to Botswana in 1961, became the country's founding president, and eventually was knighted.

Upon his return to Botswana, Seretse became the head of the Bechuanaland Democratic Party, which he along with Dr. Quett Masire, who succeeded him as president, had created. The BDP won the emerging nation's inaugural election in 1965 and Seretse Khama became prime minister. In 1966, he became president of the Republic of Botswana and during his

tenure Botswana became a successful economy. Though the country has suffered from a severe HIV/AIDS epidemic since the 1990s, Botswana has some of the continent's most advanced programs to contain and fight the disease. Politically Seretse Khama's legacy was efficient, honest, and open government. Externally he played a key regional role in the creation of the Southern African Development Community (SADC).

## **KHMER ROUGE**

In the early 1960s, then "neutralist" ruler of Cambodia (Kampuchea), Prince Norodom Sihanouk, coined the term Khmer Rouge (KR) (literally Red Khmer) to describe the indigenous Communist Party of Kampuchea (CPK). The CPK had begun as a nationalist anti-French independence movement in the 1950s with ties to the Vietnamese communists. Its leaders were mostly Buddhist, traditionally educated, and rural moderates. By 1962, they had evolved into a more doctrinaire group as a younger group of urban, Paris-educated, anti-Vietnamese Marxist radicals, led by Pol Pot, gained control of the standing committee of the CPK Central Committee. They were known as the party "Center." Pot, born Saloth Sar in rural Kampuchea in 1925 (some say 1928), had gone, on scholarship, to Paris to study but became so involved in the Marxist movement he lost his scholarship and returned, in 1953, to join the communist revolutionary movement in his homeland.

In 1970, Sihanouk was overthrown by pro-American forces led by General Lon Nol. Sihanouk fled to the countryside and, in an effort to regain power, allied himself with the CPK/KR. He soon discovered that the Center was in ever increasing control. Pragmatic to the extreme, the Center officially allied the KR with the Democratic (Socialist) Republic of Viet

Nam (DRV) in the war against the United States and her allies, while covertly purging thousands of CPK members who were moderates and/or Vietnamese-trained. Among those purged in the 1970s were moderates or independents who supported Sihanouk or intellectuals like Hou Yuon. Throughout this period, Pot denounced dissidents for being corrupted by materialist desires and neglectful of ideological purity. In retrospect, it is also clear that these rivalries were fraught with regional overtones since most anti-Center members were concentrated in eastern Kampuchea.

In spring 1975, the KR defeated Lon Nol's forces occupying the capital of Phnom Penh shortly after the chaotic departure of US. personnel in April. What followed was a scene from Dante's *Inferno*. To a nation already devastated by years of war, the KR leaders added Draconian measures for implementation of their twisted vision of Marxist ideological purity. Literally overnight 2 million city dwellers were herded out of urban centers into rural forced labor camps.

At first the rural population supported the KR but soon even they were forced to perform unpaid collective labor. This "Stalinist" depravity included total abrogation of all civil rights and basic liberties. Religion was outlawed, as was land ownership. Rival members of all political parties were rounded up and summarily executed. Families were splintered with children encouraged to spy on their parents and teens drafted into unpaid military service or labor camps. Hundreds of thousands died. According to Ben Keirnan, foremost expert on the subject, of a total population of 7.89 million Kampucheans in 1975, 1.67 million died directly at the hands of the KR during their four-year rule of terror.

In the mid-1970s, the KR reserved a special hell for ethnic minorities undertaking a systematic campaign of genocide by massacring two hundred thousand Chinese, one hundred thousand Cham Muslims, twenty thousand Thais, and ten thousand Vietnamese. In May 1978, they announced a campaign to "exterminate 50 million Vietnamese" and "purify" the Kampuchean population of all Vietnamese culture and influence. This led moderate communists in the "Eastern Zone" to rebel against the KR. While the KR killed nearly 250,000 of the 1.5 million people in eastern Kampuchea, they could not completely crush the rebellion. At the most critical moment, forces of the DRV joined the rebels eventually defeating the KR and occupying Phnom Penh on January 7, 1979. Pol Pot and his KR forces fled to jungle sanctuaries along the eastern border of Thailand. In the 1980s, supported by the Vietnamese occupiers, Eastern Zone moderates like Hun Sen, who became prime minister in 1985, worked to rebuild Kampuchea's economy and bring peace to the war-torn nation.

In 1989, the Vietnamese withdrew their forces and, two years later, the KR, Phnom Penh faction, and two smaller rebel groups signed a pact designed to disarm all factions, bring peace, and lead to free elections. Indeed, the 1993 UN-sponsored elections did lead to a coalition government comprised of several leftist factions including Sen's government faction and (by then) King Sihanouk's party. However, at the last-minute Pol Pot and the KR, who never disarmed, refused to support the elections. Instead, he and his ten thousand-man army continued the bloody civil strife often supported by the People's Republic of China (PRC), mainly because of its conflicts with Viet Nam; powerful Thai elements; and even, at times, the United States who feared Vietnamese domination of the region.

In August 1996, Pol Pot's former brother-in-law and chief collaborator, Ieng Sary, along with four thousand guerillas, defected to the government side. In return for Sary's control of western portions of Kampuchea, King Sihanouk, now titular head of state, reluctantly granted him a royal amnesty. In early 1997, the government coalition began to splinter into a bitter and often violent conflict between the two co-prime ministers, Hun Sen and Prince Norodom Ranariddh. At the same time, new conflicts arose within the KR. Even so, negotiations began between dissident KR leader Khien Samphen and Ranariddh's National United Front to absorb the KR back into a government in opposition to Hun Sen's Cambodian People's Party if the KR would purge Pol Pot.

Pol Pot reacted violently by executing long time KR defense minister Sien Sen and fifteen of his family and friends. Pot's forces captured Samphen and the KR negotiating team. But, resupplied by Ranariddh's faction the dissidents finally defeated Pot's faction on June 19, 1997, near Anlong Venh. The sickly seventy-two-year-old Pol Pot surrendered lying on a stretcher. Brother Number One's bloody career was over. However, with peace within reach, on July 6, Hun Sen seized power forcing Ranariddh to flee the country and the KR to return to their jungle hideout. Early that fall, at KR headquarters in Anlong Venh the new KR leaders held a show trial in which Pol Pot, dazed and leaning on a cane, was summarily convicted, not of genocide, but plotting against fellow KR leaders. He was sentenced to life in prison.

Instead of peace, this left KR leaders (whose guilt was as great as Pol Pot's) allied with Ranariddh's military forces in a continuing struggle against Hun Sen's government forces. On April 15, 1998, Pol Pot died but the struggle, albeit sublimated, continued with more than 2 million Kampucheans having paid the ultimate price for Marxist ideological purity. Indeed, thirty years of war and revolutionary violence

have devastated the population, the economy, the social fabric, the political process and the lives of millions of otherwise peaceful people. This once “peaceful kingdom” of rural prosperity is now one of the most underdeveloped nations on earth. Prospects for the future are grim and bloodshed seems to be the endless legacy of the Khmer Rouge.

## KHOMEINI, AYATOLLAH RUHOLLAH

The Ayatollah Khomeini (1902–1989) inspired a religio-political revolution against Iranian monarch Shah Reza Pahlavi and founded the Islamic Republic of Iran. Khomeini brought down the Shah with an odd combination of religious mysticism and legalism, and for the last ten years of his life (1979–1989) ruled Iran with supreme self-confidence, even as the country plunged into a disastrous war with Iraq. Khomeini was uninterested in anything outside Persian culture and Shi'a Islam, yet shrewdly used mass media to mobilize religious revolutionaries.

Ruhollah Al-Musavi was born in Khomein, a small town south of Tehran, on September 24, 1902. (“Ayatollah” is an honorific title meaning “the sign of God.” Al-Musavi began using his birthplace as a surname at age twenty-nine.) Khomeini’s father Mustafa Musavi was murdered before the boy was a year old, so he was raised by his mother and an aunt.

Ruhollah received a religious education from his older brother. He studied Arabic and is said to have

memorized the entire Koran. His mother and aunt both died when he was sixteen. In 1919, he began formal Islamic studies under a conservative teacher. The turbulent Persian politics of the 1920s left their mark on the young man. A military officer named Reza Khan seized power in 1921 and four years later changed the country’s name from Persia to Iran. Reza Khan was a Westernizer and modernizer whose ideas echoed those of the Turkish revolutionary, Atatürk. In 1926, Reza Khan crowned himself *shahanshah* (king of kings) and Khomeini began his lifelong struggle against the monarchy. Soon he was under police surveillance.

In 1929, Khomeini married Batul Saqafi, the ten-year old daughter of an ayatollah. Their first son, Mustafa, was born in 1932, followed in time by three daughters and another son. Khomeini taught Islamic jurisprudence in Qom, where his lectures attracted a growing circle of students. In 1937 and 1938, he made religious pilgrimages to Mecca and to the Shi’ite holy city of An-Najaf in Iraq.

British and Russian forces invaded Iran in 1941 to prevent the pro-Fascist Reza Shah from allying with Nazi Germany. They deposed Reza Shah but allowed his son, Mohammad Reza Shah Pahlavi to succeed him. Khomeini declared that “all orders issued by the dictatorial regime . . . have no value at all.” In 1944, with the war still on, he denounced the royal family and called on the nation to “rise up for God.” His call was finally answered thirty-five years later.

By the early 1960s, the Shah’s program of rapid economic development had generated a conservative backlash. Innovations such as voting rights for women and secular education for the masses offended the devout, and the Shah’s land reform program threatened the financial base of the Shi’ite establishment. Khomeini mounted bold public attacks against the government. On March 22, 1963, the Shah sent paratroopers into the *madrasa* (Islamic school) in Qom. They killed eighteen people and arrested Khomeini. When released, the Ayatollah resumed his public denunciations of the Shah. On June 5, 1963, Khomeini was arrested again and sentenced to three months in jail.

In October 1964, Khomeini accused the Shah of treason. This time the Ayatollah was sent into exile, first to Turkey and then to Iraq, from where he smuggled tape-recorded sermons back into Iran. In 1970, Khomeini published a tract, *Islamic Government*, in which he railed against “the Jews and their foreign masters” who were “plotting against Islam and preparing the way for the Jews to rule over the entire planet.”

The Shah, who once styled himself a reformer, was by the late 1970s bogged down in extravagance and

nepotism. His secret police tortured opponents and they may have murdered Khomeini's son, Mustafa. In December 1977, students in Tehran demanded Khomeini's return. A cycle of popular protest and violent repression built up. By September 1978, Tehran was under martial law and protesters were being shot by the hundreds. The Shah prevailed on Saddam Hussein to expel Khomeini from Iraq. This proved to be a tactical blunder, for Khomeini simply moved to France, from where he deftly orchestrated the growing street demonstrations in Iran.

Khomeini's potent charisma derived not from any special oratorical ability but rather from messianic Shi'ite theology. Shi'ites believe in a "twelfth Imam," who vanished a thousand years ago but never died, and whose return will initiate a reign of divine justice on earth. In the minds of many, Khomeini was that Imam.

On January 16, 1979, the Shah departed Iran, leaving a temporary government unable to command popular obedience. One million people marched in Tehran calling for the Ayatollah to return. When Khomeini arrived on February 1, delirious crowds swamped his motorcade. The Ayatollah delivered his verdict on the Shah's designated prime minister, Shahpur Bakhtiar: "I shall slap this government in the mouth. I shall determine the government with the backing of this nation, because this nation accepts me." Khomeini appointed his own prime minister, Mehdi Bazargan, but undermined him by reserving all final decisions for himself.

The Islamic Republic of Iran was established by popular referendum in March 1979. Khomeini called it the "Government of God," and set about erasing "all the corrupt practices of the West." He banned independent newspapers and Western music (except for military marches). A special militia, the Army of the Guardians of the Islamic Revolution, carried out an estimated seven thousand executions of political enemies, petty criminals, homosexuals, and members of religious and ethnic minorities. On November 4, 1979, students entered the American embassy in Tehran, seized fifty-two hostages, and held them for 444 days.

The new Iranian constitution named the seventy-seven-year-old Khomeini *Velayat Faghi* (Spiritual Leader) for life. It was an unrestricted grant of power to a man who claimed that "during my long lifetime I have always been right about what I said." With no experience in running a country, Khomeini could only try to balance the interests of competing secular and religious interest groups. The economy descended into turmoil as the government nationalized banks and factories.

The uncompromising Ayatollah lacked a sense of caution. He denounced both the Soviet Union and the

United States while waging war against Iraq. The war settled into a bloody stalemate because the military advantage lay with the defensive on both sides. Approximately nine hundred thousand Iranian youths lost their lives. Eventually, the Iraqis used poison gas on the battlefields and launched missiles at Iranian cities. Khomeini finally agreed to a cease-fire on August 20, 1988.

The Ayatollah Khomeini died on June 3, 1989. In his last will and testament he denounced the United States as "a terrorist state," King Hussein of Jordan as "a professional criminal," and the House of Saud as "traitors to the House of God." At Khomeini's funeral, eight mourners were crushed to death in a frenzied stampede to touch his body.

### KHRUSHCHEV, NIKITA

Nikita Sergeevich Khrushchev (1894–1971) was born in Kalinovka, Kursk province, Russia, in 1894. He attended elementary school, then worked as farmhand, coal miner, and mechanic. He was active in promoting the 1917 agrarian revolution and joined the Bolshevik (Communist) party the following year. He fought on Red side in Russian civil war and, as a party district committee secretary in Yuzovka region, backed Stalin's faction in intra-party struggle. In 1929, he enrolled in the Industrial Academy in Moscow, where he came to Stalin's notice and rose to become a Central Committee member in 1934.

Appointed the first secretary of Moscow city and regional party committees in 1935, Khrushchev helped to construct Moscow metro (subway) system and to

purge party organizations of Stalin's critics, and became a full member of the Politburo in 1939. During World War II, he served as political commissar on various front councils and reached the rank of lieutenant-general. After the war, as the chairman of the Ukrainian Council of Ministers from 1944–1947, he was charged with responsibility for postwar reconstruction, but moved back to Moscow to take a post as the Central Committee secretary. In 1949, he became the head of the party organization in the capital, and soon after Stalin's death in March 1953 won control of the party apparatus.

He did much to dismantle the tyrant's heritage, win popular backing for the regime's policies, and promote socio-economic development. Yet he clung to the Leninist ideology of unremitting class struggle and maintained a belligerent stance towards Western "imperialism" that in 1962 brought the world to the brink of nuclear catastrophe. Millions of prisoners were released from forced-labor camps (Gulag) and the security police, renamed KGB, was brought under the party leadership's control. At the twentieth CPSU congress (February 1956) Khrushchev indicted Stalin for his arbitrary and terroristic methods, thereby irrevocably shattering the defunct leader's aura of infallibility and unleashing a process of critical thought that soon threatened to get out of hand. But the Hungarian revolution (October 1956) was violently suppressed and dissidents elsewhere silenced.

The crisis nearly cost Khrushchev his job. His Stalinist colleagues plotted to remove him but in June 1957 he outwitted them, thanks to the support of pro-reform cadres, and went on to become the head of the Soviet government in 1958, meaning building up an apparatus of loyal officials, some of whom helped to foster a new "personality cult" centered on him. Continuing with his reformist inclinations, he introduced an ambitious new party program at the twenty-second Communist congress in 1961. Yet his position was less absolute than Stalin's had been and many groups, including the military, took exception to his impetuous, populist leadership style. In 1962, under US pressure, Khrushchev withdrew nuclear-armed missiles from Cuba. In October 1964, his colleagues on the party Presidium, many of them his protégés, forced his resignation. Under his successor, Leonid Brezhnev, the USSR reverted to a more conservative course. Khrushchev was allowed to retire in Moscow and despite harassment wrote valuable, if self-serving, memoirs. He died in Moscow on September 11, 1971.

Khrushchev's peasant origins showed in his commitment to better the condition of hard-pressed Soviet farmers. Agricultural prices were raised, delivery quotas reduced, and farm managers' qualifications

improved. Machinery and fertilizer output increased dramatically, as did the cultivation of corn as live-stock fodder. A vast program was launched to grow grain on marginal land in Kazakhstan and other eastern territories. But Khrushchev shunned market-oriented reforms, holding fast to the principle of collectivized agriculture, with its bureaucratic interference and inadequate incentives for producers. Likewise in industry administrative devolution did not make for greater efficiency, since prices were still fixed centrally by the planners, and producer goods, especially for the military, continued to be given precedence over those catering to consumer needs. Even so, there was a better choice of foodstuffs in the shops and the provision of urban housing improved. Public opinion was generally supportive, the popular mood being boosted by propaganda hailing Soviet successes in space exploration (Sputnik I 1957; first manned cosmic flight 1961). Dissent among intellectuals was still mainly confined to cultural issues, in which Khrushchev often meddled crudely, as he did also in scientific decision-making. Under his rule, civil rights remained precarious, yet a generation grew up that proved capable of taking independent initiative after 1985, once the shackles of conformity were again loosened by Mikhail Gorbachev, whose policies Khrushchev up to a point anticipated.

### KIRIBATI

The Republic of Kiribati (pronounced *kee-ree-bas*) lies in the central Pacific (4° N–3° S latitude and 173°–177° E longitude). Its territory straddles the equator, lying to the west of the International Date Line. Thirty-three mainly coral atoll islands (land area: 810 square kilometers, 313 square miles) are

## KIRIBATI

scattered across 5.2 million square kilometers (2 million square miles) of the Pacific Ocean. Kiribati is part of Micronesia and bordering countries are Tuvalu to the south, the Marshall Islands to the northwest and Nauru to the west. Most of the islands are volcanically formed atolls with a central lagoon surrounded by islets or coral reefs. The nation comprises three administrative units: (1) eight of the eleven Line Islands, including Kiritimati (formerly Christmas Island), (2) seventeen Gilbert Islands including Banaba (formerly Ocean Island), and (3) eight Phoenix Islands. The capital, Bairiki, is on Tarawa atoll.

The population (ninety-nine thousand in 2003) is nearly all Micronesian, with about 30% concentrated on Tarawa. The population is growing at 2.3% per annum and approximately 40% of the population is zero to fourteen years old. Birth and death rates are 31.2 per 1,000 and 8.6 per 1,000 respectively and life expectancy for males and females is 58 and 64, respectively. The official language is English; the other main language is I-Kiribati. I-Kiribati, as the nationals are called, are mostly Christians; about half are Roman Catholic and 45% are Protestant.

Kiribati has few natural resources. Fishing and growing taro, bananas, and coconuts form the basis of the largely subsistence economy and livestock (mainly pigs and poultry) are raised for local consumption. Fish and copra became the chief exports after phosphate mining on Banaba ended in 1979. Development is constrained by the country's remote location, geographic fragmentation and poor infrastructure. Tourism is similarly constrained but nonetheless provides 20% of the gross domestic product (GDP). The country's economy depends on financial aid from Australia, the United Kingdom, Japan, New Zealand, Taiwan, and China. Remittances from I-Kiribati working overseas (mainly in the marine industry) are a significant source of foreign exchange. The GDP in 2003 was \$54 million (\$404 per capita).

A member of the British Commonwealth, Kiribati is a republic with an elected president, cabinet and a forty-two-member, unicameral legislature. The islands were administered (1892–1916) with the Ellice Islands as a British Protectorate that became, in 1916, the British colony of the Gilbert and Ellice Islands. The islands gained self-rule in 1971. The Ellice Islands became, with independence in 1978, Tuvalu, and the Gilbert Islands were granted independence in 1979 as Kiribati. US claims to several islands, including Kanton (formerly Canton) and Enderbury, were abandoned in 1979 and, in 1983, the United States Senate recognized Kiribati's sovereignty over the Line and Phoenix Islands.

The elected members of the House of Parliament choose presidential candidates from among their members and those selected compete in a general election to serve as president for a four-year term. In 1994, Teburovo Tito was elected president and reelected in 1998. Anote Tong replaced him as president in July 2003.

Austronesians from Southeast Asia first settled Kiribati between 200 and 500 AD. Samoans migrated to the islands in the eleventh and fourteenth centuries. Tongans and Fijians invaded in the fourteenth century, remaining as settlers on the islands. European explorers and whalers visited the islands, which were mapped by 1826. Islanders were kidnapped into slavery by Peruvian, British, Australian, and other slave ships to work in Fiji, Samoa, Tahiti, Hawaii, and Central America. Britain proclaimed the islands a British Protectorate in 1892 and annexed Banaba in 1900 after the discovery of rich phosphate deposits.

The Japanese bombed Banaba and landed on Tarawa and Butaritari Islands shortly after the attack on Pearl Harbor, but by November 1943, after fierce fighting, American forces took control of Tarawa and other islands occupied by the Japanese. In 1945, Banaba was liberated from the Japanese but all but one man of the labor force imported by the Japanese from other islands had been massacred. In 1957 and 1962, Britain used Kiritimati (Christmas) Island, to carry out atmospheric tests of three hydrogen bombs.

Islanders were given more control of their affairs in 1963 and became an independent nation on July 12, 1979. The Banabans sued in the British High Court in 1975 to be compensated for damage to their island from phosphate mining. They also sought independence from Kiribati. They were paid \$9.04 million in compensation and, while the constitution ensures Banabans a seat in the Kiribati House of Assembly, they were not granted independence. In 1999, Kiribati became a member of the United Nations. In order to promote tourism the International Dateline was moved to its present delineation and one of the islands renamed Millennium Island as Kiribati competed with the Chatham Islands to become the first country welcoming the dawn of the twenty-first century.

The climate is equatorial maritime: hot throughout the year with the heat moderated by northwest and southeast trade winds. Temperatures range between 22°C–32°C and humidity is always high: 70%–90%. Strong, tropical storms (typhoons), while rare, can occur at any time of the year but are more common between November and March. Rainfall varies between islands, with those in the far north receiving up to 3,000 mm (118 inches) per year. Islands further south, such as Banaba are drier and can get droughts.

Twenty-one of the thirty-three islands are inhabited and overpopulation on many of the islands is a serious problem. In 1988, over 4,500 people living on more densely populated islands were resettled onto less populated islands. More recently, with a grant of \$400,000 from the Asian Development Bank, five of the Phoenix Islands are being developed as settlements for people from the overpopulated Tarawa Islands. Pollution is not a major problem within the country as a whole but lagoons adjacent to densely populated areas, such as the Tarawa Islands, have sewage pollution as traditional use of tidal areas as latrines continues. The environment on Banaba Island was destroyed by phosphate mining, and Banabans were moved in the 1940s to Rabi Island in Fiji.

Most of the islands are low-lying (one to three meters above sea level; the highest point in the nation is on Banaba Island: eighty-seven meters above sea level). This nation is very susceptible to the sea level rise that will accompany global climate warming. Aside from coastal erosion and flooding, sea level rise will result in salinization of freshwater aquifers on which many inhabitants depend for drinking water. Communicable diseases (respiratory tract infections, diarrhea, and skin infections) are leading causes of morbidity and tuberculosis poses a serious public health problem. Lifestyle changes (smoking, alcohol consumption) and changes in diet (more processed foods) have led to an increase in diabetes, cardiovascular disease and cancers. In 2000, a United Nations Development Program report concluded that HIV/AIDS rates in the nation were as high as those in some African nations.

## KOREA, NORTH

The Democratic People's Republic of Korea, or Choson to its inhabitants, is situated on the northern half of the Korean Peninsula. Its coasts border on Korea Bay and the Sea of Japan, and its land boundaries are with China, South Korea, and a tiny nineteen-kilometer border with Russia. The climate is continental. Winters tend to be very cold, due to winds blowing from the Siberian plain, with frequent

snowfall. North Korea is also located within a monsoon region, making summers short, hot, and very rainy, with at least one typhoon every summer on the average. The population is estimated at 22,697,553, with a growth rate of 0.98% (CIA est. July 2004). The capital is Pyongyang, located in the southwest of the country near Korea Bay; the population of the capital city is estimated at 2.8 million.

## Histography of North Korea

The collapse of the Soviet Union, the People's Republic of China's adoption of market-oriented economic policies and the implementation of *Juché*-based economy has left North Korea (the Democratic People's Republic of Korea, or DPRK) as one of the last bastions of communism as well as one of the most isolated regimes on the planet. Located on the northern half of the Korean Peninsula, North Korea has chosen a self-sufficient course of economic development and been in self-imposed economic and diplomatic isolation since the early 1990s. In contrast with the capitalist south, North Korea has pursued a hybrid model of Stalinist economic development, *Juché* or a self-reliant economic policy. The *Juché* ideology would serve as the central principle of North Korean social policy, politics, economics, international relations, and national defense.

The Democratic People's Republic of Korea emerged out of World War II as competing Cold War interests established rival regimes on the Korean Peninsula following Japan's surrender on August 15, 1945, that ended World War II. The geopolitical vacuum north of the thirty-eighth parallel, created by the expulsion of the Japanese colonial administration was quickly filled by Kim Il Sung (Kim Il-sŏng), a Soviet-Korean backed by the Kremlin. In the South, a government ruled by right-wing nationalists supported by the United States seized power. His personal rivalry with South Korean leader Syngman Rhee (Yi Sŭng-man), would eventually lead the two fledgling countries into a bitter civil war that would later come to define the Cold War.

From a Cold War perspective, North Korea's importance lay from its geopolitical position as a buffer against the growth and expansion of the international capitalist system in Northeast Asia (e.g., South Korea, Japan, and the United States). While, the Korean War solidified the hitherto disputed borders and the permanent division of the Korean Peninsula, North Korea lay in ruin. What industrial that wasn't destroyed by the retreating Japanese Imperial Army at the end of World War II, was completely destroyed

by American bombing during the Korean War. Thus, at the end of the Korean War, North Korea was faced with the daunting task of developing a viable economy from scratch. The manner in which North Korea pursued its economic self-reliance policy is unique in the history of economic development.

Developing a hybrid economic model of Marxist-Leninism called *Juché*, Kim Il Sung attempted to build an independent, self-reliant national economy through the establishment of a all-encompassing command economy, limiting economic relations with other countries while playing Cold War allies, the Soviet Union and China against each other in order to extract generous subsidies that helped sustain the anemic North Korean economy until the early 1990s when the collapse of the Soviet Union and China's economic reorientation meant the cessation of economic support to North Korea. This created widespread shortages throughout the entire economy, something North Korea has yet to recover from.

### Economic Development—Past and Present

As late as the 1880s, Korea had been an agricultural society, aspiring to industrialization based on the much-hated Japanese model, but without the skills, raw materials or capital necessary to sustain their economic expansion. By the end of the Japanese colonial period (1910–1945) North Korea was primarily an agricultural economy, but inherited a varied industrial base, with considerable manufacturing capability, essential to build a modern economy. Most of the industrial centers were concentrated in and around Pyöngyang, strategically located near ports to connect them with Japan. The Korean War saw the near total destruction of the North Korean economic infrastructure.

Following the war, North Korea pursued what is considered to be the most centralized and planned economic development strategy of any country in the world utilizing a hybrid of Marxism-Leninism called *Juché* (independent or self-reliance). North Korean economic policy and development strategies can be divided into several distinct phases: (1) the Socialist Nation-building period (1945–1960); (2) the Evolution of *Juché* Economy period (1961–1970); (3) the Implementation of the *Juché* Economy period (1971–1980); (4) opening of the *Juché* Economy period (1981–1990); and (5) the Economic Collapse period (from 1991).

Between 1953 and 1960 all agriculture was collectivized, followed by the nationalization of industries. All factories that were owned by the Japanese or their

Korean cohorts were confiscated by the state. The introduction of the *Chöllima* movement, in 1956, was the embodiment of the *Juché* philosophy. The *Chöllima* movement was a mass-mobilization movement to develop light industry and agriculture in conjunction with heavy industry through the utilization of local resources to build local consumer goods industries, thus stimulating the entire industrialization process and the collectivization of agriculture to develop rural areas.

During the 1960s, North Korea achieved faster economic growth and greater economic equality and stability utilizing central economic planning. Agricultural output rose by over 12% annually. Industrial output grew by an estimated 23% during the 1960s. Self-sufficiency had apparently been attained. This belied the fact that economic aid from the Soviet Union and China had been significantly decreased as a consequence of Khrushchev's policy of de-Stalinization and the "Cultural Revolution," respectively. Thus, North Korea was forced to continue its industrialization process without the aid of its closest allies.

In the 1970s, the geopolitical events and faltering economic performance meant that North Korea faced the prospect of establishing economic relations with capitalist countries. As a consequence, Pyöngyang began to emphasize exports, a conflicting plan from its *Juché* policy. Despite its attempts at importing advanced technology from the West, chronic trade deficits coupled with low level of exports meant that North Korea soon defaulted on its international debt obligations.

In the early 1980s, North Korea tried to re-establish economic relations with the outside world as it neared the limits of self-sustained economic growth. The North Korean leadership sought to import advanced technology from the West. Yet, at the end of the 1980s, three-quarters of North Korea's trade was still with China and the Soviet Union. This overdependence on foreign trade with its Communist brethren would come to haunt North Korea as geopolitical events dictated a change in the international environment. The world was moving toward a post-Cold War international order.

Soviet and Chinese assistance to North Korea had virtually disappeared by 1991. North Korea edged closer towards bankruptcy as the Soviet Union and China began to seek payment in hard currency and charge "market" prices. As Pyöngyang became increasingly isolated, both economically and diplomatically, small markets began to appear throughout North Korea. The growth of these new markets did not seem to undermine the cohesive of North Korean society as the state maintained tight controls over daily life.

## Juché

It is hard to pinpoint the origins *Juché* ideology. North Korean historians have attempted to place the origin of *Juché* in the early experiences of Kim Il-Sung. Nonetheless, in order to achieve economic self-sufficiency, Kim Il Sung needed to transform North Korea's war-ravaged agrarian economy through a far-reaching development strategy. Kim developed an alternate economic policy called *Juché* which was not fully articulated until December 1955 when Kim Il Sung introduced *Juché* ideology in response to the political situation of North Korea vis-à-vis the Soviet Union. *Juché* would transform pre-war agrarian society into a modern industrial state through the utilization of domestic resources. Eventually the *Juché* ideology would become the foundation of the entire North Korean economic and political system.

Under the *Juché* economic model, North Korea would implement a self-sufficient inward-looking economic development strategy utilizing planning goals, guidelines, and targets while shunning economic relations with other countries. The major tenets of *Juché* development strategy were: (1) North Korea should seek balanced economic development; (2) Industrialization would be achieved primarily relying on domestic resources; and (3) In order to develop technologies domestically and increase productivity, the state would emphasize human capital formation. In short, North Korea would achieve economic self-sufficiency through the implementation of *Juché* model of autonomous industrialization utilizing indigenous resources and internal demand.

*Juché* slowly evolved from a development strategy to become the official guiding principle in all facets of North Korean life. Kim Il-Sung utilized *Juché* to force North Koreans into a total mobilization system as the North Korean economy began to slow and stagnate. Politics, foreign policy and national defense policy would also be guided by *Juché*'s principle of self-reliance. Thus, *Juché* provided a theoretical basis for North Korea's closed-door policy. By 1965, *Juché* had become a comprehensive political theory. Eventually, *Juché* became a totalitarian political system that encompassed all aspects of daily life in North Korea.

## North Korean Economic Decline

Since 1991, the North Korean economy failed as a result of dual (internal and external) economic

conditions. Domestically, the economy stagnated as a result of ill-conceived *Juché* policies. Internationally, major changes in the international system, including the dissolution of the Soviet Union and China's rapid economic and political reorientation meant the end of generous subsidies that subsidized the North Korean economy and the severing of economic ties with Soviet Bloc countries meant a precipitous economic decline that has seen a shortage in food production followed by a decline in industrial output. The very structure of the North Korean economy compounded the economic downturn as the interdependence of the industrial sector binds the highly integrated economy. A setback in one industry triggers a domino effect in other sectors of the economy.

The unexpected death of Kim Il Sung on July 8, 1994, further strained the economy as his son and successor, Kim Jong-Il declared a three-year mourning period. It is unclear if North Korea will be able to reverse its economic decline. As long as North Korea remains committed to its *Juché* economic policies, the leadership will be unable to introduce the steps required to move away from an inward-looking economic development strategy to outward-looking economic development strategy necessary to resuscitate its deteriorating economy.

North Korea is currently on the brink of disaster. The country has suffered through five successive years of famine. Residents of Pyöngyang reported survive on a combination of food rationing. Much of the population outside of Pyöngyang suffers from an acute food shortage and survives on humanitarian aid.

## KOREA, SOUTH

The Republic of Korea, or Han’guk to its inhabitants, is situated on the southern half of the Korean Peninsula. Its coasts border on the Yellow Sea and the Sea of Japan. Its only land border is the demarcation line with South Korea, or the People’s Republic of Korea. The climate is temperate, with a rainy season in the summer. The population is estimated at 48,598,175, with a growth rate of 0.62% (CIA estimate July 2004). The capital is Pyongyang, located in the northwest of the country near the Yellow Sea; its population was 10,276,968 at the end of 2003.

### Histography of South Korea

Geography, culture, and history combined to give South Korea a unique place as the intersection of Northeast Asia. Located on the southern half of the Korean Peninsula, South Korea has been vulnerable to influence by its more powerful East Asian neighbors, China and Japan. Throughout much of recorded history, the Korean Peninsula has been a crossroads of culture, trade, and war because of its strategic geographic location. Japanese rulers considered Korea as a gateway to continental expansion while Chinese emperors’ viewed Korea as a protective

safeguard against foreign invasion of the Eastern border of the Middle Kingdom.

The Republic of Korea (South Korea) emerged out of World War II as competing Cold War interests established rival regimes on the Korean Peninsula following Japan’s surrender on August 15, 1945, that ended World War II. The geopolitical vacuum south of the thirty-eighth parallel, created by the expulsion of the Japanese colonial administration was quickly filled by Syngman Rhee (Yi Sŭng-man), an American-backed Korean expatriate whose personal ambition outweighed the needs of nascent republic. His personal rivalry with North Korean leader Kim Il Sung (Kim Il-sŏng) would eventually lead the two fledgling countries into a bitter civil war that would later come to define the Cold War.

From a Cold War perspective, South Korea’s importance lay from its geopolitical position at the intersection of conflicting great powers (e.g., the People’s Republic of China, the Soviet Union and the United States). While, the Korean War solidified the hitherto disputed borders and the permanent division of the Korean Peninsula, much of South Korea lay in ruin. Seöul was completely devastated and millions of people were left homeless. Deprived of pre-war industrial resources located in Pyöngyang, the restoration of the economic base of South Korea would be seen as the pivotal in the struggle against Communism. As such, the integration of South Korea into the international capitalist system was of primary importance to the United States to buffer South Korea against Communist influence.

### Economic Development—Past and Present

Following World War II, South Korea could hardly be thought of as a candidate for economic development that would shape the course of the latter half of the twentieth century. Prior to the colonization of the Korean Peninsula, Korea had been an isolated agrarian kingdom that had been forcibly opened through ‘gunboat’ diplomacy in the later half of the nineteenth century.

As late as the 1880s, Korea had been an agricultural society, aspiring to industrialization based on the much-hated Japanese model, but without the skills, raw materials, or capital necessary to sustain their economic expansion. As such, the Korean government found itself vulnerable to external economic and political pressure. During their colonial occupation, the Japanese built the beginnings of an economic infrastructure—a road and rail network—albeit to serve their needs; the export of raw materials needed

to support military expansion and conquest throughout Asia. It has been argued that the Japanese laid the foundation for the latter development through the introduction of comprehensive educational system coupled with the spread of literacy. In addition, the Japanese oversaw the development a native bureaucracy, the emergence of an entrepreneurial class that would serve as a base to economic development.

The years between 1948 and 1960 saw a brutal civil war, the permanent division of the Korean Peninsula, and the emergence of an authoritarian government in South Korea that combined civil and military administration to govern the state with military-like discipline. The Korean War laid waste to much of the economic infrastructure as well as depriving South Korea of industrial resources. In the years following the civil war, South Korea had a crippled economy and was heavily dependent on foreign—primarily American—aid and assistance. It wasn't until the adoption of export-led development in the 1960s that economic development took off thereby reducing their dependence on American aid.

By the early 1960s, South Korea had many of the necessary ingredients for rapid economic growth: integration into the post-war international political and economic order, access to foreign capital and technology, an entrepreneurial class and cadre of low-cost, educated workers. The coup d'état that led to installation of Park Chung Hee (Pak Chông-hŭi) as president of South Korea signaled a turning point in the economic development of South Korea. Park's primary focus was on attaining national wealth and power through economic development. As such, the government established the basic strategy for economic development to which it adhered to for the next forty years. The first part of the strategy was the introduction of the first Five-Year Economic Development Plan in 1962 which established the basic guidelines for development: economic development was to be achieved through industrialization; economic development was to be achieved under government direction and control; foreign capital inflow was to be reduced; and growth was given a higher priority than income distribution and uneven economic development. Nonetheless, during the 1960s the rate of growth of South Korea surpassed that of all developing countries.

During the late 1970s and early 1980s, the South Korean government export policy gradually shifted from export of labor-intensive manufactured goods to an export policy that emphasized gradual export substitution in capital skill-intensive industries. The shift in policy was a change from earlier policy in that emphasis went from maximizing export growth to strengthening competitiveness. The government

introduced a variety of legislative measures designed to restructure competitive industries, introducing market mechanisms, stimulating private initiatives as well as enhancing price stability.

At the beginning of the 1980s, the second oil crisis and Korean domestic political turmoil gave rise to difficulties as the Korean government experienced the first negative growth since the implementation of the first development plan and a huge current account deficit. The government undertook a series of structural adjustment measures to enhance economic efficiency. The priority of the Korean economic policy shifted from growth to stability and actively encouraged the adjustment of duplicated investment and liquidation of troubled enterprises. At the same time, opening of the economy and deregulation were pursued on a case-by-case basis as part of the move to private initiative in economic management.

### **The Rise of the Korean “Tiger”**

The success of South Korean economy is one of the unsurpassed stories of the post-World War II era. Beginning in the early 1960s, South Korea had one of the most dynamic economies in the world. Devoid of natural and physical resources, South Korea would enjoy a cumulative rate of growth that far exceeded that of most of the other Third World countries during the same period.

Different theories have been posited as to explain the successful pattern of development in South Korea. Much of the debate centers on the political basis of economic development. Did South Korea have culturally built in conditions that pre-disposed South Korea for the phenomenal growth that has fascinated policymakers and theorists alike? While it is agreed that economic growth in South Korea, and East Asia (e.g., Taiwan, Singapore, Hong Kong) for that matter, was based in large measure on government intervention in support of light export manufacturing. Others argue about the role of the state. Initially, observers posited that trade liberalization, private enterprise, and the restricted role of the state in economic affairs led to economic development. Later, scholars questioned the previously held assumption that the state played an indirect and minimal role in economic development as evidence suggested that centralization of power in the bureaucratic polity enhanced economic development.

Much of the development literature suggests historical and developmental conditions under which state economic development is possible: international

relations with states and multi-national corporations, access to export markets as well as development resources, including large amounts of capital and technology. This is called the neo-classical model, which is based on free market economics forces. According to this model, South Korea benefited from privileged access to US and foreign markets. The economic benefits, in turn, were used to strengthen and sustain economic growth.

Despite continued US development assistance and increasing levels of foreign direct investment by multi-national corporations in South Korea, economic development did not stimulate general development of the South Korean economy; democracy did not take root, nor was their equitable distribution of income. This school of thought argued that economic links between the developing world and the capitalist system produced exploitation and economic stagnation. This is called the dependency school. Scholars asserted that economic integration of a developing country into the capitalist system encouraged import-substitution led growth that created a structural imbalance that created dependency on foreign capital and technology that would constrain development.

Neither of these models can fully explain the unique set of circumstances that led to the remarkable economic development achieved in South Korea. What is agreed is that state economic intervention is an essential component of growth. South Korea fit that model as it had a series of authoritarian governments that combined civil and military administration to govern the state with military-like discipline through the implementation of comprehensive state-managed economic programs through its control of extensive bureaucracy fostered close collaboration between the government and tightly-held commercial conglomerates (*chaebol*). Furthermore, what is known is that economic growth in South Korea was stimulated and conditioned by a number of international, social, political, and cultural factors.

### ***International Factors***

Following the Korean War, the Republic of Korea little or no economic infrastructure. What little industry that was left by the Japanese was destroyed during the Korean War. Following the Korean War, the United States wanted a capitalist democracy and opposed any leftist influence. As such, the integration of South Korea into the international capitalist system was of primary importance to the United States to buffer South Korea from Communist influence. The eventual adoption of export-oriented policies that stimulated the rapid economic development coupled

with the protectionist policies of South Korea allowed the development of capital and technology-intensive industries with entrée to the capitalist system thereby allowing privileged access to US and other Western markets.

### ***Domestic Political and Social Factors***

Outside pressure(s) cannot entirely explain economic development and growth in South Korea. Certain domestic conditions and circumstances existed that laid the foundation for the rapid transformation from an agrarian society into an industrial society. In contrast with other developing nations, the absence of any organized class opposition to industrialization in South Korea allowed for the rise of an entrepreneurial class. This removed the political barriers to the transfer of landed wealth and into commerce and industry thereby strengthening economic growth. Social factors also played a key role in industrialization. South Korean workers were not only highly-skilled but comparatively inexpensive.

### ***The Role of Culture***

It is generally acknowledged that a unique set of cultural traits aided in the economic development of South Korea. In spite of centuries of foreign invasion and colonization, Korea remained relatively homogeneous. This gave people a sense of unity—*han min-jok*—which the government was able to tap into and manipulate. The South Korean government was able to subordinate sub-state loyalties to clan or region and use cultural nationalism as an ideology to mobilize support for development planning. Furthermore, the government was able to tap into the immediate past memory of the Japanese colonial occupation to intensify nationalist feelings and the sense of national pride of Koreans to match or outdo the achievements of their former colonial masters.

## KUBITSCHKEK, JUSCELINO

Juscelino Kubitschek de Oliveira (1902–1976), president of Brazil and builder of Brasília, was born in a decayed diamond-mining district of Minas Gerais, a state once wealthy from colonial gold mining. His father, of Czech descent, died before he was born. His mother earned a meager income as a school teacher.

To rise out of poverty he studied to become a doctor, working as a telegraph operator. He married into a socially prominent family and established a thriving surgical practice in the state capital, Belo Horizonte.

Coming to the attention of the local political establishment, he was named mayor of Belo Horizonte in 1940. Having successfully raised himself out of poverty, he resolved to use public office to do the same for his society, emphasizing economic development through industrialization. Benefiting from increased world demand for minerals from Minas Gerais during the Second World War, Kubitschek used revenue from exports to enhance the physical infrastructure of his city by improving roads, electricity, and sewage. He even inaugurated a modernist architectural complex in the city, bringing together the leading Brazilian architects, landscape designers, and painters.

Elected governor of Minas Gerais in 1950, he again concentrated on improving infrastructure; he expanded the number of roads, bridges, hydroelectric plants, schools, and clinics. Improvements in transportation and energy were fundamental in order for the state to achieve economic development and modernization.

In 1955, he won election as president of Brazil, basing his appeal on an alliance with populist political forces and upon a program of national economic development that outlined a sequence of goals that his government would achieve. He promised that in his five-year presidential term there would be “fifty years of progress in five.” He further promised that he would move the federal capital from Rio de Janeiro to a new city in the central highlands, to be named Brasília.

His plan for economic expansion concentrated on the development of industry and physical infrastructure. The Kubitschek government had as its goals specific increases in the production of iron, steel, cars, roads, electricity, etc. It achieved dramatic increases in production together with a wider distribution of national income. These accomplishments made of Kubitschek an enduring symbol of successful, democratic civilian government in Brazil.

Brasília was built in the central highlands of Brazil in order to transfer the center of power and population to the interior of the country. The futuristic city highlighted Kubitschek's effort to modernize the country and brought together the country's chief architects, planners, painters, sculptors, and landscape designers. It was a symbol of Kubitschek's goals for national economic development and modernization.

Although his presidency was successful in terms of achieving its industrialization goals, it spurred a cycle of inflation that burdened the Brazilian economy well into the end of the twentieth century. Moreover, conservative and military forces scorned him for his political alliance with populist and radical elements and for the alleged corruption of his administration.

Kubitschek had his political rights denied by a military regime that came into power in 1964. He died in 1976 in an automobile accident between São Paulo and Rio de Janeiro.

## KURDISTAN

Kurdistan constitutes the geographical area where Turkey, Iran, Iraq, and Syria converge. Before World War I, Kurdistan was divided between the Ottoman Empire (mostly) and the Persian Empire. Following World War I, Kurdistan was divided among five different states. Turkey has the largest portion (43%), followed by Iran (31%), Iraq (18%), Syria (6%), and the former Soviet Union (now Armenia and Azerbaijan—2%) (Izady 1992).

Kurdistan is landlocked and mountainous. Although the rugged terrain contributes to the lack of Kurdish unity, these mountains have protected the Kurds from being fully conquered or assimilated by their neighbors. The Zagros range constitutes the most important portion of these mountains, running northwest to southeast. Portions of the Taurus, Pontus, and Amanus Mountains also rise within Kurdistan.

The climate of these mountains is cool throughout the year. Central Kurdistan, however, enjoys a lower elevation and thus a warmer, even relatively balmy climate, though summers can be very hot and humid. Winters in most areas are bitterly cold and snowy. These climatic contrasts have been sharpened by deforestation due to overgrazing, logging for fuel or construction, and the effects of war. In contrast to most other parts of the Middle East, much of Kurdistan enjoys adequate and regular rainfall. Agriculture products include corn, barley, rice, cotton, tobacco, and sugar beets. Animal husbandry (goats, sheep, cows, and buffaloes) continues to be a mainstay.

Because of its water (in the Turkish and Iraqi parts) and oil (in the Iraqi section), Kurdistan has great economic and geostrategic importance. Despite being economically underdeveloped compared to the non-Kurdish areas of Turkey, Iran, Iraq, and Syria, Kurdistan witnessed a tremendous amount of economic, political, and social modernization during the twentieth century. Indeed, Iraqi Kurdistan's economy surpassed that of the rest of Iraq in the late 1990s due to the oil-for-food-program funds it received through the United Nations (UN). The Turkish, Iranian, and Syrian portions of Kurdistan still lag behind economically.

The Kurds are a largely Sunni Muslim, Indo-European-speaking people. They are distinct ethnically from the Turks and Arabs, but related to the Iranians.

No reliable estimates of the Kurdish population exist, as most estimates are politically biased. A significant number of Kurds have assimilated into the Arab, Turkish, or Iranian populations. In addition, Kurdish enclaves exist outside of Kurdistan, while communities of Turks, Turkomans, Arabs, Assyrians, among others, live within Kurdistan.

A reasonable estimate counts 12 to 15 million Kurds in Turkey (18% to 21% of the population), 6 million in Iran (11%), 4 million in Iraq (20% to 23%), and eight hundred thousand in Syria (7%). At least one hundred thousand Kurds also live in parts of the former Soviet Union, while recently a Kurdish diaspora of more than 1 million has risen in western Europe, with more than five hundred thousand Kurds in Germany. Some twenty thousand Kurds live in the United States.

The Kurds were Islamicized in the seventh century CE and today constitute a mixture of various groupings, the result of earlier invasions and migrations. The Kurdish language (which is related to Iranian) has two main variants, Kurmanji (or Bahdini) spoken mainly in the northwest of Kurdistan, and Sorani spoken mainly in the southeast. In addition, Dimili (Zaza) is also spoken in parts of Turkish Kurdistan, while Gurani is spoken in sections of Iraqi and Iranian Kurdistan. These Kurdish dialects (or languages) are only partially mutually understandable.

Until recently, Kurdish tribes received more loyalty than any sense of Kurdish nationalism. In the various Kurdish revolts of the twentieth century, significant numbers of Kurds from other tribes have supported the government because of their antipathies for those rebelling. The aghas (feudal landlords or tribal chieftains) and sheikhs (religious leaders) continue to command strong allegiances.

## Turkey

Ataturk's creation of a secular and purely Turkish state led to three great, but unsuccessful Kurdish revolts in the 1920s and 1930s. As a result, the Turkish authorities decided to eliminate anything that might suggest a separate Kurdish nation. A new Kurdish insurgency began in the 1980s and continued until the end of the twentieth century when Abdullah (Apo) Ocalan, the leader of the *Partiya Karkaren Kurdistan* (PKK) or Kurdistan Workers Party was captured by Turkish authorities and sentenced to death. Turkey's candidacy for European Union membership forced the government to suspend Ocalan's execution.

## Iraq

The Kurds in Iraq have been in an almost constant state of revolt since World War I. Mulla Mustafa Barzani (1903–1979) eventually emerged as the leader and fought the Iraqi government with his *peshmerga* (literally, those who face death, or guerrillas) for more than half a century. Despite his conservatism and tribal mentality, he was the guiding spirit in the establishment of the Kurdistan Democratic Party (KDP) in 1946, and at the height of his power negotiated the March Manifesto of 1970 which provided for Kurdish autonomy under his rule. When Iran and the United States withdrew their support in return for Iraqi concessions in 1975, Barzani's uprising collapsed. His son Massoud Barzani eventually emerged as the new leader of the KDP, while Jalal Talabani established his Patriotic Union of Kurdistan (PUK) as a rival. The two Iraqi Kurdish parties have alternated between cooperation and conflict ever since. They also have suffered from such horrific repression as Saddam Hussein's chemical attack on Halabja in 1988 and genocidal *Anfal* campaigns of 1987–1988.

After the Gulf War and failure of the ensuing Kurdish uprising in March 1991, Kurdish refugees fled to the mountains. The United States reluctantly created a safe haven and no-fly zone in which a Kurdish state began to develop in northern Iraq. A 1991 UN Security Council Resolution condemned the treatment of Iraqi Kurds and demanded an end to the oppression. Never before had the Kurds received such official international mention and protection.

The KDP and PUK battled from 1994–1998. The resulting instability and power vacuum drew in neighboring Turkey, Iran, and Iraq since for reasons of state none of them wanted to see an independent Kurdistan. The United States finally brokered a successful cease-fire. There are now two separate rump governments in Iraqi Kurdistan.

By the late 1990s, the economic situation had begun to improve in Iraqi Kurdistan due to the oil-for-peace funds, the cessation of internal fighting, and border customs collected by the KDP on its frontier with Turkey. A relatively free, liberal, and prosperous civil society began to develop both in the KDP and PUK regions. The problems of Saddam Hussein and numerous internally displaced persons continued, however.

## Iran

Until these developments in northern Iraq, the short-lived Mahabad Republic of Kurdistan (1946–1947) in

northwestern Iran represented the only Kurdish state in the twentieth century. This was destroyed and its president Qazi Muhammad hanged. Iranian agents also assassinated Abdul Rahman Ghassemlou, the leader of the Kurdistan Democratic Party of Iran (KDPI) in 1989 and his successor Sadegh Sharafkandi in 1992.

The Kurdish movement in Iran has been less developed than in Iraq or Turkey. The Iranian province of Kordestan represents the only usage of the term in any state for even part of the historical territory of Kurdistan.

## KURDS

Until the middle of the nineteenth century, Kurds had enjoyed an effective or actual independence in the homeland of Kurdistan. Although at other times, the Kurds—or rather, their princes—had paid homage to various powers in the area, this had never mounted to a direct rule. The introduction of technological innovations in armament mustered by their neighboring imperial powers, however, gradually ended this independence. What has followed to the present day is a relentless state of rebellion and warfare by the Kurds.

Kurdistan consists basically of the mountainous areas of the central and northern Zagros, the eastern one-third of the Taurus and Pontus, and the northern half of the Amanus ranges. Despite its mountainous

nature, Kurdistan has more arable land proportionately than most Middle Eastern countries.

Although presently an Indo-European-speaking groups with a strong European genetic admixture, Kurds, like most other large nations, are culturally and genetically an aggregate group. Genetically, Kurds are the descendants of all those who came to settle in Kurdistan, and not any one of them. Thus, ancient peoples such as the Kurti, Guti, Mede, Mard, Carduchi/Gordyene, Adianbene, Zela and Khaldi, each constitute only *one* ancestor and not *the* ancestor of the modern Kurd.

The earliest evidence so far of a unified and distinct culture (and possibly, ethnicity) by people inhabiting the Kurdish mountains dates back to the Halaf culture of 8,000–7,400 years ago. This was followed by the Hurrian cultural period, which lasted for nearly 4,000 years from circa 6,300 to 2,600 years ago. The Hurrians divided into many clans and subgroups, who set up city-states, kingdoms and empires. By about 4,000 years ago, the first vanguard of Indo-European-speaking peoples were trickling into Kurdistan. They formed the aristocracy of the Mitanni, Kassite, and Hittite kingdoms. Meanwhile, around 3,800 years ago, the name “Kurti” (Kurd) made its first debut into ancient records for a people and a kingdom located on the south shores of Lake Van and the Hakkari heights.

By about 3,000 years ago, the trickle had turned into a flood, and Hurrian Kurdistan was fast becoming Indo-European Kurdistan. By 300 BC, Kurds had established important dynasties in Anatolia. These had become Roman vassals by the end of the first century BC. In the east the Kurdish kingdoms of Adiabene, Sophene, Gordyene, Cortea, Media, and Kirm had, by the first century BC, become confederate members of Parthia. By the third century BC, the use of the name Kurd (Greek: Kurti; Latin: Cyrti) for the people inhabiting modern Kurdistan and other Kurdish colonies had become prevalent in the classical Graeco-Roman texts.

While all larger Kurdish kingdoms of the west gradually lost their existence to the Romans, in the east they survived into the third century AD and the advent of the Sasanian Persian empire. The last major Kurdish dynasty, the Kayosids, fell in AD 380. Smaller Kurdish principalities (called the *Kofyâr*, “mountain administrators”) however, preserved their autonomy into the seventh century and the advent of Islam.

The eclipse of Sasanian and Byzantine power by the Muslim caliphate, and its own subsequent weakening, permitted the Kurdish principalities and “mountain administrators” to set up new, independent kingdoms. The Ayyubids stand out by the vastness of their

domain. From their capital at Cairo they ruled territories of Libya, Egypt, Nubia, Yemen, western Arabia, Syria, the Holy Land, Armenia, and much of Kurdistan. As the custodians of Islam’s holy cities of Mecca, Medina, and Jerusalem, the Ayyubids were instrumental in the defeat and expulsion of the Crusaders from the Holy Land.

By AD 1500, there were over a score of independent and autonomous Kurdish kingdoms and principalities. None, however, showed any serious inclination for a unification of Kurdistan. The advent of the Safavid and Ottoman empires in the area in the sixteenth century, their division of Kurdistan into two uneven imperial dependencies, and their introduction of heavy artillery and a scorched-earth policy into Kurdistan was a new, and devastating development.

Nonetheless, this is when for the first time, Kurdish authors begin calling for a unified Kurdish kingdom to guard the land and foster Kurdish culture and language. Thus the historian Bitlisi wrote in 1597 the first pan-Kurdish history, the *Sharafnâma*, as Ahmad Khani, the collector and versifier of the national epic of *Mem-o-Zin*, called in 1695 for a Kurdish state. Kurdish nationalism had been born.

It is noteworthy that, prompted by externally-induced national distress, a century earlier than Europeans the Kurds were writing of the need for a unitary Kurdish ethno-national state—a “nation-state.”

The disintegration of the Ottoman authority highlighted by the virtual independence of Egypt and Arabia, meanwhile, persuaded the ancient, autonomous Kurdish princely dynasties to sue for full independence. The first of these was the principality of Soran (central Kurdistan). In the early 1830s, a scion of the Rewandid dynasty, Dostakid Prince Muhammad, embarked on establishing an independent kingdom of Kurdistan. At his capital of Rewanduz, he established foundries to forge artillery and firearms, enabling his army in 1834 to score a major victory against the Ottoman forces that included the Prussian officer Helmuth von Moltke (future general and conqueror of Paris in 1871). Prince Muhammad’s realm spread to cover the entire central Kurdistan, including Arbil and Kirkuk, where justice and law reigned supreme. A contemporary visitor, J. Baillie Fraser, wrote:

The great contrast which is observed between Turkish and Koordish territories. In the former, all villages were deserted, the inhabitants having taken flight to avoid the government imposts... On the other hand, no sooner did [one] reach Altoun Kupree [on the border], than all people flocked out, wearing flowers on their heads as on holidays, and shouted and cheered... They depend on no country but their own for the supply of all their

wants. Everything they require is produced at home, and while their mountains form impregnable defenses against foreign invaders, their rugged sides and valleys, with little effort, produce abundantly everything they desire to cultivate, and afford a never-failing supply of wood, water, and pasture.

Prince Muhammed's undertakings were aborted when a local grand mullah was bribed to issue a religious edict in 1836, forbidding Muslim Kurds from fighting the Ottoman Sultan/Caliph. Deserted, Prince Muhammed surrendered and was murdered in captivity at Trabzon the following year.

With the fall of Soran, the neighboring principality of Jezira (modern Cizre), under Bokhti Prince Badir (1802–1868) pursued the same goal by establishing links with other Kurdish princely houses at Muks, Bitlis, Kars, Hakkari and even the Ardalans in Persia, extending his dynasty's influence to most of Ottoman Kurdistan by 1840. To his diverse subjects, Badir attracted the allegiance of the Christian Armenian, Assyrian, and Chaldian inhabitants of Kurdistan. Awakened to the threat posed by Prince Badir and other Kurdish royalties, the Ottomans, now resuscitated by vast military support from Prussia/Germany, brought their full force against the fledgling Kurdish kingdoms. After three years of full-scale war, by 1848, the Ottomans had succeeded in shelling all Kurdish princely capitals into surrender. Jezira/Cizre, the ancient and charming capital of the Bokhti principality, was utterly leveled.

By 1867, the House of Ardalan—the last autonomous Kurdish principality in Persia—had been likewise extinguished. For the first time in history, the Ottomans and Persians now ruled all of Kurdistan directly, via governors.

The loss of independence and/or autonomy of Kurdish provinces created a political turmoil in the land which was to be further exacerbated after the end of WWI and the effective fragmentation of Kurdistan into five isolated sectors.

## Modern Times

Following World War I, the territories of the Ottoman Empire which contained three-quarters of Kurdistan was divided between the European winning colonial empires. The Treaty of Sèvres (signed between Ottoman state and the European victors on August 10, 1921) anticipated an independent Kurdish state to cover a small portion of the former Ottoman Kurdistan. A larger portion—in fact the entire northern Kurdistan, from Van to Ardahan, from Bitlis to Bayezid—was scheduled at Sèvres for inclusion in a

planned independent “Armenia.” Luckily for Kurds, none of this came to pass.

Unconcerned with the natives' call for independence, France and Britain divided former Ottoman territories according to their own needs, with Kurdistan apportioned to the new states of Turkey, Syria, and Iraq. The Treaty of Lausanne (signed June 24, 1923) formalized this division. Kurds of Persia/Iran and Russia/USSR, meanwhile, were kept where they were before by Teheran and Moscow. Even though Lausanne dashed the Kurds' hope for independence for the rest of the twentieth century, it saved them from the ethnic cleansing that had been openly planned and partly implemented by the Armenians in large portions of the Kurdish territories scheduled by the Treaty of Sèvres for inclusion in an independent Armenia.

The drawing of well-guarded state boundaries dividing Kurdistan has, since 1921, afflicted Kurdish society with such a degree of fragmentation that its impact is tearing apart the Kurds' unity as a nation.

The 1920s saw the setting up of a Kurdish Autonomous Province (“Red Kurdistan”) in Soviet Azerbaijan. It was dissolved in 1929. In 1945, Kurds set up a Kurdish republic at Mahabad in the Soviet occupied zone in Iran. It lasted one year, until the Iranian army reoccupied it.

After the fall of the monarch in Iraq in 1958 and the effective exit of Britain from that state, the successive juntas attempted at centralizing the power in Baghdad, thus running afoul of the Kurds who had enjoyed a benign autonomy under the British mandate and the monarchy. War broke out between the Kurds, led by the charismatic tribal leader and the head of the Kurdistan Democratic Party (KDP), Mustafa Barzani, and Baghdad, culminating in a Kurdish defeat in 1975. This led to a political split among the Kurds, leading to the emergence of a rival, Patriotic Union of Kurdistan party (PUK), headed by Jalal Talabani.

A year earlier in 1974 and as a preventive measure, the Iraqi Kurds had been offered by Baghdad a limited autonomy in about half the Kurdish territories which went into effect in 1975. Ever since, they have enjoyed an official autonomous status with varying degrees of actual autonomy in a portion of that state's Kurdistan. By the end of 1991 and the conclusion of the Gulf War I, they had become all but independent with the help of the United States. By 1995, however, the Kurdish government in Arbil (the autonomous region's capital) was engaged in a factional fighting between various Kurdish warlords. In August 1996, the Barzani faction called the Iraqi army into Kurdistan to help it dislodge the rival Talabani faction. An American brokered cease-fire stopped the bloodshed by distributing the income from Iraqi oil,

transit fees (and various other licit and illicit trades) equitably among the two primary Iraqi Kurdish factions: the Barzani and Talabani parties.

The Gulf War II in 2003 saw an unusual cooperation between the Iraqi Kurds on the one hand, and the Coalition Forces on the other. The fruits of this atypical Kurdish cooperation and wise choice of ally culminated in the enshrinement of Kurdish autonomy in three Iraqi Kurdish provinces (comprising about 60% of the Kurdish-inhabited regions of Iraq) in the provisional constitution of Iraq (March 2004)

Since 1987, the Kurds in Turkey—by themselves constituting a majority of all Kurds—have waged a war of national liberation against Ankara's seventy years of heavy-handed suppression of any vestige of Kurdish identity and its rich and ancient culture. The massive uprising had by 1995 propelled Turkey into a state of civil war. The burgeoning and youthful Kurdish population in Turkey is now demanding absolute equality with the Turkish component, and failing that, full independence.

In the Caucasus, the fledgling Armenian Republic in the course of 1992–1994 wiped out the entire Kurdish community of Red Kurdistan (Lachin, Kelbajar, Zangelan). Having ethnically cleansed its Kurdish inhabitants, Armenia has effectively annexed Red Kurdistan's territory that separates the Armenian exclave of Nagorno-Karabakh from Armenia. The fate of Red Kurdistan should serve as a model of what was in store for northern Kurdistan, had it been included into Armenia in 1920 by the provisions of the Treaty of Sèvres.

Following World War I and until 1991, Kurdistan was administered by five different sovereign states, with the largest portions of land respectively in Turkey (43%), Iran (31%), Iraq (18%), Syria (6%), and the Soviet Union (2%). Since the dissolution of the USSR in the year, Kurds find themselves natives of an additional five states which include Armenia, Azerbaijan, Georgia, Turkmenistan, and Uzbekistan. (Kurds of Kazakhstan and Kyrgyzstan are deportees.)

Iranian Kurds have lived in that state and the Battle of Chaldiran in 1514. Excepting occasional spells of independence, the other three-quarters of the Kurds lived in the Ottoman Empire from 1514 until its break-up in 1918. The French Mandate of Syria received pieces, and the British incorporated central Kurdistan or the "Mosul Vilayet" and its oil fields at Kirkuk into their Mandate of Iraq. The Kurds in Russia/USSR had passed into that sphere when territories were ceded by Persia in 1807–1828, and by the Ottomans in 1878.

Today the Kurds remain the only ethnic group in the world with indigenous representation in four world geopolitical blocs: the Arab World (in Iraq

and Syria), NATO (in Turkey), the South Asian-Central Asian bloc (in Iran and Turkmenistan), and the Russian-dominated bloc (since 1991, Armenia, Azerbaijan, and Georgia). As such, the Kurdish nation as a whole lacks a natural ally, and each of her nine fragments must deal with different settings, alliances, countries, and political realities within different world power blocs. This has rendered a pan-Kurdish external (or even internal) policy impracticable if not self-defeating.

### KUWAIT

The state of Kuwait lies at the northwestern end of the Persian/Arabian Gulf. It encompasses 17,818 square kilometers (about 7,000 square miles) of land, including several islands, the most important of which are Failaka, a repository of ancient ruins off the coast of the Salmiya district, and Warba and

Bubiyan, low, marshy flats lying off the northern coast. Kuwait's topography slopes gently from west to east but is mostly level, except for one "mountain" in the south and a ridge in the north. It has a hot, desert climate. There is a short period of cold weather in the winter. Dust storms occur mostly during spring. Summer temperatures can rise very high, occasionally surpassing 50°C (122°F). The 2003 population of Kuwait was estimated as 2.4 million persons, 37% of whom are Kuwaiti citizens. The vast majority of citizens are Muslims, approximately 30% of whom are Shi'i and the rest Sunni.

Desert nomads roamed for centuries across what are now Iraq, Kuwait, and Saudi Arabia looking for water for their flocks; however, the political community grew from an urban nucleus on the seaside, settled early in the eighteenth century by refugees fleeing a prolonged drought in the central Arabian Peninsula. "Kuwait" is thought to be a diminutive of *kut*, or fort, but the community also was known as Qrain. In 1752, the Sabah family was chosen by community leaders to provide Kuwait's rulers but, until the late nineteenth century, Kuwaiti merchants and ship owners were richer and more powerful than the Sabahi amirs. Merchant wealth came from pearling and from buying and selling goods transported by dhow across south Asia, the Arabian Peninsula, and east Africa.

The balance of power between rulers and merchants changed with the reign of the amir Mubarak (r. 1896–1915), the only Kuwaiti ruler to come to power through a coup. Having killed his predecessor, Mubarak did not hesitate to bring other political forces to heel. He played the Ottomans off against the British in a mostly successful attempt to preserve his autonomy, ensure access to income independent of taxes paid by the merchants, and guarantee that the right of succession would be limited to his direct descendants. In return, Mubarak surrendered authority over Kuwait's foreign policy and as-yet undiscovered oil reserves to Britain.

Oil is the foundation of the modern Kuwaiti economy. Its exploitation rescued Kuwait from economic devastation resulting from tribal warfare, British competition in the transit trade, and the loss of markets for natural pearls caused by the advent of cheaper cultured pearls. The Kuwait Oil Company (KOC), a joint venture owned by a British and a US oil company, discovered oil in 1938. KOC began commercial exports of crude in 1946. Production capacity expanded rapidly, spurred by a British and US-led boycott of Iranian oil in the early 1950s. Kuwait is estimated to possess about 10% of global oil reserves. It was a founding member of the Organization of Petroleum Exporting Countries (OPEC) in 1960. In spite of extensive overseas investments, Kuwait continues to

depend on oil sales for more than 90% of its GDP. It produced about 2.4 million barrels of crude per day in 2004.

By the mid-1950s, under the amir Abdullah al-Salim (r. 1950–1965), generous programs were inaugurated that distributed a large portion of the nation's oil income to the citizen population in the form of social services and cash payments. Health care and income support raised the quality of life for Kuwaitis along with their life expectancy, which rose from less than forty-five years in pre-oil Kuwait to nearly seventy-eight years in 2004. Education is compulsory for girls and boys between six and fourteen years of age. By 2003, 90% of Kuwait citizens ten years or older were literate. Most Kuwaitis are employed in the public sector but recent changes in employment policies such as the requirement that social allowances go to citizens working in the private sector as well as to government employees are making private-sector employment more attractive. Virtually all unskilled labor and workers employed in hazardous industries are foreigners whose wages are substantially lower than what Kuwaitis earn. The disparity in living standards between citizens and non-citizens is visible in nearly every aspect of life in Kuwait.

Kuwaiti citizenship was shaped by two experiences of invasion. Wahhabi raiders from Saudi Arabia invaded Kuwait from the south in 1920, reaching Jahra, an agricultural settlement to the west of the city, in October. Anticipating attack, the amir Salim (r. 1917–1920) called upon the residents to build a wall around the city. Toiling throughout the hot summer, the Kuwaitis completed the wall some weeks before Jahra, which Salim himself went out to defend, was attacked. The invaders were defeated at Jahra but the citizenship laws of the modern state defined as originally Kuwaiti only those families who had resided in the city in 1920, during the construction of the wall.

The second invasion occurred in August 1990 when Iraq seized Kuwait and claimed it as Iraq's "nineteenth province." The Iraqi occupation lasted until the end of February 1991 when an international coalition led by the United States expelled Iraqi forces and liberated Kuwait. The occupation was a defining event that united Kuwaitis as citizens but also divided them according to their experiences inside or outside the country during this period. Liberation marked a resumption of democratization. In 1992, responding to pressure from Kuwaiti citizens and governments that had spearheaded the liberation effort, the Kuwaiti government ended a six-year suspension of the constitution and parliament with parliamentary elections in October.

Despite this, Kuwait is not yet a democratic state. Women are not permitted to vote or run for political

office, while the relationship between parliament and government leaves the lion's share of power with the latter, still firmly controlled by the Sabahi. Kuwaitis are not eager for revolutionary change in their country but across the political spectrum and hope for its gradual transformation into a constitutional monarchy. Civil society, buttressed by traditional institutions like family businesses and the *diwaniyya* (weekly home-based meetings), supports a highly diversified collection of religious and secular voluntary organizations and political movements. They contribute significantly to Kuwait's democratic potential even though some Islamist groups oppose democratization and seek to make religious law (*Shari'ah*) the basis of the legal and political system.

### KUWAIT FUND FOR ARAB ECONOMIC DEVELOPMENT

The Kuwait Fund for Arab Economic Development ("the Fund") is a lending institution that finances development projects in Third World states. It operates as a public corporation managed by a board of directors with up to eight members appointed and formally chaired by the prime minister, who may delegate these powers to the minister of finance. The Fund's daily operations are overseen by the director

general, who is appointed by decree of the Emir on the recommendation of the board of directors. Since 1986, the position of director general has been held by Bader Mishari al-Humaidhi. In 2003, the Fund's management was transferred from the ministry of finance to the ministry of foreign affairs.

The Fund was established on December 31, 1961, shortly after Kuwait gained its independence from the United Kingdom. It was the first aid agency in the developing world. Originally endowed with an operating capital of Kuwaiti dinar (KD) 50 million (KD 1 = \$3.43, March 3, 2005) this was increased to KD 200 million in 1966, KD 1 billion in 1974, and KD 2 billion in 1981. Within a decade of its inception, the Fund had extended loans to all Arab states, with the exception of oil-producers Oman, Qatar, and Saudi Arabia. The Fund's mandate was originally limited to other Arab states. In July 1974, as high energy prices swelled the Kuwaiti treasury, its scope was extended to include all developing countries. Despite this broader mission, the Fund has been most heavily involved in Arab countries (53% of all loans), followed by South Asia and the Pacific (21%), and West Africa (9%).

While it has no formal restrictions on the type of projects it can sponsor, the Fund focuses mainly on transportation (32% of all loans), energy (22%), agriculture (16%), water and sewage (11%), and industry (11%). As of December 7, 2004, it had made 659 loans over its lifetime. Tunisia, Yemen, and China had the greatest number of loans, at twenty-nine each. Egypt had received the most credit, at KD 322 million. The Fund had also committed KD 328 million to fellow development institutions, the most important of which was the Arab Fund for Economic and Social Development, at KD 169 million. Its loan commitments totaled KD 3.4 billion, disbursements reached KD 2.7 billion, KD 1.5 billion of which had been repaid.

The Fund is empowered to extend loans not only to sovereign states, but also sub-national governments, development institutions, and private non-profit corporations. Its assistance can take the form of direct loans, guarantees, joint financing with other agencies, advisory services, or capital subscription for development institutions or enterprises. The recipient must be a developing country, or, in the case of a non-state borrower, a national of a developing country. The Fund does not provide budgetary or balance of payment assistance. The criteria for evaluating project finance applications include: (1) economic justifications; (2) environmental impact; (3) total cost; (4) managerial capacity; and (5) technical viability. Interest rates are determined on a case-by-case basis, averaging 3.5% annually with a mean maturation

period of twenty-two years. In general, the Fund funds a maximum of 50% of the total cost of a project and uses the Kuwaiti Dinar as its unit of account. The board of directors may grant exemptions from both these rules for reasons related to the nature of the project or the economic circumstances of the beneficiary country. The Fund does not require recipients to purchase any goods or services from Kuwait.

During the Fund's first two years of existence, the World Bank ("the Bank") provided it with an advisor to guide it in its operations. The legacy of this early tutelage remains visible, for example in the Fund's tendency to privilege large infrastructure projects. There are, however, significant differences between the two organizations. The Fund limits itself to providing loans, whereas the Bank openly seeks to influence recipient states's fiscal policy. The Bank funds not only individual projects, but sectors of the economy and government institutions as well. The Fund's smaller size allows it to have an average project cycle of six months, as opposed to eighteen for the Bank. As the first Arab aid agency, the Fund has served as an example to other oil-rich governments in the creation of similar entities. The most prominent of these are the Abu Dhabi Fund for Development, established in 1971, and the Saudi Fund for Development, founded in 1974. Moreover, the Fund has played a major role in building and financing a number of multilateral aid agencies. These include the Arab Fund for Economic and Social Development in 1968 (headquartered in Kuwait), the Arab Bank for Economic Development in Africa in 1974, and the Inter-Arab Investment Guarantee Corporation (also headquartered in Kuwait), the OPEC Fund for International Development, and the Islamic Development Bank, all in 1975.

Officially, the Fund's sole purpose is to foster development in the Third World. However, the government has also recognized it as one of Kuwait's foreign policy tools. Jordan's 1970 military action to expel the Palestine Liberation Organization resulted in a suspension of the Fund's most high-profile activities there. Tentative approval for a loan to Iraq was withdrawn under government pressure in 1973, following the latter's occupation of a Kuwaiti frontier post. Egypt's establishment of diplomatic ties with Israel led to a freeze on new loans, though the Fund honored its pre-existing commitments. Liberia suffered similar consequences when it restored diplomatic ties with Israel in 1983. Shortly after the 1990 Iraqi invasion, Kuwaiti Emir Sheikh Jaber al-Ahmad al-Sabah announced before the UN General Assembly the cancellation of all outstanding interest payments due to the Fund. This amounted to arrears of KD 12.4

million, shared by forty-three countries. Conversely, aid to Jordan, Sudan, and Yemen was suspended when they supported Baghdad.

## KYRGYZSTAN

The Kyrgyz Republic (also known as Kyrgyzstan and by convention called Kirgizia until 1991) is located in Central Asia, bordering with China in the east, with Tajikistan in the south, Uzbekistan in the west, and Kazakhstan in the north. The country has a land area of 198,500 square kilometers (76,640 square miles) and is the second smallest in the Central Asian region.

The population of Kyrgyzstan is estimated at just over 5 million (2004). It is predominantly rural with only around 35% of the people living in cities and towns. The country's capital city, Bishkek (known as Frunze between 1926 and 1991), is home to seven hundred thousand people (2001) or 14% of the population. Kyrgyzstan has a population growth rate of 1.44% and it is estimated that its population could double by 2044. Kyrgyz and Russian share status as official languages; Uzbek is also spoken. The major religion is Islam, with 75% of the population; 20% are Russian Orthodox.

For centuries, the Kyrgyzstanis have been engaged in animal husbandry, raising horses, sheep, goats, and cattle. The mountainous land can support millions of sheep, but only 7% of the countryside is arable. Relations between Kyrgyzstanis and their neighbors have often been interrupted by devastating wars and military conflicts, which have had a negative effect on Kyrgyzstan's economic and social development. Consequently, Kyrgyzstan entered the nineteenth century as a feudal country with most of the population engaged in subsistence economy. Gradually, the Russian Empire established political control over the Kyrgyz land.

Major economic and social changes were brought to Kyrgyz society with the arrival of the Russians in the nineteenth century. The Russian Revolution of 1917, which was directed against the imperial regime and promised social justice, had profound effects on the Kyrgyz elite. In 1924, with Soviet assistance, Kyrgyzstan was established within its present borders, becoming a Soviet Autonomous Oblast (province), a constituent part of the Russian Federation. The Kyrgyz Communist Party came to power, to remain the single ruling party for the next sixty-six years.

The Soviet concept of development in Kyrgyzstan included radical political and economic changes, state control of all types of economic activities and central state planning. At the same time the government suppressed basic political freedoms; however, it eliminated mass illiteracy, developed extended free education and medical services to all sectors of the population, and installed a comprehensive welfare network. Between the 1930s and 1980s the government forced all farmers to join large-scale farming centered around *kolkhozy*, state-controlled collective farms (specializing in animal herding, cotton, silk, etc.). During and after World War II, it emphasized state-led industrialization which included defense, heavy industry such as agricultural machinery, light industries such as textile and garment, and mining in antimony, gold, uranium ore, and so on. As in most socialist countries, almost all economic activities in Kyrgyzstan were state-controlled, and private entrepreneurial initiatives were limited. Until the 1990s, the Soviet Union and the East European countries remained Kyrgyzstan's main trading partners, and the chief market for its products. According to official statistics, the Kyrgyzstan economy grew at an average annual rate of 6% to 9% between the 1930s and 1960s, but was stuck at 2% to 4% in the 1970s.

Major changes came in the middle of 1980s with the relinquishing of the centrally planned economy, and the introducing of limited democratization and economic experiments within the socialist system. These changes were largely peaceful, since they were initiated by the ruling elite under the influence of the Gorbachev's *perestroika* policy. In 1990, the Constitution of Kyrgyzstan was amended and the first multi-party election for the *Jogorku Kenesh* (Parliament) was held. The CPK was challenged by the newly formed Democratic Movement of Kyrgyzstan and some others. The CPK gained almost 80% of the seats in the new Parliament and formed the government, but its representative, Apsamat Masaliyev, lost the Presidential election to Dr. Askar Akayev, a candidate supported by the opposition.

## Recent Development

Kyrgyzstan declared its independence from the USSR on August 31, 1991. President Akayev showed great toleration toward the opposition and promoted genuine reforms, liberalizing the political system and introducing a new Constitution (1993) and a new unicameral Parliament (1994). However, as Akayev won two consecutive presidential elections (in 1995 and 2000) there was evidence of increasing authoritarianism. It is important to note, however, that the transition in Kyrgyzstan was largely peaceful and, unlike many Third World countries, its military does not play any active role in its politics. After the parliamentary elections in 1995 and 2000 the *Jogorky Kenesh* emerged as a stronghold for opposition.

In the economic area, from the early 1990s the Kyrgyzstan government adopted an IMF-designed program of radical economic changes (the so-called shock therapy approach). This program is based on three main mechanisms: rapid mass-privatization, rapid price liberalization and currency reform with the assistance of international organizations such as the World Bank and the IMF. The government quickly abandoned the centrally planned economy and focused on mass-privatization, promotion of private entrepreneurship, liberalization of its trade, and opening up the national economy to international investment. It was able to privatize most of the enterprises in the industrial and agricultural sectors, establish a freely convertible currency system (Kyrgyzstan's *Som* was introduced in May 1993 and has remained relatively stable), and achieve macroeconomic stabilization. At the same time, the state downsized the social welfare system, and privatized medical services, educational institutions and the pension system. Due to its rapid and extensive economic liberalization, Kyrgyzstan became the first among the Commonwealth of Independent States to be accepted into the World Trade Organization (WTO) in 1998.

However, the state's sudden change of the economic policy and withdrawal of subsidies, combined with the disintegration of the Soviet market, led to a steep de-industrialization and transitional recession affecting almost all sectors of the economy. According to the IMF, Kyrgyzstan's economy declined at an average annual rate of 4.1% between 1989 and 1999 (between 1992 and 1995 the industrial sector alone declined at an average annual rate of 20%), while the United States was experiencing a decade of unprecedented growth. The country increasingly relies on the export of raw materials to the international market, and it is extremely vulnerable to fluctuations in world prices for its major export products—gold

and agricultural products. Kyrgyzstan needs considerable foreign direct investments and international assistance to modernize existing technologies and to conduct major economic changes. However, both local and foreign investors are reluctant to invest in the economy due to the small size of the market, the weakness of the legal system and the inability of state institutions to implement property rights and contract law.

Agriculture, industries, and services are the three main pillars of post-Soviet Kyrgyzstan's economy, contributing 39.4, 26.4 and 34.2% respectively to the gross domestic product (GDP) (2000 World Bank estimate). Kyrgyzstan's exports are narrowly based on sales of raw materials in international markets. The country's main exports are nonferrous metals (accounting for almost 41% of total export earnings in 1998), garments and textiles, electricity, and agricultural products. The mining industry is largely concentrated around the single largest mining field, Kumtor. The country depends heavily on imports of machinery, fuel, industrial consumer goods, and food products. Due to the transitional recession and the disappearance of aid from the former USSR, Kyrgyzstan's economy increasingly relies on foreign aid and credits. Total external debt has reached almost \$1.4 billion US dollars (2001), quite a large figure for a nation of only 5 million people.

Despite macroeconomic stability and success in structural changes, the economic changes led to a steady decline in living standards among pensioners, rural people, and women with children. The country remains one of the poorest countries of the former

Soviet Union, with 52% of population living below the poverty line (2001 estimate) and a sizeable number of people are leaving for other countries in search for jobs and better standards of living. In 2001, the United Nations Development Program (UNDP) Human Development Index (HDI) put Kyrgyzstan in ninety-second place out of 162, behind all the former Soviet countries except only Moldova, Uzbekistan, and Tajikistan.

## **LAAR, MAART**

Born in 1960, Maart Laar proved to be one of the most influential politicians to emerge during the intense period of economic, political, and social transition in post-independence Estonia. Laar was credited with Estonia's rapid advancement towards European integration during the 1990s.

Laar was born in Viljandi, Estonia in 1960. Laar received a BA in history and later an MA in philosophy from the University of Tartu. From 1990–1992, Laar served on the Estonian Congress and Estonian Committee, as well as the Supreme Council, positioning himself to become an active participant in Estonian politics. The thirty-one-year-old, self-professed “grandson of Margaret Thatcher,” was chosen by president Lennart Meri as prime minister in 1992. Laar would serve as Estonian Prime Minister from 1992–1994 and again from 1999–2002.

Expectations were enormously high for Laar's first government, led by the *Isamaa* (Fatherland) party. The young parliament members were perceived as being intrinsically honest in comparison to the former Soviet governments. The ambitious Laar set out upon a course of reforms and programs to realign Estonia with Western Europe. Laar established a radical neoliberal economic regime; including the elimination of all tariff restrictions and replacing the existing tax code. The progressive income tax was replaced by a fixed, flat rate of 26% in the hope of allowing individuals greater economic choices. Unlike Laar's peers in other successor states of the Soviet Union, Laar was most concerned about leading Estonia toward a

clearly Western orientation rather than the Commonwealth of Independent States (CIS). While this policy proved to stimulate economic growth, it led to great economic hardship for many Estonians.

The harsh reforms set in motion by *Isamaa* and Laar's personal arrogance ultimately led to the failure of his first government. *Isamaa* mandated strict new legislation concerning the Russian population in the country, demanding that the nation's five hundred thousand former Soviet citizens register for residency or risk expulsion from the country. The severe economic dislocation caused by the market reforms led to questions of major social implications, including a rising crime rate. Local elections in October 1993 only served to prove the public's growing discontent with the *Isamaa* government. Of sixty-four seats on the Tallinn City Council available, only five went to Laar's party. In response, Laar stated that Estonia could either move forward toward European integration or find itself as a full member of the CIS. This arrogance, and accusations of corruption proved to be Laar's first undoing. After the revelation that 2.3 billion Soviet rubles were withdrawn from circulation and sold to Chechnya without parliamentary consent, a vote of no-confidence was held, and Laar stepped down on September 26, 1994.

Laar reemerged as prime minister in 1999 after parliamentary elections, creating a coalition government consisting of *Isamaa*, the Estonian Reform Party, and the Moderates' Party. The government's main concern was preparing Estonia for formal European Union accession and the expansion of the

high technology sector of the economy. Laar resigned from office in January 2002 amidst growing tensions within the coalition and was replaced by Siim Kallas.

## LABOR

Labor encompasses primarily the physical activity of work, though following a Marxist view the idea of labor-power is often implied. Labor-power is the worker's need/ability/desire to sell his or her work to employers, in return for compensation, which can be in the form of wage, salary, or non-monetary means, as has been the case historically in many developing countries. For example, in the late nineteenth and even the early twentieth century, mining workers, who lived and worked in very remote areas, often received so-called company-tokens which they could—or had to—exchange for expensive food and other life-supporting commodities. In the process, workers frequently became indebted. In many developing countries, share-cropping is a familiar sight. In return for their work, peasants are entitled—more often by tradition than by legal contract—to a certain and perhaps negotiated share of land or of the harvest. Thus land, and more specifically land ownership, has been and continues to be of crucial importance for peasants all over the developing world.

Labor not only describes the physical activity of work or the laborer's need to sell his/her work to any given employers, but most importantly, labor connotes a social relationship—and thus also a relationship of power, including also (mutual) dependence—between two or more categories of social actors. History has seen an endless number of variations of that social relationship, including slave-labor, wage-labor, and more recently so-called full-time labor, part-time labor, sub-contracted labor, outsourced labor, stock-holding labor, informal labor, and more. Following both Marx and Weber, the relationship between labor and employers is a class relationship that has also a political dimension to the degree to which labor, that is, workers, are interested in (a) obtaining suffrage (more the historic case of European than developing

countries) and (b) improving wage and working conditions, in short, improving their social rights (as understood by TH Marshall). In their pursuit of social rights, workers most often appeal to the state and in so doing can choose between two political approaches: revolution or reform, although the latter may have its own variations, for example, the so-called “third way” (Europe), “corporatism” (Latin America) or, more recently and adopted worldwide, the “neo-liberal” phase. Historically, workers have not been very successful in bringing about major socio-political and economic changes via revolution. Reasons for this are complex and multiple. Following Marx, workers need to organize in the labor movement, which in turn helps workers obtain “true consciousness” which in turn prepares them for the revolution and the seizure of political power. The role of working-class parties has often contributed to the improvement of workers' social rights, but at the cost of accommodation and postponement of revolution. Despite unprecedented industrialization, no country has ever produced a pure working-class political majority; hence even revolution by suffrage alone (as compared to the violent overthrow of the so-called bourgeois state) has not occurred. The country that came closest to that was most likely Chile in 1970, in which a Socialist was elected President, with a program to gradually move from capitalism to socialism. But even there, working-class parties were not able to control Congress, and political divisions led the country to the brink of civil war in 1973. With the fall of the Soviet Union and the end of Communism, Cuba and North Korea notwithstanding, radical working-class parties where they still exist(ed), have become more accepting of capitalism and democracy. Hence the role of working-class parties—or of parties who claim to represent “the working people”—becomes crucial for workers' interest, and this is nowhere more evident than in the Social-Democratic types. And while this option puts the revolution forever on “hold,” workers have obtained substantial gains over the last two centuries.

Yet, for many workers in developing countries, even this “second-best” scenario (Social Democracy) remains elusive, in part precisely because many countries have not been able to industrialize to the degree to which this has occurred in developed countries. In other words, they have not been able to “repeat” the development path taken by the developed world. Therefore, agriculture remains a crucial economic activity and peasants often labor in conditions similar to those a century ago. Thus, in part as a result of structural conditions related to economic development, working-class parties in most developing countries remain small and mostly bereft of any

major political power. In developing countries, modernization of agriculture is relatively widespread, though the effects on labor are heterogeneous. In some cases, increased use of technology has had positive effects on wages and/or working conditions, but the trade-off to this economic policy is frequently unemployment or low job creation that usually cannot keep up with population growth. Hence, in many developing countries, the countryside has had an ambiguous view on modernization. Many workers and families welcome better jobs, but many realize that work in and of itself is not always an improvement to working and living conditions. Often, too, there is fear that modernization replaces or changes culture and customs.

With the end of Keynesian economic policies and Import-Substitution Industrialization (especially in Latin America), so-called neoliberalism has become the latest economic “model.” Most if not all Latin American and Asian countries (see here especially the “NICs”—the newly industrialized countries of Southeast Asia) have over the past two to three decades adopted that neo-liberal model in one way or another. One important consequence of this has been the reduced role of the state in the economy. For many developing countries, this has not been an easy choice and favorable macroeconomic indicators do not always tell the whole story. Not surprising then, many workers in developing countries are beginning to resent Neo-liberal economics. Those workers who are organized in labor unions often resort to strikes and protests in order to defend what they believe to be their interests and rights. However, unionization has witnessed a major decline beginning in the late 1970s and early 1980s, and as rule, unions in developing countries do not enjoy the kind of “strength” witnessed in developed countries (especially Northern Europe). Therefore, workers often have to rely on their own luck in finding work that permits them a livable wage. Nevertheless, many democratic governments of the developing countries were eager to adopt neo-liberal policies, in part because of the conviction that state-led development had contributed to low productivity, inefficient enterprises, budget deficits, and more.

While the social division of labor frequently denotes workers’ position in any given economic and political structure, the sexual division of labor calls attention to the way in which males and females experience work differently—as workers but also often as husbands and wives, fathers and sons, and daughters and mothers. In other words, the dual structures of work and household affect women differently from men. Domestic labor is still mostly a female place, underpaid, and not sufficiently appreciated by state, economy, and society of all countries.

To what degree developing countries “lag behind” in their cultural, economic, and political recognition of female labor is very much debated in academia. And even though Modernization and Dependency Theory of the 1960s and 1970s, respectively, each had their own insights to the “problem,” it is clear that equality for female labor, at work and at home, is still a major challenge in the new millennium of developing and developed countries alike.

### LAKE CHAD BASIN COMMISSION

The Lake Chad Basin Commission (LCBC) was created by the Fort Lamy (N’Djamena) Convention signed on May 22, 1964, by the heads of state of four countries that share the Lake Chad, namely, Cameroon, Niger, Nigeria, and Chad. The Central African Republic was admitted as the fifth member state in 1994, which more than doubled the area of the new Lake Chad Conventional Basin, from 427,300 square kilometers to nearly 1 million square kilometers. Lake Chad was once the sixth-largest lake in the world, but since 1964, the lake level has continuously fallen with the surface area reducing from about 25,000 square kilometers in the 1960s to less than 2,000 square kilometers today, while its volume has decreased by close to 60%. There are several reasons for this shrinking of Lake Chad but perhaps the biggest reason was the severe droughts in the region in the 1970s and 1980s, combined with diversion for irrigation. Despite its low level readings, according to the Famine Early Warning Systems Network,

hydrological station readings indicate that the levels are slowly rising.

The Lake Chad Basin is a source of life, socio-economic diversity, and biodiversity for this region of the world. The population of the conventional basin, according to its Executive Secretary Abubakar B. Jauro, is about 20 million distributed as 2,550,000 in Cameroon, 193,000 in Niger, 11,376,000 in Nigeria, 5,048,530 in Chad, and about 634,283 in Central African Republic, respectively. A majority of this population survives directly from the practice of agriculture, nomadic and semi-nomadic animal husbandry, and fisheries. There are more than 150,000 fishermen living on the lake's shores and its islands. According to the WWF International and its Living Waters Programme, the current estimate of annual fish production from the lake is sixty thousand to seventy thousand tonnes. The raising of cattle, sheep, and camels is also economically important, together with the cultivation of some traditional crops. The most common system is the lake-bottom cropping or receding moisture cultivation, which has been a response to the contraction of Lake Chad. In addition to direct support for livelihoods, according to the WWF International and its Living Waters Programme, the lake also plays an important socio-economic role in regulating annual water supply, recharging ground water, and helping to control flooding. WWF International also reports that over one hundred species of fish have been recorded from the upper Chari system, while over 120 species are known from the lake itself and the lower reaches of the Chari River. Furthermore, the region is also notable for the Kuri ox, a domesticated breed of *Bos Taurus longifrons* at risk of extinction.

The LCBC was established for the regulation and planning of the uses of the waters and other natural resources of the convention basin. Today, the LCBC is also mostly concerned with, but not limited to, collecting, evaluating and disseminating information on projects prepared by member states and to recommend plans for common projects and joint research programmes in the Lake Chad basin; drawing up common rules regarding navigation and transport; examining complaints and promoting the settlement of disputes and the resolution of conflicts; promoting regional cooperation, coordinating regional programmes; and planning, mobilization, and following up of national projects with regional implication.

### LAND DISTRIBUTION PATTERNS

Land distribution patterns reflect and underpin social power so that changes in patterns of land ownership necessarily involve changes in the structure of society itself. Land reform means the redistribution of land and other agricultural resources to reduce or eliminate the concentration of assets in the hands of a small number of powerful and wealthy elites. Land reform entails a comprehensive overhaul of the way in which agricultural land is held or owned, the methods of cultivation that are employed, or the relation of agriculture to the rest of the economy. The term *agrarian reform* is also used to refer to a fundamental change in access to and use of land in a broader sense to include agricultural institutions, such as credit, taxation, rents, and cooperatives. Sitting governments or political parties introduce such reforms to resolve or prevent economic and political crises. The main objectives are to abolish exploitive control of farms and related labor and to generate economic development on behalf of poor peasants and indigenous peoples who rely on land for livelihood and welfare. Governments often intervened to transfer land ownership from an established landed class to the state or key constituents in the countryside. Although land reform resulted in lower agricultural productivity in some cases when it included collectivization, it generally increased productivity when land was redistributed directly to the tiller.

Land reform has its origins in the classic eras of Greek and Roman empires, but land redistribution is more closely associated with the Enlightenment period and the major liberal democratic revolutions in Western Europe and the United States. The equitable distribution of land and the right to own land as a fundamental human right lie at the heart of democratic egalitarian societies as envisioned by the

US and French experiences. However, centuries of enclosure and eviction in much of Europe created a vast displaced population whose only recourse was to migrate to the industrial centers. Peasant uprisings were based on the demands of small freeholders, yet the modern state, the crown and the church resisted the restructuring of land ownership to protect the interests of aristocrats and oligarchs. In the wake of the abolition of slavery in the United States after 1865, freed people of African descent sought fundamental shifts in social relations in land tenancy and labor conditions in southern states. Many former slaves became family farmers, often working land they rented through various sharecropping arrangements, although many blacks continued to work in relationships reminiscent of slave-like dependence on white landlords.

## Latin America

The creation of new nation-states in Latin America in the nineteenth century eliminated communal ownership of land among indigenous communities. A variety of liberal dictatorships designated vast land holdings in private individual or family titles causing many indigenous communities to lose their customary property rights to private estate owners. Farm land was often sold without consent or just seized outright. By the late nineteenth century, many indigenous villages disappeared and native peoples were forced into destitution as agricultural laborers and miners. The desperate need for land reform was a major force behind the Mexican revolution of 1910. Emiliano Zapata championed the resurrection of communal land access which was given official legal status in Article 27 of the 1917 Constitution. State-held *ejido* land was distributed to poor indigenous cultivators in perpetuity. However, amendments to Article 27 in 1992 weakened *ejido* restrictions on the sale and division of land into individual parcels.

The onset of the Cold War introduced an ideological dimension to struggles for access to land. From 1952 through the 1970s, a wave of nationalist revolutionary movements in Latin America led governments to implement agrarian reforms on behalf of constituents among the rural poor. The reforms failed to address marginalized indigenous peoples, notably Bolivia, Ecuador, and Peru. Military rule in Brazil in the 1970s and 1980s spawned intense pressure for land reform led by the Landless Peoples Movement. Land reform in Chile under the government of Salvador Allende (1970–1973) was reversed once the military dictatorship of Augusto Pinochet took power in 1973.

The communist regime in Cuba embarked on agrarian reform after 1959 through the nationalization of the sugar sector that was mainly responsible for lucrative agricultural exports and miserable rural living standards. The goals were to increase production and rationalize labor inputs, but state intervention led to inefficiency and resistance.

The modern history of Central America is replete with conflict over land. The repression of peasant uprisings in El Salvador in 1932, and the subversion of a genuine attempt at agrarian reform in Guatemala in the early 1950s, eventually led to the emergence of revolutionary guerrilla organizations that advocated land redistribution. In El Salvador, a military coup by junior officers in October 1979 installed a provisional government that proposed limited land redistribution. The Basic Agrarian Reform Law promulgated in March 1980 affected about 15% of farmland. Additional provisions allowed renters or sharecroppers to claim legal titles, and several commercial banks were nationalized to reallocate credit to the reformed sector. The Christian Democratic government attempted to utilize land reform as a disincentive for landless peasants to join the guerrilla insurgency. In Guatemala, the overthrow of the democratic government of Jacob Arbenz in 1954 catapulted the country into a ferocious civil war for the next four decades. The issues of land reform and indigenous rights to land were central features of the peace accord sponsored by the United Nations in 1996. Upon the fall of the Somoza dynasty in Nicaragua in 1979, the Sandinistas embarked on agrarian reform primarily with the property of the Somoza family and its closest allies. The revolutionary government collectivized some rural production in cooperatives and state farms, but did not intend to attack the non-Somoza landed elite. However, in July 1981, the regime announced broader legislation that permitted the confiscation of large tracts of abandoned, idle, or underutilized land. When the Sandinistas lost the presidential election in 1990, the new government privatized state land and dismantled agricultural cooperatives.

## Sub-Saharan Africa

The African national liberation movements against colonial rule subsumed tribal and peasant demands for land under a broad agenda of political self-determination and popular will. The socialist experiment in Tanzania under Julius Nyerere aimed to persuade the peasantry to accept the moral rectitude of the control of land by the state. However, the

policy of rural resettlement became coercive in the 1970s. The use of militia against farmers who rejected the village scheme poisoned relations between the regime and the countryside. Kenyan tribal and agricultural elites circumvented pressures for wholesale restructuring of land ownership in the 1970s, while the state attempted to resettle and title land to over a million progressive small farmers. The government's efforts to register titles, consolidate fragmented holdings, and adjudicate subsequent land disputes were hampered by intransigent relationships between local land patrons and clients that cut across ethnic, regional, and family lines.

In Zimbabwe, the Lancaster House agreement in 1979 protected the position of white farmers who were allocated twenty seats in parliament. Land reform, specifically the redistribution of white-owned land to landless black peasants, was promised but was delayed to smooth the transition to black majority rule. During the 1980s, the government of Robert Mugabe increasingly moved away from its Marxist rhetoric and toward support for political and economic liberalization in southern Africa. Yet, under pressure from the democratic opposition, Mugabe announced a controversial program of land redistribution in 1997. About 1,500 white-owned commercial farms, nearly half of the country's total commercial farmland, were designated to be seized without compensation and divided among landless blacks and blacks with only small landholdings. The ongoing process of land reform in South Africa is a direct response to the history of land dispossession during the colonial period in the eighteenth and nineteenth centuries, the Natives Land Act of 1913 and subsequent legislation in 1936 creating *native reserves* for African populations, and the forced resettlement of 3.5 million Africans into *homelands* by the apartheid government after 1948. The democratic government led by the African National Congress embarked on a multi-pronged approach to land reform in 1994. The program addressed restitution, redistribution, and tenure security. However, political, fiscal, and technical problems slowed progress during a decade of democratic rule.

### Global Perspective

Other notable cases of land reform are connected historically to world war and revolution in the twentieth century. The Bolshevik revolution in Russia in 1917 led to a type of land reform known as collectivization in which all arable land became state property and peasant farmers cultivated and harvested under

state control. Land reform was an essential part of the transition to democracy in Japan after World War II. United States occupation forces supervised land redistribution that transferred over 80% of Japan's cultivated land from absentee landlords to permanent tenants by 1949. Taiwan and South Korea adopted limited land reforms in response to the Maoist revolution in China in 1949 and the ideological split of the Korean peninsula in 1953, respectively. In China, dynastic rule and warlord competition, combined with Japanese occupation and a debilitating civil war in the 1920s and 1930s, contributed to the acute concentration of land in the hands of estate owners and foreign exporters with ties to the nationalist regime. The communist regime redistributed land among the peasant population in the form of massive communes. This policy had disastrous effects on food production and led to starvation in the countryside. The commune system was abolished in favor of market-oriented agriculture in the 1980s.

Indigenous peoples regard themselves as belonging to their lands. Land reform became an essential element of the movement for sovereignty among aboriginal peoples and indigenous communities in North America, Australia, and New Zealand. The movement for political independence from British rule in Scotland in the late 1990s also hinged on profound land reform. Scotland has one of the most concentrated patterns of land ownership in the world. Upon the promulgation of the independent Scottish parliament, an array of public officials and intellectuals advocated land reform as a means to achieve fairness in access to land and to secure the public good through land use policies.

## LANDSBERGIS, VYTAUTAS

Vytautas Landsbergis, with Lech Walesa and Vaclav Havel, is one of the Central Europe's "velvet revolution" beacons: a musician who went on to liberate his country, Lithuania, from the Soviet/Russian domination.

Landsbergis was born on October 18, 1932, in Kaunas, Lithuania. He graduated the Lithuanian Conservatoire in Vilnius in 1955. He began his career as a tutor in 1952 at M.K. Čiurlionis Music School and remained in the teaching profession until entering politics in 1990. He authored ten books in musicology, arts and history of music, five books on political developments, and a volume of verses. His chief topic of research and writing is the life and work of Lithuanian artist and composer M.K. Čiurlionis, for which he was awarded the Lithuanian State Prize. He was also actively involved in musicians' community life, including as a head of M.K. Čiurlionis Society, Chairman of the Organizing Committee of the International M.K. Čiurlionis piano and organ competition, and M.K. Čiurlionis Competition Foundation.

On June 3, 1988, Landsbergis was elected member of the initiative Group of the Lithuanian Reform Movement "Sąjūdis," during Sąjūdis Founding Congress on October 22–23 of the same year—to the Sąjūdis Seimas (Assembly) and Seimas' Council, and a month later, Chairman of the Sąjūdis Seimas' Council. Since December 15, 1991, he has been Sąjūdis' Honorary President. He has chaired the Lithuanian Conservative Party—Homeland Union—since its founding in 1993.

On March 26, 1989, the city of Panevėžys elected Landsbergis to represent Lithuania in the USSR Congress' of People's Deputies. Following his election to the Supreme Council of Lithuania on February 24, 1990, he was elected on March 11, 1990, to lead the Council as its President and Head of State. In this capacity, he chaired parliamentary session, which declared the independent Republic of Lithuania's re-establishment, and was part of the Baltic States Council (1990–1992), chaired Commission for the New Constitution (1990–1991), and led the State Delegation to the negotiations with the USSR. Under his leadership Lithuania resisted the armed violence and Moscow-imposed blockade and achieved an agreement for withdrawing Russian troops from Lithuania.

Landsbergis is a staunch anticommunist. He firmly opposes Russian Soviet domination over Baltic countries as well as over other territories, especially Caucasus. As a politician, he advocates individuals' freedom, civil society, and private market economy.

On June 13, 2004, Landsbergis became a European Parliament Member. With money from the Norwegian People's Peace Prize he established the Vytautas Landsbergis Foundation to support care and education of handicapped children and young performing artists.

## LANGUAGE, INFLUENCE ON DEVELOPMENT

### Development

The measure of human progress through most of the twentieth century was the country's economic performance computed on the basis of gross domestic product (GDP) and the annual income per capita. This approach to development ignored all non-economic factors as indicators of progress. Toward the end of the last century new indices were recognised as crucial components of development and now feature prominently in the World Bank and United Nations Development Program (UNDP) Development Reports. For example, a country's development rating takes into consideration the country's human rights record, the proportion of its population that has access to clean water and sanitation, basic education, health services, and so on.

Language, being a significant aspect of culture, merits consideration when human development and progress is being computed. For example, access to good education depends to a large extent on the medium of instruction, the selection of which is part of a people's educational language rights (ELRs). In a situation where children are introduced to school education in a strange language, they are disadvantaged and therefore denied one of their fundamental human rights.

In recognition of the importance of language as a right, the United Nations (UN) **Declaration on the Rights of Persons Belonging to National or Ethnic Religious, and Linguistic Minorities**, which was adopted by the UN General Assembly in December 1992, has the following clauses:

**Article 1.1:** States shall protect the essence of the national or ethnic, cultural or religious and linguistic identity of minorities within their respective territories, and shall encourage conditions for the promotion of that identity.

**Article 4.3:** States should take appropriate measures so that, whenever possible persons belonging to minorities have adequate opportunities to learn their mother tongue or to have instruction in their mother tongue.

Unfortunately for most of the developing countries, the national languages are minority languages since the countries have adopted ex-colonial languages as their official languages. This means that most of the crucial public functions such as court

and parliamentary deliberations, education, mass communication, and public administration are carried out in foreign languages, mainly English, French, Portuguese, and Spanish in the case of Africa. The implication of this state of affairs is that the majority of the citizens in these countries are excluded from the management and control of the critical national institutions which are entrusted with the development matters in the country. The lack of participation by the majority in the development programmes can be seen as a language-related problem and unless this is redressed through a deliberate national language policy, its effects will continue to manifest themselves in the form of reduced productivity of individuals, limited national integration and slow national economic-industrial progress.

### Language, Thought, and Culture

Culture is a shared way of life, which includes: shared social identity, shared attitudes, shared knowledge and skills, and a shared communication system. These shared attributes are those aspects of the group's life which by consensus the group members have agreed upon as valuable to the community. Language as a medium of expression is considered to be the embodiment of that culture and for many, language and culture have meant one and the same thing.

According to Ong (1982:74), since "the spoken word proceeds from the human interior and manifests human beings to another as conscious interiors as persons, the spoken word forms human beings into close-knit groups."

Language is, therefore, critical in shaping human consciousness and the definition of self and identification of dialectical relationships in the physical and nonphysical world.

The critical relationship between language and culture can be traced back to the Linguistic Relativity Hypothesis, which in its strong form proposes that language structure determines the manner in which one thinks and perceives the world around him. In Whorf's (1956) words:

The linguistic system fashions the ideas, it is the programme and the guide of individual mental activity, the cause of their analyses of impressions, the cause of their syntheses which operates his mental stock.

The deterministic view of the relationship between language and thought has been criticised by many sociolinguists. First, the hypothesis is preoccupied with people living in a monolingual and homogeneous speech community and disregarding the many

language-contact phenomena such as code-mixing and borrowing. The hypothesis also ignores the dynamic nature of language and the deliberate actions of speakers on their language. In other words, speakers are not helpless before the grammar of their language; they can willingly and consciously change their language.

Notwithstanding the sound criticisms of linguistic relativity, the hypothesis in its weak form has continued to influence the discussion on language and culture, especially in the area of language maintenance and the protection of minority languages for cultural advancement of their speakers. The influence of language on the way people identify themselves as a social group cannot be gainsaid and the loss of a language is still regarded as a devastating cultural loss.

Of all the modes of identification, the language system is the most salient and symbolic. In most developing countries, thus, the existence of many languages has been viewed as a source of political conflict and economic backwardness. This perspective has its roots in the eighteenth century when language and nationality were seen to be the source of cultural and political strength by European states. Language was also strongly regarded as representing the cultural origin of humankind. One of the best known thinkers of that era was Herder, who associated language with the national culture, the integrity of the nation and the way a country's citizens think. According to this view "culture derives from the people, language expresses the spirit of the people, the love of the nation" (Williams 1992).

The question that arises from this position is what happens to the developing nations that have had to adopt a foreign language as a national language and have to deal with many indigenous languages? Can a foreign language still express the 'spirit of the people'? Can the country's citizens think in a non-native language? Can the love of a nation be expressed in an imported language? Or can true development be achieved through a non-native language? In his discussion of multilingualism as a resource in the developing countries, Bamgbose (1994), however, gives the following arguments to disentangle language from ethnicity and nationality:

1. If the relationship between language and ethnicity was that strong, a member of an ethnic group would not speak more than one language. In fact, the reality in many African countries is that children grow up with more than one language, some of which they learn simultaneously at home and in the neighbourhood.

2. If the argument was valid, members of different ethnicities would not speak the same language. One linguistic universal according to Noam Chomsky is that all humans are born with a Language Acquisition Device (LAD) which enables us to acquire any natural language. Language is, therefore, not culture-specific; that is, acquiring language is an innate predisposition which has nothing to do with the cultural surrounding in which one is born.

3. The absence of a common language does not preclude ethnic identification since boundary-marking can occur through other means such as religion, literary tradition, types of food and eating habits, architecture, aesthetic values and customs. For example, the Abasuba of Kenya have virtually lost their language to the extent that the few that speak it are bilingual in Olusuba and Dholuo. However, the Abasuba still identify themselves as a distinct cultural group from the Luos. Similarly, the Irish, Scots, and Welsh have adopted English as the primary language but they still would insist on being identified as the Irish, Scottish, and Welsh people and not as the English people. The objection to the strong link between language and ethnicity is summed up by Eastman (1984) as follows:

What we have changed is our 'language use aspect' of our ethnicity but 'the primordial sense of who we are and what group we think we belong to, for the remainder remain intact.

Cultural identification does not depend only on the material aspects of culture such as architecture or literary works; it has its very strong anchor in the way members of a community would like to be identified and the way they perceive themselves to be different from "Others." The non-material aspects like attitudes, sense of history, myths, and stereotypes might for some groups, play a more important role in boundary-marking than language, architecture or mode of dressing. We can, therefore, achieve development through a language other than our own provided some conditions are meant, as we see in the next section.

### Language Planning for Development

The surest way to avoid the possibility of using language to achieve unfair socio-political advantage is to plan for all languages in the same way we plan how to exploit other national resources for development. The

Republic of South Africa, for example, recognised this and the 1996 Constitution Chapter One **Founding Provisions** Section Six (Two) reads:

Recognising the historically diminished use and status of the indigenous languages of our people, the state must take political and positive measures to elevate the status and advance the use of these languages.

The fact that the state has a constitutional responsibility to protect, recognise, and develop minority languages, speakers of these languages will feel safe within the national borders of their country and would be in a state to think of development. The Organisation of African Unity also took up the language issue quite seriously and drew up the **OAU Language Plan of Action for Africa** to be used as a blueprint for national language planning projects, aimed at liberating Africa from linguistic imperialism. The following are three of the seven objectives outlined in the document:

- (1) To encourage each and every member state to have a clearly defined language policy;
- (2) To ensure that all the languages within the boundaries of member states are recognised and accepted as a source of mutual enrichment;
- (3) To liberate the African peoples from undue reliance on the utilisation of non-indigenous languages as the dominant, official languages of the state in favour of the appropriate and carefully selected indigenous African languages in this domain.

The main issue with the use of non-indigenous languages is that they inhibit intellectual development of the African children and retard economic and industrial development. The use of European languages for education in the early years of primary school does not allow children to exploit their creativity and other cognitive abilities to the full. Although there is some merit in using European languages in education, research shows that there is greater benefit if children learn educational concepts in school through their mother tongues for at least six years before they change over to a non-indigenous medium. The argument is that children easily transfer literacy skills to a new language once they have mastered the skills well in their mother tongue. (Cummins 1984).

In government administration, it is increasingly being recognised that the use of an unfamiliar language in the provision of public service tends to alienate sections of the population and leads to disinterest and apathy. European languages as official languages in Africa are seen as languages of *exclusion* since they lock out the majority of the population from the management of the affairs of their country. This, according to Vic Webb and Kembo-Sure (2000), leads to:

- Restricted access to knowledge and skills;
- Low productivity and ineffective performance in the workplace;
- Inadequate political participation by the public, manipulation, discrimination, and exploitation by the ruling powers, national division, and conflict; and
- Linguistic and cultural alienation.

At the core of planning for minority languages is the **allocation of functions** for each language so that they acquire **social prestige**. When a language is assigned an important task, for example, medium of education, it acquires new importance. When there is deliberate state intervention to make sure a language has a function for its users we are talking of **status planning**. That is, the language is given enhanced status. Status planning bestows social prestige on the language and adds group pride to its speakers. Since the members of the community see their cultural and political worth in the new linguistic status of their language we also talk of **ethnolinguistic vitality**. The ultimate goal of language planning for minority languages is to **revitalise** them so that they enter active use in important domains of public life, such as education, the mass media, judicial administration, and parliamentary debates. Increased employment of these languages in important public domains assures them continued existence lest they go into disuse and begin to **decline** or become **obsolete**. Languages which are neglected gradually get displaced by *stronger* languages, what we call **language shift**, and eventually die.

In economic development discourse, the use of indigenous languages by the Asian *Tigers* and their phenomenal economic and industrial progress have been cited. There may not be a neat causative relationship between language and economic and/or industrial development, but it is instructive to note that the two Koreas, Malaysia, Indonesia, and earlier, Japan, have carried out their development programmes in the indigenous languages. In Africa, Tanzania may not have experienced an industrial takeoff as is the case with the South Asian countries cited here, but it has used Kiswahili effectively for mobilisation of its citizens; achieving over 90% literacy rate and becoming the most unified state in Africa. The political maturity of Tanzania is demonstrated by the regular national elections and the peaceful changeover of leadership since the retirement of the first head of state, Mwalimu Julius Nyerere, a feat that has been achieved by very few African countries. Although political integration is not a sufficient condition for a country's development, it is certainly a necessary one and it

cannot be achieved without a well coordinated language policy.

## LANGUAGE, INFLUENCE ON POLITICS

### Language as a Tool

In the empirical and deductive tradition, the study of language was regarded as scientific and language as an autonomous object which could be studied in the same way that we do materials and substances in the physical sciences (Bloomfield 1935). The positivistic view was challenged later by Chomsky's Generative Grammar revolution of the 1960s, which emphasised the cognitive character of language (Chomsky 1965). The positivistic approach as well as the generative grammar, however, excluded the

social and affective aspects of language from linguistic theory, arguing that those areas would not be objectively and empirically handled.

However, in recent years the study of language as a social reality has given rise to new disciplines in linguistics such as: Critical Linguistic Study (CLS), Sociolinguistics, Politics of language, Pragmatics, and Discourse Analysis. These disciplines differ only in the degree of emphasis of certain aspects of language, but they all agree on the centrality of the dialectical relationship between society. In this respect they all regard the primary data as coming from language in use and not some idealised texts and speakers. They all study language in context.

In a society or country where two or more languages/varieties are spoken, a language or variety reflects and reinforces the power-sharing patterns in the community. The language of power is often in short supply and the privileged group endeavours to limit access to it by the underprivileged groups. Language, in this sense, becomes a significant site of class struggle as it is regarded as a critical factor of production alongside human labour and land.

According to the Deficit Hypothesis, developed by a British sociologist, Bernstein (1972), working class children are exposed to the variety of language which does not promote critical and creative thinking and this he called the **restricted code**. On the other hand, middle class children are exposed to what he calls the **elaborated code**, which allows for divergent and rational thinking. According to Bernstein (1960), working class children were disadvantaged at school since the school demands the use of the elaborated code with the consequence that children from working class homes fail to develop their potential in the education system dominated by middle class speech forms and discourse styles.

If we agree with Bernstein's categorisation then language becomes a factor in deciding who fails and who succeeds in an education system and thus reflects and reproduces class categories. Middle class children succeed in school, come out and occupy civil service and important private sector jobs, and thus monopolize and control decision-making institutions in the country. Children from poor families content themselves with low-level jobs that require minimal manipulation of the officially declared respectable code.

### Language and Power

The emergence of nation states in earnest in eighteenth century Europe saw the monopolisation of

power by the political elite and language became a formidable tool in the exercise of power. For example, the state decided which language or variety to be used for what purposes in which institutions. The thinking then was that a single language was desirable for state administration; that is, one language used throughout the country would ensure effective collection of taxes, uniform application of law, and equitable delivery of education and health services.

In the developing world the same notion was inherited from ex-colonial administrations, which promoted the European languages in the administration of the colonies and marginalised all the local languages. The small elite group who were trained in the foreign languages replaced the European officials and entrenched in the administrations the use of European languages as official languages of their independent states.

Even for the few countries which adopted local languages as official such as Tanzania, India, Indonesia, and Algeria, the elite have often circumvented the spirit of the language policy by sending their children to private schools which provide education through European languages. The graduates of the private schools are often preferred by employers, especially by multinationals who find them suitable candidates for the promotion of corporate culture globally. In countries where the foreign language is official, critical jobs in both public and private sectors are reserved for those candidates with 'good' mastery of European languages. The result is that European languages are equated with political power and economic prosperity whereas the local languages are associated with servitude and poverty.

In most of these countries one of the qualifications demanded of those wishing to be members of the legislature is proficiency in the official language. Since proficiency in a foreign language is acquired only in school, the great majority of the population is excluded from the law-making process. Besides, the fact that only those who can speak a European language become candidates, the electorate are disfranchised in a sense that they cannot vote for the person they want if he cannot speak the official language to a level acceptable to the ruling elite. In Kenya, the Minister of Local Government has proposed a bill in parliament requiring mayors of all towns and cities to have university degrees whereas such requirement does not exist for members of parliament and the head of state. One of the complaints about the present mayors is that some of them can hardly speak English. English therefore becomes a justification to exclude a section of the population from running the affairs of their country.

The area where the choice of a foreign language is most controversial is education. The choice of a foreign language as medium of instruction is in a way interpreted as a strategy by the ruling elite to limit access to higher education. The fact that the majority of the underprivileged children have limited exposure to the official language, they often fail not only in the language as a subject but also the other subjects taught through the language. School drop-outs and educational failure can thus be explained partly by the choice of medium of instruction adopted by an education system.

In rural Africa, children go to school with proficiency in two or more languages, but at school none of those languages they speak is taught or used to teach school subjects. One of their first reactions is that their languages and the related cultures are useless and irrelevant to them if they have to succeed in the life. The fact that the local languages are so devalued, their speakers are disempowered and are persuaded by the artificially created circumstances to disrespect them.

A national language policy which marginalises the majority of the population on the basis of their linguistic background is consistent with a political plan which concentrates power in the hands of a small group and few institutions which control the state apparatus. The language of the elite and the relevant institutions is therefore the language of power and control.

### **Democratisation of Linguistic Ecology**

Language can be used to promote greater political participation as it can be used for exclusion. The first step to ensure participation is for the state to ensure protection and recognition of all languages. That is, learning of and through one's mother tongue should be recognised as a human right. Secondly, every citizen must be guaranteed public service in the language of their choice, preferably their mother tongue.

By providing education and other social services through a familiar medium more people are brought into active participation in the affairs of their country and therefore enabling them to determine their political future. It is a step towards political inclusion of the critical population of the nation.

Another strategy is to ensure equitable and effective provision of foreign-language education. The intranational and international importance of a foreign language demands that all children receive

quality language instruction to the level that no one is disadvantaged on the basis of speaking a non-standard variety or that they were not exposed sufficiently to the official variety. Access to adequate foreign-language teaching would then be considered a child's human right as is general education.

Democratisation of language policy entails the abandonment of the dichotomy between the official language and other languages. There should not be a situation of either the foreign language or the indigenous language(s). Languages in this sense are all regarded as cultural, social and economic resources whose utilisation must be deliberately and carefully planned for the benefit of all.

Whenever necessary, language policy decisions should be guided by a constitutional provision specifically guaranteeing protection and recognition of all languages. This is what the Republic of South Africa has done having experienced a historic tragedy of balkanisation along linguistic and racial lines. The South African new constitution recognises eleven official languages but also guarantees protection of all non-official languages. This is a recognition that language policy, to a large extent, determines who does what in which political institution.

Deliberate government moves to democratize the linguistic environment are motivated by the recognition of multilingualism as a resource and not a curse. The protection and recognition of all languages is an endorsement of the policy of pluralism.

## LAOS

Laos, officially the Lao People's Democratic Republic, is a landlocked country, covering approximately 91,400 square miles (236,800 square kilometres), surrounded by China, Vietnam, Cambodia, Thailand, and Myanmar.

The terrain is mostly forest-covered mountains, with deep river valleys and abundant wildlife. The Annamese Cordillera lies along the Vietnamese border with many secondary mountain ranges. The highest point is Mount Bia at 9,245 feet (2,818 metres). There are two significant plateaux: the Plain of Jars in the north, characterized by grassy, scrub-covered, limestone and sandstone hills; and the Bolovens Plateaux in the south, having fertile basaltic soil and a high rainfall, but mostly undeveloped, covered by brush and tall grass. Limestone karst landscapes are found in central areas, with fertile lowlands lying along the eastern banks of the Mekong River. All the major rivers in Laos flow into the Mekong, which forms the border with Myanmar and most of Thailand. The Mekong floods regularly along its southern reaches.

The climate is tropical monsoon with cooler temperatures in mountain regions. During the wet season, from May to October, the average rainfall is 1,778 millimetres (70 inches). Temperatures range from minimums of approximately 16°C (60°F) in the cool months of December to February to maximums of approximately 32°C (90°F) during March and April. The average temperature from May to November is 27°C (80°F).

Laos' ethnically and linguistically diverse population of 5,660,000 (2003), mostly living in rural lowland areas, makes it the most sparsely populated, least urbanized Asian country. The population is young, with a high birth rate offset by high infant mortality.

## History

The Kingdom of Lan Xang formed from numerous small principalities in 1353, covering modern Laos and much of northern and eastern Thailand. In the 1700s, Lan Xang was dissolved into three kingdoms centred on Luang Prabang, Vientiane (the current capital), and Champassak. Siam (Thailand) captured these lands, but France entered in 1893. Following treaties with Siam in 1904 and 1907, France gained control over the area now known as Laos. In 1953, after Japanese WWII occupation, the French granted independence, but Lao nationalists began a

protracted civil war. After a series of failed coalition governments, the Pathet Lao, supported by communist Vietnam, gained control in December 1975, immediately embarking on radical socialism. The fall of communism in the USSR forced Laos to liberalise economic and social reforms. The US trade embargo was lifted in May 1995. In July 1997, Laos was admitted to ASEAN. Kaysone Phomvihanh led Laos from 1975 until his death in 1992. Nouhak Phoumsavane became President, succeeded by Kham Thai Siphandone in 1998.

## Economy

Laos remains one of the world's poorest countries. Gross national income (GNI) is \$310 US dollars and gross domestic product (GDP) is \$2 billion US dollars (World Bank 2002). The GDP growth rate has slowed from 7.3% in 1999 to 5% in 2003. Agriculture's share of the GDP is 57.5%, industry, 17.7% and services sector, 24.7%. Main exports are hydro-electricity and timber products. Large disparities exist between urban and rural areas where most of the population survives on subsistence agriculture. Poor roads and no railways hinder economic growth. Freedom from civil war and liberalization of government controls are beginning to bring economic growth, but much of the annual budget is still met by foreign aid.

## Development Since 1954

Prior to 1953, apart from road construction, the French did little to develop Laos. The following two decades of civil war precluded any significant development in spite of massive amounts of US aid. Concerned that Laos would fall to communism, from 1955 to 1963, the USA contributed more assistance per capita to Laos than any other country including South Vietnam. Much of this funded the Royal Lao Army, built road and communication networks of military value, and disappeared into the pockets of Lao officials. Between 1953 and 1959, military spending equaled \$184 million, but only \$1.3 million went to over 90% of the population engaged in agriculture.

Small improvements in living standards were achieved, mostly in urban areas. Three years of primary school education was compulsory, but many villages had no school and only about 30% of children attended. Very few continued to secondary education.

Education and health systems suffered a lack of trained personnel. Three hospitals were established with foreign aid, but there was no medical school. Most Lao still survived on subsistence agriculture. Industry was rudimentary, the legal system outdated, and transport and communications inadequate.

Between 1964 and 1974 development in Laos was non-existent due to the Vietnam war, during which Laos suffered heavy bombing by the USA.

The next decade from 1975 to 1986 was characterized by the new communist government's attempts to create a centralized socialist economy including agricultural collectives, nationalized industry and commerce, and 're-education camps' for dissenters, resulting in 10% of the population fleeing to Thailand. US aid ceased, partially replaced by aid from Vietnam and the USSR. Thailand seriously restricted trade. Inflation and drought forced the government to request rice from the United Nations (UN).

In 1986, recognizing the failure of the reforms, the government pragmatically began to liberalize controls. Collectivization was abandoned and the New Economic Mechanism endorsed. Self sufficiency in rice was achieved, but problems were caused by high reliance on foreign aid, lack of trained personnel and corruption. More children enrolled in school but education standards fell. More health clinics existed, but trained personnel and medicines were severely lacking. Malaria and other endemic diseases increased. However, personal and religious freedoms improved. Buddhist festivals were permitted again, although monks were obliged to study Marxism-Leninism.

A difficult period of rising prices, poor investment decisions, drought and reducing hydroelectricity production (Laos' main export) in 1987 and the collapse of the USSR, forced Laos to reform the state sector and allow foreign investment, leading to liberal investment laws, improved relations with Thailand and increased international aid.

In 1991, the constitution was adopted. Legal, economic, and environmental reforms continued. Following Vietnam's example, Laos continues to pursue economic reforms while maintaining a one party socialist political system. In 1994, the first bridge (built with Australian aid), across the Mekong to Thailand was opened, symbolizing the opening of Laos to increased trade, tourism, and international influence. A road transport route between China and Thailand is being constructed through Laos. Massive hydro-electric projects have been constructed, with more planned. The impact of increased foreign trade, tourism, and HIV/Aids upon Laos' fragile traditional culture is a concern as are environmental pressures such as deforestation, pollution, soil erosion, and ecological damage caused by the illegal logging,

slash-and-burn agriculture and hydroelectric dam construction.

The reforms have improved the economy, but Laos is still developmentally about thirty years behind its neighbours. Poverty and health indicators are extremely poor. Low education standards, weak legal system, inadequate infrastructure, and heavy reliance on foreign aid hinder Laos' development, but relative political stability, continuing reforms, and openness to foreign investment are encouraging.

## LATIN AMERICAN INTEGRATION ASSOCIATION (ALADI)

The Latin American Integration Association, more commonly known in Latin America as the Asociación Latinoamericana de Integración (ALADI), was established in 1980 by the governments of Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Mexico, Paraguay, Peru, Uruguay, and Venezuela. ALADI replaced the defunct Latin American Free Trade Association (LAFTA), which had been formed in 1960 to create a common economic market for its members through progressive tariff reductions. Although regional trade in Latin America increased during the 1960s and 1970s, it did not approach the lofty goals expounded upon in the Montevideo Treaty of 1960. LAFTA's failure can be blamed on the lack

of adequate transportation infrastructure between neighboring nations, the absence of strong trading links between neighboring countries, the incompatibility of goods being offered by member nations, and differing levels of national development. In addition, the larger nations in the association consistently valued their domestic markets over the potential of expanding into regional markets. The larger nations, which were engaged in aggressive import substitution industrialization, continued to protect their nascent industries behind tariff barriers. Although LAFTA's deadline to eliminate tariff barriers by 1973 was extended to 1980, the association was doomed to fail. On August 12, 1980, eleven Latin American foreign ministers, realizing that LAFTA's goals were untenable in the immediate future, disbanded the organization and signed the Montevideo Treaty of 1980, which resulted in the creation of ALADI. Unlike LAFTA, ALADI, which is headquartered in Montevideo, Uruguay, has no deadline for the implementation of a common economic market in Latin America. ALADI has the more limited goal of encouraging free trade in Latin America.

All Latin American nations are eligible to join ALADI. On August 26, 1999, Cuba became the twelfth full member of the association. Nations with observer status include Costa Rica, the Dominican Republic, El Salvador, Guatemala, Honduras, Italy, Japan, Nicaragua, Panama, People's Republic of China, Portugal, Romania, Russia, South Korea, Spain, and Switzerland. Observer organizations include the Andean Development Corporation, the European Community, the Inter-American Development Bank, Inter-American Institute for Cooperation on Agriculture, the Latin American Economic System, the Organization of American States, the United Nations (UN) Development Program, the UN Economic Commission for Latin America and the Caribbean, and the World Health Organization.

ALADI supports the creation of an area of economic preferences, with the ultimate goal being the creation of a common economic market in the region. ALADI encourages tariff preference for products originating in the member countries; regional economic agreements, such as the Southern Cone Common Market (MERCOSUR); and favorable conditions of economic engagement for the less developed members, such as Bolivia, Ecuador, and Paraguay, within the association. In addition, ALADI supports the promotion and regulation of trade, the development of complementary economies, and market expansion.

Recent economic difficulties in the economies of the larger member states, such as Argentina, Brazil, and Venezuela, has limited the ability of ALADI to

implement its agenda. Nevertheless, although economic cooperation and development has not proceeded as quickly as originally envisioned, there has been progress toward lowering trade barriers in the Americas, especially since the creation of MERCOSUR in 1991 and the North American Free Trade Agreement (NAFTA) in 1994.

## LATVIA

The Republic of Latvia covers approximately 64,500 square kilometers of territory on the eastern shores of the Baltic Sea. Latvia shares borders with Estonia to the north; Belarus and Lithuania to the south; Russia to the east; and the Baltic Sea on the west. Latvia consists of low-lying plains with rolling hills in the eastern part of the country. Latvia has a maritime climate, consisting of cool, wet summers, and moderate winters. Latvia has few natural resources. The primary Latvian resource is peat. Peat bogs cover nearly 10% of the nation's total land. In addition, timber, gypsum, and amber consist of the remainder of Latvia's resources. In an attempt to lower the reliance on foreign sources of energy, major hydroelectric plants have been constructed along the Daugava River. The estimated population is approximately 2.3 million, with an estimated declining population at  $-0.71\%$ . Riga, the capital city, and its metropolitan area consist of 1 million inhabitants. Other important cities are Daugavpils, an industrial center in the north; and Leipaja, an ice free port.

Due to political instability caused by the 1917 Russian Revolution and Germany's defeat in World War I, Latvia first became an independent nation in November 1918. Prior to 1918, the territory of Latvia

was subject to German, Polish, Swedish, and Russian hegemony, dating to the thirteenth century. Latvian independence, however, was threatened by the presence of Soviet and German troops still occupying Latvian territory between 1919 and 1920. National sovereignty was not secured until the signing of the 1920 Latvian-Russian peace treaty.

Janis Cakste was elected Latvia's first president in 1920. The 1922 constitution established a democratic system of government. Throughout the 1920s, the large number of political parties created a plethora of weak coalitions within the Saeima (parliament), resulting in widespread political instability. Based on a claim of a Communist conspiracy to overthrow the government, Prime Minister Karlis Ulmanis declared a state of emergency in 1934. Ulmanis abolished political parties and suspended parliament. Most Latvians, however, tacitly supported the Ulmanis dictatorship as a justification to preserve democracy in Latvia. Ulmanis maintained power throughout the 1930s. As a result of a secret protocol contained in the 1939 German-Soviet Nonaggression Pact, Latvia was incorporated into the Soviet Union in August 1940. World War II and the Soviet occupation created lasting consequences in Latvia's demographics. Due to Soviet exiles and murders; the Holocaust; wartime casualties; and emigration; nearly three hundred thousand Latvians were killed, deported, or fled the country. Sovietization policies increased the ethnic Russian presence to over 30%, while simultaneously decreasing the ethnic Latvian presence to 55%.

Gorbachev's liberalization of the USSR during the 1980s, led to a renewed spirit of Latvian nationalism. Following the failed August 1991 coup in Moscow, Latvia regained its independence from the Soviet Union. In September 1991, the Soviet government recognized the independence of Latvia, which was admitted to the United Nations later in the month. The first parliamentary elections were held in 1993, leading to Guntis Ulmanis's election as president. In the hope of undertaking a more western orientation, Latvia became an associate member of the European Union (EU) in 1995.

Latvia began the arduous task of implementing sweeping economic reforms in the hopes of creating a western style market economy. As a result of being fully incorporated into the Soviet command economy, the primary reform was the privatization of all Latvian industries. Economic policies restricted government spending; loosened restrictions on the banking system; eliminated price control; and lifted regulations on small businesses. Due to the disintegration of the USSR and Latvia's few natural resources, the industrial sector entered a period of crisis, resulting in

low output and high unemployment. The economy did not start to grow until 1994. Growth was temporarily halted in 1995 due to a major banking crisis. The crisis led to the government establishing a stronger regulatory institution to control the banking system. The establishment of the Latvian currency, the *Lat*; and the economic growth during the late 1990s attracted large amounts of foreign investment and created one of the most stable economies among all former Soviet republics.

The estimated 2004 gross domestic product (GDP) was \$23.9 billion. The service sector contributed 70.9% of the GDP, whereas industry consisted of 24.5% and agricultural production 4.5%. Despite non-membership in the Commonwealth of Independent States (CIS), Latvia's primary trading partner is Russia. Russia purchases nearly one-quarter of Latvia's exports, and in return contributes one-fifth of the nation's imports. Other major trading partners include Germany, the United Kingdom, Finland, Sweden, and Lithuania. Major exports include forestry materials, foodstuffs, machinery, and textiles. Imports consist primarily of energy sources, as well as industrial machinery and textiles. Latvia is a member of the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (World Bank), the World Trade Organization, and the European Bank for Reconstruction and Development.

Domestic politics in the post-independence period have been marred by disputes over economic transformations, social policies, and fighting corruption. The severe economic dislocation caused by the faltering industrial sector in the early 1990s and the banking crisis of 1995 proved to be major catalysts in the collapse of many coalition governments in the Saeima. There were constant strains between political parties that promoted free trade and foreign investment and those that demanded higher tariffs to protect the agricultural sector. Due to fears of the large Russian minority, the Saeima passed legislation in 2002 requiring all elected officials to be fluent in the Latvian language. Later this legislation was repealed to assist in the EU accession process. Recent legislation, however, such as the February 2004 law mandating Latvian as the official language of instruction in schools has upset the large Russian-speaking population. Despite such problems, in comparison to other eastern European countries, Latvia has made great strides. In 1999, the Saeima elected Vaira Vike-Freiberga as president—the first female president in Eastern Europe. Vike-Freiberga was reelected in 2003. In May 2004, Latvia became a full member of both the European Union and NATO.

## LEBANON

The Lebanese Republic is situated at the eastern end of the Mediterranean Sea, bordered to the south by Israel and to the east and north by Syria. It has approximately 225 kilometres of coastline and is about 80 kilometres at its widest point. There is a narrow coastal strip that rises quickly to a mountainous interior, although the northeast of the country is dominated by the fertile Biqa' Valley. Lebanon has a Mediterranean climate with hot, dry summers and cool, wet winters with heavy snow falling in the mountainous regions. The population is estimated at 3.8 million, with an estimated annual growth rate of 1.3%. Its capital since independence is Beirut with a population estimated at over 1.6 million.

The mountainous nature of much of Lebanon had provided an effective sanctuary for religious minorities for hundreds of years, and it is the relationship between these groups, and with foreign powers, that has had the most profound effect on Lebanon's development. Due largely to the longstanding French links with one of these minorities, the Maronite Christians, the Sykes-Picot Agreement of 1916 promised France mandatory control over the Syrian territories of the Ottoman Empire after its defeat. In 1920, the State of Greater Lebanon was established, appending surrounding areas to the Christian-dominated Mount Lebanon in order to make it economically viable. The newly created entity was unpopular with many Sunni Muslims and, in order to reconcile the differences between the confessional groups' attitudes to the new state of Lebanon, an unwritten agreement known as the National Pact of 1943 was struck between the leading Christian politician Bishara al-Khoury, and the Sunni Riad al-Solh. The Pact established a *modus vivendi* between the different confessional groups in their relations with the new state, including the apportionment of political representation. Using the 1932 census figures

as the basis, the number of parliamentary seats was set as a ratio of 6:5 favouring the Christians, and the positions of President, Prime Minister, and Speaker were to be filled by a Maronite Christian, Sunni Muslim, and Shi'a Muslim respectively. Independence from France was formally achieved in 1943, and the last French forces left Lebanon in 1946.

Throughout the 1950s and 1960s, the Lebanese state largely prospered owing to unwillingness by the political elite to invoke their confessional differences over fundamental domestic or regional political issues. Ultimately though, the inability of the informal political arrangement to reform in the face of demographic changes (particularly the increasing size of the Shi'a Muslim minority), and the impact of regional political issues such as the Palestinian situation, plunged the country into a ruinous civil war between 1975 and 1990 that killed more than one hundred thousand people. The civil war was ended with the signing of the Ta'if Accord, and since that time the country has been under the political influence of neighbouring Syria, given the permanent stationing of tens of thousands of its troops in Lebanon. The conventions of the National pact were largely retained, although parliamentary seats are now divided equally between Christians and Muslims, and the powers of the President have been reduced.

Lebanon's relatively weak central government has meant that the country has been hostage to the vagaries of regional politics, and has suffered from foreign military intervention for many years. The Cairo Agreement of 1969 gave Palestinian militias, resident since 1948, freedom of movement to launch operations against Israel from Lebanon's south, and their numbers were boosted following the expulsion of Palestinian guerillas from Jordan in 1970. Israel conducted a limited invasion of Lebanon in 1978 and a full-scale one in 1982 in an effort to destroy the Palestinian presence. The 1982 invasion resulted in an occupation of Southern Lebanon by the Israelis, and also led to the emergence of the Shi'a militia group Hezbollah, which was fostered by their co-religionists from Iran. The Israelis withdrew in May 2000 in the face of mounting casualties from Lebanese guerrilla groups including Hezbollah. Syria entered Lebanon as part of an Arab peacekeeping force in 1976, and has maintained a large military presence since that time.

Lebanon's liberal banking laws and cosmopolitan national makeup had made it the regional financial and tourism capital during the 1960s, but the civil war put an end to Lebanon's financial and recreational dominance. Since the end of the civil war, reconstruction of war-torn Beirut and national economic infrastructure became a priority. Impressive gains have been made in that time with much rebuilding

completed, government revenue being received and inflation brought under control. Much of the reconstruction, however, was financed through heavy borrowing, and the burgeoning national debt has been serviced through cuts to government services and large contributions from donor countries. The economy has been heavily reliant on the services sector, particularly banking, since prior to the civil war, although it has some industrial capacity (oil refining) and agricultural exports such as citrus fruits, grapes and olives. The per capita gross domestic product (GDP) was estimated at \$4,800 in 2003, and 28% of the population was living below the poverty line (1999 estimate).

The adult literacy rate is approximately 87%, and the country possesses several universities, the most famous of which, American University of Beirut, attracts regional and international students. The quality of Beirut's health system had made it a regional health care centre prior to the civil war, and it is slowly regaining this reputation to a degree, although the public health system is still recovering. Life expectancy for males is sixty-nine years and seventy-four years for females. The infant mortality rate is twenty-five out of one thousand live births. While Lebanon produces many well-educated graduates, employment opportunities are limited and many have to emigrate to find work. The unemployment rate is estimated to be 18%.

### LEE KUAN YEW

As Prime Minister of Singapore from 1959 to 1990, Lee Kuan Yew (b. 1923) was the leading figure in its

transformation into a flourishing and dynamic First World economy. The small population and size of the island enabled him to be involved in the minutiae of policy formulation and even implementation. At different times he took particular interest in defence and economic planning, industrial relations reform, and social welfare policy. Although he resigned the Prime Ministership in 1990, he continued as an influential cabinet member with the title Senior Minister.

Born in 1923, Lee's first job was as a transcriber in Japanese Propaganda Department. He went on to study law at Cambridge University, where he took first class honors and was admitted to the London bar in 1949. He returned to Singapore the following year and worked as an attorney for the next several years, representing many trade unions. The speed with which the Japanese military routed the British in Southeast Asia in early 1942 had shocked Singapore and shattered the idea of British superiority, and Lee led the struggle for independence through the formation of the People's Action Party (PAP) in 1954. As the PAP leader he became Singapore's first Prime Minister in 1959.

In the early 1960s, it seemed obvious that Singapore needed the Malay hinterland as a market and source of raw materials, food, and water. Singapore joined the Malaysian federation in 1963 to meet those needs, but it was soon clear that the Malay leadership on the peninsula wanted to control Singapore's Chinese majority. Lee broke away from Malaysia and created the independent Republic of Singapore in 1965.

Economic development, defence, and social harmony were the major challenges facing Lee in the mid 1960s. Pragmatism and realism rather than ideology guided his search for solutions. Lee's commitment to open markets and economic competition was combined with selective government intervention in the economy and society. Lee chose ministers who shared his thinking about development to fill key positions. These included the first three Finance Ministers Goh Keng Swee, Lim Kim San, and Hon Sui Sen. Lee followed their advice to switch from his initial emphasis on import replacement to export promotion as the central plank of trade policy.

Even though international trade continued to be essential it alone could not ensure sustained economic growth. Lee created a Tourist Promotion Board to boost tourism and this industry soon provided many jobs in services like transport, catering, and cleaning. The British military presence contributed 20% to the gross domestic product (GDP) so Lee was alarmed in 1968 to hear of their plans to withdraw. He tried to persuade them to delay the process but when this failed he appointed Hon Sui Sen to oversee the conversion of the military bases and

equipment to profitable civilian uses. Lee also took a direct role in building the Singapore Armed Forces as well as cementing alliances with other Commonwealth countries in the Five Power Defence Agreement. Race riots involving Chinese and Malays during the 1960s were dealt with through the rigorous but non-discriminatory enforcement of the criminal law. Later Lee oversaw changes in housing laws to ensure that the Chinese, Malays, and Indians, who make up nearly the whole population, would live in mixed neighborhoods.

The Central Provident Fund (CPF) was set up by the colonial government as a pension scheme in order to create a social security without a welfare state. Lee gradually increased the amount that workers paid into their individual CPF accounts and extended its functions so that workers could draw on savings to purchase homes and pay for medical services. The Housing Development Board (HDB) was established in 1960. Its slum clearance project was completed in the 1960s. The HDB built homes that workers bought with their CPF funds. Home ownership also secured support for the government, contracts for the building industry and employment for building workers.

An important part of Singapore's economic transformation was the creation of industrial estates the most famous of which was Jurong. Lee was keen to attract multinational corporations (MNCs) for their capital, technology transfer and as providers of skill enhancement. Finding Singapore's tax breaks, stable economy, strong work force, and infrastructure assistance a hospitable environment, many MNCs set up factories, offices, and training facilities. Lee particularly admired leaders of US MNCs for their drive to succeed and innovate and willingness to transfer technologies and skills. Texas Instruments, National Semiconductors, and Hewlett-Packard were three of many US MNCs to make long-term commitments in Singapore.

In 1968, the Economic Development Board was created to co-ordinate various aspects of development. Lee encouraged a corporatist model of co-operation between government, business and labor. Industrial Relations Tribunals mediated disputes and from 1972 a National Wages Council set pay rates so that raises were not higher than either productivity growth or the capacity of business to pay. In the 1980s, Lee encouraged a shift from industry to company unions to promote worker-employer co-operation at the workplace level. He supported the formation of trade union co-operatives which provided cheap goods and services to their members. These included taxi and insurance services and retail stores.

In the 1980s, Lee encouraged a shift of emphasis from manufacturing to services in computing,

information technology, business and banking. Although he continued to welcome foreign capital, new investments could increasingly be financed by Singaporeans' own savings. The Government Investment Corporation, established in 1981, was the conduit through which money flowed from the CPF to various businesses and investments.

Lee has been criticized for Orwellian social engineering, repressive laws, and interference with his citizens' privacy. For example, in the early 1980s Lee oversaw the creation of a Social Development Unit whose task was to encourage highly educated people to marry and have more children. Tax incentives and other measures reinforced this goal. Lee was concerned that the high birth-rates of the poorly educated and the low rates for the well-educated would gradually lower the quality of the people and adversely affect the country in the long-term. Laws proscribing chewing gum, an Internal Security Act that allowed lengthy detention without trial, and media laws that restrict freedom of the press have attracted criticism and ridicule.

Lee ruled Singapore for three decades before resigning as Prime Minister in 1990, though he was immediately appointed Senior Minister in his successor Goh Chok Tong's cabinet. Perspectives on Lee's achievements differ markedly. Some regard him as a visionary politician and statesman who within a generation turned Singapore from a poor country into a prosperous nation with a highly-educated population and few of the social problems that afflict the modern West. Critics of Lee emphasise his authoritarian streak, the structures and forces that undermine the democratic institutions, and the resulting usurpation of politics by administration.

### LEGAL SYSTEMS

More than 260 nation states ('states') exist around the world today. Each recognises a set of laws that regulates its relations with other states, as well as possessing a legal system that governs its own citizens. The laws that regulate a states' relations with other states are known as international laws, while those laws that govern the behaviour of a state's citizens within its own boundaries are known as municipal or domestic laws.

International law regulates three types of international relationships: between states, between states and persons, and between persons in different states. These relationships are often referred to as public and private international law. Public international law is a distinct body of law in its own right dealing with relations between states, and between states and persons. Private international law, also known as conflict of laws or laws of conflicts, deals with persons (natural or juridical) where there is a conflict between states. However, in recent years it has become difficult to differentiate between public and private international law as the lines between them have become increasingly blurred. Contemporary international law now regulates any conduct that falls outside state boundaries.

During the twentieth century, three dominant legal families could be identified: (Romano-Germanic) civil law, (Anglo-American) common law, and Sino-soviet (socialist) law. However, the failure of communism in the early 1990s resulted in the demise of Sino-soviet law and as a result it is no longer necessary to consider it as a dominant legal system. While Marxist-Leninist thought and socialist law still have a role to play in some states, for example, China, North Korea, Cuba, and Algeria, most of the former communist states have turned to the civil law.

Civil law is the dominant legal system in Europe, as well as forming the basis of most legal systems in Central and South America, parts of Asia and Africa. Its codificatory style of law-making made it a much more amenable system to adopt than common law with its origins embedded in case law and precedent. Common law can be found in most of the former colonies of the British Empire. In the Middle East and parts of Asia, Islamic law plays an important role in the legal system of the state. Islamists will argue that Islamic law (*Shar'iah*) is a complete set of laws, not just a religious law system, and that because it is God's will it is superior to man-made laws. It is also possible to identify elements of customary law influencing the legal systems of many states.

Cultural, economic, political and, perhaps today most importantly, religious factors shape not only

political systems but also legal systems. While the legal systems of common law countries such as the US, Australia, and Malaysia are all based on common law principles, significant differences still exist between the laws of each state. A similar comparison can be made between civil law states such as France, Germany, and Brazil. These factors not only produce differences among states with common systems, but can also lead to more profound consequences. For example, the collapse of communism in the early 1990s resulted in the demise of Sino-Soviet law; the growth of the European Community has led to the development of a new legal system (European Community law); the weakening of the nation state because of globalisation has heightened the influence of various religious movements and their laws in parts of the developing world; rejection of western values in non-Western states resulting in a resurgence of customary law.

## The Civil Law System

### *The Meaning of the Term “Civil Law”*

The term *civil law* has several meanings. First, it can mean a reference to an entire system of law that has its origins in Europe and which establishes all basic principles of law in a Code through the adoption by a parliamentary body of an authoritative and exhaustive set of rules of law. Second, in a civil law system it can be a reference to private law, which governs the relations between citizens and corporations, as distinct from public law where the State is a party. The distinction is important because there are different hierarchies of courts dealing with public and private law. Third, it can be used to describe the substantive body of private law that is based on the French Civil Code of 1804, and can be contrasted with commercial law which is not regulated by the Civil Code. Finally, it can be a reference to the type of proceedings that might be commenced in a common law system to regulate disputes between private individuals and provide the injured party with a remedy, as distinct from the criminal law which involves offences against the State by a person and which involves punishment if the person is found guilty. It is in its first sense that civil law is most relevant here.

### *Origins*

The origins of the civil law system, also known as the continental European system, can be found in Roman

law, and in particular the four compilations (or codification) of Roman laws, known as the *Corpus Juris*, by the Roman Emperor Justinian (527–565 AD). However, it was not until the beginning of the 11th century AD when scholars began to study and interpret the *Corpus Juris Civilis* that Roman law began to form the basis of a common law of Europe. Even then it took a further five centuries to produce a common law of Europe (the *jus commune*), consisting of a mixture of local statutes and customs based on Roman law (or the *Corpus Juris*) and reinforced by canon law (or the law of the Church). Over the following three centuries civil law became codified as *droit coutumier* or customary law, that were local compilations of legal principles recognized as normative. From these sources developed perhaps the two most influential civil law systems as they formed models for most other contemporary civil codes and are the basis of modern civil law: the French Napoleonic Code and the German Civil Code. While both Codes are different in style and tone, they are both based on laissez-faire economics and autonomous rights for citizens.

The prototypical civil law country is France. In 1804, the French Napoleonic Civil Code was enacted. It set out flexible general rules in clear and concise language for use by its citizens, producing Europe’s first single system of law. Structurally similar to the *Corpus Juris Civilis*, its authors relied heavily on the *jus commune*, as well as incorporating many of the principal ideas of the French Revolution including the right to own property, freedom to contract, and the autonomy of the patriarchal family.

The German Civil Code was enacted almost a century later. Like the French, the Germans relied on the *jus commune* and made extensive use of the *Corpus Juris Civilis*, but unlike the French they focused on the underlying principles and organisation of the *Corpus Juris Civilis*. The German Civil Code, the *Bürgerliches Gesetzbuch* (the “BGB”) was issued in 1896, and came into effect on January 1, 1900. The BGB unified private law in the German Empire, emphasising the individual and their need for freedom to achieve social justice. The language of the BGB is precise and technical and was meant for the use of civil lawyers rather than the layperson.

### *Features*

The essence of a civil law Code is twofold: first, it is independent of government and secondly, it contains a comprehensive statement of rules, many of which are framed as broad, general principles so as to deal with any dispute that may arise.

Under the civil law, the judge's role is inquisitorial. It is limited to the application of the law to the facts of each case. If there was no law to cover the situation, the judge was expected to refer the case to the legislative body which would then pass a law to deal with the situation. However, the reality has proved to be rather different with the legislative bodies discovering that they could not make laws quickly enough to meet all the different circumstances coming before the courts. As a result an unwritten system of judicial precedent similar to, but not the same as, that found in common law systems where lower courts will generally follow the decisions of higher courts has developed over time. The difference between the two legal systems is that civil law judges are not *per se* bound to follow previous decisions of higher courts, as are their counterparts under common law, but the reality is that the previous decisions do have *de facto* authority, particularly under German law where some recourse to case law is necessary.

Under the civil law, unlike the common law, it is the judge who investigates the facts and when arriving at a decision, based on deductive reasoning rather than the inductive reasoning found in common law systems, s/he will not (publicly at least) state reasons for that decision to the parties. The judiciary in civil law countries does not play the central role in interpreting and 'making' the law as it does in common law jurisdictions. However, the reasons for the particular outcome of a case are kept, albeit confidentially, as part of the court file which other judges can then access. Outwardly at least, the common law application of the doctrine of precedent and the need to follow previous decisions in like cases cannot apply. However, the reality is somewhat different and civil law courts may choose to follow previous decisions if they feel them to be appropriate although the Code is still central in the decision-making process.

In civil law states there is a sharply drawn distinction between private law (the law of persons, family law, property law, the law of succession, the law of obligations, commercial law, and labour law) and public law (constitutional and administrative law), the latter having been treated in a variety of ways in the civil law states with some countries establishing special agencies to deal with public law matters while others have created Constitutional Courts. In the majority of civil law systems, criminal matters aside, the jurisdiction of the ordinary courts is limited to dealing with disputes governed by the private law. This can be contrasted with the common law system which does not provide a separate court to deal with public law matters, instead providing different remedies for the private citizen.

## The Common Law System

The phrase 'common law' may be used in at least three different ways. First, it may refer to the basic principles of law originally found in the written decisions of judges, rather than relying on codification of the law. English law was never influenced by Roman law in the way that continental Europe was: English common law was already well established by the time that a common law of Europe was developed. Today, common law includes case law derived from the common law courts and courts of equity, as well as statute law and while the common law is increasingly turning to the use of comprehensive codes, their importance, application, and validity are still determined through case law. Second, it may be used to describe the decisions of judges in the common law courts as distinct from the decisions made in the courts of equity. Finally, it can be a reference to that body of legal rules that can be found in countries that have adopted or adapted the English system of law and which predominantly consist of law made by the judges. The term 'common law' is being used here to both describe a legal system and that part of English law which has been applied or accepted in other jurisdictions around the world.

## Origins

The origins of the common law system can be traced back to William the Conqueror. In order to consolidate his position, he began to centralise the legal system. He appointed a number of judges and instructed them to begin administering a uniform system of law in the name of the King—the common law. To assist judges in their decision-making, the judges began keeping records (known as plea rolls) setting out not only the facts and judgement of each case, but often the reasoning behind the judgement. This enabled judges in later similar cases to follow the decisions of the judges in the earlier cases. It is the common law's reliance on court decisions or precedent that is the principal feature distinguishing it from Romano-Germanic civil codes.

By the fourteenth century, the common law was procedurally both complex and very strict. To overcome the deficiencies of the common law, litigants began to petition the King to hear their pleas. By the fifteenth century, Courts of Chancery had been established to administer this new body of law—known as equity law—but the growth of this jurisdiction led to clashes with the common law. In 1620,

James I decided that in the event of a conflict between equity and common law, equity would prevail.

The role of Parliament as a law making body began after the forced signing of the Magna Carta by King John in 1215. Legislation was made initially by the King after the meeting with Parliament was over. However, by the reign of Henry VI (1422–1461), laws were being framed and discussed by the two Houses of Parliament. By the middle of the nineteenth century, the majority of law came from Parliament in the form of statutes to consolidate or fill gaps in existing law. Where a conflict arose between statute law and case law, statute law prevailed.

### Features

The common law system does not provide a separate court to deal with public law matters, instead providing different remedies for the private citizen. Under the civil law system, there is a sharply drawn distinction between private and public law with separate courts to deal with each.

The procedural basis of common law is adversarial or accusatorial. The parties are required to produce appropriate evidence and to be responsible for proving their case. The judge's role is to ensure that the parties observe the rules of procedure. The judge is not expected to take an active role in the proceedings to get to the truth of a matter, as would be the case in a civil law system.

Certainly one of the main distinguishing features of the common law system is its use of case law as precedent. A precedent is a judgement or decision of a court of law cited as an authority for the legal principle embodied in its decision. This is known as *stare decisis*, which literally means “to stand by a decision.” The doctrine of precedence seeks to ensure that people will be treated equally and fairly over a long period. This gives everyone the opportunity to conduct their affairs in the knowledge that certain rules and procedures operate to make it possible to predict, with a fair degree of certainty, what the likely outcome will be in the event of a dispute.

In order for precedent to operate there has to be in existence a court hierarchy where the lower courts will be bound by the decisions of higher courts. Precedent may be binding or persuasive. In the case of a binding precedent, each court is bound by the decisions of courts of the same level or higher, whether or not the judge believes a decision is correct, unless the judge can ‘distinguish’ the case on its facts, or law, or both from the precedent. It is only the *ratio decidendi* (the reason for the decision) which can create a binding precedent. Anything else said in a judgment

about the law is classified as *obiter dicta* (sayings by the way), and is at best only capable of being of persuasive value.

### Common Law Countries

The application of English law to new colonies depended on whether it was a conquered or ceded colony, or a settled colony. In the case of the former, it was recognized that a legal system was already in existence and the laws of the conquered people continued to exist, thereby creating a form of legal pluralism where common law co-existed with customary and/or religious law, unless or until they were repealed by statute, for example, Malaysia, India.

Where the new territory was regarded as *terra nullius* or unoccupied land, that is there were no settled inhabitants or there was no recognised legal system, the settlers took with them the law of England, for example, North America, Australia, and New Zealand.

### European Community Law

The development of the European Union (EU) or ‘European Community’ has led to the growth of a new regional legal system—European Community Law. While it has its roots in the Franco-German civil codes and has been influenced by common law traditions such as precedent, it also has its own distinctive legal characteristics. As a result, it falls somewhere between an international organisation and an association of states and can best be described as “supranational,” a regional system but one created by law.

### Origins

The driving force behind European unification was the desire for peace. The establishment of a unified Europe was seen as being one way to reduce the chances of war between the Community's Member States. Unity would only endure where equality could be established. To that end, not only are all Community citizens equal before the law, but no State is to have precedence over another.

Unlike the civil law and common law legal systems, the history of European Community Law is relatively recent with a history that can be traced back to the 1950s and post-World War II Europe. The Treaty of Paris in 1951 and the Treaty of Rome in 1957

laid the foundations for the establishment of the European Community (EC) when they created the European Coal and Steel Community (1951), the European Atomic Energy Community (1958), and the European Economic Community (1958).

The *Single European Act 1986* committed EC Members to establish a progressively free single market with four basic freedoms—free movement of goods, persons, services, and capital—and its rules on competition. The *Treaty of Maastricht* in 1993 which established the creation of the European Union (EU) and established the EU as an international organisation in its own right. The ‘European Economic Community’ was renamed the ‘European Community’ to give recognition to its change from that of a purely economic community to a political union but it did not otherwise affect its status. The legal acts of the respective bodies of the EC still constitute legal acts of the Community and have precedence over national law of the Member States.

The Treaty of Amsterdam in 1997 made substantial changes to the Treaty of Maastricht. Of particular legal significance was the greater emphasis on safeguarding of fundamental rights of EU citizens, and the adoption by the EU of a co-decision procedure (the legislative procedure involving the European Parliament and the Council), with the European Parliament now playing a much greater role in the legislative processes.

In 2001, the European Council met to consider establishing a Constitution for Europe. Among other issues, this included recommending a merger of the Treaties and the attribution of legal personality to the EU. The constitution, discussed for two years and passed at the European Convention of 2003, aims to streamline decision-making in an expanded EU of twenty-five members, with agreement expected to be reached among member States in mid-2004.

### *Features*

Unlike the written Constitutions that establish the legitimacy of most States, the EU constitution is not contained in a comprehensive constitutional document (yet). The EU is dependent on law for its unification, and its existence.

Member States are not absorbed into the EU, nor do they lose their national identities when they become members. They are, however, expected to limit their legislative sovereignty in the interests of solidarity and unity, requiring them to not only observe the Community treaties and secondary legislation but to also implement it and bring it into existence. Where the direct rights and obligations of the Community

citizen conflict with a rule of national law, Community law will have supremacy as long as it has been made in accordance with the Treaties.

Fundamental rights and civil liberties are firmly established in the constitutions of EU Member States with the individual a main focus on the Community, although the Treaties establishing the European Communities do not spell out any details of fundamental rights. However the Court of Justice of the European Communities has established a body of case-law to serve as a basis for safeguarding fundamental rights through a number of provisions in the Treaties dealing with equality and equal treatment. The direct applicability of Community law principles confers rights and imposes obligations directly on Community institutions and the Member States, as well as the Community’s citizens.

The European Court of Justice (ECJ) is the highest and only authority on matters of Community law, with each member State sending one judge, and together with the Court of First Instance, the only authority. The ECJ has sole responsibility for monitoring, interpreting and developing Community law and to achieve these ends, the Court’s work involves legal advice in the form of opinions as well as adjudication. The Court of First Instance was established to relieve the pressure on the ECJ. It is a constituent component of the Court of Justice, but in organisational terms it is an autonomous body with its own Registry and rules of procedure.

### *European Community Law Countries*

Currently there are twenty-five member countries of the Economic Community, placing it only behind the United States as a political and economic superpower. From the six founding States in 1951—Belgium, Germany, France, Italy, Luxembourg, and the Netherlands—it has grown to a membership of twenty-five States. The United Kingdom, Denmark and Ireland joined in 1973. In 1981, Greece became a member and was followed by Portugal and Spain in 1986. Austria, Finland, and Sweden joined in 1995 in what had by then become the European Union following the adopting of the Treaty of Maastricht in 1993. Of these fifteen Member States, only the United Kingdom and Ireland have common law systems.

In 2004, ten new States were admitted to membership, and the Greek side of Cyprus, Malta, and eight from the old Soviet bloc—the Czech Republic, Hungary, Estonia, Latvia, Lithuania, Poland, Slovakia, and Slovenia. Applications for membership have also been received from Turkey (1987), Switzerland (1992, though processing of the application

subsequently stopped), and Bulgaria (1995). A referendum in Norway resulted in voters rejecting membership in 1993 and Greenland voted by referendum to leave the EU in 1982.

## Islamic Law

Within Muslim society, there is no separation between church and state as in Western countries. Government, religion, and law are one and the same. It follows that Islamic law (*Shar'iah* or the path to follow God's law) will be an integral part of Islamic religion. *Shar'iah* contains the rules by which a Muslim society is organized and governed and may be viewed by westerners as a moral code more concerned with ethical behaviour than as being a legal system in its own right. This is because it controls, rules, and regulates all public and private behaviour as well as prescribing specific rules for religious matters.

### Origins

*Shar'iah* is derived from a number of sources rather than relying on one source for its broad knowledge base. The first and primary source of guidance and rulings in *Shar'iah* is the *Qur'an*, which is authoritative in Arabic only. As it is considered to be the direct word of Allah, it is the final arbitrator.

The second source of Islamic law is the *Sunnah*. It consists of the teachings of the Prophet Mohammad and helps to explain the *Qur'an*, detailing concepts, laws, and practical matters stated in the *Qur'an*, as well as providing rulings on some matters not explicitly stated in the *Qur'an*. It is a complementary source to the *Qur'an*, but it cannot be interpreted or applied in any way that is inconsistent with the *Qur'an*. The content of the *Sunnah* is found in *hadith*, or traditions. *Hadith* are statements passed through a reliable chain of communication to present adherents directly from the Prophet and its importance is judged on its reliability.

The third source of Islamic law is known as the *Ijma* (or consensus). The *Ulama*, or Muslim religious scholars may be consulted on a range of issues that are not found explicitly in the *Qur'an* or the *Sunnah* and when the *Ulamas* reach a consensus on an issue, it is interpreted as *Ijma* and forms part of the *Shar'iah*. Islamic judges are then able to examine the *Ijma* for solutions to problems that come before them.

The fourth element of *Shar'iah* is that of *Qiyas*, or analogical reasoning. The *Qiyas* are not explicitly found in the *Qur'an*, *Sunnah*, or given in the *Ijma* and can be used by a *Shar'iah* judge (or *Qadi*) to decide new case law.

### Features

The closing of the door of *ijtihad* (deducing rules of law through juristic reasoning from original sources) in the tenth century AD, three centuries after the founding of Islam, by the Sunnite Muslim authorities declaring the principle legal issues of the *Shar'iah* to be complete. The effect has been to produce a legal system that is often at odds with the modern world. Attempts to reopen the door of *ijtihad* by Sunnites have been vehemently opposed by traditionalists. Shi'ite Muslims have always recognised *ijtihad*.

One of the important features of *Shar'iah* is its emphasis on the correlation between rights and obligations or duties.

Unlike Western thinking, under *Shar'iah*, law is perceived as constituting an integrated part of social organisation and is not seen a separate branch of human activity. Law is seen as an expression of God's will and as a consequence, from an Islamic perspective, it is difficult to imagine a secular state or secular legal system.

### Islamic Influence

There are over 1.5 billion Muslims worldwide. They make up 25% of the world's population. There are thirty-five nations with population over 50% Muslim, and there are another twenty-one nations that have significant Muslim populations. There are nineteen nations which have declared Islam in their respective constitutions. Islamic law is the principal source of law in Iran and Saudi Arabia.

## Sino-Soviet (Socialist) Law

A majority of comparative lawyers regard socialist law as a family of law separate to the civil law family. While it is possible to identify a number of similarities between the two systems, principally in the codificatory style of law-making, the use of civil law institutions and the role of legal scholars as a source of law, it is the influence of Marxist-Leninist ideology that differentiates the two systems, and distinguishes it from any other systems for that matter.

In socialist countries, the Communist party, as the dominant (and often the only) political party, viewed the legal system as a political tool to be used by the State and its agencies to promote its political aims and objectives. Law was considered to be subservient to the economy and the creation of a new economic order to safeguard worker's interest.

Certainly one of the most important distinguishing features of socialist law was its treatment of property. Under socialist law, property was classified as either socialist property or personal property. Socialist property involved collective ownership through the State of any property which contributed to the means of production, including farms, while personal property was the property owned by individuals for their own personal needs. Other distinguishing characteristics of socialist law included the lack of separation of powers; the role of the courts as advocates of government policy; and the inability to criticise either party policy or the legal system.

The triumph of capitalism over socialism by the early 1990s resulted in the collapse of communism in most countries around the world and led to the decline of the socialist legal system as a dominant legal system. Indeed, as a result of the collapse of communism, many of the former socialist States have returned, or turned, to civil law. While countries such as North Korea, Uzbekistan, and Cuba have retained large elements of socialist legal theory, most of the remaining communist countries, such as mainland China, have slowly lost many of the distinctive command economy features that highlighted their legal systems, as they move to adopt more free-market economies.

## Customary Law

Customary law consists of rules that have developed in the community and become accepted by the community as establishing a pattern of behaviour that is binding on the members of that community. For customary practice to become accepted as customary law, it is generally accepted that it is necessary to first establish consistent and recurring action, and secondly that the citizens of the community recognize the custom as binding. The origins of both the modern codification of civil law and common law can be traced back to customary law. In addition, many Asian and African states still contain aspects of indigenous custom in their legal systems, for example, the use of *chotei* procedure (conciliation) under Japanese law and tribal law in the case of many West and East African states.

## Hybrid Systems

To a layperson a hybrid system is usually taken to mean one where more than one legal system co-exists, but to a comparative lawyer this usually means where common law and civil law types of law can be found operating together as a result of colonisation, annexation, occupation, or adoption. The laypersons understanding of 'hybrid systems' is used here for convenience. It is being taken to mean any country which has two or three types of laws or legal traditions operating all at the same time, and is what many comparative lawyers would describe as legal pluralism.

## LESOTHO

The Kingdom of Lesotho is a small country surrounded by the Republic of South Africa. Formerly known as Basutoland, the kingdom gained independence from Great Britain and is now an independent, limited monarchy.

The Basuto tribe developed only recently in Africa's history. It resulted from the disruption of the "Wars of Calamity" brought about by Shaka, king of the Zulus, in the early nineteenth century. While many Bantu, Suto, and Nguni clans were disrupted by

the Zulu raiders, a minor chief named Moshoeshoe gathered those he could on the plateau of Thaba Bosiu, near the Caledon River in what is now north-west Lesotho. Moshoeshoe was then able to avoid conflict with the Zulus.

Soon after Moshoeshoe's organization of the remnants of the original tribes in 1823, another conflict, this time with the European Dutch settlers known as the Boers, developed. In the early 1800s, the Boers began to move away from coastal south Africa as the British came in greater numbers, and by 1831 they had begun to move into the area inhabited by the Basuto. Reports of Boer mistreatment of Africans led Moshoeshoe to seek the protections of the British. In 1848, Moshoeshoe agreed to permit Great Britain to control the territories around the area he controlled.

Relations between Moshoeshoe and the British deteriorated soon, however, and in 1852 the Basuto and British fought one another. Moshoeshoe diplomatically brought the fighting to an end, and despite clashes with British settlers over the next few years, the Basuto remained free until the Great Basuto War, fought against the Boers, led Moshoeshoe to ask the British for formal protection again.

The Boers, who were Calvinists, had angered the British through their religious repression of Protestant missionaries in the region, and Great Britain agreed to annex Basutoland, placing it under local British control in the province of Natal.

Following Moshoeshoe's death in 1859, Basutoland was formally annexed into Britain's Cape Colony in 1871. The increase in British influence made the region more productive and profitable, but when British forces attempted to disarm the Basuto the tribal members resisted, fearing that without weapons they would be unable to protect themselves from the Boers. Following the "Gun War," which went badly for the British, the Basuto were eventually allowed to keep their weapons, and in 1883 Basutoland was disannexed. The next year, Moshoeshoe's son, King Letsie, agreed that the Basuto would become British subjects and British rule was established in Basutoland.

The British had learned to accept some tribal customs in their dealings with Africans, and in Basutoland this meant that Letsie, the Paramount Chief, was in fact still in control of the territory. This freed the British from having to deal with internal conflicts among the Basuto. Only the Basuto were permitted to own land, and eventually the Basuto (with British encouragement) developed a National Council to provide some degree of representative government. However, over several decades of this indirect rule Basutoland did not prosper and by the 1950s efforts to revise the power structure were made by the British.

A constitution was put in place in 1959 and elections were held in 1960 to form a new government, although Basutoland would still be one of Britain's High Commission Territories (along with Swaziland and Bechuanaland). This government, the Basutoland National Congress, took power on March 12, 1960.

Basutoland's geographic location, totally surrounded by the nation of South Africa, was the basis for a new concern. When Great Britain ruled South Africa as well as the High Commission Territories some degree of consistency could be established for the region. However, the Republic of South Africa was established and withdrew from the British Commonwealth. South Africa had developed its *apartheid* policy of racial segregation and exclusion, and with Great Britain's influence in southern Africa reduced, Basutoland's status as a colony was seen more as a liability than an asset. In 1963, a constitutional commission recommended rapid independence for Basutoland, and on October 4, 1966, the British territory of Basutoland formally became the independent nation of Lesotho, a constitutional monarchy.

Since independence Lesotho has been ruled sometimes by democratic institutions, but the government was overthrown by force by the military in 1998, resulting in widespread violence and destruction of property. Order was restored by intervention from forces from South Africa and Botswana in 1999, and Lesotho had orderly parliamentary elections in 2002.

The economy of Lesotho is largely dependent on employment in South Africa. While most of the adult workforce in Lesotho survives by subsistence farming, nearly one-third of the adult males work as migrant laborers in South Africa, which provides economic benefits for the families of the workers. While such use of migrant laborers is seen by some as exploitation, it does provide a means by which some wealth can be transferred from prosperous regions to others.

Lesotho's primary industrial export is electricity generated by the Lesotho Highlands Water Project, a joint venture between South Africa and Lesotho. This project began in 1984 and is expected to be complete by 2020.

The cooperation between Lesotho, Swaziland, South Africa, Namibia, and Botswana in the Southern African Customs Union (SACU) creates a regional trading bloc that has contributed to economic development in the region.

### LIBERATION THEOLOGY

Liberation theology arose within Roman Catholicism in Latin America as an effort to reinterpret the message of the Gospel while confronting political oppression and economical deprivation. It seeks to express religious faith by helping the poor and working for political and social change. The intellectual roots of this movement can be traced to certain European theologians, such as J. Moltmann and D. Bonhoeffer. Its ecclesiastical and social origins were made public in 1968, after the Latin American Bishops' Conference in Medellín, Colombia. That final declaration can be seen as a milestone, with its clear affirmation of the rights of the poor and denunciation of the industrialized nations, accused of enriching themselves at the expense of the exploited and deprived masses of the Third World.

Drawing inspiration from certain aspects of Marxist theory, emphasis was placed on the liberating potential of social action, at the level of the local community or of global revolution. Without denying eternal life, salvation is thus seen in terms of achieving the kingdom of God on earth, through the creation of a society based on justice and equality. In the words of one of the founders of the liberationist movement, the mission of the church is "at all times to protest against injustice, to challenge what is inhuman, to side with the poor and the oppressed" (1971). The ultimate justification for this position is to be found in the nature of God, conceived as being historically engaged against oppression and injustice. The fundamental act of divine liberating immersion is found in the Incarnation and the universal value of Jesus Christ resides in his total commitment of struggle for the poor and the outcast.

Opposing a conventional theology that legitimises the interests of the powerful, a truly liberating theological reflection was seen emerging out of an historical commitment, praxis of engagement in the interests of the poor. An important aspect of this focus on

social action was the creation in various Latin American countries of hundreds of grassroots religious communities ("comunidades de base"). During the period of widespread social unrest and civil war in Latin America, in the decades of 1970–1980, many of these communities were targeted by repressive regimes as feared hotbeds of revolutionary subversion. Thus, tens of thousands of their members, leaders, nuns, and priests, became the victims of repression, particularly in Central America. The progressive Archbishop of El Salvador, Mons. Oscar Romero, was murdered in 1980, an outrage tragically repeated in 1989, with the murder of the liberation theologian Ignacio Ellacuría and several of his close associates.

From the beginning liberation theology was criticized by conservative church circles and the Vatican for a dependence on Marxist tenets and proclivity for revolutionary violence. Several of its representatives were sanctioned and silenced, as in the case of the Brazilian Leonardo Boff. Critical voices from within Protestantism pointed to the insistence by liberation theologians of salvation through social change and the neglect of the personal and emotional aspects of religiosity. They were also quick to remind that liberation has always been at the heart of Christianity and that Scripture rather than praxis should continue to be the fundamental theological guideline.

Liberation theology has undergone significant development over the years, partly as a result of changed political conditions—not the least the fall of Eastern European socialism—and above all, as in any intellectual movement, through the development of thinking expressed by its proponents. Although perhaps not in the sense anticipated by its early adherents, liberation theology has, by the beginning of the twenty-first century, diversified and expanded in several directions. It now includes the liberation of women from patriarchal structures, the liberation of ethnic groups and minorities within nation states, and an increased awareness of the need to address, in the face of global ecological degradation, the nature of the relation between man and nature; in other words, to liberate theology from the fetters of an older perspective of domination and move on to develop a perspective of stewardship and participation.

Most significantly, there has been growing interest in the specifically theological meaning of the concept of liberation. Without renouncing the essential commitment for a more just society, there is an increased inward focus on the importance of scripture as a basis for theological reflection and personal spiritual development, as can be seen in the work of, among others, Aloysius Pieris in Sri Lanka, and bishop Pedro Casaldáliga in Brasil.

There has been, in general, a shift away from an early idealisation of socialism without abandoning a critical stance against capitalism and the neo-liberalism of globalization.

At the same time, the expansion of liberation theology into other parts of the world, such as Africa, Asia and the Middle East, has resulted in the acceptance of the cultural implications of its basic tenets. Among other things, this means that the constructive realisation that the idea of an ultimate reality as a personal being that creates the cosmos out of nothing and summons human beings to a redeeming encounter with his divine Self, is almost nowhere to be found outside Semitic monotheism. This means, for instance, the beginning of a dialogue on equal terms with Aymara religion in the Andes of South America, with religious syncretism in Brasil or with Maya religion in Central America. It means also the emergence of a Black Theology in North America and a generous and open-minded attitude towards what can become a portentous long term cultural meeting with the vast tradition and rich symbolism of Asian religiosity.

Thus, there are today not one but several liberation theologies. There are various regional issues to assume, as when Christian Palestinians invoke a liberationist outlook in their struggle to attain nationhood, and there is also the challenge of formulating a viable alternative to the mechanisms within the current process of globalization that maintain and even aggravate poverty and inequality for millions of human beings.

### LIBERIA

Liberia, like neighbouring British Sierra Leone, was born of mixed motivations to spread Christianity and Western civilisation to Africa, while ridding the

United States of an undesired class of freed Blacks. In 1816, the American Colonisation Society, with the support of a US congressional grant, began to transport freed slaves back to Africa. Following the US abolition of the slave trade in 1819, the settlements proved a dumping ground for recaptive slaves seized by the American anti-slave trade squadron. Between 1822 and 1892, over sixteen thousand freed slaves were resettled in scattered settlements under the control of the Society's various state chapters.

In 1831, the Maryland chapter broke with the Society and established its own Maryland County colony. Such chapter rivalry was reflected in fragmentary administration, though not development assistance. Many of freed blacks had urban skills, not applicable to the frontier conditions, and found themselves in competition with indigenous peasants. Some became absentee planters, using recaptive labourers to grow sugarcane, coffee, rice, and so forth. Many turned to petty trading, some to illicit slave trade—the most viable economic venture available.

Britain refused to recognize the sovereignty of the American Colonisation Society and the United States was ambiguous; it refused to accept responsibility but tended to oppose British and French territorial ambitions. The Americo-Liberian seized the initiative, declaring Liberia a republic, on July 26, 1847. Maryland County was subsequently annexed in 1857.

Until the 1890s, Monrovia controlled only isolated coastal enclaves. The dominant Americo-Liberian elite, with their Christian faith, American colonial lifestyle, and racial prejudices, looked down upon the indigenous 'savages' and the captives as only slightly better.

In 1869, Edward Roye of the new True Whig Party became the first fully Black Liberian president. An educated and financially successful businessman, Roye sought to offset falling revenue with a series of British loans, commencing a downward debt spiral. Roye's death in 1871, under mysterious circumstances, led to a brief revival of Republican power, but triumph by the True Whig Party in 1877 ushered in over a century of one-party rule.

The economy was increasingly threatened by a glut of tropic produce and imperial shipping cartels undercut the older Americo-Liberian coastal cutter trade. Simultaneously, Liberia was forced to defend its territory against British and French imperialism by demonstrating its 'effective-control' of the interior, resulting in clashes with indigenous rulers.

President Arthur Barclay (1904–1912) introduced a system of 'native administration' based on British 'Indirect Rule' through native chiefs, who received a share of local revenue. He also increased ports of entry, thus legitimising a trade the state could not

control, and initiated a new loan agreement, negotiated by the famous British explorer, Sir Harry Johnston. The new loan was to retire existing debts, some \$800,000 in 1906, with the balance used for development by the British Liberian Rubber Corporation. In return, a British official was placed in control of Liberian Customs. Much of the money disappeared when Harry Johnston's Liberian Development Company collapsed. When Pres Barclay tried to renegotiate the loan, the British government insisted on greater controls over Customs and a Liberian Frontier Force under British Officers. Increased British hegemony aroused French demands and American intervention. US Afro-American officers replaced the British officers.

In 1912, the United States organised an international loan of \$1.7 million, to pay off Liberia's debts, but Liberian Customs was placed under an American-chaired international receivership. Government retrenchments, continued corruption, and falling terms of trade, exacerbated by the sharp wartime decline in trade with Germany, Liberia's largest trading partner, led to native uprisings amongst the Kru and Kpelle. British hostility to Liberia's wartime neutrality and support for the Kru was thwarted by American intervention. The Kru were brutally crushed and Liberia subsequently followed the US into declaring war on Germany.

In response to an attempted Anglo-Dutch rubber cartel, in 1927, Harvey Firestone sought a ninety-nine-year lease on a million acres, in return for a 5 million dollar loan to Liberia and the replacement of the international receivership by US control of the budget. The world price of rubber collapsed shortly thereafter but not repayments on the loan.

The other scandal of the 1930s concerned exploitative contract labour from Liberia to Spanish Fernando Po. The League of Nations pilloried Liberia, though Spain and other colonial exploiters were largely ignored. Liberia's international reputation was resuscitated during World War II, when it became the principal source of Allied rubber with the expansion of Firestone's investments, and a base for air-strikes against North Africa from what became Roberts Field airport outside Monrovia.

President William Tubman, inaugurated in 1944, adopted a US "open door" policy to promote foreign investment and, unlike his predecessors, encouraged some local participation in government. He died in 1971 and was succeeded by William R. Tolbert, who continued the free-enterprise policies but sought a less conservative image and strengthened ties with West African nations. An attempt to promote domestic rice production through higher prices led to demonstrations in 1979.

In 1980, Master Sgt Samuel K. Doe assassinated Tolbert and overthrew the government. Doe abrogated the constitution and ruled in conjunction with a People's Redemption Council (PRC). He doubled army pay and publicly executed thirteen former ministers in a backlash against more than a century of Americo-Liberian political and economic exploitation of the indigenous population. Despite international protests, the United States recognised the regime and increased the level of assistance.

Doe won the 1985 presidential elections and his National Democratic Party of Liberia secured a majority, amid accusations of electoral malpractice. Many opposition figures died under suspicious circumstances. Then, in 1989, Charles Taylor of the National Patriotic Front of Liberia launched an invasion from Cote d'Ivoire, supported by Gio tribesmen. The ensuring civil war, with its complex tribal factions, was fueled by an illicit diamond and drug trade, in exchange for arms.

Despite intervention by Economic Community of West African States (ECOWAS) the brutal fighting continued. Doe was eventually captured and tortured to death by a rival warlord. The war created desperate food shortages and a total breakdown of civil society, with hundreds of thousands of refugees.

There were numerous peace conferences and discussion, leading to elections in 1997, won overwhelmingly by Charles Taylor on a platform of vote for continuing atrocities or me. Taylor murdered, imprisoned or drove out his rivals, holding onto power with the support of illicit diamond smuggling by his RUF allies in neighbouring Sierra Leone. In 2002, rebels of Liberians United for Reconciliation and Democracy (LURD) seized control of most of the north and advanced on Monrovia. By 2003, the rival rebel Movement for Democracy in Liberia (MODEL) controlled most of the west. Under pressure from rebels and facing an indictment by the United Nations (UN) Special Court in Sierra Leone, Taylor fled into exile in Nigeria.

A multi-party transitional government was established in 2003; and under President Gyude Bryant, a local businessman, a UN-sponsored disarmament program was initiated.

## LIBYA

The country's conventional name is Great Socialist People's Libyan Arab Jamahiriya or most commonly known as the *Libyan Arab Jamahiriya* is situated in north Africa, next to Egypt and Algeria.

The northern part of Libya has a typical Mediterranean landscape and climate, with an average rainfall of about fifteen inches annually and temperatures ranging from 86°F to 46°F. Towards the middle and southern part of the country the average rainfall decreases gradually, it becomes very dry and the desert takes over most of the territory: more than 90% of the country is desert or semi-desert. Southern Libya has a desert climate with daytime winter temperatures ranging between 59°F and 68°F, falling below zero at night. During the summer months, there is virtually no rainfall and temperatures soar to over 122°F.

The present population is estimated at 5.6 million, with a growth rate of about 2.37% annually. Libya is between the countries with the lowest population density in the world. The urban population is 86%, a high value in the region. The port of Tripoli, the capital city, has a population estimated at 1.7 million. The official language is Arabic, with Italian and English also understood in major cities. Most people's religion is the Sunni Muslim, which accounts for approximately 97% of the population.

Libya was formerly occupied by the Roman Empire, inherited by the Byzantines until it was conquered by the Arabs. During the sixteenth century, the Turks invaded and imposed a series of dynasties until 1912 when the Italians, by Mussolini's order,

conquered the native tribes. After World War II, the territory was assigned to France and Great Britain but soon Libya gained and declared its independence on December 24, 1951, before any other African country that had been formerly under European control. Libya was proclaimed a constitutional and hereditary monarchy and Sheikh Sidi Idris was proclaimed King Idris I. During Idris's mandate, Libya maintained a tendency favourable to the western countries until on September 1, 1969, a small group of military officers led by Muammar Qaddafi staged a *coup d'état* against King Idris, a fact later known as *The Libyan Revolution*. The new regime abolished the monarchy and proclaimed the new Libyan Arab Republic. Qaddafi's political system was a combination of both Socialism and Islam (Muslims beliefs) which he called the *Third Universal Theory*.

During the 1980s, Libya incurred in some conflicts with the United States all of which resulted in a boycott by the United States to Libya. Later, in 1992, the United Nations (UN) Security Council condemned Libya to political and economical isolation during the 1990s. UN sanctions were suspended in 1999 and finally lifted in 2003 after Libya resolved the Lockerbie case. Libya then began establishing important reforms such as privatization of the country's oil sector and the incorporation of Libya to the World Trade Organization, giving up in some way to Qaddafi's socialist philosophy.

Since 1959, Libya's oil and petroleum export revenues have accounted for more than 90% of its earnings. Libya's economy depends primarily upon revenues from the oil sector, which contributes practically all export earnings and about one-quarter of the gross domestic product (GDP). In 2004, the GDP was estimated at \$35 billion with per capita income of \$6,400, quite high for the region. The non-oil manufacturing and construction sectors account for about 20% of the GDP and agriculture sector only contributes with 8% of the GDP. Because climatic conditions and poor soils limit agricultural activities, Libya imports about 75% of its food.

Despite Libya's relatively strong economic growth and high per capita income, unemployment remains high as the country's population grows rapidly and new jobs are not created rapidly enough. The unemployment rate was estimated at 30% in 2001. Libya has a relatively poor infrastructure (i.e., roads and logistics) having only a well-developed net of oil pipelines from the inner part to the sea.

However, the incomes generated by the petroleum exploitation have allowed the government to implement social welfare plans, which have improved the people's living conditions. All health international standards show that Libya's health conditions have

improved in the last five decades. Between 1970 and 1985, the number of medical doctors and dentists increased seven times and the number of hospital beds tripled. A net of public hospitals and health centres provides free and medium quality health service accessible for all citizens. The infant mortality rate experienced significant improvement: it passed from being 105 infants (per 1,000 live births) in 1970 to only 16 in 2002. Also the under-five mortality rate passed from being 160 per 1,000 live births in 1970 to 19 in 2002. As a result of this the general life expectancy at birth has improved from being 58 years in 1970 to 72 years in 2002 (UNDP 2004). Consequently the country is qualified among those with medium human development by the United Nations Development Program (UNDP 2004), which situates it better than any other African country. Progress included eradication of malaria, malnutrition, and significant gains against trachoma, tuberculosis, and leprosy. However, diseases such as typhoid, infectious hepatitis, rabies, meningitis, and venereal diseases remain a problem.

Primary education between six and fifteen years in Libya is free and compulsory. The primary school enrolment ratio was 96% in 2000. Secondary school is attended until the age of eighteen and scholars have the chance to enter one of the twelve universities. The major universities are the University of Garyounis in Benghazi and the Al-Fateh University in Tripoli. The adult literacy rate has improved a lot in the last decades: it was 60% in 1985, then 75% in 1995 and finally it reached 81% in 2002.

A project called the Great Man Made River project, is being implemented to bring water from underground aquifers beneath the Sahara to the Mediterranean coast, which will reduce the country's water shortage and its dependence on food imports by encouraging the development of agriculture.

#### LIBYAN CULTURAL REVOLUTION

The Libyan Cultural revolution was launched in April 1973 on the Prophet Muhammed's birthday anniversary by Libya's charismatic leader Colonel Muammar Qaddafi. Libya's monarchy had been overthrown in a bloodless coup by Qaddafi and a troupe of fellow officers in 1969. With Qaddafi as the chair of the Free Unionist Officers, Libya was to embark on a path to full independence from foreign influence, to Arab unity, socialism, and freedom. By 1973, dissatisfied with the progress of the "revolution" Qaddafi had consolidated enough of a powerbase to lead the revolution in a new direction. Qaddafi announced that drastic measures were required to preserve the revolution. The Libyan state and society would be revolutionized along the guidance of Qaddafi's Third Universal Theory, which he elaborated in the three volumes of the *Green Book* published soon afterwards. The pillars of the new Libyan state were egalitarianism, socialism, pan-Arabism, and anti-imperialism. Qaddafi's Third Universal Theory was offered and recognized as a third and uniquely Arab alternative to capitalist and communist development.

The Libyan Cultural Revolution was apparently modeled after China's Cultural Revolution, but Qaddafi denies this. Its goals were (1) to replace all imperialist laws with revolutionary laws, (2) to weed out counter-revolutionaries, (3) to foster an administrative revolution that would sweep away bourgeois bureaucracy, (4) to replace the state bureaucracy with people's committees, and (5) to eliminate all imported and foreign ideas. Qaddafi hoped to combat bureaucratic inefficiency and resistance in the state while simultaneously instilling the people of Libya with revolutionary fervor and participation.

The most important innovation of the Cultural Revolution was the People's Committees. The People's Committees were to be the primary instrument of the revolution, and they were created at all levels to take over administration and governance. People's Committees were formed to administer universities, private business firms, schools, farms, public utilities, government bureaucracies, the broadcast

media, and municipalities. Thousands of government bureaucrats were fired. Estimates vary, but by August 1973 from one thousand to two thousand People's Committees were created. The People's Committees replaced all alternative forms of representation in government. At the top of this new system was the General People's Congress (GPC). Later Qaddafi would add "Revolutionary Committees" to guide the People's Committees. Qaddafi's intention was to bring Libya "true democracy," instead of Western representative democracy. Qaddafi renounced his formal titles, but remained the head of the army and the Leader of the Revolution, hence, the de facto ruler of Libya.

The Cultural Revolution also brought forth other reforms; Libya was to be egalitarian, socialist, and Arab. Properties were seized from landlords and given to their occupants. Private property was abolished. Workers were encouraged to take over their places of employment and create a system of self-management. Retail trade was to be abolished. Libyan embassies were converted into people's bureaus. The Libyan army was demobilized and replaced by a People's Army, and military training was made mandatory from high school age onwards for both men and women. Private savings accounts were eliminated.

## LITHUANIA

Lithuania, situated on the east coast of the Baltic Sea, covers approximately sixty-five thousand square kilometers. Lithuania shares borders with Belarus, Latvia, Poland, and the Russian Oblast of Kaliningrad. Lithuania mainly consists of lowlands with rolling hills in the east. Lithuania has a maritime climate in the west and a continental climate in the east. Summers and winters are moderate although the climate in the east is more variable. Lithuania lacks an abundant supply of natural resources. What resources are

available include peat, sulfates, limestone, chalk, sand, gravel, and amber. There are limited oil and gas holdings available offshore. Lithuania, however, is an exporter of electricity with its nuclear power industry. The population is estimated at 3,608,000 with a declining population of  $-0.33\%$  annually. Vilnius, Lithuania's capital, is the major urban center consisting of 16% of Lithuania's population with 518,000 inhabitants. Other important cities include Kaunas, Klaipeda, and Siauliai.

Unlike Estonia and Latvia, Lithuania acquired statehood prior to the twentieth century. Through a dynastic marriage in the fourteenth century and the threat of an expanding Muscovy, the kingdoms of Lithuania and Poland were united by the Union of Lublin in 1569. The union created a Polish-Lithuanian commonwealth (*Rzeczpospolita*) stretching from the Baltic Sea to the Black Sea. The Polish partitions of the late eighteenth century resulted in Lithuania's incorporation into the Russian Empire. As a result of World War I and the 1917 Russian Revolution, Lithuania declared its independence in February 1918. There were major issues that plagued Lithuania's claim to independence. Immediately following Lithuania's declaration, Bolshevik forces invaded Vilnius and established a pro-Bolshevik government. The provisional government, exiled to Kaunas, organized a national army to expel the Bolsheviks. Due to Polish ambitions, Lithuania lost the Vilnius region to Poland. Kaunas served as Lithuania's capital during the interwar period. A permanent constitution was drafted in August 1922 officially creating an independent, democratic Lithuania. The constitution called for a unicameral legislature, the Seimas, and an elected president. Due to the ineffectiveness of competing liberal and conservative politicians in the Seimas, President Antanas Smetona led a military coup d'état on December 17, 1926. Smetona expelled liberal members of the Seimas and changed the constitution, granting him supreme authority until fleeing the country in 1940.

The secret protocol contained in the September 1939 German-Soviet Nonaggression Pact relegated Lithuania to a German sphere of influence. Later in September, however, Lithuania was shifted to the Soviet sphere. In exchange for the possession of Vilnius, Lithuania signed a mutual assistance pact with the USSR in October 1939, paving the way for Soviet annexation. In August 1940, Lithuania became a constituent member of the USSR. Nazi Germany occupied Lithuania from 1941-1944, resulting in 200,000 Lithuanian casualties including an estimated 160,000 Jews. Following the defeat of Germany, the USSR systematically exiled as many as 350,000 Lithuanians to prison camps. Although many

Russians immigrated to Lithuania, it was not of the same magnitude in comparison to Estonia and Latvia. Liberalization of the Soviet system and the *Sąjūdis* (Lithuanian Movement for Reconstruction) led to a renewed demand for independence. In March 1990, Lithuania became the first Soviet republic to declare independence. However, it was not until August 1991 that the USSR recognized Lithuania's independence claim. Lithuania undertook the path of a more western orientation by becoming an associate member of the European Union in 1995.

Lithuania's economic reorientation was initially very turbulent. High-energy costs and price deregulation gave way to sharp inflation, plunging Lithuania into depression during the early 1990s. Lithuania's gross domestic product (GDP) dropped significantly each year until 1994. The privatization of the agricultural sector established many small inefficient farms throughout the country. The introduction of a new currency, the *Lita*, in 1993, helped establish a more stable economy. The *Lita*, initially tied to the US dollar in 1994, however, was pegged to the Euro in 2002, reflecting Lithuania's ambition to join the European Union. Lithuanian goals for European Union (EU) accession were secured by becoming an associate member in 1995. Lithuania was rocked by a banking crisis in 1995. The government due to embezzlement charges closed Lithuania's two largest banks—the Innovation Bank and the Litimpeks Bank. The 1998 Russian economic crisis caused a recession in Lithuania in 1999. Despite this tumultuous period, Lithuania's economy emerged as one of the strongest of former Soviet republics.

The 2004 estimated GDP was \$40.8 billion. The service sector contributes 63% of the GDP, whereas industry consisted of 31% and agricultural production 6%. Lithuania's major imports and exports include mineral products, textiles, machinery, transportation equipment, mineral fuels, metals, and consumer goods. Other important trade partners include Germany, Poland, Latvia, the United Kingdom, France, Denmark, Sweden, Estonia, and Switzerland. Lithuania is a member of the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (World Bank), the World Trade Organization, and the European Bank for Reconstruction and Development.

Public discontent due to Lithuania's rapid economic transformation and corruption plagued Lithuanian politics in the 1990s. Lithuania's first post-Soviet government collapsed under pressure from a population suffering from a decline in living standards and growing unemployment. Since the mid-1990s, living standards have improved, but Lithuanian politics faced mounting pressure due to corruption in the public

sector. Lithuania's first president, Algirdas Brazauskas, demanded the resignation of Prime Minister Adolfas Slezevicius in February 1996 after allegations that Slezevicius withdrew his personal savings from Innovation Bank two days prior to the bank's collapse. Brazauskas decided not to run for reelection in January 1998, paving the way for Lithuanian-American ecologist Valdas Adamkus's presidential election. Adamkus is widely credited for attempting to eradicate corruption in Lithuanian politics and leading Lithuania towards full EU and NATO membership. Lithuania became a full member of the EU and NATO in May 2004. Despite widespread popularity, Adamkus was defeated in the January 2003 runoff election to former Prime Minister Rolandas Paksas. Paksas, however, was impeached and removed from office in April 2004 due to implications of personal contacts with Russian organized crime and threats to national security. Adamkus was reelected president in July 2004.

### LOMÉ CONVENTION

The Lomé Regime, a political framework within which economic processes are carried out, comprises four conventions entered into between the European Union (EU) and a group of African, Caribbean, and Pacific countries (ACP) from 1975 to 1999. Each convention lasted for five years. Against the backdrop of the failed attempt by the developing countries at the United Nations (UN) to usher in a New International Economic Order (NIEO), Lomé I (1975) was touted as an example of an equitable world order. An increase in the number of ACP states adhering to this regime from forty-six in Lomé I, to fifty-eight in Lomé II, sixty-six in Lomé III, and to seventy-one in Lomé IV (bis) in 1999 begins to validate this contention. Seemingly, the regime's signature products—trade and aid and provisions and

Europe's commitment to promoting industrialization in the ACP states—were its principal baits. The preferential treatment granted ACP products under Lomé was more attractive than the Generalized System of Preferences (GSP), privileges granted by most developed countries to imports from developing countries. However, a critical examination, shows that the regime's impact on the development of its ACP partners has been minimal. Changes in the international environment such as the end of the Cold War and the growth of neoliberalism as promoted by the Washington consensus, the advent of the World Trade Organization (WTO) rules as well as the increase in EU membership and the signing to the Maastricht Treaty have led to a change in the Lomé "spirit" which privileged partnership.

Under Lomé, about 97% of ACP products were allowed free entry into the EU market. Instability in earnings from primary commodity exports (groundnuts, cotton, and hides) were compensated, to a large extent, by the Stabilization of Export Earnings (STABEX) facility as well as SYSMIN which aids mineral producing countries (copper, cobalt, manganese, and phosphates) if their production is affected by circumstances such as a fall in world prices or a political crisis. Despite these, the ACP share of EU's overall imports continued to decline, from 20.5% in 1975 to 16.6% in 1985. Seen through another prism, imports from the ACP between 1975 and 1992 grew by 2.28% as compared to those from Latin America, the Mediterranean, and Asia which increased by 5.97%, 5.87%, and 11.7% respectively. Rules of origin stipulations and the imposition of non-tariff barriers (NTBs), to a large extent, helped to stymie its growth. Under the rules of origins provision, no less than 50% of the value added in ACP goods must originate from the ACP states and/or the EU. Studies have shown that Commonwealth Africa cannot benefit from this provision "because they have only between 20% and 48% of value added as a proportion of their gross value" (Cosgrove Twitchett 1978). Also contributing to trade distortion was the threat of the imposition of non tariff barriers, though outlawed by the Treaty. A threat by the United Kingdom, for example, to invoke the Safeguard Clause in the Treaty forced Mauritius to conclude a voluntary export restraint restricting its textile exports to the EU (Parfitt 1981). Other impediments include supply side factors such as the effects of natural disasters, drought desertification and the lack of capacity. The composition of ACP exports, however, changed as twenty-eight states developed a capacity to export some seventy new commodities to the EU.

The aid package increased from European Currency Unit (ECU) 4,362 million in Lomé I to 5,409 million, 8,500

million, and 12,000 million for Lomé II, III, and IV respectively. Consisting of mostly grants and soft loans, they were administered by the European Development Fund (EDF). Under the first three conventions, about 70% of the funds were set aside for the projects under the National Indicative Programs (NIPs). Decisions over funding amounts were, however, the prerogative of the EU. The remainder of the non-programmed EDF aid was allocated to other mechanisms, notably STABEX and SYSMIN. Until 1990, STABEX funds had to be repaid. That these funds were inadequate is demonstrated by their failure to completely compensate for shortfalls. Payments were more than halved in 1980 and 1981 and in 1987 claims amounted to over ECU 803 million while the fund had only ECU 375 million. Financing for the fast disbursing Sectoral Import Programs (SIPs) for the import of necessary inputs in sectors such as agriculture and industry was introduced under Lomé III. Despite the increase in absolute terms of the aid package, it decreased considerably over time from the vantage point of its per capita value. It dropped by 30.9% between Lomé I and II and 12.5% between Lomé II and III (European Report, 1988).

Lomé was also committed to promoting industrialization among the ACP states. The Industrial Development (CID) was to serve as the lead structure in this process. But it was hobbled by several factors. Funding for the transformation of the ACP economies, despite the guarantees, were never put in place. Even when this finally occurred, the funding was grossly inadequate. The CIDs budget, for example, was increased from ECU 40 million in Lomé III to 60 million in Lomé IV. This paled in the face of demands which increased dramatically, jumping from 575 projects in 1994 to 1,248 in 1995. Of those approved in 1995, only 400 could be funded. Even the European Investment Bank could not fill this lacuna. For a five-year period in the 1980s, Edwin Carrington, the Secretary General of the ACP notes, it could only disburse one third of the ECU 600 million over a five-year period. Over this period, the African Development Bank had invested over 1 billion US dollars (Parfitt and Bullock 1990).

Lomé IV bis, concluded for a twenty-year period after a fifteen-month debate of the European Commission's Green Book focuses on the fight against poverty. ACP attempts to protect their *acquis* were to no avail. Given the tendency in the EU to align its policies with those of the WTO and the Washington consensus, STABEX, SYSMIN, non-reciprocity and trading preferences have disappeared. But to cushion the shock, the European Union conceded that the present trading regime be maintained during a

preparatory period (2000–2008). The parties shall also use this period to negotiate a new trading accord that would be put in place between 2008 and 2020 (Crozet and Lopez-Caniego 2000). Aid has been streamlined as it now consists of three instruments only: long-term, regional, and investment assistance. Conditionalities similar to those in the World Bank's Structural Adjustment Programs have been introduced. An early sign of the rapprochement was the insistence of the EU that Malawi accept conditionalities, prior to their definition by the Bank, as a basis for financing its SIP.

### LUMUMBA, PATRICE

When Belgium rushed to grant independence to the Congo on June 30, 1960, Patrice Lumumba rapidly emerged as a key political contender for national leadership of this enormous country.

In the colonial division of Africa at the 1885–1886 Berlin Conference, King Leopold of Belgium became the only head of state to acquire his personal colony, the Congo Free State. Intense international pressure brought to bear on the abusive imperial rule of the country resulted in the takeover of the colony by the Belgian Parliament in 1908. Between then and 1960, Belgian governmental paternalism and protected private mining enterprise utterly failed to prepare the colony for independence.

Belgium's grudging reluctance to allow any indigenous political participation in the colony ultimately

led to civil riot in the capital in 1959 and worsening unrest, which brought a complete breakdown of civic order. Hastily granted independence, agreed to only in January 1960, allowed for the first national elections only a month before the end of Belgian rule. No single party showed sufficient strength to form a government. The two leading contenders agreed to share the two main offices. Joseph Kasavubu became president and Patrice Lumumba assumed the prime minister post.

Within days after independence, the army mutinied and two outlying provinces immediately seceded. In the midst of chaos, the mineral-rich state became a pawn in the Cold War, which prompted the dispatch of a large United Nations peacekeeping force, staying in place until June 1964. Among all political rivals, only Lumumba appeared to stand for a unitary, centralized government, in part perhaps because he came from a minor tribal group in the country's distant interior. He served only two months as prime minister before he was incarcerated by rivals and thereafter murdered in January 1961 by opposition elements.

A fiery orator and leader of the only political party to seek national representation, he lacked the skills of coalition building to secure a national government. Viewed as visionary and martyr by his supporters and mercurial and diabolical by his opponents, he collected enemies easily. Intense, high energy, and uncompromising, he became engulfed in internal factionalism, seized upon as a symbol by anti-imperial elements elsewhere on the continent, and supported by Moscow seeking ideological gain in the emergent Third World.

The importance of Patrice Lumumba lay in his brief leading role as an indigenous, Third World, anti-imperial spokesman, and early pursuer of a wider, non-tribal, political posture, which simulated a nationalist impulse. Africa's pre-colonial history, characterized by massive internal people migrations with no common sense of destiny, followed by colonial-drawn artificial borders and imperial rule, left Sub-Saharan Africa without a common legacy of organizing political sentiments on a macro scale. Factionalism, clientelism, and tribalism, as opposed to nationalism, for the most part have governed Africa's political relations. Lumumba tried to change that course for his country.

## LUTHULI, ALBERT

Albert John Luthuli (1898–1967) (also spelled “Lutuli”), Africa’s first winner of the Nobel Prize for Peace and the president-general of the African National Congress (ANC) from 1952 until his death, is recognized as the father of the non-violent campaign for civil rights in apartheid South Africa.

His exact birthday unknown, Luthuli was born Albert John Mvumbi (Zulu for “continuous rain”) Luthuli around 1898 in Southern Rhodesia where his father served as a Seventh-Day Adventist missionary at the Solusia Mission Station (near Bulawayo) among the Matabele people. After his father passed away around 1906, Luthuli and his mother returned to their native Groutville in the Natal region of South Africa where his grandfather served as chief of a small Zulu community, an elective post that Luthuli, after many years of being a teacher, applied for in 1935 and won. This became the first occasion when Luthuli’s Christian faith (instilled through his family and education) was tested by the everyday realities of the country’s racial politics. In 1946, while chief, Luthuli also briefly served as a member of the Natives Representative Council, a board of black South Africans advising white senators who “represented” the black population at the parliament. The board was abolished after it protested the government’s violent suppression of the black miners’ 1946 strike at the gold mines of Witwatersrand.

Luthuli joined the African National Congress (ANC) in 1944, and became the president of the party’s Natal province office in 1951. When on June 26, 1952, Luthuli led the party’s non-violent “Defiance Campaign” against the discriminatory laws passed by the Afrikaner National Party, which ruled the country since 1948, the government deposed him from his Chieftainship, an act which only made Luthuli’s political stature more prominent. In response, Luthuli wrote “The Road to Freedom is Via the Cross,”

a speech issued in public barely a month before the ANC elected Luthuli its President-General in December 1952.

Regardless of the repeated bans the government issued against the ANC under the “Suppression of Communism Act,” Luthuli remained politically active and was arrested and brought to court along with 155 others for high treason in December of 1956 (a charge he was acquitted of a year later for lack of evidence). Luthuli continued to organize successful, peaceful strikes throughout the late 1950s, but after the Sharpeville Massacre in 1960, when state forces crushed a peaceful protest of black Africans protesting the pass-laws, and the government outlawed all African (black) political organizations, Luthuli began to experience his growing irrelevance as a tempered voice within his now banned party. On December 16, 1961, a day after Luthuli returned from Oslo as the first African to receive the Nobel Peace prize for his non-violent struggle against racial discrimination, Unkhonto we Sizwe (“The Spear of the Nation”), ANC’s military wing dramatically announced its emergence by attacking government installations. Luthuli’s non-violent campaign had been abandoned and a new era was dawning for resistance against apartheid.

Luthuli remained as ANC president-general until his death on July 21, 1967, when he was hit by a train while on his regular walk near his small farm where he had been living in government-enforced isolation.

## MACAU/MACAO

Macau is located in East Asia approximately 60 kilometers (37 miles) southwest of Hong Kong, bordering China. It comprises Macau city and the islands of Taipa and Coloane. The country has a land area of 21 square kilometers (8.3 square miles). Comparatively, the territory of Macau is a quarter of the size of Manhattan. Macau is linked to the Chinese province of Guangdong by a narrow land corridor.

The population of Macau was estimated at 469,903 in July 2003, and it is virtually all urban. In 2003 the birth rate stood at 12.07 per 1,000 and this low level is mainly attributed to the effect of urbanization. The death rate in that year stood at 3.85 per 1,000. The estimated population growth rate is 1.72%, although unofficial estimates show higher figures due to high net migration rate, which, according to the *CIA World Factbook*, stands at the level of 8.93 migrants per 1,000. Macau has one of the highest population densities in the world, at around 22,370 people per square kilometer (or 58,100 per square mile).

Macau was established as a Portuguese colony on the small islands on the Pearl River in 1556. Gradually it became an important international trading port that remained under Portuguese control until the twentieth century. Its significance as a trading center rose over several centuries as the Chinese government maintained a policy of voluntary isolation from the world, allowing international trade only in few assigned ports. Portugal proclaimed Macau a free port in 1849. However, in the nineteenth century the importance of Macau declined with the rise of the British colony

of Hong Kong. In 1951 Portugal officially made Macau an overseas province, and in 1974 the new democratic Portuguese government offered Macau back to China. On December 20, 1999, Macau was officially returned to Chinese jurisdiction. Macau became a Special Administrative Region (SAR) of the People's Republic of China (PRC) with a "high degree of autonomy" in domestic affairs and remained so for a period of fifty years, under the principle of "one country, two systems." In 1999 Edmund Ho became the first governor appointed by China's central government. He replaced General de Rocha Vieira, the last Portuguese governor of the territory. According to the Macau's Basic Law, the territory's legal code, the governor has a strong policy-making and executive power, which is limited only by the central government in Beijing and by the Macau legislature.

Traditionally, the Macau economy has relied on manufacturing and services. Macau, like Hong Kong and Singapore, has an export-oriented economy, which benefits from growing trade with Western Europe and the United States. Throughout the twentieth century it specialized in manufacturing various products for export and servicing international merchants and bankers. Throughout the twentieth century the Macau administration has maintained a free-market economy, which, in combination with local entrepreneurship and political stability, contributed to economic growth. Macau's main exports are textiles, clothing, and services, though it stays behind Hong Kong and Singapore in the proportion of value-added production. Tourism also plays a significant

role in the national economy. However, it was the gambling industry that greatly contributed to the image of Macau as a major tourist destination among residents of Southeast Asia and China. Gambling is the main source of revenue in Macau, accounting for 44% of total revenue (1999). The pataca, the Macau currency, is linked to the Hong Kong dollar at the rate of 1.03 patacas per Hong Kong dollar. Unlike South Korea, Thailand, or Indonesia, the pataca has remained remarkably stable. The gambling industry also attracted highly organized criminal syndicates, the so-called “triads,” which are involved in gambling, illegal trafficking of persons, prostitution, and pirated production of various goods, including music and computer CDs. During the 1990s the government made considerable efforts to restrain and eliminate the power of these criminal groups. This campaign contributed to a decrease in violent crime, although experts say that the “triads” still have considerable stakes in the various sectors of the local economy.

### Recent Development

Since handover in 1999 Macau has continued to attract investments and technologies to its manufacturing industry (mainly textiles, clothing, toys, and electronics) due to its low cost and efficient range of production for export to Europe and the United States. However, the manufacturing sector share in the gross domestic product (GDP) has been steadily declining due to the strong competition from China’s Special Economic Zone in Guangdong. The Macau administration has considered liberalizing and promoting further its gambling, tourism, and financial industries in order to attract new investments and obtain additional sources of revenue. Between 1997 and 1999 the Macau economy experienced three consecutive years of recession caused by the Asian financial crisis of 1997. However, the country experienced a remarkable recovery between 2000 and 2004. The travel and gambling industries were also hit by the region-wide fear of the Severe Acute Respiratory Syndrome (SARS) in 2003 and in 2004, although Macau itself managed to escape an outbreak of SARS.

Macroeconomic stability and success in structural changes brought prosperity and better living standards to Macau. The country’s average incomes remain far above that in the neighboring People’s Republic of China, and immigrants continue to travel to Macau searching for jobs and better standards of living.

## MACEDONIA

### Location

Macedonia, officially referred to as Former Yugoslav Republic of Macedonia (FYROM), is located in southeastern Europe. Macedonia occupies a strategic and central position in the Balkans as a communication axis between the cities of Belgrade in Serbia-Montenegro and Thessaloniki, Greece. With a land area of 25,713 square kilometers, Macedonia, a landlocked country, is surrounded by Albania to the west, Bulgaria to the east, Greece to the south, and Serbia-Montenegro to the north. The population of 2,046,209 (July 2001) is divided among Slavic-Macedonian (64.2%), Albanian (25.2%), Turks (3.8%), Gypsies (2.7%), and Serbs (1.8%).

### Land and Climate

Macedonia is a mountainous country. The highest peak, Golem Korag, lies along the Albanian border (2,753 meters). The country is bisected by the Vardar River running from northwest to southeast. Three major lakes are divided by at least one frontier: Lake Ohrid, Lake Prespa (west), and Lake Doiran (southeast). The Macedonian climate is continental with warm and dry summers and relatively cold winters. Macedonia is located in an area of seismic risks. In 1963 an earthquake heavily damaged the capital city Skopje (six hundred thousand inhabitants).

## Current Economic Situation

Macedonia is a poor country with limited resources (chromium, lead, zinc, manganese, tungsten, nickel, low-grade iron ore, sulfur, and timber). The industrial sector is dominated by light industry, though overall underdeveloped and outmoded (oil refining, mining, textile production, and manufacturing). Agricultural products include wheat, corn, other vegetables, rice, and tobacco. Tourism is also an important sector around the lakes of Ohrid and Prespa.

Macedonia faced an irregular transition after its independence from Yugoslavia in 1991. The UN sanctions against Yugoslavia, one of Macedonia's major markets, and two Greek embargoes (1992, 1994) damaged economic growth until 1995. Although the economy improved after 1995, these results were undermined with the bombing of Serbia (1999) and the Albanian insurgency (2001). The GDP was negative until 1995. It went from 2% in 1996 to 4% in 1998, 0.3% in 2002 then rose to 2.8% in 2003. Between 1992 and 2001 Macedonia benefited from about 570 million Euros, mostly in grants, from the European Union. Germany, Greece, Italy, and the US are the major trade partners. Like most of the ex-communist states, Macedonia suffers from corruption and a substantial "gray economy," which for 1998 was estimated to account for about 50% of the Republic's GDP. Unemployment is constantly rising: 32% in 2000 and estimated at 44% in 2003.

## History Until 1945

The history of Macedonia is linked to a larger area, an historical region also named Macedonia. It included the northern part of modern Greece and the south-western part of Bulgaria. At the end of the fourteenth century, like most of the Balkan Peninsula, the historic Macedonia was integrated into the Ottoman Empire. From the nineteenth century on, the destiny of Macedonia was marked by turbulence with the decline of the Ottoman Empire and the formation of new states as Greece, Serbia, and Bulgaria competed to integrate Macedonian territories within their borders. The Internal Macedonian Revolutionary Organization, created in 1893, fought to promote Macedonian national identity.

The Balkan Wars of 1912–1913 brought a radical solution: partition. The treaty of Bucharest, signed on August 10, 1913, established the departure of the Turks and the division of the Macedonian territories amongst four states: Greece (Aegean Macedonia,

51.3%), Serbia (Vardar Macedonia, 38.4%), and Bulgaria (Pirin Macedonia, 10.1%), while Albania was granted a small territory. Each of these states began to assimilate the population into their respective territories and the name Macedonia disappeared from the European map.

During 1945–1946 the part of Macedonia that had been integrated into Serbia became one of the six republics that constituted Yugoslavia under the name Yugoslav Socialist People's Republic of Macedonia.

## Macedonia's Developments After 1945

After 1945, for the first time, the Yugoslav government provided a national Macedonian frame. National institutions were created, a president and a parliament were elected, a language had been agreed upon in 1947, the Macedonian Orthodox church was reestablished in 1958, and the Macedonian Academy of Sciences created in 1967 promoted Macedonian culture and strengthened national identity. Until Tito's death (1980) Macedonia remained under the control of Belgrade. The creation of Macedonia served the purpose of establishing a difference between the Slavs living in this country and those living in Bulgaria or in Serbia. Under Tito's regime, Macedonia benefited from substantial economical and financial aid that contributed to setting up a modern infrastructure. However, social progress remained slow and limited. Macedonia's people have undergone a major transition from a traditional patriarchal rural society to a mixed urban industrial-agricultural society with 40% still living in the countryside.

Macedonia's departure from Yugoslavia in 1991 is considered as a success story as the country remained at peace during the war of 1991–1995 when Yugoslavia collapsed. On September 8, 1991, following a referendum, independence was proclaimed.

The transition toward democracy was realized with the establishment of a parliamentary system: a new constitution was adopted (1991), a multiple political party society emerged, and elections have been held every four years. The president Kiro Gligorov (1991–1999), a major political figure since the 1960s, was succeeded by Boris Trajkovski, who died in a plane crash in February 2004. The ex-prime minister Branko Crvenkovski was elected president. However, corruption plagues the system as clientelism, as with the rest of the region, is endemic.

The development of Macedonia has been challenged by two major issues: First, the international recognition was delayed by Greece's opposition to the use of the name and flag, considered as Hellenic symbols. In

1993, the UN recognized the state under the temporary name FYROM, a move that was followed by most of the EU states. Greece lifted its embargo only in 1995. Bulgaria was the first Balkan state to recognize the independent Macedonia in 1991, but it denied the existence of the Macedonian nation. Albania established diplomatic relations with Skopje in 1993.

Second, the status of the Albanian minority has led to a continuing major crisis. They are concentrated in the western part of Macedonia around the city of Tetovo. Following independence, Skopje has had an uneasy cooperation with the Albanians: since the elections of 1994 Albanians participate in the political arena and hold legislative, ministerial, and administrative positions. However, Albanians ask to be recognized as “constituent people” and continue to feel treated as “second-class citizens.” In 1999, during the war in Kosovo, around 350,000 Albanian refugees entered FYROM, threatening to disrupt the fragile political balance. Later many returned to Kosovo but tensions grew.

In 2001, the country narrowly escaped civil war when Albanian rebel members of the National Liberation Army took up arms and started major fights around Tetovo. The Albanians were divided between moderate and nationalist elements: some were asking for full equality with the Macedonians while others defended the creation of “greater Albania” or even “greater Kosovo.” In June of that year, EU officials negotiated a cease-fire that was followed by the Ohrid Agreement, signed in August, in which NATO soldiers would disarm the guerrillas. In November, the parliament modified the constitution granting broader rights to the Albanian minority. Albanian became one of the country’s two official languages. However, the situation remains volatile. The country still needs international security assistance. UN and NATO forces have maintained a presence since 1993 and 1997, respectively.

### MACHEL, SAMORA

Samora Moises Machel, third of five sons in a family that was relatively well-off by local standards, was born on September 29, 1933, at Chilembene, now the Chókwe district, Gaza province, in southern Mozambique. His father, Mandande, retired from the gold mines of South Africa and invested in agriculture and cattle.

Declining an offer to enter a seminary, in 1952 Samora began a nursing course in the Miguel Bombarda Hospital in Lourenço Marques (now Maputo) to become a full-time nurse in 1954. When the Mozambique Liberation Front, FRELIMO, was formed in Dar es Salaam in June 1962 under the leadership of Eduardo Mondlane, Samora was ready to join it. In 1961–1963 Machel was chased and interrogated by the Portuguese political police PIDE, and he decided to leave the country.

Machel was among the second group of FRELIMO recruits sent to Algeria for military training in 1963. On his return he was put in charge of the Kongwa training camp in Dodoma, and entered the war zones of Mozambique in November 1965. A year later, Machel was appointed military commander of FRELIMO. In April 1969 after Mondlane was killed, Michel was elected to lead the movement, confirmed by the Central Committee in May 1970.

Machel was independent Mozambique’s first president. He initiated a single-party Marxist state, nationalized all industry, and abolished private land ownership. He was a devoted Marxist, who firmly believed that centrally planned collective economy will bring prosperity to his country and all Africa. With Mozambican support, Zimbabwe, formerly Rhodesia, achieved independence in April 1980.

In September 1980 formal ranks were introduced into the armed forces, and Machel himself became

Marshal of the Republic. In 1982, to prevent South African attacks, he requested negotiations, which resulted in the Nkomati Accord on Non-Aggression and Good Neighborliness, signed on March 16, 1984, by Machel and P. W. Botha of South Africa. Samora Machel continued the search for peace in the region, which involved negotiations with Presidents Banda of Malawi, Kaunda of Zambia, and Mugabe of Zimbabwe. In the fall of 1986 Machel threatened to place missiles along the border with Malawi and close it to traffic. On October 19, Samora Machel flew to Zambia for a summit meeting to discuss a solution to destabilization with the presidents of Zambia, Angola, and Zaire. He never returned—the Tupolev 134A in which he flew crashed mysteriously into a hillside at Mbuluzi in South Africa, killing Machel and all thirty-four members of his team.

## MADAGASCAR

Madagascar is an island country 250 miles off Africa's southeastern coast. At 224,500 square miles it is the world's fourth-largest island. The narrow shape, 995 miles long and 360 miles wide, is significant as it contributes to great climatic differences between regions. Madagascar's total Gross Domestic Product (GDP) is \$5.5 billion (2003), making it one of the world's smallest economies. Madagascar has one of the world's lowest levels of development, and 72% of the population lives in abject poverty.

Madagascar has a population of approximately 17.5 million people, growing at 3% per year. While this makes for a relatively low population density, the scant 5% of arable land creates agricultural pressures for a vast portion of the island's inhabitants. A 30% urbanization rate, increasing rapidly, creates a further development challenge.

Madagascar is generally considered to have eighteen ethnic groups. People of the largest ethnic group, the *Merina* of the central highlands, tend to have stronger Indo-Malay features where coastal groups tend to have darker African features. This

ethno-racial divide is also the most important socio-political divide in Madagascar's history.

Europeans first came to Madagascar in 1500. Feudalism began to grow with the fomentation of a caste system and monarchism which, as in Europe, grew out of feudal centralizing tendencies. A *Merina* Monarchy began to take seed in the eighteenth century. Small lordly kingdoms reacted to hostilities by supporting the rise of King Andrianampoinimerina in 1787. When his son Radama took the throne in 1810 he created an alliance with the British. By the time he died, eighteen years later, most of the island was under *Merina* control, and a class system began to rise with coastal peoples at the bottom.

In the 1880s and 1890s Madagascar felt the blows of both British and French expansionism. The French sought to overtake the island while certain *Merina* groups sought, in vain, British support to repel them. On August 6, 1896, France deposed Queen Ranavalona III and made General Joseph Gallieni governor. Madagascar was colonized by the French.

From 1896 to 1946 the French ruled directly but used the *Merina* Monarchy as an organizational mechanism. As a result, *Merina* benefited disproportionately in terms of trade, jobs, education, and quality of life. In 1947 rebels, seeing the relatively small numbers of French soldiers and hearing rumors of American support for their cause, attacked military garrisons and settlers. The response was epic. By the time rebels surrendered in March 1949 an estimated one hundred thousand people were killed by French soldiers, soldiers brought by the French from Senegal, and *Merina*. The *Merina* divide from coastal peoples, especially *Betsimisiraka* of the northeastern coast, was made all the greater.

At independence it was clear that a *Merina* president would lead to conflict. Philibert Tsiranana, an ethnic *Tsimihety*, was an original provincial assembly delegate who became prime minister in 1958. When Madagascar became independent in 1960 the French supported his rise to power. Adamantly pro-French, many accused him of fostering neo-colonialism. By 1969 political patronage, economic favoritism, and poor liberalization left the economy in tatters. Tsiranana was ousted by General Gabriel Ramanantsoa, a *Merina* from a high caste, in 1972 in what many Malagasy consider to be the country's "real" independence. Violence against *Merina* rose as the economy continued to slide. Ramanantsoa's power was gradually being undermined by General Richard Ratsimandrava in 1973. Also *Merina*, Ratsimandrava was more palatable to the population as he came from a slave caste. When Ratsimandrava ousted Ramanantsoa in February 1975, his intended reforms and inclusiveness threatened the bourgeois *Merina* establishment.

He was assassinated six days later. The military directorate appointed the Foreign Minister, Lieutenant-Commander Didier Ratsiraka, to head of state. A *Betsimisiraka* who spoke perfect *Merina* dialect and French, he was seen as someone who could win the hearts of the coast while enriching the *Merina* elite.

While nominally in the Chinese tradition, Ratsiraka's government was more anti-Western than it was pro-ideology. In December 1977 Ratsiraka introduced a new investment plan leading to the massive nationalization of private industry. The result was catastrophic. Within three years inflation was rampant, national debt was mounting, and the currency was kept afloat only by unrealistic political controls over exchange rates. In 1981 Madagascar requested the assistance of the International Monetary Fund (IMF).

The 1980s saw the rise of a small elite class in Madagascar through the opening of doors to the West. However, economic rationalization meant a significant devaluation of the currency and a 25% freefall in gross domestic product. Life for the majority poor became much more difficult. To maintain power, Ratsiraka became politically more autocratic. Elections were merely ratifications of leadership. The only candidates who could run were members of the socialist National Front for the Defense of the Revolution (FNDR). Opposition leaders fled to France where they formed their own alliances. Civil society groups formed, such as the Council of Christian Churches of Madagascar (FFKM). These both became political forces directly challenging the president's authority.

Heading into the 1989 elections, a strong and growing opposition fragmented and President Ratsiraka gained ground in the legislature, winning a sizable victory in the presidential elections. However, his successes were his undoing as it led to a groundswell of support for his ouster. With no Soviet Union to turn to, Ratsiraka had to turn back to France and the West. He instituted more economic reforms, but it was too little too late. On June 10, 1991, Zafy Albert, head of the *Hery Velona* (Living Forces) opposition coalition, led a one hundred thousand-person civil servants strike, bringing the country to a halt. Zafy set up a parallel government and forced Ratsiraka into a transitional government on October 31, 1991. A new constitution was written and adopted and new elections were held in November 1992. After a second round of elections Zafy became the head of Madagascar's first democratic republic.

Madagascar's third republic was a significant break from the past. A referendum in September 1995 changed the character of the Constitution, shifting power from the prime minister to the president. While a successful revolutionary, Zafy proved to be a

less-than-impressive president. His efforts to centralize power brought accusations of political malfeasance. He also suffered from the persistent divide between *Merina* and the coastal population. He was accused of corruption and exceeding his constitutional power and was impeached in July 1996.

In the elections that followed, the only viable choices presented to voters were the former autocrat claiming he was reformed or the recently impeached Zafy. Ratsiraka became president again in 1997 and his AREMA party gained control of the legislature a year later. A 1998 referendum pulled power from the capital to Ratsiraka's base in the provinces. The country saw modest economic gains, but satisfaction with Ratsiraka both at home and abroad was low as he sought to re-establish his personalized network of rule.

Six months before the December 16, 2001, presidential elections it appeared there was none of the growing field of candidates who could challenge Ratsiraka. Then Marc Ravalomanana, the handsome, popular mayor of Antananarivo, declared his desire to run. Ravalomanana is a self-made man—founder of Tiko, the country's largest food products company. He campaigned on a slogan for national unity and change, promising to use his business acumen to move the country forward.

By election day it was clear Ravalomanana was the favored candidate. However, the National Electoral Council (CNE) of the sitting Ratsiraka government shut down the transparency of the vote-counting process. Both Ravalomanana and a committee of independent observers said that Ravalomanana had won better than 50% of the vote. But the CNE said he won only 46.6%, requiring a run-off election. Fearing electoral manipulation, Ravalomanana refused to stand in a run-off. The matter went to the High Constitutional Court (HCC), but Ratsiraka had stacked the court prior to the elections so it let the results stand. Ravalomanana took his cause to the streets. By the end of January 2002 more than half a million people took to the streets of the capital, Antananarivo, and the country was shut down. On February 22 Ravalomanana declared himself president. This set off a maelstrom and the country was Balkanized between Ratsiraka supporters in the provinces and Ravalomanana supporters in the capital. Heated military and diplomatic actions ensued until Ratsiraka was ultimately forced to flee from Madagascar on June 14, 2002.

Ravalomanana's presidency has been characterized by both a political and an economic sea change. Politically, he has worked to grow the business class while strengthening democratic institutions. Economically, he rapidly entered into a liberalization program,

which drew significant support from the World Bank and the IMF. Both of these actions have deepened Madagascar's relationship with liberal democracies around the world, most notably the United States and Germany.

## MAGHRIB PEOPLES

The region known as the *Maghrib* (pronounced and sometimes written as Maghreb) corresponds to the modern North African states of Morocco, Algeria, Tunisia, Libya, and the disputed region of the Western Sahara (currently under Moroccan sovereignty). Mauritania is often associated with the region in both social and political terms, but due to geography and a more heterogeneous population, it can best be termed an intermediate state between North and sub-Saharan Africa. The term Maghrib is itself an Arabic term meaning “west” and people throughout the Arab world sometimes refer to North Africans (minus Egypt) as *al-Maghribi*, or westerners. The region is dominated by the Sahara desert and Atlas Mountains, while the majority of the population (roughly 90%) lives along the more fertile Mediterranean and Atlantic coasts.

The inhabitants of the region are predominantly Caucasoid “Arab-Berbers,” but this term implies a complete and even fusion of the two groups, which is not the case. Arab (in the Maghrib sense) can best be termed a linguistic classification that covers an expansive area, whereas the Berbers are the region's dominant group in both genetic and historical terms. In fact, most Arabs are believed to be *arabized* (those who adopted the Arabic language, culture, and Muslim faith) Berbers and other peoples as well as some

being of actual partial Arab ancestry. The Berbers (derived from a Greek term meaning *foreigner*) refer to themselves as the *Imazighen* or free men and are the region's earliest known inhabitants. They appear to have expanded from their North African base further south into the Sahara even before the arrival of Islam. Both displaced and mingled with black sub-Saharan peoples in what is today Mauritania (a term that was once used to denote a region overlapping Morocco and Algeria), as is often the case with many of the Tuareg, who are well-known in the west as the Blue Men due to their distinctive blue robes. Interaction with sub-Saharan Africa has had a significant impact throughout the Maghrib for centuries, with some groups showing partial sub-Saharan ancestry, and cultural aspects such as music have definitive black African roots. In contrast, numerous theories abound about the origins of the Berbers, who do not appear to be of sub-Saharan origin, with the latest identifying them with the Capsian culture that inhabited the region between 9000 and 7000 BCE. The Berbers appear to have migrated from their Red Sea homeland as part of a larger Afro-Asiatic group that dispersed many millennia ago and settled in North Africa, with some having reached as far west as the Canary Islands (a people there called the *Guanche* are believed to be of partial Berber descent). Modern self-identifying Berbers appear to be a majority only in Morocco, where estimates place the population at roughly 60%. There is also an active minority in Algeria (up to 33% of population), particularly in the Kabyle region, that is quite prominent and vocal about Berber cultural rights. Small numbers of Berbers are also found in Tunisia and Libya where the arabization process has significantly reduced any overt examples of Berber culture. By contrast, Mauritania has a more stratified society with Arab-Berbers acting as a single unit, but one that is outnumbered by the so-called black Maurs and sub-Saharan peoples. Unlike their Maghribi neighbours, the vast majority of people in both Tunisia and Libya simply identify themselves as Arabs.

The Maghrib peoples are a complex combination of groups who have settled in the region over time. Phoenicians, Greeks, Romans, Vandals, and Byzantines have been prominent invaders and immigrants to the region. Christianity took root in the region a few centuries after the death of Christ and prominent figures such as the half-Berber theologian St. Augustine of Hippo played a pivotal role in the early years of the faith. During the seventh century CE, Muslim Arabs conquered the region and named it the Maghrib, but it was not until the second millennium that the majority of the region's inhabitants became nominal Arabic speakers and Islam fully supplanted

Christianity. Adding to the cultural landscape were Iberian Muslims and Jews who were forced to flee to North Africa following the Spanish *Reconquista*. Ottoman Turks took control of most of the North African coast by the 1600s and during their reign, Barbary pirates and corsairs terrorized European and American vessels. Finally, European expansion resulted in French control of Algeria and Tunisia during the nineteenth century and Morocco by the early twentieth century. Spain also emerged as a dominant power in Morocco and the Western Sahara region, and later Italy would attempt to colonize Libya. During this period large numbers of *colons* (colonists) arrived from southern Europe and France, and they eventually made up 10% of the population in Algeria alone. During this tumultuous period, the colons dominated all aspects of sociopolitical life, and this persisted until their expulsion following the various independence movements that culminated with Algerian independence in 1962. Spain is the exception as they continue to hold two small city-states called Ceuta and Melilla along the Moroccan Mediterranean coast.

The modern states of North Africa reflect these nineteenth- and twentieth-century borders and do not correspond to any specific ethnic or linguistic cleavages. Currently, the countries of the region associate with each other through the Maghrib Union and are prominent in the Arab League as well. Sunni Islam, the Arabic language, and a rise in Berber nationalism as well as the use of French (except in Libya) in aspects of public life are some of the common traits found in various parts of the region. Mauritania has a different situation due to the ethnic and linguistic conflict between its “white” Arab-Berber minority and the largely sub-Saharan majority. In addition, millions of North Africans have moved to Western Europe for various reasons ranging from early movements of Francophiles who fled after various independence movements to those seeking better economic prospects. Their cultural impact has altered the landscape, particularly in France, with some signs of assimilation as well as cultural conflict. Remittances by guest workers have been important for the economies of Algeria, Tunisia, and Morocco.

The region remains largely undemocratic by Western European standards. Democracy has had a sporadic history in the region with Algeria having reversed elections when Islamists won preliminary elections in 1991, while Tunisia has moved towards some plurality recently by allowing opposition parties. Morocco has a monarchy that allows multiple political parties to take part in its government, while Libya continues to be dominated by the vague yet totalitarian regime of Colonel Muammar Qaddafi. Mauritania has had

elections since 1991, but accusations of fraud and single-party dominance have marred progress there as well. Islamic jurisprudence and tradition play a substantial role throughout the region, ranging from the more secular societies of Algeria and Tunisia to the so-called Green Law found in Libya. The impact upon women’s rights has been fraught with difficulty, but some limited progress has been made in Algeria and Tunisia where women are increasingly entering the workplace, while Berber women, especially those in villages at the foothills of the Atlas Mountains, often go unveiled and share many responsibilities with men as they have since pre-Islamic times.

Economic development has transformed the region and globalisation has helped to integrate it into the world economy, with the EU emerging as an important trading partner. Oil and natural gas play prominent roles in terms of regional income for Libya and Algeria, while Morocco and Tunisia have more mixed economies. Tunisia is also engaged in significant manufacturing and has become an important tourist attraction due to its appealing Mediterranean climate, inexpensive environment, and stable sociopolitical landscape. Agriculture is quite important in Morocco and Mauritania, but remains limited due to unpredictable rainfall. Capitalism and free enterprise have expanded throughout the region in recent years with mixed results. Urbanization is a continuing trend as more and more people have moved to the cities seeking employment. Literacy and education have made inroads throughout much of the region with some Maghribis studying abroad as well. The Maghrib has emerged as the most economically vibrant region of Africa and is more on a par with the Middle East to which it is culturally, historically, and ethnically very closely linked.

## MAGSAYSAY, RAMON

Ramon Magsaysay (1907–1957) was born at Iba, the capital of Zambales Province, Philippines, on August 31, 1907. Son of an artisan, he graduated from Jose Rizal College in 1932. He worked as a mechanic at Try Transportation Bus Company in Manila where he became general manager.

Early in World War II, Magsaysay served with the Philippine 31st Infantry Division. During the Japanese occupation he fought as a guerrilla and became commander of the Zambales Military District composed of some ten thousand fighters located near Mount Pinatubo. The Japanese army put a never-collected reward of fifty thousand pesos on his head.

In February 1945, US General Douglas MacArthur appointed Magsaysay as military governor of Zambales. In 1946 he ran as a Liberal for his nation's House of Representatives and won with the biggest margin in Zambales history. He served as a member of the House Committee on National Defense. Reelected in 1949 he became the committee's chairman.

In April 1950 Ramon Magsaysay journeyed to Washington, DC, seeking grants-in-aid. There he met Colonel Edward Geary Lansdale, who would become his lifelong friend and mentor.

That same year, President Quirino asked him to become Secretary of National Defense and Magsaysay quickly accepted. He instituted many reforms to counter widespread corruption within the armed services: He raised the pay of his soldiers. He made constant and unannounced visits to military units. He ordered military lawyers to represent civilians who could not afford to hire one. His soldiers labored on public works projects. And he harshly punished military crimes.

Magsaysay instituted a system whereby anyone throughout the country who had a problem could send a free telegram to him, and he promised that it would be answered within a few days. The first year he received fifty thousand of them—and answered all of them.

He fought the *Hukbo ng Bayan Laban sa Hapon* (People's Anti-Japanese Army) commonly known as the Hukbalahaps, or Huks. Having fought as leftist guerrillas during the war, they were infuriated by the central government's treatment of their demands and began an insurrection. Official efforts to destroy them failed.

Sometime earlier Colonel Lansdale had been assigned to the Philippines. His instructions were to support Magsaysay in the struggle against the Huks, to encourage his social engineering, and to groom him for higher office. The two men planned and initiated ways to improve life in the Philippines and sought methods that would be successful in the war against the Huks. Magsaysay began by basing anti-Huk tactics on small—rather than large—unit attacks. Lansdale suggested to him dozens of ideas on conducting psychological warfare against them.

The anvil of peace held out to the Huks was the promise of “land for the landless.” If they surrendered and turned in their weapons, the government would provide for them, on the island of Mindanao, an acreage of fifteen to twenty-five acres, farm tools and animals, seed, initial start-up food, a home with electricity—an unheard-of luxury among Asia's teeming multitudes. This program, known as the Economic Development Corporation (EDCOR), broke the back of the guerrilla movement. As early as 1955 over 1,500 Huks had quit their rebellion.

In 1953 Magsaysay agreed to run for the presidency against Elpidio Quirino. He won handily, his campaign supported by voters wearing pins emblazoned “My Guy, Magsaysay.” His popularity remained immense.

On March 16, 1957, he made a political trip to Cebu along with twenty-five others, including members of his cabinet, aboard his presidential plane, *Mount Pinatubo*. After ten busy hours he and the others filed aboard his plane for the return flight to Manila. The aircraft took off just past 1 AM on March 17. A few minutes later and twelve miles out, the *Mount Pinatubo* crashed against the side of Mount Manunggal. All aboard died.

**MAHATHIR BIN MOHAMAD,  
DATO SERI**

Considered the major architect of the so-called Malaysian economic miracle of the 1980s and 1990s, Dr. Dato Seri Mahathir bin Mohamad (b. 1925) (pronounced Mahat'hir) was the prime minister of Malaysia from 1981 to 2003. Throughout his career as the leader of the Malaysian government he continuously advocated and propagated active intervention of the government and state institutions in economic development and economic restructuring of the country. During his term in office Malaysia experienced one of the fastest rates of economic growth in the region.

Mr. Mahathir was born in Alor Setar, Kedah. He graduated from the University of Malaya in Singapore in 1953 and was working in the government medical services until 1957. He became actively involved in politics from 1945, when he joined the Kedah Malay Union and Kedah Malay Youth Organization. He joined the United Malays National Organization (UMNO), the leading political party in Malaysia, and won a parliamentary seat in 1946. Mahathir was highly vocal in his criticism of the UMNO leadership for not addressing the economic and social imbalances and growing disparity among the major ethnic groups in the country, i.e., Malays, Chinese, and Indians. In 1969 he was expelled from the UMNO and lost his parliamentary seat. In 1970 Mahathir published the highly controversial book *The Malay Dilemma*, in which he outlined his views on the problem of Malays and Malaysian development. The book was banned by the government, but it won the author substantial popularity among ordinary members of the UMNO and among the Malay community. With the change of leadership in the UMNO, Mahathir was readmitted to the organization. In 1974 he won a parliamentary seat and was appointed as the minister for education. In 1976 he became the deputy prime minister and in 1978 he acquired the portfolio of the minister for trade and industry. In 1981 Mahathir Mohamad became the president of the UMNO, the prime minister, and the minister for home affairs.

As the prime minister of Malaysia, Mahathir Mohamad launched the "Look East Policy," which envisioned rapid economic growth of the country through developing new work ethics, adaptation of new technologies, and developing quality education. He believed that to achieve these goals the Malaysians had to turn to the so-called "Asian values." He also promoted an economic strategy that was based on three pillars: state-led industrialization of the country; measured privatization, and a concept of "Malaysia Incorporated" (the latter meant positive relations

between private and state sectors of the country). Mahathir-led government continued to use five-year indicative plans, which were introduced in the middle of the 1960s, as a basis for the official development strategy "Malaysia 2020." Malaysian five-year indicative plans target certain economic growth and social changes and allocate public resources for priority sectors of the economy and for infrastructure development. Malaysia had never instituted centralized control over the state's economy at the level seen in China or the former USSR. Among the priority projects controlled by the five-year indicative plans were the national car (Proton) scheme, construction of a large steel complex (Perjawa), and several other large industrial enterprises. Some of the projects, especially in heavy industry, proved to be controversial, as the international organizations, such as the IMF and World Bank, were highly critical of the Malaysian government subsidies to the loss-making enterprises and of protectionist tariffs, which Malaysia temporarily established in several sectors of the economy. Yet, the Malaysian government was successful in attracting electronic assembly plants to the country in the 1990s, which made Malaysia the world's third-largest producer of integrated circuits and one of the leading producers of domestic appliances. Some of the world's largest corporations, such as Dell and Microsoft of the USA, NEC and Mitsubishi of Japan, and others, opened their branches in Malaysia. In the mid-1990s Mahathir launched the Multimedia Super Corridor (MSC) project, aiming to attract leading multinational corporations to move their assembly and Research and Development (R&D) to Malaysia, thus transforming the country into the world's leading player in information technology. As part of the project, the Malaysian government decided to move federal political and administrative institutions into newly built Putrajaya City on the outskirts of Kuala Lumpur. However, the Asian financial crisis in 1997 and the US's new economy crash in 2000 severely undermined the MSN project and the Malaysian information technology sector.

However, it was the extraordinary reaction of the Mahathir-led government to the Asian financial crisis in 1997 that placed Mahathir and his government in the center of criticism by the international financial institutions. In 1997 Malaysia was heavily affected by the Asian financial crisis that started with the currency collapse in neighboring Thailand. Unlike Indonesia and Thailand, however, Malaysia became the only country in Southeast Asia to reject the IMF's package of conditions and financial assistance. Mahathir, blaming international speculators for creating the crisis, opted for direct state intervention in dealing with it. The government imposed temporary restrictions

on the currency exchange market, instituted tough capital-control measures to contain capital outflow, and introduced some other measures, which were against the recommendations of the IMF. The Malaysian currency, the Ringgit, was pegged to the US dollar at a fixed rate of RM3.8 per US dollar (according to the IMF, out of 16 larger emerging market economies only China and Malaysia have pegged their currencies). As a result, the Malaysian economy experienced a much milder recession than neighboring Indonesia or Thailand, although the economic recovery and new direct foreign investments were slow to occur.

Mahathir also initiated several political and constitutional changes between 1983 and 1992. The power of the Malaysian king (constitutional head of the Malaysian Federation) and sultans (heads of the states) was considerably reduced and the royal immunity from legal prosecutions was removed. In 1997 and 1998 Mahathir was involved in a bitter conflict with Mr. Anwar Ibrahim, his deputy and official successor-to-be. The conflict started as a personal dispute over the economic policy in reaction to the Asian financial crisis, but grew into a battle of political personalities and political factions within the UMNO. Anwar Ibrahim was sacked from the government and unsuccessfully tried to relaunch his political career as a major opposition figure and the leader of the movement for democratic reforms. He was arrested and put on trial over sexual and corruption charges, which he vigorously denied. In 2000 Anwar was sentenced to nine years of imprisonment. This trial and sentencing provoked widespread national and international criticism of Mahathir Mohamad and his government for authoritarianism in dealing with political opposition and independent mass media. The prime minister dismissed the criticism, insisting that it was a purely criminal case.

In the international arena Mahathir regularly voiced his grievances against the western domination over the international economy and “unfair treatment” of the developing countries by western governments, international organizations, and multinational corporations. He played an active role in strengthening regional free trade and cooperation within the ASEAN and APEC, although he resisted opening the Malaysian economy for international or regional trade. In 2003 he voluntarily resigned from all his official positions.

### MALAN, D. F.

Daniel Francois Malan was an Afrikaner nationalist politician born in Riebeeck West in 1874. He began his career as a pastor in the Dutch Reformed Church. His political career was launched when he became the founding editor of *Die Burger* (“The Citizen”) newspaper in 1915.

When J. B. Hertzog formed the National Party (NP) in 1914, Malan became the NP’s Cape provincial leader. *Die Burger* became a leading advocate of Afrikaner nationalism under Malan. The NP (deploying the slogan “South Africa First”) opposed South Africa being a British dependency and opposed English being the sole national language. In 1924 an NP/Labour Party coalition came to power under Prime Minister J. B. Hertzog. Malan became Minister of the Interior in Hertzog’s government (1924–1934). Under this government Afrikaans was made a national language, given equal status to English (1926); South Africa achieved a measure of autonomy from Britain (the Balfour Declaration, 1926); and South Africa got a new flag (1928). In 1934 Hertzog and Jan Smuts formed the United Party (UP). The NP ceased to exist. Malan regarded Smuts as pro-British Empire and pro local (Anglo-run) capitalism. He saw Hertzog as having capitulated to British imperialism. Consequently, Malan refused to join the UP. Instead he founded the “Purified” NP. These “purified” Nationalists were opposed to British colonial domination; wished to create an Afrikaner-controlled republic, independent of Britain; and advocated state interventionism to overcome Afrikaner poverty. Malan’s “Purified” NP advocated Christian Nationalism—an ideology arguing that all groups had a right to their own sovereign states. Malan’s Christian Nationalists saw themselves as engaged in a struggle against three “foreign,” “materialist,” and “Godless” ideologies, namely capitalism, fascism, and communism. Capitalism’s single-minded pursuit of profit was opposed as “Godless materialism”. Fascism was rejected as “unChristian,” and Communism was especially passionately opposed because it advocated materialist atheism. In the 1940s Malan’s NP fought a struggle

against both the local Nazis (*Ossewabrandwag*) and Smuts' capitalist "integrationism," advocating instead for "separation" of South Africa's ethnic groups under the slogan "apartheid" (separate-ness). Smuts' capitalist "integrationism" was seen as "unjust" because it was grounded in a white supremacist segregation logic, while Malan's NP argued their apartheid policy represented a "just" (and Christian) separation based upon "cultural autonomy" and "mutual respect" (for cultural differences). The local Nazis were opposed for their resistance to democratic-constitutional government and their radical, unchristian attitude toward "others."

In 1939 Malan and Hertzog's Nationalists came together to form a "Reunited" NP. This Reunited NP, led by Malan, defeated Smuts' UP in 1948. Malan became Prime Minister. The 1948 elections ended Anglo political domination, initiated the Afrikanerization of South Africa; and launched the era of "separate-ness" (apartheid). Under Malan apartheid's early foundations were laid. Malan appointed both the Sauer and Tomlinson Commissions to examine South Africa's racial problems. The Sauer Report (1948) codified the basic apartheid program, advocating political-partition/"vertical separation," and the halting of black mass migration to the cities. The Tomlinson Report (1955) proposed the partition of South Africa into eight states. Seven of these "homelands" would be built from existing "black reserves" to which new land would be added. From the Sauer and Tomlinson Commissions grew the apartheid model. Following the Sauer report Malan advocated black tribes "develop along their own lines in their own fatherlands"; separate "black homelands" be created; and African detribalisation (and migration to the cities) be stopped. Racially mixed marriages were prohibited (1949) and racial segregation enforced by the Group Areas Act (1950); Communism was banned (1950); and "internal passports" were created for black people (1952). Malan tried to take coloureds off the voters roll (1951), but this legislation was overturned by the High Court. Malan retired as Prime Minister in 1954. Under Malan, ANC support dramatically increased due to the Defiance Campaign (1952). Malan's vision of development can be summed up in the term "*volkskapitalism*" (people's capitalism). This involved encouraging Afrikaner businesses to deliberately challenge Anglo capital and an "affirmative action" project to upgrade Afrikaners impoverished by capitalism following the Boer War (1899–1902). Malan's NP captured the state and used it to create opportunities for Afrikaner advancement. This generated an ethnic-patronage system (e.g., public service jobs). A separate Afrikaner education system (schools, colleges, and universities) was built to upgrade the NP's

constituency during the 1950s–1960s. Separate Afrikaner socioeconomic structures were created alongside and parallel to Anglo structures. The parallel infrastructure was paid for by taxing businesses (generally Anglo-owned). The trade-off was that the state facilitated the exploitation of black workers by the business sector. Under Malan, a racial-capitalist framework was consolidated, which meant businesses could—even after paying tax—generate substantive profits from exploiting black workers. This laid the foundations for significant capital accumulation and industrialization in the 1960s. Malan died in 1959.

## MALAWI

Malaŵi, formerly the British colony of Nyasaland, is an elongated, landlocked country in Southern Africa (land area: 94,080 square kilometers). Surrounded by Mozambique to the east, south, and southwest; Zambia to the west; and Tanzania to the north, Malaŵi is dominated by the southern end of the East African Rift Valley. Lake Malaŵi (area: 29,600 square kilometers) fills 580 kilometers of the rift valley along the eastern border. The lake is drained by Malaŵi's only large river, the Shire, which flows through much smaller Lake Malombe, and the low-lying Shire valley to its confluence with the Zambezi. The central plateau of Malaŵi is hilly with elevations between 750 and 1,250 meters. In the north, the rolling grasslands of the Nyika and Viphya plateaus rise to over 2,500 meters. The isolated massifs of the Mulanje and Zomba Mountains dominate the south of the country. Altitude varies from thirty-seven meters above sea level (Shire Valley) to the summit of Mount Mulanje (3,050 meters above sea level).

The climate is tropical and monsoonal with a wet season (November–May) and a dry season (May–November). The dry season is mostly cool but hot and humid prior to the first rain. Maritime influences ameliorate the dry season in the Shire Highlands with periods of light, misty drizzle, locally known as

*chiperoni*. Mean temperatures in October range from 21°C in the highlands to 29°C at low altitudes. Corresponding figures for July are 15°C and 22°C, respectively. Areas above one thousand meters are cool with annual temperatures ranging from 14°C to 18°C. Temperatures in the lower Shire Valley may reach 37°C. Frosts occur at altitudes above 1,800 meters. Rainfall varies between six hundred and three thousand millimeters depending on altitude, but most of the country receives sufficient rain for at least seasonal, dry-land farming.

The predominant vegetation is savanna woodland (*miombo*), adapted to the monsoonal climate. Evergreen forests grow where soil water remains plentiful. Grasslands are found on high plateaus. Wildlife in Malaŵi is largely restricted to national parks and game reserves and includes elephants, giraffes, lions, leopards, zebras, monkeys, and several antelope species. Hippopotamuses and crocodiles inhabit large rivers and lakes. Fish diversity in Lake Malaŵi is very high with over four hundred species, most in the family Cichlidae.

Bantu speakers colonized Malaŵi between the first and third century AD. At the time of early European (mainly Portuguese) contact, Malaŵi was peopled by small, localized tribes each owing allegiance to a chief. Colonization by Yao and Swahili speakers from the coast saw the establishment of trade in ivory, skins, copper, and slaves with the Arabic commercial center in Zanzibar. The Yao established political control in southern Malaŵi and the slave trade peaked in the nineteenth century, controlled by Swahili speakers and Yao.

The arrival of missionaries, notably David Livingstone, inspired further exploration and strong anti-slavery sentiments in Europe. The Church of Scotland established a station in 1876 that developed into the present-day commercial capital, Blantyre. A British Consul was appointed in 1883 and the country became a British Protectorate in 1891. The slave trade ended, and the colonial period resulted in construction of railways and roads and the occupation of much land by foreign settlers who developed coffee, cotton, tea, and tobacco estates, particularly on the rich soils of the Shire Highlands. African smallholder farming initially focused on food crops but expansion into the cash crops of cotton and tobacco was promoted in the 1960s and now constitutes a significant component of the economy.

In 1944, the Nyasaland African Congress was formed as the first indigenous political party. A federation of the colonial entities of Southern Rhodesia, Northern Rhodesia, and Nyasaland was formed in 1953. The Federation was disliked by much of the African population in Nyasaland, and poor social

conditions and land alienation fostered political dissent. The return of Dr. Hastings Banda after 40 years in exile provided leadership and united anti-colonial political factions into the Malaŵi Congress Party (MCP). The independence struggle culminated in the dissolution of the Federation in 1963 and independence for Malaŵi in 1964. In 1966 Malaŵi became a Republic, with President Hastings Banda as its first Head of State. Banda concentrated power in his own hands and established a one-party dictatorship. He declared himself life president in 1971. Through Banda's anti-socialist views and recognition of the apartheid regime in South Africa, aid and capital investment from the West and South Africa fostered a strong economy in the 1970s. The capital was moved from Zomba to Lilongwe to consolidate Banda's power in the region where his support was strongest. Those suspected of opposition to his rule were imprisoned, executed, or assassinated and potential rivals went into exile. Proponents of human rights criticized Banda's regime and in 1992 Roman Catholic bishops circulated a pastoral letter decrying the lack of political freedom, economic inequalities, and human rights abuses. This act precipitated civil unrest, reductions in foreign aid, and the development of political parties opposed to the MCP. A referendum held in 1993 indicated support for the creation of a multi-party state. Despite significant civil unrest instigated by the Young Pioneers, the military wing of the MCP, political change occurred with free elections held in 1994. Of the 193 seats in the National Assembly, the United Democratic Front (UDF) won eighty-four, the MCP won fifty-five, and the Alliance for Democracy won thirty-six. In the presidential elections, Bakili Muluzi defeated Banda. The UDF also won the election held in 1999 with ninety-four seats. Under President Muluzi, Malaŵi has regained some investor confidence but corruption scandals have plagued his two administrations. Economist Bingu wa Mutharika was elected president in May 2004. Muluzi and the United Democratic Front supported his candidacy.

The population of 11,651,000 (2003 estimate) is growing at 2.21% with 47% of the population in the zero to fourteen years age group. With a population density of 98 persons per square kilometer, Malaŵi is one of the most densely populated countries in Africa. Life expectancy at birth is 37.9 years (2003). Only 14% of the population lives in urban areas; the balance lives on smallholdings growing maize, cassava, millet, sorghum, groundnuts, rice, and fruit and vegetables to feed themselves, selling any surplus in local markets. Malaŵi's population is dominated by Chewa and Nyanja. Other ethnic groups include Tumbuka, Yao, Lomwe, Sena, Tonga, Asian (mainly Indian), and European. Religions include traditional animist,

Christianity, and Islam, the latter two of which spread into Malawi with the slave trade.

Malawi is one of the least developed countries in the world. Poor infrastructure, limited access to seaports, and few mineral resources have hindered economic development. The economy is largely agricultural and major exports are tobacco, tea, sugar, cotton, coffee, peanuts, and wood products. In 2001, agriculture provided 40% of GDP, 90% of export revenues, and 85% of the country's employment. Malawi's principal trading partners are South Africa, Germany, Japan, the United Kingdom, the United States, and Mozambique. Mineral resources include limestone and coal and unexploited deposits of uranium and bauxite. Industrial development is limited to food processing, tobacco products, soap, furniture, footwear, and textiles. Artisanal fisheries operate on Lakes Malawi, Malombe, and Chilwa. Labor was a major export in the 1970s, with some 250,000 Malawians employed outside the country, most in South Africa. Migrant labor is much reduced now. The government has recently introduced market-based interest rates, removed direct control on credit, and improved access to finance for both local and foreign investors.

The government faces major challenges in meeting the demands of the growing population for education and improved access to health services. In 1998, 59% of the population had attended primary school. A further 8% had attended secondary school and only 0.3% had a post-secondary school education. HIV/AIDS infection rates are rising and this disease is putting additional stress on health resources already stretched through the prevalence of endemic diseases such as malaria, schistosomiasis, leprosy, and tuberculosis. Recent surveys suggest that 20% of the sexually active population in urban areas is HIV positive. Health problems also include high levels of under-five mortality, high rates of maternal mortality, malnutrition, and contaminated drinking water. Malawi has traditionally been self-sufficient in food, but malnutrition among children became more common in the 1990s. In 2002, the World Bank approved a \$50 million drought recovery package to provide famine relief. Pressure to increase agricultural production has led to increasing deforestation and soil erosion.

### MALAYSIA

Malaysia is a federation of thirteen states that incorporates the southern tip of the Malay Peninsula, excluding the island/state of Singapore, and two territories in North Borneo, Sabah and Sarawak (but not the enclave of Brunei). Its capital is Kuala Lumpur, and its population is approximately 25 million, divided among three principal ethnic groups: Malays or *bumiputera* ("sons of the soil") are the majority, with approximately 52%; ethnic Chinese make up approximately 35% and Indians make up approximately 10%. There are other minorities as well, including hill tribes generically referred to as *orang asli* (literally, "original people"). Islam is practiced by approximately 55% of the population, Christianity is practiced by approximately 35%, and Hinduism and Buddhism account for approximately 7% each (religion loosely follows ethnic lines). The climate is tropical, with rainy and dry seasons dictated by monsoons (seasons differ depending on location).

Malaysia was a British colony, and the British ruled through local sultans. The regions in Borneo were run privately by the North Borneo Trading Company (this region became Sabah) and by the descendants of James Brooke, a British adventurer who became known as the "White Raja" (this region became Sarawak). The British consolidated the territory following World War II, and began moving toward decolonization. Because the ethnic Chinese controlled a disproportionate amount of wealth, the majority Malays were concerned with the first system that the British proposed, the Malayan Union Plan. In response, the British created the Federation of Malaya Plan, which favored Malays in terms of representation, but in turn angered ethnic Chinese, triggering the Malayan Emergency and a Chinese-led communist scare. The conflict eventually lessened in intensity, and Malaya became independent in 1957, led by Tunku Abdul Rahman and his United Malays National Organization in alliance with the Malaysian Chinese Association and the Malaysian Indian Congress. In 1963, Singapore, Sabah, and Sarawak were incorporated into the Federation of Malaysia. Just two years later, Singapore peacefully left the Federation over ethnic and political differences (Singapore is predominantly ethnic Chinese). The alliance formed by Tunku became the *Barisan Nasional* (National Front) in 1973, and remains the predominant force in Malaysian politics. Malaysia's long-serving prime

minister, Mahathir Mohamad, stepped down in 2003 after twenty-two years in that post, and was replaced by Abdullah Ahmad Badawi.

The British introduced extractive industries and widespread cash cropping during their reign. Tin mines in the interior employed mostly imported Chinese labor, and rubber and palm oil plantations employed Chinese and Indian migrants. The colonial legacy of producing cash crops for export to provide raw materials for the British (and others) continued after independence until the early 1970s, when the Malaysian economy began to expand into other sectors including manufacture, and most recently, information technology. Malaysia's economy grew rapidly, with a significant drop in poverty and a rise in wages. Foreign investment poured in, spurred by Malaysia's stability, openness, and lower degree of corruption than some of its neighbors. Malaysia's stability during the Mahathir years was enforced through severe restrictions on the press and political opposition, backed by willing courts, and supported by Mahathir's insistence on the existence of a set of "Asian Values" that were appropriate to the region but distinct from Western ideals of human rights and democracy—an argument shared by the leaders of neighboring states, especially those of authoritarian regimes (although the "Asian Values" claim is debated among civil society in the region, and is seen as a way for leaders to consolidate their power without opposition).

In 1990, Mahathir instituted "Vision 2020," a plan to have Malaysia "fully developed" by the year 2020 through a series of five-year plans (similar to five-year plans that Malaysia had already been implementing). Vision 2020 calls for universal primary education, emphasizing human capital, eradicating poverty, increasing the role of *bumiputera* in the economy, increasing private sector investment, and other ideals (one physical manifestation of Vision 2020 is the Petronas Towers, currently the world's largest building). The plan was temporarily sidetracked during the 1997–1998 economic crisis, but Malaysia has emerged much better off than some of its neighbors. One significant casualty of the economic crisis was Anwar Ibrahim, Mahathir's Deputy Prime Minister. In the early phases of the economic crisis, activists took to the streets in support of *reformasi* (reform), as they did in Indonesia. Anwar became a figure in support of this reform movement, and criticized publicly Mahathir's economic policies, only to be sacked, leading him to turn to more open rivalry for political power. Unlike Indonesia, however, the reform movement did not oust the leadership, but rather lost much of its steam as Anwar was tried and found guilty of sodomy, charges largely perceived to be trumped up. The *reformasi* movement provided somewhat of a

spark for traditionally weak civil society in Malaysia, including the founding of the opposition National Justice Party by Anwar's wife, Wan Azizah Wan Ismail. Civil society in general, however, remains weak and not deeply rooted. Anwar was released six years to the day after being imprisoned, under Malaysia's new Prime Minister, Badawi.

Racial tension between *bumiputera* and ethnic Chinese remains, although it seldom boils to the surface as in Indonesia. As part of Mahathir's development plan, *bumiputera* are favored through a sort of reverse affirmative action, in which the majority population benefits in order to lessen differences among ethnic groups. Under the plan, new businesses must include *bumiputera* as part owners, *bumiputera* are assigned quotas at universities and access to scholarships, and other incentives are offered as a means to offset the disproportionate wealth of the ethnic Chinese. Short- and long-term problems associated with Malaysian development include urbanization, the equitable distribution of wealth, the fate of *orang asli* (mostly in Sabah and Sarawak) in their attempts to modernize without losing their culture or being taken advantage of, and environmental problems associated with rapid industrialization. Unlike most of its neighbors, Malaysia does not have any serious separatist movement threatening the unity of the state.

## MALDIVES

The Republic of Maldives is a country consisting of a group of atolls in the Indian Ocean, southwest of India. The numerous coral reef islands, 1,190 in total, form an archipelago of twenty-six natural atolls. The climate is tropical and hot all year. The humid and rainy season takes place between June and August and the dry season between November and March. The Maldives population is estimated at 298,000, with a

growth rate of about 1.4% annually. The capital city, Male, unlike any other island in the country, is a city of high-rise buildings and paved roads. It houses about one-third of the country's population with seventy-five thousand inhabitants.

In olden times, the islands provided the main source of cowrie shells, then used as currency throughout Asia and parts of the East African coast. Historically, Maldives has had a strategic importance because of its location on the major marine routes of the Indian Ocean. Therefore, already in the year 1558 the Portuguese established themselves in the country. Later they were expelled by Maldivian rebels and the country came under the influence of the Dutch, and from 1887 on, of the British as a protectorate, but Maldives has always had a significant level of self-government and freedom. Maldives remained a British crown protectorate until 1953 when the sultanate was suspended and the First Republic was declared under the short-lived presidency of Muhammad Amin Didi. However, a year later the sultanate was restored. As in many other states, finally, on July 26, 1965, Maldives gained independence under an agreement signed with Britain. In a national referendum in March 1968, Maldivians abolished the sultanate and established a republic on November 11. The British continued to maintain an air base on the island of Gan in the southernmost atoll until 1976. The Second Republic was proclaimed in November 1968 under the presidency of Ibrahim Nasir who ruled until 1978. That year Maumoon Abdul Gayoom was elected president, a position that he acquired by winning all the intervening elections by a large amount of the votes.

The Maldivian's religion is Islam, which was introduced early, in 1153 CE, as the cornerstone of their history. From then on, the King adopted the Muslim title and name of Sultan Muhammad al Adil, initiating a series of six dynasties consisting of eighty-four sultans and sultanas that lasted until 1932 when the sultanate became elective.

Maldives' estimated gross domestic product (GDP) for 2002 was \$1.25 billion, with a per capita income of about \$3,900. The economy is based on tourism, its largest industry, and also on fishing, its second largest. Since the first establishment of a resort in 1972, the number of tourists has gradually increased. In the year 2000, tourist arrivals exceeded 466,000. This industry accounts for approximately 20% of the GDP and more than 60% of Maldives' foreign exchange receipts. In second place is the fishing sector, which employs about 20% of the labor force and contributes about 10% of the GDP. Fish is also the major export on the islands, along with cowrie shells, fish meal, and copra, sent to their main export partners: the United States, Thailand, and Sri Lanka. The imports are what

the island can't produce: rice, sugar, wheat flour, petroleum products, and intermediate and capital goods.

Agriculture and manufacturing continue to play a lesser role in the economy, constrained by the limited availability of cultivable land and the shortage of domestic labour. Only subsistence crops such as coconuts, bananas, breadfruit, papayas, mangoes, taro, betel, chilies, sweet potatoes, and onions are grown. Industry consists mainly of garment production, boat building, and handicrafts, and accounts for about 18% of the GDP.

Maldives is situated among the countries with a Medium Human Development level, ranking eighty-four in the general list of the United Nations Development Program (UNDP, 2004). The life expectancy at birth for both males and females is sixty-seven years (2002), much better than it was thirty years ago (fifty-one years in 1975). The adult literacy rate is at about 97%, quite high for the region, due to the good educational system of the islands. The modern schools, run by both the government and private sector, provide primary and secondary education. Primary school enrolment is over 98% and secondary school enrolment over 44%.

The health expenditure in 2002 was 5.6% of the GDP, similar to the Netherlands or other developed countries. Also, almost 100% of the population is immunized against tuberculosis and measles. The infant mortality rate is 58 per 1,000 live births, much better than it was in 1975 (121 per 1,000). Notable achievements have also been made in the control of communicable diseases. There has been no indigenous case of malaria seen for the past ten years. The health services are organised under the Primary Health Care approach. These services are provided through a countrywide referral network of Family Health Workers, at least one in each inhabited island; twenty-seven Atoll Health Centres; four Regional Hospitals; and a central-level hospital in Male. In 2000 there were 226 doctors in the country, with a ratio of 8.4 per 10,000 population. There were also a total of 470 beds in the hospitals, giving a population-to-bed ratio of 577 to one.

So as to solve the scarcity of fresh water and to prevent water-borne diseases, through the help of Danish aid, desalination plants have been installed. Also, sewage systems have been installed to prevent the country from pollution- and water-borne epidemics, among other diseases.

More recently, the tsunami (a giant tidal wave generated by an earthquake in the ocean) generated in December 2004 in the Indian Ocean saw many parts of Maldives sink under sea water and many people end up homeless. This situation created severe social problems for the country's inhabitants.

Another potential problem for the country is the global warming effect as it is said that this could increase the mean sea level and make the atolls disappear under the ocean.

## MALI

The West African landlocked Republic of Mali lies south of Algeria, surrounded east to west by Niger, Burkina Faso, Ivory Coast, Guinea, Senegal, and Mauritania. The northern half of Mali lies in the Saharan and Sahelian zones, where aridity is exacerbated by the harmattan. The area is home to only about 20% of the population; migration southward or abroad is frequent. The southern region, where rainfall is heavier, is covered by the savanna and thin forests. Population density is high only on the fertile lands around the Senegal and Niger Rivers. The latter crosses the country from west to east, deviating northward in a wide bend forming a large interior delta, which moderates the climate and irrigates the land. Poverty due to climate is exacerbated by high population growth. After 1973, recurrent droughts leaving in their wake famine, dead cattle, dry wells, and villages buried under sand, have made Mali one of the poorest nations on Earth. Since 1992, due to better management and free market trade, the country, while remaining poor, is no longer subject to famine and remains eligible for international aid.

Agriculture employs 82.4% of the population and constitutes 45% of the Gross Domestic Product. The main crops are millet, sorgho, rice, peanuts, and cotton. The cotton crop, grown mainly for export, has become essential to economic development. Next in importance is cattle-raising, which represents 20% of the Gross National Product and is also exported.

Fishing, a traditional activity in interior waters, is an important source of food. Salted, some fish is also exported to neighboring countries. Mali has mineral resources, but exploitation is embryonic. The only mineral presently exported is gold, obtained by panning. The industrial and service sectors provide little employment to date.

Mali's past wealth did not come from the resources of its land, but rather from its location at the crossroads of trans-Saharan trade routes where caravans successively spawned the empires of Ghana, Mali, Songhai, and the Bambara kingdoms, between the eight and the eighteenth centuries. Economic and social conditions gave rise to major cities, which became centers of Islamic learning. However, by the end of the eighteenth century, Malian empires vanished, as European seafaring shifted trade centers to the Atlantic coasts. In the nineteenth century the area saw successive Islamic jihads and the spread of French colonialism.

In control of Mali, the French amalgamated it with their other West African holdings into the Federation of French West Africa (AOF) in 1895. They neglected Mali's development because the country lay far from the coasts. After World War II, Mali, like all AOF members, progressed toward independence. The 1950s saw the emergence of a Malian leader Modibo Keita, co-founder of a new political party, the Sudanese Union. After a brief unsuccessful attempt at federation with Senegal in 1959, Mali became the Republic of Mali in 1960, and Keita its president.

A Marxist, Keita adopted socialist policies and established close ties with communist nations. Eager to erase all traces of colonialism, he Africanized civil service, nationalized key sectors of the economy, instituted agricultural collectivism, and declared currency independence. Results were disastrous; food production plummeted, requiring major purchases abroad. Keita had to reverse course and request French support for the Malian currency.

Notwithstanding his international prestige as one of the major representatives of African nationalism, he was unable to stabilize Mali. He responded to protests and strikes with repression, purges, and a Maoist cultural revolution. In 1968 he ordered the National Assembly dissolved and the party's political bureau closed. He was overthrown in a bloodless coup in November of the same year, led by junior army officers, and spent the rest of his life under house arrest.

Lieutenant Moussa Traoré, who had led the coup, became head of state and promised democracy and economic liberalization, which never occurred. He did not cancel those socialist programs that were popular, but rather sought international aid to implement

them. However, in order to receive the latter he had to restructure the economy and cut governmental spending. The changes caused widespread unemployment and economic hardship, which triggered unrest. To pacify the country, Traoré instituted several reforms. He dismissed some corrupt officials, gave civilians partial access to government, and made minor economic concessions. Foreign donors balked at these and suspended aid. As the government found itself unable to meet payrolls, rebellion spread. Discord even arose within the military junta.

Willing to undertake structural adjustment, Traoré, however, rejected any form of democracy and remained in total command as president and head of the military-sponsored political party, the Mali People's Democratic Union (UDPM). Corruption was rampant. Costly wars caused additional destabilizing expenditures. Rebellions by nomadic Tuareg in northern Mali generated upheavals; only after Traoré's fall from power did negotiations begin to bring fruit.

Traoré did endeavor to improve conditions by increasing the yield of subsistence farming and introducing new agricultural techniques for the cultivation of the main cash crops, peanuts and cotton. However, his attempts were overshadowed by his obsession with absolute power. Opponents took advantage of the small steps towards liberalization, forced upon him by foreign pressure, to organize. Matters came to a head when, in 1991, young people took to the streets and Traoré ordered soldiers to shoot into the crowd. There were close to one thousand victims. Shortly thereafter he was arrested by paratroopers prodded by lieutenant-colonel Amadou Toumany Touré, who took over the reins of government and appointed a provisional government to draft a new democratic constitution and hold free elections. These resulted in Alpha Oumar Konaré of the Alliance for Democracy in Mali (ADEMA) becoming president in 1992.

Konaré reestablished democracy and tried to mend political enmities by commuting Traoré's death sentence to life imprisonment and sponsoring a national forum charged with revising the constitution and electoral laws to strengthen guarantees against a return of one-party rule.

Changes were numerous and positive and under Konaré's presidency progress was made with regard to resettlement of the Tuareg. However, the regime was burdened by inherited foreign debts, which required unpopular structural adjustments.

Presidential elections in 2002 were won by Amadou Toumany Touré, briefly interim president in 1991–1992. Although there were claims of electoral fraud, Touré's win was ultimately validated by the country's Constitutional Court, but Touré, widely popular prior to his election win, faces significant problems.

Instability within his government and perpetual economic difficulties keep Mali among the world's poorest nations, despite France's 2002 promise to write off 40% of the country's debt.

### MALVINAS/FALKLANDS

Nearly three hundred miles east of the southern coast of Argentina lie two main islands and about two hundred smaller islands, occupying an area of 4,618 square miles. Under British control since 1833, and claimed by Argentina, these islands are referred to by the British as the Falkland Islands, while the Argentines called them *Islas Malvinas*.

With approximately three thousand English-speaking inhabitants, the islands' economy was largely dependent on wool exports until 1990. Since then, the selling of fishing licenses to foreign fleets to fish within the islands' fisheries accounts for their principal source of revenues. Additionally, there are indications of possible oil deposits on the ocean floor.

Originally settled by the French in 1766, the islands were ceded to Spain in 1769. Argentina, after gaining its independence from Spain, claimed the islands and settled them in 1823. In 1833, Great Britain invaded the islands and expelled the Argentines.

In the 1900s, Argentina undertook diplomatic efforts to recover the islands. Great Britain responded by extending its sovereignty over the South Georgia and South Sandwich Islands, also claimed by Argentina. After World War II, the slogan of “Malvinas Argentinas” became an important component of General Juan Domingo Perón’s nationalistic rhetoric, but there were no attempts to recover the islands either by diplomacy or by force.

Argentina’s quest to recover the islands was strengthened in 1960 when the United Nations General Assembly approved Resolution 1514 calling for self-determination for colonial possessions. In 1965, the General Assembly passed Resolution 2065, urging Argentina and Great Britain to proceed with negotiations concerning the islands’ sovereignty and taking into consideration the interests of its inhabitants.

For seventeen years, both countries engaged in negotiations. Argentina’s position was clear: it wanted sovereignty over the islands. Great Britain, on the other hand, interpreted the interests of the inhabitants as their wishes to remain British.

Frustrated by British delaying tactics, the military junta led by General Leopoldo Galtieri decided to put into effect a plan to recover the islands by force. Judging a British military response to be minimal and believing that Argentina’s covert military aid to the Contras in Nicaragua would convince the United States to press the British into a diplomatic solution favorable to Argentina, the junta continued its recovery preparations. Furthermore, the junta believed that Third World nations would support the takeover as a just war against colonialism.

The recovery attempt was scheduled for July 1982. However, the junta was forced to implement the plan ahead of schedule when a series of protests against its economic policies spread throughout Argentina in March. In an effort to neutralize public discontent, the junta launched “Operation Rosario.” On April 2, 1982, Argentine commandos landed on Port Stanley (Puerto Argentina) and quickly occupied the islands and South Georgia. By late April, twelve thousand Argentine troops were on the islands.

Reaction in Argentina was ecstatic as demonstrations in support for the junta’s action occurred throughout the country. Stunned by “Operation Rosario,” British Prime Minister Margaret Thatcher, who had been experiencing a wave of unpopularity, ordered a twenty-eight thousand-man task force to set sail for the islands on April 6 and declared a two hundred-mile exclusion zone around the islands.

At the United Nations Security Council, Argentina suffered a diplomatic setback when the Council passed Resolution 502, calling for the immediate withdrawal of Argentine forces and urging a diplomatic

solution. On the other hand, member nations of the Organization of American States—with the exception of Chile, Colombia, and the United States, which abstained—sided with Argentina.

United States Secretary of State Alexander Haig shuttled between Buenos Aires and London, offering possible diplomatic solutions, only to be met with intransigence on both sides. By April 25, the British had regained South Georgia and on April 30, the United States joined the European Common Market in imposing economic sanctions against Argentina. Moreover, the United States began giving the British logistic and intelligence support.

On May 1, the British began bombarding Puerto Argentina. The following day, Peruvian President Fernando Belaúnde Terry offered a mediation plan calling for an Argentine and British withdrawal, resumption of diplomatic negotiations, recognition of the islanders’ interests, and an interim international administration. Both sides appeared favorably inclined to accept the plan and a jubilant Belaúnde announced that an accord would be signed that evening. However, at 4:00 PM, the Argentine cruiser *Belgrano*, which was sailing toward the mainland, outside the exclusion zone, was torpedoed by the HMS *Conqueror*, leaving 360 sailors dead. President Belaúnde’s plan dissipated with the *Belgrano*’s sinking and the war intensified as Argentine planes sank the British destroyer *Sheffield* two days later.

On May 27, British forces launched an offensive at Goose Green, which was defended by Argentine conscripts. While the conscripts were no match for the British, the Argentine air force proved to be extremely effective. Although it lost fifty-seven planes during the campaign, the air force sank nine British vessels and damaged thirty-two others. By June 11, however, the British had surrounded Puerto Argentino and on June 14, the Argentines surrendered.

The Argentine defeat not only resulted in the junta’s downfall, but with the exception of the air force, it discredited the military. Ironically, the defeat opened the way for democratic rule, as elections were held in 1983. Although Argentina has remained politically stable, its civilian leaders have been unable to effectively deal with a perennial economic crisis caused by industrial stagnation, hyperinflation, and a gargantuan foreign debt. In Great Britain, the victory resurrected Thatcher’s popularity, but for many years, the government had to devote a large share of its budget to the defense of “Fortress Falklands.”

Diplomatic relations between Great Britain and Argentina have been reestablished. Although Argentina still maintains its sovereignty claims over the islands, it has declared that it will no longer use force. Great Britain, on the other hand, has rejected

proposed Argentine negotiations concerning the islands, and the possibility of a solution for their future appears bleak.

## MALVINAS/FALKLANDS WAR, 1982

The Malvinas/Falklands War in 1982 was a conflict between Great Britain and Argentina for possession of a group of two large (East and West Falkland) and two hundred small islands in the South Atlantic, three hundred miles east of Argentina. The origins of the dispute date to eighteenth-century claims by Spain and Great Britain. Argentina gained independence from Spain in 1822 and claimed the islands as national territory and established settlements. In 1833 Great Britain took the islands and expelled the Argentinean settlers and named the islands the Falklands. The islands proved useful for raising sheep and by the twentieth century were home to some two thousand British subjects. Argentina never relinquished claim and referred to the archipelago as the Malvinas. Argentina renewed interest in the Malvinas during the first presidency of Juan Perón (1946–1955). Perón used the issue to raise nationalistic fervor as part of his vision for a "greater Argentina." The United Nations encouraged the two parties to resolve the issue in a 1965 resolution. While the islands were thought to be of little economic value to Great Britain or Argentina, negotiations were stalled by the islanders who desired to remain under Great Britain. A later complicating factor was the possibility that the waters surrounding the islands had vast deposits of oil.

Juan Perón returned to power via election in 1973 but died on July 1, 1974. His third wife, Isabel, who had served as his vice president, assumed the presidential

sash. Argentina, largely due to Perón's policies during his seventeen-year exile, had suffered political instability. His death and Isabel Perón's ineffectiveness as a leader led to even more chaos. Isabel Perón was overthrown by the Argentine military in 1976, which established a military junta to run the country.

By 1982 the military regime had proved ineffective in dealing with Argentina's economic malaise and was increasingly repressive in dealing with dissidents. In an attempt to regain a measure of popular support, the army commander and head of the junta, General Leopoldo F. Galiteri, ordered preparations for the invasion of the islands. Galiteri surmised that the nearing 150th anniversary of the British takeover of the islands would rally the average Argentine citizen to the cause. In addition, the British had reduced their military forces on the islands and seemed not to be as committed as they once were to retaining possession.

On April 2, 1982, Argentine troops landed on East Falkland near the capital of Stanley. A small contingent of Royal Marines briefly resisted but was soon captured. Argentina proclaimed possession and placed the two thousand islanders under a military governor. Initially, the bold attack had the effect that Galiteri desired and there was an outpouring of patriotic support for his regime. However, the international community was shocked and the United Nations Security Council passed a resolution supporting the British position. The United States attempted to mediate a withdrawal of Argentine forces to be followed by negotiations, but this attempt failed. Great Britain, led by Prime Minister Margaret Thatcher, assembled a naval task force and vowed to retake the islands.

As the British task force steamed the eight thousand miles to the islands, the British nuclear-powered submarine *H.M.S. Conqueror* sunk the Argentine cruiser, *General Belgrano*. On April 18, crack troops of the British Special Air Service began infiltrating the islands to prepare for the main task force. Successful raids were conducted on Pebble Island on May 15, resulting in the destruction of a radar station, eleven aircraft, and supply dumps. These raids were followed by an amphibious assault on Port San Carlos, which provided an adequate harbor and bridgehead for the campaign to take the capital of Port Stanley.

After securing the bridgehead, British forces crossed the island and engaged the Argentine army at Goose Green on May 27. The battle at Goose Green was a significant British victory and opened the way for the siege of Port Stanley beginning on June 11. For three days and nights there was fierce fighting in the hills on the outskirts of the capital. However, Argentine forces had been effectively cut off from supply from the mainland by superior British

air and naval power. On June 14 all Argentine forces on East Falkland surrendered.

On June 20 the British declared an end to the war. Argentine casualties included 746 men killed, 1,336 wounded, and 11,400 soldiers who became temporary prisoners of war. British losses included 256 killed and 777 wounded. Only three civilian residents of the islands lost their lives in the brief conflict.

The outcome of the war boosted the prestige of Margaret Thatcher and her Conservative Party, which soon won reelection. The hard-fought victory also made Britain determined to hold the islands and to commit additional force to deter any future Argentine aggression.

For the Argentine military government, the war was an unmitigated disaster and led to the resignation of General Galiteri and the return to civilian rule in 1983. In addition to losing political power, the Argentine military lost its credibility with the public. Soon there were calls for investigations of human rights abuses. The war was also a setback for Argentina's economic and social development. The war was costly and Argentina entered a period of hyper-inflation. In addition, any immediate prospects of obtaining the Falklands and exploiting petroleum deposits were lost. On the other hand, Argentina needed to focus on its domestic problems and could no longer use the Malvinas issue as a reason not to do so.

## MANDELA, NELSON

Nelson Mandela was born into the Thembu royal house in the tribal lands of the Xhosa people in Transkei, South Africa. Growing up in the royal residence after the death of his father, Mandela was exposed to the ideals of democracy within the context of the tribal council, parliament, and judiciary.

Enrolled in the University College of Fort Hare, Mandela studied English, anthropology, politics, native administration, and Dutch Roman law. Mandela became active in student government, advocating

change through greater representation for the underclassmen and the residents. At the end of his second year, in 1940, he was expelled for refusing to accept his elected position on the Student Representative Council (SRC). A majority of the students boycotted the elections in an effort to air their grievances. Mandela believed his refusal to accept the election results was morally right and, that the SRC did not have the confidence of the majority of the student body. His decision set the stage for his future activism.

Arriving in Johannesburg in 1941, Mandela found work as an articled clerk (a lawyer's apprentice) in one of the largest firms in town. He began attending meetings of the African National Congress (ANC). As he became increasingly interested in the liberation movement, he enrolled in the law program as the only African student at the University of Witwatersrand (Wits). While at Wits, Mandela became friends and political allies with a variety of people from all racial groups who would later become leaders in the anti-apartheid movement.

As Mandela's political acumen grew, he began to devote his life to the liberation struggle. In 1943, Mandela, along with a number of his contemporaries, approached the president of the ANC with their intention to form a Youth League and initiate a campaign to mobilize mass nationwide support for the liberation movement. The ANC president supported this new commitment and the Youth League was officially formed in 1944 with Mandela serving on the Executive Committee. The ideology animating Mandela was African nationalism—the idea that African liberation would only come at the hands of Africans themselves and not from the blind adoption of foreign ideologies such as communism or Western democracy.

In 1948, the ANC adopted Mandela's Youth League-inspired Programme of Action only after the Afrikaner National Party came to power in an all-white election and the government began to enact increasingly repressive apartheid (racial segregation) laws. The new policies of the Youth League advocated the use of boycotts, strikes, civil disobedience, non-cooperation, and mass demonstrations as a means to fight against the National Party regime. Furthermore, the Programme called for the attainment of full citizenship rights for all races, direct parliamentary representation, and free and compulsory education for all children. This new agenda would set the social, political, and economic course of interactions with the South African government for the next forty years. The development of South Africa was intricately entwined with the anti-apartheid liberation struggle; the government's effort to maintain its power; and the political, economic, and cultural status

of its white population. The liberation movement would ultimately set up a power dynamic between white and black, rich and poor, developed and undeveloped that would adversely effect and destabilize not only South Africa but also the entire region.

A number of Mandela-led ANC initiatives during the 1950s brought the wrath of the apartheid state. The 1952 Campaign of Defiance was a nationwide civil disobedience campaign designed to resist the burgeoning apartheid system. The 1955 Congress of the People's adoption of the Freedom Charter called for the end of racial discrimination, equal rights for all, and a participatory democracy. The Charter was a rallying cry for the liberation struggle and a blueprint for the future South Africa. Shortly after, Mandela and others were arrested on charges of high treason and conspiracy to overthrow the state. The Treason Trial lasted more than four years, at the end of which Mandela and his co-defendants were found not guilty.

With all channels of peaceful protest exhausted, in 1961 the ANC made the decision to put aside their nonviolent principles in order to combat the growing repression and violence of the state. With Mandela as the commander-in-chief, the ANC formed *Umkhonto we Sizwe* (Spear of the Nation) as its military wing. Mandela left the country in 1962 to gain international support for the anti-apartheid liberation struggle. Upon his return he was again arrested and charged with illegal exit from the country and incitement to strike. He was convicted and sentenced to a five-year prison term. While serving this sentence he, along with a number of his colleagues, were charged with sabotage. The subsequent trial, known as the Rivonia Trial, drew the attention of the world to South Africa's liberation struggle and condemned Mandela to a life sentence.

During the 1980s South Africa came under increasing international pressure to end apartheid. Finally, the National Party government was forced to capitulate and begin negotiations with the liberation movement. After refusing on a number of occasions to be conditionally released, Mandela began meeting with government officials in 1988 to discuss the future of South Africa. In mid 1989, he met with state president P. W. Botha shortly before Botha's resignation due to health problems. Late in 1989 many of Mandela's political prison-mates were released. In December 1989, Mandela then met for the first time with Botha's successor, F. W. de Klerk. In February 1990 the ban on the ANC and other political organizations was lifted after thirty years. On February 11, 1990, Nelson Mandela was unconditionally released from prison.

The difficult work of forming a government of national unity, which included the dismantling of the apartheid system, was to begin. Mandela became

president of the ANC in 1991, was awarded the Nobel Peace Prize along with F. W. de Klerk in 1993, and was inaugurated the first democratically elected president of South Africa on May 10, 1994. During his five-year term as president, the ANC government enacted the Reconstruction and Development Programme, which was a socioeconomic program to reconstruct South Africa and reconcile it with its past. Furthermore, the government, led by Mandela, enacted the Truth and Reconciliation Commission as a means to shine the light on the hidden truths of the apartheid era and heal the wounds it had caused.

Mandela retired to private life in 1999, near the village of his birth in the Transkei. He continues to be a prominent statesman and advocate for social justice and travels the world as the struggle of his life continues.

### MAO ZEDONG

Mao Zedong (1893–1976), elected leader of the Communist Party of China from 1945 to 1976, is said to have developed Marxism-Leninism by adapting it to the special situation in China and merging it with elements of traditional Chinese thought. The Chinese Communist Party (CCP) adopted Mao Zedong Thought as its leading ideology and still clings to it, although after Mao's death most of his theoretical contributions made after the CCP's rise to power were criticized as being left deviationism.

Mao was born December 23, 1893, in Shaoshan, Hunan, China, to a peasant family. He was educated in China and became a librarian at Beijing University, where he encountered Marxist debates and became a Marxist under the influence of the Russian Revolution of 1917. He was one of the founders of the CCP in 1921, but not acknowledged as one of its leaders until the Long March (1934–1935).

He was elected leader of the CCP in 1945 at the Seventh Congress of the CCP, and Mao Zedong Thought was declared the guiding principle of the Party. He proclaimed the founding of the People's Republic of China (PRC) on October 1, 1949.

Mao Zedong's thinking on questions of development was mainly aimed at formulating a strategy of the Chinese revolution in which China's peasantry was mobilized to fight with military means for political aims. With the end of internal and external wars, Mao had to shift focus from military concerns to political and economic strategies in overcoming poverty in China. Instead he led the country into the Korean War and mobilized the population against class enemies both outside and inside the party. Mass mobilization was for him the main tool to avoid the kind of fossilization and degeneration he observed in the Soviet Union under Khrushchev and Brezhnev.

Mao started developing his ideas on a post-colonial future in China in the early 1940s. He blamed imperialism for having hindered the evolution of capitalism in China and therefore asked for a transitional period of "new democracy" to be inserted between the semi-colonial and semi-feudal present and the socialist future. During the "new democratic" period, the Communist Party was supposed to take over a leading role in society, guaranteeing that China could make up for its underdevelopment without having social inequality arise. Different forms of property rights would coexist, and different parties were allowed to articulate the political interests of their respective memberships. This kind of rationally planned and restricted capitalism was supposed to give enough room to accelerated economic growth while at the same time paving the way for a socialist future under proletarian dictatorship.

After the Communist takeover in 1949, however, Mao grew suspicious about his own theories and stressed that class struggle would have to go on even after the rise to power of the Communist Party. Much in contrast to the mainstream in the then-international Communist movement and to most leading members of the CCP, he did not believe that the main contradiction in socialist societies was the contradiction between underdeveloped means of production and the highly developed organization of production. For him

the contradiction between bourgeoisie and the working classes was still of major importance, which is why he heralded the continuation of class struggle as the top priority for guaranteeing development in the political, social, and economic sense of the term. Whoever propagated to shift the focus of the Party from political revolution to economic development would meet with Mao's suspicion if not be criticized for right opportunism and empiricism.

According to this theory, the problem of the shortage of capital was to be solved by making use of the enormous manpower China was endowed with; the low productivity of China's industry was to be overcome by the growing motivation and consciousness of the workers. That is why these workers were to be trained politically and not technically, and their motivation was not to be fostered by economic incentives but rather by convincing them politically of the bright future of socialism in China.

As this strategy of overcoming underdevelopment by mass mobilization met with criticism inside and outside the Party, Mao Zedong saw his suspicion proven and replied to his critics by using his position as the charismatic leader of the Party to directly mobilize the masses against them and accelerate the speed of reform. That is how he changed his ideas of slowly expropriating the so-called "national bourgeoisie," depriving her of the opportunity to contribute to economic development in China; he also turned away from earlier thoughts of land reform as "giving land to the tillers" and instead introduced the system of "People's Communes," hoping for private and collective ownership to disappear from the countryside as soon as possible. Intellectuals having been attracted by the CCP in great numbers in the hope of a privileged position as consultants for the new regime, were selected as targets of vigorous attacks beginning in the early 1950s, instead of being mobilized as political supporters and experts. With inner party struggle as a direct reflection of conflicts between social classes, Mao hoped for the nation to reach the classless society of communism as soon as possible. Even when he saw that his plans could not be realized, he still envisaged China as, by moral and political standards, the most advanced socialist country of the world. As a consequence, he was suspicious of international contacts and wanted the country to be self-reliant and self-contented.

Every time Mao Zedong succeeded in putting his theories into practice, the country was hit by a major economic crisis. During the Great Leap Forward (1957–1958), the mobilization of the peasant population was supposed to quickly raise China's steel production, but instead left the country with a severe shortage of grain. In 1966, with the launching of the

Cultural Revolution, the industrial sector was severely disturbed so that after ten years of political turmoil, the economy was at the fringe of collapse and several parts of the country again were hit by severe famine. Under the conditions of crisis, Mao realized that the legitimacy of the Communist regime was subverted by its lack of economic success. He was therefore willing to divert from his theories and agreed to the policy of readjustment introduced by Zhou Enlai in the aftermath of the Great Leap.

He continued to serve as the chair of the CCP until his death on September 9, 1976.

### MAQUILADORA PROGRAM

The Maquiladora Program is a set of international trade policies and regulations that permit a business firm of the United States, or another "originating" nation, to temporarily transfer goods to Mexico, where they receive added value with minimal or no tariffs being applied to the goods so long as they are shipped back to the originating nation. Almost all instances of the Maquiladora Program involve the United States as the originating nation. The intended benefits of this program are low labor costs for the firm, lower prices for consumer goods, economic development for Mexico, and political good will. Critics point out that these benefits come at the expense of job loss for the originating country, creation of "sweatshop" working conditions in Mexico, and greater international dependence for the originating country.

The term "maquiladora" is derived from the Spanish verb "*maquilar*," which historically referred to the milling of wheat into flour, the "*maquila*" being a portion of the product given as payment to the miller and to other workers instead of cash wages. The modern meaning of "maquilar" is "to assemble" and "maquiladora" is generally translated into English as either "bonded assembly plant" or "twin plant." A bonded assembly plant is a factory that is authorized by the Mexican government to temporarily import goods duty free. Once the goods have been combined through an assembly process, or in other ways have received additional value, they are then re-exported to the originating country or, less frequently, to another country. While in Mexico, the goods are under the supervision of Mexican customs officials who insure that the goods are delivered directly to the factory, are kept separate from other goods, and that they do not leave the factory until they have been modified. In certain circumstances, a bond must be posted by the firm as a guarantee that the goods will leave Mexico in a timely fashion and not be sold on the local market, thereby avoiding normal duties. The advantages of the Maquiladora Program to the firm are convenience and financial in that they do not pay tariff duties unless the goods are sold in Mexico, and the wage rates are lower than in the originating country.

A twin plant, sometimes referred to as a "production sharing plant," is a common arrangement for taking advantage of the Maquiladora Program whereby a US firm locates two factories in close proximity but on opposite sides of the US–Mexican border. The plant on the US side of the border prepares materials for assembly and the plant on the Mexican side of the border does the assembly work. This twin plant arrangement minimizes transportation time and costs and it allows for centralized management control. Several paired US–Mexican border towns have experienced economic growth because of twin plant activity and have developed extensive cross-border relationships. Examples include Los dos Laredos (Nuevo Laredo, Mexico and Laredo, Texas) and Los dos Nogales (Nogales, Mexico and Nogales, Arizona). The Maquiladora Program is, essentially, a program of the Mexican government, created in the mid-1960s to replace the earlier "Bracero" program.

As discussed by Kelly (2001) there are three ways to establish a Maquiladora Program in Mexico. The most common method is to establish a wholly-owned subsidiary in Mexico that would own and operate the maquiladora. The second method is to use a shelter operation that invests in facilities, hires employees, and manufactures products for a fee based on labor

costs and profit. The shelter operator generally relies upon the manufacturer to provide the equipment required for the plant. The third method is to use a subcontractor whose charges are based on unit cost rather than labor cost, and who is usually responsible for obtaining equipment.

## Background of the Maquiladora Program

Because of the drain on factory, railroad, and agricultural labor caused by the Second World War effort, the United States faced labor shortages in the early 1940s. Mexican immigrants, legal and illegal, helped to fill the need, especially in the agricultural sector. In order to provide for the regulation of working conditions of this international work force, the United States and Mexico entered into an agreement known variously as “The Mexican Farm Labor Supply Program,” “The Mexican Labor Agreement,” and “The Labor Importation Program of 1942–1964.” Perhaps the most widely recognized name given to the program is, simply, the “Bracero Program”—from the Spanish noun *brazo* (arm) indicating physical labor. From the US perspective, the program was created to obtain badly needed temporary workers for US farmers, but it was also intended to insure that Mexican workers were provided with basic necessities as required by Mexican statutes governing the treatment of workers in Mexico. US support for the program was made available through Public Law 45 of 1943. Specifically, the US statute made funds available for the following: the recruiting and transportation of workers, their families, and necessary property; furnishing of health, medical, and burial services, training, subsistence, protection, and shelter for workers and their families; advancing sums due from US employers; personnel, and expenses to carry out these purposes.

The Bracero program was modified several times until it was discontinued in 1964. In 1948, the contractor role was moved from the US government to the individual farm employer. Through Public Law 78, enacted in 1951, the US Congress modified the program substantially to allow the Secretary of Labor to arrange for recruitment of Mexicans for temporary agriculture work only when there were not enough US workers available. Major criticisms of the program were that enforcement methods were intimidating and insufficiently staffed, that it was creating an artificial labor market and reducing employment opportunities for US citizens, and that it was keeping a cap on US wage levels.

From 1949–1959, the number of Braceros increased from 8,500 to 84,000 and then dramatically

decreased due to agricultural mechanization. In 1962, Bracero wage rates were raised sharply to a level determined to protect the wages of US workers. In addition, because so many Mexicans were attempting to enter the United States, Mexico was experiencing a labor shortage crisis. Opposition from workers’ unions and the Kennedy administration tipped the balance, and when Public Law 78 was presented for renewal in 1963, the US congress extended it for only one year and it finally came to a formal end on December 31, 1964.

Immediately after the termination of the Bracero program, illegal immigration increased dramatically, although many workers were not successful in finding work in the border region. A number of studies were conducted to determine how to fill the needs of Mexican workers for employment and US manufacturing firms for low-wage workers. These studies led to several initiatives, one of which was the Border Industrialization Program (BIP), which made it possible for foreign-owned firms to build assembly plants in Mexico; these assembly plants became known as maquiladoras.

The BIP was enacted by the Mexican government in 1965. The major objectives of the BIP were to continue developing the economies of the country through attracting foreign investment and to provide employment opportunities for workers that had lost jobs due to the termination of the Bracero Program. The underlying strategy of the BIP was to take advantage of US Tariff Schedule 807, which allowed certain goods to be exported from the United States to another country where they would be modified and then re-exported to the United States with no tariff duties attached. “Tariff Schedule 807” is a classification found in the Tariff Schedule of the United States (TSUS), which was implemented in 1963 and replaced in January of 1989 by classification “9802” of the Harmonized Tariff Schedule of the United States (HTS). The HTS is administered by the United States International Trade Commission (formerly United States Tariff Commission). The founding legislation for this provision is the Tariff Act of 1930 (Hawley-Smoot), which is currently included as Chapter Four of Title 19 (Customs Duties) of the Code of the United States of America. The major mechanism used to achieve the goals of the BIP was the establishment of maquiladoras as described above.

## Development of the Maquiladora Program

Although the BIP provided the opportunity for maquiladoras to be established and to operate, several

## MAQUILADORA PROGRAM

modifications since 1965 have resulted in a more formalized, more highly regulated and controlled program. In order to provide for more standardization, the Mexican Government issued the Maquila Decree on December 22, 1989. This decree, as amended several times, is the basis for the Maquiladora Program as it operates today. Specifically, the Maquila Decree (*Decreto para el Fomento y Operación de la Industria Maquiladora de Exportación*) established the Mexican Secretariat of Commerce and Development (SECOFI, later renamed Ministry of Economy) as the governmental agency responsible for the regulation of maquiladoras and the agency that issues permits for operation of a maquiladora. Further, it specified that while the maquiladora is a registered Mexican corporation, 100% of the capital investment, ownership, and management of the firm may be foreign. Similarly, it specified that the firm is entitled to import, duty free, on a temporary basis, all equipment and materials necessary for operation of the business. Also, it allowed that land may be completely owned by the foreign investors except for two narrow strips along the US border and the coasts. Maquiladoras may be located anywhere in Mexico except Mexico City, Guadalajara, and Monterrey because of congestion already present in those cities.

A major element of the decree relates to the application of Mexican labor laws, which are the most restrictive aspect of the program. Among the labor requirements are: (1) every salaried and hourly employee must have a written employment contract; (2) maximum work week of six 8-hour shifts; (3) calculation of wages on a daily rate with a seventh non-working day included; (4) payments to social security and national housing funds; (5) paid pregnancy leave, profit-sharing, national holidays, vacations, and severance benefits; and (6) payment of normal corporate income and asset taxes.

On December 24, 1993, the Maquila Decree was amended and, essentially, the effect was to relax several regulations. It was no longer required that 100% of the firm's product be exported; time limits for temporary storage of tools, materials, trailers, and containers were extended; a restriction on the manufacturing of textile products was removed; and the time limit on the application of sanctions by SECOFI was extended. With the implementation of the North American Free Trade Agreement (NAFTA) in 1994, trade between the United States and Mexico grew rapidly, yet direct influences on the operation of maquiladoras and on the trends in overall maquiladora output were minor. Analysis conducted by Gruben and Kiser (2001) indicated that certain aspects of NAFTA may have encouraged maquiladora growth, some had little impact, and others may actually

have discouraged maquiladora growth. They determined that US industrial production in general, and international currency and wage variability specifically, had the greatest influence on maquiladora employment.

One major difficulty that NAFTA initially posed for the maquiladora program, however, was Article 303 of the NAFTA agreement, which required that tariff duties be applied to all materials used in manufacturing that had originated outside of NAFTA countries. This was particularly problematic in the electronics industry, which had traditionally imported electronic products from Asia as components for products that were assembled in maquiladoras and then exported to the United States. An ingenious solution to this problem was developed by the Mexican government with the establishment of Industrial Sector Promotion Programs (PROSEC) through a decree issued on December 31, 2000. PROSEC stipulated that a firm would be in literal compliance with Article 303 if the items brought in from a non-NAFTA country, to be assembled with other components for re-export to a NAFTA country, had not traditionally been available in Mexico. So long as this opportunity to import such items was available to all Mexican firms, and no Mexican firm would supply the items, then Article 303 would not have an effect on the maquiladora.

On May 12, 2003, the Maquila Decree was amended once again. These modifications resulted in clarifying five distinct forms of maquiladoras: maquila operation (excludes services); industrial maquila (manufacture and transformation of goods); holding maquila (manages two or more operations under one firm); services maquila; submaquila. In addition, the 2003 amendments require more detailed proposals by firms desiring to establish a maquiladora, expand NAFTA regulation exceptions to the European Union and the European Free Trade Association, and, in general, provide greater regulatory specifications.

## MARCOS, FERDINAND

As the sixth president of the Republic of the Philippines, Ferdinand E. Marcos (1917–1989) took office in 1965 amid heightened expectations and with the good will of most Filipinos. He won the election running on an anti-corruption platform, and vowed in his inauguration speech “to make this country great again with the help of the masses.” Even when he declared martial law in 1972 and effectively ended twenty-six years of democracy, many Filipinos welcomed the event and expected some good to come from it. After all, Marcos had been raised by parents who passed on to their son a notion of excellence in everything he would attempt. Born in Sarrat, Ilocos Norte, in 1917, Marcos was valedictorian in his grammar school and high school and only narrowly missed being valedictorian of his graduating 1935 class at the University of the Philippines Law School. In 1939 he made the highest score in history in the national bar examination. During World War II, he carried out guerilla activities against the Japanese occupation and served in the US Army’s 14th Infantry Division, then returned to Ilocos Norte in 1946 and began a criminal law practice.

He was elected to the House of Representatives in 1950 and married Imelda Romualdez, a former Miss Manila, in 1954. Five years later, he won a Senate seat and worked his way up the political ladder to election as President of the Senate in 1963. Two years later, he was elected President.

Despite the veneer of reputability, Marcos’ corruption had begun while he was a congressman and head of the import control board, where he took huge bribes for approving import licenses. As only a representative in congress on a small salary, Marcos had already become a millionaire. As president, his lust for personal aggrandizement acquired epic proportions. While corruption seemed a characteristic of many politicians in the Philippines, the scale of the plunder carried out

by Marcos and his cronies defied the imagination of his cohorts. A conservative estimate would be that Marcos looted, diverted, and laundered around \$5 billion in public assets in extraordinarily complicated legal and semi-legal schemes.

Marcos did not end corruption and smuggling (as he promised many times) but, instead, brought it into Malacañang (the presidential palace). He did not create new, productive jobs (as he promised many times) but, instead, created a swollen bureaucracy loyal only to him. By the late 1960s discontent grew as the economy faltered. In 1968 a dozen former university students reorganized the banned Philippine Communist Party, formed the New People’s Army, and prepared for a long rural guerrilla war.

The following year, in an allegedly fraudulent election, Marcos won a second presidential term, the first time in Philippine history that a president had been elected to a second term. Major disturbances rocked the Philippines, and more than two thousand demonstrators marched on Malacañang.

The economy spiraled downward, the gap between the rich and the poor widened, and protestors filled the streets of Manila. On September 23, 1972, Marcos imposed martial law. Supposedly aimed at the multiple rebellions of Manila students, communists, and the Muslims in the southern Philippines, the declaration of martial law was itself a prime example of the corrupt Marcos. Marcos knew that he needed a specific incident to make martial law acceptable to the public, and that incident was the alleged machine gun attack on Secretary of National Defense Juan Ponce Enrile’s car by communists. After the fall of Marcos, Enrile himself confessed that the attack had been faked. Citing the threat of communism, Marcos sent his troops throughout the country to arrest scores of opposition politicians, journalists, students, and others critical of Marcos’ rule as well as to shut down newspapers and broadcast stations. (Marcos had already put his relatives and ethnic mates in charge of the armed forces.)

He rewrote the Constitution to empower himself even more, and over the next five years his security forces imprisoned more than seventy thousand people. Many, however, at first welcomed martial law, accepting Marcos’ explanation, enjoying the decline in street violence, and expecting improvements in the economy, which did, indeed, show some initial signs of strength.

Meanwhile Marcos and his cronies encouraged export-oriented growth, with exports such as sugar and coconuts, and created a small number of huge enterprises that were controlled either privately by Marcos intimates or by the government, which itself came to control more than three hundred

corporations in a Mussolini-style collusion between industry and government. First Lady Imelda Marcos squandered public funds on public-relations projects such as a multi-million-dollar center for the arts.

In August 1983 opposition leader Benigno Aquino returned from exile in the United States and was assassinated upon his arrival at Manila International Airport. General Fabian Ver, military chief of staff and a cousin of Marcos, was charged with Aquino's slaying, along with twenty-five other army officers. In November, bowing to US pressure, rioting in the streets of Manila, and calls from the Philippine business community and the Roman Catholic church, whose priests proclaimed a pastoral critique of Marcos in churches throughout the Philippines, Marcos set presidential elections. When Ver and the others were acquitted, Aquino's widow, Corazon, announced as candidate for president. The election was held in February 1986, and the consensus was that Aquino won despite widespread fraud by Marcos supporters. Nevertheless, the Marcos-controlled National Assembly proclaimed Marcos the winner. Aquino called for a nonviolent campaign of strikes and boycotts.

Later in February both Marcos and Aquino took the oath of office in separate ceremonies. Marcos' ceremony, however, was attended by only a handful in Malacañang, while Aquino's ceremony was attended by half a million or so in the great central park of Manila, Rizal Park. Later that day, Marcos took a helicopter to the US air base in central Luzon and then flew on to exile in Hawaii.

After twenty years of rule, Marcos left the country with a historically greater gap between rich and poor, a starved economy that was way behind neighboring countries, and an even stronger Muslim and communist insurgency.

In 1988 Marcos and his wife were indicted by the US government, mainly on charges that they used embezzled money to buy real estate in the United States. Marcos was, however, too ill to stand trial, and the charges were dropped. He died in exile in Honolulu in September 1989, and was finally laid to rest in the Philippines three years later.

## MARSHALL ISLANDS, REPUBLIC OF

The Marshall Islands people have had development thrust upon them, as well as pursued their own development concerns. Commitment to a cash economy has increased as the population has grown from less than twenty thousand after World War II to fifty-six thousand in 2005. Local resources are not adequate to provide for today's needs such as food, housing, medical care, and education. The current push towards privatization is dependent on further outside assistance.

### Political Developments

The Marshall Islands gained independence in 1983 after almost forty years of administrative rule by the United States as part of a United Nations Trust Territory of the Pacific Islands (TTPI). Previous colonisation by Spain, then Germany, Japan, and the United States, as well as the aftermath of World War II, fought on their territory, has left a number of alternative foreign ideologies which Marshallese have made their own. The desire to control their own affairs has been mitigated by the need to finance administrative programmes.

The new Republic of the Marshall Islands (RMI) elected to continue its relations with the United States under a Compact of Free Association, signed in 1987, for a period of fifteen years, and a second Compact was signed in 2004 for a further fifteen-year period. In return for allowing the United States to continue to use Kwajalein atoll as a Missile-Testing Range, the RMI receives an annual injection of funds from Washington, decreasing over the next fifteen years; a community fidelity fund for the future; and access to certain US federal programmes. It has control of its own internal affairs.

The Constitution of 1983 provided for a parliamentary-style government headed by a president and

Cabinet with a Legislature and a Council of Chiefs charged with monitoring traditional affairs. The first commoner president, elected in 1999, followed a president who had held dual authority as senior *iroij* (chief) and elected president, and thus commanded much respect. The commoner President Kessai Hese Note marks a new era in RMI politics as he strikes a path toward improved solvency, greater accountability, and the people's concerns (Pollock 2004). The matter of land rights as the basis for collateral for loans looms large as outside demands for financial sustainability come face to face with the foundation of Marshallese identity—land.

RMI maintains its position in the Pacific by its close collaboration with its neighbours and former TT members, Palau and the Federated States of Micronesia. The nation is also an active member of the Pacific Forum, and other Pacific-wide agencies such as the Secretariat for the Pacific Community, Forum Fisheries Agency, and Pacific Arts Association.

## Economic Development

Marshall Islands' resources remain underdeveloped. As a nation of twenty-six atolls and low coralline islands, surrounded by a large section of the Pacific Ocean, land resources are minimal compared to the potential of their marine resources. During Trust Territory times, little was done by the United States as trustee to further economic development other than to triple the TT administrative budget after 1963 (Hanlon 2001).

RMI relies on external inputs in the form of aid and grants. The United States provides 70% of government income, with Japan, ROC/Taiwan, and Australia contributing small additional amounts. The Asia Development Bank provides advice and funding in line with US policies. Concessional loans amounted to 18% of all external assistance in 1999–2000, but the amount varies from year to year (Hughes 2001).

The financial situation of the government remains precarious, heavily dependent on these outside sources. For households, the four Section 177 communities—Bikini, Enewetak, Rongelap, and Utrik—have assured quarterly income from their nuclear compensation claims, but the rest of the population must rely on income from a few government jobs, and expectations from the growth of private business. The subsistence sector on the outer islands has diminishing income from copra (dried coconut meat), together with use of local foodstuffs from breadfruit, pandanus, taro, and fish. Transportation to these twenty-four scattered atolls is a vital link.

Copra has been the main source of earned revenue since German times, but its export value is diminishing. The activities of fisheries have increased since independence, with Taiwanese fishing boats having a notable presence in Majuro lagoon. For many Marshallese, fishing is a recreational activity, but attempts by Marshall Islands Marine Resources Association to develop it as an economic resource are thwarted by difficulties of transportation, fresh water, and marketing. Pearl fishing, the shrimp industry, and marine conservation are growing.

Tourism struggles. High costs of transportation to the mid-Pacific, and limited hotel facilities hamper further development. Dive Bikini offers opportunities for underwater exploration of the WWII battleships that the United States sank in Bikini lagoon as part of their nuclear tests.

Urbanisation by outer islanders seeking jobs and social services in either of the two urban centres, Majuro or Ebeye (Kwajalein atoll), now accounts for 60% of the resident population. Polarisation of urban and outer island lifestyles is a development trend being addressed by loans and grants supported by agencies such as ROC/Taiwan (Marshall Islands Journal 2005). Downsizing the public service in 2001–2002 has placed greater pressures on households seeking cash to feed and support their members. Some 10% of Marshallese have established communities in US states.

## Social Developments

Under the UN Trust Territory administration, social development was largely unplanned and unmonitored. The Marshall Islands administration drew on its funds to provide education, health, and transport facilities, but these met only minimal needs.

Advanced health and education facilities have been centred in the two urban areas. While clinics and primary schools provide basic services on outer atolls, the hospitals and secondary schools contribute to increased urbanisation. Youth assistance programmes are offered both through government- and church-funded agencies. The churches play an important role in social support. Women's affairs are coordinated through a Non-Governmental Organization (NGO), Women United Together Marshall Islands, which links outer islanders with urban women, as well as with church and secular groups. With fewer than ten women in elected or appointed government positions, gender relations appear unbalanced. Yet women provide the strength for all communities.

The media in the form of a newspaper (*Marshall Islands Journal*), radio, and television provide for social commentary. These media have become more vocal over issues associated with settlement of the second Compact, and thus their future.

## Conclusions

The major issue facing Marshall Islands development is the degree of control they can exercise over their own future. RMI government relies on financial support derived from US need for continued use of Kwajalein Missile Range. The degree to which that dependence will reduce over the next fifty years will stem from marine projects, fishing, possibly mining, and other global developments. The country's strategic location in the mid-Pacific may become a casualty of global warming and sea level rise, or it may prove vital in future world developments.

## MARTINIQUE

Martinique is a French *département d'outre-mer* (overseas department) in the Caribbean. The northernmost

of the Windward Islands, Martinique occupies 1,060 square kilometers of territory. The island, which is sixty-five kilometers long and twenty kilometers wide, is located between Dominica to the north and St. Lucia to the south. Fort de France, the capital, is located on the western side of the island. Mt. Pelée, the highest point at 1,397 meters, is in the north. The northern half of the island is much more mountainous than the southern half. Beaches on the northern half of the island have black sand, while beaches on the southern half have white sand. Most of Martinique's 430,000 people are French-speaking Roman Catholics of African descent. The most famous person born in Martinique was the Empress Josephine (ne. Beauharnais), the daughter of wealthy sugar plantation owners and the wife of Napoleon Bonaparte.

When Christopher Columbus discovered Martinique in 1502, it was occupied by hostile Carib Indians. Spain's attempts to settle the island during the sixteenth century were frustrated by fierce resistance from the Indians. In 1635, a group of French settlers established the first permanent settlement on Martinique at St. Pierre. In 1640, the French built a large fort above the harbor at Fort de France. By 1660, the French successfully removed the Indians from the island and established a successful sugar-producing colony based on African slave labor. The British intermittently occupied Martinique from 1794 to 1802. French planters, frightened by the excessive violence that accompanied the French and Haitian Revolutions, willingly accepted the British occupation. The French planters, who were able to sell their sugar in British markets, prospered during the British occupation. Although Martinique was eventually restored to French control, the importance of the sugar industry declined after slavery was abolished in 1848.

On May 8, 1902, Mt. Pelée erupted, destroying the colonial capital of St. Pierre and killing the town's twenty-nine thousand inhabitants. The only survivor was a prisoner—Louis Auguste Cyparis, who eventually joined the Barnum and Bailey Circus—locked in a solitary confinement dungeon in the jail. Before the eruption, St. Pierre had been known as the Paris of the West Indies. French Governor Louis Mouttet, eager to keep the population in the city for the upcoming May 11 elections, ignored the minor explosions that began at the end of April and prohibited people from leaving the city. Although St. Pierre was eventually rebuilt, the capital was moved to Fort de France.

Repeated attempts by the inhabitants of Martinique during the twentieth century to gain greater autonomy often resulted in violence. The enhanced racism and authoritarianism exhibited by the Vichy government after it came to power in 1941 shattered the illusions that the people of Martinique had about

color-blind French brotherhood. A significant number of people on the island began to embrace the philosophy of *negritude*, which urged black people to reject cultural assimilation and emphasize their African heritage. Author Aimé Césaire (b. 1913), the mayor of Fort de France from 1945 to 2001, consistently sought greater autonomy for the island. Basing his ideas on a blend of *negritude*, anti-colonialism, and communism, Césaire believed that the political assimilation of the French colonies into the French Republic would guarantee the human rights of the people of Martinique.

In 1946, Guadeloupe, Martinique, and French Guiana officially became French overseas departments. Although Martinique was offered independence in 1958, the inhabitants, motivated by economic factors, voted to continue their relationship with France. As an overseas department of France, Martinique is entitled to elect two representatives to the French Senate and four representatives to the French National Assembly. The French president, on the advice of the French Minister of Interior, appoints a governor, known as a prefect, to represent the interests of the French government in Martinique. The power of the prefect—Yves Dassonville since 2004—is largely ceremonial. Local power is vested in a General Council consisting of forty-five members and a Regional Council consisting of forty-one members. The presidents of the General and Regional Councils are elected by their respective members. Claude Lise was elected president of the General Council in 1992. Alfred Marie-Jeanne, president of the Martinique Independence Movement (MIM), was elected president of the Regional Council in 1998.

By 2004, agriculture, once the mainstay of the island's economy, only generated 5% of the island's revenue. Banana exports have surpassed sugar exports as the primary agricultural commodity. Although limited attempts at light industry have been implemented, tourism has become the most important source of foreign exchange. Revenue from tourism, which was enhanced by a large increase in the number of US cruise ships visiting Martinique, was hurt by the tragic events of September 11, 2001. Hurricanes have had a negative impact on both agriculture and tourism. France continues to provide huge subsidies.

## MARXISM

Marxism is the name given to a critical theory of society first elaborated by Karl Marx, a German philosopher of the nineteenth century who lived most of his adult life in England, that became one of the principal currents of socialist thinking, first in Europe and then worldwide. Endorsed by the Bolshevik wing of the Russian Social Democratic party led by V. I. Lenin, it became the official ideology of the Communist Party of the Soviet Union, and hence of the government of that one-party state, after the “October Revolution” of 1917; it retained this position, often under the more accurate label “Marxism-Leninism,” until the dissolution of Communist political dominance there in the early 1990s. Meanwhile, within the institutional framework of the Third Communist International, Communist parties in many nations submitted, in varying degrees, to centralized political and ideological control exercised by the Soviet leadership in the name of Marxist theory. In the aftermath of World War II, a number of the nations of Eastern Europe as well as China, North Korea, and later North Vietnam acquired Communist governments, and Communist parties played important roles—often in hostile opposition, sometimes in temporary collaboration—in the political life of many developing nations as well as in some developed ones, notably France and Italy. By the end of the twentieth century, Marxism or Marxism-Leninism remained the official ideology of North Korea, China, Vietnam, and Cuba, and it continued to claim many intellectual adherents, although far fewer than in previous decades.

## The Marxism of Marx

As Marx's friend, collaborator, and popularizer, Friedrich Engels, recounted it, Marx drew on three main intellectual traditions—those of “utopian socialism”

(a label they attached above all to the theories of the Count de Saint-Simon, Charles Fourier, and Robert Owen), of early capitalist economic theory beginning with Adam Smith, and of G. W. F. Hegel's philosophy, with its dialectical view (that is, development as taking place through successive internal oppositions) of history and reality in general. On this account, socialism moved from mere utopian wishful thinking to being a scientific worldview when Marx derived "the secret of surplus value" from his analysis and internal critique of bourgeois political economy and used Hegel's method, purged of its idealistic conception of history as the self-unfolding of "Spirit" or God in the world and understood instead in a purely materialist way, to demonstrate that capitalism would eventually have to collapse through its own internal contradictions.

By the "secret of surplus value" Marx meant the perception that human labor power is treated as a commodity like any other within a capitalist economic system, inasmuch as it, too, is bought and sold on the market, but that it has the unique capacity of being able to produce more than it costs—that is, more than the subsistence wage paid to the worker for his or her upkeep, plus reproduction of the next generation of workers. Agreeing with Smith's premise that labor is the ultimate producer of value within this exchange system, Marx contended that the difference between the amount of time needed for the worker to add enough value to the product on which he or she is working in order to earn subsistence, on the one hand, and the total amount of time (per day, week, or year) that the worker has agreed to work in order to be hired, on the other, constitutes "surplus value" extracted by the owners of capital. Marx's early, more ethically-oriented work, notably his *Economic and Philosophical Manuscripts of 1844* (which were not widely known until the mid-twentieth century), emphasized the *alienation* of workers—from their own life-activity, from its products, and from one another—in this competitive system wherein they are ostensibly free but in fact must work, under conditions not of their choosing, just in order to live. In the great classic of his later years, *Capital (Das Kapital)*, Marx combined these insights with a more complicated and mathematically oriented analysis of the workings of the system to demonstrate that it tends in the direction of a polarization between a relatively few owners of large concentrations of capital and the vast majority of workers, the proletariat, who will eventually be in a position to wrest the means of production away from the owners with comparative ease.

Although nothing in Marx's complex analysis of the variable factors in the system (which includes, e.g., the possibility of achieving vast and rapid increases in

productivity through automated machinery, and the great expansion of capitalist trade and exploitation to other parts of the world that were not yet fully capitalist in the mid-nineteenth century) led deductively to the conclusion that it would reach its final crisis anytime soon, Marx himself expected that this crisis was imminent. This is clear in his *Manifesto of the Communist Party* (1848) and in numerous personal letters. Engels, who outlived Marx by twelve years, had more doubts, especially as industrial workers, especially the more skilled ones, though on the whole still living in miserable circumstances, began here and there to enjoy some small prosperity. Disputes that were at once both theoretical and practical broke out within the large German Social Democratic Party and similar parties elsewhere over whether, *inter alia*, to treat Marx's analyses as scientific predictions of an inevitable future and hence in no need of active implementation, or as implying the necessity of violent revolutionary action in order to be realized.

### Imperialism and the Marxism of Lenin and His Successors

Lenin, who treated the first of these views as an anti-Marxist heresy that he labelled "Economism," strongly supported the latter view. He argued that, particularly in light of the extremely repressive political conditions of Tsarist Russia, the formation of a group of professional revolutionaries who would serve as the "vanguard" of the proletariat was required. Moreover, he believed that it was unnecessary for Russia, with its relatively underdeveloped industry, to wait to "catch up" with Western capitalist countries before undergoing a Marxist revolution. He saw World War I, which to him was essentially a struggle between the principal European imperialist powers for control over colonies in the rest of the world, as providing the occasion for just such a revolution in backward Russia, which could then spark similar upheavals worldwide. The collapse of the Tsarist army and weaknesses in the provisional government headed by A. F. Kerensky enabled Lenin's Bolsheviks to take power from the latter within a few months of the revolution's formation. After a brief period of comparative openness, the new regime, menaced by both armed domestic opposition and the dispatch of expeditionary forces to portions of the Russian territory by several Western governments, and disappointed by its lack of success in encouraging revolutionary uprisings elsewhere, became authoritarian and repressive, insisting on an ideological conformity that enthroned a rigid interpretation of Marxism as official dogma.

The civil war ended and the expeditionary forces left, but Joseph Stalin, Lenin's successor as General Secretary of the Soviet Communist Party and hence supreme director of the international Communist movement as well as ruler of the federation that took as its name the Union of Soviet Socialist Republics, intensified these tendencies. He drove his former comrade Leon Trotsky into exile—thus incidentally spawning a rival version of Marxism, Trotskyism, which insisted on the need for a worldwide revolution and regarded the Soviet regime as a bureaucratic betrayal of Marxist principles—and conducted bloody purges of other former rivals, of dissidents, and of rural small landholders. He also promoted rapid, forced industrialization and created a chain of “*gulags*,” or slave labor camps, for political prisoners. His substitution, in effect, of a new form of Russo-centrism for the Marxism of Marx may, however, have helped him to rally citizens behind him in repulsing Hitler's invasion during World War II, at the end of which Stalin was accorded control over the group of Central and East European countries that (with the slightly later addition of Czechoslovakia) became known as the Soviet Bloc or the Warsaw Pact. By the time of Stalin's death in 1953, the superpower rivalry and struggle called the Cold War, thought to oppose the Communist “East” (a geographical designation given greater apparent legitimacy as a result of the success of the Marxist revolution in China under the leadership of Mao Tse-Tung) to the democratic “West,” was conducted to a considerable degree in ideological terms, with “Marxism” being identified by both “camps” as the ideology of Communism.

### Western Marxism and Other Marxisms

While there had always been adherents of Marxism, besides Trotskyites, who treated it more as an insightful philosophical method to be employed in social criticism than as the rigid, deterministic, scientific worldview that Soviet Marxist “orthodoxy” claimed it to be, the development of schools of thought known collectively as “Western Marxism” was strongly abetted by a widespread post-World War II revulsion against the many remaining vestiges of European colonialism, to which Marxism's revolutionary spirit seemed clearly opposed, as well as, on an intellectual plane, by the new dissemination of Marx's early, “humanistic” writings. Among the best-known Western Marxists were members of the German “Frankfurt School” of critical theory, notably Herbert Marcuse and, from a later generation, Jürgen Habermas. Future postcolonial leaders in Africa and Asia had often come

into contact with, and been inspired by, Marxist thinking during their studies in France, the United Kingdom, and other Western countries, and the existence of growing numbers of self-described Marxists who did not accept Communist Party discipline was a further encouragement to many of them to advocate and pursue socialist policies when they attained positions of influence. One example, among many, of such intellectual fertilization that was also political in nature was the endorsement given by the prominent French philosopher, Jean-Paul Sartre, during the long Marxist phase of his career, to the writings and work of Franz Fanon, the Martiniquan-born psychiatrist who threw in his lot with the Algerian revolution against French domination. A center of Marxist-inspired resistance to the intellectual hegemony of the Soviet version of Marxism, one that provided special encouragement to East European Marxist dissidents, was the “*Praxis Group*” of independent-minded but still avowedly Marxist philosophers in Yugoslavia, a country posed as a more or less neutral buffer between East and West, and of which the long-time President, Marshal Tito, contributed significantly to the creation of the movement of developing “Third World” countries during the 1950s. In Latin America, too, Marxism inspired many revolutionary and reform movements (including an important hybrid Marxist-Christian movement known as “liberation theology”), particularly in the wake of Fidel Castro's ascendancy to power in Cuba and subsequent self-avowal as a Marxist and Communist.

### Dénouement

The “Thaw,” a loosening of political and ideological constraints that was initiated by Stalin's successor, Nikita Khrushchev, who also made public some previously-concealed facts about Stalin's enormous excesses, for a time rendered more thinkable a climate of genuine debate and criticism within the officially Marxist countries similar to that promoted by Western, Yugoslavian, and some Third World Marxists. It was soon nullified, at least in large measure, by Soviet suppression of a popular worker-supported government in Hungary that had briefly replaced the Soviet-sponsored one. This 1956 event already occasioned widespread loss of hope for serious reform of Soviet socialism and, given the common though not entirely justified identification of the two, a concomitant decline in Marxism's attractiveness to many and an increasing cynicism concerning it. Equally or perhaps even more damaging along the same lines was the 1968 Soviet invasion of Czechoslovakia, another Warsaw

Pact member state, where Prime Minister Dubcek had been attempting to carry out internal reforms known as the “Prague Spring.” Twenty-one years later, the “Velvet Revolution” in that same country met with little or no military resistance and heralded the break-up of the Warsaw Pact, the end of Communist Party dominance, and the eventual dissolution, into separate, smaller entities with often highly nationalistic orientations, of the Soviet Union, Yugoslavia, and even Czechoslovakia itself. Marxism had always been touted as a unique combination of theory with political practice; so it is not surprising that the disappearance of so many actual regimes that had claimed to be Marxist, combined with the aggressive advocacy, on the parts of Margaret Thatcher, Ronald Reagan, and other Western leaders, of such capitalist practices and institutions as privatization and global free markets that are the objects of Marxism’s severest criticism, has led to a palpable decline in its influence. Nevertheless, there are those who continue to find elements of classical Marxism to be of use in generating new critical social theories, particularly with respect to the current course of global development.

### MAU MAU

*Mau Mau* was an armed anti-colonial rebellion that broke out in 1952 and took to the use of violence to compel the colonial government in Kenya to address African grievances. Its activities were concentrated in central Kenya, particularly among the Kikuyu ethnic group; but the uprising was not simply a Kikuyu affair. It recruited fighters from various ethnic groups in Kenya, like the Luo, Samia, and Banyala of Western Kenya; the Maasai of Southern Kenya; the Kamba of Eastern Kenya; and the Meru of Central Kenya. That the rebellion started in central Kenya, with the Kikuyu as the majority of its fighters, was due to the fact that British colonialism started there and the Kikuyu were the most exposed to the colonial pinch.

The colonial administration in Kenya created the economic, social, and political conditions that contributed to the outbreak of the rebellion, for it was essentially a reaction to the sustained underdevelopment of the Africans throughout the colonial period. The inception of colonialism in Kenya saw many Africans, especially the Kikuyu, lose their fertile land to the European settlers in the highlands. Whereas this disrupted African agriculture, pastoralism, particularly among the Maasai, was also disrupted as Africans were henceforth confined to specific geographical localities known as “reserves,” where grazing land was inadequate. In addition, smallholder agricultural production in the “reserves” was confined to subsistence farming, for Africans were barred from growing cash crops. In the midst of this economic downturn, the colonial administration imposed heavy taxation on Africans to compel them to provide cheap labor on European plantations. The colonial administration also introduced the carrying of identification cards (known as *kipande* in Kiswahili) in order to restrict the movement of Africans into other areas that would have satisfied their economic interests. This arrangement cemented an economic squeeze for Africans.

There was also the color bar in the social realm. Besides racial segregation in the residential areas, social services were provided along racial lines. Africans attended separate medical and educational institutions, which were often poor compared to those of the Europeans and Asians. Moreover, it is the missionaries who attempted to provide such services to the Africans and not the government, yet Africans paid taxes. Whereas missionaries were making great effort in this regard, their rejection of African culture drew yet another bone of contention between the Europeans and the Africans, especially among the Kikuyu who insisted on practicing female circumcision to the

chagrin of the missionaries. The resultant tensions and quarrels with the missions led, among other things, to the establishment of independent schools by the Kikuyu. Other communities in the country complained of the generally poor conditions regarding health, education, employment, taxation without representation, police brutality in the urban areas, and so forth.

Landlessness was, however, the immediate cause of the uprising. The demobilization of soldiers who had fought in the Second World War increased the demand for land among the Africans. Whereas white soldiers were settled on fertile land to engage in lucrative cash-crop farming, African soldiers were not given land but only a small amount of money to start a business. The frustrated soldiers concurred with an emerging radical African mass in the conclusion that only force would compel the colonial government to address African grievances, particularly the land question. To this end, a mass political movement emerged under the leadership of the Kenya Land Freedom Army (KLFA), an underground force that targeted the colonial administration and its African sympathizers. The assassination of Chief Waruhiu, who was reputed for serving the interests of the colonial administration, in Kiambu on October 7, 1952, was linked to the activities of this movement.

The declaration of a state of emergency by the governor, Sir Evelyn Baring, on October 20, 1952, in order to track down the activities of KLFA, exploded into an open violent rebellion against British authority in the name of *Mau Mau*. In response to the guerrilla war in the forests, the British put up a fierce military campaign that saw thousands of Africans lose their lives while many others were arrested and detained. By 1953, the rebellion had been militarily defeated, but occasional skirmishes continued into 1956.

Despite the military defeat, *Mau Mau* paved the way for economic, social, and political reforms in the remainder of the 1950s, which contributed to development among the African population. In the economic sphere, the colonial government set up a commission under R. T. M. Swynnerton to make recommendations on how to avoid a similar rebellion in future. This commission came up with "a plan to intensify the Development of African Agriculture in Kenya" in 1954, which was christened The Swynnerton Plan. Among other things, it recommended land reform for the development of African agriculture as the first step in the then-expected agrarian revolution in Kenya. Land was to be consolidated and registered under individual title deeds. This marked the onset of private land ownership among Africans in Kenya.

The Swynnerton Plan also recommended that Africans be allowed to grow cash crops. This enabled Africans to participate in the cultivation of profitable export crops like tea, coffee, and pyrethrum as well as dairy production. With the privatization of land tenure, African farmers could obtain credit against land titles for the improvement of agricultural production. Agricultural extension services were also extended to African farmers for the first time, partly for the purpose of ensuring that agricultural credit was utilized properly. This transformation of African agriculture laid the foundation for economic development.

*Mau Mau* also forced the colonial regime to embark on political reforms that saw greater African participation in the colonial state from the mid-1950s. Political activities and organizations that had been proscribed were allowed. Various constitutional reforms were also made specifically to improve on the representation of Africans in the Legislative Council and Local Authorities. These political reforms paved the way for Kenya's independence in 1963. It is against this background that *Mau Mau* has been credited with facilitating the granting of independence to the country.

#### MAURITANIA

The Islamic Republic of Mauritania is located in Northwestern Africa. It is bounded on the west by the North Atlantic Ocean, with a 754-kilometer coastline. It is bordered on the north by Western Sahara, the northeast by Algeria, the southeast by Mali, and the south by Senegal. Around 40% of the nation is composed of the Sahara Desert and about 30% is semi-desert. There is a narrow band of fertile land along the Senegal River, the only permanent stream.

## MAURITANIA

Climate is constantly hot, dry, and dusty; average temperature in January is 16°C–20°C, in July 30°C–32°C; precipitation is about fifty to four hundred millimeters annually. Terrain is mostly barren, flat plains of the Sahara, with some central hills, and a narrow band of fertile land along the Senegal River. Most of the population—estimated at 2,998,563 (July 2004)—is concentrated in the capital city of Nouakchott (population 612,000), Nouadhibou (population 113,000), and along the Senegal River in the southern part of the country.

Territory of present Mauritania has been settled since the end of the Neolithic Era. About the beginning of the first millennium it was colonized by nomadic Berbers, and during the eighth to ninth centuries most of the population converted to Islam. In the eleventh to twelfth centuries Mauritania was the cradle of the Almoravid movement, which spread Islam throughout the region and for a while controlled the Islamic part of Spain. European traders began to show interest in Mauritania in the fifteenth century. First the Portuguese established a coastal observing station to facilitate naval travel, and this was followed by the Dutch, English, and French.

In 1814, direct French rule was instituted, and in 1920 Mauritania was made part of French West Africa. In 1946 Mauritania was given the status of an overseas territory under France, and in 1958 it became an Islamic republic within the French community. Two years later, on November 28, 1960, it obtained independence under President Moktar Ould Daddah. Morocco for a time tried to absorb it. In 1978, Daddah was ousted by a military coup d'état instigated by a military committee. The committee was dismissed in 1981 by Col. Maaouya Ould Sid Ahmed Taya, who was elected head of state in December 1984, and reelected in 1992 and 2003.

In 1989 ethnic tension with Senegal mounted, but it improved by 1992. Mauritania annexed the southern third of the former Spanish Sahara (now Western Sahara) in 1976, but had to retreat three years later because of raids by the Polisario guerrilla front seeking independence for the territory. Opposition parties were legalized and a new constitution adopted in 1991. Two consequent multi-party presidential elections were widely perceived as being flawed. In reality, Mauritania remains a one-party state, with the Democratic and Social Republican Party (PRDS) ruling almost unopposed. Politics continue to be tribally based. In 2003–2004, three failed coup attempts were staged by dissident army officers, and there has been suppression of Islamic radicals who form the backbone of the civilian opposition. In the end of 2004, about 180 military personnel and civilian opposition figures went on trial at a remote military barracks in

the desert, charged with plotting to overthrow the president.

This country still experiences ethnic tensions between the dominant Maur (Arab-Berber) population and its 30% black minority. Nearly 100% of the population are Muslims. Mauritanian claims to the Western Sahara have been dormant in recent years.

Half the Mauritanian population still depends on agriculture and livestock for a livelihood, even though repetitive droughts in the 1970s and 1980s forced many of the nomads and subsistence farmers to the urban areas. Mauritania has extensive deposits of iron ore, which account for nearly 40% of total exports. Because of the decline in world demand, production has dwindled. The coastal waters are among the richest fishing areas in the world, but over-exploitation by foreign vessels endangers this key source of revenue.

In the past, drought and economic mismanagement resulted in a buildup of foreign debt. In February 2000, Mauritania qualified for debt relief under the Heavily Indebted Poor Countries (HIPC) initiative and in December 2001 received strong support from donor and lending countries. In 2001, exploratory oil wells in tracts eighty kilometers offshore indicated potential extraction at current world oil prices. The Chinguetti offshore field was to be the first to start production in the first half of 2005, producing around 75,000 barrels per day for export. The even bigger neighboring Tiof field was scheduled to follow.

An investment code adopted in December 2001 enhanced the opportunities for direct foreign investments. Negotiations with the IMF involve issues of economic reforms and fiscal discipline. In the meantime, the government underscores reduction of poverty, improvement of health and education, and promoting privatization of the economy. Per capita GDP was estimated in 2003 at \$1,800.

There are 717 kilometers of railways, 7,720 kilometers of highways of which only 830 kilometers are paved, and some ferry traffic on the Senegal River. Of the country's five maritime ports, only the one near Nouakchott is deepwater (opened in 1986). There are eight airports with paved runways, out of a total of twenty-four, of which only three are able to receive large aircrafts. The literacy rate among the adult population is less than 42% (among males, almost 52%; among females, 32% [2003 estimate]). Reforms provide for unification of the education system, promotion of vocational and technological training, strengthening of education in sciences and foreign languages, and both civic and confessional teaching. The main academic institution in Mauritania is Nouakchott University, founded in 1981, and there is also the National Institute of Pedagogy. Mauritania officially banned slavery only in 1981, but despite

official denials, it still exists. According to the World Health Organization (WHO) data from 1995, there are approximately fourteen physicians and sixty-two nurses for every one hundred thousand people. Life expectancy for males is fifty years and 54.5 years for females (2004 estimate). The population growth rate is 2.91% annually (2004 estimate) and the infant mortality rate is 72.35 deaths for every one thousand live births.

## MAURITIUS

Mauritius, a 1,860-square kilometre island of volcanic origin, lies in the Indian Ocean east of Madagascar. The topography is varied: from the central highlands the land slopes to the coastal plains, most extensive in the north and east where sugar is the dominant crop. The climate is tropical and the island lies within the cyclone belt. The economy is healthy: per capita Gross National Income (GNI) in 2003 was \$4,090 and growth rates during the period 1983–2003 averaged over 5%. The country includes the island of Rodrigues, five hundred kilometres to the east, which is significantly less prosperous and culturally quite distinct.

Uninhabited when discovered by Europeans, Mauritius was first permanently settled by France in 1722 and transferred to British administration in 1814. Economic development in the British period was synonymous with sugar- and slave labour-fuelled growth; following the abolition of slavery in 1835, indentured labourers from India were imported to work in the

cane fields. Today the island's largely French-speaking population of 1.2 million may be subdivided into Hindu (approximately 50%) and Muslim (20%) Indians, Creoles of mixed African and European ancestry (30%), and small but economically significant Chinese and Franco-Mauritian ("white") minorities.

Towards the middle of the twentieth century, stagnant sugar output levels and rapid population growth raised concerns about the island's future. The colonial administration, recognising that independence was inevitable, commissioned an economic survey of the island that would provide a framework for future policy. The ensuing report, published in 1961 and known as the Meade report, was a thorough, influential, and somewhat pessimistic analysis of the island's economy. It made it clear that economic diversification and industrialisation were essential if the island were to have any hope of achieving real and sustained growth.

Policies established in the 1960s were initially aimed at encouraging import substitution industrialisation (ISI). Although not without results, ISI failed to have the desired impact, both for want of a sufficiently skilled workforce and due to a reluctance on the part of the sugar estate owners to invest their capital. Consequently, when Mauritius acceded to independence in 1968, sugar still accounted for 95% of export earnings and the first post-independence government shifted emphasis to manufacturing for export. It established an Export Processing Zone (EPZ), aimed at attracting both foreign and domestic capital into an industrialization program through an attractive package of incentives including tax relief; subsidies, and credit facilities; assurances of good infrastructure; and a competent, cheap, and reliable labour force. At the same time, quotas and preferential tariffs guaranteed sugar sales in Britain and the EEC, providing a reliable source of revenue for economic growth.

Based principally on textiles, the EPZ was a success but it was dependent upon the health of the sugar sector. In the early 1970s, while world sugar prices were extremely buoyant, Mauritius produced several bumper crops and the resultant profits fuelled growth. Sugar profits also funded investment in the tourism sector and in services, as well as providing increased government revenue, thus permitting improvements to social services and general infrastructure development.

The worldwide recession in the mid-1970s, competition from other developing nations, and two devastating cyclones led to an economic downturn and rising external debt. In 1979 the government was obliged to implement an IMF-imposed program of structural adjustment that included state disengagement from the economy and a greater emphasis on free market forces. Nevertheless, the government

maintained its commitment to social programs, including free education and health care; these policies were costly, and there was little improvement in the economy until the mid-1980s, when a healthier international climate finally allowed renewed growth in the increasingly important tourism sector and accompanied a similar increase in industrial output, again largely in textiles.

Since the 1980s the government's emphasis on continued diversification has led to growth in the financial services sector, particularly in offshore banking, as well as in transport (flag-of-convenience shipping) and other offshore operations. Annual growth rates have regularly been on the order of 6%–7% and unemployment remains low. The public health and education systems are both free and of high quality; literacy rates and life expectancy are high, while infant mortality and population growth rates are low. Nevertheless, some 10% of the population, excluded from the benefits of economic growth, continues to live below the poverty line.

The success of Mauritius may be attributed to several factors, and some are clearly more important than others. A stable democratic system, based on the Westminster model, is a reflection of a more fundamental feature of Mauritius, that of its identity as a European colonial construct. Descriptions of Mauritius as an “enigma” and a “miracle” among developing African states are misleading: Mauritius is not an African country except in a geographical sense, and that only tenuously. Economically and politically, Mauritius is a creation of the colonial world and as such has always been firmly inscribed within the Western economic system.

If Mauritius was formerly underdeveloped, then this was a result of the island's place in this system and not, as was the case in most African countries, its absence therefrom. Social, economic, and political constraints on capitalist development are noticeably absent in Mauritius; the educational system is resolutely Western, and the country has also benefited from a predilection for a strong, socially committed state, inherited from post-Second World War Britain. An emphasis on social policies, including social security and equality of income, has been a feature of all Mauritian governments regardless of their political orientation, and it is of note that there have only been three prime ministers in the thirty-five years since independence. The role of domestic capital in local investment has also been important: unlike many other developing nations, Mauritius is less subject to the whims of foreign investors.

Other advantages, such as the lack of a standing army (removing the risk of military intervention in the political process), the small size of the island

(facilitating infrastructure development), and the country's ethnically diverse population, have also contributed to Mauritius' success. This last feature has hitherto been far more of a help than a hindrance: inter-ethnic tension is rare; no group is dominant socially, economically, or politically, and as a result of its cultural diversity Mauritius maintains a range of links with various parts of the Indian Ocean and beyond.

Despite the successes, the government is aware that there is no cause for complacency. Diversification notwithstanding, the economy remains dependent upon external markets and the economic base remains narrow: textiles, tourism, banking, and sugar. Furthermore, the country's success has depended upon privileged access to European markets under the terms of the Lomé Convention and not upon free market forces. Continued diversification and increased competitiveness are thus seen as priorities as growth rates start to slow and unemployment increases.

### MBEKI, THABO

Thabo Mbeki (b. 1942) became president of the Republic of South Africa in 1999. He was born in Idutywa, Transkei, on June 18, 1942. His father, Govan,

joined the ANC as a student (1935), later was elected chairman (1956), and spent twenty-three years in prison alongside Nelson Mandela, who was later to become the first majority-elected president of the Republic of South Africa (1994).

Mbeki attended high school at Lovedale and joined the African National Congress (ANC) Youth League at age fourteen. He was expelled from high school following student strikes, and continued in home study, ultimately earning a master's degree in economics from the University of Sussex as a correspondence student. Two years after the government banned the ANC, in 1960, Mbeki was sent overseas for his higher education. He served in a number of ANC positions abroad, including posts in London, Zambia, Swaziland, Nigeria, and Botswana, and received military training in the USSR. He did not return to South Africa until 1990.

While abroad, Mbeki rose in prominence in the ANC. He became a member of the ANC National Executive Committee in 1975 and was appointed political secretary to the ANC president in 1978. As the director of the ANC's Department of Information and Publicity (1984–1989), Mbeki acted as the organization's chief international spokesman. Meanwhile, he led ANC delegations in secret talks with the South African government and the private business sector, which resulted in the unbanning of the ANC and release of political prisoners, including Nelson Mandela in 1990. Mbeki was elected chairman of the ANC in 1993 and president of the organization in 1997. Two years later, he was elected president of South Africa.

Polished and charming, easygoing, and politically pragmatic, Mbeki proved to be an excellent choice to advance the ANC from a political liberation movement and guerrilla army to success at the ballot box. However, compared to Mandela, Mbeki appears more detached and less a man of the people.

The largely peaceful evolution of South Africa from a nondemocratic, national security state with deep racial, political, and economic distortions to the continent's largest democracy, most successful economy, and regional leader has both domestic and international implications. Its 43 million people, 75% of whom are black, share understandably higher expectations with the end of apartheid rule. Its white minority citizens (13%), tracing their African origins to the establishment of a naval refreshment station by the Dutch East India Company at the Cape of Good Hope in 1652, also stand as claimants to South African heritage.

The decade of the 1990s saw more than forty African governments hold national elections, marked dramatically by Mandela's election in 1994. The South African national economy accounts for 40% of

Sub-Saharan Africa's gross domestic product. Nevertheless, Africa on the whole has more wars, the most poverty, the highest number of displaced peoples due to civil war, climatic catastrophes, and pandemic disease, including the most AIDS casualties of any world region. South Africa shows the most capabilities and potential of any state in its region and on the continent. The state carries a heavy burden of high expectations among the G-7 advanced, industrial nations. A common perception is that as goes South Africa, so goes the continent.

Mbeki's opposition quickly points to the nation's standstill economic growth, a 40% adult unemployment rate; the free fall of the national currency in the world market; the worst per capita murder rate in the world; and inability to provide clean water, adequate housing, medical care, public education, and jobs. Mbeki's repeated denials of the link between HIV and AIDS have detracted from his image in South Africa and globally. On another front, his refusal to criticize Zimbabwe president Mugabe for sponsoring violent attacks on his political opposition and the forcible takeover of white-owned farms generates moral and political outrage.

President Mbeki has tried to build upon Mandela's success at reconciliation of bitter ethnic hostilities and to pursue transformation that ensures political, economic, and humanitarian advancement.

### MEIR, GOLDA

Golda Meir (1898–1978) was instrumental in the creation, development, and survival of the State of Israel. As an early pioneer, she was familiar with every aspect of the Jewish occupation of Palestine. She was one of Israel's biggest promoters abroad, personally raising the millions of dollars to assure its

survival. Although the primary focus of her activities was labor, she held many political posts throughout her career, eventually becoming prime minister. Her primary goal was to help establish a homeland in which Jews from anywhere in the world could find refuge.

She was born Golda Mabovitch in Kiev, Russia. She immigrated to the United States as a child in 1906 and lived in Milwaukee, Wisconsin, the child of a carpenter father and grocer mother. As a young woman, she worked with her father for the People's Relief Committee. She taught Yiddish to children at a Labor Zionist Party school, joining the Party herself at seventeen and engaging in both speechmaking and fundraising. After marrying Morris Meyerson, she emigrated with him in 1921 as part of the Third *Aliyah*, or wave of Jewish immigration, to Palestine.

Meir's contribution to the development of Israel can be divided into three phases: the work she did during the Jewish occupation in Palestine under British Mandate Rule; her World War II and pre-independence activities; and her political involvement after the formation of the State of Israel in 1948.

### **The Jewish Occupation of Palestine (1921–1939)**

Golda Meir's contribution during her early years in Palestine consisted primarily of working on behalf of the *Histadrut* (General Federation of Jewish Labor). Shortly after arriving in Palestine, the Meyersons applied for permission to join Merhavia, a kibbutz, where they lived for two years before her husband's health required them to return to Tel Aviv and then Jerusalem, where, over the next four years, she bore and raised two children. She eventually returned to Tel Aviv to work for the Histadrut.

Her first job with the Histadrut was that of secretary of the Women's Labor Council in 1928. This council ran the workingwomen's farms that trained immigrant girls in agricultural skills. Meir served as a labor representative during that time to a number of international conferences abroad, but much of her work involved talking about the conditions of Jews in Palestine and raising funds in the United States, working on loan as national secretary of the Pioneer Women in the United States.

Eventually, she was appointed to the Executive Committee of the Histadrut and remained there for fourteen years, working on setting up an unemployment fund and resolving the myriad problems associated with immigration, which increased considerably after Jews from Germany began to

enter Palestine. It was during this time that she got to know people such as David Ben-Gurion and Levi Eshkol, who would play important roles in the establishment of the State of Israel, as well as in Meir's own career. As chair of the Board of Directors of the Workers' Sick Fund, Meir continued to raise funds for the Histadrut and was instrumental in establishing its shipping business through her US fundraising efforts. The purchase of ships would be the means by which European Jews found their way to Palestine.

In 1939, when the British issued a White Paper reversing their position on the establishment of a Jewish state and limiting Jewish immigration to a maximum of seventy-five thousand Jews for five years, while also restricting the purchase of land by Jews in Palestine, Meir shifted her focus away from labor problems to helping as many Jews as possible find their way to Palestine.

### **World War II and Pre-Independence Activities (1939–1948)**

Following Ben-Gurion's position, "We shall fight Hitler as if there were no White Paper and fight the White Paper as if there were no Hitler," Meir served on the War Economic Advisory Council during World War II, assisting the British with the war effort and negotiating fair wages for Jewish civilian workers, but also working to get as many Jews into Palestine as possible in spite of the illegality of the process. The so-called Committee of the Illegal Immigration met in her apartment, and she personally wrote some of their leaflets.

In 1946, Meir organized a hunger strike to protest the British exclusion of two ships of Jewish refugees headed for Palestine. The ships were eventually released and refugees allowed to enter. Later, Meir became acting head of the political department of the Jewish Agency, becoming its leader when Moshe Shertok was imprisoned and Ben-Gurion was kept out of Palestine under threat of arrest.

In 1947, the United Nations Commission of Inquiry recommended an end to the British Mandate and the partition of Palestine into equal parts, an act that the Jews accepted but the Arabs did not. Meir was part of the Zionist negotiations with the British and worked actively to raise \$50 million in the United States to arm the State of Israel in anticipation of the war of independence it would have to fight once the British withdrew. On May 14, 1948, the day of that withdrawal, Golda Meyerson was one of thirty-eight signers of the Proclamation of Independence that created the State of Israel.

## The State of Israel (1948–1978)

After the formation of the State of Israel, Meir held diplomatic and cabinet posts, but for the most part continued to raise money, to work to solve the problems of the new state, and to assure its survival. She was Ambassador to the Soviet Union, appointed in 1948. In January 1949, Israel won its war of independence and an armistice was declared. The first elections were held and Meir became a member of the Israeli cabinet, working as the first Minister of Labor, a job that involved responsibility for housing, job training, buildings, and roads for what she called “my seven good years.” During this time, there was an ever increasing migration to Israel and increased unemployment and inflation. Meir oversaw the building of permanent public housing, a network of roads, and other projects for which she continued to raise money on trips to the United States and Europe. In this post, Meir was instrumental in the passage of labor laws limiting the maximum number of work hours, providing national insurance, and guaranteeing paid maternity leave.

In June 1956, Meir became Foreign Minister of Israel, and it was at this time that she officially changed her name from Meyerson to the Hebrew *Meir*, which means “to illuminate.” In this post, she represented Israel at the United Nations, which was especially important following the Sinai War in 1956. Meir also played a key role in extending knowledge and assistance to many developing African and Asian countries, sending experts to assist and inviting foreign students to come to Israel, and providing fellowships for that purpose as part of her International Cooperation Program.

After serving as Secretary General of the Labor Party, Meir retired in 1968, only to be called upon six months later in 1969 to become Prime Minister of Israel after the death of Levi Eshkol and to avert a potential Labor Party split. She held the office until 1974, when disillusionment with her party’s handling of the October War (also known as the Yom Kippur War) and its high death toll led to a general loss of confidence in the Israeli military leadership. She resigned the office on April 11, 1974.

When she died of cancer on December 7, 1978, she was given a state funeral without eulogies, according to her wishes. It was attended by dignitaries from all over the world.

## MENCHÚ TÚM, RIGOBERTA

Rigoberta Menchú Túm, a Quiché-Maya Indian woman, was born to a relatively poor family on January 9, 1959, in Chimel, a village in the province of El Quiché, Guatemala. It is Central America’s poorest and most populous country with approximately 14.3 million people, half of whom are direct descendents of the Maya Indians. Although Maya are the majority population in Guatemala, historically they have been an oppressed group. Menchú Túm’s family are *Quiché*, the largest of the country’s twenty-two Indian groups.

Rigoberta Menchú Túm is perhaps the most famous indigenous person in the world and certainly the most famous Guatemalan. She first rose to international prominence in the early 1980s when her *testimonio*, told to Venezuelan anthropologist Elizabeth Burgos-Debray, was published in Spanish. The *Testimonio, I, Rigoberta: An Indian Woman in Guatemala*, told the story of the condition of Guatemala’s indigenous population from the 1954 military coup that ended Guatemala’s nascent democratic regime through the impact of Latin America’s longest-running civil war and the subsequent series of military governments. While the book was banned in Guatemala, it won the prestigious “Casa de las Americas” prize for best testimonial, which helped provide Menchú with an international forum for her message. This authority to talk on behalf of indigenous people in Guatemala was further enhanced when she was awarded the UNESCO Prize for Education for Peace in 1990.

The country's military regimes governed without respect for individual rights or traditional Indian rights. The military regimes' stated motivation was to fight communism in the country. The regimes' counter-insurgency operations had a profound impact on the majority Indian population. As the military strengthened its position in Guatemala, its leadership became increasingly repressive toward the indigenous population. In particular in the early 1980s, General José Efraín Ríos Montt let loose a wave of repression against the indigenous population in the countryside, forcing them to join self-defense militias or to be killed. Indeed, in a 1982 *New York Times* article, the General articulated his policy toward the indigenous people stating, "If you are with us, we'll feed you; if not, we'll kill you." Government repression was aided by right-wing death squads, most notably the *Mano Blanca* (White Hand), that were given free reign to act against the indigenous peoples.

It was this military repression that drew the Menchú family into the country's political life and eventually many of them were killed as a consequence. Rigoberta's father, Vicente Menchú, a peasant activist and smalltime landowner, was killed during the occupation of the Spanish Embassy in Guatemala City in January 1980. The occupation ended in an inferno that reduced the embassy to rubble and killed thirty-nine people including the Spanish Ambassador, many of his staff, and the protestors who had taken over the embassy to protest government human rights violations. The cause of the fire is still inconclusive; the military accused the occupiers of torching the building, but the occupiers' sympathizers have consistently blamed the military.

Later in the same year, Rigoberta's mother, Juana Túm Kótojá, was kidnapped by the military and was never seen again. As the violence worsened, Menchú Túm left Guatemala and sought refuge in Mexico.

By the mid-1980s the country began a gradual return to democratic rule. A new constitution and new government institutions, including a more independent Supreme Court and a Human Rights Ombudsman's office, were created. But this process remains incomplete even with the most recent elections of January 2004. Violence against human rights workers remain a persistent problem.

Menchú Túm's work toward a resolution to the 36-year civil war in Guatemala was recognized on the anniversary of the five hundredth anniversary of the European colonization of Latin America in 1992 when she was awarded the 1992 Nobel Peace Prize. Rigoberta Menchú used the money from the prize to establish the Rigoberta Menchú Túm Foundation (RMTF) in Guatemala, Mexico, and the United

States. The Foundation fights for Human Rights and the rights of Indigenous Peoples, and facilitates peace processes both in Guatemala and abroad.

According to Arturo Arias, a noted Guatemalan academic and novelist, prior to her return to Guatemala in 1988, Rigoberta Menchú Túm was a virtually unknown figure in her native country, even among the Mayan people. This was changed in a flash by the Guatemalan military through their handling of her return. Menchú Túm was asked to return by the administration of President Vinicio Cerezo (1986–1991) to show to the world that Guatemala was now a full-fledged democracy governed by the Rule of Law. Menchú Túm returned to her country with three other exiled leaders of various banned opposition groups. When Menchú Túm's plane touched down in Guatemala City, she was immediately arrested, but the increasingly independent Supreme Court demanded her release. The military's heavy-handed treatment of Menchú's return was on the front pages of newspapers around the world, including in Guatemala.

Menchú was involuntarily thrust into the middle of an ongoing "culture war" in the United States during the 1980s and 1990s when some leading universities required that her book, *I Rigoberta*, be taught in place of some European classics. Moreover, US anthropologist David Stoll's fieldwork investigations into the veracity of Menchú Túm's *testimonio* of Guatemala's civil war revealed some inconsistencies between Menchú's own account of the fate of her family and reports of other Guatemalans on her family's life. The media picked up on the debate and the story appeared on the front page of the *New York Times* in 1998. The newspaper article sparked an international debate concerning the accuracy of Menchú's version of events in Guatemala's civil war and added a new chapter to the culture war, reigniting the shrill debate between the left and right of the political spectrum both in Guatemala and in universities across the United States. Menchú's book and the resulting debate about factual accuracy also raised a discussion about the role of *testimonio* as a form of literature.

Despite the debate surrounding Rigoberta Menchú's account of the fate of her family, there is little doubt that she has had a profound impact on alerting the world to the repression and violence in Guatemala and the needs of indigenous people around the world.

### MENEM, CARLOS

Carlos Saul Menem was the flamboyant president of Argentina from 1989–1999. Menem was born in 1930, the son of Syrian immigrants. Raised as a Sunni Muslim, Menem converted to Catholicism in his youth. Menem was trained as a lawyer. He has had a contradictory but interesting role in Argentine history as a president with populist appeal who carried through conservative economic reforms, who was indicted on corruption charges, and who has re-emerged as a political force. Menem also seemed to provide strong leadership to Argentina after a long period of economic decline.

Menem is a member of the Peronist Party, with long-standing ties to the CGT (*Confederación General de Trabajo*) labor union and the Peronist leadership. The Peronist Party was geared around the charismatic Juan Peron, who had developed a strong and deep popular appeal as well as ties to Argentina's labor unions. Following a military coup, Peron had been in exile in Spain through much of the 1960s. Peron made a brief return to Argentina in 1973, before he died. The Peronist movement, now led by Peron's second wife, stuttered amidst a growing economic crisis, which precipitated a military coup in 1976. Menem served as governor of the province La Rioja from 1973–1976 and from 1983–1989. As a prominent member of the Peronist Party, Menem was imprisoned by the military government in 1976. Amidst continuing hyper-inflation, and the disgrace of the loss of the war with the United Kingdom over the Falklands/Malvinas Islands, the military finally gave up power.

Democracy was restored to Argentina in 1983 and Raul Alfonsín of the Unión Cívica Radical was elected president. Although Alfonsín was successful in stabilizing democracy in Argentina, the economy continued to suffer from both high inflation and

unemployment. Menem surprised many in winning the 1989 presidential election, garnering 49% of the vote. He was an old-style Peronist candidate, promising a return to government intervention and spending and a reduction in unemployment. Menem took the party by surprise, when, after taking office, he adopted the opposite set of policies. Menem traveled to the United States and Great Britain soon after taking office. In 1990 he gave pardons to military officers for human rights abuses. Menem also passed major economic reforms by decree in early 1990. He engaged in tight fiscal and monetary policies and moved toward privatization of key industries, including ENTEL (telecommunications); Aerolíneas Argentinas (the national Airline); YPF (the national oil company); and the electricity system (dominated by SEGBA). He liberalized the economy, opening up Argentina for investment through the elimination of restrictions; eliminating export taxes and most quota restrictions on imports; and reducing other import duties. Menem completed his full-scale transformation from former labor leader to neoliberal with new labor regulations. Menem's erstwhile minister of the economy, Domingo Cavallo, tied the Argentine currency to the dollar in 1992, which seemed at the time to pay big dividends in terms of increasing investment in the country and stabilizing national accounts, particularly in controlling inflation. Menem made important steps forward in the MERCOSUR (see Southern Cone Common Market [MERCOSUR]) integration process. Menem was hailed as a hero and economic statesman at that point, and used his popularity to push through a Constitutional amendment permitting him re-election. He was easily re-elected in 1995, with 50% of the vote but no close contender. Menem seemed to have created a new, more moderate wing of the Peronist Party around his "revolución productiva," called "Menemismo," though dissidents formed the FREPASO alternative.

By the late 1990s, however, unemployment remained in the double digits in the country. Wage data do not reveal any significant increases during the 1990s. The exact reasons for the Argentine meltdown remain controversial, but many analysts suggest the maintenance of the fixed exchange rate was unnecessary after inflationary expectations had declined. As well, there is some evidence that the privatizations had little lasting effect on overall levels of external debt or the fiscal deficit, and much of the investment in the country remained in quickly withdrawn portfolio capital accounts. Brazil's devaluation in 1999 hastened the end of the Argentine "boom," with an accentuation of a balance-of-trade deficit adding to these long-term problems. By 2001, confidence in Argentina began to quickly erode, setting up the financial crisis that

began in that year. Menem's political career took a nosedive with the economic downturn and came to a seeming end. His attempt to change the Constitution again to allow for a third term failed. He was tied to a corruption scandal involving arms sales to Croatia and Ecuador in 2001. Though the Supreme Court ruled that there was insufficient evidence, Menem's political career seemed over.

Based on public exasperation of the seemingly feeble state responses to the economic crisis and a search for stability, Menem attempted a comeback in the 2003 special presidential elections, which had been called on account of the collapse of the government due to the economic crisis that began in 1999. Menem appeared a strong candidate at first, winning the first round of the primary with 24% of the vote. However, as rival Nestor Kirchner pulled away, Menem withdrew from the race. Nonetheless, Menem has continued to work behind the scenes as a political leader. Amidst the depression Argentina entered into starting in 2002, Menem somehow became a renewed symbol of nationalism with the appeal of former elements of the Peronist Party.

### MENTAL HEALTH

While almost all aspects of health are low priorities on global and national agendas, mental health has

always been among the lowest. Countries with inadequate or struggling economies pay little attention to health in general, putting what few resources they have into creating political, economic, and military security. The resources that are committed to health go to urgent and visible public health issues and the provision of basic human needs. Mental health is no less urgent and no less of a threat to development, but it is far less visible—and thus often overlooked.

Common definitions of mental health encompass psychological well-being and reasonable adjustment to one's life. Mental illness includes an extensive range of disorders and disabilities that vary from mild to severe, including Alzheimer's disease, autism, depression, epilepsy, learning disabilities, schizophrenia, and substance abuse. In 2000, mental and behavioral disorders accounted for 12.3% of the global burden of disease, with an estimated 450 million people affected worldwide (World Health Organization 2001). Populations in both industrialized and developing countries experience mental illness; such illnesses place an even heavier burden on those in developing or transitioning countries, who lack services, treatment, and support due to the problematic political, economic, social, and health care environments. Availability, access, and quality of mental health services in developing countries vary considerably, and are usually seriously deficient.

Many of the barriers to access for physical health care are magnified for mental health care. These barriers include travel and housing expenses to often very distant health care clinics, prohibitive official or unofficial costs (bribes) of health care, poor quality of treatment, lack of medicines, and stigma or psychological costs. For example, patients in India may have to spend the equivalent of several months' salary for transportation to a clinic (Narayan 2001). In areas of Africa, nearly 90% of epilepsy patients do not have access to anti-convulsant medications (Weissman, Ustun, and Eisenberg 1999).

Additionally, mental health care diagnosis and treatment is seriously lacking in many developing countries. Doctors and other health care workers lack training in mental health, and thus fail to diagnose distress and disorders. This is understandable, perhaps, given the immediate physical health problems they must treat under comparatively difficult circumstances, but health care workers in developing countries thus fail to address the overlap between physical and mental health. There is also the common misperception that mental health disorders remain untreatable. Along with a lack of resources, the lack of attention to mental health explains these deficits and misperceptions.

In the mid-1990s, the Global Burden of Disease study utilized the Disability Adjusted Life Years (DALYs) method for measuring disability as well as mortality indicators. (Each DALY is equivalent to one healthy year of life lost.) Though mental health diagnosis by health care practitioners is limited, surveys of clinic patients and other tools do enable researchers to estimate incidence of mental illness. Once disability was added to the equation, five of the top ten causes for lost disability-adjusted life years in the world were related to mental health. The burden of mental and behavioral disorders exceeded DALYs lost to HIV/AIDS, cancer, and tuberculosis. Depression, alcohol abuse, bipolar disorder, and schizophrenia topped the list (Murray and Lopez 1996).

Mental health's historic "Cinderella" status means there have been far fewer comprehensive studies of its impact in developing countries than one might expect. It may be one item included in larger public health studies, but until recently, few development studies focused solely on mental health or its overlap with physical health or development issues. Despite continued debate over specific causal effects and cross-cultural applications, there is growing recognition that mental health is integrally related to not only physical health but also development issues such as poverty, economic productivity, political instability, conflict, provision of basic human needs, social cohesion, and human rights. These relationships are complex and inseparable, particularly for the most common mental and behavioral disorders.

The World Health Organization (WHO) updated the Global Burden of Disease study in 2000; three mental health disorders rank in the top twenty causes of lost DALYs: depressive disorders, alcohol abuse, and self-inflicted injuries. Additionally, among ages 15–44, the top two causes of years of life lived with disability (YLDs) are depressive disorders and alcohol abuse (WHO 2001). While most people in developing countries remain mentally healthy, they face increased risks due to the political and economic environments. Depression, substance abuse, and suicide thus have a significant impact in developing countries. Cultural differences, dislocations, and violent conflict further complicate the impact of these three disorders. The process of development itself creates both benefits and challenges to progress toward mental health in developing countries.

## Depression

Depressive disorders, specifically unipolar depressive disorders, seriously impact societies throughout the

world, and caused the fourth-highest burden of disease in 2000. For all age groups, among both men and women, depression caused 4.4% of DALYs lost. The situation is even bleaker for ages fifteen to forty-four, where depression ranks number two at 8.6% of DALYs. It is also the second leading cause for women in that age group. Estimates suggest that, by 2020, depression will account for 5.7% of DALYs, making it the second leading cause of burden of disease for all age groups of both sexes (WHO 2001).

Depression presents both psychological and physical symptoms. Feelings such as worthlessness, inadequacy, sadness, hopelessness, and diminished pleasure in life combine with sleep disturbances, weight changes, fatigue, headaches, and chronic pain. A diagnosis of depression comes when these symptoms are present over a period of time. Both biologic and social in origin, depression can be episodic or chronic, mild or severe. Chronic depression is most common, and disrupts an individual's ability to function at home, at work, and in society. Treatment, at least in the Western world, includes medication and psychotherapy.

Studies show a high incidence of depression in developing countries, with up to 30% of women and up to 40% of all health care patients exhibiting symptoms of depression. In Africa and Latin America, surveys suggest that depression is the main reason that one-fifth to one-third of all patients seeks care. Lack of mental health training, cultural differences, and stigma, however, often prevent the diagnosis. Patients present their physical rather than psychological symptoms. This not only inhibits diagnosis and treatment of depression, but also can lead to unnecessary health care costs as doctors seek to address the physical condition only (Desjarlais *et al.* 1995; Patel 2001).

Links between socioeconomic conditions and depression remain ill-defined, though studies generally conclude that uncertain political and economic conditions in developing and transitioning countries place populations at higher risk for depression. Unfortunately, citizens of these countries, if diagnosed, have less access to treatment for depression. Medications may be expensive or unavailable. There is considerable question as to whether Western psychotherapy would be effective treatment in other cultures. Most authors call for further research to determine best practices for treating depression in developing countries.

## Substance Abuse and Dependence

Substance abuse and dependence are increasingly common in developing countries, with alcohol the

most common addiction. Substances used vary across regions and include alcohol, tobacco, opium and heroin, cocaine, sedatives, stimulants, and solvents. As a cause of burden of disease, alcohol dependence ranks in the top twenty, accounting for 1.3% of DALYs lost. For men ages fifteen to forty-four, alcohol dependence is the fourth leading cause of burden of disease, at 5.1% of DALYs lost (WHO 2001).

Health care professionals distinguish abuse from dependence. Abuse, or harmful use, occurs when substance use prevents individuals from functioning economically and socially, leads to physical or mental damage, drives individuals to seek more despite harmful consequences, and results in withdrawal symptoms when usage stops. Dependence goes beyond abuse and entails a compulsive need to take the substance, inability to control use, withdrawal symptoms when usage is reduced or stopped, neglect of personal and other needs, and continued use regardless of consequences to self or others (Desjarlais *et al.* 1995; WHO 2001).

Desjarlais *et al.* (1995) point out that “drug abuse is often a consequence of rapid social change (even social turmoil) brought on by factors such as rapid modernization and urbanization, civil strife, disease epidemics, and extreme economic hardships.” These conditions are all too common in developing countries and create vulnerable populations. Alcohol, for example, can create feelings of relaxation and freedom that are desirable to individuals facing social and economic difficulties. However, it also depresses the nervous system and can lead to depression, violence, and impaired functioning. Excessive, long-term drinking leads to physical complications such as cirrhosis and mental health complications such as psychotic episodes and hallucinations. Alcohol abuse is directly linked to accidents, interpersonal violence, and suicide.

Treatment for alcoholism is very limited in developing countries. Alcoholics receive treatment only for disorders and wounds resulting from substance abuse, not for the addiction (Patel 2001). Studies encourage policy makers and health care workers in developing and transitioning countries to alter policies and perceptions to focus on treatment of dependency. Addressing alcohol dependence is important because alcohol abuse has consequences for communities and societies as well as individuals: increased crime, violence, traffic accidents, unemployment, and reduced productivity. It is difficult to quantify the cost of alcohol dependence to developing societies, but estimates suggest it costs at least 1% of a developing country’s gross domestic product (GDP).

The vulnerability of developing and transitioning country populations to alcohol, tobacco, and other

substance dependence is exacerbated by the economic benefits associated with substance sales. Governments tax sales of alcohol and other legal substances and thus gain substantial revenues. Health professionals insist that the human cost outweighs any economic gain and indirect costs of alcoholism, such as health care, lost productivity, and law enforcement exceed revenues collected. They seek changes in government policies related to alcohol sales and consumption. Governments remain unconvinced, and the tension between the economic gains and human costs of alcohol dependence remains. A mid-1980s campaign against alcohol in the Soviet Union illustrates this point. For nearly three years, the government limited hours for alcohol sales, jailed those selling alcohol illegally, increased vodka prices, and had police arrest those drinking in public. Estimates suggest the campaign saved over half a million lives and reduced mortality rates in Russia. However, the campaign also reduced government revenue, perhaps by as much as 10% of indirect taxation, and is blamed in part for the Soviet Union’s subsequent financial collapse.

Though many cultures accept usage of traditional drugs, substance abuse and dependence place an increasing burden on developing and transitioning societies. Without mental health and policy intervention, substance dependence will likely continue to limit opportunities for development.

### Suicide

Depression and alcohol abuse are related to each other and to self-inflicted injuries and suicide. In 1995, for countries that reported such statistics, suicide was one of the top ten causes of death (Desjarlais *et al.* 1995). The World Health Organization considers suicide a serious public health problem. The Global Burden of Disease 2000 study ranks self-inflicted injuries, including intentionally killing oneself, eighteenth among causes of burden of disease at 1.3% of disability-adjusted life years lost. Suicide rates are consistently higher among men worldwide; suicide is the seventh leading cause of death for men ages fifteen to forty-four, accounting for 3.0% of DALYs.

Suicide rates vary considerably, geographically and culturally. As well, statistics on the subject are unreliable and sometimes unavailable. The general perception that suicide occurs primarily in industrialized countries is, however, a myth. As of 1995, the country with the highest rate of suicide was Sri Lanka (Desjarlais *et al.* 1995). Between the 1980s and 1990s, suicide increased nearly 62% in Mexico and 54% in

India, but decreased by 5% in the United States and 14% in Japan. These overall figures may disguise increases in regions within countries or in particular age groups (WHO 2001). The human cost of suicide is clear for both victims and their survivors. The economic cost is less clear.

Desjarlais *et al.* (1995) assess determinants of suicide, considering severe stressors as well as psychiatric disorders. The relationships between severe stressors and suicide are often indirect or inconsistent across countries. They find no direct link between suicide and modernization or urbanization, though social forces related to modernization do affect suicide rates. These forces—all of which can be present in developing countries—include economic insecurity and unemployment, social instability, political repression and protests, and both collective and domestic violence. The authors conclude that “simply put, personal troubles might be less important than social problems,” particularly in developing or transitioning countries. Other studies reinforce this conclusion as they document increases in suicide during civil war, ethnic conflict, and their aftermath. Preventing such severe stressors is key to reducing suicide, but remains a challenge in most developing and transitioning societies.

These four examples demonstrate the presence, complexity, and severity of mental health disorders in developing countries. And, of course, many more are present. The Global Burden of Disease 2000 study documents years lived with disability (YLDs) as well as DALYs. Conditions affecting years lived with disability also include Alzheimer’s, schizophrenia, panic disorders, obsessive-compulsive disorders, and post-traumatic stress disorders. In fact, for men ages fifteen to forty-four, the top four causes of YLDs are all mental health disorders (WHO 2001).

Many factors complicate mental health in developing countries. Political, economic, and social conditions are as important as biological predispositions for depression, substance dependence, suicide, and other mental health disorders. Developing countries experience conditions that are more extensive than or not present in industrialized countries. Cultural differences complicate mental health. Treatments for many mental health disorders are determined in industrialized countries and there is a question of effectiveness in other cultural contexts, as noted above with regard to depression. The status of women provides another example of cultural complications. Worldwide, men have higher rates of suicide. In China in 1998, however, suicide was the leading cause of death in rural areas among women but ranked third among causes of death for men (WHO 2001). Explanations include the low status of women in China, the reproductive

repression they face, more general constraints on life choices, and a culturally based tradition of suicide and the threat of suicide as a “lever of domestic power and form of protest” among Chinese women (Desjarlais *et al.* 1995).

Disasters and dislocations also seriously complicate mental health in developing and transitioning countries. Industrialized countries have stronger support systems and economic reserves to deal with both natural and man-made disasters. International organizations suggest up to 50 million people are displaced, either within their own countries or as refugees. The situations that prompted flight are also likely to prompt mental distress or severe stressors that contribute to mental disorders. Refugee and internally displaced populations have little access to health care of any kind. Relief planning gives increasing attention to mental health services but obstacles to their effective provision are numerous, including funding, safety, and overwhelming numbers of people needing assistance. Again, cultural differences also serve as a challenge; many argue the diagnosis and treatment of post-traumatic stress disorders are specific to Western culture. Nonetheless, there is general recognition of the significant impact of disasters and dislocation on mental health.

Conflict and state or structural violence are usually treated as a category separate from disaster, as they involve longer-term stressors. War, ethnic conflict, state terror, and political repression all create serious political, social, economic, and psychological threats to mental health. These threats can be direct, such as immediate psychological trauma, and indirect, such as disruptions of communities, cultures, and traditions. Estimates suggest up to one-half of all populations affected by conflict suffer mental distress or disorders. Post-traumatic stress disorder is common in these situations. As most social services break down during conflict, what little mental health care was available is likely to disappear. Thus, while difficult, preventing such conflict and violence is deemed the most effective means of preventing the resulting mental distress. With regard to treatment in or after conflict situations, Desjarlais *et al.* (1995) argue that the impact of conflict and violence is mitigated in resilient, unified communities and therefore suggest community-level mental health interventions would be more effective than individual-level therapy.

A successful process of development may itself diminish these complications to mental health by reducing conflict and dislocations and through cultural changes that accompany modernization. More generally, development may improve the political and economic environments and thus reduce some stressors, increase resources for mental health, and lead to

better support systems. But development does not automatically increase mental health. The preconception that industrialized countries suffer from more suicides may be false, but it grew out of the fact that psychosocial disorders (and attention to them) did increase in many countries when their economies were growing rapidly. Even positive developments like increased life expectancy complicate mental health, as individuals will live long enough to experience Alzheimer's disease or other age-related mental disorders.

When the 1996 Global Burden of Disease (GBD) report was issued, a stunned public health community realized just how neglected mental health had been throughout the world. The World Health Organization's World Health Report 2001 focuses on "Mental Health: New Understanding, New Hope." It bluntly acknowledges that the public health community has long neglected the importance of mental health to overall well being. Current attention to mental health will give it priority on global health agendas and, perhaps, national agendas. However, the significant political, economic, and social challenges in developing and transitioning countries remain unchanged, making it difficult for them to immediately address mental health or, indeed, health in general. As Desjarlais *et al.* (1995) point out, "To think about mental health, then, we must consider a range of interrelated forces that, at first glance, might not appear to be 'mental health' problems." Until these interrelated forces are successfully addressed, mental health may well remain a low priority in developing and transitioning countries.

**MEXICO: HISTORY AND ECONOMIC DEVELOPMENT**

Mexico forms the southern part of North America and stretches into Central America. Its borders are with the United States to the north and with Belize and Guatemala to the east. Mexico's long coastline borders three bodies of water: the Gulf of Mexico, the Caribbean, and the Pacific. Mexico is the third-largest country in Latin America: at 761,600 square miles, it is approximately three times the size of Texas. It is home to an estimated 105 million people; in addition, more than 20 million Mexicans and their descendants live in the United States. Approximately 20% of the population, or 21 million, live in metropolitan Mexico City.

Mexico is a country of great geographical diversity. Two major mountain ranges, the Sierra Madre Occidental and the Sierra Madre Oriental, run parallel to the Pacific and Gulf Coasts before meeting in the Sierra Volcánica Transversal and tapering off in the Isthmus of Tehuantepec. The peaks of the Sierra Volcánica include Mexico's highest mountains: the Citlaltépetl (also known as Pico de Orizaba), the Popocatepetl, and the Ixtaccíhuatl. These mountain ranges contribute to a great variety of climate and terrain ranging from the deserts of the north to the tropical rainforests of Chiapas. As a result, Mexico numbers among the most diverse developing nations in terms of mineral and agricultural resources. Mexican mineral exports have had a significant impact on global markets. In the late eighteenth century, what was then the Spanish colony of New Spain was the world's largest silver producer, and by the 1890s, silver pesos provided cash flow in South and East Asia. By then, copper mining had transformed the border state of Sonora, and shortly thereafter, an oil boom began in the Gulf states. Today, Mexico is one of the world's leading oil producers not affiliated with OPEC (Organization of Petroleum-Exporting Countries). Agricultural products include coffee, flowers, fruit, and sugar, along with basic foodstuffs

such as corn, which is thought to have originated in Mexico. However, only 13% of the country's territory is arable, and Mexico depends on imports for feeding its growing population.

This population is as diverse as the country it inhabits. Prior to the age of European exploration, what is now central Mexico was the most densely populated area of the Americas. The Aztec empire alone was home to an estimated 16 million to 25 million people, and millions more lived in the east, where the great Mayan civilization had once flourished. The conquest by Spain beginning in 1519 not only brought colonial rule, but also exploitative labor systems and epidemics unknown to the indigenous people—diseases that wiped out approximately 90% of the native population during the century that followed. During the seventeenth and eighteenth century, a miscegenated society emerged in Mexico that combined indigenous, European, and African elements, while the indigenous population slowly began to recover. Despite this ethnic mixture, Mexico is still home to more than 16 million indigenous people, and the country features sixty-two living indigenous languages in addition to Spanish, the official language.

The Mexican economy forms a bridge from the highly developed North American economies of Canada and the United States to the less developed economies of Central and South America. In the last fifty years, Mexico has emerged as one of the more highly industrialized countries of the developing world. Service and industrial occupations amount to 82% of all employment, and remittances from migrant workers in the United States constitute an important source of national income. In 2003, per capita Gross Domestic Product (GDP) was estimated at \$9,000, after Argentina the second highest among the independent nations of Latin America but less than one-fourth that of the United States. Even before the 1992 signing of the North American Free Trade Agreement (NAFTA), a treaty that will create a single North American market by 2009, the economic linkages between Mexico and the United States overwhelmed ties to other regions of the world. In 2003, the United States absorbed 87.6% of Mexican exports, and 61.8% of Mexican imports were of US origin.

Wealth has always been unevenly distributed in Mexico. In 2002, the poorest 10% of the population enjoyed just 1.6% of household income, while the top 10% accounted for 35.6%. The Gini index—a key measure of social justice that increases with inequality—reads 53.6 for Mexico, compared to forty-four for the United States and twenty-five for Sweden. By way of comparison, this figure resembles that of Chile and

Peru, whereas the Gini index for Brazil, the country with which Mexico is most frequently compared in terms of economic performance, is 60.8. In general terms, the distribution of wealth follows ethnic lines, with the more European elements of the population enjoying greater access to economic opportunity as well as political power.

While the Spanish conquest and colonial period sowed the seeds of this inequality, the two centuries since independence have featured several attempts to redress the imbalance. The independence movement began in 1810 with the Hidalgo Revolt, a movement rooted in the peasantry of central Mexico. In the 1850s, the Liberal Reform swept an indigenous leader—Benito Juárez—to power even as the Liberals disentailed the Catholic Church and handed its land over to private investors. Landless peasants, including the indigenous army of Emiliano Zapata, played a key role in the Mexican Revolution of 1910, along with workers, the middle classes, and disaffected members of the elite, and the Constitution of 1917 enshrined land reform and the rights of workers as important and inalienable rights. During the 1920s and 1930s, a succession of governments put some of these promises into practice. At each juncture, however, popular demands for social change confronted powerful advocates for the status quo that included landowners, political bosses, entrepreneurs, and foreign investors. Hidalgo was captured and shot by colonial authorities; Juárez's liberalism eventually gave way to the authoritarian dictatorship of Porfirio Díaz; and the Mexican Revolution finally fell under the control of a single party that controlled the presidency from 1929 to 2000. Renamed the PRI (*Partido Revolucionario Institucional*, or Party of the Institutional Revolution) by President Miguel Alemán Valdés in 1946, this ruling party epitomized both popular demands for change and the efforts of a new elite to co-opt and even to thwart those demands. This became obvious as recently as 1994, when a rebel army that called itself the EZLN (*Ejército Zapatista de Liberación Nacional*, or Zapatista Army of National Liberation) rose up in protest against NAFTA, an agreement the rebels believed to be prejudicial to indigenous peasants in the southern state of Chiapas and in Mexico in general. Mexican history since 1945 has therefore followed three basic trends: rapid industrialization and urbanization; a deepening crisis of legitimacy of the PRI that finally cost the party its hold on power; and increasing integration into the North American (and hence, global) economy. These trends occurred over the course of three phases: the so-called Mexican miracle (1948–1968), a populist era (1968–1982), and the neoliberal era (beginning in 1982).

A time of rapid economic growth and industrialization, the Mexican miracle was rooted in growing US demand for Mexican export products. The immediate postwar period had been a time of economic crisis. As Mexico had helped the Allied war effort in large part by furnishing strategic raw materials, the postwar drop in demand for such products hurt the Mexican economy severely. At a time when the end of the war removed a major stimulus for the US economy, US businesses also turned away tens of thousands of Mexican workers hired under the Bracero Program in the early 1940s, adding pressure to a labor market already straining under the weight of a growing population. At the same time, mounting inflation, particularly in foodstuffs and other items of necessity, confounded the expectations of many Mexicans that the Allied victory in the war would benefit them.

Faced with this slump, the Mexican government joined other large Latin American nations in embracing the advice of the Argentine economist Raúl Prebisch, the president of the United Nations' Economic Commission for Latin America. Prebisch had diagnosed the reliance on externally driven development—the export of raw materials to pay for imported industrial goods—as the cause for the economic underdevelopment of Latin America. According to Prebisch's analysis, trading raw materials for manufactured products constituted an “unequal exchange,” as the prices of most raw materials tended to decline in the long run in comparison to those of manufactured goods. To solve this problem, Prebisch proposed government-assisted import-substitution industrialization (ISI) programs accompanied by a protectionist trade policy. Picking up on an industrialization project that had brought many light industries to Mexico over the course of the preceding sixty years, the Mexican government joined those of Argentina and Brazil in making a strong push toward state-assisted modernization. This effort did not imply a move toward autarky so much as it changed the type of dependence on the United States and, to a lesser extent, Western Europe. Instead of buying hardware from the United States, for example, Mexican companies purchased the machinery needed to produce such hardware. Another phenomenon was the opening of foreign-owned assembly plants in Mexico during the 1950s and 1960s.

With the help of strong US demand for Mexican products and a growing interest in Mexico as a tourist destination, ISI produced results that looked impressive: an average growth rate of 8% in the 1948–1968 period, accompanied by great strides in literacy and health care. Aside from Mexican companies, many multinational corporations began

production in Mexico. For example, in 1966, Volkswagen began to produce its signature Beetle automobile in its new plant in the city of Puebla. Likewise, *maquiladoras*, or partial assembly plants, dotted the northern states close to the US border, from where the maquiladoras shipped their products to be fully assembled in the United States. The result was a more urban society: Mexico City grew from 650,000 inhabitants in 1945 to 20 million fifty years later, and other metropolitan centers such as Guadalajara, León, Monterrey, and Puebla also experienced exponential growth. Much of this growth attested to the fact that poverty was on the rise even as national income improved, as a ring of *ciudades perdidas*, or shantytowns, came to surround Mexico City and other metropolitan areas.

This effort relied on a ruling party that centralized power in the presidency with a corporatist model developed in the 1920s and 1930s, and particularly following the influence of Presidents Alvaro Obregón, Plutarco Elías Calles, and Lázaro Cárdenas del Río. The PRI not only worked to take power from the military *caciques* who had continually defied central authority in the two decades following the Revolution of 1910, but it also claimed to represent the revolution itself. By incorporating several mass-based organizations, including the CNC (*Consejo Nacional Campesino*, or National Peasant Council) and the CTM (*Confederación de Trabajadores Mexicanos*, or Confederation of Mexican Workers), the PRI mediated social conflict at the same time that it supported the president in carrying out the ambitious industrialization program and engineered a string of electoral victories. The resulting balancing act provided a friendly environment for investors even while a succession of presidents decreed higher wages and new benefits for workers.

If this system worked fairly well during times of economic growth and political stability, the late 1960s put it to a severe test. After 1966, the global economy slowed down at the same time that an opposition student movement emerged in Mexico—a movement heavily influenced by similar trends in countries such as France, the United States, and West Germany. These students decried the PRI state as a one-party dictatorship that did not allow dissenting voices to be heard. For the student movement, the 1968 Olympics in Mexico City became a prime opportunity to showcase its concerns, as the Mexico City Olympics were the first ones to be held in a developing nation. On October 2, 1968—only two weeks before the opening of the Olympic Games—Mexican security forces massacred hundreds of student protesters in the Plaza de las Tres Culturas in Tlatelolco, Mexico City, and the PRI had shed its mask as the defender of the

revolution. At the same time, the student movement had shown the degree to which Mexican society and culture reflected global trends. Not only was this movement just as politicized as those in the United States and Western Europe, but it also represented a counterculture: in 1970, Mexico featured its own version of the famed Woodstock music festival near the small town of Avándaro.

By then, Mexico had entered a populist era in which the PRI government again invoked the social and political promises of the Revolution of 1910. Presidents Luis Echeverría Álvarez (1970–1976) and José López Portillo (1976–1982) represented themselves as latter-day versions of former president Cárdenas, a beloved icon of the Mexican left wing who had died shortly before Echeverría's inauguration. Across Mexico, former adherents of the student movement decapitated at Tlatelolco went underground: some joined urban guerrillas, and others—like the rebel Lucio Cabañas—organized a rural uprising in the state of Guerrero near the resort town of Acapulco. Between 1970 and 1976, abductions and political assassinations rocked Mexico: the guerrillas killed a wealthy Monterrey industrialist, Eugenio Garza Sada; Cabañas' forces kidnapped a federal senator; and a revolutionary group held for ransom Echeverría's father-in-law, Guadalupe Zuno Hernández.

Echeverría responded to this popular challenge with a mixture of coercion and co-optation. He sent over ten thousand federal troops into Guerrero to carry out a scorched-earth policy that killed hundreds of innocent bystanders along with Cabañas and twenty-seven of his closest collaborators. He also knew, however, that he needed to make concessions to the proponents of reform, many of whom desired more radical change in Mexican society than he was prepared to offer. Thus, Echeverría revived the long-dormant land distribution program, parceling out more land to peasants than his four predecessors combined; he lowered the voting age to eighteen, and he inaugurated an ambitious profit-sharing scheme designed to increase the gross pay of workers. To detract from his own “dirty war” against guerrilla insurgents and other opponents of his regime, he also offered asylum to South Americans fleeing the recently established military dictatorships of Chile (1973) and Argentina (1976). While the Mexican government thus muzzled its own opposition, Mexico City became the cultural capital of Latin America as the new home of hundreds of dissident intellectuals from the Southern Cone.

For his part, López Portillo built on Echeverría's populist style. The discovery of new oil deposits fueled optimism in government circles about Mexico's

future as an economic power at a time of high oil prices. And yet, the crisis that had begun in 1968 continued to fester. Corruption was rampant, and criticism of the PRI's stranglehold on the political process even resonated in the government-sponsored newspapers. Like Echeverría, López Portillo attempted to use an active foreign policy to cover up the domestic shortcomings of his regime (see Mexico: International Relations). Convinced that the gushing oil wells constituted a sort of cornucopia, the president attempted to translate newfound economic riches and diplomatic successes into political capital. He also borrowed heavily from foreign banks to finance ambitious social programs and government subsidies for housing and food.

This effort to revive the populist rhetoric of the 1920s and 1930s to cover up the shortcomings of the PRI state failed in the aftermath of the debt crisis of 1982. In a climate of high interest rates and falling oil prices, the Mexican government defaulted on its mounting foreign debt. In a panicked effort to prevent massive capital flight, López Portillo nationalized the country's banks, but it was already too late. By June 1983, the peso had fallen 85% against the dollar, and over the course of the administration of López Portillo's successor, Miguel de la Madrid, real incomes fell almost 40%. To reestablish creditworthiness with foreign banks, de la Madrid accepted a severe austerity program prescribed by the International Monetary Fund. This program not only mandated a balancing of the government's books, but also enjoined de la Madrid to sell off state-owned assets and end the fifty-year experiment in making the state a major player in the economy.

The de la Madrid administration ushered in the most recent period in Mexican history: the neoliberal era. De la Madrid and his successor, President Carlos Salinas de Gortari (1988–1994), officially dismantled the image of the PRI as a revolutionary party, and Salinas even led a successful effort to strike many of the nationalist and social reformist provisions of the Constitution of 1917. In doing so, de la Madrid and Salinas publicly likened the restructuring and privatization to Mikhail Gorbachev's *perestroika* in the Soviet Union, even though Mexico, unlike the Soviet Union, had never left the path of state-sponsored capitalism. Salinas also spearheaded the effort to win approval of NAFTA in Canada, Mexico, and the United States, and he considered the passage of NAFTA his signature achievement. In the late 1980s and early 1990s, the sale of state-owned assets and a global economic recovery marked a brief return to the growth rates of the 1950s and 1960s. Not even the Zapatista rebellion of 1994, which plagued the last year of Salinas' government and that of his successor,

Ernesto Zedillo—a last-minute replacement for Luis Donaldo Colosio, Salinas' hand-picked successor who was assassinated under mysterious circumstances in April 1994—could dispel the optimism that reigned in government circles. The following year, however, Mexico once again entered a downward cycle with the peso crisis of 1995, and ordinary Mexicans were again hit hard as their currency lost almost two-thirds of its value. Although the crisis passed fairly quickly, thanks in part to swift intervention by the US government, Mexicans dubbed the time they lived in the “*décadas perdidas*,” or lost decades—a far cry from the upbeat rhetoric from the national government.

As his own term neared a close, Zedillo realized that the PRI had finally reached the twilight of its undisputed rule. Already in 1988, Salinas had won a highly questionable victory over the left-wing opposition candidate Cuauhtémoc Cárdenas amidst allegations of fraud. Since that time, the PRI had steadily lost influence in northern Mexico to a conservative opposition party, the PAN (*Partido de Acción Nacional*, or National Action Party). Zedillo understood well that his own legacy could either consist of prolonging the rule of the PRI by illegal means, or serving as the president who at long last brought democracy to Mexico. As a result, he consented to a wide-ranging electoral reform that gave greater opportunities to opposition parties at the precise moment when the PAN offered a charismatic leader, the former Coca-Cola executive Vicente Fox Quesada. In July 2000, Fox's triumph in the national elections ushered in a new era in Mexico—one in which the PRI is only one of three major parties. Although Fox's rule has been overshadowed by yet another economic crisis and inefficient government, Mexico is today more truly democratic than at any other point in its history. It remains to be seen whether political democracy can translate into greater social justice or sustainable economic development that benefits the majority of the population.

## MEXICO: INTERNATIONAL RELATIONS

Mexico is the only developing nation that shares a land border with a highly industrialized society. As a result, since independence in 1821, Mexican international relations have centered first and foremost on the country's relationship with the United States. For Mexicans today, the secession of Texas (1836) and the US–Mexican War (1846–1848) hold far more traumatic memories than the French Intervention (1862–1867) because these military engagements with US forces resulted in the annexation of half of the nation's territory. Among more recent instances of US intervention, Mexicans remember the occupation of Veracruz (1914) and the Punitive Expedition against Mexican revolutionary Pancho Villa (1916–1917). Distant in time, these events burned themselves into the national consciousness and made national icons out of Villa and others who resisted the United States. And yet, Mexicans have long recognized that the relationship with the United States is vital for the economic development of their country.

As a result, Mexican foreign policy has sought to take advantage of US capital and technological know-how while attempting to limit direct attacks on the country's sovereignty. In this scheme, relations with countries other than the United States have sought to mitigate the powerful influence of Mexico's northern neighbor, either by seeking European investments and immigration to balance US economic

influence, or by encouraging nationalist and anti-imperialist movements in Latin America. Therefore, President Porfirio Díaz (1876–1880 and 1884–1911) courted British, French, and German investments even as he oversaw what came to be known as the “Pacific Conquest” of Mexico by US investors, and he supported Central American leaders critical of US influence such as Nicaragua’s José Santos Zelaya. Similarly, the governments of the Mexican Revolution (1910–1940) sought to force foreign investors to obey Mexican laws, and in 1938, President Lázaro Cárdenas even expropriated the foreign-owned oil industry—all at a time when US investments in Mexico had reached a new high. Finally, President Manuel Avila Camacho supported the United States and its allies in World War II but turned a deaf ear to US demands to extradite ethnic Germans and Japanese and to nationalize property held by Axis nationals and Mexicans of German and Japanese descent. Instead of confiscating this property and closing down German and Japanese mercantile establishments, as many Central and South American governments did, Avila Camacho placed them under the supervision of a government agency.

Since 1945, this effort to enjoy the benefits of the vicinity of the United States without its attendant risks has become even more complicated. As the Cold War began to polarize world politics, migration and the maturation of transnational business networks integrated Mexico into an even closer relationship with the United States. To add to this trend, World War II had left the United States as the only regional power in the Caribbean era. These incentives to support the US side, however, were at least partially offset by the enduring legacy of an anti-imperialist foreign policy dating back to the nineteenth century. This legacy, and the social forces that sustained it, prodded the Mexican government to support social revolution and criticize US intervention. Furthermore, the very strengthening of US power dictated a policy that showcased Mexico as an independent nation rather than an ally of the United States.

At the end of the war, Avila Camacho’s first foreign-policy priority was to assist the project of import-substitution industrialization (see Mexico: History and Economic Development). Avila Camacho and his successor, Miguel Alemán Valdés, maintained close ties to the Monterrey Group, the country’s most important network of industrialists. With the help of the Mexican state, the Monterrey Group participated in joint ventures with US multinational corporations that accelerated the industrialization project. As US exporters could not meet the burgeoning Mexican demand for manufactured items,

and since industrialization provided opportunities for the export of capital goods, the US government supported Mexican import-substitution industrialization. As a result, postwar US–Mexican relations were harmonious. In 1947, Alemán and US President Harry S. Truman exchanged state visits in an unprecedented show of goodwill. During his visit, which coincided with the centennial of the US–Mexican War, Truman honored the *niños héroes* (boy heroes), the young cadets from elite Mexican families who had died defending Chapultepec Castle against the advancing US forces.

Alemán also moved to improve relations with Mexico’s former enemies during World War II. Even before the resumption of diplomatic relations with Germany and Japan in 1952, the president took steps toward normalization by returning government-administered German property to its owners. However, the appropriately named president, whose last name translates to “German” in the Spanish language, disappointed many Japanese-Mexicans whose property had been sold during or immediately following the war.

Alemán began a diplomacy that distinguished itself for its support of the United States in the Cold War and by its anticommunism. Mexico backed the United States on a variety of matters ranging from the Korean War to Eastern Europe, and it maintained cool relations with the Soviet Union. The anticommunism of Alemán and his successor, Adolfo Ruiz Cortines, resulted in part from personal conviction, in part from ceaseless US mass media propaganda in Mexico, in part from the Mexican government’s desire to discourage radical protest movements, and in part from a keen sense of political opportunity. In the fall of 1949, the communist triumph in China had heightened the US fear of a world revolution. By the summer of the next year, the US involvement in the Korean War had led to a complete military mobilization. As mobilization entailed lucrative contracts for Latin American mineral exporters, an anticommunist stance could help procure these contracts for Mexico. The victory of World War II hero Dwight D. Eisenhower in the 1952 US presidential elections made an anticommunist diplomacy even more important. As the CIA-assisted coup d’état in revolutionary Guatemala (1954) demonstrated, Eisenhower intended to quash economic nationalism and socialism in Latin America. In this context, anticommunism was a strategy of political survival.

As the case of Guatemala revealed, however, this anticommunist stance found its limits in the matter of US aggression in Latin America. To avoid US hostility, Mexican diplomats presented their objections at an international diplomatic forum. On the occasion

of the Tenth Inter-American Conference held in Caracas in March 1954, US Secretary of State John F. Dulles presented a resolution against communist subversion in the western hemisphere. Seeing the resolution as a thinly veiled cloak to justify US intervention in Guatemala, Mexican diplomats introduced a number of motions designed to weaken it. When a majority of the delegates defeated most of these motions, Mexico joined Costa Rica and Argentina as the only countries to abstain from the final vote. Although the Ruiz Cortines administration remained silent throughout the coup d'état, it also allowed supporters of the ousted Guatemalan government free entry into Mexico. This stance constituted a compromise between the demands of geopolitics and the business elite on the one side and the nationalist left led by ex-President Cárdenas.

By the late 1950s, new President Adolfo López Mateos found conditions ripe for a more assertive and independent foreign policy. Throughout a decade of rapid economic growth, Mexico's international prestige had grown immensely, and the recovering European and Japanese economies took notice of its potential as a trading and investment partner. Furthermore, international issues played an increasing role in political discourse. Labor and peasant unrest prompted by the unequal distribution of the fruits of economic growth prompted López Mateos to display a nationalist foreign policy. In particular, the triumph of Fidel Castro and Che Guevara in Cuba left a great impact on Mexican public opinion, and López Mateos found himself between an anti-Castro business community and largely pro-Castro popular organizations. In addition, the beginning of decolonization in Africa and the emergence of champions of the so-called "Third World" such as Egypt's Gamal Nasser weakened the dominance of NATO and the Warsaw Pact in the United Nations General Assembly and provided new openings for criticism of US policy.

López Mateos' foreign policy was remarkably balanced between friendship with the United States and these new opportunities. López Mateos maintained cordial relations with US President John F. Kennedy. In 1961, Mexico embraced the Alliance for Progress, a program designed to forestall Castro-type revolutions in Latin America with US-sponsored economic and social reform. A year later, Kennedy proclaimed during a visit to Mexico City that the goals of the Alliance for Progress were identical to those of the Mexican Revolution. Nonetheless, López Mateos also sought to open up new economic and political partnerships around the globe. His government gravitated toward the nascent Non-Aligned Movement, and Mexico became one of the founding

members of the Latin American Free Trade Association (LAFTA). The president was particularly proud when Mexico City was selected as the host city for the 1968 Summer Olympics as the first (and so far only) Latin American city to host the event.

The Cuban Revolution revealed both the possibilities and the limits of this new foreign policy. Initially, López Mateos welcomed Castro's victory. When Castro proclaimed himself a socialist, however, the Mexican government ceased to praise the Cuban leader. Instead, López Mateos defended Cuba's right to self-determination and maintained that posture in the face of enormous US pressure after the unsuccessful Bay of Pigs invasion of April 1961 sponsored by the CIA. Not even the Cuban Missile Crisis of October 1962 could make a dent in this opposition to US intervention. While López Mateos joined Kennedy in condemning Castro for requesting Soviet nuclear missiles, he cautioned that his action did not imply acquiescence to a US invasion of Cuba.

This policy of reserved toleration of the Cuban Revolution continued into the succeeding decade, albeit accompanied by an increasing distance between the Mexican and Cuban governments. Under President Gustavo Díaz Ordaz (1964–1970), Mexican politics moved to the right at the same time when Castro made sporadic efforts to encourage Latin Americans to emulate his revolution. Invoking the same arguments that it had used in the defense of the Cuban Revolution, the Mexican government opposed what it viewed as interference in the internal affairs of other nations. Far from being an issue of international principles, this stance sought to discourage the Mexican left from seeking Cuban assistance. In fact, however, Díaz Ordaz need not have worried, as Castro never aided subversive movements in Mexico. The Cuban leader either spared Mexico because of its principled diplomatic efforts, or he feared US reprisals if he were to stir up trouble in a country that bordered the United States. In any case, however, Díaz Ordaz did not share his predecessor's tolerance for Castro's revolutionary experiment. Mexican–Cuban relations deteriorated during his administration, and the Cuban hijacking of Mexican commercial airliners in May and June 1970 led to a low point in relations. Nonetheless, he never publicly condemned the Castro regime, and the appearance of tolerating the Cuban Revolution and defying US policy therefore remained.

From 1970 to 1976, the presidency of former Secretary of Gobernación Luis Echeverría Álvarez, the man whom many Mexicans considered responsible for the massacre of hundreds of student protesters at Tlatelolco, witnessed a turn toward an even more independent foreign policy. Echeverría sought

to recover the ground his party had lost at Tlatelolco by shifting official rhetoric dramatically to the left. As part of this effort, Echeverría proclaimed himself a champion of the “Third World” and asserted that Mexico would assume a position of leadership in what is now known as the Global South. Continued by his successor, José López Portillo, this self-proclaimed leadership role increasingly clashed with US policy, particularly as regarded Mexican positions in the United Nations and toward social revolution in Cuba and Central America. Taking advantage of a number of international trends that allowed a degree of independence from US objectives, this assertive Mexican foreign policy was designed above all to make people forget Tlatelolco.

The international panorama offered an opportunity for a more independent foreign policy. At the time, the United States was bogged down in Vietnam and engaged in a process of détente with the Soviet Union. In Latin America, Mexico increasingly appeared to represent a “middle way” between two opposing tendencies: the rise of military regimes in Brazil, Paraguay, and Uruguay, and revolutionary nationalism in Cuba and Salvador Allende’s Chile. In the early 1970s, it appeared unlikely that the United States would launch a military intervention against either the Chilean or the Cuban Revolution, and Echeverría believed that Mexico enjoyed an unprecedented margin for an assertive foreign policy.

Thus encouraged, Echeverría launched a diplomatic offensive on several fronts. Pointing to the unfavorable terms of trade of most developing nations, he called for global economic justice with vaguely defined references to a new commodity price structure. He also nationalized the tobacco and telephone industries, pointing to these sectors as examples of foreign exploitation. The Mexican president also invented himself as a critic of the Cold War. He became one of the leaders of the “nonaligned movement” within the United Nations and maintained a dialogue with Castro. To make his point even clearer, he posed for photo ops with Palestinian leader Yasser Arafat, a symbol of anti-Zionist and anti-“American” sentiment in the Middle East, and he openly befriended Chilean leader Salvador Allende. When a CIA-assisted coup overthrew Allende, Echeverría granted asylum to thousands of Chileans fleeing the ensuing repression. After another coup overthrew Argentine president Isabel Perón three years later, Echeverría opened Mexico’s doors to Argentine refugees as well. Mexico’s status as a safe haven for South American refugees detracted attention from Echeverría’s own “dirty war” against Lucio Cabañas and other insurgents operating in the Mexican countryside after the Tlatelolco massacre.

If Echeverría had primarily asserted Mexican objectives in the United Nations and in exile policy, López Portillo returned to Mexico’s traditional role as a middle power in Central America. In May 1979, the López Portillo administration broke relations with the Somoza dictatorship in Nicaragua. Two months later, the Sandinista leadership of a movement that had fought Somoza since 1963 arrived in Managua aboard a Mexican jet to begin eleven years of revolutionary rule in Nicaragua. In the first years of the revolution, López Portillo generously lavished favors on the “new Nicaragua.” Awash in petrodollars, the Mexican government awarded \$39 million in cash and goods to the Sandinistas. When US President Ronald Reagan began to undermine the Sandinistas, whom he regarded as the work of Cuban-Soviet subversion, López Portillo helped Nicaragua on the diplomatic front. He sponsored a US–Nicaraguan dialogue in the Mexican port town of Manzanillo, and he also unsuccessfully took up the subject of Nicaragua in the course of two meetings with Reagan in the first half of 1981. That same year, López Portillo also participated in an attempt to end a protracted civil war in El Salvador between a government controlled by right-wing death squads and left-wing opposition groups. In August, he and French President François Mitterrand issued a joint communiqué that recognized both opposition groups, the Democratic Revolutionary Front (FDR) and the Farabundo Martí National Liberation Front (FMLN), as “political forces representative of the Salvadoran people.”

If the year 1981 was the high watermark of Mexican foreign policy in the postwar period, the following year forced López Portillo into retreat. Citing Soviet influence in the Sandinista junta and alleging Nicaraguan aid to the rebels in El Salvador, the Reagan government trained and armed thousands of Nicaraguan exiles, also known as Contras, in bases in Florida and Honduras, from where they launched forays into Nicaragua as part of an undeclared US war on the Sandinistas. At the same time, Mexico entered a severe economic crisis due to the collapse in oil prices and mounting foreign debt. As a result, Mexico soon returned to the cautious policy that had marked the 1950s and 1960s. New President Miguel de la Madrid shifted from lending direct assistance to the Sandinistas to seeking a mediated solution to the multiple crises in Central America. De la Madrid undertook this effort through the Contadora group made up of Colombia, Panama, and Venezuela.

De la Madrid’s course proved prudent, as relations with the United States demanded his full attention. In particular, undocumented immigration complicated relations. During the 1970s, the number of undocumented Mexicans in the United States had grown

rapidly; after 1982, the effects of the economic crisis added significantly to these numbers. Even while the US Congress debated measures to crack down on further immigration, the increasing trafficking in illicit drugs came to the fore as another explosive issue.

In the face of these difficulties, de la Madrid and his successor, Carlos Salinas de Gortari, decided to cast Mexico's lot with the United States and embrace neoliberal policies (see also Mexico: History and Economic Development). The culmination of these policies was the passage of the North American Free Trade Agreement (NAFTA), which not only set Canada, Mexico, and the United States on the path toward a common market, but also committed Mexico to relinquishing its postrevolutionary tradition of economic nationalism. If Echeverría had been a trendsetter for developing nations in the 1970s, the Harvard-trained Salinas became a poster child for the wave of globalizing policies that swept the developing world in the late 1980s and 1990s. Other moves toward free trade made Mexico a member of the General Agreement on Tariffs and Trade (GATT) and ultimately resulted in the signing of free trade agreements with Chile and the European Union. NAFTA set off acrimonious debate in Mexico, where Salinas had faced a stiff electoral challenge from Lázaro Cárdenas' son, Cuauhtémoc Cárdenas, who had broken ranks with the ruling PRI. The younger Cárdenas decried NAFTA as an attack on national sovereignty and a move to make Mexico an economic appendage of the United States. In particular, he worried that the treaty would reverse seventy years of land reform in Mexico, a process that had turned more than 80 million acres of land over to peasant cooperatives. This critique, however, paled in comparison to the response of a guerrilla group in Chiapas. On January 1, 1994, the day that NAFTA took effect, the *Ejército Zapatista de Liberación Nacional* (EZLN, or Zapatista Army of National Liberation) began its uprising, in large part to protest the adverse effects of the treaty on land tenure and social justice in Mexico. The EZLN successfully distributed its message by means of radio, television, and the Internet, however, it could not reverse the neoliberal trend.

Within a year after the beginning of the Zapatista uprising, new Mexican President Ernesto Zedillo confronted a turbulent landscape. In March, the assassination of Luis Donaldo Colosio, Salinas' hand-picked successor, had rocked Mexico. Investors responded immediately by taking money out of Mexico, pulling down the country's foreign currency reserves by more than \$10 billion within one month. The ensuing capital flight undermined the Mexican currency. On December 19, Zedillo allowed the peso to fall 15% against the dollar. The devaluation turned

into a free fall, and the currency continued to decline for a few years until it leveled off at ten new pesos to the dollar (ten thousand old pesos): one-third of its 1994 value. Just as in 1982, the Mexican government stood at the brink of default, and it was only after US President Bill Clinton put together an emergency loan package that it averted even more serious consequences. Resulting in the second precipitous drop of living standards since 1982, this crisis shook the faith of many Mexicans in neoliberalism and spelled the end of the PRI's hold on power. Ironically, however, the end result was the triumph of a movement even more committed to neoliberalism than Zedillo's PRI. In July 2000, the victory of former Coca-Cola operative Vicente Fox, the candidate of the opposition *Partido de Acción Nacional* (PAN, or National Action Party), in the presidential elections spelled the end of seventy-one years of PRI rule and also ushered in the rule of a man who vowed to further improve relations with the United States.

As Fox has discovered, however, the Mexican government is still caught in an uneasy balancing act between the United States and nationalist demands at home. In early 2003, during Mexico's most recent term as a member of the UN Security Council, the Mexican delegate confronted the efforts of US President George W. Bush to win United Nations support for the impending war against Saddam Hussein's Iraq. Aware that the vast majority of Mexicans opposed the Bush administration on this matter, Fox instructed the delegate to vote against the United States. Even in an age when transnational networks have weakened the nation state, it still behooves the Mexican government to pay attention to dissenting voices that desire a greater distance from the interests of Mexico's powerful northern neighbor.

## MICRONESIA, FEDERATED STATES OF

The Micronesian archipelago in the western Pacific Ocean includes four island groups located south of the Marianas and west of the Marshall Islands, including the high volcanic islands around Pohnpei, Kosrae, and Chuuk (Truk), and the low-lying group around Yap. The 607 islands and islets of Micronesia are scattered across an expanse of ocean larger than Western Europe, but in total land area these chains comprise only 607 square miles. Archaeological evidence of advanced human occupation dates from at least 500 BCE, and Spanish explorers in the sixteenth century named the islands the New Philippines. In 1899 Germany acquired most of the islands from Spain, but lost them to Japan in World War I. Japan established garrisons on the main islands, and in World War II these outposts were used to launch attacks on other Pacific islands, including Guam. The harbor at Truk served as Japan's main naval base in the region. After World War II, the United States assumed administrative authority over the islands.

Japan's early administration in Micronesia was managed by its "South Seas Bureau," a governmental entity headed by a civilian governor. The Bureau worked through the village chiefs on the main islands, using them to collect taxes from and communicate

official pronouncements to the local population. There were isolated instances of native resistance, including the burning of a Japanese school and social restrictions enforced against those who collaborated with the Japanese; the Japanese made occasional arrests of the resistance leaders.

Micronesia's commercial development accelerated in the 1880s, when Japan's ships carried the islands' copra, coconut, and coconut oil exports. In 1906 Japanese companies controlled 80% of the total trade with German Micronesia, and by the start of World War I, much of the agricultural production, fishing, and freight and passenger services to the islands were Japanese-controlled. Once in power, Japan provided capital to develop phosphate mines, sugar plantations, and fishing. While Japanese were barred from owning land, they did lease land from local owners. The colonial government, meanwhile, seized commonly held acreage on the larger islands and allocated it to support the influx of Japanese colonists in the 1930s. Later, the Japanese military seized additional land for military facilities.

The United States' wartime "island-hopping" strategy in the Pacific largely bypassed Micronesia, and in 1944 Japan abandoned the base at Truk. The United States seized the islands, which came under US Navy administration. The United Nations later placed the islands under US authority in a unique "strategic trust" arrangement that obligated the United States to promote the political, economic, social, and educational advancement of local inhabitants, including aiding their preparation for self-government.

In actuality, US defense concerns took precedence and the welfare of the population was generally neglected. US interests in the region centered upon nuclear testing in the Marshall Islands to the east. In 1962 the Kennedy administration launched an investigation of living conditions in the islands, and subsequently ordered that US federal welfare programs be extended to all the US trust territories in the Pacific. Income support, housing assistance, and medical programs were introduced, and Peace Corps volunteers were dispatched to teach and build housing and local facilities. By the late 1960s these initiatives began attracting people to the principal islands, away from traditional homesteads on outer islands. Higher unemployment soon emerged, as agricultural and traditional pursuits were abandoned in favor of widespread dependence upon federal welfare programs.

Other US-funded assistance initiatives expanded after 1979 when a constitutional government, known as the "Federated States of Micronesia" (FSM), was formed and entered into a "Compact of Free Association" with the US government. Envisioned as the

final stage of local political evolution preceding full independence, the arrangement saw Washington provide the islands with access to federal aviation regulation, weather prediction, and postal services, as well as several programs aimed at attracting capital investment and creating jobs. Such subsidies were estimated at more than \$2.5 billion over a fifteen-year period beginning in 1986, when President Ronald Reagan signed the legislation that put the “compact” into effect. Micronesia’s transition to full independence was completed in 1991, and the FSM joined the United Nations that year. Even so, the FSM still retains many elements of its “compact” relationship with the United States, including continuing receipt of economic development assistance.

In 2000 the FSM’s population was estimated at 118,000, with an annual growth rate of around 2%. Universal education and the rights to reside and work in the United States have produced a trained yet mobile work force. The lack of domestic employment opportunities has caused substantial levels of emigration by young workers to Guam and the mainland United States. Remittances from these migrant workers to family members in the FSM constitute an important source of household income throughout the country.

Domestic economic activity is concentrated in the subsistence agriculture and fishing industries and in the modern government services sector, including education, utilities, and the administration of government programs. Bilateral economic aid from the United States, Japan, and Australia supports numerous official FSM initiatives. In 2003 US and FSM negotiators reached agreement on renewal of the “compact” subsidies made available to the islands. The United States pledged to provide at least \$1.8 billion in economic assistance to the FSM over twenty years, while also continuing its annual contributions to a trust fund designed to finance future economic development requirements in the FSM. Despite post-September 11 security concerns, Washington agreed to permit FSM citizens’ continued immigration to the United States.

As a member of the Asian Development Bank (ADB), the FSM receives loans that stimulate private sector growth, including expansion and modernization of FSM’s deep-water fishing industry. The ADB, aware that waterborne diseases affect at least 5% of the FSM population annually, has also granted loans to modernize water supply facilities. With electricity transmission to private homes limited and supplies to businesses unreliable, priority has been assigned to upgrading the islands’ electricity grid. New sewers, pumping stations, wastewater treatment plants, underground electricity transmission lines, and a power

generation station are being built, with most improvements concentrated on the principal islands. Environmental remediation efforts have also been made where aging facilities have created contamination hazards.

## MIDDLE EAST: HISTORY AND ECONOMIC DEVELOPMENT

The Middle East occupies a strategic geographical location at the crossroads of three major continents, Europe, Asia, and Africa. The area defined as the Middle East for the purposes of this work stretches from Turkey in the north, to Iran in the east, Israel in the west, and the Arabian Peninsula in the south. These countries are Israel, Lebanon, Jordan, Syria, Turkey, Iraq, Iran, Saudi Arabia, Bahrain, Qatar, United Arab Emirates, Oman, and Yemen.

The size of these countries varies from the smallest being the tiny island of Bahrain, which has an area of only 665 square kilometers, to the neighboring kingdom of Saudi Arabia, which has an area of 1.960 million square kilometers. Iran is the next-largest country, with a total area of 1.648 million square kilometers.

The value of the Middle East has long been measured in terms of its oil, despite the fact that only a small number of countries have significant oil reserves. In the 1930s and 1940s, exploration for oil rights by US and British companies in the Gulf countries made the region important for Western interests. However, it is only since World War II that oil has been produced and exported in commercial quantities. Continuing Western dependence on oil as an energy source heightens the importance of oil-exporting Middle Eastern countries today.

## Society

Most of the countries in the Middle East share similarities in ethnicity, language, and religion. However, given the vastness of the region, there are also exceptions.

The majority of the population in the Middle East is ethnically Arab and shares Arabic as a common language. But though most countries are Arabic-speaking, there are differences in regional dialects. The spoken Arabic of a Jordanian Arab does not sound the same as that of an Arab from the Gulf states, though the two may still be able to understand each other. The written, classical form of Arabic is standard throughout the Middle East, however. All Arabs therefore share a linguistic and ethnic bond.

Turkey and Iran are exceptions to the predominantly Arab Middle East. The Turks and the Persians are the two largest non-Arab ethnic groups in the region. Linguistically, they also differ. Turkish is the dominant language of Turkey, while Farsi is used in Iran. The Kurds are the fourth-largest ethnic group, and they are spread out in Turkey, Iran, Iraq, and Syria. They have their own Kurdish language, though as citizens of Arab countries, their linguistic rights are not officially recognized.

Religion is another issue on which, superficially, the Middle East appears to be homogeneous. The majority of people in the Middle East are Sunni Muslims. Iran and Iraq are unique because they have predominantly Shi'a Muslim populations. Iraq has an approximately 60% Shi'a population, while Iran is 89% Shi'a. Two smaller countries, Bahrain and Yemen, have Shi'a majorities.

The significance of Sunni-Shi'a differences in the Middle East is based on politics. Since the Iranian Revolution brought an Islamic theocracy to power in Shi'a-dominated Iran in 1980, the country's neighbors have experienced fears of similar Shi'a uprisings. In Iraq, Saddam Hussein's ruling regime was predominantly Sunni and therefore feared a revolt from the

majority Shi'a population. In the case of Saudi Arabia, the monarchy feared a challenge to its strict political control and puritan Wahhabi religious ideology from the Shi'a minority in the Eastern Province.

Religious identity drives politics in Lebanon. The Lebanese political system stands out in the Middle East because it is based on confessional politics. However, the system failed under pressure from rising tensions between the four religious minorities. Conflict between Maronite Christian and Muslim groups erupted into a fifteen-year-long civil war beginning in 1975.

Israel is an exception in the Middle East as a non-Muslim country, one with a predominantly Jewish population. Though there were small Jewish communities in other countries in the region, there was generally a migration to Israel after 1948. Israel has a mixture of secular Jews, Ashkenazi, and Sephardic Jews, in addition to a small minority of Arab-Israeli citizens. The Palestinians in the Israeli-occupied West Bank and Gaza are not counted as part of the official Israeli population.

## Geography

Much of the Middle East is arid land and does not receive much precipitation. The topography varies considerably, from valleys to desert to mountain ranges. There are limited fertile, agricultural areas, and these are dependent on access to water and irrigation systems.

The coastal regions of Yemen, eastern Turkey, the Tigris and Euphrates valleys in Syria and Iraq, and the coast of the Mediterranean in Lebanon are all examples of agricultural areas. Mountainous areas are found in the Taurus mountains in Turkey, the Elburz and Zagros in Iran, and the highlands of Yemen. Major river systems include the Tigris and Euphrates in Iraq and Iran; the Kizil Irmak, or the Red River in Turkey; and the Litani, Orontes, and Jordan Rivers that pass through Lebanon, Israel, Jordan, and Syria.

Water is a valuable natural resource in the Middle East. Access to water resources is the basis of territorial or border disputes along the Shatt al Arab (between Iran and Iraq) and the Jordan River.

Lack of uniform rainfall in the region is the reason why agricultural output is concentrated in certain countries. The Middle East is a net importer of grain. Turkey and, interestingly enough, Saudi Arabia, both produce wheat, and sometimes have a wheat surplus. In terms of tree crops, the Mediterranean countries produce olives, citrus fruits, and dates.

## Political Systems

Political systems vary across the Middle East, ranging from monarchies to authoritarian military rule to parliamentary republics. Jordan and the Gulf countries of Saudi Arabia, UAE, Bahrain, and Qatar are all ruled by kings or shaikhs. The Shah of Iran was overthrown in 1980 by the Iranian Revolution. The Revolution replaced the monarchy with a theocratic republic, an Islamic regime of rule by jurists, led by Ayatollah Khomeini.

The military has played a dominant role in politics in the region, whether overtly or covertly. In Syria and Iraq, military coups in the late 1960s resulted in the consolidation of authoritarian dictatorships under Ba'ath Party leaders Hafez al Asad and Saddam Hussain, respectively. The Iraqi regime was overthrown by US military intervention in 2003, while Syria maintains the same political system under the leadership of Bashar al Asad, the son of Hafez al Asad. In contrast to Syria and Iraq, which experienced an uninterrupted stretch of thirty years of authoritarian rule, the Turkish military has stepped in only intermittently, in 1960, 1971, 1980, and 1997, in Turkish politics. The rest of the time, elected civilian governments have been in power.

## Impact of Colonialism

The impact of colonialism has been uneven in the Middle East. The strategic location of the region made it important to both the British and French, as they divided up the region amongst themselves after WWI. In some cases, these colonial powers shaped the map of the region. Jordan (initially known as Transjordan) and Iraq were both created as artificial states in the early 1900s, with Arab kings who would be willing to protect British interests in the region set on the throne. In Jordan, the Hashemite family continues to rule up to the present day, with the current ruler, King Abdullah. In Iraq, the monarchy was overthrown by military officers in 1958. The third country affected by British colonial rule is what is known today as the State of Israel. Israel was created in 1948, after the British Mandate in Palestine ended and the British withdrew from the region.

The French had control over Syria and Lebanon, which lasted until the mid 1940s when the two countries became independent. The French policy of divide and rule kept the various ethnic and religious minorities living in the area under separate administrative units. This instigated political instability,

which continued after independence, as well. For example, the French favored the Christian Maronites of Mount Lebanon under the guise of the French imperial, religious, and moral duty to protect Christian communities of the region. This preference alienated the Muslim communities, which made up the majority of the population. In Syria, French colonial policies marginalized the Alawi and Druze religious minorities from the majority Sunni Muslim population. When Syria became independent in 1946, the new political state had to contend with the distrust between these groups.

In contrast to these four countries, others in the region had limited interaction with colonial powers. The Arabian Peninsula remained uncolonized, although the British had negotiated treaties with the ruling sheikhs of Kuwait, Qatar, Bahrain, and Oman, in order to maintain the stability of its empire. The British were particularly concerned about their trade routes and established a port at Aden, at the southern tip of the Peninsula.

## Economy

### *Development*

The contrast between oil-exporting countries and non-oil-rich countries in the Middle East is responsible for different paths toward industrialization and economic development in the region. While oil-rich Gulf states such as Saudi Arabia and the United Arab Emirates have experienced high gross domestic product (GDP) per capita income growth, other countries such as Jordan and Yemen have lagged behind. According to the UN Human Development Report, Yemen had a GDP per capita (in purchasing power parity terms) in 2002 of \$870, while the UAE had the highest for the region, at \$22,420. The gap between these two countries is emblematic of the uneven distribution of per capita income in the region.

Human development has lagged significantly in the Middle East as a whole, despite rapid levels of industrialization and urbanization in the last few decades. There is a vast gap between the highest- and lowest-ranking countries in the region, according to the 2004 Human Development Index (HDI). Israel has the highest rank of twenty-two, while Yemen has the lowest at 149. The HDI ranking looks at indicators such as life expectancy, school enrollment, literacy, and income, in order to determine the overall state of human development in a country.

A comparison of GDP per capita income and HDI rankings illustrates the fact that even though some

countries may be doing well based on GDP per capita, such as the UAE and Qatar, their populations are lagging in overall human development. These countries had an HDI rank of forty-nine and forty-seven respectively, behind Israel's twenty-two. However, Israel's GDP per capita value was lower than theirs. Israel's GDP per capita in 2002 was \$19,530, while the UAE had \$22,420 and Qatar \$19,844 (United Nations Development Program [UNDP] 2004).

When looking at the difference between the HDI rank and the GDP per capita rank, most countries received a negative value, meaning that their per capita income was higher than the overall well-being of the population. The only countries that had positive values were Israel, Lebanon, Jordan, Syria, and Yemen, indicating a balanced growth pattern in economic and human development. It is noteworthy that with the exception of Israel, the other countries are on the lower end of the GDP per capita scale (UNDP 2004).

## *Oil*

Oil plays a critical role in shaping political and economic development in the Middle East. Oil was first discovered in the region in the early 1900s, but commercial exploration and production did not occur until the middle of the century. The British were the first to claim concession rights to oil exploration and production in Iran at the end of the nineteenth century. The Anglo-Iranian Oil Company and the Iraqi Petroleum Company were the first foreign oil companies in the region. Saudi oil was not discovered until the 1930s, when a US oil company, Standard Oil of California (SoCal), gained concession rights from the Saudi king, King Abdul Aziz ibn Saud.

The importance of oil was such that the Middle East became a strategically important region to Western countries, especially to the United States. By 1948, seven Western oil companies controlled oil concessions in the region. Four were US—Standard Oil of New Jersey (later Exxon), Mobil, SoCal, and Texaco; one was British, British Petroleum; and the last was a joint British–Dutch company called Royal Dutch-Shell.

Today, the state controls oil output and export in each of the oil-rich countries. This has resulted in a unique type of rentier state, a state in which the government relies on oil revenues to drive economic growth and sustain the material well-being of its population. The government becomes the primary distributor of oil profits in the form of subsidies and loans to its people. In particular, it does not tax its people in return for their acceptance of the state's distribution

of benefits (Beblawi 1987). Saudi Arabia is a classic example of a rentier state. The challenges for rentier economies will be discussed in more detail below.

Today, there is a gap between oil-producing and non-oil countries in the Middle East. Though the general image of the Middle East is often that of an expanse of sand with oil rigs dotting the desert, in fact, there are only a few major oil-exporting countries: Saudi Arabia, Iraq, Iran, and the United Arab Emirates. Saudi Arabia is the leader, with approximately 25% of the world's petroleum deposits located in the country. It also accounts for the majority of the region's oil exports, at 6.652 million barrels of crude oil a day. According to OPEC statistics, the UAE and Iran are the next-highest oil producers and exporters, after Saudi Arabia. Iran exports 2.396 million barrels of crude oil a day, while the UAE exports 2.048 million barrels a day. Iraq was also a major exporter until the first Gulf War in 1991. Since the second Gulf War, its oil production and export remain uncertain since its infrastructure was destroyed during the war.

Global oil prices have fluctuated drastically in the last fifty years. They are affected by events in the region in addition to general market supply–demand conditions regulated by OPEC. Price fluctuations are marked by several notable highs and lows. For example, in 1973–1974, the OPEC oil boycott almost quadrupled the price of oil per barrel. Later, at the outbreak of the Iran–Iraq war in 1980, disruption in oil production in these two countries resulted in another price hike. However, the second half of the 1980s and early 1990s saw a worldwide decline in oil prices, resulting in lower revenues for petroleum-exporting countries.

The regional implications of fluctuations in oil prices include changes in the amount of Arab aid from Gulf countries to non–oil-producing countries. For example, Saudi Arabia gave aid to Iraq during the Iraq–Iran war in the form of grants and loans. Syria was a recipient of aid from its wealthier Arab neighbors, as well. When oil revenues declined, it meant that the non-oil, aid-recipient countries received less Arab assistance as well. In the Syria case, this was partially responsible for an economic crisis in the early 1980s.

Oil-exporting countries also attract many workers from non-oil countries, since they have a high demand for labor needed to maintain the petroleum industry. There is a significant amount of labor migration in the region to the Persian Gulf countries, mainly from Jordan, Syria, and Yemen. When oil revenues declined, labor remittances from these workers back to their home countries also declined, affecting those economies in a ripple effect that permeated the entire region.

The domestic implications for oil-rich countries are also important to note. Oil is a non-renewable resource. Its supply is limited, and therefore countries that are heavily dependent on oil revenues to maintain their political and economic systems face an eventual cessation. This requires not only a diversification of the economy to include non-petroleum-based sectors of production, but also a move away from rentier economic systems.

In conclusion, oil is both a boon and a blessing for the Middle East. For the countries that have been lucky enough to have significant petroleum reserves, it has spurred rapid industrialization and modernization processes, which have allowed a dramatic increase in growth. However, these same countries also face the instability of being dependent on the fluctuations of oil prices and therefore a certain degree of political and economic instability in the long term, as well. At some point, when the oil reserves run out, they will face a rude awakening. For example, Saudi Arabia has already had to face tighter spending controls as a result of low oil revenues in the 1990s and it continues to struggle with the challenge of economic diversification.

### *Foreign Aid*

Foreign aid has played an important role in the economies of some Middle Eastern countries. Israel is one of the largest recipients of foreign aid in the Middle East, primarily from the United States. A 2003 estimate placed external aid from the United States to be at \$662 million. This aid is directed toward economic and military expenditures.

The Soviet Union and Gulf Arab countries have also been aid donors in the Middle East. Syria was dependent on Soviet aid during the 1970s and 1980s, until the collapse of the Soviet Union in 1990. Syria also received aid from richer Gulf Arab countries. After 1979, when oil prices declined, Arab aid to Syria decreased drastically over the course of several years, from \$1.6 billion in 1980 to \$500 million in the early 1980s (Heydemann 1993).

In general, there has been a steady decline in aid flows to the Middle East in the past two decades. In 1980, the aid-to-GDP ratio was 7%. In 2000, it was a little above 2%. However, in periods of strategic importance in the aftermath of conflict, there have been temporary spikes in aid levels. For example, after the Israeli-Egyptian peace agreement in 1979, after the first Gulf War in 1991, and after the Oslo Agreement in 1995, there were momentary increases in aid to the region (World Bank 2003).

### *Labor Force*

The oil-rich countries in the Persian Gulf have traditionally had small populations, and have needed to import labor from outside in order to meet their needs. In the mid-1970s, there was a wave of labor migration to these Gulf countries, in particular from Jordan and Yemen. From 1975 onward, about 40% of the Jordanian workforce, including Palestinians, worked abroad. By 1981, remittances from these workers were valued at 27.8% of the Gross National Product (GNP). With the fall of oil prices in the 1980s, the Jordanian economy also suffered from a decrease in remittances.

Expatriate workers in the Gulf also come from the Indian subcontinent and Southeast Asia. The numbers of Asian workers in the Gulf countries increased dramatically in the 1970s and 1980s. There are several reasons why there was a demand for nationals from these countries. First, the need for skilled and semi-skilled labor was not being met by workers from Arab countries. Second, the labor supply in Asian countries was cheaper and the labor market was more organized. Lastly, these non-Arab workers were less likely to stay permanently in the Gulf countries, and therefore were less likely to be politically troublesome as members of society in the long term. Three decades later, these expatriate workers are still considered “temporary workers,” even though many of them have spent their entire working lives in the Gulf countries.

The political ease with which governments can expel expatriate workers was demonstrated by the Iraqi invasion of Kuwait in 1990. Yemeni workers in Saudi Arabia were roundly expelled because the Yemeni government professed support for Iraq. Palestinians working in Kuwait and Saudi Arabia were also “punished” for Arafat’s support for Iraq by expulsion from these two countries. These actions demonstrated the fact that expatriate workers are politically expedient pawns, which the government can manipulate when it is under pressure.

The current outcome of this labor migration is that there is a significant expatriate population with the skills and human capital to run the country’s businesses and industries in most of the Gulf countries. In Saudi Arabia, there are roughly 7 million expatriate workers. In the UAE, the foreign population outstrips the local population.

This dependence on foreign human capital has handicapped economic development in these countries, creating a lack of qualified workers from within the national population. There has been political pressure in the past decade to substitute expatriate workers with nationals in Saudi Arabia, as the country has faced increasing unemployment rates,

high population growth, and economic slowdown because of low oil prices. The relative success of this policy of “Saudization” remains to be seen.

### *The Need for Change*

Economic activity in the Middle East has relied up to now on several factors: oil revenues, a state-dominated public sector, foreign aid, and workers’ remittances. The economic model based on these factors is no longer sustainable in the long term. Factors such as high unemployment rates, inefficient state-dominated economies, declining foreign aid levels, and lower oil prices are spurring a move toward economic reforms in the region.

First, as noted earlier, dependence on oil revenues has made the economic patterns of oil-exporting countries dependent on global oil price fluctuations. A decline in average (real) oil prices over the last twenty years has put an end to the rapid burst of economic growth that characterized the Gulf countries in the 1970s. In addition, the fact that oil is a non-renewable energy resource means that these countries also have to look at other ways to sustain GDP growth in the long term. Thus, rentier states such as Saudi Arabia have had to focus on diversifying their economy to focus more on non-oil sectors in the 1990s. Currently, oil revenues make up about 75% of the Saudi budget, and account for 45% of the GDP. The Kingdom has encouraged some private-sector growth in order to balance GDP growth from the oil sector, but change has been incremental.

The United Arab Emirates is an example of a Gulf country that has been more successful in making this transition to an emphasis on non-oil sectors. Despite the fact that it has the world’s third-largest recoverable oil reserves and significant natural gas reserves, it has focused on growth in non-oil sectors of its economy, as well. It spent the 1990s diversifying to include petrochemicals, fertilizers, cement, aluminum, tourism, trade, and manufacturing sectors. By 2000, these non-oil sectors of the economy accounted for 70% of the GDP, and 43% of exports. Overall GDP growth has averaged 7% a year since 1993.

Among its policies for encouraging private-sector growth and trade has been the creation of twelve free trade zones, of which Dubai’s Jebel Ali free trade zone is the largest. Companies established in the free trade zone are allowed to have 100% foreign ownership, which is in contrast to other Gulf countries where there are significant government restrictions on foreign investment and ownership in companies. In addition, the UAE has a strong telecommunications and trade infrastructure, which has also fostered foreign

investment. However, despite the economic success of the UAE, the country remains dependent on foreign labor for its human capital. About 90% of the labor force is composed of expatriate workers, mostly from the Indian subcontinent, other parts of the Middle East, and the Philippines (World Bank 2003).

Another factor that characterizes economic development models in the Middle East is a strong state dominance in the economy and especially in the public sector. In the 1970s and 1980s, under the leader Hafez al-Asad, the Syrian economy was dominated by state-run industrialization efforts. The combination of a socialist-oriented economy and an authoritarian political system created a closed and ultimately inefficient development process. Ultimately, economic crisis propelled the Syrian government into instituting a series of limited economic reforms. Since the 1990s, Syria has had to move away from the state-dominated model and toward allowing the private sector greater flexibility for economic participation, though it is debatable as to the real extent of this private-sector participation (Anderson 2001).

Socialist economies are not the only ones that have strong government control. As a rentier state dependent on oil revenues, the Saudi government also exercises far-reaching domestic economic control. Oil revenues have allowed the government to institute a system of heavy subsidization of basic resources, in addition to provision of healthcare, education, and other social services. Royal patronage of industrialists and indirect royal ownership of private-sector ventures is also common in Saudi Arabia (Anderson 2001).

One of the realities causing a shift away from heavy state dominance in the public sector is the shortage of jobs. A lack of jobs has created high rates of unemployment in many countries. For example, Syria has a 2002 estimate of 20% unemployment. The 2004 estimate of the unemployment rate in Saudi Arabia is 25%. Iran has a 15.7% unemployment rate, based on 2004 estimates (*CIA World Factbook* 2004). In addition, these countries also have a high percentage of young people who will be entering the workforce shortly, only to find that the government-subsidized jobs that their parents had are no longer available to them. Encouraging private-sector growth as a source of potential employment for the growing population is an imperative for countries that have traditionally relied on a highly government-subsidized economic system.

### **Political and Economic Reforms**

For the past two decades, there has been pressure for political and economic reforms in the Middle East

that will open up the countries to foreign trade and investment as well as allow greater political freedoms to the populations. The underlying assumption in this line of argument is that the current state is temporary, and that these countries are in the process of developing in the direction of greater economic and political openings. To some degree, this assumption is valid, since most countries have state-dominated economies and limited political rights and freedoms. With the exceptions of Turkey and Israel, which have elected leadership, ruling regimes in most other countries remain entrenched in power on the basis of dynastic rule or military/authoritarian power.

Popular political representation, political accountability of the leadership, and greater economic and political participation for women are all key political reform issues. Some countries, such as Bahrain and Qatar, have taken steps in this direction by allowing reasonably free elections. In October 2002, Bahrainis elected members of the lower house of Bahrain's reconstituted bicameral legislature, the National Assembly. Women candidates were allowed to vote and to run for office for the first time in these elections. But unfortunately, no female candidates won a seat. The same outcome took place in Qatar's municipal elections in 1999, where, again, none of the six women candidates won any seats. However, it is important to note that these were the first democratic elections in these countries, in a region where if there are any elections, their results are usually predetermined by the state.

Jordan and Oman are other examples of countries with limited female political participation. The Jordanian assembly has reserved seats for women in the House of Representatives, and in 2003, three women were also appointed to cabinet positions. Oman has two female members on its consultative council, but they are not elected positions.

The role of civil society in creating democratic governance is also important to note. Debate on this issue centers around what constitutes civil society in the Middle East, whether it exists, and its prospects for future development, given the authoritarian nature of the state in most countries. State responses range from repression to limited openings for civil society. Thus, the response to these questions is not clear-cut. In Iran, the post-Revolution Islamic regime has cracked down on all forms of opposition that do not conform to the state's ideological position, and continues to restrict political freedoms of the population. The government routinely arrests journalists, activists, and other members of civil society organizations who voice any critique or opposition to the regime.

In contrast, Qatar has permitted limited political reforms, most recently embodied in changes to the

country's constitution in 2003, which allow for the right to assembly and the right to establish associations. The most far-reaching policy, though, was the removal of all domestic restrictions on freedom of the press by Emir Hamad bin Khalifa al-Thani in 1995. This paved the way for the 1997 launch of Arab TV satellite channel al-Jazeera. The channel has shaped the development of civil society in the region through fostering debate and discussion on sensitive issues that governments have traditionally not been willing to tackle on state-controlled media.

One line of argument on the issue of political and economic reforms in the Middle East is that market-oriented economic reforms need to take place in conjunction with political reforms that allow for greater power-sharing between the state and its people. However, the competing line of argument states that economic reform can and does occur without recourse to political liberalization. In other words, the two do not necessarily have to go together. Syria is an example of an authoritarian state that instituted economic liberalization reforms from 1982 to 1992 without engaging in significant changes to its political system.

The debate on how far-reaching and how meaningful democratic political reforms can be, or how much they can change the distribution of power in the political system, continues. While there may have been political reforms that are democratic in nature in the Middle East, few of these reforms have led to a definitive establishment of a full-fledged democracy. In contrast to political liberalization, moves toward economic liberalization have been relatively more extensive in the region. The extent to which this economic and political development process will result in meaningful change in the Middle East remains to be seen, however.

## MIDDLE EAST: INTERNATIONAL RELATIONS

Cultures have crossed and contended in the Middle East since the beginning of recorded history. In ancient times the region witnessed the rise of empires and the wars between the Persians and the Greeks leading to conquests of Alexander the Great and the Roman Empire. In general, three types of struggles have occurred there—geo-political, ethnic, and religious. In the Middle Ages, after the Arab conquests of the seventh century, religious wars erupted between the Moslems and the Byzantine Christians on their border in Anatolia. The conquest of Anatolia by the Seljuk Turks in 1070 led to the Crusades from the eleventh to the thirteenth centuries when Western Christians were temporarily able to control certain portions of the areas.

The basic ethnic conflicts among Moslems centered on Persians, Arabs, and Turks. The geo-political conflicts revolved around Persia, Egypt, and Syria. By the end of the fifteenth century, the Moslem Ottoman Turks came to rule the entire region excepting Persia but including even the European Balkans. After reaching their height in the sixteenth century, the Ottomans began to retreat as European powers took over their lands in Europe and various Moslem war lords and independent pashas carved out their territories around the Empire.

Beginning in the eighteenth century, the Great European powers began to wrest concessions from the Ottoman Empire, known as “the sick man of Europe,” and gain control over its economy. In World War I the Ottomans sided with the Central Powers, and France and England secretly planned to carve up its territory with the Sykes-Picot agreement. Russia, which also had hoped for spoils, was eliminated after the Bolshevik Revolution. At the same time, the British sponsored a revolt by the Arabs against Istanbul and, with the Balfour Declaration, promised the Jews a homeland in Palestine.

After World War I the Turkish Republic under Mustafa Kemal Atatürk managed to retain its

independence through war and agreements with the victorious Allies. Atatürk renounced claims to the other Ottoman territories, which the Allies, particularly Great Britain and France, took over directly or indirectly through League of Nations mandates or prewar agreements. The interwar period, however, witnessed much unrest as various leaders fought each other for control, national movements attempted to overthrow foreign rule, and radical and secular movements fought traditional leadership. During the Second World War there was more disruption, especially after the fall of France in 1940. The Allies were for the most part able to keep the Axis out of the Middle East (excluding North Africa where Italy had colonies), but the idealism of national liberation grew even stronger.

After the war British imperialism around the world began to disintegrate and the countries of the Middle East took shape based on traditional and colonial formations. In the postwar world several major issues and factors determined the course Middle East politics. First was the question of liberation and the establishment of modern nation-states; second, the relations of the great powers with the countries of the region; third, the role of oil in the world economy and the politics of the region; fourth, the attempts by strong persons to dominate the region; fifth, the clash of various political groupings in the region, e.g., radicals as opposed to traditional monarchists, secularists vis-à-vis various religious parties, and rival ethnicities; and last but certainly not least, the question of Israel and Palestine.

The issue of national liberation concerned the attempts by the Middle Eastern countries to wrest control from European occupation. During World War II the Free French allied to the United Nations stated it would not continue French rule over Syria and Lebanon (their League of Nations mandates). However, when victory was won, Paris was reluctant to relinquish control. After several months of negotiations in April 1946, the French left and Syria and Lebanon gained independence. London's position in the region was stronger since unlike the French, England did not lose to Germany and had continued occupation of its mandates and territories during the war. However, in 1923 London had already recognized partial independence of Jordan and in March 1946 granted it full independence under Emir Abdullah who became king. In 1949 the country officially became the Hashimite Kingdom of Jordan. Palestine was divided into a Jewish and Arab state by United Nations resolutions in 1947, and the British left. In the subsequent war between the Jews and the neighboring Arab States in 1948, the Jews won and established Israel, occupying more territories than the

UN had allotted. The remaining areas were taken over chiefly by Jordan, but an independent Arab Palestine state was not formed.

Saudi Arabia was granted full independence in 1932 but it still depended on British and US subsidies. Egypt, too, was formally recognized as an independent monarchy in 1923, but the British continued to exert control over the government and British troops remained in the country. Anti-British sentiment was prevalent in the country and after the fall of the monarchy in 1952, conflict between London and Cairo reached the level of hostilities culminating in the Suez Crisis of 1956. In the small states of the Arabian Peninsula, Britain retained its protectorates until 1968 when it withdrew its troops. Kuwait remained under British protection until 1961 when London recognized its independence, but it still relied on Britain, the United States, and other states to protect it from Iraq, which had coveted its oil-rich territory since 1938. Bahrain declared its independence in 1971, and signed a treaty of friendship with Great Britain. Oman and Qatar received full independence about the same time. Bahrain followed Saudi foreign policy and had difficulty with Iran over its pro-Western policies. In 1990 Bahrain supported with air bases and ports the coalition against Iraq. Abu Dhabi led the move for the creation of the United Arab Emirates (UAE) out of the seven small trucial states after the British left in 1973. The UAE, threatened by Iran and Moslem fundamentalism, helped found the Gulf Cooperation Council (GCC), an alliance of the small Gulf states, in 1981 and joined the Arab League and the UN in 1991. It quarreled with Iran over disputed Persian Gulf islands and also supported the Desert Storm coalition. On the southern end of the Arabian Peninsula the two states of Yemen and North Yemen gained independence in 1977, and in 1990 they united.

Iran, which was technically independent, in fact really lay under the domination of Russia and Britain in the nineteenth century. With the Bolshevik Revolution and the Soviet renunciation of concessions in Iran, the British were left in control. In the 1920s Reza Khan rose to power and in 1925 had himself crowned as Reza Shah Pahlevi. Reza Shah promoted the ethnic difference of the Iranians from the Arabs and in fact changed the traditional name of the country, Persia, to Iran (Aryan), to emphasize their links with the Indo-Europeans, the linguistic group to which the Farsi language belongs. In the 1930s, to counteract British influence, Reza Shah made commercial concessions to Nazi Germany. During World War II the Soviets and British invaded his country and forced him to abdicate in favor of his son Mohammed Reza Shah.

After the war the nationalist Mohammad Mossadeq came to power, ousting the Shah, but his anti-Western policies, including nationalizing the oil industry, led to a Western-backed coup, bringing back Mohammad Reza Shah. The shah now was dependent on the West and maintained power through dictatorial instruments, especially the secret police he created—SAVAK.

Neighboring Iraq had been part of the Ottoman Empire and Britain obtained a League of Nations mandate over the country after the war. In 1932 London granted the country independence under King Faysal. The military, however, gained control of the country, and during World War II, the British occupied the country. Between 1945 and 1958, riots, upheavals, martial law, and coup d'états punctuated Iraqi life. The country was divided religiously between Moslems and Christians and the Moslems between Shiites and Sunnis. There was also a significant Kurdish minority. There was contention between the younger and older political leaders, dissent in the army, and disputes between the young King Faysal II and his regents. There was popular unrest over the Palestine crisis, and anti-Western feeling because of British and US concessions over the country's oil resources and the monarchy's pro-Western policies. Finally in 1958, a group of army officers ousted the king.

In the years after World War II, the Middle East was also a battleground in the Cold War. The lead in Western interests in the region was assumed by the United States. Their opponent was the Soviet Union. The two major issues were oil and the Israeli–Palestine conflict. In addition, Britain and France joined Israel in 1956 to prevent Gamal Abdul Nasser of Egypt from seizing the Suez Canal. The Western oil companies pushed their governments to maintain treaties with the Middle East countries that gave them favorable concessions, but the oil-rich nations looked to their own advantage. However, since the Soviet Union backed radical governments, the traditional monarchies tended to favor the West. These included Saudi Arabia, Jordan, Iran under the shah, and most of the small states of the Persian Gulf—Kuwait, the United Arab Emirates, Oman, and Bahrain. On the Israeli–Palestine question, even the conservative governments sided with the Palestinian Arabs. The West took a more ambivalent stance—supporting Israel's right to exist, but at first reluctant to appear too pro-Israeli. The Soviet Union initially supported the creation of Israel, in part on the hope it would become a socialist ally in the immediate postwar years. Furthermore, the horror of the Holocaust coupled with the need to resettle survivors and rebuild Europe made the existence of a Jewish homeland important

to both the Soviets and the West. However, in the 1950s Moscow turned away from Tel Aviv, giving complete support to the Palestinians. After the Six-Day War of 1967, Moscow and most of its allies broke off relations with the Jewish state. Furthermore, the Western states, chiefly the United States, supplied Israel with arms. Washington was also giving arms to its allies in the Middle East—Saudi Arabia, Iran, Turkey. Domestic politics in the United States made support of Israel important for Washington's position.

Although communist parties existed in the Middle East, they never made much headway in domestic politics. The Soviet Union then supported anti-Western nationalist states in Syria, Iraq, and Egypt whom Moscow supplied with arms. They also maintained friendly diplomatic relations with the shah, even though the latter was clearly in the pro-Western camp. Turkey, which had a long history of hostility with Tsarist Russia, joined the Western camp. Ankara joined the United Nations coalition in Korea and even became a member of the North Atlantic Treaty Organization (NATO). Furthermore, Iran and Turkey, two Moslem but not Arab countries, recognized Israel. Washington and London formed the Middle East Treaty Organization (also known as the Baghdad Pact, where its headquarters were located) in 1955. Turkey, Iraq, Iran, Pakistan, and Great Britain were founding members. Like NATO, it was directed against the Soviet Union and especially interested in protecting the oil resources of the region. In 1959, after the fall of the king, Iraq left and the headquarters moved to Ankara, and the United States became an associate member. The organization was renamed the Central Treaty Organization or CENTO. In 1979 the Shah fell and the organization was dissolved.

Ankara invaded Cyprus in 1974 and established the Turkish Republic of Northern Cyprus, which received no other recognition. Then Turkey moved closer to the Soviet Union in the 1970s, mistrusting the Western position on Cyprus. However, it still leaned more toward the West, seeking trade relations with the European Union. It supported the coalition against Iraq in 1991, but the strength of the Islamic party in the country caused problems with this pro-Western stance.

A number of Middle East states joined the Non-aligned Movement (NAM) starting with Egypt in 1964, three years after the start of the organization. Others that have joined over the years include Bahrain, Iran, Iraq, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Syria, the UAE, and Yemen. The NAM tried to develop policies for those countries not associated with either the West or the Soviet bloc.

Oil resources have played a major role in the politics and international affairs of the region. It has brought great wealth to a number of the states, especially those of the Arabian Peninsula. Oil is also found in Iran and Iraq, but only in limited amounts in Turkey. It is not found in Israel, Jordan, or Lebanon. In 1961 the oil-rich countries joined a number of others from around the world to form the Organization of Petroleum Exporting Countries (OPEC) to regulate the production of oil. This cartel, along with increasing world demand, helped to drive the price of oil to increasingly high levels. However, in general, except for some isolated cases, OPEC based its policies on economic rather than political issues. Saudi Arabia did carry out a short oil boycott in 1973 over Washington's support of Israel. By 1984 the Saudis had gained complete control of ARAMCO, the Arabian-American Oil Company.

Another factor determining the domestic and international politics of the Middle East has been the rise of strong personalities who have attempted to play a dominant role in the region. The first of these in the postwar world was Colonel Gamul Abdul Nasser of Egypt. In 1952, on a strong anti-Western nationalistic policy, he led a coup d'état against the dissolute king of Egypt, Farouk. In 1958 he convinced Syria to unite with Egypt in the short-lived United Arab Republic, which ended in 1961 after a coup in Damascus brought new leadership that wished for independence. In 1964 he became the first Arab leader to join the NAM, disassociating Egypt from either bloc in the Cold War, although he signed treaties with both sides and in fact stood close to Moscow, inviting Soviet military advisors into the country along with Soviet arms. However, the main issue that Nasser as well other Arab leaders used to promote themselves was the Palestinian cause. Nasser, like many others in the Arab world, called for the elimination of the Jewish state, and he participated in two wars with Israel. In 1956 he announced his plans to nationalize the Suez Canal, which Egypt operated under international regulations. He planned to use the tolls to finance his project to build the Aswan dam for irrigation. This provoked Britain and France, who had interests in the Suez Canal Company, to join Israel in the seizure of the canal. Israel, aroused by Nasser's bellicose pronouncements, support for Arab raids, their ban from using the canal, and his blockade of the Straits of Tiran at the mouth of the Gulf of Aqaba, readily agreed. The three countries easily occupied the canal but they were not backed by Washington, and the United Nations forced them to leave. Nasser reached a compromise settlement, paying off the shareholders of the canal company and ending the

blockade of the Straits of Tiran. For the Egyptians he emerged a hero.

In June 1967 the tension between Israel and its neighbors once more was raised to fever pitch as a new Syrian government began making raids into Israel and amassing troops on its borders. The Syrians egged Nasser to join in and he sent his troops into the Sinai Desert, which was being guarded by UN peacekeepers. He also renewed his blockade of the straits of Tiran, closing Israeli access to the Red Sea. When Jordan also joined the coalition, Israel struck first and in six days completely defeated all its adversaries, seizing their land including the Sinai, the West bank of the Jordan, as well as all of Jerusalem and the Syrian Golan Heights. Nasser's plans for Arab leadership were over, although he remained a hero to the Egyptians who rejected his offer to resign. The Soviet Union replaced the planes and armaments he lost in the war, but he turned to Washington to seek some peace overtures with Israel. Three years after the 1967 war, Nasser died suddenly of a heart attack.

Although from North Africa rather than the Middle East, the Libyan leader Muammar Qaddafi played a major role in the politics of the region. Qaddafi seized control of Libya in 1969 when he overthrew King Idris I. The Arabs of North Africa had not shown much interest in the Palestinian question before 1967, but Qaddafi used the issue to try to unite Arabs from the Middle East with those of North Africa. However, he was never able to make much headway in his goal to get other leaders to follow him. He sought a union with Egypt, Tunisia, and the Sudan, but geopolitical and ideological conflicts prevented these alliances. In fact, in 1977, as a result of the more conservative policies of Nasser's successor Anwar Sadat, an inconclusive war between Libya and Egypt erupted. Qaddafi also supported guerilla movements around the world, culminating with his support of the terrorists responsible for the bombing of Pan American Airlines Flight 103 over Lockerbie, Scotland, in 1988. In 1986 the United States air force conducted air raids over the country, injuring one of Qaddafi's daughters. The UN placed sanctions on Libya because of its terrorist activity. Qaddafi ultimately gave up his support of terror and in 2004 promised to dismantle efforts to create weapons of mass destruction, as a result of which relations with the West improved.

Another figure who must be counted as one of the strong leaders of the Middle East is Yasir Arafat. Although he never had a state to rule and therefore lacked the base to be a dominant political leader like Nasser, his position as leader of the Palestine Liberation Organization (PLO) gave him the authority to mobilize large number of sympathetic Arabs and Moslems and direct Middle Eastern politics. Arafat

took over direction of the PLO in 1969, replacing the ineffectual Ahmed Shuquari as a consequence of the Arab defeat in the 1967 Six-Day War. In the beginning of his leadership, he was committed to the total destruction of Israel and its replacement with a Palestinian state where Jews, Christians, and Moslems may live, but where Jewish immigration would not be permitted. He used terror and attacks on Israel as the method of achieving this. He was behind the hijacking of airlines and assassinations in order to achieve his goals, but in the end this was unsuccessful. His use of raids into Israel and a policy of guerilla warfare earned him the title of terrorist by his enemies and freedom fighter and revolutionary by his friends. In 1972 he made a speech before the United Nations General Assembly, which saluted him as a hero. Although he was able to build a cohesive following of Palestinians living in refugee camps in Jordan, Egypt, and elsewhere around the world, he was never fully accepted by other Arab leaders, and they did not push hard to achieve an independent state or resettle the Palestinian refugees. Nevertheless, his popularity forced them to pay heed to his leadership, and international Arab organizations permitted the PLO to join as a recognized entity.

After the Gulf War of 1991, in which the United States led a coalition of both Western and Middle Eastern States to expel Saddam Hussein of Iraq from Kuwait, there was a renewed effort to settle the Palestinian-Israeli issue. This was continued by President William (Bill) Clinton after he replaced George Bush who had led the Gulf War. The talks led to agreements in the Oslo Accords and an historic meeting between Arafat and Israeli Prime Minister Yitzhak Rabin in the United States, including a handshake between the two. However, the agreements did not last. An Israeli extremist assassinated Rabin, and a new wave of terror by Palestinians hit Israel. Arafat did not follow up on the peace proposals and lost real control of the Palestinians, unable to stop the terror. The Israelis blockaded him in his citadel on the West Bank, not allowing him to leave until his death in 2004.

Saddam Hussein, the ruler of Iraq, was a charismatic leader, the head of the Ba'ath Party. He had been one of a group of officers who overthrew President 'Abd al-Salam 'Arif in 1968. Gradually Hussein assumed absolute control of the country by ousting his colleagues. A member of the minority Sunni sect, he kept strict control over the majority Shiites and another minority, the Kurds of the north. He brutally suppressed the Kurdish revolt of 1988 using poison gas. He also joined other Arab states in the wars against Israel. Like Nasser he aspired to be a leader of all Arabs, but he ran into difficulties with other

leaders in the area. In 1981 the Israelis bombed his Osirak nuclear research laboratory out of fear that he was planning to build bombs. He also had a border war with the Iranians after the Shiite religious revolution in that country in 1979 that brought down the shah. The war lasted eight years (1980–1988) without much change. During that period he was supported by the United States, as Tehran was an avowed enemy of Washington.

Hussein now felt emboldened to add oil-rich Kuwait to his realm, believing Washington and the West would not intervene. However, the move caused a coalition of Western and Middle Eastern states led by the United States to declare war and utterly destroy his forces, driving him from Kuwait, but leaving him in Iraq. The United Nations imposed a series of sanctions on Baghdad to force him to allow inspections of his armaments. His refusal to comply over the next decade led to numerous air raids and bombings of his country. Hussein in the meantime looked for new support in the Arab World. As religious fundamentalism became a popular movement among Moslems, he turned from his previous secularism and attempted to put on a religious front. In 2002 President George W. Bush, the son of the president who had ordered the Gulf War, invaded Iraq to topple Hussein, whom he believed was in contact with the al-Qaeda terrorists who had bombed New York's World Trade Center the year before and was building weapons of mass destruction. Although both beliefs were erroneous, the US-led coalition toppled and arrested Hussein, but found itself in a difficult war in Iraq fighting anti-US insurgents.

Another factor in Middle Eastern politics has been the rivalry of various movements and governments in the regions. After the war, most of the countries were controlled by monarchies, the majority of which claimed descent from the prophet Muhammad. In Iran the monarch was the shah, the son of the ruler who had declared himself to be a king. These monarchies tended to be authoritarian and conservative. Some, like in Saudi Arabia, ruled by Islamic law. Some shared the largess they achieved through oil wealth with their citizens. Most monarchs also tended to be pro-Western. However, in the 1950s and 1960s secular radical movements attempted to seize power. The most successful was the Ba'th movement, a form of Islamic socialism. Ba'th parties were successful in Syria and Iraq.

Another form of conflict involved ethnic confrontations. Most prominent were the struggles between the Kurds and the various countries they inhabited—Turkey, Syria, Iraq, and Iran. Their attempts to establish an independent Kurdistan failed, and they suffered various forms of harassment for their efforts.

In Turkey, Kurdish leaders were censored and imprisoned. In Iraq, Saddam Hussein attacked Kurdish villages with poison gas. Some conflicts were geopolitical. Saudi Arabia and Oman fought over their border in the 1950s and confronted Nasser who supported North Yemen and railed against the Saudi monarchy. Qatar and Bahrain, who were allied in the GCC, still argued over the ownership of the Hawar islands. There were also religious conflicts. In Lebanon, Moslems and Christians fought a civil war (1975–1976), causing neighboring Israel and Syria to invade and occupy the country. The country was virtually destroyed, and finally found itself under the domination of Syria. The Iraq–Iran War was a war between Sunni-led Iraq and Shiite Iran, but it also involved an Arab country, Iraq, against non-Arab, Persian Iran.

Perhaps the most important issue of post–World War II Middle Eastern foreign policy is the Palestinian–Israeli issue. During World War I, the Arabs hoped to regain the lands of their medieval caliphate from the Ottoman Empire and were allied to the British who supported their revolt. Furthermore, Jewish Zionists, who had been purchasing land from the Sultan since the 1990s, also hoped for a restored Jewish homeland there as London had promised in the Balfour declaration. However, after the war, Palestine was controlled by the British under a League of Nations mandate. The term “Palestinians” then designated Jewish immigrants who continued to work for the Zionist goal of resettlement. Jewish–Arab battles occurred throughout the interwar period, and Britain limited the number of Jews allowed to immigrate into the area. This became a critical issue during the rise of Nazism in the 1930s and especially during the years of the Holocaust in World War II when only limited immigration was possible and even then difficult. In the immediate postwar years, the British still barred many of the survivors, although a number were able to enter the region both legally and illegally. Strife between the Arabs and Jews continued and the Jews began a war of terror against the British. In 1947 the United Nations voted to divide the region into Jewish and Arab portions, and in May 1948 when the British left, the Jews declared their new country called Israel. Arab armies from Jordan, Lebanon, Syria, Egypt, and Iraq invaded the Jewish portion to eliminate the state, but not only did the Israelis drive them out, they also occupied more than their allotted portion and encouraged the Arabs to leave the area although many still remained. With the armistice, fighting ended, but the Arab states refused to recognize the legitimacy of Israel. The Palestinian Arabs who left settled in refugee camps where they remained for the rest of the century.

While Israel continued to develop as a modern state, welcoming more Jews, Arabs from refugee camps from time to time entered into the country to commit acts of terror. Meanwhile, the Arabs still living in Israel were better off in many ways than those in the refugee camps, but lived as second-class citizens. After the initial influx of Holocaust survivors, it was difficult for Tel Aviv to persuade Jews from Europe and the Americas to immigrate, so the Israelis looked for immigrants from the Arab countries and from the Soviet Union and Eastern Europe. It was hard, however, for the 5 million Soviet Jews to get permission to leave the country. Eastern Europe was a different story and at various times from the 1940s to the 1960s, large numbers entered from Bulgaria, Romania, and Poland.

As mentioned above, in 1956 Israel joined Great Britain and France against Egypt, after Nasser nationalized the Suez Canal. Nasser in his attempts to become the leader of all Arabs had consistently supported anti-Israeli propaganda and even the raids from the Sinai into Israel. During the war, Israel drove the Egyptians back to the canal and occupied the Sinai, but Washington did not support the alliance and the United Nations restored control of the canal to Egypt. Nasser continued to promote anti-Israeli propaganda, but the Jewish state became less of an issue in his policies and in Arab politics in general, although Arab states refused to recognize the country. However, in the mid-1960s the Ba'ath party, which had seized power in Syria, stepped up guerrilla attacks on Israel. In May 1967 the relations between Israel and her neighbors reached a crisis when Jordan and Egypt blockaded the port of Elat, cutting off Israel's access to the Red Sea. After a stalemated debate in the United Nations Security Council where the Soviet Union backed the Arab action and the United States supported Israel, the Israelis struck against all its neighbors on June 5, quickly defeating their armies in the "Six-Day War."

Israel was now in control of the entire Sinai, the West Bank of the Jordan, the whole city of Jerusalem where they had moved their capital, and the Golan Heights of Syria. Furthermore, Israel was now seen to be the dominant military power of the Middle East. When Anwar Sadat took over in Egypt after the death of Nasser, he planned another war against Israel. In 1973 this broke out on the holiest day of the Jewish calendar, Yom Kippur. Despite some initial successes and significant Israeli casualties, the Arab forces were unable to regain territory.

Although it had shown that Egypt could stand with Israel in battle, the Yom Kippur War profoundly affected Sadat as he lost his brother, an Egyptian pilot, in the war. The Egyptian leader now was

prepared to make peace with Israel. He traveled to Jerusalem, and Israeli Prime Minister Menachem Begin went to Cairo. The two leaders, under the auspices of President James Carter, then went to Washington and worked out a negotiated peace. The two countries changed ambassadors, and Israel returned the Sinai to Egypt. The other Arab countries condemned Sadat as a traitor, but Sadat and Begin shared the Nobel Peace Prize for 1978. Three years later, a Moslem extremist assassinated Sadat while observing a military parade commemorating the Yom Kippur War, just as in 1995 a Jewish extremist had assassinated Yitzhak Rabin for negotiating with Arafat.

In 1985 Israel left Southern Lebanon but still maintained control of the West Bank, the Golan Heights, and Gaza. Thus Jerusalem had a large number of Palestinian Arabs under its control. In 1987 the Palestinians, especially the youth, reacted with stonethrowing attacks on Israeli forces, the *intifadah*. Israeli forces retaliated with water cannons and rubber bullets, causing a number of injuries. Against terrorist invaders they responded with harsher actions. During the Gulf War of 1991, Washington persuaded Israel not to retaliate against Iraq, which had sent Scud missiles against the country trying to break up the coalition against it, which included a number of Arab countries. Jordan recognized Israel in 1993 and King Hussein became the custodian of the Moslem Holy Places. In 2000 Palestinian organizations like Hamas and Islamic Jihad began a systematic use of suicide attacks (the second *intifadah*) with individuals who were mostly teenagers—men and women, moving into crowded areas in Israel with bombs strapped to their bodies. Once again Israel responded with force, invading Palestinian areas trying to destroy terrorist bases. The most serious invasion took place in February 2002 when they invaded the headquarters of Arafat, although they had promised Washington that they would not kill the Palestinian leader. Jerusalem also built a wall separating Israeli land from Palestinian territory, causing a great deal of controversy and condemnation from the United Nations and the World Court. Jewish settlements on Palestinian land have been condemned by both friends and foes of Israel alike. However, attempts by the government to remove them have aroused dissent inside the country, causing domestic political difficulties.

## MIGRATION

Differences in living standards and opportunities explain why an increasing pressure for migration exists between countries of the Southern and Northern Hemispheres, as well as among countries of the Southern Hemisphere. As economies expand, as communications, transportation, and education offer people access to modernity, people move within their

countries and abroad. Powerful social, cultural, economic, political, and psychological factors facilitate migration from the South to the North or from the South to more developed countries in the South.

In the 1980s, the report of the Brandt Commission (*Common Crisis: North, South: Co-operation for World Recovery*), which received its name from its president, the former German Chancellor Willy Brandt, favoured a global project to promote Third World development that would, among other things, bring work to the labour force rather than the labour force to the work. However, a global redistribution of employment has not proved possible, and in the 1990s the emphasis was on development of the countries of the South to allow these countries to become more competitive internationally.

## Historical Overview

Why is industrial transformation generally followed by rural-to-urban migration, which contributes to urbanization? Some theorists suggest that internal and international migrations are induced by the same processes of social and economic development. The volume of emigration is determined by the degree of economic integration between the sending region and the region of destination.

In pre-industrial societies, economies are characterized by an agricultural sector organized around village-based peasant agriculture. When elites outside the peasantry, such as landed aristocrats, political leaders, capitalists, foreign companies, or international agencies try to substitute capital for labour, and to create markets, peasant agricultural production is destabilized; peasant farm workers begin to be underemployed, and redundant to agricultural production. The economic development of the peasant agricultural production contributes thus to the creation of markets, and the selling of labour. Peasant farmers may work as sharecroppers or as daily wage workers. Markets created for the purpose of economic exchange emerge: markets for land, capital, labour, food, consumer goods, and so forth. These processes weaken individuals' social and economic ties to rural groups and let appear large-scale migration.

In Britain, these processes took place in the late eighteenth and early nineteenth centuries (Massey 1988); a similar process occurred in Mexico at the end of the nineteenth century (Cardoso 1980). One of the most important reasons for migration is the uneven economic development of different regions or countries (Hoffmann-Nowotny 1973). Rural–urban migration thus brings about a progressive

urbanization of societies. In European countries, during the nineteenth and early twentieth centuries, urban areas did not absorb all of these rural–urban migrants. Large groups immigrated instead to countries overseas. This immigration is generally regarded as an outcome of economic development under a market economy.

The cyclical nature of industrialization in urban areas, linked to a constant pressure for out-migration from rural areas, creates large groups of possible migrants who respond to development processes. When no political-administrative barriers exist, a demand for immigrant workers in a foreign country, and a wage differential that covers the cost of relocation are sufficient to let appear international migration. The uneven geographic distribution of economic growth within countries and between countries leads to a structure of emigration: as an economy enters a difficult economic cycle, there are other overseas destinations with economic development, and a demand for labour. Furthermore, in more recent years, the declining real costs of transportation and communication let increase the net returns to international movements. The construction of railroads and roads, and the establishing of phone, radio, and television communications led to an integration of developing countries into international markets. People's personal networks became increasingly connected to communication systems of developed economies overseas. Consequently, development rendered international movements easier, and cheaper.

The immigration to developing countries can be explained by the creation of a pool of migrants through capital formation, market creation, and by disparities in economic development across time and space. This structural condition for international movements is accentuated by improvements in transportation and communication systems. It becomes clear that every country and region that has developed its economy has experienced migration. However, there are differences among countries in the amount of emigration: nineteenth-century France experienced rather low levels; during the same period, Britain experienced a mass exodus. Differences between countries depend on the state of the world economy, colonial relationships, technologies, and political factors. The economic links between the developing country and the country of destination are, nevertheless, important factors of explanation. In general, an increasing integration and interdependence let increase the volume of migration.

B. Thomas demonstrated this fact for the developing Atlantic economy of the nineteenth century. The link between the Mexican oil boom and the US economic boom of 1982–1987 has been clearly

established, too (Massey 1988). Recruitment of workers from less developed countries by agents from more developed economies was widely used in history: European workers came to the United States in the late nineteenth and early twentieth centuries; in the 1960s, Western Europe recruited workers from major trading partners, especially former colonies (Castles and Kosack 1973; Massey 1988).

Emigration was thus a common response to economic development not only in Europe, but in developing societies, too. Internal migrations are linked to the same economic and social development as international migrations. Workers respond to differences in wages, urbanization, and education. With the growth of economic integration, large-scale movements of labour between countries occur. Massey indicated a close relation between the onset of industrial development and the migration flows (the beginning correlation is 0.59) and later peak of emigration (correlation is 0.49) (Massey 1988). B. Thomas studied figures on emigration from Britain, Ireland, and Germany with economic development in the United States, and Britain from 1830 to 1913. D. Thomas (1941) studied population movements in Sweden between 1750 and 1933. She found that US business cycles were positively correlated with emigration; and rural–urban migration was positively correlated with the Swedish economic cycle. The work of these scholars shows that emigration is closely linked to economic development. The transformation of peasant economies created a constant rural out-migration directed to internal or international centres. Emigration fluctuated with the changes in the European economy.

## Theories: Migration and Development

This subsection addresses the question of whether migration triggers development or does development trigger migration. The large international and internal income differences have been considered by sociological theory (Hoffmann-Nowotny 1973) as one of the most important factors bringing about internal or international migration. Hoffmann-Nowotny showed that migrants from poorer European countries move to richer countries. He studied this phenomenon in Switzerland and Canada in the 1970s. Schuerkens' study of the Congo (Brazzaville) and Sudan (1981) was influenced by this approach. In this study it was found that regional economic, urban, and educational differences influenced the direction and the level of migration. However, poorer regions contributed only

on a small scale to internal migrations, whereas regions which were situated on a higher level of development contributed to a much higher degree to internal migrations.

In many parts of the developing world, migration processes led to high rates of urbanization during the 1980s and 1990s, processes that demonstrate these mutual links. Today, it is no longer obvious that an increase in per capita income reduces migration, as Hoffmann-Nowotny and I suggested in our studies. The statement that the best migration policy is development policy, which means that an increase in income would reduce out-migration, is challenged. According to Fischer, Martin, and Straubhaar (1997), the relation between migration and development is actually considered with the concept of a “modified inverted U-curve.” They wrote: “Development often first enhances and thereafter reduces the scope and incentives for migration, but the sequencing of enhancement and reduction is usually different for different types of migration.”

Classic economic theory considers that sending regions obtain benefits from out-migration for their development processes. Another economic school argues that out-migration may be an obstacle for the development of the sending areas. The “brain-drain” discussion is linked to this second approach: high-level migrants drain poor countries of valuable resources that are needed for development. Migration may further development in the core countries at the expense of the poor periphery. Whether so-called *convergence* or *divergence* processes (countries either get closer to each other or still increase their differences) predominate depends on the particular economic development of a region. Empirical studies indicate that migration seems to have positive short-term effects for regions of out-migration and in-migration. In the long term, empirical studies suggest that migration does not strongly influence the development process. There seem to be “turning points” in development when migration becomes more important.

One of the simplest economic explanations of migration is that people move with the aim to improve their situation. On an international level, this would mean that large groups of migrants move from poor to rich regions. However, the total number of migrants is rather small: it is estimated by international organizations, such as the International Labour Organization, the International Organization of Migration, and the United Nations High Commissioner for Refugees, as about 1.5% of the world population. Furthermore, most migrations are internal rather than international in spite of large international income differences. South-to-North migrations are

small compared to South-to-South migrations, for instance, from West Africa to Nigeria, or from Southern Africa to South Africa. The direction of migration flows reveals the predominance of cultural and historical links as well as geographical distance. As mentioned above, the largest migration flows come from countries that are not the poorest ones. Moreover, the position of countries in international migrations changes over time. Changing income levels induce a rise or a fall as an emigration area; for instance, sending countries are becoming receiving countries: Italian migrants went to Germany in the 1960s; in the 1990s, Italy had already become an immigration country for African immigrants.

Fischer et al. emphasize that “international migration is *partly* dependent on differences in income and development between macro-level areas.” Lack of comparable data and measurement problems render international comparisons of migration groups rather difficult. Nevertheless, Fischer et al. “calculated correlation coefficients between the net number of people born abroad in percent of total population and relative average real per capita GDP.” They found the following correlations:

These scholars concluded their study by writing: “Despite plenty of reservations to be made as far as the data used are concerned, the calculations derive a relation between the net stock of foreign-born people and GDP per capita which is overall positive, with a correlation value of +0.46.” In fact, the correlation of Europe is quite strong with +0.81. The correlation coefficients for the Middle East (+0.89) and the United States (+0.73) are high, too. The low coefficients for Africa and the former Soviet Union let us presume that in these regions, political reasons for migration are more important than economic reasons.

In order to differentiate still more the relation between development and migration, Fischer et al. restricted their migration typology to three migration subgroups:

Table 1: Correlation coefficients

Region	Note	Correlation value
World	Ex-Soviet Union excluded	0.46
Europe	Maghreb and Turkey included	0.81
Africa	Maghreb excluded	0.43
United States		0.73
Middle East	Turkey excluded	0.89
Far East and Australia		0.73
Ex-Soviet Union		-0.19

- a. Internal (short-distance) migration
- b. International (long-distance) migration of low-skilled workers
- c. International (long-distance) migration of high-skilled workers.

They understand by high-skilled workers those migrants who are “qualified for employment above, say, the level of simple manufacturing jobs.”

Regions with low per capita income levels usually do not participate in international migration flows because of lack of financial possibilities. In these regions, people exploit natural resources or work in agriculture. Countries that are more developed are frequently known for having large spatial (rural–urban) inequalities that lead to internal migration movements. In these countries, international migration can be attractive for high-skilled migrants who possess the necessary financial means and information about other life-possibilities abroad. Yet, the majority of the population has at their disposal no financial means to realize a migration. Countries with still higher per-capita income try to reduce internal regional differences. Thus, they slow down incentives for internal migration. Nevertheless, financial possibilities to engage in international migration increase, and more low- and high-skilled people will decide to move because of higher possible benefits of out-migration. But most of the people will not leave their place of residence.

The *convergence* effect of migration can be shown when differentiating the impact of migration on development in both the short- and the long run. Migration influences wages in emigration and immigration regions in the short term to medium terms. Migrants who sent parts of their income to the country of origin (*remittances effect*) influence the economy of their home countries. Migrants’ contribution to the financing of public services in the country of immigration causes effects on public transfers. The availability of labour may furthermore lead to changes in the production structure and may influence the terms of trade of both countries. What about the quantity effect of labour in the South (abundant) and in the North (scarce)? Migration from the South to the North decreases wages in the North and increases them in the South.

Neo-classical growth models have often been tested empirically. These tests reveal that convergence takes place, but at a slow rate of about 2%–3% per annum. However, most of the growth can be explained by changes in technology and not by neo-classical convergence processes. It is a matter of fact that one finds convergence within Northern countries and Southern countries as two different groups, but

rather little convergence between the South and the North.

Marx, Myrdal, Hirschmann, and Wallerstein argued that migration increases rather than decreases development differences in the world. These scholars think that technological progress does not spread from the Northern core to the Southern periphery. For them, as Fischer *et al.* wrote:

Wages and/or returns on investment will therefore remain lower in the disadvantaged region. The latter can only catch up by improving its technology and efficiency, which becomes more difficult once factors of production begin to leave. If in the extreme case all input factors were mobile, the disadvantaged location would in the long run face a total outflow of production factors, until ‘the last turns off the light.’

Immigration into economically more important areas strengthens their position as core economies, while smaller economies lose their competition effects. Structural changes or the integration of markets, which induce migration flows and their direction, may determine which economy becomes core and which periphery. “The mobility of people is therefore one of the potential determinants of core-periphery structures” (Fischer *et al.* 1997).

In conclusion to this issue, we can say that empirical case studies let appear the co-existence of the convergence and divergence theses related to migration. Periods of economic development of regions and countries exist when migration causes divergence effects. They may be followed by periods when migration induces convergence effects. The actual link between migration and development thus remains an empirical question studied in concrete situations.

Fischer *et al.* concludes in the following manner:

For most countries, the impact of international migration on development tends to be positive but essentially short-term. Especially labour-market and balance-of-payments problems are frequently eased, sometimes some growth effects due to increased consumption are noticeable. Convergence, rather than divergence effects of migration on development are usually detected. But migration rarely seems to be able to induce the far-reaching social and economic changes that are required to advance the development process in most countries of the South.

## Remittances

Central to the links between migration and development are remittances, a part of migrant workers’ earnings sent back from the country of employment

to the country of origin. These remittances depend on the rules and characteristics of workers abroad; levels and types of economic activity in sending and host countries; and the difference in wage, exchange, and interest rates. These factors influence the decisions of the migrants and their families on remittances: whether they spend funds in their country of origin or spend them abroad; whether they remit through official or informal channels; how they use their earnings, for consumption or for investment.

Remittances are private transfers and only a part of them flows through official channels. Estimates about official remittances can be derived from the International Monetary Fund's *Balance of Payments Statistics Yearbook*. Nevertheless, data are not reported for all countries and some countries report them in different categories of the balance-of-payments statistics. Three categories are of relevance: workers' remittances, migrants' transfers, and labour incomes. World Bank studies include all three categories when analysing remittance flows. But not all scholars follow this definition, a fact that results in an extreme disparity of research results. A recent study found that nominal remittance credits increased from US\$43.3 billion in 1980 to US\$65.6 billion in 1989 (Russell 1992).

For many international emigration countries, remittances constitute sizeable proportions of exports, imports, and GDP. In some countries, remittances can be 25%–50% of the value of merchandise exports and 10%–30% of merchandise imports. Yet, remittances are volatile, and countries may experience economic shocks following the disrupting of flows. There is evidence that remittances constitute an important mechanism of money transfer between developed and developing countries. The nominal net transfers (that is, credits minus debits) from developed to developing countries rose from US\$21.1 billion in 1980 to nearly US\$31 billion in 1989. In 1988, official development assistance was US\$51 billion, a fact that revealed the minor influence of development aid as a means to reduce migration pressures (Russell 1992).

What about the use of remittances? There is some contradiction in the empirical evidence on this point, which results from the fact that, for instance, expenditures of migrants are not separated from those of non-migrants. In general, migrants have to choose between consumption and investment expenditures. But analysts do not agree on the effects in the wider economy. Some scholars argue that remittances are used for the purchase of land and housing, jewelry, and general household consumption, rather than *productive investments*. They conclude that remittances do not stimulate regional or national development.

Another group of scholars argues that migrants save and invest, and that expenditures for land, housing, and jewelry have positive multiplier effects in the wider economy, and reduce government spending on infrastructure, subsidies, and services.

There is empirical evidence to support both points of view. For instance, Sahelian migrants in France often hold low- or unskilled jobs in France. A significant portion of their savings is utilized by migrant associations to finance the social infrastructure of their home villages: schools and dispensaries. Yet, the households of these migrants use remittances primarily for consumption (food, clothing) (Condé *et al.* 1986).

Evidence on the consequences of remittances for development is mixed, too. Scholars found no *automatic mechanism* by which international migration and remittances resulted in development. The effects of migration on poverty depend on the extent to which poor people migrate. In Pakistan, scholars found that remittances raised the average income of migrant households by nearly 31%. However, migrants come often from above-average income households. Remittances may increase income inequality, as scholars found in Egypt, where upper-income households produce a greater part of migrants. Direct economic aid from overseas relatives often raises income levels, the material quality of life, and the social position of those left behind. For Pakistan, scholars argued that remittances were equally distributed over the national population. One of the major migration dilemmas of the sending countries is whether they should subsidize the development of emigration areas or try to maximize the development impact of remittances at the macro level (Russell 1992).

### High-Level Skills Migration and Return Migration

It is rather difficult to identify professional categories who migrate. The notion of *brain drain* was coined in the United Kingdom to stigmatize the migration of British physicians or biologists who left for the US in the decades following the Second World War. Despite theoretical and ideological controversies, the notion was implanted and began later on to include migrations from the countries of the South to those of the North, if these migrants possessed qualifications that were likely to be absent in their country of origin.

The central question about this topic is: which experiences losses and/or gains, the country of origin

or the country of settlement. It is difficult to measure the contribution of international highly qualified migrants in both contexts. Do they contribute to the scientific progress in their country of origin? Would they produce the same output in their own country? Do they try to establish links from their country of settlement with elites in their country of origin? In fact, this problem is confronted with two viewpoints. *Internationalists* analyse this sort of migration to the countries of the North as a normal phenomenon of an international market, by arguing that qualified manpower goes to places where optimum salaries and productivity exist. In contrast, *nationalists* argue: (1) the international economy does not permit an equal distribution of expert knowledge, which tends to go to the North and is missing in the South; and (2) highly qualified migration movements are artificial, because they are induced by select migration policies of the countries of settlement with the aim to raise their own gains. This second argument was retained by the United Nations for international policy measures. Politics that favoured return migrations could be integrated into national development policies.

The idea of returning to the country of origin is linked to international migration, even if this idea remains mythical or virtual. It contributes to the identity formation of the migrant during his or her residence in an alien country. The migrant's decision to return is associated with taking stock of his or her life: the outcome of costs and benefits of a return migration influenced by professional, economic, familial, cultural, or emotional factors. Several countries, such as Taiwan and South Korea, implanted national policies to invite their elites to return to their countries of origin. Financial measures and a strengthening of the exchange of ideas between the expatriated elites and the national scientific community should contribute to these endeavours. Return migration is thus potentially a real development factor. In this sense, the International Organization of Migration created a programme to favour the return of highly qualified manpower to South America, Asia, and Africa. The TOKTEN (Transfer of knowledge through expatriate nationals) programme of the United Nations Development Programme (UNDP) tried to gather the expert knowledge of expatriates in numerous agricultural, scientific, and technical programmes. Yet, this programme does not plan a definite return, but rather the utilization of the expert knowledge of expatriates in the countries of the South. Furthermore, the creation of specialized research institutes, in India and South Korea, for instance, offers conditions that are able to attract expatriates who are looking for international co-operations and worldwide collaborations.

## Policy Measures

Theories developed to understand processes of international migration focus on very different causal mechanisms. Policy measures are thus influenced by various models and policy makers might attempt to regulate international migration by changing wages and employment conditions in destination countries; by promoting economic development in origin countries; by establishing programmes of social insurance in sending societies; by reducing income inequality in places of origin; by improving futures or capital markets in developing regions; or by some combination of these actions. Or one might advise that all of these programmes are fruitless given the structural imperatives for international movement growing out of global market relations (Massey *et al.* 1998).

Given the importance of contemporary international migration flows, policy measures on international migration will be most important in the following decades. *Durable solutions* have to be found to emigration pressures through improved international relations. In an increasingly international economy with open borders for movements of information, commodities, and capital, it is difficult to close borders for people. A long-term solution for the reduction of international migration seems to be sustainable development in poor countries, which enables economic growth and integrates the growing labour force. Measures may include national strategies, trade policy, development aid, and international relations.

A labour-sending country needs to assess its domestic development strategy in order to find the sources of migratory pressure. This would reveal the possible breaks between the macro-economic development strategy and trade and labour policies on one side, and the migration objectives of the country on the other side. In the past, many countries adhered to the import-substitution approach with neglect of the export sector, and a low use of the abundant labour force. This policy meant less employment in the organized sector, and low earnings in the agricultural and informal sectors, which, in turn, encouraged emigration. These policy inconsistencies can obviously be corrected. An employment-oriented policy will therefore focus on the dynamic use of low-cost labour and a systematic focus on a growing technological level, an upgrading of existing products, and a production of higher-value goods. Labour with more skills may be employed gradually; foreign direct investment and aid may contribute to the industrialization and economic growth of the country. This strategy has been followed by Asian NICs, which were able to control their emigration pressure. Even if this strategy has to be

adapted to the particular historical situation of a country and the world economy, its different elements continue to be essential for migrant-producing countries.

Since 1986, many countries with an abundant labour force have announced unilateral trade liberalization in order to benefit from an open trade policy. An absence of trade barriers in Organization for Economic Cooperation and Development (OECD) countries, for instance, would mean growth and employment in migrant-producing countries of the Southern Hemisphere. On the other hand, a rising level of trade protectionism would weaken trade reforms in countries with an abundant labour force. Often, it is important to diversify the export sector, with special attention to the development of trade in services, which creates employment. This way has been successfully adopted by some Asian countries in the computer industry. Nevertheless, changes will only come gradually, because of the fact that politicians are not willing to confront their own labour force in times of recession.

Development aid is another strategy to reduce international migration over the long term. Several decades of development policies have resulted in a still-growing gap between poor and rich countries. Inequality within the countries of the South has also grown between the wealthy elites and the impoverished masses. Credit policies controlled by the International Monetary Fund and the World Bank led to increased debt services in many countries, and meant an increased dependency from the North.

Development aid can be used at three levels. At the macro level, it can support programmes that tackle the generation of employment and income, demographic change, human capital development, promotion of trade, and foreign investment. At a micro level, it can focus on particular regions that produce migrants. At an intermediate level, development aid can target sectors such as the services sector, and small enterprises in the informal sector, which are important to migration flows. Results of these methods may be mutually reinforcing.

Aid can act as a facilitator to increased foreign direct investment and improved technologies. The newly industrializing countries in East Asia were able to increase their development by widening their links with foreign companies. The availability of low-cost labour in these countries was one of their assets. Nevertheless, in the contemporary world economy, a certain development of the human capital and infrastructural facilities is needed to attract foreign direct investments. Technical and financial aid programmes may be helpful to prepare countries of the South for the inflow of foreign direct investments. As conditions for investments improve, governments may be in a better position to deal with foreign companies.

Another course of action concerns micro-enterprises in the informal sector, where millions of people in the developing world earn their living. Development aid can improve the productivity and labour-absorption capacity of these enterprises through training, supply of credit, the development of co-operatives, and so forth. The growing interest of international donor countries in this sector can be linked to the policies to reduce emigration. Aid-financed projects can target small-scale industries and agro-based industries linked to rural and regional development.

The World Employment Programme of the International Labour Office has developed a programme of study to examine the prospects for relieving migration pressures through official development assistance, with possibilities appropriate to the particular problems of source regions: regional development in Mexico; urban job creation in Sri Lanka and the Philippines; rural development in India, Bangladesh and Pakistan; population programmes in Algeria and Tunisia, and so forth.

## Case Studies

What about the present magnitude of migration? According to Appleyard (1992), a large proportion of the estimated 1 million permanent migrants each year to the so-called traditional receivers (United States, Canada, Australia) are from developing countries and as many as 70 million persons, mostly from developing countries, work either legally or illegally in other countries.

The potential for emigration is much more important: the majority of the world's present and projected future population lives in developing countries. According to Golini *et al.* (1991), developing countries have the capability of employing in only twenty years an additional number of workers (733 million) much greater than the 1990 stock of the entire developed world (586 million). The central issue here is whether enough jobs are available for these large groups of people. The prognosis is not favourable, with high rates of unemployment or underemployment in the countries of the South. Therefore, emigration pressures from developing countries will be one of the most acute development problems of the coming decades. The Human Development Report stated that unless trade barriers are reduced, South-North migration (and South-South migration) will increase. Aid, similar to the Marshall Plan, has been suggested as an appropriate measure in light of the differences between the North and the South. This aid could help to reduce inequalities and, in turn, emigration

pressures, even if, in the short term, emigration resulting from development would increase.

## Conclusion

“[T]he almost inevitable global population of 11 billion within a century will create increasing emigration pressures in developing countries” (Appleyard 1992).

The question of how long the inequality gap between rich and poor countries can continue widening, and the policy of the developed countries to manage flows of economic resources, including labour, from the South to the North according to their own interests, are certain to remain major topics of the political debate for the following decades. In our increasingly integrated world system, it is important to examine population movements that seem to be an important element in the changing world order. A broader knowledge of international migration flows, and of the impact of decisions of governments and individual migrants on patterns, causes, and impacts of migration will contribute to insights on the new world order of the twenty-first century.

In order to understand more deeply the actual migration and development patterns, case studies based on country- or region-specific macro-conditions are needed. A uniform South does not exist and the effects of migration on development will not be the same for all countries of the South. A dynamic theory of migration and development has to consider the mutual links of migration and development, the influence of a beginning development on migration, and the effects of migration on development. Such a theory should connect theoretical approaches originating from different disciplines.

The analysis of the development–migration link leads us to expect growing international migration flows between the South and the North. More and more people of the South are included in the world economy. Their level of per capita income increases. These processes induce migration as an option for increasing parts of populations in the South. However, development processes are subject to very complex determinants and not just to the mobility of people. In most cases, migration is a minor factor of development, although this may be due to the rather limited scale of migrants. In the short run, empirical evidence suggests that migration has had positive effects for countries of emigration and immigration. However, long-term impacts of migration are rather difficult to identify, because of the complexity of real situations.

## MILITARY AND CIVILIAN CONTROL

### Civil–Military Relations in Theory and Practice

The issue of civilian control of the military involves the proper role that the national armed forces occupy in relation to a country’s political institutions and centers of decision-making power. While government

by civil authorities has prevailed in both the industrialized and Communist countries, the intervention of the military in politics has been a standard occurrence in the majority of developing nations since the Second World War. The extent to which armies are involved in political activity is therefore a critical aspect of development, as it can affect the prospects for establishing democratic governance or maintaining the stability necessary for achieving economic prosperity.

In traditional theories of civil–military relations, the officer corps is instilled with the doctrine of “professionalism,” or conservative values that create an ethic of political neutrality and subservience to national leaders. In the former Soviet Union and the socialist republics of Eastern Europe, its equivalent was referred to as the commissar system, in which the agenda of the military was directly controlled by the ruling party through a political officer who presided over the command unit at every level of its organization. This “civilian control model” also asserts that a clear division between the army and civil institutions is best maintained when military doctrine is oriented toward the traditional task of defending national sovereignty against external threats.

However, in reality military command structures do not always adhere to these restrictions. In a nation that won its independence from a colonial power through armed struggle, the military may be regarded as the founding stone of the republic. Thus, it can be repeatedly called upon to reinforce the status quo in periods of crisis or change. In other settings, the government may integrate the functions of the military bureaucracy and party ministries, giving them a direct stake in political decisions. Further, it is apparent that military officers also possess their own political interests and goals. The policies of an incumbent government regarding salaries, status, and general privileges afforded to the national army can motivate officers to react to or even challenge the present regime. The delicate balance between abstention and direct involvement in politics is especially pronounced in countries that are still undergoing a transition between types of political and economic systems. Such issues are particularly pertinent to the structural characteristics of developing countries, and have a considerable impact upon whether efforts at democratization and market reform will be successful.

### **The Nature of Civil–Military Relations in the Developing World**

The role of the military in the structure and function of the modern state has traditionally been separated

into three areas: (1) *military security*, or the defense of national sovereignty from foreign powers; (2) *internal security*, or the protection of the state from subversion from within its territorial boundaries; and (3) *situational security*, or the preservation of state power against unforeseen social or environmental changes. In many nations of the Third World, the second category has been the primary concern of the armed forces. This preoccupation with maintaining internal stability is often linked to the inability of some governments to effectively manage the shocks created by such conditions as economic crisis, ethnic tensions, or increased demands for participation. In the Western European experience, the formation of state bureaucracies involved the recruitment of both civil and military elites for the essential tasks of governance, among them the provision of an adequate national defense, the preservation of public order, and tax collection. In circumstances in which the process of state construction is incomplete or being redefined—in effect, the developing and transitional societies—the orientation of the military toward these concerns gives it an inherently political purpose. The absence of broad popular legitimacy, combined with the weakness of post-colonial institutions, have caused many leaders in the Third World to resort to military force to suppress dissent and consolidate their political power. In this situation, national military organizations were most often arrayed not in the defense of civil society, but against the populace for the purposes of preserving the existing government. It is this fundamental distinction that calls the professional ethic into question, and further contributes to conditions for a politicized military.

### **Models of Civil–Military Relations in the Developing World**

An examination of civil–military arrangements across developing countries reveals that the nature of the polity and the balance of political forces in the process of state-building are often related to the government’s policies on deployment and defense posture. The function and purpose of national armies are therefore strongly conditioned by the characteristics of the institutional order in which they are situated. In more than a few post-colonial nations, the military has played a predominant role in the founding and consolidation of the state. Revolutions or wars of national liberation often place former commanders at the helm of the new regime whose experience with the practice of governance is limited. Therefore, when subsequent leaders are faced with the necessities of

political or institutional reform, the army is frequently referred to as a source of authority. Conversely, some militaries are said to act as a “moderating power,” which intervenes only in the event that the effectiveness of the incumbent government is threatened by internal polarization or institutional failure. The various models of civilian control employed by developing country governments reflect such distinctions. For example: in Turkey, the army serves as guarantor of the secular state; in China, it has representatives within the Communist party apparatus; in several South American countries, it has ruled in direct collaboration with the dominant civilian party. Conflicts of interest between conservatives and reformers within ruling parties, or opposing factions in coalition governments, may also involve military leaders who support one policy position or another. In this manner, the political agendas of military elites are expressed even where there is no motivation to interfere directly in the decision-making process.

### Prospects for Civil–Military Relations in the Developing World

In the contemporary world climate, there has been a major shift away from the prevalence of authoritarian and socialist regimes in many countries toward democratic governments and market-based economies. This change of conditions also stands to have a significant impact on the issue of civilian control of the military in the developing nations. In particular, it calls into question the purpose that militaries will serve in these new systems, as well as their ability to adapt to the decentralized environment of deliberative governance. If a regime transition coincides with the resolution of internal conflict such as a guerilla insurgency, the armed forces must convert their strategic doctrine from counter-offensive to peacetime operations. If economic reforms increase the number of actors in society that are involved in production and distribution, then the military may become a participant in the management of industries and facilitating foreign investments as well as national defense.

However, the global trend toward participatory government in Third World states does not entirely eliminate the threat of military intervention in politics. Attempts at restoring or introducing competitive electoral processes have sometimes been unsuccessful. The holding of elections without substantial restructuring of institutions might allow a reversal to authoritarianism. This could invite the military to play a more prominent role in managing an uncertain

political environment. The problem of maintaining civilian oversight in the course of democratic transitions is especially pronounced in circumstances where pacts or constitutional arrangements may allow militaries to retain their previous positions of influence. Additionally, traditional national security doctrines directed at controlling subversion by organized dissident groups may take considerable time and effort to reform. If the army maintains a doctrine in which mass protest is identified as a threat to public order rather than a popular expression of grievances, serious violations of civil liberties could result. Thus, the issue of maintaining politically neutral and effective national armed forces will continue to impact the politics of developing countries in the years to come.

### MILITARY AND DEVELOPMENT

The role played by the armed forces in the economic and political development in developing countries has varied enormously from situation to situation. In some cases the military has been a primary agent of change, while in all too many others, it has hindered development.

The concept of “development” is a decidedly Western one. It has been generally assumed that economic development and political development are interdependent processes that lead countries to adopt systems that approximate the forms enjoyed by the advanced industrial democracies. Economic development

generally entails the adoption of new technologies, industrialization, and diversification of production away from a purely agriculturally based economy. While elites in developing countries have for the most part desired economic development, the commitment to the Western view of political development goals has varied considerably. This view of political development ideally includes the establishment of a democratic republic, with civilian control of government and guarantees of basic political freedoms. Civilian control over the armed forces is the *sine qua non* of proper civil–military relations in this model of political development.

Several national military institutions have played pivotal roles in economic modernization, industrialization, and technology acquisition through the influencing, or even the imposition of, specific policies. It has been less common to find military institutions in developing countries that have been as adept or as enthusiastic in fostering political development, in the sense of establishing democratic institutions and protecting basic civil rights, though some armies have supported democratic civilian rule.

### **Military Attitudes**

One common stereotype of the military institution sees it as essentially conservative. There are many good reasons for this view. However, the military has often shown itself to be the motor for social, political, and economic change in the appropriate circumstances. The military has often been the elite group most outspoken in its call for modernization, political development, or industrialization. Especially in those regions where conflict between the rapidly advancing Western European states and non-Europeans was most constant, the internal struggles within the non-Western powers pitted the military and other elites against traditionalists. The military officers often literally bore the brunt of these conflicts against Western forces, and were most anxious to adopt the means that Westerners were using to defeat them in battle.

A striking example of the military playing this sort of revolutionary role may be found in the late Ottoman Empire and in the Turkish Republic that replaced it. Within the declining Ottoman Empire of the nineteenth century, it was mainly the officer corps, along with the more cosmopolitan segments of the middle classes (physicians, students, and merchants), that struggled against the traditionalist rulers in order to adopt not only military tactics and weaponry from the West, but also technological know-how,

industrialization, and political practices. Officers were among the most forceful backers of the Constitutional (Tanzimat) Movement in the mid-nineteenth century, which sought to limit the power of the sultan. They were among the leaders of the various quasi-nationalist movements, the Young Ottomans, and later the Young Turks, which advocated the adoption of European political arrangements and concepts in the Empire. The military tended to support modernizing policies as the only means for stopping the encroachment of European powers, and of resisting the breakaway nationalist movements in the Balkans. They opposed an extremely conservative sultanate and religious establishment, which were reluctant to adopt any Western innovations, on the premise that the non-Muslim powers could not possibly have superior methods and institutions. In the view of these traditionalists the answer to this apparent decline was not to adopt Western ways, but to redouble efforts to reassert the traditional ways of Islamic civilization.

The Ottoman Empire was broken up after World War I. A shadow of the former Empire tenuously ruled the Anatolian Peninsula, but under British, French, and Italian spheres of influence. Mustafa Kemal, one of the few recognized military heroes of the Ottoman army during the war, was infuriated that the sultan had signed a humiliating treaty with the European powers, and was doing nothing to stop Greek penetration into Anatolia. He and his followers revolted against the Empire, drove back the Greeks, and established the Republic of Turkey. Mustafa Kemal, taking the surname Atatürk, then instituted a series of sweeping reforms meant to reorient Turkey toward Europe, to modernize its institutions and mores, and to bring the new republic into the “modern” world. Among these innovations were the promulgation of a new European-influenced constitution and a civil code borrowed from the Swiss, the expansion of education, and the granting of women’s suffrage. Policies were also introduced and enforced that were intended to Westernize Turkish culture, such as the adoption of a new Latinized alphabet, the standardization of surnames, and the banning of the fez. Policies were also introduced to modernize and expand industry and trade. The army became the repository for and defender of the philosophy culled from the program of Atatürk, known as Kemalism. Since the 1920s, the military has remained the bastion of Kemalist republican modernization and secularism, defending it against challenges by Marxists no less than by Islamist movements.

Similar modernizing aspirations could be discerned in Latin American officer corps in the mid-nineteenth century. Middle-level officers were often frustrated by

the inability or unwillingness of the civilian elites to effectively pursue economic modernization. As the Latin American republics fell further behind Europe and North America, they were more easily exploited by outside powers, particularly Britain. Though these officers were educated in the new professional manner of the European officer corps, this training made them all the more painfully aware of just how far their countries lagged behind, especially in the areas of industry and technology. Many soon came under the sway of the philosophy of Positivism, which derived from the works of the French philosopher Auguste Comte. Distilled into its Latin American version, Positivist ideas emphasized a dynamic program of modernization and education, especially in the sciences, which would create the conditions that would lead these weak republics out of the doldrums. Positivist clubs and parties were formed throughout the hemisphere. The new doctrine was particularly popular among army officers. In many states the military as an institution began to pressure their governments to adopt more forward-looking policies. The movement was perhaps strongest in Brazil, where, after a military-led coup ousted Emperor Pedro II and established a republic in 1889, the motto of the Positivists, "Order and Progress" (*Ordem e Progresso*), was prominently displayed on the new national flag. Some modernization did occur in limited regions of certain Latin American countries, but overall, what progress there was came in fits and starts. In countries like Brazil and Mexico, where Positivist officers had taken power or held influential positions, it was not long before their progressive policies were abandoned for baser political practices.

### **Civic Action and the Military in Newly Emerging Nations**

Until World War II, most of Africa, Asia, and the Caribbean were still under the direct control of the great European empires. But very soon after the end of the War, the imperial systems began to weaken and break apart, beginning with Britain's withdrawal from India and Palestine in 1947. Some colonies were supposedly being "guided" toward independence, while in many others local independence movements began to grow. Some of the guerrilla groups fighting for liberation would become the nuclei of national militaries once independence was won.

Most of the former colonies were woefully underdeveloped upon achieving independence. Infrastructure was minimal, and usually nonexistent outside of the region of the capital city or major ocean ports.

There was generally very little industry. Education in the Western sense barely existed outside the largest cities. In many cases, political elites were inexperienced at ruling, and economic elites were often unprepared to compete in a worldwide industrial and trading system dominated by the advanced European and North American countries.

Policy makers and political scientists in the West began to recommend models of government and economic systems for the so-called "Newly Emerging Nations." Western theories of "developmentalism" advocated a series of steps that would lead emerging states to expand their middle classes, achieve "take-off" in economic modernization, and establish democratic republics.

The conditions in these new independent states varied so widely that the notion that one meta-model could fit all cases was soon revealed to have been surprisingly naive (though competing models advocated by the Soviet Union, and later by China and Cuba, proved no less so). These new states were confronted with so many pressures and handicaps that it was hard to know where to begin the process of development. Many of the Asian and African states were made up of dozens, sometimes hundreds, of tribal, ethnic, linguistic, "national," and religious groups. The international boundaries of these artificial states divided identifiable groups more often than they united them. With such natural disunity and inter-group rivalry present in so many of these new states, "nation building" became a top priority for the new political elites.

In the late 1950s and early 1960s, Western scholars and policy makers began to tout the idea that the armed forces in developing countries were ideally suited to act as the main institution for fostering national unity and political development in the newly emerging nations. This nation-building and nation-serving function was known as "civic action." In such new and weak states, national government agencies were struggling to professionalize, and to expand their authority and legitimacy from the capital cities out to the more remote regions. The military was assumed to be the most organized and efficient institution with a national scope. It was poised, according to advocates of this model, to undertake a variety of activities that could help to push the country forward. Its engineering units could be employed to build roads, bridges, irrigation systems, and other elements of infrastructure. Its national scope would allow it to draw people from the disparate ethnic, religious, and linguistic groups, and socialize them into a new national identity. The structure of the army could also be used to teach useful new skills to recruits, and improve the health of recruits from

impoverished areas. The army would also be in a position to represent the new national government in extending essential services to the populations in remote areas.

Another assumption of this policy derived from the less naive notion that an army was essentially a fighting force. In a situation where the government was weak, where few other national authorities existed, and where local loyalties were a constant threat to national unity, it might be necessary to make sure that the army was gainfully employed in productive projects, so that they would not readily revert to using force against the government, or against national minorities.

However, the very attributes that recommended the armed forces for civic action programs also made it the strongest single entity within the government. By virtue of its monopoly of arms, many military institutions would pit themselves against other government agencies or political parties, sometimes from frustration at the inefficiency of the bureaucracy, or at its corruption, and sometimes at the behest of officers who were little more than warlords and political bosses. Despite the promise of civic action in theory, the military often became a major obstacle to political development rather than its sponsor.

While many of the newly independent countries struggled with the perplexing problem of nation building, there were some that managed to achieve a certain satisfactory level of political development, at least according to the idealized model. India is a particularly striking case of a newly independent state with multiple and competing linguistic, religious, and national groups, which nevertheless managed to create a reasonably stable democratic republic. Most notably for this discussion, the military very closely followed the model of an institution that serves elected civilian political leaders. The military is a very influential organization in Indian society, due in no small part to India's international security environment, as well as its pretensions to regional power status. Its military industries have been the focus of significant investment, and there were hopes here, as in many other third-world countries anxious to modernize, that such investment would yield industrial and technological spin-offs for civilian industry. Scholars still differ as to whether government investment in military industrialization contributed to civilian industrialization, or whether these funds might have been better invested in the civilian economy or spent on the provision of social services. Nevertheless, India does offer an important example of the viability of the Western model of civil-military relations in developing countries.

## **Economic Development Precedes Political Development**

The dependent position of almost all newly independent nations, as well as those few that had achieved independence in the nineteenth century (mainly in Latin America), persisted, and was a constant source of frustration for the political and economic elites. A variety of strategies were tried, and alliances were made with one or the other of the rival Cold War powers to achieve advantage. But development remained elusive.

By the 1960s, a very small and varied group of states, most controlled by the military, embarked on rigorous courses of economic development. These regimes pursued the establishment of heavy industry, often centered on arms production, and the acquisition of cutting-edge technologies. In those states ruled by the military, most notably South Korea and Brazil, military control allowed for the suppression of dissent from opposition politicians and intellectuals, and especially from those social groups that suffered most from the imposition of these policies. Military governments were also able to co-opt those elites who benefited directly from the new growth, and who therefore went along with government control over investment, credit, and financing, and establishing production priorities (usually oriented toward exports). Among those states that successfully modernized, there was no one pattern that was followed. In countries like Israel (with a Western-style parliamentary regime) and Brazil, industrialization was led in large part by the arms industries, which received special attention from the government. In South Korea, Taiwan, and Chile, arms industrialization was eventually pursued, but this was not the primary focus of industrial policy. The salient common denominator among these successfully industrializing states was that in none of these cases was the developmentalist model prescribed by Western policy makers and academics followed, even if there was some element of civic action thrown into the mix. In all the successful cases, there was extensive government involvement and direction of economic policy, usually accompanied by strong protectionist measures.

Of course, neither military control, nor influence over the government, nor centralized government control over the implementation of economic policy was a guarantee of successful industrialization. For example, the People's Republic of China was characterized by extensive inter-penetration between the leadership of the ruling Communist Party and the upper echelons of the armed forces. Government and Party exercised extensive control over economic

policy, and the military was politically influential and received preferential treatment from the regime. However, industrial policy was erratic, and was for several decades determined more by ideological imperatives than by pragmatic concerns. Defense industries were established, but were isolated from other sectors of the economy. With the extensive economic reforms initiated in the late 1970s, the segregation of defense industries from the rest of the economy was ended. At the same time, the presence of high-ranking military officers in the Communist Party leadership was diminishing. Insofar as recent Chinese economic modernization can be judged successful, it has been achieved in part because of the relative de-politicization of the military. Seen in this light, the case of China provides an important alternative scenario to that of Brazil, Chile, Israel, South Korea, and Taiwan as discussed above.

Success in industrialization and technology acquisition on the part of military regimes or states with strong defense needs, and therefore an extremely influential military institution, are not the norm. Most developing countries ruled by military regimes that undertook such policies ultimately failed to achieve positive results. Other military or one-party regimes with centralized control over economic policies simply transformed into kleptocracies or autarchic authoritarian states.

### **Neoliberal Globalization and Military Concerns**

In the 1980s and 1990s, many authoritarian regimes collapsed and were replaced by democratic systems (some became authentically democratic, others only nominally so), most notably in Latin America, Eastern Europe, and the former Soviet Union. This also meant that the armed forces in these countries took on a new role, now serving elected civilian leaders (or, at least, civilian ruling elites), following the Western model of civil–military relations.

With the end of the Cold War and the subsequent emergence of the era of globalization, most developing countries still remained woefully behind in terms of both economic and political development. Neoliberal ideology has become the dominant paradigm for development and the policy model that international institutions such as the International Monetary Fund, the World Bank, and the World Trade Organization impose upon economically struggling countries. While there is still a great deal of variation in the response of the people in developing countries to neoliberal globalization, from enthusiastic embracing

of its prescriptions, to resignation, to outright resistance, these policies present a unique problem for military officers.

The neoliberal paradigm calls for a reduction in the role of the state, fewer regulations, less government involvement in economic affairs, the privatization of government enterprises, reduced subsidies, and the scaling back of protectionist policies. Barriers to international investment and the flow of capital and profits were to be gradually eliminated. Advocates of these policies promise economic growth and modernization to those who faithfully follow the new rules. Professional officers, as noted above, have often been at the forefront of movements for economic modernization and industrialization. Therefore, the promise of these new policies holds a certain attraction for the military. On the other hand, critics of neoliberalism claim that wholesale adoption of these policies could lead to the erosion of national sovereignty and the surrender of decision making to foreign actors and international capital markets.

As an essentially nationalistic institution, dedicated to the defense of the nation and to its independence and sovereignty, some officers are inclined to fear neoliberalism as a very real threat to national independence. Indeed, the most extreme neoliberal visionaries speak of an end to the traditional nation-state, an idea that constitutes a major challenge to the worldview of professional officers, which sees the state as the essential expression of the nation. Many officers therefore find themselves in a painfully ambiguous situation as a result. By embracing neoliberalism, their countries may take advantage of massive foreign investment and have access to cutting-edge technologies, but at the cost of compromising their national sovereignty. By resisting global neoliberal institutions such as the World Trade Organization, their countries may preserve national autonomy but cut themselves off from the most dynamic international markets.

There is no single pattern that developing countries have followed since achieving independence. Likewise, there is no single pattern of civil–military relations in developing countries, or of military influence or involvement in economic and political development. With the current trend toward democratization in many developing countries, there is an expectation that their armed forces will become increasingly professionalized. Professionalization should then reinforce military support for the Western civil–military paradigm.

## MILITARY AND HUMAN RIGHTS

### Historical Background

Rules of armed conflict have existed for centuries, if not millennia. Medieval European knights along with warrior castes such as the Samurai of Japan had their rules of chivalry and codes of honor that applied to battle situations. Generals and kings saw the practical benefits of rules limiting unnecessary killing and property destruction, since the victors benefited from those who remained alive to work the land and businesses that survived the war intact. The modern rules of human rights in the context of armed conflict are called “international humanitarian law” (IHL). They developed primarily in Europe and have spread to the rest of the world. Contemporary international law

divides IHL into two sets of rules: those justifying the initiation of war, known in Latin as *jus ad bellum*, and those governing the conduct of war, *jus in bello*.

### Jus ad Bellum

Christian theologians maintained that countries should engage in just wars only. The seventeenth-century Dutch philosopher Hugo Grotius wrote that for a war to be just, it must be initiated by a legitimate sovereign for a just cause after more peaceful alternatives have failed. The amount of force employed should not exceed that which is needed for the justified objective, and the war should be undertaken with peace as its ultimate goal. In the twentieth century, various theorists maintained that the war against fascism, national liberation struggles against colonial powers, and humanitarian interventions to protect subjugated people against tyrannical rulers constituted just wars.

The United Nations Charter confines just wars to self-defense and humanitarian interventions, initiated by the Security Council. The Charter prohibits the acquisition of foreign territory by force. Charter Article Two states that, “All members shall refrain in their international relations from the threat or the use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the purposes of the United Nations.” Article 51 holds that, “Nothing in the present Charter shall impair the inherent right of individual or collective self-defense if an armed attack occurs against a Member of the United Nations.” In 1991, an American-led armed force with a UN Security Council mandate employed military might to oust Iraqi forces from their illegal occupation of Kuwait, and in 1999 North Atlantic Treaty Organization forces, without a UN mandate, bombed Serbia to force the Belgrade regime to stop ethnic cleansing of Albanians from Kosovo. Both of these operations were justified by the principle of humanitarian intervention, since they were engaged in to protect the human rights of subjugated peoples.

### Customary Jus in Bello

Once war has been initiated, its conduct is subject to the rules of armed conflict or *jus in bello*. This branch of IHL relies on treaty law as well as customary law. The latter consists of those customary principles of war that the leaders of most states regard as legally

obligatory, even though they may violate them in practice.

The customary international law principle of proportionality concerns the interrelationship between weapons, targets, and resulting damage. In general, a warring party should attack military targets with weapons whose destructive power does not significantly exceed that which is necessary for the legitimate objective. Attacks violate the principle of proportionality and human rights if they kill or injure civilians or damage civilian property to a degree that is excessive in relation to the anticipated military advantage of the attack. Under most conditions, the use of nuclear weapons would violate IHL because such weapons would cause civilian casualties and environmental damage disproportionate to the value of the military targets they destroy.

The principle of discrimination obligates warring parties to carefully discriminate military from non-military targets, both in their selection and aiming of weapons. Area bombardments that by their nature do not distinguish between military and civilian targets are prohibited. The use of biological or chemical weapons, whose lethal power can be carried away in the atmosphere to unintended areas and victims, are also illegal. Germany's World War II rocket attacks on London and the United States' atomic bombing of Nagasaki and Hiroshima all involved indiscriminate weapons and excessive civilian deaths, thereby violating the principle of discrimination as well as other IHL principles.

The principle of military necessity requires that attacks be confined to those non-civilian targets that contribute directly to the enemy's military strength. Combatants are justified in attacking targets whose nature, location, purpose, or use makes an effective contribution to military action and whose total or partial destruction, capture, or neutralization, in the circumstances of the time, offers a definite military advantage. Legitimate military targets include: an enemy's armed forces, barracks and installations, war ministries, munitions and fuel dumps, vehicles, airfields, rocket launch ramps, and naval bases. Legitimate infrastructural targets include those communication facilities, railway lines, roads, bridges, tunnels, and canals that are of fundamental military importance. Legitimate military-industrial targets include factories producing weapons, transportation vehicles, communications equipment, or other products for military purposes. Generally, libraries, museums, concert halls, hospitals, civilian homes, schools, and cultural monuments are not targets justified by military necessity. Attacks on them violate IHL.

Related to the principle of military necessity is the principle prohibiting the use of weapons that cause

unnecessary suffering or superfluous injury. In 1869 a number of European powers issued the St. Petersburg Declaration, which established the principle prohibiting the employment of weapons that cause unnecessary suffering. The European leaders reasoned that the only legitimate object during war is to weaken the enemy's military forces by disabling the greatest possible number of its military. Therefore, weapons that unnecessarily aggravate the sufferings of disabled soldiers are contrary to the laws of humanity. Poisoned bullets, barbed bayonets, and dum dum bullets designed to flatten on impact are generally regarded as prohibited because they cause unnecessary suffering and superfluous injury. This principle also prohibits the use of explosive projectiles filled with undetectable, clear glass fragments that make soldiers' wounds more difficult to treat.

### **Twentieth-Century Tribunals and Humanitarian Law Codes**

While World War II was still raging, the Allies began a series of meetings to plan the creation of a post-World War II tribunal to try major war criminals of the European Axis powers. Meeting in London in August 1945, US, British, French, and Soviet representatives reached an agreement establishing the International Military Tribunal (IMT) at Nuremberg. Article 6 of the IMT Charter listed the following acts as IHL crimes falling within the jurisdiction of the Tribunal and for which there would be individual responsibility:

1. Crimes against peace: namely, planning, preparation, initiation, or waging of a war of aggression, or a war in violation of international treaties, agreements, or assurances;
2. War crimes: namely, violations of the laws and customs of war ... [including] murder, ill-treatment or deportation to slave labor or for any other purpose of civilian population of or in occupied territory, murder or ill treatment of prisoners of war or persons on the seas, killing of hostages, plunder of public or private property, wanton destruction of cities, towns, or villages, or devastation not justified by military necessity; and
3. Crimes against humanity: namely, murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war, or persecutions on political, racial, or religious grounds in execution of or in connection with

any crime within the jurisdiction of the Tribunal, whether or not in violation of the domestic law of the country where perpetrated.

The first two categories of violations concerned international relations, specifically war between states. The second category was based on the Hague Convention of 1907, signed by a number of European states.

The third category—crimes against humanity—attacked the very heart of state sovereignty by defining gross human rights violations against citizens by their own governing powers as international crimes subject to universal jurisdiction. Crimes against humanity covered atrocities committed by Germans against German citizens as well as against others. This, of course, included the Nazis' treatment of Jews, Gypsies, homosexuals, and other "undesirables" in concentration camps, factories, and so forth. Prior to the IMT, a government's violations of its own citizens' human rights, with few exceptions, was considered internal affairs not covered by international humanitarian law.

The IMT also firmly established the principle of individual responsibility for gross human rights violations. In its 1946 "Opinion and Judgment" the Court wrote: "Crimes against international law are committed by men, not by abstract entities, and only by punishing individuals who commit such crimes can the provisions of international law be enforced." The IMT had no provisions for securing indemnity for victims.

In the first and most famous of the IMT trials, twenty-two notorious Nazi figures—including Herman Wilhelm Göring—were prosecuted. Hundreds of other Germans were prosecuted by the Allied occupying powers under Control Council Law Ten. US General Douglas MacArthur, the Supreme Allied Commander in Japan following the war, created the Tokyo Tribunal, modeled after the IMT, to prosecute senior Japanese officials.

## The Interim Years

After World War II, the International Committee of the Red Cross, a private organization headquartered in Switzerland, codified much of then-existing IHL in the four Geneva Conventions of 1949 and their Additional Protocols of 1977. Together, the 1949 Geneva Conventions list the human rights duties that warring parties have toward the wounded and sick on land or at sea, prisoners of war, and civilians. The Conventions contain a list of grave breaches of IHL that

includes: willful killing; torture or inhuman treatment (including medical experiments); willfully causing great suffering or serious injury to body or health; extensive destruction and appropriation of property not justified by military necessity and carried out unlawfully and wantonly; compelling a prisoner of war or civilian to serve in the forces of the hostile power; willfully depriving a prisoner of war or protected civilian of the rights of a fair and regular trial; unlawful deportation or transfer of a protected civilian; unlawful confinement of a protected civilian; and taking of hostages.

Additional Protocol I of 1977 expanded the list of grave breaches to also include: making civilians and non-defended localities the object or inevitable victims of attack; the perfidious use of the Red Cross or Red Crescent emblem; transfer of an occupying power of parts of its population to occupied territory; unjustifiable delays in repatriation of POWs; apartheid; attack on historic monuments; and depriving protected persons of a fair trial. Under the Geneva Conventions and Additional Protocol I, states must prosecute persons accused of grave breaches or hand them over to a state willing to do so. Protocol II of 1977 addresses human rights duties and violations in the context of internal war.

Countries that have ratified the Geneva Conventions are required to instruct their military personnel about the Conventions' contents. For this purpose, the US Army uses Field Manual 27-10: The Law of Land Warfare.

## UN War Crimes Tribunals

During the fifty years after Nuremberg, an estimated 250 armed conflicts occurred, causing approximately 170 million human casualties. Due to the Cold War division within the UN Security Council between the Western and Communist camps, it failed to address IHL violations in a unified way. Consequently, until the 1990s, political and military leaders responsible for war crimes, genocide, and crimes against humanity generally enjoyed impunity. Eventually, with the collapse of the Soviet Union and the specter of atrocities on the doorstep of Western Europe, the Security Council acted creatively and in unison.

There were many astonished by the brutality of the conflicts in the former Yugoslavia that erupted in June 1991 and intensified thereafter. As part of the UN response to the conflicts, the Security Council created the International Criminal Tribunal for the Former Yugoslavia (ICTY) under Chapter VII of the UN Charter. By utilizing Chapter VII, the Security

Council obliged all UN member states to cooperate with the Tribunal and to honor any lawful requests it makes for assistance under its statute.

The ICTY differs from the post-World War II Nuremberg and Tokyo tribunals. Unlike its predecessors, the ICTY does not have the competence to adjudicate crimes against peace. Its jurisdiction covers war crimes, genocide, and crimes against humanity. Secondly, whereas its predecessors dealt only with IHL violations associated with an international armed conflict, the ICTY is empowered to adjudicate IHL violations committed in the course of conflicts within or between the states of the former Yugoslavia. Thirdly, the ICTY is not the organ of a particular group of victor states, but an organ of the international community and consists of judges from many different countries, regionally disbursed and representing different legal traditions.

The ICTY was authorized to apply the established rules of international humanitarian law, which bind all states. These include the laws applicable in situations of armed conflict as embodied in: the four Geneva Conventions of 1949; the Hague Convention of 1907; the Convention on the Prevention and Punishment of the Crime of Genocide of 1948; and the Charter of the International Military Tribunal of 1945.

Articles Two to Five of the ICTY Statute empower the Tribunal to prosecute civilian persons accused of ordering or committing grave breaches of the four Geneva Conventions, violating the laws or customs of war, committing genocide, or being responsible for crimes against humanity.

Statute Article Three, "Violations of the Laws and Customs of War," is based on the Annex to the 1907 Hague Convention, which was subsequently reaffirmed by Article 6(b) of the Nuremberg Charter. Its list of violations includes: the employment of poisonous or other weapons calculated to cause unnecessary suffering; wanton destruction or devastation of cities, towns, and villages not justified by military necessity; attack on or bombardment of undefended towns, villages, dwellings, or buildings; seizure, destruction, or willful damage of religious, charitable, scientific, art, or educational institutions or of historic monuments; and plunder of public or private property.

Article Four of the ICTY Statute replicates Articles Two and Three of the Convention on the Prevention and Punishment of the Crime of Genocide (1948) and defines genocide as any of the following acts committed with intent to destroy, in whole or in part, a national, ethnic, racial, or religious group: killing group members; causing serious bodily or mental harm to group members; deliberately inflicting on the group conditions calculated to bring about its complete or partial physical destruction; imposing measures

intended to prevent birth within the group; and forcibly transferring children to another group. Persons who commit genocide or who attempt, conspire, or incite others to commit genocide are punishable.

Statute Article Five, "Crimes against Humanity," follows the Nuremberg Charter. It empowers the Tribunal to prosecute persons responsible for the following crimes against any civilian population committed during an international or internal armed conflict: murder; extermination; enslavement; deportation; imprisonment; torture; rape; persecutions on political, racial and religious grounds; and other inhumane acts. The crimes constituting "ethnic cleansing," a term closely associated with the conflicts in the former Yugoslavia, are covered by Articles 2–5.

The ICTY, located in The Hague, the Netherlands, has been actively prosecuting Serbs, Croats, and Bosnian Muslims suspected of IHL violations.

In 1994 Rwanda erupted into one of the most appalling cases of genocide that the world had witnessed since World War II as radical Hutu attempted to eliminate moderate Hutu and Rwanda's entire Tutsi population. The UN Security Council, having just created an international criminal tribunal for humanitarian law violators in the European states of the former Yugoslavia, decided it could do no less for African Rwanda. Consequently, it created the UN Criminal Tribunal for Rwanda, modeled after the earlier one for the former Yugoslavia. The Security Council authorized the ICTR to apply existing international humanitarian law applicable to non-international armed conflict. The humanitarian law included in the Tribunal's statute consists of crimes against humanity (as defined by the Nuremberg Charter), genocide, Article Three Common to the 1949 Geneva Conventions, and Additional Protocol II.

ICTR Statute Article Three, "Crimes against Humanity," is based on Article 6(c) of the Nuremberg Charter, but it eliminates the requirement that such crimes must have been committed "before or during the war." Consequently, crimes against humanity do not need a war nexus.

Article Four of the statute empowers the ICTR to prosecute persons committing or ordering to be committed serious violations of Article Three common to the four Geneva Conventions of 1949 and of the Additional Protocol II thereto of 1977. These violations include: (a) violence to life, health, and physical or mental well-being of persons, in particular murder, torture, or mutilation; (b) collective punishments; (c) taking of hostages; (d) acts of terrorism; (e) outrages upon personal dignity, in particular humiliating and degrading treatment, rape, enforced prostitution, and any form of indecent assault; (f) pillage; (g) sentences or executions rendered extra-judicially or without

due process; and (h) threats to commit any of the foregoing acts.

The ICTR, located in Arusha, Tanzania, has successfully prosecuted a number of high-ranking Hutu officials responsible for the mass murder of fellow Rwandan citizens. Neither the ICTY nor the ICTR can compensate victims for injuries, medical expenses, pain and suffering, destroyed property, rehabilitation, and so forth. However, both can order the return of any property and proceeds acquired by criminal conduct to their rightful owners.

## The International Criminal Court

On July 16, 1998, after fifty years of effort, the international community endorsed the creation of a permanent International Criminal Court (ICC) by a vote of 120 to 7 with 21 abstentions. This historic step took place in Rome at a United Nations diplomatic conference. Only Libya, Iraq, Qatar, Israel, Yemen, China, and the United States voted no.

The Court is designed to bring to justice those who commit the most serious IHL violations, including genocide, war crimes, crimes against humanity, and aggression (to be defined later by a special law commission). It also criminalizes the recruitment of children under sixteen years into militias. In order for the ICC to become a reality, its statute, officially entitled the "Rome Statute of the International Criminal Court," must be ratified by sixty states.

The ICC's jurisdiction will extend to IHL violations committed in both international and internal armed conflicts. Because the ICC will have jurisdiction over the citizens of many more states than any of its predecessors, its potential for contributing to the cessation of IHL violations, achieving justice, contributing to the reconciliation of the parties, and deterring future humanitarian law violations is greater.

The Rome Statute is also designed to secure indemnity/compensation for victims. Article 79 directs the Assembly of States Parties to the Statute to create a trust fund for victims and their families. It also authorizes the ICC to order money and property collected through fines and forfeitures to be transferred to this fund. Article 75 directs the ICC to establish principles for determining the amount of restitution, compensation, and rehabilitation it may award victims and their families. The ICC may assess convicted persons the cost of the above or it may authorize awards from the Trust Fund.

Like its predecessors, the ICTY and ICTR, the ICC is designed to guarantee the due process and other rights of victims and defendants as recommended in

the most recent human rights conventions. Hence, it should be a model court for the protection of human rights of victims and defendants.

## Conclusion

Some IHL violations most probably have been committed in most wars. Modern democratic states appear to regard IHL more seriously than others. IHL violations are quite common during military conflicts within or between undemocratic countries that are afflicted with severe economic problems and intense competition for resources. During such conflicts, certain unscrupulous political or military leaders convince at least some of their followers that the enemy's inhumanity justifies the worst kind of treatment.

Advocates of IHL within the militaries of technologically advanced states claim that modern weapons that can be more precisely aimed at legitimate military targets, markedly diminish the number of civilian casualties and IHL violations. As recent military conflicts have shown, however, even so-called "smart bombs" can kill civilians, in violation of IHL, when they are negligently deployed or deployed with inaccurate intelligence.

## MILOŠEVIĆ, SLOBODAN

One of the most influential and notorious politicians of the 1990s, the Serbian Communist Party leader, president of Serbia and of the Federal Republic of Yugoslavia for a decade, Slobodan Milošević is a

controversial figure. To many Serbs he embodies the modern vision of Greater Serbia; to others he is simply “the butcher of the Balkans.” Milošević presents himself as a moderate nationalist technocrat. His personality is marked by stubbornness and conservatism.

Milošević was born August 20, 1941, in Pozarevac, Serbia, to a father who was a teacher of religion and a mother who was an ardent communist. Milošević’s father left the family when he was in elementary school; he committed suicide in 1962. Milošević’s mother also killed herself, in 1974.

Milošević graduated with a law degree in 1964 and started his career in the Socialist Party of Yugoslavia. He achieved Belgrade party leadership between 1984 and 1986, but remained an obscure technocrat until 1987 when, on the six hundredth anniversary of the battle of Kosovo, at which the medieval Serbian statehood was crushed by the Turks, he gave a seminal speech in front of a 1-million-strong crowd and became the symbol of historical Serbian resistance.

His rise to power as chief secretary of the Serbian Communist Party was supported by his mentor and godfather, Ivan Stambolić, who became president of Serbia in September 1987, on the fermentation ground of suppressed but growing nationalism in the fragile country. However, in December of that year, Milošević forced his former mentor’s resignation from office. In 2000 Stambolić was kidnapped and murdered.

By the end of the 1980s, Milošević became the speaker of the dominant Serbian stratum of the Yugoslav society, who were angered by the marginalisation of Serbians under Tito and who opposed the federal autonomy granted in 1974 for the provinces Voivodina and Kosovo, which contained large ethnic Hungarian and Albanian minority populations. Milošević pursued a policy of ethnic homogenization as well as conservation of the territorial integrity and unity of Yugoslavia. His first action of Serbian ethnic dominance in 1989 after being elected president of Serbia was the abolition of the autonomy of Voivodina and Kosovo.

Acting against the tide of economic and political changes, he clung adamantly to the socialist economic model. Despite proclaiming political pluralism, he maintained the state-directed economy. Milošević managed to maintain a low profile in the media, yet preserve the nationalist and populist bases of his power.

## **The Creator of Greater Serbia**

After the collapse of the Soviet bloc, each new nation tried to redefine itself and its borders. The Serbians

were frustrated not to have achieved a Greater Serbia. They considered themselves the core element of the Federal Republic of Yugoslavia, fostered by their relative majority status in population, and the Slavic resistance against Turks and Germans in the Balkans. They felt it was time to convert Serbian ethnic dominance, under the guise of Pan-Slavism, into the presence of Greater Serbia.

In January 1990, Milošević worked to reduce the powers of the republics, which would empower the relative majority population, the Serbs, causing the final rift in the Yugoslav Communist Party, the Croatian and Slovenian delegations leaving the congress. Soon afterward he founded the Socialist Party of Serbia and orchestrated the transformation of Serbia into a republic, whose first president he became after the elections of 1990.

In response to Serbian threats of hegemony led by Milošević, Slovenia and Croatia seceded from the federation in June 1991, followed in September by Macedonia and in March 1992 by Bosnia and Herzegovina. The secession was unrecognized by the Serbian-dominated federal leadership and the Yugoslav army went to war to crush it.

The Serb minorities in Croatia and Bosnia demanded that their sections of the territories remain in Yugoslavia. On the incitement of Milošević, the Serbs of Croatia (580,000 or 11% of the population) started organizing their own secessionist state, called the Serbian Republic of Krajina. It encompassed the Serbian majority enclaves and one-third of the Croatian territory. The Yugoslav army fought to secure the Serbian majority enclaves of Croatia and Bosnia, the latter with a 1.6 million or 32% Serbian population, demanding independence if their annexation to Serbia would not be possible.

The disintegration of Yugoslavia led to the collapse of the internal markets and to hyper-inflation aggravated by the arms embargo, which turned into a general embargo against Serbia. In 1992 the inflation rate reached 8,700% and the war efforts led to an 11% decline of the gross domestic product (GDP). At the height of the war, financed through hyper-inflation, the inflation rate reached to a staggering 300,000% in 1993, leading to currency reform in 1994. In spite of a new convertible dinar linked to the strongest European currency, the German mark, an even greater recession of -19% followed, during the Kosovo war.

Increasing international outrage about ethnic cleansing as well as economic recession led Milošević to the conviction that the creation of Greater Serbia had to be postponed, but that an advantageous peace could be negotiated in Bosnia and win also the sympathy of the West. In 1995, Milošević began

presenting himself as the moderate, pro-western leader, and therefore a suitable treaty counterpart to Bosnian Serb leaders. He shifted to a cautious approach toward Serbian unification. On behalf of the Bosnian Serbs he had negotiated an advantageous peace treaty with Franjo Tudjman on behalf of the Croats and with Alija Izetbegovic, the Islamist leader of Bosnia, under US pressure. Under the Dayton Agreement, Milošević secured 49% of the territory for the 32% Serbian community. By bringing an end to the war, he was credited in the West as a pillar of stability, while hard-line Serbians considered him a traitor to the Greater Serbia ideal.

The West had supported Milošević's regime following the overturned local elections of 1996, despite democratic opposition. Later, in 1997, Milošević recognized the opposition victory, but he retained his power in the form of federal presidency of Serbia and Montenegro. In 1998, his regime fell from the West's good graces following the start of a hard-line Serbian crackdown on Kosovo Albanians.

### The Savior of Kosovo

After "losing" the Croatian war due to international pressure and obtaining only a moderate victory in Bosnia, the Serbian nationalist anger turned inward against the loudest minority voice, that of ethnic Albanians looking for self-determination and eventual unification with Albania. In 1998 the so-far peaceful resistance of the Albanian majority turned into an armed uprising, which led to brutal Serbian army offensives and police reprisals.

The Albanians called for international intervention as the campaign caused their mass exodus—840,000 Albanians fleeing to neighboring countries. The West, fed up with aggressive nationalism and intent on avoiding a new Balkan war, called in NATO forces, which engaged in air strikes against the Federal Republic of Yugoslavia from March to June of 1999. This resulted in Serbia's subsequent military withdrawal from Kosovo in spite of a desperate attempt of the Serbian parliament to drive Russia into the conflict by declaring union with it. Milošević's popularity initially increased during the bombings, but then began to fall.

### The Downfall

Yugoslavia held presidential elections in September 2000. Despite Milošević's confidence that he would

win, the opposition received a majority of the votes. Milošević refused to acknowledge the election results, leading to mass demonstrations and, consequently, his regime's downfall. Vojislav Kostunica became president and Zoran Djindic, a pro-western liberal reformer, became prime minister. Djindic had Milošević arrested in 2001 on charges of abuse of power and regime-linked corruption. On June 28, 2001, as a result of an ultimatum by the US Congress that made Milošević's prosecution a condition of economic aid to Serbia, Milošević was extradited to the War Tribunal in The Hague, where he was charged with genocide and war crimes.

### MINORITIES/DISCRIMINATION

Where discrimination and intra-state conflicts are being discussed, there is often talk of minorities. Underneath the global structure of currently 193 states there are probably some ten thousand ethnic, national, religious, linguistic, and other minorities. In addition to these "old minorities," thousands of migrant communities constitute "new minorities" in a very large number of states. To place the content of ethnic, national, or religious conflicts on a par with that of minority conflicts is, in many cases, mistaken. The terms minorities and discrimination seem in need of elucidation; the main frameworks for them are the nation state and the international community at large. Unfortunately there are only a few studies that compare various regional and local attempts at dispute resolution within the framework of state

policies on minorities and nationalities. The states' interaction with the minorities in their territory range, in ascending order, from racial segregation; through unilateral assimilation and ideas about melting pots (social and racial amalgamation); to purely formally equal integration; to the replacement of unitary-cum-homogenist ideas with the notion of "diversity in unity"; and, ultimately, to inclusion, respect, protection, and encouragement for otherness on an equal basis—for example, within the framework of multicultural tolerance and affirmative action, and for ethnic and national minorities in the form of autonomy arrangements, free association, or federalism. More far-reaching demands by the latter minorities, which claim the status of nations or nationalities, point to structural differences between minority and nationality policy. Generally, the term "minorities" is applicable in most countries of Asia-Pacific, the Americas, and Europe. In most of Africa the term doesn't make sense since there is no national or ethnic majority; this reflects the fact that Africa is culturally and ethnically the most heterogeneous continent.

The concept of minority, and the reality, in which minorities are created and obliged to live, point up a variety of facets that are often ignored in the debate about minority, religious, or ethno-national conflicts. The most important seems to be that the concept of minority is essentially ascriptive in nature: as a rule, it is the state that decides what makes a minority and to which circle of people the term will apply. The state itself is often dominated by, or in the ownership of, a particular ethnic group that defines itself as a majority but often is not one in demographic terms. National censuses and demographic statistics are hot issues and often just one more battlefield for all actors concerned. Statistics are usually presented according to predetermined political conditions. In extreme cases, an ethnic group apostrophized as a minority is only a political minority, measured in terms of power, while demographically it constitutes the majority (as in the case with the Oromo in Ethiopia or the Mayan peoples in Guatemala). The case of large transnational minority peoples (such as Berbers in a dozen northern African counties or Kurds in five West Asian countries) seems similar.

In the international discourse about the minority question, the dual concept of national minorities has come into increasing use in recent years. This is a consequence of the increased attention that has been paid to the contentious minorities issue in post-Cold War Europe and the Former Soviet Union; but it also means that a compromise formula has been found, ostensibly bridging or unifying the varying usages in Eastern and Western Europe.

The concept of minorities requires elucidation for a variety of other reasons as well. Many nationalities that find their rights curtailed by states, or are harassed, discriminated against, threatened, or persecuted by them, do not regard themselves as minorities; they do not share the socio-psychological characteristics of classic minorities—on the contrary, some even cultivate a robust nationalism.

### Forms and Definition of Discrimination

Discrimination means that the dominant ethnic or national majority mostly regards national minorities as subordinate segments of the state's society, whereby it may deny them basic rights and freedoms; impede their social, cultural, and economic development; and obstruct political representation and participation. Minorities have special phenotypic and cultural peculiarities ascribed to them. These kinds of ascribed markers are looked down on by those segments of the state society that are dominant (either in terms of power or numerically). Some traditional societies, among them most indigenous peoples, derive their distinctiveness and reproduce themselves on the basis of their non-integration into market economies; in a few cases they have developed a whole series of autonomous, self-supporting modes of production. But many more minorities are vulnerable and find no way of escaping discrimination.

There is a vast scope of different forms of discrimination against minorities. The victims are usually members of a multitude of non-dominant groups. Minorities exist in almost every state, only their composition between indigenous minorities (national or language minorities), religious communities of belief and origin, diverse migrant communities, asylum-seekers and refugee populations, and so forth, and their proportion of the resident population may change from country to country. Specifically targeted are undocumented migrant workers, Muslim communities in Islam-phobic environments, (semi)nomadic peoples, and women of minority groups. Gender, ethnicity, belief, and illegality are factors that profoundly contribute to appalling situations of multiple discriminatory practices.

Discrimination against minorities has structural features that are generated by the way economic, political, and social institutions operate. Structural racism categorizes and marks people, makes minority members visible, and denies such people equal access to jobs, education, medical facilities, social welfare, leisure, and habitation. Governments, local and state administrations, the education system, domestic

companies and transnational corporations, and (not least) the media are part of the apparatuses that form a *dispositif* against different categories of minorities; these are the forces producing “others” and “aliens” and shaping public attitudes toward others, such as national minorities, and aliens, such as the new minorities of migrants, refugees, asylum seekers, and trafficked people.

The worst form of discrimination is the one based on what is perceived as race or colour. As a rule, racist discrimination in the developed world is not perceived as the splitting up of a population but as hostility toward an alien group of others (as opposed to its own breed of us-self); the terms of racialization and scapegoating, coined in a decade-old debate by social scientists, is essential to understand the nature of new domestic racism that replaced the old colonial racism. With the increase of new minorities in the past decades, racists found it easier to construct scapegoats and to blame aliens and minorities for socioeconomic losses. In the Americas the legacies of racial discrimination against Native Americans, Blacks, and Hispanics are still powerful and destructive; compared with that, the new Asian minorities suffer less discrimination due to above-average income and education. There is an increasing tendency in the developing world for post-colonial states to claim as citizens or to reject a number of nationalities, such as ethnic minorities and/or indigenous peoples.

Globalization does not exclude fragmentation, as exhibited by the global trend toward an increase in intra-state conflicts. While discrimination toward ethnic minorities was, in empirical-cum-historical terms, one of the most dangerous sources of conflicts and wars both in the post-colonial wars of Africa (since the period of decolonization) and, since 1989–1990, in the former socialist states—with two-thirds of current wars being susceptible to “ethnic” interpretation—violence against minority groups again became a reality in Europe, in its eastern and southeastern parts, in Yugoslavia and the Caucasus. If we take the examples of Bosnia (Serbs versus Croats) or Rwanda (Hutu versus Tutsi) and compare these with objective attributes (see next section), we will find very little or no ethnic distinction at all. Often ethnicization and racialisation occur on the basis of minor differences. The decisive factors are not the perceived differences but the interest of political elites to use them as resources for their power struggle and as a source for mobilizing the mobs. Those conflict types suitable to ethnic and racial interpretation—with ethnicization or racialisation as mobilizing forces—seemed to grow fastest in the South (underdeveloped), although they have been prominent for quite some time, and appear again in the North (developed), as organized violence against

minorities, racial and ethnic discrimination, or “ethnic cleansing.”

In fall 2001 Rwanda’s parliament passed a law imposing prison terms and a fine on any person practicing discrimination and segregation. This is one of the lessons drawn from the devastating 1994 genocide. The new law aims at enforcing positive discrimination in favour of vulnerable groups like the Batwa minority (1% of the populations of both Rwanda and Burundi). The law gives a comprehensive legal definition of discrimination as “any act, utterance or writing aimed at depriving a person or group of persons, their rights, by reason of sex, ethnicity, age, race, color, opinion, religion, nationality or origin.”

### Minorities and Ethnic Communities

The term “ethnic groups” is used as a technical term; according to linguists there are some 6,500 ethnic core groups worldwide. The general supposition is that religions, like nationalities, generate a transcendent identity-forming link, whereas ethnicity, though identity forming, has a divisive effect. This supposition does not seem to fit all cases. Connections (or rather conflicts) between religion, nationality, and ethnicity ought not to be denied. One of several possible approaches to the subject focuses on attributes based on clusters of special features or social specializations, which are both seen as constituting “ethnic markers.”

Ethnic markers are only relevant within the framework of inter-ethnic relations. Often they only become a major focus of perception when situations of conflict arise. The attributes of an ethnic community include, as a minimum, a self-reproducing community with a name, a culture, a distinct language, a memory, and solidarity between its members. These attributes by no means constitute a definitive checklist; they are, rather, an attempt to get closer to the problem of ethnicity, the individual elements of which need to be examined more closely and be defined in detail for each concrete instance. An ethnic community in the position of a non-dominant group may be regarded as a national minority or nationality—a nation without its own state—if, despite the claims to dominance and sovereignty from outside, it constitutes a distinct space of communication and interaction, i.e., it is able to form or maintain a public sphere of its own; it has a particular mode of production and life identifiable with it, and is able to reproduce it; it maintains some form of political organization; it has settled an identifiable area of land (more than a

neighbourhood) or a demarcated territory; it is distinctive, i.e., its members identify themselves or are identified by others as members of this particular community.

In the case of migrant communities, several of these attributes do apply while others are obviously obsolete due to changed life conditions. Ethnicized or racialised characteristics are only relevant within the framework of inter-ethnic relations and it is primarily in conflict situations that they become a major focus of perception. The same characteristics—particular sociocultural practices, for example—may be totally unimportant in various situations of interaction, but in a different context they may suddenly acquire huge significance. For example, skin colour and other phenotypic features are of secondary importance in most societies of the Southern hemisphere; but in Western societies, physical characteristics are one of the main distinguishing features.

### Ways to Combat Discrimination

Combating discrimination, racism, and destructive ethnicization and the prevention of violence are political imperatives for the twenty-first century. The task to explore policy strategies and measures to address these problems starts with rethinking definitions and core concepts. Efforts to accommodate ethno-cultural difference are an essential part of anti-racist strategies; they have conflict-preventive force and contribute to the long-term transformation of intra-state conflicts. The main topics are laws against discrimination, cultural and other autonomies, collective rights, self-governance, and nationality policies. The political-cum-humanitarian concern is to ensure that all possible means of avoiding violent forms of multi-ethnic interaction are exploited, strengthened, and made more attractive to the majority populations.

An important approach in improving mutual relations between majorities and minorities is the policy option that discrimination toward non-dominant groups should be outlawed and that some measure of temporary and targeted affirmative action should be institutionalized. However, it comes as no small surprise to realize that only a third of the respondents in Eurobarometer polls (regularly made by the EU) agree with outlawing discrimination, though 60% were classified as more or less tolerant. Nevertheless, in 2000, an EU Council directive incorporated the principle of racial equality and a second directive established a general framework for equal treatment in employment and occupation.

As a rule, the victims of discrimination and xenophobia are members from among a multitude of “minorities-at-risk” (Gurr 2000). When talking about discrimination, most West Europeans first think of migrant communities (especially Muslim communities) as victims, while people in the Americas, Eastern Europe, Asia, and Africa think of indigenous, religious, and ethnic minorities; historic nationalities; and other non-dominant groups. But even in the enlarging European Union, the population of indigenous non-dominant groups is numerically exceeding that of migrant communities by far. Many minorities are either permanently confronted with everyday discrimination and racism (for example, the sad examples of 15 million Roma all over Europe, 30 million Afro-Americans, and 180 million Dalit of India), or they are discriminated upon in different ways by the respective demographic majorities or otherwise dominant groups. Anti-discrimination policies ought to address the rejection of non-dominant groups by large national-chauvinists groups among the majority populations in many states.

The focus should be on activities that are essential to combat discrimination of manifold minorities. Among others, a list of essentials to such policies has to include combating and outlawing militant chauvinism and racism. The conception of new policies for preventing and combating discrimination follows strategies that are targeting its structural, institutionalized, and organized forms. The political-cum-humanitarian concern to find ways of avoiding structural and direct, personal forms of discrimination leads on to the questions of how ethnic and cultural difference can be acknowledged and recognized; how destructive forms of interaction between states and communities and between majorities and minorities can be prevented; how violent, militant forms of racism and xenophobia can be effectively combated; and which institutions, legal measures, and policies are most appropriate for these purposes.

### Structural Prevention of Conflicts Between Majorities and Minorities

Regarding forms of structural prevention of troubles, the word “structural” implies that new frameworks and institutions are created to avert discrimination and possible direct violence and reduce structural violence, mainly all forms of discrimination against non-dominant groups. Johan Galtung developed the concept of structural violence in the 1970s, based on his path-breaking distinction between direct personal

violence and structural violence; Galtung also reflected on cultural violence, e.g., values that promote/justify violence and superiority complexes that result in aggressive attitudes. Structural prevention aims at ending discrimination, repression, injustice, and racism, which are ingrained in many state policies and which are also inherent part of the cultural attitudes held by many dominant groups.

However, there are practical problems politicians face in promoting preventive measures and policies—beyond rhetoric. When it comes to implementing declared policies, the difficulties are threefold: the unspectacular and long-term character of many such measures makes them not really attractive if quick results are required, the difficulty in measuring their effectiveness, and a number of rather diverse institutions—measures and policies have preventive character but they often remain unrelated or only partially implemented.

In preventing discrimination against minority groups there are no easy solutions. The great diversity of cultural and political characteristics exhibited by different types of minorities demand different regulatory mechanisms. Steps to mitigate and pre-empt destructive forms of interaction between majorities and minorities should be prioritised. The classic solutions for indigenous minorities range from cultural autonomy, special rights, and territorial self-governance, to forms of de facto sovereignty. Protection of ethnic and national minorities by means of a variety of autonomy arrangements did not begin until the twentieth century, triggered by a worsening of the so-called “minorities problem” in Europe, as a result of revolutions and the regroupings in the wake of two World Wars.

Account should be taken of positive policies of a number of multinational states when it comes to looking for methods of preventing and dealing with latent or open ethno-national conflicts. Many states have been able to pursue active and successful policies of prevention of troubles by making concessions and negotiating offers involving elements of reactive minority protection and proactive nationality policy, in Europe most prominently by granting home rule for the Faeroese and the Inuit in the Kingdom of Denmark from 1948 onward. Others have—often with limited success—used similar offers to try and resolve armed conflicts that have already escalated (for example, the regionalization and granting of autonomy to Basques, Catalonians, Andalusians, and Galicians in post-Franco Spain).

Nationality policies are generally conceived of as solutions to discrimination but not to conflicts that are smoldering or have already erupted. Some procedures aim more at containment, or pose the

nationality question in a purely sociopolitical context. But such policies are part of the problem that they claim to be solving. A detailed comparison ought to be made of the different approaches to nationality policy pursued by selected states such as Denmark, Italy, Spain, and the former USSR (maintained in the Russian Federation). This might include comparison with lessons learned from affirmative action in the United States as well as autonomy and constitutional arrangements realized in the past fifty years in China, India, and Panama, and more recently, in Colombia, Australia, Nicaragua, and Ethiopia.

One factor of major importance in preventing discrimination toward minorities is not only the focus on basic rights of these groups (and the granting of citizenship and autonomy/self-governance) but also the extension of international norms and standards of protection for non-dominant minorities. The role of multilateral regimes in preventing discrimination of minorities and resolving latent and violent conflicts should be discussed more systematically in order to draw the “lessons learned” from it. Critical reviews should focus on the activities undertaken by NGOs in protecting minorities, the efforts of the Council of Europe in regard to national minorities, similarly the efforts of the Organization for Security and Cooperation in Europe (OSCE), as well as the efforts of the UN Human Rights Commission to work out minimum standards for the rights of minorities and indigenous peoples. New paths in this direction have been embarked on with the Framework Convention for the Protection of National Minorities issued by the Council of Europe, which laid great emphasis on the protection of national minorities, and the creation of the institution of a High Commissioner for National Minorities within the OSCE. Legal instruments are not sufficient in themselves in promoting good relations between majorities and minorities. In addition to such standard-setting activities, more confidence-building and practical measures at the grass-roots level aimed at increasing tolerance and understanding between citizens belonging to different ethnic communities are required.

### MIXED ECONOMY

Different countries engage different economic systems to allocate scarce resources. In the *command (planned)* economy, the government decides what, how, and for whom to produce. The government sets the economic objectives and the course of action. There is no private ownership and no market incentives. In the *free market (capitalist or laissez faire) economy*, households and firms (private sector) have freedom to make their own economic decisions. Price mechanism is the main force in the market. Prices of products are determined by the demand for and the supply of such products.

A *mixed economy* has the features of both command and market economies. It functions in the framework of a capitalist market with the intervention of the government. A mixed economy embraces the mixture of private and public decision making and ownership. The government and the private sector work closely with each other to determine what, how, how much, and for whom to produce. The private sector is encouraged to create jobs, income, and wealth within the legal framework. However, the main objective of the private sector is profit maximization, not serving the public. Thus, the government has to intervene when there is market inefficiency. Certain industries considered essential to national sovereignty and security may be nationalized. Yet, there are exceptions in some countries. McTaggart (2003) observed that some economies are based on

custom or religion such as the caste system in India or the Islamic banking systems in Middle Eastern countries. The secular government may be less powerful and have to compromise with religious leaders in making decisions.

Overall, the level of government intervention varies from country to country.

### Private and Public Sectors

In a mixed economy, the economic activities are performed by both the public and private sectors. Private enterprises usually engage only in business that can maximize profits and the interests of stakeholders. However, some industries in the economy are not attractive enough for the private sector, so the public sector will take the lead in industries that are vital for national security or cannot generate enough profit to attract the private sector. Recently, *privatization* has been introduced to release the burden of public sector inefficiency. The most common form of privatization is to sell public sector enterprises to private owners. Because they must turn a profit, private owners have more incentive to better manage the business. In addition, *deregulation* has been implemented in some industries that were previously controlled tightly by the government, such as airlines, banking, telecommunication, energy, and water supply. On the other hand, the government may continue regulating industrial and business standards to improve job opportunities, workplace safety, occupational health, consumer protection, free and fair competition, and so forth.

### Forms of Government Intervention

In a mixed economy, the government provides the legal framework and ensures the enforcement of law. The most popular forms of government intervention are economic regulations (price control, setting quotas, promoting free and fair competition), social regulations (workplace safety, occupational health), and fixed business standards. Trade legislation contributes to the stabilisation of the economy. Anti-discrimination acts prevent some groups of people (minorities, the disabled, women, indigenous people, etc.) from being marginalised from the mainstream of society.

Allocation of scarce resources to meet public need is also a type of government intervention. The government directs some amount of resources to provide goods and services (roads, defense, policing, currency,

programs that care for the elderly and those that promote health) that are essential to the public and the country and that cannot be effectively and efficiently produced by the private sector.

Lastly, the government has to competently manage government revenue and expenditures by redistribution of income through taxation and subsidies.

### When, Why, and How Can the Government Intervene?

The government often intervenes when there is market inefficiency. Market failure has many indicators.

The first indicator is *public goods* possessing two characteristics, non-exclusion and non-rivalry. Non-exclusion means nobody will be excluded in the usage of public goods whether or not they pay for them. Non-rivalry means everybody can enjoy the same level of satisfaction when consuming the same product. A good example of public goods is the street light. The private sector will not provide this type of goods due to the “free-rider” problem in which people want to use but do not want to pay for such goods. The government will have to provide such vital goods and services in order to promote economic stability and maintain a minimum standard of living for citizens.

The second indicator of market imperfection is externality. *Externality* refers to the external costs or benefits generated from economic transactions that are incurred by third parties who are not involved in such transactions. In *negative externality*, external cost is incurred during the production process when Marginal Social Cost (MSC) is bigger than Marginal Individual Cost (MIC). For instance, a chemical factory can generate external costs by polluting the air and the water with its chemical waste, which affects the environment. External cost is incurred during the consumption process when the Marginal Social Benefit (MSB) is smaller than the Marginal Individual Benefit (MIB). For example, many people drive cars, which may cause congestion and noise. Individuals can enjoy some benefit by driving their own cars, while the benefit to the society is minimal. In this case, the external costs are environmental problems. Thus, the government has to reduce the amount of negative externalities by levying taxes that may increase the prices of cars (if the sellers do not absorb the taxes), impose charges, or tighten the issue of permits/licenses. *Positive externality* can be incurred during the production process when the MSC is smaller than the MIC. Research and development is a good example since the total cost incurred by the

society is smaller than the cost paid by a firm. External benefit is generated during the consumption of a product when MSB is more than MIB. When individuals travel by public transport, the social benefit of getting less noise and congestion is much higher than the individual benefit. Therefore, the government encourages the consumption of such products by providing goods and services at lower prices or subsidizing the needy. More incentives to preserve the environment are also implemented to improve market performance.

Third, *asymmetric* information is another indicator of market failure. Some consumers may not have sufficient knowledge of or receive distorted information about products they want to buy or consume. Their ignorance may harm them physically, emotionally, or financially. The government may intercede by providing accurate information and setting policies, regulations, standards, or codes of conduct to prevent businesses from misleading the consumers. The government encourages the establishment of business and consumer associations or watchdogs and works closely with them to address these problems.

Fourth, *monopoly* occurs when there is only one supplier of products that have no close substitutes in the market. Other competitors can hardly enter the market because of high overhead costs, economies of scale, a franchise with exclusive rights, and legal barriers (government license and patents). In this case, one monopolist firm is the price setter and dominates the market. Customers will suffer because of higher price and lower quality. Thus, a mixed-economy government will discourage monopoly by promoting free and fair competition. Antitrust law has been introduced in the United States, the United Kingdom, and other countries to eliminate sole market power. However, in some industries, natural monopoly is acceptable. *Natural monopoly* happens when the cost of producing a product will increase when there is more than one supplier in the market. Nevertheless, the government also regulates natural monopoly.

Fifth, the government needs to intervene when there is *economic inequality*. Inequality may arise because of the provision and usage of merit goods. *Merit goods* possess two main characteristics: (i) the private sectors can provide merit goods but at a very expensive price, and (ii) the more consumers consume merit goods, the more the society can enjoy their benefits. To address the inequality, the government will transfer some payments from the higher-income class to the lower-income groups in terms of social security, price subsidy, or manipulation of income tax. People with higher income have to pay more taxes, while the unemployed, the needy, or the disadvantaged will receive social security. In some countries,

## MIXED ECONOMY

the farmers receive price subsidies that go against the international agreements on free and fair trade.

A mixed-economy government not only protects consumers but also supports businesses. Fiscal and monetary policies are utilised to stabilise the economy. Other macroeconomic policies are taken into account in order to solve the problems of high unemployment and inflation rates.

### Advantages of a Mixed Economy

Since a mixed economy is the combination of command and market economies, it has all the strengths and weaknesses of these two systems.

In a mixed economy, individuals and firms have the freedom to decide what they want to do as long as their activities are within the legal framework. Both public and private sectors can operate in the market and can substitute for or complement each other. Competition gives more incentive to the market and allows customers the choice of more varieties of products with better quality and at cheaper prices. Both consumers and firms are protected by rules and regulations.

A government may help allocate scarce resources more efficiently. Some countries have economic committees that help all sectors in the economy make better economic choices and decisions.

Property ownership rights encourage people to protect their own possessions and thus can address the problem of “common property” and waste of public resources.

### Disadvantages of a Mixed Economy

Similar to the free market, there is little protection for individuals in the mixed economy. In some countries, the government can provide financial assistance to the needy (social security to the unemployed, the disabled, or the aged; or grants to new parents or first-time home buyers). In other countries, there is no such assistance or only very limited, short-term assistance.

Redistribution of income may inadvertently create inequality. It is not easy to measure externalities and their consequences, to apply different levels of assistance to different groups or levy different levels of taxes to firms. There is no incentive for the firms to implement “good practices” if, for example, the cost incurred by using advanced technology, which can

reduce negative externalities, is higher than the amount of taxes they have to pay.

Lack of knowledge and information about the market and the inefficient performance of public servants may cause inconvenience to the public and create opportunities for bureaucracy, red tape, and corruption.

Ineffective regulations may immobilise factors of production. Input factor immobility and the time lags between the policy making and implementation processes can cause economic disequilibrium. Poor management of price controls may cause shortages and surpluses of some products and the economy may fall into a recession.

Too many restrictions will create disincentives in the market. Too frequent changes in policies related to taxation, subsidies, ISO standards, and so forth also make it difficult for firms to comply.

In short, each system has its own advantages and disadvantages. However, political stability, good leadership with clean government, and proper economic policies, which can encourage both private and public sectors as well as civil societies to share the burden of allocation of scarce resources, will help countries achieve their goals and objectives.

## MODERNIZATION

Bridging the disparity between economically rich and poor nations—whether referred to as developed and developing countries, First World and Third World, the North and the South, or industrialized and non-industrialized economies—has been a major impetus for interest in modernization. Thus modernization may be understood as the planning and management of economic development and concurrent social

change, which together would facilitate, in principle at least, the emulation of developed countries by the less-developed. The issue was particularly topical in the immediate post–World War II era as many former colonies gained their independence as nations from European powers. Colonialization was a subtle form of modernization as the colonists' society was promoted as an example of progress, advancement, and superiority. In the immediate post-colonial era, especially, developing countries were keen on economic progress but wary of the accompanying cultural imperialism or “Westernization,” as it was commonly called. The term modernization is closely linked with the terms social change and economic development, though the latter terms tend to be the more contemporary and commonly used, while the former is now largely associated with a particular school of thought. Before discussing explanatory theories of the twentieth century, the roots of modernization thought in the previous century are worth exploring briefly.

### Theoretical Origins

The social, cultural, political, and economic changes in Europe brought about by the Renaissance in the seventeenth century and the Enlightenment in the eighteenth century were the catalyst for differentiating between previously medieval and presently modern societies. Thus, modern societies were defined as being composed of autonomous and enquiring individuals who by their reliance on reason and experience in turn stimulated the growth of scientific and technological innovation. The Industrial Revolution in Europe brought about widespread socioeconomic change and prompted much interest by scholars in how societies could, should, or did indeed develop. The ideas of Charles Darwin about evolution in the natural sciences also influenced thinking in the social sciences, particularly the notion that societies might evolve through incremental stages toward a utopian ideal of economic, social, and technological advancement. The industrialized society that developed consequently would be increasingly characterized by democratic participation, social mobility, education, bureaucratic organizations, rational planning, market economics, and secular institutions. These constitute much of the ideals of modernity and thus the process of modernization to the present day.

The ideas of three European thinkers of the nineteenth century on industrialization, social change, and economic development have stood the test of time, though their approaches are somewhat divergent. Emile Durkheim was concerned with how societies

are organized, and saw a contrast between what he saw as traditional and modern types of societies. The former was characterized as undifferentiated, while the latter was characterized by the division of labor and consequent interdependency of its members. While Durkheim did not explain exactly how modernization takes place, apart from it being a natural outcome of population growth, his ideas influenced modernization thinkers of the twentieth century. Max Weber held the view that Calvinist Protestantism motivated people to seek this-worldly success to demonstrate to others, as well as to themselves, that they had been predestined for eternal salvation. Not without controversy did he conclude that the requisite willingness to accumulate for longer-term success was prior to, and provided the ideological change instrumental in, the rise of modern capitalism, and thus industrialization and modernization. Karl Marx, on the other hand, believed that the ideological structure of society was based upon the modes of production. Changes in the economic infrastructure were for him the prime agents of social change and modernization, and thus were not value-free. While all three thinkers examined the rapid social change of their times, they differed on its antecedents and consequences, thus influencing different schools of thought on modernization.

### Underdevelopment to Industrialization

Modernization is concerned with the process of transforming an underdeveloped country into a developed one. Development is defined as social and economic progress by countries considered developing, less developed, or Third World. Its achievement is measured primarily by economic growth, as well as statistics such as food self-sufficiency, nutrition, health care, life expectancy, shelter, communications, employment, literacy, and education. More recently, other indices have been gradually introduced such as human rights, environmentalism, quality of life, and so on. Countries are then classified into developed versus developing countries, the latter term growing in preference to the value-ridden “less-developed” and “underdeveloped.” But the much larger category and quite diverse nature of developing countries has precipitated the creation of sub-categorization schemes by various intergovernmental agencies or non-governmental organizations (NGOs). These have resulted in such classifications as newly industrialized countries (NICs), least-developed countries (LDCs), big emerging markets (BEMs), middle-income economies (MIEs), and the like.

Generally speaking, economic, social, and political development is considered to be achieved through modernization, namely by following the model of the developed countries, through their aid and investment, training, and transfer of technology to developing countries. In the name of “nation-building” in the newly post-colonial country, the state often takes a significant role in the planning and management of development, with the help of Western agencies. As a consequence there is disenfranchisement of civil society out of fear that any dissent expressed might undermine progress. The expectation is for the country as a whole to achieve economic growth and thus all its citizens will experience a significant increase in financial income and material well-being. But economic reversion rather than development is possible and indeed has happened, to the impoverishment of its people. Many in developing countries that have embarked on the road to modernization have experienced uneven development, inequitable structures, even discrimination and oppression. Blame has then been placed inappropriately on colonialists up to 50 years after independence, though some blame may be justifiably assigned to foreign multinational corporations (MNCs), in collusion usually with corrupt and incompetent leadership in the developing country.

Modernization is closely linked to industrialization or the mechanization of production processes through the use of electricity, steam, oil, and other forms of energy. This technological change is characterized by shifts from personal labor to machine process, individual workshop to factory, crafted to standardized products, agricultural to mineral inputs, and from small-scale to large-scale production. Industrialization results in the declining emphasis on primary production or agriculture amidst growth in size and importance of secondary production or industry and tertiary production or services. The need for raw materials as well as markets for finished products prompted much of the colonialization imperative of previous centuries. One legacy has been the interdependence of nations and economic imperialism or neo-colonialism by multinational corporations. While industrialization developed in Western Europe in the nineteenth century, it took thinkers like Eisenstadt to argue that by no means need it be a phenomenon confined to the West but rather one replicable through the world, and thus the means of modernization for the developing world.

### Modernization Theories

Although development and social change are recognized as complex multi-causal processes, there was

still a tendency among modernization theorists to see economic factors as the pre-eminent determining ones. Walt Whitman Rostow, for instance, claimed that with adequate preparation an economy would take off into a period of self-sustained growth through mass consumption, which is taken as a litmus test of a modernized society. The newly independent third-world countries in the postwar era were most interested in this viewpoint but soon came to realize that the influx of capital was not a sufficient factor in and of itself. The rapid modernization of some countries but not others, despite similar levels of capital investment, was put down to the lack of appropriate social institutions, human resource development, and appropriate cultural values. David McClelland, in particular, pointed out the critical importance of people having an “achievement motivation” if a society was to develop or modernize through innovation and risk-taking. Such an argument belies the continuing influence of Weber on modernization thought.

While this initial paradigm espoused certain socio-demographic and structural prerequisites for modernization globally, research in developing countries actually undermined these notions and demonstrated the ahistoricity, paternalism, and ethnocentricity of such functionalism and thus modernization theories. For one thing, capitalism grew out of the peculiar European feudal system of the sixteenth to nineteenth centuries that has few equivalents elsewhere. For another, the path of modernization in the so-called West subsequently has not been without social and economic crises as it is made out to be when upheld as a model for the developing world. Each national society is composed of multiple sub-systems of social, cultural, and economic organization that differentiate one society from another. It is such differences that extend or limit the choices that a society has in relation to the process of modernization. Whether politically, economically, socially, or culturally, the developing world is simply not composed of homogeneous developing nation-states as modernization theorists presuppose, let alone clones of the developed world prior to industrialization. Thus the wholesale transfer of institutions, practices, and policies from the developed to the developing worlds, particularly through financial and technological aid, is no guarantee of modernization.

### Functionalist Interventions

Structural-functionalists analyze how functions adapt to maintain a stable social structure composed of mutually dependent sub-systems, or fail to adapt

resulting in dysfunctions. Influential on sociologists of this century, the structural-functionalist Talcott Parsons believed in the inevitability of modernization resulting in economic growth, universal education, and political democratization worldwide. Modernization theorists advocated precipitating dissatisfaction with traditional life as a means of stimulating aspirations for the material benefits of modern society. The role of media in modernization, as the functionalists theorized, was to democratize access to and choice in cultural products, and facilitate gradual cultural change without threatening the social system. In fact, modernization was seen as a process by which empathy with the idea of social mobility was fostered through the media. Notably, Daniel Lerner claimed that the media was a key accelerator of the transition into modernization along with urbanization, literacy, and political participation. Consequently, specific media policies were prescribed for developing countries as a means of achieving modernization and its benefits. The media were believed to aid in widening horizons, promoting empathy with different lifestyles, focusing attention on social mobility, raising material expectations, and changing attitudes and values, among other helpful effects for modernization.

Many governments in the developing world introduced television as a means of promoting modernization, either directly through development programming or indirectly through Westernized entertainment programming. But influential as structural-functionalism was in media development, research on its effects in the developing world bore equivocal results. Indeed, when Everett Rogers investigated diffusion of innovations, he found that the media were important to the earliest stage of awareness of innovations but it was interpersonal communication that was critical to the final stage of their adoption. Marketing and advertising have also been considered as benefiting modernization through encouraging competition, production efficiency, product innovations, and lower prices, as well as subsidizing the mass media. However this appears an argument for the dominance of commercial broadcasting emphasizing entertainment over public broadcasting focusing on education. Investigating the effect of modern institutions in developing countries, sociologists found that schools, the factory workplace, and the media were equally powerful in influencing modernization.

## Dependency Theories

Taking a more radical or critical approach, dependency theorists argue that underdevelopment is caused

not by sociocultural factors but by politico-economic ones, namely the exploitation of developing countries by capitalist developed ones. This view originates with Marx who explained historical transformation of societies through the growth of capitalism, which in turn was due to the exploitation of the working class. Lenin expanded this model to incorporate the relationship between imperial powers and their colonies. The need to update this Marxist perspective led to the dependency model, which asserted that persistent underdevelopment of a society was a symptom of its place within an exploitative world capitalist system. Even though many developing countries may be politically independent from their previous colonizers and seem to have national sovereignty, they are still subject to neo-colonialism. A form of economic and political dependency, this is achieved through developed-country investments in developing countries, infrastructural distortion of the latter's economies, and suppression of any independent policies by the developing world. As such, any effort to achieve economic development such as import substitution is fraught with difficulty, and even aid from the developed world can serve to perpetuate the exploitation.

The only alternatives left open to each developing country were to isolate itself from the capitalist world system, or seek to have the terms of international trade radically revised. The former alternative was tested by some countries such as those of the former Second World, which sought to set up a socialist-communist world system and found it wanting. The latter solution is currently being pursued via the General Agreement on Tariffs and Trade (GATT) and resultant World Trade Organization (WTO) with greater impetus since the end of the Cold War in the 1990s. But dependency theorists are skeptical of the value of GATT and WTO for developing countries, especially those in financial strife and coming increasingly under the control of the World Bank and International Monetary Fund (IMF), which are themselves driven by US foreign policy. After all, the Third World's lobbying over the 1970s and early 1980s for a New International Economic Order (NIEO) through the United Nations was impeded by the United States and other first-world countries, which preferred GATT as their platform since in it the developing countries were not a collectivity. Thus some thinkers from or sympathetic to the Third World consider the WTO to be a thinly-veiled attempt by the developed countries to control world trade and provide opportunities for their multinational corporations to dominate third-world markets. In what is sometimes described as recolonization, developing countries seem to be forfeiting their already limited economic sovereignty in their desire

for integration into the capitalist global economy controlled by the industrialized First World, without any guarantees of affluence. But as critics of structural-functionalism, dependency theorists tend to err in the opposite direction by propounding theories emphasizing the forces of conflict and disruption, and often failing to acknowledge the forces for social order and stability.

### World-Systems Theories

Through his study of modernization in Africa, Wallerstein became convinced that the state was not the valid unit of analysis when the economic system, of which it was a part, spanned the world. Thus he formulated “world-system” theory, a variation of dependency theories which states that a global economic system exists through which capitalist-developed or core countries and their multinational corporations exploit developing or “periphery” countries through low prices for raw material and high prices for finished goods. As part of the system, semi-peripheral countries were both dependent on the core countries and exploitative of the periphery ones. In his later prognosis, global integration of this system in favour of the inequitable status quo between nation-states would result in resistance, fragmentation, and its ultimate collapse, but for the buffer of semi-peripheral states.

Thus world-systems theory might be seen as merely a reaction to the inadequacy of modernization theory, which had used developed nations as the basis of comparison for developing countries, but which failed to demonstrate political and economic relations between the two systematically. Criticisms of world-systems theory revolve around its simplistic one-dimension analysis of causality, namely economic exploitation. The assumption that the world system is formed by developed and developing nation-states in an unequal relationship is questionable when it can be argued that the world system preceded the existence of these nation-states and was even instrumental in the latter’s formation. Some critics have put forward alternative models of geopolitical factors, primarily citing political power rivalry between nation-states. Those from the classical economics school would argue instead for the theory of comparative advantage, which holds that all countries involved are better off through unrestricted trade than if they did not trade at all. Therefore peripheral countries choose to trade with the core because they find it to their advantage, core countries need not coerce them to do so, and peripheral countries are not necessarily exploited when core countries progress.

### Third-World Applications

Many First World thinkers have defended the value of capitalism in bringing about economic development in the Third World. Like others before and since, Berger is persuaded that the efficient productive power and high standard of living of the masses generated in advanced industrial nations of the First World are being replicated in those Third World nations which are well incorporated into the global capitalist system. Of particular interest are Asia’s newly industrializing countries, such as South Korea, Hong Kong, Taiwan, and Singapore, which seem to demonstrate that genuine economic growth can occur despite state intervention in the economy and their relative dependency on the global capitalist system. But as in the First World, capitalism promotes a class system that permits social mobility, individual autonomy, and democratic processes, though these are slow processes given the traditional culture and society of the Third World. This contrasts with the failure of industrial socialism of the Second World, but it need not necessarily imply that there is an intrinsic link between it and inefficient economic systems and authoritarian political culture. The commitment to capitalism in many Asian, African, and Latin American countries has not resulted in sustained economic development, and in some cases has resulted in dire economic strife, requiring rescue by the IMF and World Bank. Others have questioned whether the authoritarian control by governments in some of these capitalist countries in pursuit of such economic progress is a cost worthy of the ideals of modernization to which societies are to aspire. For this reason, Herman Daly and John Cobb devise an alternative measure of economic activity, which incorporates the negative costs that traditional economists have long ignored. They point out that not only are developed nations depleting natural capital and actually achieving negative growth, but developing countries involved in modernization are also being drawn into the same self-defeating process instead of aiming at sustainable development. Recent decades have seen adverse reactions in some countries to cultural consequences of rapid modernization. Most notable among these are probably Iran, where the religious leaders succeeded in bring about a revolution against the modernizing impetus of the last Shah, and Cambodia, which under the Khmer Rouge attempted to turn back to a pre-industrial era. While there have not been recent reversals, the turn of the twenty-first century sees creeping influence of cultural and religious fundamentalist movements in developing countries opposed to Western neo-colonialism

and imperialism, both cultural and economic. There has also been an astounding growth of networks of informal social movements and non-governmental organizations, which question the purported benefits of modernization and point out the obvious disadvantages for various sectors of society in both the developed and developing countries.

## Role of Culture

Modernization involves changes in individual attitudes, values, and behaviors, as well as in social organization. Cultures conducive to modernization are said to have their roots in that of nineteenth-century Western and Northern Europe where industrialization first began, and then spread to parts of the world that were settled, rather than simply colonized, by its migrants—namely North America, Australasia, and to a lesser extent South Africa. In much of the developing world, the impetus to modernization has come from socially marginal groups and entrepreneurial subcultures, many of which predate colonialization but were co-opted or at least tolerated by European colonialists. Widely acknowledged examples of these are the Overseas Chinese in Southeast Asia, the Gujerati Indians in East Africa, and the Lebanese in Latin America. Among the indigenous peoples of developing countries, it was often the traditional elites, such as landowners and royalty, who collaborated with colonial authorities and post-colonial leaders in their agenda of modernization and industrialization, though sometimes it was a new educated or merchant class that was at the forefront. The crony capitalism or corrupt links between business and government that have bedeviled many developing countries, even some of the successful models are symptomatic of this phenomenon.

There has been a tendency since Durkheim and Weber to contrast tradition and modernity, and to imply that traditional culture with its orientation to the past, emphasis on kinship, and fatalistic worldview is an impediment to modernization. Harrison, Huntington, and other contributors to their recent edited volume argue that culture matters immensely in economic development and political democratization, and by implication that there are modernization-prone and modernization-averse cultures. Not only are cultural attitudes and values explanatory variables of the wide variation of modernization among developing countries, but these can also comprise a dependent variable in that economic development changes cultures in turn. But any survey of societies in the

developing world would soon reveal the inadequacy of any typology of traditional, pre-industrial versus modern, industrialized societies. Even in the most modern of societies, traditional elements such as kinship and religion persist, while some groups in so-called traditional societies have capitalized on opportunities to adopt modern economic practices. The conservatism and passivity that are said to permeate traditional societies may have more to do with their historical experience of exploitation from inside or outside the country such as via colonialization and imperialism. Hence, the allegations of idleness and non-ambition may be revealing of the failure of authorities, colonial or national, to understand the complex social and economic structures that pre-existed in local communities. These have often proven to be more sustainable and functional than the large-scale or national projects being imposed in the name of modernization based on a Western industrialized model.

## Counting the Costs

Modernization is often proffered by its proponents as a panacea for the economic and social ills of countries in the developing world. Although academics have long expressed reservations over the claimed benefits of modernization, only in recent decades, even years, has there been much popular dissent in both the developing and developed world. Life-expectancy and infant survival rates are higher in modernizing societies, but these lead to rapid population growth with which developing countries are not ready to cope in terms of infrastructure. There might be a decline in infectious and parasitic diseases, but a rise in unhealthy lifestyle and the stress-related and degenerative illnesses associated with modernized societies. Migration to cities in search of jobs and a more materialistic lifestyle often results in unfettered urbanization, shantytowns, inadequate services, high unemployment, crime, and other forms of urban blight. Rising expectations by the masses about consumption, fueled by advertising and the media, cannot realistically be fulfilled in many developing countries in Asia, Latin America, and Africa.

Currently the much less populated developed world utilizes the lion's share of the world's energy and natural resources. If the developing world were to catch up with the developed world in terms of standard of living, the depletion of resources would be at an alarming and unsustainable rate. Yet the de-industrialization of the developed world and adoption of a lower standard of living by its citizens seems an unrealistic hope. At the same time, many

## MODERNIZATION

developing countries are determined to emulate the social and economic practices of the developed West, and even those that are succeeding seem to have acquired massive debts. E. F. Schumacher's seminal idea of intermediate development is less about the why and how of development than it is about what is appropriate for developing countries wishing to modernize. His proposal of appropriate technology or incremental, small-scale innovation may be a valuable solution but there has been little interest in it by governments in developing countries, except for some rural communities. It is certainly not supported by aid agencies and multinational corporations from the developed world who have vested interests in promoting their large-scale technologies to developing countries.

### Late Capitalism and Globalization

Perhaps in response to the criticisms of Immanuel Wallerstein's view of monolithic global capitalism, other theorists adopt a more multi-causal perspective on modernization. With the onset of the postmodern age, nation-states are seen as co-players along with multinational corporations (MNCs), non-governmental organizations (NGOs), and other inter-governmental bodies (IGOs) on the world stage. In lieu of Marxist and non-Marxist periodizations, Scott Lash and John Urry offer a three-stage model of the development of capitalist economies: liberal, organized, and disorganized. The present "disorganization" of capitalism in the industrialized nations they attribute to four trends: the rise of multinational corporations and international financial markets, the decline of mass industries, devolution of government and dispersion of population, and the growth of a "service class" of white-collar professionals. Through their analysis of the major developed economies of the late twentieth century, Lash and Urry demonstrate that they are collectively well on the road from being modern to the next stage of being globalized, postmodern societies.

Worldwide changes in technology, education, and mass communications have led in turn to new consequences in social issues, conflict, and political institutions in the capitalist West, liberalizing the communist world and developing countries alike. One widely acknowledged outcome is the declining political interest in nationalism and increasing popular support for supra-national entities and ethnic identities. Increasing regionalization and globalization seem also to make a mockery of domestic economic policy in the West because Western countries generally fail to consider developments in other countries, particularly

in the Third World. This is quite evident in the intransigence of the economies in the developed world at the turn of the twenty-first century to domestic policies designed to create growth and employment. These policies fail simply because they do not recognize the changed global political and economic environment of which the nation-state is a part.

Globalization is conceived of in contemporary academic literature as a process of linking individuals and organizations that transcends the boundaries of the system of nation-states that comprise the manifest world political-economic system. Thus events and decisions in one part of the world come to have significant consequences for communities in other, often quite distant parts. Hence, Giddens conceives of globalization as influenced by four factors: capitalism, the inter-state system, militarism, and industrialism. Globalization is seen as a natural outgrowth of modernization when traditional social institutions in any country are superseded by global ones. Achieved through better communications, this phenomenon results in a greater sense of world citizenry or of interdependence on a global basis among individuals. The lynch-pins of economic and political globalization today are said to be the worldwide growth of capitalism with its accompanying processes of commodification and marketization. In recent years, globalization seems to have superceded modernization as the primary focus of social change, and this might be thought of as an inevitable outcome of the modernizing process.

### Modernity Versus Postmodernity

Down through the ages modernity has been a term used to contrast a present era with a previous one regarded as outmoded. Enlightenment thinkers of the eighteenth century considered themselves modern in relation to the ancient and medieval societies. In our era, modernity has been the badge of modern industrialized society and is characterized by a disdain for the past and a love of novelty. Modernity defines people as autonomous individuals within a free society rather than primarily as members of an ascribed collective. It favours reason and rationality, which undergirds scientific discovery, technological advancement, and material progress considered vital to modernization. Modern society and culture is based on industrialization, bureaucracy, the nation-state, and economic growth. As such the fragmentation of post-colonial nation-states, the globalization and marketization of the economy, hybridization of cultures, the resurgence of religion, subjectivism in

morality, among other symptoms that have occurred in recent decades have suggested to some thinkers that the world has entered into a postmodern age. Whether this applies equally to the developing world as to the developed one in which such views are formulated, remains an unresolved issue.

Postmodernism may be thought of as the skeptical aftermath of the optimistic humanism and technological utopianism of the modern industrialized era. Like globalization, postmodernity is a phenomenon over which there is little consensus of definition. Some thinkers portray postmodern society primarily as a consumer society characterized by fragmentation and chaos, pastiche and schizophrenia. Thus distinctions between reality and imagination are eroded, making impossible a comprehensive grasp of postmodernism. Others consider postmodernism to be in continuity with modernism and simply the cultural logic of late capitalism. Societies seem to be converging in economic and technological aspects but diverging especially in social aspects, while staying the same in yet other aspects. Cultural hybridity, for instance, takes a range of forms from mimicry, syncretism, and creolization, to global *mélange* and counter-hegemony, a phenomenon evident in the Third World across the arenas of television, music, theatre, sport, food, movies, and a range of popular culture. Perhaps globalization ought to be seen as an openness to cultural eclecticism that characterizes postmodern societies as a late consequence of modernization.

## MOLDOVA

The Republic of Moldova lies in the southeast part of Central Europe. Its neighbours are Ukraine in the north, south, and east, and Romania in the west. Its surface area is 33,700 square kilometers and its population is about 4,446,455 inhabitants (CIA estimate July 2004). The capital city of Moldova is Chişinău. Beginning in the nineteenth century the present Republic of Moldova was known as Basarabia. The population is divided as follows: Romanians 64.5%, Ukrainians 14%, Russians 13.5%, Găgăuzi 3.5%, Bulgarians 2%, Jews 1.5%. On the whole over sixty nationalities are represented here. Regarding religions practiced here, 98% of the population are Eastern Orthodox; 1.5% are Jewish; and the remaining 0.5% are of varying religions, including Baptist. The landscape of Moldova is composed of plains and low hills and the climate is temperate. The forests, which used to cover a quarter of the country, represent less than 10% nowadays.

In the fourteenth century the Principate of Moldova was established, which included the territories east of the Nistru and the Black Sea. In 1792, Transnistria was annexed to tsarist Russia and transformed in a “gubernia” (county), with the capital at Tiraspol. After the Russian–Turkish war of 1806–1812, won by the Russians, the Tsarist Empire took the territory between the Prut and the Nistru (that belonged to the feudal state of Moldova) and gave it the official name of Basarabia. In 1917 the Communist Revolution led by Lenin took place and the tsarist regime was abolished. On December 2, 1917, the Country’s Council (Parliament) proclaimed the Democratic Federative

Moldavian Republic, which voted in the independence of the new republic in January 1918. On March 27, 1918, the Country's Council proclaimed the union with Romania. In 1924, Moscow approved the forming of the Autonomous Soviet Socialist Republic of Moldova, on the territory of Transnistria, then a part of the Ukrainian Socialist Federative Republic.

Beginning in June 1940, the Soviet Army initiated its piecemeal occupation of Moldavia and, when completed on August 2, 1940, changed the territory's name to Socialist Soviet Moldavian Republic. The occupation of Basarabia and North Bucovina meant a real tragedy for the population. A terror regime was set up, much persecution took place, many people were deported, and there were even massacres among the Romanians. On June 22, 1941, the marshal Ion Antonescu, the leader of the Romanian State supported by the people and the political power, started the war against the Soviets and reintegrated Basarabia into the Romanian frontiers. After three years of Romanian administration between 1941 and 1944, Basarabia was occupied again by the Red Army as a result of the front evolution during the Second World War.

The Paris Peace Treaties (1947) established the Soviet–Romanian frontier according to the borders in existence on June 22, 1941. Between 1944 and 1953, hundreds of thousands of Moldavians were killed, locked in labour camps, or deported to Siberia by the Soviet government. Through a political diversion the Romanian language (a Romance language) in Basarabia was called the “Moldavian language” and adopted the Russian characters.

After Mihail Gorbaciov took power in the USSR, he introduced the “glasnost” and “perestroika” policies. The Democratic Movement in Moldova was founded in 1986. It organised a great meeting on August 27, 1989, which imposed the Romanian language as an official language and restored the Latin alphabet. After the Communist regime had fallen in Europe, the Chişinău Parliament adopted the Declaration of the Sovereignty of the Socialist Soviet Moldavian Republic on June 23, 1990 (which had Transnistria as one of its territorial components). On May 23, 1991, a new name of the country was adopted—the Republic of Moldova. According to the Constitution, Moldova became a presidential republic. The legislative powers belong to the president and to the Parliament and the executive powers belong to the Council of Ministers, named after legislative elections. In December 1991, Moldova joined the Commonwealth of Independent States.

The economy of the Republic of Moldova is mainly agricultural, and consists of cereal, tobacco, sugar

beets, sunflowers, and vineyards. The main industrial branches are food processing, textiles, and heavy machinery or home improvement construction (tractors, television sets, washing machines, etc.). The most important natural resources are imported from Russia, which creates an economic dependence. After 1990, the Republic of Moldova took important steps toward democracy and a free market economy but the transition has been difficult. Most of the population lives in poverty, and corruption increased. The new liberal prices started the process of privatization but foreign investments remained scarce, because of the political instability and the complicated bureaucracy. In 1992, Transnistria (with the tactical support of Russia, which has established an important military arsenal in the area) proclaimed itself an autonomous republic, starting a civil war. The Transnistrian crisis remains unresolved, and the breakaway region has yet to be recognized by any country or international body. Moldova is a member of the Commonwealth of Independent States (CIS) and is the first of the CIS countries to be fully admitted into the European Council. Furthermore, Moldova signed the Cooperation Treaty with the European Union, in which it is stated as the final goal that Moldova integrate into the European Union. While the liberal and democratic parties desire this orientation toward the West, the conservatives look more toward Moscow, especially after the Communist victory in the 2000 elections.

Moscow declared (in 2004) that, to resolve the Transnistrian crisis, Moldova and Romania should reunite their borders, giving the example of the unification of the two German states. Transnistria would then be part of the Russian Federation. But such a reunification would slow Romania's integration process considerably; therefore the Romanian political class rejected the project, although it still remains a possibility for the future.

## MONARCHIC GOVERNMENT

Monarchy, possibly the oldest form of government, is rule by one. A monarch stands alone above his or her subjects rather than as one among them: his or her role and demeanor are parental rather than partisan. In Benedict Anderson's words, the monarch occupies the "high center" in a "dynastic realm," one from which tiers of subjects cascade downward. The monarch's sovereignty radiates outward, gradually attenuating into porous frontiers where boundaries marking one realm from another mix imperceptibly together. Monarchical authority partakes of the divine, modeled in scriptures and demanded by priests. The "Mandate of Heaven" legitimizing the Emperor of China was inferred from its absence. Calamities like earthquakes, hurricanes, plagues, crop failures, and military defeats signified the withdrawal of heavenly approval of a ruling house and conferred permission on subjects to overthrow it.

Aristotle thought that monarchy was the best government, disinterested and free from internal conflict. But every ideal has its evil opposite. For monarchy, it is tyranny, a self-interested rather than a disinterested high center. To the tyrant, the subject is a means to satisfy his or her desires, whims, and perversities. While religious strictures might reduce or regulate the propensity of populations to rise up against tyrants, they offered no protection against them. The horrors of tyranny encouraged philosophers and revolutionaries to think of ways to curb monarchical power.

Philosophers like Thomas Hobbes, John Locke, and Jean Jacques Rousseau sought to restrain the power of rulers through contracts and laws. Constitutional government evolved as customary practice and in discrete formal documents, creating permanent institutions independent of monarchs and rules of engagement circumscribing their interaction. Revolutionaries overthrew monarchies, replacing them with new forms of rule by the few and, gradually, by the many. The popular image of the nation slowly shifted from a hierarchy cascading from a high center to a horizontal arrangement of equal citizens. Yet these changes were neither uniform nor worldwide. The

career of Belgium's King Leopold II is an extreme example of how European imperialism kept tyranny alive abroad despite democratization at home. His rule over the Belgian Congo was ruthless and brutal. It suppressed all native opposition and was intolerant of freedoms for native residents.

After World War II, imperialism became untenable and former colonial possessions gradually became independent. Conventional wisdom also predicted the end of monarchy despite lingering remnants in such places as Britain, Japan, and Scandinavia: other monarchical survivals would be like them, merely ceremonial. In the words of Walter Bagehot, they would be "dignified" rather than "efficient." While a vestigial monarch might reign, he or she no longer would rule.

Yet several years into the twenty-first century, efficient or ruling monarchs remain, most of them in the Middle East and North Africa. This can't be explained simply as the result of tradition; some of these regimes are relatively new. The end of imperialism did not automatically lead to the end of monarchy. Some former dependencies did overthrow emperors and monarchs. Others still have theirs, the result perhaps of a combination of crafty adjustments by rulers and second thoughts by citizens that their neighbors' efforts to end monarchy in places like Egypt, Iraq, Iran, and Syria had merely produced another, more efficient form of tyranny. Observing that monarchies appear to be more resilient than expected, scholars have tried to explain why.

Lisa Anderson suggests that monarchies persist for psychological reasons. Monarchs are uniquely able to act as nation-builders because their authority depends on their personal qualities, especially military valor, and because they evoke primordial loyalty. Loyalty comes from religious authority and is ceremonially reinforced in rituals like the annual ram sacrifice in which the King of Morocco plays a dominant role. The monarchies of the Persian Gulf present themselves as epitomes of Arabian tribal values and call upon primordial loyalties to the "family" of the nation. The monarch is thus a *pater familias*, the legitimate representative of his (or her) family/subjects who wields life-and-death power over them.

Explaining the persistence of monarchy in oil-exporting countries, Hazem Beblawi combines a tacit image of the monarch as father-provider to an elaborate picture of the state as the owner of oil revenues. Monarchs of such "rentier states" stay in power as long as they can earn enough money from foreign oil sales to buy off likely revolutionaries and provide high levels of welfare to their populations. Yet the rentier state thesis does not explain the overthrow of the monarchy in Iran or the persistence of the monarchy of Jordan.

Michael Herb argues that the persistence of monarchy results from well-crafted institutions able to adjust to the pressures of modernity. He says that “dynastic monarchies,” which include Morocco and the Persian Gulf kingdoms and emirates, are resilient because of the structure of interests within the ruling class. In dynastic monarchies, kingship is not passed from father to son but rather by consensus among powerful ruling family members. Errors in judgment that produce an obviously incompetent ruler can be rectified by the same procedure. Other family members control key positions in government, thereby eliminating power bases that could be occupied by potential revolutionaries. Yet dynastic monarchies in Kuwait and Saudi Arabia have failed to remove moribund rulers while the late King Hussein of Jordan decided suddenly on his own to substitute his son Abdullah for his brother Hassan as Crown Prince. While these situations demonstrate the stability of dynastic monarchies, they also illustrate their fragility.

The continuation of monarchical rule in the twenty-first century is undoubtedly the result of effective statecraft, but it also reflects good luck and a hospitable international environment. Most of today’s ruling monarchies were able to find protectors during the Cold War and, until recently, could expect outside support to counteract some effects of internal opposition. Any explanation for the persistence of monarchy thus must include a role for external actors and conditions as well as psychological and structural supports for this ancient form of rule.

### MONEY LAUNDERING

Money laundering is the process through which criminal and illegal money is “laundered,” creating the illusion that it is legally earned. Laundered money

refers only to money that goes against anti money-laundering legislation and is not necessarily synonymous with dirty money. Dirty money is money that violates any laws in its origin, movement, or use. Therefore, defining money laundering as the handling of any sort of criminal or tax-evading proceeds is inaccurate. The United States, for example, still maintains dozens of categories of criminal money that remain outside the anti money-laundering legislation.

Anti money-laundering legislation varies from country to country. In some countries, for example, it is an offence to launder the proceeds of another person’s criminal conduct. In others, laundering is regarded as an ongoing offence; hence, the actual timing of the criminal activity is not seen as relevant. Therefore, what in one country may be considered as laundered money may not be so regarded in another.

It is estimated that every year the equivalent of one trillion US dollars is laundered worldwide. According to Raymond Baker, a leading money-laundering expert at the Brookings Institution, approximately half of this sum is generated by violent criminal activities, such as organized trafficking in drugs, weapons, or people. The other half is illegal capital flight—tax-evading money derived from kickbacks, bribes, falsified invoices, and sham transactions by overseas nationals who place that money into outside secure accounts, mostly in US institutions.

### Money Laundering and Terrorism

Terror organizations also use money-laundering techniques to move money around the globe. Terrorists finance their operations through criminal activity, or they may also use funding from legal sources. In either case, terrorist groups utilise financial networks in the same way that other criminal groups do. Consequently, after the events of September 11, several countries have changed their anti-money laundering legislation. Special measures have been taken also by the Financial Action Task Force on Money Laundering (FATF). Established by the G-7 Summit in Paris in 1989, the FATF initially developed forty recommendations. Members of the FATF comprise twenty-nine countries and jurisdictions—including European, North and South American, and Asian major financial centres—as well as the European Commission and the Gulf Cooperation Council.

After September 11, the FAFT expanded its mission in order to focus on eliminating terrorist financing. It issued new international standards to combat terrorist financing, and is involved in identifying the systemic weaknesses in the anti-money

laundering programmes of certain jurisdictions. The FAFT also attempts to identify emerging new methods and trends used for laundering money.

## Laundering Drug Money

To counteract the anti-money laundering policies, Latin American drug traffickers have developed the Black Market Peso Exchange. This system is elusive to traditional monetary controls because it does not involve the physical movement of cash from one country to another.

In the early days of the Medellin drug cartel, cash was flown back to Colombia by the same planes that took the drugs to the United States. Once in Colombia, the process of converting dollars into pesos was very slow and required the help of local bankers. Drug traffickers had to store huge amounts of cash. One Colombian drug trafficker buried so much cash on his property that when it rained heavily, the floods washed US dollars downstream, clogging the sewage system. US dollars are of no use to the Colombian drug cartel or to the Revolutionary Armed Forces of Colombia (FARC), the terror group acting as its militia, or to the Shining Path/Sendero Luminoso in Peru. Members of these organizations need domestic money to pay local growers, to buy protection, to bribe politicians, to recruit, and to purchase arms and explosives.

In the 1990s, drug traffickers and terror groups infiltrated the Colombian currency black market and transformed it into the Black Market Peso Exchange. The drug traffickers ship to and sell the narcotics in the United States; in exchange they receive US dollars in cash, which they hand over to a money broker inside the United States. The broker agrees to exchange it at a discount to the official rate, generally around 40%, and to deliver the corresponding pesos in Colombia within a few weeks. The broker then distributes the cash to a vast staff of runners, who deposit it in small amounts into thousands of US bank accounts under their names. Once the money is in the bank, it is “clean.” To avoid being monitored by the US monetary authorities, bank deposits and purchases are always below the \$10,000 limit imposed by the IRS. Breaking down large sums of deposits into several transactions of less than \$10,000 is illegal in the United States.

At the same time the broker has an office in Colombia where locals go to buy foreign products, ranging from US cigarettes to TV sets, which they acquire using pesos. The purchases are done with an exchange rate that generally is 20% above the official

exchange rate. The US money broker buys the goods in the United States using the drug money deposited by its runners, often from companies that know the origins of the funds; the broker then ships the products to his or her office in Colombia where they are sold for pesos. These pesos are then used to pay back the drug traffickers.

The Black Market Peso Exchange is also used by South American professionals to send dollars to their children studying in the United States. According to the IRS, from 1999 to 2003, the volume of money laundered via the Black Market Peso Exchange increased from US\$1 billion to \$6 billion.

## Origins of Money Laundering

The history of money laundering is that of hiding money or assets from the state to protect it from confiscation or taxation. People have used money laundering to move money resulting from crime, but also to hide it from governments, including oppressive regimes. Two thousand years before Christ, merchants in China hid their wealth from rulers. Often, they invested it in businesses in remote provinces or even outside China. Thus, the birth of the offshore industry and tax evasion coincides with the advent of money-laundering activities.

Through the ages, the principles of money laundering have not changed. What has changed are the mechanisms. When gold coins were worth their weight in gold, it was immaterial what country had issued them. The value of the coins was determined by the quality and quantity of the gold. Melting the coin was an easy and efficient money-laundering technique. Today, gold remains one of the main non-currency means of holding money, including laundered money.

The use of the term “money laundering” is a modern phenomenon. It is linked to the rise of the famous US gangsterism, which originated from the Prohibition of the 1920s—the banning of the sale of alcohol in the United States. Organized crime utilized several mechanisms to disguise the illegal origins of profits generated by the import and sale of alcohol and other “rackets” such as gambling. The money was in cash, often in small-denomination coins, and could not be deposited into banks unnoticed. So they used businesses, such as laundries that generated profits in coins, to filter through their profits. This is how the term “money laundry” was born.

**MONGOLIA**

Mongolia (also known as Mongolian People's Republic [MPR] until 1992) is located in Inner Asia, bordering with China in the south and Russia in the north; a small strip of the Chinese territory in the west separates Mongolia from Kazakhstan. The country has a land area of 1,565,000 square kilometers (604,250 square miles); comparatively, the territory of Mongolia is slightly smaller than the state of Alaska, the largest state in the United States.

The population of Mongolia was 2,712,315 (July 2003, CIA estimate), up from 1,564,000 in 1979. It is predominantly urban with about 58% of the people living in cities and towns. The country's capital city, Ulaanbaator (Ulan Bator), is home to about 780,000 people or almost one-third of the population. Mongolia has a population growth rate of 1.42% (CIA estimate 2003) and it is estimated that its population could double by 2050. Major languages include Khalkha Mongol (90%), Kazakh (4%), Russian, and Chinese. The major religion is Tibetan Buddhist Lamaism, 96%, with the remaining 4% practicing Shamanism and Christianity.

For centuries, the Mongols have been engaged in animal husbandry, raising horses, sheep, goats, and cattle. The vast dry prairie land can support millions of sheep, but only about 8% of the countryside is arable. Until the twentieth century, relations between Mongolia and its neighbors have often been characterized by devastating wars and military conflicts, which have had a negative effect on Mongolian economic and social development. Consequently, Mongolia entered the twentieth century as a feudal

country with most of the population engaged in subsistence economy. In the nineteenth and early twentieth centuries the Chinese and Russian Empires competed with each other to establish political control over this strategically important area.

The major economic and social changes were brought to Mongolia after the national revolution of 1920–1921. The Mongolian People's Party, with Soviet assistance, successfully fought its opponents, and in 1924 the Mongolian People's Republic was declared. However, it took many decades before the international community recognized the MPR, and only in 1961 did the country become a member of the United Nations. The Mongolian People's Party (renamed the Mongolian People's Revolutionary Party in 1924) remained the single ruling party for the nearly seventy years.

Under Soviet influence, the Mongolian government introduced radical economic changes, including state control of all types of economic activities and central state planning. It eliminated mass illiteracy and developed extended free education and medical services for all sectors of the population, but at the same time the government suppressed basic political freedoms, banned opposition, and did not allow private entrepreneurship. In the 1930s, the government forced all farmers to join large-scale farming centered around *negdels*, state-controlled collective farms. The *negdels* traditionally specialized in animal herding, grain, and so forth. During and after World War II, the government developed the industrial sector of the country with major investments from the Soviet Union. The state-controlled industrial enterprises included agricultural machinery, mining, and light industries such as shoes, garments, and food processing. During the Socialist era, all economic activities in Mongolia were state-controlled, and private entrepreneurial initiatives were limited. Until the 1990s, the Soviet Union and the East European countries remained Mongolia's main trading partners and the chief market for its products. According to the International Monetary Fund (IMF), the Mongolian economy grew at an average annual rate of 6.0% between 1979 and 1989, which was one of the highest growth rates in communist countries.

Under domestic and external pressures, the Mongolian government introduced major changes in the late 1980s, abandoning the socialist economic model in favor of a centrally planned economy and total political and economic control. These changes were largely peaceful since they were initiated by the ruling elite under the influence of the neighboring Soviet Union and China. In the early 1990s, the international organizations such as the International Monetary Fund and the World Bank together with the Mongolian

government formulated a program of radical economic changes (the so-called shock therapy approach). This program was based on three main mechanisms: rapid mass privatization, rapid price liberalization, and currency reform. Under this program, the state privatized major sectors of its economy including housing, catering, retail, and agricultural enterprises; allowed private ownership of the land; liberalized its domestic and international trade; and opened the national economy for international investors.

Initially, the country experienced an economic slow down and a “transitional recession.” According to the IMF, Mongolia’s economy declined at an average annual rate of 0.1% between 1989 and 1999, while the United States experienced a decade of unprecedented growth. However, after the completion of the first stage of the reform, the national economy experienced moderate annual economic growth of about 3%–4%. Due to its rapid and extensive economic liberalization, Mongolia was accepted into the World Trade Organization (WTO) in 1997.

Mining, agriculture, and agricultural product processing are the three main pillars of the Mongolian economy. The modern Mongolian economy largely relies on export of raw materials to international markets. The country’s main exports are copper concentrate (which accounted for almost 47% of its total export earnings in 1998), cashmere (the country produces almost 30% of world’s cashmere), textiles, and meat products. The mining industry is largely concentrated around the second- and third-largest Mongolian cities, Erdenet and Darhan. The country depends heavily on imports of machinery, fuels, industrial consumer goods, and food products since it has very limited industrial capacities. Due to the transitional recession and disappearance of aid from the former USSR, Mongolia’s economy increasingly relies on foreign aid and credits. Total external debt has reached almost US\$1.037 billion (World Bank estimate 2002).

## Recent Development

Transitional reforms in Mongolia conducted throughout the 1990s with World Bank and IMF assistance brought mixed results. On the one hand, they disassembled the state control over the economy, allowed private entrepreneurship, and diversified international trade partners. On the other hand, they brought widespread poverty; a diminishing social welfare system, especially health care and education; a rise in organized crime; and extreme income polarization. The country increasingly relies on the export of raw

materials to the international market, and it is extremely vulnerable to fluctuations in world prices for its major export products—copper and agricultural products. Mongolia needs considerable foreign direct investments and international assistance to modernize existing technologies and to conduct major economic changes. However, both local and foreign investors are reluctant to invest in the economy due to the small size of the market, the weakness of the legal system, and the inability of state institutions to implement property rights and contract law. In addition, small private farmers, without state support, have become highly vulnerable to environmental changes and extreme weather conditions.

Despite macroeconomic stability and success in structural changes, the economic changes led to a steady decline in living standards among pensioners, rural people, and women with children. In 2004 the World Bank classified Mongolia as a low-income economy with a Gross National Income (GNI) per capita of \$430, with about 52% of its population living below the poverty line (2002 est.). In 2003 the UNDP’s Human Development Index (HDI) put Mongolia in 117th place out of 175, behind Bolivia, Honduras and Equatorial Guinea, but ahead of Gabon and Guatemala.

## MONTENEGRO

Montenegro is a small democratic republic located on the west Adriatic coast of the Balkan Peninsula between Bosnia, Serbia, and Albania. A mountainous country with 120 miles of coastline, it covers slightly over forty-nine thousand square miles. Its sandy beaches are suitable for tourism, and its climate ranging

## MONTENEGRO

from continental to sub-tropical along the coast allows for general as well as specialized farming. The mountains, however, rise sharply, causing obstacles for communication into the interior. The rivers of Montenegro have cut deep gorges in the area creating spectacular scenery, and the low level of development has left much of the country's mountains, rivers, and forests in a pristine condition.

Many Montenegrins consider themselves to be Serbs. Yet a separate Montenegrin national consciousness has persisted, encouraged by a post-World War II Yugoslav governmental philosophy emphasizing the federal character of the country. Montenegrins speak a dialect similar to Serbo-Croatian and the majority belong to the autocephalous Montenegrin Orthodox church, but their pre-1919 history is separate from that of Serbia except for a short period in the Middle Ages when they were part of the Serbian empire. According to the 1991 census, 62% of the population identified themselves as Montenegrin and only 9% as Serbian. The country's 620,000 population also has a large Albanian and Muslim minority.

Formally part of the Ottoman Empire in the early modern period, the country was in fact an independent monarchy led by its Eastern Orthodox bishop, a member of the Njegoš dynasty. In 1852 Prince Danilo secularized the dynasty, whose independence the European powers recognized in 1878. In 1919 his son Nikola (proclaimed king in 1910) reluctantly left the throne as the Kingdom of Serbs, Croats, and Slovenes (renamed Yugoslavia in 1929), which the victorious World War I Allies created under the rule of the Karađorjević family, absorbed the tiny mountain monarchy. During World War II the Axis powers broke up Yugoslavia, recreating the Montenegrin kingdom, but linking it to the Italian monarchy. After World War II when the victors once more restored Yugoslavia, Montenegro returned to the state.

In 1945 Josip Broz-Tito established Communist rule in the country and changed it into the Yugoslav Federation of Republics. Montenegro became one of six autonomous republics. In 1948 Tito broke with Josef Stalin and successfully established a separate Communist course from the Soviet Union emphasizing decentralization in the economy.

During the period between the world wars, Belgrade paid little attention to the economic development of Montenegro. Many Montenegrins left the country for better opportunities elsewhere. Because of the area's poverty and its pan-Slav traditional friendship with Russia, many Montenegrins supported the Communist Party, and thus the postwar republic gave Yugoslavia a disproportionate number of officials, police, and army officers. Montenegro

had the greatest proportion of members on the ruling Federal Executive Council and Central Committee of the League of Yugoslav Communists than its population (3% of the total) warranted, usually 20% or more. However, one of the most famous Montenegrins, the one-time Communist Milovan Djilas, was a critic of both Stalin and Tito, and the latter imprisoned him many times.

Montenegro received much federal aid and incentives such as tax breaks, and industrialization began, but its development never reached expected goals. Belgrade attempted to develop the steel industry in the republic and exploit the region's bauxite mines. The difficulty of integrating Montenegro into the main industrial and economic areas of the country and the republic's remoteness hampered this development. The government did not begin the development of the coast as a tourist region until the 1980s.

Yugoslav policy in the postwar years siphoned resources and money from the richer republics, especially Slovenia and Croatia, to develop the poorer ones (Montenegro, Macedonia, and Bosnia), creating a great deal of hostility and tension. Croats especially accused Belgrade of robbing their republic to develop South Serbia and Montenegro—an example of the Greater Serbian politics of domination that characterized Yugoslavia in the monarchal period.

The 1947 plan to industrialize Yugoslavia emphasized fantastically high increases in development à la the Soviet five-year plans, especially in basic industries. New factories were destined for underdeveloped areas like Montenegro. The ambitious, naive plan was doomed to fail and the rupture of relations with Moscow insured it. The 1957 five-year plan gave Montenegro, as an underdeveloped area, federal grants and budget and tax incentives for industrial development. However, in 1961 a recession forced changes, and a special development fund was established for underdeveloped regions. Statistically, Montenegro profited more than other countries.

The 1964 index for net national product ranged from 190 (Slovenes) to thirty-five (Kosovo). Montenegro was sixty-eight. Social backwardness and technical lagging hampered development. The ambitious and primitive plans as well as annual changes in those plans furthered inefficiency. Montenegro's steel mill was a disaster. Construction began in 1953 at Nikšić, but a rail connection to the Adriatic did not appear for eight years, a road for over ten, and a standard-gauge railroad not until 1975.

In 1988–1989 a pro-Milosević (who has Montenegrin relatives) political faction controlled the republic, and Podgorica joined Belgrade in its wars in Bosnia and Croatia. After 1991 Montenegro was forced to face the dilemma of its relation to Serbia. On the one

hand, the federation provided it with resource opportunities, but the isolation of Serbia because of its involvement in ethnic cleansing in Bosnia and Kosovo hurt its reputation and harmed the tourist industry. In 1992 with the breakup of Yugoslavia, Montenegro and Serbia formed a new federation, and ten years later, in March 2002, the two states created an even looser federation called “Serbia and Montenegro.”

The Liberal Alliance, the major opposition party, has promoted the independence of Montenegro from Serbia, especially as Serbia’s international reputation has declined under the rule of Slobodan Milošević, but the ruling Democratic Party of Socialists led by president Milo Djukanović (2002) favored the continued alliance with Belgrade. In the 1990s many associations in the West such as the Montenegro Association of America and Montenet UK promoted relations between Montenegro and the West, its separation from Serbia, a retelling of its separate history and culture, and the economic development of the country.

## MONTONEROS

The *Movimiento Peronista Montonero*, more commonly known as *Montoneros*, was one of three Peronist guerrilla movements active in Argentina during the 1970s. They sprang from the multifaceted left-wing

faction of the Justicialist Movement, which was inspired and led by Juan Domingo Perón, and had the ultimate objective of instituting a socialist system in Argentina through armed revolutionary struggle. In order to further their cause, the *Montoneros* relied on an eclectic support base that included trade unions, student organizations, radical members within the Catholic Church, and the dispossessed urban classes. The *Montoneros* were the first revolutionary group in Latin America to successfully carry out urban guerrilla operations with far-reaching political implications, including violent attacks against Argentinean authorities and elites as well as foreign capital interests. At the height of their activities in the 1970s, the *Montoneros* had up to seven thousand guerrilla fighters.

The origins of the *Montoneros* can be traced back to Perón’s first presidency (1946–1955). In order to rally support for his political leadership, Perón introduced sweeping labor reforms that significantly improved the working conditions of the urban proletariat, including increased wages, pensions, a reduced working week, and housing and health benefits. However, far from being an anti-capitalist, Perón favored a corporatist path whereby the interests of both capital and labor would be balanced out in the administration of the economy. In this context, Perón resorted to a message of social justice that translated into tangible gains for the working class, earning him a loyal following that sustained him in power for almost ten years. The end of his regime was orchestrated by the local capital elites, who saw their fortunes slide as the clout of labor increased under Perón, and by foreign interests, mainly the United States, who saw Perón as a potential threatening figure too closely attached to socialist ideals.

After Perón left office, a large segment of his supporters acknowledged the need to perfect Perón’s sketchy vision of social justice by fundamentally changing the course of political action. This leftist *Peronista* segment, increasingly influenced by revolutionary socialist ideas, proposed that the national capitalist elites and their foreign counterparts should not be included in the equation for a progressive society precisely because they themselves were the source of the problem. From this perspective, a diverse coalition of Perón’s supporters set out to organize a national party that would fuse urban guerrilla warfare with the popular struggles of the *Peronista* movement as the means to bring about a socialist revolution in Argentina. It is important to note that the initial common ground for the *Montonero* membership, which included members of the Catholic Church, socialists, and at first even right-of-center middle class *Peronistas*, revolved around a rather broad nationalistic sentiment that sought the return to

national self-determination and economic prosperity. However, as the direction of Argentinean politics tilted in favor of capital and national elites, the *Montoneros* also shifted their ideological platform by favoring the ways of socialism and armed struggle, to the exclusion of all other methods, as the paths to vindicate their interpretation of *Peronista* social justice.

The *Montoneros* began their violent political actions against the Argentinean state and foreign multinational corporations in the late 1950s, concentrating on the assassinations of high-ranking public officials and perpetrating kidnappings of rich businessmen to finance their activities. Their activities continued in the 1960s, but these were sporadic and registered little political repercussions. In 1973, a frail Perón returned to Argentina and won the presidential election that year, but instead of uniting the different currents of *Peronismo*, his victory managed to pull them further away. As violence erupted between the *Montoneros* and right-wing *Peronistas*, and as demands from each side put pressure on the decision making of the new government, Perón sided with the conservative faction. In May 1974, the *Montoneros* were officially expelled from the Justicialist Movement by Perón. However, the *Montoneros* vowed to continue fighting for what they believed were the revolutionary ideals of authentic *Peronismo*.

A fundamental turning point that fueled the armed activities of the *Montoneros* came in March 1976, when a military junta, led by General Jorge Rafael Videla, ousted the government that Perón's wife had taken over after his death in 1974. Now operating under an openly repressive political atmosphere, the *Montoneros* raised their activities to new heights. During this turbulent period, their most significant operations had to do with the kidnappings and ransoming of members of the business elites, the assassinations of executives from General Motors and Chrysler, and the massive bombing of the Federal Intelligence Department in Buenos Aires in July 1976. The upholding of the armed struggle as the only means to face the military junta radicalized the activities and ideology of the *Montoneros'* rank and file, losing the support of more moderate members and at times engaging in internal ideological feuds that curtailed the success of their political and military activities by turning members against each other.

The military junta answered the *Montoneros'* offensive with a systematic campaign of terror. Between 1976 and 1983, *La Guerra Sucia* (dirty war) was conducted by fostering and protecting groups of vigilante death squads, such as the Argentine Anti-Communist Alliance (Triple A), that engaged in activities that targeted perceived enemies of the junta and supporters of revolutionary groups. These death squads

engaged in mass arrests, torture, extra-judicial executions, and disappearances of up to thirty thousand people during those years, instituting a regime of generalized state terror that managed to neutralize the activities of opposition groups, including the *Montoneros*. Close to one-quarter of the *Montoneros'* active membership had been killed by 1978, their operations had been disrupted, and the surviving members were forced to either disperse or go into exile.

The last remnants of the *Montoneros* were effectively defeated by the early 1980s, and it was not until 1984 that civilian rule returned to Argentina. Although unsuccessful in bringing about the "authentic Peronist vision" through armed struggle and radical politics, the legacy of the *Montoneros* remains in the relevance of the core goals they fought for: the need for social justice and national self-determination.

## MONTSERRAT

Montserrat, a pear-shaped island in the Leeward Islands, is forty-three kilometers southwest of Antigua and seventy kilometers northwest of Guadeloupe. The 102-square kilometer island is an overseas territory of the United Kingdom. Montserrat, which means jagged mountain, is named after a mountain of the same name in Barcelona, Spain. Of volcanic origin, Montserrat has active sulfur vents in the mountainous south-central region. Because of its lush tropical rain forest, travel brochures repeatedly refer to the island as the Emerald Isle. Over 90% of Montserrat's people are of African descent. Owing to uncertainty about the island's economic future, most of Montserrat's people do not favor independence. Montserrat is a member of the British Commonwealth of Nations and the Organization of Eastern Caribbean States.

Although British officials are responsible for defense and foreign relations, local elected officials are responsible for all internal affairs, except security.

Queen Elizabeth II, the head of state, is represented locally by a governor—Deborah Barnes Jones (b. 1956) since 2004—who oversees the Legislative Council. The governor is appointed by the British government. Nine of the eleven Legislative Council members are directly elected by the people of Montserrat. The attorney general and the financial minister serve as ex-officio members of the Legislative Council. Although appointed by the governor, the chief minister—John Osborne (b. 1936) since 2001—is normally the leader of the majority political party in the Legislative Council.

Arawak and Carib Indians were the first inhabitants of the island. Christopher Columbus, who discovered the island in 1493, named the island Santa Maria de Montserrat. The British were the first Europeans to colonize the island, in 1632. The first settlers were Irish Roman Catholics. The cultural footprint of the Irish is evident in the predominance of Irish surnames today. During the colonial period, the British landowners implemented an agricultural system based on large estates. In 1958, like the rest of the British Caribbean, Montserrat joined the ill-fated West Indies Federation, which lasted until 1962 when Jamaica and Trinidad and Tobago withdrew from the association. Beginning in the 1960s, hundreds of North Americans and British subjects began to arrive on the island and build luxury homes. Real estate development and construction became a key component of Montserrat's economy.

The dominant figure in Montserrat's political system since the 1970s has been Chief Minister John Osborne, whose People's Liberation Movement (PLM) was the largest political presence in the Legislative Council from 1978 to 1991. In 1984, Osborne startled the people of Montserrat by suddenly calling for independence. His pronouncement was based on the British government's veto of Montserrat's decision to send a police force to participate in the police action in Grenada after the 1983 US-organized invasion following the overthrow of Maurice Bishop. Although most of Montserrat's people supported the US invasion of Grenada, they were against independence. Osborne subsequently promised that no decision on independence would be made until a referendum was held. In 1991, Osborne's main rival, Reuben Meade, leader of the National Progressive Party (NPP), became chief minister. A reinvigorated PLM returned to power in 2001.

In 1995, the Soufriere Hills volcano began to show signs of volcanic activity. In 1996, minor eruptions led to the evacuation of the southern third of Montserrat, where Plymouth, the capital, was located. Fortunately, all 3,500 people in Plymouth were evacuated. Subsequent eruptions in August 1997 covered the

capital with lava and ash. The island's only airport was destroyed and the capital city was reminiscent of Pompeii. Of the island's eleven thousand inhabitants, over eight thousand fled to neighboring islands and the United Kingdom. A large portion of the island's annual income, therefore, comes from remittances by overseas citizens. The tourist industry, which only lured twenty-five thousand visitors per year to the colony during the early 1990s, came to a virtual stop in the aftermath of the volcanic eruptions. In 1998, the British government moved the capital of Montserrat to Brades in the Carr's Bay vicinity in the northern part of the island.

People who live in the northern part of the island are protected from the Soufriere Hills volcano by a mountain range in the center of the island. Thus, there is no danger to citizens and tourists in the northern region of the island. Therefore, since 1998, thousands of Montserrat's refugees began to return to their homeland. The government's tourist bureau has also made energetic attempts to lure tourists back to Montserrat. The dome of the volcano collapsed in 2003, which has greatly reduced volcanic activity in the region. Nevertheless, the volcano is still active and entry into the southern region of the island is restricted. Trespassers in the restricted zone are subject to fines and imprisonment. The British have implemented a multi-million-dollar recovery program to help reconstruct the economy. Included in the redevelopment program are plans for a new airport in the northern part of the island. The southern half of the island, however, will remain uninhabitable until 2010.

### MOROCCO

The Moroccan Kingdom, “*Al Mamlaka Al Maghribiy*” in Arabic, is a North African constitutional

monarchy with a bicameral legislature. Its capital is Rabat and the largest city is Casablanca (over 3.5 million inhabitants in 2001), located on the Atlantic coast. Morocco's total population is 30,645,305 (July 2001 estimate) and the rate of population growth is about 1.7%. The country's official religion is Islam, with Christian (1.1%) and Jewish (0.2%) minorities. Arabic is the official language, although French is widely spoken and is the language of business, government, and diplomacy. Spanish is commonly used in the northern provinces. There are tensions between Morocco and Spain concerning the alleged violations by Spain of Moroccan waters and illegal immigration. Tensions between Morocco and Algeria over Morocco's Western Sahara cloud the relationships between the two neighbors.

Morocco is strategically located along the Strait of Gibraltar. The country's total area (including the Western Sahara) is 710,850 square kilometers. The climate is Mediterranean on the coastal regions and hot, dry, and continental in the interior. The northern coast and interior are mountainous with large areas of bordering plateaus and rich coastal plains. The main natural resources are phosphates, iron ore, manganese, lead, zinc, fish, and salt. The national currency is the Moroccan dirham (8.4 units to the US dollar as of February 28, 2005).

Morocco became independent from the French authority on March 2, 1956, under Mohammed ben Youssef, also known as King Mohammed V. He died on February 26, 1961, and Hassan II was crowned king of Morocco the same day. It is under the reign of Hassan that Morocco started its movement toward modernization.

Between 1945 and 1956, Morocco was under French authority. During this period most projects were set up by colonial authority. In the agricultural sectors, modern farms were created in the most productive areas of the Gharb, Doukkala, Saiss, and Haouz. The French administration continued to build roads and railroads to facilitate transportation of phosphates and other natural resources to Europe. French and Spanish banks and industrial firms set up subsidiaries or mergers, mainly in Casablanca. However, there was no genuine interest in developing the Moroccan economy in the long run and for Moroccans. The investments (aside from railroads) had a short-term vision and monopoly profits for non-Moroccan investors.

Between 1956, the year of independence, and 1972, there was an effort to increase literacy rates and reduce unemployment. There were efforts aimed at strengthening the economy, but these were hampered by several political issues that ultimately led to severe human rights abuses, including the assassination of

the political leader and militant Mehdi Benbarka in France, allegedly by conspiracy between Moroccan and French authorities.

In 1973, Morocco instituted the *Moroccanization* law according to which foreigners cannot own more than 49% of a Moroccan business. While by today's standards this would be viewed as detrimental to the economy, it did help stop the financial hemorrhage practiced by foreign (mostly French) firms. Throughout the 1970s, the central government emphasized the public sector's role in the economy. It increased food subsidies to offset the effects of agricultural protection. The sharp increase in world prices for phosphates helped secure significant revenues. However, in 1977–1978, phosphate prices fell sharply and the military spending increased as a result of the war in the Western Sahara. Consequently, financial imbalances increased. In 1980, the World Bank proposed a structural adjustment plan but due to the severity of the reforms involved, the Moroccan government could not pursue it. In the following year, an International Monetary Fund stabilization program that required increases in prices and reduction of subsidies caused riots in major cities and forced the government to postpone price reforms. In 1980–1983 the current account deficit approached 10% of gross domestic product (GDP) and the government budget deficit exceeded 12% of GDP.

The year 1983 marked a turning point in the relations between Morocco, and the World Bank and the IMF. Loans became linked directly to reform programs, for example, an agricultural-sector adjustment loan in 1985 and an education-sector loan in 1986. Structural reforms proceeded gradually between 1983 and 1989 and during most of the 1990s. A substantial amount of the required funds was disbursed by the World Bank. During 1983–1990 Morocco began implementing liberalization programs. Several favorable factors helped these programs. The dirham was depreciating, which helped to strengthen manufacturing exports. External factors included a sharp decline in oil prices (Morocco imports most of its oil) and favorable weather. Consequently, in the early 1990s, Morocco was viewed by world financial institutions as a potential success story.

In September 1993 Morocco repealed the *Moroccanization* law (only agricultural land and some mining industries remain subject to restricted foreign ownership). In addition, tax reforms, including changes in the corporate profit tax in 1984 and the introduction of the value-added-tax (VAT) in 1986, have led to simplification, neutrality, and more transparency of the tax system. Trade liberalization was enhanced by the introduction of current account convertibility in 1993. Morocco also privatized the

Casablanca stock exchange (CSE) in 1993. Between 1993 and 2001, Morocco privatized many public enterprises in different sectors of the economy. In addition, Morocco has achieved a high degree (perhaps one of the highest in the Arab world) of decentralization and localization of authority.

Over half of Morocco's trade is with EU nations. Morocco signed the Euro-Mediterranean Association Agreement on March 1, 2000. The Agreement includes clauses on the gradual liberalization of trade over a period of twelve years, by the end of which a free-trade area will be in effect. A timetable for abolishing customs tariffs for industrial products entering Morocco is set in the agreement. Morocco also started negotiations in September 2001 concerning the gradual liberalization of trade in agricultural products.

While Morocco has achieved significant progress in macroeconomic stabilization, many social developments in education, poverty alleviation, and gender issues have yet to be implemented. The literacy rate among Moroccans age fifteen and over is only 51% (World Bank 2000). In 1997, the World Bank found that although Morocco had stabilized the economy through budget deficit reduction, it failed to foster employment and achieve higher economic growth, and improve social development.

Under the reign of the current monarch, Mohammed IV, Morocco has undertaken several steps to enhance democracy and social welfare. Several dissidents, including Abraham Serfaty, a Moroccan Jew, have returned to the country.

### MOSSADDEQ, MUHAMMED

Dr. Muhammed Mossaddeq (1882–1967) was born in Tehran on May 19, 1882, into arguably the most prominent Iranian political family of the past century. Mossaddeq traveled to Europe, where he studied in France and Switzerland and acquired a doctorate in law. Beginning in 1921, he served in numerous political positions including finance minister, deputy in Iranian parliament (Majlis), and finally as prime minister from 1951 to 1953.

On October 1949, at the age of sixty-seven, Muhammad Mossaddeq was the moving force behind the establishment of the National Front. This loose coalition of political groups professed liberal democratic goals and strongly opposed all forms of foreign influence in Iran, particularly that of the Anglo-Iranian Oil Company (AIOC). The Anglo-Iranian Oil Company was a symbol of British influence in Iran's post-World War II affairs, and one that served to bolster Iranian nationalism. The AIOC was believed to be a host company for British political officers who indirectly had been controlling the political destiny of Iran.

Dr. Mossaddeq, who was the chair of the oil committee in the Majlis, and several members of the Majlis who belonged to the National Front under his leadership, pushed for the nationalization of the AIOC. The news in 1951 of the new arrangement between Aramco (The Arabian-American Oil Company) and Saudi Arabia and their agreement to a fifty-fifty profit-sharing plan advanced the cause of nationalization in Iran. On April 30, the Majlis passed a nine-point enabling law that included a provision for compensating the AIOC. The British government protested the nationalization and insisted that under the 1933 agreement Iran should submit to arbitration. The Iranian government replied that the British government had no right to interfere in a matter between Iran and an oil company. On April 28, Mossaddeq was appointed prime minister and on the same day the Majlis voted unanimously to seize the company's properties in Iran. On May 2, 1951, the young Shah signed the Nationalization Bill, completing the process.

Events occurred swiftly and surprised practically everyone concerned with the crisis. The British were

surprised to see that Iran was not intimidated by threats, the freezing of Iranian assets, or even the sending of gunboats to the Persian Gulf. In the course of the crisis, which lasted two years, half a dozen alternative proposals were made, most of them accepting the principle of nationalization, but they all failed to bring about a solution. The British complained to the United Nations. In September 1952 Mossaddeq went to New York to defend Iran's case, contending that nationalization was an internal matter and subject to no international jurisdiction. The Security Council referred the question of jurisdiction to the World Court and the Court decided in favor of Iran, stating that the problem was an internal question and outside of the competency of the World Court or of the United Nations.

The British government, refusing to accept a reduced role in Iran, persuaded President Eisenhower's administration to intervene directly to overthrow the Mossaddeq government. The British government used the threat of a possible communist takeover as its major tactic in attracting American involvement. On August 19, Iranian conservatives, Britain, and the United States cooperated fully to oust Mossaddeq. The coup was successful and an era of intense US involvement in the support of the dictatorship of the Shah of Iran began. Muhammed Mossaddeq was arrested, tried by a military tribunal, and found guilty of treason. He spent three years in prison and the rest of his life under house arrest. He died in 1967.

The 1953 coup changed Iran's history in fundamental ways. It was clearly a setback for Iran's political development. The coup alienated Iranian intellectuals and weakened the moderate, liberal nationalists represented by such organizations as the National Front, and it paved the way to extremism.

## MOZAMBIQUE

Mozambique has considerable human and natural resources. However, the violent cross currents of its recent history and complexity of its social fabric have considerably complicated its development. The past of this region is immeasurably ancient since it is where the human species itself developed.

To the north Mozambique is bordered by the country of Tanzania; along the east by the Mozambique Channel, which separates it from the island of Madagascar in the Indian Ocean; along the south lie Swaziland and South Africa; to the west, Zimbabwe; and the northwest, Zambia and Malawi. Mozambique is approximately the size of Alaska. It is dominated by mountains and plateaus in the north. These descend to highlands in the central region. Curving through the central portion of the country is the Zambezi River, the fourth largest in Africa. The southern part of the country consists of rolling lowlands. The native minorities of Mozambique divide into numerous subgroups. They differ extensively in their historic economic pursuits, social structures, and sizes and roles relative to each other.

Mozambique's population of almost 20 million people is very diverse, and contains many different tribes. In addition, foreign trade and invasions have produced minorities of Western Europeans, mainly Portuguese; southern Asians, mainly Indians; and *mestiços* or mixed bloods of Africans and Europeans. Although Portuguese has long been the language of official business, only 27% of the population speaks it. Several dozen native languages are used; Makhuwa, Tsonga, Lomwe, and Sena are four of the major ones. Religious diversity accompanies this cultural complexity. Religions include native-spiritism (about 50% of the population), Christianity (30%, mainly Catholicism but also small Protestant sects), Islam (20%), and syncretisms of native-spiritism and Christianity.

The Portuguese were the colonial overlords of the region from the sixteenth century onward. They developed trade in slaves, minerals, and foodstuffs along the coastal region and up the Zambezi valley. The south has been the traditional economic and administrative center of the country. Trade with South Africa increased with the late-nineteenth-century development there of gold and diamond mining. White southerners and their allies controlled commerce. Early in the twentieth century, hundreds of miles of rail lines were laid into the interior.

Until independence in 1975, the dominant elite in Mozambique was a tiny minority of white Portuguese. Supporting the Portuguese were further small minorities of mixed-race *mestiços* and natives who

had been assimilated (*assimilados*) into European ways. Portuguese influence decreased, however, as one advanced into the interior. Portugal attempted systematic settlement there toward the end of the nineteenth century and as other European nations enlarged their interests in Africa.

Mozambicans have tended to divide between northerners and southerners. A complex of antagonisms has grown around differences between colonized and colonizer, debtor and creditor, governed and governor, rural and urban, black and white, victim and combatant, non-Christian and Christian, upland and lowland, and native and foreign.

Various degrees of poverty are common to all the country, but what sparse wealth does exist concentrates in the south and mostly in Maputo, the capital, and a few other cities. The poverty of Mozambicans results from the very unbalanced development that occurred under Portugal.

Independence occurred on July 25, 1975. Most Portuguese administrators, businessmen, and professionals fled the country. Civil war broke out between two rival groups trying to dominate the new national government.

In 1964 the Marxist-Leninist *Frente de Libertação de Moçambique* (FRELIMO—Mozambique Liberation Front) began armed struggle for independence. It assumed the national government in 1975. However, Mozambique's powerful capitalist, white-dominated neighbors, Rhodesia and South Africa, formed and financially backed an anti-Communist movement, the *Resistência Nacional Moçambicana* (RENAMO—Mozambican National Resistance). It was strongly backed by US President Gerald Ford and Secretary of State Henry Kissinger. FRELIMO received support from the Soviet Union. Events unraveled in a manner similar to those occurring at the same time in Portugal's other major African colony, Angola.

RENAMO maneuvered against FRELIMO throughout the country, attacking in the south and occupying strongholds in the highlands. FRELIMO held the capital in the south, and RENAMO raided around there and in the north. The conflict assumed a north-south character, and everywhere it left hundreds of thousands dead, wounded, or displaced. Only the end of apartheid in South Africa and of the Cold War between East and West brought a tentative reconciliation between FRELIMO and RENAMO, a peace of exhaustion.

Mozambique reconstituted itself in 1990 as a multi-party state, established regular elections, and allowed private investment. In the latter part of the 1990s, Mozambique began to offer some possibility of fulfilling its economic promise. In 1999 it achieved an

annual rate of economic growth of 10%, reaching a per capita income with purchasing power of US\$1,000.

However, in 2000 epic floods ravaged the land and people, who mostly reside in the rural interior. A cholera epidemic broke out in the wake of the floods. Public health issues are widespread in Mozambique, which has one of the highest rates in Africa of people infected with the HIV virus or suffering from AIDS. Parents who have died from this disease have left many orphans. War produced a sizable minority of handicapped soldiers and civilians, refugees, displaced persons, and further orphans.

While the country has an exceptional birth rate of nearly 3.8%, its rate of population growth is just under 1.5%. Only 3% of the population is over 65, and nearly two-thirds of this group is female. Life expectancy is less than forty years for both sexes. Two-thirds of the population is under twenty-one. Both adults and, even more so, older people are minorities. There are 1.5% fewer males than females, a surprising balance given the years of warfare. However, the number also reflects how war along with disease has equally devastated soldiers and civilians.

Mozambique has used education, particularly emphasis on literacy, as a basis for attempting to lift itself up. Such an effort may offer some long-term opportunity for a common, beneficial development among the country's varied peoples.

## MUBARAK, HOSNI

Hosni Muhammad Mubarak became Egypt's president in 1981. Born in Minufiyya province to a middle class family, Mubarak graduated from the Military Academy in 1949 and from the Air Force Academy the following year. He did not take part in the military coup that has come to be called the Egyptian Revolution of July 1952. After a brief stint as a fighter pilot, he served as an instructor at the Air Force Academy from 1954 to 1961. He spent the following academic year at the Soviet General Staff Academy and in 1964 took charge of training Egyptian pilots at the Frunze Military Training Center in Moscow. He was the commandant of Egypt's Air Force Academy from 1967 to 1969, air force chief of staff from 1969 to 1971, and commander-in-chief from 1971 to 1974. He took charge of Egypt's aerial preparations for the October (1973) War and was promoted to the rank of air marshal for his outstanding wartime performance. Egyptian President Anwar al-Sadat appointed him vice president in 1975, and Mubarak served him loyally for the next six years. He played no conspicuous role in the Camp David peace talks with Israel or in any of Sadat's other spectacular initiatives during that time.

After Sadat was assassinated on October 6, 1981, Mubarak assumed the presidency, was soon officially nominated by the National Democratic Party (NDP), and was confirmed by a nationwide referendum. Upon taking office, he promised to address Egypt's economic and social problems, publicly curbed the favoritism and corruption that had marred Sadat's final days, and released many of the political and religious leaders whom Sadat had imprisoned. Although the Egyptian people knew little about him, his earliest policies as president won widespread approval.

While restoring diplomatic relations with the USSR, Mubarak maintained Egypt's ties with the US government, on whose military and economic aid it had come to depend under Sadat. He did not break diplomatic relations with Israel (although he did recall Egypt's ambassador from Tel Aviv during Israel's invasion of Lebanon) and he gradually resumed good relations with the other Arab governments and the Palestine Liberation Organization, which had withdrawn their ambassadors from Cairo soon after Sadat signed the 1979 Egyptian–Israeli Peace Treaty. Although his government still encouraged

Western and Arab investment in Egypt's economy, he curbed the operation of foreign multinational corporations within the country. He also increased the state's role in economic planning and protecting the welfare of the workers.

The failure of his efforts to mediate the 1990 dispute between Iraq and Kuwait became a precipitating factor in Saddam Hussein's decision to invade and occupy Kuwait. Although Mubarak initially hoped that the Arab leaders would resolve the crisis, his government soon rallied behind the US-led Operation Desert Shield, sending forty thousand troops to join the allied coalition in Saudi Arabia (but refusing to invade Iraq). Egypt was later rewarded by the cancellation of some \$14 billion worth of accumulated foreign debt to various Arab and Western countries. The plan for Egypt and Syria to provide a long-term peacekeeping force to stabilize the Gulf States foundered on Kuwait's opposition.

During the first decade of Mubarak's presidency, Egypt made some progress toward democracy. Political parties created under Sadat were allowed to grow, publish newspapers, and run growing numbers of candidates in the legislative elections. Since 1992, however, the government has tried to limit the proliferation of parties, restricted freedom of the press, and curbed movements that it deems subversive. Mubarak has been reelected to the presidency—without opposition—in 1987, 1993, and 2000. He has never appointed a vice president, and many Egyptians believe that he is grooming his son, Gamal, a rising star within the ruling NDP, to succeed him. The Emergency Laws, under which Egypt has been governed almost continuously since World War II, have remained in effect throughout his presidency.

The Mubarak government initially countenanced the resurgence of Islamist movements in Egypt, most notably *al-Jihad* and *al-Jam'a al-Islamiyya*. The former was responsible for the plot to assassinate Sadat and has formed ties with *al-Qa'ida*. The latter was implicated in numerous attacks on cabinet ministers, Copts, and foreign tourists. In recent years, however, the government has tried to stop terrorist activities, especially after an attempt was made on Mubarak's life in Addis Ababa in June 1995 and an attack on tourists at Luxor in November 1997 took sixty-two lives. Because of Egypt's heavy dependence on revenues from tourism, Mubarak's policies opposing Islamic-inspired terrorism have so far enjoyed public support, but the ability of the Supreme Council for Islamic Affairs to censor books and films and of the legislature to Islamize some of the nation's laws have also increased during Mubarak's presidency. The long-established Muslim Brotherhood retains its influence, especially in the professional associations,

but it has renounced terrorism. Egyptians believe that the Islamists' influence has blighted their country's literary, artistic, and journalistic creativity and harmed its cultural preeminence in the Arab world.

Mubarak's government has continued the process of privatizing state-owned firms begun under Sadat; has reduced government subsidies on consumer goods used by the poor; and has inaugurated the Toshka Project, a massive public works scheme to divert Nile waters backed up behind the Aswan High Dam to irrigate portions of the Western Desert. Despite numerous government efforts to improve Egypt's economy, population growth continues to offset economic gains. As of July 2004, Egypt's population was estimated to be 76 million; it was 19 million in 1947. The gap between rich and poor Egyptians remains wide—a potential threat to the stability and survival of his regime, which has lasted longer than any since the reign of Muhammad Ali (1805–1849). Egypt's close relationship with the US government, which furnishes about \$2 billion in economic and military aid each year, has lost public support because of the Iraq War and the perception that George W. Bush's administration favors Israel over the Arabs. Some say that the Egyptian people, if they were empowered to elect their own leader, would choose Amr Moussa (the Arab League's current secretary general) over Mubarak.

### MUGABE, ROBERT

As one of the leaders of the revolutionary uprising known in Zimbabwe as the second Chimurenga (rising) of the 1960s and 1970s, Robert Gabriel Mugabe (b. 1934) led the Zimbabwe African National Union of the Patriotic Front to victory over the undemocratic regime of the Rhodesia Front's white Prime Minister Ian Smith. After the liberation war ended in 1979, the new African state of Zimbabwe elected Mugabe as its first prime minister in March 1980. Mugabe formed a multi-party Government of National Unity of black and white Africans. When Zimbabwe's government took a presidential form, Mugabe became the first executive president—replacing the nominal head of state—as leader of the government, the principal political party, and the state. He has won reelection every five years including in 2000.

In the late 1990s and the early twenty-first century, Mugabe has become increasingly autocratic. Unlike other aging liberators such as Nelson Mandela, he has refused to step aside and permit a new generation to assume leadership.

Mugabe was born on February 21, 1924, at Kutama in Zvimba, near the Rhodesian capital of Salisbury (renamed Harare after independence in 1980). He attended Kutama's Jesuit Mission elementary school and teacher training college. He developed a dual passion for education and later for the socialism of Kwame Nkrumah, Ghana's liberator from British colonialism in 1957.

In 1934 Robert's father, Gamaliel Mugabe, left his family to work in Bulawayo and then South Africa. That same year, Robert's older brother Miteri (Michael) died. Robert had a younger brother, Dhonandho (Donald), and a sister, Sabina. The family engaged in subsistence farming, as the vast majority of Zimbabwe's black African population still do.

In the 1890s the British South Africa Company (BSAC) expropriated the best land for European "pioneers," including Christian missions. The BSAC's Cecil John Rhodes induced the British crown to recognize his company as the government of its colony until a settler government took over in the 1920s. The Africans' lot was subsistence farming by which they produced their staple food of maize. The BSAC forced them to assume a dependency on the company and missions for education, work, and religion. In turn the Europeans denounced African culture, including African religion, food, dress, and language, as "heathen."

At the Roman Catholic mission school Mugabe became a voracious reader and highly disciplined

student of the Jesuit fathers. When he was 14 he announced his ambition to become a teacher. He followed that vocation from 1942–1960 in his pre-revolutionary days in Rhodesia and Ghana up to the time of his marriage to his first wife, Sally, in 1961. During his imprisonment by the Ian Smith regime in the 1960s and 1970s Mugabe set up a school for his fellow prison inmates. At the same time he pursued external degrees in education, law, and economics from the University of London to add to his B.A. from Fort Hare University in South Africa through correspondence programs while he was in prison.

His rise to leadership in the socialist liberation movement in Rhodesia was gradual, but persistent. He was a persuasive speaker and had clear ideas of the interests of Africans in their fight for one-person, one-vote democracy and their desire to reclaim the land they had lost in the 1890s, a desire that continues to the present. Without external assistance, however, the revolution could not be sustained, and Mugabe was a primary force in seeking diplomatic recognition for his party and its struggle in the capital cities of the capitalist West and the communist East.

Because most of the support for the African liberation movement came from the communist bloc nations led by the Soviet Union and China, Mugabe's political sympathies became increasingly Marxist and Maoist. Since the Soviets favored the Zimbabwean African People's Union (ZAPU) leader Joshua Nkomo, a member of the Ndebele ethnicity, Mugabe found his source of arms and training for his soldiers in Eastern Europe and Asia. Thus his forces used the general title of Patriotic Front, although they were bifurcated in their sources of military arms and foreign political support.

But humanitarian aid came from both the communist East and the capitalist and socialist West. Sweden, Switzerland, Norway, and individual donors in other European states and the United States, offered funds for education, medicine, and government organization, as did non-governmental agencies such as the World Council of Churches' Program to Combat Racism. Ultimately the Frontline States of Africa and the United Nations supported majority rule, despite the support of the British and US governments for UN sanctions against what they argued was Rhodesia's illegal claim to an independent republic in 1965. Zimbabwe's diplomatic success was largely the result of Robert and Sally Mugabe's persuasive entreaties. Sally lived in exile in Ghana and London for over a decade while Robert was in prison, during which time two of their young children died.

The story of Robert Mugabe's later years is more difficult to explain than his rise to eminence. During

the liberation phase from 1961 to 1979, Mugabe established himself as the triumphant leader in a military and political struggle to topple European control of Rhodesia/Zimbabwe. In the second phase of his leadership, from 1979 to the mid-1990s, he devoted himself to fulfilling his prewar aims to build an educational system to promote literacy in Zimbabwe; to construct a socialist system of cooperative farms and state-run businesses; and to restructure the government into a one-person, one-vote democracy of equal justice under the law. For his work in both of these phases he received international acclaim as a significant voice for African independence and Africa's capacity for self-rule.

However, from the mid-1990s into the twenty-first century, Mugabe's behavior changed considerably. Veterans of his liberation army have been employed to inflict harm on his African political enemies and the shrinking white minority. He has ceased to use his capacity for diplomacy that won the peace in 1979, and has instead intimidated the press, the courts, the military, and police.

Robert G. Mugabe has lived with accusations that he committed atrocities against whites and Africans, even comrades in the 1970s liberation leadership. Sorting out such claims has not been easy for objective historians. Records of Ian Smith's police and Selous Scouts were destroyed at the end of the war, and those of the Mugabe government and its armed militias are not readily available. In addition, the anecdotes of oral witnesses of Smith's and Mugabe's enemies and friends remain to be sorted out. In fact, there is a great shortage of academic interest in Zimbabwe at the present time.

The most adequate record of the years since the 2000 election, which Mugabe won in spite of a solid effort by the opposition Movement for Democratic Change led by Morgan Tsvangirai, must be sought in press reports and op-ed evaluations, mainly in the British media. Brutality and tampering have accompanied elections since 1980, and land grabs have tarnished Mugabe's record in recent years.

## MUJAHEDIN

Mujahedin, literally “those who struggle,” but also interpreted as “holy warriors,” is a word used widely to describe many Islamic military groups, but usually refers to the Muslim fighters that fought against the Soviet forces in Afghanistan during the Soviet Union’s incursion into that country from 1979 to 1989. The Mujahedin was not only composed of native Afghan fighters, but also Muslim fighters from throughout the Islamic world transcending tribal, racial, and ethnic groups. Many of the fighters answered the call to come to the aide of their Muslim compatriots in Afghanistan.

### The Soviet Invasion of Afghanistan

The emergence of the Mujahedin began in the turmoil that was Afghanistan in the late 1970s. A coup in 1978 deposed and killed military dictator General Muhammad Daud, who had seized power from his cousin, King Zahir Shah, in 1973. The immediate power vacuum was not filled, and an intense struggle for control ensued. The struggle between the two leftist leaders, Hafizullah Amin and Nur Muhammad Taraki, was won by Amin. Outside of Kabul, the countryside was in revolt. Making the most of Afghanistan’s unstable situation in 1979, the Soviet Union began its invasion of that country to remove Amin from power and install its pro-communist dictator of choice. Amin was executed in the process. Moscow settled on Babrak Karmol, a communist leader in Afghanistan’s People’s Democratic Party, to fill the leadership void.

Many former adversaries united against their Soviet occupiers. International condemnation of the Soviet intervention yielded no change of agenda for Moscow. The Mujahedin was at first composed of native tribesmen such as the Pashtun, Hazara, and Tajik. The composition of the Mujahedin was as complex as Afghan society itself in terms of ethnicity, tribe, Islamic interpretation, and region. Prior to the invasion by the Soviets, the Pashtuns had dominated Afghan society. In fact, the term Afghan is used to refer to the Pashtuns. The rallying of the various peoples of Afghanistan, whether Tajik, Uzbek, Sunni, Sufi, Shi’a, or otherwise, involved the recruitment of community elders. These measures of recruitment reached fruition in the form of a loose collection of allies stable enough to hold the Soviets at bay. The Pakistani leader, Zia ul-Haq, and Pakistan’s Inter-Services Intelligence (ISI) favored Islamist leaders over more moderate and nationalist ones. However, the plight of Afghanistan was an important struggle

for the entire Islamic world, as well as for the anti-communist West. Recruits for the Mujahedin came from Arab countries, neighboring Pakistan, Central Asia, and elsewhere. With the secret backing of the United States and its Central Intelligence Agency (CIA), Pakistan’s ISI, the government of Saudi Arabia, and others, the Mujahedin became a force to be reckoned with for the Soviet invaders. Monetary and human reinforcements streamed in from Saudi Arabia and other Gulf states concerned with the plight of their Afghan brethren. One individual involved was the eventual founder of *al-Qa’ida*, Usama Bin Ladin. Muslims from other countries ranging from Saudi Arabia to the United States eventually joined the Mujahedin. The effort would not have stood a chance against the superior Soviet force otherwise. The Mujahedin exercised guerrilla warfare against the Soviets. Eventually, the Soviet army’s advantage in its Hindis helicopter gunships was checked by the introduction of US stinger missiles into the battlefield in 1986. During the war, the Mujahedin operated out of thousands of bases in both Afghanistan and Pakistan. Some of the Mujahedin would continue to fight for the freedom of Afghanistan even after the evacuation of the Soviets and the ousting of their chosen leader. The new threat was from Islamic extremists, known as the Taliban, many of whom had fought the Soviets as Mujahedin during the 1980s.

Across the border into Pakistan in 1985, the various Mujahedin groups formed for a united cause against the Soviets. By this time, much of Afghanistan’s population had left the country, mostly for refugee camps in neighboring Pakistan and Iran. Also at this time, the new leader of the Soviet Union, Mikhail Gorbachev, promised an eventual withdrawal of the Red Army. In 1986, Babrak Karmol was replaced by Najibullah as the Soviet-backed leader of Afghanistan. In 1988, Afghanistan, Pakistan, the Soviet Union, and the United States signed peace accords, and the Soviet pullout began. Afghan casualties from the war are estimated at over a million, while Soviet casualty estimates range from the official Soviet number of thirteen thousand to other estimates of around twenty-eight thousand.

### Post-Soviet Afghanistan

The last Soviet troops left Kabul International Airport on February 15, 1989, but the Afghan civil war continued. The Mujahedin sought to eradicate any Soviet-influenced presence, including Najibullah. After Washington and Moscow agreed to stop all financial support of the warring parties, the Mujahedin

succeeded in capturing Kabul and ousting Najibullah in 1992. A Tajik, Burhannuddin Rabbani, was appointed president by the Mujahedin groups in 1993. Conflict emerged between Rabbani and the Pakistani-favored Gulbuddin Hekmatyar, a radical Islamist known for throwing acid in the faces of women not wearing a *burqa* (veil). A shaky alliance between the two was established to the detriment of the loyalty of Rabbani's supporters. The little success that this alliance achieved was short-lived.

One of the most successful, respected, and enduring commanders of the Mujahedin is the figure of Ahmed Shah Massoud. Near the end of the war with the Soviets, Massoud is reputed to have commanded a force of over ten thousand. His fighters, along with those under former Soviet-backed General Abdul Rashid Dostum, were the two forces able to close in and capture Kabul in 1992. Massoud, a Tajik from the Panjshir Valley, held the area even after the Pashtun-dominated Taliban's rise to power. Areas under his control remained the only parts of free Afghanistan. Massoud's Northern Alliance held some regions in the north of the country and continued to resist Taliban control. The Mujahedin were eventually beaten back by the Taliban, and in 1996, the Taliban were successful in taking over Afghanistan. Massoud was assassinated by two *al-Qa'ida* operatives posing as a film crew on September 9, 2001, just two days before the September 11 attacks in the United States. Despite his death, Massoud's legendary status has reserved him a place as an icon in both the East and the West. Massoud's Northern Alliance joined with other Mujahedin and US forces to oust the Taliban from power and destroy the *al-Qa'ida* presence within Afghanistan beginning in late 2001. Those Mujahedin forces included that of Afghanistan's first democratically elected president, Hamid Karzai. The Mujahedin forces have largely disbanded, and many of the fighters now serve in the Afghan army.

### MUJIBAR RAHMAN, SHEIKH

Born near Dacca, Bangladesh, on March 17, 1920, to middle-class landowners, Sheikh Mujibar Rahman (1920–1975) attended Islamia College, Calcutta, and studied law at Dacca where he began his political career with the Muslim Students' Federation in 1940. A Bengali nationalist, he organized student demonstrations against the imposition of Urdu as the national language at the cost of Bengali. He spent six days in prison as a result and was expelled from university. He then organized a strike of university workers, was arrested, and spent two and a half years in prison. While in prison he was elected secretary of a new party, the Awami League, founded by H. S. Suhrawardy in 1949. He became the principal organizer of the party in East Pakistan.

In 1956 he led demands for provincial autonomy in the East Pakistan assembly and advocated separation of East Pakistan from West Pakistan. Between 1956 and 1957 he served as the minister of commerce in the government of East Pakistan. When the Pakistan Army staged a military coup in 1958 he was jailed under the Public Safety Ordinance and held without charge for 18 months. In 1962 he refused to abstain from politics for five years and was imprisoned for a further six months. With the death of Suhrawardy in 1963, Mujib became the leader of the Awami League. In 1966 he proclaimed the Six-Point Program, the *Mukti Sanad* (Charter of Freedom), which called for a federal government with control only of foreign affairs and defense, a separate currency or separate fiscal accounts, taxation at the provincial level only, control of all provincial foreign exchange earnings by each provincial government, and a militia for each province. He was imprisoned in 1967 and again in 1968 and brought before a military court along with thirty-five others in the Argatala Conspiracy Case.

When rioting brought down the government of Ayub Khan in 1969 he returned to East Pakistan a hero. In December 1970 he led the Awami League to an overwhelming victory in the general elections in East Pakistan, winning 167 of 169 seats. On March 26, 1971, he proclaimed the independence of East

Pakistan as Bangladesh. He was imprisoned and served most of his imprisonment under sentence of death. Civil war followed in East Pakistan, which India ended on December 16, 1971, when the Indian Army occupied Dacca. On January 10, 1972, Mujib returned to East Pakistan a national hero and the prime minister of an Awami League ministry. On December 16, 1972, the new constitution set up a cabinet form of government based on the four principles of Mujibbad (Mujibism): nationalism, secularism, democracy, and socialism. On February 25, 1975, however, he amended that constitution to create a presidential system with himself as president. On June 7, 1975, he made Bangladesh a one-party state and banned all existing parties. His Awami League formed the nucleus of a new party, the Krishak Sramik Awami League (BAKSAL). However, he lost support of the urban and military elite after he identified with the state, ignored charges of corruption, and installed his relatives in high government positions. He was killed, along with over twenty members of his family and political allies, in a military coup on August 15, 1975.

## MULTINATIONAL CORPORATIONS AND DEVELOPMENT

Multinational Corporations (MNCs) can be defined as large for-profit businesses that operate in multiple nations. MNCs usually maintain their headquarters in one larger company (the parent company) located in their country of origin, generally an industrialized Western nation, and keep smaller companies (subsidiaries) in foreign countries as part of their overall operations. Despite MNCs' global geographical presences, evidence shows that the crux of their research and development programs and their profit repatriation patterns are concentrated in their parent companies and home countries.

The impacts that MNCs have had when dealing with developing countries have been mixed. On the

one hand, MNCs are acknowledged as key contributors to development due to the flows of investment they inject into national economies, which create jobs, transfer needed technology, and generate taxes for public treasuries. On the other hand, MNCs are often the cause of concern given their mobile nature, allegations of their disregard for labor and environmental standards as a way to maximize profits, and the large repatriation of profits to parent companies rather than local economies. This debate has acquired a new character in the era of globalization as the economic power and influence of MNCs have increased substantially. This has allowed the most powerful MNCs to become more important players in the configurations of global exchange and production than many national-states.

### MNCs: Origins, Operational Patterns, and Their Relevance to Development

MNCs have existed for several centuries. The origins of the modern MNC can be found in the East and West Indies traders of the European mercantilist period (sixteenth–eighteenth centuries). With the emergence of the Industrial Revolution, the first MNCs, as conceived in their modern form, were established as they expanded their activities to multiple markets and took advantage of abundant raw material sources. Yet, the management and capital of these early MNCs were still confined to the boundaries of the country of origin. By the latter part of the twentieth century, and with many state-dominated telecommunications facilities, power generation systems, and financial monopolies moving into the functioning of international markets, the MNC had become a key dominating player in the global trade of goods and services.

As strategies of penetration, MNCs usually utilize the purchase of shares in existing national firms, create new subsidiaries using fresh capital, or they participate in the takeover of national firms as part of privatization programs. More precisely, MNCs follow a strategy of internalization to take advantage of their competitive strengths by operating under a bargaining strategy so as to gain the most when dealing with competitors and regulators. Essentially, this bargaining strategy considers MNCs as part of a multi-player game in which national governments set rules to accommodate MNC activities in their domestic plans, while MNCs attempt to out-compete their rivals and to minimize the regulatory burdens imposed by governments. Hence, the impact of MNCs

on national economies and the success of their penetration strategies can only be entirely understood by analyzing their relationship vis-à-vis the capacity of state regulation.

Within this context, MNCs count on two primary strategies for expansion: A North–South or “outsourcing strategy” strategy and a North–North “market consolidation” strategy. In the first instance, the North–South strategy is promoted by MNCs in an effort to minimize production costs as they invest abroad in countries with cheaper labor, energy, and real estate, often complemented with low transportation costs and trade barriers. Secondly, the North–North strategy is sought when MNCs attempt to have access to large consumer markets, and as such, investment is directed to gain that market access. The success of these strategies depends on several factors, especially the capacity of MNCs to use state regulation to their advantage; the localization of foreign direct investment (FDI) in places and quantities that best suit the particular goals of the company; and the favorable conditions, or not, presented by international business cycle patterns.

Developing countries are important elements within the framework of these MNC expansionary strategies. This growing relationship between the developing world and MNCs has yielded both positive and negative results (see below for more information), and although it would be hard to generalize a common trend among poorer countries to assess their associations with MNCs, the former have been active in attracting FDI as a potential booster of national development. As the relevance of MNCs in the pursuit of developmental programs grows, developing countries have to transform or consolidate their economic, legal, and political systems so as to make them more accommodating to the profit-seeking interests of FDI. With globalization, competition to attract FDI is increasingly among host countries, as opposed to MNCs competing against each other to gain access to local markets. This trend has allegedly forced developing countries to lower regulatory standards in order to attract FDI. Others argue that it is high but fair standards which constitute the determinants that guide the allocation of FDI.

The factors that determine the injection of FDI are several and multifaceted: political and macroeconomic stability; transparent and non-discriminatory legal and regulatory configurations; and minimal bureaucratic and procedural rigidity. Beyond this institutional background, MNCs generally favor countries committed to liberal market-oriented policies, favorable taxing schemes, fiscal incentives, and free trade. Furthermore, MNCs take into account the growing market patterns of the host country's domestic and

regional economic contexts, the existence of efficient communication and transportation systems, and the conditions of the domestic labor pools as they relate to the specific business strategy of the MNC. These are just several of many factors that influence MNC decision making; however, it can be asserted that the attraction of FDI by developing countries requires the establishment of specific rules that pose a central question: Does the accommodation of FDI demands necessarily imply the achievement of national development in the long-run?

### **MNCs and Development: The Positive Contributions**

The advocates of MNC expansion into developing countries provide several arguments to substantiate their claims. In essence, they argue that the capital and technology transfers supplied by MNCs constitute an imperative element in order for developing countries to boost their chances of success in an increasingly globalized economy. Without access to foreign capital and technology, they argue, economic development in poor countries would be very difficult and even impossible. One key aspect of MNC contributions to development is job creation in the host country. By and large, MNCs are very likely to create more jobs, pay higher wages, and have higher labor standards than domestic firms. Moreover, a transfer of expertise and knowledge from parent countries as well as a tendency for MNC investment to shift toward capital-intensive production may result in high-skill, high-paying jobs for local workers. This also helps in the diversification of the domestic marketplace, allowing previously marginalized groups, such as women, to integrate themselves as active economic players in society. The impressive growth experienced by the Southeast Asian region, and current positive experiments in India, Chile, and Turkey, have partially been achieved through the helpful impact that MNCs have had by investing capital and creating jobs.

Another important contribution of MNCs is the transfer of technology and managerial know-how. For most developing countries it is extremely expensive to develop a domestically grown technological base, and thus MNCs represent a crucial source of technology that enables poor countries to access innovative methods and practices to promote long-term national development. Moreover, by translating into practical results the theoretical knowledge related to the technological and managerial aspects of FDI, key sectors of the domestic economy, such as agriculture, industry, and pharmaceuticals, could experience

significant improvements in productivity and diversification. Without the access to MNC technology and knowledge, the economies of many developing countries could face stagnation and poor competitiveness in international markets.

Finally, the supporters of MNC operations in the developing world argue that FDI can be of great help in helping nation-states deal with economic and financial reform. MNCs provide a tax base that enhances public coffers, and their largely positive role in the manufacturing and agricultural sectors allow for more high-quality and competitive products to be exported. Both these elements help national governments deal with budget deficits. Furthermore, FDI can participate in the privatization of public firms by purchasing them, not only turning them into potentially more productive and efficient entities, but also providing another source of income for governments that can be allocated toward pressing national needs. In the end, MNC penetration into the economies of developing countries, combined with the proper state regulation and policies, could prove to be extremely beneficial for long-run growth and productivity.

### **MNCs and Development: The Negative Side**

The critics of MNCs point out that their business operations fundamentally lack ethical and human rights standards in terms of labor and the environment. In order to reduce costs and maximize profits, many MNCs invest in developing countries that must reduce labor and environmental standards in order to receive the investment in the first place. Therefore, there is a general perception that MNCs sacrifice the human rights of their employees and their working conditions in the name of more profits. Companies such as Reebok, Nike, and Levi Strauss have been accused of systematic labor exploitation in Southeast Asian countries where the wages received by workers are significantly lower than the retail value of most of the commodities they produce. Even if the economies of some of these countries are booming due to MNC investment, this is being done at the expense of perpetuating inhumane living conditions and illegal wages for the millions of workers.

Secondly, there is a great deal of concern over the profit-repatriation practices of many MNCs. In other words, MNCs tend to send back to the parent company most of the profits they have reaped in their operations in the developing world. This is problematic because this practice discourages the reinvestment of capital in the local economies/communities, and also represents a regrettable drain of limited foreign

exchange resources and a burden on the developing country's balance of payments (that is, trade deficits or surpluses). Thus, the repatriation of profits reinforces the accusations of exploitation by MNCs as resources and wealth produced using the labor and resources of developing countries are drained out, leaving very little or nothing for domestic use. Moreover, poorer developing countries in need of capital often offer very favorable tax exemptions and fiscal incentives to MNCs in order to receive investment, foregoing a potentially important source of revenue for the national treasury.

Finally, the critics of MNCs argue that the highly mobile nature of MNCs represents a key concern that often affects the interests of developing countries. As a logical step, MNCs tend to establish subsidiaries in places where conditions are most favorable, but if these conditions change to their disadvantage or an economic downturn takes place, they also tend to relocate their operations. As a result, MNCs are accused of not possessing a sense of loyalty to, and responsibility for, the countries where they invest. In addition, their ability to close down their business whenever they see it fit gives them tremendous leverage and clout when negotiating with national governments that often depend on the jobs provided by MNCs. In this context, MNCs are seen as opportunistic and exploitative entities that place their own interests ahead of those of the countries where they operate and the people they employ.

By the end of the twentieth century, and with the intensification of market globalization, the role of MNCs in the world economy had grown exponentially. Currently, they account for 70% of the total global trade of \$7 trillion, and the revenues of the top five MNCs are more than double the total gross domestic product of the world's one hundred poorest countries combined. The relationship between MNCs and developing countries is bound to grow in the future, but the challenges for the latter will revolve around their ability to channel the potential benefits of FDI to benefit their societies while trying to minimize the disadvantages that this relationship is likely to recreate.

## MUSLIM BROTHERHOOD

The Muslim Brotherhood is an Islamic organization founded in 1928, after the collapse of the Ottoman Empire, by its first Egyptian leader Hassan al Banna. Its aim was to restore the principles of the Koran and to unite Muslims in a caliphate. It expanded through most parts of the Arab world, with cells in Syria, Palestine, Jordan, Lebanon, Sudan, Israel, Saudi Arabia, and other countries. Nowadays it has branches in over seventy countries all over the world.

The Brotherhood's ideology claims that Islam is a way of life and that it is not possible to live in an Islamic society unless the whole of the society, including the government, is adapted to strict Islamic principles. This idea led the Brotherhood to conflicts with several governments, especially when those were under the influence of Western countries who the Brothers considered as the enemy. It has also been a fundamental principle that Muslims should establish a pan-Islamic state, going beyond all current political and geographic boundaries.

The organization has proven to be extraordinary powerful, and has often been described as a "state within the state." This power was an encouragement for the development of the countries, as long as they supported the current government, but otherwise the Brotherhood proved to be a drawback. For instance, in 1948 the organization blamed the Egyptian government for being passive against "Zionists" and joined the Palestinian side in the Egyptian war against Israel. That same year a Muslim Brother assassinated the prime minister of Egypt and in response to that, Al-Banna himself was killed by government agents in Cairo in 1949.

However, the Brotherhood on other occasions contributed to the reinforcement of democracy by participating in free elections, as it did in 1961 in Syria, winning ten seats in the Parliament, or when in the 1950s Jordanian members supported King Hussein of Jordan against political opposition. Another valuable contribution was the cooperation with the Socialist Labour Party and the Liberal Socialist Party to form the Labour Islamic Alliance in 1987 in Egypt, obtaining seats and fostering democracy.

Nevertheless, the Brotherhood has in the past engaged in acts of terrorism: an attempt to assassinate President Nasser in 1954, the assassination of Egyptian President Anwar Sadat in 1981, and more recently the accusation on behalf of the Egyptian government of offering tacit support for the military groups that launched a campaign in the 1990s to bring down Hosni Mubarak's government.

The Muslim Brotherhood has been more influential in some countries than in others, taking prominent roles in countries like Jordan and Sudan and less of a role in others such as Syria. After Hassan al Banna, other leaders have included Seid Kutub Ibrahim and Mohammed Abed Alsalam Faraj, the founder of the Egyptian Jihad organization.

Currently, the Egyptian Islamic Brotherhood exists as a clandestine group. The Brotherhood is also internationally connected with military and resistance organizations such as Hamas (the Arab acronym for Islamic Resistance Movement), Gama'a al-Islamiya, and Islamic Jihad.

## MUSLIM LEAGUE

The Muslim League is a political organization in Pakistan. It was founded in 1906 by Agha Khan III in order to protect the interests of Muslims in British India and later became instrumental in the creation of Pakistan. The role it played in the creation of Pakistan can be best described by the slogans that Muslims of India used during the time of their struggle for freedom from the British and even after Pakistan became an independent country in 1947:

- *Pakistan Zindabad* (Long Live Pakistan)
- *Muslim League Zindabad* (Long Live Muslim League)
- *Quaid-i-Azam Zindabad* (Long Live Quaid-i-Azam)

It was Quaid-i-Azam Mohammad Ali Jinnah who propounded the two-nations theory and the idea that the Muslims of India are a separate nation from Hindus culturally, religiously, and socially. However, it was Muhammad Iqbal, the philosopher-poet of Indian Muslims, who first advocated the idea of establishing a separate Muslim nation in his presidential address at the Annual Muslim League Session held at Allahbad in 1930. Three years later, Chaudari Rahmat Ali, a law student at Cambridge, came up with a name for an independent Muslim nation-state to be called Pakistan, “the Land of the Pure,” to consist of the Sindh, Punjab, Baluchistan, North West Frontier Province, and Kashmir where the majority of Muslims resided. However, it was Jinnah who played a role of great importance in restructuring the Muslim League. He gave it a new life by organizing various activities and by entering into alliances with the political leaders of various provinces. He made speeches in public appealing directly to the people on the issue of the two-nations theory.

By 1940, under the leadership of Mohammad Ali Jinnah, the Muslim League gained strength and was

then in a position to demand a separate Muslim state. In March of 1940, Muslims from all over India gathered in Minto Park at Lahore. Jinnah put forward the two-nations theory in this gathering and argued for the creation of a separate Muslim state. It was passed as the Lahore Resolution. This stirred the emotions of Muslims throughout India and they joined the Muslim League in its struggle for the creation of Pakistan. As a result, the Muslim League in the 1946 Indian elections captured all the Central Assembly seats in the areas where Muslims were a majority, except in the North West Frontier. This provided strong evidence for the creation of a separate state for the Muslims of India.

Thus, the following year partition of India took place and Pakistan came into being on August 14, 1947, and the Muslim League became its major political party. But, after the creation of Pakistan, the Muslim League could not hold together its forces, nor was it able to visualize the future of the newly born country in terms of its ideology or articulate its agenda or planning by which one could foresee how and where it would go further. This could be attributed to the fact that there were many factions in the organization itself with conflicting interests. This led to formation of several different political parties within the Muslim League itself. By 1958, the Muslim League became impotent as a political power and General Ayub Khan imposed marshal law in the country. In the meanwhile, the Muslim League was reformed into the Convention Muslim League (under Ayub Khan) and the Council Muslim League; the former ceased when Ayub Khan resigned in 1969 and the latter saw its death blow in the elections of 1970. Thereafter, Pakistan became subject to military rule and marshal law. After a long interval, the Islamic Democratic Alliance, a coalition of political parties, won the majority of seats in the Parliament when the elections were held in December 1990, and Nawaz Sharif of the Pakistan Muslim League became prime minister. In July 1993, Sharif, under the pressure of military power, resigned the office. In the February 1997 elections, the Pakistan Muslim League again won the majority of seats and Sharif became the prime minister only to be ousted in October 1999 by General Pervez Musharraf. The future prospects of the Pakistan Muslim League remain to be seen.

## MYANMAR

Myanmar (formerly known as Burma) is located in Southeast Asia, bordering the Andaman Sea and the Bay of Bengal, between Bangladesh and Thailand. It also shares borders with China, India, and Laos. With an area of just under 262,000 square miles, Myanmar is slightly smaller than the state of Texas; with a population of close to 42 million, it falls between Spain and France in size. Myanmar has a tropical monsoon climate, with cloudy, rainy, hot, humid summers but with mild temperatures, lower humidity, and little rainfall during the winter.

Natural hazards include earthquakes and cyclones, while flooding and landslides are common during the rainy season (June to September). Two distinct geographic characteristics divide the country physically and ethnically: the central lowlands and the surrounding high mountainous regions along the country's borders with India and China. The lowlands of the Irrawaddy delta are populated by significant numbers of ethnic hill tribes, including the Shan, Karen, Arakan, Kachin, Chin, and Mon. While Myanmar is 90% Buddhist and ethnic Burmese constitute 68% of the population, the major hill tribes and other ethnic minority groups are large enough to have been waging war with Myanmar's central governments since the end of World War II.

Politically, Burma is run by a military dictatorship called the State Peace and Development Council (SPDC), which took over from the previous military council, SLORC, in 1997. The SPDC allows no opposition political parties, holds no competitive elections, and keeps the Burmese tightly controlled and watched. The people enjoy no civil liberties, with the SPDC controlling the press, all travel, and all civil society. This situation has prompted several countries, including the United States, to impose economic sanctions on Myanmar, strictly limiting US economic investment and aid.

The SPDC has had limited success in opening up Myanmar to foreign economic investment and encouraging private economic activity, which is mostly centered in agriculture, light industry, and transport. The state controls most other sectors, including energy, heavy industry, and the rice trade. Government policy in the 1990s aimed at revitalizing the economy after three decades of tight central planning, and

private activity did increase in the mid-1990s, but began to decline shortly thereafter due to frustrations by investors with the unfriendly business environment and political pressure from Western nations. Much of Myanmar's foreign trade is thus understated because it occurs on the black market or involves illicit border trade with Malaysia and Thailand. And, while the current government has made strides in forging peace agreements with several tribal groups, the problems inherent in these conflicts are still present: In the state of Shan alone, estimates of the number of refugees who have fled to Thailand to avoid conflict and economic displacement range from five hundred thousand to 1 million.

Ethnic conflict is, however, but one problem for a country that has been dubbed "a rich country gone wrong" (Sesser 1993). Myanmar is seen by many as a negative and contradictory model of economic development. Once the world's leading rice exporter when it was under British colonial rule, in the last decade of the twentieth century it has had trouble feeding itself. It is a nation with abundant natural resources, including arable land, oil, coal, gas, timber, fish, teakwood, and fertile soil, yet is now one of the poorest countries in Southeast Asia. And, since 1988, when a popular democracy movement was crushed by the military government, Myanmar has been at war not only with minority ethnic tribes, but with large elements of its own population, leaving an economy largely dependent upon the selling of its natural resources, from drugs to timber to precious gems. Ironically, to the outside world, Myanmar's most famous export is one of its jailed citizens, Aung San Suu Kyi, the woman who led the 1988 democracy movement and received the Nobel Peace Prize in 1991 for her non-violent approach to dissent. Suu Kyi has been in and out of jail since 1988 and was put under house arrest again in September of 2000 for organizing her party, the National League for Democracy.

Myanmar secured its independence from Great Britain in 1948 and until 1962 struggled under parliamentary democracy. These fourteen years of democratic government were marred by ethnic conflict, a communist insurrection, and political corruption. Still, Myanmar's current stagnant economic development and dismal international and domestic political situation can largely be attributed to xenophobic policies and the abysmal economic plans of its military governments, starting with General Ne Win and his "Burmese Path to Socialism" in 1962.

The military virtually sealed Myanmar off from the outside world after Ne Win came to power, with the aim of "liberating" the country from any reliance on foreign goods, capital, and outside markets. Under a single-party dictatorship, military officers took

control of the economy, and in the process expelled most ethnic Chinese and Indians, who were the country's skilled merchants and technicians. The result for Myanmar was unfortunate: In the mid-1950s the country's per-capita income of \$200 was roughly comparable to that of Thailand and South Korea, but by the mid-1980s, while Myanmar's per-capita income remained at \$200, Thailand's was \$1,200 and South Korea's was 20 times higher. And, while Myanmar's external debt was \$100 million in 1970, by 2000 it had reached \$6 billion.

There have been some encouraging signs regarding prospects for future foreign investment and economic development in Myanmar, with the most important being its acceptance into the Association of Southeast Asian Nations (ASEAN) in 1997 and increased economic contacts with China and ASEAN member nations Singapore and Indonesia. Nevertheless, Myanmar's problems are many: international condemnation and sanctions (which sharply limit foreign aid, especially World Bank funds); opium addiction and smuggling; continued ethnic strife and refugee flows; internal barriers to foreign investment; harsh military rule and the subsequent suppression of

political groups and Aung San Suu Kyi; and high inflation rates and increasing governmental corruption. Thus, the prospects for significant economic development in the near future are negligible.

## **NAMIBIA**

The Republic of Namibia was formerly South West Africa, a territory of the Republic of South Africa. However, in 1966, the United Nations passed Resolution 2145, which revoked South Africa's mandate and changed the country's name to Namibia. Namibia is bounded on the north by Angola and Zambia, on the east by Botswana and South Africa, on the South by South Africa, and on the west by the Atlantic Ocean. The total area of Namibia is 824,269 square kilometers. Windhoek is the capital and the main city.

Population in 2004 (est.) was 1,954,033 with an estimated 1.25% growth rate. Racially, Black Africans make up 87.5% of the population, white Africans 6%, and people of mixed race 6.5%.

About 50% of the population is Ovambo and 9% Kavango. Other ethnic groups include Herero 7%, Damara 7%, Nama 5%, Caprivian 4%, San or Khoikhoi 3%, Baster 2%, and Tswana 0.5%.

English is the official language of the country, but only about 7% of the population speaks it. Afrikaans is commonly spoken, and is the primary language of about 60% of the white population. About 32% of the population speaks German; indigenous languages such as Oshivambo, Herero, and Nama are also spoken.

Christianity is the major religion in the country, practiced by between 80% and 90% of the population. At least 50% of these are Lutherans. Approximately 10% to 20% of the population follows indigenous religions.

Prior to being a territory of South Africa, Namibia (then South West Africa) was a German colony. South Africa occupied the colony during World War I and took charge of its administration before annexing South West Africa after World War II.

The South West Africa People's Organization (SWAPO), a Marxist guerrilla group founded in 1960, began fighting for the country's independence in 1966. The United Nations achieved a breakthrough in 1977 when South Africa accepted the so-called Western Contact Group consisting of the United States, United Kingdom, France, West Germany, and Canada. This granted the United Nations jurisdiction over the territory of South West Africa. Only in 1988, however, did South Africa agree to withdraw from Namibia. Namibia held United Nations-supervised elections in November 1989. A total of 90% of eligible voters voted, and SWAPO won decisively, with Sam Nujoma, one of the leaders of the independence movement, elected president. Namibia became officially independent on March 21, 1990. This was not a random date; rather, it was symbolically chosen to commemorate the thirtieth anniversary of the Sharpeville massacre of black protesters in South Africa.

After independence, SWAPO pursued a course of compromise with opposition groups and of gradualism in addressing racial inequalities within the country. In the November 2004 elections, Hifikepunye Pohamba was elected president, replacing Nujoma.

The currency is the Namibian dollar; the South African rand is also used. Mining accounts for 20% of the gross domestic product (GDP). The main

exports of Namibia are diamonds, copper, uranium, gold, lead, tin, lithium, cadmium, zinc, salt, vanadium, natural gas, hydropower, fish, silver, and tungsten. The mining sector employs about 3% of the population; about half of Namibia's population is dependent on subsistence agriculture. Namibia imports a number of products and goods such as foodstuffs, including cereals and other staples; petroleum products and fuel; machinery and equipment; and chemicals.

Agriculture constitutes 11% of the Namibian GDP, industry 28%, and services 61%. However, the agriculture sector employs 47% of the labor force, industry 20%, and services 33%.

Namibia faces many problems, politically, economically, and socially. It has limited water resources. Desertification, land degradation, and wildlife poaching have also been serious problems. The unemployment rate is more than 30%. The spread of the human immunodeficiency virus (HIV) has been increasing; 20% of adults in Namibia are currently infected. The continued presence of Angolan rebels and refugees in Namibia has also caused problems.

On the positive side, Namibia was the first country in the world to include laws regarding environmental protection in its constitution. This has ensured that around 14% of the land is protected, including almost all of the Namib Desert. The government has ratified international environmental agreements pertaining to biodiversity, climate change, desertification, endangered species, hazardous wastes, law of the sea, ozone layer protection, and wetlands. It has also joined many international organizations such as Interpol and the World Trade Organization (WTO).

### NASSER, GAMAL ABDEL

July 23, 1952, the date on which a group of Free Officers carried out the Egyptian Revolution, is widely accepted as a key day in contemporary Egyptian history. General Mohammed Naguib and Colonel Gamal Abdel Nasser (1918–1970) led the army coup that overthrew King Farouk I and that finished the Ali dynasty installed in Egypt since 1805. Democracy was from then on to be Egypt's political regime.

Naguib was in charge of the Revolutionary Committee until 1954 when, accused of participating in an attempt on Nasser's life carried out by the Muslim Brotherhood, he was arrested. In October 1954, Nasser became the sole leader of the revolutionary process and two years later he ran unopposed and was elected president of Egypt. He then promoted a new constitution and established a political regime known as "Arab Socialism." He was one of the most influential leaders in Egyptian history.

Among his first important measures were an agrarian reform, through which the government expropriated large amounts of fields that belonged to a small group of landowners; the nationalization of several banks and of an important part of the industries; the establishment of extensive educational programmes for both boys and girls; and the development of the country's medical infrastructure.

Within an international context of a Cold War between the Western and the socialist Eastern Bloc, the sudden introduction of such nationalistic and socialist measures was not well seen by the occidental developed countries, who quickly withdrew their economic and political support for the Egyptian Revolution.

In order to resolve his economic issues, Nasser decided to raise funds by implementing another radical measure. Hence, on July 26, 1956, President Nasser announced through the national papers the nationalization of the Suez Canal Company and accordingly of the Suez Canal, so as to collect funds to build the Aswan High Dam with the income from tolls on the traffic on the canal. Until then, the Suez Canal had been occupied by Anglo-French forces. Consequently, the English and French invaded the Canal zone, especially the Port Said area. At the same time Egypt entered into a military conflict with Israel, which quickly turned in favour of the latter when they occupied the Sinai Peninsula. However, the 1956 war didn't finish until the United Nations (UN), mainly supported by the United States and the Soviet Union, took action. In the end, the Anglo-French and Israeli troops withdrew from the zone and Egypt kept the management of the Canal.

This was Nasser's first and probably most important achievement. He gained renown throughout the

Arab and the Third World as well as immense popularity among his own people. Beyond the economic value, the nationalization of the Canal and the withdrawal of British troops had a stunning symbolic value for the Egyptians as it meant the end of colonialism for them.

Perhaps Nasser's second great contribution was the construction of the Aswan High Dam, begun in 1960 and inaugurated in January 1971. The execution of this pharaonic work had begun with North American and British support years before, but the refusal of those countries to continue the project in 1956 forced Nasser to look elsewhere for aid. Therefore the fulfillment of the dam project was done with technical and financial support of the Soviet government. The opening of the dam in 1971 was beneficial to Egypt's development, as it provided hydroelectric power to the industrial sector and to the general population. In addition to that, the Aswan High Dam benefited irrigation projects and the fishing industry in Egypt, although it also caused contamination, land erosion, and agricultural conflicts.

Prior to the dam's inauguration, Nasser had decided in 1958 to look for allies and therefore signed a self-defense and political union pact with Syria, setting up the United Arab Republic (UAR). This treaty only lasted three years and was broken in 1961 when a rebel group seized power in Syria and it became again an independent country. However, Egypt kept the name UAR until 1971 as a symbol of Nasser's hope and dream to construct the Pan-Arab Union.

Despite having had so much success in building the dam and keeping the Suez Canal under Egyptian control, Nasser's external politics weren't so successful and during 1967 led the country to a third war with Israel. This time not only Egypt (at that time the UAR) was involved, but also the whole Arab League (UAR, Iraq, Saudi Arabia, Lebanon, Jordan, Syria, Yemen, Libya, Sudan, Morocco, Kuwait, and Algeria), equipped with Soviet weapons, against Israel. This war, due to its short time frame, was called the Six-Days War, and its consequence was an outstanding defeat of the Arab countries.

This was a bitter result for the whole League, but especially for Nasser and the Egyptians who had been quickly beaten again by the same enemy. Nasser felt guilty and presented his resignation letter to the National Assembly on June 9, 1967. However, he was widely supported by a large crowd that took over the streets of Cairo (Egypt's capital city) to support him.

On June 10, 1967, the National Assembly accepted the withdrawal of his letter and Nasser became president again. He served until his sudden death of a heart attack September 28, 1970. He will always be

remembered as a pioneer and as the most prominent socialist leader of Egypt.

### NATION BUILDING

The idea and practice of nation building is most closely associated with US foreign policy and the influential theories of modernization and development that emerged in the Cold War era. In general terms, nation building can be defined as an externally driven attempt to form or consolidate a stable, and sometimes democratic, government. Post-1945 US efforts in West Germany and Japan were directed at building stable democratic polities, while the emphasis in the case of South Korea and South Vietnam, for example, was on stable anti-communist governments. In the early years of the post-Cold War era, there has again been greater emphasis on democracy as part of wider nation-building efforts. Nation building in the Cold War era was usually a US- or Soviet-sponsored effort, with important relative exceptions such as United Nations (UN) involvement in the Congo from July 1960 to June 1964. The *Operation des Nations Unies au Congo* (ONUC) was the biggest UN action since the Korean War (1950–1953), which was formally a UN initiative despite the fact that it was an overwhelming US operation in practice. Furthermore, it was not until the post-Cold War era, when the United Nations again began to play a somewhat more significant role in nation-building efforts, that it

intervened on the scale of its operation in the Congo in the early 1960s.

While democracy emerged as central to UN- and US-sponsored nation-building initiatives in the 1990s, the scope and scale of post-Cold War nation-building efforts (even in Iraq since 2003, which will be discussed below) is far more limited than it was in the immediate post-1945 era, such as in West Germany and Japan. These were two of the most intense and substantial nation-building efforts of the entire post-1945 era. In both cases the United States initially expected formal occupation would be relatively brief, but it ended up assuming the responsibilities of an occupying power for a number of years. In the context of the Marshall Plan (1947) the United States, along with Britain and France, presided over the establishment of a federal government in West Germany by 1949, but military occupation continued until 1955. Of course, significant numbers of US troops remained after 1955, but their deployment by this stage was as a front-line force in the Cold War rather than as an occupation force. In Japan, nation building was supervised directly by General Douglas MacArthur, with the majority of US troops remaining until 1952. In Germany and Japan, nation building included the reconstruction and reform of the education system, the press, industry, and the legal system, as well as the retraining of the police, and major disarmament, demobilization, and demilitarization initiatives.

Nation-building efforts in West Germany and Japan encouraged subsequent attempts in the emerging Third World; however, the level of US commitment to nation building decreased in the wake of the failed effort at nation building in South Vietnam (Washington spent over US\$120 billion on the Vietnam War between 1965 and 1973). At the start of the 1960s there had been an increased emphasis in US foreign policy circles (symbolized by the election to the US presidency of John F. Kennedy, 1961–1963) on the need for a more ambitious nation-building and counterinsurgency strategy in the so-called Third World. This involved taking the initiative in Asia and Latin America, as well as the Middle East and Africa, to counter the communist threat via the infusion of increased levels of military and economic aid, advice, and support. Nation building also emerged as an important concern of North American political science in the 1950s in the context of the Cold War and the rise of modernization theory. Some observers define modernization theory in a way that includes development economics, a sub-discipline of economics that emerged in the 1940s to address the problem of “underdevelopment” in what would come to be called the Third World. However, it is probably

more precise to view development economics as having provided the earliest systematic formulations of development theory generally, while modernization theory can be said to have appeared in the late 1950s as a particularly North American response by political scientists to the perceived failure of development economics to come up with a political framework for nation building. In this situation, the late 1950s and early 1960s can be characterized as an era in which modernization theory rose to prominence in US academic and foreign policy circles. In the context of the Cold War, modernization theorists sought to articulate a non-Marxian alternative for the developing nations. They systematized an evolutionary and elite-oriented conception of political change and nation building grounded in a romanticized conception of the history of the United States of America. Furthermore, although early modernization theorists were rhetorically committed to “democracy,” their vision of democracy was elitist and technocratic and stability was generally regarded as more important than democracy.

These themes are apparent in the work of Lucian Pye, an influential advocate of nation building in the 1950s and 1960s. Pye’s work combined an explicitly psychological approach to political behavior with the examination of political change in the emerging nation-states of Asia and Africa. His first book, published in 1956, was on the communist insurgency in British Malaya. He argued that the fundamental basis of the appeal of communism in Malaya and other “underdeveloped” countries was the insecurity experienced by people who had lost their “traditional way of life” and were undergoing psychological stress as part of their effort to achieve a “modern” existence. Pye’s analysis meshed with the thinking that increasingly underpinned the US nation-building and counterinsurgency efforts in South Vietnam by the early 1960s. According to Pye, if peasants in “transitional societies” joined guerrilla movements to acquire a modern identity, then the way to defeat the guerrillas was to establish governing institutions that were more effective, more appealing, and more modern than those provided by the Communists. In a 1962 study by Pye, *Politics, Personality and Nation-Building: Burma’s Search for Identity*, he argued that, as colonies in Africa increasingly moved toward decolonization, they, like the new nations of Asia, would be “crucially affected by deep psychological conflicts.” In this context he lamented the apparent lack of “nation building” doctrines, the formulation of which had been constrained by an “unreasoned expectation” that democracy was “inevitable” and by the assumption that political development was a “natural” process that could not be “rationally planned or

directed.” Pye emphasized that there was a “need to create more effective, more adaptive, more complex, and more rationalized organizations” to facilitate nation building.

South Vietnam, more than any other country, encapsulated US nation-building efforts by the early 1960s. For President Dwight D. Eisenhower (1953–1960), and more particularly his successor, John F. Kennedy, the regime of Ngo Dinh Diem (1955–1963) was to be a “showcase” for nation building that would make clear the pre-eminence of North American institutions and values in the global Cold War. With the election of Kennedy, US efforts in South Vietnam entered a new phase. In 1961 the fighting between the South Vietnamese regime and the National Liberation Front of South Vietnam (NLF), a popular front organization that had been established in December 1960, was steadily increasing. In 1962 and 1963 the Strategic Hamlet Program emerged as central to Washington’s nation-building policy in South Vietnam. The Kennedy administration encouraged and facilitated the removal of peasants from widely dispersed villages, placing them in concentrated settlements that could be controlled more directly by the Saigon government. The State Department scheduled almost US\$90 million to be spent on strategic hamlet programs for fiscal year 1963. Using this strategy, the US Military Assistance Command (MACV) and the Agency for International Development (USAID) sought to prevent, or at least seriously weaken, the NLF’s ability to get intelligence, food and other supplies, as well as recruits. They also sought to inculcate new ideas about national citizenship that were centered on loyalty to the government of South Vietnam. In 1962 it initially appeared as if the strategic hamlets were undermining the influence of the NLF; however, the guerrillas acted rapidly to counter this trend. The NLF promised the peasants (many of whom were profoundly alienated from the government that had forced them from their villages) that following the revolution they would be allowed to return to their old villages. The NLF also intensified its military attacks on, and recruitment activities in, the strategic hamlets, undermining the effectiveness of the nation-building effort.

By the time of the military overthrow of the Diem regime, and the assassination of Diem and his brother Nhu Dinh Diem in late 1963, the term “strategic hamlet” was being dropped from the counterinsurgency lexicon. However, subsequent efforts to resettle and control the rural population reworked the basic nation-building framework that underpinned the efforts of the early 1960s. The United States had hoped that the overthrow of the unpopular Diem regime would improve the stability of South Vietnam;

however, the deterioration in the military situation following the coup paved the way for the escalation of US involvement and direct military intervention by 1965 (at its peak, in January of 1969, the number of US personnel stationed in South Vietnam was 542,400). The pervasive reliance on the United States, economically, militarily, and politically, generated growing possibilities for government and private corruption that completely undermined the South Vietnamese government’s nationalist credentials. While a significant number of people in the south were hostile to the Communists, they also lost interest in fighting for the corrupt and despotic US-backed regime in Saigon. Furthermore, in their effort to build a modern nation-state in the southern half of Vietnam, US policy makers overlooked the fact that many southerners identified with the culturally and historically delineated nation of Vietnam that was larger than the post-1954 polity presided over by Diem and his successors.

In the context of the escalation of the war in Vietnam, the creation of institutions and organizations that could provide order became even more important for proponents of nation building. The assumptions and concerns of the officials who carried the United States into full-scale war in Vietnam were closely connected to the revised theories of modernization and nation building that emerged during the 1960s. For example, the major concern of Samuel Huntington’s influential 1968 book, *Political Order in Changing Societies*, was to determine what might or might not be necessary to ensure continued social order and political stability. He held up political order as the ultimate goal of any society. He argued that, contrary to earlier expectations, the instability in Asia and the rest of the Third World since World War II was primarily the result of “rapid social change and the rapid mobilization of new groups into politics coupled with the slow development of political institutions.” Furthermore, US foreign policy since 1945 had, in his view, missed this point, because Washington had placed too great an emphasis on the “economic gap,” while overlooking the “political gap.” He emphasized that the political gap had been ignored because of the assumption in North America that political stability flowed from “social reform” stimulated by economic development. However, in his view it was actually the process of modernization that led to political instability. For Huntington, organization was the “road to political power” as well as the “foundation of political stability.” In a famous article, also published in 1968, Huntington argued that the key to combating wars of national liberation in South Vietnam and elsewhere was to adopt a policy of “forced-draft urbanization” and “modernization,” which would quickly

shift the nation-state in question beyond the stage where a rural-based revolution has any chance of building up enough support to capture national political power. Huntington's prescriptions held out the possibility that successful nation building in South Vietnam and elsewhere remained within Washington's power. However, with the Tet Offensive in early 1968, the elite consensus in North America that US power could turn South Vietnam into a stable capitalist nation-state and achieve military victory against the North had been completely undermined. With the elevation of Richard Nixon to the presidency (1969–1974), the United States began to look for ways to withdraw “with honor.”

US nation-building efforts in the early 1960s also focused on Latin America. Under the auspices of the Alliance for Progress, the Kennedy administration sought to contain the “communist threat” to Latin America in the wake of the Cuban Revolution of 1959. The Alliance for Progress started as a ten-year program of land and economic reform. The United States made an initial contribution of US\$1 billion and a commitment to raise another US\$20 billion overall from both public and private sources. As part of an effort to encourage the consolidation of stable capitalist and democratic polities, it set the achievement of an annual economic growth rate for the region of at least 2.5% as one of its main goals. It also sought to achieve greater productivity in the agricultural sector, stimulate trade diversification, generate improvements in housing, eradicate illiteracy, and ensure better distribution of incomes. But an important, albeit implicit, goal was the protection of US investments in Latin America, an objective that many of the Alliance's proposed reforms endangered. Trade diversification would undermine the monopoly of primary agricultural products and mineral extraction enjoyed by a number of US-based corporations. At the same time, land reform threatened the power of the still largely land-based ruling elites in Latin America. This meant that the reformism of the Alliance for Progress was increasingly sidelined by Washington's deepening commitment to military and police aid, along with support for authoritarian governments and counterinsurgency programs. By the late 1960s, high rates of economic growth in many Latin American countries had been achieved. However, high growth rates exacerbated social inequality, while politics, instead of becoming more democratic, moved increasingly toward authoritarianism. This was reflected in the fact that there were sixteen military coups in the region in the 1960s.

The waning of the Alliance for Progress and the US defeat in Vietnam provided the context for a shift in US nation-building efforts. While the United

States still sought to stabilize and consolidate anti-communist states, the quantity and character of economic support shifted, while direct US military involvement decreased dramatically. Furthermore, while the United States continued to support authoritarian military regimes in the Middle East, Africa, and Central America in the 1970s and 1980s, there was limited emphasis on democracy and Washington's military commitment virtually always remained indirect. Then, with the end of the Cold War, there was another reorientation of the US role. While the focus of US foreign aid by the 1980s had been changed to reflect the ascendancy of “free market” ideas, with the end of the Cold War, President Bill Clinton (1993–2000) presided over a range of reforms that ostensibly sought to reduce the significance of security concerns in the disbursement of foreign aid. USAID was still expected to promote economic development by encouraging trade, investment, and market-oriented reform, but it also established new programs aimed at building democratic political institutions. A greater emphasis was also placed on humanitarian assistance and sustainable development. However, this reorientation, symbolized by the passage of a new foreign aid bill by Congress in 1994, still involved a major commitment to US geo-strategic and security concerns. For example, Israel and Egypt continued to receive over one-third of all US foreign aid. In 1994 Israel received US\$3 billion and Egypt received US\$2.1 billion, while Sub-Saharan Africa was allotted a total of US\$800 million. Foreign aid was also directed increasingly at the former Soviet bloc, again for security reasons. The long shadow of the Vietnam era also continues to shape nation building in the post-Cold War era. For example, despite increased emphasis on humanitarian intervention, the death of eighteen US soldiers in Somalia in 1993 reconfirmed for US policy makers that there was a need to avoid making significant commitments in those parts of the world where there is no obvious “national interest” at stake. Meanwhile, the idea of nation building more specifically still carries with it connotations of the US defeat in Vietnam. In the post-Cold War and particularly the post-9/11 era, the term has been reinstated albeit reluctantly. For example, on September 25, 2001, President George W. Bush reassured the US public that the new “war on terrorism” would not involve nation building in Afghanistan. However, by early 2002, Washington was not only engaged in nation building in Afghanistan, but the Pentagon had also begun planning the military invasion of Iraq and the State Department had begun developing plans for post-war nation building in Iraq (plans, however, that the Pentagon ignored after the fall of Baghdad).

Meanwhile, as noted above, the 1990s saw the expansion of UN-sponsored peacekeeping and nation building, but the ouster of Saddam Hussein (1979–2003) and the subsequent occupation of Iraq were initially notable for the complete absence of the United Nations, while subsequently its role has remained relatively marginal. The initial US intervention in Iraq was organized around a “coalition of the willing” and had no formal UN involvement. This flowed from the fact that while the UN played a long-standing role in weapons inspection in, and the maintenance of sanctions on, Iraq, the US-led overthrow of the regime in Baghdad had been preceded by increasingly antagonistic relations between the United States and the UN, particularly with key members of the Security Council, over how to deal with Baghdad, with the United States eventually deciding to embark on nation building in Iraq without the authorization of the UN Security Council. As the US occupation of Iraq progresses, the UN has once again become involved, although it remains primarily a US operation, which appears set to be at the center of US foreign policy and the ongoing debate about successful and unsuccessful nation building for the foreseeable future.

### NATIONAL ACTION PARTY

Mexico's National Action Party (generally referred to by its Spanish acronym, PAN) was founded in 1939. The PAN emerged in response to the semi-authoritarian form of government and the state-driven reformist economic model espoused by the Institutional Revolutionary Party (PRI), the political party that monopolized political power in Mexico between 1929 and 2000. Originally, leaders of the PAN proposed a twofold ideology. The party advocated liberal democratic principles, which emphasized free and fair elections, sociopolitical pluralism, transparent and accountable government, as well as responsible management of public finances. The PAN also furthered a set of moral principles dubbed “catholic humanism,” which provided guidelines for the civic education and spiritual improvement of Mexicans, and demanded greater economic welfare as well as social justice.

These two ideological currents have cohabited uneasily throughout the PAN's history. By the mid-1970s, the catholic humanist wing of the PAN had drifted to the left, denouncing capitalism for the socioeconomic abuses it generated, and promoting abstention from Mexico's electoral process as an act of dissent against the PRI's authoritarian rule. This stance alienated the more socially and economically conservative PAN supporters. In reaction, the party's liberal democratic wing set forth a platform proposing a reorientation of the PAN away from left-leaning ideological concerns and toward greater voter mobilization and electoral participation. This faction ultimately sought to further the democratization of Mexico's political regime, reduce the power of the government, and promote market-based economics. The liberal democratic wing hoped that such a strategy would enhance the PAN's electoral base by channeling the growing popular dissatisfaction with the PRI's repressive tendencies and inability to deal with the

country's pressing economic difficulties. After significant infighting, the liberal democratic faction's platform prevailed. Nevertheless, ideology continues to represent a significant source of internal tension, and normative Catholic prescriptions still permeate the PAN's policy orientation.

From the 1940s to the 1960s, the PAN constituted a party of notables, whose leadership was centralized in Mexico City and held strong ties to Catholic organizations. As a result of its aforementioned mid-1970s ideological reorientation, the PAN increasingly attracted the support of Mexico's middle classes and businesspersons, enticed by the PAN's liberal political and economic orientation. This new breed of members—referred to as “neopanistas”—generally lived outside of Mexico's capital city. In fact, since the early 1980s, the PAN's electoral strength has been mostly concentrated in the northern and some central states, as well as in the Yucatan peninsula. Furthermore, the PAN typically draws its electoral support from urban-based and educated citizens, who enjoy medium to high levels of income.

During the 1980s and 1990s, neopanistas gradually captured the PAN's leadership, bringing to the party important technical skills, powerful business connections, as well as sizeable financial resources. At the same time, the PRI progressively liberalized the electoral process, in the hope of re-legitimizing its rule, and hence grew more tolerant of PAN victories—although it still restricted gains from the leftist opposition. In order to take advantage of this opening, the PAN chose to enter into limited strategic alliances with the PRI. The PAN also privileged capacity building at the sub-national level. The PAN's flexible ideological platform, its dynamic organization, as well as its efficient campaigning style attracted the support of an increasingly large segment of the population, frustrated with the PRI-led authoritarian regime. As a result, the PAN significantly improved its representation in the local and state parliaments, and secured seven state governorships between 1989 and 2000. This produced a coattails effect, as the PAN's share of seats in the national legislature steadily increased through the 1990s.

The transitional elections of 2000 represent a high point in the PAN's electoral popularity. The party's candidate—businessman Vicente Fox—claimed the presidency, thus ending the PRI's authoritarian rule. The PAN also obtained two-fifths of the seats in the Chamber of Deputies. Nonetheless, this success was followed by less impressive showings in subsequent regional and national elections. This is largely attributable to the citizenry's disappointment with President Fox's inability to fulfill the majority of his ambitious electoral promises. Indeed, the resistance

of opposition parties—which controlled Mexico's parliament between 2000 and 2006—and poor communications between the federal administration and the PAN's congressional fraction have hindered the adoption of President Fox's comprehensive reformist policy program. The PAN has also been plagued by serious factional power struggles since 2000.

## NATIONAL FRONT FOR THE LIBERATION OF SOUTH VIETNAM (NFLSV)/NATIONAL LIBERATION FRONT (NLF)

The *Mat Tran Dan Toc Giai Phong Mien Nam*, literally the National Front for the Liberation of South Vietnam (NFLSV), best known as the National Liberation Front (NLF), was formed on December 20, 1960, in Tay Ninh Province in South Vietnam as a result of decisions reached at the Third National Congress of the Vietnamese Workers' Party (VWP) in Hanoi in September 1960. Congress members decided that after six years of trying to unify the country through political means, they should accept the recommendations of Central Committee member Le Duan and approve the use of armed violence through the NFLSV's military arm, the People's Armed Liberation Forces (PLAF), or as the Allies called them, the “Viet Cong.” In an effort to gain wide national support, NFLSV leaders, concealing the Front's Communist leanings, publically declared that the NFLSV was a broad-based “front” opposing the US-backed regime of Ngo Dinh Diem in Saigon.

While the NFLSV directly replaced the Fatherland Front (*Mat Tran To Quoc*), created in Hanoi in 1955, its ideological antecedent was the League for the Independence of Vietnam, commonly known as the Viet Minh, established in May 1941 as an anti-Japanese and later anti-French nationalist movement. The NFLSV, like the Viet Minh, sought reunification through any means based on widely shared objectives such as national independence and social justice. While the NFLSV had major southern components, it was dominated by northern Communists.

The NFLSV's organizational structure was similar to the Viet Minh. At the top was an elected central committee and a presidium. The chairman of the presidium was Nguyen Huu Tho, a lawyer who had been involved in resistance activities since the late 1940s, but who publicly downplayed his Communist ties. Similar committees existed at the provincial and district levels. At the heart of the NFLSV were grassroots organizations that appealed to specific constituencies such as peasants, workers, women, students, writers, and artists, as well as oppressed ethnic and religious groups.

Local associations served as the initial contact points between the Front hierarchy and the common people and provided a means for channeling local aspirations into support for the programs of the movement. Talented and dedicated members of such organizations were then enlisted into upper levels of the NFLSV, PLAF and/or the People's Revolutionary Party, a southern branch of the VWP. During the 1960s, the NFLSV became the focus for the revolutionary movement in South Vietnam, with membership reportedly in the millions.

The reality was that the NFLSV was a classic Communist front organization comprised of Communists and non-Communists. Its primary purpose was to mobilize the anti-Diem forces in South Vietnam. Like the Viet Minh before them, NFLSV leaders made temporary alliances with any southern group who opposed US intervention and the Saigon regime.

The NFLSV's attacks on the Diem government concerned Saigon and Washington. From the birth of NFLSV, Washington policy makers claimed that Hanoi alone directed the armed struggle in South Vietnam. Key members of both President John F. Kennedy's (1961–1963) and Lyndon Baines Johnson's (1963–1969) administrations argued that the flow of troops and supplies from the north to the PLAF kept the revolution alive. This became the official basis for US involvement in the conflict and provided its justification. Even under the administration of Richard M. Nixon (1969–1974), US foreign policy focused on efforts to stop this “externally supported

insurgency” by interdicting the flow of men and materials.

Especially in the 1960s, US officials believed South Vietnam could be stabilized if they could prevent the North from re-supplying their NFLSV and PLAF “puppets.” Those who opposed US intervention argued on the other hand that the insurgency was essentially a civil war. They suggested that the NFLSV was a southern organization that had risen out of southern initiatives responding to southern demands. The complicated part of the NFLSV is that this was partly true. Indeed, most southern members of the NFLSV and PLAF believed this to be true.

PLAF attacks against US Army installations at Pleiku and Quy Nhon in February 1965 convinced the Johnson administration that they had to stop the infiltration of soldiers and supplies. It was impossible, they concluded, to build a stable government in Saigon while the Democratic Republic of Vietnam (DRV) and its Communist supporters waged a war of aggression. Johnson therefore ordered retaliatory air attacks on North Vietnamese targets, thus leading to *Operation Rolling Thunder*, the sustained bombing campaign of 1965–1968. US ground operations also changed when Military Assistance Command, Vietnam (MACV), General William C. Westmoreland requested two US Marine battalions to protect Da Nang Air Base. Johnson approved the General's request, sending the first major contingency of US ground troops to Vietnam in March 1965.

Soon, US troops began “search and destroy” operations designed to interdict supplies and destroy PLAF and PAVN forces. Westmoreland hoped he could inflict higher casualties on enemy forces than they could replace. Theoretically, this would diminish Communist will and lead to a negotiated settlement.

The NFLSV reached its pinnacle of power during the Tet Offensive of 1968 when Communist forces launched coordinated attacks against nearly every major urban center in South Vietnam. Although they suffered heavy military losses, according to most experts the NFLSV gained a great psychological victory. The Front had demonstrated its ability to attack heavily guarded cities, long thought to be safe havens. The PLAF attack on the US Embassy in Saigon had a great impact on policy makers in Washington. Many longtime supporters began to question the optimistic predictions of Johnson's administration. This led to Johnson's decision not to run for re-election. As Tet died down, talks opened in Paris and the NFLSV sent its own representatives, Nguyen Thi Binh and Tran Buu Kiem, to the conference.

In 1969, the NFLSV oversaw the creation of the Provisional Revolutionary Government (PRG), which hoped to come to full power in the South

after the war ended. It was designed to be a legal counterpart to the government in Saigon. As the war dragged on, regular northern forces played a growing role in the Communists' southern strategy. Eventually, this created tensions between the NFLSV and leaders in Hanoi. The NFLSV suffered heavy losses during the final years of war. In December 1976, over a year and a half after the fall of Saigon, to the dismay of many NFLSV members, it was merged into the Fatherland Front, while only a handful of its officials were incorporated into the new national government.

## NATIONAL LIBERATION ARMY (ELN) (COLOMBIA)

The National Liberation Army (*Ejército de Liberación Nacional*, ELN) is one of three irregular forces in Colombia listed by the US State Department as terrorist organizations, primarily for its frequent use of kidnapping and extortion. It has an estimated strength of some five thousand fighters, concentrated mostly in central and northern Colombia. Its ideology is nominally Marxist-Leninist.

The ELN, like most of Colombia's guerrilla groups, can trace its origins to the period known as *La Violencia*, which began in 1948 and formally ended with the restoration of democracy in 1958. And like the country's other groups, the ELN was founded, in part, by Liberals and other guerrillas who refused to lay down their arms at the close of hostilities. It also incorporated disaffected members of the Liberal Revolutionary Movement (MRL), which was disbanded in 1964, and radical students who had traveled to Cuba in 1962 for training in Ché Guevara's *foquismo* tactics. The latter held that guerrilla groups would serve as the seeds of insurrection in Latin America, rallying peasants to their cause and waging war from the countryside.

The ELN burst upon the scene with an attack on the town of Simocota in the northern department

of Santander in July 1964. While the attack failed, its audacity attracted the attention of radical Roman Catholic priest Camilo Torres and his group, United Front. Torres joined forces with the ELN but was killed in an armed action in 1967. The ELN's early base of support was among the petroleum workers of the Middle Magdalena region and one of its historic causes has been to protect Colombian oil from foreign exploitation. But the ELN—and other guerrilla groups—assumed incorrectly that Colombia was in a pre-revolutionary state and its actions were designed with a fairly rapid victory in mind. This belief led to disastrous results and the group was nearly annihilated by the Colombian military in 1973.

But the group survived under the leadership of Spanish-born priest Manuel Pérez, weathering the authoritarian presidency of Julio César Turbay (1978–1982), resisting efforts to sign a cease-fire in 1984, and becoming known as a single-issue movement due to its persistent calls for the nationalization of the country's petroleum industry, all the while blowing up sections of the main pipeline and kidnapping prominent oil company officials. In the late 1980s, it joined forces with the *Fuerzas Armadas Revolucionarias de Colombia* (Revolutionary Armed Forces of Colombia, FARC) to form the National Guerrilla Coordinator (CNG). The latter negotiated with the government of President César Gaviria in 1991 and 1992 but failed to reach another cease-fire. While the CNG continues to exist nominally, the ELN is largely independent of the larger FARC. Tensions arose when the FARC signed a cease-fire with President Andrés Pastrana that included the concession of a sizeable tract of land in the Colombian Llanos, to the southeast of Bogotá. At the time, the ELN insisted on receiving its own "zone" in the Middle Magdalena region, which Pastrana refused. Negotiations, which have become few and far between, are now carried out on a one-to-one basis between the ELN and the government.

Over the course of the 1990s, the ELN became known for a number of daring mass kidnappings, the most infamous of which took place in a suburb of Cali in 1999. A total of 143 people were abducted from a church in an affluent neighborhood but all but thirty-six were soon released. Another hijacking involved a Venezuelan commercial airliner. In recent years, though, the kidnappings and other activities have decreased and the ELN has stated a willingness to negotiate concerning three major issues: national sovereignty, drug trafficking, and petroleum. Informal talks have occurred outside of Colombia so far but no real progress has been achieved.

## NATURAL DISASTERS

On December 26, 2004, a massive earthquake shook the Indian Ocean floor off the coast of the Indonesian island of Sumatra. Thousands of residents of Aceh Province, on the northern tip of the island, died in the initial temblor. Within minutes, a series of massive tsunamis struck the coastline, killing thousands more.

The waves raced across the Indian Ocean basin, transmitting death and destruction to destinations as disparate as Thailand, Sri Lanka, India, and Somalia. More than 250,000 perished. The Sumatran earthquake tragedy illustrated many factors, both natural and man-made, that make developing nations especially vulnerable to natural disasters.

The developed world is not immune to natural disasters. The Atlantic and Gulf coasts of the United States are especially vulnerable to hurricanes. Tornadoes may rip through the cities of the Great Plains. Fires are a bane to the residents of California. Active volcanoes, earthquakes, and tsunamis are threats all along the Pacific Rim, even to the thriving metropolises along the West Coast of the United States and in Japan.

Even though the developed world is not immune to natural disasters, a number of factors combine to make developing nations especially vulnerable. Among them are factors that cannot be controlled—that is, geography—coupled with human factors such as a lack of monitoring and forecasting resources, communications networks, transportation networks, emergency preparedness (and training), public health infrastructure, or basic civil services (such as adequate food and water supplies).

Natural disasters can inflict a heavy toll on populations in the areas affected, even in developed nations with adequate resources and planning. But the

magnitude of suffering in the aftermath of a disaster can be magnified in regions caught unprepared.

## Natural Hazard Versus Natural Disaster

A natural hazard is some natural phenomenon that may harm humans. A natural disaster is some destructive event—caused by a natural hazard—that affects many people over a widespread area.

Natural hazards come in basically two types: climatic hazards and geologic hazards. Climatic hazards include hurricanes, winter storms, droughts, floods, thunderstorms, and tornadoes. The rate and intensity of climatic hazards may be influenced by normal climatic cycles, such as the El Niño/Southern Oscillation (ENSO), or by global climate change. Geologic hazards include earthquakes, volcanoes, tsunamis, and mass movements (landslides and avalanches). Climate, geology, and human activities often interact to enhance or mitigate an impending natural disaster.

## Climatic Hazards

### *Tropical Cyclones*

Tropical cyclones have a variety of names including hurricanes and typhoons, and are massive storms with maximum sustained surface winds of at least 74 mph (120 km/hr) that bring thunderstorms with heavy rain, intense winds—including tornadoes—and storm surges and other flooding to affected areas. The storms cover wide swaths of the Earth's surface, averaging 350 miles (600 kilometers) in diameter, and are characterized by spiral circulation—counterclockwise in the Northern Hemisphere, clockwise in the Southern Hemisphere—with low central atmospheric pressures.

The center of a tropical cyclone is likewise characterized by an eye, an area of clear skies and calm conditions surrounded by a bank of clouds—the eye wall—beyond which the storm rages. The storms, fueled by high temperatures and massive amounts of water, typically originate over tropical waters in the Atlantic, Indian, and Pacific oceans. Tropical cyclones are also powerful—one storm can expend as much energy as the average amount of electricity consumed each year in the United States and Canada.

The largest tropical cyclones have sustained winds as high as 190 mph (305 km/h). As the winds blow, they drive the water at the surface of the ocean ahead of them to produce a wall of water called the storm

surge—the height of which can be increased depending on whether the storm makes landfall at high tide as opposed to low tide. Tropical cyclones thus pack a lethal wallop of wind and water that can weave a path of destruction over large regions.

The most active ocean is the Pacific. By virtue of its size—it is the largest of the ocean basins—the storms have wide expanses of warm tropical waters to fuel their development and plenty of room to roam to increase in size. Pacific storms lash the Asian mainland, including Japan, Taiwan, and the Philippines; Australia and Oceania; and the West Coast of the Americas.

The Atlantic Ocean is the second largest of the world's oceans. Hurricanes that form in the Atlantic (including the Gulf of Mexico and Caribbean Sea) affect North and Central America, the Bahamas, the Caribbean Islands, and northern South America.

While the Indian Ocean is the third-largest ocean, it has the unfortunate distinction of having the deadliest tropical cyclones. Indian Ocean cyclones can strike anywhere from Africa eastward to Indonesia and Australia. The Bay of Bengal is most vulnerable to cyclones. Bangladesh, most of which lies within the Ganges Delta, is very low lying and prone to severe flooding—even without a massive storm surge and accompanying rainfall.

The deadliest hurricane in recent memory was the Bhola Cyclone, which slammed into Bangladesh (at the time known as East Pakistan) with 120-mph (190 km/h) winds and a storm surge on top of an exceptionally high tide on the night of November 12–13, 1970. The official death toll was put at 150,000—with 100,000 missing. Some estimates, however, put the number of deaths at half a million. Approximately 139,000 died in another cyclone in Bangladesh on April 29, 1991.

Two of the deadliest typhoons in the Pacific Basin struck China early in the twentieth century. An August 1922 typhoon killed sixty thousand. Ten years earlier, in August 1912, a storm killed fifty thousand. In the Atlantic, the Great Hurricane of 1780 killed more than twenty thousand in the Antilles. Hurricane Mitch stalked the Caribbean and Central America between October 22, 1998, and November 5, 1998, killing about eleven thousand.

### *Droughts*

Arid climates occupy a large portion of the Earth's surface—especially in the subtropics as well as in continental areas far away from large bodies of water. A prolonged dry spell in an area that receives a small amount of rain every few months or years thus is not a drought—it is normal.

Droughts occur instead when a region gets less precipitation than it normally receives in a given season. This typically happens in areas under the periodic influence of subtropical or continental highs. High-pressure cells are characterized by subsiding air, which warms and essentially dries out as it descends toward the Earth's surface.

Below-average precipitation in a region may have a host of adverse effects on the local population, from disrupting water supplies, to crop failures, to an increase in fire frequency. Droughts typically have the greatest effect on human societies in semiarid grasslands and savannas where some of the range has been converted to cropland and pastureland. Prolonged droughts can accelerate deforestation, which in turn can lead to increased soil erosion—thus ironically increasing the potential for crop failure—when the rains return.

Possibly the worst drought-related famine in history occurred in China in 1907 where 24 million are believed to have died. China has had three other droughts in the twentieth century that claimed 3 million or more victims. The Sahel region of Africa, along the southern border of the Sahara, has been through periodic waves of drought and famine in which hundreds of thousands have died. The last big Sahel drought was in 1984–1985.

### *Fires*

Fire is often associated with drought, as natural vegetation dries out from lack of rain, thus becoming tinder awaiting a suitable spark. Fire is a common natural disturbance in tropical savannas and other grassland environments, and is often necessary for maintenance of the health of those environments, thus it rarely rises to the level of a natural disaster in the more arid portions of the developing world. But fires can be devastating in tropical forests.

Borneo—the island shared among Indonesia, Malaysia, and the Sultanate of Brunei—was hard hit by destructive fire outbreaks in the 1980s and 1990s. While few human lives were lost, large swaths of tropical rainforest were destroyed on the island. Forests that survive the flames are often left more vulnerable to human exploitation. The cumulative effects have rendered much of Borneo's spectacular animal life—including a number of threatened and endangered species—homeless.

### *Floods*

Floods are caused by a number of factors. Coastal flooding is usually related to weather systems (such as

tropical cyclones, above) or to tsunamis (see below). Flooding is often seasonal, triggered by monsoon rains or spring snowmelt. Since the earliest human settlements were typically along bodies of water—water being essential for life—floods are one of the oldest and most frequent natural disasters referred to in the historical record.

Flooding is an especially significant problem in monsoon climates, such as that of South and East Asia. In these types of climates, the prevailing winds originate from the interior of a continent—and thus are relatively dry—during part of the year. The winds originate from the oceans—and thus have high water content—the remainder of the year. In extreme cases, an area with a monsoon climate can have no rain for several months, then receive several feet (more than a meter) of rain during the monsoon months. Mountain ranges, such as the Himalayas, can enhance the effect of monsoons, forcing wet air masses to rise, cool, and unload more moisture than they would otherwise do over flat terrain.

Some of the worst non-tropical cyclone-related floods in history have occurred in China and Southeast Asia. For example, the Yangtze River escaped its banks in July and August of 1931, leaving 3.7 million dead from drowning, starvation, and disease. More than 51 million people were affected.

In nearby Vietnam, flooding in the Red River Delta killed more than one hundred thousand in August 1931. One of the heaviest monsoons in the twentieth century flooded three-fourths of Bangladesh. Only about 1,300 died, but about 30 million were left homeless.

Flooding can be a problem even in arid climates. A storm system over Iran in 1954 produced heavy rains and flooding that claimed one thousand casualties.

### ***Other Climatic Hazards***

Winter storms and tornadoes mainly affect the developed world, with winter storms primarily affecting the temperature latitudes of the Northern Hemisphere—Asia, Europe, and North America. The United States has more tornadoes by far than any other nation in the world. Nevertheless, both types of storms can be problematic in developed nations.

Winter weather can strike alpine areas anywhere—even in the tropics. A blizzard that struck Iran in 1972 killed more than four thousand people. Tornadoes and waterspouts may appear anywhere that large thunderstorms are generated, such as the thunderstorms spun off of tropical cyclones. Bangladesh has been hit by several killer tornadoes. On the night of February 19–20, 2005, a tornado capsized a ferry boat near Dhaka—the capital of Bangladesh—and killed more than one hundred passengers and crew.

### ***El Niño/Southern Oscillation (ENSO)***

The Southern Oscillation is a cyclical reversal of the distribution of warm and cold waters in the equatorial Pacific Ocean. Normally, cold surface waters prevail in the Eastern Pacific off the coast of South America, while warm surface waters prevail in the Western Pacific in the neighborhood of the Malay Archipelago. ENSO events can disrupt oceanic currents in the Pacific Ocean as well as atmospheric circulation patterns globally.

During an El Niño, warm surface waters are located in the Eastern Pacific and cold surface waters in the west, causing significant climate disruptions: Below-average precipitation in the Malay Archipelago and Southeast Asia may cause devastating droughts and fires, as described above. In the Americas, unusually high rainfall and storm activity in the areas along the Pacific Coast can lead to coastal erosion, landslides, and other natural disasters.

## **Geologic Hazards**

### ***Earthquakes***

Earthquakes typically occur along boundaries between large segments of the Earth's crust known as tectonic plates. The plates move apart from one another along divergent margins or rift valleys, collide into one another along convergent margins, or slide past one another along transform faults. The vast majority of earthquakes are associated with these three types of plate boundaries.

The most devastating earthquakes occur along convergent margins, but large earthquakes can occur along transform faults as well. The December 26, 2004, earthquake and tsunami in the Indian Ocean occurred along a convergent margin where the dense oceanic crust of the Indian plate is forced under the less dense continental crust of the Burma plate. The largest earthquake on record, a magnitude 9.5 (Richter Scale) temblor in Chile on May 22, 1960, also occurred at a convergent margin where the Pacific plate is forced under the South American plate.

The Pacific Ocean's "Ring of Fire" is in fact lined with convergent margins. Ten of the largest eleven earthquakes since 1900—including the two earthquakes mentioned above—have occurred along the Ring of Fire. Most have occurred in the North Pacific region—three in Alaska and the Aleutian Islands, two in Siberia's Kamchatka Peninsula, and one in the Kuril Islands north of Japan; two in or near South America (Chile, above, and off the coast of Ecuador);

and two in Indonesia (the December 26, 2004, earthquake off Sumatra and another in the Banda Sea).

The deadliest earthquakes in history have occurred along convergent margins where two continental plates collide. The mountain belt stretching from Western Asia to Eastern Asia—which includes the Himalayas—is raised by the collision of the Indian plate with the Eurasian plate. The situation is further complicated to the east with the collision of the Eurasian and Pacific plates. The collisions also generate faults where the crust is fractured and blocks slide past one another, even further clouding matters.

The other member of the top eleven earthquakes list struck Tibet and India's Assam Province on August 15, 1950. Between twenty thousand and thirty thousand were killed. But magnitude isn't always correlated with death toll. Less powerful quakes may produce far higher death tolls. For example, the deadliest earthquake in history, a January 23, 1556, temblor that struck Shansi Province in China, is estimated to have killed more than eight hundred thousand.

China has had at least four other earthquakes that have killed more than one hundred thousand: a July 27, 1976, quake in Tangshan that killed 255,000 (officially; but other estimates place the death toll as high as 655,000); one on December 16, 1920, in Gansu that killed two hundred thousand; another on May 22, 1927, in Xining that killed two hundred thousand; and a September 1290 earthquake in Chihli that killed one hundred thousand. Iran, where the Arabian and Eurasian plates collide, has had its share of deadly quakes: one on December 22, 856, in Damghan in which 230,000 died; and another on March 23, 893, in Ardabil in which 150,000 died. In what is now Turkmenistan, 110,000 died in a temblor on October 5, 1948.

One of the deadliest earthquakes in history, however, occurred on August 9, 1138, along a transform fault—the Dead Sea Transform, which marks the boundary between the Arabian and African plates. More than 230,000 were killed. One of the most active and deadly earthquakes zones in recent history is along another transform fault—the North Anatolian Fault—that runs from northern Turkey across the Aegean Sea into Greece. The North Anatolian Fault marks the boundary between the Anatolian and Eurasian plates. An earthquake near Izmit, Turkey, on August 17, 1999, killed more than seventeen thousand.

### *Volcanoes*

Volcanic activity is also driven by tectonic processes. The most violent volcanoes are located near convergent margins, where plate collisions generate heat and

where slabs of crust are forced deep into a molten layer called the mantle. As the affected rocks melt, the magma formed from the melting rises, fueling eruptions at the surface.

Extensive volcanic activity along the Pacific Rim led to the name commonly given to the region—the Ring of Fire. Most deaths from volcanic eruptions arise from famine, tsunamis, ash flows or falls, or mudflows. Because volcanic soils are often very fertile, human populations encroach upon the slopes of volcanoes, and thus are at significant risk.

The two deadliest volcanic eruptions in history occurred in what is now Indonesia. Tambora, on the island of Sumbawa, erupted on April 10, 1815, in one of the largest explosions in history. Tambora blasted fifty cubic kilometers (about eleven cubic miles) of material as high as forty-three kilometers (twenty-six miles) above the Earth's surface. The eruption had global effects, as ash blocked incoming sunlight and dropped global temperatures an average of 1°C (1.8°F).

More than ninety thousand residents of Sumbawa and nearby islands died—about ten thousand directly from the eruption, the rest as a result of famine and disease. Because of the climatic effects—the following year, 1816, was known as the “year without a summer” in the Northern Hemisphere as well as some parts of the Southern Hemisphere—the eruption may have triggered disease outbreaks and famines that killed tens of thousands as far away as the British Isles. (The weather was so gloomy in Europe that it may have helped inspire Mary Shelley to write “Frankenstein.”) Tambora's eruption may even have contributed to the biggest cholera pandemic of the nineteenth century.

On August 26–27, 1883, Krakatau (or Krakatoa), a volcano in the Sunda Strait just west of Java in what is now Indonesia, began a series of cataclysmic eruptions that climaxed in the obliteration of two-thirds of the island. The eruption is arguably the most famous in history—save for possibly Vesuvius in 79 CE. It was the loudest blast in recorded history, heard 4,600 kilometers (2,900 miles) away—as far west as Rodriguez Island and Sri Lanka, and as far east as Australia. The volcano collapsed into the sea and generated a tsunami with waves as high as 40 meters (130 feet). The waves swept the Sunda Strait, killing thirty-six thousand in Java, neighboring Sumatra, and surrounding islands. The tsunami waves—measured as far away as the English Channel—swept around the world's oceans several times.

The third-deadliest eruption occurred in the Caribbean, on the island of Martinique. The main volcano on the island, Mount Pelée, erupted on May 8, 1902, and destroyed the city of St. Pierre with a *nuée ardente* (glowing cloud)—a glowing mass of ash and other particles that speeds downslope with the force

of a hurricane. Destruction of St. Pierre was total—twenty-nine thousand died. There were only two survivors of the blast: a shoemaker named Léon Compere-Léandre and a man named Louis-Auguste Cyparis, who was a prisoner incarcerated in the city's dungeon. Cyparis was badly burned, but the building—with only one small opening above the door—protected him from the worst. He was rescued four days later.

In addition to explosions and clouds of hot gas, volcanoes can be just as deadly with mud and water. Nevada del Ruiz, a glacier-capped volcano in the Andes Mountains near Bogota, Colombia, erupted on the night of November 13, 1985. The onrush of hot ash and debris rapidly melted the ice and snow at the summit, triggering lahars—debris flows—that tore down canyons lining the mountain and picked up more debris as they went. A town at the base of the mountain, Armero, lay in an area that had twice been destroyed by similar debris flows in the previous four hundred years. Despite the fact that town officials knew the town lay on a particularly hazardous site, preparations for prompt evacuation in the event of another eruption were inadequate. More than twenty-three thousand died when a lahar destroyed the town.

Volcanoes loom over many cities in the developing world—Bogota, Colombia; Goma, Democratic Republic of the Congo; Jakarta, Indonesia; Manila, Philippines; Mexico City, Mexico; and San Salvador, El Salvador, for example. Some of the largest, such as Manila and Mexico City, because of rapid growth coupled with underdeveloped infrastructure, may be unable to adequately respond to volcano hazards.

### *Other Hazards*

Tsunamis are devastating waves generated by earthquakes or volcanic eruptions, and thus have been discussed above. Mass movements are smaller-scale events that, as part of a larger event, may cause large numbers of casualties—such as in the lahar that destroyed Armero, Colombia, following the eruption of Nevada del Ruiz, or in the landslides and mudslides that caused most of the casualties in Central America during Hurricane Mitch.

### **Disaster Preparedness**

As illustrated in the disaster that swept the Indian Ocean basin following the earthquake and tsunami on December 26, 2004, developing nations face a number of challenges in adequately preparing for natural disasters.

First, many lack the resources to devote to monitoring and forecasting natural hazards. For example, observatories monitor earthquake activity in the Pacific basin. When an earthquake occurs, warnings are issued to nations lining the Pacific Rim if the tsunami risk is judged to be high enough. The warnings have been effective in reducing the number of casualties from tsunamis in the Pacific. However, the nations lining the Indian Ocean, facing a number of other pressing problems, had not judged the risk of deadly tsunamis high enough to warrant the implementation of a tsunami warning system in that basin—the last significant tsunami had followed the 1883 eruption of Krakatau, more than 120 years before the 2004 disaster. Several nations are now preparing to implement a warning system.

Second, officials in many developing nations lack the personnel and training needed to respond quickly to an emergency. In the case of the Sumatra earthquake, scientists elsewhere noted the risk of a tsunami, but had no officials to call in the affected nations to warn of the impending disaster. Even as the tsunami swept away from Sumatra, officials within the affected region failed to notify their colleagues to begin evacuating people at risk along the coast. Even if officials had notified one another, there is no guarantee that they could have reached enough of the at-risk populations with warnings, as communication networks are sketchy in parts of the affected region.

Third, many developing nations lack adequate transportation networks to mount effective evacuations from at-risk areas (this problem is not restricted to developing nations, however). Many people fled on foot in the face of the tsunami waves crashing onto the shore throughout the area affected by the December 26, 2004, disaster. Even boat traffic was disrupted in some areas close to shore. But some nations have improved emergency procedures substantially following devastating events. Bangladesh, where hundreds of thousands have died in the past century following floods and tropical cyclones, has improved evacuation procedures and shelter facilities. Death tolls from more recent floods and tropical cyclones have been considerably reduced as a result.

Fourth, in developing nations where basic civil services are underdeveloped, a disaster such as the Indian Ocean earthquake and tsunami can have long-lasting effects on the survivors. Contaminated water supplies can trigger outbreaks of diseases like cholera. Interrupted food supplies can trigger famines. Public health facilities can be overwhelmed by the initial casualties of the disaster. As people fall ill due to inadequate food or fresh water, and as interrupted transportation and communication networks prevent re-supply and/or reconstruction of health

facilities, public health networks may collapse, adding to the casualty figures following a disaster. Improved medical care in many of the nations affected by the December 26, 2004 disaster, coupled with a swift international response, appears (at press time) to have staved off the type of epidemic that many experts initially feared would follow.

**NDI, NI JOHN FRU**

Ni John Fru Ndi (b. 1941), the chairman of Cameroon's Social Democratic Front (SDF), was born in Baba II in the North-West Province. He attended the Basel Mission and Native Authority primary schools before proceeding to the Lagos City College in Nigeria. Entering the labor market early, he worked with the West Coast Fisheries and as a traffic officer at Ikeja Airport (Nigeria) between 1957 and 1960. Thereafter he served as the assistant manager of Eastwood and Chaples Company in Lagos and as director

of Sameday Cleaners in Ibadan (Nigeria). He returned to Cameroon in 1966 and became a hawker of fresh vegetables and eventually started the Bahemo Vegetable Society. Following a six-month training course in bookselling with the British Council in Britain, he opened the EBIBI Book Center in Bamenda. He has been the chairman of the Social Democratic Front (SDF), the main opposition party in Cameroon since its formation in 1990. His social ascendancy was fostered when he served as president of an elite division football club, the PWD, between 1979 and 1988, and president of the Lions International Club (Bamenda branch) between 1987 and 1988.

Endowed with this capital, he ran for Parliament for Mezam Central on the "khaki" list for the Cameroon People's Democratic Movement (CPDM) in 1988 and lost. That these elections were rigged in favor of the "white" list is evidence of the reticence of the ruling oligarchy. A commitment to promoting transparency and the rule of law caused Ndi and others to form the SDF, which was launched in May 1990 at a historical juncture when fear was the only mode of consciousness. Because of the police rule of law, six people were killed at the launch of this party. This thrust Ndi into national prominence and his popularity grew in the face of his defiance of the authoritarian regime and an unflinching decision to "live with the truth." Fondly referred to as "Pa" or "the Chairman," he contributed enormously to enriching Cameroon's protest repertoire with obtrusive modes of protest. Prominent among these was the ghost town operation (*villes mortes*), a form of civil disobedience that brought the country to a complete halt in an attempt to force the government to introduce democratic reforms. That the opposition in most other African countries adopted these modes of protest shows that it is constituted of people who believe themselves to be mobile. Staying the course, unlike most Cameroonian opposition leaders who joined the government with a view to practicing the "politics of the belly," further helped to enhance his stature. He is seen as having paranormal powers because he has survived several government attempts to kill him.

As candidate of the Union for Change, a group of opposition parties, he supposedly won the March 1992 presidential elections that were flawed. And since the Supreme Court, while acknowledging this, still declared Paul Biya the winner, Ndi was for a long time considered the legitimate president. It is with a view to ending this apparent bicephalism and curbing post-electoral violence that the government declared a state of emergency in the North-West Province and placed him under house arrest. This decision brought the women back into the public sphere as it resuscitated the *takembeng*: Consisting mostly of

old women, dubbed the “Amazons of the SDF,” they successfully built a defense perimeter around Ndi’s house, thereby preventing him from being arrested by the police force. This signaled an engendering of the struggle for democratic change and the fact that old modes of protest can be used successfully to confront new modes of violence.

Unlike most other Cameroonian politicians, Ndi has remained connected to the people and has resorted to the use of unobtrusive modes of protest. He led cleanup campaigns in towns where the SDF had won the 1997 municipal elections, defended the interests of hawkers who abound in the informal sector, and has been in the forefront in the fight against HIV/AIDS in Cameroon. In short, he has been involved in confidence-building measures needed to revalorize a population whose productive capacities have witnessed a free fall, and is not willing to consign its future to a government that suffers from a legitimacy deficit. Believing in a politics of inclusion, he has been involved in Gandhi-like treks to inaccessible places, which have not known the state except for its extractive capabilities, around the country. This overwhelming presence in the public sphere has caused his house to be dubbed as the “Ntarikon palace.”

To foster the probability of alterations in the October 2004 elections, he joined other opposition parties to form the National Council for Reconciliation and Reconstruction (NCRR). He was not chosen as its standard bearer and decided to go it alone. Criticism of this decision by some voices in the opposition and civil society showed that his popularity, though not depleted, had waned. In the elections that the SDF and some independent observers considered rigged, Ndi came in second to Paul Biya with 17%. To a large extent, he is still considered an emblematic figure to the powerless whom he has helped to empower.

### NEHRU, JAWAHARLAL

Jawaharlal Nehru (1889–1964), also addressed later on as *Pandit* (a learned person), was raised in an affluent upper-caste family in India. His father was a lawyer, a leader of the Indian liberation movement, and a major influence on Nehru. Nehru got his degree at Cambridge and studied law in London. He returned to India in 1912 and started his law career. In 1916, he met Gandhi, whose name had already become famous in India because of his successful political victories in South Africa. Gandhi became an ally, a political mentor, and a father figure.

In 1929, while Nehru was the president of the Congress Party (Indian National Congress), the resolution for full independence of India was passed. He was elected president of the party six times and became the most important figure in the Indian liberation movement, next only to Gandhi. He was imprisoned nine times in all, for a total of more than nine years, and wrote extensively while in prison.

Elections were held in 1937 all over India and the Congress Party swept the legislative seats. The Congress Party passed the “Quit India” resolution in August 1942. The British agreed to give independence to India, provided the Congress Party work out a solution with the Muslim League party representing the Muslim minority in India and resolve their differences. From 1946 Nehru served as prime minister in the interim government with Lord Mountbatten as the governor general.

India gained freedom in 1947. Nehru had assumed the office of India’s first prime minister in the interim government in 1946 and continued to serve in that position. Nehru resumed his positions as prime minister and minister of external affairs after the Congress Party won the elections in 1950. He continued with his platform of industrialization and socialization of industry and commerce.

The policy of the British government, often described as “divide and rule,” succeeded in developing animosity among the different religious groups and castes in India. Though he was against the partitioning of India, the riots in India in the months prior to independence convinced Nehru that it was necessary in order to avert a possible civil war. The partition resulted in mass migration of more than 10 million people and a loss of more than two hundred thousand lives in India and Pakistan.

Nehru’s vision was the attainment of national independence first and foremost. In addition, it also included a secular democratic government, economic and social development, social reforms, nonalignment of the third-world countries, and international peace. After Gandhi’s assassination in 1948, Nehru carried

on as leader of the country. He wanted to modernize India through government-owned, large-scale projects such as the construction of steel mills and the building of dams for irrigation and electricity. He had to seek capital for these developments from outside the country, especially from the Soviet Union. More than six hundred independent princely states were brought under the rule of the Indian government during his administration. Nehru also strongly encouraged the development of science and technology, and the establishment of the atomic energy commission and now-famous technological institutes. Throughout his career he tried to improve the social and economic situation of minorities, including women, untouchables, Muslims, and the agrarian rural poor, but only succeeded partially. He was also a believer in a secular parliamentary form of democracy. He also believed in socialism, though he was aware of the drawbacks of the system.

Nehru straddled both the Indian and Western worlds and was an internationalist at heart. Nehru, the best-known politician to emerge from any colonial country, exerted an influence on the world scene far beyond India. He participated in the Bandung conference in 1955 as one of the major leaders of the Third World nonalignment movement along with Nasser of Egypt and Tito of Yugoslavia. His doctrine of *Panchsheel* or *Panchshila* (five principles) of peaceful co-existence and non-aggression was endorsed by China and adopted with modifications at the Bandung conference. He set an example for many developing countries by agreeing to join the British Commonwealth, with India participating as an independent nation.

On the other hand, Nehru has also been described as indecisive and vacillating. He was not always firm or practical in his policies and actions, and was not keenly interested in day-to-day administration. In spite of his knowledge of the international scene, he was quite naive in his implicit trust of other countries. For example, in 1962, India was caught unprepared when the Chinese attacked occupied parts of the country. This was perhaps the most severe blow to his foreign policy and personal reputation as a leader, as Nehru had championed the entry of China into the United Nations. Many leaders in the Western countries thought that the Indian policy of non-violence and nonalignment was hypocritical in view of the police action India initiated against Goa, a Portuguese territory in India.

Nehru's tenure as a prime minister has been criticized by many Indians because of the resultant slack in economic growth. He has also been blamed for the unresolved Kashmir problem. The country is still riddled with communalism and casteism in spite of

the official policy of secularism. India has developed atomic weapons though it is in favor of world peace.

Nehru died after his last stroke in 1964, but many of his visions for India's future still live. India, for example, is still the largest functioning democracy in the world. A political dynasty was another unintended legacy of Nehru. His daughter, Indira Gandhi, and his grandson Rajiv Gandhi have both served as prime ministers of India.

## NEOCOLONIALISM

As a term, colonialism has been explained as the policy of a nation seeking to extend or retain its authority over other peoples or territories of another nation. In this regard and on the basis of its core meaning, neocolonialism—or “new” colonialism—is the desire to continue the same policies of the colonial powers by a new set of administrators trained and educated by the colonialists, long after they have quit the region.

In other words, neocolonialism is the continuation and retention of the same policies and permanent interests of the colonialists along with the method of control that originated and was implemented during colonial rule. In addition, this is continued with the same zest and dedication by the subalterns. Simply put, neocolonialism has been defined by the *Webster's Encyclopedic Unabridged Dictionary* as “the policy of a strong nation in seeking political and economic hegemony over an independent nation or extended geographical area without necessarily reducing the subordinate nation or area to the legal status of a colony.”

With this in mind, the agents of “neocolonialism” provide a justification for the marginalization of the natives' heritage in their educational system and replace it with colonial norms and method of control.

Neocolonialism continues to oppress the native people. It distorts, disfigures, and destroys the country's connection with its past and its history along with its language and its ties to the native soil. Thus, neocolonialism is a process by which old colonial policies are culturally constructed and ideologically loaded by recreated historical information that is shaped to benefit the sociopolitical and socioeconomic mold designed to allow the colonial philosophy and mission to flourish that were laid down at the time of colonization. Interestingly enough, this newly constructed mission statement is hammered down and implemented by the so-called cadre in the civil servants established and encouraged from among the native population to promote the grand design and methods of the colonialists.

Neocolonialism in its initial task makes sure to sustain and keep the focus on the destruction of the people, the land, their history, and national heritage, prior to colonial times, and rewrites the glories of pre-colonial days by replacing them with its so-called "achievements" in the colonial era. Therefore, the past and its heritage is labeled as a hindrance to progress and for its basic nature is weeded out as an age of ignorance. In such an environment the seeds of Macaulayism championed by Thomas Babington Macaulay (1800–1859) were sowed in earnest during English India. Macaulay was a British essayist and historian who worked in India from 1834–1838 laying the foundation of English rule in South Asia. With this vision, he looked forward to leaving a permanent impact and a set of teeth in the manner that colonialism will continue to thrive and function as machinery long after the mother country has left the landscape. Thus, in order to understand the true nature of the idea behind the creation of "neocolonialism," we need to study the philosophy and the vision of Macaulayism in its details.

Lord Macaulay's "Minute on Indian Education" and its total political support by Lord William Bentinck, the then-Governor General of Bengal, was stated in these words: "I give my entire concurrence to the sentiments expressed in this Minute." In fact, "Macaulayism" became the official policy of British rule in India and it contained the recipe of what came to be known as "neocolonialism."

As the president of the Committee of Public Instruction in Bengal in 1834, Macaulay declared that "a single shelf of a good European library is worth the whole native literature of India and Arabia" (Anderson 1991). Furthermore, John Clive reported that Macaulay proposed that an immediate halt be put upon the printing of Arabic and Sanskrit books. Macaulay sought to curb native civilization and culture at its very roots. He also recommended that both

Sanskrit College in Calcutta and the Madrassa should be closed down. Thus, instead of engrafting English to an already existing Arabic/Persian/Sanskrit foundation, Macaulay advocated total Anglicization by demanding complete substitution of native languages by English as a medium of instruction. Macaulay as an imperial agent was scheming to destroy native history and creating a space for neocolonialism as a matter of governance beyond the age of imperial rule in English India.

Macaulay believed, and wanted others to believe with him, that the West or the colonial Masters were not only superior to the natives in language and heritage, but will produce and enhance their lives more than their backward life styles and ways of thinking. In 1836, Macaulay outlined his plans for colonizing Bengal, wherein he intended "to turn idolaters 'not so much into Christians, as into people culturally English'" (Anderson 1991, p. 91). This is to say that Macaulayism is the mouthpiece of colonialism, and in this case, English colonialism. However, it must be noted that Macaulay did not recommend or envision neocolonialism for Ireland as he did for India. Needless to mention, the nineteenth-century Anglicists had already implemented in Ireland what he was trying to implement for English India. Interestingly enough, the "backwardness" of Ireland Macaulay blamed upon the Catholic Church and not the oppressive laws of colonialism. For him the natives in Ireland were responsible for their woes and hardships, not colonial England. Macaulay must have felt that it was the failure to implant "an English education" and the permission to allow a native administrative system that had kept the Irish people attached to their religion. Nevertheless, it must be pointed out that unfortunately for the English policy, English education failed to transform both the Indians and the Irish people into nations that were "culturally English."

This is not to deny the creation and the existence of cultural elites in both these countries. Elites who have been transformed into what are called *Bhodro Lok* (gentlefolk) in South Asia and the ruling elites in Ireland; however, their influence was not strong enough to alter the lifestyle and overall condition of the natives in their respective nations. The formation of these people as the ruling bastion and the promotion of their idea of civil administration is what can be termed as "neocolonialism."

In India, "Macaulayism" or "neocolonialism" merely succeeded in creating a dent because of two reasons: (1) between the Indian War of Independence in 1857 and India's ultimate freedom in 1947, the British ruled for only ninety years; and (2) "Macaulayism" created such a siege mentality among Indian

## NEOCOLONIALISM

nationalist writers that they mostly wrote in their native languages.

Neocolonialism is an extended arm of the colonial powers, serving the interests of the colonies: be it England, France, or Germany (to name just a few). In the post-colonial era, other steps to carry the ball of colonialism were seen first in the formation of a federation of former colonies as was seen in Australia and New Zealand in 1931. Another form was seen in the construction and the promotion of camaraderie in the British Commonwealth of Nations after the demise of the British Empire as a sociopolitical power and economic entity because of the ultimate effects of the Second World War in 1945. Today, there are fifty-four former nations of the British Empire who have agreed to form the British Commonwealth. This is a group of nations and dependent territories that are united by a common allegiance to the British Crown. Only Ireland, it must be pointed out, refused to join the Commonwealth. Obviously, these nations are associated by their own choice of common social, political, and economic interests with the former power of colonial England. In all candor it can be acknowledged that the ruling forces in almost all these nations have been trained and educated by the colonial machine, and as stated earlier, formed the fabric of colonialism.

This entire notion of “neocolonialism” as a dominant force can be better understood by the speech of Frantz Fanon at the Congress of Black African Writers, in 1959, in which he said: “Colonial domination ... very soon manages to disrupt in spectacular fashion the cultural life of a conquered people. This cultural obliteration is made possible by ... expropriation, and by the systematic enslaving of men and women” (Fanon 1959).

This “systematic enslaving” of individuals that Fanon articulates refers to the continuation of mental slavery of the people of the so-called free and independent nations that were granted political freedom in the late 1940s.

In this regard it becomes crystal clear that Thomas Babington Macaulay’s firm belief in colonial “Eurocentric education” and its power of metamorphosis in eternally changing the mindset of the native peoples is finally proven true. The dream and desire of neocolonialism as to eradicate and replace that mindset with colonial doctrines become a harsh reality.

Neocolonialism is therefore, as Fanon concludes in his speech with reference to the colonial experience in Africa, the product of a national culture under colonial domination. According to Fanon, “a national culture under colonial domination is a contested culture whose destruction is sought in systematic fashion.... There is no taking of the offensive and no

redefining of relationships” (Fanon 1959). Colonial policies are continued by the natives as administrators because in this post-colonial phase even the indigenous people feel that the colonial policies are not only superior but they are the only road to progress.

## NEOLIBERALISM

Neoliberalism is one of the most polarizing terms in development. There are very strong feelings both for and against neoliberalism that cut across the spectrum of economic, political, and social issues by groups both in the developed and the developing world. Neoliberalism evokes such strong concerns because it most generally describes the controversial economic policies that countries have adopted across the globe. This set of policies is seen by some as the only possible avenue of economic development, and by others as a most exploitative and repressive set of policies.

Although neoliberalism is sometimes conflated with US foreign policy and fragile democracies in the developing world, neoliberalism is more accurately defined as a set of economic liberalization policies that are expected to lead to both economic efficiency and growth. Neoliberal reforms have often occurred in two stages. In the first stage, designed to control inflationary pressures and create accurate prices, government spending is cut and the money supply is reduced. In addition, the economy is opened up to foreign trade and investment. Tariffs and quotas on imports and taxes on exports are lowered or eliminated. Restrictions on the flow of investment are reduced or eliminated. In the second stage, state-owned enterprises are privatized, and regulations

and institutions regarding the market are developed, such as strengthening contract laws. Financial and fiscal reforms also are pursued, including the attempt to raise taxes and create stability within the banking system. In addition, the country starts to enter into international trade agreements to expand reciprocal access to free markets. Not surprisingly, this second stage of neoliberalism, which includes creating clear results such as unemployment from privatized companies and attempting to pass new tax legislation, have met with fierce resistance, both on a domestic and international level.

The origins of neoliberalism can be traced in large part to the writings of Friedrich Von Hayek and the group of University of Chicago economists, particularly Milton Friedman. The basic orientation of these economists is to point out the optimality of allowing markets to determine economic outcomes. In tandem with this aspect, they have a generally profound skepticism of any government intervention into national economies. However, unlike the classic “liberal” thought of Adam Smith and David Ricardo, neoliberal economists see that limited government intervention in order to ensure the smooth functioning of markets and to provide for “externalities” is necessary. Neoliberal thought thus generally sees the government’s role in economic terms as regulating markets, such as providing transparent price information, and ensuring the smooth functioning of commodities markets. Neoliberals concede that there are some areas, such as providing for national defense, in which the government must take the lead.

In the developing world, the neoliberal revolution really began in Chile in 1975, when “the Chicago Boys” became the primary government advisors. They shaped a new economic program in line with the education they received at the University of Chicago in the 1950s and 1960s on an exchange program. One of the main contributions of Chicago thinking was a new approach to fighting inflation, which had previously followed a more Keynesian type of analysis. When, in 1973, the Organization of Petroleum Exporting Countries (OPEC) successfully raised world oil prices to four times what they had been, the international economy experienced a new situation of both economic recession and inflation (rising prices), called at the time “stagflation.” The Chicago line of thinking focused on inflation as the central obstacle to creating sustainable economic growth. In Chile, the policy prescriptions were carried out in the guise of a wide-ranging monetary policy-based “shock treatment” in 1975. While the program was successful in cutting inflation, it was accompanied by a severe recession and unemployment, a combination that continues to haunt neoliberal policies today.

By 1977, with inflation under control, the Chilean economy began to rebound. The Chicago Boys then introduced a broad-ranging program called the “Seven Modernizations.” The new modernizations moved beyond controlling government spending and tightening the money supply to embracing wide-scale privatizations and liberalization of trade and investment in Chile. These initiatives reduced tariffs and subsidies and taxes on investments so that foreign investors and exporters could have relatively open access to the Chilean economy. The new policies also weakened the labor code, and the government began a series of experiments in targeting social welfare spending to those most needy. The move toward reform of the pension system in the early 1980s in Chile, as well as the boom in new exports, made Chile a great “success story” of neoliberal policies that helped them spread throughout the developing world.

When oil prices rose again in 1979, the United States and the United Kingdom were hit especially hard by a new round of stagflation. The elections of Ronald Reagan and Margaret Thatcher in 1980 to leadership of their respective countries brought the neoliberal “revolution” to the international arena. When the US Federal Reserve severely raised interest rates in 1982 to control inflation, the resulting liquidity shock was felt throughout the already reeling developing world. The US program to “whip” inflation fed directly into a very severe external debt crisis that continues to plague developing countries today. Some countries owe up to a third of their national annual production (GNP) in debt.

In the 1980s, with the United States and the United Kingdom at the forefront, the wider version of neoliberalism, including not just control of inflation, but also privatization, deregulation, and liberalization of investment and trade, became the dominant paradigm, or way of thinking, across the globe. With the debt crisis looming over them, developing countries had little choice but to cut back severely on government spending, open the economy to new investment, increase exports, and attempt to control runaway inflation. As a result, neoliberalism swept across the globe in the 1980s, leading Francis Fukuyama to coin the 1990s as “the end of history,” in the sense that free markets and democracies were seen as the best ways to run politics and economics. Country after country, from socialist strongholds Ghana and Tanzania in Africa to India in Asia, adopted neoliberalism as their dominant perspective. For a brief while, it did appear to be the last wave of history, as the Soviet Union and the possibility and promise of creating Communist societies seemed to disintegrate. With the conversion of former Communist countries such as China and Vietnam to the market-based fold, the

phrase TINA (there is no alternative) seemed apt for describing the revolution in ideas. Populist leaders such as Fujimori in Peru, Menem in Argentina, and Rawlings in Ghana as well as the rise to prominence of finance ministers such as Cavallo in Argentina and Singh in India signaled the widespread support of neoliberal reforms in the early 1990s.

Neoliberalism is attractive to developing country policy makers as it gives them a more positive view of these wholesale changes in their economies. Neoliberal thinking has it that the construction of competitive private markets yields up new efficiencies. Thus, the productivity rate of newly privatized economies should be on the rise. Moreover, neoliberal thought on the optimality of markets extends to the efforts toward international integration. So, the move toward the European Union, the North American Free Trade Agreement, and the MERCOSUR pact in the Southern Cone are seen as very positive developments that create larger, more competitive markets. The ultimate beneficiary is the consumer who experiences lower prices everywhere.

To be sure, there seem to be a number of improvements in the developing world as a result of the neoliberal revolution. First, there is much more accountability on the part of governments. Governments are now keenly aware of their need to balance their budgets. Second, as governments have stepped back from interference with markets, there is arguably a considerable dropoff in corruption and disincentives for new types of production. Developing countries' government-run companies in the post-World War II period often became behemoths of political patronage and corruption, with huge payrolls. Third, in a large number of developing countries, inflation has been brought under control for the first time in thirty years. Inflation made long-term investment decisions extremely difficult, and led rich classes in developing countries to put their savings in foreign countries and currencies. This phenomenon, known as "capital flight," meant that a developing country had a very small pool of its own domestic capital available for investment. Since the middle and particularly the upper classes were able to "hedge" in this and other ways against inflation, the poorer classes really paid the heaviest price. Fourth, by the end of the 1970s, with industrialization experiments running out of steam, developing countries found themselves in many cases with inefficient and uncompetitive domestic industries. Moreover, neither these highly protected industries, which often relied upon imports of foreign inputs, expertise, and parts, nor the often regressive and highly taxed agriculture sector, were able to create the new export productivity to pay off the debt and to grow. By contrast, the export sector in many

developing countries has become dynamic and more diversified, reaping the benefits of new foreign investment attracted by the more inviting neoliberal policies.

While there have been some important benefits from the turn to neoliberal policies in the developing world, there remain a number of important, purely economic issues as well. Foremost, the renewed growth that has occurred in the developing world has been notoriously uneven. There has been a growing *relative* inequality gap between the rich and the poor, both internationally and in the developing economies. The growth has also benefited certain sectors, namely those associated with exports. Neoliberalism does not seem to have made a dent into the problems of either unemployment or access to education and health for most developing countries' citizens. As privatized state-owned companies lay off thousands of workers, there has been no sign that export growth can absorb any significant proportion of these idled employees. In several cases, such as that of Menem in Argentina, the privatization process was tainted with scandal. Privatization and investment liberalization have not made a dent into the huge external debt burdens of many developing countries. Moreover, as we saw in the 1980s and 1990s in a series of financial crises, the developing world finds itself subject to highly volatile international financial flows. Thus, neoliberalism has not yet delivered on the sustained and stable growth that it promises.

In most developing countries, there has been a strong backlash against some aspects of the neoliberal program in the form of street protests and political mobilization. This resistance has held up some key aspects of the neoliberal reform, such as lifting price controls on basic food items, in a number of countries. Some countries have been able, furthermore, to grow faster and attract more investment than others. For example, while the World Bank and the International Monetary Fund (IMF) have anointed Ghana as a great example of the success of neoliberal policies, there has been little indication of long-term investment in the country. Indeed, we might say that the results of neoliberal policies have largely been to move Ghana and other developing countries back toward neocolonial reliance on primary product exports, such as cocoa, which they sought to change with their state-led industrialization over the last thirty years. As a new stagnation of growth and the weight of adjustment from the state-led system hits developing economies, we are seeing signs of increasing mobilization against neoliberal policies, such as in Argentina.

While there is strong criticism of neoliberalism, there is as yet no real alternative that has been forwarded to replace it. The alternative of socialism

seems to have died with the Cold War. Moreover, the developing world remains racked with massive external debts and the need and desire to obtain trade access and investment from the First World. International organizations that regulate access, such as the World Bank, the IMF, and the World Trade Organization, are thus seen as the enforcement agencies for the neoliberal order. To be sure, the First World has much greater leverage on the developing world because of the economic context of trade and investment. However, there are a number of interesting contrasts in both the level and type of response to neoliberalism across the developing world. For example, Malaysia recently instituted capital controls to slow capital flight in the wake of the financial crisis in Asia. The development of the MERCOSUR treaty marked a South–South integration scheme among South American countries that is in sharp contrast to the NAFTA treaty between Mexico, the United States, and Canada. There are a number of countries who have not fully privatized their state-owned sector, or who have found other ways to intervene in their markets. These countries are really not that different from First World countries who, despite a general neoliberal orientation, continue to heavily protect and subsidize strategic sectors of their economies, such as agriculture, high technology, and health care.

In both the developing and the developed world, the retreat of the state from economic issues under neoliberalism has left societies reeling. With uneven and volatile growth in much of the world, and a new feeling of vulnerability, there is a strong and growing countercurrent to the widespread acceptance of neoliberalism. The international countercurrent stems in part from the dismantling of the social safety nets that have accompanied neoliberal policies. Moreover, the development of new private markets has not always led to lower prices and higher levels of competition. Indeed, there is strong evidence that key markets in several developing markets are inefficient and uncompetitive, putting consumers at the mercy of a dominant foreign or domestic private monopoly or oligopoly. As a result, a spate of new moderately anti-neoliberal candidates began to be elected in the developing world by the late 1990s, particularly in Latin America. These include Gutierrez in Ecuador, Lula in Brazil, Chavez in Venezuela, and Kirchner in Argentina. In India, the party associated with the neoliberal reforms of the 1990s, the BJP, lost to the Congress Party in elections in 2004. An international social movement leading to protests of international trade summits and international organizations such as the WTO and World Bank became an organizing force for anti-neoliberalism across the North

and South. These groups organized a World Social Forum as an alternative to the business-oriented World Economic Forum. However, the movements seems to lack a clear alternative strategy that could unite the diverse groups and lead to new policies.

The most recent neoliberal response to some of these accusations has been, in part, to recognize their merits. International organizations that back neoliberal policies began in the last decade to place greater emphasis and resources on social funds during adjustment and to encourage local participation at the grassroots level, generally through non-governmental organizations (NGOs). Moreover, means tests and “workfare” programs seek to create new incentives for those who need temporary social help to become active again in the labor market. Fiscal reform to create more effective and progressive tax systems is high on the agenda of almost every developing country. Last but not least, there are a number of new initiatives to develop “civil society” and “governance.” These initiatives recognize the importance of developing strong, independent, and fair markets and institutions that are responsive to, and include input from, the public. The outcome of these experiments at modifying the neoliberal model for broader sustainability will be fascinating, to say the least.

### NEPAL

The Kingdom of Nepal, situated in the centre of Asia, is a small country between the world's most populated countries: China and India. Nepal is a landlocked country, surrounded by India on three sides

and by China's Xizang Autonomous Region (Tibet) on the north. Nepal covers an area of 56,827 square miles and is divided into four topographical zones: the Great Himalayas, the Middle Himalayas, the Outer Himalayas, and the Terai. The highest is the Great Himalayas Zone, in northern Nepal, in which are located most of the world's highest mountains, among them: Mount Everest (29,035 feet), the highest mountain in the world; Mt. Kangchenjunga (28,169 feet); Mt. Lhotse; and Mt. Makalu among others. To the south are located the Middle Himalayas, with peaks averaging less than 9,900 feet, and then comes the zone of the Outer Himalayas, with an average elevation of about 3,300 to 6,600 feet. The most southern part of the country is the Terai zone, a generally flat, fertile lowland.

Because of the shape of its territory and the height changes in every topographical zone, Nepal has tremendous climate variations. The Terai region presents subtropical weather, while the northern and central parts of the country present an alpine climate with cool summers as well as severe winters. Summer (June–August) and late spring (March–May) temperatures range from 83°F in the hill regions to more than 104°F in the Terai. In winter, average minimum and maximum temperatures in the Terai range from 45°F to 74°F. Much colder temperatures prevail at higher elevations. The Kathmandu Valley, situated in the Middle Himalayas zone, ranges between 67°F and 81°F in summer and between 36°F and 68°F in winter. Average annual precipitation ranges from seventy inches in the east to thirty-five inches in the west.

The population is estimated at approximately 24.7 million, with an annual growth rate of 2.2%. As of 2001, the capital city, Kathmandu, has a population of about 800,000. Nepal is mainly a rural country having only 15% urban population. The official religion and language are Hinduism and Nepali, respectively. However, over twenty distinct languages are also spoken, with English also widely understood.

As early as 1790 the Nepali tried to extend their territory into Tibet, but the Chinese invaded the country and the Nepali had to ally with the British to fight the invaders; however, they were defeated. Nepal continued as an ally during other conflicts and after World War I, having fought as soldiers for the British. In 1923 Nepal and Great Britain signed a treaty of friendship, which granted Nepal's independence. In 1948 Nepali Prime Minister Padma Shamsheer Rana announced the first constitution of Nepal. Nepal already was a constitutional monarchy.

Until 1951, members of the Rana family held complete control of the government. That year Bisweswar Prasad Koirala became the first non-Rana prime

minister for more than one hundred years. In 1959 the first free elections were held and a new constitution inaugurated, although in December 1960 King Mahendra banned all political parties and suspended the Constitution until it was restored in 1962. In 1972 King Mahendra died and was succeeded by Prince Birendra.

In May 1980 a referendum was held to give the people a choice between a reformed version of the existing system or a multi-party-based system, which resulted in the return of the Rashtriya Panchayat. In February 1990 violence erupted over demands by ten thousand civilians for an end to the Rashtriya Panchayat. Police and the Army responded and around fifty people were killed, following which the king announced that a new constitution would be drafted that would allow for a multi-party system of government. A Maoist insurgency, launched in 1996, gained traction and threatened to bring down the regime. In 2001, the crown prince is believed to have massacred ten members of the royal family, including King Birendra and the queen. In October 2002, the new king dismissed the prime minister and his cabinet, after which the Parliament was dissolved and elections could not be held because of the ongoing insurgency. As of this writing, the country is governed by the king, Gyanendra Bir Bikram Shah, uncle of the assassinated Birendra, and his appointed cabinet, which has negotiated a cease-fire with the Maoist insurgents until elections can be held at some unspecified future date.

The Nepali economy has traditionally been based on livelihood and agriculture, mainly in the production of rice, corn, and wheat. The industrial sector is less important but constitutes approximately 20% of the GDP. The primary industries include tourism, and carpet and textile production, along with jute, oilseed, cement, and bricks. However, industry only accounts for 3% of the labour force, while agriculture occupies 80% and 40% of the GDP. The rest of the GDP is from the service sector. The total GDP for the year 2004 was estimated at \$38 billion, and per capita income was around \$1,400.

Exports consist mainly of carpets, leather, and jute goods; imports consist of petroleum products, machinery, and other equipment. Major trade partners are India, China, and the United States.

The unemployment rate is around 47% and nearly 42% of the total population lives below the poverty line, with further disadvantages experienced by women and people of particular ethnic and socioeconomic groups.

One of Nepal's major social concerns/issues is the serious lack of available health care and poor access to education. According to the United Nations Development Program (UNDP), Nepal is rated as a

medium developed country but at the border of becoming a low developed one (UNDP 2004). Nepal's maternal mortality rate supports this fact. It is the highest in the South Asia region at 740 per 100,000 live births (2000). The infant mortality rate has improved considerably in the last three decades. In 1970 it was 165 deaths per one thousand live births but by 2002 it had decreased to sixty-six (UNDP 2004). Consequently, with the improvement in the infant mortality rate, the life expectancy at birth also got better, although nowadays it is one of the lowest in South Asia. It is currently fifty-nine years both for male and female, much better than in the 1970s when it was forty-six and forty-nine, respectively.

The gross school enrollment ratio has also advanced a lot in the last thirty years, changing from 26% of the population in 1975 to approximately 80% as of this writing. However, the adult literacy rate is very low (44%, 2002 est.).

As of 2005, the World Bank has undertaken several financial programs to help the development of the health, education, and economic sectors.

## NETHERLANDS ANTILLES

The Netherlands Antilles (*Nederlandse Antillen*) are five islands in the Caribbean under Dutch control. While they are not a colony in the traditional sense (they are politically autonomous for domestic affairs), their foreign affairs are controlled by the Netherlands, which provides for their defense needs. Until

1986 the Netherlands Antilles also included the island of Aruba, but in that year Aruba became a separate unit (an “autonomous member”) of the Kingdom of the Netherlands. The people of the Netherlands Antilles are citizens of the Netherlands, as are residents of Aruba. Curaçao and Sint Maarten are to become independent in this way as well, but dates for their change in status have not been set.

The islands of the Netherlands Antilles are geographically separated into two groups. The western islands, Curaçao and Bonaire, are located approximately 280 kilometers northwest of Caracas, Venezuela. These islands, along with Aruba, are commonly known as the A-B-C islands from the first letters of their names. The geography of these islands is a mixture of their dormant volcanic origins and thousands of years of coral growth, resulting in higher elevations than the other islands in the group. Natural forces have brought an abundance of plant life to these islands, and erosion has created the beaches, which have become part of the attraction for tourists in the modern era.

Prior to the arrival of Spanish explorers at Curaçao in 1499, the A-B-C islands were inhabited by the Caiquetios, related to the Arawak Indians of what is now Venezuela. The first Europeans to reach these islands were led by Alonso de Ojeda, whose chief pilot on this voyage was Amerigo Vespucci. The reports of this first voyage contain some contradictions, but in any case the islands were explored to some degree in the summer of 1499. The names of the A-B-C islands changed many times during the first years of their exploration; Curacao had first been reported as the *Isla de los Gigantes* (Island of the Giants) based on Vespucci's reports of the inhabitants (he also noted that the people of Bonaire were tall); later the island was referred to by many derivations, which may have come from the Spanish (*corazón*) or Portuguese (*curazon*) word for “heart.” Bonaire was shown on early maps as *Isla de Palo de Brasil* (Brazilwood Island).

Other than brazilwood, which was used by Europeans to create a red dye for cloth, little else considered to be of value was found by the Spaniards. The native populations of Aruba, Bonaire, and Curacao was captured in the early 1500s and taken to the larger Spanish island of Hispaniola as slave laborers, but within a few years some of them were brought back to their native islands to serve as a workforce for the Spaniards who had taken control of these islands. In addition to manipulating the human population of the A-B-C islands, by the 1530s the Spaniards had introduced European work and farm animals (goats, pigs, cattle, and horses) as well as non-native plants for farming.

The smaller islands of Saba, Sint Eustatius, and Sint Maarten (the northern half of which is called St. Martin and is claimed by France as part of the “overseas department” of Guadeloupe) are located approximately 260 kilometers east of Puerto Rico, some eight hundred kilometers northeast of Curaçao. Saba, Sint Eustatius, and Sint Maarten, and are part of the islands known in English as the Leeward Islands of the Lesser Antilles, but are known in Dutch (*de Bovenwinden*) and Spanish (*las Islas de Barlovento*) as the Windward Islands.

Unlike the A-B-C islands, these Leeward Islands were not inhabited when first visited by Europeans. It is believed that the native Arawaks had been conquered by the more warlike Carib Indians. These smaller islands had less attraction to the European colonizers, and rather than living resources (brazilwood or slaves), the first Dutch interest in Saint Martin in 1631 came from the Dutch need for salt, which was used as a preservative by the Dutch fishing fleet. However, this Dutch presence so close to Spanish territories led to a Spanish conquest of Saint Martin in 1633. The Spanish held the island until 1648, and upon their departure the island was retaken by the French on the north and the Dutch on the southern side.

European politics continued to drive Caribbean activities throughout the seventeenth and eighteenth centuries, and those islands with significant populations were fortified. The American Revolution added an additional player in these moves, with the French allying themselves with the Americans and using ports in the Caribbean for their activities. The Americans sought to gain the Netherlands as a European ally as well, and when the British heard of this they sought to end Dutch trade with the Americans. Curaçao and Sint Eustatius had been major trading ports, which provided war supplies for the American revolutionaries, and in 1781 the British fleet attacked the port of Sint Eustatius to end its trade with America. In the years to come, Holland would become America’s major source of foreign loans.

The French Revolution led to renewed conflict between England and France, and this affected the Netherlands and its colonies as well. The governments of France and the Netherlands drew closer, but on Curaçao support for the French was seen as a source of potential trouble. The governor of the island chose to remain neutral, placing him at odds with French naval ships in the Caribbean. This led to a French entry into Curaçao’s capital city of Willemstad in 1800, but this was ended by a British naval intervention (and French withdrawal), and Curaçao became an English possession for the next three years. The treaty ending the conflict between France and

England (the Peace of Amiens) called for Curaçao to be returned to Dutch control. The islands changed hands among the Dutch, the Spanish, and the British over the next several years, with the Kingdom of the Netherlands finally establishing control in 1816.

As with the A-B-C islands, the Leeward Islands changed hands among the French, Dutch, and British in the seventeenth and eighteenth centuries and like with the other islands, Dutch control was established in 1816.

In the nineteenth century the Netherlands Antilles were affected less by European politics than by the increasing influence of Venezuela. Trade in salt continued to be an important source of revenue, and late in the 1800s phosphate was also discovered on two islands. Gold was found on Aruba and mined until the supply was exhausted, and since the end of World War I the Netherlands Antilles have been a major site of oil refining in the Caribbean. Recently, drug trafficking in the Antilles has also increased via passenger flights from the Antilles to the Netherlands.

The Antilles have exercised autonomy in internal affairs since 1945. In 1954, the Netherlands Antilles became a full part of the Kingdom of the Netherlands rather than a colony. The island of Aruba was divided off in 1986. In 1993, the Antilles held a general referendum on the issue of independence; the majority voted to stay a part of the Kingdom. However, in 2000, the island of St. Martin held its own referendum, wherein 69% of the population voted to remain within the Kingdom of the Netherlands, but to become autonomous from the federation of the Antilles. In 2004, a commission confirmed this opinion, recommending that St. Martin and Curaçao be autonomous. No actions, however, had been taken on these recommendations at press time: the Dutch government does not support this division due to fears that St. Martin would not be able to support its own government or infrastructure.

As of 2004 the population of the islands of the Netherlands Antilles was slightly under 220,000 and stable. In addition to petroleum refining, tourism and banking are the major industries of the islands.

## NEW ECONOMIC POLICY (MALAYSIA)

Malaysia's New Economic Policy (NEP) of 1970–1990 was a successful redistribution of Malaysia's historically high rate of economic growth in order to significantly improve the lives of the impoverished and with a focus on enriching the historically disadvantaged *Bumiputra*. The NEP coupled explicit statistical targets with diverse (and pragmatically flexible) means of attaining them. This bold and long-term vision was a response to the grave May 1969 race riots; the riots resulted in the twenty-one-month suspension of parliamentary democracy and in the 1971 revision of the Constitution so that it became sedition to publically question the necessity for the New Economic Policy.

*Bumiputra* is defined as the ethnic majority Malay people as well as the diverse indigenous societies in contemporary Malaysia. It literally translates as "sons of the soil." In the 2000 Census, *Bumiputra* are the largest ethnic minority, making up 65% of the population, followed by ethnic Chinese (26%) and Indian (8%). In 1970, relative to the other two ethnic groups, *Bumiputra* had the highest poverty rates (65%) and the lowest average income (2.29 times lower than the average Chinese, and 1.76 times lower than the average Indian).

One of the NEP's two primary objectives was a dramatic reduction of poverty irrespective of race. In 1970 nearly half of all households in Peninsular Malaysia were below the poverty line. By 1990 the official poverty rate was down to 17% in the country. Critics emphasize that the agricultural states with the greatest poverty were largely excluded, that rural development programs and price subsidies were grossly inefficient, and that plantation workers (primarily Tamil-speaking Indians) were almost entirely overlooked by the NEP.

The other primary objective was the restructuring of society to reduce the identification of race with economic occupations. In practice this generally meant improving *Bumiputra* relative to ethnic Chinese. In 1970, two-thirds of all agricultural workers were Malay and only 13% of Malays were in middle-class occupations (professional, technical, administrative, managerial, clerical, or sales jobs). As a result of rapid industrialization and diverse affirmative action

programs in both public and private sector businesses as well as university admissions, by 1990 only one-third of agricultural workers were Malays and 27% of Malays were in middle-class occupations.

In Malaysia the restructuring of society is frequently measured in terms of corporate ownership. Malay ownership of the corporate sector rose from 1.5% in 1970 to 20.3% in 1990. This was accomplished by government-engineered mergers and acquisitions of foreign-owned Malaysian companies, the creation of financial trusts to hold corporate equity on behalf of *Bumiputra*, and the creation and promotion of Malay-owned corporations.

The NEP is a critical case in contemporary debates regarding whether a state with a redistributive agenda is capable of generating new industries and an entrepreneurial middle class from a historically disadvantaged class, or whether it merely creates crony capitalists at the expense of others. Especially striking was that Malaysia was capable of this flexible redistributive policy while maintaining an open economy reliant on foreign direct investment. However, two key questions remain. First, have such policies altered the economic structure so that *Bumiputra* are not merely reliant on continuing government subsidies, preferences, and special regulations? Secondly, given that preferential treatment for *Bumiputra* continues throughout every industry in the Malaysian economy, can such preferences be maintained without creating renewed social conflict grounded in racial resentment?

## **NEW INTERNATIONAL ECONOMIC ORDER (NIEO)**

In the 1970s developing countries began to challenge the international economic order, under the grounds that the existing economic structures had been strongly stacked against their economic interests. One sign of this was the imbalance in the distribution of international monetary reserves. While the developing world constitutes 70% of the world's population, they received less than four percent of the international reserves of US\$131 billion during the first half of the 1970s.

Another sign was the control exerted over how and in what way the value-added products traded internationally were to be distributed. Developing nations usually received only a small fraction of the final price. The processing, shipping, and marketing of the primary products are controlled in the developed countries. Developing countries were sometimes forced to repurchase their own exports at inflated prices because they had been unable to process the raw materials.

Thirdly, developed nations introduced various forms of tariff and non-tariff protections in order to protect their own domestic industries and standards of living.

Fourthly, many developing nations protested that multinational corporations (MNCs) "engineered" their contracts and concessions to their own benefit, but at the expense of host countries. Additionally, because of tax concessions, royalty payments, transfer pricing, and capital allowances, developing countries often received a small fraction of the profits from foreign investments, despite the exploitation of their own natural resources.

Finally, developing countries have been under-represented in international organizations. Though representing a majority of the world's population, developing countries have an insignificant representation at the World Bank and International Monetary Fund (IMF) as well as at the United Nations.

The UN General Assembly NIEO resolution of April 1974 committed the organization to establishing an order based on equity, sovereign equality, common interest, and cooperation among all states to eliminate the developmental gap. This declaration spawned a series of "programs of action" that avoided new forms of economic colonialism. The NIEO program addressed four fronts including aid and assistance; international trade; industrialization and technology; and social issues.

Aid and development assistance is required to ensure that developed countries set aside a small proportion of their gross national product (GNP) for aid.

All developed countries aimed at increasing assistance to an agreed target of 0.7% of their GNP. International trade issues include redefining the terms of trade and access to markets achieved through the use of a stable foreign currency with prices indexed for certain commodity prices for manufactured goods, to stabilize price fluctuations of primary commodities by establishing buffer stockpiles and preferential treatment of exports from developing countries. Industrialization issues include import-substitution industrialization (ISI), technology transfer, regulating the activities of MNCs, and the improved use of natural resources. In social terms, proposals ensured an equitable distribution of income; the elimination of unemployment; and the provision of health, education, and other cultural services.

## **NIEO Program for Action**

The NIEO Program for Action included re-examining issues of industrialization and technology.

- Objective 15 of the NIEO involves the negotiation for a redeployment of the industrial productive capacity to developing countries. This proposed a shift of the industrial capacity of developed countries to the Third World, especially those high labour content industries, those industries which required natural resources, and industrial processes requiring locally available raw materials.
- Objective 16 establishes a mechanism for the transfer of technology. Developing countries need access to modern technology if they are to achieve their objectives. The NIEO calls for greater access to technology through a review of international patents, the facilitation of access to patented and non-patented technology, the expansion of assistance to Third World countries for R&D programs, and the control of the import of technology.
- Objective 17 relates to the regulation and supervision of the activities of MNCs and the elimination of restrictive business practices. An international code of conduct prevents enterprises from interfering in the internal affairs of countries in which they operate, eliminates restrictive business practices, and requires that more activities conform to national development plans. Also, the proposal encourages MNCs to assist in the transfer of technology and management skills to developing countries, to regulate the repatriation of profits accruing

from off-shore operations, and to promote the restructuring of their profits in developing countries.

A principal weakness among most developing countries is both the lack of access to technology and their poor command of it. However, merely acquiring technology itself is insufficient because it needs the infrastructure to absorb these new ideas—the so-called “absorptive capacity.” Technology transfer may involve the sale of patents and equipment, the supply of know-how and processes, and the dissemination of scientific and technological information. The benefits include the reduction of production costs, increases in production efficiency accompanied by the elimination of wastes, the re-allocation of capital resources, and improvements in the use of technology resulting in higher productivity.

But “backwash effects” resulting from the transfer of technology arise through the following:

- The spread of MNC domination in investments in domestic economies;
- The imposition of Western products on fragile Third World markets behind import-substituting tariff barriers that protect the monopolistic practices of MNCs;
- Outmoded and irrelevant systems of education and university training, which engender inappropriate international professional standards;
- The “dumping” of cheap products in markets, thereby upsetting industrial processes in developing countries; and
- Harmful international trade policies that lock Third World countries into primary-product exports.

### NEW JEWEL MOVEMENT

The New Jewel Movement (NJM) was a Marxist-inspired political party that ruled Grenada from 1979 until 1983. The NJM came into being on March 11, 1973, when Maurice Bishop’s Movement for Assemblies of the People (MAP) merged with Unison Whittman’s Joint Endeavor for Welfare, Education, and Liberation (JEWEL). Until the 1970s, Grenadian politics had been dominated by Eric Gairy’s Grenada United Labour Party (GULP) and the Grenada National Party. The NJM called for a program to raise the standard of housing, living, education, health, food, and recreation for all people. *The Manifesto of the New Jewel Movement (1973)* stated: “The people are being cheated and have been cheated for too long—cheated by both parties, for over twenty years. Nobody is asking what the people want. We suffer low wages and higher costs of living, while the politicians get richer, live in bigger houses, and drive around in bigger cars.” The NJM also called for the nationalization of all foreign-owned hotels.

In May 1973, the British government announced that Grenada would receive independence in February 1974. In 1976, Bishop won a seat in the House of Representatives and became leader of the opposition. In 1977, while Gairy established close ties with Chile’s Augusto Pinochet, the NJM established ties with Cuba’s Fidel Castro. On March 13, 1979, the NJM staged a virtually bloodless revolution and established the People’s Revolutionary Government (PRG). One school of thought holds that the charismatic Bishop was merely a figurehead for a group of pro-Soviet sympathizers within the NJM intent on encircling the Caribbean in a communist net, aided by Nicaragua and Cuba. Another school of thought holds that Bishop truly wanted democratic reform, but that hostility from the United States and neighboring Caribbean states pushed him into an alliance with Castro. Although the NJM called for a form of popular socialism based on grassroots democratic local councils, it arrested hundreds of political prisoners, closed newspapers, and rapidly militarized the nation.

On October 18, 1983, the NJM imploded. Minister of Finance Coard, who wanted to pursue a more

## NEW JEWEL MOVEMENT

pro-Soviet, anti-US policy, overthrew Bishop with the support of the army. Bishop and many of his closest associates were arrested and executed the next day. On October 25, US President Ronald Reagan unleashed Operation Urgent Fury, which removed Coard and his supporters from power. Although pro-Bishop survivors of the 1983 coup organized the Maurice Bishop Patriotic Movement (MBPM), the Grenadian political system since 1984 has been dominated by Keith Mitchell's New National Party (NNP) and the National Democratic Congress (NDC), which maintains close ties with members of Coard's faction of the NJM.

## NEW PEOPLE'S ARMY

The military wing of the Communist Party of the Philippines (CPP), the New People's Army (NPA), is a Maoist group formed on March 29, 1969. The NPA started with sixty fighters armed with only nine automatic rifles and twenty-six inferior arms (single-shot rifles and handguns). Its avowed aim is to overthrow the Filipino government through protracted guerrilla warfare. Like the CCP, it advocated land reform and the establishment of a socialist state.

Jose Maria Sison is both head of NPA and CPP. Sison has been in exile in the Netherlands for the past two decades but he still sets the general direction of the NPA. Because the top leadership is located overseas, local NPA commanders have considerable autonomy. In recent years, there are credible reports that some local NPA cells were involved in kidnapping and ransom activities. There are also reports that some have become killers for hire.

The NPA derives most of its funding from contributions of supporters in the Philippines, Europe, and elsewhere, and from so-called "revolutionary taxes" extorted from local businesses. In the rural areas, most businesses cannot rely on the government to protect them and must pay the NPA.

The NPA grew substantially during the reign of the dictatorial regime of Ferdinand Marcos (1965–1986)

when many opposition elements sided or joined the NPA after Marcos suppressed legitimate political opposition. Several priests influenced by liberation theology also joined the NPA. During this period, the NPA also developed strong sympathy from leftist student movements who opposed US bases in the Philippines.

When Marcos was deposed and democracy was restored in 1986, the NPA continued its fight against the administration of Corazon Aquino and subsequent governments. Despite continuous operations by the Philippines armed forces to wipe them out, the NPA has managed to survive. High levels of poverty in the rural areas, no land reform, and corruption among local government officials are the primary reasons why the NPA still enjoys support among the populace.

The NPA strongly opposes any US military presence in the Philippines and attacked US military interests before the US base closures in 1992. In the past, the NPA had claimed responsibility for the assassination of US military personnel. In January 2002, the NPA publicly expressed its intent to target US personnel sent to the Philippines as part of the war against terror.

Although primarily a rural-based guerrilla group, the NPA has active urban cells that conduct assassinations of high-profile individuals such as politicians, military and police officers, judges, government informers, former rebels who wish to leave the NPA, US troops stationed in the Philippines, and so forth.

At present, the NPA is estimated to have slightly more than ten thousand fighters. They operate in sixty of the Philippines' seventy-three provinces. They are most active in the northern islands of the Philippines with limited presence in the South.

## NEWLY INDUSTRIALIZED ECONOMIES (NIES)

Newly Industrialized Economies (NIEs) are defined as: the economies of export-led industrialization.

The World Bank established a GNP per capita threshold to determine which developing countries belonged to this category. At the beginning of the 1980s, the World Bank used the term “newly industrialized economies” for the first time. The Organization for Economic Cooperation and Development (OECD), however, prefers the term “new industrialized countries.” But the two international organizations converged regarding their explanation of this category: it involves a scheme of development based on a contribution of industry above 25% to GNP, with exports composing the major part of manufactured products; the developing country has high economic growth and the gap with developed countries is closing. Even if no clear classification is established, the following countries fall into this category: the four dragons of Asia—Singapore, Hong Kong, Taiwan, and Korea; plus, later on, the four ASEAN countries—Thailand, Malaysia, Indonesia, and the Philippines; and a few Latin American countries—Brazil, Mexico, Chile, and to some extent Argentina.

The most represented countries were to be found in Asia; during a twenty-five-year period (1965–1990), the export-oriented model was followed by the dragon economies, and exports as a proportion of GDP increased from 27% to 72.1% (Islam and Chowdhury 1997). The World Bank also recognizes that regional integration is one factor of economic growth, along with the development of market-oriented economies in the NIEs at the beginning of the 1980s and the increase of intra-regional trade at the end of the 1980s.

The newly industrialized economies, during their economic takeoff, accepted the challenge of choosing a new direction for their economies and a new way of life for the future. They adapted continually to changes in their economy, which enabled them to have a unique economic success. The means employed by these countries, with exceptional success, can be a model for other developing countries. Their industrial revolution was implemented through export-oriented strategies in order to counterbalance the weakness of their domestic markets (Arrighi, Hamashita, and Selden 2003). These newly industrialized economies recognized their potential for success as part of the new integration to the global economy. However, even with a common economic orientation, the economic systems of the newly industrialized countries present significant differences, which force them to translate their experience to a higher standard of economic growth. These deep economic changes promoted a long-term high growth rate (averaging 8%) for most of these countries during a twenty-year period. Even during the two oil crises of the 1970s, their economic activity remained high.

In the 1970s, various authors elaborated a new approach to international economy. In these new theories they integrated diverse contributions: new micro-economies in the situation of incomplete information, industrial economy in terms of corporate strategy, local economy in terms of agglomeration effects, territoriality and game theory in terms of interactions between strategic players. The structure of imperfect competition of markets and increased output has been favored by the NIFs over local comparative advantages (Hugon 1997).

According to P. Krugman (1991) in his *Geography and Trade*, the production of economic goods appears in a determinate spot and its effects are linked with increasing output, leading to and reinforcing a spill-over, and competitive poles or competitive advantages; thus, it is possible to explain that international specialization develops from territorial specialization.

### **An Historical Approach of Development and Technological Transfer**

From 1965 to 1995, some countries had a remarkable growth rate sustained by low-end industrialization. After the themed-1970s a peak of success was attained in contrast to stagnation in the world economic picture caused by the two oil crises. In the middle of the 1980s, mastery of the industrial process provided a new impetus to the NIEs, which in turn gave them a higher ranking among industrialized countries. They prepared their economic structure for industrial and technological development by choosing an outward-oriented economic development model, which meant increasing exports. Among the NIEs, the Asian NIEs have particularly progressed in this way. Hong Kong has benefited from mainland refugees inspired by a capitalistic spirit. A great number of them came from the Guangzhou area with their know-how and their capitalistic way of managing companies. Concerning Singapore, this state-city benefited from UK aid until 1965, the year of its independence from the Malay Federation. It then adopted the export industrialization strategy and received guidance from its own government. Malaysia also followed the example of Singapore and has adopted the industrial export scheme (Dufour 1998).

Taiwan and South Korea, whose development was turned toward the domestic market in agriculture and textiles, radically changed their approach to economic development at the beginning of the 1970s by concentrating on an industrial and technological

strategy turned toward exports. To do this, they abandoned the import-substitution system in favor of export production to other Asian and foreign markets. For South Korea, economic development was assured by enormous US financial assistance during the Korean War and lasting for ten years after the war—a total of about fifteen years of aid.

Then, by the end of the 1960s, the new orientation of the World Bank was “trade, not aid.” This new orientation was immediately put into practice with a decrease of US aid to South Korea as well as to Taiwan, and these two countries, later followed by Singapore, Malaysia, and Hong Kong, have acquired a comparative advantage, based on low labor costs, for gaining foreign direct investment. This has resulted in the de-localization of US and Japanese companies. It was the beginning of the transformation of financial flow from foreign aid to foreign direct investment. Then foreign direct investment from the United States and Japan showed exponential growth for about fifteen years, until the end of the 1980s. This foreign direct investment included know-how and transfer of technology, even if in the 1970s, the latter was only intermediate technology, especially from Japan. In the starting phase of industrialization, textiles, garments, and chemical and petroleum derivative products were the main exports. These were high-labor-intensity and low added-value products. During this period the NIEs’ success became associated with the image of sweatshop conditions and low salaries.

The NIEs with their export industrialization strategy in the 1970s were classified as the first 10 countries of the Third World for manufactured product exports. During the decade of the 1980s, these countries quadrupled their industrial exports and doubled their share of manufactured products in international trade (Assidon 2000).

As these Asian NIE countries mastered sophisticated technology, high-end semi-conductor activities developed. But this new technology-based economy has drained increasing financial assets of enterprises and caused increased indebtedness.

During the 1980s the NIEs diversified their industrial exports in new sectors, such as electronics and machine tools, which has allowed them to launch new industrial de-localization strategies and increase the dynamics of growth. The transfer of technology was the central question posed by international organizations such as the World Bank, OECD, and the transnational companies. The Asian NIEs and especially South Korea have asked the transnational companies to increase the transfer of technology in the local companies by means of shared know-how and apprenticeship. In the second half of the 1980s, the

NIEs were considered as industrialized countries and they upgraded their production methods in, for instance, electronics, automobile industry, and naval construction.

In the mid-1990s, South Korea and Taiwan became principal exporters of semi-conductors. In the same period, Hong Kong developed one of the world’s biggest stock exchanges and Singapore had one of the highest levels of ship traffic in the world.

### **The Process of Economic Liberalization of the NIEs**

In the case of the Asian NIEs, through the middle of the 1990s, regional integration came into being through the setting up of regional arrangements. At this point, the concept of open regionalism was on its way, different from the European integration or regional blocs, and having access to the international markets with more trade and foreign direct investments. But in order to set up such regional economic arrangements, liberalization of the economies was a necessity (Garnaut and Drysdale 1994).

All through the different APEC Summits of the 1990s, the recurrent motives were to follow a process of trade liberalization between member countries and to find concrete ways of associating with the business world (Paix and Riviere d’Arc 1997). Then, in 1993, an informal structure was set up: the Pacific Business Forum, which was later replaced by the APEC Business Advisory Council. In this way the principle of open regionalism was adapted, without adding constraints to the diversity of national economies and leaving a large autonomy of decision making to the member countries. An original and flexible institutional framework was on its way to meeting the demands of internationally oriented economic growth (Kagami, Humphrey, and Piore 1998).

The 1993 World Bank report entitled “East Asian Miracle, Economic Growth and Public Policies,” explained that in fact it was not a miracle, but that labor and capital increases and technical progress were responsible for this success, aided by strong governmental support given to new industries. If the term “miracle countries” is used, it is because these countries were able to rapidly master industrial processes similar to those of developed countries.

The Asian NIEs began to get richer and their per capita GNP tremendously increased; social indicators progressed in terms of services: drinking water, electricity, sanitary equipment, household appliances, and number of telephones. The NIEs are ranked

high in the UNDP's Human Development Index. These successes were possible because of the high literacy rate and the emphasis that was placed on education. And in 1996, South Korea became the first NIE member of the OECD.

The governmental interventionist policies of the NIEs were brought to bear on the economy until the beginning of the 1990s and were beneficial to the companies. But economic reform was retarded by the dominant role of the state and it was necessary to reduce that role in order to liberate the economy. This form of governmental intervention became an impediment to the development of enterprises. Japan was the model for this type of governmental overseeing (Androuais 2002). In the NIEs, the government was never entirely neutral toward the market and its intervention was too strong and of too long a duration.

The brutal 1997 economic crisis forced the newly industrialized economies to change certain orientations in order to take a new direction in their development. The Asian financial crisis of July 1997 started in Thailand when hedge funds dropped their interest in the region because of negative anticipation. This financial crisis had a tremendous negative impact on the Asian economies; it revealed weak factors, such as overcapacity in production, company debt, and the short-term capital financing of long-term capital.

After the Asian crisis, the IMF requested structural reforms at the governmental level and also in the private sector, which would prepare for a greater liberalization of the economy and less state intervention. These policies were widely applied to economic and financial situations, such as uniformity of customs taxes, additional measures to finance the economy, and the reduction of public debt. The main instruments of this liberalization were the deregulation of finances, reforms in public finances, and changes to upgrade the economy. At the beginning of the new millennium, the Asian NIEs started to adopt a postindustrial model, that is to say, a model having a technological services base (Dufour 2000).

## NICARAGUA

Nicaragua is located in Central America between Costa Rica and Honduras, bordering both the Caribbean Sea and the North Pacific Ocean. It has a coastline of 910 kilometers and is the largest but most sparsely populated country in Central America. The climate is generally warm and relatively humid with some regional variation, mainly a function of altitude—tropical in the lowlands, cooler in the highlands. The Pacific lowlands are generally more fertile than Caribbean ones. Rainfall is periodic, with May through October as the wettest months. The eastern part of the country receives high average annual rainfall, while the west is drier. Precipitation varies between 1,000 and 6,500 millimeters annually. The Caribbean coast is subject to destructive tropical storms and hurricanes from July to October.

Nicaragua has three major geographic regions. The Pacific lowlands or western region is characterized by flat terrain broken by a line of active volcanoes between the Golfo de Fonseca and Lago de Nicaragua paralleling the Pacific coast. East of the volcanoes lies a large structural rift forming a long, narrow, swampy, and indented depression (sixty to one hundred kilometers) from the Caribbean Golfo de Fonseca southeastward—Costa de Mosquitos (the Mosquito Coast). The two largest freshwater lakes

in Central America (Lago de Managua and Lago de Nicaragua, connected by the Tipitapa River) are also located in this rift. The eastern Caribbean lowlands region covers about half of the national territory and consists of tropical rain forest and pine savannas crossed by numerous rivers flowing to the Caribbean. Between the Pacific lowlands and the Caribbean lowlands are the central highlands. The highest point is Mogoton, at 2,438 meters. Western Nicaragua is situated at a juncture between colliding tectonic plates, resulting in a high incidence of earthquakes and volcanic activity. The population as of July 2004 is estimated at 5.36 million. The capital and largest city is Managua, with a population of 1.4 million.

Prior to the Spanish colonization, Nicaragua was settled by Indian tribes of Nicarao, from which the country's name is derived, as well as the Misquito, Garotegas, and others. The area was discovered by Europeans in 1502 with the arrival of Christopher Columbus, and twenty years later the Pacific Coast of Nicaragua was absorbed as a Spanish colony. In 1812 a constitutional monarchy was established in Spain, which liberalized colonial rule. The election of town councils in Central America marked the beginning of national political life. The United Provinces of Central American declared independence from Spain in 1821, a result of the War for Independence of the Spanish colonies in America. At first, Nicaragua was part of the short-lived Mexican Empire under General Agustín de Iturbide, later Emperor Agustín I (1822–1823). From 1823–1838, Nicaragua was, together with Costa Rica, Guatemala, Honduras, and El Salvador, part of the United Provinces of Central America. Political conflict and contradictions between federation members and the capital increased from 1829 on. In 1838, the Central American Congress allowed states to leave the federation; Nicaragua, Honduras, and Costa Rica seceded and became separate republics.

For the next century, Nicaragua's politics was dominated by the competition for power between the Liberals, who were centered in the city of Leon, and the Conservatives, localized in Granada. Britain occupied the Caribbean Coast in the first half of the nineteenth century, but gradually ceded control of the region in subsequent decades. In 1856 US mercenary William Walker was hired by a Nicaraguan political party to topple the president, but he took control of the government and set himself up as president. He was ousted the next year and executed in 1860. US marines intervened following the chaos and disorder after ousting the dictator José Santos Zelaya in 1909, and they remained there from 1912 to 1933.

In 1927 prospects emerged for a peace agreement among fighting factions in Nicaragua with provisions

for ending US occupation and installing subsequent elections. However, General Augusto C. Sandino refused to accept a peace accord and launched a guerrilla war against the US Marines. Five years later an interim president was elected, and General Anastasio Somoza García was named commander-in-chief of the newly established, allegedly non-partisan National Guard in Nicaragua. The US Marines withdrew. The next year Sandino was murdered by members of the Nicaraguan National Guard. In 1937 Somoza became president, and for the next forty-two years Nicaragua was ruled by the Somoza dynasty—Anastasio; his two sons, Luis and Anastasio Jr.; and various figureheads. Its abuses and corruptive practices caused fierce opposition. Somoza Sr. was assassinated in 1956. He was succeeded as president by his eldest son, Luis Somoza Debayle, a United States-trained engineer. His brother Anastasio “Tachito” Somoza Debayle, a West Point graduate, took over leadership of the National Guard, launching a major political repression campaign. Luis Somoza Debayle won the presidency in 1957 with little opposition. During his six-year term, from 1957 to 1963, his government provided citizens with some freedoms and raised hopes for political liberalization. Puppet figures held the presidency from 1963 until 1967. When poor health prevented Luis Somoza Debayle from running, his brother Anastasio won the February 1967 presidential election. Two months later, Luis—who also objected to “Tachito's” rise to power—died of a heart attack. As president, Anastasio Somoza Debayle retained the National Guard directorship, which gave him absolute political and military control over Nicaragua. Corruption and abuses intensified, accelerating opposition from both populist and business groups. When his four-year term was to end in 1971, Anastasio Somoza Debayle amended the constitution to stay in power until 1972. Increasing pressures from the opposition and even from his own party, however, forced the dictator to formally step down and introduce a three-member junta to rule from 1972 until 1974.

Popular discontent grew also in response to deteriorating social conditions. Illiteracy, malnourishment, inadequate health services, and lack of proper housing also ignited criticism from the Roman Catholic Church, led by Archbishop Miguel Obando y Bravo. On December 23, 1972, a powerful earthquake shook Nicaragua, destroying most of the capital city. It left approximately ten thousand dead and some fifty thousand families homeless, and destroyed 80% of Managua's commercial buildings. Immediately after the earthquake, the National Guard joined the widespread looting of most of the remaining business establishments in Managua. When reconstruction

began, the government's illegal appropriation and mismanagement of international relief aid, directed by the Somoza family and members of the National Guard, shocked the international community and produced further unrest in Nicaragua. By some estimates, Somoza's personal wealth soared to US\$400 million in 1974. As a result, Anastasio Somoza Debayle's support base within the business sector began to crumble. A revived labor movement increased opposition to the regime and to the deteriorating economic conditions. Somoza Debayle's intentions to run for another presidential term in 1974 were resisted even within his own party. Increasing political repression and further censorship of the media and the press was the rebuttal. In September 1974, Anastasio Somoza Debayle was re-elected president. Leftist forces founded the Sandinista Front for National Liberation (FNSL), which initiated armed resistance, reaching dimensions of a civil war. About the end of 1970s, the United States suspended its backing of Somoza. Marxist Sandinistas came to power on July 19, 1979; Somoza fled into exile and was later murdered. The Sandinistas' communist-type regime launched agrarian reform, nationalization of the banks and some industries, and social reforms. The Sandinistas' support for the leftist rebels in El Salvador, backed by Cuba and the USSR, incited the United States to fund anti-Sandinista "freedom fighters," led by conservatives but composed of people representing many political views, during most of the 1980s. When Nicaraguan free elections were held in 1990, 1996, and in 2001, the Sandinistas were voted out of power and yielded to conservatives, who were represented by Chamorro and Aleman. Moreover, in 1997 the transfer of power between the media owner Violeta Chamorro and the former mayor of Managua, Arnoldo Aleman, acted out the very first time in Nicaragua's history that this office was transferred peacefully and democratically from one democratically elected individual to another. This recurred in 2001, when Arnoldo Aleman stepped down to open the way to the newly elected President Enrique Bolaños. In addition to the political turmoil and economic woes, twice during the last century—in 1932 and in 1972—earthquakes led to the devastation of the capital city of Managua. The country slowly rebuilt its economy during the 1990s, but the Atlantic Coast suffered severe damage from hurricanes Juana in 1988 and Mitch ten years later.

Nicaragua is one of the poorest countries in the Western hemisphere. It faces low per capita income, massive unemployment, and huge external debt. Per capita GDP is \$2,200, and more than half of the population lives below the poverty line. Distribution of income is one of the most unequal anywhere in the

world. This country has made some progress toward macroeconomic stability early in the twenty-first century; however, GDP annual growth of 1.5%–2.5% has been far too low to meet the country's needs. Nicaragua will continue to be dependent on international aid and debt relief under the Heavily Indebted Poor Countries (HIPC) initiative. Donors have made aid conditional on the openness of government financial operation, poverty alleviation, and human rights. A three-year poverty reduction and growth plan (2003–2005), agreed to with the IMF, steers economic policy. The country received immense support from the international community in 2004 when the IMF and World Bank forgave \$4.5 billion of Nicaragua's debt.

Relatively smooth democratization of the country has been overshadowed by continuing corruption. Former president Aleman was charged with fraud and embezzlement, and in 2003 was sentenced to twenty years in prison. However, he was released on December 3, 2004, after only six months of incarceration, and the Court of Appeals found that evidence for his indictment was insufficient. Aleman is also suspected of conspiring with Sandinista leader, Daniel Ortega, to make certain amendments in the constitution and to undermine president Bolaños' positions. The country still relies heavily on foreign assistance and aid. During the past two decades, freedoms of press, assembly, and speech have increased, and respect for human rights has improved considerably. Ethnic issues have never been a serious source of strife. There are territorial disputes with Colombia over the Archipelago de San Andres y Providencia and Quita Sueno Bank region, and about the Honduran access to the Pacific at Golfo de Fonseca; and a legal dispute exists over navigational rights of the San Juan border river. Criminal drug smuggling persists—Nicaraguan shores serve as a transshipment point for cocaine destined for the United States, and for arms-for-drugs dealing.

Nicaragua's economic infrastructure leaves still room for improvement and shaping according to the modern standards. Railways are only six kilometers narrow gauge; highways total 19,032 kilometers, of which 2,094 kilometers are paved. There are 2,220 kilometers of waterways, including Lakes Managua and Nicaragua. Airports have eleven total paved runways, of which three are equipped for landing of large air crafts. There are seven maritime and river ports and harbors, but no merchant marine. The educational system is generally underfinanced and insufficient. Access to education improved during the 1980s, with introduction of free education, but a large majority of the population has not completed primary school. A literacy campaign in the 1980s reportedly raised the functional literacy rate from

about 50% at the end of the Somoza regime to 67.5%, almost equally distributed for males and females. There are universities at León and Managua. Health indicators are generally poor. Life expectancy at birth was seventy years in 1991; birth rate is 25.5 per 1,000; population growth rate is 1.97% (2004 est.); infant mortality rate 30.1 per one thousand live births. There is a high incidence of malnutrition; a high incidence of infectious diseases, mainly enteritis, malaria, and tuberculosis; and a still relatively low incidence of the HIV virus. The health care system is still inadequate despite modest improvement during the 1980s. There are approximately 85.6 physicians and ninety-two nurses per one hundred thousand population. Welfare indicators are generally poor, too. Nearly 50% of the working force is unemployed or underemployed, there is unsatisfactory access to safe drinking water, and the quality of basic public services is generally poor, especially in rural areas and on the Caribbean coast. Quality of housing is inferior in urban, suburban, and rural areas, with an acute housing shortage in the capital.

## NICARAGUAN REVOLUTION

The Nicaraguan revolution cannot be categorized as peasant, proletarian, or bourgeois like other classic revolutions in Europe, North American, and Asia. The Sandinista Front for National Liberation (FSLN) gathered a broad array of social forces that overthrew the dictatorship of Anastasio Somoza Debayle on July 19, 1979. On that day, it was difficult to find a citizen in the country who did not talk like a revolutionary and claim the vindication of national hero and martyr August César Sandino.

### From Sandino to Fonseca

The roots of the Nicaraguan revolution are intertwined with the lives and the deaths of its principal intellectual architects. August César Sandino was born in 1895 as the illegitimate son of Gregorio Sandino, a merchant, and Margarita Calderón, a coffee picker, in the small town of Niquinohomo. He went to Mexico in the early 1920s to work in the oil fields near Tampico and Veracruz. There he absorbed a wide range of revolutionary ideologies from anarchism to communism and participated in radical union organization. This experience influenced his moral outrage at the intervention of the United States in Central American and the Caribbean conflicts. In 1926, Sandino returned to Nicaragua to support the military campaign of Liberal forces against a Conservative government with ties to the administration of Calvin Coolidge. He pledged his loyalty to Liberal general José Moncada, who espoused classical liberal values of the rule of law, respect for private property, and limited republican government. However, a contingent of US Marines maintained a strong presence in the country to defend Conservative politicians and to protect US business interests. When US envoy Henry Stimson arranged a truce between Liberal and Conservative factions in 1927, Sandino decided to form his own army in the northeastern mountains of Nicaragua.

In the village of El Chipote, he promulgated the Articles of Incorporation of the Defending Army of the National Sovereignty of Nicaragua. After nearly five years of sporadic engagement with guerrilla combat units, the administration of Franklin D. Roosevelt withdrew the Marines as part of his Good Neighbor Policy unveiled in 1932. Roosevelt left the responsibility of maintaining order and stability to Anastasio Somoza García, a graduate of the US military academy at West Point, who became the chief officer of the Nicaraguan National Guard. In August 1933, the National Guard attacked a Sandinista

camp, which prompted Sandino to request that Liberal President Juan Batista Sacasa declare the Guard unconstitutional. Nevertheless, in February 1934, Sandino agreed to meet with Sacasa and Somoza García in Managua to negotiate a settlement. Upon leaving the presidential headquarters, National Guardsmen kidnapped him, his brother Socrates, and two Sandinista commanders, and executed them in an empty field.

When Somoza García became president in 1937, he began to use state power to repress political opposition and to enrich a small clique of family members and close associates. Through the instrument of the National Guard, he monopolized the security forces and controlled the judicial system, the banks, and the construction industry, and the primary means of national communication and transportation. In September 1956, the assassination of Somoza García by a radical poet, Rigoberto López Pérez, sparked a state of siege and the bogus convictions of university professors and Conservative political leaders. In this atmosphere, a young law student at the National Autonomous University of León, Carlos Fonseca Amador, began to acquire a revolutionary consciousness. In 1957, Fonseca quit a youth organization affiliated with the Conservative Party and joined the Nicaraguan Socialist Party. In June 1959, Fonseca assembled an armed column of students, peasants, and Cuban advisers in southern Honduras to carry out attacks on the National Guard at several points in northern Nicaragua. The Honduran military arrested the group before the plan could be executed, but Fonseca was released less than a week later. This aborted attempt to destabilize the dynasty occurred almost simultaneously with the emergence of a moderate reform movement of Social Christian and Christian Democrats led by Conservative dissident Pedro Joaquín Chamorro.

Fonseca soon realized the futility of agitating within the restrictive ideology of the Socialist Party and started the New Nicaragua Movement, with fellow Socialists Tomás Borge and Silvio Mayorga, in 1960; they created the Sandinista National Liberation Front (FSLN) in July 1961. As the principal thinker behind the organization, Fonseca carefully refined Sandino's socialist and nationalist orientations to address the repressive political climate and the desperate social conditions of the working classes and rural poor. The FSLN advocated cooperation with diverse urban and rural groups and the gradual accumulation of forces. But the Sandinistas' military actions in the 1960s were dismal failures. The National Guard captured Fonseca in 1964 and deported him to Guatemala. He returned clandestinely to Nicaragua to continue the cause, but was later arrested for bank

robbery in Costa Rica. Once Fonseca was freed from jail after Sandinista operatives hijacked an airliner, he spent most of his time in Cuba, under the tutelage of Fidel Castro, developing a strategy of prolonged popular war that guided the guerrilla campaign in the 1970s.

By the time that Anastasio Somoza Debayle took control of the state apparatus in 1967, the FSLN had been eclipsed by the rise of other sources of opposition to the dictatorship among Social Christians and other progressive Catholics, and leftist university professors and students. On December 23, 1972, a massive earthquake destroyed Managua. Somoza's blatant misuse of emergency relief funds alienated even some erstwhile supporters and exacerbated unemployment, the lack of social services, and the scarcity of food in the capital. In December 1974, the Sandinistas burst back into the public eye with a dramatic raid on a party at the home of a cabinet minister and took hostage several foreign diplomats and corporate executives.

In 1975, the FSLN divided into three ideological factions. Fonseca led the dominant Prolonged Popular War faction that borrowed heavily from the successful guerrilla strategy promoted by Che Guevara in Cuba. Maoists shaped the Proletarian Tendency based on factory workers and barrio dwellers. Daniel and Humberto Ortega forged the Third (*Tercerista*—"the Third Way") faction that avoided the dogmatic positions of the other groups and sought alliances with businessmen, religious leaders, and professionals. Humberto Ortega had fought alongside Fonseca in the remote mountains during the 1960s, but he wanted to pursue an urban insurrectionary struggle. On November 8, 1976, the National Guard killed Fonseca in an ambush near Matagalpa at the height of ideological competition within the FSLN. While Fonseca is still considered the most prominent historical figure of the Nicaraguan revolution, his death proved advantageous for the *Terceristas*, who assumed control of the surging revolutionary tide in the late 1970s.

## Victory and Revolutionary Government

On January 10, 1978, Pedro Joaquín Chamorro, the leader of the centrist Democratic Liberation Union and the editor of the newspaper *La Prensa*, was assassinated while driving through Managua. Following this event, mass demonstrations, business lockouts, and labor strikes spurred the creation of the Broad Opposition Front that included prominent politicians, intellectuals, entrepreneurs, and clerics. The

Front called for the resignation of Somoza, yet it lacked political leverage and the moral authority of a leader like Chamorro whose anti-Somoza credentials stretched back to the 1950s. Meanwhile, the FSLN organized the United People's Movement around student groups, trade unions, and progressive Christian activists. Several urban guerrilla attacks, the most dramatic of which was the occupation of the National Palace by Sandinista commandos, enhanced the FSLN's popularity. In March 1979, the Sandinista factions united publicly to conduct the final offensive on major urban areas that vanquished the National Guard. On July 20, the FSLN entered Managua accompanied by jubilant crowds to assume political power.

Daniel Ortega became the Sandinista representative on the Governing Junta of National Reconstruction. The Junta immediately nationalized the banking, insurance, foreign commerce, and mining industries and confiscated the substantial property holdings of the Somoza family and its closest associates. After the resignation of Edén Pastora and Violetta Chamorro, two non-Sandinista members of the junta, in April 1980, Ortega and Sergio Ramírez, a university professor and literary figure, became the dominant political figures of the revolution. In coordination with the nine-member Sandinista National Directorate, the junta pursued aggressive policies of literacy, health, agrarian reform, a mixed socialist-capitalist economy, and a nonaligned international status.

Commitments to popular democracy, social justice, and economic transformation punctuated the revolutionary decade of the 1980s. The Sandinista leadership emphasized the redistribution of resources in favor of their constituencies among urban working classes, small farmers, and the poor. The program in agrarian reform focused primarily on land expropriated from the Somoza family and its closest associates in the early 1980s. But the state gradually increased the confiscation of property from other economic elites who remained in the country or went into exile in the United States. The arbitrary application of agrarian reform laws alienated peasants and rural labor and infuriated larger capitalist interests that attempted to operate within contradictory state policies about production and marketing. Agricultural credit and food prices were heavily subsidized to levels that placed great monetary and fiscal pressures on state coffers. Public housing projects and universal health care raised living standards in urban areas, especially in Managua where commercial and industrial labor was concentrated. Primary, secondary, and university education policies delivered on revolutionary promises but also served ideological purposes. The formation of labor and trade unions,

professional organizations, and neighborhood activist groups complemented Sandinista social initiatives in urban slums; isolated rural areas; and among women, youth, and artisans.

However, many middle-class and grassroots elements began to criticize openly the government's heavy-handed vertical administrative style. Although the FSLN dominated the political landscape, other moderate and conservative political parties, business organizations, and non-governmental organizations expressed opposition openly and played critical roles in the representation of non-revolutionary economic and social groups. The newspaper *La Prensa* and the Supreme Council of Private Enterprise (COSEP) were the primary voices for non-Sandinista civil society. The government closed *La Prensa* on several occasions and jailed outspoken COSEP leaders, but never outlawed them.

After the Sandinista ticket of Daniel Ortega and Sergio Ramírez won the national election in November 1984, the government convened a constituent assembly to craft a new constitution. The new constitution that was promulgated in January 1987 reflected the mass appeal of a socialist vanguard party and the desire to consolidate a unique revolutionary experience in Latin America. During this period, Ortega divided his time between the constitutional debate, economic planning, and diplomacy. He traveled widely in Latin America, Europe, and Asia in search of economic and military assistance and international solidarity. He played a key role in the negotiations for a regional peace agreement initiated by former Costa Rican President Oscar Arias in February 1987.

Relations between the United States and Nicaragua deteriorated rapidly after Ronald Reagan became president in 1981. The Reagan administration accused the FSLN of fomenting instability in El Salvador and formed a counterrevolutionary force of Somocista (who followed Anastasio Somoza) exiles under the guidance of the Central Intelligence Agency (CIA). The *Contras*, as they became popularly known, operated from camps in Honduras and Costa Rica to carry out economic sabotage, military incursions, and political intimidation. The CIA mined the Port of Corinto in 1984 and continued to fuel the civil war even after the United States Congress had prohibited any further backing of the *Contras*. In 1985, the Reagan administration imposed a trade embargo and a lending moratorium through the cooperation of the International Monetary Fund and the World Bank. These international conditions hampered the Sandinista government's ability to deliver to its main constituents the promise of revolutionary transformation.

Under the pressures of a deep economic and social crisis in the late 1980s, the Sandinista government

implemented a structural adjustment program intended to control hyperinflation, encourage greater productivity in the private sector, and reduce public spending. At the same time, Ortega opened lines of communication with Conservative and Liberal opposition political parties and the business community in anticipation of the 1990 presidential election. The FSLN was contested by a fourteen-party coalition that supported the candidacy of Violeta Barrios de Chamorro, widow of slain newspaper editor Pedro Joaquín Chamorro. Barrios de Chamorro's victory with 52% of the vote to Ortega's 41% demonstrated significant discontent among important sectors of society, including peasants, housewives, and young males. In the wake of defeat, Ortega promised Sandinista stalwarts that the revolution would continue "from below."

### **The End of the Revolution and Democratization**

The Chamorro administration and its legislative majority pursued an agenda of liberal democracy, market economics, and individual rights. Official efforts to reform the state's role in the economy and society targeted the Sandinista state apparatus. The executive bureaucracy used decree powers between 1991 and 1994 to privatize hundreds of public enterprises and return land to original elite owners whose property had been confiscated under the provisions of revolutionary laws governing agrarian reform. In January 1993, the National Assembly launched a comprehensive overhaul of the 1987 constitution that struck at the heart of Sandinista institutions and ideology. The reformed constitution of 1996 placed paramount importance on the individual rights of citizenship and civil liberties, competitive politics, private enterprise, and property ownership. The provisions that governed agrarian reform were altered to emphasize the democratization of property, the fair distribution of land, and the pursuit of sustainable economic development rather than collective justice in the countryside.

Furthermore, the Sandinista officer corps was subordinated to civilian authority, and references to the revolutionary heritage of the Sandinista Popular Army were expunged in favor of the defense of sovereignty, independence, and territorial integrity. The reforms adjusted the relationship between the executive, legislative, and judicial branches of government, thus limiting the decree powers of the president and strengthening the autonomy of legislators and magistrates. The responsibilities of the Supreme Electoral

Council were expanded to manage national, departmental, regional, and municipal elections.

Over the course of the 1990s, the FSLN remained the largest single political party in the country, holding approximately 40% of the seats in the National Assembly. However, the Sandinistas reexamined their platform and policies and reorganized their membership and party bureaucracy. Sandinista legislators and party officials supported painful market-oriented economic reforms; drastic cuts in social spending on education, health, and welfare; and the reduction of the army's rank and file from ninety thousand to fifteen thousand soldiers. The negative social impact of the dramatic reduction of state employment, subsidies, and services caused rifts in the party hierarchy and the resignation of several key leaders, including Sergio Ramírez and Humberto Ortega, the chief of the Sandinista Popular Army since 1979. In addition, the popular base of the FSLN eroded in urban neighborhoods and rural communities, and among teachers, students, and professional and labor groups that once exemplified the multi-class character of the revolutionary coalition aligned against the Somoza dictatorship.

During the first half of the 1990s, the FSLN faced a wave of demands from popular organizations to decentralize the party apparatus and implement pluralist and autonomous decision-making practices. Resistance at the pinnacle of the FSLN led to the emergence of factions, including the Sandinista Renewal Movement. The rigors of competitive elections revealed the Sandinistas' weaknesses in the face of new challenges from old sources of Liberal and Conservative political interests. Daniel Ortega's effort to regain the presidency in 1996 ended in defeat at the hands of Arnaldo Alemán and the Liberal Alliance. Alemán enjoyed the support of traditional Liberal families that had long associations with the Somoza family during the dynastic years. The Liberal resurgence in the late 1990s raised optimism among thousands of claimants who wanted to retrieve property that was confiscated by the FSLN during the 1980s. Liberal and Conservative economic elites mounted a legal assault against several Sandinista decrees and laws that remained in effect after 1990 and challenged the validity of executive actions on the property question during Chamorro's term in office. The struggle over property rights rekindled lingering ideological hostilities from the revolutionary past in which the Sandinistas insisted on the defense of acquired rights to land and enterprises.

Daniel Ortega was nominated once again as the FSLN's presidential candidate for the 2001 national elections. Dissident Sandinista groups objected to the party's decision, arguing that Ortega no longer

represented the diversity of opinion within the Sandinista movement. The winner, Enrique Bolaños, a Liberal businessman and Alemán's former vice-president, maintains antipathy for the Sandinistas due to the confiscation of his property in the mid-1980s.

## NIGER

The Republic of Niger is a land-locked West African country, bordered by Algeria, Libya, Chad, Nigeria, Benin, Burkina Faso, and Mali. The country totals

489,189 square miles with less than 3% arable land. Niger consists primarily of the Sahara Desert, including the partly volcanic Air mountains in the central region, with some flat-to-rolling savanna plains in the south where most of the population resides. The Niger River flows for approximately 310 miles (five hundred kilometers) through the country's southwestern-most corner. From July to September, the river is navigable by small boats and provides irrigation along its immediate banks. The country shares Lake Chad on its southeastern corner with Nigeria, Chad, and Cameroon. Niger contains large quantities of tin, iron ore, copper, phosphates, and uranium. Agriculture, primarily groundnuts, millet, sorghum, cassava, beans, and rice, as well as pastoralism dominate the domestic economy, with some fishing and rock salt mining. Several ethnic groups, including the Hausa (56% of the population), Djerma (or Zerma), Songhai, Fulbe, and Tuareg inhabit Niger, which is about 85% Muslim. French is the official language, with Hausa, Djerma, and Fulbe as national languages. The population totals approximately 11.5 million with almost 1 million people living in the capital, Niger, situated on the Niger River. The country consistently ranks as one of the ten poorest countries in the world, with annual per capita income estimated at less than \$800.

The nomadic Tuareg were the first inhabitants of the region, followed by the Hausa and other sedentary groups. About one thousand years ago, Arab traders from North Africa first made contact with the Tuareg and Hausa, introducing Islam and linking the region with the increasing trans-Saharan trade, comprising exchange in supplied salt, metals, and slaves. Parts of the area were loosely incorporated into the great Western Sudanic empires of Mali and Songhai, although the Tuareg in the northern desert regions retained much of their autonomy. After the fall of the Songhai Empire in the late sixteenth century, a series of small political entities and Tuareg confederations emerged, including several Hausa city-states in the extreme south. The Fulbe jihads of the early nineteenth century affected the southern region, which was eventually subsumed into the newly created Sokoto Caliphate where it remained until conquest by the French in the late nineteenth century. Parts of the desert north were not disrupted by the Europeans until well into the twentieth century. Niger became a French colony in 1922, administered from Dakar, Senegal.

The French launched military expeditions into the interior to control and tax trading caravans. The colonial administration also imposed taxes to force people to farm, particularly groundnuts for export. Little was invested in social or infrastructural

development. Local government was left in the hands of traditional ruling elites. No Western-educated elite emerged as it did in coastal colonies. In 1946, the peoples of Niger, in common with other peoples in French Africa, were granted French citizenship with limited self-rule, and a small but short-lived political party was formed. In elections in 1958, Hamani Diori won the presidency and he retained this position when the country won independence on August 3, 1960. Close ties were maintained with France, and French advisers and troops remained in the country.

Diori and his elite supporters concentrated on attempts to develop the economy and consolidate their own power. Diori won re-election in 1965 and 1970, but he was overthrown in a military coup in 1974 by Lt. Colonel Seyni Kountche who promised to root out corruption and push for development. He also had strong French support for his proposed reform policies. The Sahelian drought of the late 1970s and early 1980s profoundly affected the country, as did falling uranium prices on the world market after 1979. Kountche confronted growing popular opposition and attempted coups and assassinations with an increasingly authoritarian style. In 1987, Kountche died and was succeeded by Colonel Ali Seybou, who was chosen as president by the Supreme Military Council. Seybou was forced to accept austerity measures and a structural adjustment program consisting of privatization of state enterprises and cuts in student scholarships and civil servant salaries. Seybou also oversaw a transition program to civilian rule, which included a new constitution. A national conference convened in 1991 to draft a new constitution set the stage for multiparty elections in 1993, won by Mahamane Ousmane as president and Mahamadou Issoufou as prime minister. Infighting between the two men, as well as continued drought and declining uranium prices, disrupted the country's stability and economic progress. Issoufou resigned in 1994 and new elections for prime minister were won by opposition leader Hama Amadou. Infighting paralyzed the government, internal unrest among students and northern Tuareg rebels intensified, and bankruptcy loomed. Both Ousmane and Amadou were overthrown in a violent military coup in January 1996 led by Colonel Ibrahim Barre Mainassara who declared himself president of the Fourth Republic of Niger. He was assassinated in early 1999 by the presidential guard whose leader, Major Mallam Daouda Wanke, assumed power briefly. Free elections in late 1999 elevated Mamadou Tandja to the presidency while Hama Amadou was reinstated as prime minister. Tandja signed peace agreements with Tuareg rebels and, although periodically instituting states of emergencies to repress student rebellions in the

capital, Niamey, has generally moved toward easing strict security measures. Structural adjustment measures continue to be implemented, albeit slowly.

In addition to the constant threat of rebellions and coups, Niger faces severe economic hardships. The economy is based on uranium mining, totaling over 75% of the country's exports, and subsistence agriculture, practiced by 80% of the population. Desertification, resulting from both natural and human activity, poses a significant and growing problem. The country is heavily dependent on foreign aid, mostly from France. The GDP is estimated at \$9 billion with an external debt of over \$1.6 billion. Education and health care are sorely lacking. The adult literacy rate is approximately 16%; life expectancy averages forty-two years for men and women. The infant mortality rate is 122 per 1,000 live births and population growth is 2.9% with an 80/20 rural/urban ratio. Niger's future political and economic prospects appear bleak.

## NIGERIA, THE FEDERAL REPUBLIC OF

The Federal Republic of Nigeria is situated in Western Africa, bordering the Gulf of Guinea, between Benin and Cameroon. Nigeria's climate is characterized by strong latitudinal zones, becoming progressively drier as one moves north from the coast. Rainfall is the key climatic variable, and because all of Nigeria is within the tropics, there is a marked alternation of wet and dry seasons in most areas. The wet season takes place between May and September and the dry season between October and April in most of the country; the temperature is always warm. Rainfall varies from more than 130 inches along the

coast to less than twenty-six inches along the northern border. Maximum temperatures range from 95°F on the coast, where cloud cover is nearly continuous, to above 105°F in the north. Minimum temperatures range from 72°F in the south to 66°F in the north. The northern part of the country consists mainly of desert, which rises to savanna-covered hills and a central agricultural plateau. The southeastern and southwestern zones consist of savanna and rain forests. Along the coastline are thick mangrove swamps.

Nigeria's population is one quarter of the entire African continent and is Africa's most populated country with an estimated population of about 137 million and an annual growth rate of 2%. Among the most populated countries in the world, it occupies the tenth place. Prior to 1991 the capital city had been Lagos, but from then on Abuja, a much smaller city with 371,674 persons (1991) and located in the geographical centre of the country, has occupied its position.

Nigeria's two main rivers are the Niger River and the Benue River. Nigeria is culturally rich but also diverse and complex. The country has three major ethnic groups (Igbo, Yoruba, and Hausa) and hundreds of ethnic subgroups. There is no single language that can be understood by the masses, but English is the official language followed by the Hausa, Yoruba, Igbo (Ibo), and Fulani in different parts of the country. As for religion, half the population are Muslims, who live mainly in the north; Christians are about 40% and they mostly live in the south; and 10% of people have indigenous beliefs.

As early as 1849 the British had already occupied the cities of Benin and Biafra, developing commercial strategies that mainly consisted of the slave trade. In 1885, British claims to a sphere of influence in that area received international recognition and, in the following year, the Royal Niger Company (RNC) was chartered under the leadership of Sir George Goldie. On January 1, 1901, Nigeria became a British protectorate. In 1914, the area was formally united as the Colony and Protectorate of Nigeria. Following World War II, successive constitutions legislated by the British government moved Nigeria toward self-government on a representative basis. Nigeria was granted full independence in October 1960 under a constitution that provided for a parliamentary form of government.

In October 1963, Nigeria altered its relationship with the United Kingdom by proclaiming itself a Federal Republic, and Nnamdi Azikiwe became the country's first president. However, tensions between ethnic groups grew stronger and conflicts arose. On January 15, 1966, a small group of army officers, mostly southeastern Igbos, overthrew the government

and assassinated the federal prime minister and the premiers of the northern and western regions. This was the beginning of more than thirty years of almost continuous military rule and conflicts in Nigeria until the year 1999.

In 1966, the federal military government that assumed power under General Aguyi Ironsi, was unable to quiet ethnic tensions or produce a constitution acceptable to all sections of the country. In July, a second coup established the leadership of Major General Yakubu Gowon. In May 1967, Lt. Col. Emeka Ojukwu, who emerged as the leader of increasing Igbo secessionist sentiment, declared the independence of the eastern region as the Republic of Biafra. The ensuing Nigerian Civil War was bitter and bloody, ending in the defeat and disappearance of Biafra in 1970 and a resulting two million casualties.

On July 29, 1975, Gen. Murtala Mohammed staged a new bloodless coup, accusing the military government of Gowon of delaying the promised return to civilian rule and becoming corrupt and ineffective. General Muhammed replaced thousands of civil servants and announced a timetable for the resumption of civilian rule by October 1, 1979. However, Muhammed was assassinated on February 13, 1976, in an abortive coup.

In 1979, five political parties competed in a series of elections in which Alhaji Shehu Shagari was elected president. Again, in December 1983, the military overthrew the Second Republic. Maj. Gen. Muhammadu Buhari emerged as the leader of the Supreme Military Council (SMC), the country's new ruling body. The Buhari government was peacefully overthrown by the SMC's third-ranking member, Maj. Gen. Ibrahim Babangida, in August 1985.

Babangida ruled with military force until the new presidential election was finally held on June 12, 1993. The historic presidential elections indicated that the wealthy Yoruba businessman M. K. O. Abiola had won. However, on June 23, Babangida annulled the election. Without popular and military support, he was forced to hand over to Ernest Shonekan who was supposed to rule until new elections, scheduled for February 1994. But he had to resign his power and deliver it to Defense Minister Gen. Sani Abacha who forced Shonekan's "resignation" on November 17, 1993. In October 1995 Gen. Sani Abacha announced the timetable for a three-year transition to civilian rule. Abacha, widely expected to succeed himself as a civilian president on October 1, 1998, died suddenly of heart failure on June 8 of that year.

He was replaced by General Abdulsalami Abubakar who decided to have elections in 1999. In February 1999, former military head of state Olusegun

Obasanjo ran as a civilian candidate and won the presidential election. The emergence of a democratic Nigeria in May 1999 ended sixteen years of consecutive military rule. Finally, the April 2003 elections marked the first civilian transfer of power in Nigeria's history, with elections won again by Obasanjo.

The Nigerian economy is the largest and most dynamic in Black Africa. In 2004 the GDP was estimated at \$114.8 billion. Since the beginning of oil exploitation in the 1970s, Nigeria's unpopular military rulers have failed to make significant progress in diversifying the economy away from overdependence on the oil sector, which provides 30% of GDP, 95% of foreign exchange earnings, and about 80% of budgetary revenues. The United States remains Nigeria's largest customer for crude oil, accounting for 40% of the country's total oil exports; Nigeria provides about 10% of overall US oil imports and ranks as the fifth-largest source for US imported oil.

The oil boom accelerated massive migration to urban centres, which then became crowded with rural migrants who lack jobs and the resources to return to the countryside. This meant increasingly widespread poverty, especially in rural areas, and a collapse of basic infrastructure and social services since the early 1980s. The country's urban population is 45% of the total.

Besides the oil sector, agriculture is an important sector as it employs more than half of the total population, mostly on a subsistence level, but contributes only about 30% of the GDP. The exports consist of rubber, cotton, and palm oil. The country used to be a great exporter of cocoa, but nowadays exports are stagnant at around 180,000 tons annually, whereas twenty-five years ago it was three hundred thousand tons. The leading subsistence crops are yams, cassava, and cocoa in the south; and maize, guinea corn, rice, and millet in the north.

Lake Chad is the prime source of fish. The largely subsistence agricultural sector has failed to keep up with rapid population growth, and Nigeria, once a large net exporter of food, now must import food. Other important industries are textile manufacturing, food processing and brewing, cement production, motor-vehicle assembly, sawmilling, and small consumer-goods manufacturing. The poor infrastructure of the country is a major constraint to economic development with most of the roads and ports in poor shape.

Although Nigeria's GDP is growing, the country is far from being a developed one. Despite having a large GDP, the per capita income has been as low as \$900, which makes Nigeria one of the poorest countries worldwide in terms of per capita income. Nigeria has a terribly unequal distribution of resources and

services. Although its territory has many resources, the distribution of those is so unequal that most of its population suffers from economic, health, and educative problems. The constant civil wars from 1966–1999 prevented the country from advancing in its development.

As for the health conditions, Nigeria had 1,170 hospitals in 1994, most of them in poor condition. The number of beds was 46,544, amounting to nearly 1,912 persons per bed. As of the early twenty-first century, around 15% of Nigerian children do not survive to their fifth birthday. The leading causes of child mortality are malaria, diarrhoea, and malnutrition, which contribute to 52% of deaths of children under the age of five. Malnutrition has become commonplace, and infant and maternal mortality rates continue to be among the highest in the world. The under-five infant mortality rate has slightly improved in the last thirty years, passing from an alarming 201 per one thousand live births in 1970, to 183 in 2002. The life expectancy at birth also improved a little, from forty-four years in 1970 to fifty-one in 2002 (UNDP 2004). Despite improving, it still is very low, below the average even for Sub-Saharan countries (forty-six years in 2002).

Less than half of the population has access to safe water and water-borne disease is widespread. Since the beginning of the economic crisis in the 1980s, the health sector has suffered dramatically. Development and recurrent expenditure has declined, resulting in a scarcity of drugs and medical supplies, and the deterioration of facilities.

Similar conditions reign for the education sector. The percentage of the GDP spent in 1990 for education was very low, only 0.9% (UNDP, 2004). Compared to the developed countries, which spend around 7%, this is very low. It is also very low when compared to neighbouring countries with a low human development index. These are all indicators that education is not a national priority in the country.

Six years of primary education are free and compulsory. Secondary-school enrolments are limited. The primary enrolment was only 60% in 1990 and 69% in 1995. At both the primary and secondary level, schools are generally overcrowded, and they lack teachers and basic infrastructure such as buildings, teaching aids, equipment, textbooks, and furniture. At the tertiary level, education has experienced phenomenal expansion without a proportionate increase in funding and facilities. The system suffers from problems such as outdated, dilapidated, or non-existent infrastructure; poorly stocked libraries, inadequate laboratories and equipment, low staff-student ratio, and poor quality of teaching; as well as low quality of graduates, especially in science and

technology. The adult literacy rate improved from being 40% in 1985 to 66% in 2002.

The working conditions are not much better. The unemployment rate is quite high and so is the number of poor people. About 66% of the population now falls below the poverty line of about a dollar a day, compared to 43% in 1985. Although Nigeria's economy is forecast to keep growing, the growth is primarily driven by the energy sectors and is unlikely to feed through to the wider population.

Nigeria's official foreign debt is approximately \$31 billion and about 75% is owed to Paris Club countries. As of the early twenty-first century, in the absence of government programs, the major multinational oil companies have launched their own community development programs. A new entity, called the Niger Delta Development Commission (NDDC), has been created to help catalyze economic and social development in the region. Although as of this writing, it has yet to launch its programs, hopes are that the NDDC can reverse the impoverishment of local communities and improve human conditions in the country.

#### NIUE

Often said to be “the world's largest uplifted atoll,” Niue is oval in shape and has a surface area of one hundred square miles (260 square kilometers). Located in the heart of Polynesia at coordinates 19°02"S and 169°52"W, its nearest neighbours are Tonga, Samoa, and the Cook Islands. Niue's upper plateau is composed of coral rocks interspersed with pockets of soil and a covering of forest and scrub, while rugged limestone cliffs dominate the coastline. Its climate is tropical, with a mean annual temperature of 75.5°F, an average annual rainfall of eighty inches, and trade winds from the southeast. An underground lens of fresh water can be accessed only via deep caves or (in recent decades) piped bores. Droughts and cyclones are a constant threat.

The ancestors of the Niuean people arrived from Tonga about 1,500 years ago. By late traditional times, however, the island was effectively an isolate, due to its singular location, dangerous shores, and fierce warriors. In the 1600s, Niue's population of four thousand was divided into eight districts, each possessing a similar pie-shaped portion of coast and land. Within each district, family groups pursued slash-and-burn horticulture (taro, yam, sugarcane, coconut), along with hunting (fruitbats, birds, landcrabs), gathering (fruits, berries, roots, crustaceans), and fishing (from both reef and canoe). Each area of usable land belonged to a family, while coastal zones and virgin forests were usually controlled by the district. Gender and age constituted the only real divisions of labour, with each co-resident group being materially self-sufficient. Unlike its Polynesian neighbours, Niue had neither hereditary elites nor chiefly institutions.

Contact with whaling ships from the 1820s, and especially the establishment of the London Missionary Society on the island in the late 1840s, triggered major changes. The introduction of steel axes, knives, and fishhooks, in particular, significantly increased productive capacity, which in turn encouraged the export of coconut sennit, copra, fungus, cotton, and handicrafts. But, during the 1860s, Niue was found to have an even more important resource—labour. At any time over the next five decades, two hundred to five hundred men from the island would be absent as indentured workers in plantations, mines, or on ships throughout the Pacific.

During the great territorial carve-ups of the late nineteenth century, Niue's role as a supplier of labour was what most interested the imperial powers. Thus, in 1900 Britain formally annexed Niue, and the following year transferred control of the island to New Zealand. With the formal ending of the indenture system in 1915, the emphasis changed to ensuring

the territory's social and economic self-sufficiency. Paternalistic colonial administrations now haphazardly encouraged domestic industry, particularly exportable food crops and traditional handicrafts, though such initiatives invariably were undermined by natural calamity, international conflict, economic depression, and unreliable shipping.

Top-down modernisation arbitrarily imposed on the people of Niue after World War II contributed to the murder of New Zealand's resident commissioner in 1953. Under pressure from the United Nations, New Zealand then began to emphasise decolonisation as much as development. New policies offered unprecedented levels of investment in public service infrastructure and wage employment, especially in the education, health, communications, and administrative sectors. Migration to New Zealand—where there was an ongoing shortage of unskilled labour—also was encouraged, culminating in the opening of Niue's first airport. In 1974, after a United Nations-administered referendum on independence, the island became a self-governing territory constitutionally associated with New Zealand. From then on, an elected assembly, cabinet, and premier were to control its internal affairs, while New Zealand accepted responsibility for international relations and financial supply.

Development plans also were introduced about this time, though their hopes often were not achieved. On the one hand, key indicators such as levels of participation in the formal economy, real incomes, educational attainment, life expectancy, and so on show that basic living standards continued to improve. But such gains were consistently undermined by out-migration, with the resident population falling from a high of 5,200 during the late-1960s, down to around 1,500 in the early twenty-first century. As a result, about twenty thousand persons of Niuean descent now live in New Zealand, where they have automatic citizenship rights, and hundreds of others have moved on to Australia.

Several times over recent decades, New Zealand has reduced its funding to Niue and demanded restructuring of the public sector—always at the cost of jobs. While most households have continued to provide much of their own basic foods through cultivating, fishing, hunting, and gathering, the need for cash income is a constant pressure. Lack of wage employment often triggers emigration, especially for young adults. Different products and services have been variously promoted, often with considerable government support, as “the solution” to Niue's economic problems: fish, coconut cream, taro, lime oil, honey, passion fruit, timber, sewing footballs, philatelics (the production of attractive stamps for sale to

collectors), offshore banking, tourism, and the Internet. In each case, however, tangible success has been limited in duration or constrained by actual circumstances. Most often, unreliable airline and shipping connections have undermined the very best efforts at helping Niue escape the aid-dependency trap.

Nature similarly continues to exert its hold on “the world's smallest nation.” In January 2004 an unprecedented category-five cyclone devastated Niue and destroyed much of Alofi, its main town. Since then, environmental recovery and material reconstruction have been this microstate's priorities, with considerable help from New Zealand and elsewhere. But a predicted “final exodus” from the island in the wake of Cyclone Heta has so far failed to materialize, suggesting that Niueans always will maintain a core population on their homeland, guaranteeing their unique society and culture an ongoing existence—regardless of ecological and economic uncertainties.

#### NKRUMAH, KWAME

Kwame Nkrumah (1909?–1972), was a pre-eminent Ghanaian statesman, pan-Africanist, and political philosopher, best known for his fight against colonialism. He was born in Nkroful in the Western Region of

Ghana. (Nkrumah's date of birth is uncertain; however, he used September 21, 1909—a date stipulated on his baptismal certificate by the priest who baptized him into the Roman Catholic Church—in many of his official records). Nkrumah graduated from the prestigious Achimota College in Legon, Accra, in 1930, before leaving for the United States where he earned a B.A. in economics and sociology from Lincoln University in 1939; a B.A. in theology from the Lincoln Theological Seminary in 1942; and completed a Ph.D. candidacy in philosophy at the University of Pennsylvania in 1943. He later moved to London, where he read law at Gray's Inn, and also attended law lectures at the London School of Economics in 1945. While in England, Nkrumah assumed the editorship of the *New African*, a journal of the West African National Secretariat, and also became the joint organizing secretary (with George Padmore) of the Fifth Pan-African Congress in Manchester in 1945. In 1947 he moved to Ghana (then the Gold Coast) to become the general secretary of the United Gold Coast Convention (UGCC)—a nationalist organisation. In 1948, Nkrumah broke away from the UGCC to form the Convention People's Party (CPP) with which he spearheaded the struggle that eventually secured Ghana's independence from Britain in 1957, making Ghana the first independent nation in Black Africa, and Nkrumah its first prime minister.

Even though the practical realities of politics compelled Nkrumah to start his major political activities in his native Ghana, he devoted ample attention to Pan-Africanism. Nkrumah's contribution to development went beyond his native Ghana; it includes his active involvement, leadership roles, and collaborative efforts with such notable Pan-African pioneers as W.E.B. Du Bois, Sékou Touré, Julius Nyerere, and Leopold Sédhor in the formation of the Organization of African Unity (OAU, now African Union [AU]) in particular, and the African liberation struggle in general.

### **Nkrumah's Development and Political Philosophy**

Nkrumah saw development as a multifaceted phenomenon, entailing economic, cultural, social, and political progress. However, he believed in the primacy of politics in the development process. In his words: "Seek ye first the political kingdom and all other things will be added unto it." Nkrumah was an exponent of the dependency theory, which posits that the world system is divided into "cores" and "peripheries," with the former exploiting the latter.

Nkrumah contended that the nations of the periphery would remain dependent on those of the core, as the relationship between the two entities is inherently exploitative. Nkrumah saw no better approach to development than socialism; his infatuation with this ideology emanated from his experience with racism and injustice in both United States and Britain, as well as his personal encounter with colonialism in Africa.

The most insightful exposition of Nkrumah's philosophy is in his book, *Consciencism*, where he argues that colonialism entails two forces: positive action and negative action. According to him, the former "is the sum of those forces seeking social justice" while the latter "is the sum of those forces tending to prolong colonial subjugation and exploitation" (Nkrumah 1964, p. 99). According to Nkrumah, negative action always exceeds positive action under colonialism. To him neo-colonialism is a guise adopted by negative action in order to give the impression that it has been outweighed by positive action; thus "neo-colonialism is negative action playing possum" (Nkrumah 1964, p.100). Nkrumah's "consciencism" was couched in socialism, as he was convinced that the traditional African society was essentially egalitarian and communalistic. Nkrumah originally favoured nonviolence. However, after his overthrow in 1966, he became very radical, advocating for violence in several of his publications, notably in *The Struggle Continues* (1973), and *Revolutionary Path* (1973). His position on religion was decidedly ambiguous. He writes in his *Consciencism* that while his philosophy is underpinned by materialism, "it is not necessarily atheistic." Still, he claims in the same book that "religion is an instrument of bourgeois social reaction."

### **Contributions to National and International Development**

After Ghana's independence, Nkrumah sought to centralize power by moving toward a one-party state. He diminished the power of the military and the role of the traditional chiefs, making the latter dependent on his ruling party, the Convention People's Party (CPP), for official recognition. While this helped alleviate tribalism, it also entrenched him in power. Nkrumah launched Ghana's First and Second Development Plans, from 1951–1956 and 1959–1964, respectively. With these D-Plans, he embarked on massive industrialization, using local raw materials and labour to provide employment and to reduce the nation's dependence on imported goods.

Nkrumah built the Volta River Project to provide power for the new industries and for mass electrification. The nation's state farms were established in the 1960s to curb food and raw material shortages; a Workers' Brigade was also created to provide labour for these farms. Nkrumah increased the production of cocoa, the main cash crop, but, unfortunately, the price of cocoa plunged in the world market for the greater part of his time of reign.

The Ghana National Trading Corporation (GNTC) was established to reduce the role of middlepersons and expatriate traders in the distribution of consumer goods. Similarly, the Ghana Commercial Bank and the Black Star Line were founded to compete with the existing foreign banks and shipping lines, respectively. The most enduring legacy of Nkrumah is his policy of free education, which gave Ghana the highest enrolment rate in Africa by 1966. Nkrumah also made the provision of basic health care free across Ghana.

Regarding Pan-Africanism, Nkrumah teamed up with Sékou Touré to form the Ghana–Guinea Union in 1958, as part of his plan to create a Union of African States with one parliament and an All-African Defence Force. Nkrumah organized the first All-African Peoples' Conference (AAPC) in Accra in 1958; this culminated in the formation of a Pan-African Secretariat in Accra. Mali, under President Modibo Keita, joined the Ghana–Guinea Alliance in 1960. However, practical problems of geography, language, and the emergence of competing regional groups with different ideologies (e.g., the Casablanca Group, the Brazzaville Group, and the Monrovia-Lagos Bloc) thwarted Nkrumah's efforts to form a federation of African states. Indeed, some African leaders then, including Milton Obote, Modibo Keita, and Leopold Sédhor, were concerned that Nkrumah might use his Pan-Africanism to interfere with their internal affairs. Nonetheless, initiatives in the early twenty-first century by the African Union (AU) to form an all-African federation not only attest to Nkrumah's prodigious foresight, but they also lend support to Nietzsche's famous aphorism that "some people are born posthumously." Additionally, Nkrumah was actively involved in the nonaligned movement, the United Nations, the Commonwealth, and the international peace movement. In fact, it was during a peace mission to Hanoi that he was overthrown in 1966.

Even though Nkrumah left an enduring positive legacy in Ghanaian and African politics, he was hardly a paragon of virtue. By the time of his overthrow, he was virtually running a one-man regime. Nonetheless, the fact that Nkrumah was a shrewd political leader in Ghana and a pacesetter in the African

liberation struggle remains indubitable. His remarkable accomplishments earned him many international awards, including an Honorary Doctorate of Law from London University in 1957 and the International Lenin Peace Prize in 1962. Nkrumah lived in exile in Guinea, following his overthrow in 1966; he died in a hospital in Bucharest, Romania, on April 27, 1972, and was buried in his home town after state funerals in both Guinea and Ghana.

### NONALIGNED MOVEMENT

The end of the Second World War witnessed the polarization of the world into two power blocs—the Communist and the Western—and the beginning of the Cold War. Each bloc engaged in economic, cultural, political, and ideological warfare against the other and tried to draw the newly independent countries of Asia and Africa into its own camp. Owing to a widespread desire on the part of these newly independent countries to keep clear of superpower politics and to work jointly against imperialism and racialism, a movement against alignment developed. The Asian-African Conference held in

Bandung in 1955 may be considered a precursor of nonalignment.

The term “nonalignment” was used first by Jawaharlal Nehru, India’s first prime minister and also the foreign minister who shaped India’s policy of nonalignment and was a leader of the movement. He believed that India was too large a country to allow herself to be drawn into one or the other hostile camp, and would prefer to judge each issue as it arose on its own merit. Nehru felt this would help in creating an era of peace and preventing another world war. Another essential feature of nonalignment was a resolve to maintain friendly relations with all countries. By being nonaligned, moreover, the doors could be kept open to all possible sources of aid—Western and Soviet.

Western writers in particular have sometimes defined nonalignment as neutralism. In Nehru’s view, however, nonalignment is not neutralism as that would mean not having an opinion on any issue and keeping neutral, which certainly India did not intend to do. As has been emphasized by the architects of nonalignment, among others, it goes beyond equidistance from power blocs or neutrality. It stands for a number of things, which it strove actively to promote: anti-imperialism, anti-racism, anti-neocolonialism, and peaceful coexistence of all countries. It also supports the right of every nation, no matter how small, to exist and progress without having to join the big powers. Beginning with the first summit meeting in Belgrade in 1961, the policy of nonalignment was institutionalized into a movement. In its early years, nonalignment was often looked upon with incomprehension and even hostility by the superpowers. But as the Cold War gave way to *détente*, it began to be viewed with tolerance, even approval, by the United States and the USSR.

The movement did have a regional emphasis, with most of its members from Asia and Africa, though the former Yugoslavia was an important European member country with Marshal Tito as one of the leaders of the movement.

An important development was that the nonaligned countries came to have a two-thirds majority in the United Nations by the 1960s. Given the deadlock in the Security Council as a result of superpower rivalry during the Cold War, the General Assembly (and the nonaligned member states who formed the majority here) was able to play a much greater role in international affairs—including in situations of crisis—than what had been originally envisioned. The nonaligned countries in turn looked upon the United Nations as the most representative forum (its goals also coincided with their own declared objectives) and at successive nonaligned conferences,

reiterated their commitment to upholding its principles and goals. Thus the nonaligned movement, or NAM, came to have a significant impact, even if it was not wholly successful, in resolving the Suez Crisis (1956), the Indochina conflict, and others. Through collective and consistent action in the General Assembly, it also managed to sensitize the world community with regard to a number of issues, including the apartheid system in South Africa.

In the 1970s the economic aspect of independence gained prominence in the NAM in a bid to right the perceived imbalances in the North–South economic relations. The call for a New International Economic Order (NIEO) crystallized in the UN resolution on NIEO in May of 1974. This was a call for restructuring international economic relations, including trade and technology transfer, to lessen the gulf between the developed and developing world. The nonaligned countries tried to achieve their economic goals through the Group of 77 and UNCTAD. Self-reliance and cooperation among countries of the South were emphasized.

The mid-1970s to the late-1980s were the period of the heyday of nonalignment. Starting with twenty-five members at the Belgrade summit in 1961, its membership rose to nearly one hundred. But it also began to appear that its principles were jeopardized due to sheer weight of numbers, as individual members used it to promote their narrow national and ideological interests. On other occasions, during developments in nonaligned countries in the Middle East, the horn of Africa, Afghanistan, and Indochina, these countries have taken distinctly partisan positions and thus revealed the bloc-wise position division within their own ranks.

On the whole, however, the movement was successful in keeping the nonaligned countries insulated from superpower rivalries. They were, over the years, able to strengthen the UN system and make it an important source of public opinion in international affairs.

In the aftermath of the collapse of the Soviet Union in 1989–1991, a development that left the United States at centrestage as the sole superpower, reservations were expressed in several quarters regarding the continued relevance of NAM, with the disappearance of bloc divisions and rivalry. But what must also be noted is that international relations have traveled a long way since the Cold War days. The world has come to have new, autonomous decision-making centers and a new sense of unpredictability permeates it.

At the same time many of the problems that then confronted the nonaligned countries still remain, along with some new ones. Therefore, the reason for continued solidarity also remains, albeit the basis of

this may have to be reviewed. Since 1989 a new, cohesive group of fifteen countries (the G-15) has emerged in the NAM. It is meant to function as an institutional mechanism of interaction between the developing countries and the industrially advanced G-7. One of the items on its agenda is to undertake collective negotiations with the G-7, especially in view of the developments during the Uruguay Round of trade negotiations.

## NON-GOVERNMENTAL ORGANIZATIONS (NGOs)

Non-governmental organizations (NGOs) have come to occupy an indispensable position in the realm of development. The presence of NGOs since the Second World War has been conspicuous in most parts of the world. In particular, the growth of the sector has been significant in developing countries. They are known under a variety of names and are broadly grouped as the third sector. Voluntary agencies or organizations, action groups, private organizations, non-profit organizations, people's organizations, grassroots organizations, community organizations, self-help organizations, public service contractors, quasi-autonomous NGOs, and intermediary organizations are some of the popular names of NGOs.

Not only in number but also in terms of coverage, activities, and programmes, the growth of the sector has been quite impressive during the last few decades. NGOs have proven to be both a vital agency and a crucial link between people and development. Rough estimates indicate that NGOs reach 250 million poor people in the developing countries (Streeten 1997) and more than 20% of the official aid for development is now being channelled through NGOs in different countries.

The operations of the NGO sector in some developing countries in Asia and Latin America have

achieved remarkable dimensions. In varying degrees of magnitude and activities, NGOs have a presence of their own in all Asian countries. India, for instance, is estimated to have the largest number of NGOs in the world (Lyons and Hasan 2002) with approximately 1.2 million organizations for a population of over one billion. Close to India is China, the most populous country, with about one million registered organizations (Young and Woo 2000, quoted in Lyons and Hasan 2002).

### Defining NGOs

Since the coining of the term NGO, for the first time by the United Nations in 1945 and popularized in the following decades, it has undergone extensive changes both in the structure and activities at different levels in disparate locations. For the UN, an NGO is any international organization that is not established by inter-governmental agreement and that accepts members designated by governmental authorities, though such membership does not interfere with the free expressions of the organization. Nevertheless, the basic characteristic pertaining to its governance, which is typified in the name "non-governmental," has remained unchanged for the last 60 years.

Although consensus about an acceptable definition of NGOs is hard to arrive, one can draw at least three important components from the term. They are non-governmental, non-profit making, and voluntary organization. As NGOs are generally organizations that do not include governmental representatives or governments, governmental components are excluded from the definition (Martens 2002). This characteristic of NGOs does not preclude them from seeking some of their funds from government or governmental agencies. Since NGOs are also understood as organizations not seeking governmental power, political parties and organized political groups are excluded from the notion of NGOs (Martens 2002).

Importantly, the second element of non-profit making is rather relative vis-à-vis that of the profit-making corporate sector. This facet of NGOs has been undergoing changes from an exclusively voluntary nature to something more business-like, but not toward making profit from programmes and activities. From organized collectives, meant mostly for voluntary and unpaid services, NGOs have transformed into professionally competent and specialized entities to carry out specific tasks that require skills and expertise by employing paid professionals and experts. This transformation in fact has diluted

the purely voluntary character of the NGOs, which was once the hallmark of such organizations. The loss of the purely voluntary nature of the NGOs is partly due to the resultant outcome of the growth that NGOs have been passing through from playing a charity and welfare role to resource providers (Hailey 1999). Members aspiring to join NGOs are now less motivated by their will to contribute to the declared objectives of NGOs on a voluntary basis or their concern for the marginalized and underprivileged sections of the society, but more because of the attractiveness of paid employment.

The most distinguishing feature of NGOs has been the element of voluntarism that motivated people to join such organizations for a specific purpose to achieve, often without the intention of getting paid but with a sense of commitment to the cause of the poor, the neglected, and the marginalized sections of the society. During the course of transformation of such solely voluntary-based organizations into more service-oriented, target-specific, and expert-driven modern NGOs, the spirit of voluntarism has given way to an attitude of pay for the work. NGOs are now service contractors, as Korten (1992) appropriately labels them. Still, they are non-governmental and non-profit organizations with the avowed purpose of providing services but are driven by market considerations rather than values. The new brand of NGOs is like other businesses rather than strictly voluntary organizations that pursue a social mission driven by a commitment to shared values (Korten, 1992). Nevertheless, they remain unique and distinct from the state and organs of the state meant to serve similar purposes.

The third component of "organization" in NGOs signifies that they can be distinguished from other groups or movements of less permanent organizational structure (Martens 2002). NGOs have more or less enduring organizational structures, members, offices, and funds to run them, making them formal institutions of a self-governing nature. Permanence cannot be treated as a universal trait of NGOs as many tend to disappear from the scene after achieving the objectives for which they had been originally formed or when their lifecycle has completed a circle. Sometimes they may take their new incarnation into a different form, or change to a different location with another set of objectives and functions.

Briefly, an NGO is a non-profit, organized group of people who do not seek any governmental office (Willets 1996), managing with internally or externally raised funds and retaining their commitment to people and society as distinguishable from that of the state and state organizations.

### Roles NGOs Play

NGOs have assumed an array of roles in development. They act as advocates, educators, catalysts, monitors, whistle blowers, mediators, lobbyists, activists, mobilizers of people and resources, protectors of human rights, conscientizers (stimulating consciences to correct injustices), animators, and conciliators, responding to the needs of the community and society at large. In developing countries, NGOs undertake initiatives that are often innovative and creative in nature to deal with issues related to poverty, literacy, education, health, unemployment, human rights, empowerment, sustainable development, conservation, the environment, and several other areas. Obviously, NGOs in developing countries have created their own niches, drawing support from the affected population and civil society but not without attracting resistance from the state.

### Typology

NGOs are of different kinds. They can be classified into many categories, depending on the basis of the preferred criteria of classification. Based primarily on major functions and activities, they are broadly grouped into consulting NGOs, welfare NGOs, development NGOs, and advocacy NGOs (Bowden 1990). They are also classified as project-based NGOs, national NGOs, international NGOs, and network NGOs (Conyers and Kaul 1990). If origin is the basis, NGOs are either self-initiated or externally supported (Avina 1993). The self-generating ones are usually small organizations that begin with limited internal financing, at least in the initial stages of formation, with moderate goals that are grounded in the immediate needs and resources of the community wherein they are located. In comparison, the externally supported NGOs are built around the locally perceived needs, promoting an externally designed development approach. Organizationally, they benefit from outside technical assistance, field experience of the founding organization, and the political or economic leverage of the founding organization (Avina 1993). In some developing countries, large-scale organizations of the latter kind have outweighed the self-generated ones. There are also cases of self-generated NGOs becoming the second category in the immediate stages of growth due to the availability of and dependency on funds for their activities.

NGOs can be delineated from civil society organizations (CSOs), which inhabits the area between

individuals (or families) and the state (Blair 1997). As the UNDP definition goes,

Civil society is, together with state and market, one of the three "spheres" that interface in the making of democratic societies. The organizations of civil society, which represent many diverse and sometimes contradictory social interests, are shaped to fit their social base, constituency, thematic orientations (e.g., environment, gender, human rights) and types of activity. They include church-related groups, trade unions, cooperatives, service organizations, community groups and youth organizations, as well as academic institutions and others. (Bebbington and Riddell 1997)

In other words, while all CSOs are NGOs, all NGOs are not CSOs (Blair 1997).

### Origin, Growth, and Lifecycle

In normal circumstances, the origin, growth, and development of NGOs are determined and facilitated by a set of internal and external factors. External ones are those chiefly rooted in the socioeconomic, cultural, and political settings, whereas the internal ones, which are more relevant in the phases of growth than origin, concern all those factors that fall within the organization. Necessarily, the emergence of NGOs varies from context to context and country to country, influenced by the above internal and external factors.

Importantly, the origin, growth, and development or the lifecycle of NGOs can be portrayed through four stages of startup, expansion, consolidation, and closeout (Avina 1993). All these four stages are not mandatory for the NGOs to follow in a rigid fashion. Some may skip the stages, choosing an entirely different route, while some might follow all the four stages in order. An organization that closes its functioning for some reason may begin its operations later in a different locality. Similarly, an NGO that closes out its operations in one area may start new programmes elsewhere, and thus closing out and starting up would happen simultaneously.

In developing countries, the lifecycle of NGOs generally starts with the attempts of an inspired founder or a group of individuals of similar interests. Focussing on NGOs in India, which has the largest sector of organizations in the world, Radhakrishna (1993) concludes that in the first ten years of existence, the organization struggles hard. If everything goes well, it reaches a plateau or a peak of high quality of work in the second decade. The organization at this stage attracts recognition. At the end of the second decade, as the leadership moves to the next generation, new problems crop up and there are

chances for organizational deterioration within the organization. This may be due to several reasons: the expansion of the organization to other geographical spots, proliferation of activities and programmes, the generation gap between the founder leader (or group of leaders) and the current workers, vested interests, alienation between the organization and the community it is meant to serve, increasing bureaucratization within the organization, indifference to the socioeconomic and political changes that happen in the society, increasing demands of the workers for more benefits and unionization, and the pains and pangs of transition. This stage, with the oncoming of organizational difficulties, is a critical period for the life of any organization. Either there is reaffirmation of earlier goals and objectives by the new leadership or redefinition of roles in the changed context. If the opportunities are missed, the graph goes down like an inverted "U" called a hyperbole.

### NGOs and Government

NGOs are sometimes viewed in juxtaposition to the state and state agencies, primarily because of the efficiency with which the programmes of NGOs are designed and implemented. Numerous are the advantages for NGOs vis-à-vis that of the state and state agencies. NGOs are known for their proximity to people, responsiveness to needs, sensitivity to the immediate needs, flexibility, micro-based programmes and smaller constituencies of activities, inexpensive strategies that lead to appropriate programmes, people-centeredness, participatory and personalised approach to the problems, and the ability to invent solutions. Compared to the government and other formal agencies, NGOs are more adaptable, sensitive to local conditions, and better suited to work with the poor (Streeten 1997). Within NGOs there is a perceptible lack of bureaucratic rigidity. Flexibility allows NGOs to tailor programmes and services that suit the requirements of the beneficiaries and the communities for whom they are intended for (Salamon 1987). Micro-level operations enable them to define their constituencies and standpoints clearly and work toward innovative solutions to deal with the issues they have chosen to address (Korten 1992). Innovative experiments have often been successfully carried out by NGOs in different locations and in several areas of development that directly affect the lives of the poor and the needy. In community health, indigenous medicine, evolving techniques of delivery of services to the poor in remote destinations (Bhatt 1995), microfinance, and in mobilizing workers in the informal

sector, to take a sample, the innovative and creative spirit and strategies of NGOs have been evident.

Placed parallel to NGOs, the state is typified as inefficient, hampered by bureaucracy, and in the control of self-interested politicians (Clark 1997; Robinson 1997). On the other hand, NGOs ensure that the people, the vulnerable groups in particular, are involved in the process of decision making (Clark 1997). Quite often it is the NGOs that begin to venture out into areas where immediate attention is required, even before government agencies start thinking of it (Salamon 1987). NGOs can therefore serve as a test-bed for new ideas and methodologies that are difficult for the government and business sectors to experiment with (Korten 1992). They have successfully acted as a sounding board for government policies and programmes as well. NGOs make use of the scanty resources available at their disposal in a more economic, efficient, and appropriate way than the state tends to do. Due to the talents and expertise that the NGO sector attracts, combined with a heightened sense of commitment among the workers and the staff, the innovative and enterprising spirit for finding solutions to the problems of the society are always kept alive and encouraged. Time and again, the innovative experiments tested and implemented by NGOs have proven to be instrumental in influencing governmental policies in a desirable direction, benefiting the neglected and the marginalized. NGOs do play their advocacy role effectively in areas where interventions are warranted. Illustrations from varied locations are numerous. Naturally, these achievements bring accolades to NGOs as trailblazers, whistle blowers, pioneers, and creative inventors.

### **NGO-Government Partnership**

Individual advantages and disadvantages, merits and demerits, or strengths and weaknesses of NGOs and the government do not necessarily prevent both from entering into partnerships to achieve common goals and objectives of development. Partnership has been promoted as a solution to attaining efficiency and effectiveness (Brinkerhoff 2002). It acts as a mechanism to combine the advantages of both the partners, namely the NGOs and the government, in the delivery of services to the people. Working in collaboration for commonly agreed and accepted objectives through jointly designed strategies and programmes, within the ambience of mutual understanding and recognition of the strengths and weaknesses of the involved partners, NGO-government partnership has

accomplished significant feats in development. The major advantage of this partnership is that it can provide a better service than either partner could provide on its own (Salamon 1987).

NGO-government partnership is apparent in a range of forms: monetary assistance, institutional support, policy formulation, a policy of cooption bringing opposition opinion into the mix, and adoption and application of innovative endeavours. Partnership is bound to be country-specific and subject to societal characteristics as well as the character and nature of NGOs and the government (Clark 1997). The success of NGO-government partnership depends largely on factors such as the attitude of the government officials and the NGOs toward striking such a partnership, the degree of encouragement from both the partners, direction and selection of relevant NGO partners (Clark 1997), and the exigency of needs that necessitate immediate action (such as the united action demanded by unforeseen natural calamities and disasters).

Successful partnership experiences reported from developing countries demonstrate that NGO-government collaboration works effectively with specific programmes that entail some sort of urgency on the part of the people and the state. Time-bound, specific programmes are likely to be more successful under a partnership venture than in a permanent partnership relation within a formal institutional structure. As cases illustrate, adequate financial support from the government motivates NGOs to enter into partnerships and the same monetary supports work as a prerequisite for the successful completion of the ventures undertaken in partnership. NGOs need financial resources, though they have the skills, expertise, and other resources essential for delivering goods efficiently.

Partnership programmes at the same time depend greatly on the government in power, especially its political ideology and commitment to the disadvantaged and deserving sections of the population. Importantly, this political dimension shapes the willingness and cooperation on the part of NGOs who have chosen to work for similar but agreed objectives with the government.

Partnership becomes a positive activity when governmental agencies shed their rigidity and change themselves into a pro-people apparatus, at least for the sake of achieving the agreed objectives with the NGOs. Partly due to the time-bound nature of the programme and the immediate concerns of both the partners, bureaucratic delays give way to expediency. Partnership endeavours should not be restricted to securing financial assistance alone as they also demand participation, sharing, and involvement of

the partners in matters of skills, capabilities, and readiness to make the partnership effective and useful for the people.

What benefits do partnerships bring to the partners concerned? Partnership programmes can influence the official structures in bringing about greater transparency, responsiveness (Clark 1997), and enhanced sensitivity of the bureaucracy to the immediate requirements of the people. In return, NGOs gain benefits in the form of better awareness about strategic planning and the macro-level concerns of the government.

Yet, there are imminent strains, difficulties, and dangers in NGO–government alliances. For the NGOs, partnership programmes might create tension and conflict at various levels: between their service role and advocacy role, and between their role as deliverers of government-funded services and their role as critics of government and private policies (Salamon 1987). Salamon (1987) cautions about three potential dangers in this alliance. Heavy reliance on governmental support, firstly, can lead to the loss of autonomy of the NGOs. Secondly, it can lead to “vendorism,” or the distortion of the mission of the NGOs in pursuit of governmental support. Finally, there is the danger of bureaucratization and over-professionalization due to government programmes and accounting requirements as the government officials are more concerned about the problems of management supervision, accountability, and authority. The involvement in government programmes impinges on the prominent features of NGOs such as their reliance on volunteers, their sense of independence, and their usual informal and non-bureaucratic character in their dealings with people (Salamon 1987). At the same time, neither the replacement of voluntary sector by the government, nor the replacement of the government by the voluntary sector makes as much sense as their collaboration (Salamon 1987).

## Issues

The commendable role played by the NGO sector in developing countries and the recognition it has earned for being influential in the processes of development do not rule out the potential for difficulties and problems that emanate from both within and outside the sector. Internally, NGOs confront problems relating to their objectives (original as well as the added ones in the later stages of growth and expansion), ideology, perceptions on organizational concerns, organizational matters, leadership, management, volunteers, paid workers, staff programmes,

resources, and the like. As NGOs are established with specific goals and objectives, the *raison d’être* is likely to vary and therefore, the strategies and programmes are bound to differ from NGO to NGO. It is also possible that organizations with similar objectives can have an altogether different orientation and programmes to achieve the same.

The objectives with which NGOs begin to work are often subjected to change when they grow in size, programmes, and institutional complexity. In this process that brings about changes in the originally envisaged objectives, NGOs are likely to miss the link between objectives, programmes, and beneficiaries. When this link is misplaced or lost, incongruity between objectives, programmes, and beneficiaries occurs. If the objectives conceived at the inception of NGOs are not allied with appropriate strategies, there can be problems in achieving their original objectives. More often than not, it is the availability of projects and funds that compels NGOs to deviate from the originally designed goals and programmes, motivating them to take up the new ones in tune with the prescriptions of donors for funded projects. It does not imply that NGOs should keep themselves away from constantly identifying new objectives and programmes during the course of their existence. Any new objective, which may be the result of the understanding of the changing contexts or needs of the people, should seriously take into account the resources available within the organization. Perhaps this incongruity explains why the “implementation gap” between what is planned and what is implemented is very great among the NGOs in developing countries (Turner and Hulme 1997).

NGOs accept projects designed by sponsors (Avina 1993) and statutory agencies, reducing their role to that of an intermediary. More than one-third of the funds of NGOs comes from official donors (Streeten 1997). NGOs look up to the funding agencies for tailor-made programmes by changing themselves into implementing agencies of the donors, or as Korten (1992) calls them, “public service contractors.” For a number of reasons, there are regular pressures on the modern NGOs to become public service contractors. Korten’s (1992) list includes:

- The fatigue of constantly existing at the margin of financial survival and the attraction of donor funding;
- The strain faced by more activist organizations who must constantly fight established interests, values, and practices;
- The difficulty of maintaining the value consensus and commitment of the organization as the organization grows in size;

- Moral obligation to provide job security for the paid staff of the organization; and
- The belief that contracting will bring in more funds and therefore it will be possible for the organization to do more things.

In these circumstances, the primary concern of the organization shifts from people to the mere survival of the organization with an uninterrupted inflow of funds. NGOs of this kind assume new responsibilities where financial assistance is easy to obtain. When the motive becomes the continued existence of the organizations through a regular flow of funds and new projects, NGOs fail to adopt better management skills for effective functioning. Obsolete management techniques keep the organization at a level from which it cannot grow in tune with the changing times. Tailor-made projects limit the scope for indigenous and innovative strategies as they usually come with a specific package of management guidelines suited only for specific purposes. Programmes and approaches lose urgency and appropriateness as they are planned more in consideration of the source and availability of funds and benefits to the organization than the benefits the projects would bring to the beneficiaries (Sooryamoorthy and Gangrade 2001).

Funded projects and closeness to donors also have consequences on the lifecycle and the functioning of NGOs. Apparently, the birth of NGOs is not always closely linked to the needs of the people or the community where they start their operations. Rather, as is the case in some Asian countries like India, they remain to be self-employment ventures of the founder and his or her team. Easy availability and flow of external funds, in turn, develops problems such as alienation and isolation of organizations, making them more secretive in their nature and function (Radhakrishna 1993). This in due course takes its toll on the transparency and accountability of NGOs. On another front, too, the consequence of this is obvious: well-established NGOs can monopolize the flow of funds to them, limiting the resources for the relatively new and smaller organizations (Salamon 1987).

The shift from people-oriented work to project-oriented activities is more vivid now among the NGOs in developing countries. The dependency of NGOs on government and international donors has not only affected the autonomy of the organizations but has also become counterproductive in their expected role as advocates and lobbyists, leading NGOs to assume the characters of governmental appendages.

On the other hand, an increasing number of organizations in South Asia and Latin America are now diversifying their sources of funding and generating

their own income from a mixture of commercial ventures, cost recovery, and local fundraising (Edwards et al. 1999). This kind of change toward resource mobilization would eventually help the NGOs to assume more of the characteristics of a genuine civic actor rather than a service delivery contractor (Edwards et al. 1999).

Structural changes are also part of the consequences of flow of external funds and greater dependency on them. NGOs begin to grow institutionally. Informal type of functioning gives way to a more formalized and complex set of procedures and structures. Presence of professionals and experts in NGOs, predominance of paid workers over volunteers, well-paid staff, and projects designed and supported by donors become the salient characteristics of modern NGOs. Institutionalization correspondingly brings in changes in the approach and attitude of the workers. Although not necessarily stated, new rules and norms are put in place for adherence. The changed setup may require the volunteers and paid workers to work according to a time-bound schedule. Strategies are pre-designed and guidelines of the sponsors are followed, undermining the role of the people and the workers in choosing the appropriate ones. As the NGO grows into a more complex institutionalized structure, the workers wish for the NGO to become a permanent body that would protect their interests as workers. In other words, the workers want the NGOs to act more like an employer than an agency that brings developmental opportunities to the people. In India, for instance, there are twenty million paid and voluntary workers in 1.2 million NGOs, contributing 14.8% to the gross national product of the country.

At times NGOs carry on with several programmes simultaneously without considering their structural and functional limitations such as the relevance and usefulness of the programmes, the benefits the programmes could bring to the people, and the infrastructure and resources at their disposal. Efforts are made in such a way that no opportunity to start a new assisted programme is lost. In this process NGOs lose their credibility and efficiency. Empirical studies have revealed that the organizations that undertake and run several programmes concurrently would register a low member-accountability vis-à-vis the organizations that concentrate on a single programme at a time (Smith-Sreen 1995).

Sometimes NGOs are silenced by the mechanism of cooption (Tandon, 1988), particularly when they become critical of governmental policies and programmes, and when they play their advocacy role. Cooption happens in many ways: allocating funds for NGO programmes, and offering respectable positions

in government bodies with perks and privileges are some of the means by which NGO workers are coopted. Cooption can come not only from those in power but also from other political actors; including the opposition, as happened in some Arab countries. For them, NGOs are instruments that can be used for the extension of political support and influence.

## Conclusion

For the last few decades, NGOs have been playing a very vital but active role in several realms of human life. NGOs have proven to be an indispensable player in developmental programmes affecting the majority of the population scattered in different continents. They have ventured into new areas of activities and have proven themselves to be effective and successful players. This is evident in the growth the sector has achieved over the years. The growth of the sector has been incredible, particularly in some developing countries. For instance, in India and Brazil the number of organizations has grown to one million and 210,000 respectively (Salamon and Anheier 1997). But the spread of NGOs across developing countries is neither uniform nor even. This unevenness, to some extent, is due to reasons of political stability and the presence (or absence) of democracy.

In reality, the roles NGOs take up, variations in contexts and needs notwithstanding, are seldom played in a cordial and complimentary atmosphere, as many of them are critical of state policies that adversely affect the people. Democratic structures and qualities of a nation serve as a determinant factor in providing a conducive and fertile ground for NGOs to take root. African countries in general, for instance, are not offering an encouraging environment for the growth of NGOs, which is attributed to the poor economic performance, limited legitimacy, and cultural heterogeneity that exist in such countries (Dicklitch 1998). In relation to the population, the number of NGOs in most African countries is disproportionate and their role has been confined to filling the gaps left by the withdrawal of the regimes or working in collaboration with the regime to further the objectives of the regime. Although the regimes accept funding from international NGOs, they do not welcome overly political or advocacy-oriented NGOs to their countries. While accepting NGOs as partners in development, the regimes also want to control them through a variety of forms, using their authoritarian, autocratic, and coercive political powers. Things are changing, however, in countries like South Africa where democracy has taken root since 1994.

Despite adverse conditions at the operational level, the element of volunteerism and commitment to social ideals, coupled with innovative programmes and strategies, have enabled NGOs to offer an alternative to the people. In the changing but challenging global situation, the NGO sector will be taking up more and more new roles to serve the people who are sidelined in the process of development and globalisation. Moving from the level of organizations acting at micro levels to dealing with the immediate needs of the society, NGOs are now becoming broad-based organizations. Networking with like-minded NGOs has helped the NGOs to establish links and extend their activities and programmes to new territories. In several developing countries, they are performing more strategic and lobbying functions. This is evident in their lobbying power of the international financial institutions, monitoring of international commitments (like Social Watch), and the democratisation of global economic and other regimes (for example, the WTO) (Edwards et al. 1999). One would naturally hope that in the coming years the NGO sector will be taking over more and more new functions that were hitherto performed by the state, and bring in the fruits of development to the deserving majority.

## NORTH AFRICA: HISTORY AND ECONOMIC DEVELOPMENT

### North Africa: The Region

Although there is little consensus on a clear delineation of geographical and political boundaries for the Near East, Middle East, and North Africa, for

the purposes of this essay the region of North Africa refers to five countries: Algeria, Egypt, Libya, Morocco, and Tunisia. North Africa is the region north of the Sahara Desert, largely surrounded by water on three sides: the Atlantic Ocean to the west, the Mediterranean Sea to the north, and the Red Sea to the east. The vast Sahara Desert has traditionally separated North Africa from the rest of the African continent. Beginning in the west, the Atlas Mountains run from Morocco to Tunisia. The high peaks of the Atlas produce considerable rainfall. On the northern slopes, flowing rivers produce fertile lands for agriculture and forests. The majority of Moroccans can be found living in the foothills and fertile farmland, valleys, and plateaus stretching from the mountains to the coast. The tallest peak in the Atlas Mountains is Mount Toubkal in southwestern Morocco, reaching a height of 13,665 feet. The mountains are also rich in minerals, including phosphates, lead, zinc, and iron ore. Approximately, 20% of Morocco's land is arable. Earthquakes occasionally strike in the northern mountains. Years of neglect have posed environmental threats of desertification, water supply contamination, and pollution of coastal waters.

Moving eastward to the second-largest country in Africa, we reach Algeria, which comprises a terrain of mostly high plateau and desert. Only about 3% of this country, which is about 3.5 times the size of Texas, is arable. The climate is arid, summers are hot and dry, and winters can be wet and cold. Earthquakes also occur in the mountainous region, and mudslides and floods can strike in the rainy season. Soil erosion, desertification, and industrial pollution have contributed to a neglected ecosystem. Algeria's natural resources include phosphates, iron ore, lead, zinc uranium, petroleum, and natural gas.

Directly east is Libya, which is comparable in size to Alaska. Most of Libya's flat and barren land is inhospitable, given to dust and sand storms. Only 1% of Libya can be farmed. Libya's dry terrain and shortage of fresh water resources have led to the country's investment in the largest water development program in the world, the Great Manmade River Project, designed to tap into ice age water reserves trapped in sandstone beneath the Sahara and pump the water to coastal cities. Oil and natural gas are plentiful in Libya. Like the rest of North Africa, desertification is cause for environmental concern.

In contrast to its two huge neighbors, Tunisia is a tiny country about the size of the US state of Georgia, snuggled in the north between Algeria and Libya on the tip of North Africa, just southwest of Sicily. Approximately 18% of Tunisia's land is arable. Northern Tunisia is mild and rainy in the winter, and hot and arid in the summer. The mountains of the

north give way to the Sahara Desert in the south. The land produces phosphates, iron ore, lead, zinc, and petroleum. Improper hazardous waste disposal is now posing health issues. Soil erosion, desertification, and water pollution are additional environmental concerns.

Egypt is the easternmost country in North Africa. The Red Sea, Israel, and Gaza border it on the east, and Sudan on the south. Because over 90% of the country is barren desert, the majority of Egyptians live along the Nile River, which runs south to north and has served as the lifeblood of Egypt for thousands of years. East of the river is the Sinai Peninsula, a huge triangular desert region, home to Mount Sinai and Mount Katherine. The pinnacle of Mount Katherine represents Egypt's highest point at 8,625 feet. Although Egypt is large, about three times the size of New Mexico, less than 3% of the country can be farmed. The land is hot and dry and receives very little rainfall. The winters are moderate with an average temperature during the day of about seventy degrees. Egypt's natural resources are iron ore, phosphates, limestone, gypsum, lead, zinc, natural gas, and petroleum. The country is prone to earthquakes, flash floods, dust storms, and sandstorms. Water pollution from oil, industry, and pesticides now threaten the coastal region. Desertification and soil salination are also environmental concerns.

These five countries all share a common and interlocking heritage, culture, history, and religion. All are Arab countries, meaning the majority of the population speaks a dialect of Arabic. With the exception of Egypt, the Berber language is spoken by some 12 million people across North Africa. The Berbers share an ethnic heritage that stretches back to about 2400 BC, thousands of years before Arabs arrived in the seventh century AD. The newly arriving Arabs of that period brought Arabic and Islam with them. Today the social fabric of North Africa is cut from the cloth of Islamic heritage. Although geographically lying on the African continent, culturally and politically, North Africa is intimately linked with the Middle East and the rest of the Arab world.

## History

The modern history of North Africa is closely linked with that of the West and is largely a product of European colonial endeavors in the region.

By the beginning of WWII, tension surfaced between the ruling class of one million European, primarily French, colonists and the nine million Algerian Muslims. The French colonial history of Algeria

was characterized by inequality that left the most fertile, and highly coveted, farmland and governing authority in the hands of colonists. This inequality created profound bitterness between the two groups. Algerian nationalism began to take the form of a growing Islamic movement intent on expanding Algerian independence and assimilation. The Algerian masses wanted complete equality with their colonial rulers.

During WWII, many Algerian Muslims fought alongside the French. In 1945 after the war, Algerian nationalists celebrating the Allied victory, displayed an Algerian flag at a city called Setif. A series of ensuing scuffles with the French police soon escalated into a massacre of some ninety colonists. The French military reacted by brutally killing more than 1,500 Algerian civilians. In November 1954, the National Liberation Front (FLN), an indigenous resistance organization, initiated a series of assaults on police and government targets. Within a year, the FLN's membership had swollen from twenty to approximately two thousand. In August of 1955, Algerian Muslims revolted and slaughtered 123 men, women, and children at Phillipville. The French military retaliated by massacring thousands of Algerians. Over the next year in an effort to eliminate the FLN, French authorities launched a campaign of arrests and torture of known Algerian nationalists. As violence escalated in August 1956, the French targeted a bomb factory at 3 Theves Street that killed eighty civilians. The following month, Algerians retaliated by bombing three civilian targets. Far from discouraging extremists, the French actions forced many moderate Muslims to sympathize with the FLN. By 1957, the resistance fighters had risen to nearly twenty-five thousand as violence escalated. Half a million French troops eventually quelled the rebellion and drove a debilitated FLN into rural areas.

The news of French brutalities in Algeria generated a huge anti-war movement at home in 1958, as the French publicly protested these human rights violations. War hero Charles de Gaulle, who was elected president of France in 1959, negotiated a truce in 1962, and Algerians voted for independence in a referendum. De Gaulle proclaimed Algeria an independent nation, and all but thirty thousand Europeans left Algeria over the next year.

Algerian World War II hero and FLN militant leader, Ben Bella, assumed the premiership in 1962 and was elected president the following year. But struggles in Algeria were far from over. Houari Boumedienne, Ben Bella's defense minister, staged a coup against the president in 1965. For the next fifteen years Ben Bella remained under house arrest until he left the country in 1980.

Between 1972 and 1974 the price of crude oil quadrupled from \$3 a barrel to \$12. Many Arab oil-producing nations reacted to the 1973 War in Israel by placing an embargo on nations that supported Israel. The resulting Arab Oil Embargo produced shortages in supply for those countries. The Iranian revolution further decreased production, driving the price of crude from \$14 in 1978 a barrel to \$35 in 1981. In the mid-1980s the price of crude oil dropped to below \$10.

Algeria as a member of OPEC has the fourteenth largest natural reserves of oil. It ranks fifth in natural gas reserves and is second in natural gas exportation. The oil boom of the 1970s and early 1980s yielded huge profits for Algeria, and as a result it enjoyed a vibrant economy. The plummeting prices in the mid-1980s, however, took their toll on the Algerian economy. In the early 1990s, Algeria's economy improved due to rescheduling of foreign debt and economic policy reforms supported by the World Bank and International Monetary Fund (IMF).

In 1991, an Islamic extremist movement known as the Islamic Salvation Front (FIS) won the first round of general and presidential elections, gaining 188 of the 231 seats in parliament. The military and the FLN—which won only fifteen seats—canceled the second round of elections, banned the FIS, and arrested a number of its members. A backlash of violence broke out and evolved into a civil war in 1992. Islamic extremists assassinated Mohammed Boudiaf, the newly elected president of Algeria, the same year. In 1999 amnesty was granted to many armed militants, and in 2000 the Islamic Salvation Army, the armed wing of the FIS, was disbanded. The civil war claimed an estimated one hundred thousand lives.

Thousands of Italian colonists settled in Libya in the 1930s. Libya became part of Italy in 1939 and served as a major battleground in World War II. The Allied forces defeated and replaced the Axis powers in Libya in 1943. The postwar Libyan economy was broken. The country's infant mortality rate reached 40% while the literacy rate dropped to 10%. Although the United Nations granted Libya independence in 1951, the West continued to exert its influence in Libya.

British-supported King Idris granted the British permission to establish military bases on Libyan soil. The United States began using Wheelus Field as an Air Force base in 1943 after the British 8th Army captured it from the Germans. The United Kingdom of Libya was granted independence in 1951. Libya went on to align itself with the West through the adoption of the Eisenhower Doctrine in 1957. The doctrine, designed to counter the growing expansionist efforts of the Soviet Union, committed

the United States to military action to protect allies in the Middle East.

The discovery of oil in Libya in 1958 changed the dynamics between the former Italian colony and the West. Over the next decade, the state's revenue vastly increased as its dependence on foreign subsidies diminished. In 1964 Libya expelled most of the British military although a handful of British and US forces remained. In 1969 Colonel Muammar Qaddafi led a group of military officers in a bloodless coup d'état to overthrow the monarchy of King Idris. Qaddafi crafted a type of Islamic socialist rule over Libya, which emphasized social services and public-owned industry, on the one hand, and nominal Islamic values—such as proscribing alcohol and gambling—on the other. During the early years of his rule, Qaddafi seemed to pacify Washington with his ardent anti-Soviet policies. In the years to follow, Qaddafi instituted a set of policies on oil, terrorism, Israel, and the Soviet Union that served to alienate Libya from the United States. In 1973 the Libyan leader supported Arab forces in the Arab-Israeli War. After the war, Qaddafi campaigned to impose an oil embargo against Israel's supporters. Qaddafi subsequently supported the Palestinian Liberation Organization (PLO) and sought to warm relations with the Soviet Union. Throughout the 1970s and 1980s, Libya was implicated in a number of terrorist activities, including support for the "Black September Movement" responsible for the massacre at the 1972 Olympics in Munich, Germany.

In 1982 the United States banned the import of Libyan oil and the export of US petrochemical technology to Libya. Accusing Qaddafi of supporting terrorism, US President Ronald Reagan launched a brief bombing campaign against suspected terrorist sites in Tripoli and Benghazi in 1986. The attack killed sixty people including Qaddafi's young daughter. Two years later, Libya was linked to the terrorist bombing of a Pan Am airliner over Lockerbie, Scotland, that killed 270 people. The United Nations imposed sanctions against the North African nation in 1992. Finally in 2003, Libya assumed responsibility for the Lockerbie disaster after two of its government employees were implicated in the bombing. Qaddafi also established a \$2.7-billion fund to compensate families of each victim in the Lockerbie bombing. As a result, the UN lifted sanctions in September 2003.

After the fall of Saddam Hussein in 2003, Qaddafi publicly unveiled his nation's weapons of mass destruction program and invited international inspectors to dismantle it. The inspectors subsequently began identifying and destroying Libya's chemical and nuclear weaponry. In light of Qaddafi's recent

reversal in position, the United States took steps to normalize relations with Libya in 2004.

During World War II, the British used Egypt as a center of operations in North Africa. The war ended in 1945. Three years later, in May 1948, Egypt sent troops to Palestine to bolster Iraqi, Lebanese, Palestinian, and Syrian fighters in an effort to defeat the newly declared Israeli state in the First Arab–Israeli War. The Israeli troops, primarily comprising Haganah soldiers who had gained experience in WWII, defeated the Arab forces. Egypt succeeded in gaining control over the Gaza Strip.

Against the backdrop of the humiliating Arab defeat in the war and widespread Egyptian discontent with Israel, the West, and Egyptian monarchy, Gamal Abdul Nasser led the Free Officers—a group of revolutionary military officers—in a coup that ousted King Farouk in the Egyptian Revolution of July 1952. Later, Nasser assumed the premiership by arresting General Muhammad Naguib. Two years later, Nasser ran uncontested for the presidency and won. Although Nasser’s regime brutally repressed his opponents—most notably, communists and Islamic militants—his popularity in the Arab world soared. Nasser came to represent the epitome of the defiant Arab leader who resisted Western pressure.

Preying on US fears that Egypt would align itself with the Soviet Union, Nasser accepted US support in a project to construct the Aswan High Dam in 1956. The same year, the Egyptian leader later turned to the Soviets for weapons after the United States refused to sell Egypt arms. As a result, US President Dwight Eisenhower announced his withdrawal of aid for the dam project. In a speech one week later, Nasser sent the coded message *Ferdinand de Lesseps* to Egyptian troops to seize the Suez Canal. Nasser proceeded to nationalize the canal and oust British officials from the country. British and French powers, seeking to protect their financial investments in the canal, plotted with the Israelis to attack Egypt. In October 1956, the Second Arab–Israeli War erupted when Israel invaded the Sinai. When Nasser refused British and French demands to withdraw troops from the canal zone, the Western powers bombed Egyptian military targets. Moscow and Washington responded by pressuring the invading forces to withdraw, and Nasser surfaced as a champion of the Arab world for his defiance toward the West.

In 1958, Nasser merged Egypt with Syria in an effort to create a Pan-Arab state. Nasser served as president of the new entity, called the United Arab Republic, with Cairo as its capital. Due to internal problems, Syria withdrew in 1961.

Tensions between Israel and her neighbors continued to rise over the next few years. A series of

posturing activities led up to the Third Arab–Israel War (also called the Six-Day War or the 1967 War). In 1966, Egypt and Syria signed a defense pact. Border skirmishes escalated. In May 1967, Nasser demanded that UN forces evacuate the Sinai, which had served as a buffer zone between Israel and Egypt. The two nations immediately mobilized troops along the border. Egypt closed the Gulf of Aqaba, obstructing Israel’s access to the Port of Eilat. Jordan signed a treaty with Egypt, placing Jordanian troops under Nasser’s command. The war officially began on June 6, 1967, when Israel launched a preemptive strike against Egypt. During the first three days of the Six-Day War, Israel seized the Sinai, crushed Egypt’s air force, and reached the Suez Canal. On the last three days of the war, Israeli forces captured the West Bank, Jerusalem, and the Golan Heights.

In the humiliation of defeat at the hands of the Israelis and the loss of the Sinai and Gaza Strip, Nasser offered his resignation. The Egyptian people, however, refused. Nasser remained in power until dying of a heart attack in 1970. Nasser was succeeded by Anwar Sadat, an original member of the Free Officers and close associate of Nasser.

President Sadat sought to restore Egyptian prestige and regain the Sinai after the previous military defeats. Sadat’s request of US Secretary of State Henry Kissinger to negotiate the return of the Sinai to Egypt was rejected. The Fourth Arab–Israeli War began on October 6, 1973, when Egypt launched a surprise attack against Israeli forces in the Sinai, and Syria attacked Israel from the north. Iraq sent thirty thousand troops to support Syria in addition to eight other Arab nations that joined forces against Israel. A massive airlift of weapons to Israel by the United States saved the Israeli military. The conflict escalated to an international incident when the Soviets countered with an airlift of weapons to Syria and Egypt. Kissinger flew to Moscow to defuse tensions. The UN brokered a cease-fire on October 25, and Egypt succeeded in securing concessions regarding the Sinai from Israel. Sadat addressed the Knesset (Israeli parliament) in 1977. A year later, US President Jimmy Carter hosted a series of peace talks, known as the Camp David Accords, between President Sadat and Israeli Prime Minister Menachem Begin at Camp David, Maryland. In March of 1979, Egypt and Israel signed a peace agreement that ended more than thirty years of conflict. In order to encourage continued peace, the United States promised both nations billions of dollars in military and economic assistance.

For his role in the peace accords, Sadat received the Nobel Peace Prize in 1978. Sadat’s foreign policies succeeded in gaining international recognition,

regaining the Sinai, securing billions in aid from the United States, and establishing peace in a volatile region. Yet while the peace treaty was applauded in the West, much of the Arab world perceived Sadat as having sold out the Palestinians. Egypt's membership in the Arab League was suspended. In Egypt, a number of violent uprisings erupted. In 1981 during a military parade, Islamic extremists assassinated Sadat.

Hosni Mubarak succeeded Sadat as Egypt's president. Mubarak's foreign policies continued to cultivate good relations with the United States and Israel while seeking to improve relations with the Arab world. Due to a changing political landscape in the region over the next decade, the Arab League reinstated Egypt's membership in 1989. In 1991, Egypt joined the US-led coalition against Saddam Hussein's invasion of Kuwait, and Mubarak helped broker the peace agreement between Israel and the Palestinian Authority in 1993. Intensified struggles with Islamic militants at home plagued Mubarak's government from 1992 through 1997, culminating with a deadly attack on foreign and Egyptian tourists near the Temple of Queen Hatsheput in Luxor in November 1997. During those years, some 1,200 Egyptians, primarily Coptic Christians, were killed in the violence. Mubarak's brutal counterterrorist measures succeeded in reducing violence in the country. The October 2004 bombings of Israeli tourist resorts that killed thirty-four people in the Sinai were the first major terrorist attacks since the Luxor attacks in 1997.

### **Economic Development**

North African nations left with the economic legacy of the past century now face a number of challenges to reform and adapt their economies to the realities of the twenty-first century. Like much of the Arab world, North African economies are characterized by bloated public sectors, excess government spending, and constraints on the private sector and foreign trade. Industrial production is regularly hampered by the small size of Arab markets, uncompetitive Arab economies, and lack of transparency and accountability. Nepotism and corruption traditionally discourage competition. The legacy of traditional agriculture and dependence on oil revenues has presented obstacles for development. Arab economies routinely discourage foreign investment while much-needed Arab capital is often invested in industrialized nations. Government investment in human capital has failed to keep pace with the growing demand,

and the "brain drain" is contributing to what the drafters of the 2003 Arab Human Development Report call "reverse development aid." Talented, educated Arabs regularly leave their homeland for more promising careers in developed nations.

Algeria's capital is Algiers. The nation's current population is 32 million. With a workforce of about 9.6 million people, 32% work for the government, 14% work in agriculture, 13.5% in industry, 14.5% in trade, and 10% in construction and public works. The per capita GDP is \$6,000. Like other oil-producing countries in the region, the government has struggled to diversify the economy to become less centered on the energy sector. Hydrocarbons still account for 30% of the nation's GDP and 95% of its export earnings. The country continues to suffer from huge foreign debt (40% of GDP), high unemployment (26%), Berber unrest, and a small-scale armed insurgency that attacks government interests in the south.

The capital of Egypt is Cairo. The economic reforms of the early 1990s orchestrated by the IMF helped to improve Egypt's economy. Solid fiscal and monetary policies contributed to lowering inflation and reducing budget deficits. For her part in the Gulf War in 1991, Egypt was relieved of \$7 billion in foreign debt. A bulging public sector, excess spending, and allegations of corruption, however, have contributed to domestic ills. Egypt's per capita GDP is \$4,000. The \$2 billion in US aid each year serve as a stabilizing force in Egypt's economy. Egypt relies heavily on tourism. The 1997 terrorist attack in Luxor hurt tourism, and the 2004 attacks on Israeli resorts in the Sinai have raised concerns about the future of the tourist industry.
