Son of a Croat father and a Slovene mother, Tito (1892–1980) was born in the small Croatian town of Kumrovec (at that time part of the Habsburg Monarchy) into a working class family. He attended primary and secondary schools and was trained as a locksmith. Soon after finishing his education and assuming his first employment in Zagreb, Tito became involved in local politics by joining the Croatian Social-Democrats. His first experience with communism was in Russia during World War I, where he spent several years as a prisoner of war after being drafted and sent to fight the Russian army in Romania. In 1920, Broz formally became a member of the Russian Communist Party, and soon after returned to his homeland and joined the Communist Party of Yugoslavia which, at that time, was rather marginal and not a very influential political party. In the period between the two World Wars, his status climbed rapidly from that of an ordinary party member to eventually becoming its leader in 1938. Despite Tito's personal skills, the communists lacked large public support, mainly because of their revolutionary ideas

and political organizational methods based on Soviet models. Such ideas, although directed against a widely disliked regime, attracted little support in a democracy. On the other hand, when World War II broke out, the Communists were among the first to organize a resistance against German forces and local puppet regimes. This time, revolutionary methods proved to be useful in helping Tito become established as a leader of communist partisans and antifascist fighters. Because of this status, Tito emerged from World War II not only as an undisputed communist leader but also as the leader of a revolution that abolished a kingdom. At the end of the war, Yugoslavia's communists solidified their position as the strongest party, gained legal recognition, and established the regime that lasted for the next forty-five years.

Tito's political role and accomplishments as a leader are still a matter of debate amongst scholars. On one hand, he is portrayed as having been a dictatorial opportunist who used the system for personal promotion and the development of a personality cult, building an international image while ignoring internal problems. Proponents of this theory justify their view with Tito's "President for Life" title, which was given to him in 1974. On the other hand, Tito is considered a great uniter of Southern Slavs who put Yugoslavia on the world map, bravely resisted the Soviet Union in 1948, and stabilized the region previously (and still in the early twenty-first century) considered an ethnic powder keg. Regardless of perspectives, the general consensus is that Tito possessed the characteristics of a skillful politician and charismatic leader. Under his leadership, a predominantly agricultural country, awash in the economic backwaters of Europe, experienced rapid transformation. The Communists' priorities were industrialization, urbanization, and education improvements, which were generally accomplished, although not without negative consequences. One developmental problem was the Communists' inability to comprehend the negativity associated with running the country through strict ideological limits which created many obstacles to economic development.

During the early post-World War II years, Tito consolidated his power by acting as prime-, foreign-, and defense-minister. Finally, in 1953, he was selected as the President of Yugoslavia. He held this position, with some modifications, until his death. Perhaps the most significant contribution of Tito's personality to the Yugoslav people was his rejection of Stalin's attempts to control the country's Communists. Not willing to follow anyone's orders in terms of implementation of communistic ideology, Tito pursued an independent path, which brought Yugoslavia to the brink of war with the Soviet Union in 1948 and expulsion from Cominform (a Moscow-dominated

## TITO, JOSIP BROZ (MARSHALL TITO)

organization of Communist parties), but Yugoslavia never became its satellite state. Because of his very strong stand against Stalin and the Soviet Union, Tito quickly rose in the eyes of Western leaders, many of whom began providing him with economic support. After Stalin's death in 1953, Khrushchev normalized relations with Tito, and after that Tito used his sensitive position between superpowers to obtain favors from both sides.

On the international scene, Tito's biggest contribution was the 1961 formation of the Non-Alignment Movement (NAM) with cofounders Gamal Abdel Naser of Egypt and India's Jawaharlal Nehru. This was an international organization of countries unwilling to align themselves with either side in the Cold War. In this role, Tito was the leading ambassador. Through his friendships with many leaders in this organization, Yugoslavia benefited economically as many of its companies received lucrative contracts from throughout Asia and Africa.

Domestically, after initial success in modernizing the economy and implementing so-called "market socialism," the country struggled to overcome ideological barriers that were blocking economic reforms and the eventual establishment of a free market economy. Through a series of reforms in the 1950s, state ownership of production was replaced with the workers' management of factories. This arrangement helped reduce the government's ultimate power in the decision-making process and accelerated economic growth. Yet in the 1960s, in order to prevent inflation and rising foreign debt resulting from market socialism, Tito's government began implementing reforms, which, although on a path to success, were soon abandoned for being ideologically unacceptable. Thereafter, under greater government control, the Yugoslav economy continued to weaken.

From the beginning of his rule, Tito always held a tight grip on nationalistic and separatist tendencies that arose among the various ethnic groups residing in Yugoslavia. Although he encouraged coexistence, Tito's methods were vigorously repressive when dealing with unsatisfied sides in the Yugoslav federation. In 1971, for example, Tito arrested hundreds of Croatian protesters who had mounted a spirited challenge to the existing system. Tito died in 1980 in Ljubljana, Slovenia.

## TOGO

Togo (the official name of the Togolese Republic) was a part of the French occupations in Africa, a then French-administered United Nation (UN) trusteeship. It was called French Togoland, and its name was changed after independence in 1960.

The main ethnic groups in Togo are Ewe, Kabiye, Gurma, and Dagomba. In Togo's population, religious affiliations include Indigenous beliefs of 50%, Christian beliefs of 35%, and Muslim beliefs of 15%. In July 2004, the population of Togo was estimated at 5,556,812, with an approximate growth rate of 2.27%.

French is the official language and the language of commerce, while some African languages are widespread, mainly Ewe and Mina (in the south), Kabye or Kabiye, and Dagomba (in the north). Lomé is the capital and the main city.

The currency of Togo is the franc of the *Communauté Financière d'Afrique*, or the franc of the African Financial Community, called the CFA franc, and it consists of one hundred centimes (490 francs equal one US dollar or USD as of March 2005). The first political party in Togo was formed in 1941: the Committee of Togo Union. From 1969 until 1991, the Togolese People's Assembly was the sole political party. Togo now has a multiparty system, adopted in 1992 via a constitution approved by the High Council of the Republic and by a public referendum, and many political parties are now active.

The legislative body in Togo is unicameral National Assembly (eighty-one seats; members are elected by popular vote to serve five-year terms). General Gnassingbe Eyadema, installed as a military ruler in 1967, is Togo's president and Africa's longest-serving head of state. Officially, presidential elections based on a popular vote are held every five years. Despite the constitution mentioned above, however, Eyadema and his Rally of the Togolese People (RPT) party continue to wield virtually all political power in the country.

Togo's high population growth rate has placed increasing pressure on the country's natural resources. Environmental problems are widespread, and include deforestation, desertification, water pollution, and air pollution. Many wildlife species are endangered. Togo's government has signed a number

of conservation agreements, but basic services such as access to safe drinking water and sanitation services, especially in rural areas, are still lacking.

As a dependent economy, Togo faces many problems, including corruption and widespread poverty. The economy depends on commercial and subsistence agriculture. Though 65% of the population is employed in the agricultural sector, Togo must nevertheless import some of its staple foods. It exports cocoa, coffee, cotton, and phosphate; however, power shortages and mining costs caused phosphate production to drop by about one-fifth in 2002. The Togolese government has made attempts at economic reform, per the International Monetary Fund and World Bank guidelines; but these efforts, as well as attempts to bring in foreign investments, have moved slowly. In addition, most of Togo's international aid has been suspended due to allegations of human rights abuses.

## TONGA

The Kingdom of Tonga consists of 171 islands, thirty-six of them inhabited, near the Tropic of Capricorn and just west of the International Dateline in the Pacific Ocean. According to the 1996 census, the population (made up almost entirely of Polynesians) numbered 97,446, with the bulk of them living on the main islands of Tongatapu (68% of the population), Vava'u, Hu'apai, and Niua. The capital, Nukuloafa, is on the island of Tongatapu and is home to approximately one-fifth of the total population. The climate is tropical with an average annual temperature of 70°F (21°C) and rainfall between fifty-nine to seventy-one inches (1500 and 1800 millimeters). The warmer months, when the temperature gets into the thirties, are October to April, and trade winds occur all year round at a constant fourteen to

eighteen knots. The islands are a mix of coral and volcanic areas with most being flat. Many look like iconic Pacific islands with coconut palms, white beaches, and lagoons bordered by reefs.

Tonga is unusual in the Pacific in that it has maintained its independence and has never been colonised. Despite being a protectorate of the United Kingdom from 1900 to 1970, Tonga has been continuously ruled by a relatively small group of nobles and the Royal Family without major disruption. The major changes have been the adoption of Christianity and the introduction of limited forms of democratic government and processes. A constitution was granted by King George Tupou I in 1875, a form of British monarchy (hence the adoption of the name George), and a Constitutional Monarchy was established. Since independence in 1970, the government has been made up of a Cabinet that is appointed by the King, nine nobles elected by thirty-three hereditary nobles, and nine representatives elected by popular vote. The first political party was formed in 1994. The Royal Family and King Taufa'ahau Tupou IV continue to exercise absolute economic and political control over the country, although there have been challenges to this control. In addition to being a Constitutional Monarchy, Tonga is also a very religious country with the main church being the Free Wesleyan Church of Tonga. Christian religious beliefs have been merged with traditional Tongan cultural traditions, and the church is an important focus for community and cultural life. Tongans enjoy a good life expectancy (seventy-one years), high levels of education, and a literacy rate of 90%.

Tonga's economic development has been hampered by a reliance on a small range of exported products and varying demand for these products; regular cyclones (typically a major cyclone occurs every three years); the poor management of the economy, including the resources devoted to a large public service; and a dependence on remittances and foreign aid. Agriculture provides 95% of total exports, and the manufacturing base is small. Exports have been dominated by squash (pumpkin) and fish, with bananas and coconut products becoming less important crops throughout the 1990s. In 2003, exports were valued at \$31 million US, with \$26 million US going to Japan and the United States. At the same time, imports amounted to \$100 million, with \$43 million coming from New Zealand, primarily in the form of meat, timber, boats, and dairy products. External indebtedness has continued to rise from \$24 million in 1985 to \$64 million in 1995 and \$73 million in 2003. Tourism and fishing play an important role in contributing to income although what sustains the Tongan economy to a significant extent are aid and

remittances. Aid has declined in recent years (\$39 million in 1995 to \$19 million in 2000), which has added to an unfavourable balance of trade and reduced local economic development options. Remittances, or the money sent to Tonga citizens from Tongan residents who live overseas, is significant and has been estimated to represent 45% of the gross domestic product (GDP). There is a large diaspora of the Tongan population, especially in New Zealand and the United States, with a level of ongoing emigration that limits population growth in Tonga itself (typically to 0.5% growth per annum). The overall effect of these various factors is indifferent economic performance (real GDP growth in 2002 was -1.1), a substantial trade imbalance, budget deficit, and employment growth considerably less than the rate of increase in the labour force.

International agencies, such as the Asia Development Bank and the World Bank, along with governments who supply aid, notably New Zealand and Australia, have been pressing for economic reform. One issue has been the numbers employed in public service (the government payroll accounted for 57% of expenditure in this line of work for 2001). Prince Lavaka, who was elected Prime Minister in 2000, has made a concerted effort to restrict government activity and employment to the core public services. The Public Finance Act, passed in 2003, has set the agenda for tax reform and the rationalisation of the public service. There is also political pressure for change. The Human Rights and Democracy Movement (formerly the People's Party), led by Member of Parliament (MP) Akilisi Pohiva, have been pushing for more public accountability and democratic participation in the running of Tonga. Part of the government's response has been to restrict debate and to punish opposition, including banning a prodemocracy newspaper, *Taimi o Tonga*, and imprisoning opposition MPs and activists. Social problems add to the issues facing Tonga. The Asia Development Bank Programme for 2005–2006 will focus on improving urban infrastructure, in part because of growing social problems, including youth unemployment, increasing crime rates, prostitution, substance abuse, and teenage pregnancies.

Tonga remains one of the most hierarchical countries in the Pacific with significant political, economic, and social challenges. Power is concentrated in the hands of the nobles and the Royal Family, and while there is considerable respect for these traditional rulers, there are also growing levels of concern and outright opposition. Structural reforms have begun to address the concentration of resources and employment in the public service, but the reliance on a few exports to a small number of countries as well as the imbalance between imports and exports and the role

of aid and remittances in supplementing locally generated income will all contribute to a difficult economic future.

### TORRIJOS HERRERA, OMAR

In 1968, Lieutenant Colonel Omar Torrijos Herrera (1929–1981) led a successful *coup d'état* against democratically elected President Arnulfo Arias. Although this was the third time that Arias had been forcibly removed from office, the 1968 *coup d'état* was fundamentally different from previous military revolts in Panamanian history. Torrijos, who ruled Panama until his death in a suspicious plane crash in 1981, epitomized the populist-reformist trend of some military governments in Latin America during the 1960s and 1970s. He immediately consolidated his power by dissolving all political parties in Panama. At the head of the Panamanian National Guard of eight thousand well-armed men, Torrijos excluded the traditional elites—known in Panama as the *rabi-blancos* (white tails)—from political power, but he allowed them to keep their economic power. Torrijos, who catered to the nationalistic sentiments of the masses to gain support, implemented an authoritarian Socialist dictatorship. Torrijos balanced his populist, leftist rhetoric with strong support of the business sector and maintained a friendly relationship with the United States.

Born in Santiago on February 13, 1929, in the province of Veraguas, Torrijos was the sixth of twelve children. The son of a rural schoolteacher, Torrijos won a scholarship to a military academy in El Salvador. He graduated with a commission as a second lieutenant and joined the Panamanian National Guard in 1952. He was promoted to the rank of captain in 1956 and

continued his military studies at the US Southern Command's School of the Americas in the Canal Zone. By 1966, he had reached the rank of lieutenant colonel. He promoted himself to the rank of brigadier general in 1969. Torrijos unveiled a new constitution in 1972 that granted the executive branch of government exceptional powers. He implemented a series of social and economic reforms collectively referred to as "military socialism."

Torrijos used carrot and stick policies to co-opt the various corporatist sectors of Panamanian society. Although Panama's most fertile land remained in the hands of the oligarchy, Torrijos distributed 5% of the nation's agricultural land to the peasants. Major public housing projects and social welfare programs were especially appealing to the urban poor.

Torrijos also implemented a new labor code in 1972 that significantly improved the bargaining position of the workers. He implemented liberal banking and tax legislation that lured more than one hundred international banks to Panama. The bank secrecy laws, however, made Panama a repository for money laundered from the narcotics trade. The most popular of his populist policies was the 1977–1978 Panama Canal Treaty that provided for Panamanian control of the Canal Zone by 2000.

Although Torrijos stepped down as the head of state in 1978, he continued to be the commander of the Panamanian National Guard until his death. Meanwhile, Torrijos created his own political party, the *Partido Revolucionario Democrático* (PRD). After Torrijos's death, however, Manuel Noriega, who had been Torrijos's chief of intelligence, discarded Torrijos's military socialism and nationalistic economic development programs and implemented a corrupt, brutal regime. Regardless, Torrijos's brand of authoritarian populism is still appealing to many of Panama's people.

## TOTALITARIANISM

Totalitarianism is a completely modern phenomenon, something only foreshadowed before the twentieth century. In an age of mass democracy, the "totalitarian concept" has been a useful term to typify a particular genre of contemporary regime in which the population can be controlled by a variety of means, especially terror. Dictatorships, despotisms, and autocratic regimes are akin to totalitarian ones in their elitist rule, arbitrary use of political power, minimization of private individual rights, and their ordered and hierarchical institutions. Police states have similarities in the strong intervention of state power and the arbitrary exercise of police power, often including a secret police.

Totalitarianism depends on manipulating and controlling the masses that make up the object as well as the rationale for the totalitarian dictatorships. In *The Origin of Totalitarianism*, Hanna Arendt points out, "Practically speaking, it will make little difference whether totalitarian movements adopt the pattern of Nazism or Bolshevism, organize the masses in the name of race or class, pretend to follow the laws of life and nature or dialectics and economics" (Arendt 1951). For Arendt, the rise of totalitarianism was preeminently the story of breakdown: of the nation-state, the class system, and the political parties. The root of this breakdown was in the nineteenth century. It was largely accomplished in the twentieth century, and its most terrifying fruits were the totalitarian regimes of Germany and the Soviet Union. The unrestrained working of the Capitalist system before World War I led to what Arendt regarded as the breakdown of the nation-state, with its commitment to a real politics and to the rule of law, in favor of a world of total economic competition. However, how such a development, if it really took place, led to totalitarianism is not at all clear.

Sociologist Philo C. Washburn, after examining Fascist Germany and Stalin's Russia, identified some of the interrelated social conditions that were favorable to the development of totalitarian systems. These include a long tradition of autocratic rule; a pathological distrust of foreigners; hypernationalism and racism; absence of democratic characteristics; mass mobilization; central leadership committed to rapid industrialization; and a single state determined ideology (Washburn 1982).

Many of today's Third World countries, such as North Korea, Iran, and Saudi Arabia, exhibit a number of social conditions mentioned by Washburn. North Korea, Saudi Arabia (under the Saud family), and Iran, especially during the period under Ayatollah Khomeini (1979–1989), do not have totalitarian regimes but do assert substantial control over culture,

## TOTALITARIANISM

religious practices, and social life. Therefore, the tendency toward totalitarian rule has been apparent in these countries in recent decades. At present, only a few countries have totalitarian regimes, but there is no guarantee that totalitarianism will not rear its ugly head again.

In *Totalitarian Dictatorship and Autocracy*, Carl Friedrich and Zbigniew Brzezinski developed the most widely cited analysis of totalitarian regimes. They insisted on the modernity of totalitarianism, giving it a “preliminary characterization as . . . an autocracy based on modern technology and mass legitimation.” “In this sense,” they argued, “totalitarian dictatorship is the adaptation of autocracy to twentieth-century industrial society.” According to these authors, a totalitarian political system is composed of a cluster of six traits. A totalitarian dictatorship exists only when all six characteristics are present. Each can exist separately in some constitutional democracies. The six points are summarized by Friedrich and Brzezinski (1956) as follows:

1. An official ideology covering all aspects of human existence to which every member of the society must adhere, not only by outer forms but also by inner convictions;
2. A single mass party led by one man, the “dictator,” and consisting of a relatively small percentage of population;
3. A system of terroristic police controls making full use of modern science and, more especially, modern psychology;
4. Centralized state control of the mass media;
5. Complete control over all means of effective armed combat; and
6. A central control and direction of the entire economy through bureaucratic coordination of all productive enterprises.

Friedrich and Brzezinski note that there may be additional characteristics that often accompany these six. Among the most important of these are administrative control of justice and the courts as well as political expansionism. However, they argue that these are not to be regarded as defining characteristics of totalitarian rule.

The essence of Friedrich and Brzezinski’s book was a careful analysis of Nazi and Soviet politics in terms of their six points. They recognize that there may be variations between totalitarian dictatorships. The dictatorships all might not exhibit the key characteristics to the same degree. For example, the ideology of Russia under Stalin was more specifically committed to certain principles than was the ideology of German Fascism—where ideology was formulated by the leader of the party. In Italy, some of these traits were

hardly present at all. They took different periods of time to reach the stage of monopolistic political control in which all opposition, actual or potential, had been eliminated and terror became the dominant element in the system. However, all totalitarian systems share, to some extent, the same six traits. Examples offered by Friedrich and Brzezinski are those of the USSR, pre–World War II Germany under Hitler, Italy under Mussolini, and the post–World War II Communist countries in Europe, China, Cuba, and Ghana.

Totalitarian systems embody not only strong and arbitrary power but also the insistence on conformity of the whole society, mass mobilization, the subjugation of all classes to a dominant political group, and attacks on the enemies of the system and on their ideology. Resting on mass support and mass movements, totalitarian regimes are tutelary in nature, purporting to incarnate the true and necessary values to give meaning to the lives of its citizens. Totalitarianism has meant that no interest falls outside the embrace of the state or the wielders of power; that the purposes of individuals, groups, and society are subordinate to those of state; that the state or ruling group monopolizes decision-making processes; that all opposition is prohibited; that there are no independent expressions of public opinion; that there is no constitutional form of self-government; and that there are few or no limits on the rulers.

### Totalitarianism and Modern Science

Many of the basic characteristics of totalitarians listed previously by Friedrich and Brzezinski are possible only in modern society. They point out that although historical dictatorships had characteristics of totalitarian systems, modern technology is required for the ruling dictatorship to control every phase of society, every means of production, and every aspect of human life. The monopoly of communication would be impossible without modern technology. Friedrich and Brzezinski also point out that the centrally directed economy presupposes the reporting, cataloging, and calculating devices provided by modern technology. Technology does not cause totalitarianism, but without its usefulness in providing and categorizing data, “propaganda, the terror, and central planning would be quite impossible” (Friedrich and Brzezinski).

### Totalitarianism and the Use of Terror

If there is any single characteristic that differentiates totalitarian systems from others, it is the extreme use

of terror although regimes differ widely in the amount, type, and ways of using terror. As Solzhenitsyn (1973) points out, totalitarian systems, at least in some of their phases, have been characterized by massive coercion—police acting unrestrained by any outside controls, concentration camps and torture, imprisonment and executions without proof of guilt, repressive measures against whole categories of people, the absence of public trial and even an opportunity for defense, and the imposition of penalties completely out of proportion to the actions of the accused, all on a scale without precedence in recent history. Hannah Arendt similarly argues that totalitarianism is a form of government “whose essence is terror and whose principle of action is the logicity of ideological thinking” (Arendt 1951). The terror can be physical or psychological and is used by governments in the deliberate effort to intimidate. Stalin’s Russia was the setting for political assassinations, expropriation of personal property, forced labor, the widespread use of terror as a means of political control, and mass executions. Governmental terror seeks to frighten those under its sway into conformity and obedience. It therefore may create a measure of consensus and willing cooperation. The effect of the terror is to generate a pervasive atmosphere of anxiety and a general sense of insecurity.

Although totalitarian regimes were usually developed out of civil wars and one-party dictatorships, Arendt cautions against confusing totalitarian terror with terror associated with civil wars and revolutions. According to him, a one-party dictatorship develops into a full-blown totalitarian state when political liberties and other human rights become nonexistent, dissidents and nonconformity are not tolerated, and almost all of those citizens who do not submit often vanish or are dispatched to the firing squad. Genuinely totalitarian terror sets in when the regime resorts to political assassinations and mass executions as means of total political control (Arendt 1994).

Terror keeps totalitarian society in constant motion. It is a principle radically opposed to the principle of law, which is designed to function as a stabilizing factor for the ever-changing movements of man. By subjugating its population to constant and arbitrary persecution, totalitarian rule destroys the world as a relatively stable order that can be counted on.

Just as significant, if not more, as the scale of the terror in some totalitarian systems has been its use against whole categories of people irrespective of any evidence of guilt or even intention of threatening the political system. The deprivation of human rights, wholesale arrests, and extermination of people who belong to a certain ethnic group (such as Jews and gypsies by the Nazis) or a certain class (such as

landlords and clergy in Communist countries) have been unique in modern times. Between 1941 and 1945, the German Fascists systematically killed millions of men, women, and children because they were Jews, Gypsies, or Slavs and were defined by the dominant ideology as threatening to Germany. In those cases, the victims did not need to be personally guilty of any acts against the state or the social order, and their prosecutors did not have to attempt to make a case against them based on any charges, real or imagined.

Another unique feature is the extension of the terror to members of the elite. In fact, the harsher punishment particularly under Stalin of those who had taken part in the revolution with him and those who had positions of responsibility, and whose loss of favor or trust in other systems would lead to their demotion, returned to private life and often to powerlessness. Many of the intellectuals who had played key roles in the Russian Revolution of 1917 were killed off in the Great Purge. Later, Marxist critics of the regime met the same fate.

### **Mobilization of the Masses**

The mobilization of the masses is essential to the modern totalitarian dictatorship. This mobilization is done through a combination of ideology with its promise of security and future utopia, mass propaganda, and mass education. The infusion of ideology becomes an important catalyst to the proper mobilization of society. Manipulating symbols and mobilizing society are important ingredients of totalitarianism. Under Fascist rule, members of the mass public were to devote themselves to the German race and the Fatherland—a combination of undiluted racism and extreme chauvinism. People were to dedicate themselves without question to their nation, for the community was all-important and the individual totally insignificant apart from the nation. They were to give their unquestioning loyalty and obedience to their leader, Adolf Hitler, who was to be considered the infallible representative of the true will of the German people. They were to attend marches, to attend huge mass rallies, and to sing songs that reinforced these prescribed loves and hates. They were to deal with the enemies identified by the regime in a ruthless and often violent manner.

Totalitarian regimes are always dependent on mass support for their survival. According to Hannah Arendt:

Hitler’s rise to power was legal in terms of majority rule and neither he nor Stalin could have maintained the

## TOTALITARIANISM

leadership of large populations, survived many interior and exterior crises, and braved the numerous dangers of the relentless intraparty struggles if they had not had the confidence of the masses. (Arendt 1951)

### Ideology and Totalitarianism

There can be no doubt that totalitarian leaders, individuals, or groups, in contrast to other nondemocratic rulers, derive much of their sense of mission, their legitimation, and often very specific policies from their commitment to some holistic conception of man and society. The initial commitment of a ruler or ruling group to an ideology imposes constraints, excluding a greater or smaller number of alternative values, goals, and styles of thinking and sets a framework that limits the range of alternative policies.

Ideologies in totalitarian systems are a source of legitimacy and a source of a leader's or a ruling group's mission. While the ideology imposes some constraints, more or less narrow, on the rulers and their actions, the relationship is not one-sided, and much of the effort in such systems goes into the manipulation, adaptation, and selective interpretation of ideological heritage, particularly in the second generation of rulers. Supposedly based on Marxism-Leninism, the Stalinist era has been explained or defended by the need to create those conditions necessary for the building of a Socialist society. However, it is difficult to ascertain whether the Stalinist practice was in any way related to that need or based on ideological conviction.

The reason why ideology is perceived as so fundamentally important to totalitarian dictatorship stems from the role given to propaganda directed ultimately at the maintenance in power of the party controlling it. Propaganda and educational training are viewed as the means for achieving the total ideological integration of the people.

Totalitarianism has been a valuable term for designating the uniqueness of a limited number of systems at a specific moment in modern history. Their style, organizational devices, and political structures differentiate them from other nondemocratic systems. The relationship between the rulers and the ruled separates them from despotic dictatorships or outright tyrannies, such as those of the Third World countries.

### TOURÉ, SÉKOU

Sékou Touré was the first president of the Republic of Guinea, West Africa, and a well-known anticolonial figure throughout Africa and the Third World.

Touré (1922–1984) was born in a poor Muslim *Mandinka* farming village in the colony of French Guinea. He claimed descent from the late-nineteenth-century anticolonial resistance hero, Samori Touré. Sékou Touré was sent to study in Conakry and then held numerous jobs in the capital city, including the post of secretary general of the Post and Telecommunications Workers' Union in the late 1940s, and organized several labor strikes. In 1958, he joined with some other West African Nationalist leaders, such as Felix Houphouët-Boigny of the Ivory Coast (Cote d'Ivoire), to establish the *Rassemblement Démocratique Africain*, which was in the forefront of West African opposition to French colonialism.

Touré was twice elected to the French National Assembly, and in 1956, he was elected mayor of Conakry. He belonged to several political and union organizations that sought autonomy for Guinea. With his eloquent, passionate, and direct calls for immediate independence, Touré reached not only the educated elite but also urban workers and rural peasants. In 1958, when President Charles De Gaulle of France offered a choice between membership in a French community or immediate independence, Touré led the fight for severing all ties with the colonial power. Guinea was the only territory to vote for autonomy. France quickly stopped all assistance, repatriated its citizens, who made up the majority of the skilled workers, and dismantled and carted off as much of the infrastructure as possible. Touré, elected shortly after the independence vote, desperately sought help from both the Eastern and Western blocs. The Soviet Union eventually responded, and Touré established warm relations with the Eastern bloc and further antagonized the French and the West. He rapidly transformed Guinea into a Socialist state with agricultural collectivization schemes, state-run industries, and a highly centralized economy and bureaucracy. Despite his draconian efforts, Guinea, which was popularly known as “Guinea Sékou Touré,” was one of the poorest and most isolated countries in the world. Touré blamed foreign saboteurs and indigenous resisters to socialism for deteriorating economic conditions. He established a virtual police state, detaining, exiling, or killing anyone, including peasants, he felt resisted his rule and the Socialist state. Thousands died, and more than 1 million fled, particularly into neighboring Senegal and Cote d’Ivoire, both of which had cut all ties to his regime. Only President Kwame Nkrumah of Ghana maintained cordial relations with Sékou Touré.

Touré was an outspoken proponent of pan-Africanism and African liberation. Touré became a hero and sponsor of several militant groups in Africa and overseas. Some African-American dissidents, such as Stokely Carmichael (later Kwame Touré), took refuge in Guinea. Numerous assassination and *coup* attempts against Touré, some French sponsored and others internally motivated, intensified his authoritarian rule and intolerance for any dissent. Touré visited the United States several times, usually to address the United Nations. He died unexpectedly of heart failure in a Cleveland hospital on March 26, 1984, without appointing a successor.

## TRADE POLICIES AND DEVELOPMENT

Trade is a highly unusual topic in development in that the strongly polarized dialogue surrounding it seems to have moderated considerably in the twenty-first century. While there are growing protests about international trade, the main thrust of these seems to be more about modifying the ways in which trade is carried out, and, more particularly, how international trade agreements are reached, rather than whether trade is beneficial or harmful for development. These developments can be traced by first examining trade theory from its economic origins, then looking to the historical development of political economy schools of thought on trade and development, and finally taking a brief overview of the most prominent contemporary issues.

Trade is the exchange of goods, and thus trade, like markets, exists in any society. Trade can be considered a natural part of human relations. As the development of a modern nation-state took hold in Europe in the sixteenth century, a doctrine called “mercantilism” laid out some initial thoughts on trade. The basic idea behind mercantilism is that the nation-state should seek to gain benefits, generally unilateral, from trade. Thus, mercantilists saw trade as a zero-sum game in which they could gain by protecting their domestic market while making money from exporting to other countries. Important variants of this thinking have filtered into contemporary trade theories and are discussed in the upcoming paragraphs.

Modern trade theory, however, largely rests upon the classical economic works of the eighteenth century, primarily the work of Adam Smith and David Ricardo. Adam Smith’s classic work *The Wealth of Nations* lays out the benefits of trade among nations in what he called “absolute advantage.” Smith laid out the most important principle that specialization in production can lead to gains. Thus, if a country, such as England, is better at making a product such as cloth, and Portugal at making wine, then both

would be better off in *concentrating on the goods they produce best* and trading with each other. David Ricardo is the other seminal theorist on trade, and he lays out the principle of “comparative advantage.” Ricardo pointed out that even where one country, such as Portugal, could produce goods cheaper than a potential trading partner, such as England, trade would still benefit both. The reason again is *specialization*. If England specialized in the product it produced most cheaply, the overall production of both nations could be increased. The very powerful principle of specialization as a basis for trade is, then, made even more important by the more contemporary concept of “economies of scale.” Economies of scale means that the per-unit cost of producing a good, like automobiles, decreases as large production runs are reached. Thus, if a country wants to produce goods with high economies of scale efficiently, which is the case with many manufactured goods, it needs to produce large amounts of them at a time. With the investment of time, resources, and people skilled to work in such factories, it makes even more sense in the present day to trade so that nations can specialize in certain manufactures.

One of the real questions, if the above principles are accepted, is how to determine which nations produce which goods. The principle economic theories behind this include the Heckscher-Ohlin theorem, the Stolper-Samuelson factor price equalization theorem, and a number of other theories, including the new endogenous growth theory that attempts to take technology and “human capital” into account.

The basic idea behind the Heckscher-Ohlin theorem is that countries will have a comparative advantage in the goods for which they have the most abundant resources. Thus, a country that is relatively rich in agricultural land (compared to other nations), such as Argentina, will have a natural comparative advantage in agriculture. Stolper and Samuelson point out that under certain conditions, trade will have important effects on factor prices. Thus, as Argentina begins to produce more agricultural goods for trade, the domestic price of land will go up. The price of land in its trading partners’ countries (that produce other goods) should decline as they reduce their agricultural production because they can now import food more cheaply.

The basic idea behind the Stolper-Samuelson theorem contains profound implications for the *distributional* effects of trade. This theorem has led to a whole literature on political coalitions for and against trade policies. Another important component of modern trade theory is a series of writings that concern the role of technology. The Harrod-Domar model of the 1950s pointed out the important role of technology in

the costs of production. Theodore Schultz pointed out that the level of workers’ skills also had important effects on the costs of production. These two insights, in particular, have led to a contemporary debate about whether comparative advantage can be changed and developed, known as “strategic trade theory,” which is discussed below.

Moving beyond the purely economic issues of trade, one can encounter a much more contentious debate about it. This debate can be characterized as a discussion between three basic schools of thought. The first is the “liberal” perspective, which reflects the Ricardian basis of mainstream international economics. The second is the Marxist school of thought and its more trade-oriented application of dependency. The third is the structuralist school of thought, which seems to reach some middle ground between the first two perspectives. A key variable for understanding these three schools of thought is the role of the state (government) in economic affairs.

The liberal school of thought emphasizes the *absolute* benefits of trade to all parties who engage in it. Because liberals believe in natural factors of comparative advantage, they do not see any need for major state intervention in the economy. More modern liberals are called “neoliberals” because they see the government as playing an important but limited role in making sure markets function smoothly. Thus, a government may be needed to reach free trade agreements and to ensure that “externalities” to markets, such as pollution, are limited. Neoliberals believe that if a government distorts natural comparative advantage, it is simply working against its own citizens’ interests. Because competition through trade should lead to lower prices, all consumers benefit the most if governments reduce interventions to a minimum.

The Marxist approach looks at trade in terms of economic classes. Economic classes can be generally understood as natural groups in a society of people who work in similar kinds of professions and of similar levels of income and wealth. In the most basic terms, the upper, middle, and lower classes can be referred to. Marxists would make much finer distinctions and clarify that economic classes depend in good part on how production is organized in a society. Thus, a primarily agriculture-producing country would have a different “mode” of production and thus have different economic classes rather than an industrial manufacture-producing one. The most potent contemporary Marxist application to trade theory is the dependency school, whose adherents are known as *dependistas*, focusing on the relations between developing and developed countries. While some Marxists, such as Lenin, believed that capitalist relations (that is the dominance of the capitalist class

and mode of production) would eventually spread across the world, *dependistas* see both domestic and international economic relations between the developed and developing worlds as inherently exploitative. They point out that these exploitative relationships started out with the way that colonies were set up under mercantilism, as providers of raw materials to the mother countries. Colonizers often took steps to squelch out industries in the developing world, as was the case with England crushing the Indian textile industry.

The modern *dependistas* point out that a form of “neocolonial” relations continues to exist between the developing and developed worlds. Thus, the developing world *depends* on the developed world for export markets for its products, technology, investment, and a host of other factors that allow its economies to function. However, this dependency is one-way because developed nations have no such reliance on developing nations. Thus, trade is seen as another vehicle of exploitation carried out by local *comprador* classes, with more ties to developed countries than the majority of their own. The primary weakness of the dependency theory is the failure to propose a clear solution to these problems. However, Marxist theory in general sees the need for a socioeconomic revolution, in which the state, as an embodiment of the revolting classes, could reorganize economic relations. Moreover, from this point of view, a revolutionary state should cut the exploitative ties to the First World that choke the local economy.

One of the keys to the dependency argument and one that is shared with the structuralist school of thought is the “terms of trade” debate. An important tenet of both schools is that there is a different price trajectory for manufactures versus raw materials and basic goods in the international market. Thus, there is a tendency for the relative price of manufactured goods to increase over time relative to raw materials and agricultural goods. Since the developing world still primarily exports the latter, it faces declining or deteriorating terms of trade over time. That is, even while its economies try to grow, the countries are paying more for imports and receiving less for their exports in international trade over time.

The structuralist school of thought recognizes this problem but rejects the implied solution of dependency to cut exploitative ties and push for self-sufficiency. Structuralist thought has its origins in mercantilism in the sense that it also sees the need for strong state intervention to maximize the *relative* gains of trade. Thus structuralists would fully buy the terms of the trade argument, but the central focus of their thought is that such disadvantages *can be overcome through state action*. Structuralists believe that a comparative

advantage can be molded, modified, and created to some extent. Thus, the developing state could take actions to move from the production of raw materials toward industrialized goods and services. The state’s actions might take any number of paths, including tariff protection for domestic “infant” industries to funding basic research that would create new technologies. The contemporary variant of structuralism is called “strategic trade theory.” In good part, this wave of the political economy literature came out in response to the highly successful trade policies of East Asia, discussed further below, which seem to embody the relative gains view of trade and which have led to changes in comparative advantage over time.

In terms of development, modern trade theory really comes into play after World War II. Part of the postwar recovery plan set up by the United States and its European allies included the Bretton Woods regime, which set up the basic rules and institutions for international exchange and trade. The Bretton Woods regime really embodies the liberal paradigm of mutual gains in international trade. In terms of trade, the most important treaties are the General Agreement on Tariffs and Trade, signed in 1947, which sought to reduce tariff barriers to trade, and its complement named the General Agreement on Trade in Services, signed in 1994, which includes services. It is fair to say that the rules and institutions of international trade have been dominated by the First World.

The principal international institutions for international trade include the International Monetary Fund (IMF), the World Bank, the World Trade Organization (WTO), and the various meetings of the largest developed economies, including the G-7 (G meaning group of), G-5, and the Triad. In addition, there exist various regional institutions, such as the Inter-American Development Bank and the Asian Development Bank, that promote and study regional trade and development. All of these institutions, as well as the United Nations (UN), rely heavily upon developed countries, particularly the United States, for their funding. Thus, developed countries have a proportionately much higher say in their policies and decisions. Nonetheless, their ability to control developing countries’ economic policies should not be overemphasized. Like all international law and agreements, there is no direct enforcement mechanism. Thus, for example, the GATS agreements are riddled with voluntary “exceptions” that countries take to reducing domestic intervention. In terms of development, there is some degree of overlap among the principal institutions, but in practice they seem to generally occupy certain niches of activity. The IMF tends to concentrate on balance-of-payments and

related exchange rates problems. The World Bank's and the UN's various arms focus more on longer term issues of development, but the World Bank is generally more project- and sector-oriented. The regional banks also focus on projects but also have a larger proportion geared toward certain regional objectives, such as basic human needs, which change over time.

It is interesting to note that the role of the international institutions, despite the fact that their true independence of action is quite limited, has become increasingly controversial. After World War II, there was a great expansion of international trade, which gave new prospects to developing countries in the 1960s for growth. At that time, most developing nations were following a structuralist-inspired or Socialist-inspired trade strategy. In Africa, the state became heavily involved in setting up both agricultural and industrial enterprises, sometimes calling for a Socialist transformation. The rapid historical industrialization of Russia seemed to point to the need for heavy state intervention for economic development. Thus, the first generation of independent leaders in Africa, including Nkrumah in Ghana and Nyerere in Tanzania, believed that their new states could achieve rapid growth and egalitarian results through a "big push" from the state.

Developing countries in general adopted policies by which the state was heavily involved in setting up domestic industries, often times owning them, and placing barriers on foreign investment and trade. However, there were important variants of trade policy both within and across regions. Latin American countries generally had proportionately less state dominance of their economies than their African counterparts, with the important exception of Socialist Cuba. Latin American economies were guided by the work of the United Nations' Economic Commission for Latin America to follow a policy called "import substituting industrialization" (ISI). The basic idea behind ISI was that the government would set up or create incentives for new industries to arise to serve the domestic market. The previously imported manufactures would now be made at home. At some point later, when domestic industries had "grown up," they could compete with foreign manufacturers. In practice, ISI ran into a number of practical policy problems. First, there was a problem in terms of the difficulties of setting up whole new industries, which require a substantial amount of technical and managerial expertise as well as skilled labor and financing capital. Second, to solve this problem, Latin American governments taxed their natural resources and agricultural sectors. This naturally led over time to a decline in the productivity and volume of their principal exports of agriculture. Along with the decline in

exports came a need to import equipment and expertise from abroad to set up the factories. The combination of these two major factors led to increasing inflationary and exchange rate crises by the end of the 1960s. Third, though growth rates were relatively high and the industrial base was built, there was an increasing inequality and unevenness of the growth so that the main benefits of ISI tended to accumulate among the "enclaves" of the industrial factories, their managers, and their workers. The increasing inequality fed directly into the blossoming of dependency analysis in Latin America. Fourth, the state-run enterprises and incentives, both in Latin America and Africa, tended to become politicized so that state companies could no longer make budgetary, pricing, and hiring decisions on the basis of economic or financial logic. Many parastatals and state-owned enterprises became patronage machines, with policies and personnel changing on the basis of political whims.

Despite the lack of well-developed proposals, the dependency theory has had practical impacts on trade policies. A number of countries in the developing world expropriated foreign assets, though often with some level of compensation. A number of countries also imposed strong restrictions on multinational companies, such as limiting levels of profit repatriation or requiring a certain level of local hiring and training. Several developing (and developed) countries, including India and Egypt, promoted "cultural" industries, such as filmmaking, to combat dependency on US communications and media. A number of ambitious South-South developing country forums were established to create a list of demands on the developed world for better international economic rules. These demands reached a peak in the mid-1970s with the creation of the New International Economic Order (NIEO) manifesto, including a demand for international buffer stocks to stabilize commodity prices. These proposals, as well as ones in the future for debt relief and South-South integration, have largely come to naught in terms of actual changes in the international economy.

East Asian states, in part because of their *lack* of easy natural resources and in part because of the historical context of Japanese and then United States occupation, followed a different strategy toward industrialization. Their policy can be described as export-oriented industrialization (EOI). EOI has the same analytical base in structuralist thought but with a huge difference. East Asian states industrialized with the idea of producing goods for the US and European markets, not their own domestic markets. Thus, EOI was able to reduce two of the major pitfalls of the ISI: exchange rate crises and increasingly uncompetitive and inefficient enterprises. Because East Asian states

forced their new industries to export, they had to reach international levels of quality. The fact that the companies were exporting meant that the export revenue could be used as a new source of funds to fuel further investments in (new) industries. More importantly, East Asian countries tended to create more competition among their own industries for subsidies and protection. Following the Japanese model, East Asian countries, namely South Korea and Taiwan, created incentives and goals, such as export targets, that domestic and foreign investors had to reach to qualify for favorable treatment. Another interesting contrast between East Asia and other developing regions is that they undertook a major agrarian reform and invested heavily in education and health care, so there was much less tension over distributional issues of growth.

The Socialist and ISI experiments of the 1960s might have come crashing down in the early 1970s were it not for the new development of an international financial market. The breakdown of the original Bretton Woods system, the development of Eurobanks, and the new appearance of “petrodollars” from the newly rich oil-producing countries combined to create a large pool of capital in the 1970s. This international financial capital was used by countries to pay for the imports of both oil and the inputs needed for industrialization. When the United States heavily raised interest rates in 1982 and oil prices began to drop, international liquidity dried up. The result was the debt crisis, which, for the reasons mentioned earlier, hit Africa and Latin America especially hard. “The lost decade” of the 1980s was one in which countries struggled to make their debt payments amidst dealing with the higher interest rates. Because of this continuing financial straight-jacket, both Latin American and African countries were forced to make major adjustments to their trade policies, generally in the mid-1980s.

The new set of policies is called “neoliberal” because it reflects the liberal view of trade. Neoliberal trade policies call for reducing state favoritism in the economy, which is seen as distortional and generally ineffective. The idea is that foreign competition should be allowed on an even playing field and that those national competitors who are viable will be able to enter the market regardless. If the state tries to favor national competitors, it will create inefficient enterprises that need continual subsidies. Those subsidies will have to be raised by taxing more productive sectors. Thus, it makes more sense for market forces to make allocative decisions. Moreover, in neoliberal thinking, the ultimate beneficiaries are the developing country consumer and the entrepreneur. Consumers can now choose goods from anywhere according to

their liking and at a natural market price. If domestic producers have an advantage in producing certain goods, this fact should be reflected in the price, and local demand will therefore spur local production in a way that makes sense. Similarly, local entrepreneurs should see the opportunities in both local and international markets for new types of production. They will be more nimble, incentivized, and efficient in this pursuit than governments ever could be because they are using their own resources and not the resources of taxpayers or external lending agencies. The neoliberal record of policy results on trade is still too new for an adequate assessment, but the volume of trade has increased dramatically, along with a growing inequality in the benefits. A second generation of neoliberal policies has moved beyond basic monetary and fiscal tightening toward privatization and deregulation, thus further dismantling the ISI structure.

Part of this “second round” of neoliberal adjustments to trade involves the growth of international and regional free trade agreements. Following the inconsistent but steady progress of free trade in the European Union (EU), the early 1990s saw the development of a number of major new trade pacts and organizations. Among the Southeast Asian countries, the development of the Association of Southeast Asian Nations (ASEAN) trade agreement created a forum for local coordination of economic policies. The Asia-Pacific Economic Cooperation (APEC) organization is working toward free trade between the Pacific states of the Western Hemisphere and those in Asia. The most important agreement outside the EU was the creation of the North American Free Trade Agreement (NAFTA).

The NAFTA agreement between Canada, the United States, and Mexico, created in 1994 has been and continues to be highly controversial. Critics of NAFTA believe that the agreement overlooks labor exploitation, environmental degradation, and generally lax government regulation of Mexican industries. On the other side, US and Canadian companies see Mexico as a necessary part of their strategy to compete in international markets. Since East Asian countries and Japan have been so successful in wracking up consistent trade surpluses and in entering new product lines, North American companies have begun to look for new ways to compete. NAFTA gives them a cheaper source of labor, by which they can lower their production costs and thus lower the price of their goods. NAFTA has been strongly attractive to other Latin American economies, so there are serious explorations of a Free Trade Agreement of the Americas (FTAA) that would include all countries of the Western Hemisphere. However, because of the contentious nature of the NAFTA debate and the

lack of “fast track” authority for the president to negotiate the terms of a new treaty, the FTAA has hardly gotten off the discussion table.

After NAFTA and the EU really consolidated by the late 1990s, there was much concern about the creation of “regional blocs” of international trade for the Western Hemisphere, East Asia, and Europe. Concern rose about a dampening effect on trade among the various blocs from extraregional protectionist measures. Much of this discussion has died down in the twenty-first century for a number of reasons. First, the regional bloc scenario does not make much sense if one recognizes that almost all trade and investment is among the triad of the United States, Japan, and the EU, not between the North and the South. Second, for the reasons mentioned earlier, East Asia could never be considered a viable bloc when most of its trade is oriented outwardly toward EU and US markets. Third, there has been a big push to keep multilateral organizations and negotiations on a parallel track, hence the creation of the APEC and the continued activity in the WTO.

Nonetheless, patterns of North-South trade along regional lines do exist. For example, most Latin American countries almost exclusively trade with the United States. For most African countries, Europe is the main trading partner. Thus, the possibilities for trading between nontraditional partners seem more limited because the preferential treatment given by First World Nations tends to favor countries within the same region. However, even within the same region, there are important differences in terms of access to markets. NAFTA gives Mexico strong advantages over Latin American counterparts. The countries included in the US Caribbean Basin Initiative (CBI) enjoy better terms for some products than others. Similarly, Europe has separate agreements and differential access to its markets, so poorer European states, such as Greece, enjoy multiple advantages over any African competitors.

One particularly interesting experiment is the Southern Cone Common Market (MERCOSUR), which is a free trade agreement between Brazil, Argentina, Uruguay, and Paraguay, with Chile and Bolivia as associate and conditional members. MERCOSUR is the only real case of successful South-South integration thus far. In many ways, it does not make much sense for developing nations to integrate with each other. They tend to compete with each other for the same international markets, and their economies are geared toward export and import ties with the First World. Thus, the level of trade among developing countries, even those who are neighbors, is usually far below than the level of trade between these countries and a developed country.

MERCOSUR was created in 1994 in good part in response to NAFTA, which left other Latin American countries out. Part of the thinking behind MERCOSUR is to create a bloc that can negotiate better terms for an eventual FTAA, but there is also genuine hope that developing countries can find a new source of economic growth through trade with each other. Indeed, MERCOSUR has led to dramatic increases in intraregional trade. The hope is that as local companies learn to compete within MERCOSUR, they will eventually be ready for international-level competition in an FTAA. Despite the gains in trade, the MERCOSUR is still far more limited than either the NAFTA or the EU. There are important exclusions from MERCOSUR for sensitive industries, such as exclusions regarding automobiles and footwear. There is no real regional organization and no clear dispute resolution. In short, MERCOSUR remains very much a limited agreement and one whose progress depends on continual diplomatic negotiations.

The growing levels of relative inequality, the continuing extremely high levels of debt, and the feeling that international trade rules are unfairly biased in favor of First World corporations are the main complaints about the current international trading system in regard to development. Although the neoliberal period has brought growth in trade volumes, the gap between developed and developing nations has continued to increase. The gap between the rich and the poor *within* most nations has also tended to increase. In fairness, the structuralist period of economic policies experienced the same phenomenon. However, as the process of the globalization of production progresses, whereby different parts of the production process are done in different parts of the world, there is a fear that the developing world will be left with only the most labor-intensive, unskilled parts of that process. Unlike Raymond Vernon’s seminal work on the product cycle, which expected that products, over time, would be shifted to the Third World, the greatest areas of economic growth have come from high technology and high innovation products. The information technology revolution and the spread of computers are marked by a continual innovation. The developing world has been able to capture only a small part of these new industries.

There is a general sentiment that many developing countries liberalized their trade too easily in the most recent trade rounds (such as those in Uruguay in 1995) without wresting away enough concessions from the First World. In fact, despite its high-flown rhetoric, the First World remains a highly protectionist and interventionist region for developing countries. The high levels of subsidies and protection for agriculture are a particularly sore point as the basic theory of

comparative advantage would seem to point to the gross inefficiency of such measures. On the other side, First World countries would like to gain greater protection for intellectual and artistic property rights and greater access to newly emerging service markets. Thus, one particular bone of contention revolves around First World pharmaceutical companies' ability to control the sale of the medicines that they develop through large research and approval procedures. In a number of developing countries, both artistic material and intellectual property are copied ("pirated") and sold at a much lower cost, with no royalty to the creator. These are the issues at the forefront of the post-Uruguay round of ministerial meetings; they surround the issue of China's accession to the World Trade Organization.

Other issues are also prominent, but these do not seem to have gained the formal attention of the international and national trade negotiators and institutions. The well-publicized protests at the 2000 WTO Ministerial meeting in Seattle included a long list of complaints, such as the need for forgiveness of developing countries' debts; for international environmental and labor protections; and for greater insulation for national priorities, such as a national health care system. Perhaps the most pressing issue is the general lack of public participation in trade fora. This has been a major polemic surrounding the EU free trade agreement and is a galvanizing catalyst for the anti-WTO protesters. They correctly point out that there so far has been only limited consultation and input from the public in trade negotiations, despite the fact that the effects on everyday life are profound. It is interesting to note that there are a number of other issues affecting trade that are not really explored by either the protest movements or the international trading institutions. One of the most prominent of these is the massive movements of illegal immigrants from the developing world to the developed world. Another is the development of increasingly sophisticated narco-trafficking networks. For the most part, even the more mainstream issues of trade and development suffer from a lack of well-developed analysis. The lack of clear evidence makes it extremely difficult to sift through the different views on basic trade issues, such as the positive and/or negative effects of the NAFTA agreement on different groups within Mexican, US, Canadian, and other countries.

## TRADING PATTERNS, GLOBAL

### Growth in Trade

"Trade" is commonly defined as the exchange of goods and/or services between countries. Aggregate trade among countries has increased significantly since the mid-twentieth century, generating over \$5 trillion USD per annum at the beginning of the twenty-first century. Since 1950, the increasing integration of the global economy became apparent due, in part, to the fact that merchandise trade grew faster than merchandise production. Developing world economies have benefited from the increasing volume of global trade, as trade is a key mechanism for technology transfer from developed world economies. Exports from developing world economies prior to 1945 were typically primary products, such as food and raw materials sold to colonial powers, but by 1970 the composition of developing world exports had changed along with the recipient nations, as the value of manufactured product exports exceeded that of primary products. Data on world trade in services only became available from 1980 onward, and the current contribution of such trade is

estimated by the World Trade Organization (WTO) to be at least 20% of total world trade. Global trade in services occurs mostly in the developed world and plays a smaller role for developing market economies.

## Spatial Patterns

The geography of trade is very complex due to varying levels of specialization in agricultural, fossil fuel, and industrial production throughout the world. As Knox *et al.* (2003) assert, “advanced industrial economies have long dominated international trade, and in general, the trend has been towards intensification of the long-standing domination of trade within and between developed countries at the expense of trade between developed countries and less-developed countries—with the major exception of trade in oil” (pp. 48–49). Bearing this statement in mind, with the realization that developing economies are no longer just exporters of primary products but are turning increasingly to exports of manufactures and services, it is possible to identify several distinct patterns of trade for developing economies.

In general, disparities among developing world nations’ participation and success in global trade have increased. Oil is the most important single commodity in world trade, and oil-exporting countries have seen steady growth in exports, both for the large-volume Middle Eastern oil states and smaller nations such as Nigeria and Cameroon in Africa as well as Venezuela and Ecuador in Latin America. Other non-oil raw material exporting countries, though, have had little participation in international trade. For example, Asia, Bangladesh, Pakistan, Sri Lanka, Nepal, and Afghanistan have remained isolated from the global economy through the implementation of protectionist policies, such as high tariffs (cross-border taxes or duties) or non-tariff barriers, including quotas, subsidies, or licenses. Most countries in sub-Saharan Africa have had declining export volumes in the latter part of the twentieth century due to the reliance on non-oil primary products, the inability to replace export of primary products with manufactures, and worsening terms of trade. “Terms of trade” refers to the ratio of the prices at which exports and imports are exchanged. In the case of these primary product-exporting countries, the price of their exports has fallen relative to the price of imports (manufactures and services) from the developed economies or newly industrialized countries (NICs).

Imports of primary products to the developing world from the developed world include food exports from Australia, Canada, and the United States.

Imports of manufactures to the developing world from the developed world tend to be such things as heavy machinery and transport goods from such countries as the United States, Japan, and Germany.

Approximately three-fourths of the developing world’s manufactured exports come from eleven countries: Asian countries include China, Hong Kong, India, Malaysia, Singapore, South Korea, Taiwan, and Thailand; Latin America countries are Brazil, Mexico, and Chile. The first developing world exporters were South Korea, Taiwan, Singapore, and Hong Kong, often labeled the original East Asian Tigers, NICs, or newly industrialized economies (NIEs), and export mostly to Organization for Economic Cooperation and Development (OECD) economies. These developing world exporters are relatively large recipients of foreign direct investment (FDI) and are seen as the most successful developing nations in the global economy. Exports from these NICs are characterized by growing domestic market penetration of developed economies such as those of the United States, United Kingdom, Germany, and Japan. Generally, the East Asian economies are more important as exporters of manufactured goods than they are as producers. Newer NICs, such as Malaysia and Thailand in Southeast Asia as well as Brazil and Mexico in Latin America, are also increasing the volume of exports of manufactured goods. Other emerging markets, such as Argentina, China, Indonesia, and India—usually the largest nations in their respective continents—have also seen increases in export volume of manufactured goods to developed economies.

More than two-thirds of all developing world non-services exports go to developed world nations, and one of the most controversial nontariff barriers imposed by the developed world is the Multifibre Agreement (MFA) that involves quotas on textile and clothing imports from the developing world. The MFA was taken effect in 1970 and has lasted through 2005; the end of this barrier will have significant implications for the geography of trade within the textile and garments industry, probably resulting in an increase in the volume of exports from China, India, and other South Asian nations.

The transitional economies of the former Soviet Union are worthy of consideration because of the dynamic nature of economic restructuring and the potential for trade participation of some of the larger economies, especially the Russian Federation, Poland, Czech Republic, and Hungary. These nations have seen a small but steady increase in the rate of manufactures exports, and the inclusion of all but the Russian Federation in the European Union (EU) in 2004 will likely alter both the economic development and spatial trading patterns in Eastern Europe.

Although global trade in services did not become fully established until the end of the twentieth century, some developing world economies, particularly Hong Kong, China, South Korea, and Singapore, are now top services exporters. Tradable services, such as telecommunications, financial services, management, advertising, as well as professional and technical services (including software), play an increasing role in these countries' gross national products (GNPs).

### **Impact of Transnational Corporations**

Much of the impetus driving the changing patterns of global trade since 1950 can be attributed to the role played by transnational corporations (TNCs), which are sometimes also called multinational corporations (MNCs). According to Dicken (2003), "a TNC is a firm that has the power to coordinate and control operations in more than one country, even if it does not own them" (p. 198). TNCs account for about two-thirds of world exports of goods and services, and much of that is intrafirm trade, which is much more difficult to measure than trade between countries. TNCs have the ability to coordinate and control processes and transactions within and between different countries. They have the ability to take advantages of geographical differences in the distribution of factors of production (labor, resources, and capital) and in trade-related state policies. TNCs also have great geographical flexibility with the ability to switch resources and operations between global locations through the use of subcontracting and subsidiaries. A New International Division of Labor (NIDL), which is defined as a reorganization of spatial divisions of labor and was formerly organized at the national scale and then to a global scale based on international production and marketing systems, is driven primarily by TNCs.

#### ***TNCs and Foreign Direct Investment***

Most trade in exports from the developing world—albeit in a very uneven geographic pattern—goes to the developed world. Consideration of imports to the developing world has to address the role of foreign direct investment (FDI) done primarily by TNCs. FDI is direct investment in a foreign country by a (usually large) company through firm takeover or creation of new subsidiaries; the goal is to achieve managerial and production control. According to Dicken (2003), for the global economy "the primary mechanism of integration has shifted from trade to FDI. Trends in the growth of FDI, trade and

production are not independent of each other. The common element is the TNC" (p. 52). Historically, FDI was concentrated in the primary (natural resources) sector' until the 1980s, most FDI was directed to the manufacturing sector. By 2000, the services sector saw the greatest relative increase.

Advanced industrial economies still absorb most flows of FDI, but the amount of foreign investment in the developing world is increasing. At the beginning of the twenty-first century, approximately three-quarters of all FDI inflows to the developing world went to just seven NICs: in Asia, the inflows went to Singapore, South Korea, Malaysia, and China (including Hong Kong); in Latin America, they went to Mexico, Brazil and Argentina. A new trend in FDI is seen with the emergence of TNCs from developing countries. The greatest amount of outward FDI from developing countries comes from China (including Hong Kong), Singapore, Taiwan, South Korea, Malaysia, and Brazil and goes to other developing nations as well as developed market economies.

### **Globalization, Regionalization, and Trade Regulation**

It is important to note that another feature of the geography of trade is that the bulk of international trade is based on a few trading blocs with most trade taking place *within* these blocs. A "trading bloc" is defined as a group of countries with formalized systems of trading agreements. "Membership of these trading blocs is principally the result of the effects of (1) distance, (2) the legacy of colonial relationships, (3) geopolitical alliances" and recognizes "the persistent dependence of less developed countries (LDCs) on trade with developed countries that are geographically or geopolitically close (Knox *et al.* 2003: 48, 51). Trade statistics show, for example, that the United States is the chief trading partner of Latin American countries, and Japan is the main trading partner for Asian LDCs.

The first international regulatory mechanism for trade was established after World War II. The General Agreements on Tariffs and Trade (GATT) had, at its inception, a membership of twenty-three countries. In 1995, GATT evolved into the World Trade Organization (WTO) that has more than 130 member nations. During the lifetime of GATT, average tariffs were reduced from 40% in 1940 to 5% in 1994. The basis of GATT (and now WTO) is establishment of nondiscrimination, using the most-favored nation principle (MFN) and the national treatment rule. MFN states that a trade concession negotiated

between two countries must apply to all countries, and the national treatment rule states that imported foreign goods are treated in the same way as domestic goods.

An important caveat to the MFN principle is that an exception to equality can occur if a subset of WTO members forms a regional trading organization, such as a customs union or a free trade area. The least restrictive regional trading institution is a “free trade area” where trade restrictions between member nations are removed, but individual members retain their individual trade policies with nonmembers. A “customs union” is an institution where members belong to a free trade area but also have a common external trade policy toward nonmembers. Further economic integration occurs within a “common market” where trade barriers are removed and where a common external trade policy is adopted, but in addition, free movement of capital and labor between members is permitted. The most integrated regional economic alliance is an “economic union,” which adds harmonization of economic policy and limited supranational political and legislative capabilities to the common market characteristics.

The WTO nondiscrimination and equality principles are challenged, therefore, when the sheer number of such regional economic alliances is counted. In the Western Hemisphere for example, the North American Free Trade Agreement (NAFTA) links the economies of the United States, Canada, and Mexico in a free trade area; the Southern Cone Common Market (MERCOSUR) binds Argentina, Brazil, Paraguay, and Uruguay in a common market; and the Caribbean Community (CARICOM) involves fourteen island nations in a common market. In the Asian realm, AFTA—the Association of Southeast Asian Nations (ASEAN) Free Trade Agreement—links ten Southeast Asian economies in a free trade area, and in the European realm, the EU ties twenty-five European nations together in an economic union. In Africa, a new institution—the African Union (AU), formerly the Organization of African Unity or OAU—was created in 1994 and comprises fifty-three member nations that have the goal of establishing a continent-wide African Economic Community (AEC).

## TRANSPARENCY

“Transparency” is a term loosely used to signify that political and business decisions and documents are open to public scrutiny. Transparency is a safeguard against corruption and abuse of power. Equated with accountability and democratic values, transparency presupposes a public sphere of robust debate that sustains reasoned consensus. The ensemble of communication channels that is part of the mass media constitutes the public sphere. Thus, a press free of undue governmental coercion and excessive manipulation by private interests would form the bulwark of an ideal transparent society. The utopian goal of the eighteenth-century Enlightenment was that the free reign of reason would render society transparent to itself. “Transparency” is the late twentieth-century truncated expression of that goal.

The idea of transparency has tremendous significance for developing nations seeking aid, investment, and integration into Western economic, political, and security alliances. Industrialized nations use freedom of the press and openness in governmental and business sectors as criteria to gauge the level of corruption and degree of risk factors that condition aid and investment. As World Bank President James D. Wolfensohn once stated that “corruption undermines development” and dries up grassroots Western support for aid to developing countries.

However, with respect to Western aid, investment and trade transparency is a reciprocal concern. Salient issues include how funds intended for public projects are administered and allocated and who is

held accountable for policies and decisions. In addition, the visibility in corporate hiring practices, licensing agreements, joint ventures, and profit margins are all salient issues as well.

Transparency is thought to promote trust and better service. Visibility and accountability are antidotes to mismanagement, inefficiency, waste, and poor service. Uncertainty and suspicion dissipate when constituents and clients are allowed to see the actions taken on their behalf. In the event of a process going awry, public visibility permits intervention and possible salvation before the process reaches closure. Thus, transparency promotes greater efficiency and responsiveness.

### Historical Development of the Concept Transparency

In *Discourse on Method* (1637), René Descartes formulated a method for ascertaining the truth using *reason* and provided an embryonic definition of transparency: *clarity* and *distinctness*.

Jean-Jacques Rousseau's writings wielded tremendous influence on modern political theory and the creation of democratic institutions. Rousseau spread the "cultural ideal of transparent and unmediated intellectual exchange among citizens themselves" (Hesse 1994).

Adhering to Descartes' great faith in the power of reason and influenced by Rousseau, Immanuel Kant added the crucial idea of using unfettered reason in the *public sphere*. "The public use of one's reason must always be free, and it alone can bring about enlightenment among men," Kant asserted in the essay *What Is Enlightenment?* (1784).

### Transparency in the Information Age

In the eighteenth century of Rousseau and Kant, the channels for *unmediated* or undistorted communication included coffee houses, books, pamphlets, speeches, journals, and newspapers. However, the complexity and size of modern societies requires that public opinion be *mediated*. The global span of communication technologies and the mass media's ubiquity seem to have provided the means of propagating knowledge and realizing the Enlightenment goal of self-determination based on transparency.

However, the philosopher Gianni Vattimo argues that information saturation has not made societies more transparent or enlightened, but rather more

complex and chaotic. In a deluge of information, fatigue from overload and separating the important from the trivial, among competing interpretations, become problematic. Jurgen Habermas argues that commercial interests have transformed the public sphere "into a medium of advertising" and public relations. Thus, vested interests have muddied the clear channels of the public sphere, producing distorted information. Indeed, the very term "transparency" has become the mantra of public relations campaigns and election promises.

The volume of entreaties on transparency issuing from corporations, governments, Non-Governmental Organizations (NGOs), the European Union (EU), the World Bank, and the World Trade Organization (WTO) have brought the term to the brink of oversaturation and insipidity. Transparency is not always desirable. Bringing to light a bank's temporary instability may erode public confidence and prevent recovery. Internal bank forecasts about interest rates and inflation expectations may affect public perceptions and cause panic. Opaqueness in patent information and trade secrets is warranted as preventing industrial espionage.

As digital communication penetrates developing countries, so too will the technology enabling breaches in the veil of privacy. The availability of consumer information garnered from credit card purchases, banks, Web site visits, voting records, and scores of governmental data banks may bring unwanted transparency. Such information is sifted, mixed, matched, and recombined to form myriad lists that are sold to direct marketers, special interest groups, and political parties—typically without citizen knowledge or consent. Increasingly, citizens are classified based on income, buying patterns, and voting behavior. The result is information segregation predicated on potential "value": different messages for different segments.

### Transparency and Compliance

The degree of compliance with standards and laws is ultimately an impressionistic judgment. For example, an international NGO annually releases a *Corruption Perceptions Index* based on surveys that document the *perceptions* of analysts, academics, and business people. The 2001 profile of ninety-one countries ranks Finland first (9.9)—10 is a perfect "clean" score—and Bangladesh last (0.4).

There are many ways to circumvent the disclosure of information. In spite of legal obligations, compliance is essentially a measure of good faith. Compliance

does not ensure that proffered information is useful. In instances of closed-door policy deliberations, for example, “transparency” simply means that meeting minutes, however vague or incomplete, are posted. Essentially toothless, disclosure policies are no guarantee that information will reach the public. Both the IMF and the World Bank release certain information only to their member governments, never directly to citizens. An agency may choose to disclose pedestrian data or to obfuscate information in lengthy documents couched in tortured language. And there are always exemptions. Both the US Freedom of Information Act (1966) and the NAFTA transparency decision against Canada (2000) permit governments to withhold information *those governments* deem vital to national security.

An idea spawned from a rich philosophical lineage, transparency states a goal, the freedom—actualized by self-governance—and the means for achieving it, open communication in the public sphere. Utopian transparency, which is impossible to fully measure and achieve, is the pithiest expression of the quest for self-determination and self-legislation. Ultimately, the dissemination of useful information will depend more on providing motives and incentives than the threat of sanctions and uncertain enforcement.

### TRINIDAD AND TOBAGO

Trinidad and Tobago are the southernmost islands in the archipelago of the Caribbean, lying about eleven

degrees north of the Equator. While Tobago lies entirely within the Atlantic Ocean, Trinidad itself faces the Atlantic on the east and southeast, the Caribbean in the west and northwest. The larger of the two islands, Trinidad, lies within sight of the coast of Venezuela; the silt and debris from the delta of the Orinoco River reach the southern coast of the island. The silt and debris also travel as far as Tobago, which is twenty-two miles to the northeast of Point Toco on Trinidad. Geologically speaking, Trinidad is part of the South American continent.

The climate is tropical, with a rainy season in the summer and fall. Precipitation, however, is higher to the north, where a tropical rainforest covers the northern slopes and reaches almost one thousand meters above sea level, which is impressive because of the sudden rise of the landmass from the sea. The climate is rather dry toward the southwest. The hurricanes do not reach Trinidad although they occasionally devastate portions of Tobago. Cane fields spread across the southern two-thirds of the island, which is mostly hilly.

The population of Trinidad, estimated at 1,104,000 (in 2003), is quite diverse. Before the “Columbian Exchange,” the mix of culture and race that occurred after Christopher Columbus reached the Western Hemisphere, got underway, the island was settled by Carib Native Americans who inhabited much of the coastal areas of northern South America. The Caribs displaced the Arawak, who may have been the first to settle the islands, or miscegenated with them. Some Native Americans survived on the islands as late as the eighteenth century; in fact, there is still a Carib community in Arima, Trinidad.

Although the statistics may be misleading, it is generally accepted that Blacks and East Indians are evenly matched in numbers. The so-called mixed population, recorded at 18.4%, could belong to either ethnic group. There is also a prominent white minority, albeit less than 1%, as well as a Chinese minority involved in commerce. The history of the island of Trinidad explains the presence of both French and Spanish surnames and place-names, beginning with the name Trinidad itself. Port-of-Spain is the capital city, one of the few towns with an Anglicized name, while Tobago has mostly English place-names and a population with English surnames. Nevertheless, English is the language spoken by most citizens although Hindi is spoken also, and there is a smattering of other languages. With regard to religion, there is a Catholic plurality, with a sizable Hindu minority. Fundamentalist Christian denominations and Muslims, especially Black Muslims, are probably the fastest growing religious groups.

Although Trinidad was christened by Columbus during his third transatlantic voyage in 1498 and

colonized on behalf of the rulers of Spain, it remained sparsely populated until the late eighteenth century. Tobago suffered the fate of most islands of the Caribbean, changing colonial masters as a function of European wars. Trinidad, however, was under continuous Spanish jurisdiction until 1797, when it was captured by the British and held briefly by the French. In 1814, the British also took Tobago from the French.

The society and economy of Tobago and Trinidad are rather different. Tobago had a plantation economy with a majority slave population going far back in time, whereas Trinidad had relatively few slaves. Although the latter produced tobacco and cocoa, it was not until near the end of the eighteenth century that sugar became an important commodity; along with sugar, the population, particularly the slaves transported from West Africa, increased rather suddenly. Cocoa remained an important commodity to the end of the nineteenth century. Sugar production remained considerable in Trinidad, roughly on a par with (the much smaller) Barbados and second only to Guyana.

By 1807, when the British parliament abolished the slave trade, the majority of the islanders on both islands were of African, particularly Igbo, descent. While in Tobago there were many generations of slaves, in Trinidad slavery lasted little more than a single generation. West Africans, including Yoruba from what is present-day Nigeria, continued to arrive after emancipation in 1833, leaving an imprint on the syncretic culture of Trinidad in particular. Consequently, race relations, attitudes, and politics in Tobago, with its more homogenous population, also differ from those of Trinidad.

Oil, exploited since 1909, and gas, the production of which has risen considerably in the last few years, are the mainstay of the economy. In fact, Trinidad and Tobago are the most prosperous of the island-nations in the Caribbean, and the gross domestic product (GDP) is once again on the rise, particularly in the twenty-first century.

Although oil prices have their ups and downs on the world market, Trinidad and Tobago have both achieved and maintained the highest per capita income in the region, except for Puerto Rico. The GDP per capita in 1999 was about the same as in 1971, before the boom. Between 1973 and 1980, however, the value of manufacturing increased by about 15%, thanks to the public sector and, more specifically, to the diversification project at Point Lisas, on the Gulf of Pariah, masterminded by Eric Williams. Trinidad and Tobago produce canned goods, beverages, and a large range of other manufactured products, some of which are exported to other Caribbean islands.

While industrial production experienced modest gains since 1970, agriculture has declined steadily,

resulting in greater need for imports. Thus, it is possible to describe the country as a “monoculture” because of the reliance on oil for export earnings (mostly to the United States). Thanks to the efforts of the People’s National Movement led by Williams, in August 1962 the island-country achieved independence from the United Kingdom. Eventually, in 1976, it achieved republican status.

Civil society is well established. While elections are heavily contested, the transfer of power between the major parties, the People’s National Movement (PNM) and the United National Congress (UNC), has been relatively peaceful. The country has experienced two major attempts at a *coup d’état*, one by the “Black Power” movement in 1970—Stokely Carmichael aka Kwame Toure, the founder of the Black Power movement in the United States and elsewhere, was born in Trinidad—and the other by a group of Black Muslims in 1990, who managed to hold Prime Minister Robinson hostage, temporarily.

The legislative is bicameral, with a Senate of thirty-one seats, appointed by the president, and a House of Representatives, with only thirty-six seats. Tobago has a separate legislature, with a House of Assembly of fifteen members. Since 2002, the prime minister is Patrick Manning, who replaced Basdeo Panday.

During the twentieth century, Trinidad and Tobago, along with the rest of the Caribbean, was increasingly drawn into the sphere of influence of the United States. One manifestation of the US influence was the transfer of the naval base at Chaguaramas, immediately west of the Port of Spain capital, from the United Kingdom to the United States at the very beginning of World War II (eventually returned to the jurisdiction of the island-nation). American influence is reinforced by the fact that the West Indian diaspora—the dispersion of West Indians to other lands—gravitates toward the United States, particularly New York, rather than London. Closer cultural and family ties with the United States inevitably result in the loosening of ties with the United Kingdom.

The tourist trade on Tobago accounts to a large extent for the increasing prosperity of that island, but has also occasioned friction and conflicts. Indeed, prior legislation against foreign ownership of land, particularly on Tobago, has now been rendered ineffective; and the growing tourist trade has elicited a backlash, but also has fueled movements for greater autonomy, if not independence.

## TRUJILLO, RAFAEL LEONIDAS

Born in 1891 in San Cristóbal, Dominican Republic, Raphael Leonidas Trujillo Molina worked as telegraph operator and sugar mill security guard before joining the national constabulary force in 1916. He was promoted through the ranks of the national police force before being named general and chief of staff of the Dominican National Army in 1928. Two years later, he joined the revolt against President Horacio Vásquez Lajara and later in 1930 ran unopposed in the presidential elections of 1930. His inauguration marked the beginning of the "Era of Trujillo." For thirty-one years, the "Benefactor of the Fatherland" ruled the Dominican Republic as if it were his fiefdom and as though he had complete control over all aspects of Dominican life.

Trujillo took over a country that was morally, politically, and economically bankrupt, and he transformed it into a debt-free, self-sufficient (in terms of food), and politically stable nation. The Dominicans, however, paid a high price, for the Era of Trujillo was one of the darkest periods in Caribbean history.

Trujillo's philosophy on development was a simple one: political and economic stability through his guidance was foremost, and political freedom and dissent were not to be tolerated. To achieve his objectives, Trujillo depended on two key ingredients: the military and the United States. Trujillo's tight control over the armed forces gave him a most effective vehicle to achieve political stability, while his close ties with the United States provided him with much-needed economic modernization.

Following his staunch support for the Allies during World War II, "El Jefe," as he was known throughout the Dominican Republic, took advantage of the Cold War by becoming the sentinel of anticommunism in the Americas. Lauded by US politicians and business figures, the Trujillo regime was a principal recipient of United States economic and military aid.

The 1950s were Trujillo's glory years. Buildings were constructed in the capital. Electricity was brought to the countryside. The tourism industry saw its rise, and capital investments multiplied. In addition, the

Dominicans, for the first time in their history, felt safe from their Haitian neighbors.

The Benefactor of the Fatherland, however, was the main beneficiary of this unprecedented economic growth. It is estimated that at the time of his death in 1961, Trujillo controlled 65% of the Dominican economy, and the Trujillo family private fortune was calculated to be between \$800 million and \$1 billion.

In 1959, though, cracks began to develop in Trujillo's governmental apparatus. Demand for Dominican commodities dropped in the world market, and the Dominican masses were confronted with unemployment and price increases. Furthermore, the Trujillo family's voracious appetite for corruption and lavish spending fueled public discontent. Moreover, middle-class students, dissatisfied with the stifling political and intellectual climate, longed for individual rights.

In June 1959, Dominican exiles, supported by Venezuelan President Rómulo Betancourt, landed in the Dominican Republic and were crushed mercilessly. Alarmed by Trujillo's repressive tactics, Catholic bishops issued a warning to "El Jefe." On June 24, 1960, Trujillo retaliated against his Venezuelan nemesis when his hired men attempted to assassinate Betancourt. On August 20, 1960, in response to the assassination attempt, the Organization of American States virtually declared the Trujillo government an outcast and imposed strict sanctions.

In 1961, the new administration of John F. Kennedy, tired of Trujillo's antics, began to contact disgruntled officers in Trujillo's vaunted military. On May 30, 1961, as Trujillo was driven to his hometown of San Cristóbal, "El Jefe" was assassinated.

## TUDJMAN, FRANJO

As the most prominent figure of the Balkans in the late twentieth century, besides Slobodan Milošević, Franjo Tudjman (1922–1999) is credited with the creation of an independent Croatia.

Called the “Father of the Croatian Nation,” Tudjman was a brilliant strategist and excellent diplomat. He normalized relations with Serbia in 1998 though he permitted the North Atlantic Treaty Organization (NATO) to use Croatia’s airspace against Serbia during the Kosovo campaign. After Croatian independence, he focused his work on the country’s admission to the European Union (EU) and NATO. However, Tudjman has been criticized for his nationalism and his authoritarian paternalistic rule, during which civil liberties were curtailed and power was concentrated in the hands of a small group, mostly made up of members with close ties to Tudjman.

Born in northern Croatia/Velko Tragoviste, Tudjman was educated in the Croatian nationalistic spirit. He envisioned Panslavism under Croatian leadership in Yugoslavia but became frustrated because of Serbian hegemony. Persecuted for his views in 1940, Tudjman joined Josip Broz Tito’s partisan forces, becoming a carrier soldier after 1945. Despite his appointment as a general in 1960, he left active military service, dedicating himself to the study of geopolitics and earning a doctorate in political science in 1965. Distanced from mainstream politics, he was the leader of the 1971 “Croatian Spring,” which was crushed by Tito who perceived it as a threat to Yugoslavia’s unity. Tito imprisoned Tudjman, who was released only a year later. Due to his dissident stance and his interviews given to Western media, in which he denounced the failure of the Yugoslavism and the oppression of the Croats, he was imprisoned again in 1982. Tudjman was publicly skeptical of the Serbian nationalistic myth, which was based on the disputed number of victims at the Jasenovac concentration camp, the largest World War II concentration camp in Croatia and possibly the third largest in the world at the time. Serbian Nationalists used these numbers as a moral justification for revenge and creation of a united Serbian Yugoslavia, in fact a Greater Serbia.

In 1990, after the split of the Yugoslav Communist League and founding of his HDZ or Croat Democratic Union party in 1989, Tudjman won Yugoslavia’s first presidential elections. In 1991, he declared Croat independence, relying heavily on the sympathy and support of Germany, Austria, Hungary, and the Catholic Church. Serbian forces waged war on the new Croatian state, attacking the major cities and practicing what became known as ethnic cleansing, as many civilians were killed or forced to flee.

In 1993, Tudjman reached a deal with Milošević upon the partition of Bosnia. In 1995, he captured the self-proclaimed Serbian Republic of Krajina, causing a mass exodus of two hundred thousand Serbs. Later that year, however, Tudjman signed the Dayton agreement in 1995 on behalf of the Bosnian Croats, and the war ended. Once the Greater Serbia ideal had been defeated, he agreed to the cautious return of Serbian refugees, cooperated with the UN War Crimes Tribunal, and resolved the conflicts with Bosnian Croat Separatists intent on leaving the confederation and forming their own republic. Although his vision of Great Croatia, which would have included Bosnia, was not realized, Tudjman was successful in keeping all the territories of the Socialist Croat Republic.

Tudjman was elected to three consecutive terms as Croatia’s president. In 1999, however, his health declined, and he died on December 10, 1999.

## TUNISIA

The Tunisian Republic (*al Jumhuriyah at Tunisiyah* as translated in Arabic) is a small state located in North Africa, also called the *Maghreb*. It borders Algeria to the west and Libya to the southeast, with shores along the Mediterranean Sea to the north and east. The climate is semiarid, with desert covering the southern and central regions. Northern Tunisia is cooler and incorporates the eastern edge of the Atlas mountain system and the Medjerda Valley, whose river system empties into the Gulf of Tunis. Almost all of Tunisia’s fertile soil is located in this region. Tunisia covers a total of 163,610 square kilometers. Its population is estimated at 9,974,722, with a growth rate of approximately 1.01%. Life expectancy is 74.7 years, and the literacy rate is 74%. The gross domestic product (GDP) grew by 5.1% in 2004 to \$68.2 billion. Per

## TUNISIA

capita income is \$6,900. Resources include agricultural products, iron, phosphate, natural gas, and petroleum. The population is largely Arab Berber and Sunni Muslim, with small Jewish and Christian minorities. The official language is Arabic, with French widely used in commerce. The capital city is Tunis, located in the northeast on the Lake of Tunis, with a population estimated at 674,100.

After Rome destroyed Carthage in 146 BC, the Medjerda Valley became the Empire's breadbasket. The Vandals and Byzantines ruled Tunisia until the Arab conquest in the seventh century. Tunisia became a part of the Ottoman Empire in 1574. In 1705, Hussein bin Ali founded the Husainid dynasty, which ruled until the monarchy's abolition in 1957. Ahmed Bey's rule from 1837 to 1855 saw the establishment of light weaponry and food processing industries as well as a short-lived ban on slavery. In 1869, European creditors of a bankrupt Tunisian state imposed the International Finance Commission to control the budget, undermining Tunisia's economic sovereignty. France invaded the country in 1881, making it a protectorate in 1883. The authorities promoted migration by transferring land from religious trusts to European settlers, while agricultural production expanded and while phosphate mines opened in the south. Increasing nationalistic sentiment and World Wars I and II led to Tunisian independence in 1956. A year later, the Neo-Destour party leader Habib Bourguiba became president.

At the time of independence, Tunisian industry was largely controlled by foreigners. The technical and managerial positions in 257 of the 290 industries with over fifty employees were almost entirely held by non-Tunisians. The economy was closely linked to France's, with the latter buying 55% of Tunisia's exports and providing 69% of its imports. Economic policy in the early years of statehood was a mix of liberalism and statism. Bourguiba believed that Tunisia's future lay with Europe and the West, while the General Union of Tunisian Workers (UGTT) sought more interventionist policies. The government nationalized infrastructure, including the railways, ports, electricity, and gas utilities. It also expropriated land owned by religious trusts for sale to rural elites in exchange for their support. Between 1956 and 1960, the number of state employees rose from twelve thousand to eighty thousand. There was also extensive social change as polygamy was outlawed, the judiciary was secularized, and a minimum age was set for marriage of women. In 1958, a central bank was created, and in 1959, the Tunisian dinar was adopted as the currency.

The 1961 installation of former UGTT leader Ahmed Ben Salah as Minister of Social Affairs and

Economy signaled a shift toward socialism. In 1962, the government adopted central planning and banned the Communist Party, officially installing one-party rule. The state emphasized public sector-driven industrialization and invested heavily in Tunisia's periphery by financing steel mills, fertilizer plants, and other manufacturing activities. The government equated this move from primary to secondary production with decolonization. By the end of the decade, agriculture accounted for 18% of GDP, down from 24% in 1960. By 2004, services made up 54% of GDP, the highest of any North African state. In 1964, a wage increase triggered a fiscal crisis that caused the first-ever devaluation of the dinar, while the Neo-Destour became the Socialist Destour Party. The era of central planning ended in 1969 when Bourguiba dismissed Ben Salah and launched a policy of economic opening, or *infatih*.

Law 72-38, adopted in April 1972, underpinned the new approach. It granted export-oriented industries tax-exempt status, free reign to import their inputs, and guaranteed the right to repatriate profits. The following year, Law 73-19 created the Industrial Promotion Agency (API), whose mandate was to streamline investment rules and attract foreign investors. Exports rose from 12% of GDP in 1969 to 42% in 1981. Manufacturing went from one-fifth in 1970 of exports, to one-third in 1977, to two-thirds in 1988. Textiles also became an important good, rising from 2% of exports in 1971 to 30% in 1986. The Tunisian economy became increasingly tied to Europe's: exports to the European community rose from 50% of the total at the start of the *infatih* to over 80% by the 1990s. The policy's success was mixed: annual growth during the 1970s averaged 7.3%, but an expanding current accounts balance deficit reached over \$800 million by 1984. Increasing labor unrest culminated in a general strike on January 28, 1978. Two hundred died in clashes between workers and the military.

Rising inflation, falling oil prices, and declining terms of trade forced the adoption of a stabilization plan, triggering bread riots in 1984 that left up to 120 dead. With foreign reserves virtually exhausted, the government turned to the International Monetary Fund (IMF) in 1986. In 1987, Prime Minister Ben Ali took advantage of the chaotic situation to declare Bourguiba incompetent and take power. Austerity measures included a currency devaluation and the removal of trade barriers. Public debt in 2004 was \$14 billion, or 60% of GDP. In 1990, Tunisia joined the General Agreement on Tariffs and Trade. In 1995, it became the first South Mediterranean country to sign an association agreement with the European Union (EU), committing itself to forming a free trade area with the EU by 2008. In 1996, an EU-funded program of technological modernization was

launched. As of April 2003, it had approved 2.4 billion dinars for 1,448 firms.

## TUPAMAROS

The Tupamaros, also known as the *Movimiento de Liberación Nacional* (MLN) or the National Liberation Movement, were an urban guerrilla organization in Uruguay founded in 1965. They caused a fierce but relatively short period of antiestablishment terror in Uruguay in the late 1960s. They named themselves after the Inca Chief Tupac Amaru, who fought the Spanish and was quadrisected by the Spaniards on May 18, 1781, in Cuzco (Peru). This name was reused also by the revolutionary group *Movimiento Revolucionario Tupac Amaru* (MRTA), or the Tupac Amaru Revolutionary Movement, in Peru, notorious for their 126-day siege of the Japanese embassy in Lima in 1996.

Initially located in the countryside, the Tupamaros accepted a Robin Hood style of distributing stolen food and money among the poor in the suburbs. In 1963, a group of young men raided the Swiss Gun Club, an event that marked the birth of Latin America's most famous urban guerrilla group. They engaged in urban terrorism, political kidnappings, and murder, temporarily paralyzing Uruguay's political and economic life. News of their success inspired extremists worldwide, and they served as a role model for European urban guerrillas.

Following the assassination in August 1970 of Dan A. Mitrione, a US security official, and the kidnapping of British Ambassador Geoffrey Jackson in January 1971, both by the Tupamaros, parliament imposed twice suspension of all civil liberties. On September 9, 1971, after the escape from prison of more than one hundred Tupamaros, President Pacheco put the army in charge of all counter guerrilla activity.

In April 1972, after a bloody shooting with the Tupamaros, President Juan María Bordaberry declared a state of "internal war," suspending all civil liberties and adopting a draconian State Security Law. By the year's end, the army had decisively defeated the Tupamaros, whose surviving members were either

imprisoned or had fled into exile. Despite this accomplishment, the civilian government relinquished running the country to a military *junta*—the Generals' Council (June 27, 1973)—that led to further repression against the population. Until that date, Uruguay had been the sole country in Latin America with the continuing tradition of a civilian democratic government.

Democracy was restored in 1985, and the Tupamaros became one of the few Latin American examples of successful transition to a legal political force. As a former urban guerrilla organization, with several hundred members, it was politically insignificant. In order to run candidates in the November 1989 elections, the former Tupamaros together with other ultra-leftist forces created the People's Participation Movement (*Movimiento de Participación Popular*, MPP). Since the Spring of 1995, it has been represented in the Parliament by the sixty-two-year-old Pepe Mujica, a founding member of the movement, who was held for thirteen years by the military government in absolute isolation. Later, this faction joined a larger Left reunion, Frente Amplio, further renouncing armed struggle and accepting democratic procedure.

## TURKEY

The Republic of Turkey (*Türkiye*, in Turkish) is a Eurasian country that occupies the Anatolian peninsula and a small portion of the Balkans. Turkey borders Greece, Bulgaria, Georgia, Armenia, Azerbaijan, Syria, Iraq, and Iran. In addition, Turkey lies along the Mediterranean Sea, the Aegean Sea, and the Black Sea. Turkey's total land area is approximately 779,452 square kilometers. The country contains sharp contrasts in topography, ranging from the Pontus and Taurus Mountains in the east, the high central plateau, and narrow coastal plains in the west. Turkey often suffers from earthquakes due to tectonic

## TURKEY

pressures from the African landmass moving against Eurasia. The climate of Turkey can best be described as Mediterranean with extreme variations; for instance, moderate coastal plains are contrasted by harsh conditions in the interior and east. Rainfall corresponds to this variability as the coastal regions experience a wet rainy season with an average rainfall of 2,500 millimeters. The more prominent lakes and rivers of Turkey are found in the east and include Lake Van and the Tigris, Euphrates, and Araks rivers. Most of Turkey's growing population of 72.3 million (a United Nations estimate) lives in an area ranging from the central plains to the western coast. The capital is Ankara and has a population of more than 3.5 million. Turkey's largest metropolis is its former capital, Istanbul, with a population of more than 15 million. Urbanization has transformed Turkey from an agricultural society to an increasingly urbanized one, with roughly two-thirds of the population residing in cities.

Although the term "Turk" is applied to denote all of its citizens, Turkey has a multiethnic society whose genetic origins link it to the Balkans and the Caucasus as well as the Levant and Central Asia. Modern Turks speak an Altaic language that is part of the larger Ural-Altaic linguistic family (including such disparate members as Mongolian, Finnish, Uzbek, and Hungarian). Turks comprise 78% of the population and include various distinctions, such as Anatolians and Rumelians. There are also a considerable number of Muslims from the Caucasus, including Circassians, Georgians, and the Laz. Turkey's largest ethnic minority are the Kurds, whose numbers range from 10% to as high as 20%. They can, in turn, be broken down into disparate groups who sometimes cannot comprehend each other's dialect. *Kurmanji* is the majority's dialect of the Indo-European Kurdish language in Turkey, while a minority speak the southern *Kurdi* dialect, which is more prominent in neighboring Iraq. *Dimli* is a related Iranian tongue that is often confused for a Kurdish dialect, but it is actually a separate language spoken by close to 1 million people. In addition, a significant number of self-identifying Kurds have abandoned the use of Kurdish and either speak it as a second language or simply speak Turkish. Arabic speakers are concentrated in southern Turkey along the Syrian border and number more than 1 million. Other prominent minorities in Turkey include refugees from Bulgaria, Iran, and Bosnia as well as small numbers of Greeks and Armenians.

Religion in Turkey is tempered by the secular state, but the vast majority of Turks are nominally Muslim. However, the secularism of Turkey is not of the same vein as that found in the European Union (EU). Turkey's government directly regulates religion and

even trains religious scholars and *mullahs*, and thus practices a form of governmental regulation of religion rather than a strict separation of church and state as is prominent in the West. Sunni Islam dominates Turkey with 75% to 80% of the population adhering to this sect, while the Alevi, a variant branch of Shia Islam, make up at least 19% of the remainder. Most of the Dimili (or Zaza), for example, distinguish themselves further through their adherence to Shia Islam, as do Azerbaijanis and Turkmen. Sufism is the more philosophical and meditative branch of Islam that is historically responsible for converting large numbers of Greeks and Armenians to Islam. Most of the Christian minority in the country includes Greeks, Armenians, and Assyrians. In addition, a small Jewish community of Ladinos and Ashkenazi is found mainly in Istanbul.

Turkey's diversity is derived from its central location near the world's earliest civilizations as well as a history replete with population movements and invasions. The Hattite culture was prominent during the Bronze Age prior to 2000 BCE, but was replaced by the Indo-European Hittites who conquered Anatolia by the second millennium. Meanwhile, Turkish Thrace came to be dominated by another Indo-European group, the Thracians for whom the region is named. The Hittites and Thracians were swept aside by Greeks who came to dominate the history of western and central Anatolia, while the Armenians and possibly early proto-Kurdish groups may have entered eastern Anatolia by the first millennium BCE. Persians and mainland Greeks contested the region, which culminated in Greek conquest and colonization of the Persian Empire itself by 323 BCE. Subsequently, *hellenization* of the elites transformed Anatolia into a largely Greek-speaking region.

Roman conquest in Anatolia was complete by forty-three CE and morphed into the Byzantine Empire. Christianity became the dominant faith of Anatolia and would remain so until the arrival of Islam. Small bands of Muslim Turks began moving into Anatolia by the early part of the second millennium CE. The pivotal point that began the transformation of Anatolia into a Turkish-speaking Islamic domain was the Battle of Manzikert in 1071, where the Byzantine army was defeated by Seljuk Turkish invaders. The Byzantine Empire would last until 1453 when the Ottoman Turks finally took the city of Constantinople. Like the Byzantine Empire before it, however, the Ottoman Empire began a slow decline even as it reached its apogee, losing the Crimea, Egypt, and most of its Balkan territories during the nineteenth century. World War I witnessed the Ottoman Empire's last gasp as its alliance with Germany and the Austro-Hungarian Empire in 1914 proved to be a fatal gamble.

Even as the Ottoman Empire disintegrated, the Young Turk Movement and its founder, Mustafa Kemal (later dubbed “Ataturk”), spearheaded a Turkish Nationalist revival based on a Turkish ethnic identity rather than a multiethnic empire. Following the disastrous war, the Turks were given harsh terms by the Allies: not only were the lands not populated by Turks divided among imperial powers, but the Turkish majority areas also were to be partitioned by the Allies. Ataturk, who had emerged as a national hero, rallied the Turkish resistance and pressured the Ottoman government to relinquish its authority in 1921. The Nationalists led by Ataturk laid out their own terms that included renouncing claims that lay outside Turkish Muslim territories. France and Italy found the new Turkish military too formidable to challenge in its own homeland and withdrew, leaving only the Greeks to confront the resurgent Turkish forces. The Bolsheviks of the newly formed USSR had no desire to confront Turkey and signed a peace treaty in 1921 following cooperation between the two states in subjugating the newly independent state of Armenia.

The war against the Greek army was equally successful: Turkish Nationalist forces drove out the last of the Greeks by August 1922. Following these developments, the Allies renegotiated, and the Treaty of Lausanne, signed in Switzerland in November 1922, recognized Turkey as a state. The Allies gave in to Turkish demands, including recognition of the new Nationalist government and borders that corresponded to Muslim-Turkish majority areas (and northern Kurdish areas claimed by Turkey) as formed by Turkey’s War of Independence. Thus was born the modern secular Republic of Turkey. Ataturk transformed Turkey into a Western and more “Turkish” state by separating religion and state; replacing the Arabic alphabet with a Latin script; ordering name changes from Arabic to ethnic Turkish; and adopting Western clothing, traditions, and laws into both government and society. Turkey aligned itself with the West following World War II, and during the Cold War it was a frontline state confronting the USSR. Despite sporadic conflicts with Greece over the Aegean region and Cyprus, Turkey has been a North Atlantic Treaty Organization (NATO) member and a consistent ally of the West. It is poised to become the first Muslim majority state to join the EU sometime in the first decade of the twenty-first century.

Turkey’s political landscape has evolved since its inception. The Republican People’s Party (*Cumhuriyet Halk Partisi* [CHP] in Turkish) dominated the early years of the republic. Following elections after World War II, the CHP lost power to the Democrat Party (DP) in 1950, which stayed in power for a

decade. The DP began to cement its control, which led to civil unrest and prompted one of the many military *coups d’état* that would take place in modern Turkish history. The DP government was dismantled and replaced by a military council, which held elections in 1961. Thus began an oft-repeated cycle in Turkish politics, with a civilian government devolving into chaos, a military *coup* staged to restore order, and then another round of elections and purges. The Justice Party (*Adalet Partisi* [AP] in Turkish) emerged as the new rival to the CHP. Military intervention again took place in 1971 as the various political parties in Turkey could not form a government, and civilian control was again restored in 1973 following a regime appointed by neutral nonparty intellectuals. During this period, in 1974, conflict with Greece over the Cyprus issue embroiled Turkey in a conflict that persists in the twenty-first century. In addition, Kurdish nationalism came to the forefront during the 1970s and would also persist into the twenty-first century. Fearing Islamic influence in the government of the late 1970s, the military again intervened in 1980 and then restored civilian control in 1982 with the ascension of Turgut Ozal and the Motherland Party, whose administration would remain closely overseen by the military. The True Path Party came to power in a peaceful transition in 1991, and Turkey has maintained peaceful democratic elections since. The Justice and Development Party (*Adalet ve Kalkınma Partisi* [AKP] in Turkish) is the party in power since elections in 2002, which again relegated the CHP to secondary status. Some secularists fear the AKP’s moderate Islamic leanings, but it seems unlikely that the legacy of Ataturk’s secularism will be altered anytime in the near future, if at all.

Turkey’s economy has had a similar tumultuous history, but it has been steadily improving for decades. The transition to a free market economy has helped to improve some aspects of the Turkish economy since the 1980s. Substantial deficits and a large debt (more than \$104 billion) have led to high inflation rates and an anemic banking industry. However, under the International Monetary Fund’s (IMF’s) assistance, which has included substantial loans aimed at helping Turkey’s transition toward market-oriented reforms, Turkey has shown significant changes in government policy including restrained fiscal policies and liberalization of previously state-controlled industries, banks, and energy concerns. Turkey has suffered economically as well as politically from the tumultuous crisis in Iraq, and the chaos has heightened Turkish worries about an independent Kurdish state with substantial oil reserves on its doorstep.

In addition, trade with Iran has declined substantially as many EU states now trade with Iran via the

## TURKEY

Persian Gulf rather than through Turkey. Turkey has made great strides in manufacturing, which makes up 30% of its economic activity, while agriculture has improved in efficiency. Turkey continues to import far more than it exports, and underemployment has led to a substantial diaspora of Turkish guest workers moving to EU countries, especially to Germany (with more than 1 million living there indefinitely). Unemployment is not substantially higher than most EU countries, but a substantial number of Turks live at or below the poverty line (roughly one-fifth of the population). Foreign Direct Investment (FDI) was high in the 1990s, but it has slowed following fears of slow reforms, continued state control in many sectors of the economy, Turkey's massive debt, and perceived political worries over the possible rise of Islamic parties (which view themselves as more akin to the Christian Democrats in Germany as opposed to the ruling clerics of Iran). Turkey's prospects have greatly improved as a positive timetable has been set for its entry into the EU in the not too distant future but with strict conditions, including recognition of Cyprus. In addition, debate rages over fears of an onslaught of Turkish workers flowing out of Turkey and into more prosperous parts of Europe.

Many Europeans have shown concern over Turkey's large and growing population, Islamic character, and spotty human rights record, including its treatment of the Kurds. However, Turkey's economic improvements and diligent attempts to comply with EU standards have made its entry almost inevitable. Turkey has conducted reforms that allow for the free flow of international capital and protection of intellectual property rights, and this appears to have led to increased interest from foreign investors. With an increasingly educated populace and a per capita income that has reached Eastern European levels (\$6,700 in 2003), Turkey's economic prospects continue to improve, barring the destabilizing political issues it faces with Kurdish nationalism, an Iraqi civil conflict, and continued problems with Greece over the Cyprus issue.

## TURKMENISTAN

The Republic of Turkmenistan is located in Central Asia, bordering with Iran in the south, with Afghanistan in the southeast, with Uzbekistan in the northeast, and Kazakhstan in the north. The Caspian Sea forms a natural border in the west. The country has a land area of 488,100 square kilometers (188,455 square miles) and is the second largest in the Central Asian region.

The population of Turkmenistan is estimated at 4.86 million, with 55% living in rural areas. The country's capital city, Ashgabad, is home to 580,000 people, or 8% of the population. Turkmenistan has a population growth rate of 1.85%, and it is estimated that its population will double by 2040. Turkmen is spoken by approximately 72% of the population, Russian by 12%, and Uzbek by 9%; other languages make up 7% of the population. The predominant religion is Islam, practiced by 89% of the population, and 9% of the population are Eastern Orthodox Christians.

Until the twentieth century, animal husbandry (horses, sheep, camels, and cattle) was the main source of income, supplemented by trade on the Silk Road. The desert terrain, which occupies almost four-fifths of the country, can support millions of sheep and camels, but there are few arable oases. The economic development of Turkmen land was often interrupted by war, and many cities and oases never recovered after the Mongol invasion in the thirteenth century and decades of internal conflicts in the seventeenth and nineteenth centuries. The Russian Empire established political control after overcoming resistance of the Turkmen tribes in 1881.

Capitalism was brought to the Turkmen society with the arrival of the Russians in the end of the nineteenth century and the building of a major railroad, but this only aggravated social disparity. After the Russian Revolution of 1917, with the help of British forces, Turkmen Nationalists declared independence from the Bolshevik state but eventually were brought back, becoming a part of the Turkistan Soviet Autonomous Republic. On October 27, 1924, Turkmenistan was established within its present borders,

becoming a Soviet Socialist Republic, a constituent part of the USSR. The Communist Party of Turkmenistan (CPT) came to power and remained the republic's single ruling party for the next seventy years.

The Soviet concept of development deeply affected Turkmenistan development from the 1930s until the 1980s, as the state initiated radical political and economic changes, state control of all types of economic activities, and central state planning. Between the 1930s and 1980s, the government forced all farmers to join large-scale farming centered around *kolkhozy*, state-controlled collective farms, and invested huge resources into building the Karakum Canal irrigation system, the largest in the USSR. After World War II, the Soviet government also initiated an industrialization program that brought into the republic the heavy industry, light industries (textile, garment, and carpets), petrochemical industry, and natural resources extraction (gas, oil, iodine, and other such resources). The government also heavily invested into the social sector, improving literacy, developing extended free education, and offering medical and social welfare services to all sectors of the population. At the same time, basic political and religious freedoms, free entrepreneurship, and cultural relations with countries outside the "iron curtain" were suppressed. According to official statistics, the Turkmenistan industrial production grew twelve-fold between 1940 and 1984, at an average annual rate of 8%–10%. By the end of the 1980s, Turkmenistan became the second largest gas producer in the USSR. The extensive economic development, however, led to ecological problems such as salinisation.

In the mid-1980s, the central government led by Mikhail Gorbachev introduced major changes, relinquishing centrally planned economy and introducing limited democratization. These changes were largely peaceful although the Turkmenistani elite silently resisted *perestroika*. The government banned emerging opposition parties, and the CPT easily won majority of 175 seats in the new Parliament and formed the government in January 1990. Its representative, Saparmurad Niyazov, ran unopposed in the October 1990 presidential election.

## Further Developments

On October 27, 1991, Turkmenistan declared its independence from the USSR. President Niyazov moved swiftly to introduce a new constitution (May 1992) and some political and economic changes. Gradually, these reforms brought into life one of the most extravagant political regimes in the former USSR, combining

extreme forms of statism, egalitarianism, and authoritarianism combined with nationalism and emphasis on traditional values. In December 1999, Mr. Niyazov-Turkmenbashi was elected as the president-for-life.

After independence, the Turkmenistan government rejected radical economic changes. The government believed that the sale of its gas reserves would allow it to achieve prosperity within ten years. It approved small-scale privatisation, limited price liberalization and currency reforms, allowed private entrepreneurship, and liberalized its trade. But at the same time, it retained some form of the centrally planned economy. The national currency—the *manat*—was introduced in November 1993, but it remained unconvertible. In 1992 through 1998, the annual inflation rate was between 600% to 3000% but declined to 9.5% in 2003 (CIA estimate).

However, the economic miracle did not materialise, largely due to nonpayments for the gas by the Commonwealth of Independent States (CIS) partners, absence of pipeline capacities to the non-CIS market, and flaws in the economic development model chosen by Turkmenistan's leaders. According to the World Bank, Turkmenistan's economy declined at an average annual rate of 4.8% between 1990 and 2000 but rebounded in 2001 through 2004. The country increasingly relies on the export of raw materials to the international market, mainly its gas, cotton, and agricultural products. Turkmenistan needs considerable foreign direct investments to modernize existing gas and oil extracting capacities and to build major pipelines.

Agriculture, industries, and services are the three main pillars of post-Soviet Turkmenistan's economy, contributing 27.3%, 50.0%, and 22.6%, respectively, to the gross domestic product (GDP) (World Bank estimate, 2001). The exports are narrowly based on sales of raw materials in international markets. The country's main exports are gas (exported 38.6 billion cubic meters of gas (CIA estimate 2001), textiles, cotton (Turkmenistan is the world's tenth largest producer of cotton), silk, and other agricultural products.

The post-Soviet economic changes led to a steady decline in living standards among all groups of the population, despite the state's supplying water, electricity, and gas for free to all citizens of the country and despite the recent macroeconomic stabilisation. The country remains one of the poorest countries of the former Soviet Union, with 58% of population living below the poverty line (2001 est.) and an average life expectancy of sixty-one years. In 2004, the United Nations Development Programme's (UNDP's) Human Development Index (HDI) put Turkmenistan in 86th place out of 177.

## TUTU, BISHOP DESMOND

Bishop Desmond Tutu, a black South African Archbishop and a Nobel Peace Prize winner, is best known for his defiant opposition to apartheid. Born in Klerksdorp, South Africa, in 1931, Tutu rose from an impoverished childhood to become the archbishop of Cape Town, the highest position in the South African Anglican Church. When Tutu was twelve, his family moved to Johannesburg, where his father had found a better teaching position and his mother was also fortunate enough to find work as a cook in an Anglican missionary school. Tutu attended the Johannesburg Bantu High School (Madibane) in Western Native Township and went on to earn a teacher's diploma from the Bantu Normal College in Pretoria in 1953 and a BA degree in teaching from the University of South Africa a year later. He received his initial formal training in religion from St. Peter's Theological College in Johannesburg, from 1958 to 1960, and followed it up with a BA (honors) in London and then a master's degree in Theology from King's College in London in 1966.

It was during his childhood in Johannesburg that Tutu met Father Trevor Huddleston, a fearless critic of apartheid, who became Tutu's mentor until his (Huddleston's) death in 1998. Under the guidance of his parents and the spiritual mentorship of Huddleston, Tutu became aware of the damaging impacts of apartheid on Blacks and the need to oppose it, not with violence, but with love, reconciliation, and

respect for others; these themes were later woven into Tutu's theology of *ubuntu*. Tutu had an illustrious teaching career—from his appointments as a high school teacher at Madibane (1954–1955) and Munsieville High School in Krugersdor (1955–1958) to his lectureships at the Federal Theological Seminary in Alice, Cape Province (1967–1969), and the University of Lesotho (1970–1971)—before his major leadership roles in the church in South Africa, which included his positions as the Dean of St. Mary's Cathedral in Johannesburg in 1975, Bishop of Lesotho in 1976, General-Secretary of the South African Council of Churches in 1978, and Bishop of Johannesburg in 1985, all of which culminated in his position as the Archbishop of Cape Town, from 1986 to 1996.

## Tutu's *Ubuntu* Theology

In a number of sermons, speeches, and books, Tutu advanced an eclectic theology, which combines elements of African spirituality, liberation theology, and Christian teachings, with a dose of South African politics, under the rubric *ubuntu*. The concept of *ubuntu*, often translated as “community” and sometimes as “humanity” or “respect for others,” is seen by Tutu as the mysterious quality that makes a person a person. According to Tutu, one is a Christian only to the extent that he or she cares for others and that people are human through their relationships with others—hence, his favorite saying is “*U muntu ngu muntu ngabantu*,” which means “a person is a person through other people.” Tutu sees this focus on community and relationships with others as a corrective worldview to the Western salvation theology, which is centered on the individual. *Ubuntu* is also premised on the Christian doctrine that human beings are created by God in his image (*imago Dei*). Implicitly, a race-based discriminatory system like apartheid makes no theological sense from the standpoint of Tutu's *ubuntu*, as it undermines this notion of *imago Dei*. Unlike apartheid, which gives the primacy of human identity to race, Tutu's *ubuntu* gives it to the human spirit or the image of God. *Ubuntu* certainly underpins Tutu's advocacy for nonviolence and reconciliation, even in the face of intense provocation. No documentation of Tutu's theology can be complete without some mention of his delicious humour. Tutu notes in his foreword to Mary Benson's *Nelson Mandela* (1986) that “we laugh only because if we did not, we would cry and cry.” According to Tutu, humour is liberating because it helps a person not to take the isolated self as seriously as the self in relation to others.

## Tutu's Role in the Political Transformation of South Africa

With the conviction that religion and politics are inseparable, it is hardly surprising that Tutu was constantly embroiled in the South African apartheid politics. To him, Christianity is not a personal matter, as it invariably has public consequences, especially in South Africa where religion was used as a medium of oppression. As he once put it in an interview with *The Australian*, Tutu says that “in a situation of injustice and oppression as we have in South Africa, not to choose to oppose it is in fact to have chosen to side with the . . . oppressor.” Not surprisingly, Tutu has been vilified by whites, who brand him as anything from a “theological imposter,” “political agitator,” to a “communist operative,” and by blacks, especially the youth, who criticize him for holding back their liberation struggle with his antiviolence stance. Tutu once admitted in his characteristic straightforwardness that “if I were a young black, I wouldn't listen to Tutu any more.”

Tutu, a consummate peace-lover, rejects all forms of violence, either from the erstwhile apartheid system or from those who sought to overthrow it. At the same time, he was realistic enough to warn, as he did in an open letter to Prime Minister John Vorster in May 1976, that “a people made desperate by despair, injustice and oppression will use desperate means.” Tragically, just the following month, Tutu's warning came to pass, with the Soweto uprising in which some six hundred black children were killed. Tutu's abhorrence for violence compelled him to favour economic sanctions against South Africa. Working with the international prosanctions lobby, made up of such notables as Rajiv Gandhi, the British Labour Party, and the exiled African National Congress—against equally formidable opposition from the likes of President Reagan, Margaret Thatcher, and Chancellor Helmut Kohl—Tutu's defiant advocacy facilitated the dismantling of apartheid and the ultimate transformation of the South African society; indeed, the only thing that kept Tutu from prison, then, was his international fame.

Tutu's anti-apartheid views have long put him in a collision course with the government. In 1981, the government accused Tutu and the South African Council of Churches, of which he was the General Secretary, of financial mismanagement and subversion and appointed the Eloff Commission to investigate. Tutu was defiant as ever, asserting in his submission to the Commission that “they may remove a Tutu . . . but God's intension to establish His Kingdom of justice, of love, of compassion will not be thwarted.” At the end of its long inquiry, the Commission uncovered nothing that could justify any kind

of censure for lawbreaking. In 1990, as sanctions intensified and political violence increased, President de Klerk heeded the relentless warning by Tutu and other anti-apartheid advocates and released Nelson Mandela, paving the way for free and democratic South Africa. Mandela spent his first night of freedom in Tutu's house, in appreciation for the latter's outstanding contribution to his release. Tutu was named the Chairman of the Truth and Reconciliation Commission set up by the Mandela government to investigate the abuses of the apartheid government.

Tutu's selfless opposition to apartheid has earned him numerous reputable citations and awards, including the Nobel Peace Prize in 1984. Other notable ones are honorary degrees from Oxford, Harvard, Columbia, Emory, Yale, Kent, Sydney, Cape Town, and Ruhr universities. He also holds the Order for Meritorious Services Award (gold) from President Mandela; the Archbishop of Canterbury's Award for Outstanding Services to the Anglican Communion; the Prix d'Athene (Onassis Foundation); the Mexican Order of the Aztec Medal (Insignia Grade); the Martin Luther King Jr. Humanitarian Award of Annual Black American Heroes and Heroines Day; and the Martin Luther King Jr. Peace Award and many more.

## TUVALU

Tuvalu is an independent Pacific microstate. A parliamentary democracy with the British monarch as

nominal head of state, Tuvalu has ties to a number of international organizations, including the British Commonwealth, the Pacific Islands Forum, and the United Nations. It comprises a chain of nine small atolls and coral islands stretching from northwest to southeast in a four-hundred-mile long arc south of the Equator and just west of the International Dateline. Its nearest neighbors are the Republics of Kiribati to the north and Fiji to the south. Tuvalu, as the former Ellice Islands, and Kiribati, as the former Gilbert Islands, constituted a protectorate and then colony under British control from 1892 to 1975, but Fiji is now Tuvalu's most important link to the outside world.

From north to south, the Tuvalu islands are Nanumea, Niutao, Nanumaga, Nui, Vaitupu, Nukufetau, Funafuti, Nukulaelae, and Niulakita (a relatively recent addition purchased by colonial authorities after World War II as a population safety valve for the most crowded island, Niutao). The total land area of the archipelago is only about ten square miles. Loyalty to individual islands is strong and has been recognized with a degree of constitutional decentralization.

The climate is tropical maritime (the average daily maximum temperature is 75°F–86°F or 24°C–30°C) with a stormy season from November through March. A rainfall of 105 to 140 inches per year generally precludes prolonged drought, but storage constraints and saltwater contamination have encouraged systems of communal rationing when required. Soils pose a challenge for agriculture, being 98% calcium or magnesium carbonate and therefore highly alkaline. The most adaptive form of cultivation (primarily of swamp taro, *Cyrtosperma chamissonis*) uses large compost-filled pits dug down into the top layers of freshwater lenses. Other cultigens include varieties of coconut palms, pandanus, bananas, and breadfruit, all suited to atoll conditions, as well as “real” taro (*Colocasia esculenta*), which requires special treatment and soil production. Copra used to be produced for export, but low market prices and transport difficulties mean the industry is now virtually defunct. Inshore and lagoon fishing are still practiced intensively, and some of the catch is now sold locally.

The 2002 census recorded a population of about 9,500, meaning growth had slowed overall, but its uneven spread had intensified. Funafuti, the capital and “urban” center, had almost 4,500 inhabitants; Vaitupu, the location of the main high school, had about 1,500; and the rest had between four hundred and seven hundred, except for Niulakita (thirty-five). Many people on Funafuti are “outer islanders” in search of economic opportunities, education, and medical treatment, or they are visiting relations. About three thousand Tuvaluans have moved to New Zealand, the country mentioned most often as

an environmental refuge in the event of global warming (despite the government there downplaying such commitments). Scientists disagree as to whether Tuvalu is genuinely threatened by rising sea levels, but climate change in the form of more frequent and/or more serious storms may be just as great a threat.

Protestant evangelization began in the 1860s and 1870s, and the Tuvalu Christian Church is still overwhelmingly the main denomination. A significant proportion of household income is diverted into the upkeep of church administration and local pastors. In return, the church has provided primary education and some elite employment opportunities. Since independence in 1978, however, most of the educational system has been run by the government. Primary education is mostly free and universal; secondary and tertiary education levels are restricted to fees-paying or scholarship students. Tuvalu has a relatively high literacy rate, usually cited as well over 90%, though this may mask declining achievement. Young men compete to enter the local maritime institute at Amatuku to train as merchant seamen for international shipping lines. Seamen's wages are an important source of remittances.

Infrastructural development and the development of a cash economy proceeded slowly under the British colonial administration but received a boost from Tuvalu's position as a northerly forward Allied base in World War II. US forces built airfields, including what remains the only international airport on Funafuti, and some locals found employment in construction. Straddling this wartime “boom” was an influx of money from overseas laborers, mainly in the phosphate mining operations of Banaba and Nauru, now closed or near the end of their economic life.

These developments all reinforce the depiction of Tuvalu as a classic MIRAB economy, that is, based on **M**igration, **R**emittances, **A**id, and **B**ureaucracy. Being small and poor in land-based natural resources, the country has had to survive by managing its political relations with metropolitan aid donors and has done so quite successfully, even though Tuvalu has no natural migration outlet (with no rights of access to Britain, the former colonial power) and despite the prospect of remittance “decay” from those living overseas. Tuvaluan leaders have turned Tuvalu into an internationally recognized symbol of impending environmental disaster from global warming and have garnered rewards through the cultivation of good diplomatic relations with countries like Taiwan, which seeks friends in the Pacific. Another source of income is the Pacific Islands Forum Fisheries Agency, which negotiates licensing agreements with Distant Water Fishing Nations seeking to exploit the valuable Central Pacific tuna fishery. With an Economic

Exclusive Zone of about 600,000 square miles, Tuvalu gains substantial income from this source (\$6.5 million Australian in 2002).

The Tuvalu Trust Fund was established by Australia, Britain, and New Zealand with a grant of \$27 million Australian in 1987. Its market valuation had more than doubled by 2000, providing substantial income for the running of government services (perhaps as much as 40% by 1998). Government remains the most important area of employment, especially on Funafuti, though the private sector is growing. Other revenue accrues from licensed use of Tuvalu's Internet domain suffix (.tv). Managed by a Canadian company, returns were expected to reach almost \$20 million Australian in 2002 and to continue growing. Rental of spare telecommunications capacity also briefly provided some major windfall revenue in the 1990s, but this declined abruptly with the revelation that much of it came from international phone sex lines, prompting opposition from the church hierarchy. Tourism is constantly touted as another avenue of economic development but, given Tuvalu's relative inaccessibility and infrastructural problems, has only a small role to play for the foreseeable future.

In short, Tuvalu is a tiny democratic microstate, lacking natural resources and infrastructure and handicapped by geographical remoteness and fragmentation. Its people survive by generating revenue from a number of fortuitous engagements in the global economy, which supplement the localized pursuit of agriculture and fishing.

### 26TH OF JULY MOVEMENT

The 26th of July Movement was the guerrilla opposition in Cuba led by Fidel Castro and his instrument to gain support of the Cuban people for the overthrow of Cuban dictator Fulgencio Batista y Zaldívar. July 26 commemorates the day in 1953 on which Castro and his comrades attacked the Moncada army barracks at Santiago de Cuba. The date of the attack, July 26, 1953, was deliberately chosen because it was the 100th anniversary of the birth of the Cuban writer and patriot Jose Martí who fought against the Spanish rule over Cuba. This futile but defiant 1953 attack and his long speech of self-defense at his trial made Castro a hero among the Cubans. Six and one-half years later, Castro was able to seize power, and despite all odds and misfortunes, he is still in command.

The attack on Moncada barracks was doomed as an act of despair and poorly designed by a group of visionary and radicalized youngsters. It was a reaction to the March 10, 1952, coup d'état that made the comeback of Fulgencio Batista in the power. Nearly 1,500 people, almost everyone under thirty years of age, were involved in the preparations for the attack, and none of them betrayed. They intended, benefiting of surprise, to seize the barracks, catch the arms they needed, inducing soldiers to join them, and on the radio station nearby to call on the people to rise up against Batista.

On July 26, 1953, with the town busy celebrating a carnival, 125 young men and women gathered to ignite the spark that they were convinced would loose a revolutionary tempest over the entire country. At 5:15 a.m., they rallied by singing the national anthem and reciting the poem "Ya Estamos en Combate" (We Are in the Battle) by soldier-poet Raul Gomez Garcia, and verses by Jose Marti declaimed by Fidel Castro himself. The attack itself went badly

wrong for the young revolutionaries. Half the forces, the better armed, lost their way in the unfamiliar city streets and never made it to the battle. The others who made it there were unable to take the garrison, and the order to withdraw was given. Few lives were lost in the battle itself; 95% of the casualties came from the army's brutality against revolutionaries who were captured alive. Fidel, his brother Raul, and about eighteen others managed to escape. A week later, they decided to come out of hiding in order to save innocent people in Santiago from the terror and reprisals. At the open trial, Castro, a professed lawyer and gifted orator, delivered his famous speech, "History Will Absolve Myself". He was sentenced to fifteen years in prison on the Isle of Pines but received amnesty on May 15, 1955, after serving only eleven months. With few followers, he fled to Mexico, the site of military training for guerrilla warfare. In July 1955, in exile, they founded the Movimiento Revolucionario 26 de Julio (MR-26-7, 26 July Revolutionary Movement), named after their first revolutionary act in 1953. Here, their team was joined by the physician from Argentina Ernesto Guevara, alias "Che."

On November 30, 1956, three hundred men (led by Frank País) wearing red and black armbands with the July 26 emblem attacked police headquarters, the Customs House, and the harbor headquarters in Santiago. This was planned to coincide with the arrival of Granma boat with eighty-two rebels from Mexico, but stormy weather delayed the trip and sent forlorn sailors to a remote place. All but twelve were slain in the first combat with the regular army, but most of the important leaders—Fidel, Raul, Che, Camilo Cienfuegos, and Juan Almeida—made their way into the Sierra Maestra mountains.

Rebel forces relied on the peasants for support. Their first guerrilla unit of the 26 July Movement was combat-ready on December 18, 1956. Batista's ruthless attacks against pro-Castro helpers only stirred up more support for the rebel leader. Batista's troops were unprepared for the fighting conditions in the mountains and the guerilla style of warfare; desertion and surrender were commonplace among the dictator's forces.

On May 24, 1958, Batista launched Operacion Verano. With seventeen battalions, tanks, planes, and gunboat fire from the sea, they intended to easily defeat Castro's rebels. Though greatly outnumbered, rebels repeatedly inflicted heavy casualties on the army and drove them back. Eventually, Batista decided that the situation was hopeless, decided to give up the fight, and on New Year's Eve, he fled to Spain.

Santa Clara was taken by Guevara's army, who then turned toward Havana. Santiago surrendered without a fight. The forts in Havana also relinquished, and Castro's forces triumphantly entered the capital. It was just five years, five months, and five days after the attack on the Moncada barracks.

After the revolution's success, the 26th of July Movement was joined with other groups to form the United Party of the Cuban Socialist Revolution. Castro began to refer to the revolution as "socialist" and Marxist-Leninist—though still in his "History Will Absolve Me" speech, he stated clearly that "the revolutionary government would have assumed all the faculties inherent to it: it would have assumed the legislative, executive, and judicial powers"—only during 1961. On October 3, 1965, the new Communist Party was founded, replacing the party originally established in 1925. The First Congress of the Communist Party met in 1975 and drafted a new constitution.

July 26 remains the most important date in the Cuban revolutionary calendar. The former Batista Presidential Palace is now the Museum of the Revolution and contains "Granma," and countless artifacts and insignia and flags of the 26th of July Movement. This day is the best chance to see *el Comandante* Fidel Castro in one of his most prominent roles of a captivating public speaker—albeit with his progressing age, he lost most of the charisma of his younger days. Commonly, these speeches were delivered in front of a massive gathering of thousands of people and involve a vivid dialogue between the leader and the crowd.

## UGANDA

Uganda is located in East Africa. It has the largest freshwater lake in the world—Nalubale, or Lake Victoria. Uganda is bordered to the north by Sudan; to the south by Tanzania, Rwanda, and Burundi; to the east by Kenya; and to the west by the Democratic Republic of the Congo. The climate is tropical but mild, with average daytime temperatures of 75°F–82°F (24°C–28°C). The dry season is from November to March, with July as the coolest month of the year. Near Lake Victoria and in the mountains, average annual rainfall is 60 inches; in the northeast of the country, it is less than 40 inches. The population is estimated at 26,404,543, with an estimated growth rate of 2.97% annually (CIA estimate July 2004). The capital, Kampala, is located in the southeast region of the country on Lake Victoria and has a population of about 1.2 million.

The delimitation of Ugandan territory by European colonial powers brought together an African population composed of about fifteen different ethnic groups, which can be categorized into four main language clusters: Bantu, Nilo-Sudanic, Lwo, and Ateso. Although during the period of its rule over Uganda the British government was committed to developing the country as a single political unit, in practice the colonial government's economic and political policies fostered uneven development between regions. In addition, the sociopolitical policy of ethnic compartmentalization pursued in the colonial period, combined with economic policies, militated against territory-wide social cohesion. Preferential treatment

of Buganda and Busoga by the British colonial administration allowed for the first formal political organizations on the national scene to emerge in that region of the country. After World War II, Africans began political agitation, first to demand their rights in the political process and then to challenge the pyramidal racial power structure in the country. In Buganda, the Bataka Party was formed in 1946, and the Uganda African Farmers Union was inaugurated the following year. After the insurrection by Africans in 1949, the British colonial government granted Africans in Buganda the right to elect their representatives to the Colonial National Legislative Council, on which hitherto only Europeans and Asians had sat. The action heralded populist politics against the colonial authorities in Buganda; in the 1950s, it spread to other parts of the country.

The first mass political party, the Uganda National Congress (UNC), was founded in March 1952 and was a lineal descendant of the Bataka Party and the Uganda African Farmers Union. Although the UNC was initially a Buganda-based political party, its leadership identified itself with Africans across the country. As it expanded, its leadership became dominated by Protestants. This caused apprehension among Roman Catholics, and in 1956 they recast nationwide the Democratic Party (DP), which had been launched in Buganda in 1954 by Catholic action to represent their interests.

Although the UNC was arguably the most broad-based Nationalist party in the country, it was, after the formation of the DP, torn by internal division and

personal bickering. A number of splinter parties emerged, one of which was the Uganda Peoples Union (UPU). In March 1960, the UPU and A. Milton Obote's faction of the UNC amalgamated to form the Uganda Peoples Congress (UPC), which adopted a Pan-Africanist posture at the same time that it exhibited antipathy toward Buganda; in fact, two groups were bound together by common fear of domination of the rest of the country in Buganda in a postcolonial Uganda. In October 1958, the first general elections on the basis of qualified franchise were held to elect African representatives to the Legislative Council. However, only eighteen constituencies in Uganda participated; the Buganda Lukiiko (traditional parliament), fearing the erosion of its privileged status and committed to Kiganda nationalism, together with the districts of Ankole and Bugisu, dissociated themselves from the elections.

In March 1961, a second general election, conducted by the British colonial authorities on common rolls and with a broadened qualified franchise-based on income, was held. Although the general election brought a substantial majority of elected African representatives to the Legislative Council and even though about 80% voted throughout Uganda, only 3% turned out in Buganda. The results of the election, favoring the DP over the UPC, pointed to the emergence of an ideological alliance in the country along ethnoregional and religious lines. The results also demonstrated that there were now only two dominant political parties in the country. But because only a minuscule proportion of the population in Buganda participated in the elections, there was the distinct possibility that the Buganda Lukiiko could constitute a third force in Ugandan politics. That possibility became a reality when late in 1961 a political party representing the interests of the Buganda Lukiiko and opposed to the Catholic-based DP, the Kabaka Yekka (KY, known also as "the King Alone"), was formed for the principal purpose of allying itself with the non-Kiganda but predominantly Protestant party, the UPC.

In April 1962, another general election was held to presage the granting of juridical independence to Uganda. The UPC gained forty-three seats and the DP twenty-four in a parliamentary National Assembly of ninety-one seats. The remaining twenty-four seats were claimed, in accordance with a provision in the constitution, by the Buganda Lukiiko for its political party, the KY, which then entered into an alliance with the UPC. Thus, when Britain granted political independence to Uganda on October 9, 1962, it was the UPC–KY alliance that formed the first postcolonial government of the country. By the terms of the UPC–KY

coalition, the leader of the UPC, A. Milton Obote, became prime minister and thus executive head of state, but his position was offset by the appointment of the *Kabaka* as president—the titular head of state. The UPC and the KY were opposed on virtually every policy issue, but they were held together by their common resentment of the Catholic-dominated DP.

Within a year of the formation of the coalition, strains in the UPC–KY relationship quickly developed when the UPC began to establish political branches in Buganda. One year later, in 1964, the alliance broke down irretrievably when the UPC, in accordance with a constitutional provision, resolved to settle a territorial issue while the *Kabaka* attempted to secure Baganda's retention of two counties at issue by settling Buganda's ex-servicemen there. The termination of the UPC–KY alliance led to a bloody military confrontation between the *Kabaka's* forces and those of Obote in 1966 and the resultant demise of the Kiganda monarchy.

The use of the military by Obote to settle political differences between the UPC and the KY emboldened the army to intervene directly in politics. This was, among other things, a precondition of the *coup d'état* of January 25, 1971, led by Gerald Idi Amin Dada. Since then, the equation of power has rested on the determination of the military, which in July 1985 overthrew the second government of the UPC and was in turn ousted on January 25, 1986, by another military organization, the National Resistance Army (NRA), led by Yoweri Kaguta Museveni.

## UKRAINE

Ukraine is the second largest country in Europe. The area of the country is 233,090 square miles (603,700 square kilometers), and its population reached 47,732,079 in 2004. Ukraine borders Russia, Belarus, Poland, Hungary, Slovakia, Romania, Moldova, and the Black Sea. The Ukrainian flag consists of two horizontal stripes: blue on top and yellow at the bottom, representing the golden grain fields under blue skies. Trident, another common national symbol of Ukraine, dates to the medieval times of Kievan Rus (a preheraldic symbol visible, for instance, on coins of Vladimir the Great and his successors). The capital of Ukraine is Kiev, one of the oldest cities in Ukraine that dates to the times of the Kievan Rus. It is also the largest Ukrainian city with the population presently exceeding 2.6 million. Although Ukraine was represented in the United Nations (UN) as an autonomous country, it was one of the Soviet Union republics until 1991. Ukrainians celebrate their Independence Day on August 24, a day that commemorates an anniversary of breaking up with the Soviet Union in 1991.

Ukrainian diverse ecosystems consist of lowlands along the Black Sea coast, open areas—steppes in central and southern Ukraine—wetlands, forested uplands in the central and northern parts of the country, and the Carpathian and Crimean Mountains in the south and southwest. The highest point is Hora Hoverla at 6,762 feet (2,061 meters) in the Carpathians, and the second highest mountain is Roman-Kosh in the Crimea, reaching 1,543 meters above sea level. Ample annual rainfalls and snowfalls contribute to numerous rivers and lakes. Several big rivers cut through the country, flowing generally from north to south and southeast. All rivers except for those in the extreme western part of the country contribute to the Black Sea watershed. The biggest among them are Dnepr, Dniestr, Boh, and Donets. Southern Ukraine borders the Black Sea with Crimean Peninsula.

The climate in Ukraine ranges from Mediterranean-like, warm, and humid in southern part of the country, to continental and dry in central and northern Ukraine. Generally, summers are warm or even hot in the central and the southern regions, and winters are mild in the south but cold and snowy in the central, northern, and western parts of the country. Ukraine still suffers from one of the most dramatic environmental disasters of the twentieth century: the Chernobyl Nuclear Power Plant accident of 1986 caused radiation contamination especially in the northeastern Ukraine and also around the world, but especially in Eastern and northeastern Europe.

Ukraine has always been a multicultural country with several significant ethnic groups and many other

ethnic minorities. Modern ethnic relations include Ukrainians at 75% and Russians at about 20%; other minority groups are Romanians, Belarussians, Moldovans, Tatars, Bulgarians, Poles, Hungarians, and Jews. Other, less numerous ethnic groups include Slovaks, Germans, Swedes, Greeks, Albanians, Serbs, Karaims, Armenians, and Romas. Several ethnographic cultures are recognizable within Ukrainian territory. Among them, the best known are the Tartars of the Crimea and the Hutsul Highlanders in the Carpathians. Ethnic diversity caused several significant conflicts in the past, namely between Ukrainians and Jews as well as Ukrainians and Poles. Modern Ukraine adopted a policy to solve ethnic conflicts peacefully, and Crimean Tartars, who were displaced under the Soviet ruling from their homeland in the Crimea, were allowed to return to southern Ukraine. The newly elected Ukrainian president Victor Yushchenko promised the Polish minority in Western Ukraine more cultural rights. Languages spoken in Ukraine include Ukrainian, Russian, and Polish, especially in western Ukraine, and Hungarian and Romanian are spoken in the southwestern part of the country. The Ukrainian language belongs to the Indo-European family of languages and is classified as one of the Slavic languages of Eastern Europe. It uses the Cyrillic alphabet. There are several local dialects of the official language that developed in the eighteenth century, like the Boyko or Hutsul dialects in the west or the Volynian dialect in northern part of the country. Most Ukrainians speak the Ukrainian language although some, especially those who live in the eastern, more industrialized part of the country, claim Russian as their native language. After 1991, the use of the Ukrainian language increased. Cultural diversity can also be seen in a variety of religions followed by modern Ukrainians. The dominant religion is Orthodox Christianity, which includes Ukrainian Orthodox, Ukrainian Catholic (Uniate), and Ukrainian Autocephalous Orthodox. Other religions are also present, namely Roman Catholicism, Judaism, Protestantism, and Islam.

In the past, some areas of Ukraine were included into one of the first Eastern Slavic pristine states, the Kievan Rus, which originated in the tenth century. It is not clear who established the state. Historians link its origins with a group of people who probably migrated from the Scandinavian region and settled on the Dneper River, where Kiev is located. Archaeological records confirm the existence of Scandinavian artifacts in the early levels of medieval Kiev. The first ruling dynasty was named the Ruriks; they ruled a wide region occupied by people of Slavic origin. The Kievan kingdom is sometimes called the *Red Rus* in the historical sources. The state persisted for about two hundred

years and declined at the time of Mongolian rides in the beginning of the thirteenth century and during the fourteenth century. By the end of the fourteenth century, Ukraine became a part of the Lithuanian kingdom, and after Polish and Lithuanian unification in 1386, Ukrainian lands became the domain of the Polish kingdom. During the sixteenth and seventeenth centuries, Ukraine was part of one of the most politically and economically significant European state, the Commonwealth composed of Lithuania, Belarus, Ukraine, and Poland. At the same time, in the southern part of Ukraine in Zaporozhian Sich, Cossacks formed a military-like political entity, a sort of a chieftom run by military chieftains (hetmans).

The Cossacks initiated several uprisings mostly against the Commonwealth dominated by the Polish noblemen. The most memorable was the rebellion led by hetman Bohdan Khmelnytsky, whom historians see as the one who formulated the first concept of the Ukraine as a sovereign state. After 1654, the Cossack military chieftom was limited in its political activities as an aftermath of the Pereiaslav Agreement, when most of Ukraine was incorporated into the Russian domain, but the final blow to its existence was the Empress Catherine II's Decree of 1775 that extended the Russian ruling over the traditionally free Cossacks lands. Even until the twenty-first century, the Cossacks are seen as the first attempt toward free Ukraine and bearers of Ukrainian national culture and identity. At the time of partition of the Polish kingdom at the end of the eighteenth century by Russia, Austria, and Prussia, the western part of Ukraine was occupied by Austria and the eastern part with Kiev by Russia. Regions under the Russian rules suffered the most as the Russian authorities officially banned the Ukrainian language. After the Russian Revolution of 1917, Eastern and Western Ukraine gained independence, and two separate Ukrainian states briefly existed before unification in 1919.

In 1922, a part of western Ukraine was incorporated to Poland, while the rest of the country became one of the republics of the Soviet Union. The Soviet rules over Ukraine were harsh. Despite a brief revival of Ukrainian culture in the 1920s, the destructive process of eliminating the Ukrainian symbols from culture continued throughout the 1920s and 1930s. The Soviets were also accused of causing a genocidal famine of 1933 when more than 7 million Ukrainians, mostly peasants who preserved the traditional Ukrainian culture, perished. In September 1939, the Polish part of Western Ukraine was taken over by the Soviet Union, when the Nazi Germany invaded Poland from the west and the Soviet Red Army from the east, initiating World War II. During 1941 through 1944, Ukraine was occupied by the Nazi Germany.

Some Ukrainian forces joined the Nazis, while others fought alongside the Red Army to liberate Europe. During the war, old ethnic conflicts erupted, especially in western Ukraine that witnessed ethnic cleansing of Poles, Ukrainians, and Jews. Polish, Ukrainian, and Soviet resistance forces also clashed. Many Ukrainians suffered the hardship of war, and many migrated to other countries, mostly Canada, the United States, and Western Europe. It has been estimated that the Ukrainian population decreased by about seven million, including more than half a million Jews. After the war, Ukraine remained a part of the Soviet Union, and it gained independence again in 1991.

Ukraine is one of the most industrialized regions in Eastern Europe. The country was traditionally an agricultural state, but, beginning in the mid-1990s, it has turned into a more industrialized economy. The most common natural resources include iron ore, coal, manganese, natural gas, oil, salt, sulfur, graphite, titanium, magnesium, kaolin, nickel, mercury, timber, and arable land. Due to the lack of other significant resources, Ukraine depends on Russia for several critical resources like natural gas. Diversified heavy industry, including steel mills and coal mines, is concentrated in the eastern part of the country, whereas the western part is mostly agricultural. Key industries include those of coal, electric power, ferrous and nonferrous metals, machinery and transport equipment, chemicals, and food processing (especially sugar). Most significant agricultural products are grain, sugar beets, sunflower seeds, and vegetables; beef and milk are also products. Export commodities include ferrous and nonferrous metals, fuel and petroleum products, chemicals, machinery and transport equipment, and food products. Among export partners, the most significant are Russia 17.8%, Germany 5.9%, Italy 5.3%, and China 4.1%. The Ukrainian labor force is presently diversified. Most people work in services (44%), industry (32%), and agriculture (24%). Ukraine imports mostly energy, machinery and equipment, and chemicals. Among the key import partners are Russia 35.9%, Germany 9.4%, and Turkmenistan 7.2%. The Ukrainian currency is known as the hryvnia.

In general, Ukraine is characterized as a parliamentary republic with a president who nominates the prime minister who forms the government. Administrative structure of Ukraine includes twenty-four provinces, one autonomous republic (Crimea), and two municipalities (Sevastopol and Kiev). The new Ukrainian Constitution was adopted June 28, 1996. The Ukrainian political system includes the executive, the legislative, and the judicial branches of the political structure. The legislative branch is composed of a unicameral 450-seat Supreme Council elected for a four-year term. The judicial branch consists

of the Supreme Constitutional Court, and the executive branch of the government consists of the president elected by the popular vote for a five-year term. The head of the government is the prime minister appointed by the president and confirmed by the Supreme Council. The government is appointed by the president and approved by the Supreme Council. The president is a chief of state. In stormy presidential elections of November–December 2004, Victor Yushchenko defeated Viktor Yanukovich and replaced Leonid Kuchma as the president of Ukraine. The event was labeled by journalists as the “Orange Revolution” after the most popular color used by Yushchenko’s followers in Ukraine and elsewhere. Hundreds of thousand of Ukrainians, mostly in Kiev and other big cities of western Ukraine, demonstrated against the outcome of the first round of presidential elections when Yanukovich was proclaimed the winner. They accused the authorities of falsifying the results of the election, and international observers confirmed that claim. Yushchenko’s followers gathered in the Freedom Square in Kiev, and some of them stayed there for several weeks until the results of the repeated voting were made official, and Yushchenko was announced to be the next Ukrainian president. It is significant to notice that the conflict was solved peacefully although information about a planned *coup d’état* reached the public. Due to involvement of several European politicians in solving the Ukrainian internal conflict, the danger of bloodshed was diffused, and Yushchenko was sworn in as the president of Ukraine on January 26, 2005. He briefly outlined the key points of his politics, emphasizing that he would initiate talks with the European Union about Ukraine becoming its member in the future.

### ULMANIS, GUNTIS

Guntis Ulmanis, born September 13, 1939, in Riga, Latvia, spent his early years in extradition by the Soviet authorities with his family in Siberia. He graduated from the Department of Economy of the Riga Latvian University in 1965, and, after completing his service in the Soviet Army, he mingled teaching at the Riga Polytechnics and Riga University with administrative jobs. Later he became an employee of the Riga public utilities’ company and rose through positions in the management to become its director. Being a *nomenklatura* position, he was invited to join the Communist Party. He remained member until 1989, when, with the height of the nationalistic movement, he became affiliated with the newly founded Latvian Popular Front.

In 1992, Ulmanis became member of the Board of the Central Bank of Latvia. He was named and soon elected honorary president of the traditional center-right party, the Latvian Farmers Union (*Latvijas Zemnieku Savienība*, LZS), founded in 1917 with his great-uncle Karlis Ulmanis as its leader. LZS scored fourth in the elections to the Saeima (Parliament) in June 1993, and G. Ulmanis became the Minister of Parliament (MP). On July 7, 1993, he was elected by the Saeima to the newly established position with limited jurisdiction, the president of the republic.

President Ulmanis was able to usher his country to an independent position and to secure essential preliminary requirements for a sustainable development. He urged for amending the controversial citizenship law, thus obtaining international approval for Latvia’s citizenship policy, and opened doors for Latvian membership in the Council of Europe and European Union (EU). He imposed a cessation for the execution of death penalty beginning in 1996. Another important achievement was the agreement for the withdrawal of the Russian troops from Latvia, which was completed on August 31, 1994.

Thus, a man who would remain an ordinary citizen in other circumstances emerged as the needed national leader in a time of a great transformation for his nation. He was able to bring political foes together to form a government in late 1995 when it looked like the contention and libel would go on forever. Thanks to his intervention, a government coalition far surpassing expectations was finally tailored; he has been instrumental in the formation of other governments since then. On June 18, 1996, Ulmanis was reelected for a second term. Three years later, legally prohibited to seek a third term, Ulmanis was replaced on June 17, 1999, by the independent candidate Vaira Vike-Freiberga. Initially, Ulmanis returned to position of the LZS honorary president; however, on September 6,

2001, Ulmanis retired from the LZS, and later he supported the project of Einars Repse, president of the central bank, to found a new center-right party.

## UM NYOBE, REUBEN

Reuben Um Nyobe (1913–1958) was the first secretary general of Cameroon's *Union des Populations du Cameroun* (UPC). A member of the Bassa tribe, Um Nyobe was born in 1913 in the village of Boumnyebel. He attended the Teachers Training College in Sangmelima. On April 10, 1948, a group of Nationalists, led by Leonard Bouli, met in Douala to form a national liberation movement, which resulted in the founding of the UPC on April 14, 1948. Although Um Nyobe could not attend the meeting because he was hospitalized in Sackbayeme, within six months he had not only joined the movement but had also taken over leadership of the movement.

As the leader of the UPC, Um Nyobe's main goals were the liberation of Cameroon from European colonialism and the unification of the British and French Cameroon. After World War I, the League of Nations gave 80% of German Cameroon to France and 20% of German Cameroon to the United Kingdom. The British sector was subsequently divided into Northern and Southern Cameroon. Given the differences in colonial administration and language, the possibility of unifying the British and French sectors of Cameroon was a daunting proposal. Nevertheless, Um Nyobe argued that unification was essential to Cameroon's political and economic future. After independence, Um Nyobe envisioned a socialist economy and a complete break in political and economic ties with France.

In 1955, the UPC launched a war of national liberation in French Cameroon. Claiming that the UPC had engaged in terrorist activities and was dominated

by Communists, the French authorities declared the UPC illegal. Um Nyobe and his supporters fled to the southern section of British Cameroon. Between 1955 and 1958, Um Nyobe frequently met with officials of the United Nations (UN) to discuss the impending independence of Cameroon. Um Nyobe, however, was killed by French forces on September 13, 1958, at Boumnyebel. He was succeeded as general-secretary of the UPC by Felix-Roland Moumie, who was killed by French security agents in Geneva, Switzerland, on October 15, 1960.

On January 1, 1960, French Cameroon became an independent republic. Since independence, contrary to the wishes of Um Nyobe, Cameroon has maintained close ties with France and pursued a Capitalist form of economic development. In 1961, the southern portion of the British colony joined the Federal Republic of Cameroon, while the northern portion of the British colony joined Nigeria. Significant portions of the population in the former southern sector of British Cameroon continue to argue that Um Nyobe's ideas of unification were misguided and that the southern sector of the former British colony should be an independent nation known as Ambazonia.

## UNDERDEVELOPMENT

### Origin and Evolution of the Concept of Underdevelopment

On January 20, 1949, Harry S. Truman, in his inaugural address as president of the United States, spoke of embarking on "a bold new program for the growth of 'underdeveloped areas.'" Two years later, the terms "underdevelopment" and "underdeveloped" were used for the first time in a United Nations (UN) report entitled *Measures for the Economic Development of Underdeveloped Countries*, with reference

to nonindustrial societies. Later, to avoid the charge of using a value-laden label, the term “underdeveloped” was replaced by “developing.” But this change did not necessarily make the task of spelling out the meaning of the concept any less onerous.

Early in the 1950s, socioeconomic progress in non-industrial societies was analyzed in terms of economic growth. The so-called underdeveloped countries were characterized, in the main, by a relatively low standard of living. The way out of this predicament was said to consist in a significant increase of the productivity of their economies. Growth was generally regarded as a quantitative process involving expansion of the existing system of production. It was believed that absence of economic growth could be assessed by, among other criteria, stagnation in the amount of goods and services produced and of trade as well as a stationary per capita national income.

Somewhat later, the concept of growth yielded place to “development.” If growth was basically a quantitative concept, development was conceived in both quantitative and qualitative terms that included the generation of new structures and institutions. Although some die-hard economists continued to look at these largely in economic terms, it soon became clear that the process of development was also attended by certain noneconomic characteristics, and that, because development implied a total process, it was futile to attempt a separation between the economic and the noneconomic aspects of the phenomenon.

An early thinker to emphasize the inadequacy of the prevailing assumptions of classical economics was the Swedish economist, Gunnar Myrdal. Myrdal argued that one of the central concepts of classical liberal economics, “equilibrium,” that is supposed to operate through the self-regulating mechanism of market forces actually presents a distorted picture of the underdeveloped countries. He also stressed the need to conceptualize development as a total process in which economic and noneconomic factors were closely intertwined. Myrdal’s lead was followed by several others, among them Dudley Seers (1972) and those that were later instrumental in preparing the United Nations Development Program’s (UNDP’s) Human Development Index (HDI).

### **Causes of Underdevelopment**

Causes of underdevelopment have been analyzed from a variety of perspectives, frequently related to contrasting theoretical orientations and ideologies. Preoccupied with the notion of evolution, some nineteenth-century thinkers explained uneven development

of various societies with reference to their progression from one stage to another. Such attempts often resulted in the construction of unilinear “grand theories,” embracing the entire spectrum of human history and covering different societies of the world (theories of Auguste Comte, Lewis Henry Morgan, and Karl Marx and Friedrich Engels). Other scholars, less ambitious, focused on a central notion that is supposed to highlight the transition from one stage to another. For Henry Maine, this meant the substitution of “status,” stressing the social bond, and by “contract,” symbolizing the growing importance of individuality in a modern society. The German social scientist Ferdinand Tönnies expressed the process as a passage from *gemeinschaft* (“community”) to *gesellschaft* (“association”), while the French sociologist Emile Durkheim offered a comparable idea by referring to “mechanical solidarity” in the traditional society yielding place to “organic solidarity” in the modern industrial world. Max Weber of Germany saw in the march of “rationality” the quintessence of the unfolding of civilization, traditional societies with sluggish development characterized by limited rationality.

Recent attempts to account for underdevelopment, stunted development, and distorted development have been more context specific and grounded in empirical data. In the 1950s and the early 1960s, some leading social scientists, such as S. N. Eisenstadt and Talcott Parsons, offered both a diagnosis of underdevelopment and a prescription for a course of action that would, they claimed, lead to development in general and industrialization in particular. This approach, labeled as the modernization model, suggests that prevailing social institutions accompanied by appropriate values and beliefs account for the backwardness of underdeveloped societies. It argues that the history of socioeconomic development of the West is not to be considered as something unique, but rather as the model to be emulated by non-Western societies (designated as “traditional”) whose development is retarded or sluggish. The traditional-modern dichotomy did not find universal acceptance, even among Western social scientists. Some spoke of a “transitional” phase before full modernity is achieved, and others claimed that there are several stages of growth. W.W. Rostow identified five distinctive stages to “economic maturity,” the final phase promising to be the age of mass consumption. The take-off stage, the third step in the sequence, is the “great watershed” when growth becomes a “normal” circumstance. More than implicit in this model is the supposition that entrepreneurship and capital accumulation constitute the single most important factor in the development process. This is what emerges

as crucial from Western experience, and this is what needs to be replicated in the rest of the world for a successful passage from underdevelopment to development.

A contrasting approach takes note of the historical circumstances surrounding imperial expansion of the West, including the establishment of colonies. A leading example of this kind is the Marxist analysis of underdevelopment focusing on the international framework of power sustained by the world capitalist system. A corollary of this is the asymmetrical relationship between the industrial world of the West and developing countries of Africa, Asia, and Latin America. The seminal work expounding this perspective was produced by V. I. Lenin (1916), in which he defined imperialism as the monopoly stage of capitalism. Lenin argued that the export of capital from capitalist countries resulted in the annexation of colonies and the subjugation of their inhabitants. This state of affairs does not only cause underdevelopment in the dependencies, but it also leads to imperialist wars because of renewed demands for a redivision of the world in keeping with the uneven development of individual capitalist countries.

At the end of World War II, the international situation changed dramatically. Starting in the late 1940s, many dependencies in Asia and Africa gained formal independence. However, this did not necessarily alter the division of power worldwide, and it did not end the state of underdevelopment former colonies suffered from. Indeed, some observers, such as the first President of Ghana Kwame Nkrumah (1965), argued that in the changed circumstances, despite formal decolonization, many former dependencies have been subjected to a kind of socioeconomic domination from the outside that is not based on direct political control. Since such a state of affairs contributes to their persistent socioeconomic stagnation and dependence on the outside, neocolonialism, it was argued, has to be considered a prime cause of underdevelopment in the modern period.

The international framework involving the unequal relationship between capitalist countries of the West and the Third World was emphasized additionally by certain Marxist economists such as Paul Baran (1957). Baran conceived of underdevelopment as the undermining of the potential for development and argued that this was caused by the appropriation by capitalist countries of the economic surplus of the Third World. Similar in approach is the “dependency” model of capitalist underdevelopment that enjoyed a certain amount of currency in Latin America (such as those models of André Gunder Frank, F. H. Cardoso, and J. Petras) in the 1960s and the 1970s. According to this perspective, the draining of their

resources and surplus to the “metropolitan centers” has caused the industrial backwardness of Third World countries that have, consequently, remained “satellites” on the “periphery of the metropolitan centers.” The way out of this predicament is for the satellite countries to dislodge from their position of power the agents of the metropolitan bourgeoisie in their respective countries. According to the dependency theory, this can be achieved through joint action of the peasantry and industrial working class in a satellite as well as the establishment of a self-reliant socialist economy.

Like the dependency theory, the world systems theory, as expounded by Immanuel Wallerstein, also rejects the attempt to study underdeveloped countries in isolation from the international framework. According to this model, the lack of development of the Third World is to be seen as a by-product of capitalist development in the world at large. It holds further that there is a single-world capitalist mode of production with different manifestations of colonial and neocolonial dominance. An international division of labour buttresses this, without being necessarily sustained by a unified structure of power. Critics of the world systems theory point, however, to its implicit tendency to assign a passive role to the Third World—the periphery—and by implications to accept the dominant role of the center in the development process.

Disillusionment with the prevailing orthodoxies regarding the concept of underdevelopment and suggested paths to generate “real” development has given rise to what is sometimes called “alternative development.” This phrase stands for a range of ideas that are not necessarily related but that generally agree on the need to reject the simplistic equation between development and the growth of capitalism driven by the thrust for mass production and urban growth.

A populist, and some would say utopian, movement of this nature, aimed at bringing “the capitalist demon” to heel, was spearheaded in the early nineteenth century by Robert Owen in Britain via the establishment of cooperative settlements. Critics argue that this attempt was bound to fail because it was unaccompanied by any effort to squeeze the life out of the demon—capitalism—with the Capitalist production relations remaining virtually the same in the society at large.

On the other hand, an ecological movement challenges the argument that absence or limited use of modern technology causes underdevelopment. It further rejects the conventional idea of development that lays emphasis on the cumulative process of mechanization, industrialization, and urbanization. Starting on a low key, the ecological protest against wanton

destruction of nature has now grown into a powerful movement, with substantial social and even political mobilization, leading to its participation in decision making at different levels in several countries. Side by side, the United Nations Environment Program (UNEP) and the World Resources Institute, supported by several other organizations, have been articulating this position internationally with some success.

A third stream in alternative development counters the idea that underdevelopment is causally related to the application of simple production techniques using local materials and producing for local consumption. This approach, summed up in the notion of “alternative technology,” sets considerable store by social egalitarianism. It rejects in no uncertain terms imported high technology that only wealthy elites can afford and that tends in the long run to widen the gap between the rich and poor, thus contributing to the persistence of underdevelopment.

### Measuring Underdevelopment

The active engagement of international agencies, such as the World Bank (since the late 1970s) and the UNDP (since 1990), in the lively debate surrounding development issues has added a comparative and global dimension to the field and contributed at the same time to the systematization of the methodology to study the phenomenon of underdevelopment. A spin-off of this dialogue is seen in the many experiments that have been carried out for designing various indicators to capture, singly or collectively, diverse dimensions of underdevelopment. In addition to the HDI, the UNDP itself has applied several other indexes such as the Gender Empowerment Measure, the Gender-Related Development Index, and the Human Poverty Index (HPI) to gauge aspects of social life that impinge on the development process as some of its causes as well as consequences. Additional indexes that have been suggested during the last two or three decades are the Corruption Perception Index (constructed by the Transparency International operating from Berlin), the Economic Freedom Index (constructed by the Fraser Institute of Vancouver), and the World Competitive Index (constructed by the Institute for Management Development of Switzerland).

A major problem with using a variety of indicators to subsume diverse factors that challenge the problem of underdevelopment relates to the task of combining them into a single composite index capturing the quintessence of development and the quality of life. Research by Adelman and Morris (1973) and Dudley

Seers (1972) and a collaborative study carried out by the United Nations Research Institute for Social Development (UNRISD) in Geneva (1969) were some of the early attempts in this field. The UNDP took a significant step in this direction with the construction of the HDI, composed of three indicators: life expectancy at birth, educational attainment, and the standard of living as measured by the gross national product (GNP) per capita. The HDI constitutes the main focus of a succession of annual human development reports being published by the UNDP starting in 1990.

### Twenty-First Century State of Underdevelopment

At the beginning of the twenty-first century, all indications point to the markedly skewed nature of world development. The World Bank's *World Development Report 2002* estimated that in 2000 CE, 903 million people of world's population enjoyed a gross average income per capita of \$27,450 US dollars (USD) measured in terms of purchasing power parity. These were concentrated overwhelmingly in eighteen countries of Western Europe, together with Australia, Canada, Japan, New Zealand, and the United States. This data can be contrasted with 5,152 million people, drawn almost entirely from Africa, Asia, the Caribbean islands, and Latin America, who belonged to the low and middle income categories, with an average gross per capita income of \$3,890 USD, calculated according to purchasing power parity. The global inequality is also seen in measures that are broader in scope. According to the HDI figures of 1999 (UNDP *Human Development Report 2001*), forty-eight countries and areas enjoyed high human development in that year (HDI 0.800 and above). Only ten of them were in Asia and none in Africa. In the same year, thirty-six countries and areas had low human development (HDI below 0.500), of which twenty-nine were in Africa and six in Asia. Haiti was the only other country to be included in this group.

This situation may lead some people to a facile conclusion that underdevelopment is causally associated with race and culture. In the second half of the nineteenth century, such popular misconception was given an “academic” veneer by A. de Gobineau. Gobineau argued that the essential factor contributing to a society's development is the racial composition of its people. This view was introduced into Germany by H.S. Chamberlain toward the end of the nineteenth century. The doctrine was later incorporated in the ideological repertoire of the national socialism of

Germany. In the 1960s, the American psychologist Arthur Jensen, supported by some other academics, aimed to demonstrate a linkage between race and intelligence (leading, on its part, to achievement and development)—an attempt that generated an animated debate. However, no conclusive evidence has been found to prove that certain races are inferior to others in intelligence or cultural and developmental potential due to biological reasons.

Notwithstanding several decades of intensive and coordinated efforts to ensure greater equality worldwide and within countries, a certain degree of stubbornness seems to have characterized the uneven state of development that has been taking place. According to an early world development report of the World Bank of 1984, leaving out the five high-income oil-exporting countries (Kuwait, Libya, Oman, Saudi Arabia, and the United Arab Emirates), nineteen industrial market economies represented by fourteen countries of Western Europe plus Australia, Canada, Japan, New Zealand, and the United States constituted the richest category in 1982 with an average annual GNP per capita of \$11,070 USD. In the same year, there were thirty-four low-income economies in the world including China and India with an average annual GNP per capita of only \$280 USD. About two decades later in 2001, all the nineteen high-income countries of 1982 were still in the top bracket, while thirty-two of the developing countries of 1982 remained, as before, in the low-income category, although with some changes in their income levels.

Yet things have not proved to be entirely static. According to the *World Development Report 2000/2001*, compared to 1984, the ranks of the high-income group increased, in 1999, to fifty. Granted, some of these economies belong to small territories and dependencies of various sorts for which separate statistical reports are available. It is furthermore true that several new states emerged in the intervening period (such as Slovakia and Slovenia), and because of their high income they are included in the top category. But all this cannot obscure the fact that several countries, which were not very prosperous before, rose to the top income bracket between 1984 and 2001. These include the Bahamas, Barbados, Brunei, Cyprus, Greece, Hong Kong, Israel, Portugal, Singapore, Taiwan, and the United Arab Emirates. Some other countries like the Republic of Korea (South Korea) and People's Republic of China, although not forming part of the high-income group, have made significant strides toward fuller development, both in terms of GNP per capita and the HDI.

A consideration of the points delineated in the previous paragraphs suggests that development is better regarded as a process rather than a specific goal to be

targeted. This view is further upheld when taking note of the fact that in a *very general sense*, all countries are underdeveloped because no country can claim to be fully developed at any time. The flexibility of the concept, reflected in its sidedness, appropriately underscores the need to capture its essence through different indicators—to which references have been made previously. There are attempts to take the debate to a deeper level and focus on *human* development: its progress, stagnation, or decline. The *2001 Human Development Report*, thus, sums it up:

Human development is about much more than the rise or fall of national incomes. It is about creating an environment in which people can develop their full potential . . . . Development is thus about expanding the choices people have to lead lives that they value.

In like manner, it can be said that underdevelopment exists when people's choices are constricted.

## UNITED ARAB EMIRATES (UAE)

The United Arab Emirates (UAE) is a small oil-rich country located on the Arabian Peninsula. Within a generation of its formation in 1971, the UAE has transformed from a nomadic tribal structure to one of the most economically developed and technologically advanced societies in the world. Inevitably, this development has been uneven in some areas, and issues in governance, gender equity, and labour rights are among those areas requiring further consideration.

### Political Background

The UAE is composed of seven emirates that act together as a single state. The emirates are Abu Dhabi, Dubai, Sharjah, Fujeirah, Ras al-Kheimah, Ajman, and Umm al-Qawein. The capital city is Abu Dhabi although the largest city is Dubai, which also houses most of the commercial and technological centres of the country. Sharjah hosts the bulk of the small manufacturing and processing industries, while the remaining four northern emirates are considered comparatively poor and underdeveloped. Abu Dhabi was selected as the capital at the formation of the country in 1971, when Sheikh Zayed, the emir of Abu Dhabi, was elected as the ruler and remained the ruler until his death at the end of 2004.

The UAE has achieved considerable levels of wealth owing to the presence of oil and hydrocarbons in its territory. Some 60% of total revenue in Abu Dhabi derives from this source, and another significant portion is accounted for by investment mostly related to the industry. Both sources of revenue are volatile and depend on the international political situation and on the perception of locating future reserves. Most of this resource is located in Abu Dhabi and is managed by the Abu Dhabi National Oil Company (ADNOC). Abu Dhabi provides large subsidies to the others. Approximately 40% of all revenues are recycled through the Abu Dhabi Investment Authority (ADIA), which has made investment decisions internationally on a massive scale. It is believed that the ADIA works on the basis that all known oil and gas reserves will be exhausted within approximately 120 years and that returns on investments made will have enabled long before then a continued level of income to all UAE nationals. In other words, as long as the world economy continues within predictable limits, there will be no economic need for any UAE citizen to have to work.

Nevertheless, some within the UAE, especially from Dubai, are seeking to position themselves as

leaders of the Arab world economically and culturally. This has manifested in the creation of the Internet and media city office complexes as well as the creation of new airlines and television networks to provide sophisticated and high-technology media content.

The political system is autocratic and lacks transparency. There are neither political parties nor trade union organisations, and political dissidence is not encouraged. The country is strongly linked with the Islamic faith, and although Shariah law is not officially in force, religious beliefs inform many legal practices and decisions, including the nature of marriage and divorce, children's rights, and free speech rights. UAE citizens receive significant personal subsidies in terms of low cost or free telephone services and electricity as well as freedom from other regulations. This has led to abuses in the case of some businesses. No personal income tax is collected on any earnings inside the country. The large personal incomes of many private individuals and religious injunctions to give to charity mean that institutions exist to care for underprivileged individuals in some categories. Charitable giving as also been linked to money laundering in some cases and some high profile—though not openly discussed—incidences of fraud have cast some doubt about the suitability of the business environment for investment.

### History

The emirates have historically been small, open trading ports occupying a position of trade routes frequented by Arabs, Persians, and Indians, among others. In a territory with very few natural resources or comparative advantages, most people continued to live nomadic lives, trading with coastal towns and developing complex intertribal relationships. Islamization occurred very early (by 1000 AD), and the area remained something of a backwater under Arab and subsequently Ottoman rulers. During the period of European expansion, trading posts were created along the coast, and British ships presented a tempting target for the dominant Al Qawasim tribe, but this attracted a fierce response from the British, who enforced treaties that brought the UAE under its effective control, established as the Trucial States. Leadership of the tribes passed to the Bani Yas tribe that was based inland at Al Ain and remained there under the rule of Sheikh Zayed.

Independence was finally achieved in 1971 following the withdrawal of British presence from the region. In negotiations, Qatar and Kuwait decided on independence, as did Ras Al Kheimah although it joined

the confederation a few months later. Subsequently, the UAE has remained a strong ally of the West, recognizing the importance of providing a stable oil supply to ensure the development of its own people and acting as a moderate voice in Arab councils concerning Israeli-Palestine relations and other areas of potential conflict. At the time of independence, citizenship was awarded to all people who lived within the borders of the new country, and, henceforth, all discussions of previous ethnicity were strongly discouraged. Many women have been imported to the UAE as wives (as the men are allowed to take four wives according to Islamic tradition) from a range of other Islamic countries, including Egypt and northern Africa. However, statistics relating to these issues are not available, and development is hampered to some extent by the lack of accurate census data. The presence of hydrocarbons has led to rapid economic development, and the main cities of the country are now advanced in technology and services and offer excellent infrastructure. However, smaller villages and traditional tribal areas continue to provide a challenge for the provision of services owing to the difficulties and expense of building in the climate and the terrain. Questions have also been raised about the sustainability of development and the efficiency of resource allocation.

### Geography and Climate

The emirates are located along the Persian Gulf and the Gulf of Oman, in the eastern part of the Arabian Peninsula. Saudi Arabia is to the west of the UAE, with Kuwait and Qatar along the coast to the north and Oman to the south. The climate is uniformly hot and dry (although humid) throughout the year. Rainfall is limited to a few days per year. Daily temperatures average 104°F (40°C), making agriculture challenging; dates represent the only agricultural product in any form of abundance. Most forms of meat, vegetables, and fruit are imported from India, Iran, or further afield. However, the sea provides fish and seafood for supplementary protein.

Inland, the traditional centre of Al Ain is based on an oasis, and some agricultural production is possible there. Former UAE president Sheikh Zayed articulated his vision of “greening the desert,” and resources are being devoted on a large scale to developing the physical infrastructure. The brightly lit Abu Dhabi-Dubai and Abu Dhabi-Al Ain highways are among the few human-made artifacts now visible from space.

### International Relations

The UAE has sought a multilateral course that satisfies the religious sensibilities of its people together with the need for security that its alliances with Western countries represent. Sheikh Zayed himself took the lead in promoting the idea of Islamic and Arabic unity through careful negotiation and the judicious use of financial inducement. Egypt was returned to the fold of Arab states in 1982, while solidarity in the Gulf States through the Gulf Cooperation Council (GCC) helped to prevent further turmoil in the wake of the Iraqi invasion of Kuwait and the subsequent US-led war to overthrow Saddam Hussein. The long-term occupation by Iran of three disputed islands, Greater and Lesser Tumb and Abu Musa, has been contained by similar tactics although the issue has not been resolved.

The UAE has been a willing partner in the fight against money laundering and the spread of terrorism. However, a general lack of transparency in both the government and the private sector has tended to militate against complete success in these areas. Abu Dhabi joined Organization of Petroleum Exporting Countries (OPEC) in 1967 and has played an important although unspectacular part in the cartel subsequently by being the only major player to retain significant excess capacity.

### Industry and Economy

The economy of the UAE remains dominated by the extraction of oil and liquid natural gas. Much of the extraction is managed by foreign firms in partnership with the UAE government, and the product is sold in large-scale, long-term contracts to promote economic stability. Foreign firms benefiting from the industry are generally required to offset profits by investing in other sectors of the UAE economy with a view of diversification. In addition, certain strategic business sectors have been identified as being important because of diversification and possible creation of comparative advantage. Taking advantage of free trade zones and subsidized production as well as some manufacturing and assembly work takes place in textiles and consumer goods; however, these industries are fundamentally unsustainable because of a lack of international competitiveness. Capital intensive industries such as banking and financial services offer more sustainable economic development possibilities.

## Health Care

Health care facilities rapidly improved during the last decades of the twentieth century, and capital-intensive importing of medical staff and technology has significantly improved life expectancy. This has helped to boost the population of permanent residents as the number of young people continues to increase.

In the population as a whole, the prevalence of men of working age in the country has had an impact on health priorities, while workplace accidents continue to be significant risks. Smoking is a widespread practice, while cultural factors have raised concerns about reproductive health issues, especially among women.

## Labour Market and Population

The majority of the population in the UAE is composed of temporary migrant workers. Approximately 60% to 70% of the population comes from South Asia, the Middle East, and Europe, with representatives from most countries of the world. Since most migrants are male, there is a significant gender imbalance in the country. Owing to the strongly conservative Islamic culture of most UAE citizens, women remain at home or otherwise away from public scrutiny, and so public spaces in the country are dominated by men. Many of the expatriate workers are overqualified for the work they do and suffer from low job security and inability to express entrepreneurial skills.

Women's fertility remains high with an average of more than six births per woman. This is possible with the generous support provided to mothers. Nevertheless, UAE women face a number of social issues in entering the labour market and rarely stray from the public sector, where salaries and benefits are very generous for UAE women, and provisions for maternity leave and for sequestered working space are deemed appropriate by most families.

The education system has increased in scope and capacity through the opening of several new universities, including the female-only Zayed University, which has significantly improved the education of women. Large numbers of young men continue to be sent overseas for their higher education. Even so, the Colleges of Higher Education network has helped to inculcate vocational and practical skills in young people of both genders. Literacy levels, however, remain at a comparatively low rate, and few women are able to exercise their education and skills outside of the home. Men, meanwhile, also face significant

disincentives to work and study, and many corporations registered as being under local control are in fact managed by expatriate workers.

## UNITED ARAB REPUBLIC (UAR)

The United Arab Republic (UAR) was a union of Egypt and Syria that lasted from 1958 to 1961. Proclaimed in the aftermath of the 1956 Suez war, it underlined the soaring popularity of Egyptian leader Gamal Abdel Nasser in the Arab world; its dissolution marked the collapse of the Nationalist dream of the Arab union.

Syria was under enormous external and internal pressures by 1958. The competition between Nasser, the charismatic Arab Nationalist leader, and the Western powers and their conservative Arab allies was roiling the Middle East. Syria's 1955 arms purchase from Czechoslovakia and subsequent dealings with the Soviet bloc led the United States to fear it was going Communist, while Syria feared the United States was plotting to overthrow its government. Western efforts to form an anti-Soviet defensive pact in the region set in motion the events leading to the 1956 British, French, and Israeli effort to seize the Suez Canal from Egypt; the reversal of this aggression established Nasser as the undisputed champion of Arab Nationalist interests. Nasser's popularity in Syria skyrocketed when Egypt landed troops there in October 1957 to protect it against possible Western aggression. Internally, intense competition between the Ba'ath and Communist parties, which were outbidding one another with ever more fervent calls for Arab union, coupled with a fractious military threatened the foundations of political order.

On January 12, 1958, senior Syrian army officers abruptly flew to Cairo to beg Nasser to save Syria from collapse, and they were closely followed by the Syrian cabinet carrying the same message. Nasser had pushed the idea of Arab unity as opposed to a union, and he was reluctant to agree to an immediate merger. But given Syria's precarious situation and Nasser's desire to maintain his position in the Arab world, Nasser believed he had little choice. Nasser imposed major conditions on the union: he demanded a free hand, a highly centralized state, the dissolution of political parties, and the withdrawal of the army from politics. With virtually no planning or preparation, the United Arab Republic was proclaimed on February 1, 1958.

Frightened by the merger of the two leading Arab Nationalist states, the Hashemite monarchies in Jordan and Iraq quickly proclaimed their own union. But a military *coup d'état* led by Arab Nationalist officer Abdel Karim Qasim overthrew the Iraqi monarchy in July 1958. This precipitated US and British military interventions in Lebanon and Jordan, respectively, to shore up those countries' pro-Western governments. Qasim, though, was not a Nasserite, and with the cooperation of the Communists, he suppressed a bloody revolt by UAR-backed Arab Nationalist and Ba'athist army officers in March 1959. Nasser's rivalry with Qasim pushed Egypt closer to its former foes in Jordan, Saudi Arabia, and the United States. When Qasim laid claim to Kuwait in June 1960, Nasser endorsed the British military intervention to uphold Kuwaiti sovereignty. Nasser's moves to reconcile with the conservative monarchies and the Western powers at the expense of an Arab Nationalist regime in Baghdad caused many in Syria to rethink the union with Egypt.

Domestic factors also undercut Syrian support for the UAR. First, most of the Syrian players had miscalculated and came to repent their precipitous decision for union. The Communists had not been serious about the union, but they had advocated this position to undercut the Ba'ath. Unable to win control of the state through the ballot box, the Ba'ath saw the union as a way to gain power and eliminate its rivals. Despite the ban on political parties, the Ba'ath believed it would play a major role in the UAR as Nasser's ideological guiding force. Both parties thought the union would free them of military interference in politics, while the military thought the union would allow it to rule without the meddling of politicians. Nasser sidelined them all.

The Ba'ath in particular felt betrayed. The party dissolved itself to secure its goal of Arab union, yet the UAR did not fulfill its expectations or expand its ideological influence. Nasser did not turn to the party

for guidance, and it did poorly in the July 1959 Syrian elections. The possibility of further gains for the Arab union seemed out of reach given Nasser's opposition to the regime in Iraq; worse still, Nasser was siding with reactionary forces against Baghdad. In protest against Nasser's removal of a Ba'athist minister in September, the other Ba'athists resigned from the cabinet in December 1959. This earned the Ba'ath Nasser's enmity.

Ordinary Syrians chafed under the UAR as their country became "Egyptianized." Egyptian officials were sent to rule Syria, bringing with them the opaque, red tape complexities of Egyptian bureaucracy. Egyptians dominated the Syrian Cabinet, and decisions were made in Cairo without input from Damascus. The Egyptian-controlled intelligence and security services were ruthless. Syria had had an active, almost hyperkinetic, political society prior to union, but it now found itself cut off from effective participation and unable to voice its discontents. Bitter at its subordination to the Egyptians, the army began to plot against the UAR.

On September 28, 1961, the Syrian army proclaimed a national uprising, packed Nasser's men on a plane to Cairo, and seceded from the UAR. Nasser angrily responded that he had not wanted the union to begin but had been forced into it by Syrian popular will. He refused to recognize the new Syrian regime and began to wage a fierce propaganda battle against it. The heated exchanges between Cairo and Damascus nearly brought about the collapse of the Arab League.

In early 1963, the Ba'athists seized control in both Syria and Iraq and clamored for union with Egypt. Nasser was not about to be dragged into another ill-conceived union project, and he used the Cairo talks that spring to humiliate and punish the Ba'athists, especially the Syrians. When the Syrian Ba'athists brutally suppressed a pro-Nasserite *coup* attempt in July, the war of words was renewed between Damascus and Cairo. Pro-Nasserite elements did succeed in ending the Iraqi Ba'ath's bloody rule in November, sparking an all-out propaganda battle between Ba'athist Syria and Iraq's new Arab Nationalist leaders. Far from uniting the Arab world, the United Arab Republic and its aftermath bitterly divided it.

## UNITED MALAYS NATIONAL ORGANIZATION (UMNO)

Sixty years after the formation of The United Malays National Organization (UMNO), the organization's main objective of protecting the Malays' interests has not changed. The UMNO, founded in May 1946, has adopted a number of economic policies, including the creation of a Malayan business class. Malayan businesspeople, virtually all of whom had UMNO connections, were given preference in obtaining licenses, credit, and government contracts.

UMNO has been the strongest Malayan political party since its foundation. Its leaders place it preeminently in the history of Malayan nationalism and independence. Historically, the leaders of UMNO were more concerned with safeguarding the rights of Malays (the ethnic group that makes up the majority of the Malaysian society) vis-à-vis the other races of Malaya. UMNO was more likely to collaborate with the British authorities in opposition to radicalism within their own community. Thus, the formation of UMNO was a remarkable event, as it was the first time a Malayan movement emerged to attack British policy. The Malayan union is usually regarded as the colonial challenge that provoked the emergence of a united Malayan Nationalist movement.

UMNO was founded as a communal party concerned exclusively with the protection of Malays' interests. It was by no means a radical Nationalist party. Many of its leaders were employed as civil servants. Only in the 1950s did UMNO begin to campaign for independence from British rule.

UMNO's policies reflected the interests of its leaders, who were largely drawn from the Malayan upper and middle classes. Most of its early leaders were civil servants, often from aristocratic or semiaristocratic family backgrounds. In later years, aristocratic leaders were less prominent than a new class of educated Malays, often from fairly humble backgrounds, who were produced by postindependence education policies. Grassroots leaders were often local officials, teachers in Malayan schools, and rural landowners.

In the late 1970s, as a result of the New Economic Policy (NEP), Malayan businesspeople became more prominent as business opportunities were channeled

to party supporters. UMNO came to represent mainly conservative groups that had little interest in social reform for the peasants, small landholders, and fishermen, who made up a large part of the Malayan population.

## UNITED NATIONS CENTER FOR HUMAN SETTLEMENTS (UNCHS)

The United Nations Center for Human Settlements (UNCHS) is the United Nations (UN) agency responsible for sustainable urban development. UNCHS is more commonly known as UN-HABITAT and was created in 1978 after a UN-sponsored meeting, known as Habitat I, held in Vancouver, Canada. Its ultimate goal is to promote socially and environmentally sustainable towns and cities that provide adequate shelter for all people, especially in the developing world. UN-HABITAT is headquartered in Nairobi, Kenya, with regional offices in Fukuoka, Japan and Rio de Janeiro, Brazil. The agency has a full-time staff of two hundred people and an annual budget of \$300 million. UN-HABITAT works with governments, non-governmental organizations (NGOs), and civic action groups in an attempt to reduce urban poverty and promote sustainable development.

When the agency was founded, less than one-third of the world's people lived in urban settlements. During the last quarter of the twentieth century, however, there was a rapid urbanization process throughout the globe, especially in the developing world. During that period, UN-HABITAT was in the forefront of the global movement to prevent and alleviate the problems caused by rapid urbanization, especially in Third World cities. By the end of the twentieth century, half of the world's people lived in urban areas. In 1996, the UN sponsored a second conference, known as Habitat II, in Istanbul, Turkey, to evaluate the

progress of UN-HABITAT and formulate the agency's agenda for the twenty-first century. The result of the conference, known as the Habitat Agenda, was an extensive list of one hundred commitments and six hundred recommendations signed by representatives from 171 nations.

Given the desperate situation of the world's urban poor, especially in the developing world, UN-HABITAT is committed to improving the lives of 100 million slum dwellers by 2020. Although UN-HABITAT's efforts are to be commended, 100 million slum dwellers only represent 10% of the current global slum population, which is increasing by 25 million people each year. Demographers predict that more than two-thirds of the world's population will live in urban areas by 2050. Thus, as cities and towns grow at alarming rates, sustainable urbanization planning by agencies such as UN-HABITAT is essential to ameliorate disease, crime, pollution, and poverty. Slum dwellers have little or no access to shelter, water, and sanitation. To prevent growing social unrest, UN-HABITAT initiates projects that seek to provide slum dwellers with access to safe water and sanitation, safe shelter, and social inclusion, while simultaneously protecting the environment.

UN-HABITAT supports two major global campaigns: the Global Campaign on Urban Governance and the Global Campaign for Secure Tenure. For example, UN-HABITAT participates in a joint UN-HABITAT/World Bank slum upgrading program, known as the Cities Alliance, which promotes effective housing development policies; helps campaign for housing rights; promotes sustainable cities and urban environmental planning and management; and addresses postconflict land management and reconstruction in nations devastated by war or natural disasters. The Safer Cities Program helps fight urban crime, while other programs address solid waste management, urban planning training for local leaders, and urban investment. As of 2005, UN-HABITAT was operating over 150 technical programs in 61 nations, most of which are among the least developed nations of the world. UN-HABITAT currently has projects in postwar societies such as Afghanistan, Somalia, Iraq, Rwanda, and the Democratic Republic of the Congo (the nation formerly known as Zaire). Essential to revitalizing urban areas in these war-torn countries is providing shelter for all, improving urban governance, and reducing urban poverty within the framework of self-reliant and self-sustainable management.

One of UN-HABITAT's most significant programs is the Sustainable Cities Program. A sustainable city, according to UN-HABITAT guidelines, is a city where achievements in economic, physical, and

social development are made to last. Sustainable cities have access to natural resources and use them wisely. In addition, sustainable city planners develop strategies to minimize the effect of potentially devastating environmental hazards. For example, development on land prone to flooding should be avoided. Since cities are centers of economic productivity, the success of the Sustainable Cities Program is essential to economic and social development at the national level. Following the economic development strategies first devised by Albert Hirschman, the Sustainable Cities Program devises urban development strategies based on a case-by-case approach. Since all cities, especially in the Third World, have vastly different environmental settings and administration development, a single holistic policy of urban development is not applicable to the Sustainable Cities Program.

The Sustainable Cities Program currently has projects in Accra, Ghana; Amman, Jordan; Asuncion, Paraguay; Concepción, Chile; Dar es Salaam, Tanzania; Dakar, Senegal; Freetown, Sierra Leone; Gaza, Palestine; Guayaquil, Ecuador; Ibadan, Nigeria; Ismailia, Egypt; Katowice, Poland; Lusaka, Zambia; Madras, India; Maputo, Mozambique; Nampula, Mozambique; Shenyang, People's Republic of China; St. Petersburg, Russia; Tunis, Tunisia; and Wuhan, People's Republic of China. Other cities, such as Belo Horizonte, Brazil; Blantyre, Malawi; Colombo, Sri Lanka; Harare, Zimbabwe; Jinja, Uganda; and Kampala, Uganda, have petitioned for participation in the Sustainable Cities Program. Given the success of the Sustainable Cities Program in Concepción, Ismailia, Ibadan, and Dar es Salaam, secondary cities in Chile, Egypt, Nigeria, and Tanzania, have begun the process of applying to the program.

## UNITED NATIONS CHILDREN'S FUND (UNICEF)

The United Nations Children's Fund (UNICEF) is one of the oldest humanitarian assistance agencies formed under the aegis of the United Nations (UN). The UN General Assembly Resolution that gave life to UNICEF was approved on December 11, 1946, in the very first session of the world body. The initially temporary nature of UNICEF was in keeping with the belief that the crisis prevailing at the close of World War II in the numbers of displaced persons, refugees, and war-ravaged populations that disproportionately affected children would eventually abate. Although UNICEF has continued throughout its history to provide emergency assistance for children, eventually it took on activities to promote long-term development assistance for children, and in the decades since its inception, UNICEF has evolved into one of the major international development agencies.

### Genesis and Early Years

UNICEF was established in a climate of crisis and concern about the highly vulnerable status of children among the thirty million persons displaced by World War II. The international community had become increasingly aware of the needs of children even as early as the League of Nations, which promoted efforts to eradicate the trafficking of women and children. In 1924, the league adopted the Geneva Declaration that asserted the rights of children. While the League of Nations, and the UN as its successor, believed as most people do now that the protection and nurturing of children properly and primarily rests with the family, circumstances arise, as they did during World War II and its immediate aftermath, that place overwhelming stress on both families and governments to meet the basic needs of children. Increasingly, the international community has acknowledged its duty to offer assistance for the primary institutions of the family so that children are not subjected to unnecessary hardship. Given the large numbers of war-affected refugees after World War II, the displacement of families and the tens of thousands of children who were orphaned, steps by the international community to alleviate the situation were essential. During World War II, the UN Relief and Rehabilitation

Administration (UNRAA) addressed the emergency needs of displaced persons in Europe. However, this body ceased to exist in 1946 in Europe and in 1947 in Africa as well as in the Far East, so its assets were inherited by several other UN bodies, including UNICEF.

Given the overwhelming emergency needs of children in the postwar setting, UNICEF provided blankets, food aid, and medicine for children. However, as the emergency situation abated, UNICEF, although still providing material aid, initiated programs designed to provide technical assistance to governments in promotion of child welfare, including the fields of health and nutrition. Thus, although UNICEF, like so many other emergency assistance bodies established after the war by the UN, was initially seen as a temporary and *ad hoc* response to emergency needs, it began to carve out for itself a more permanent position in the constellation of UN development bodies. It assumed the lead role in advocacy for the social welfare needs of children, and in 1953, the name of the organization was changed from the UN International Children's Emergency Fund to the UN Children's Fund although the acronym UNICEF continued to be used. As the UN grew in size with the addition of new member states, mostly from the developing world, UNICEF and other specialized agencies of the UN found themselves shifting attention to the daunting needs of poorer nations.

### Structure and Authority

UNICEF is a specialized agency of the UN and reports to the Economic and Social Council (ECOSOC). ECOSOC chooses the thirty-six members of the Executive Board of UNICEF. Board members serve three-year terms. The board oversees the operations of UNICEF and monitors its budgets and programs. In turn, UNICEF is administered by the director of the UNICEF Secretariat. The director administers the budget and operational programs from UNICEF headquarters in New York. UNICEF maintains a Supply Division in Copenhagen, Denmark, where critical supplies, such as measles vaccines, are stored. It also runs a Research Center in Florence, Italy, and maintains regional offices in Geneva, Brussels, Panama City, Bangkok, Nairobi, Amman, Katmandu, and Dakar.

UNICEF is funded entirely by voluntary contributions, two-thirds of which come from governments. The other one-third of the budget is raised from millions of private individuals. Much of this private fund-raising is promoted by thirty-eight National

Committees for UNICEF, which are private nongovernmental bodies established in various countries to support the work of UNICEF. Popular and well-known fundraising efforts include the UNICEF “trick-or-treat” program in which children themselves become diplomats and fundraisers for UNICEF at Halloween time. A portion of UNICEF expenses is met by the sale of holiday cards, which from its earliest years served as a means of both publicizing its work internationally and earning some independent revenue. Measured in terms of its annual budget and expenditures, UNICEF is one of the largest UN assistance agencies. Its work is undertaken in 126 country offices, with programs that reach 157 nations.

### Development Activities

Starting in the 1960s, when many former colonies gained their independence and began to join the UN, UNICEF's move into development assistance activities accelerated. Many of these new UN members required not only multilateral aid to meet various needs associated with children but also the technical support to develop national infrastructures and programs. UNICEF, in efforts to prevent childhood diseases and high mortality rates, supplemented its emergency aid and oral rehydration programs with support for the development of potable water supplies and sanitation in areas where waterborne diseases, including diarrhea, were major causes of death for children. UNICEF also sponsored programs for primary health care, especially for pregnant and lactating mothers, childhood immunization programs, and various initiatives to promote basic education and literacy among children. In the 1980s, the appearance of acquired immunodeficiency syndrome (AIDS) among children prompted UNICEF to participate in international efforts to curb the spread of the epidemic. In pursuing its work in areas with high percentages of childhood human immunodeficiency virus (HIV) infection, UNICEF collaborates extensively with other UN development bodies, including the UN Development Program (UNDP) and the World Health Organization (WHO).

Although an increasingly large portion of UNICEF's budget is set aside for development-related programs, UNICEF still responds to disasters and emergencies throughout the developing world, and it collaborates extensively with the UN High Commissioner for Refugees and the World Food Program. UNICEF is a member of the UN's Inter-Agency Standing Committee, which helps to coordinate international responses to complex emergencies through

the UN Office for the Coordination of Humanitarian Affairs. Much of this emergency aid focuses on provision of clean water, on children's health, and on nutrition.

In more recent decades, UNICEF, as part of its work to implement the UN Convention on the Rights of the Child, has been active in promoting international attention issues affecting children. In 1990, UNICEF was instrumental in the UN World Summit for Children, at which 159 countries produced a World Declaration and Program of Action on the Survival, Protection, and Development of Children. Governments established goals and objectives to reduce rates of infant mortality, maternal mortality, and malnutrition as well as to expand access to safe drinking water, to improve sanitation, and to provide universal basic education. More recently, UNICEF was a major actor in the Special Session on Children of the UN General Assembly, held in May 2002. The program of action emerging from the special session emphasized the theme of creating a “World Fit for Children.” The terrible conditions in which many families and children find themselves, especially in war-torn regions, continue to challenge UNICEF and the entire international community. The general development and economic prosperity of families represent the key to the health and vitality of children, and so even in the most difficult emergency situations where the primary task is immediately to save lives, UNICEF and like-minded international agencies and governmental bodies work to maintain a long-term vision that builds to a peaceful society and sustainable economy.

UNICEF's work in highlighting the rights of children, including the most basic rights of good nutrition, health, and education, necessarily has a development focus. Many international agencies, including UNICEF, have undertaken initiatives to promote civil society, especially in those countries most seriously affected by civil strife. For this goal, UNICEF and international agencies must work with and respect the rights of primary institutions, including families and local governments, which are the institutions most directly engaged in and responsible for the promotion of stability and the welfare of children. To promote education and broader awareness of the needs of families and children, UNICEF undertakes an ambitious publications program, which includes the annual *State of the World's Children Report* that provides comprehensive analyses of the conditions facing children in every country throughout the world. UNICEF promotes the full implementation of the UN Convention on the Rights of the Child, which won swift and nearly universal adoption by the nations of the world in the early 1990s.

## Conclusion

A sample of UNICEF's recent activities finds its representatives working to involve the international community in the humanitarian crisis in Darfur, Sudan, where ethnic cleansing of local populations has produced hundreds of thousands of refugees and displaced persons. In India, UNICEF programs help locally affected families in Assam to cope with floods that compromised water and sanitation systems and increased the incidence of waterborne diseases. While oral rehydration salts distributed by UNICEF save lives, the agency also restores safe water supplies and sanitation. In Madagascar, UNICEF launched a program for vaccination of ten million children to forestall a potential epidemic in August, 2004. In Iraq, UNICEF worked to provide safe water supplies, while encouraging the massive countrywide return of children to schools, many of which had long served as ammunition warehouses. Carol Bellamy, UNICEF's executive director, in the same month traveled to Liberia, where civil war caused about fifteen thousand children to be conscripted into rebel armies or otherwise separated from their families. UNICEF promoted the reintegration of such child soldiers with their families.

UNICEF sponsors a similar program in Afghanistan, where child soldiers were also common. In the Democratic Republic of the Congo, which has been torn by civil conflict since 1995, UNICEF sponsors a program for children subjected to rape and physical and mental abuse. Elsewhere, UNICEF sponsors programs on AIDS awareness. Much of UNICEF's work still focuses on emergency needs, but other programs, such as those focusing on the availability of water, sanitation, child nutrition, and education, are essential building blocks for the establishment of the foundation of economic and social development.

## UNITED NATIONS COMMISSION ON CRIME PREVENTION AND CRIMINAL JUSTICE (CCPCJ)

The United Nations Commission on Crime Prevention and Criminal Justice (CCPCJ) is the major body of the United Nations (UN) providing policy guidance in the field of crime prevention and criminal justice. It was established in 1992 by the UN Economic and Social Council (ECOSOC), but international efforts to harmonize criminal justice policy date back to the nineteenth century, when representatives of various European nations met periodically to exchange information and to consider common standards in the treatment of offenders. The CCPCJ consists of forty members elected by ECOSOC on the basis of the principle of equitable geographical distribution, which is described as follows: African States (12), Asian States (9), Latin American and Caribbean States (8), Western European and other States (7), Eastern European States (4).

The CCPCJ's priority themes include organized crime; economic crime, including money laundering; the role of criminal law in the protection of the environment; crime prevention in urban areas, including juvenile and violent criminality; and improving the efficiency and fairness of criminal justice administration systems. Aspects of those themes are selected for consideration at each session of the commission, which meets yearly at its headquarters in Vienna, Austria.

In the broadest sense, the mandate of the CCPCJ covers the management and development of international cooperation in crime prevention and standards of criminal justice. More specifically, it assists the UN in setting policy, monitors progress at the international level, and develops international instruments (agreements) in the area of crime prevention and criminal justice while overseeing the implementation of those already in existence. It also works to improve the management of national justice systems in the interest of efficacy and the humane treatment of offenders, and it coordinates UN technical assistance

to member states, including assistance in formulating or revising laws to bring domestic legislation in line with international standards. Because of overlapping interests, the CCPCJ coordinates its activities with those of the Commission on Narcotic Drugs and the Centre for International Crime Prevention of the Office of Drug Control and Crime Prevention of the UN Secretariat.

The CCPCJ provides policy guidance to member states in the field of crime prevention and criminal justice. It develops, monitors, and reviews the implementation of the UN Crime Prevention Programme. The commission facilitates and helps to coordinate the activities of the interregional and regional institutes on the prevention of crime and the treatment of offenders as well as mobilize the support of member states.

The Centre for International Crime Prevention (CICP) has the role of implementing the decisions of the UN CCPCJ. The UN, through its crime prevention and criminal justice programme, is endeavouring to promote cooperation between its member states in combatting an accelerating crime problems and to bring about common standards of criminal justice in the interests of facilitating adherence and follow-up to international agreements; the UN also ensures the respect for human rights that is necessary for sustainable human development.

## UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT (UNCTAD)

The impact of trade on development is one of the issues that has occupied the attention of countries and multilateral bodies ever since the Great Depression and increasingly so in the aftermath of World War II. The United Nations Conference on Trade and Development (UNCTAD) was formed in 1964 as a UN-specialized agency through which the trade and development interests of countries in the developing world could be voiced more effectively.

A consensus existed after World War II that the individual economies of nations and the international economy generally would benefit from a policy of free trade; in addition, the rapid and reciprocal reduction in tariffs and other barriers to trade would be a great economic boon in terms of eliminating artificial barriers to trade, increasing competition, lowering prices on goods, increasing production, and stimulating economic growth. To this end, the General Agreement on Tariffs and Trade (GATT) was instituted in 1947 as a means by which countries could negotiate free trade agreements. However, as many new and poorly developed countries gained their independence, and as the implications of the GATT system of reciprocal reductions in trade barriers on developing country economies became clearer, developing countries began to call for special consideration to be given to the structural difficulties their economies faced in the GATT system. UNCTAD became the forum in which the countries' calls for reform of the GATT system were articulated.

### Developing Countries: Terms of Trade Dilemmas

While the GATT system of reciprocal trade reductions promoted an expansion of global trade, the impact of the system on newly independent countries of the developing world was not always positive in light of the terms of trade problem. Industrialized countries benefited from the system owing to the fact that manufactured goods generally held or increased their value on world markets, but developing countries that depended largely on commodity exports often saw commodity prices decline over the long term, relative to manufacturing goods. This led to a net transfer of income in trade from the developing world to the developed world. Moreover, developing countries were in no position to develop nascent industrial sectors because these could not possibly compete with the better established enterprises in the industrialized nations. As long as a reciprocal tariff reduction system along GATT lines persisted, developing countries seemed consigned to a status of permanent dependence with agriculturally or commodity based economies.

The UN was aware of this problem as early as 1954, when the Economic and Social Council (ECOSOC) established a Commission on International Commodity Trade to study the problem of commodity fluctuations. In 1962, this commission reported that a long-term trend of commodity price declines was

well established. In response, ECOSOC called for the convening of a conference on trade and development. After the UN General Assembly's approval and preparatory meetings, UNCTAD met from March to June 1964 in Geneva, Switzerland. One of the chief and controversial recommendations of the UNCTAD meetings concerned the granting of preferential trade rights to developing countries. Under a preferential trade rights system, a country relying on commodities as exports could enjoy low tariff access to developed country economies while imposing tariffs on manufactured goods imported from those countries. This would permit them to protect infant industries from foreign competition and would also give them a fighting chance to establish a manufacturing sector for their domestic economies. The UN General Assembly approved the establishment of UNCTAD as a specialized agency, and like GATT, it continued to meet every four years to discuss the important nexus of trade to development, under the influence of the large majority of developing countries. This majority is known as the Geneva 77, named after the seventy-seven developing countries that attended the original UNCTAD meeting. Although the members' number grew substantially in subsequent years, the term "Geneva 77" continues to be used to describe this influential bloc of developing countries.

### Trade Reforms and Controversies

Owing in part to the persistent demands of UNCTAD and the growing number of developing countries that enjoyed majorities in UNCTAD and the UN generally, wealthier countries began revising GATT regulations concerning reciprocal tariff reductions, and eventually a preferential trade rights system was adopted to redress the adverse terms of the trade situation facing developing countries. Known as the General System of Preferences, this system was eventually adopted by the European Economic Community and by the United States in their trade agreements with developing nations.

The Geneva 77 continued to press, both in the UNCTAD forum and in the UN system at large, for other major reforms. UNCTAD became the vehicle through which developing countries pushed for a new international economic order, not only in trade but in regard to such issues as setting minimum transfers of foreign assistance, transferring technology, restructuring the international monetary system, and promoting debt reduction and cancellation. These debates were often quite shrill and controversial and produced little agreement or progress, as important

developed countries refused to accommodate to the wide range of proposed reforms.

### Further Developments

With the failure to gain much ground from confrontation, many developing countries began to explore domestic economic reforms rather than attempting to leverage resources through international negotiation. The collapse of the Communist systems in the early 1990s added pressure to the international assistance networks even as the collapse removed some of the ideological heat from international development dialogue. The rapid globalization of international trade was given further impetus in 1995 with the establishment of the World Trade Organization (WTO), which replaced GATT. In the following year, the UN called upon UNCTAD to undertake a thorough review of its role in light of the new global trade system. It has focused much of its work on identifying problems facing the most heavily indebted poor countries.

## UNITED NATIONS DEVELOPMENT PROGRAM (UNDP)

The United Nations Development Program (UNDP) was established by the United Nations (UN) General Assembly in 1965 in the wake of intensified international discussions about how best to address the poverty faced by many newly independent countries that had recently gained membership in the UN. In the constellation of UN agencies, UNDP's role is to offer technical assistance to governments and to coordinate—especially at the country level—the variety of national, bilateral, and multilateral initiatives and programs addressing development. Its function, then, is less operational than consultative and coordinative in nature.

## The Genesis of UNDP

Under the League of Nations, a number of technical organizations were established to deal with economic, financial, health, communication, and transportation issues. The league also cooperated with other international organizations, such as the International Institute of Commerce and the International Labor Organization, concerned with national and international development activities. The increasing need for economic and technical cooperation among nations became apparent even before World War II. After the war ended and reconstruction efforts began, governments realized a more pressing need to address international development questions more explicitly at the international level. Thus, the International Bank for Reconstruction and Development (World Bank, IBRD) and the International Monetary Fund (IMF) were created to assist in postwar recovery, and the UN Food and Agriculture Organization (FAO) was initiated to enhance international cooperation in the development of agriculture. The United Nations found itself addressing development-related questions in its own right, even as other specialized agencies, such as the UN Educational, Scientific, and Cultural Organization (UNESCO), the World Health Organization (WHO), and the General Agreement on Tariffs and Trade (GATT) were established to address various components of the international trade and development process. In the late 1940s and early 1950s, the UN itself was directly involved in the creation of various assistance agencies, such as UNICEF, the International Refugee Organization (IRO), the UN Relief and Works Agency for Palestine, and the UN High Commissioner for Refugees, which replaced the IRO.

In 1950, at the initiative of the United States, the UN General Assembly established the Expanded Program of Technical Assistance (EPTA) to supplement and expand the work of the growing number of agencies focused on development. The EPTA funds were accumulated on a strictly voluntary basis, with the United States underwriting as much as 60% of the revenue in the early years. Initially, the EPTA resources stood at about \$20 million, but as other countries joined the efforts, the pool of resources reached about \$50 million in the early 1960s, and the US government portion of contributions dropped to about 40%. With new revenues to administer, a Technical Assistance Administration was established within the UN Secretariat, and a Technical Assistance Board of member states was established to oversee the process. During the late 1950s and early 1960s, additional international development organizations

were established, including the International Finance Corporation (IFC), the International Development Association (IDA), and the World Food Program (WFP). During this period, a sense of greater urgency arose regarding development issues. In 1957, after spirited debate among the developed and developing member states, the Special UN Fund for Economic Development (SUNFED) was established. Its pool of resources was less substantial than poorer countries had hoped for, but it soon attracted considerable voluntary support, substantially more than the EPTA, which continued to operate as a separate, though related, source of development programming technical assistance.

UN membership grew by thirty nations in the first half of the 1960s, and all of them were developing countries that voiced the need for more extensive UN assistance to further their economic development. The need for a single UN agency to coordinate technical assistance became apparent, and the first proposal to establish the UNDP was brought forward in 1962. After three years of study, the UN General Assembly established UNDP and its governing body, composed of roughly equal numbers of developed and developing states. The EPTA and SUNFED programs continued to operate but under UNDP oversight. The initial UNDP budget was \$145 million. In subsequent decades, the UNDP budget rose substantially, hitting the \$1 billion mark in 1989 and rising even higher in subsequent years. What had begun as a modest experiment in the coordination of technical assistance and development programming blossomed into a substantial and integrated approach in development planning and coordination.

## Structure and Authority

The UNDP is governed by a thirty-six member executive board of member states. This body meets three times a year to oversee the budget, programs, and operations of the UNDP Secretariat. The secretariat is led by the administrator, who manages the organization's technical assistance activities in 166 countries. The majority of executive board members represent African, Asian, Pacific Rim, Latin American, and Caribbean nations, with sixteen seats occupied by Eastern European, Western European, and other economically developed countries. The UNDP administrator is the third highest ranking official in the UN system. The administrator is appointed by the UN secretary-general and approved by the UN General Assembly and serves a four-year term. The administrator in turn reports to the executive board.

UNDP works with developing countries to provide technical expertise to assist in their economic development. This process is furthered through the national offices of UNDP resident representatives, who serve as the coordinating authority for all UN assistance in particular countries and as the UN contact point for the host government's development-related ministries. UNDP coordinates the in-country development planning process. This puts UNDP squarely at the center of development planning within the UN system and as the principal actor in consultation with governments. The governments themselves determine program needs and priorities, and UNDP assists in facilitating them and promoting coordination of international and local assistance initiatives and activities.

### **UNDP Programming Efforts**

Given the wide range of activities that fall under the rubric of economic development, UNDP serves as a centralized reservoir of consultative resources to assist governments in promotion of agricultural development, environmental quality, conservation and reforestation, crisis management, disaster prevention, emergency aid, poverty reduction, development of transportation and communication infrastructure, energy supply, health policy, job creation and diversification, financial stability, extension services, protection of human rights, promotion of the role of women in development, promotion of democratic governance, modernization of information systems, and promotion of business enterprise. Various UN agencies that specialize in these areas of international cooperation in turn work with UNDP to coordinate funding and other development-related efforts. In recent years, UNDP has reached out to the wide variety of nongovernmental organizations (NGOs) and multinational corporations that supply an additional reservoir of expertise and resources to direct these resources in support of a country's own development priorities and planning.

The UNDP began approaching development programming as a long-term and regional process in the early 1970s with the emergence of zonal development strategies. Problems and needs were identified and strategies for addressing them mapped out over periods of five and ten years. Even where emergency problems, droughts, or refugee flows interrupted plans, these were to be addressed through attention of the impact of emergency assistance on longer-term development. UNDP involvement in the African drought and refugee crises of the 1980s was critical in the formulation of refugee-related development assistance

programs. At this time, UNDP also began to explore more aggressively the need to interact with NGOs and businesses as partners with national governments in the development programming enterprise.

With the holding of the UN Millennium Summit in 2000, the UNDP has been actively involved in the follow-up program in pursuit of the Millennium Development Goals, which include promoting democratic governance, reducing poverty rates by half by the year 2015, coping more successfully with natural disasters and civil conflicts via early warning systems and conflict resolution mechanisms, enhancing energy resources without degradation of the environment, and managing the impact of HIV/AIDS in developing countries. The UNDP supports national efforts in all of these areas in its current programming.

Promoting democratic governance, for instance, is an important aspect of political development and of stable civic institutions. Cambodia, a country that recently suffered from bloody civil wars, is now embarking on an unprecedented effort at judicial reform by training Cambodian lawyers and judges in democratic principles of justice and in international humanitarian law. The UNDP supports these seminars and programs as a part of its larger effort to promote political stability as a precursor to economic development. To help countries in their efforts to reduce poverty, UNDP works with governments to incorporate Millennium 2000 goals into their national development strategies. UNDP also works to promote the education and empowerment of women as productive agents of development through gender equality programs in a number of countries; for example, in Kyrgyzstan, the UNDP cosponsors gender-related seminars at the university level. In support of the Millennium Development Goal of promoting crisis prevention and recovery, UNDP has supported land mine removal programs in various countries such as Angola, where agricultural activities are inhibited by the danger of mine-littered farms and fields. UNDP is engaged in a study with the International Peace Research Institute to study the impact of mines on development and how best to integrate de-mining programs into national development planning processes. Similarly, UNDP has supported efforts to reintegrate ex-combatants in the Democratic Republic of the Congo, which has been plagued by deadly civil war. Reintegration kits give ex-soldiers an incentive to reintegrate into productive civil life, thus enhancing national recovery efforts. UNDP engages in similar programs in the Ivory Coast (Cote d'Ivoire) and in Liberia, where it is also engaged with the World Bank and the IMF in promoting economic reconstruction.

In promoting Millennium Development Goals in the areas of energy and the environment, the UNDP

emphasizes programs for water usage and conservation measures (especially in the area of combating desertification) to encourage incorporation of environmental awareness into national energy and development planning and conservation of biodiversity. An example of UNDP efforts in a variety of these areas is its Drylands Development Center, which combines research and action programs in nearly twenty countries in Africa, the Arab States, and West Asia. Similarly, UNDP is a cosponsor of the UNAIDS program, which seeks to prevent the spread of AIDS in developing countries through galvanizing governmental agencies at all levels in promoting AIDS awareness and prevention.

## Conclusion

UNDP is one of the major actors in the UN system for promotion of economic development, one of the chief goals of the UN Charter. Because of its mandate to coordinate UN specialized agency activities with member governments, it is the most central actor among all the agencies. While the work of the UNDP does not involve the huge outlays of resources characteristic of World Bank activities or bilateral assistance programs of governments, it is nonetheless essential in terms of providing key consultative support and in coordinating the overall development strategy of countries as they seek greater economic stability and prosperity.

## UNITED NATIONS ECONOMIC AND SOCIAL COMMISSION FOR ASIA AND THE PACIFIC (ESCAP)

Following World War II, the United Nations (UN) initiated a program to address the specific needs of postwar reconstruction in Europe and Asia. Two regional commissions were established, namely, the Economic Commission for Europe (ECE, established in 1947) and the Economic Commission for Asia and the Far East (ECAFE, established in 1947). ECAFE became the Economic and Social Commission for Asia and the Pacific (ESCAP) in 1974 and, along with the ECE, was joined by the Economic Commission for Africa (1958), the Economic Commission for Latin America and the Caribbean (1948), and the Economic and Social Commission for Western Asia (1974).

## Overview of the Commissions

The commissions are regarded as an integral part of the decentralisation of the UN's economic and social development activity, which is a major portion of the UN's work. Each commission has determined its own pattern of organization, with separate committees for areas of particular concern in their region, but they all operate under the auspices of the UN Economic and Social Council (ECOSOC) to which they report annually. The commissions work with other UN agencies, such as the Food and Agricultural Organization (FAO) and the UN Development Program (UNDP), and with other regional organizations, such as the Organization of African Unity (OAU) and the Organization of American States (OAS).

The commissions have had differing degrees of success. According to Bennet (1988), ECLAC has contributed to the establishment of the Latin American Free Trade Association, the Central American Common Market, and the Inter-American Bank. On the other hand, ECA, while involved in the establishment of the African Development Bank, has not been as effective in the region because it has been hampered by internal dissent among member states.

An evaluation of ESCAP reveals both progress and the challenges facing multilateral agencies. It has been involved in major regional projects, such as the Mekong River Development, and in the establishment of institutions, such as the Asian Development Bank. But it has also been criticised as being ineffectual, bureaucratic, and overly centralised and criticised for covering the work of already existing agencies.

## History and Functions of ESCAP

ESCAP has fifty-three members (2004), primarily UN member states within the Asia Pacific but including European countries, such as the United Kingdom and France, with interests in the region. There are also nine associate members, such as the island states of Guam, New Caledonia, and Hong Kong (SAR), that are states within the region but are nonmembers of the UN. ESCAP's region of activity stretches from West and Central Asia through South Asia, Southeast Asia, and North and East Asia and also includes economic giants such as Japan and China as well as the small island states of the Pacific such as Fiji. This diversity in itself has presented challenges to the viable functioning of ESCAP because these countries represent vastly different needs and agendas for development.

Based in Bangkok, ESCAP's purpose is to serve as the UN's main economic and social development forum within the Asia Pacific by formulating and coordinating relevant projects, initiating and facilitating technical cooperation, and strengthening economic relations and cooperation within and between the region and countries outside it. In practical terms, these aims are primarily carried out in the conferences and specialist seminars organized by the ESCAP secretariat and in data collection and publications, such as economic and social surveys of the Asia Pacific that fall within its terms of reference. ESCAP can also provide advisory services to governments if requested.

ESCAP is designed to formulate and promote activities and projects in line with the needs and priorities of the region. These needs are determined by the commission, the main legislative body of ESCAP that meets every year at ministerial level to set policy within UN guidelines and resources. Ministerial meetings can also be held on an *ad hoc* basis to address specific issues under the auspices of ESCAP's program committees. The commission is intended as a forum for member states to discuss economic and social issues in the region and to enhance opportunities for cooperation. Liaising between the commission and the secretariat is the Advisory Committee of

Permanent Representatives (ACPR) and other representatives designated by members of the commission; they meet every month with the executive secretary to provide advice and input into the commission's work. The ACPR is composed of ESCAP members and associates.

The ESCAP Secretariat, a branch of the UN Secretariat, includes the Office of the Executive Secretary and a series of divisional subcommittees. It coordinates all the activities of ESCAP, prepares for the commission and other meetings, conducts research, and implements and provides coordination for programs in the region. The secretariat and its subcommittees organize and document ESCAP conferences and workshops held throughout the Asia Pacific each year. The secretariat is also responsible for coordinating ESCAP activities with other intergovernmental organizations and UN agencies and departments.

A series of committees and subcommittees guide the commission's work and make recommendations in accordance with program areas. Three thematic committees focus on poverty reduction, globalisation management, and emerging social issues. Each committee has its own objectives and terms of reference and is designed to act as a regional forum for members and associates to promote cooperation, review research and trends, examine best practice development models, evaluate program implementation and effectiveness, and disseminate information on these more specific issues. The focus on poverty reduction ties in with wider UN goals documented in the Millennium Declaration (2000). There are eight subcommittees under the ambit of their relevant thematic committees, with areas of interest corresponding to the subprograms of ESCAP. These subprograms indicate the current priority areas of the commission and include social development (including emerging social issues); environment and sustainable development; information, communication, and space technology; poverty and development; statistics; trade and investment; and transport and tourism. Administrative services and program management committees provide logistical and administrative support. There are also two Special Bodies that focus on the particular issues facing least developed and landlocked countries, such as Laos, and Pacific island developing countries.

One of ESCAP's principle activities is the organization of conferences, forums, and training workshops and the provision of opportunities for technical cooperation. In 2004, more than two hundred various regional meetings, training workshops, and conferences were held. For example, ESCAP convened a meeting of e-commerce law experts from the region to discuss assistance to the governments of less developed

countries in planning their legal and regulatory systems for e-commerce. ESCAP also assists intergovernmental liaison and interdevelopmental consultations prior to international conferences. The commission encourages governments to contribute to the provision of these services.

Some of the challenges ESCAP faces can be discerned from the overview of its functions and structure just described. An early critique was that the organization was overly centralised in Bangkok and neglected the Pacific region. This was addressed by establishing a Pacific Operations Centre in Vanuatu in 1984. There are also an additional four regional institutions: the Asian and Pacific Centre for Transfer of Technology (in India); the Regional Coordination Centre for Research and Development of Coarse Grains, Pulses, Roots, and Tuber Crops in the Humid Tropics (in Indonesia); the Statistical Institute for Asia and the Pacific (in Japan); and the Centre for Agricultural Engineering and Machinery in China.

The multilateral nature of the organization presents challenges to its effectiveness that are familiar to similar bodies; most notably, one of the challenges involves the dependence on cooperation and support of member states that may at times have conflicting agendas. Differences over goals and resources have led to tentative relationships with governments in the region. According to Alley (1998), ESCAP has had to limit its involvement in intergovernmental cooperation, avoiding more contentious matters such as public/private sector links, the harmonisation of trade and nontariff barriers, resource issues (such as water and waste management), and the removal of nontariff barriers. A common issue has been the disagreement over the wording of documents. Attempts to establish regional sustainability plans have met with reluctance on the part of members to fund activity.

Other critics have claimed ESCAP has failed to present empirical indicators to support development goals in the region. This, it could be argued, is an unfair assertion given ESCAP's major focus on research and analysis. It is perhaps the most convenient, least controversial space of operations given the constraints of dealing with diverse member states. Maintaining this level of cooperation with member states can, however, also encourage the development of an aversion to risk taking. The major tool that ESCAP has is persuasion, but as Bennet (1988) has suggested, persuasion is a relatively weak technique for driving cooperation and coordinating states concerned with protecting their sovereignty and the autonomy of their own programs and projects.

ESCAP's lack of authority and diverse channels of operation makes coordination difficult, but this was compounded by a burgeoning of other UN agencies

in the region. The commission itself has been critical of this sectoral rather than coordinated approach to regional development, particularly when UN agencies have established their own regional networks and multiplied their offices (Taylor 2000). Avoiding a bureaucratic culture and the duplication of work have become complex issues. Policies such as joint meetings, joint divisions of UN agencies and the commission, and posting of agency staff in commission offices have been implemented. These have been useful steps but not always fully effective according to Taylor (2000), and it can be a costly policy in terms of staff and budgets.

With limited resources and influence, dependent on the cooperation of governments and other agencies, it could be argued that ESCAP has not played a central role in economic and social development in the Asia Pacific. It does not develop economic policy as such, leaving this to bodies such as the International Monetary Fund (IMF) and the Asian Development Bank. There has been a lack of implementation of its own plans, such as the Manila Declaration of 1994 that declared the eradication of poverty by 2010 from the ESCAP region, targeting in particular health care, elderly and education sectors, employment expansion, social integration, and the decline of gender, ethnic, and cultural discrimination.

However, while resisting some measures, ESCAP members have, according to Alley (1998), managed to coordinate joint positions to meet moderate reform objectives, particularly relating to social goals. The secretariat has produced major reports and surveys on the social and economic states of the region, organized wide-ranging conferences and workshops to disseminate information and skills, and in some areas has established working relations with other agencies, such as with the UNEP with regard to environment programs.

An evaluation of ESCAP and its programs began in the 1990s, culminating in an organizational review in 2000 that identified major issues that needed to be addressed in the organization's future role; the review also addressed comparative advantage, budgetary concerns, external image, governance, management culture, human resources and program management, and administrative blockages (*ESCAP Towards 2020* 2004). Several strategies and recommendations were made, including the grouping of programs under the three themes already noted; a shift in focus from microinitiatives to larger, interdisciplinary projects; the continued support for decentralisation with plans for further regional institutions; and a new structure for conferences aligned with the program themes. There were also initiatives to restructure the secretariat in 2003, reorientating the organization toward

“performance” and “results-based” management. Changes in priorities, policies, and structure have been designed to translate into the future effectiveness of ESCAP’s programs and activities.

## UNITED NATIONS ECONOMIC AND SOCIAL COUNCIL (ECOSOC)

One of the six major organs of the United Nations (UN), the Economic and Social Council (ECOSOC) was established with the negotiation of the UN Charter in San Francisco in 1945. The League of Nations prepared the way for the emergence of ECOSOC through the wide range of technical committees that dealt with economic, social, and health concerns. Even before ECOSOC’s demise, an evaluation of league activities identified the need for a more effective coordination of these areas of functional cooperation between governments. Thus, under pressure from smaller powers, governments at San Francisco decided to elevate ECOSOC to the status of a UN organ, so that it might serve as the central coordinating body of the economic and social work of the UN and of the UN’s work with other international and nongovernmental bodies.

One of the four main purposes of the UN, as stipulated in Article 1 (3), is to “achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and fundamental freedoms.” Coupled with the UN Security Council, which was established

to prevent and control conflict, ECOSOC was seen as being responsible for addressing a wide range of underlying causes of conflict, which if properly addressed would reduce the frequency of conflict among nations while fostering cooperation in mutual problem solving. To this end, Chapters IX and X of the UN Charter vest in ECOSOC a variety of specific issues for discussion and action, including “a. higher standards of living, full employment, and conditions of economic and social progress and development; b. solutions of international economic, social, health, and related problems; and international cultural and educational co-operation; and c. universal respect for, and observance of, human rights and fundamental freedoms for all.” The UN Charter explicitly names ECOSOC as the body responsible for bringing all international bodies working toward these ends into coordination with the UN. It also has the authority to make recommendations regarding these policy areas and to coordinate the work of the various agencies. It may establish commissions, initiate studies, issue reports, call international conferences, recommend the creation of new agencies, and propose treaties dealing with all matters within its competence. It is the focal point of UN consultation with nongovernmental organizations (NGOs). All UN specialized agencies report to ECOSOC, which in turn reports to the UN General Assembly. In short, ECOSOC is a very important coordinating and policy body dealing with international economic- and development-related issues.

### Early Initiatives

ECOSOC was active from the very outset of the UN in organizing its work and in establishing ties with other international agencies, such as with UNICEF in 1946, the World Bank in 1947, and the World Health Organization (WHO) in 1948. ECOSOC was swiftly involved in the process of reorganizing international responses to the refugee situation in Europe with the creation of the International Refugee Organization in 1946 and the UN Relief for Palestine Refugees in 1948. In 1946, ECOSOC established the Human Rights Commission, tasking it with the drafting of human rights agreements, including the Universal Declaration of Human Rights and the Genocide Convention, which were eventually adopted by the UN in 1948. Its humanitarian activities continued with the establishment of the UN Relief and Works Agency for Palestine in 1950 and the UN High Commissioner for Refugees in 1951. In 1946, ECOSOC established a Commission for Narcotic Drugs; in 1947, the organization established a Population Commission. In the

meantime, war in Korea necessitated an international response to the economic and humanitarian situation there, precipitating the establishment of the UN Korean Relief and Reconstruction Agency. To focus and rationalize its attention on economic development issues, ECOSOC established two regional economic commissions in 1947, the UN Economic Commission for Europe and the UN Economic and Social Commission for Asia and the Pacific. This was followed in 1948 by the establishment of the UN Economic Commission for Latin America and the Caribbean. Two additional commissions were established for Africa in 1958 and Western Asia in 1973. All of these bodies report directly to ECOSOC.

During its second decade, the UN increasingly began to focus on issues of concern to the growing number of developing countries that had gained membership upon attainment of independence. In 1965, ECOSOC was expanded from eighteen to twenty-seven seats and in 1973 from twenty-seven to fifty-four seats; most of the new seats were occupied by states from the developing world. The voice of developing countries increasingly elevated attention to matters of concern to them, including the problems of underdevelopment, poverty, foreign assistance, transfer of technology, international trade and investment reforms, debt relief, racial discrimination, and resource development. In 1961, the Food and Agriculture Organization (FAO) and the UN initiated the World Food Program (WFP) to cope with emergency food needs. International development planning and cooperation, which had previously been promoted by the Expanded Program of Technical Assistance (EPTA) since 1950, was further emphasized in 1957 with the establishment of the Special UN Fund for Economic Development (SUNFED). These programs were later combined under the UN Development Program (UNDP) in 1965. The World Bank added a special International Development Fund (IDA) in 1960. The UNDP itself was a product of three years of debate that began in ECOSOC in 1962.

At the same time, developing countries met in Geneva in 1964, establishing the UN Conference on Trade and Development (UNCTAD), as an alternative mechanism to voice developing country concerns about the General Agreement on Tariffs and Trade (GATT) system that tended to ignore the adverse terms of the trade situation for many developing countries. In 1967, yet another UN development bureaucracy, the UN Industrial Development Organization, was established. Thus, as ECOSOC and the UN entered their third decade together, much of the work of these bodies was marked by increasing controversy over how best to promote economic development in the Third World. Developing countries lobbied for

extensive assistance programs and expanded multilateral activity by UN bodies, while many developed countries resisted these demands and began to call for more careful rationalization of programs and budgets. ECOSOC was in the thick of international debates concerning the establishment of what was called the New International Economic Order (NIEO), which called for substantial restructuring of international aid, trade, and investment policies.

## **ECOSOC and Conference Diplomacy**

ECOSOC has routinely called for international conferences to deal with the growing controversies among developed and developing nations. Such conferences ranged from those dealing with the environment (1972), population (1964, 1974, 1984, 1994), food (1974), women (1975), and human settlements (1976), among many others. These conferences often recommended the establishment of new agencies placed under the coordination of ECOSOC. These included, for instance, the UN Environment Program, the UN Fund for Population Activities, the UN International Research and Training Institute for the Advancement of Women, and the UN Human Settlements Program. The formation of UNCTAD in 1964 drew ECOSOC into the very heart of the controversial debates regarding the NIEO, which were often at the center of disputes at various international conferences as well. The array of UN economic development bodies established by governments reflected a piecemeal approach to problems based on voting majorities in the UN who wished to emphasize development concerns rather than a coherent strategic plan of organization. The result was a large number of often overlapping and competing agencies, together with the inefficiencies that necessarily resulted from this incoherent approach. Countries in the developing world objected to this growing bureaucracy and to what they saw as the increasingly irresponsible budgetary implications of it. Since the wealthier developed countries pay for most of the costs of UN development activity, they began to insist during the 1980s and 1990s that UN specialized agencies show greater budgetary restraint. During the same period of time, the UN undertook substantial reforms, both in its administrative organization and in its spending.

The role of ECOSOC as an initiator of international conferences and debate and as a coordinating body is seen in the progress of these many and wide-ranging disputes. ECOSOC is not, itself, a programmatic body. Rather, it serves as the mechanism through which a wide variety of UN agencies cooperate and

coordinate their activities. The organization is driven by the voices of its member states, along with those of the UN General Assembly, to which the ECOSOC reports. ECOSOC serves as a mechanism for the gathering of information and the articulation of interests by thousands of NGOs that have gained consultative status with it. Thus, ECOSOC, which now sits at the apex of the UN Department of Economic and Social Affairs after the restructuring of the UN's administrative operations, is not a development agency proper but, rather, a political body that serves to coordinate the work of operational agencies. Thus, as the nature of international economic and development debates evolve, ECOSOC is the body in which changing problems are dealt with by changing policy approaches.

For example, the 1970s and early 1980s were dominated by shrill and often unproductive disputes between developed countries and developing ones, the latter demanding and the former resisting international economic reforms of various kinds. Sometimes agreements were reached, as with the establishment of general systems of preference in trade that helped developing countries compete more effectively on international markets; however, as often as not, reform efforts failed, as with the idea of mandatory levels of foreign aid, mandatory transfer of technology, codes of conduct on international investment, mandatory commodity indexation schemes, and the like. Much of the controversy generated in these debates centered on Capitalist, Socialist, and Communist ideological differences. However, with the collapse of communism throughout much of the world in the late 1980s, the tone of international debates on development also changed. ECOSOC and other UN bodies began exploring ways to enhance global trade and investment, promote commerce, reduce barriers to business, encourage the growth of private enterprise, encourage democracy, and promote reductions in inefficient state-owned and state-operated enterprises. A greater degree of realism and a sense of cooperation have thus been reflected in various international initiatives related to trade, giving rise to the World Trade Organization in 1995. Similar realism and serious discussion has evolved in regard to global monetary issues, such as debt rescheduling and cancellation, and in rationalization of international humanitarian responses to complex emergencies.

### Future Outlook

The world has moved rapidly since the 1990s toward the globalization of international trade, communication,

and investment. These developments have placed a great deal more power into the hands of individuals, private businesses, and enterprises. This represents a considerable shift from the idea of world organization that prevailed during the 1970s and 1980s. Governments still sit at the center of the discussion about how to structure and manage economic development today, and they will continue to use multilateral bodies such as the UN, ECOSOC, and other multilateral bodies as avenues for discussion and action. In this process, ECOSOC will continue to function as a forum for debate, a mechanism for multilateral cooperation, and a means for coordination of economic, social, cultural, and humanitarian affairs.

### UNITED NATIONS ECONOMIC COMMISSION FOR LATIN AMERICA AND THE CARIBBEAN (ECLAC)

The United Nations Economic Commission for Latin America, commonly known as the *Comisión Económica para América Latina* (CEPAL), was one of the most influential sources of development ideas in the post-World War II period. CEPAL was founded in

Santiago, Chile, in 1948. CEPAL was a product of the representatives of Latin America, who insisted on some kind of recovery plan similar to the Marshall Plan for the region. While CEPAL originally covered just Latin America, it later expanded to include the developing nations of the Caribbean. In its English translation, the organization became entitled the United Nations Economic Commission for Latin America and the Caribbean (ECLAC). It is interesting to note that although ECLAC has always been a part of the United Nations (UN), it has always had a high degree of independence from the rest of the organization. ECLAC was one of five regional commissions set up for postwar recovery, but it has had little collaboration over the years with its counterparts.

The organization's mission centers on the economic development of Latin America, including its ties to the rest of the world economy. As Santiago is fairly remote, ECLAC has over the years opened subregional headquarters in Mexico City and Trinidad and Tobago. ECLAC also has country offices in Brasilia, Brazil; Buenos Aires, Argentina; Montevideo, Uruguay; and Bogotá, Colombia. In addition, ECLAC has a liaison office in Washington, D.C.

ECLAC is headed by the Office of the Executive Secretariat. The secretariat's office generally sets the policy direction for the organization; sets up meetings of the member states; and otherwise supervises activities. It is important to note that ECLAC is a client of and serves its member states, to which the secretariat must respond. The states have a continual conversation with the organization, but the biannual meetings organized by the secretariat are the main vehicle for assessing and changing the direction of the organization. The member states include the United States and several European countries, including the United Kingdom and France. The main divisions of ECLAC include the field offices already noted; the Office of the Deputy Executive Secretary; the Programme Planning and Operations Division; the Office of the Secretary of the Commission; the Division of Administration; the Latin American and Caribbean Institute for Economic and Social Planning or ILPES, the Spanish acronym; and the various research divisions.

ECLAC's current programs for Latin America include most prominently work on macroeconomic stability; on improving competitiveness in the international economy; on improving sectoral performance, including the development of infrastructure; on economic integration; on social equity, including a special office on women; on population growth; and on the environment. Historically speaking, ECLAC's prominence, scope, and types of activity have changed dramatically over time.

After ECLAC was founded, it became for the next two decades the most prominent economic development organization around the world and a dominant influence on economic policy decisions in Latin America. It is interesting to note that although the United States has been a long-time principal funding source, ECLAC has always been able to maintain a fairly independent line of analysis on Latin American development. Part of the reason for ECLAC's great influence initially was the absence of any well-developed corps of economists in Latin America at the time as well as a basic lack of economic data. ECLAC continues today to serve as a leading source for regional statistics. ILPES for a time served as the premier training location for economists from around Latin America. In other words, ECLAC was at the center of most conversations concerning Latin American development. Most important, economists from Latin America participated in some way with ECLAC, whether through meetings, training sessions, or policy discussions.

The other important reasons for ECLAC's influence concerned its charismatic leader, Raul Prebisch, and the development of a distinct view of economic development called "structuralism." Prebisch, an Argentine by birth, was a Latin American "caudillo" in the classic sense. He was a natural born leader, with a keen intellect and the ability to command audiences' attention and loyalty. His early work in the Central Bank of Argentina, which experienced frequent problems in paying off external national debts, helped him to begin constructing the basic tenets of structuralist thought, which would spread his and ECLAC's name around the world.

The main tenets of structuralist thought are found in Prebisch's 1948 report to ECLAC called *The Economic Development of Latin America and its Principal Problems*. In the report, Prebisch lays out a number of problems endemic to Latin America and proposes some basic remedies. The first tenet of structuralism is called the Prebisch-Singer hypothesis. The basic idea is that the prices of primary product goods, such as raw materials and basic foodstuffs, that the developing world has traditionally produced, have a *relatively* lower price than the manufactures that the First World produces. Thus, the developing world is stuck making products that are worth less and less as time goes on. The second basic tenet considers inflation. Prebisch considered that there were basic "bottlenecks" in developing economies that prevented or delayed production from increasing in response to increasing demand. Thus, even as consumers in developing economies began to demand more products, such as televisions and automobiles, the local economies were unable to respond with increases in

production. The bottlenecks that slowed down the development of local production could be any number of things, from the inability to obtain credit to a basic lack of infrastructure, such as reliable and cheap energy. The third basic tenet of structuralism was that only the government or “the state” could solve these problems. The state could do so through two basic strategies. The first was to move toward the production of industrialized goods that would not suffer from the deteriorating terms of the trade price problem noted previously. The second was that the state could proactively begin to cut or loosen the bottlenecks also already noted. These ideas were eventually embraced around the developing world. It is important to note that structuralism did not start state intervention into developing economies, but rather it created a logical framework and plan of action around which it could develop.

Like other theoretical perspectives, structuralism was a dynamic analytical framework that was added to and modified as events played out. As several Latin American governments (and many outside of the region), notably Chile, Brazil, and Mexico, began to adopt structuralist policies, several problems started to become apparent. The first related to the policy of “import substituting industrialization.” By this policy, Latin American governments taxed agriculture and other primary product exports and protected finished industrial goods to promote their domestic production. In many cases, governments actually created state-owned enterprises to produce these goods. By the mid-1960s, Latin American governments began to experience severe inflationary and balance-of-payments problems. A key source of these problems was that these countries were still importing the equipment, expertise, and capital to produce the final industrial products at the same time as they were taxing their exports. Another problem, which still continues in the twenty-first century, was a basic inability to balance government budgets. The result was a major economic imbalance. At that time, ECLAC began to emphasize the importance of paying attention to agricultural productivity and to suggest that land reform was an important key. The general situation led economist Albert O. Hirschman to come up with the idea of economic “linkages.” Hirschman pointed out that developing economies needed to consider production as a whole process, not just as producing the final versions of goods. Thus, part of the problem was importing car parts to assemble cars instead of producing the parts as well.

Another problem was the limited size of the domestic markets of Latin American countries. Industrial products need to be produced in large numbers to reach the lowest per unit cost, or “economies of

scale.” There were simply not enough consumers to lead to adequate production runs in Latin America, so ECLAC began to promote the importance of exports, and became, and has continued to be, a major promoter of intra-Latin American economic integration. ECLAC also began to propose some cautious steps toward income redistribution, which it felt would further increase the size of the domestic markets. Unfortunately, these reforms were never really embraced. Exports were never seriously promoted. Agricultural reform was tepid at best in most places. The ostentatious signing of integration agreements had nothing to do with the reality that there was a very limited and retreating will to move toward the integration of economies.

By the end of the 1960s, as in the rest of the world, Latin America was wracked by a polarization of leftist groups agitating for major social change, usually in the form of socialism, and rightists who wanted a more moderate, if any, pace of reform. ECLAC itself was internally divided along these lines, and the momentum of structuralist thought and policies was lost. In addition, Prebisch moved on to leadership in the United Nations Conference on Trade and Development in Geneva, and his leadership was missed. One camp of ECLAC moved closer to the newly emerging dependency paradigm, which is much more pessimistic about the prospects for development. Two members of ECLAC, Fernando Henrique Cardoso and Enzo Faletto, wrote the most important book of the dependency school: *Dependency and Development in Latin America*. The book was very much a product of the times, when leftist guerrillas were active throughout the region and socialism seemed like a viable alternative. ECLAC itself was torn apart when Salvador Allende’s government was overthrown by General Augusto Pinochet’s military government. Many core members of ECLAC who had sympathized with Allende fled Chile during the Pinochet regime, and the organization itself went into a lull of inactivity. By the end of the 1970s, the structuralist policies concerning import substituting industrialization had largely fallen into disrepute, much as socialism and dependency did ten years later.

In retrospect, it really is quite unfair to consider structuralist policies a clear “failure.” As Rosemary Thorp points out in *An Economic History of Latin America in the 20th Century*, the period of import substituting industrialization succeeded for the most part in creating a strong industrial base for domestic production, albeit one that was wracked by efficiency, technical, and managerial problems. Moreover, economic growth rates in several Latin American economies, particularly Mexico and Brazil, were quite high during the 1960s. So even though income distribution

worsened, there was substantial progress in improving the absolute living standards of Latin Americans. However, structuralism was never reformed along the lines already noted. The revolutionary leftist groups failed in securing power as the military took over in most of the region. Instead of carrying through the already described needed reforms, Latin American governments began borrowing massive amounts of capital to smooth out balance of payments problems and continuing increasing government spending. This borrowing set the region directly up for the external debt crisis when international interest rates rose dramatically upon the direction of the United States in 1982. The ensuing decade is known as “the lost decade” as Latin America began to sink into ten years of economic contraction. Whether the reforms to structuralism could have “saved” the set of economic policies is one of those historical imponderables that does not seem to receive adequate discussion.

ECLAC itself reorganized in the 1980s around a new set of policies that it called “nestructuralism.” Nestructuralist thought was best articulated by Ricardo Ffrench-Davis in the 1980s but has nowhere near the impact of its predecessor. Basically, nestructuralism seeks to implement a softer version of the neoliberal model, one in which a minimal social safety net, environmental preservation, and other concerns are taken into account. While still honoring the memory of Prebisch, ECLAC has also changed in other ways.

ECLAC now has a large contingency of American-trained economists, who have a more mainstream orientation than the Prebisch generation. ECLAC also has lost much of its leadership position in Latin America. There are a number of reasons for this loss, but two primary reasons are that most countries now produce their own economic experts and that they have their own research and statistical databases. It remains to be seen whether ECLAC can regain its importance among Latin American states. The organization continues to serve as an important information portal for Latin American economic statistics and research and as an important place for regional economic studies.

## UNITED NATIONS FOOD AND AGRICULTURE ORGANIZATION (FAO)

The United Nations Food and Agriculture Organization (FAO) was established on October 16, 1945, in Quebec, Canada, with the ultimate goal of defeating world hunger. The FAO attempts to raise levels of nutrition and standards of living, increase agricultural productivity, and improve the condition of rural populations. The FAO seeks to meet the needs of present and future generations by promoting development that does not endanger the environment and is technologically appropriate, economically viable, and socially acceptable. FAO officials contend that making sure people have regular access to sufficient quantities of high-quality food will enable people to lead active, healthy lives and contribute to the growth of the world economy. To bring global awareness to the plight of the world’s peoples suffering from hunger, in 1981 the FAO declared that October 16 would henceforth be celebrated as World Food Day. The theme for World Food Day in 2004 was biodiversity for food security, which highlighted biodiversity’s role in ensuring that people have sustainable access to enough high-quality food to lead active and healthy lives.

The FAO employs approximately 3,500 staff members. In addition to its headquarters in Rome, the FAO maintains regional offices in Egypt, Thailand, Ghana, and Chile. The FAO also supports over seventy-five country offices, primarily in the developing world. The FAO is composed of eight departments that focus on administration and finance, agriculture, economic and social issues, fisheries, forestry, general affairs and information, sustainable development, and technical cooperation.

The FAO is involved in four major areas of activity: putting information within the reach of people, sharing policy expertise, providing a meeting place

for concerned nations, and bringing knowledge into the field. In an attempt to foster development, the FAO staff (made up of agronomists, foresters, fisheries and livestock specialists, nutritionists, social scientists, economists, statisticians, and other professionals) collects, analyzes, and distributes information to millions of people. In addition to publishing a plethora of reports, books, documents, newsletters, and magazines, the FAO maintains an extensive site on the World Wide Web. As such, the FAO serves as a virtual clearinghouse of information, providing farmers, scientists, traders, and government officials with the knowledge they need to make rational decisions.

In an attempt to achieve rural development and alleviate hunger, the FAO works on a national level to help individual countries devise agricultural policy, draft effective legislation, and create national development strategies. The FAO is a neutral forum where representatives from the developed and developing nations can meet to discuss the major food and agricultural concerns facing the world. The FAO monitors international standards and helps organize international conventions and agreements as well as regularly hosts conferences, technical meetings, and consultations of experts. Since its inception in 1945, the FAO has supported thousands of field projects throughout the world, especially in the developing nations. The FAO is committed to reducing global hunger in half by 2015.

## UNITED NATIONS HIGH COMMISSIONER FOR REFUGEES (UNHCR)

The United Nations High Commissioner for Refugees (UNHCR) is one of the largest United Nations (UN)

assistance agencies. The vast majority of the refugees and other people under its care and protection reside in asylum countries of the developing world. Although the UNHCR is charged first and foremost with the protection of refugees, its assistance activities have a direct bearing on the development situation in countries that host refugees and in countries of origin that receive returnees home from exile.

### Origins and Development of UNHCR

The UNHCR was established on January 1, 1951, as the successor to the International Refugee Organization (IRO), which in turn had been established as a temporary body to resolve the circumstances of millions of refugees and others displaced by the events of World War II. With several hundred thousand refugees in displaced persons camps remaining as the IRO drew near the end of its five-year term of existence, governments decided to create the UNHCR as a temporary agency to finish the work of the IRO by repatriating, permanently settling, or resettling refugees. The role of the UNHCR was limited at the time to offering legal protection services to refugees. Other bodies were to provide actual operational assistance. But in time, the UN General Assembly allowed the UNHCR to seek voluntary assistance from its member states for the benefit of refugee populations. The UNHCR's mandate was gradually extended from three to five years and has been routinely reauthorized at five-year intervals ever since its inception; this extension is a result of the growing need for the UNHCR's protection and assistance services, as refugee situations began to arise outside of Europe, such as in Africa, Asia, and Latin America. As both the number of refugee situations and the numbers of refugees began to increase, especially in developing countries unable to cope with the economic and social consequences of large refugee flows, the UNHCR found itself confronted with the need to offer both emergency and long-term care and maintenance assistance as necessary components of the organization's protection activities on behalf of refugees.

### Zonal Development Programs

In the early 1960s, UNHCR programs on behalf of Burundian and Rwandan refugees in Central Africa acknowledged that assistance to refugees must take into account the effects of the refugee flows on the local economies of the host countries. One of the

observations made by UNHCR was that the targeting of large amounts of emergency assistance, food aid, medical assistance, housing, and social services on refugees alone could quickly place a refugee population in a privileged position relative to the often poor and underprivileged host population, leading to resentments among the latter toward refugees and to protection problems for refugees. On the other hand, to the extent that aid was aimed at the entire population of a refugee-affected area, both the refugees and the local population benefited, leading to a more harmonious relationship in which protection of refugees was more easily guaranteed. However, the UNHCR labored with the self-understanding that it was a nonoperational agency. It could intercede on behalf of refugees to convince governments that they should offer asylum and protection, and it could issue appeals for assistance on behalf of refugees; however, it was the responsibility of the governments and of other intergovernmental and nongovernmental organizations to actually implement assistance programs on behalf of the refugees. Thus, although the zonal development idea was a promising one, the UNHCR was not equipped to promote it, and other UN bodies with explicit development-related responsibilities did not at the time adopt the idea as one worthy of consistent and wide application; this was especially true since development agencies viewed refugee aid as a temporary and emergency-related activity lasting only a few months or a few years, whereas development horizons encompassed much longer spans of time. There was no sense of urgency in the 1960s to integrate or coordinate short-term humanitarian aid with long-term development assistance (Betts 1984).

### **The Process of the International Conference on Assistance to Refugees**

The zonal development notion waned to the point of extinction during the 1970s, but as refugee situations, especially in Africa, began to proliferate during the late 1970s and into the early 1980s, the notion experienced a renaissance; by the time of the second International Conference on Assistance to Refugees (ICARA II), held in 1984 at Geneva, the idea of refugee-related development assistance gained new currency. At ICARA II, largely at the urging of the UNHCR, governments hosting large numbers of refugees or returnees were encouraged to identify development-related projects related to the economic and social infrastructure of refugee- and returnee-affected areas of their countries. More than 100 projects were submitted for funding in the hope that donor countries

might fund road building, reforestation, education, health care, agricultural programs, food storage, and other development-related programs in refugee-affected regions. Although many of the projects failed to attract funding, the notion that refugee aid and regional development planning were linked had become firmly planted in the outlook of both the UNHCR and gradually among other UN development agencies, such as the UN Development Program (UNDP), which was a cosponsor of ICARA II. In the late 1980s, the Central American Refugee Conference (CIREFCA) also attempted to link the aid for refugees, returnees, and displaced persons to the larger development needs of Central American states seeking to rehabilitate badly degraded infrastructures after a decade of civil discord. International responses the CIREFCA proved more generous than toward ICARA II projects.

### **UNHCR as the Catalyst for Refugee Aid and Development Linkages**

The linkage of refugee aid to the development strategy of a refugee hosting country was to a very large extent advanced by the UNHCR, which over the years developed substantial experience in responding to refugee situations in developing nations. The UNHCR, unlike its sister development agencies in the UN system, had extensive contacts in developing countries directly and through nongovernmental organizations (NGOs) with which it contracted to implement emergency care and maintenance assistance to refugees. This routine presence in the field attuned UNHCR personnel to the effects of its assistance on refugees and on the host populations alike. Often called upon to assist and protect not only refugees but other displaced populations in refugee-like circumstances,

UNHCR became more acutely aware of the ways in which its assistance activities either helped or hurt the livelihood of local populations. Large amounts of refugee food aid imported from foreign sources, for instance, typically had the affect of driving local food prices lower, thereby providing disincentives for local food producers. On the other hand, if cereal grains could be purchased from local stocks, local producers had incentives to produce more. If refugees were given food for work opportunities, resentment among locals tended to increase. Likewise, if refugees were given access to health care clinics, local animosity was likely to grow. When such opportunities and services were extended to local people and the refugees alike, the former tended to look upon the presence of refugees as an asset to the local economy. To the extent that

refugee labor could be directed toward projects aimed at strengthening local infrastructure, the UNHCR could encourage not only a safer environment for refugees but also contribute in modest ways to the eventual development of refugee-affected regions. Thus, the UNHCR for many years had discovered ways in which it could offer refugee aid in a way that was compatible to the development of host countries.

The more difficult step was convincing UN development agencies and the development arms of local and donor governments to take into account in their long-range indicative planning processes the refugees' impact on regional development within receiving countries. By engaging the UNDP at ICARA II and CIREFCA, the UNHCR took a big step in increasing the awareness among UN agencies and governments to the linkages between its humanitarian work on behalf of refugees with the development work of such sister agencies. Large refugee or returnee populations represent a burden on local infrastructures. Refugees foraging for firewood can quickly denude wide areas surrounding refugee settlements, creating potentially long-term and adverse environmental effects. Overland shipments of food aid can degrade local roadways. In arid regions, large refugee populations overtax local water supplies, both by reducing supplies and, where sanitation is poor, by polluting them. Disease in densely crowded refugee settings can easily spread to the local population and overwhelm the capacity of the local health infrastructure. Even when refugees have managed to settle spontaneously, outside of formally established refugee camps and settlements, pressures on local schools, hospitals, clinics, and other social services placed on such infrastructure and services can be severe.

While development agencies of host governments might consider such pressures to be temporary, there are many cases in which refugee populations spend more than a decade in their countries of asylum before opportunities to repatriate to their homeland materialize. It behooves governments, UN agencies, and NGOs alike, then, to anticipate the effects of large-scale refugee populations on the development of the host country. The UNHCR, by persistently and patiently reminding the international community of these realities in a variety of fora during the 1980s, placed these concerns in the mainstream of international policy making.

## UN Policy Responses

In 1992 and again in 1997, the UN became increasingly aware that coordination of humanitarian and

development assistance in situations involving civil war and complex emergencies would require greater interagency cooperation. During the 1980s, refugee-related development questions gained greater visibility in the development planning processes of various countries. In the preparation of country development strategy plans of refugee-receiving states, in cooperation with in-country roundtable discussions with donors and in the consultative group process of the World Bank, refugee-related issues rose to the fore as matters worthy of discussion in development planning circles. During the early 1990s, the establishment of a Department of Humanitarian Affairs (DHA) to serve as a coordinating body for humanitarian aid in developing country contexts provided a first step toward greater interagency sharing of information and coordination of assistance packages to regions of the world experiencing humanitarian emergencies. The establishment of the UN Office for the Coordination of Humanitarian Affairs further consolidated this effort. The UNHCR is a major player in these interagency contexts.

The fact that the overwhelming majority of refugees throughout the world flee from developing countries into neighboring developing countries means that UN aid-giving bodies, including the UNHCR and a host of UN development agencies, will need to continue coordinating with one another as they pursue their respective mandates. The days when development assistance was provided without regard to refugees and refugee assistance without regard to the wider development situation are long gone. But effective distribution of such assistance continues to put a premium on the effective coordination of UN agencies, governments, and NGOs, as both refugee problems and development needs persist throughout the developing world.

## UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION (UNIDO)

The United Nations Industrial Development Organization, referred to as its acronym UNIDO, was set up in 1966, but it became a specialized agency of the United Nations (UN) in 1985. UNIDO has responsibility for promoting industrialization throughout the developing world, in cooperation with its 171 member states. Its headquarters are in Vienna, Austria, and it is represented in thirty-five developing countries.

The main purpose of the UNIDO is to bridge the gap between the poor and the rich, in other words between the developing and developed states. The importance of the UNIDO's role is increasing in light of the following facts: sub-Saharan Africa's share of the world's manufacturing value-added has fallen from 0.8% in 1975 to 0.3% in 1995; industry accounts for one-third of the world's greenhouse emissions and a large percentage of hazardous materials; for every ton of food produced, developed countries spend \$180 on processing it, while developing nations spend \$40; between 60% and 70% of the female population is employed in the agriculture sector, while the majority of women employed in industry work as an unskilled labor force; and, finally, one-fourth of the gold sold on the world market comes from artisanal miners who use mercury for extracting gold ore. This method pollutes hundreds of kilometers of rivers. More than two million small-scale gold miners work in Africa, Asia, and Latin America, and seven million people depend on related activities. In this respect, many projects have been implemented by UNIDO to end problems related to pollution resulting from industrial activities.

UNIDO assists the Philippines in substituting for the use of mercury by small-scale miners. A similar programme was successfully completed in Venezuela,

where gold miners agreed to change their work methods. They improved their living and working conditions, the source of pollution was eliminated, and their activities were legalized. More than ten countries have solicited the implementation of this UNIDO programme. Another project was implemented in Cospa Mica, the Romanian town and the most polluted place in Europe in 1991. People, animals, grass, facades, and virtually everything was black from the soot emitted by the Cabosin chemical plant, while the Sometra smelter factory discharged lead. A UNIDO project was implemented, and it took seven years to clean up Copsa Mica. UNIDO advised the closure of Cabosin, while Sometra improved its production methods and managed to transform the town. UNIDO's concern for environmental protection is translated into numerous programmes. Cleaner production centers—ten in existence worldwide—provide training in the efficient use of raw materials and energy, elimination of toxic raw materials, and reduction of emissions and wastes. UNIDO is one of the four implementing agencies of the Montreal Protocol, which was ratified in 1987, and calls for eliminating the production of ozone-depleting substances. In addition, many women in Africa support their families by selling agricultural products and garments, and the value added to their work increases profits. UNIDO's programme in Tanzania focused on the use of improved technology and development of entrepreneurial skills. Numerous projects in Africa, Asia, and Latin America train small and medium-sized business entrepreneurs in ways to add value to their work, improve production, expand business operations, and generate profits.

The main objectives of UNIDO are (i) to promote sustainable industrial development in countries with developing and transition economies, (ii) to harness the joint forces of government and the private sector to foster competitive industrial production, (iii) develop international industrial partnerships and promote socially equitable and environmentally friendly industrial development, and (iv) to create a better life for people by laying the industrial foundation for long-term prosperity and economic strength.

The United Nations Industrial Development Organization (UNIDO) helps developing countries and countries with economies in transition in implementing their development plans that are facing the challenges of the globalization age. The organization mobilizes knowledge, skills, information, and technology to promote productive employment, a competitive economy, and a sound environment. In its work, UNIDO has eight service modules that are Industrial Governance and Statistics, Investment and Technology Promotion, Industrial Competitiveness and Trade,

Private Sector Development, Agro-industry, Sustainable Energy and Climate Change, the Montreal Protocol (regarding substances that deplete the ozone layer), and Environmental Management.

Recently, UNIDO has launched two initiatives. One is the Market Access Initiative, launched at the International Conference of Financing for Development in Monterrey, Mexico, in March 2002. The second is the Rural Energy for Productive Use Initiative, launched at the World Summit for Sustainable Development in Johannesburg, South Africa, in September 2002.

UNIDO works not only with governments but also with business associations, high-level experts, and individual companies to solve industrial problems. During the 1990s, UNIDO experienced pressure to reform its operations, which were mainly in the administration rather than in its programmes. Despite UNIDO's reform efforts, the United States withdrew from the organization at the end of 1996, citing as the reasons federal cutbacks in foreign aid expenditures and a lack of commitment to the agency from some members of the US Congress. Moreover, in 1996, Britain and Australia also announced plans to withdraw from UNIDO. Critics in the United States and Britain concede that UNIDO has made substantial progress in meeting the reform goals of member nations. The decision of both countries to withdraw from the organization instead reflects domestic political considerations and the desire to send a message to the UN about disagreements concerning the organization's policies. Critics also argue that at least two other UN organizations—the United Nations Development Program (UNDP) and the United Nations Conference on Trade and Development (UNCTAD)—focus on development in impoverished nations. Because the United States and Britain contributed one-third of the organization's budget, their withdrawals have affected the survival of UNIDO.

## UNITED NATIONS INTERNATIONAL COURT OF JUSTICE (ICJ)

The International Court of Justice (ICJ) is based in The Hague (Netherlands). It is the principal judicial organ of the United Nations. The ICJ was created in 1945. Its jurisdiction and powers are established by the Statute of the International Court of Justice. The ICJ is at times colloquially referred to as the “World Court” although this is not its official title.

### Functions

The ICJ has two principal functions. First, the court must settle legal disputes submitted to it by those states that have accepted its jurisdiction. Second, the court must render advisory opinions on legal questions referred to it by authorized international organizations and agencies. In either case, the ICJ decides the questions before it in accordance with international treaties and conventions, international custom, and the general principles of law, supplementing its analysis with reference to decisions of other courts as well as the writings of well-known publicists [Statute of the International Court of Justice, art. 38(1)]. The ICJ does not have jurisdiction over individuals or entities that are not states [Statute of the International Court of Justice, art. 34(1)]. This differentiates the ICJ from the International Criminal Court which, when it comes into effect, will be able to prosecute individuals who commit genocide, crimes against humanity, and war crimes.

### Contentious Disputes Among States

Contentious disputes between consenting states occupy most of the ICJ's attention. States can consent to jurisdiction in a particular dispute in one of three ways. First, the states can make between them a special agreement to submit the dispute to the ICJ. Second, the states can consent by virtue of what international lawyers call a “jurisdictional clause,” which is a clause in a treaty that requires disputes arising under that treaty to be brought before the ICJ. When a treaty contains a jurisdictional clause, the ICJ will assume jurisdiction over a dispute among states that are parties to that treaty when the dispute involves the meaning, effect, or application of that treaty [Statute of the International Court of Justice, art. 36(1)]. Many treaties or conventions contain a jurisdictional clause. Third, the states can consent through declarations made by a state under the ICJ

Statute that it accepts ICJ jurisdiction as compulsory in the event the state enters into a dispute with another state that has made the same declaration (Statute of the International Court of Justice, art. 36[2]). That the jurisdiction of the ICJ over a state is based on that state's consent reflects the importance of state sovereignty in the international legal order.

Proceedings begin with a written phase during which disputants file and exchange pleadings. This is followed by an oral phase consisting of public hearings before the judges. Following the oral phase, judges deliberate and thereafter deliver the judgment publicly. Judgments are final and without appeal (Statute of the International Court of Justice, arts. 59–60). Should a state fail to comply with an ICJ judgment, this may constitute a violation of the UN Charter of the United Nations, and the other party may have recourse to the UN Security Council. The two official languages of the ICJ are English and French.

## Personnel

The ICJ consists of fifteen judges elected to nine-year terms by the UN General Assembly and Security Council. No two judges can be of the same nationality. Elections are held every three years for one-third of the judge positions. Retiring judges may be reelected. ICJ judges do not represent their governments. The composition of the ICJ reflects the principal legal systems of the world.

## Jurisprudential Activity

As of 2001, the ICJ has delivered a total of seventy-two judgments on disputes and twenty-four advisory opinions. The ICJ has been involved in boundary disputes (land and maritime), civil claims, legality of the use of force, noninterference in the internal affairs of states, and diplomatic relations. The ICJ also has addressed violations of humanitarian law. Advisory opinions have concerned a number of issues, including admission to UN membership, reparation for injuries suffered in the service of the UN, and the legality of the threat or use of nuclear weapons.

Of the nearly twenty-five cases pending before the ICJ, half concern disputes between two developing countries or one country from the South and one from the North. This is an important change, given that as recently as the 1970s the ICJ mostly was called upon to settle disputes among developed nations.

## The ICJ and Development Issues

Although the ICJ's competence is limited by its statute largely to concern itself with disputes concerning the interpretation of treaties, questions of international law, and breaches of international obligation, in a number of opinions it has discussed development issues. Specifically, the ICJ has considered sustainable development, the alleged right of development, and intergenerational equity. Although discussion of some of these concepts only has been undertaken in separate opinions, the ICJ has been helpful in propounding principles of international law that harmonize economic development with environmental concerns and social justice.

Sustainable development—the notion that economic development is to meet the needs of the present without compromising the ability of future generations to meet their own needs—was discussed by the ICJ in its 1997 decision in the *Gabcikovo-Nagymaros Project* (Hungary vs. Slovakia). This dispute arose because Hungary reneged on a treaty commitment it had made that it and Slovakia would construct and operate locks on the Danube River. Hungary suspended work and withdrew from the treaty owing to evidence that the project would damage the environment. Slovakia continued with the project by implementing a modified system that drastically reduced the downstream flow of the Danube into Hungary. The ICJ directed both parties to restructure and revitalize the project and, in so doing, to consider the principle of sustainable development (*Case Concerning the Gabcikovo-Nagymaros Project* 1997). In a separate opinion, ICJ Vice President Christopher Gregory Weeramantry wrote that sustainable development was a principle with normative value that forms an integral part of modern international law (*Case Concerning the Gabcikovo-Nagymaros Project* 1997, separate opinion). Interestingly, Weeramantry noted that sustainable development emerged from a need to reconcile the right to development (a right that developing nations strenuously have argued for) with the right to environmental protection. By affirming that the right to development constitutes a juristic base for sustainable development, Weeramantry may have increased the currency of developmental rights. However, for the most part, developed countries have not been supportive of developmental rights.

Intergenerational equity also has caught the eye of Vice President Weeramantry. Intergenerational equity posits that justice and fairness concerns are not only to operate within the present dimension. Instead, economic development and other motivations of present generations should be informed by the needs of

future unborn generations. The majority of the ICJ has not dealt with the concept of intergenerational equity. However, Weeramantry's dissenting opinion in 1995 in the Nuclear Tests Case (New Zealand vs. France), in which he identified the principle of intergenerational equity as an important and rapidly developing principle of contemporary environmental law, may constitute an important bellwether for future cases that specifically may involve the law of development.

## UNITED NATIONS INTERNATIONAL DRUG CONTROL PROGRAM (UNDCP)

The United Nations Drug Control Program (UNDCP) was established in 1991. It was renamed the United Nations Office on Drugs and Crime (UNODC) in 2002 and received a broader mandate. It was established in response to an increasing threat to the global security and stability from the growing production and distribution of illicit drugs, which burgeoned to a black-market business of \$500 billion US (UNODC est. 2004). In the 1990s and early 2000s, the illicit drugs production and distribution became a particularly serious issue, as the so-called drug dollars were increasingly channeled to finance international terrorism and local and regional conflicts in various parts of the world. The agency was established to govern the international system of treaties on drug control and to coordinate activities of the individual states and international agencies fighting illicit drugs' production and distribution.

The UNODC has the following objectives: to conduct research and analytical work on harmful effects of illicit drugs and drug-related crimes and disseminate the information about development in these areas; to provide all forms of assistance to individual states in developing domestic legislation on drugs, crimes, and terrorism and in implementing international

treaties on drug-related issues; and to implement technical cooperation projects to combat illicit drugs trade, trafficking, and terrorism.

The UNODC basis its work on three major international drug control treaties: the Single Convention on Narcotic Drugs (1961), the Convention on Psychotropic Substances (1971), and the Convention against Illicit Trafficking in Narcotic and Psychotropic Substances (1988).

The UNODC sponsors or supports several major actions around the world, including projects in Central Asia aimed at combating narcotics trafficking; projects in Southern and Eastern Africa aimed at improving judiciary system and training law enforcement officials; and projects in Bolivia, Columbia, and Peru aimed at counter narcotics cooperation and judiciary reforms. The agency also provides support to drug-abuse treatment and rehabilitation centers around the world. In 2003, the UNODC was accused of corruption; in response, the United Nations Office of International Oversight Services (OIOS) conducted an independent assessment and found no evidence of corruption or mismanagement.

The UNODC has its headquarters in Vienna (Austria), a liaison office in New York, and twenty-one field offices in various countries of Africa, the Americas, Asia, and Europe. The agency has about five hundred staff members, and its director is appointed by the UN secretary-general. The agency's budget is formed partly by contributions from the United Nations and partly by voluntary contributions from the member states. As of 2004, the United States was the largest single contributor to the agency's budget as it committed about \$140 million USD to various projects, mainly through the Department of State's Bureau of International Narcotics and Law Enforcement Affairs.

## UNITED NATIONS INTERNATIONAL FUND FOR AGRICULTURAL DEVELOPMENT (IFAD)

The International Fund for Agricultural Development (IFAD), a specialized agency of the United Nations (UN), was established as an international financial institution in 1977. The IFAD was a direct outcome of the resolutions proclaimed at the 1974 World Food Conference, which was held in response to the food crises of the early 1970s that affected the Sahel region of Africa. The participants at the UN-sponsored conference insisted that an international fund for agricultural development be established to finance agricultural development projects for food production in the developing countries. The delegates to the congress contended that the causes of food insecurity and famine in the Third World were not so much failures in food production in as much as they were structural problems relating to poverty and that a significant number of the Third World's people lived in the rural areas. The IFAD is committed to achieving the UN's Millennium Development Goals, especially the proposal to reduce the proportion of hungry and extremely poor people by 50% before 2015.

Through low-interest loans and grants, the IFAD works with Third World governments to develop and finance projects that enable the rural poor to overcome poverty themselves. Currently, there are about two hundred IFAD-supported rural poverty eradication programs and projects, valued at more than \$6 billion, half of which have been funded by the IFAD. The rest of the financing is contributed by partners, such as governments, bilateral donors, and multilateral donors. The IFAD's current projects are expected to benefit 100 million families in the rural regions of the developing world. Since its inception in 1978, the IFAD has invested almost \$9 billion in funding for more than 650 programs and projects in the Third World. These programs and projects have benefited more than 250 million families in the developing world. Funding from external donors to IFAD programs and projects has exceeded \$16 million.

The IFAD was created to mobilize resources for programs that alleviate rural poverty and improve nutrition. Unlike other international financial institutions that have a broad range of objectives and goals, the IFAD has the specific mandate to combat hunger and rural poverty in developing countries. The IFAD attempts to enable the rural poor in the developing countries to overcome their poverty by fostering social development, gender equity, income generation, improved nutrition, a sustainable environment, and good governance. In addition, IFAD projects and programs focus on country-specific solutions to increase

the rural poor peoples' access to financial services, markets, technology, and land.

IFAD projects and programs seek to develop and strengthen the ability of the poor to confront the issues they define as critical, increase access to knowledge so that poor people can overcome obstacles, enhance the bargaining power of the poor in the marketplace, and expand the influence that the poor people exert over public policy. IFAD programs and projects strive to empower the rural poor to take the initiative in their own development. The IFAD insists that the rural poor must be able to develop and strengthen their own organizations so they can advance their own interests and dismantle the obstacles that prevent them from creating better lives for themselves.

## UNITED NATIONS INTERNATIONAL INSTITUTE ON AGING (UNIIA)

The United Nations International Institute on Aging (UNIIA) was established in 1987 as an autonomous body under auspices of the United Nations (UN). It was officially inaugurated in 1988 and established its headquarters in Malta.

The institute was established due to the growing concern over the population aging in many developing and developed countries. According to the United Nations Development Program (UNDP), the number of people over the age of sixty will surpass those under the age of fifteen. It might become a particular problem for developing countries, as it is expected that the number of people over the age of sixty will rise from 8% in 1999 to 19% in 2050 and to 30% in 2150. Some of the issues arising from the aging populations are those concerned with social security and

health care for the elderly as well as opportunities for them to stay active.

A long-term action-oriented program was needed to provide direction for the international community to overcome social and economic problems expected in the aging societies. In 1979, the General Assembly of the United Nations called for a World Assembly on Aging to be held in 1982. The World Assembly on Aging adopted the Vienna International Plan of Action on Aging. This document became the key international document for the worldwide actions on aging. Following this recommendation, the UN Economic and Social Council (ECOSOC) created resolution 1987/41, and the official agreement was signed between the United Nations and the Government of Malta in October 1987. The agreement was officially inaugurated by the UN secretary-general on April 15, 1988.

The UNIIA has the following mandate: to empower the less developed countries to deal with the issue of the aging population and to build their capacity to train their own personnel to formulate and implement their own policies; to help establish regional training centers; to provide continuing support to the network of the training institutions; and to promote interactive partnerships between developing countries and facilitate information transfer on the issue of mass longevity from developed to developing countries.

The main objective of the institute is to provide training to the developing countries and to facilitate implementation of the International Plan of Action on Aging. The UNIIA provides training through regular training programs in Malta and *in-situ* training programs in various developing countries, such as Brazil, China, India, Kuwait, Russia, Singapore, Tunisia, and some other countries. By 2005, the institute had trained more than 1,600 people from 128 countries (INIA est. 2004), and more than 1,100 people were trained through its *in-situ* programs.

In addition to the training activities, the UNIIA collects data, produces publications, promotes research and technical cooperation between various institutions and research groups, and maintains its website. The institute carries its own research projects, hosts meetings for the expert groups, and provides consultancy services. It also cooperates with the University of Malta in running a postgraduate diploma course in gerontology and geriatrics. The UNIIA publishes a quarterly international gerontological journal entitled **BOLD**.

Most activities of the institute are funded by the UN agencies, regional and international organizations, and individual governments through cosharing arrangements. The training programs are financially supported by the UN Population Fund (UNFPA).

The work of the institute is carried out under the supervision of the International Board that consists of nine members. The board's term of office is three years. The secretary-general of the United Nations appoints its Chairman and six members, while the government of Malta appoints the remaining two members.

## UNITED NATIONS INTERNATIONAL RESEARCH AND TRAINING INSTITUTE FOR THE ADVANCEMENT OF WOMEN (INSTRAW)

The United Nations (UN) International Research and Training Institute for the Advancement of Women (INSTRAW) was established by the UN Economic and Social Council (ECOSOC) in 1976. This action was based on a recommendation of the World Conference of the International Women's Year held in Mexico City in 1975 to found a research and training institute devoted to the advancement of women. It is one of the three institutes within the UN system that is dedicated to the advancement of women worldwide and that plays the role of a special adviser to the Secretary-General on Gender Issues and Advancement of Women (OSAGI) and the Inter-Agency Network of Gender Focal Points (IANWGE). Other bodies and programs within the UN system cope with gender issues only within their programs of work.

INSTRAW is autonomous. It is the only UN body commissioned to advance gender equality, particularly in developing countries, through research, training, and the collection and dissemination of information. The institute serves as a vehicle to integrate women as participants and as beneficiaries in the developmental

process, to raise awareness of women's issues worldwide, and to assist women to meet new challenges and directions. To realize these mandates, INSTRAW also plays a catalytic role assisting the efforts of inter-governmental, governmental, and nongovernmental organizations.

In 1979, ECOSOC recommended that INSTRAW locate in the Dominican Republic, a developing country. As a result, the headquarters of INSTRAW were established in the Dominican Republic on premises donated by the host country. In late 2003, former Deputy Minister of Foreign Affairs of Mexico Carmen Moreno was appointed by Secretary-General Kofi Annan as director of INSTRAW.

INSTRAW's activities promote, establish, and undertake research and training projects and programs on gender and women's issues. Thus far, these projects and programs include diversified issues related to women's economic and political empowerment in developing countries. The following topics are addressed by INSTRAW: gender statistics and indicators; measuring and imputing value to the unpaid work of women; women in the informal sector; women and economic development; women and credit; women and rural development; women's studies and curricula development; women and water supply and sanitation; women and new and renewable sources of energy; women and environmental and sustainable development; women and media and communications; women and ageing; women and migration; and women and development planning.

One of the main activities of INSTRAW is establishing and undertaking training projects to raise awareness about gender inequality and its manifestations. INSTRAW holds a number of gender workshops, lectures, discussions, and seminars with collaboration with other institutes worldwide to mainstream gender and women's issues in development and ultimately to bring about a change in consciousness, behavior, and attitudes of policy makers.

In 1995, INSTRAW Acting Director Martha Dueñas-Loza gave an overview of INSTRAW's future role. Basing her comments on recommendations of the Fourth World Conference on Women in Beijing, she identified major issues devoted to the advancement of women. A major issue concerned elderly women in development. Rapid population growth and migration will have an increasing impact on economic and social infrastructure of all countries. INSTRAW published "Ageing in a Gendered World: Women's Issues and Identities" in 1999, which explains that the majority of elderly people are women who live in poverty and maintains that the issues of the elderly women must be addressed as individual components within development plans and programs.

Among other research projects based on the Beijing Conference is the project of Women, Peace, and Security. INSTRAW highlighted gender-based violence as the greatest threat to women's security in times of both conflict and conflict resolution. In collaboration with the United Nations Development Fund for Women (UNFEM), research on this issue has continued.

INSTRAW also perceives significance of the economic and social contributions of women migrants to developing countries and their development strategies although the majority of studies and programs have ignored the issue of remittances by women migrants in spite of the fact that a number of women independently migrate as main economic providers. The institute understands that remittances by women migrants include the movement of money from an immigrant woman to family members in her country of origin as well as a transformation of social and political values in both countries that has been stimulated by women's international transfer of funds. Through the research project, INSTRAW urges the inclusion of a gender perspective in research, programs, and policies of remittances to eliminate gender discrimination on banking and financial policies and to clarify the new economic, social, and political roles of women migrants.

In 1999, INSTRAW obtained a new and additional mandate to perform its activities through the utilization of new information and communication technologies (ICTs). Responding to the new mandate, the institute developed a new operational methodology of the production, management, and dissemination of gender-related knowledge and information: the Gender Awareness Information and Networking System (GAINS). GAINS is a pioneering electronic system that serves as a "virtual workshop" for collaborative research, training, and networking and promotes interactive dialogues between civil society and governments through the virtual places. Using the GAINS methodology, INSTRAW has facilitated two collaborative research programs that aspire to the promotion of a more holistic and cooperative response: Men's Roles and Responsibilities in Ending Gender-Based Violence and Women's Access to Information and Communication Technologies.

INSTRAW carried out two main research projects concerning women in development in the early 2000s. These were Financing for Development and Remittances and Gender. In the former, INSTRAW noted the lack of gender perspectives in three major agreements on financing for development that the international community reached during 2000 to 2002: (i) the Millennium Development Goals in 2000, (ii) the IV Ministerial Conference of the World

Trade Organization, and (iii) the Final Declaration of the International Conference on Financing for Development, known as the Monterrey Consensus (2002). In “Gender Issues and Concerns in Financing for Development” (2004), INSTRAW insists that all stakeholders (such as governments, UN agencies, international financial institutions, and NGOs) consider the harmful influence of development on women’s living and consider mainstreaming a gender perspective in financing for development.

Thus, INSTRAW has made efforts to promote gender equality and empower women, particularly in developing countries, through creating as well as sharing knowledge to mainstream the gender perspective in development policy and practice.

## UNITED NATIONS PERMANENT FORUM ON INDIGENOUS PEOPLES

The Permanent Forum on Indigenous Peoples, created in 2000, is the highest-level international body ever empowered to deal with the rights and needs of indigenous populations. It is the first time indigenous voices nominated by indigenous peoples are speaking for indigenous peoples as members of an official United Nations (UN) body. Established by means of a resolution of the UN Economic and Social Council (ECOSOC), the forum consists of sixteen members, eight to be nominated by governments and elected by ECOSOC and eight to be appointed by the president of the council following formal consultation. The forum’s mandates are (i) to provide advice and recommendations on indigenous issues to ECOSOC as

well as to programs, funds, and agencies of the UN through the council; (ii) raise awareness and promote integration and coordination of activities relating to indigenous issues within the UN system; and (iii) prepare and disseminate information on indigenous issues.

Indigenous peoples, representing five thousand languages and cultures, inhabit more than seventy countries in the world. Historically displaced by powerful expanding states, many indigenous peoples have become minorities within sovereign nations. Although some nation-states have instituted laws guaranteeing original rights to the communal lands held over millennia by aboriginal peoples, many indigenous communities have been expelled from their lands, prohibited from using their languages and practicing their lifestyles. Indigenous peoples are among the most vulnerable and poorest populations in the world (OIT/ILO 2003; AIUSA 2003). In the early twenty-first century, indigenous peoples have become increasingly involved in the shaping of international procedures involving their human and cultural rights.

The establishment of the permanent forum represents an achievement for indigenous peoples that has taken decades of persistent effort from within the UN and outside it. It is the outcome of many accumulated events, principally of the UN Working Group on Indigenous Populations that was established in 1982. According to an Economic and Social Council Resolution and part of the UN Sub-Commission on the Promotion and Protection of Human Rights, the UN Working Group on Indigenous Populations was established to promote and protect indigenous peoples’ human rights and fundamental freedoms by developing international standards, measures, and review mechanisms related to indigenous rights. The working group has played an important role in increasing the participation of indigenous people in the formation of international policies. Meeting annually in Geneva since 1982, it has become one of the largest UN forums on human rights, with hundreds of indigenous non-governmental organizations (NGOs) in attendance. The group contributed to many advancements in indigenous rights and a growing awareness of indigenous issues at the international, governmental, and local levels.

The Permanent Forum on Indigenous Peoples met for the first time in May 2002 at the UN in New York City. Subsequent meetings took place in May 2003 and 2004 and are expected to be held annually. Meetings occur over ten days, allowing discussion of cultural and human rights as well as of environmental, educational, and health concerns. Although only persons who represent the indigenous peoples of the UN’s member countries are authorized participants, the

sessions may be attended by any person representing indigenous organizations, indigenous advocacy NGOs, or other interested parties and observers.

## UNITED NATIONS POPULATION FUND (UNFPA)

The United Nations Population Fund (UNFPA) is the world's largest source of funding for population and reproductive health programs. It directly controls 25% of the world's population assistance to developing countries. Sub-Saharan Africa receives the largest percentage of UNFPA assistance. Since it began operations in 1969, the UNFPA has provided \$6 billion in assistance to developing countries. UNFPA, which currently has about one thousand employees, has worked with governments and nongovernmental organizations (NGOs) in more than 140 countries. Initially established as the United Nations Fund for Population Activities, in 1987 the organization was renamed the United Nations Population Fund, but the acronym of UNFPA remained the same. UNFPA was originally administered by the United Nations Development Program (UNDP). In recognition of the scope of its operations, UNFPA was placed under the UN General Assembly's direct authority in 1972, raising it to the same status as the UNDP.

One of the fundamental goals of UNFPA is to improve reproductive health. The UN has consistently argued that reproductive health is a means to sustainable development and a basic human right. Investments in reproductive health save and improve lives, slow the spread of HIV/AIDS, and encourage gender equality. This, in turn, helps to stabilize population growth and reduce poverty. UNFPA promotes a holistic approach to reproductive health care that includes access to safe and affordable contraceptive methods, counseling, prenatal care, assistance with deliveries, emergency obstetric care, postnatal care, and the prevention of sexually transmitted diseases, including, but not limited to, HIV/AIDS. Since UNFPA began operations in 1969, access to voluntary family planning programs in the developing world has increased, and fertility rates in the Third World have diminished by 50%.

Although all UNFPA programs promote women's equality, many UNFPA programs specifically target

gender-based discrimination and violence. UNFPA has specifically sought to develop projects that empower women economically and promote legal reforms. UNFPA also advocates reproductive health and rights, including the right to choose the number and spacing of one's children.

UNFPA works to ensure that adolescents and young people between the ages of fifteen and twenty-four have accurate information, nonjudgmental counseling, and comprehensive and affordable services to prevent unwanted pregnancy and sexually-transmitted infections such as HIV. UNFPA efforts in sub-Saharan Africa, the area of greatest HIV infection, have dramatically increased to confront the spread of HIV, which has a devastating impact on health as well as on the social and economic stability of developing nations. HIV prevention, which is being integrated into reproductive health programs throughout the world, is the main focus of UNFPA's campaign against the disease. Prevention methods include promoting safer sexual relations among young people and making condoms readily available. In many developing nations, condoms are urgently needed to prevent the further spread of the deadly HIV virus.

UNFPA also supports projects that help people who are displaced by human-made and natural disasters. In conflicts, the risk of sexual violence and the spread of sexually transmitted infections, including HIV, increases dramatically. Complications of pregnancy and childbirth are the leading causes of death for displaced women of childbearing age. UNFPA provides supplies and services to protect the reproductive health of displaced peoples, especially those in refugee camps. UNFPA also assists developing nations to collect and analyze population data and integrate population and development strategies into national and regional planning.

The UNFPA contends that people's needs for education and health are a prerequisite of sustainable development. After the International Conference on Population and Development (ICPD) held in Cairo in 1994, UNFPA was charged with implementing the conference's program of action. By 2015, UNFPA hopes to facilitate universal access to reproductive health care services, foster universal primary education, close the gender gap in education, reduce maternal mortality by 75%, reduce infant mortality, and increase life expectancy. Regarding one of the most serious threats to humankind in recent years, UNFPA hopes to reduce HIV infection rates in people fifteen to twenty-four years of age by 25% by 2010.

## UNITED NATIONS RELIEF AND WORKS AGENCY FOR PALESTINE (UNRWA)

The United Nations Relief and Works Agency for Palestine (UNRWA) was established as a temporary agency by the international community in response to the flight of Palestinians from their homes during the first Arab-Israeli war following the creation of Israel by the United Nations in 1948. Initially, the UN turned to the International Refugee Organization (IRO) to offer assistance to Palestinian refugees, but the IRO's mandate was limited to Europe, and so it declined to expand operations to Palestine.

The UN then established the UN Relief for Palestinian Refugees (UNRPR) program to address the needs of the hundreds of thousands of Palestinians displaced by the war. UNRWA succeeded UNRPR in December 1949. It commenced operations in May 1950, and it remained in charge of Palestinian refugee programs even after the establishment of the UN High Commissioner for Refugees (UNHCR) in 1951. The initial focus of UNRWA contained both a relief and development component, with the initial emphasis being on relief. Over time, however, UNRWA got involved in the establishment of education programs and other activities of a more clearly developmental nature, such as health and social services. UNRWA made its headquarters principally in Vienna, Austria, until 1996 when its headquarters were transferred to the Gaza and Amman, Jordan, at a time when progress was being made in resolution of Israeli-Palestinian relations. Though a "temporary" body, its mandate has been repeatedly renewed by the UN General Assembly as the Palestinian refugee situation has persisted. UNRWA's budget primarily focuses on assistance to about 1.3 million

Palestinian refugees who continue after generations to reside in refugee camps in Israel, the West Bank, and the Gaza Strip as well as in Lebanon, Syria, and Jordan.

**Background**

The Arab-Israeli dispute exploded after the creation of the UN partition of the Palestinian Mandate previously administered by the United Kingdom. The partition plan called for the creation of both a Jewish and a Palestinian state. Arab countries, however, refused to acknowledge the existence of Israel and invaded Palestine for the purpose of destroying Israel before it had a chance to establish itself. Confident of victory, Arab countries urged Arab Palestinians to flee, await victory and the destruction of Israel, and return home to a Palestinian state. Events proved otherwise. Israel not only resisted extermination but actually expanded its size to include areas originally slated to be part of the Palestinian state. Neighboring Arab countries seized other parts of what might have become a Palestinian state, and thus Palestinians found themselves under the rule of either Israel or neighboring Arab States, with as many as seven hundred thousand of them qualifying as stateless refugees. Thus was born the Palestinian refugee problem. To address the situation, the UN eventually established UNRWA to offer relief- and development-related assistance to refugees until they were able to return home. Repatriation of Palestinian refugees has been a controversial matter between Israel and Arab countries and remains almost sixty years later an unrealized dream. Thus, although UNRWA was established as a temporary agency, it has actually become a permanent feature of the humanitarian assistance and political landscape of the Middle East.

The fortunes of the Palestinians have been closely tied ever since to the ups and downs of the Arab-Israeli dispute, and the UNRWA, though attempting to navigate an impartial course through the disputes, has had to cope with the reality of the highly politically charged atmosphere in which the staff works. For political reasons, refugee situations and often deprived camp settings that might have been resolved years ago remain festering problems that continue to contribute to the hatred and violence so characteristic of the Arab-Israeli dispute, including the legacy of terrorism, suicide bombings, periodic open rebellion, and Israeli government retaliation against such activities. In wider humanitarian assistance circles, the Palestinian case is regarded as a textbook example of how not to deal with a refugee situation, and long-term refugee

situations are often described as having suffered from a “Palestinization process,” that is, a politically prolonged situation.

### **From Relief Activities to Development**

In its first decade, the UNRWA applied the majority of its funds to the immediate needs of Palestinian refugees, including emergency food, medical attention, and eventually housing. A major problem in the early years was the high infant mortality rate owing to malnutrition and dehydration. UNRWA focused on provision of clean water, proper sanitation in camp settings, immunization against common diseases, and oral rehydration programs for infants. Within the first few years, the emergency situation abated, and as with most refugee situations, especially when emergency situations ease, the attention began to focus on education, long-term health, and other development-related activities, including promotion of businesses and development of enterprises. Typically, UNRWA dedicates 60% of its budget to educational activities, including building schools, training teachers, training in the technical and vocational arenas, offering university scholarship programs, providing textbooks, and guaranteeing free primary and preparatory education to Palestinian refugees. UNRWA now operates nearly 650 schools with a staff of almost 17,000 who reach about 490,000 students. By law, UNRWA must use the curriculum of the country in which it operates schools, and these are sadly often highly prejudicial, propagandistic, and ideologically motivated. To counter this, UNRWA attempts to offer programs with supplemental texts and a program emphasizing non-violent conflict resolution and respect for human rights. It is difficult to assess how well these programs function in light of the periodic and pervasive situation of violence that has marked the politics of the region.

In sixty years, refugee camps might well have been eliminated given the levels of aid provided, but many complicated factors unite to make the camps a persistent feature of the region. Palestinian leaders have seen the camps as convenient symbols of ongoing Israeli oppression. While emergency relief assistance has declined to a mere 11% of the UNRWA budget, every time violence is renewed, the need recurs for emergency assistance, including food, employment aid, and funds for reconstruction of destroyed housing. Thus, UNRWA has repeatedly found itself seeking special emergency assistance from the international community, especially during periods of

*intifadah* or uprising, when access to both employment and education becomes problematical for refugees living in the occupied territories. Thus, while the lion’s share of the UNRWA budget is dedicated to education and health activities, the agency has been in the long-term business of emergency aid depending on where the violence and conflict are most keenly felt. Its emergency work has generally increased after conflicts, such as after the 1967 and 1973 wars.

During the early 1980s, Lebanon was the center of dispute and conflict, when the Palestine Liberation Organization (PLO) took up residence in that country and used southern Lebanon as a launching pad for terrorist activities inside Israel. Israel predictably retaliated against such actions, often targeting refugee camps from which suspected terrorists mounted their assaults. In 1982, Israel intervened in southern Lebanon and forced the PLO to leave Lebanon altogether. This period marked a very delicate time for the UNRWA, especially in attempting to provide humanitarian aid to the innocent Palestinian refugee population. Uprisings in the West Bank and Gaza occurred in 1987 and most recently from the year 2000 to 2005. These situations of generalized violence generally have set back efforts at peace, have promoted higher levels of unemployment among Palestinians, and have disrupted educational activities as well, forcing UNRWA to seek additional international assistance to cope with rising needs. At other times, a glimmer of hope has explicitly focused energies on development activity, such as in the aftermath of the Oslo Peace Accords in the mid-1990s.

### **Other Development-Related Activities**

Coupled with its large educational programs, UNRWA has sponsored small-scale enterprise programs with subsidized loans ranging from \$1,000 to \$75,000. More than a thousand small businesses have benefited from such loans, which have stimulated small industries; agricultural and manufacturing enterprises; and medical, publishing, and domestic services. A microenterprise credit program funding similar activities has reached forty-three thousand beneficiaries. UNRWA has developed women’s solidarity group loan programs that encourage Palestinian women to engage in the local economy. More than twenty thousand such loans, which amount to a few hundred dollars, have been awarded. UNRWA operates more than 120 primary health care facilities in refugee camps and among local populations affected by the presence of refugees, employing several thousand local staff to provide these services.

UNRWA has funded shelter rehabilitation programs since 1993 as part of its Peace Implementation Program that followed the Oslo Peace Accords breakthrough. Subsequent violence in the region and the destruction of additional housing continues to give this program much work. UNRWA has also funded the establishment of women's centers and community rehabilitation centers, where the special needs of the disabled can be addressed training and employment.

### Future Prospects

The death of Yasser Arafat in November 2004 holds out the promise under new Palestinian leadership that peace negotiations can be restored and a greater emphasis placed on the long-term development agenda of UNRWA, which now employs Palestinians as the principal managers of its work. Israel in the meantime has embarked on a unilateral program of withdrawal from the vast majority of the occupied territories. At the same time, it has begun construction of a security wall to prevent terrorist attacks in Israel. The wall seems to have succeeded in reducing such attacks, but it has also caused much hardship among Palestinians whose homes lie on one side and whose jobs lie on the other side of the security barrier. The Israeli government has shown some willingness to compromise on resituating the barrier to reduce such hardships but has insisted, in principle, on the necessity of the project for its national safety and security. The general course of the wall follows lines fairly similar to those indicated by the Wye Peace Agreement, which was ultimately rejected by Yasser Arafat but that might find new life in the wake of his death. All of this leaves open the possibility that a new Palestinian leadership might be in a position finally to consolidate authority and begin a more determined road to peaceful statehood. In that event, UNRWA's involvement could be largely devolved to the capable Palestinian management, which to a large extent already performs the bulk of UNRWA program activity. International funding of these activities might well need to be continued; however, UNRWA, which was always conceived as a temporary agency, may at long last complete its work and bequeath its efforts to a full Palestinian administration.

## UNITED NATIONS TRUSTEESHIP COUNCIL

With the establishment of the League of Nations in 1919, the principle of self-determination of nations was articulated, along with the idea that non-self-governing territories should be prepared for eventual self-government. This principle was applied in the Mandate System set up to prepare former colonies of the Axis powers for their eventual dependence under the guidance of various victorious powers, which served as the new governing authorities in these territories. Three classes of mandates were established depending on their initial readiness for political and economic dependence. The United Nations (UN) reiterated many of these principles in the UN Charter, especially in its Declaration Regarding Non-Self-Governing Territories and in its establishment of the International Trusteeship System. In 1945, the various League of Nations mandates were placed under the stewardship of the Trusteeship Council, along with various territories detached from Japan and some other territories placed voluntarily under a trust territory system. Economic development was one of the main areas of concern to the Trusteeship Council as it received reports from the trustee nations that exercised administrative responsibility for the territories. The Trusteeship Council successfully completed its work in 1994 when the last of the trust territories achieved independence; as of 2005, the members of the council

consist of the five permanent members of the UN Security Council, and no further work for the body has yet been agreed upon.

### **The Purposes of the Trusteeship System**

The UN Charter conceived of the Trusteeship System as a means of maintaining international peace and security by placing non-self-governing territories under a system of stewardship that would prepare them for eventual independence. To this end, the governments charged with administrative oversight were obliged under Article 76 of the UN Charter “to promote the political, economic, social, and educational advancement of the inhabitants of the trust territories, and their progressive development towards self-government or independence.” This also called for a respect for human rights and fundamental freedoms of the inhabitants. Members of the Trusteeship Council included all countries serving as administrators of trust territories, the permanent members of the UN Security Council, and other countries selected by the UN General Assembly to ensure an equal number of administering and nonadministering governments. The Trusteeship Council entered into agreements with the trust authorities, received and considered annual reports from them, received petitions from indigenous populations, and made occasional visits to the territories. The reports made to the Trusteeship Council were based on its authority to seek and receive information from the administrative government concerning the “political, economic, social, and educational advancement of the inhabitants.”

The Trusteeship Council was not conceived primarily as a UN agency for economic development. Indeed, the UN Charter (Article 91) called upon it to “avail itself of the assistance of the Economic and Social Council and of the specialized agencies” in regard to economic matters falling outside its own competence. However, inherent in the notion that a trust territory must be prepared for self-government was the necessary principle that the inhabitants should achieve the capacity for political and economic development, and all the trust territories qualified as developing areas.

### **Outcome of the Trusteeship System**

All eleven territories placed under the UN Trusteeship system are now independent states. In Africa, British Togoland became independent as Ghana in 1957, while French Togoland achieved independence in 1960 as Togo. Somaliland gained independence from

Italy and joined with the British protectorate of Somaliland to form Somalia in 1960. The French Cameroons attained independence in 1960 as Cameroon, while in 1961 the British Cameroons divided at independence, the northern territory joining Nigeria and the southern Cameroon. Tanganyika (later Tanzania) gained its independence from the British in 1961. Ruanda-Urundi divided at independence from Belgium in 1962 to form the new states of Rwanda and Burundi. In the Pacific, Western Samoa achieved independence as Samoa from New Zealand in 1962, Nauru from Australia in 1968, and New Guinea from Australia in 1975, as Papua New Guinea. The Trust Territory of the Pacific gained independence from the United States as four new countries: Micronesia, the Marshall Islands, and the Northern Mariana Islands, all in 1990, and then Palau in 1994.

All of the trust territories continue to fall under the rubric of developing nations, each with specific challenges and struggling economies. The most severely underdeveloped of the countries, namely Somalia, Rwanda, and Burundi, have also experienced the most intense and prolonged civil unrest, war, and large-scale loss of life. Tanzania is a country lacking substantial natural resources, but it has enjoyed political stability. With the adoption of economic reforms, it has posted strong economic growth in recent years. Ghana, known in colonial times as the “Gold Coast,” has achieved significant gains in development in recent years with the restoration of a stable government and new gold discoveries, but it remains heavily indebted. The Cameroon is one of the better resource endowed countries in sub-Saharan Africa, with rich farmland and oil resources, but these resources have not been consistently well managed. The Island States of the Pacific, with the exception of New Guinea, are lightly populated. Nauru, with only thirteen thousand citizens, faces substantial economic challenges with the depletion of its once significant phosphates resources. Papua New Guinea on the other hand has more than five million people and substantial resources although most of its people engage in subsistence activities. Samoa enjoys the greatest per capita wealth of all the former trust territories, but a major share of this wealth takes the form of remittances from its citizens employed overseas. Tourism is another area in which the island nations have made economic gains, notably the Northern Mariana Islands, but many of the former Pacific Island trust territories continue to rely heavily on assistance from the United States. Although the trust territories have experienced variable levels of economic development since independence, each continues to face significant challenges while struggling to achieve greater prosperity.

### UNITED NATIONS UNIVERSITY (UNU)

In 1969, the United Nations (UN) Secretary-General U. Thant suggested that consideration be given to establishing an international university devoted to world progress and peace. In response, the UN General Assembly voted to establish the United Nations University (UNU) in 1973. The government of Japan pledged \$100 million to UNU's endowment fund and offered a headquarters for the university in Tokyo. UNU began activities in 1975 at its Tokyo headquarters, focusing mainly on peace and conflict resolution, development in a changing world, and science and technology in relation to human welfare.

UNU operates under the joint sponsorship of the United Nations and the United Nations Educational, Scientific, and Cultural Organization (UNESCO). Its mission is to find original, forward-looking solutions to the most pressing problems that concern the United Nations and the peoples of its member states. The UNU undertakes research and training on a broad range of issues, including food and nutrition, information technology, land use and climate change, the freshwater crisis, urbanization, and the causes of complex humanitarian emergencies. Experts in the UNU engage in the direct exchange of ideas and research findings with policy makers and practitioners around the world.

The UNU's Peace and Governance Program organizes and supports research that produces policy-oriented recommendations for solving contemporary problems and identifying longer term trends that have implications for peace, security, and governance. Its challenging agenda includes finding solutions to civil and ethnic conflict, interstate war, terrorism, poverty,

the threat of weapons of mass destruction, the scourge of small arms, the negative impacts of economic globalization, human rights abuses, and the problems experienced by transitional and democratizing societies.

Administratively, the UNU consists of a council of twenty-four members who serve as the governing board of the university; a rector is responsible for the administration, programming, and coordination of the university, and the University Center assists the rector. The council is appointed jointly by the UN secretary-general and UNESCO's director-general. The rector is appointed by the UN secretary-general and normally serves for five years, with the possibility of reappointment. The center, which is located in Tokyo, promotes exchanges of scholars as well as scientific and technical ideas and information within the world academic community, particularly in developing countries through conferences, workshops, and publications. The UNU operates as an autonomous academic institution under the joint sponsorship of the UN and UNESCO. Its chief source of funding is an endowment fund established by Japan and augmented by the voluntary contributions of other countries and private foundations.

Scholars and institutions from around the world collaborate in the work of the UNU. They represent a wide spectrum of disciplines, ideologies, and cultural backgrounds. The UNU does not have a student body. Instead, it offers postgraduate training to people from developing countries to study at a worldwide network of research and postgraduate training centers. Three of these centers are the Institute of Nutrition of Central America and Panama (located in Guatemala City), Chiang Mai University in Thailand (for the study of agroforestry systems), and the Tropical Agricultural Research and Training Center in Costa Rica.

## **UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT (USAID)**

The United States Agency for International Development (USAID) is an independent federal agency that receives its direction from the US Secretary of State. Independent federal agencies are created by the US Congress to deal with complex policy matters that Congress cannot address because it does not have the resources nor the desire to manage these matters. Congress entrusts independent agencies with decision-making powers beyond those granted to other federal agencies. USAID is headed by the administrator, who is appointed by the president and must be confirmed in office by the US Senate. In 2004, the agency's administrator was Andrew S. Natsios; he has held this position since April 2001. USAID is the US government agency responsible for nearly all of the United States' bilateral foreign aid programs. The agency plans and administers the world's largest bilateral aid program. In 2004, USAID administered some \$12.65 billion in foreign aid, of which \$2.44 billion of this was USAID assistance to Iraq.

As a US government agency, USAID has always shaped its policy and aid programs by the perceived national security and domestic political needs of each US presidential administration and of the US Congress. Hence, during the Cold War, USAID's underlying priorities included a strong dose of anticommunism and, following the September 11, 2001, terrorist attacks on the United States under the George W. Bush administration, antiterrorism. A second concern that conditions how USAID is able to operate is that although the United States contributes more than any other nation to international development, its contributions have remained stagnant and have even declined slightly over time; they are among the smallest on a percentage basis of any of the major developed nations. Only about 0.5% of the US budget is spent on nonmilitary foreign assistance (Tarnoff and Nowles 2004). Although USAID's assistance programs concentrate on aid to the developing world, it is important to realize that USAID's primary goal is to further the foreign policy goals of the United States.

Assistance provided by USAID largely falls into three categories: Economic Support Funds, Development Assistance, and Food for Peace. Economic Support Funds (ESF) provide about half of all US economic aid. ESF include direct cash transfers, commodity import programs, and individual development programs. ESF, more than any other US aid program, are targeted at assisting politically important countries to advance US political and security objectives (Hoy 1998). Although the legislation

authorizing ESF states that ESF should be used to the maximum extent possible for development, two-thirds to three-fourths of ESF are spent on security (Hoy 1998; Burnell 1997). Moreover, historically the majority of the funds, although this proportion is generally decreasing, assist Israel and Egypt.

Development Assistance (DA) is the second category of US foreign assistance. DA consists of grants to support economic development programs (Hoy 1998). Congress specifies specific sectors, such as health, population, agriculture, and rural development. DA funding has been on the decline and during the 1980s and 1990s was the frequent target of cuts. The third category of USAID assistance is Food for Peace. While food aid is welcome during emergencies, the Institute for Food Policy, for example, charges that the United States often uses food aid to dispose of domestic surpluses, to open new markets for commercial sales of US farm products, and to extend the reach of US agribusiness (Hoy 1998). Indeed, US food aid to Somalia was blamed for discouraging local production, making the food crisis even worse.

### **A Short History of USAID**

USAID was created by an executive order from President John F. Kennedy on November 3, 1961. The creation of USAID followed the reorganization of US foreign assistance by the Foreign Assistance Act (FAA) passed by Congress on September 4, 1961. The new law required the creation of a separate agency to administer foreign economic aid programs. Hence, USAID was created as the first US foreign assistance agency to take a long-term approach to economic development separately from military aid. Indeed, prior to the creation of USAID, almost 80% of all US foreign aid was military aid. Following the birth of USAID, more than half of US foreign aid would become economic aid intended to foster long-term economic development in developing countries.

USAID fused into a single agency the functions of several preexisting US agencies. USAID combined the economic and technical assistance operations of the International Cooperation Agency, the foreign loan functions of the Development Loan Fund, the bequests of the Development Grant Fund, the local currency support of the Export-Import Bank, and the Food for Peace program of the Department of Agriculture. Moreover, the 1961 FAA and USAID highlighted the new Kennedy administration's commitment to maintaining and increasing foreign assistance to developing countries. Kennedy championed the creation of USAID and the administration's new

emphasis on foreign assistance on several premises: (i) the fragmented, awkward, inconsistent, and slow foreign aid programs of the time proved largely unsatisfactory and ill suited for the needs of both the United States and developing countries; (ii) the economic collapse of developing countries that “would be disastrous to our national security, . . . and offensive to our conscience;” and (iii) the perception that 1960s presented a historic opportunity for industrialized nations to move less-developed nations into self-sustained economic growth. Kennedy saw US direct foreign aid to developing countries as a moral obligation and “counter to totalitarianism” (About USAID 2004). Furthermore, Kennedy asserted that for the United States to fail in meeting its moral obligations would be a long-term disaster for the nation and the world, threatening the security of the United States.

USAID’s most important goal was toward long-term economic and technical assistance on a country-by-country basis with the commitment of aid on a multiyear and programmatic basis. This would mean bilateral as opposed to multilateral aid. The United States would continue to contribute to multilateral aid agencies and organizations, but USAID would concentrate on bilateral aid. In addition, the foci of USAID would be on economic growth, political stability, and democracy in the developing world to prevent the threat of instability arising from poverty and the spread of communism. Furthermore, the birth of USAID also marked a change in strategy for US foreign aid away from major industrial projects to other areas such as agriculture. Data from the mid-1960s show that only 10% of USAID went to industrial and mining projects (Wood 1986).

The early USAID’s development program was based on the development theory (also known as modernization theory) of Walt W. Rostow, President Kennedy’s Deputy Special Assistant to the President for National Security Affairs and President Lyndon B. Johnson’s Special Assistant for National Security Affairs (modern equivalent is National Security Advisor). Rostow’s 1960 book, *The Stages of Economic Growth: A Non-Communist Manifesto*, posited that economic development takes place in five stages: traditional society, preconditions for take-off, take-off, drive to maturity, and high mass consumption. Rostow argued that a stimulus, such as foreign assistance in the form of capital, technology, and expertise, is needed to propel the developing world beyond the precondition stage to the take-off stage. Beyond this latter stage, foreign aid would no longer be required because economic growth becomes an automatic process.

According to USAID, one of its crowning achievements under the FAA of 1961 was setting up country-by-country planning and long-term, rather than

short-term or crisis, development planning mechanisms. Also among the agency’s early benchmarks was the Alliance for Progress. The 1961–1973 Alliance for Progress was intended as a Marshall Plan for Latin America. The United States pledged \$20 billion in assistance through grants and loans (Scheman 1988). In comparison, the Marshall Plan dispensed \$13 billion mostly to Europe. The Alliance for Progress was the largest US aid program for developing countries up to that point. USAID hoped that the aid program would strengthen capitalism, economic development, and democracy in Latin America and strengthen ties between the United States and Latin America. Even though the Alliance for Progress was a bold step, it did not seem to improve the economic and political situations of Latin America extensively, and the program was abandoned. Yet, in retrospect, the record of the Alliance for Progress is better than perceived at the time.

USAID and the FAA have been subject to change over time as a result of US domestic politics and events in international affairs. For example, in the early 1970s, in part a counter-reaction to the Vietnam War and in part a reaction to perceptions that US foreign aid to developing countries was counterproductive and wasteful, Congress rejected President Richard M. Nixon’s foreign assistance spending authorization bills. The result was that Congress amended the FAA to ensure that USAID assistance would be reserved for the poorest sectors of developing countries with the notion that assistance ought to go to directly to the recipient nation’s needy population to provide for their basic needs. Under this new “Basic Needs” approach, Congress replaced old categories of technical assistance grants and development loans with new functional categories aimed at specific problems such as agriculture, family planning, and education. The aim of bilateral development aid was to concentrate on sharing American technical expertise and commodities to meet development problems rather than relying on large-scale transfers of money and capital goods. One significant 1973 amendment to the FAA, the Helms Amendment, prohibits the use of US funds for abortion services. The structure of the FAA remains much the way it was following the 1973 amendments. Another change in 1979 divested administrative power from the secretary of state to the administrator of USAID.

In 1984, President Ronald Reagan announced a more stringent US, policy on foreign assistance concerning abortion. Reagan announced a ban on US government financial support for US and foreign family planning agencies that were involved in any way with the provision of abortion in foreign countries. The ban, known as the Mexico City Policy, totally removed all US government funding from

international agencies that provided abortion procedures, provided abortion counseling, or advocated for women's abortion access anywhere in the world. Thus, a family planning agency's funding might have been cut off from its contraceptive/family planning counseling services in one country if it had any abortion-related activity in the same or in another country. President William J. Clinton rescinded this ban in 1993 through an executive order. The ban was reinstated by President George W. Bush in 2001.

Another major change in USAID direction occurred under the George H. W. Bush administration, was renewed with vigor under the William J. Clinton administration, and confirmed again by the George W. Bush administration. In response to the wave of democratic transitions of the late 1980s, USAID issued a new initiative in December 1990, the Democracy Initiative. USAID would focus its resources explicitly to help promote and consolidate democracy. Democracy assistance programs were implemented to be further strengthened in 1995. Moreover, reflecting the revolutionary changes occurring in the world during the late 1980s and 1990s, democracy, economic, and technical assistance programs were expanded to include USAID assistance to Russia and the post-Soviet states from 1993 onward. The promotion of democracy had always been given lip service by the United States and USAID, but during the 1960s, 1970s, and 1980s, the United States tolerated and even assisted authoritarian states as long as they were anti-Communist.

A second major change in direction for USAID was the 1993 Clinton administration's decision to contract out some USAID development programs. By 1998, half of all USAID funds for development assistance were delivered in the form of contracts. This means that although funds still are used in developing countries, the services are provided by US firms, which is where the funds actually go. This change was initiated to appease domestic US critics who claim US foreign aid is wasted money. If the funds go to US firms and create US jobs, critics may be silenced. Nevertheless, the policy has possible shortcomings such as too many large-dollar contracts awarded to too few contractors, recipient needs becoming less important than US domestic economic interests, an emphasis on fulfilling the contract rather than fulfilling the need, noncompetitive contract awards, and very low standards of acceptable contract performance (Berríos 2000). Widely reported examples, but not of aid contracts administered by USAID, of the tenacity and possible validity of some of these criticisms surrounds the 2002 to 2004 condemnation of the contracts awarded to Bechtel Corporation and Halliburton by the Pentagon for the rebuilding of Iraq.

Since September 11, 2001, antiterrorism became a priority of USAID. "Defeating terrorism is our nation's primary and immediate priority," asserted President George W. Bush in the White House press release entitled *National Strategy for Combating Terrorism* of February 14, 2003. USAID has joined the effort to deny terrorists resources and state sponsorship and to work toward amending the conditions of poverty and oppression that terrorists seek to exploit (Natsios 2004). The war on terrorism brought USAID new funding for projects in Afghanistan, Iraq, the Philippines, and Palestine, but the bulk of these have gone to Iraq and are not new developmental assistance projects. Many of the projects that are now labeled as targeted against fostering the conditions of terrorism are the same projects relabeled. Nevertheless, the new urgency of international development, even under the label antiterrorism, is not negative for the developing world. It means that USAID and like programs will be easier to justify to Congress.

President George W. Bush announced in a speech at the Inter-American Development Bank on March 14, 2002, that the United States would increase its core development assistance by 50% during the following three years, resulting in a \$5 billion annual increase over current levels. President Bush said that combating poverty is a moral imperative and that he has made it a US foreign policy priority. To meet this challenge, the president has proposed increased accountability for rich and poor nations alike, linking greater contributions by developed nations to greater responsibility by developing nations. Bush's proposal would mark the largest single-year increase in bilateral aid in decades (Brainard *et al.* 2003). Bush's proposal also marks a newfound interest in and emphasis on international development.

USAID priorities and programs since 2004 have included initiatives to build roads in Afghanistan; to train educators in Africa, Latin America, and the Caribbean; to prevent the trafficking and sexual exploitation of people, particularly women and children; to promote clean energy and electrification in developing nations; to promote economic development in Central Africa while conserving the region's forests and wildlife; to expand information and communications technologies in Senegal, Peru, and Indonesia; to empower community and faith-based organizations (under the Bush administration's controversial policy on faith-based initiatives); to address global climate change; to combat the spread of communicable diseases, particularly AIDS, tuberculosis, and malaria, in developing nations; to assist in the development of agricultural technology for families and communities to fight hunger in Africa; to promote economic growth and job creation in Central

America and Africa; and to improve access to clean water throughout the developing world.

## UNITED STATES–DOMINICAN REPUBLIC–CENTRAL AMERICA FREE TRADE AGREEMENT

For obvious geographical reasons, the United States has always been an influential actor in the evolution of political and economic life in Central America and the Caribbean, starting in the years after the United

States's independence in 1776. The Monroe Doctrine from US President James Monroe stated as early as 1823 that European powers could no longer intervene in America's countries, allowing the United States to become the main foreign power in the Western Hemisphere. By the early twentieth century, the doctrine had been extended to justify military intervention in the area and the implantation of semipro- tectorates.

Rapidly after independence in 1821, Central America's economies developed as export-led economies. Coffee and banana were the main export products and were central in the process of integrating the region in the world economy. The United States rapidly became the first buyer of the region's goods. As early as 1920, the American market was the destination of between 50% (for Costa Rica) and more than 85% (Honduras) of exports of the different countries of the Central American subcontinent. These two trends are to be kept in mind to understand the evolution of the relations between the United States and Central America.

A major attempt to break the export-led development scheme was envisaged in the 1960s and 1970s with the formation of the Central American Common Market (CACM) that promoted an import substitution model, whereby industrialization was seen as the main solution to solve the problems of underdevelopment. Unfortunately, for some political and economic reasons, this effort to ground economic development on a "closed regionalism," that is on the formation of an economic bloc that protected its internal markets, failed to reach sustainable success, even if the CACM raised the rate of the intraregional trade in relation with foreign trade from less than 7% in 1960 to more than 25% in 1970.

In the 1990s, two events occurred that would have significant importance in the process leading to the signature of the United States–Dominican Republic–Central American Free Trade Agreement (US-DR-CA-FTA). The creation of the World Trade Organization (WTO) in 1995 confirmed a tendency through the multilateralization of trade negotiations. Even if, at the same time, a lot of bilateral and regional trade agreements were signed, the ideological context of these integration treaties moved from a "closed regionalism" to an "open regionalism," where the regional trading blocs were seen as a step to integrate the globalizing economy rather than to isolate them like it was the case in the 1960s and the 1970s. Nevertheless, by 1999, the opposition between different groups of countries having divergent interests concerning the widening of the WTO (such as on the question whether an agreement protecting and promoting foreign investments should be

negotiated) showed all the limits of the multilateral framework.

The second event was the launch of negotiations for the creation of a Free Trade Area of the Americas (FTAA) at the beginning of the 1990s. The objective was to form a free trade zone that would enter into force at the beginning of 2005. The negotiations were much more difficult than anticipated, and by the years 2002 and 2003, it appeared more and more that this goal was impossible to attain.

Facing such difficulties in the multilateral and hemispheric forums, the administration of President George W. Bush, led by Trade Representative Robert Zoellick, launched a succession of bilateral negotiations leading to bilateral or regional free trade agreements. For Central American countries whose economies are historically dependent on the US market, the signature of a free trade agreement then became the sole opportunity to penetrate and consolidate their link to this market.

The negotiations between the United States and Central American countries began in January 2003, and a final agreement was signed in May 2004. Then, in August, the Dominican Republic joined the treaty that became the United States–Dominican Republic–Central American Free Trade Agreement that was yet to be ratified.

The treaty is relatively classical in the sense that it covers the same components shared by other free trade agreements ratified by the United States in the last decade. It provides facilitated access for goods and services, offers better protection for foreign investment (and the possibility for investors to get access to international arbitration in case of dispute with the state receiving their investments), and forces countries to apply rules regarding government procurements and the protection of intellectual property. It includes a chapter on labor and another on the environment that essentially mandate member countries to enforce their own legislation on these two subjects. Possibly the strongest critique of the agreement concerns the issue of agriculture. Central American farmers fear to be unable to compete with the highly subsidized American multinationals that will now have an easier access to their market.

## UNIVERSAL DECLARATION OF HUMAN RIGHTS

In 1948, the United Nations (UN) General Assembly adopted the Universal Declaration of Human Rights as an international commitment to humanity. Although many philosophers, statesmen, and religious leaders had argued throughout the ages for human rights, it took the genocide and crimes against humanity committed during World War II to finally make countries commit themselves to protecting human rights in a unified way.

The Nazi Holocaust of World War II resulted in the enslavement, torture, and murder of millions of people: Jews, Poles, gypsies, Soviet prisoners of war, homosexuals, the mentally and physically handicapped, and Nazi political opponents. Efforts to defeat the Axis powers became synonymous with the struggle to universalize human rights and punish those who violated them. President Franklin D. Roosevelt's Four Freedoms speech before the United States Congress in 1941 propelled the momentum toward universal recognition of inalienable human rights. In his address, Roosevelt proclaimed that all people were entitled to freedom of speech and expression, freedom of worship, freedom from want, and freedom from fear.

On April 25, 1945, as World War II was coming to an end, representatives from forty-six nations gathered in San Francisco, California, to form the United Nations and agree on the UN Charter. That UN Charter gave human rights a new international legal status. Its preamble identifies human rights as one of the four founding purposes of the UN. The UN Charter's first article declares that UN member states must work to "achieve international cooperation . . . in

promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language or religion.” Article 55 states that the UN will promote “universal respect for, and observance of, human rights and fundamental freedoms,” and Article 56 states that members “pledge themselves to take joint and separate action” to achieve that respect. The UN Charter does not, however, define human rights. Instead, its Article 68 mandated that the UN Economic and Social Council (ECOSOC) should create a commission for that purpose.

ECOSOC established the official eighteen-member UN Commission on Human Rights in June 1946. The commission elected US Delegate Eleanor Roosevelt as its chairperson, China’s P.C. Chang and France’s René Cassin as vice chairmen, and Lebanon’s Charles Malik as rapporteur. The UN Secretariat supported the commission’s work under the direction of John P. Humphrey, Director of the UN’s Human Rights Division. The commission formed a subcommittee to draft a universal human rights document. The subcommittee was composed of Roosevelt, Chang, Malik, and Humphrey as well as representatives from Australia, Chile, France, the Philippines, the Soviet Union, the Ukrainian SSR, the United Kingdom, Uruguay, and Yugoslavia.

The subcommittee completed the *Universal Declaration of Human Rights* on June 18, 1948, and on December 10, 1948, the UN General Assembly voted to adopt it without dissent. Forty-eight member states voted yes, while eight abstained (the Soviet bloc countries, South Africa, and Saudi Arabia). Two countries were absent and did not vote.

The declaration’s preamble recognizes that “the inherent dignity and . . . the equal and inalienable rights of all members of the human family [are] the foundation of freedom, justice and peace in the world.” It goes on to state that, “Member States have pledged themselves to achieve, in co-operation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms.” Because “a common understanding of these rights and freedoms is of the greatest importance for the full realization of this pledge, . . . the General Assembly proclaims this Universal Declaration of Human Rights as a common standard of achievement for all peoples and all nations.”

According to the declaration’s thirty articles, universal human rights include the right to life, liberty, and security of a person; freedom from torture and discrimination based on race, religion, ethnicity, or gender; freedom of thought, conscience, religion, opinion, speech, and press; the right to participate in

the political system, to own property, to marry and have a family, and to associate with others; freedom from arbitrary arrest and searches; the right to a fair trial, to confront prosecution witnesses, and to put on witnesses and evidence in one’s own defense; the right to work and to an education; and the right to maintain one’s culture and native language. Article 29 states that every person also has the duty to respect the rights and freedoms of others, and that governments may limit human rights listed in the declaration only for purposes of “meeting the just requirements of morality, public order and the general welfare in a democratic society.”

The UN adopted the Universal Declaration of Human Rights as an aspirational rather than as a legally binding document. The UN General Assembly intended the Universal Declaration to become the basis for a single, comprehensive human rights convention that states could formally ratify and thereby legally bind themselves. Unfortunately, the polarization of the Cold War prevented this from happening. The West, especially the United States, favored a convention containing only civil and political rights, while the Communist countries favored social and economic rights. The result was the creation of two separate documents: the Covenant on Civil and Political Rights (CCPR) and the Covenant on Economic, Social, and Cultural Rights (CESCR). Both were adopted by the UN General Assembly in 1966. A decade later, enough countries had ratified both for them to come into force. The United States ratified the CCPR in 1992 but has refused to ratify the CESCR.

Since its adoption in 1948, the Universal Declaration of Human Rights has grown in stature and respect. It has become a basic source for the development of the international law of human rights. Human rights advocates worldwide constantly invoke its principles, and numerous countries have incorporated it into their national constitutions. Consequently, the Universal Declaration has become the basis of domestic law of many states.

### UNTOUCHABLES (DALITS)

The Reservation Policy, India's version of Affirmative Action, has brought about great changes in the lives of India's Untouchables, now commonly called Dalits. Quotas in political bodies and educational institutions as well as in government service have created some political power but most importantly a sizable and vocal middle class. However, the development of pride and self respect has also resulted in rural attempts to better conditions that have frequently resulted in violence against Dalits, graphically reported in *Broken People*.

### Scheduled Castes, Harijans, Ex-Untouchables, and Dalits

The names used for the lowest castes in the Indian hierarchy of caste indicate the history of change. In 1935, the British government in India placed more than four hundred castes on a list or schedule to receive government benefits. These castes were discriminated against because they worked with leather, human waste, dead animals, or cremation grounds; in addition, they could also have been held to be polluting by birth in spite of work such as basket making and village guard. The benefits have been continued and expanded for ex-Untouchables, so called because the practice of "untouchability" was made illegal in the Indian Constitution in 1950.

"Harijan" was Mahatma Gandhi's term for the Untouchables, developed in 1932 when he campaigned against their depressed conditions, but "people of God" was rejected as a patronizing and useless name by politicized Untouchables. "Dalit" (meaning broken down, oppressed) began to be used proudly in the early 1970s in the context of a militant group of

Untouchables in the state of Maharashtra, Dalit Panthers, and the development of protest literature, Dalit Sahitya, a genre of literature that has been translated from the Marathi in *Poisoned Bread*. Dalit has become the standard word for modernizing Untouchables and has been used in the general press. All these words are in use in various contexts.

### The Basis of Untouchability

Untouchable castes have been in evidence since about the sixth century CE although the idea of despised and polluting individuals is apparent in the literature that followed the earliest text, the *Rig Veda*. A theory of purity (the Brahmins, the priestly caste) and pollution (the Untouchables), the top and bottom of a graded hierarchy, was the religious justification for denying water and temple rights, a place in the village itself, and even literacy until the modern period. The *varna* system of Brahmin, *Kshatriya* (warrior, ruler), *Vaishya* (merchant), and *Shudra* (workers) did not include the Untouchable, who was outside the hierarchy but in specific castes—these castes included *Chamars* (leather workers); *Pariahs* (drummers), whose name has come into English as "outcaste;" *Bhangis* (waste removers); and *Mahars* (village servants). The majority of Untouchables are and probably were part of landless agricultural labor.

Untouchables are not separate by race from higher caste Hindus, just as the Burakumin of Japan are not separated; these people of Japan are part of a despised leather-working and butcher group and are treated much as are treated Indian Untouchables, even though Japan has no caste system as such. Much of the treatment and progress of the Untouchables in India, however, bears similarities to that of the treatment of the African-Americans in the United States.

### Dr. B. R. Ambedkar (1891–1956)

Although India has had reformers and protesters against "untouchability" since the time of the Buddha, the most important was (and is) Bhimrao Ramji Ambedkar, a *Mahar* from Maharashtra who led the Untouchable movement in his day and now has become a symbol of progress and protest in most sections of India. Ambedkar secured an extraordinary education in the United States and England with the help of reformist non-Brahmin princes and used that education to bring legal redress to boycotts, to found

an educational system, to speak to all British parliamentary bodies, and, in a final triumph, to serve as chairman of the Drafting Committee of the Constitution of India and as law minister in independent India's first cabinet. After decades of protest against the caste system, Ambedkar also converted to Buddhism, taking millions of followers with him. His statue today, usually with one hand holding a book that represents the constitution, is seen in most town squares and Untouchable localities as a symbol of achievement. Resentment of Untouchable advances by higher caste Hindus is often shown by attempts to dishonor or destroy the statue. The Bahujan Samaj Party that honors Ambedkar, especially in the North, has superseded Ambedkar's Republican Party in importance.

## Progress and Problems

India's commitment to equality may be seen in the current position of a Dalit, K. R. Narayanan, as the very effective president of India, and the late G. M. C. Baliyogi, as speaker of the India Parliament, also a Dalit. Educational advances have resulted in the appointment of Dalits in both the vice chancellor and the registrar positions of the University of Mumbai. Meanwhile, more Dalits than higher caste Hindus are below the poverty line, and literacy rates are a consistent 15% below that of higher caste Hindus, with Dalit women lagging 24% behind. Village atrocities continue, and many Dalits fear that with privatization will come many fewer jobs for the ex-Untouchables.

## URBANIZATION: IMPACT ON DEVELOPMENT

It is conventional to measure the level of urbanization as the percentage of a country's population living in areas classified as urban and its level of development by calculating its per capita gross domestic product (PCGDP). Neither measure is perfect. Countries' definitions of what qualifies as "urban" vary, and GDP, the value of all goods and services produced in a specified time period, usually one year, is an estimate subject to frequent revisions. The population divisor is an annual interpolation between censuses, themselves prone to error; in addition, for purposes of comparison, different countries' PCGDPs have to be converted to a common currency, typically US dollars, and adjusted to correct for differences in purchasing power.

Subject to these caveats and qualifications, comparison of the two variables is illuminating. One method is to plot countries as points in a graph that has level of urbanization on the vertical axis and level of development on the horizontal axis. With data for 1950, the graph reveals a close correlation. A narrow band of points rises from countries that have low levels of both urbanization and development to countries that have high levels of the two variables. The band of points is contained within a floor and a ceiling to urbanization, both of which rise with development. The graph for 2000 is different. Whereas there still is a rising floor to urbanization as development increases, the ceiling is gone. Instead of a narrow band of points, there is a scatter throughout the triangle above the floor. Countries at low levels of development now display levels of urbanization that vary from low to the levels achieved in world's most developed regions. The change occurred because the second half of the twentieth century saw the decoupling of the relationship between urbanization and development in significant ways. Only the floor to the level of urbanization now rises with economic development.

## 1950: Development Drives Urbanization

In 1950, economists believed that simple causal relationships linked urbanization to economic development. On the demand side, Engel's Law was said to hold: because the income elasticity of demand for urban commodities is greater than that for rural commodities, the demand for urban commodities will increase faster than that for rural commodities as incomes rise. Thus, the society in which economic

development is occurring devotes more of its resources to urban activities. Complementing this, on the supply side, unbalanced technical change in which faster progress is made in manufacturing than in agriculture results in faster growth in manufacturing jobs and the attraction of migrant workers from agriculture to find urban employment. Hence, urbanization was said to be a consequence of economic development. The evidence was the pattern in the 1950 graph described in the previous paragraphs.

### **2000: Massive Overurbanization?**

The radical changes that unfolded between 1950 and 2000 suggest that this comfortable argument of Engel's Law may be of declining utility. Between 1950 and 2000, the world's urban population increased from 750 million to 2.86 billion and the urban percentage from 30 to 47. In the developing countries, the urban population increased from 392 million to 2.16 billion and the urban percentage from 20% to 42%. The number of cities in the world with a population of more than 1 million increased from 83 to 387—those in the developing countries increased from 43 to 297, or from 52% to 77% of the total. But much of this increase in developing country urbanization was in areas where the level of economic development, although increasing, remained low, belying the earlier idea that it is development that drives urban growth. Immigration to urban areas came from zones of rapid population increase marked by high fertility and the reduced death rates produced by improved medical services as well as from areas with growing pools of surplus labor caused by technological advance in the agricultural rather than the industrial sector.

In part, the early rush may have been encouraged by urban bias in the policies of newly independent developing country governments. Exchange rates, tariffs, and tax policies penalized rural dwellers and favored the urban elite. The consequence has been "overurbanization," the growth of cities to sizes unsupported by their traditional economic bases, with much resulting poverty and distress. The problem is most apparent in sub-Saharan Africa, but elsewhere, faced by the same immense challenges, the response has been remarkable. Price distortions have been reduced, often through reforms introduced by structural adjustment programs imposed by the World Bank and International Monetary Fund (IMF). More important, the new urban populations are inventing specializations that are turning the theory of

the 1950s around: instead of development driving urbanization, urbanization now is beginning to drive developing-country growth.

### **The New Dynamic: Cities Propel Growth**

Many features of life in the new cities are creating conditions conducive to growth. There are substantial health advantages to urban living compared with the rural alternative, as evidenced by greater declines in the mortality rate in urban areas. Urban areas offer better infrastructure and easier access to health care services. In some developing countries, chronic and degenerative diseases, accidents, and injuries are becoming more important than infectious diseases as causes of death, a sure sign that the mortality transition that accompanies development is well advanced. Large urban areas also offer marked advantages in the provision of piped water, waste disposal, electricity, and schools. They also influence individual and family perceptions of economic costs, benefits, and uncertainties. New urban opportunities are affecting women's wage rates and, through wages, the opportunity costs of time spent in child care. These opportunity costs have long been identified as important factors in fertility decisions. In many developing countries, the other half of the demographic transition—reduced fertility—is now beginning to take hold. Parents also are becoming aware of the economic returns to schooling and are increasingly willing to forego high fertility to have fewer but better-educated children. Such increased investment in human capital pays off in the creation of a more capable labor force that can attract economic activities from elsewhere, first the factories seeking low money wages and later those that rely on education and skills. This in turn increases urban income growth, which raises government revenue and provides the means to further improve public services.

With improved preconditions for growth, other economic factors begin to play their role: initially, the benefits of increased returns to scale and, subsequently, innovation and agglomeration economies. When production is characterized by increasing returns to scale—a doubling of inputs yielding more than a doubling of output—firms are motivated to concentrate their production spatially. Concentration of production implies concentration of the labor force. Two varieties of concentration are evident. Localization economies arise when the firms of a given industry cluster spatially, permitting the suppliers of inputs tailored to that industry to save on transport

costs and allowing for further specialization in the production of inputs. Urbanization economies arise with the cross-industry clustering of firms and the suppliers of inputs used across a variety of industries. When firms are spatially clustered, workers can search among them more efficiently, expending less time and fewer resources in locating jobs that are well matched to their human capital. Consumers can benefit from the increased array and quality of differentiated goods.

Layered on top of localization and urbanization are new types of agglomeration economies produced by spillovers of ideas and technologies both within and between industries. Such spillovers may be produced when one firm is able to observe the innovations, experiments, production processes, or competitive strategies of another. Workers carry such innovative ideas with them as they circulate among firms. They may also arise from the stimuli provided by diversity so that creative energies in one industry are stimulated by the collision of disparate ideas and facilitated by developments in other industries: creative ferment occurs when entrepreneurs, scientists, artists, and firms find themselves struck by analogies and by the observation of activity in spheres that overlap but do not wholly coincide with their own. These benefits of urban diversity are greatest in the initial stages of product development. Once a production process becomes standardized, some of its elements can be relocated to sites where wages and rents are lower. Services and production in high-technology sectors derive special benefits from economies of diversity, as is evident on the remarkable scale of change in the cities of Asia, particularly those of the Pacific Rim. Initially spurred by multinational corporations' search for cheap productive labor, growth in cities as diverse as Bangalore in India, Shenzhen in southern China, and Kuala Lumpur in Malaysia now is driven by technology and innovation, as it was earlier in Singapore and Hong Kong and throughout South Korea and Taiwan. In such cases, cities have been able to mobilize great quantities of human capital, to attract foreign investment, and to invent new economic specializations in a short period of time, becoming the engines driving their nations' economic growth.

The largest developing country cities now are joining the ranks of the "World Cities" that have pivotal roles in the global economy. Among these, New York, London, and Tokyo occupy the uppermost tier because of their dominance of finance and specialized services, their importance as sites of production and innovation, and their role as markets for new products and services. There are, however, as many as thirty other places, many in the developing

world, that now play a central role in the internationalization of capital, production, service, and culture.

## URBANIZATION: IMPACT ON ENVIRONMENT

The world's urban population increased fourfold between 1950 and 2000, with most of the increase occurring in middle- and low-income developing countries (Table 1). A growing share of this increase was in cities with more than one million inhabitants, for which the developing countries accounted for 77% of the world total of 387 in 2000, compared with 52% of a total of 83% in 1950 (Table 2). Megacities with a population of more than five million increased from 8 to 39 in the same time span, with 30 in the developing countries in 2000 compared with only 3 fifty years before (Table 3). The United Nations (UN) predicts that by 2010, more than half the world's population will live in urban areas, growing to two-thirds by 2030 when the developing countries are expected to account for 83% of the world's urban population of some five billion.

What are likely to be the environmental consequences of this massive surge of big-city population concentration in the developing countries? There are no definitive answers because little monitoring and even less analysis has been undertaken in these countries. One must rely on research conducted in high-income nations, recognizing that the consequences may differ because much of the developing world is characterized by lower incomes, different physical environments and cultures, and frequent absence of effective urban planning and environmental

regulation. Developed-world research reveals that modifications of the physical environment produced by rapid urban growth occur at three geographic scales: local, regional, and global.

At a local scale, urban development alters the nature of the Earth's surface. The natural surface of soil, grass, and trees is replaced by brick, concrete, glass, and metal at different levels above the ground. These artificial materials change the nature of the reflecting and radiating surfaces, the heat exchange near the surface, and the aerodynamic roughness of the surface.

Among the most important local effects are the land-use changes that affect the hydrologic regime (the system of rivers and streams and the patterns of runoff); changes in peak-flow characteristics (the scale and speed of runoff after storms); changes in total

runoff; changes in water quality; and changes in hydrologic amenities (the desirability of water bodies for recreation). After urbanization, runoff occurs more rapidly and with a greater peak flow than under nonurban conditions. Urbanization increases the impervious land area, and the urban area may be served by storm sewers. Both increase the peak

Table 4: Effects of large cities on environment<sup>1</sup>

Element	Compared to rural environs	
Contaminants	Condensation nuclei (particles that serve to attract condensation)	10 times more
	Particulates (e.g., soot)	50 times more
	Gaseous admixtures (mixtures of polluting gases)	5–25 times more
Radiation	Total on horizontal surface	0–20% less
	Ultraviolet, winter	30% less
	Ultraviolet, summer	5% less
	Sunshine duration	5–15% less
Cloudiness	Clouds	5–10% more
	Fog, winter	100% more
	Fog, summer	30% more
Precipitation	Amounts	5–15% more
	Days with less than 0.20 inches (5 millimeters)	10% more
	Snowfall, inner city	5–10% more
	Snowfall, lee of city	10% more
	Thunderstorms	10–15% more
Temperature	Annual mean	0.5–3.0°C more
	Winter minimums (average)	1–2°C more
	Summer maximums	1–3°C more
	Heating degree days	10% less
Relative humidity	Annual mean	6% less
	Winter	2% less
	Summer	8% less
Wind speed	Annual mean	20–30% less
	Extreme gusts	10–20% less
	Calm	5–20% more

<sup>1</sup> Landsberg (1981).

discharge: maximum sewerage and imperviousness result in peak discharges that are more than six times greater than those in nonurbanized conditions. In turn, sharper peak discharges increase flood frequencies and the ratio of over-bank flows. Urbanization thus increases the flood volume, the flood peak, and the flood frequency, and the flushing effect of storm water discharge increases turbidity (the mixing of sediments in the water) and pollutant loads. On the other hand, sediment loads may fall. The channel response will therefore shift from aggradation (build-up of sediment deposits) to bank erosion. Water pollution changes the quality of downstream resources, the ecology of the riverine environment, and the amenity value of the river bank or estuary. The effects become pronounced downstream of larger cities, where natural flushing is incapable of preventing long-term damage, and in coastal bays and estuaries, depending upon the city's location.

At the scale of the metropolitan region, by generating large amounts of heat artificially and by altering the composition of the atmosphere via emissions of gaseous and solid pollutants, big cities begin to create

their own climates (principal changes are noted in Table 4).

At certain times of the year in midlatitude cities, artificial heat input into the atmosphere by combustion and metabolic processes may approach or even exceed that derived indirectly from the sun. The heat island that results serves as a trap for pollutants. Other things being equal, the temperature difference between the city core and the rural periphery increases with city size; the difference is small and ephemeral in cities of a population of 250,000 or less but is substantial and longer lasting in larger cities. The heat island expands and intensifies as the city grows, and stronger and stronger winds are needed to overcome it. Wind speeds of 5 m/sec<sup>-1</sup> (12 mi/hr) can eliminate the heat island in a city of 250,000, but speeds of 10 m/sec<sup>-1</sup> (22 mi/hr) are required for a city with a population of one million, and speeds of 14 m/sec<sup>-1</sup> (32 mi/hr) are required for a city with a population of ten million. Yet, the surface roughness of the city serves to reduce wind speeds and inhibit this ventilation: average wind speed may be reduced as much as 30% by a big city. In cities with a population of more than ten million, the

mean annual minimum temperature may be as much as 2.5°C higher than that of the surrounding rural periphery. This difference is much greater in summer than in winter.

The causes of changes in climate in cities are two-fold, both of which are seasonally dependent. In summer, the tall buildings, pavement, and concrete of the city absorb and store large amounts of solar radiation, and less of this energy is used for evaporation than in the countryside because of the high runoff. The stored energy is released at night, warming the urban air. In winter, human-made energy used for heat and light produces warming, yet the blanket of emissions reduces incoming solar radiation by as much as 20% (a phenomenon known as heat rejection). When the Boston-Washington megalopolis reaches a population of 50 to 60 million, it will be characterized by heat rejection of 65 cal/cm<sup>2</sup>/d. In winter, the rejection is 50% of the heat received by solar radiation on a horizontal surface; in summer, this number decreases to 15%. In Manhattan, the heat produced by combustion alone in winter has been estimated to be 2.5 times the solar energy reaching the ground. This energy is trapped by the blanket of pollutants over the city, including particulates, water vapor, and carbon dioxide, and is reemitted downward to warm the ambient air.

In addition to the heat island, other regional-scale climatic effects—all increasing with city size—include greater cloudiness, fog, dust, and precipitation but lower humidity. When wind dissipates the heat island, a downwind urban heat plume is detectable in the atmosphere. Along this plume, there are increased precipitation, thunderstorm, and hail probabilities, often quite distant from the city.

Beyond such regional-scale consequences, urban activities are a major source of gaseous discharges into the atmosphere that may affect future global climates. Urban contributions to sulfur and carbon dioxide levels in the atmosphere are believed to be contributing to global warming. If warming increases, polar ice sheets will be reduced, leading to rising sea levels. Such changes are likely to be of greatest consequence for major coastal cities. Fluorocarbon emissions have been reduced significantly in the developed world but have already contributed to ozone depletion, producing the southern hemisphere “ozone hole” that has permitted increased ultraviolet radiation to reach the earth’s surface, raising skin cancer rates in southern latitudes.

Lack of effective environmental regulations in developing countries means that their cities are replacing those of the developed world as the principal sources of sulfur and carbon dioxide emissions and of fluorocarbons. Thus, it is the rapid urbanization of

the developing world that is most likely to propel global environmental change in the years ahead.

## URUGUAY

With an area of 776,853 square feet (72,172 square meters), Uruguay is the second smallest republic in South America. Its topography is characterized by the *cuchillas* (rolling hills) and the grasslands, which are an extension of the pampas.

With land ideally suited for raising cattle and sheep, Uruguay’s economy is almost entirely dependent on livestock products. However, Uruguay’s 3.4 million inhabitants are not rural dwellers. More than 75% of its population is considered urban. Uruguay’s capital, Montevideo, contains more than half of the country’s population.

Uruguay’s population is not as racially diverse as that of other Latin American nations. As a result of a large scale European migration in the late nineteenth century, Uruguay’s population is 88% caucasian, 8% mestizo, and 4% black. It has one of the highest literacy rates in the world at 98% and one of the highest life expectancy rates in Latin America at 76 years of age. Although its GDP purchasing power parity per capita (\$12,600) is high by Latin American standards, 16% of its population is unemployed.

During the Spanish colonial era, Uruguay was just a buffer zone between Spanish-held Argentina and Portuguese-controlled Brazil. When wars for independence spread throughout the Spanish Empire, *gaucho* patriot, José Gervasio Artigas, drove the Spaniards out of Uruguay in 1816, but Portugal annexed it to Brazil. In 1822, when Brazil became independent, it remained part of the Brazilian Empire. In 1828, the Brazilians withdrew, and two years later the *República Oriental del Uruguay* was proclaimed.

The Uruguayan Republic, however, was plagued by political instability as the *Colorado* (Red) faction, composed of liberal-minded city dwellers, and the *Blanco* (White) faction, composed of conservative-minded landowners, battled for political control, plunging the country into civil wars.

In the twentieth century, conditions would change in Uruguay with the rise of José Batlle y Ordóñez. President from 1903 until 1907 and from 1911 until 1915, Batlle became the most influential politician in Uruguayan history. His plans for state-sponsored social welfare programs, state participation in key economic sectors, and his system of political proportional representation were crystallized in the constitution of 1919.

The *Batllista* economic program of state involvement benefited Uruguay enormously during the 1920s as demand for Uruguayan commodities rose in the world market. The world depression of the 1930s negatively impacted Uruguay's economy. To deal with the crisis, a new constitution was proclaimed, eliminating the *Colegiado*, a nine-member Uruguayan National Council that limited presidential powers. However, the *Batllista* socioeconomic system was retained.

World War II brought a period of prosperity for Uruguay as Allied dependency on Uruguayan products increased. Postwar Uruguay became the model country in Latin America for both democratic and socioeconomic progress. In 1951, Uruguayans held a plebiscite for a new constitution calling for a nine-member executive Uruguayan National Council with no president. Based on proportional representation, the council's chair rotated on a yearly basis.

During the early 1950s, the Uruguayan economy continued to grow, for Europe was in need of Uruguayan imports, and the Korean War kept its commodities in high demand. While US investments in Uruguay were minimal, diplomatic relations with the United States continued to improve as Uruguay saw the United States as a bulwark against Perónist expansionism in the region.

Juan Domingo Perón's overthrow in 1955 ended the Argentine menace. However, a more serious situation developed. Cheaper synthetic wool substitutes cost Uruguay 50% of its export revenues. In addition,

demand for Uruguayan beef plummeted as a result of a hoof-and-mouth disease.

Faced with keeping the welfare state, the National Council turned to inflationary measures. As inflation reached astronomical proportions, a political crisis developed in 1966, and Uruguayans turned to a new constitution that replaced the National Council with a strong presidency.

In 1967, Uruguay asked the International Monetary Fund (IMF) and the World Bank for help. It received a \$500 million loan but had to incorporate a plan containing austerity measures. This action caused labor strikes and civil unrest. By the early 1970s, both Uruguayan democracy and the *Batllista* system were in danger. The *Tupamaros*, an urban guerrilla group, began to destabilize the country through terrorist attacks. Voters showed their dissatisfaction with both the *Colorado* and *Blanco* parties when in the elections of 1971, the newly created *Frente Amplio*, a leftist learning coalition, received 30% of the Montevideo vote and 18% of the nationwide vote.

Shortly after the inauguration of the President Juan María Bordaberry in 1972, the *Tupamaros* launched a new wave of terrorist attacks. They wanted to provoke the military into conflict with hopes that a popular uprising against military intervention would result in the establishment of a Uruguayan Marxist state.

Unable to stop the urban violence, Bordaberry suspended civil liberties, gave the military a free hand to deal with the *Tupamaros*, and virtually became a puppet. In 1976, the military replaced him with Aparicio Méndez, another puppet president.

Scores of *Tupamaros* were imprisoned or killed, but innocent civilians suspected of being guerrilla sympathizers were jailed and tortured. Although the *Tupamaros's* hope for a popular uprising never materialized, they succeeded in practically destroying Uruguayan democracy. In 1981, Lieutenant General Gregorio Alvarez assumed direct control as president. The military regime, successfully having eradicated the *Tupamaros*, hoped to stay in power until 1987. However, a gargantuan debt, as well as international condemnation, prompted the regime to return power to constitutional government in 1984.

In 1984, *Colorado* candidate Julio María Sanguinetti was elected president. Since 1984, three *Colorado* and one *Blanco* party members have occupied the presidency. Although the state still plays a major role in the economy, both *Blanco* and *Colorado* administrations have conducted a limited privatization policy, and in 1995, Uruguay joined MERCOSUR, the Southern Cone Common Market.

As a result of economic crises faced by its major trading partners, Brazil and Argentina, the Uruguayan economy has been adversely impacted since

2002. However, it is expected to recover as a result of a weakened dollar, low interest international loans, and high prices for Uruguayan products. As the pendulum swings, Battle's dream has not disappeared; rather, it waits for better times.

## UZBEKISTAN

Uzbekistan is situated at the very center of Central Asia. It is the most populous of the former Soviet Central Asian states, holding about twenty-five million people. Roughly the same size as California in area, Uzbekistan lies at about the same latitude as Italy and experiences a continental climate. Much of the country is occupied by the Kyzyl Kum (Red Sand) and Kara Kum (Black Sand) deserts in the west, and most of the remaining land is arid steppe. Few locations receive more than ten inches of precipitation yearly, and agriculture is made possible only by the presence of two great rivers, the Amu Darya and Syr Darya, whose waters supply extensive irrigation works. The southeastern reaches of the country are mountainous, and this region contains the Fergana Valley, the country's most important agricultural area.

Uzbekistan has been part of the Muslim world for more than 1,200 years, but was absorbed into the Russian empire in the mid-nineteenth century. The

Tsar's forces captured Tashkent, the largest city, in 1865, and political control of the region remained in Russian (later Soviet) hands for about 125 years. The imprint of Slavic culture remains strong, as Russian is widely spoken and the Muslim prohibition against alcohol is seldom observed. Independent Uzbekistan faces enormous challenges in the wake of Soviet collapse. These include widespread environmental degradation, a rapidly expanding population, a stagnant economy only tenuously connected to the global economy, widespread political instability, and human rights abuses.

In the wake of World War II, Uzbekistan became the Soviet Union's primary source of cotton, which not only satisfied domestic demand but also provided badly needed foreign earnings when sold on the international market. After 1960, a vast amount of new acreage was opened to the production of "white gold," as the lucrative crop came to be called by Central Asians. The water for increased production came from the region's streams, primarily the Amu Darya and its smaller cousin, the Syr Darya. The "monoculture" of cotton had two extremely detrimental effects on Uzbekistan: catastrophic environmental damage and a retardation of economic development, as the agricultural sector was emphasized over the industrial and service sectors for most of the period after 1945.

Environmental degradation took its most obvious form in the demise of the Aral Sea. As recently as 1960, the Aral Sea was the world's fourth largest lake, but overuse of the rivers supplying it (the Amu Darya and Syr Darya) resulted in an unprecedented decline. Satellite images from the late 1990s reveal that the area covered by the Aral Sea is one-half that of the early 1960s, and a host of health and economic problems accompanied this collapse. As the sea shrank, its salinity increased, ultimately killing most of the fish and subsequently destroying the commercial fishing industry, which in turn resulted in the loss of thousands of jobs. The disaster has had a dramatic impact on the health of those around the sea as well, with tens of thousands of people suffering from increased incidence of certain cancers, blood diseases, and respiratory ailments.

After becoming an independent state in 1991, the Uzbek administration remained under the control of the former Uzbek Communist Party First Secretary, Islom Karimov. During Karimov's tenure, full economic integration with the global economy has failed to materialize, and as of 2001, the country's currency unit, the som, remains nonconvertible in international financial markets. Official statistics for poverty levels and unemployment in Uzbekistan are generally low, but probably significantly underreported is the actual magnitude of these problems. The transition from

the Soviet-era command economy to a free market system has followed a policy of “gradualism,” and much of the agricultural and industrial sectors remain in government hands.

The potential for economic development in Uzbekistan is high if the disadvantages of distance from international markets can be overcome. Sizeable deposits of gold and natural gas are present and serve as important sources of foreign earnings. The country has a reasonably well-developed infrastructure, highlighted by a recently expanded and remodeled international airport in Tashkent. In addition, about 40% of the population is urbanized, a fairly high percentage in the region, and approximately 10% of the workforce holds a postsecondary degree. However, to date, the amount of foreign investment has fallen short of expectations, and there is little internal investment capital available. Much of the potential for tourism remains undeveloped although Uzbekistan contains many important historical sites and much natural beauty.

Prior to 1991, Uzbekistan had never existed as an independent political entity. Having emerged from the Soviet empire, the new state has not implemented stable traditions of democratic government and has been slow in developing institutions typically associated with civil society. The government is authoritarian, the media is tightly controlled by the administration, the judiciary is not independent of governmental influence, and the few opposition parties that are represented in the *Oliy Majlis*, or parliament, are in fact pawns of the ruling faction. Opposition groups that formed in the late 1980s, such as *Birlik* (“Unity”) and *Erk* (“Will”) have been driven underground and their leadership forced into exile.

The process of constructing a national identity is ongoing in Uzbekistan. This process involves

resurrecting and honoring the deeds of historical figures connected to the country’s past, such as Amir Timur (Tamerlane), Babur, and Alisher Navoi; promoting Uzbek as a national tongue; and reconnecting to Islam. The latter movement, however, is tightly controlled by the government, which asserts that a “fundamentalist” threat to the nation’s stability has grown during the 1990s, a claim bolstered by mysterious bombings in Tashkent in 1999 and subsequent incursions by Islamic insurgents in the Fergana region. Critics of the Karimov regime argue that the dangers of Islamic radicalism have been dramatically exaggerated by the government to justify a general crackdown on dissent and to silence those who wish to promote a more open, democratic society.

## VÄHI, TIIT

Tiit Vähi was born on January 10, 1947, in Valga, Estonia. Vähi received a degree in engineering from Tallinn Technical University in 1970. Upon graduation, Vähi pursued a management career with the Valga Trucking Company. Vähi emerged as one of the leaders of the Estonian Popular Front at the beginning of the national independence movement in 1989. Later in the year, Vähi was appointed Minister for Transport and Communications, where he embarked on a mission of improving transit relations with the Nordic countries and the other Baltic states. Vähi was crucial to the realignment of Estonia's infrastructure, such as seaports, railway hubs, and airports to Estonian control after fifty years of Soviet control.

Vähi became Prime Minister on January 30, 1992. Vähi's priorities included the implementation of policies to steer Estonia towards a Western market economy. The Estonian *Kroon* became the official currency of the nation in June 1992, effectively severing fiscal ties to Russia. Vähi played an essential role in the creation of the Estonian Privatization Agency, responsible for the denationalization of businesses and industries. In accordance with his agreement with the transitional government, Vähi did not seek a parliamentary position in the September 1992 elections.

Amidst public discontent about the harsh, sweeping economic reforms pursued by the conservative reformer Maart Laar and his government from 1992–1994, former communists won the largest number of seats in parliamentary elections in 1995. A coalition government was formed, and President Lennart Meri

appointed Vähi as Prime Minister. Vähi's government was comprised of political parties that held diametrically opposed views on major issues such as tariffs. Ultimately, this led to a persistent sense of governmental instability during a critical period in Estonia's economic and political transformation. Despite some public hope for a softening of the economic reforms implemented by the Maar government and renewed relations with Russia, the government continued implementing institutional reforms, thereby strengthening ties with Western Europe. The coalition was unable to deliver on campaign promises to increase social benefits and higher pensions. In October 1995, however, Vähi's government collapsed amidst rumors of illegal surveillance and wiretapping by Interior Minister Edgar Savisaar.

Despite the cabinet scandal, Vähi remained prime minister and created a new cabinet. 1996 proved to be a tumultuous year for the government. The results of local elections in the nation's capital, Tallinn, created great political difficulty. The conservative reformists expanded the local coalition to the national political arena, leaving Vähi governing in a minority position. In late 1996, Vähi introduced his "Ten Commandments," promising a more "socially oriented" market economy in the hopes of rejuvenating public support for his government, which had dwindled to 5%.

Ultimately, Vähi lost political acumen in 1997 amidst allegations of unethical privatization while he was head of Tallinn's City Council from 1993 to 1995. Laar revealed that under Vähi's watch, nearly

## VÄHI, TIIT

two hundred apartments in the city had been sold to prominent individuals for as little as 5% of their market value. Despite claiming innocence, Vähi resigned as prime minister prior to a scheduled vote of no-confidence in February 1997.

## VANUATU

### Location and Description

The Republic of Vanuatu consists of over eighty islands located in the South Pacific with the capital, Port Vila, on Efate. The aggregate landmass is twelve thousand square kilometres, and it claims a territorial coastal zone of twelve nautical miles and a two hundred-mile exclusive economic zone.

Volcanic activity is apparent with frequent minor tremors. A tropical climate is moderated by the south-east trade winds. The area is subject to cyclones, and in recent years they have severely affected the economy.

### Colonial Past and Social Development

The former New Hebrides became independent on July 30, 1980. The colony had been jointly ruled by both Britain and France by a administration known as the Condominium, a dual system in which every police post had an officer of both nationalities. There were two education systems, two legal systems, and two official languages. Two national flags flew side by side, and great pains were taken to ensure they were exactly the same height.

Unofficially, there was intense rivalry between Anglo and Gallic functionaries. This extended to the indigenous population, some of whom saw themselves as either black Frenchmen or black Englishmen. These rivalries were evident in secessionist revolts

(with covert French support) on Espiritu Santo and Tana at independence.

Colonial rivalry was matched by local rivalries. Language and cultural differences not only separated islands but the islanders themselves. The island of Tana alone has four distinct languages (as well as English, French, and Bislama the *lingua franca*). A sense of national unity was something new that had to be carefully fostered.

### Economic Development

One result of the end of World War II on Vanuatu was the John Frum cargo cult. Cargo cults, indigenous to Melanesia with roots dating back to the nineteenth century, believe that the spirits of dead ancestors will return with cargoes of material goods for their descendants. The so-called cargo cults received a boost during the Second World War, when the Allies air-dropped large amounts of cargo onto the South Pacific Islands. At the end of the war, a figure known as Jon (sometimes John) Frum allegedly appeared on the island of Tana. Some people believe that he was a Vanuatu native posing as a god; in any case, his followers believe him to be a messianic figure who lives in a nearby volcano with an army twenty thousand strong. His message was to throw away money, slaughter the animals, and feast, as all needs would be met by the goods that he would provide. The Jon Frum movement survives to the present day, with Jon Frum Day celebrated annually on February 15; the movement even has its own political party.

After independence Vanuatu produced a development plan that aimed at self-reliance in fifteen years. The measure of success was to be Vanuatu's ability to match imports with foreign exchange earnings and fiscal requirements from domestic revenues. The plan identified three areas of concern: domestic savings were inadequate for investment, there was a gap between revenue and expenditure, and the cost of imports was far greater than the country earned in exports.

The plan was to encourage the private sector and the emergence of "national entrepreneurs" (National Planning Office ND). Foreign aid was to be invested in productive infrastructure to increase exports and substitute domestic product for imports. Finally, the government intended to stabilise expenditure through wage restraint, a ceiling on bureaucracy, increased efficiency, and to "stabilise the levels of social infrastructure investment."

However, for most of the 1980s, the economy stagnated and economic growth was minimal. Economic

growth averaged 1.6%, while population grew by 2.9%, leading to a fall in the standard of living. There were good years; 1984 saw a sharp rise in copra prices which, combined with increased tourism, pushed growth up to nearly 7%, giving a sound balance of payments position and allowing a build-up of foreign exchange reserves. However, Vanuatu's vulnerability to fluctuations in world markets was demonstrated from 1985–1987, with zero growth due to the collapse of copra prices and a decline in tourism.

Economic development is hindered by a number of factors. The distance to both export markets and between islands is a handicap. Lack of skilled labour caused a reliance on high cost expatriates. Most importantly there are few exports other than primary produce—copra, kava, beef, timber, coffee—while imports include machinery, equipment, food, and fuel. The dependence on imported fuels and the imbalance between imports of value added goods and export of agricultural products is reflected in the balance of trade. The 1999 estimates had exports at \$25.3 million, while imports were \$77.2 million.

## Current Economic Situation

Subsistence agriculture remains highly important, providing for 65% of the population. Fishing, off-shore financial services, tourism, and copra produce much of the foreign exchange. There is a small light industrial sector for the domestic market. The gross domestic product (GDP) comprises agriculture, 20%; industry, 9%; and service industries, 71%. The labour force consists of 65% engaged in agriculture; 32% in the services industry, and only 3% in industry. Industries include food and fish freezing, meat canning, and wood processing. GDP growth averaged less than 3% during the 1990s. The real growth rate in 1999 was –2.5%. Despite several attempts at government reform and implementation of policies, the development plan has failed to meet its objectives.

The assumptions upon which the development plan was based are those of the International Monetary Fund and the World Bank—an open economy based on private sector activity, increasing gross national product (GNP), and exports balancing imports. Many people now question whether this development model is appropriate to a small country like Vanuatu. It is hard to see how exports could ever equal imports in value. Nor does GNP measure many of the subsistence and community activities that make up the greater part of the local economy.

The development plan aimed to balance economic development with social responsibility and the cultural and environmental heritage. Yet the development process lessened the value of cultural produce. Prestige became a key factor with people preferring imported canned fish, canned meat, and rice to what they caught or grew themselves. Similarly, ownership of motor vehicles and outboard motor boats has become an important aspiration for many people in rural areas with demand for these items closely related to their value as prestige items. In effect, local “production” is being replaced by imports with a detrimental effect on both traditional culture and the balance of payments.

Two factors give some hope for Vanuatu's development in the broad sense. First, the colonial experience combined with local differences has made the people adept at evaluating different ways of doing things and selecting the method that best suits their needs. Second, there are organizations such as Jon Frumm, which has evolved from a cargo cult into a strong cultural movement that counters the “prestige” alternatives and values traditional production and custom. Perhaps Vanuatu can find some middle ground between the dictates of a full-blown Western economy and the pragmatic dictates of a very small country.

## VARGAS, GETÚLIO

Getúlio Dornelles Vargas (1883–1954) was born in São Borja, in the far southern, cattle-raising state of Brazil, Rio Grande do Sul. He would become

the most significant political leader in modern Brazilian history. Although socio-economic change was a crucial means by which he obtained and kept power; of itself it was not his guiding objective. Such change served as but a means to his ultimate end, controlling with consummate skill the forces of political power.

The son of a general, Vargas graduated from law school in 1907. Elected to the state legislature and then the national congress, he achieved the coveted position of minister of finance in 1926. Elected governor of Rio Grande do Sul in 1928, he became a candidate for president in 1930. Defeated by powerful traditional forces, he rejected the results of the election after the assassination of his vice presidential running mate. Leading a coup to overthrow the incumbent president, Vargas became provisional president of Brazil at the end of 1930.

He faced a worldwide economic depression and plummeting prices for Brazil's most important export product, coffee. Vargas moved to consolidate his hold on political power and to manipulate or adapt to the social and economic changes developing in the country. Under a new constitution, he was elected president in 1934. Suppressing political uprisings from the communist left and fascist right, he established a dictatorial regime in 1937, the "New State," and remained in power until 1945.

For fifteen years, he molded the society and economy of Brazil. He organized unions under the federal government. He won new political adherents by authorizing a minimum wage, creating health, vacation, and retirement benefits for workers, and granting the vote to women.

As Europe prepared for war, it sought Brazilian raw materials, particularly iron for armaments and other manufactured products. With the Brazilian economy thus reignited, Vargas acted to diversify it through development of national industry, particularly iron and steel manufacturing. Thereby, further corporate segments of labor and business came to support him.

Vargas emphasized nationalism and development of cultural activities for the political ends they could serve. By projecting Brazil as a united nation under a beneficent federal government, he prepared the country for war and appeared as a defense against subversion and divisiveness. The emerging force of radio became a vehicle to propagate nationalism and the benefits of the Vargas government. In conjunction with the emerging record industry, radio also projected popular Brazilian culture, highlighting samba dance music and Carnival festivities.

The defeat of fascism at the end of World War II in 1945 meant that Vargas could no longer remain in

power; and he was removed by a military coup. However, in 1950 he won reelection to the presidency and was inaugurated at the beginning of the following year. Pledging to develop Brazil's petroleum industry as a government-controlled corporation, he provoked the ire of military and civilian political forces on the right. They exposed corruption in his administration, and the army prepared to remove him from office. To prevent that humiliation from occurring once again, he committed suicide on August 24, 1954.

### VELVET REVOLUTIONS

On November 16, 1989, students in Bratislava, Czechoslovakia, began a peaceful protest against the communist rulers of their country. One day later, another group of peacefully protesting students—this time in Prague—were beaten by the government's riot police. The treatment of the second group of students triggered a series of peaceful anti-government demonstrations involving hundreds of thousands of Czech and Slovak citizens.

The Czechs and Slovaks had taken to the streets in peaceful protests before—in the famed Prague Spring of 1968. But unlike in 1968, Soviet tanks and troops did not occupy the nation to crush the nascent rebellion. This time, on November 28, 1989, the Czechoslovak communist government announced that it would yield exclusive power, power that it abandoned altogether by the end of December.

Thus, in a nearly bloodless upheaval, the people had thrown off the Soviet shackles that had oppressed them since World War II. By demonstrating solidarity without violence, they had brought a formerly mighty empire to its knees and won.

The Czechoslovak revolution was later called the Velvet Revolution—a term that was, in time, applied to the series of political changes that shredded the Iron Curtain and conceived democratic governments throughout Central and Eastern Europe.

## Rust in the Iron Curtain

Czechoslovakia and other countries in Central and Eastern Europe had been locked behind what Winston Churchill called an “Iron Curtain” since the end of World War II. The Iron Curtain was a zone of *de facto* Soviet occupation—self-determination was not tolerated under the Soviets, who had in fact brutally put down a number of “uprisings” in the 1950s, 1960s, and 1970s—in the German Democratic Republic (East Germany) in 1953, Hungary in 1956, Czechoslovakia in 1968, and Poland in 1970 and 1976. The threat of violence helped squelch another strike in Poland in 1980–1981.

But force could only accomplish so much. The Soviet Union was reeling from the effects of a disastrous war that it had brought on itself in Afghanistan. The Soviet economy was in a shambles, especially as the Soviet military machine spent itself into oblivion trying to match American defense spending and technological development during Ronald Reagan’s presidency. A new Soviet leader, Mikhail Gorbachev, introduced *glasnost* (openness) and *perestroika* (transformation) of the Soviet system to allow limited democracy and market-based economies.

Gorbachev, who assumed leadership of the Soviet communist party in 1985, was—unlike his predecessors—not inclined to use Soviet arms to put down protests in satellite nations. He rejected the “Brezhnev Doctrine,” a longstanding policy of the Soviet Union—first articulated by Soviet Premier Leonid Brezhnev on November 13, 1968, in a speech before the Fifth Congress of the Polish United Workers’ Party—to intervene, with force, if necessary, in the affairs of satellite states if those states pursued policies perceived as “antisocialist.” Demonstrations for greater autonomy and democracy were, according to the Brezhnev Doctrine, antisocialist.

Gorbachev’s rejection of the Brezhnev Doctrine seemed to open the door for Warsaw Pact nations to break away from Soviet hegemony.

## Solidarity

The first break came, ironically, in Poland, where the Brezhnev Doctrine was first articulated to the world. Polish workers had for years been restive under Soviet occupation. They first protested in 1956 and won some concessions from the Soviets before the brutal repression of the Hungarian Revolution later that year. Two workers’ revolts in Poland in 1970 and 1976 also were brutally put down.

Workers were still restless, however, and another strike began on August 14, 1980, in the Lenin Shipyards in Gdansk. An unemployed electrical engineer, Lech Walesa, who had been fired from a shipyard job in 1976 because of his union activities, climbed over the wall surrounding the shipyard and joined the striking workers. He became their leader, but had ambitions beyond the shipyard. He began organizing a much broader movement that became known as Solidarity. Fears of another round of Soviet repression led to the outlawing of the movement a year later, but Walesa and Solidarity merely went underground.

By 1988, the Polish Communist Party realized it would have to yield some power in order to prevent another wave of civil unrest. The government began two months of negotiations with Walesa and Solidarity in February 1989. The negotiations ended in the legalization of Solidarity, increased power for the Polish Sejm (parliament), and the right of candidates from Solidarity to run for seats in the Sejm. In elections that were held in June of that year, Solidarity won every seat it was allowed to compete for—enough seats for Solidarity to form a government without forming a coalition with the Communists. The Soviets kept to Gorbachev’s word and did not intervene to keep the Polish Communist Party in power.

Walesa was elected president of Poland in a landslide in 1990.

## A Snip Through the Wire

The next sign of a corroding Iron Curtain appeared in Hungary, where Soviet forces crushed a 1956 revolt and executed its leader, Hungarian Prime Minister Imre Nagy—who tried to take his country out of the Warsaw Pact—two years later.

The wounds from 1956 had not healed, however, and the Hungarian parliament, led by reformist Prime Minister Miklos Nemeth, passed a measure recognizing political parties other than the Communist Party in January 1989. On May 2, Hungarian Foreign Minister Gyula Horn used a set of wire cutters to cut the barbed wire fence between Hungary and Austria.

Hungarian border guards began letting small groups of East Germans cross the border into Austria and freedom. Word spread, and thousands gathered in Hungary waiting for their chance to escape. Hungary was caught in a bind—it was a signatory to two conflicting treaties, an international accord pledging humane treatment of refugees, and another pact with East Germany that promised it would not allow East Germans to pass through its borders to the West. The

Hungarian government announced on September 11, 1989, that it would honor its human rights responsibilities. As the word spread, tens of thousands of East Germans began heading south to Hungary, then west to freedom.

Again, Soviet forces did not intervene. The East German government, destabilized by the mass exodus of its citizens, began to crumble.

### **Tearing Down the Wall**

East Germany possessed one of the most repressive of the Soviet Bloc regimes. In 1961, the Communist government, with the assistance of the Soviets, built one of the most recognizable and hated symbols of twentieth century repression—the Berlin Wall. Communist propagandists called it a barrier to Western imperialism. It was a barrier, but one built to keep the East Berlin residents trapped inside, not to keep foreign aggressors outside.

East German leader Eric Honecker was determined to resist the tide of liberalization. But as his citizens fled through the open gates at the Hungarian border, his power steadily ebbed. The East Germans began to take to the streets to protest the regime. Honecker looked to the Soviet Union for help, but the winds of change were blowing from Moscow.

Honecker had issued orders for his secret police to fire on demonstrators, but his subordinates were not inclined to obey. Honecker, obviously powerless, was ousted and replaced by his former internal security chief, Egon Krenz. Krenz promised change and dialogue, but the protests grew—as many as half-a-million protesters took to the Alexanderplatz in East Berlin on November 4, 1989.

By November 8, East German officials had promised to begin issuing exit visas for East German citizens the next day—at 8 a.m. Crowds gathered at a number of gates along the Wall the next morning, November 9, in anticipation. A nervous East German border guard, fearful that the crowd lining up at his gate would get out of control, opened the way west. Other gates were opened as word spread, and people flooded out of the city that had seemed a prison for almost thirty years.

The East German government soon gave up all pretense of controlling travel. Jubilant crowds on both sides of the wall began tearing the hated symbol apart. West German Chancellor Helmut Kohl openly talked of reuniting the two Germanys. By October 3, 1990, just before East Germany would have reached its forty-first birthday, the nation split apart in the aftermath of World War II was one once more.

### **From Prague Spring to Velvet Revolution**

When Alexander Dubcek assumed the leadership of the Czechoslovak Communist Party on January 5, 1968, he was determined to reform the party and implement “socialism with a human face.” On March 4 of that year, he announced the abolition of media censorship and tolerance of non-Communist parties. Prague Spring was thus born, but its life was short, as Soviet tanks rolled into Prague on August 21 to crush the movement. Dubcek was arrested and transported to Moscow, forced to surrender to Soviet demands, and then sent to internal exile in Czechoslovakia. The Soviet troops stayed in Czechoslovakia, where they maintained order—but they could not make the people forget what was lost.

When the Iron Curtain began crumbling in Poland, Hungary, and East Germany, Czechoslovakian citizens sensed the time to again demand their own freedoms had arrived. On November 17, 1989, an anti-Nazi protest by Prague students metamorphosed into an antigovernment rally. Police attacked the protesters. The battle was won by the authorities, but had sown the seeds of their own defeat in the nearly bloodless war that resulted.

A group of students, artists, and other intellectuals met at the Magic Lantern Theatre in Prague and formed the Civic Forum. A leader emerged in those meetings—Vaclav Havel, a writer whose plays helped inspire Prague Spring and who had been imprisoned several times by Communist authorities.

With the help of the organizational and propaganda skills of the member of the Civic Forum, thousands of people filled the streets of Prague and other Czechoslovak cities demanding free elections and other reforms. On November 24, just one week after the students were attacked by Czechoslovak police, Havel and Dubcek spoke to and inspired 350,000 protesters who filled Wenceslas Square.

That night, the Communist government began a catastrophic collapse. The Politburo was replaced en masse overnight. Czechoslovak workers joined a call for a general strike, and Gustav Husak, the longtime leader who reimposed the Brezhnev Doctrine in the aftermath of Prague Spring, stepped down on December 10. By December 29, free elections were held—Havel was elected president, and Dubcek was elected premier.

### **Death of a Dictator**

Romanian strongman Nicolae Ceausescu was determined that he would not be bullied by protesters, but

he made the fatal mistake of ignoring the momentum sweeping through the Soviet Bloc. Ceausescu's initial blunder came on December 10, 1989, when he tried to oust Laszlo Tokes, a minister of a Hungarian Reformed Church in Timisoara, Romania, from the congregation because of comments Tokes had made critical of the Ceausescu administration. Parishioners began to rally in support of their ministers. Others joined the protests, which were peaceful.

Ceausescu ordered his police to fire on the protesters, but initially his orders were ignored. On December 17, he denounced the commanders, and said he wanted a Tiananmen Square-style massacre. That night, Ceausescu got his wish.

Initial reports were that the massacre claimed thousands of casualties—the actual number was about one hundred—but anger toward Ceausescu swept the nation. Fighting broke out in Bucharest. By December 22, Romania's military, in response to rumors that Ceausescu had the defense minister killed for being too soft on protesters, withdrew its support from the dictator. The army gave its support to a coalition of former Ceausescu aides and dissidents called the National Salvation Front. The coalition declared itself the legitimate government of Romania.

By the time Ceausescu realized power no longer rested in his hands, it was too late. He and his wife, Elena, tried to escape in a helicopter, but the pilot betrayed them and they were captured. On December 25, Ceausescu and his wife were tried, found guilty of genocide, and executed by firing squad.

## Aftermath

The remaining communist governments in Europe soon fell. Albania and Bulgaria abandoned communism fairly quietly. Yugoslavia, not part of the Soviet Bloc, disintegrated into a series of bloody ethnic conflicts among its former republics. The Czechs and Slovaks, on the other hand, peacefully divorced in 1992, dividing the former Czechoslovakia into two countries, the Czech Republic and Slovakia. Walesa, hero of the Solidarity movement, discovered the joys of democracy when he lost his bid to be reelected president of Poland in 1995.

Several former Soviet Bloc countries have since joined the North Atlantic Treaty Organization (NATO)—the alliance they were aligned against as members of the Warsaw Pact. They are Bulgaria, the Czech Republic, Hungary, Poland, Romania, and Slovakia. The territory of East Germany became part of NATO after its reunification with West Germany.

The Soviet Union even ceased to exist after an August 19, 1991, coup by hard-line Communists failed. Boris Yeltsin, president of the Russian Federation, stood up to the rebels and assumed more power as leader of a rejuvenated Russia. Gorbachev, the engineer of the reforms that led to the dissolution of the Soviet empire, found himself consigned to the dustbin of history.

**VENEZUELA**

Venezuela occupies approximately 353,841 square miles of the northwestern part of the continent of South America. Venezuela can be considered a Caribbean nation, because that sea has been its main gateway to the world. It controls several Caribbean Islands, the largest being the famous tourist spot Isla Margarita. Its capital, Caracas, is close to the sea.

Guyana, Colombia, and Brazil are at its borders. There have been ongoing border disputes with both Guyana and Colombia. Venezuela's territory is remarkably diverse and rich in biological and mineral resources. Venezuela has tropical areas near the Caribbean coast; Lake Maracaibo, one of the greatest sources of petroleum in the hemisphere; *llanos* (central plains) and mountains in the interior; and vast sections of Amazonian jungle that are largely undeveloped. Towards the border with Brazil are the fantastic Angel Falls and the impressive mesa region. In this same Amazon area are a number of indigenous tribes as well as largely untapped mineral deposits. Venezuela thus is a highly unevenly developed country, with strong regional inequalities. Venezuela's petroleum wealth, concentrated around Lake Maracaibo, is a major factor in the very high levels of urbanization of the country, with 75% of the population residing in cities.

With a population of just 23,707,000, and incredible petroleum wealth, Venezuela would seem to have great possibilities for a very high standard of living. Unfortunately, Venezuela's wealth is highly skewed, because only a small proportion of its population has reaped most of the benefits from petroleum. Mismanagement, corruption, political instability, and poor institutional development have held back both distributional and developmental progress.

Because of its location, Venezuela was of strategic importance to the Spanish colonizers who arrived in 1498, but it was relatively neglected early on, since it lacked the gold and silver riches of Mexico and Peru. Before petroleum, Venezuela was dominated by agriculture, principally cattle-raising. With its relative isolation in the Spanish Empire, Venezuela was at the forefront of the Independence movement, and the home of its hero, Simón Bolívar.

Early Venezuelan history is marked by a series of personalistic dictatorships based around the agricultural elite and led by military officers. Despite the ongoing political instability, Venezuelan governments developed constitutions, and by the end of the nineteenth century began to develop a more widespread constituency. A long period of stability took hold under Juan Vicente Gómez, who ruled from 1909 to 1935. Gómez ruthlessly developed efficient military

and police control of the population during this period, and was able to woo foreign investors into the nascent petroleum industry.

Immigration to Venezuela occurred more recently than in other Latin American countries and was spurred by the development of the oil industry. Large numbers of immigrants from Europe came to Venezuela in the first decades after World War II. Since then, the majority of immigrants, many illegal, have come from other Latin American nations. In conjunction with urbanization, high fertility rates have placed heavy pressures for public services on the Venezuelan government.

"Sowing the oil" is the catchword for Venezuela's avowed economic strategy for the better part of this century. Venezuela was the leader in creating the Organization of Petroleum Exporting Countries (OPEC) in 1960. Venezuela also was instrumental in increasing fourfold the price of petroleum in 1973. Thus, Venezuela has been able to use its petroleum platform and related revenues to conduct an activist foreign policy in the region.

Venezuela is at the forefront of the Group of Three, with Colombia and Mexico, that seeks to promote Caribbean Basin economic cooperation, and was a promoter of many of the Central American peace processes during the 1980s.

In some ways, Venezuela has managed to use its petroleum to support industrialization. First, there has been an expansion into the petrochemical industry, including the development of local refineries. The Venezuelan state oil company *Petróleos de Venezuela* (PEDEVESA) is a world leader in the petroleum industry, and even owns retail (Citgo) gasoline stations in the United States. Second, revenues from petroleum have been used to develop light and heavy industries, including consumer goods, motor vehicle assembly, iron and steel works, and, most successfully, an internationally competitive aluminum industry. Third, Venezuela has attempted to buttress its agricultural sector through protection and subsidies, although these efforts have not had much success.

Although an industrial base has been built, Venezuela still suffers from an over-dependence on petroleum. Venezuela suffers from the same economic problem as many natural resource producers who experience a boom: the newfound revenue increases inflation, or local prices. The increase in exports also usually leads to an appreciation of the currency, so that local exports become more expensive to overseas buyers. Thus, the boom industry, in this case, petroleum, tends to "crowd out" other sources of livelihood, including both competing industries and agriculture. Of course, the overall result may

not be negative if the industry in question has great employment itself, or has industries that are linked to it that benefit from the boom. Unfortunately, petroleum tends to be a relatively isolated and concentrated capital-intensive enterprise, so that its ability to provide new jobs or demands on local industry are very limited. Thus, the real key for Venezuela would be to use the revenues from petroleum to develop other, unrelated industries. Unfortunately, Venezuelan governments have historically found it difficult to effectively sow the petroleum revenues into product diversification and overall higher standards of living. Despite a history of stable democratic governance, Venezuela's political process has been rife with mismanagement and corruption.

Upon Juan Vicente Gómez's death in 1935, the Venezuelan political system began experimenting with democratic rights. At the same time, Venezuelan governments began their attempts to claim a better deal from their foreign partners in petroleum exploitation. These attempts began with a "revision" announced by President Medina as part of a law in 1943. The Hydrocarbons Act of 1943 is considered by many to be one of the cornerstone pieces to the consolidation of the "petro-state." The key revisions embodied by the law were to shift petroleum taxes from those based upon customs and concessions to those placed on income. More importantly, Medina adopted the "50/50" principle by which the industry's revenues should not exceed those going to the state. In return for accepting these changes, foreign companies were given full concession rights for forty years until 1983. The new revenues allowed the Venezuelan government to begin a continuing tradition of public supports for industry and for public services during this period. Medina's government was overthrown by a then-progressive group of military and civilian activists in 1945.

The new group that took over with a coup was led by Rómulo Betancourt, the leader of Democratic Action (Acción Democrática or AD). AD was widely supported, and passed a new Constitution that reflected several key concerns that had been brewing. Foremost was Venezuela's continuing desire to capture even more of the petroleum wealth for itself. This led to a move towards a 50/50 split of all future profits. Secondly, AD had a strongly supportive labor rights policy. Third, the new government supported increased social spending on housing, health, education, and further agricultural and industrial projects.

Conservative elements of the military reacted strongly, with a military coup in November 1948. General Pérez Jiménez took over as a military dictator. He immediately outlawed political activity and took steps to crush AD support in labour and the universities.

He also abandoned much of the social reform spending begun by AD. Amidst widespread popular protests, a group of military officers overthrew the dictator and reinstated a transitional military-civilian government for one year, with Betancourt as its head.

Betancourt was reelected in 1959, and remained president until 1964. This administration was a watershed, because it set the political tone for Venezuelan politics for the next forty years. The two major political parties, the AD and the Social Christian Party (Partido Social Cristiano, or COPEI), generally working in cahoots, came to dominate the political landscape with an important agreement of cooperation called the *Pacto de Punto Fijo*, signed in 1958. The idea was to ensure democratic party cooperation and moderation so that the military would not have any reason for future intervention. In this point, the new system succeeded without doubt. They created a unique system of limited democracy, using strong party discipline and patron-client networks to ensure their domination of elections. At the same time, they were able, during most of the period, to develop a consultative political culture, in which disputes were ironed out. The leadership shared a general consensus that oil revenues would be used to fund industrialization. The two leaders, Betancourt and Caldera, served as the hubs of the party patronage networks and served as the focal points of party loyalty.

In 1959, Betancourt softened much of the reform thrust of his 1945 government. The government nonetheless passed an agrarian reform law in 1960, and began a national steel industry in 1962. Despite this progress, the Betancourt government was rocked by economic crisis and a guerrilla war with Communists aided by Fidel Castro. After another AD administration, COPEI's longtime leader, Rafael Caldera, won the Presidential election in 1968. Although the patronage network changed, in practice, COPEI's basic platform was hard to distinguish from AD's. Nonetheless, the Caldera government did take majority ownership of the banking industry, control of the natural gas industry, and declared a moratorium on new oil concessions.

The early 1970s marked an important turning point for Venezuelan history, as new President Carlos Andrés Pérez nationalized the iron ore industry in 1975 and the petroleum industry in 1976. In combination with the OPEC oil price hikes, the Venezuelan government was able to increase its public spending projects and patronage graft through the rest of the decades. As oil prices declined in 1979 and continued the slide in the 1980s, the Venezuelan government found itself in the midst a major economic crisis, including a huge external debt, capital flight, a general slowdown in productivity, and growing unemployment.

The slowdown in oil prices hurt Venezuela's ability to pay back its external debt, which had been based on foreign borrowing with the expectation of future long-term payoffs. More importantly, the patron-client type networks that pervaded and held up the two-party system, were dependent upon the lubricating expenditures of oil revenues. A series of AD and COPEI governments was unable to wrest themselves from the crisis. In 1989, Pérez was reelected, and surprisingly began a neoliberal austerity program. The budget-tightening measures, including the raising of prices of basic goods, led to widespread riots in 1989, which were put down by the military. Pérez survived two coup attempts in 1992, including one led by a previously unknown Hugo Chávez Frías, who was then put in jail. However, Pérez did not survive charges of corruption, and he was forced to leave office in 1993.

After several interim presidents, omnipresent Rafael Caldera was reelected, this time as an independent. Caldera's independence worked in his favor, because the population seemed weary of the AD-COPEI power-sharing arrangement, which was widely seen as both corrupt and inefficient. Caldera inherited a situation of economic chaos, in which both inflation and growing capital flight hamstrung possibilities for recovery. The government at first moved towards increasing monetary liquidity in order to restore growth, but later reinstated austerity measures, including raising taxes to cover a budget deficit and introducing a fixed exchange rate to restore investor confidence. Caldera's attempts to stabilize the economy failed, not in the least part, because of Congressional opposition to changes in the tax code. The government's plan to raise funds and efficiency through privatization also met with limited success. The privatization process, which began under Pérez, was completed for several key enterprises: the national telephone company, CANTV (a state TV broadcasting channel), and the steel sector. However, the plans for privatization of other sectors was put off, and questions about whether a fair price was received and whom benefited abounded. In 1995, a number of major bank failures and growing labor unrest, including strikes, increased tensions further. The worsening economic crisis set the stage for a revolution in Venezuela's development.

Hugo Chávez, released from prison after leading a coup attempt in 1992, decisively won the 1998 presidential elections with his new Patriotic Pole party. With 80% of the Venezuelan population living in poverty, the previous system of AD-COPEI administration led by the Betancourt-Caldera generation had clearly exhausted any remaining patience. Chávez wasted no time in suggesting a number of wholesale

changes to Venezuelan politics, beginning with a new Constituent Assembly, which created a new Constitution, approved by voters in 2000. The new Constitution promises agrarian reform, access to health care, education, housing, and social security for the whole population. On the other hand, his economic policy initiatives in contrast to his rhetoric, are much more mainstream and evolutionary in nature. There has been no significant land reform; no universal access to social services has occurred, and the marginalized majority of Venezuela are no better off, in many ways worse off, than when Chávez started. In fact, his economic policy has been rather conservative, avoiding any major swings in government spending, and avoiding the subject of further privatization or state initiatives. Even though the changes have been piecemeal, a strong minority of Venezuelans have taken to the streets regularly to protest, which has been met by counterprotests. The political and economic chaos led initially to a deterioration in overall support for the president. In 2002, a clash between the two groups led to a military coup by forces linked to conservative elements in society. As support for the coup began to melt away amidst massive demonstrations and international condemnations (with the notable absence of the United States, at least initially), Chávez purged elements of the military and government institutions, seizing upon his triumphant return from the short-lived coup. An effort to create a referendum to recall the President seemed to go nowhere by the summer of 2004.

Particularly key have been Chávez's efforts to take control of *Pedvesa*, the national oil company, which have been met with resistance by both skilled workers and management. However, up to now, the previously formidable opposition, including AD and COPEI, have shown no ability to act as coalitional vehicles, related to the general repudiation of their years of corrupt rule and economic mismanagement.

## VERWOERD, HENDRIK

An Afrikaner nationalist politician, Hendrik Verwoerd (1907–1966) was born in Holland. His family emigrated to South Africa while he was still an infant. He attended Anglo schools and studied at Stellenbosch University, with further studies in Germany, Holland and the United States. In 1927, he became Professor of Applied Psychology at Stellenbosch. During this time, Verwoerd developed an interest in Afrikaner impoverishment and organized the seminal 1936 National "Poor White Problem" Conference. He became an influential promoter of the notion that charity was no solution, instead advocating state-led ("affirmative action") interventionism to uplift, educate, and create industrial and civil service jobs to end Afrikaner poverty. In 1937, the National Party (NP) established a newspaper, *Die Transvaler*, to promote Afrikaner nationalism in Johannesburg, and appointed Verwoerd as editor. In this capacity, Verwoerd became leader of Transvaal Afrikaners, especially those raised out of poverty by the policies he promoted.

Transvaal nationalists were more ideologically dogmatic and ardently segregationist than Cape nationalists, who, representing more affluent Afrikaners, leaned towards laissez faire economics; by contrast, the Transvaal NP favoured state interventionism and race-based job-reservation in order to promote interests of working and lower middle class Afrikaners. When Malan's NP won the 1948 election, Verwoerd entered Parliament. In 1950, he was appointed Minister of Native Affairs and served in this position until 1958. During his tenure as Minister of Native Affairs, Verwoerd became the chief architect of apartheid (which he called "separate development"). He was regarded as the key intellectual behind apartheid—a socioeconomic policy that he built on the imported Dutch social theory of *verzuiling*.

As a politician, Verwoerd always faced the problem that he was regarded as "too intellectual" and a "social engineer." But over time, fewer and fewer NP politicians were prepared to challenge his views. Becoming Prime Minister in 1958, Verwoerd moved to fully implement his apartheid plan. Native Affairs was split into two departments, Bantu Administration & Development and Bantu Education. The term

"native" was dropped. Verwoerd remained in control of Bantu affairs while Prime Minister. He proposed a policy of "internal decolonization" in which separate black states would be created and eventually given independence so that ultimately there would be no black citizens of South Africa. Verwoerd argued that, otherwise, whites would be "culturally swamped" by a black majority. In 1959, legislation was passed creating separate territorial authorities on black tribal land, known as Bantustans, and removed black representation in the "white" Parliament. Ten "homeland" governments and the Bantu Education authorities were charged with promoting the traditions and culture of black ethnic groups. 1959 also saw the creation of new black universities and the Bantu Investment Corporation to promote economic development in the homelands. This was intended to "reverse the flow" of black people from tribal areas to the cities (so these cities could be kept "white"). Within "white areas," blacks were designated as foreign guest labourers—essentially, cheap labour.

Verwoerd's policies sparked urban black resistance beginning with the Sharpeville uprising (1960). Black political movements (ANC and PAC) were banned (1960), and Mandela was jailed (1964). In 1960, Verwoerd shocked Anglo South Africans by calling a referendum over becoming a republic. South Africa became a republic (1961) and withdrew from the British Commonwealth. Afrikaners celebrated severing links with the British monarchy as "independence." Verwoerd was a central player in developing the racial-capitalist framework for industrializing and urbanizing South Africa. He was killed in the South African Parliament House of Assembly in 1966, stabbed to death by a parliamentary messenger. It remains unclear whether the murder was a politically motivated assassination or whether the killer, who suffered from schizophrenia, was motivated entirely by mental delusions.

## VIET CONG

(See *People's Liberation Armed Forces [PLAF]*)

## VIET MINH

The Viet Nam Doc Lap Dong Minh Hoi, commonly known as the Viet Minh (Vietnam Independence League), was founded by Ho Chi Minh and others at the Eighth Plenum of the Indo-Chinese Communist Party (ICP) in May 1941. It served as the organizational hub for the development of a broad, national program. They called on “patriots of all ages and all types” to join a united front to oppose Japanese occupation and French rule. The purpose of the Viet Minh was tactical, never strategic. Its flexibility allowed the ICP to alter its course rapidly in response to each specific military and political situation. The Viet Minh temporarily downplayed Communist class struggle and focused on national liberation. As a result they involved all social and political groups in the “national” struggle. Anticolonialism, patriotism, and nationalism were the only prerequisites for joining this national united front. To this end, the Viet Minh made temporary alliances with several noncommunist organizations in order to achieve its more immediate objectives.

Following the Japanese invasion of 1940 and the collaboration of the Vichy French, there seemed to be no national resistance; however, General Vo Nguyen Giap raised an army for the Viet Minh which, with some US aid, effectively fought the Japanese throughout World War II. On March 9, 1945, the Japanese executed a relatively bloodless coup against French colonial forces, only to surrender to the Allies five months later. With few Allied forces available to occupy Indochina, a political void formed. Being the only well trained force in the region, the Viet Minh fully exploited the situation. In August 1945 (the August Revolution), the Viet Minh marched into Ha Noi and proclaimed Vietnamese independence.

On September 2, 1945, in Ba Dinh Square, with US Office of Special Services (OSS) operatives standing next to him, Ho read an official declaration ending French colonialism, Japanese occupation, and the Nguyen Dynasty. Shortly after Ho’s declaration of independence, the ICP announced that it was dissolving, leaving the Viet Minh as the only official party apparatus.

To the chagrin of the Viet Minh and most Vietnamese, postwar Allied treaties allowed the French to return in 1946 as colonial masters of Indochina. This touched off a war between the French and Viet Minh. As they had done during World War II, Ho and Giap withdrew the Viet Minh to mountain strongholds and appealed for broad support by ostensibly disbanding the Communist Party and emphasizing anti-imperialism, even though the communists,

bolstered with aid from the Communist Bloc, never surrendered control of the Viet Minh.

In 1951, Communist established the Vietnamese Workers’ Party (VWP) (Dang Lao Dong Viet Nam). According to revolutionary theory, the broad-based front was to be revised whenever historical circumstances shifted. As such, during the war with France, the VWP reconstituted the Viet Minh as the Lien Viet Front (United Viet Nam National Front), and in 1955, shortly after the Geneva Accords, reformed it again as the Viet Nam Fatherland Front. There is some question as to the actual date of the reconstitution of the Viet Minh. Scholars, such as Hoang Van Dao, in *Viet Nam Quoc Ddn Dang*, argue that the Viet Minh became the Lien Viet in April 1946. Others suggest that it was the Viet Minh that fought the French from 1946 to 1954. No matter, the Viet Minh have popularly been associated with the army that defeated the French at the Battle of Dien Bien Phu.

When the French left in 1954, the Communists took power in the north, while in the south, where the Viet Minh were never very strong because of a more pronounced French colonial influence, President Diem’s US-supported non-Communist regime held sway. By 1960, southern cadres of the old Viet Minh had reorganized as the National Front for the Liberation of South Viet Nam (NFLSV). Their military arm, the People’s Liberation Armed Forces (PLAF) or “Viet Cong,” launched the communist-led guerrilla war against Diem’s regime in South Viet Nam.

## VIETNAM

Viet Nam, today known as the Socialist Republic of Vietnam (SRV), is an “S-”shaped country that extends along the eastern coast of mainland Southeast Asia from the border with the People’s Republic of China (PRC) to the Gulf of Thailand. It is bordered on the west by Laos and Cambodia. It has a total area of 329,560 square kilometers, about the size of New Mexico. SRV has a tropical climate with dense jungles, lush rice paddies, and even mountains to the north and west.

As of July 2004, the population of the SRV was 82,689,518, the second largest in Southeast Asia after the Republic of Indonesia. The largest city is Ho Chi Minh City, formerly Saigon, 5,894,100, while Hai Phong is the largest port. The median age is 24.9 years, the literacy rate 94%, and the life expectancy is 70.35. A total of 85% of the people are ethnic Vietnamese. Other ethnic groups include Thai, Khmer (Cambodians), Cham (Malayo-Polynesian), Chinese, and nearly sixty tribal groups. Although the vast majority are Buddhist, there are over 2 million Roman Catholics, 2 million in the Cao Dai and the Hoa Hao sects and three hundred thousand Muslims. The primary language is Vietnamese, with many people speaking English, French, Chinese, and Khmer.

The SRV capital is Ha Noi. Under the most recent constitution, the nation is divided into fifty-nine provinces. The minimum voting age is eighteen. There is one legal party—Vietnamese Communist Party (VCP) and the General Secretary is Nong Duc Manh. The Chief of State since September 1997 has been President Tran Duc Luong, and the Head of Government has been Prime Minister Phan Van Khai. The 498-seat National Assembly is a unicameral body.

The historical Vietnamese homeland in the Red River Delta can be traced to the seventh-century BC. From about the third century BC through the eleventh century AD, Chinese rulers dominated the region. For the next six centuries, the Chinese confronted internal rebellions, each resulting in the weakening of its control over Vietnam. In the 1540s, the Portuguese became the first Europeans to arrive in the area, but their staying power quickly dissipated. Finally, in the late 1850s, the French came to stay. By 1884, they imposed a protectorate over Vietnam that lasted until 1954.

The French developed and exported rice, rubber, tea and other tropical fruits, while creating a monopoly for the importation of French manufactured goods. The French also constructed roads and railroads throughout the country to support the export businesses. But the Vietnamese workers did not benefit from the system. The French also introduced

Western democratic institutions and education, but greatly restricted Vietnamese participation in both, usually to a handful of wealthy natives. For the Vietnamese, the colonial experience was oppressive and humiliating, a fact that contributed to longstanding resistance to the French presence.

In the early 1900s, self-determination emerged as a factor in local politics, and by the 1920s several local political parties, groups, and organizations emerged to call for the ouster of the French from Indochina. The most significant individual was Nguyen Al Quoc (Nguyen the Patriot), later known as Ho Chi Minh. Ho became a founding member of the French Communist Party in 1920. In 1924, he established a proto-Marxist political organization called the Revolutionary Youth League, and five years later, the league transformed it into the Indochinese Communist Party (ICP).

The onset of World War II ended French authority in Indochina. In the fall of 1940, Vichy French colonial regime permitted the Japanese to use military installations in Indochina. Operating as a multiparty nationalist alliance called the Viet Minh Front, the ICP organized guerrillas under Gen. Vo Nguyen Giap and fought the Japanese from the mountains north of the Red River Delta. After the Japanese surrender in August 1945, the Viet Minh occupied Ha Noi and declared the creation of Democratic Republic of Viet Nam (DRV).

In the south, the British returned power to the French in Sai Gon. Ho and the French commenced negotiations regarding the relationship between Vietnam and France. In the summer of 1946, formal negotiations in France broke down and war erupted in December. Viet Minh forces retreated back to the countryside to wage guerrilla resistance.

During the First Indochina War (1946–1954), the Viet Minh grew in strength emphasizing national independence and land reform, despite French efforts to undercut the DRV by forming a puppet government under former emperor Bao Dai. In October 1949, the Viet Minh also began receiving aid from the newly created People’s Republic of China (PRC). Even with US support for the French, the war turned into a stalemate and French public support steadily weakened. In the spring of 1954, France agreed to a peace conference in Geneva. Negotiations opened just after the Viet Minh victory at Dien Bien Phu. In July, the parties agreed to a cease-fire and a division of the nation with the DRV holding the north and the French and Bao Dai controlling the south. A demilitarization zone at the Seventeenth Parallel separated the states. A political declaration drafted at Geneva and approved by all representatives except

## VIETNAM

Bao Dai and the United States called for national elections in 1956 to create a united Viet Nam.

After Geneva, Ho hoped that elections would reunify the country under DRV rule, but in Sai Gon, a new anti-communist government led by Ngo Dinh Diem refused to hold elections. President Dwight D. Eisenhower supported Diem, who faced a big challenge since the population in the South was so diverse. Diem, a Roman Catholic, never did gain the support of the 85% of the population that was Buddhist. While he agreed to US requests to form a new constitutional republic, his repression of all opposition alienated intellectuals and many ethnic and religious groups. By 1958, military conflict between the two governments marked the beginning of the Second Indochina War.

In 1960, with guidance from Ha Noi, the National Front for the Liberation of South Vietnam (NFLSV or NLF) was born. Like the Viet Minh, they stressed nationalism over class struggle. At first, party strategists, fearful of US intervention, sought victory through negotiations and later insurgent forces in the South—the People's Liberation Armed Forces (PLAF), popularly known as the Viet Cong (VC). President John F. Kennedy responded by increasing US assistance to the RVN. In the summer of 1963, Buddhists began protests over Diem's favoritism toward Catholics. The White House, frustrated by Diem's refusal to broaden his support base, turned a blind eye to a coup that overthrew Diem in early November. Diem and his brother, Ngo Dinh Nhu, were killed.

In early 1965, as the situation in the South deteriorated, President Lyndon B. Johnson sent US combat troops and began a bombing campaign against the DRV to reduce their support for the insurgency and obtain a negotiated settlement. Concurrently, increasing numbers of People's Army of Viet Nam (PAVN) forces infiltrated into the RVN and the conflict evolved into a more conventional war. The United States eventually committed more than five hundred thousand troops to support the RVN government of President Nguyen Van Thieu. By late 1967, most Americans thought that victory was near. That belief was shattered by the Tet Offensive in January–February 1968 and also marked the beginning of the end of US involvement. The war forced Johnson from the presidency and contributed to the 1968 presidential election of Richard M. Nixon with a promise to withdraw US forces. The war dragged on, however, and Nixon expanded it into Cambodia.

Peace negotiations that began in 1968 culminated in an agreement on January 27, 1973, that required the United States to withdraw all of its troops, but left more than one hundred thousand communist forces

in the south. In early 1975, the PAVN began another offensive that ended with the fall of Saigon on April 30, 1975.

One year later, on April 25, 1976, Communist leaders replaced the DRV with the Socialist Republic of Vietnam (SRV), with its capital in Ha Noi. The Party and government leadership remained the same, although some NFLSV leaders were assigned senior positions. While some Southerners complained, unification took place with little violence, although thousands were sent to reeducation camps for indoctrination or punishment.

The SRV had a hard time achieving its goal of building a socialist society. In spite of heavy wartime damage, lack of capital, and the challenge of integrating the South into the socialist North, Party leaders launched an ambitious program of socialist transformation. In early 1978, all industry and commerce above the family level were nationalized, while private farmers were forced into collective farms. Thousands of Vietnamese, many of them ethnic Chinese who believed the new laws were directed at them, fled the country into the PRC. Economic production declined, and unrest broke out among many sectors of society.

The economy continued to downspiral, illustrated by a record inflation rate of 774.7% in 1986. As a result, the VCP Sixth National Congress elected Nguyen Van Linh as Party Chief, and subsequently implemented a policy called "Doi Moi" or "do Maui" (social and economic renovation). SRV leaders initiated a more tolerant attitude toward the private sector that brought about an improvement in the economy.

Vietnam's relations with its neighbors also improved during the 1980s. Relations with neighboring Cambodia and the PRC deteriorated and border clashes began in 1975. The fanatical Khmer Rouge regime of Pol Pot in Phnom Penh refused the SRV's proposal to form an alliance of the three Indochinese countries under Vietnamese guidance. Vietnamese troops occupied Cambodia in December 1978, and the PRC responded with a brief but bloody invasion of northern Viet Nam in February 1979. When Vietnamese forces created a new pro-Viet Nam government in Phnom Penh, the PRC joined other countries, including the United States, in imposing an economic embargo on the SRV. The strain on Vietnamese resources became extreme. Throughout this period, the SRV was conducting a two-front war by defending its northern border against a Chinese invasion, and supporting its sixty thousand-man army in Cambodia. The situation changed after the election of Nguyen Van Linh as party chief in 1986. He directed the withdrawal of Vietnamese troops from Laos and Cambodia in 1988, and by September 1989, virtually all

troops were gone. Viet Nam signed the Cambodian peace agreement in October 1991 and soon after restored diplomatic relations with China.

Beyond Asia, new partnerships were formed. In 1990, the European Economic Union established diplomatic relations with the SRV. This trend continued in 1992, when the SRV established full relations with both the Association of Southeast Asian Nations (ASEAN) and the Republic of Korea (South).

The SRV also improved relations with the US as a result of Vietnamese cooperation in resolving the issue of MIAs. In February 1994, President Bill Clinton ended the economic embargo and on July 11, 1995, the United States normalized relations with the SRV. In April 1997, a pact was signed with the United States designed to repay the \$146 million wartime debt incurred by the RVN government. In November 2001, the National Assembly approved a trade agreement that opened US markets to Vietnamese goods and services, with tariffs rates dropping from rates as high as 40%. Viet Nam in return opened its state markets to foreign competition.

Despite the benefits that economic growth has brought to many Vietnamese, performance and structural inadequacies continue to plague the country. Its people continue to experience a substantial divide in terms of income and wealth distribution, and substantial incidences of poverty remain although macro economic successes have taken place. During the 1990–1993 growth period, the country's estimated overall poverty rate was 58% and food poverty affected 25% of the population. By 1998, overall poverty declined to 37% and food poverty dropped to 15%. Despite growth and poverty eradication, poverty plagues many Vietnamese. For example, Vietnam's population of about 82 million means that overall poverty affects some 27 million Vietnamese and 13 million of them go hungry and malnourished.

While poverty eradication tops the "list of things to do," Vietnamese scholars identify structural inadequacies that must be dealt with if growth with poverty eradication is going to be sustained. Policy generating and implementing institutions remain weak, regulatory systems are vague and often contradictory and the legal system, while improved, remains seriously underdeveloped. Government lacks the capacity to create sound accounting standards and its adjudication processes are inadequate when it comes to settling disputes on consistently reasonable bases. Bureaucratic red tape, high and growing levels of public corruption and abuse of power, and a haphazard taxation system that is in a constant state of flux, make conducting economic activity in the country an adventure. Banking decisions proceed without sufficient concern for

prudential lending and transparency. Production and consumption patterns contributed to environmental degradation and urban pollution, and resource preservation and human health protection efforts remain inadequate.

Vietnam remains among the lowest 25% of the world's countries measured by per capita income—no more than \$400 per year. No single measure can successfully address the causes of poverty, but clearly Vietnam's labor force is a primary contributor to what Vietnam has accomplished, and it stands to make substantial contributions to macroeconomic progress in the future if it is fully developed and used. However, numerous other obstacles stand in the way of doing so: one is high population growth rate; another is a relatively young and rapidly urbanizing population; also, a large segment of the rural work force is unskilled and deprived of sources of information. Urban immigrants tend to be young and unskilled and augmented by refugees, disabled veterans, demobilized soldiers and persons made unemployed due to shifts from State-Owned Enterprises to private-sector firms, they all make up a largely disadvantaged pool of labor.

Poverty-stricken poor Vietnamese make up 25% of all Vietnamese rural households. They live in poverty so pronounced that they could not afford to provide 2,100 calories of food per person *even if* all of their income was spent on food. Poverty in Vietnam continues to have a distinct rural bias: the ratio of urban to rural poverty increased from 1:6 to 1:10 over the 1993–1998 period. The rural poor tend to live in larger families with a larger number of both old and young dependents. They are more likely to be illiterate, have fewer years of schooling, faced limited access to credit and own less property. Ninety percent of all poorer households live in rural areas, and younger members of these family groups immigrate to urban areas where they swell the ranks of the urban poor and tax the country's capacity to generate education opportunities. This is important because while formal education has led to a nationwide basic literacy rate of 94.25% in 1996, in rural areas it was a slightly less 93.43%. Based on their education, 12.31% of the total population was trained with a useful skill, but in rural areas only 7.77% of the population had skills that were useful in a modernizing economy.

The Government of Vietnam attempted to confront poverty and, in 1997, it announced a seven-point poverty eradication strategy centering on improving economic management and competitiveness, strengthening the banking and financial system, and reforming state-owned enterprises. The strategy also involved strengthening physical and social infrastructures,

improving public administration, accelerating rural development, protecting the environment, and investing in people via formal and non-formal education and promoting social equity. In 1998, the government launched a social equity initiative in the form of its Hunger Eradication and Poverty Reduction Program (HEPRP) that targeted 1,715 of the country's poorest communities. The program included a combination of infrastructure improvement, credit expansion, population resettlement, subsidization of fees paid by the poor and training, vocational education, and agricultural extension services.

In 2000, the government sought to coordinate its various poverty eradication and alleviation initiatives via a Poverty Reduction Partnership Agreement (PPA) with the Asian Development Bank. The PPA focused on promoting sustainable development featuring agricultural diversification, social development emphasizing health and education, improving governance by concentrating on public administration reforms, and geographically targeting the poor for special treatment designed to improve agricultural output in the central regions of the country. The Agreement also concentrated on generating bilateral and multilateral assistance.

In 1998, the SRV began a drive to eliminate bureaucratic inefficiency and corruption and to curtail civilian criminal activity. These efforts reached a high water mark in June 2003, with the conviction of the notorious criminal syndicate boss Truong Van Cam, known as Nam Cam. He was sentenced to death, along with 155 other defendants, and executed in June 2004.

Despite the appointment in April 2001 of progressive Nong Duc Manh to replace Le Kha Phieu as VCP general secretary, change has been slow. There have been no concerted reform and renovation initiatives designed to bring about a more civil society by relaxing restrictions on the media, reducing the harassment of critics and dissidents, eliminating restrictions placed on individual political association, and permitting the formation of competing political parties. VCP leaders fearful of becoming another toppled communist regime continued to oppose political and civil reforms.

#### VIETNAM WAR

It is difficult to determine when this long conflict began. Its initial phases could include the self-exile to which a young Ho Chi Minh (born Nguyen Sinh Cung) dedicated himself when he left Viet Nam in 1911 for decades of world travel preaching the advantages of communism. It could have been when, on May 3, 1940, a dedicated communist history schoolteacher in Ha Noi, Vo Nguyen Giap, fled into China, fearing arrest by the French and internment or death at their hands. It could have been between August 19 and 30, 1945, when the Viet Minh (Ho's communist political party) ascended to power from the Red River to the Mekong Delta, a time known as "the August Revolution." It could have been the next month, September, when the British overseer of the occupation forces in the southern portion of Viet Nam repudiated the Viet Minh there and began a military campaign against them and turned the governance there once more over to the French.

Some might argue that the conflict began when the French government sent troops back into northern Viet Nam in early 1946 in an effort to regain control

of its colony. That sparked the first armed conflict when in December 1946 the French launched an open attack against poorly armed and trained Viet Minh troops at Hai Phong and Ha Noi. Retreating into the hills of the north, Ho's followers carried on desultory but bloody warfare with the French for the next several years. As those days passed, the Viet Minh military became ever stronger and more able to fight French troops.

Perhaps the war started on March 13, 1954, at 5:00 p.m. when Viet Minh artillery shells rained down upon French defensive positions at Dien Bien Phu, the beginning shots of the "set piece" battle, which the French had sought for so long. Or was it on May 7, 1954, at 5:30 p.m. when the beaten French soldiers at Dien Bien Phu finally hoisted a white flag over their ruined bunkers and surrendered? Thereafter, France surrendered all territory north of the seventeenth parallel, retaining a troop presence only in the south.

The Viet Minh soldiers there continued their "war of national liberation" against the French occupiers and a new Vietnamese government was authorized by the Geneva Conference of May 1954 in an attempt to bring peace to Indochina. Its president was Ngo Dinh Diem. Those in the south who opposed and fought against that new government were vilified by President Diem as "Viet Cong," a slang term for "Vietnamese communist." They might have been defeated except that they were aided occasionally by men and supplies sent down from the north. Working all through the following years to keep those allies provided were the two hundred thousand laborers controlled by northern General Vo Nguyen Giap. Those laborers moved enormous quantities of supplies to locations where they were most needed.

Two hostile nations now occupied the narrow strip of land facing along the South China Sea—the Democratic Republic of Viet Nam in the north and the Republic of Viet Nam in the south. With that development, by any standards, the war began.

In the last years of the French efforts against the Viet Minh, the United States had provided men, material, and treasure amounting to 85% of the cost of the war. Now, with the French defeated, the United States moved in to take their place. Advisers arrived in the south to instruct President Diem on how he might establish a longlasting, noncommunist government south of the seventeenth parallel. Americans advised military units, working from the highest to the lowest levels. Civilians were given the benefit of American experience and wisdom. It was never enough. Those from the United States who traveled to Viet Nam did not understand the people or their problems, belittled them, failed to learn to speak their language, and were generally unproductive.

It was not long before a major difference appeared between the nation of the north and that of the south. In Ha Noi throughout the war, for the most part, the same leaders continued to control policies and programs and could thus present a strong approach to problems. It was different in the south. Following the coup of 1963 and the assassination of President Ngo Dinh Diem, there was a rapid succession of governments. They changed so often that American Undersecretary of State George Ball coined the phrase: "The government of the week." And none of them were able to create a winning strategy against the north.

The war went on. It came to be known as a "People's War of National Liberation" by those who favored the efforts of the north. In the south, it was simply an illegal and murderous rebellion that Americans found ever more difficult either to understand or to combat. The Central Intelligence Agency (CIA) described it as "a civil war with dynastic overtones." The US government saw it as a contest between the feared Soviet Union and America, champion of world freedom. By the end of Dwight Eisenhower's presidency, some nine hundred Americans served there. When President Kennedy was assassinated, that number had grown to 16,300. Then under President Lyndon Johnson, American presence in Southeast Asia rose exponentially until it reached 536,100—and still the generals called for more soldiers. Johnson was able to so increase US participation because of supposed attacks on August 2 and possibly again on August 4, 1964, by North Vietnamese patrol torpedo boats against the American destroyers, C. Turner Joy, and the Maddox in Tonkin Bay. At Johnson's request, Congress quickly passed the Tonkin Bay Resolution, giving him full power to do whatever he might wish to protect attacks on American forces. He was quick to act. The Selective Service System fed hundreds of thousands of draftees into the Army.

The American presence became irrevocable when, on March 8, 1965, a little after 9:00 a.m., the ninth Marine Expeditionary Brigade stormed ashore onto the beaches of Da Nang wearing full combat gear. They were met by school girls in brightly colored *au dais* carrying bouquets of flowers, the mayor of the city, and a few army men holding signs saying: "The army welcomes the marines to Viet Nam." They were purportedly sent there to guard American installations, but soon Westmoreland had them operating offensively and spent the remainder of his tenure calling for ever more troops.

In the years thereafter until American withdrawal, US forces fired more small arms rounds, shot more artillery shells, and dropped more bombs than had been used in all theaters by all sides in World War II.

Many of the Americans resented their forced participation in the war. It became common to see soldiers wearing slogans on their helmets such as "Fuck the Army," or "UUUU," which meant "We are the Unwilling, led by the Unqualified, doing the Unnecessary for the Ungrateful." Traditional discipline disappeared and disillusioned soldiers at least once did the unthinkable, as at My Lai, where civilian women, children, and old men were slaughtered.

The intensity of the war grew only slowly. In the years prior to the massive infusion of American troops, the conflict was marked only by raids, murders, and kidnappings. A few years later, American forces faced large units totally dedicated to destroying them at places like "Hamburger Hill" in the Au Shau Valley and Khe Sanh. By 1968, at the time of the Asian Tet New Year's holiday, the Viet Cong (officially known as the People's Liberation Armed Forces) and the North Vietnamese Army were able to field divisions of men to attack throughout the south. They engaged American and south Vietnamese forces in forty-one of the forty-four southern provinces and in five of the six largest cities. Finally beaten back, they held on in Hue for nearly a month, during which time they executed some five thousand civilians and buried them in mass graves.

Troops there were led successively by generals William Childs Westmoreland, Creighton Abrams, and Fred Weyand. Such "tactics" were imposed on US troops as "Search and Destroy," "Free Fire Zones," "Harassing and Interdicting Fires," "Reconnaissance by Fire," and widespread bombings by the Air Force. Meanwhile, increasing numbers of Vietnamese began to sympathize with and fight for the Viet Cong.

It became the "helicopter" war, and thousands of those machines dotted the skies, carrying food and supplies, transporting wounded, taking combat-ready soldiers to attack points (landing zones), and ferrying the dead back to collection points. In the Ca Mau peninsula and the Delta, small well-armed patrol boats conducted riverine warfare, cruising the many rivers searching for enemy soldiers.

Despite the nearly unlimited supply of airplanes and artillery, M-16 rifles and mortars, napalm and night scopes, draft levies and swollen defense budgets, the richest nation on earth failed to impose a military solution on one of the poorest countries of Asia. Thus it was that, following Tet 1968, the American government began to look for ways to disengage from the conflict in Viet Nam. Newly elected President Richard Nixon said that the way to do so was to "Vietnamize" the war, to turn the fighting over to the Vietnamese themselves. Vietnamization would serve as the rationale for withdrawal.

Peace talks began in Paris in 1968 and continued four years, eight months, and seventeen days during

which time more than twenty thousand Americans and perhaps three-quarters of a million Vietnamese on both sides were killed. Finally signed on January 27, 1973, its provisions gave the DRV much of what it had sought but did little or nothing to sustain the interests of the ROV. It did, however, allow the United States to escape from Asia. The last military unit was withdrawn from Viet Nam only weeks later, on March 29, 1973.

After the American withdrawal, the North Vietnamese began to launch massive attacks against southern armies. Saigon fell on April 30, 1975. The war had finally ended.

### VIRGIN ISLANDS (BRITISH)

The Virgin Islands are the collective name for more than 120 small islands, islets, and cays located in the West Indies; twenty have permanent residents. The British Virgin Islands (BVI) consist of four major islands (Tortola, Anegada, Virgin Gorda, and Jost Van Dyke), thirty-two smaller islands, and two dozen islets totaling fifty-nine square miles. The Virgin Islands form a portion of the Leeward Islands, the westernmost part of the Lesser Antilles, situated in the Anegada Passage between the Caribbean Sea and the Atlantic Ocean, forty miles east of Puerto Rico. The British islands lie to the southwest of Anegada and the passage; adjacent American islands are located immediately to the southwest and south. The US Virgin Islands (USVI) and BVI are, at their nearest point, less than one mile apart. The islands are the peaks of submerged mountains that comprise the eastern extension of a submarine plateau in the Greater Antilles. Elevations rise from mean sea level to 225 feet, but isolated peaks, notably Mount Sage on Tortola, have an altitude of 1,780 feet. There is little groundwater; hence, inhabitants rely upon cisterns. Bare rock outcrops are common, and there are substantial areas of coral sand and shallow loam derived from volcanic material. A sparse deciduous forest was

exploited for charcoal production early in the history of the islands; scrub timber and Guinea grass are the current primary vegetation. The islands have a year-round subtropical humid climate (65–90°F range, 78°F average) moderated by easterly trade winds. Rainfall is from forty to sixty inches per annum (average forty-five inches), varying from island to island, with higher elevations receiving the greater amounts. The rainy season is May to November, but there are seasonal and annual variations; hurricanes and tropical storms (July to October) are natural hazards.

Native American hunters and coastal maritime gatherers inhabited the islands as early as 710 BCE. By 100 CE, Taino Indians lived in villages located in sheltered bays, made pottery, and practiced horticulture, but by the 1400s, Carib and Arawak Indians inhabited the islands. During his second voyage to America in 1493, Christopher Columbus arrived at Sugar Bay or Salt River Bay on St. Croix (USVI) and fought with the indigenous Caribs. Naming the islands Las Virgines in memory of St. Ursula, Columbus claimed them for Spain but no Spanish settlements were established because of Carib attacks. Charles I of Spain ordered that these natives be killed; between military attacks and introduced European diseases, the natives died or left by the late 1500s. The islands were temporary havens for Spanish treasure galleons and a favorite haunt of buccaneers. Early economic development was controlled by the Danish West India Company, which established a free port at St. Thomas (USVI). There was a brief incursion by the British during the Napoleonic Wars in 1801; the islands were occupied from 1807 to 1815, and several thousand English naval and army personnel were quartered there. The northeastern islands became the British Virgin Islands in 1672, and fifteen of the sixty islands in the BVI are currently inhabited. Tortola (Spanish for “turtle dove”) covers twenty-one square miles and was initially settled by the Dutch in 1648 and was occupied by the English in 1666. African slaves were brought to work on European sugar plantations beginning in 1673. Anegara, or “drowned” island (15 square miles), makes reference to the flat landscape and maximum elevations only a few feet above mean sea level. Virgin Gorda, “fat virgin” (eight square miles), has a maximum elevation at 1,359 feet. Westernmost Jost Van Dyke (2.5 square miles) has only two hundred inhabitants. The Peter, Salt, Beef, Cooper, Ginger, and Norman Islands are among the small islets, many clustered round the Sir Francis Drake Channel; most are uninhabited or privately owned. The major settlement and capital of the BVI is Road Town, located at a harbor on the south side of Tortola Island. The largest towns on Virgin Gorda are The Valley, Spanish Town, and North Sound.

British plantations gave way to small farming and cattle-raising in the 1800s. Current exports include rum, fresh fish, fruits, gravel, and sand. BVI tourism generates nearly half of the national income. An estimated four hundred thousand companies are listed on the offshore registry of incorporated companies established in the mid-1980s. Geographic proximity and an intertwined British-American economy prevail because most BVI inhabitants work in the USVI and, established in 1959, the currency in local use is the US dollar. The BVI joined the West Indies Federation of British Islands in 1958. The BVI are an internal-governing, overseas territory of the United Kingdom. The islands are governed by a government administrator who is subject to the governor (appointed by the British monarch), an executive council composed of ministers appointed from the elected thirteen member legislative council. The population of the BVI, estimated at 22,187 (2004), has a growth rate of 2.1%; 83% is Black, with the remainder Caucasian, Indian, Asian, and mixed ethnic and racial groups. Protestant religions predominate (Methodist 33%, Anglican 17%, Church of God 9%, Seventh-Day Adventists 6%, Baptist 4%, Jehovah’s Witnesses 2%, others 15%), Roman Catholic 10%, none 2%, and other 2%. English is the official language, but some Creole is spoken.

#### VIRGIN ISLANDS (UNITED STATES)

The Virgin Islands is the collective name of more than 120 small islands, islets, and cays located in the West Indies; twenty have permanent residents. The United States Virgin Islands (USVI), officially Virgin Islands of the United States, is an unincorporated territory that is the easternmost United States possession, is composed of three major inhabited islands (St. Thomas, St. John, and St. Croix), plus about sixty-five islets and cays with a land area of 133 square miles. The British

## VIRGIN ISLANDS (UNITED STATES)

islands and adjacent American islands at their nearest point are less than one mile apart. Elevations rise from mean sea level to 225 feet; isolated peaks rise to 1,556 feet on St. Thomas, 1,277 feet on St. John, and 1,165 feet on St. Croix. There is little ground water, so inhabitants rely upon cisterns. The fresh water supply is now augmented by seawater distillation plants on St. Thomas and St. Croix. St. Croix (Santa Cruz to Spanish speakers), the largest of the islands (eighty-two square miles), lies forty miles south of St. Thomas and has a population concentrated in the cities of Christiansted and Frederiksted. St. John (nineteen square miles) is situated two miles east of St. Thomas and less than a mile from British Tortola. Most inhabitants live in the towns of Cruz Bay and Coral Bay. St. Thomas (twenty-seven square miles) is dominated by the city of Charlotte Amalie, capital of the Virgin Islands and a major seaport. For additional information on the geography and early history, see *British Virgin Islands*.

After Columbus's visit in 1493 and minor Spanish expeditions, English settlers voyaging to establish the colony at Jamestown, Virginia, in 1607 briefly visited the islands. Dutch and English settlers landed on St. Croix in 1625 but were expelled two decades later by Spaniards from Puerto Rico. The islands became temporary havens for Spanish treasure galleons and also were a favorite haunt of buccaneers. Beginning in 1673, African slaves were brought to work on European sugar plantations. The Spanish were supplanted by the French, and the French controlled St. Croix until they sold the island to the Danish government in 1733. A permanent Danish colony was founded on St. Thomas in 1672 and Danes settled St. John in 1717, eventually establishing 109 sugar cane plantations. Economic development was controlled by the Danish West India Company, which established a free port at St. Thomas. A six-month slave uprising and massacre of European residents in 1733 decimated St. Thomas's commercial prospects. There was a brief British incursion during the Napoleonic Wars in 1801, and the islands were occupied from 1807 to 1815 by several thousand English naval and army personnel. A slave rebellion on St. Croix in 1848 led to the abolition of slavery in the Danish islands on July 3, 1848. Renewed Danish commercial enterprises proved unsuccessful because of the decline of the sugar industry because of competition from other Caribbean islands. Between 1835 and 1915, the population dwindled from forty-three thousand to twenty-three thousand.

Denmark and the United States signed a treaty on August 4, 1916, transferring control of the Danish West Indies for \$25 million in gold. The treaty, ratified on January 17, formally ceded the Danish islands on March 31, 1917. The islands are situated halfway between New York and Panama, and to protect the

newly-constructed Panama Canal, an airbase was constructed on St. Croix and a submarine base in St. Thomas harbor, and the islands were administered by the US Navy from 1917 to 1931. In 1927, US Virgin Islanders became American citizens. A fifteen-member unicameral territorial legislature was established by the Revised Organic Act of 1954; executive power is vested in a governor appointed by the president of the United States. The right to self-elect their governor and legislators was granted in 1968. In 1958, John Merwin was appointed as the first native-born governor, succeeded by Ralph Paiewonsky in 1961–1969, and by Melvin Evans, who became the first native-born black governor. Virgin Islanders have a nonvoting representative in the US Congress but remain under the jurisdiction of the Office of Insular Affairs, US Department of the Interior.

Tourism is the primary economic activity, accounting for 80% of the gross domestic product, and features water recreation as well as cultural tourism. Laurance Rockefeller purchased land on St. John in order to establish the Virgin Islands National Park, created officially by Congress on August 2, 1956. Enlarged in 1962 and in 1978, it occupies nearly three-fourths of St. John and has enhanced ecotourism. In 1976, the United Nations designated the park a biosphere reserve. Major manufacturing includes two rum distilleries, bauxite and petroleum refineries, basalt mining, and textile mill, which contribute to the export economy. One of the world's largest petroleum refineries is located on St. Croix. Scientific instruments, electronics, pharmaceuticals, perfume, jewelry, and watches are other manufactures. Beef, dairy products, and eggs are the primary agricultural products, but most food is imported; commercial fishing is limited. Tourism, manufacturing, construction, and government (the territorial government and US National Park Service) are major employers.

Slavery and migration created a mixed population of more than twenty ethnic groups. The current population is 108,775 (2004); 78% Black, 10% Caucasian, and 12% other. Protestant denominations (primarily Baptist), Roman Catholic, Episcopalian, Jewish, and other faiths are represented. English is the official language, but many islanders speak Virgin Island Creole English and lesser numbers speak Dutch Creole or Spanish, or are bilingual.

## VIRTUAL WATER TRADE

"Virtual water" is increasingly being used in the context of discussions on freshwater (hereafter referred to simply as "water") security, particularly in reference to the developing world. It was coined in the mid-1990s by Professor J.A. Allan and refers to the water required in the production of goods and services. For example, it takes on average 1,200 cubic meters of water to produce one metric tonne of wheat (Hoekstra 2003). The water is said to be "virtual" because, once the wheat is grown, the real water used to produce the crop is no longer contained in the grain. "Virtual water trade" refers to the idea that when countries or regions trade goods and certain services, they are generally also trading virtual water. For every tonne of wheat that a country trades, it is said to import or export 1,200 cubic meters of virtual water.

The virtual water trade concept was first envisioned as a solution for semi-arid and arid countries struggling with large water deficits. It is essentially an extension of the comparative advantage theory of international trade; its innovation is that it treats water as a key factor of production. It posits that a water-scarce country should limit its exports of virtual water and, depending on the level of water scarcity, resort to virtual water imports to avoid depleting its own water supplies. Indeed, if a water-scarce country imports one tonne of wheat, it is essentially freeing up 1,200 cubic meters of real indigenous water that can be used for other purposes. Water-short countries can optimize their water resources by limiting their production of water-intensive goods that have a low economic value, keeping their scarce water for highly valued uses as well as uses that yield high economic return per unit of water consumed, and by importing the water-intensive goods no longer produced domestically from water-rich regions.

Policies that encourage water conservation and technologies and practices that optimize or augment supplies, such as desalination and efficient irrigation systems, remain important tools in dealing with water

scarcity. However, in the case of severely water short developing countries, water-demand management can only stretch resources so far and technological means may be prohibitively expensive. The comparative advantage of virtual water trade is that, at present, it is generally more economic to obtain grains and certain other water-intensive goods on the international market than to desalinate water or to pump groundwater from great depths in order to grow it domestically.

The virtual water trade concept is based on the observation that the "world water crisis" is not one of total quantity, but one of distribution. While there is enough water on earth to satisfy everyone's needs in a sustainable way, the problem is that where the demand for water is high, the supply of renewable water resources is not always sufficient. Although water is a renewable resource, only a finite amount can be used up before tapping into nonrenewable supplies. At the core of the virtual water trade concept is the premise that water-rich countries—assuming they produce the water-intensive goods and services in a sustainable way—can support to a certain extent water-scarce countries through the trade of water-intensive goods and services.

Allan (2002a) estimates that many countries, such as Egypt, Israel, and Jordan, have now been dependent on virtual water imports for a few decades. Their indigenous water supplies are simply too low to allow these countries to meet all their domestic water demands. Since agriculture accounts for the overwhelming proportion of global water withdrawals (Shiklomanov 2000) and tends to yield low economic returns to water requirements, Allan (1996) observed that it becomes the reducible sector. This means that as demand exceeds supplies, water-scarce countries tend to become increasingly dependent on food imports. Israel and Jordan are two countries that have consciously adopted a virtual water trade strategy—gearing domestic production towards water-efficient goods—to try to manage their water budgets. Other water-scarce countries continue to deplete their water resources to produce low-value, water-intensive goods that they could obtain on the international market (World Water Council 2004; Qadir *et al.* 2003).

The virtual water trade paradigm is very controversial. Proponents argue that "virtual water trade" is a useful metaphor because it forces recognition of the opportunity costs associated with different uses of water. For instance, if water is used to irrigate a field, it is no longer available for domestic uses or to provide environmental services. Moreover, since the production of one tonne of wheat—to expand on our example—requires different amounts of water depending on where in the world it is produced (due mainly to differences in climatic conditions), virtual

water trade can lead to global water savings if wheat is produced in regions where the water requirement is low and exported to regions where the requirement is higher. Finally, the measurement of global virtual water trade flows also alerts us to the fact that increasing demand in water-scarce regions is placing growing stress on water resources elsewhere on the planet.

Critics stress the undesirable implications and difficulties of resorting to virtual water trade to achieve sustainable water resource development and argue that these are magnified in developing countries. They decry the recommendation to reduce the agricultural sector, which is an important source of income and employment for many in the developing world and an important means of stemming the flow of rural-urban migration. Virtual water trade also implies having to generate foreign exchange, another scarce resource in the developing world, in water-efficient, high-return (that is, industrial or service) economic activities. This is no mean feat since industrialisation has proven an elusive goal in many countries, water-scarce or not. Industrialisation also may lead to other environmental problems. Furthermore, food security is an important component of national security, and many states are weary of having to depend on access to the international market to meet domestic needs. Many people also prefer or derive a certain pride from locally grown agricultural products. In certain societies, water, agriculture, and local food have great historical, cultural, and religious value that the virtual water trade concept is said to ignore.

**WISEHRAD GROUP**

The Visegrad Four is an unofficial name given to the four Central European post-communist countries the Czech Republic, the Republic of Hungary, the Republic of Poland and the Slovak Republic. Originally, the group was called the Visegrad Troika and the Four is the result of the split of the Czech and Slovak Federal Republic in 1993. The name of this grouping was chosen during a meeting of the President of the CSFR, Vaclav Havel; the Prime Minister of Hungary, Jozsef Antall; and the President of Poland, Lech Walesa at an event held at the north Hungarian city of Visegrad on February 15, 1991. At this meeting, the leaders signed a declaration on a close cooperation of these three (today four) countries on their way to European integration.

The Visegrad Group reflects the efforts of the countries of the Central European region to work together in a number of fields of common interest within all-European integration. The Czech Republic, Hungary, Poland, and Slovakia have always shared cultural and intellectual values and common roots of religious traditions that they wish to preserve and further strengthen.

All the V4 countries aspired to become members of the European Union (EU), perceiving their integration in the EU as another step forward in the process of overcoming artificial dividing lines in Europe through mutual support. They reached this aim in May 1, 2004, when they all became members of EU.

The Visegrad Group countries are committed to closely cooperating with their nearest partners in the Central European region. They also are ready to cooperate in specific areas of common interest with countries within the wider region, with other regional groupings in Europe as well as with third countries and international organizations.

The Prime Ministers of the Visegrad Group countries express their deep conviction that further cooperation between their countries, rooted in centuries of interlinked history and based on similar political, economic, and social developments in the past decades, will enrich the community of European nations and contribute to the building of a reunited, democratic, and prosperous Europe.

All the activities of the Visegrad Group are aimed at strengthening stability in the Central European

region. The participating countries perceive their cooperation as a challenge and its success as the best proof of their ability to integrate also into such structures as is, for example, the European Union.

The V4 countries agreed on efforts to preserve contributions from the member countries to the EU 2007–2013 budget at the current level of 1.24% of the gross domestic product of each country. Some EU countries proposed lowering the limit.

The economic issues and cooperation of the V4 are managed within the Central European Free Trade Association (CEFTA). The four countries, counting the Czech Republic and Slovakia as the former Czechoslovakia, were founding members of the CEFTA in 1992.

## **WAŁĘSA, LECH**

Lech Wałęsa, known to everyone in Poland as Lech or Lechu, a charismatic leader of the 1980s, the 1983 Noble Peace Prize recipient and the president of Poland 1990–1995, was born in September 29, 1943, in Popowo, near Włocławek in northern Poland. In 1967 he started working as an electrician at the Lenin Shipyard in Gdansk.

Wałęsa's political anti-communist activities date back to December 1970, the time of social upheaval in the coastal Pomerania region in Poland, triggered by the increase in food prices. He participated in the December 1970 strike in the shipyard. The communist government officials did not negotiate with the workers, but instead crushed the strike by force. Many workers died when police and the military opened fire. Wałęsa witnessed the tragedy and his involvement in the political opposition of the late 1970s was inspired by the events of December 1970.

The tragic events of the strike caused a governmental crisis. The new communist party leadership with the first secretary Edward Gierek appointed a new administration. Wałęsa was among those who trusted the new leadership, but the government had no intention of changing the workers' economic situation. In the second half of the 1970s a new opposition movement was formed in the coastal industrial centers—the Free Trade Union of the Coast. Its objective was to inform workers of their situation and their rights. Wałęsa joined the opposition and was arrested several times for his participation in an illegal anti-government organization. As the economic situation declined,

workers became more determined. During the summer months of 1980, social upheaval erupted and workers all over Poland protested. The Gdańsk-Gdynia shipyards became the core area of the protest and Wałęsa, who was not employed by the shipyard at the time, joined the strike in the Lenin Shipyard.

Because of his involvement in the 1970 strike and in the Free Trade Unions, he was elected the head of the shipyard's strike committee. The local communist authorities complied with the mostly economic demands of the protestors and the strike was about to end when strikers from other regions of Poland asked the shipyard workers to continue the strike and help them achieve their demands. The shipyard's strike committee agreed out of solidarity with all workers and formed a new strike committee called the Interfactory Strike Committee, representing demands of factories all over Poland. Soon several intellectuals, members of the political opposition, joined the workers and became key advisors to Wałęsa and the Committee. Subsequently, in addition to the economic demands, the Committee also issued unprecedented political demands such as the existence of independent trade unions, free press, the right to strike, abolishment of censorship, freedom of speech, and so forth. The demands were known as "the 21 postulates." This was the beginning of the movement later called "Solidarity," which by the end of 1980 incorporated more than 10 million members. Wałęsa was in the middle of all events, first as a head of the shipyard's strike committee and subsequently as a head of the nation-wide Interfactory Strike Committee.

“Solidarity” became the major political power of the early 1980s in Poland. The government was still controlled by the Communist Party but had to respond to the increasing demands from the movement. Solidarity was officially recognized by the authorities and registered as a trade union in October 1980. Wałęsa became the chairman of the movement, supported by a committee composed of leaders from all regions, some of them with long-standing experience in the opposition movement like Andrzej Gwiazda, Aleksander Hall, Bodgan Borusewicz, and his friends from the Free Trade Unions of the Coast. Solidarity existed until December 13, 1980, when the government imposed martial law in Poland and Solidarity was outlawed and its leaders arrested. Wałęsa was put under house arrest, separated from his advisors and supporters, and detained for almost a year before the authorities allowed him to return home in November 1982. Wałęsa became an ordinary citizen, but remained a leader of underground Solidarity.

In 1983 Wałęsa received the Nobel Peace Prize for his contribution to “universal freedom of organisation in all countries.” Fearing that the government would not let him back into Poland if he attended the ceremony in Oslo, he remained in Poland and his wife Danuta went to Oslo to accept the award on his behalf.

Another social upheaval in 1988 brought Solidarity back into official existence. It was a different Solidarity with different leadership. Many previous members emigrated or were forced to leave the country; several leaders left Solidarity and politics. Lech Wałęsa retained his leadership and once again negotiated with the communist government regarding the future of the trade union and the future of the country. The talks are known as the Round Table Agreement of 1989. Solidarity gained a new political status and in effect the first truly free elections in the Soviet Bloc were held in June 1989. Politicians who ran on the Solidarity ticket won the majority of seats in the Polish Parliament (Sejm) and formed the first non-communist Polish government since 1945. Wałęsa refused to become the prime minister of this historic government and instead supported Tadeusz Mazowiecki as the premier.

In 1990, however, he ran against Mazowiecki in the first Polish direct presidential elections and won by a landslide. He became the first democratically elected postwar Polish president. In 1995 he sought reelection but lost to a former member of the communist party, Aleksander Kwaśniewski. As a politician Wałęsa was unpredictable, often infuriating, but he had a natural genius for politics, a matchless ability for sensing popular moods, and great powers of swaying a crowd. More recently, Wałęsa has not been

active politically, although in November 2004 he visited Kiev in the Ukraine in support of free presidential elections.

## WAR AND DEVELOPMENT

### Two Worlds of Conflict and Development

The recovery of societies from international or civil conflict is a major concern in contemporary world politics. Yet, there are important distinctions between the effects of global versus intrastate violence on sustainable growth and development. While nations such as Germany and Japan that were once devastated by the Second World War eventually returned to their original levels of economic vitality, many developing countries continue to be caught in a cycle of poverty and internal strife. When taken as a whole, the domestic conflict experienced by the nations of Africa and Asia from the mid-twentieth century to the present has produced more destruction and loss of life than both of the world wars combined. States are more seriously damaged by civil wars, as they are fought wholly on the home territory of a country. The diversion of government funds from health and infrastructure to building the military significantly reduces incomes and thus harms the national economic welfare. As vital resources and factors of production are lost or destroyed during conflict, domestic clashes can continue to have a negative impact on the prospects for growth even after a struggle has ended. The emphasis of public spending on maintaining security and police forces needed to preserve peace in the postwar period can also undermine efforts at reconstruction. Moreover, internal wars can have ripple

effects that spread beyond the borders of the affected country, producing global pathologies such as crime, disease, poverty and terrorism that will have their greatest impact in the years to come.

Thus, while the effects of war on national economies may have some general attributes, different conditions hold for the ability of nations to fully achieve prosperity after the experience of catastrophic violence. In the present world climate, international wars have become relatively rare and short-lived, while domestic conflicts are prolonged and often recurring. At the same time, a core of stable and prosperous nations enjoys peace, while civil war continues to affect certain types of developing states. The conflict-resolution issues facing these countries involve more fundamental concerns of political stability and structural viability than typically affects the industrialized nations. Managing the return to prosperous societies and economic systems therefore requires a closer look at the relationship between differing aspects of conflict and a wide range of political and economic variables.

### **Classical Theories of War and Development**

A number of classic studies have sought to determine the roles of labor, capital, and technology in the achievement of economic growth. One such work distinguishes between the impact of short- and long-term growth rates on future economic performance. This is known as the theory of convergence, which maintains that the economies of developing countries will grow faster than those of industrialized nations because of their greater investment and earnings potential. Thus, even in the event of a war or major conflict that destroys a nation's primary resources and industries, the overall social system can be expected to recover rapidly as the government seeks to restore productivity. Because of the greater possibilities for growth, the actual severity of the conflict experienced by a country is therefore positively related to the speed and extent of its eventual economic renewal.

Subsequent analyses that build on these findings have produced a statistically based theory known as the "Phoenix Factor." This theory maintains that although a country that is defeated in a world war may suffer significant losses of national power, it will catch up with and eventually overtake the victor as its postwar growth rates begin to accelerate. Such a conclusion suggests that contrary to conventional wisdom, it is a nation's pattern of domestic economic performance, rather than the provision of foreign aid, that holds the key to its recovery. The accumulated

evidence demonstrates that an advanced society that suffers severe wartime damage in terms of its population and infrastructure can return to its initial level of development within one generation.

However, while such studies may accurately portray the prospects for the great powers, this theory is not easily applicable to the majority of developing countries, which do not exhibit the internal conditions or policies conducive to rapid postwar regeneration. These nations are often faced with unresolved structural problems that foster continued instability. High levels of internal conflict rather than involvement in international wars typify the political histories of many Third World states. Despite the seeming frequency of warfare in developing regions such as Africa, there have been only two recorded African interstate conflicts since the year of independence that resulted in greater than 1,000 casualties: between Somalia and Ethiopia from 1977–1978, and Uganda and Tanzania in 1978.

Where major institutions are weak or do not enjoy broad popular legitimacy, a segment of the national population may continually challenge the government's right to rule. This is especially true of decolonizing and newly independent states. The economies of these countries have often been characterized by long-term periods of stagnation, or programs of state-led development pursued by authoritarian regimes that promote doctrines of socialism or "self-reliance." Some development policies may also produce vast disparities of income between urban elites and rural poor who rely on traditional practices and forms of subsistence, fostering tensions between social classes. These nations thus often become caught in a "poverty trap," in which high rates of fertility and increasing population levels are combined with minimal economic growth. This can slow or prevent the transition from an economy based upon the harvesting of primary goods to one based on industrial production and high technology. Worse still, the lack of effective means of dispute resolution within formal institutions can perpetuate dissatisfaction and conflict.

### **Conditional Theories of War and Development**

Just as there are important distinctions between the effects of conflict on the industrialized versus the developing nations, there are also differences in political and structural factors that may significantly influence the prospects for postwar reconstruction. If problems such as social inequality, weak institutions, and ethnic disputes remain unresolved in the aftermath of civil

war, these will continue to hamper the rebuilding of the society and economy. Additionally, the likelihood that conflict and economic degradation will continue is dependent on the goals and decision-making behavior of political leaders, and whether they pursue policies that benefit the society as a whole, or are designed to maintain their hold on power.

A second class of theories therefore seeks to address the influence of social conditions and domestic politics on the relationship between war and economic progress. The theory of collective goods applied to conflict resolution posits that in the aftermath of war, growth is hindered by the existence of institutional structures that are occupied and controlled by certain privileged groups. These ruling coalitions have a vested interest in maintaining the prewar political order, because it allows them to accumulate wealth for themselves rather than contributing resources to improving the general welfare. Therefore, it becomes a necessary first step to carry out reforms that remove entrenched political forces before significant economic gains can be achieved. The logical conclusion of this premise is that the revolutionary change or collapse that often accompanies a major war can eliminate the dominance of these groups, leading the way to modernization and growth. However, while these conditions may be of significance in producing and maintaining beneficent economic policies, this process has been shown to have little relationship to the actual rate of economic recovery.

Most essential to this issue is the observation that once a country has experienced a major internal conflict, the probability increases that conflict will resume within the near future. Therefore, the immediate post-war period is a critical phase during which the conditions for political stability and economic recovery must be created in order to prevent a recurrence of hostilities. This relates directly to the concept of a "poverty-conflict trap," in which underdevelopment and conflict occur as a cycle. Underdevelopment occurs where there are insufficient resources to sustain growth and improve economic competitiveness. Low economic growth perpetuates the tensions that foster domestic struggles and civil wars, which in turn produce the circumstances that are associated with poverty. These frictions are worsened by the maldistribution of wealth that is common in many Third World countries, in which an elite few enjoy the benefits of modern conveniences, while the majority of the population is deprived of basic necessities. Further, conflicts have often intensified where leaders have resorted to repression by the police and military in order to protect privileged classes and silence social unrest. For example: the resistance movements in Latin American nations such as El Salvador and Nicaragua were fueled

by the terror tactics used by the allies of a small group of landowning families and dictatorial governments.

Yet another important element of this equation is the intentions of political leaders in pursuing policies that may either benefit or harm the economic welfare of their countries. Unpopular leaders who seek to remain in power might engage in conflicts such as foreign policy crises or a campaign against insurgents in order to divert public attention from a poor economic performance. By demonstrating their ability to conduct a war or respond to threats, they may satisfy enough of the citizenry to maintain their hold on power, despite an obvious record of malfeasance. This in turn perpetuates the policies that foster low growth and poverty. These conflicts also waste valuable resources and hinder the investment necessary for increased productivity, insuring that these negative conditions endure. Yet again, it is certain countries, or those that suffer from an initially low level of available capital, that are most likely to be caught in the cycle of war and underdevelopment. These cases are especially concentrated in regions of the world such as sub-Saharan Africa.

Another such study of conditional factors seeks to account for both the impact of civil wars on domestic economic growth, and the extent of "spillover effects," or collateral damage on the welfare of neighboring countries. The authors extend the classical growth model by including an input for human capital in order to test for the disruptive effects of conflict on factors related to economic prosperity such as trade and foreign investment, as well as the diversion of resources from domestic investment and savings to military spending. The authors find that civil wars have an indirectly negative effect on short-term rather than long-term growth. Because low-income countries have more rapid growth rates, in the event that economic fundamentals such as labor, human capital, and investment are not directly altered, their economies can be expected to recover fairly quickly from the effects of internal war. At the same time, the degree of impact on neighboring countries is largely equivalent to the actual intensity of the conflict. Altogether, these findings demonstrate that civil wars are not simply an isolated problem that can be ignored by the developed nations.

### **Greed and Grievance in War and Development**

Armed rebellion and guerrilla warfare has long been a prevalent feature of the politics of developing nations. As the frequency of internal conflicts has surpassed

that of interstate warfare in the post-Cold War era, determining their causes has invited the application of different kinds of approaches in the study of war and development. Thus, the most recent crop of research into the causes and consequences of internal violence in the Third World attempts to present economic explanations for domestic conflict and civil wars. While traditional analyses of intrastate conflict seek to identify the political motivations for group violence, contemporary approaches have begun to emphasize the role of resource endowments and profit seeking in the initiation of civil wars, as well as their overall effect on economic prosperity. These studies have produced evidence that armed uprisings in the developing nations are motivated largely by “greed,” or the desire to control valuable resources, rather than “grievance,” or a protest against inequality of political rights. This is also linked to the finding that the risk of civil war is greatest in countries whose economies are highly dependent on income from natural resource exports, as rebel organizations can capture these industries as a source of finances for military operations. For instance, during the new wave of conflict in the Democratic Republic of Congo that began in 1998, forces led by Laurent Kabila gained control over the diamond mines that produced the income necessary to fund his regime. The results indicate that opportunities for organized rebellion afforded by illegal finances or resource wealth provide a stronger explanation for the outbreak of civil wars across countries than do variables such as inequality, political rights, or ethnic differences. Controlling access to such resources may therefore hold a key to stemming or limiting the likelihood of violent uprisings in these countries.

More problematic for the cause of preserving peace in developing nations have been the significant changes in the form that domestic conflicts commonly take. This is evidenced by a shift from the prevalence of traditional guerilla insurgencies, such as those that took place in China, Cuba, and Vietnam, to a proliferation of new types of internal wars in which the combatants have no clear intent other than to kill their enemies and gain wealth and power. These conflicts most often take place in what are typically labeled as “failed states,” in which central government authority has collapsed or is too weak to control large areas of the country. African countries such as Liberia, Somalia, and the former Zaire are familiar examples of such states. A main characteristic of these conflicts is that the participant forces do not initiate war in the pursuit of a defined political objective. In classical guerilla warfare, soldiers are motivated by an ideological doctrine, on the basis of which they intend to overthrow the existing government and replace it

with a revolutionary regime. In addition, one of the central strategies of guerilla movements is to garner popular support for their cause by responding to the needs of those most affected by underdevelopment. In contrast, the soldiers in the new internal conflicts do not seek to occupy their society as a foundation for carrying out a prolonged struggle. Rather, their primary goal is to gather weapons and gain control over territory that provides access to valued goods such as minerals or narcotics. These resources generate income upon which warlords can further build their armies and personal fiefdoms. The conditions for a perpetuation of conflict are further intensified where warring populations inhabit the same areas and communities, particularly in the case of ethnic or religious disputes. This situation has been observed in countries such as Bosnia and Rwanda, where displaced refugees are forced to return to neighborhoods co-populated by those who perpetrated ethnic killings. What makes the prospect of resolution of these wars even more difficult is that the task does not simply end with the cessation of conflict. It requires additional efforts toward state building, in which basic administrative functions must be restored before the stability necessary for reconstruction can be achieved. The dilemma of state building is especially evident in centers of international crisis such as Afghanistan.

### **The Future of Conflict and Development**

Overall, the evidence produced by twenty-first century research on war and development indicates that civil wars have become more prevalent than international conflicts, and that they are largely concentrated in a particular group of low-income developing countries. In some cases, the responsibility for the prevention or resolution of civil wars lies with the individual government of the affected country. Yet, the notion that these conflicts do not affect the well-being of wealthy nations is a falsehood. Because the instability generated by domestic conflicts can impact not only neighboring countries but also the world as a whole, the problem demands a global agenda for action.

The two primary difficulties involved in organizing such efforts are the costs to participant governments, and determining which approaches will be effective in a given setting. Experience since the 1990s suggests that the provision of foreign aid to these countries would be problematic or even ineffectual. There is often little incentive to offer aid packages to war-torn or severely impoverished nations, which may have no ability to allocate funds effectively or to repay their debts. Further, the feasibility of introducing

broad institutional or policy reform into a country at the international level is limited. In the case of attempting to impose democratic accountability and constitutional government on unstable societies, it could be potentially destructive. This demands a more careful approach to intervention and the delivery of foreign assistance in the post-conflict period. Rather than the traditional method of providing an immediate infusion of money and peacekeeping forces that are quickly withdrawn after initial stability is achieved, foreign investment and reconstruction aid should be made conditional upon the introduction of necessary preliminary reforms as a foundation upon which to base future institution-building efforts.

In addition to the management of post-conflict environments in developing countries, the preservation of peace calls for the introduction of preventive strategies as well. One possible measure that the international community might pursue to decrease the actual incidence of civil war is to help control the access to natural resources that militant groups rely upon as a source of income. This would involve creating transparency measures that would make public the manner in which revenues from the harvesting of these valuables are used. Another would be to provide resource management assistance to countries whose economies are highly dependent on primary commodities in order to reduce the impact of shocks caused by a rapid decline in world product price levels. These downturns in economic welfare have been shown to create instability that increases the likelihood of violent conflict. Lastly, though regulation of military spending and arms buildups by international monitors is a highly challenging prospect, a possible alternative might lie in a coordinated effort by financial institutions and regional organizations to reduce arms purchases. In general, the degree of success with which international peacekeeping forces can prevent the resumption of internal conflicts is dependent on the level of commitment by the parties involved. Yet, while such efforts at intervention may prove expensive in the short term, the cost of neglect in terms of the overall impact on global peace and prosperity is far greater.

## WASTE MANAGEMENT

### Defining Waste Management

Technological and industrial development has led to high volumes of different types of generated waste. Waste management includes all activities that seek to minimize the environmental, health, and aesthetic impacts of disposed waste. In order to reach sufficient results and introduce proper options in waste-management practices, waste is divided into several categories according to different characteristics—origin, physicochemical properties, material, and management options. Dividing it by origin, waste can be domestic, industrial, commercial (institutional), agricultural, and so forth. By physicochemical properties, it is divided into liquid and solid; hazardous (toxic, flammable, radioactive, etc.) and non-hazardous. The material can be paper, metal, glass, wood, food scraps, textile, and so forth. The chosen management option depends on the type of waste (combustible, recyclable, compostable, etc.).

Waste-management approaches have developed over time. In ancient times waste was thrown into the streets and roads, where it was left to accumulate. The first disposal methods were simple and consisted of open pits located out of the residential areas. As population increased, efforts were made to transport waste farther from the residential sides. Demographic and economic developments led to increased volumes of generated waste. This emphasized the importance of the way wastes are managed. The type of the waste

(combustible, recyclable, compostable, etc.) determines the way it is handled, collected, disposed of, and stored.

Waste release, accumulation, and disposal are recognized as posing risks to the environment and public health. In order to minimize adverse effects caused by released wastes, different waste-management practices have been developed. The tasks of collecting, treating, transporting, and disposing of wastes present complex challenges. They vary with regard to the type of waste—solid or hazardous. Waste management will be discussed below in terms of the specifics of solid-waste management and hazardous-waste management.

## Solid Waste Management

Solid waste is material that is not in liquid form and has served its purpose or has no value for the person who holds it. Solid waste is accumulated through different activities: residential, commercial, institutional, and industrial. Some types of waste that can pose dangers to human health and environment are defined as hazardous; these will be covered in a separate discussion under the Hazardous-Waste Management section. All non-hazardous solid waste from a community (houses, streets and public places, shops, offices, etc.) is called municipal solid waste (MSW). Although some words such as “garbage,” “rubbish,” “refuse,” and “trash” are used as synonyms for solid waste, they have specific definitions and uses. Refuse comprises garbage and rubbish. Garbage is refuse resulting from the preparation, cooking, and dispensing of food. Rubbish includes heterogeneous household and business wastes that are not classified as garbage or ashes. This involves paper, wood, glass, rags, and metals. Trash is rubbish that includes bulky items, for instance couches, refrigerators, and so forth. Except for municipal solid waste, part of the generated solid wastes are also sewage-treatment solids (biomass sludge, settled solids, etc.); mining wastes; industrial wastes (chemicals, sand, paints, etc.); and agricultural wastes (crop residues, farm animal manure, etc.).

Adequate solid-waste management requires more than just dividing waste into different groups. It is a complex issue that requires technological skills and involves social, legal, financial, and institutional aspects. It demands coordination and management of a large workforce and collaboration among many stakeholders. Good waste management identifies three major points: (1) collection and transportation; (2) solid-waste treatment approaches; and (3) integrated

waste management. The way wastes are managed is crucial to the economy, health, and the environment. When thoughtful approaches are applied, waste management reveals the potential use of waste materials as valuable resources. Waste composition and quantity vary among nations and communities depending on the level of commercialism and institutionalism. In the United States, for instance, nearly 36% of the total MSW generation, which in 2001 comprised 229 million tons, is paper and paperboard. The second-largest component is yard trimmings, followed by food scraps, plastics, metals, rubber, textile, leather, wood, and other miscellaneous materials. In Europe, waste also constitutes a challenge. Annually, the total amount of waste generated is around 2,000 million tons. Paper and organic waste make a significant share of the municipal solid waste, with an increasing share of plastic. Low-income countries score low in terms of waste-generation rates, ranging between 0.4 and 0.9 kg per capita per day. The major part of their waste content is organic. Waste composition rates are important for precise solid-waste management plans.

Waste collection is the first step in the long waste-management chain. It is important for the protection of human health, environmental quality, and safety. It is one of the most expensive parts in the waste-management process and often inadequate financing can lead to poor waste-collection services. Usually the people remaining without waste collection services belong to the low-income population. Collection costs (as percentage of income) vary from country to country. For low-income countries they are between 0.9% and 1.7%. They represent 0.5%–1.1% for middle-income countries and 0.2%–0.4% for industrialized countries. However, financial restrictions are not the only factor that can affect adequate waste-collection services. Operational methods can also influence the efficiency of the solid-waste services. These include organizational structures and procedures, management capacity, and appropriate technologies.

Waste collection should occur at frequent intervals but not less than once per week because of the rapid decomposition of some residues. Waste transportation is an important stage of waste management. It is of crucial importance especially for large and densely populated areas, when an optimal route should be selected. Specially designed trucks are used for waste transportation to the final destination of the refuse. If it is not near the place where waste is generated, then transfer stations might be designed. Waste-transfer stations are facilities where municipal solid waste is unloaded from collection vehicles and held while it is reloaded onto larger, long-distance transport vehicles for shipment to landfills or other treatment or disposal sites.

seven toxic dioxins or only to the most toxic dioxin, called 2,3,7,8—TCCD (2,3,7,8-tetrachlorodibenzo-*p*-dioxin). Other pollutants are also released as a result of the incineration process. These include lead, mercury, cadmium, and others. Lead has been associated with a variety of negative effects on human health—slowed nerve conduction, reduced vitamin D metabolism, reduced hemoglobin production, kidney damage, and others. Mercury exposure affects behaviour and can lead to renal damages even at low levels. In addition to emissions of heavy metals, dioxins, and furans, the incineration of waste generates acid gases and particulate matter. Acid gases can cause respiratory problems and can lead to ecosystem damage by acidification. Particulate matter in the atmosphere can also cause adverse effects on human health. Last but not least, incineration plants require much investment and high operating costs. For a plant to be economically feasible, costs must be minimized through sale of energy recovered. Incinerators that convert the heat released from combustion into a stream of hot water are called waste-to-energy plants. Their systems require special equipment and controls and highly skilled technical personnel.

### Landfilling

The most traditional method of disposing of municipal solid waste has been landfills. *Open dumps* are a primitive stage of landfill development. Open dumps consist of unselective disposal of waste and limited measures to control operations, including those related to the environmental effects of landfills. As this is not a sustainable method of landfill waste management, the open dump approach will be mentioned, but not discussed further here.

Operated dumps are the first-stage-upgraded landfills, which operate under control measures. Incoming wastes are inspected and recorded and other measures are applied in order to achieve better control mechanisms. However, certain issues are not taken into consideration where operated dumps are used. These include environmental cautionary approaches such as leachate and landfill gas management. Leachate is a water-type liquid that seeps out of a landfill. It results from rain infiltration through the landfill and also from the moisture fraction in the waste. Because of the predominantly anaerobic environment, leachate is contaminated with heavy metals and organics and is highly toxic. It is important that the leachate is not allowed to reach and enter surface water or groundwater. Landfill gas is a result of the anaerobic degradation of biodegradable wastes. The released gas contains around 60% methane and 40% carbon

dioxide. Methane is poisonous and potentially explosive and as such it must be controlled. Converting open dumps or operated dumps to engineered landfills and sanitary landfills is a crucial step for introducing sustainable landfill management.

A safer alternative to landfill waste disposal is the use of *sanitary landfills*—solid waste is disposed of at a carefully selected location, constructed and maintained by engineering techniques that minimize the pollution of air, water, and soil, as well as reduce other risks to human health and the environment. Sanitary landfills apply measures to control gas and collect and treat leachate. The construction of a sanitary landfill must consider different technical aspects: siting, design, operation, and environmental impacts. The selection of the landfill site depends on many factors. These include:

**Economic and technical criteria:** haul distance, available land, etc.

**Geology/hydrology of the landfill site:** soil should have a very low hydraulic conductivity,  $<10^{-9}$  m/s, so as to prevent leachate penetration through the site. If the hydraulic conductivity does not meet the technical requirement, then additional protection material is necessary.

Depending on the type of waste to be disposed of and the specifics of the location, it has become a practice to provide a protective lining system. The lining system can be either single- or multilayer and it can be made of naturally *in situ* clay, imported clay, bentonite, or synthetics. For safety reasons, a seismically unsafe zone should be avoided for landfill sites.

**Ecological and biological conditions** should be also considered when a landfill is designed. These include existing and potential water supply sources, protected areas or species, climate conditions, etc.

**Socioeconomic factors** also play a role. They involve human settlements, recreational zones, historical and archaeological sites, agricultural regions, etc.

On sanitary landfills waste is spread and compressed in thin layers. Each day the compacted waste is covered with a layer of soil so that it prevents negative impacts such as odour, dust, rodents, birds, and other pests. The final cover for a completed landfill may also be topsoil, which can support vegetative growth.

Worldwide there are different landfill practices. As Johannessen and Boyer (1999) note in *Observations of Solid Waste Landfills in Developing Countries: Africa, Asia, and Latin America*, solid-waste landfills sites range from open dumps to sanitary landfills. At the national level, decisions are made mainly with regard

## WASTE MANAGEMENT

to the gross national product (GNP), available infrastructure, and investment projects. The European Union has introduced stringent technical requirements for reducing adverse effects of waste and landfills and landfill taxes have been applied in some European countries.

Although each of the three options for solid-waste treatment propose solutions for generated waste, it is becoming more and more difficult to find adequate sites for landfills, since not all waste is proper for composting and incineration also has limits. One of the crucial issues in managing various types of waste is integrated waste management.

### *Integrated Waste Management*

Integrated solid-waste management involves a combination of techniques to manage municipal solid waste. It is based on the fact that the waste stream consists of different materials. The idea behind integrated solid-waste management is that a combination of approaches can be used to handle the miscellaneous content of the waste stream. Source reduction and reuse of materials, recycling, combustion, and land-filling are all methods of waste management. They form the hierarchy of integrated waste management.

Source reduction stays at the top of the hierarchy. It addresses how products are produced, purchased, and used. Source reduction can be achieved through design of the products, packaging with minimum material, increased product lifetime, and decreased consumption, among other methods. Implementation of source-reduction approaches can be done through education, research, financial incentives, technological development, and so forth.

Recycling is the next level in the integrated waste-management hierarchy. It cannot alone solve all waste-management problems, but it can reduce significantly the volumes of waste that are disposed of on landfills or are thermally treated. Recycling requires separation and sorting of waste. Source separation is done at the point where waste is generated (e.g., the households, business, etc.). In many cases, different materials are segregated (e.g., paper, glass, aluminum, etc.). This type of municipal waste collection is more expensive than ordinary refuse collection. An alternative to source separation are drop-off centers, which are usually situated at shopping centers or other convenient locations. Commonly recycled materials include paper (newspapers, corrugated cardboard, high-grade paper), aluminum, glass, ferrous metals (iron and steel), plastics (polyethylene terephthalate [PET]), high-density polyethylene (HDPE), mixed plastics, other plastics, and batteries.

The places where recyclables are received and processed are called materials recovery facilities (MRFs). MRFs may be designed to handle all types or certain categories of recyclables.

Recycling programs are one of the first waste-management options because they can divert significant quantities of materials from ultimate disposal. They reduce the overall waste stream that is directed either to landfills or combusting. In addition to this, recycling can have a positive impact on composting. Most recyclable materials such as glass, plastic, and metals are considered contaminants in the compost product and moreover, they are not easily composted. Recycling of toxic-containing products (e.g., batteries) leads to removal of hazardous constituents (lead, cadmium, etc.), which increases the product's quality as waste material. Integrated waste management suggests that waste-management alternatives should be designed to complement each other environmentally and economically. It shows the close link among the different waste-management options, and suggests solutions for mitigating the adverse effects of waste generation.

### **Hazardous Waste Management**

Hazardous waste is any solid, liquid, or gas material that can cause death, illness, or injury to people or environmental destruction if it is improperly stored, treated, transported, or discarded. Wastes are considered hazardous if they are *ignitable* (capable of burning or causing fire), *reactive* (able to explode), *corrosive* (able to harm organisms because of high contents of acidic or alkaline substances), *toxic* (poisonous), *containing heavy metals*, or *radioactive* (emitting ionizing energy that can harm living organisms).

### *Sources of Hazardous Waste*

Hazardous wastes result from different activities. Industries are one of the major producers of hazardous wastes. Agriculture also releases wastes that create hazards to human health and environmental safety (e.g., nitrates, herbicides, pesticides, fluoride wastes, etc.). Household-generated waste can also contain hazardous materials. These include, for instance, toxic paints, drugs, toxic batteries, pesticides, consumer electronic products containing cadmium, mercury, or flame-retardant materials. Waste from hospitals also must be treated with caution. Infected materials such as used bandages, needles, scalpels,

or materials contaminated with blood or tissue must be disposed of carefully.

Radioactive waste, particularly nuclear fission waste, continues to be one of the most dangerous hazardous wastes. It remains radioactive for thousands of years before fully decaying. Because of the complexity of the problem, the management of radioactive waste is usually considered to be a separate engineering task from other forms of hazardous-waste management.

Hazardous waste is generated at a particular site. In order to provide safe storage and further treatment of hazardous wastes, one of the initial hazardous-waste management steps is obtaining a suitable container for the waste. Safety is the primary consideration in container selection. It is also a general requirement that containers be labeled with a description of the waste material and the words "hazardous waste." In addition to safe storage, safe transportation of hazardous waste is also given special attention due to the threats that hazardous waste creates. Transportation vehicles and containers where hazardous waste is stored are designed in a way to avoid adverse impact that hazardous waste might have. Standards for cargo trucks and shipping containers are included in governmental regulations. In case of accidents during transportation, immediate and appropriate actions must be taken so that environmental and public health hazards can be reduced.

### ***Hazardous Waste Management Options***

Hazardous-waste management options are similar to those that apply to solid waste.

Hazardous waste reduction is the most desirable stage in hazardous waste management. Although reducing the quantity of generated waste or reusing and recycling waste materials are good options, they do not solve all problems with hazardous waste. There will always be need for their treatment and disposal. Chemical treatment includes oxidation, neutralization, and ion exchange. Physical processes include sedimentation, evaporation, and filtration of hazardous waste. These processes lead to reducing its volume. Biological treatment also suggests ways for handling hazardous waste. Microbes can be used on contaminated sites for stabilizing hazardous waste. This process is called *bioremediation*. In other cases, genetically engineered species that can metabolize the waste are used. Thermal treatment destroys hazardous wastes. However, high-temperature incineration can cause air pollution and this is one of the major problems posed by hazardous waste thermal treatment.

Proper disposal of hazardous waste is important in order to avoid adverse impacts on public health and the environment. A secure hazardous-waste landfill must have impermeable liners and leachate collection systems. An impermeable cover is placed over a finished landfill so as to reduce potential environmental damage. Hazardous waste can pollute the soil, surface and underground water, or the air.

### ***Legislative Framework***

Worldwide about 400 million metric tons of hazardous wastes are generated each year. This requires coordinated actions and efforts to minimize hazardous-waste generation and disposal. In response to the concerns regarding toxic waste being dumped from industrialized countries in developing countries and countries in transition, in 1989 the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal was adopted. The Convention entered into force on May 5, 1992. At the start the main focus of the Basel Convention was the "transboundary" movement of hazardous wastes, which is movement of such wastes across international borders. The Convention's objectives are to ensure environmentally sound management and adequate disposal facilities; to dispose of wastes as close as possible to the point of their generation; to minimize quantity and hazard of wastes generated; and to reduce transboundary movements. The Basel Convention introduces "environmentally sound management," the aim of which is to protect human health and the environment by minimizing hazardous waste production whenever possible. It proposes a set of strategies in order to stimulate and promote efficient activities by the parties involved.

## WATER RESOURCES AND DISTRIBUTION

### The Hydrological Cycle

Freshwater is vital to all living organisms. It is the medium in which living processes occur and all organisms require water to complete their life cycle. Humans use water for drinking; irrigating crops; watering livestock; in industry; and as a medium to dilute, assimilate, and remove wastes. Lakes and rivers provide habitat for aquatic species and many of these are used by humans for food (e.g., fish, aquatic plants) and building materials (e.g., reeds for thatching). Aquatic systems provide humans with other ecological services such as flood control and water quality enhancement. Water bodies are also used for transport and recreation, and they give humans aesthetic pleasure. Water resources are unevenly distributed over the earth's surface, largely because of climatic influences on the hydrological or water cycle.

The earth is a watery planet with 75% of its surface covered in oceans. A total of 97.6% of water on earth is stored in the oceans and saltwater lakes that are too saline to provide water for many human uses. Of the remaining 2.4%, most (87%) is frozen as ice, snow, and permafrost; only 13% of freshwater is liquid. Much of this liquid water is stored underground in aquifers and soil. Only 3% is readily accessible in surface water bodies such as rivers, lakes, and wetlands. In other words, surface water bodies contain less than 0.01% of the earth's water and many of these water bodies are in remote areas far from human settlements.

Transfers between the reservoirs of water (oceans, atmosphere, land surface, and underground stores)

occur through the hydrological cycle. Water, evaporated from the oceans by heat from the sun, condenses in the atmosphere to form clouds and returns to the earth's surface as precipitation (rain, hail, dew, sleet, and snow). Approximately 80% of all precipitation returns directly to the oceans, while the remainder, an estimated thirty-three thousand to forty-seven thousand cubic kilometers per year, falls on land. Of the water falling on land, some is intercepted by vegetation and evaporates from leaves and stems, some flows down the plants to the ground, and some falls directly on the soil surface. Water that reaches the ground either infiltrates the soil or flows along the surface. Surface runoff and groundwater may flow into streams and rivers, eventually returning the water to the oceans. Some water may replenish groundwater reservoirs. Water stored in the soil may be absorbed by plants and used by them for growth and in photosynthesis. Most water taken up by plants is returned to the atmosphere through *evapotranspiration*.

Groundwater resources consist of either shallow, rechargeable aquifers that are connected to rivers and streams or those that filled many years ago with "fossil water" and are not currently recharged. The former are replenished as rainwater infiltrates the overlying soil and enters the aquifer. Water enters an aquifer through a recharge zone, a porous layer sandwiched between two impermeable layers of rock or clay that form the underground reservoir.

Water resources vary in time and space largely through seasonal and inter-annual variations in climate. In the tropics, radiant heat from the sun is concentrated over a smaller area than in temperate regions. Greater radiant heat input at the equator warms the air and it expands and rises. As it rises, the air cools and since cold air holds less moisture, rain falls. The rising air spreads out and falls in a high pressure zone around 30°N and S. The cool, dry air warms as it falls to earth and deserts tend to occur at these latitudes. This differential heating generates trade winds that meet in an equatorial low pressure trough, the Inter-Tropical Convergence Zone (ITCZ). The convergence zone moves north of the equator during the northern summer (June–August), bringing rain to the underlying regions. At the end of the northern summer, the ITCZ migrates south of the equator, bringing rain to the southern tropics and subtropics between November and February. Equatorial regions have two wet seasons, with rainfall occurring each time the ITCZ crosses the equator. These temporal variations in climate significantly affect the availability of water resources. For example, nearly 80% of all runoff from Asia occurs in six months (May–October), and in arid regions of Africa, about 80% of annual runoff occurs in one to two

months each year. Spatially, the boundaries of lakes and wetlands may change seasonally, expanding during wet seasons and contracting in dry seasons. The discharge of rivers and streams may also vary seasonally and corresponding water levels in floodplain lakes rise and fall with the flood pulse.

Changes in surface water resources also vary inter-annually, with more water stored or discharged during wet years and less during droughts. Much of the inter-annual variation can be related to the strength of El Niño events. In El Niño years, reversal of winds and ocean currents across the Pacific results in droughts in southern Africa, eastern Australia, and Brazil; droughts and forest fires in Indonesia; and storms and wet weather along the American west coast from Alaska to Peru. Computer models that analyze tiny temperature fluctuations in the Pacific Ocean can be used to predict El Niño years, and these models provide an early-warning system that assists in planning relief efforts designed to minimize the effects of drought-induced famines. El Niño events could become more intense with global warming since warmer oceans will increase the potential for El Niño events to develop.

### **Water Resource Distribution and Human Populations**

The human population of the world exceeded 6 billion in 2000. It has been projected that the population will peak by 2050 at between 7.3 billion and 10.7 billion. After that time the population is predicted to stabilize or fall. Per capita freshwater use is increasing in almost all countries and the frequency of critical water shortages is expected to increase. In 2001, 1.2 billion people lacked access to safe drinking water and 2.5 billion have inadequate access to water for sanitation, washing, and food preparation. Globally, between 1950 and 2000, annual per capita water availability decreased from 16,900 cubic meters to 6,800 cubic meters. This is predicted to decline to 5,400 cubic meters by 2025, as human population growth outstrips increases in water supply. A widely accepted threshold for water adequacy is 1,600 cubic meters per capita, per year. 1.7 billion people live in river basins with per capita water availability below 1,000 cubic meters, and the resultant water stress impedes food production and economic development. Most such countries are in the developing world.

The distribution of water resources corresponds poorly with the distribution of human populations. Asia, where 60% of the world's population lives,

has access to only 30% of global runoff. Conversely, South America with approximately 5% of the human population, contributes 26% to global runoff from land to sea, with the Amazon River alone accounting for 15% of global runoff. This uneven distribution, in both time and space, of water and corresponding human populations, is the underlying cause of many water-resource problems. For example, the Amazon River supplies only 0.5% of the world's population and therefore most, perhaps up to 95%, of its runoff is not utilized by humans. Conversely, so much water is diverted from the Ganges River that little, if any, reaches the sea during periods of low flow. The Huang He River in China is so heavily used that in 1997, a drought year, the lower course of the river was without water from February to August. Reducing flows in rivers can seriously impact in-stream communities and water quality, and some countries have established minimum flow regimes (environmental flows) that, when reached, water abstraction must cease.

With the growth in the world's human population, per capita water availability has declined on all continents. Predicting future water need for human use is difficult, and many of the projections produced in the past have over-estimated consumption because they were based simply on extrapolation of existing trends. More recent projections, incorporating sophisticated computer modeling, are more reliable, but these have generally been applied in developed countries and there is a keen need for their application in the developing world. These projections are key as the development of water-resource infrastructure requires planning years in advance of actual need. Increasing water demand by larger human populations may be offset by increased water-use efficiencies. However, by 2025 at least 3 billion people in ninety countries are expected to face severe water stress.

### **Human Settlements and Surface Water Resources**

Water availability is the key factor in the development of flourishing human settlements. Most early settlements were built on the banks of rivers or lakes that not only provided water but also a means for exploring and colonizing new sites. Freshwater supplies can be enhanced by increasing water-storage capacity to store runoff (dams and reservoirs), inter-basin transfers of water, increasing withdrawal of groundwater, conversion of saltwater to freshwater (desalinization), and by improving water use efficiencies.

In order to reduce their dependence on the vagaries of climate that largely control the availability of water resources, humans have managed water resources for millennia. Archaeological remains of water storage dams have been found in Jordan and Egypt that date back to at least 5000 BCE. However, construction of large storage reservoirs only began in the early 1900s and by the end of the twentieth century, there were over 45,000 large (more than 15 meters high) dams in over 150 countries. During the 1990s, an estimated US\$32–46 billion was spent annually on large dams, four-fifths of it in developing countries. Of the US\$22–31 billion invested in dams each year in developing countries, about four-fifths are financed by the public sector.

Half the world's large dams were built exclusively or primarily for irrigation, and an estimated 30% to 40% of the 271 million hectares of irrigated lands worldwide rely on dams. Reservoirs are estimated to provide irrigation water that results in 12–16% of world food production. About 12% of large reservoirs are designated as domestic water supplies. Through multipurpose use, reservoirs may also provide flood control and hydroelectricity as well as sites for fishing, recreation, and tourism.

Dams can have significant negative social, economic, and environmental impacts. Impoundments reduce downstream flows and this impacts human populations living on the banks of the lower reaches of regulated rivers. Displacement of human populations from the land flooded by new reservoirs has had significant social consequences, and dam development projects often meet with strong resistance and protests from people living nearby. Scheduled for completion in 2009, the Three Gorges dam on the Yangtze River in China will impound the world's largest reservoir and supply hydroelectric power to 150 million people. The reservoir will flood large areas of high-quality farmland, displace almost 2 million people, and the Yangtze River and reservoir could become polluted from wastes from the industries that will develop to use the hydroelectric power generated. The weight of water in the reservoir could trigger landslides and earthquakes.

The Aswan High Dam in Egypt forms a barrier, trapping the rich sediment that previously built up the rich, alluvial soils of the lower Nile valley and delta. The delta has declined in area and agricultural production has had to rely more on expensive, imported fertilizers. The annual sardine harvest in the eastern Mediterranean has declined by over 80%, partially resulting from the reduction in nutrient-rich silt previously carried out to sea through the delta.

Waterways have also been modified to improve navigation, drain wetlands for agriculture and urban

developments, construct irrigation systems, and enable inter-basin water transfers. These often massive engineering works have facilitated water transport, contained flood waters, generated hydroelectric power, and provided irrigation water for agriculture and urban areas, but these benefits must be weighed against the environmental and social costs.

Groundwater reserves are particularly important in arid areas where access to surface waters is limited. Approximately 1.5 billion people use groundwater as their sole source of domestic water supply. In many areas, abstraction of water from groundwater reserves exceeds the rate at which they are replenished (groundwater mining). In Asian cities such as Bangkok, Manila, Beijing, and Madras, high rates of groundwater extraction have lowered water tables by over ten meters. Groundwater abstraction may result in land subsidence (sinking or cracking of the hardened soil as water is extracted) or, in coastal regions, significant saltwater intrusion. Saltwater intrusion into the coastal aquifer underlying Madras has been detected ten kilometers inland. Abstraction of water from shallow aquifers also reduces flows in surface waters, which these aquifers supply.

Another significant problem with use of groundwater relates to declining water quality as aquifers are recharged with polluted agricultural runoff, urban drainage, and wastewater. In the small nations of the South Pacific with low-lying islands such as those found in Kiribati, Fiji, and Tonga, groundwater reserves exist as a lens of freshwater overlying saline water tables. These freshwater lenses are very susceptible to pollution with wastewater and to salinization if use exceeds recharge rates. In some densely populated, small-island nations, such as Nauru, water has to be imported.

Basic information on groundwater resources, such as storage capacities, exploitation, and recharge rates and water quality, is lacking in many developing nations. In the 1970s Bangladesh initiated a program to utilize groundwater resources for drinking water, reducing dependence on contaminated and polluted surface waters. This program significantly reduced infant mortality from water-related diseases. Unfortunately, groundwater in the region has high levels of arsenic, derived from naturally occurring minerals. Signs of arsenic poisoning are becoming more apparent in humans drinking well water with high arsenic levels, and the number of people affected may be as high as 18 million.

In arid areas near the sea, desalination of seawater may provide freshwater to satisfy domestic and some industrial needs. Desalination is an energy-intensive process and therefore costly, but improved technologies such as multistage flash distillation and

reverse osmosis, have, in certain circumstances, made the process economically feasible. However, production costs prohibit the use of desalinated water in agriculture. Another drawback of this source of freshwater is the disposal of the concentrated brine produced. Disposal of the salt in the sea can seriously impact marine life in nearby areas. Desalination plants supply freshwater to communities in the Caribbean, Pacific Islands, Middle East, and North Africa.

## Human Uses of Water Resources

Human adults require three to five liters of clean drinking water per day just to survive. In addition, minimum requirements for sanitation, bathing, and food preparation have been estimated at, respectively, twenty, fifteen, and ten liters per person per day. This total of approximately fifty liters per person per day is the minimum required to sustain life in a moderate climate and excludes the much larger volumes of water required to grow food. Per capita water use varies considerably between countries and approximately 2.2 billion people live in over sixty countries that report average domestic water use below the fifty liter minimum.

In addition to domestic supply, the main human uses of water are for agriculture, industry, and removal of domestic and industrial wastes. Globally, agriculture accounts for about 68% of withdrawals, industry uses 19%, and municipal and domestic uses account for 9%. Regionally, these use ratios vary significantly. In Africa, agriculture, industrial, and domestic use percentages are 90%, 4%, and 6%, respectively. In India, 93% of water use is directed towards agriculture, whereas in arid Kuwait only 12% of water withdrawals are used for agriculture. A dry climate precludes significant water use for agriculture and Kuwait, through its rich oil resources, is able to import food and water and to supplement water supplies through energy-intensive desalination of seawater.

Food production is water-intensive. It takes five hundred to one thousand cubic meters of water to grow one tonne of grain. Water required to produce an average human diet varies from 640 cubic meters per capita per year in Africa to 1,830 cubic meters per capita per year in the United States. Most of this variation can be attributed to differences in calorific intake and the proportion of meat in the diet.

Almost one-fifth of the world's agricultural land is irrigated and these lands account for about 40% of the world's agricultural production and almost 70% of the world's water use. Water diverted for irrigation has in many areas significantly altered hydrological

regimes. For example, water abstracted from rivers that flow into the Aral Sea (Uzbekistan and Kazakhstan) has reduced, by over 50%, the area of what once was the world's fourth-largest lake and in some areas, the shoreline has retreated by 120 kilometers. Fish production has declined and twenty of the twenty-four fish species previously recorded from the lake are no longer caught.

One of the most serious consequences of irrigation is the increase in the salt content of agricultural soils or salinization. As irrigation water evaporates, it leaves behind the salts dissolved in it. Excessive water application can move salts up the soil profile, exacerbating the problem. It has been estimated that 20% of irrigated lands are salt-impacted; developing countries with significant problems include Argentina, Egypt, Iran, and Pakistan. Very large transfer of water from inflows to the Aral Sea has resulted in the salinization of its waters. The exposed bed of the Aral Sea, twenty thousand square kilometers in area, contains toxins and salts that are spread by the wind to surrounding farmlands. Intensive agriculture that often accompanies irrigation can also lead to soil loss, nutrient depletion, and soil compaction.

Irrigation has played a significant role in maintaining per capita food production in the last three decades of the twentieth century. However, trends indicate that the increase in food production is slowing. Growth in cereal production declined from 2.6% per year between 1967 and 1982 to 1.3% per year in the 1990s. This is partly due to reduction in the rate of expansion of agricultural lands under irrigation. In the 1970s irrigated lands were expanding at more than 2% per year but this rate fell to less than 1.4% per year in 2000. This decline in the growth rate of areas under irrigation is due to higher costs associated with irrigating more marginal land and reduced water availability. Many new high-yielding crop varieties require more water. While these new varieties have higher yields, production gains come at the cost of additional stress on water and soil resources.

Livestock use water directly and also indirectly through the production of the forage and feeds that they consume. Large differences in human per capita water requirements can be attributed to the quantity of meat in human diets. Approximately 40% of grain produced is fed to livestock and this requires a significant quantity of water to produce. Reduced meat consumption will not only increase food availability, it will also reduce water consumed in food production.

Many industrial processes require significant quantities of water, but much of it is returned to the environment, albeit often with reduced quality. Water is very effective at carrying away heat and up to 90% of water used in industry is for cooling; little is

consumed in this process and most is returned to the source. Thermal pollution (disposal of water at elevated temperature) can impact aquatic organisms in the receiving waters directly (many aquatic organisms are very sensitive to small temperature changes) or indirectly by reducing the dissolved oxygen content. Industry also uses water to dissipate wastes and this leads to significant pollution and reduced water quality. This is particularly true in newly industrialized urban areas in developing countries where few pollution controls have been implemented. Water used in industry generates economic returns per unit use of water that are fifty to seventy times greater than those from agriculture. However, due to political and social considerations and the desire for food security, many governments give agriculture a high priority in the allocation of water resources.

Water is used to carry away domestic, industrial, and agricultural wastes. Up to 80% of water withdrawn for domestic use is returned to rivers and groundwater as wastewater. Significant advances have been made in developing techniques for the treatment and recycling of wastewater. Primary treatment of sewage effluent consists of screening the wastewater to remove large particles followed by storage in ponds to allow time for smaller particles to settle. Secondary treatment involves techniques that promote bacterial breakdown of organic matter in the effluent. Tertiary sewage treatment removes certain pollutants that remain. However, in most developing countries, wastewater is either untreated or receives only primary treatment, and significant problems include high incidence of water-borne diseases and *eutrophication* (excess nutrient enrichment/pollution) of receiving water bodies. Economic development provides the opportunity to treat wastewaters and also for the implementation of economic incentives and penalties for polluters (“polluter pays” principle).

In many parts of the world, wastewater is more commonly being viewed as a resource that can be treated and cleaned to a level appropriate for a specific use. Suitably treated, wastewater can be used to irrigate urban parks and golf courses, as industrial cooling water, and for irrigation of certain agricultural crops such as fruit trees and pastures. In arid countries such as Israel, Egypt, Saudi Arabia, and Tunisia, wastewater is used extensively in agriculture and this also reduces the need for fertilizers. Alternative disposal of recycled wastewater may be required during wet seasons when irrigation needs decline. Purification costs are higher if the end-use of wastewater is to be potable water, and few developing countries have made the necessary investment. Namibia has done so and reclaimed water provides

up to 30% of the total water supply to the capital city, Windhoek.

Other uses of inland water bodies include flood control, fish production, hydroelectricity generation, transportation, recreation, and tourism. Fisheries based on natural fish stocks have little direct impact on water resources. However, fish culture in ponds is a fast-growing industry and currently provides 20% of total fish production. Aquaculture requires large quantities of water and diverts supplies away from irrigated agriculture. Aquaculture ponds are enriched with fertilizers and livestock wastes and disposal of water from them may lead to eutrophication of receiving waters.

Hydroelectricity generation provides a significant component of energy resources in many developing countries. Hydropower currently provides 19% of the world’s total electricity supply, and is used in over 150 countries with twenty-four of these countries depending on it for 90% of their supply.

### Water Quality

Safe drinking water and adequate sanitation are essential for human health. In 1977, the United Nations Water Conference declared that all people, regardless of their socioeconomic standing, have a right to clean drinking water and sanitation services that prevent diseases. A goal of the United Nations Millennium Declaration is to halve, by 2015, the proportion of people who are unable to reach or to afford safe drinking water. Contaminated water causes millions of preventable deaths every year, especially among children.

Water quality is declining through pollution, salinization, and enhanced sediment loads from soil erosion. Poor water quality is common in areas with high rates of population growth, poor sanitary conditions, and poverty. Water quality issues are more severe in arid areas where dilution of wastes is minimal. Pollutants include microorganisms that affect human health; excessive nutrients; heavy metals such as lead, mercury, and cadmium; and numerous chemical compounds including persistent and toxic organic pollutants such as PCBs and DDT. Pesticide use in India increased over fifty-fold in the latter half of the twentieth century. Pharmaceutical drugs even in low concentrations can act as carcinogens or endocrine disruptors. Poor land management and deforestation has elevated sediment loads in many tropical rivers. Most developing countries lack the resources and trained personnel to establish and maintain programs

that monitor the quantity and quality of water resources.

### **Water-Borne Diseases**

Between 5 million and 10 million people die each year from water-related diseases stemming from inadequate access to safe drinking water and from poor sanitation. Many disease vectors rely on water for at least part of their life cycle and it has been estimated that 80% of infections in developing countries are related to water. Pathogenic organisms (viruses, bacteria, and protozoans) are found in areas where untreated sewage and effluents from animal husbandry operations enter domestic water supplies. Sewerage systems in many developing countries are inadequate, serving only a small proportion of urban populations. Significant diseases that are either water-borne or spread by vectors requiring free water to complete their life cycle include: diarrhea, schistosomiasis, malaria, dengue fever, poliomyelitis, Bancroftian filariasis, and onchocerciasis.

### **Water Resources and Global Warming**

Global warming will accelerate the hydrological cycle through enhanced rates of evaporation and precipitation. This will alter water resource availability, but exactly how is difficult to predict, particularly in the tropics where most developing countries are situated. The degree of uncertainty in predicting the impacts of climate change further complicates forecasting water resource needs. Water supplies in developing countries are already under stress. Alterations to water supply through climate change can only add to the stresses caused by expanding human populations and pollution. Climate change could also exacerbate economic and political tensions, particularly in the more arid regions where water resources are already scarce.

Several predictive models of global climate suggest that rainfall in the tropics will become more intense, leading to increased runoff and reduced soil infiltration. Freshwater ecosystems will be influenced by elevated water temperatures and altered flow regimes. In some regions the frequency and duration of large floods will increase; in others droughts will be more common and prolonged. These changes will severely stretch provision of government services. Floods affected 65 million people between 1972 and 1996, more than any other type of disaster including war, drought, and famine.

### **Water Resource Planning**

Government policies on water resources have largely been directed toward increasing supply to meet increasing demand and to guarantee food security. Emerging trends indicate that we are approaching a “water crisis” in several regions—most notably the Middle East and North Africa where per capita water availability is presently 1,247 cubic meters per capita, one of the lowest in the world, compared with 18,742 cubic meters per capita in North America and 23,103 cubic meters per capita in Latin America. The main causes of water shortages are a dry climate, periods of low rainfall (drought), poor management of natural resources (deforestation, overgrazing), and water stress brought about through human population growth outstripping the growth in water supply. The main constraint to agricultural production in many areas in the near future will be the availability of water, not land.

As water resources become more limited, long-term planning becomes imperative. This process requires accurate prediction of future water demand and the development of water resources to meet that demand. The planning process should be carried out for whole watersheds and should include the environmental consequences resulting from the construction of water resource infrastructure. Effective planning will require data on precipitation, evaporation, river flows, groundwater depletion and recharge rates, and water quality, as well as information on aquatic resources and habitats.

Governments are beginning to implement water management strategies that emphasize conservation, efficient use, and watershed protection, and to develop mechanisms that encourage wise use of water resources through education, regulation, and economic incentives such as water rights trading. Implementation of these strategies has been accompanied by water resource audits, enhanced monitoring, and pollution abatement programs. The most effective water resource management plans have focused on watersheds or river basins that integrate land and water management issues in a multi-sectoral approach. Whole basin management becomes more challenging where the basin straddles one or more international borders.

### **Politics and Water Resources**

Water disregards political boundaries. One-third of the countries in water-stressed regions of the world are

expected to face severe water shortages this century. Water resource issues (supply, distribution, and quality) have been identified as a potential major cause of political instability. Depletion and degradation of water supplies, population growth, and unequal access to water resources shared between nations all combine to make water issues a threat to human security. Worldwide, demand for water is outstripping supply and water quality is declining. Small conflicts over water have already occurred and evidence suggests that the lack of water can be linked with both poverty and political instability. There are 261 watersheds that cross the political boundaries of two or more countries and 145 nations share water resources. These international basins cover 45% of the land surface of the earth and affect about 40% of the world's human population. Four river basins in developing countries (Congo, Niger, Nile, and Zambezi) are shared by between nine and eleven countries. The Amazon, Ganges-Brahmaputra-Meghna, Mekong, Tigris-Euphrates, and La Plata extend over five to eight countries.

Water has caused political tension between Jordan and Israel, India and Bangladesh, and between the countries drained by the Nile River, particularly Egypt and Sudan. The total human population of the Nile Basin is 145 million (1990 estimate) and the runoff from the Nile is approximately 85 cubic kilometers per year. The average per capita water availability is therefore less than 600 cubic meters per person per year. Actual water availability per capita, through re-use, is higher than this. The Sudanese live upstream from the Egyptians and theoretically have access to 3,150 cubic meters per person per year compared with the 925 cubic meters per person, per year available to the average Egyptian. Sudan has abided by a treaty signed with Egypt and passed on much of the water that flows through its territory. Cooperation has partly come through Sudan's inability to use its water effectively owing to political instability, and tension over water could potentially rise in the future.

Political disputes over water tend to be more prevalent in developing countries because water supply is more closely linked with human survival, opportunities to reduce use are fewer, and resources to supplement supply are meager. States will need to focus more on including principles of water resource sharing in national water legislation, developing policies that address water resource issues, and negotiating treaties with states that share regional water resources.

A number of international organizations promote strategies for the wise and cooperative use of the world's water resources. The United Nations Development Program (UNDP) provides advice, technical

support, and capacity building to member nations on policy, legal, and regulatory issues relating to improving sustainable use of water resources. The United Nations Environment Program (UNEP), through its Freshwater Unit, promotes integrated management and use of freshwater and environmentally sustainable development. The Food and Agriculture Organization (FAO) works to raise levels of nutrition and living standards, to improve agricultural productivity, and to improve living conditions of rural populations. With regard to water resources, FAO provides advice and development assistance on water use for agriculture, fisheries, and aquaculture. The Global Water Partnership (GWP), created in 1996 by the World Bank, United Nations Development Program (UNDP), and the Swedish International Development Agency, coordinates activities among government agencies, public institutions, private companies, professional organizations, and multilateral development agencies involved in water management. The GWP promotes Integrated Water Resource Management (IWRM), an approach that seeks to balance human, industrial, agricultural, and environmental needs. The International Commission on Large Dams promotes progress in the establishment of design, construction, operation, and maintenance of large dams. The World Water Commission promotes awareness of critical water issues at all levels and facilitates efficient conservation, protection, development, planning, management, and use of water in all its dimensions on an environmentally sustainable basis.

The rapidly growing human population, movement of humans from rural to urban areas, and effects of economic development are exerting stresses on finite water resources. Water scarcity is exacerbated by declining water quality. In some parts of the world, the rate of increase in demand for water has slowed in recent years and this can be attributed to more efficient use and less waste. This trend needs to accelerate and developing countries need to implement measures to conserve water supplies, reduce leaks in distribution systems, reduce use, and develop techniques that recycle water efficiently.

## WEST AFRICA: HISTORY AND ECONOMIC DEVELOPMENT

In order to provide the necessary geographic context for a discussion of the development of West Africa, we first need to grapple with the spatial definition of the region. Undoubtedly the region constitutes Africa's "big bulge," but how far north does it go? Where does the Sahara, for instance, begin and end? And, where does West Africa end and East Africa begin?

Basing their regionalization on ethnicity, the physical environment, history, culture, and the colonial frameworks, De Blij and Muller (2000), two influential world regional geographers, take West Africa to "include the countries of the western coast and Sahara margin from Senegal and Mauritania in the west to Nigeria and Niger (and part of Chad) in the east" (p. 357). Basil Davidson, one of the most respected Africanists, for his part, sees West Africa as "a handy term for all the land and the offshore islands between about 20° of latitude north of the equator down to the West African coast, and eastward to about 15° of longitude" (1998, p. 3). For Eugene Mendonsa (2002, p. 17), West Africa extends not right from the equator but from 5° to 25° north latitude and from 17° west to 15° east longitude; fairly similar latitudinal and longitudinal ranges were used by Mabogunje decades earlier. Evidently, like all perceptual or vernacular regions, West Africa has no exact geographical meaning, even though we all know where to point to on a map.

With insight from these authors, and conscious of our present interest in not only the historiography but also the economic development of the region (and, consequently, the need for reliable empirical data),

West Africa is here defined as the formal region embracing all the countries from the southern edge of the Sahara in the north to the Gulf of Guinea in the south, and from Senegal in the west to Niger and Nigeria in the east. This spatial definition includes the following sixteen countries: Benin, Burkina Faso, Cape Verde, Côte d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, and Togo. It is important to note that all the countries listed are members of the Economic Community of West African States (ECOWAS). Furthermore, the delimitation adopted here is almost coterminous with those of Davidson (1998) and De Blij and Muller (2000), with the explicit exclusion of Chad and Cameroon, both of which do not self-identify as West African countries, having opted to join the Economic Community of Central African States (ECCAS) instead of ECOWAS. Clearly "West Africa" is a mental construct, the boundaries of which can vary depending on the analysis one seeks to pursue. This should not surprise anyone, for neither the historiography nor the economic development of West Africa is actually separable from that of Africa as a whole.

### Physical Environment and Climate

While environmental determinism is now rightly rejected by most geographers and development analysts, there is no denying that more than most parts of the World, the physical environment of West Africa has strongly influenced much of its economic development over the centuries. West Africa is characterized by east–west climatic and vegetation belts, which vary sharply as one moves from the north to the south. Lying astride the equator, West Africa has a relentlessly high temperature for the greater part of the year. While the region's perpetual high temperature means that the growth of plants and animals cannot be retarded for lack of heat and light, it still makes the availability of moisture a serious problem; consequently, the role of air masses becomes the more vital in any analysis of the region's climate and vegetation. West Africa is influenced by two main air masses: the tropical continental air mass (or the harmattan) and the tropical maritime air mass. The harmattan is a warm, dry, dusty air mass that forms over the Sahara Desert and moves southwesterly from December to March. At its maximum extent in January, it covers nearly all parts of West Africa with its desert-like conditions. As the name suggests, the tropical maritime airmass emanates from the ocean—more precisely, the southern Atlantic ocean—and

moves northeasterly across West Africa. It is a warm, humid airmass that peaks around July and August to about latitude 20° north, bringing much of the rainfall in West Africa. These two airmasses are separated by the Inter-tropical Front (ITF) or the Inter-Tropical Convergence Zone (ITCZ). It is along this front that much of the convectional activities that cause rainfall in West Africa take place. From around January to July, the ITCZ moves progressively northwards, bringing rain to large parts of West Africa. However, it retreats to the south from about July to December, extending the spell of dry conditions across most parts of West Africa. The north–south oscillation of the airmasses, the ITCZ, and consequently, rain, undergirds the discernable latitudinal variation in West Africa’s environmental conditions and vegetation, which range from the Sahara Desert in the north through the Sahel, to the Savanna, on to the rain forest, and finally to the coastal plains along the Atlantic Ocean.

By world standards, West Africa does not seem to be a densely populated region. With a land area of some 6 million square kilometers (about five-sixths the area of the United States) and a population of 236 million in 2000, the arithmetic density of West Africa is 39 persons per square kilometer, compared to China’s 131 persons per square kilometer, and India’s 309 persons per square kilometer. In fact the population of all the sixteen countries of West Africa is just about a quarter of China’s or India’s (World Bank 2002a and 2002b). Travel across West Africa and you would be readily impressed by its vast open spaces, especially in countries such as Mali, Niger, and Mauritania. But a closer look at the soil would quickly reveal the extent of soil infertility that many West Africans have to grapple with. Not surprisingly, the average arable land per capita for West African countries for 1997–1999, for instance, stood at a mere 0.25 hectares, with a range of 0.06 hectares in Liberia to 0.52 in Togo (the comparable figures for China and India are 0.10 hectares and 0.17 hectares, respectively). The soils of West Africa’s Sahel and the Savanna zones are loaded with iron and aluminum, with few nutrients. The forest soils, though relatively better, are excessively leached, and highly susceptible to sun baking, erosion, and nutrient depletions, especially following the removal of the forest cover that provides much of the decaying biomass that enriches the soil. West Africa’s high temperatures, and to some extent high humidity, create natural breeding grounds for a variety of disease-carrying organisms, including mosquitoes, fleas, flies, worms, and snails, which are implicated in the spread of yellow fever, sleeping sickness, malaria, Bilharzia, and other distressing diseases across West Africa.

## History

Until quite recently, the outside world knew very little about the history of West Africa—and, indeed, of Africa, as a whole. The common misconception was that African history has little in its own right beyond the European activities. This is how Trevor Roper, once the Chair of History at Oxford University, put it: “Perhaps in the future there will be some African history to teach. But at present there is none; there is only the history of Europeans in Africa. The rest is darkness . . . and darkness is not the subject of history” (Mendonsa 2002, p. 40). This notion of a “historyless people” has almost disappeared, thanks to the recent upsurge of anti-Eurocentric scholarship. According to Davidson (1998, p. 25), “the written history of England, substantially, can be said to have begun around the same time as the written history of the Western Sudan (now West Africa).” He based this supposition on the fact that the Islamic scholar Abu Ubayd al-Bakri’s *Kitab al-Masalic wa’l Mamali* (*The Book of the Routes and Realm*), which dealt with the trans-Saharan trade in West Africa, was completed in Cordoba in AD 1068—just a couple of years after the landmark Norman invasion of England (Davidson 1998, p. 25).

The history of West Africa is invariably a central part of any meaningful attempt to understand humanity’s struggles to tame and survive in the vast and difficult continent of Africa, a continent believed to be the original home of the human race. Not only that, as the main source of Black African slaves, upon whose back the so-called New World was developed, West Africa holds a special place in the minds of Westerners, in both Europe and the Americas.

### *Early States and Empires*

West Africa had strong and durable cities, states, and empires prior to the European adventure in the region. The oldest empires include the Ancient Ghana, Mali, and Songhay (or Songhai) empires. Ancient Ghana—whose real name was Wagadu, with *ghana* (or war chief) being the title of one of its kings—was located to the northwest of the modern Republic of Ghana, covering parts of present-day Mali, Mauritania, and Senegal. While the origin of Ancient Ghana remains understandably obscure, scholars place its founding date around the second or third century AD, based on traditions recorded by Islamic scholars such as Es Sadi, al Fazari, al Kwarizmi, and al Bakri. The Soninke people of Ancient Ghana (the descendents of modern Senegal) owed much of their prominence

to the trans-Saharan trade, benefiting from their strategic location at the southern end of the caravan routes from North Africa across the Sahara, and the northern end of the trading routes that emanated from the gold- and ivory-producing regions of the south. Thus, the people of Ancient Ghana traded in gold and ivory procured from the south and salt and other commodities from the north.

For thousands of years, the kings of Ancient Ghana managed to weld various groups of people into a stable state, with the king's capital, which most likely moved from one place to another, complete with markets, religious shrines, foreign merchants, and fortified royal retreats. Available records show that at the height of its prosperity—that is, before the eleventh century AD when Ancient Ghana was invaded by the Almoravids—Kumbi Selah, its capital city, located some 320 kilometers north of present-day Bamako, was indisputably the largest city in West Africa, with more than 15,000 inhabitants. Tolls and levies on traded commodities and taxes from subjugated people were used to maintain an army and to exert law and order in the empire. Berber Muslims from the north mounted a series of invasions against Ancient Ghana around AD 1050, ruining its farmland and disrupting its trading link with the north. These invasions eventually led to the disintegration of the empire by AD 1098.

With the decline of Ancient Ghana came the upsurge and development of the Mali Empire. Originally located just east of Ancient Ghana, the Mali Empire continued to expand eastward along the Niger River, conquering Jenne and Timbuktu, both of which became major centres of the empire—ironically, the latter has somehow become the epitome of geographic isolation in the minds of many Westerners.

Writings of the famous Moroccan-born Islamic traveler and scholar, Ibn Batuta, who visited Mali in the mid-fourteenth century when the empire was at its zenith, indicate that the rulers of the Mali Empire were staunch Muslims who routinely participated in the annual pilgrimage to Mecca. The Mandingoes Muslims who ruled the empire were closely related to the Soninke of Ancient Ghana. Gold continued to be the most important export from the area, and formed the basis of Mali's wealth. In a nutshell, the people of Mali duplicated the achievements of Ancient Ghana, and exceeded them. However, it is important to note that while the active history of Ancient Ghana covered about a thousand years, that of Mali spanned only about two centuries, in which three main periods of succession occurred. The first major one was under Sundiata (1235–1260), who is known to have founded the Mali Empire. The second was under Mansa Sakuru (1298–1308); Ibn Khaldun, the great North African historian, once noted that under Mansa

Sakuru, Mali became so mighty that all the nations of West Africa stood in awe of its success. The third major period was under Mansa Kankan Musa (1312–1337), who again extended the power and influence of the empire (Davidson 1998, p. 41). By the early 1400s, Mali had outgrown its political and military strength and became highly vulnerable to invasion. The Tuareg invaded Timbuktu in 1431, and by the end of the century, Mali's rulers had lost control of the empire.

As the Mali Empire declined, other powers emerged, the noteworthy among which was that of the Songhay people of the Middle Niger, whose empire peaked around the mid-fifteenth century with the city of Gao as its principal centre of trade, wealth, and power. Other notable states and kingdoms that emerged in West Africa, prior to the European skirmish and the eventual colonization of the region, include those of the Mossi, Kanem-Bornu, Hausa, Bamabara, Wolof, Oyo, Yoruba, Benin, Dahomey, Ashanti, Bono, and the Awkamu.

### *Contacts with Europeans: Trade, Slavery, and Colonization*

European involvement in West Africa is generally traced to the early fifteenth century, when Portuguese explorers arrived in that region. The European adventure in West Africa did not merely interrupt the path of West Africans' civilization, it irreversibly changed their entire cultural, social, economic, and political systems. By the early seventeenth century, European trading ships were arriving at all the major West African coasts, from the coast of present-day Senegal in the west to Nigeria in the east. But the Europeans were yet to subdue militarily the West African states they encountered, as the latter was highly capable of repelling the former's threats of violence. And, as the accounts of Davidson and many other historians indicate, added to the perils of the ocean travel, the fevers and malarias of the mosquito-infested interior, and the fierce resistance and ambushes of the natives, were the risk of intense rivalry and fighting between the Europeans themselves. The Portuguese, who held the upper hand over the English and French, during the initial years were overtaken by the Dutch, with the capture of Portugal's Elmina Castle in the Gold Coast (present-day Ghana), which was the most active scene of European trade in West Africa during the sixteenth and seventeenth centuries. Notwithstanding the ensuing intra-European battles and native resistance, the European merchants kept coming to West Africa, due primarily to pressures from powerful political and commercial interests in Europe. With so much at stake—in terms of the procurement of gold,

ivory, and, ultimately, slaves, from West Africa—it did not take much for the Europeans to see the need for peaceful partnerships, a realization that culminated in the infamous Berlin Conference of 1884–1885, by which virtually all of Africa was divided up among the imperial powers of Europe.

The slave trade did not become a regular part of the European trade until after about 1620, when the Europeans got established in the Americas and needed more laborers to work on their budding mines and plantations. It is hard to find anything that more greatly undermined the basic humanity of both West Africans and Europeans during their contact centuries ago—and, indeed, continues to conjure emotional and sometimes vitriolic debate if not confrontation, among these two groups—than the enterprise of slavery. Common, unsophisticated, and racially motivated allegations of Blacks’ inferiority, slavish mentality, and lack of self-esteem, and of Whites’ hyper-cruelty, hypocrisy, and proclivity toward human exploitation are routinely tied to the trans-Atlantic slave trade. Contrary to what many believe, Europeans were not the first to engage in the trading and exporting of Black African slaves. The work of Chancellor Williams (1987), for instance, shows that Arab imperialism and slave trade in Africa preceded that of Europeans by centuries. Still, there is no denying that the version of slavery perpetrated by the Europeans in (West) Africa surpassed all the others in its sheer volume and brutality. Nobody knows for sure how many Blacks were shipped from Africa, primarily from West Africa, but common estimates range from 10 to 15 million people, with millions perishing not only in their capture and transshipment, but also from hard work and maltreatment in the mines and plantations of the Americas (Rodney 1974).

The key to understanding how the slave trade began and persisted as long as it did, according to the insightful analysis of Davidson (1998), lies in the slave system that existed in West Africa prior to the Europeans. African chiefs and kings, as in other parts of the world then, regularly turned war captives and some lawbreakers into slaves, who were sometimes sold, exchanged, or simply given away as gift to other chiefs, kings, and elites of society. And with time it was not exceedingly difficult for the Europeans to persuade the African chiefs and kings to sell these slaves or barter them in exchange for European goods, especially for firearms upon which the very survival of the African kingdoms and their kings came to depend.

Quite expectedly, European incursions and slave trade faced stiff resistance and battles in many parts of West Africa; perhaps the most notable were those mounted by the Ashanti warriors of the Gold Coast

against the British. Yet, the lure of European goods (e.g., alcohol and firearms) was far too strong for many people to resist. The proliferation of firearms across West Africa turned out to be awfully detrimental to the Europeans themselves, and perhaps no one captured the conundrum faced by the Europeans in this regard better than William Bosman, a Dutchman then living in the Elmina Castle in the Gold Coast: “[W]e sell them very great quantities, and in doing this we offer them a knife with which to cut our own throat” (Davidson 1998, p. 191).

As the demand of West African goods and slaves increased over the years, so did inter-tribal wars, slave raids, and invasions across the region. By the early seventeenth century, West Africans were squarely in the midst of the “profitable” triangular trade, which entailed the shipment of goods such as cotton, alcohol, and firearms from European ports for sale in West Africa, from where the Europeans procured slaves for sale in the plantations of the Americas in exchange for sugar, tobacco, rum, and other products, which were then shipped to Europe.

In the second half of the nineteenth century, after more than four hundred years of contact, the Europeans managed to lay claim to nearly all the lands of West Africa, following the Treaty of Berlin in 1885. Only Liberia was a sovereign state in the region at the beginning of the twentieth century. Apart from Guinea-Bissau and Cape Verde, which came under Portuguese control, West Africa, comprised four British colonies—Nigeria, Ghana, Sierra Leone, and Gambia—which lie separated from one another, and nine amorously contiguous French colonies. In 1957, Ghana became the first independent nation in West Africa, spurring a series of liberation struggles that resulted in the emancipation of the entire region by the early 1970s, under the leadership of such notables as Kwame Nkrumah of Ghana, Ahmed Sékou Touré of Guinea, Nnamdi Azikiwe of Nigeria, and Leopold Sédar Senghor of Senegal.

## Economic Development

Despite more than five centuries of contact with Europeans and other societies around the world, through trade and the diffusion of innovations, West Africa (and indeed, Africa), is still one of the most marginalized and least developed regions of the world. West Africa continues to experience a substantial decline in its relative position in terms of world trade, investment, production, consumption, and access to computers and Internet connectivity. The region’s exports are still dominated by minerals

and agricultural commodities such as coffee in the cases of Côte d'Ivoire and Guinea; cocoa in Ghana and Côte d'Ivoire; and maize in Benin and Burkina Faso. Despite the primacy of agriculture, West Africa still relies heavily on food imports and sometimes even food aid, as the rate of population growth outstrips that of food production in nearly all parts of the region.

Another striking feature of the West African economy is the relative weakness of the manufacturing sector. By 2000, with the exception of Senegal, Côte d'Ivoire, and Sierra Leone, the contribution of the manufacturing sector to the respective gross domestic products (GDPs) of West African countries was generally below 15% (World Bank 2002b). With both Sierra Leone and the Côte d'Ivoire engrossed in civil wars, this figure is likely to shrink. In 2000, the average gross national income (GNI) per capita for the sixteen countries stood at a mere US\$385, and ranged from a low of US\$130 in Togo to a high of US\$1,330 in Côte d'Ivoire. And, despite some improvements in the education of women and access to healthcare, most West African countries are burdened with high infant mortality rates (IMR). In 2000, the estimated average IMR for the sixteen countries was as high as 98 deaths per 1,000 live births; the worst rates were recorded in Sierra Leone (154), Guinea Bissau (126), and Niger (114). The region's problems are certainly not confined to the economic and social spheres alone; they have inevitably spilled over to its natural and living environments, with acute levels of deforestation, desertification, soil erosion, and serious deterioration of sanitary conditions occurring in nearly all parts of the region. In recent years, however, it is the unfortunate proliferation of civil war in such places as Sierra Leone, Liberia, and Côte d'Ivoire that is posing the greatest hindrance to the economic development of West Africa, as a growing number of people are thrown into precarious refugee situations.

The economic and geopolitical conditions in West Africa reflect and reinforce the region's long-standing dependence on the West in a core-periphery framework, hardened not only through colonialism and neo-colonialism, but also through the Cold War, and, critics have argued, through the World Bank and International Monetary Fund-sponsored Structural Adjustment Programmes.

The geopolitical boundaries of West Africa are a product of colonialism, with some minor tinkering in the post-colonial period. This made-in-Europe boundary framework paid minimal attention to the West African cultural mosaic at the time, lumping people who had histories of strife together, and elsewhere, such as along the Ghana-Togo border, splitting people of common cultural bonds into different countries.

It is not hard to see how this could undermine the geopolitical stability of these countries. Furthermore, the railroads and high-standard roads in all the coastal countries, from Senegal to Nigeria, still bear the imprint of colonialism. One still finds a situation where these transportation networks are orientated towards the coast, from the interior, to facilitate the shipment of goods to Europe, with minimal intra-West African connectivity. The transportation system of the landlocked countries (that is, Niger, Mali, and Burkina Faso) are even worse, with access to ocean transportation coming only at an exorbitant price, thanks to the massive spatial segmentation wrought by the political boundaries.

Faced with crop failures, lack of agricultural credit, and land shortages, many rural West Africans are migrating to the cities in search of a livelihood. This familiar scene makes West Africa one of the most urbanizing regions of the world. The growing urban population, in the absence of a corresponding increase in housing and other urban facilities, has led to serious overcrowding, high traffic density, intense air and water pollution, and the spread of slums and squatter settlements in major cities such as Lagos in Nigeria, Abidjan in Côte d'Ivoire, Dakar in Senegal, and Accra in Ghana.

It would certainly be disingenuous to attribute West Africa's development problems solely to colonialism, neo-colonialism, and other external factors, such as unfair terms of trade and the manipulations of donor countries and international financial institutions. The destructive roles of the nation-states in the region, epitomized by the growing political instability and the lack of institutional capacity; mismanagement and corruption; and disregard for human rights and the value of science and research, are all to be blamed for the economic problems of the region. While corruption is not peculiar to West Africa, nor to Africa, it is without a doubt one of the leading endogenous problems undermining the region's economic development. Given the long-standing David-and-Goliath-like struggles between West Africans (and indeed Africans) and the West in the global capitalist system, it is not surprising that an increasing number of scholars, including Davidson (1994), Manuel Castells (2000), and Bingu Wa Mutharika (1995), are calling for some form of self-reliance in Africa's development. A carefully crafted endogenous development approach—with a reasonable infusion of external scientific know-how—couched in regional cooperation and a diversified economy that blurs the usual dichotomy between agriculture and industry and eschews the detrimental reliance on monocropping and external aid, would help alleviate West Africa's development malaise. The recent strengthening of

democratic governance (albeit among a handful of countries, most notably, Ghana); the increasing regional cooperation through ECOWAS; and ongoing improvements in national and intra-regional infrastructure (for example, the construction of the region's trans-coastal and trans-Saharan highways), point to good development prospects in West Africa.

In the final analysis, though, viewed from the standpoint of "development," measured primarily with economic indicators such as GDP or GNI per capita, economic growth rates, and stock market capitalization, West Africa could not be seen in much positive light. Some would even assert categorically, as did Eugene Mendonsa (2002, p. 473), that "[d]evelopment in West Africa has failed." However, the only way the notion of development can even purport to hold any universal applicability is to move beyond its present individualistic, materialistic, and economistic underpinnings to incorporate the rich complexities of non-economized societies, such as those of West Africa. It is only through such a holistic interpretation of development that the true wealth of West Africa can be appreciated by outside observers.

### WEST AFRICA: INTERNATIONAL RELATIONS

In order to better understand the international relations of West Africa, it is necessary to underscore some of the most salient characteristics that help give shape to the subregion's interactions with states and non-state actors within the external environment. As with the rest of Africa, West Africa's political balkanization is one of its dominant characteristics. The net result of European colonization, the subregion is made up of seventeen sovereign states that are as diverse as they are similar. They are Benin, Burkina Faso, Cape Verde, Cote d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, and Togo—with Cameroon on the margins. There are vast differences not only in the population and territorial sizes of the countries but also in their military and economic powers. For instance, at about 130 million people, Nigeria's population is substantially higher than the combined total of all the rest of the other regional states. There are also huge differences in physical size between some of the larger states of the region such as Mali (461,389 square miles), Mauritania (432,000 square miles), Niger (458,874 square miles), and Nigeria (356,669 square miles) as compared to some of the smaller states such as Cape Verde (1,557 square miles), Gambia (3,977 square miles), and Sierra Leone (27,925 square miles). The overall effect of such disparities in power attributes may be seen in the differential capacity of states to influence international relations and events.

In many ways, the assorted differences in physical characteristics, level of development, and military and political powers of the states tend sometimes to mask many areas of similarities. Modern West African states are all largely the artificial creations of their European colonial powers—the United Kingdom,

France, Portugal, and Spain in the case of the still disputed Western Sahara. As such, they share a legacy of non-natural boundaries and the resulting separation of relatives and communities. Largely underdeveloped, they also share characteristics of dependency to Western (especially European) political economies. While there are huge differences, the combined effects of colonial legacy, natural disasters, and poor governance structures have served to create a subregion that suffers from a high degree of indebtedness, poverty, disease, political instability, and conflict.

Despite their diversity, and differing problems, West African states have sought to overcome the negative effects of their fragmentation by seeking to build more coherent and effective economic and political structures. Weak and inadequately equipped individually to deal equally and effectively with the leading industrial states of Europe and North America, the states of West Africa have sought ways of dealing with the severe challenges posed by a seemingly hostile external environment. As such, they have resolved to work toward developing pertinent institutions and structures that would allow them collectively to address common issues ranging from conflict prevention and resolution initiatives to coordinated approaches in addressing issues of health and the economy. Nevertheless, their general dependence and weakness vis-à-vis the leading states of Europe and North America, as well as their differing priorities and national interests, have also served to impede greater commitments to collaborative activities. The net result has been that they have struggled at times to address some of the critical factors and conditions that shape their external relations. Primarily, those factors have included the need for: economic development; conflict prevention and resolution; and poverty and disease reduction and control. Let us now examine those issues by looking at each of the four separable (albeit cross-cutting) layers of international relationships involving members of the West African subregion.

### **Subregional Relations in West Africa**

As with states in other parts of the world, member states of West Africa have a great need to interact with each other, not only in pursuit of common interests but also to address common problems. During the 1990s, ECOMOG, the regional military arm of the Economic Community of West African States (ECOWAS), became active in several countries within the region, especially in Liberia and Sierra Leone, where it provided decisive military counterbalance to

the warring factions, and in Cote d'Ivoire where it has been attempting to negotiate a political solution to the problems.

To alleviate poverty, control diseases, and foment economic growth and development, governments often find it easier and more effective to do so through cooperation mechanisms. This is especially so for weak and dependent states, which not only need infusions of external financial aid, investments, materials, and skilled workforce, but also must secure them from a hostile external environment driven by competing priorities.

Hampered by persistent poverty and underdevelopment, West African states sought to improve their bargaining capacity by pooling ideas and resources and working together. This way, they hope to achieve collectively objectives that may be harder to achieve as separate nations. This was the conceptual basis of the ECOWAS, which was founded in 1975 by its member states to serve as a vehicle for economic cooperation and integration within the subregion. It was expected that with such an integrating structure, the states of West Africa would be able to overcome many of the pervasive problems that serve to retard development, such as their narrowly-based economies, heavy reliance on the export of primary products, inadequate infrastructure, low levels of resource flows from advanced countries, declining terms of trade for their tradable goods, protectionist policies of their Western trading partners, expensive transport systems, lack of sufficient skilled labor, and small domestic markets. By sharing burdens and benefits and combining resources, the states of the subregion sought to enable members not only to promote the prevention and peaceful resolution of conflicts within and between member states, but also to create a bigger and more attractive market for internal and external investment. It would also allow them to have a stronger voice in their relations with external actors and at international forums.

Unfortunately, the colonial historical experiences of the West African subregion have also created tensions and divisions among the member states. Deep suspicions and rivalries, particularly along the Francophone and Anglophone lines, have served as a crucial seam. Not surprisingly, there was a proliferation of overlapping subregional structures, which soon came to flounder due to their relative neglect and weakness. The impact of this colonial legacy, as well as fears about the regional dominance of Nigeria, have combined to weaken collaborative activities within the region. Nevertheless, since the late 1990s, there have been some areas of appreciable progress including health, agriculture, military, and economic policy making. Important frameworks and structures

that have been established include the West African Parliament, a subregional bank (ECOBANK), the West African Chamber of Commerce, the Federation of West African Manufacturers, a regional insurance scheme, and free movement of primary goods and handicrafts throughout the subregion.

Plans for a common West African monetary system have remained in place despite a series of delays due not only to challenges posed by the adopted convergence criteria, but also to the existence of a single monetary zone that groups Guinea Bissau and seven former French colonies—Benin, Burkina Faso, Cote d'Ivoire, Mali, Niger, Senegal and Togo—under the CFA franc. As envisioned in 2005, the currency integration exercise will take place in two phases. In the first phase, the governments of all the six non-CFA countries—Gambia, Sierra Leone, Ghana, Guinea, Liberia, and Nigeria—will adopt a single currency on July 1, 2005. The second phase will involve the integration of the CFA countries into the West African monetary union.

### **Relations with Other Continental States**

In regard to other regional relations, West African states have continued to play important roles within the African continent. Due to residual effects of their colonial experiences and relatively weak economies, many of these relationships have been largely political. Various, West African states played important roles in the African decolonization processes between the late 1960s and early 1990s. Although much of their roles centered on political and diplomatic support, states such as Nigeria, Ghana, and Guinea were at the forefront of efforts that culminated in the establishment of the Organization of African Unity in 1963 and its successor, the African Union, in 2002. They provided not only academic scholarships and aid to affected Africans but also substantial financial and material support to liberation movements from Angola, Mozambique, Namibia, South Africa, and Zimbabwe. For its part, Nigeria worked very closely with the Front Line States as they battled to dislodge the apartheid system in South Africa.

Very little formal inter-African trade takes place. In 2004, such trade accounted for only about 10% of Africa's total exports and imports. West African trade with other African countries follows similar patterns to those of the rest of Africa. This is with the possible exception of Nigeria, whose light manufactures and petroleum products find their way legally and illegally into other African markets. This is partly due to the nature of West African states'

integration into the global economy as competing producers of raw materials for European markets. Other important reasons for the low level of intra-African trade include weak infrastructure, especially the comparatively feeble transport communications systems, encumbering trade policies, non-convertible currencies, high political instability, poor telecommunications networks, low worker availability and retention, poor governance structures (particularly, the lack of the rule of law, transparency, accountability, and severe corruption); and ethnic, cultural, and linguistic diversity. The introduction of the New Partnership for Africa's Development (NEPAD) has coincided with a growing importance of intra-African trade. Though criticized by some for reflecting similar patterns of global inequality as previous arrangements—particularly in the substitution of real partnership with impunity and dictation by one of the "partners"—NEPAD has remained the single most important instrument available for Africa's economic revitalization and recovery in the short and medium terms.

### **Relations with Global Powers and Beyond the Continent**

As with the rest of Africa, West African states have worked hard to develop and nurture their relations with non-African states, particularly Western Europe, North America, and other members of the OECD and the Commonwealth. For most, however, their flexibility and ability to shape their external relations have been severely delimited by the political and economic strictures inherited by the post-colonial state. With economies, infrastructure, and even politics that were often configured to suit the political and economic interests and policy preferences of their former Western colonizing powers, and a post-colonial international environment dominated by the West, most West African states have labored to stay relevant in the post-Cold War global politics. While some such as Ghana, Guinea, and Nigeria have managed (more or less) to pursue relatively independent foreign policies, most others have struggled to extricate themselves from what appears to be lingering post-colonial influences. Perhaps the most enduring relationship between the states of the subregion and the world beyond Africa has been that of the former French colonies and France. Like many other former French colonies, francophone West African states (with the exception of Guinea) were linked to France in terms of preferential trade arrangements, military defense pacts, and monetary stability arrangements. Not surprisingly,

French influence not only remains palpable in the francophone areas but there is also a growing source of tensions and instability as occurred during 2004 in Cote d'Ivoire.

Although many of the relationships cultivated by West African states have been driven by the need to foment economic development, major global issues such as the Cold War and the latest US concern, the "war against terrorism," have also affected West African states—indeed, so much so that NATO Commander General James Jones described West Africa as "where the action is." Through various security initiatives aimed at conflict prevention and management, US and European political and military leaders have crisscrossed Africa to push collaborative military programs aimed at training and equipping African security forces. Driven by the increasingly vital and fast-emerging oil resources in the Gulf Basin states (anchored by Nigeria)—which include Angola, Cameroon, Equatorial Guinea, Gabon, São Tomé, and Príncipe—as well as the growing influence of rabid Moslem fundamentalism, the West African subregion has attracted renewed attention from US political and security strategists.

Western governments are particularly concerned about growing political instability and Moslem extremism in an area whose vast oil resources are increasingly important as an alternative to the even more volatile oil-producing Middle East. Nigeria, the principal oil producer and dominant political economy in the area, has been particularly hard-hit by political instability due not only to its deep societal cleavages and growing criminality, but also to interactive effects of rapid economic decline and unprecedented poverty. The ensuing political, communal, and religious violence has imposed huge costs on lost human lives and property. The recourse to the Islamic Sharia legal system in twelve of Nigeria's northern states has served to further worsen domestic tensions at both national and local levels. To some US political and military strategists, much of this has also been exacerbated by Osama bin Laden's designation of Nigeria as one of his top-priority targets. Although the poor human rights record and endemic corruption of the Nigerian government have limited direct assistance to that country, there is strong evidence of increasing prioritisation of both Nigeria and West Africa by the United States and her Western allies. Indeed, since September 11, 2001, African and US security-based partnerships have been growing. An example of these is the Pan-Sahel Initiative (PSI) under which military forces from Chad, Mali, Mauritania, and Niger received specialized antiterrorism training.

Beleaguered by pervasive economic decline and high indebtedness, ethnic tensions and political instability,

new and significant threats from AIDS and narcotics, severe deterioration of infrastructure, and declining or low foreign exchange earnings, West African states have looked to Western Europe and North America for relief and development assistance as well as more balanced partnerships. The New Partnership for Africa's Development (NEPAD) instrument has been touted by some of its supporters as a mechanism for achieving such a relationship. Various other arrangements—such as the African Growth and Opportunity Act (AGO) offered by the United States, the Commission for Africa by the British government, and the revised Lome Agreement with the European Community—have also been established over the recent past as potentially effective mechanisms for enabling these countries to break the cycle of underdevelopment and poverty. For instance, under the Lome IV Agreement regime, Europe would provide general trade and aid benefits to African, Caribbean, and Pacific (ACP) countries through negotiated differential relationships with these countries. As part of the negotiations in pursuit of the proposed Economic Partnership Agreements (EPAs) with the European Community, West African states adopted a six-point plan in their August 4, 2004, meeting in Accra, which outlines the subregion's medium- and short-term ambitions:

- The progressive establishment, in accordance with WTO rules, of a free trade zone between ECOWAS and the European Community for a period of twelve years, starting January 1, 2008;
- The need to accord priority to development and poverty reduction;
- Cooperation in trade-related matters;
- Deepening of the integration process in West Africa;
- Enhancement of competitiveness: capacity building and upgrading; and
- Improved access for West African exports to the EU market.

Despite these lofty goals, some critics maintain that the new thinking on aid to the poorer regions of the world continues to miss the point on what is actually needed by these states to achieve effective transformative development. As such, they insist that the self-styled Economic Partnership Agreements (EPAs)—reciprocal free-trade agreements due to come into effect by 2008—are unlikely to provide the palliative needed for the transformation of West Africa's weak economies. Indeed, under the current negotiation framework, which split the ACP states into six regional groupings, West Africa is forced to negotiate its own unique relationship with Europe—thereby further weakening the putative collective bargaining strength they had as part of the ACP. There are growing

concerns that the EPAs will actually further open European investment and trade access into African markets in areas that these countries had resisted vigorously during the 2003 World Trade Organization negotiations.

Also important for many West African states are their relations with international financial and trading institutions such as the International Monetary Fund, the World Bank, and the World Trade Organization. In the two decades between 1985 and 2005, virtually all of the states in the subregion have come under the economic reform programs pushed by these institutions.

While West African external economic relations have been dominated by their interactions with Western Europe and North America, the subregion also enjoys important economic relationships with East Asian, Southeast Asian, South Asian, and Latin American states. Indeed, economic relations with countries such as Japan, China, Brazil, and Malaysia have grown in significance over the past two decades. All that notwithstanding, West Africa states have strong and long-standing political or cultural relationships with states of the global South including East Asia, Southeast Asia, South Asia, Latin America, the Middle East, Eastern Europe, and the Caribbean. The collaborative political processes date back not only to the liberation struggles during the colonial era, but also to the early post-colonial period with the Group of 77 and the Nonaligned Movement.

### West Africa's International Relations: Prospects for the Future

Generally, ECOWAS has failed to live up to expectations. The member states have been fraught with internal problems such as political instability, pervasive mismanagement and corruption, human rights abuses, lack of transparency and accountability, a culture of leadership impunity, and the suffocation of civil society. Weakened by these internal as well as many other external factors, ECOWAS has generally struggled for relevance and effectiveness due to the absence of adequate commitment on the part of the political leadership. Despite a growing appearance of commitment at the turn of the twenty-first century, many of its integration schemes have remained rhetorical and administrative chimeras. The net effect of these problems and failures has been palpable increases in poverty, criminality, prostitution, corruption, waste, disease, environmental decay, and societal ills and conflict. Indeed, it is an objective fact that

most West African states (including Cote d'Ivoire, Ghana, Guinea, Liberia, Nigeria, and Sierra Leone) actually regressed in terms of their per capita income and quality of life during the last two decades of the twentieth century.

All that notwithstanding, West Africa (through ECOWAS and the embryonic African Union) continues to represent one of Africa's most promising prospects for transformative development. The end of the Cold War ushered in a new era in West African relations with the world beyond the African continent. Although significant and steady economic decline of the late 1970s and 1980s had brought about demands for significant institutional and structural changes through much of the continent, the post-Cold War political climate served not only to intensify the domestic pressures, but also to remove external political support and protection for non-performing governments. The combined net effect was a dramatic shift in the formal, official attitude within the subregion toward conflict management and resolution, economic growth, development, and political liberalization and democracy.

## WEST AFRICAN ECONOMIC AND MONETARY UNION (WAEMU)

(See *West African Monetary Union [WAMU]*)

## WEST AFRICAN MONETARY UNION (WAMU)

### Origins

The West African Monetary Union (WAMU), now called the West African Economic and Monetary Union (WAEMU), was created by the Dakar Treaty of January 10, 1994, which formally came into effect on August 1, 1994. Comprising eight francophone countries in West Africa—Benin, Burkina Faso, Guinea-Bissau, Ivory Coast, Mali, Niger, Senegal, and Togo—WAEMU has its origins in 1895, when France, the colonial power, decided for administrative purposes to centralize the administration of its colonies in West Africa. The administrative capital chosen was Dakar, Senegal. A more defining characteristic of this consolidation was the introduction in 1945 of a common currency for all the countries in the zone, the *Franc de la Communauté Financière d'Afrique* (The Franc of the African Financial Community or the CFA Franc). The CFA was and still is backed by the French treasury and linked to the French franc at a fixed rate of exchange. Over the years, the CFA has gone through several bouts of devaluation. It was after the last devaluation, on January 10, 1994, that the countries in the group decided to transform what was then essentially a currency area to a monetary union—the West African Economic and Monetary Union (WAEMU).

The objectives as spelled out in the charter are:

1. To reinforce the competitiveness of the economic and financial activities of Member States in the context of an open and rival market and a rationalized and harmonized juridical environment;
2. To ensure the convergence of the macroeconomic performances and policies within the institution of a multilateral control procedure; and
3. To create a common market, based on the free circulation of people, goods and services, and capital.

Members of the union have a common central bank, Central Bank of the West African States (BCEAO), headquartered in Dakar, Senegal, which has the sole right to issue currency for the member states. The administrative structure of the union is as follows:

- The Conference of Heads of States;
- The Council of Ministers;
- The Banking Commission; and
- The Savings and Financial Markets Regional Council.

### *The Conference of Heads of State*

As the name implies, the Conference of Heads of State is the “supreme authority of the Union.” It decides on additions to the Union; settles issues referred to it by the Council of Ministers; and as the supreme authority, has the final say on all matters. It meets at least once a year in ordinary sessions and as often as necessary in extraordinary sessions.

### *The Council of Ministers*

The Council of Ministers acts as the executive arm of the Union. Each member country sends two ministers to the Council but only one of them votes. It is responsible for defining “the monetary and credit policy of the Union in order to safeguard the value of the common currency (CFA).” It also provides financing for the activities and development of the states of the Union. It deliberates on all matters affecting the union as outlined in the Treaty establishing the Union.

### *The Banking Commission*

The Banking Commission is at the center of the banking system of the Union. It came into force on October 1, 1990, with the express goal of restructuring

## WEST AFRICAN MONETARY UNION (WAMU)

the banking system and providing the conditions for uniformity and good-quality banking in the member states. Among the functions of the Commission are the following:

1. Off- and on-site inspection of banks and financial institutions;
2. Expression of views on the requests for authorization submitted by banks and financial institutions;
3. Taking of administrative measures when applicable provisions are not respected; and
4. Disciplinary sanctions according to the gravity of the infraction committed.

The Commission prepares Annual Reports on the banking conditions of the Union. It has a permanent secretariat comprising the officers of its common central bank, the Central Bank of West African States (BCEAO).

### *The Savings and Financial Markets Regional Council*

The Savings and Financial Markets Regional Council is the second arm in the goal of developing and integrating the economies of the Union through common financial and capital markets. The first arm is The Banking Commission/Central Bank. When in December 1993 the Council of Ministers decided to create the second arm, a Regional Financial Exchange, the task was delegated to the Central Bank (BCEAO), which recommended the creation of two entities under the Regional Financial Exchange structure, namely:

- The Regional Council for (Public) Savings and Financial Markets
- The Securities Exchange (*Bourse Régionale des Valeurs Mobilières*—BRVM)

The Regional Council for Savings and Financial Markets is a public institution with the goal of overseeing the Securities Exchange and representing the general interest of the public. The Securities Exchange is a private entity but the member states own minority shares.

### **Successes**

There is no doubt that within the context of the African continent, WAEMU and its sister organization, the Central African Economic and Monetary Union (CAEMU), have already succeeded beyond any comparable measure. The harmonization of monetary and

fiscal policies among the eight countries that make up the union is very notable. Through its central bank, BCEAO, the WAEMU has been an active participant in reforming insurance, business law, and the mobilization of savings in the region. The use of a common currency has made trade among the countries easier and may thus be responsible for some modest amount of economic growth and integration. The establishment of a common securities exchange to mobilize savings and foster economic development is a laudable goal. The union has also often spoken with one voice in international fora on matters of common interest.

### **The Future and Its Challenges**

Even as the WAEMU has become stronger over the years, there is little disagreement about the fact that this strength came from the special relationship the countries have with France and the fact that the French franc has been the anchor for the CFA franc. With Europe (and France) moving to a common currency, the *euro*, it remains to be seen whether WAEMU can survive in the new environment. Furthermore, as the rest of mostly anglophone West Africa (Ghana, Gambia, Guinea, Liberia, Nigeria, and Sierra Leone) move toward forming their own common currency area, it will be interesting to speculate on what could happen to the older WAEMU. Would the two currency areas merge into a one strong economic and monetary union, or would they compete? If they do compete, how would the smaller WAEMU fare against a more populous, economically bigger opponent? Or perhaps the WAEMU will seek to forge closer ties with its sister, the CAEMU. These are some of the challenges ahead for the WAEMU.

## WHITE COMMUNITY IN AFRICA

There has been long-standing European contact with Africa's northern coastline but a European presence south of the Sahara only emerged in the fifteenth century when Portugal established a sea trading route to India. The Portuguese transformed the economies of the Atlantic region by initiating the Atlantic slave trade from their trading forts and small colonies of slave traders along the African coast. These colonies of white slave traders along Africa's Atlantic coast used African agents to supply them with human beings who were shipped to Brazil and Portugal as slaves. An Atlantic trading system was built in which Africa was tied to Europe and the Americas. Portuguese penetration of the Indian Ocean had the effect of disrupting the old Muslim trading and slaving system. This precipitated a period of economic decline and decay along the East African coast because the Portuguese failed to rebuild an East African trading system equivalent to the one they had disrupted. Portuguese power was generally limited to gunshot range from their forts and only two small Portuguese colonies were planted in Africa, namely, in Angola and Mozambique. But the Portuguese made a significant cultural impact upon Africa by introducing new crops from South America, including maize, cassava, and groundnuts. These crops altered the African staple diet.

During the seventeenth and eighteenth centuries the Dutch, Danes, French, and British copied the Portuguese slaving model when establishing themselves in Africa. During this slaving period, whites were largely confined to a few forts along the Atlantic coast. The one exception to the rule was the creation by the Dutch of the Cape Colony in 1652. Africa's first significant white community was established at Cape Town to produce food for Dutch ships trading with the Dutch East Indies (Indonesia). An agricultural sector producing wheat, fruit, vegetables, and wine was established in the southwestern Cape, built upon a settlement of Dutch and German “free burgers” and the importation of slaves from Indonesia, Madagascar, and Africa. In the last years of the seventeenth century, French Huguenot refugees joined the Dutch and German settlers in the expanding Cape Colony. During the early eighteenth century these Dutch-French-German settlers began calling themselves “Afrikaners” (Africans) during a rebellion against Dutch rule. In the process of indigenising

themselves to Africa, they developed a new language called Afrikaans. Despite attempts by the Dutch authorities to restrict white colonization to the immediate vicinity of Cape Town, Afrikaners began pushing inland as *trekboers* (“migrating farmers”). The Khoi-San inhabitants of southwestern Africa were conquered and assimilated into the “coloured” group of mixed-race Afrikaans-speaking labourers. The *trekboers* adopted pastoralism (borrowing from African pastoral practices) as white settlements dispersed across the interior and effectively slipped beyond the control of Dutch authorities. By the mid-nineteenth century these Afrikaners had established white communities (and “Boer” states) as far inland as the Limpopo River. This inland white community became substantively cut off from contact with other Europeans and its socioeconomic and political practices became partially Africanized through a process of interaction and conflict with surrounding African tribes. A different sort of white community evolved around Cape Town based upon plantation agriculture (deploying slave labour up until 1833), and remaining connected to the European trading system.

## The Three Types of White African Community

During the nineteenth century, Africa was divided up amongst European colonial powers, which led to three different forms of white community evolving in Africa over the next 150 years.

Firstly, small outposts of *white colonial administrators* (British, French, Belgian, Portuguese, and German) proliferated across Africa. The colonial administrators were never settlers. Instead they were transient functionaries of a foreign imperial machine, transferred to Africa as bureaucrats, magistrates, soldiers, and policemen in order to coerce and administer “the natives,” or to run the plantations and mines. They returned “home” to Europe at the end of their tours of duty. These colonial administrators were always few in number (in places like Nigeria, Gold Coast, French West Africa, Tanganyika, and Uganda) and always remained culturally aloof and detached from the imperial possessions they administered. White colonial administrators congregated in small colonies in the administrative capitals, but most were dispersed to the rural “district commissioner” offices across rural Africa.

Secondly, *white colonists* settled in some African countries during the nineteenth and twentieth centuries. These colonies never attracted the large numbers of settlers seen in North America and Australasia.

Instead, white colonists tended to be dispatched to quite localized geographical areas deemed suitable for European settlement by the colonial authorities. Within these colonial possessions, white settlers became politically and economically dominant and used their power to force black and Arab populations into subservient relationships. By the mid-twentieth century, five colonial possessions contained white settler communities sizeable enough to offer resistance to the decolonisation process.

Algeria's white community of over 1 million French colons (settlers) emerged during the French colonial period (1830–1962). The first white colons arrived in the 1830s–1840s but the largest wave of settlers migrated between 1870 and 1900, mostly from France. However, large numbers of Italians, Spaniards, Maltese, and Jews were also assimilated into the Algerian white community. The colons reproduced a southern European-type agriculture (producing wheat, olives, and grapes) on fertile coastal land conquered from the Arabs. This colon community saw itself as an integral part of France—an extension of the mother country on the other side of the Mediterranean.

Angola's white community of 250,000 Portuguese grew only toward the end of the colonial period, in the 1960s, when the Salazar government launched settlement schemes to transfer Portuguese peasants and unemployed urban workers to Angola to relieve economic pressures in Portugal and to try and strengthen imperial control of Angola. Under Salazar, an extraction and plantation economy dominated by the white settlers emerged in the western parts of Angola. The white community in Portugal's other major African colony, Mozambique, never grew to the same extent as Angola's, there being only 65,000 whites in Mozambique at independence.

Rhodesia's (Zimbabwe) white community of 250,000 was largely Anglo but with a significant Afrikaner minority. White settlement began with the arrival of Anglo South Africans in the 1890 "Pioneer column." Later, Afrikaners, migrating to escape poverty after their defeat in the Boer War, became farmers in the "white highveld" area. But the largest influx of white settlers arrived from a war-ravaged Britain after World War II. They settled overwhelmingly in urban areas where they built a commercial and industrial economy based upon exploiting cheap black labour.

Kenya's white community of seventy thousand was numerically dominated by British settlers. Kenya's white community was born in 1903 when the British colonial government recruited Anglo South Africans as settlers. They were followed by a wave of post-Boer War Afrikaner migrants. Then after World War I, a government-run soldier resettlement scheme initiated a wave of British settlement during the 1920s.

Kenya's white community created a plantation economy on the "white highlands" west of Nairobi, which was built upon the exploitation of cheap black labour.

South West Africa/SWA's (Namibia) white community of 75,000 are mostly Afrikaners, although some Germans remain from the German colonial period (1884–1914). The largest wave of Afrikaner settlers arrived in the 1920s when the new South African colonial masters of SWA worked with the Portuguese authorities to transfer a community of Afrikaners out of southern Angola and into northern SWA where they established a pastoral industry based on cheap black labour. Between 1949 and 1990 SWA effectively became another South African province and the SWA white community became merely an extension of the wider South African white community—SWA whites elected representatives directly to the South African Parliament and SWA became enmeshed in the wider South African economy.

The third form of white community in Africa was called "colonialism of a special type" or "internal colonialism" by Slovo (1985). This refers to the way an *indigenised white community* emerged in South Africa that had no European "motherland" to which it could retreat in the post-colonial era. This community attempted to segregate itself from black Africans through the policy of apartheid.

The South African white community, numbering over 5 million by 1990, developed a number of characteristics seen in no other white community in Africa. Most significantly, South African whites indigenised themselves—coming to see themselves as Africans rather than as European colonials in Africa. This community developed its own cultural forms, which although derivative of northwest European forms, became autonomous and distinctively "South African." The South African white community also developed some unique internal divisions associated with a conflict between Afrikaans-speaking and English-speaking whites. South Africa's Anglo community was born of British settlement schemes (in the 1820s, 1850s, and after the Boer War) and from major nineteenth-century migrant waves generated by diamond and gold rushes that attracted settlers from Britain, Ireland, the United States, Germany, and Australia. The Witwatersrand gold rush precipitated the Boer War, which generated long-standing animosity between the Anglo and Afrikaner communities. Another unique feature of the South African white community was that, unlike other white African communities, this community included members occupying a wide array of socioeconomic status positions, including a "poor white" *lumpenproletariat*, a working class, a middle class, a professional class, and a business-capitalist

class. Significantly, white South Africans are the only Africans to have produced an indigenous capitalist class—which consequently transformed Johannesburg into an autonomous sub-metropole of capitalism. Further, following the Second World War, white South Africans created Africa's most extensive industrial complex (built upon the exploitation of cheap black labour). In consequence, by the end of the twentieth century, 90% of white South Africans were urbanized. The South African white population is also a highly multicultural community, containing (in addition to Afrikaners and Anglos) large sub-cultures of Portuguese-speakers, Jews, Greeks, Italians, and Germans.

The white South African community has given birth to a number of small offshoot communities in Namibia, Zimbabwe, Botswana, Zambia, and Swaziland.

### **Africa's White Communities Following Decolonization**

The 1950s–1960s saw the British, French, and Belgian Empires dismantled in Africa. The notion of decolonization met with some resistance in those African territories containing sizeable white communities because these communities feared for their fate under governments dominated by black Africans or Arabs. In consequence, armed conflicts broke out in these territories.

Algeria was the first African state to experience the outbreak of a guerrilla war aimed at overthrowing the colonial order. A war waged by Algerian nationalists from 1954 to 1962 saw bombs planted in the cities, colon farms attacked, and French schools burned down. It was a conflict that destabilized not only Algeria, but the French state itself. The colons tried to convince the French government to retain control of Algeria and continue to fight the nationalist guerrillas, but in 1962 France granted independence to Algeria. This precipitated a massive exodus of white colons from Algeria, many of whom moved to Corsica.

In 1951 Kenyan black nationalists launched a guerrilla struggle when white colonials in Kenya blocked an extension of black political influence. Between 1951 and 1960 a struggle aimed at overturning the Kenyan colonial order was led by the Mau Mau. Although the British army eventually triumphed over the Mau Mau guerrillas, the British thereafter opted to negotiate with the black nationalists concerning their demands and in 1963 granted independence to Kenya. As a result, many of Kenya's white community migrated to Britain, South Africa, or Australia.

Portugal refused to participate in the 1960s decolonization process. Consequently, they soon faced guerrilla struggles—beginning in Angola in 1961, followed by Portuguese Guinea in 1963, and Mozambique in 1964. These guerrilla struggles eventually led to a revolution in which the Portuguese armed forces overthrew the Lisbon government in order to end the wars. When Angola and Mozambique were granted their independence in 1975, most of the white population of these countries fled to Portugal or South Africa.

The white community in Rhodesia unilaterally declared itself independent from Britain in 1965 when it became clear the British government was not prepared to accept the continuance of white rule in Rhodesia. From 1967 the Rhodesians faced an escalating guerrilla struggle aimed at ending white rule. By 1980 the Rhodesians were beaten and Zimbabwe gained its independence. Two-thirds of Rhodesia's white community migrated to South Africa, Britain, or Australia.

In 1966 a guerrilla war was launched in Namibia aimed at ending South African control of that territory. The resultant struggle grew into a major South African-Angolan-Cuban-Namibian war during the 1980s, which became very costly for the South Africans. Namibia was granted its independence in 1990 following negotiations to end the Angolan war. No significant exodus of Namibia's white community appears to have taken place.

During the 1980s an intense anti-apartheid struggle was waged within South Africa. This led to a new constitution being negotiated that ended white rule and brought to power the first black-dominated government in 1994. Post-1994 socioeconomic changes triggered an exodus of sections of the South African white community (especially Anglos) to Britain, Australia, the United States, Canada, and New Zealand, and an internal migration of whites to the Western Cape.

## WILDLIFE PRESERVATION

The future of human civilization will be greatly affected by its capacity to preserve endangered species and their habitats. The variety of life on earth, ranging from mammals, birds, reptiles, and amphibians to insects, has been pushed to the brink of extinction. Conserving living resources and diverse life forms on earth is critical to human well-being not only because of their intrinsic and aesthetic worth but also because of tangible economic values derived from their proper management. In response to a growing recognition of the issue, international initiatives have been taken, since the early 1970s, to develop mechanisms for viable and sustainable conservation and use of wildlife resources and habitat.

### Species Extinction

According to various estimates, our planet has been home to as many as 500 million kinds of plants, animals, and microorganisms. Some scientific research suggests that today the world contains 10–80 million species, and approximately 420 to 490 million species are estimated to have been terminated. Careful scientific examination of ecosystem destruction indicates that as many as one hundred species are driven to extinction each day with an astounding annual number of thirty-six thousand species. These species are dying up to one thousand times faster than their natural rate of extinction. This alarming rate of extinction is specifically induced by a variety of human influences.

Destroying or significantly changing just one part of interdependent relationships among species harms the entire ecosystem. The extinction of one species is followed by the elimination of other species that

depended on it, since many species have developed complex mutual relationships with each other through their evolutionary processes. The destruction of the rainforests, containing approximately half of the earth's species, illustrates this intricate relationship. Each fallen tree brings down ten to thirty other species with it, including monkeys, sloths, birds, and rare orchids. Also gone are amphibians like poison dart frogs, which dwelled on the microhabitat of moss- and fungi-blanketed branches. The ground-level land is now stripped of vegetation full of microscopic bacteria and fungi, and soil becomes hard and infertile.

The destruction of a vast track of a tropical rain forest is completed after leaving only one small island of rain forest. Some species may manage to survive devastation and flee to the remaining patch of an undisturbed forest. In a tiny refugee patch overcrowded by huge immigration, food and shelter scarcity becomes severe with the increased number of species. The conversion of a large habitat to isolated islands reduces the interior of each forest patch and is inhospitable since many species cannot simply breed in small patches of forest. Species have evolved to avoid competing with one another within the same habitat. When species adapted to different ecosystems are cast together, intense competition in the pursuit of food and other scarce resources can result in species extinction.

### Values

Human species are a dependent part of the delicate ecological balance, and our own existence relies on millions of life forms. The loss of species has long-term, cumulative effects for ecosystem stability with consequences that undermine conditions for our survival. The health of larger ecological communities is maintained by a variety of functions performed by all species. Ecosystems recycle the chemical elements that make up soils and atmosphere. Nutrient cycling involves actions of all life forms (plants as the base of the food chain, animals as the consumers of plants, and decomposers such as bacteria). Whereas plants produce protein and sugars in the form of leaves and fruits to be consumed by insects and birds, their clients help their reproduction by pollinating flowers.

Biological resources have been used for supplying food, pharmaceuticals, and other physical needs for humans. The economic benefits provided by our fellow species are astronomical; the origins of hundreds of products used every day are traced back to wild species. A large percentage of the world's medicines are derived directly or indirectly from wild plants and animals. Wild species with millions of years of

evolution can help human society meet the unknown challenges of the present and future generations with scientific information that could be of great practical value. Each vanishing species can mean the loss of an opportunity to expand the breadth of human potential.

In addition, wildlife and their habitat provide a rich aesthetic resource separated from their consumptive uses. Human attitudes toward wildlife have changed with the decline in tribal cultures and religions that respect the ecosystem's own needs, intrinsic values, cycles, and energies. Recognizing other organisms' right to live and preserving endangered plants and animals are ethical issues, especially with human acquisition of the means to destroy the world. Our life is spiritually enriched by the sight of a swan nudging her offspring to swim; the lumbering grizzly bear on a grassy meadow; the graceful dive of the humpback whale; and the power of an elephant.

## Causes of Extinction

Many species are vanishing at an unprecedented rate due to habitat destruction, fragmentation or alteration, introduction of alien species, hunting, and deliberate extermination. In particular, habitat loss ranks as the leading cause of extinction and remains as the greatest long-term threat to many endangered species. When tropical rain forests, coral reefs, and wetlands are reduced, the existence of species living in the habitat is seriously challenged. Once forests, wetlands, rivers, islands, or grasslands are rendered inhospitable to the inhabitants, the progression toward species extinction proves difficult to reverse, since this has serious ripple effects with the loss of resources that many species depend on for their survival.

Natural habitats are destroyed by large-scale agriculture, cattle ranching, logging, home building, hydroelectric dams, oil extraction, and mining operations. A large number of landless poor people in Brazil and other developing countries are encouraged to convert natural areas to farms by their governments. Logging demands destroy forest habitats that are home to countless rare wildlife species, and local agriculture sucks watersheds dry. There are also multiple threats to migration with the destruction of summer and winter habitats and the resting spots in between.

Migration routes are either blocked or made difficult by human land use patterns. For example, Caribou in Arctic Canada face loss of their summer grazing tundra lands to oil drilling and pipeline installation; coniferous forests farther south used for their winter home are lost to the lumber industry.

A consistent decline in the population of migratory songbirds is attributed to the transformation of their summer habitats into suburbia, and the conversion of their winter habitat in Central America is lost to plantations. Habitat fragmentation limits availability of nesting sites and reduces food resources.

Massive species extinction can also be attributed to climatic change, water pollution, and atmospheric contamination. The vanishing sea ice in the Arctic marine ecosystem, affected by changes in the global climate patterns, threatens the very survival of the polar bear. The essential habitat of countless birds, marshes, and wetlands for aquatic life will be permanently flooded due to global warming. Unfavorable conditions for the survival of wild species are created by emissions of contaminants affecting air and wild land. Poisoning by DDT and other pesticides has taken a huge toll on the populations of eagles, peregrine falcon, brown pelicans, the California condor, and other types of wildlife.

The introduction of alien species into new territories, intentional or accidental, brings native species into extinction. In particular, islands are vulnerable to foreign species. This is illustrated by the extinction of 90% of all bird species in Hawaii following the influx of domestic animals that came with massive human settlement. In New Zealand, more than half the native birds faced a similar fate.

Increased hunting, fishing, and other natural resource exploitation threaten already stressed ecosystems. The world's fishery stocks have been heavily depleted by commercial fishing equipped with motorized boats and trawl nets. Commercial hunting is systematically putting many currently threatened species at further risk. The Asian medicine trade preys on bears for their gall bladders, tigers for their bones, and rhinos for their horns. The African continent's wild population of northern white rhinoceroses has declined from more than two thousand in the 1980s to a few left in Garamba National Park in the Congo. Many of the rhinoceroses in Africa have been slaughtered by poachers engaged in smuggling the horns to Asia to be sold for coveted medicinal properties.

In Virunga National Park on the eastern border of the Democratic Republic of Congo, the number of hippopotamuses was reduced from 29,000 in the early 1970s to 1,300 in 2003. The alarming number of hippos was killed to meet an increasing demand for hippo canine teeth in the illegal ivory trade. Smuggling rare, protected species generates increased profits, and international illegal wildlife trade becomes a lucrative business with stakes of 10 billion dollars a year. Wildlife trade has resulted, in particular, in a drastic decline in elephants, bears, gorillas, rhinos, tigers, jaguars, and cheetahs.

The elephant is expected to be close to extinction in many parts of Africa in the near future due to poaching and other systematic killings. Five hundred years ago, 10 million elephants populated Africa's forests and savannas. The elephant population dropped drastically, by nearly 50%, from an estimated 1.3 million in 1979 to 625,000 in 1989. The dramatic drop in the elephant population is attributed to the ivory trade, as the demand for ivory encourages the illegal poaching of the African elephant.

Whale hunting is another widely known example. One species after another were hunted down to the brink of extinction before commercial whaling was significantly reduced by the International Whaling Commission's regulations. In order to keep their whaling industry alive, however, Japan, Norway, and Iceland continue to harm whales under the guise of scientific research despite the international ban. Both Japan and Norway plan even to increase the number of whales to be hunted, ignoring international pressure. Japan expects to increase the number of whales killed per year from 260 to 380 in the Northern Pacific Ocean and from 50 to 120 along the Japanese coast on top of 400 whales in the Antarctic Ocean. Norway's parliament has called for a threefold increase in whale hunting. Encouraged by these examples, Iceland restarted its whaling industry in 2003 in a celebratory mood after a fourteen-year hiatus.

The world's current economic system does not value diverse biological resources. Wildlife is not given a high priority on the agendas of many states in the same way that oil or other mineral resources are. Expanding economic demand for more natural resources exposes many species to the spiral toward extinction. Profit-craving corporations and government development projects are responsible for the disappearance of huge natural areas.

### Strategies for Preservation

Traditional conservation efforts focus on the species level through devotion of resources to the maintenance of individual species under pressure for the most imminent danger of extinction. Given insufficient knowledge and resources, only a tiny proportion of the world's endangered species can be adequately surveyed, and far less will benefit from the recovery plans. The allocation of scarce resources to the conservation of a small number of high-profile or priority species may not overall prove the most efficient, because this approach does not benefit any other species under threat. Where diversity is unquantifiable with unnamed species, large areas of habitats have to be

protected. All of the species will have a better chance of survival if an entire ecological community is left intact.

The goal of conservation must be widened to embrace species everywhere because the maintenance of a complicated web of mutually dependent relationships is important to the survival of many species. Diversity within and between species is critical to the balance of the ecological complexes. Genetic variation is necessary even at the smallest level of the population in order to evolve or to adapt to changes in the environment.

At the same time, the conservation of biodiversity can be considered at different levels (such as the genetic, ecosystem, and landscape) with each level supporting the next. Ecosystem-level conservation action needs to be based on the notion that the web of mutually beneficial interactions between different life forms is woven by species living in a particular ecosystem. Methods of maintaining ecological integrity can be designed to enhance the ability of ecosystems to cope with stress and build their self-organizational capacities.

The stability of a wildlife species population is affected by the extent to which the habitat supplies the needs of that species in the complex natural communities. Dramatic changes in a physical or organic environment can have a long-range impact on species relationships. The least possible degradation for wilderness is to preserve naturalness with a lack of visible human activities. A natural process has to be allowed, to the greatest extent possible, so as to not disturb natural distributions and interactions of indigenous species of wildlife.

The long-term challenge of preventing species from becoming endangered is to protect natural habitat. The Serengeti National Park in Tanzania, the Galapagos Islands in Ecuador, and Manas Wildlife Sanctuary in India, all designated as UN World Heritage Sites, contain significant natural habitats for conserving biodiversity. To maintain representative ecosystems or important habitat types, a network of protected areas can be designated through controls on land use. In some Latin American countries, part of the rain forest was turned over to indigenous people who wanted to maintain sustainable living as common lands. Land management plans have been consolidated to maintain a critical wildlife habitat in the biologically diverse Central Andean region that is under threat from unregulated logging, poorly planned road construction, and infrastructure development. About 10% of Suriname's entire land territory was designated as a Nature Preserve. In Venezuela, a permanent title to a region of the forest, similar in size to Austria, was transferred to a native tribe.

The emerging consensus is that the larger the reserved areas, the better for conserving species. Many species need a vast range for hunting or grazing or migrate to seek their favorite weather patterns outside the borders of reserved areas. In small islands of habitats, populations are reduced below the levels that are critical to successful reproduction. A small population of Asian tigers and African lions in widely separated national parks is vulnerable to infectious disease, as exemplified by the death of one-third of the lions in the Serengeti from a viral infection in 1994.

The traditional strategy for safeguarding tigers, jaguars, cheetahs, and snow leopards in wildlife reserves was not effective for the reason that they hunt their prey over vast stretches of land. For instance, cheetahs in southern Africa traverse across six hundred square miles, and tigers in the Russian Far East reign over four hundred square miles. Even large parks would not be able to contain the fiercely territorial creatures, and they have been increasingly gunned down or poisoned by farmers, loggers, and poachers, especially when these creatures roam outside a wildlife reserve.

Since many preserved areas are too small to support all the species they shelter, establishing buffer zones and connecting corridors are essential for wide-ranging species. Reserved natural habitats can be further protected with the establishment of buffer zones and restriction of such human activity as timber cutting or cattle grazing. A strip of land can be set aside as the wildlife corridor to connect isolated patches of habitat for animals trapped in small habitat fragments by human settlement.

Mixed landscapes allow movements of species from core protected areas through land shared with humans such as tea plantations in India. In collaboration with the Indian and Nepali governments, Save the Tiger, and other groups, the World Wildlife Fund launched the Terai Arc Landscape Program in 2001 in order to turn eleven isolated preserves into one continuous, functioning ecosystem inhabited by tigers, elephants, rhinos, and deer. The World Conservation Society proposed a two thousand-mile-long chain of public and private lands needed to link the disparate populations of jaguars in the Americas. The proposed link extending from Mexico through Central America to northern Argentina would be able to save jaguar populations that lost their habitat to logging and ranching.

## **Resolving Human/Wildlife Conflict**

In many areas of the world with rapidly growing human populations and expanding economies, designing

practical solutions to resolve human/wildlife conflict is a top priority. Human/wildlife conflicts create difficulties for protecting a large number of threatened endemic species of wildlife. Wild species are often unfairly blamed for the destruction of agricultural lands and even food shortages as well as loss of human life. Natural habitat loss has been the main reason for the encroachment of zebras and other wild herbivores along with their predators such as lions on pasture lands for domestic livestock.

Wildlife, especially in densely populated parts of the world, is under extreme threat, largely because protected areas have become too small to meet the ecological needs of the animals. Elephant ranges have contracted with the extended use of forests and lands that were designated unsuitable even for agriculture as well as the rapid human population growth. Damage to crops is often caused by the expansion of human activities near or into elephant habitats or migration corridors.

Elephants invariably lose conflicts with the destruction and degradation of large areas of habitats. Hundreds of elephants are killed each year in Sri Lanka because they enter agricultural land. Kenya has been trying to mitigate conflict arising from elephant destruction of agricultural lands by moving four hundred elephants to a more suitable habitat. Although the project is innovative, it faces such challenges as insufficient space in designated reserve areas and costs involved in translocation of these huge creatures. To save elephants would require managing them across landscapes.

Human/wildlife conflict can be managed by the optimal use of land. By realizing the benefit from living harmoniously with their wild neighbors, local residents can become partners. A non-destructive economic role can be fashioned in integrating local people's needs. Saving threatened species from extinction requires collaborative projects with local scientists and educators as well as villagers and the park administration.

In collaboration with local communities in Kenya, the American Wildlife Foundation has been trying to identify key habitats for migratory wildlife and critical zones for human economic activities. Conservation priorities were determined based on the patterns of elephant movements in relation to the location of water and vegetation. This information is used to manage the daily occurrence of wildlife/human conflict with changes in land use patterns.

Trees or tall thatch grass can be used as cover by tigers prior to being harvested. The recovery of forests and grasslands brings back wild pigs, deer, and other tiger prey, reducing disturbance to farmers. In Southern Nepal's Bagmara Forest, locals directly benefit

## WILDLIFE PRESERVATION

from the return of tigers, elephants, and rhinos with the growing number of tourists who come to see the wildlife. The success results from a tree nursery set up with the help of the World Wildlife Fund and the King Mahendra Trust for Nature Conservation.

### National Parks

Granting reserve status would be more effective before any massive deforestation. National parks and reserves should be large enough to ensure the conservation of important ecosystems on adjacent land. An alarming decline in the number of species is reported in all national parks but the largest ones; this is largely related to insufficient space for all the inhabitants.

Setting aside larger areas for protection in developing countries may not be politically and economically feasible without the financial support of developed countries. The deforestation of the Virunga Volcano ecosystem by Rwandan farmers in the early part of 2004 destroyed mountain gorilla habitats that had been preserved over the past thirty years. Outside support is needed to protect Virunga National Park, which supports over half of the world's seven hundred mountain gorillas.

Some national parks, in particular, with pristine stretches of rain forests, have become one of the fastest growing tourist destinations. The government of Indonesia created a park in West Java to protect the only viable populations of Javan gibbon, leaf monkey, and a host of other endemic plants and animals. Peru's Manu National Park and Biosphere Reserve houses a variety of plant and animal life, including monkeys, reptiles, birds, and insects. As one of the largest, least touched reserves in the world, Manu offers its inhabitants ample room for sustained growth, but some species are still in danger due to human intrusion.

### International Conservation Efforts

In protecting wildlife and wild lands, expertise and funds can be poured into conservation projects, including a direct purchase and management of habitat for rare and endangered species. The World Wildlife Fund has worked with partners in the southwestern Amazon to establish protected areas and conserve natural resources, culminating in the official recognition of Manu National Park in 1973. A more recent accomplishment is the approval of a ten-year plan to create a network of protected areas almost

twice as large as any US national park with a multi-million dollar Amazon fund established by the World Wildlife Fund in 2004.

The Indonesian government recently established Tesso Nilo National Park on the island of Sumatra (originally slated for logging) in order to preserve the park's unmatched biodiversity. In support of the government's initiatives, the World Wildlife Fund has been negotiating with logging companies to increase the acreage of the new park, which is inhabited by endangered Sumatran tigers and elephants and has a plant diversity twice as high as that of the Amazon. In collaboration with Conservation International and other international and national environmental organizations, the World Wildlife Fund purchased 147,500 acres of biologically rich temperate rain forest in southern Chile's Valdivian Coastal Range. Local communities and the government were invited to develop conservation management plans and sustainable development activities.

The World Conservation Union (IUCN) compiles a Red List of Endangered Species to provide policy guidance for governments and international organizations. Expertise in wildlife research can be developed through collaboration with local academic and research institutions. The Wildlife Trust has been working with the Asian Elephant Research and Conservation Center in Bangalore, India. The activities of the National Wildlife Federation, Sierra Club, Audubon Society, and Wilderness Society are concentrated on lobbying activities in the legislative arena.

### Future Actions

Whereas worldwide efforts need to be intensified to set aside old-growth forests and other regions of biodiversity, a high population pressure has placed hundreds of thousands of wildlife species at a great risk, with a demand for further resources. The spread of human populations to natural habitats would not be slowed without control over human population growth rates through family planning services. Financial resources need to be made available to help impoverished or debt-ridden tropical countries, which contain most of the world's diverse ecosystems. Rich countries should share the cost for wildlife preservation since it is an issue of common human heritage. Developed countries can assist in capacity-building and the transfer of technology and finance.

The protection of biodiversity on public and private land needs to be mandated by more stringent environmental laws at a national level. Many programs such as the Endangered Species Act (combined with

biodiversity reserves, buffer zones, and connecting corridors) are certainly helpful for improvement in wildlife management, but they are stopgap measures. Any of these measures alone cannot be adequate enough to keep pace with burgeoning agricultural development, urbanization, and other human demands.

To live with the biological principles of sustainability demands, systematic changes are needed in the way we conduct business. The efficient utilization of resources would greatly reduce habitat destruction caused by timber harvesting and mining. Recycling minimizes our need for the consumption of more natural resources as well as the amount of pollution. Turning to renewable energy resources such as sunlight and wind could be part of the solution to global warming, acid deposition, and oil spills, which have a devastating impact on natural habitats. Long-term conservation depends upon a drastic change in human perceptions of nature.

In practicing sustainability, individual-level actions can become an essential part of the solution. A great many people live too far from ecosystems to develop any understanding of our dependence upon nature. Only a small minority in most parts of the world, such as indigenous people, maintains a sustained way of living. The challenge will remain that any measures to reduce species loss have to be tailored to the ecosystem and the local community.

### WILLIAMS, ERIC

Dr. Eric Eustace Williams is well-known in a dual capacity: as a noted historian, and as the founding father and first Prime Minister of Trinidad and

Tobago, a position he held until his death in 1981. He ranks among the greatest Black intellectuals and statesmen of the twentieth century.

One of twelve children, Eric Williams was born in Trinidad in 1911. From 1922 to 1931 he attended the Queen's Royal College in Port of Spain. Thanks to a scholarship, he attended Oxford University between 1932 and 1939, earning a doctorate in history. His dissertation, revised and published in 1944 in the United States under the title *Capitalism and Slavery*, along with the *Negro in the Caribbean*, published two years earlier, established his reputation as a scholar. These works contained several theses, hotly debated to this day, one of which pertains to slavery and the slave trade as major sources of the capital that enabled, or at least facilitated, the launching of the Industrial Revolution in Great Britain. It interpreted the abolitionist movement in the United Kingdom and the emancipation of slaves in the British West Indies in 1833 as largely due to economic factors. In several of his works he also argued that racism was not the cause of the Transatlantic slave trade, but rather the centuries of chattel slavery were largely responsible for the spread of racial prejudice.

After a teaching appointment as professor of social and political science at Howard University, he returned home and entered the political arena with his founding of the People's National Movement. Between 1957 and 1962 Williams devoted considerable energy to the realization of his vision of a Caribbean Federation, to include at least the English-speaking islands of the West Indies. On its collapse he led Trinidad and Tobago to independence in 1962, retaining membership in the British Commonwealth at first, but eventually achieving status as a republic in 1976. Williams remained at the helm for a quarter of a century. With his emphasis on development, especially industrial development as in the renowned Point Lisas complex, and thanks to the country's oil and gas resources, Trinidad and Tobago is the world's leading exporter of methanol and nitrogenous fertilizers and has thus been able to avoid the vicious cycle of underdevelopment. It ranks among the middle-income nations of the world.

His political activities notwithstanding, Eric Williams never ceased writing and publishing. Among over six hundred articles, speeches, pamphlets, lectures, and books, his major works include a history of the Caribbean, *From Columbus to Castro: a History of the People of Trinidad and Tobago*; *British Historians and the West Indies*; *Documents of West Indian History*; and his intellectual autobiography, *Inward Hunger* (1969).

The works and political activities of Eric Williams have been the subject of several international conferences, including those at the Rockefeller Conference

and Study Center, Bellagio, Italy, in 1984; the University of the West Indies in Trinidad and Tobago in 1996; Wellesley College, Massachusetts, in 2000; and the New York Public Library's Schomburg Center in 2002. The books and papers of Dr. Eric Williams, along with memorabilia and dozens of cubic feet of relevant correspondence from a variety of sources, comprise the Eric Williams Memorial Collection at the University of the West Indies, Trinidad and Tobago campus—the very institution he was so instrumental in bringing to fruition.

### WOJTYŁA, KAROL (JOHN PAUL II)

On October 16, 1979, a cardinal from Kraków, Poland, Karol Józef Wojtyła (1920–2005), a poet, playwright, philosopher, scholar, and priest, was elected the 264th pope.

Karol Józef Wojtyła was born in the small town of Wadowice near Kraków in southern Poland in 1920. His youth years were marked by several deaths in the family: His mother passed away in 1929 and an older brother died when Wojtyła was twelve. After that he lived with his father in Wadowice and in Kraków until his father's death in 1941. After graduating from high school in 1938, he enrolled in the school of drama at Jagiellonian University in Kraków. Official schooling stopped during WWII when Karol Wojtyła worked in a quarry and in the Solvay chemical factory. In 1942 he began his study in the Kraków seminary. At the same time he participated in the clandestine works of the "Rhapsodic Theatre" in Krakow. After the war, Karol Wojtyła continued studies in the Kraków seminary and in the faculty of theology of Jagiellonian University. On November 1, 1946, he was ordained to the priesthood and soon after left for Rome. He obtained his doctorate in theology in 1948. His dissertation was entitled "Love and Responsibility." It laid out the foundation for what George Weigel (2001) calls "a modern

Catholic sexual ethic." For a short time after finishing his studies, Wojtyła worked with Polish emigrants in Western Europe, namely France, Belgium, and Holland, and later in 1948 he returned to Poland. In 1951 Wojtyła enrolled in the Catholic University of Lublin to study philosophy and theology and in 1953 defended his second dissertation devoted to Catholic ethics in the ethical system of Max Scheler. Later he became a professor of ethics at his alma mater.

In July 1958 Karol Wojtyła was appointed auxiliary bishop of Kraków and in 1964 an archbishop of Kraków. On June 26, 1967, he became cardinal and in October 1979 was elected the pope and took up the name John Paul II. He participated in Vatican Council II, a sweeping program of modernization of the worldwide Catholic Church, and contributed to the Constitution *Gaudium et spes*. Mehmet Ali Agca, a Turk believed to have been serving the Bulgarian intelligence service, attempted to assassinate the pope in 1981.

Wojtyła, like his mentor Cardinal Stefan Wyszyński, is a skilled politician who dealt with the Communist government in a very pragmatic manner, opposing the secularization of Polish society. His papal years are often characterized as charismatic. He was the most traveled pope in history, having completed 102 visits to foreign countries since 1978. An advocate of interfaith cooperation and reconciliation, Wojtyła was the first pope to visit a synagogue and the first to visit the Holocaust Memorial at Auschwitz; he was also the first pope to visit Egypt. His foreign visits regularly gathered crowds of more than a million people. He was fluent in several languages.

Critics, however, say that John Paul's record is mixed. Although the church has expanded in Africa and Latin America, it has lost followers in the industrialized world. John Paul II's leadership of the Church is grounded in its conservative tradition. His rejection of contraception and abortion has been absolute and rigid.

Though John Paul's first two decades as pope were characterized by his vigor and energy, his health began to deteriorate. He had arthritis in his legs, which made it difficult for him to stand unassisted, and he underwent operations for the removal of a tumor, a hip replacement, and a tracheotomy. In January 2001, one of his doctors publicly acknowledged that the pontiff was suffering from Parkinson's disease. He cut back his hours and decreased his international travel, but made no indication that he would consider stepping down due to concerns for his health. Pope John Paul II finally succumbed to ill health and age on April 5, 2005, after completing the third longest reign in the history of papacy. He was succeeded by Pope Benedict XVI.

Throughout his career, John Paul was a prolific writer on philosophical and ethical issues. Among his best-known philosophy works are *The Acting Person*, a philosophical essay on phenomenology; *Fruitful and Responsible Love*; *Ethics and Morality*; and others. He addressed numerous topics, but was particularly concerned with the meaning of freedom and the dangers of materialism, selfishness, and consumerism. Despite his busy schedule and his frail health, he wrote a number of books, including *Rise, Let Us Be on Our Way*, and *Memory and Identity*. He has also written a number of plays and essays on theatre, and has released a book of poetry. He was a frequent commentator on international politics and an outspoken critic of dictatorial regimes, as well as a supporter of Poland's Solidarity movement. He was an opponent of the US-led 2003 invasion of Iraq.

## WOMEN: LEGAL STATUS

An increasing number of legal documents address the status of women in society, at work, and, more recently, within the family. The intention of these legal documents is to formalise and promote equality between men and women in all spheres of life by addressing issues ranging from the reconciliation between maternity and employment, to the right to vote and hold public office, to the prohibition of exploitation in a variety of different industries. In this sense, women's legal status is defined through the recognition of the rights essential for women's existence, but which need to be formally recognised in order to be protected and promoted effectively.

States define and promote women's rights in their constitutions, national laws, acts of parliament, and so forth. While the promotion of the status of women enjoys varying degrees of success worldwide, most national legal instruments do make mention of the situation of women. It is nevertheless at the international

level that the process of definition of women's legal status proves the most meaningful: while it would be impossible to describe the specificities of the hundreds of national laws dealing with women's status, the international legal framework is central to defining what are the universally recognised rights of women. The legal status of women will therefore be presented by reference to international human rights instruments at the United Nations' level. The United Nations (UN) has, from the time of its creation in 1945, recognised the need to promote gender equality and to fight against discrimination based on sex. The preamble of the first modern instrument of human rights, the Universal Declaration of Human Rights, makes it clear that "... the peoples of the United Nations have in the Charter reaffirmed their faith in fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women ... ." Article Two guarantees the enjoyment of the rights outlined by the Universal Declaration "without distinction of any kind, such as ... sex ... ." From then on, numerous UN treaties would reaffirm the prohibition of discrimination based on sex and promote equality between women and men.

Prior to presenting what constitutes women's legal status within the human rights framework, the challenges linked to addressing women's status within a legal and rights-based framework will be addressed. A short account of the historical evolution toward the official recognition of women's rights will be given before presenting the central instrument of women's legal status today: the Convention on the Elimination of all Forms of Discrimination Against Women.

### The Value of a Legal Approach to Women's Status

One popular refrain of the contemporary human rights discourse is that "women's rights are human rights." By proclaiming so, women's groups intend to emphasise the fact that, as human beings, women should enjoy the benefits of the protection offered by human rights in general. Because the two central principles attached to human rights are their indivisibility and universality, women should benefit from the entire apparatus of rights without having to claim it. Nevertheless, the historical and gendered construction of human rights has made obvious the necessity for women to re-characterise and reaffirm their status within the human rights discourse. Historically, women have been excluded from the elaboration, implementation, and monitoring of human rights instruments. There was a widespread failure to recognise the

need to characterise the subordination of women as a human rights violation. Similarly, the fact that women's rights should be a full part of human rights was not self-evident at the time of the creation of modern human rights law and subsequently had to be reaffirmed. The legal framework for the recognition of women's rights is also conditioned by the fact that the development of human rights law has been partial and androcentric. Women's lack of power in both private and public spheres was not taken into account when drafting the first human rights instruments. As a result, the narrow language of rights did not account for women's systemic subordination in society. Another central problem of mainstream human rights law is that it does not integrate the specificities of women's lives and identities. Mainly linked to women's reproductive functions, these specificities call for the recognition of rights linked to reproductive autonomy, motherhood, and care. For all these reasons, women's rights have been reaffirmed, within as well as alongside the human rights discourse.

A legal approach to women's status can also be said to account only partly for women's actual position. The problematic nature of defining women's status is linked to the public and private spheres divide. The latter sphere originally emerged from classical Western liberal thought. Its contemporary application means that women, who are more likely than men to be confined to the privacy of the home—that is, the private sphere—do not benefit from the protection of human rights that apply, in their traditional understanding, specifically to the public sphere. While the right of women to participate politically in their state's structure is broadly accepted, there is hostility towards their right to live free from violence or to decide how to plan their pregnancy and decide on the number of children they will have. One task for women's rights activists and feminists today, therefore, is to challenge the divide and to make human rights more relevant to the reality of women's everyday life. Defining women's legal status is purposeless if it ceases to apply once women have crossed their doorstep.

As a preliminary conclusion, one could say that defining the legal status of women is useful provided that the "rights" they are subsequently given are adapted to women's particular situations and needs.

### **Toward Recognising Women's Rights: The UN Decade on Women and International Women's Rights Conferences**

The determination of women's status in the international framework came to a turning point in 1975

when the UN General Assembly, following the proposition of the Commission on the Advancement of Women, accepted the adoption of a "programme of concerted international action for the advancement of women" to be implemented over the "UN Decade for Women." This decade was the result of an increasing consciousness of the necessity to address women's status worldwide following growing concerns over the issues of the world's food situation and population growth. Because of their reproductive role, women were identified as central actors of this debate and their status was thus brought to the front of the international human rights stage. The first worldwide women's rights conference was held in 1975 in Mexico City and it focused on the three issues of equality, development, and peace. Several women's rights institutions were created in the wake of the Mexico City conference. Five years later, in 1980, a second worldwide women's conference was held in Copenhagen, focusing on issues of equal access to education, employment opportunities, and adequate health care. The third women's conference took place in Nairobi in 1985, entitled "World Conference to Review and Appraise the Achievement of the UN Decade for Women: Equality, Development and Peace." While the obvious conclusion of the conference was that objectives had not been reached, participants and representatives agreed that it had been a success in terms of making the women's movement more visible, in highlighting progress that needed to be made, and in creating the structures necessary for addressing their needs. What has been by far the most important women's rights conference took place in Beijing from September 4–15, 1995. The Beijing conference was important in part because it brought together a very high number of women's organisations from all over the world. The "Beijing Declaration and Platform for Action for Equality, Development and Peace" was adopted at the end of the conference. It sets out clear objectives and identifies twelve critical areas of concern for women: poverty, education and training, health, violence against women, armed conflicts, the economy, power and decision making, institutional mechanisms, human rights, the media, the environment, and the girl-child. The review of the Beijing Platform for action was organised five years later through a special session of the UN General Assembly. At the so-called "Beijing + 5," further areas of concerns were identified. Parallel to these developments, the women's movement in civil society was also gaining significant momentum. The "Beijing + 5" session closed with the adoption of a document entitled "Further Actions and Initiatives to Implement the Beijing Declaration and Platform for Action." The next review process will be "Beijing + 10" in 2005.

## The Convention on the Elimination of All Forms of Discrimination Against Women—An Overview

### *Adoption of CEDAW*

The most important international instrument for defining women's legal status is the Convention on the Elimination of Discrimination Against Women (CEDAW). CEDAW was adopted in 1979 and entered into force on September 3, 1981, after twenty countries had ratified it. On March 26, 2004, CEDAW had 98 signatories and 177 ratifications, making it the second most widely ratified UN instrument. It is the first instrument that brings together different categories of rights relevant to women; prior to CEDAW, the only instruments available were topic-oriented conventions adopted by the Commission on the Status of Women. CEDAW is innovative in that it brings together rights already recognised with newly identified ones, such as family planning and reproductive rights (article 12). CEDAW also addresses issues of culture and tradition in order to make clear that such cannot be used as excuses to justify the violation of other recognised rights. Like other UN treaties, the implementation of CEDAW is monitored by the committee it creates.

### *Content of CEDAW*

CEDAW is central to defining women's legal status. It lists the rights specifically to be enjoyed by women and prohibits discrimination between women and men in the enjoyment of all other human rights. In its first article, CEDAW defines discrimination as:

[A]ny distinction, exclusion or restriction made on the basis of sex which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on a basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field.

Besides defining discrimination, CEDAW also provides for the necessity for states to engage in a series of positive actions, to the end of implementing the provisions listed. By ratifying CEDAW, states commit "to incorporate the principles of equality of men and women in their legal system, abolish all discriminatory laws and adopt appropriate ones prohibiting discrimination against women; to establish tribunals and other public institutions to ensure the effective protection of women against discrimination; to ensure

elimination of all acts of discrimination against women by persons, organisations or enterprises" ([www.un.org/womenwatch/daw/cedaw](http://www.un.org/womenwatch/daw/cedaw)).

CEDAW comprises a preamble and thirty articles, organised in six parts:

- I. Definitions and obligations (articles 1 to 6);
- II. Political rights and rights to citizenship (articles 7 to 9);
- III. Economic rights (articles 10 to 14);
- IV. Civil and political rights (articles 15 and 16);
- V. The Committee on the Elimination of All Forms of Discrimination Against Women, and the treaty mechanism (article 17 to 22); and
- VI. Implementation, ratification, and entry into force (articles 23 to 30).

Part I is dedicated to defining discrimination and detailing the nature of the obligations created by states' accession to the Convention. The formula used in the text of CEDAW is that "States shall take all appropriate measures" to implement the rights listed. This means that the responsibility for implementing the rights provided for by CEDAW depends upon national states adopting the necessary correlative legislation. These measures ought to be undertaken in order to combat elements potentially prejudicial to the promotion of women's equal status, including culture and stereotypes, in all fields of life. Part II addresses the promotion of the right of women to vote and be elected (articles 7 and 8) as well as the recognition of the fact that women's decisions regarding their nationality should be independent from external factors like marriage (article 9). Part III looks at women's economic and social rights, in particular women's equal right to education (article 10), health care (article 12), and rights linked to other areas of economic and social life (article 13). Article 11 promotes women's equal right to work and to enjoy work-related benefits, including equal pay for equal work and access to related social benefits; the second part of the article provides for protective measures related to women's work and maternity. Part IV provides for women's equal status before the law and their equal right to enter into contractual relationships (article 15). Article 16 focuses on women's position with regard to marriage and family matters. More specifically, it emphasises women's autonomous status with regard to entering and leaving a marriage relationship, planning and bringing up children, as well as acquiring property. The article also provides that it is not legally recognized for underage girls to be married. Part V deals with the establishment of CEDAW's committee, outlines its responsibilities and functioning mechanisms, and describes its composition and its relation with other UN agencies. Finally, Part VI

details accession, ratification, reservations, and interpretation of the Convention.

Another tool provided for by CEDAW in the protection of the status of women is the possibility, under article 21, for the Committee to make general recommendations (GR) on substantial or procedural points relating to CEDAW. The most recent general recommendation, the 25th, looks at temporary special measures. Others have dealt with a variety of issues, including circumcision (GR No. 14), AIDS (GR No. 15), and violence against women (GR No. 19). They prove a useful tool in clarifying the content of certain rights and explaining procedures more clearly, as well as increasing international attention and awareness on specific points.

CEDAW formalises a broad range of rights covering most aspects of women's lives. Nevertheless, feminists argue that CEDAW is failing to adequately address women's position in life. It addresses women's status in relation to men's and aims at bringing women to an equal position with men; however, it does not take an independent approach to women's needs and strengths. One suggestion consists of focusing "on powerlessness, exclusion, and disadvantage of women, rather than on sameness and difference" (Cook 1994, p. 156). One further problem is that while women's legal status is clearly defined through the thirty articles of CEDAW, the de facto situation is substantially different, as states do not necessarily fully implement these rights and cannot be compelled to do so. The effectiveness of CEDAW, like any other human rights instrument, rests upon states' willingness to comply; the only sanction that can be imposed is a public denunciation by CEDAW's Committee.

### *CEDAW's Reporting Procedure and the Committee*

CEDAW's Committee (the Committee) is responsible for monitoring the implementation of the Convention. The committee is made up of twenty-three experts sitting in their own personal capacity. While they are nominated by states and elected by state parties for four years, they remain independent from their respective countries. The main procedure involving the Committee is the reporting procedure. Like other treaty bodies, the Committee is given the competence and power to request, examine, and analyse state reports on the situation of women's rights in that country. The reports must account for actions that have been undertaken in order to ensure women's status is in conformity with the standards under CEDAW. States are required to submit reports to the Committee at least every four years. The accuracy of the information detailed in the reports is left

to the discretion of the states, but is usually counterbalanced by shadow reports produced by non-governmental organisations (NGOs). The Committee is responsible for examining the state reports and giving its conclusions. This monitoring procedure is the main tool available with regard to women's legal status, as internationally defined.

### *The Optional Protocol to CEDAW*

On October 6, 1999, the General Assembly of the UN adopted the Optional Protocol to CEDAW; it entered into force on December 22, 2000. It enables individuals—or groups of individuals—from a state party to this Protocol to bring a complaint for violation of rights guaranteed by CEDAW, before the Committee. While the conditions attached to the individual complaint procedure are restrictive, it is believed that the development of this procedure will allow for better protection of women's rights. Another procedure was also created that consists of the possibility for the Committee to enquire into a "situation of grave or systematic violations of women's rights" (rules 82 and 83 of the Protocol).

## Conclusion

In conclusion, the legal status of women is thoroughly addressed in international human rights law. Nonetheless, women are still the victims of multiple discriminations and rights violations. High illiteracy rates, malnutrition, discrimination in the workplace, and violation of women's reproductive rights are not recent phenomena and prove that there is still a long way to go in making this formal legal status a reality. Other women's rights violations, such as trafficking in women, are now being uncovered, and although strongly denounced, highlight a need for the rethinking of the current legal apparatus and the mechanisms available to implement it. Cultural exceptions are especially relevant to the status of women, as is shown by the significant number of culture-based reservations made to CEDAW. Even if sensitive in nature, these cultural exceptions need to be addressed in order to guarantee women a more meaningful legal status. As suggested by the Beijing Platform for Action, empowering women to address the problems they face and to suggest alternatives to the present system is the key to improving the value of their present legal status.

## WOMEN LIVING UNDER MUSLIM LAWS (WLUML)

Women Living Under Muslim Laws (WLUML) is an international network that provides assistance, information, and channels for communication to women whose lives are affected or governed by laws and customs said to derive from Islam. The network aims to develop autonomy and strengthen solidarity among women in Muslim countries and communities. WLUML's goal to document and support women experiencing various forms of discriminations and oppressions connected to Muslim rulings, laws, or various traditions existing in Muslim communities is guided through networking, media alerts, various collective projects, and publications.

WLUML began its formation in 1984 as a result of three pressing cases in which women were being denied rights. Such incidents were symptomatic of a larger challenge facing women of systematic marginalization through reference to laws said to be "Islamic." Thereafter, nine women from eight countries came together to support specific women's struggles. This collaboration evolved into its near-global network of WLUML in 1986. By 2004 WLUML was operating in more than seventy countries.

The network extends to women in countries where Islam is the state religion, where secular states have Muslim majorities, and where political groups are pressing for religious laws; it also extends to women from Muslim communities in which minority religious laws preside, those in Muslim minority communities around the world, and non-Muslim women who may have Muslim laws applied to them. The network serves marginalized women, such as minorities facing discrimination, oppression, or racism, and women who face discrimination because of their assertions of sexuality, including sexual orientation.

As part of its overall strategy, WLUML bridges identities by building a network of individuals and feminist and human rights organizations at local and global levels through which it facilitates communication and information. Women can seek assistance, alliances, information on their legal rights, shelter, mediation, contacts to lawyers, psychological support, and the sharing of experiences. Such a forum enables dialogue among women of various ideologies and stances to break barriers and face common obstacles to their autonomy and self-development. Thereby, individuals' local experiences are connected to the wider context of international injustices perpetrated against women.

WLUML collects, analyses, and circulates information regarding women's diverse experiences and strategies in Muslim contexts using a variety of media. WLUML initiates and circulates "Alerts for Action" and campaigns to an international forum as a strategy of resistance. Through locally initiated information networks, women themselves can articulate their local situation. WLUML then distributes the information to connections that include Amnesty International, UNICEF, and women's organizations. WLUML also initiates letter-writing campaigns.

WLUML organizes "collective projects," which include initiatives that arise out of women's specific needs, interests, and analyses. A project typically involves three to over twenty groups and lasts from a few months to ten years. Collective projects include training sessions, workshops, research for advocacy, meetings, and exchanges around specialized topics.

Previous projects have included an exchange program (1988), Qur'anic interpretations meetings (1990, 2002, 2004), the Women and Law in the Muslim World Programme (1991–2001), a program on feminism in the Muslim World Leadership Institutes (1998 and 1999), gender and displacement in Muslim contexts (1999–2002), and the Initiative for Strengthening Afghan Family Laws (INSAF) (began in 2002). WLUML, moreover, implements capacity-building initiatives of its networks through internships at the coordination offices, as well as exchanges, trainings, and workshops.

WLUML brings awareness of women's situations through publications. It produces a theme-based dossier, an occasional journal that provides information about the lives, struggles, and strategies of women; a quarterly newsheet on women, laws, and society; occasional papers; and other publications on specific issues such as family laws, women's movements, and initiatives.

WLUML focuses on the concrete realities of women's lives. These include bringing awareness to basic human rights abuses against women, relocating women forced to marry against their will, as well as rescuing children kidnapped by their fathers to Muslim countries. However, in principle, WLUML responds to requests for help, as opposed to initiating cases.

WLUML has been successful in mitigating harsh sentences by rallying the international community for support. Highlighting but a few incidents, in 1995 in the United Arab Emirates a sixteen-year-old Filipino girl was pardoned after she was sentenced to death for killing her employer after he brutally raped her. WLUML called for preventing the execution, demanded the UAE government amend rape laws where the onus of truth is on the rape victim. Also in 1995 when a Muslim religious leader in Chad called for the killing of a woman for making a film denouncing female genital mutilation, WLUML alerted women's and human rights groups to her sentence. With a combined effort to petition the government of Chad, the imam was made to withdraw his decree. In 2002, Toujan Al-Faisal, a feminist and anti-corruption campaigner and Jordan's first female MP, was released from jail after WLUML in a combined effort petitioned for her release. After intense letter writing in late 2004 for the release of civil society activist Dr. Mahboobeh Abbasgholizadeh, she was released on bail from the Iranian authorities. However, the network also studies the theoretical underpinnings of women's oppressions. It concentrates on themes such as empowerment, fundamentalisms, state control, militarization, sexuality, health and reproductive rights, and violence. Particular attention is given to the effects of laws and law reform. Aiming to dispel the myth that one homogenous Islamic law exists, the network documents diverse practices and laws classified as Islamic, which have developed from male-dominated interpretations of religious texts and/or the political use of religion, and which are mixed with the differing local customs and practices, formal or informal. Female researchers trace the evolution of laws and identify contradictions between customs and scripts. One of its major activities continues to include reinterpreting "Islamic" sources for Muslim laws from this exhaustive inventory to support women's issues.

At times, cases or problems take years for the network to resolve. WLUML, nonetheless, brings awareness to women's voiced concerns under Muslim laws, and in so doing incrementally effects change within Muslim countries and communities towards greater egalitarianism, justice, and stronger civil societies. It is unique in that it encourages women to pursue and define justice without essentializing women's diverse identities.

## WOMEN: ROLE IN DEVELOPMENT

### Women

The sociological category "woman" was analytically dismantled in the latter decades of the twentieth century. Feminist scholars recognised that women's experiences and activities were necessarily different due to the specific factors of every woman's social and historical context. While women in many societies share similar experiences and problems, their similarities must be balanced against women's very different experiences worldwide, especially in relation

to how their lives are shaped by race, colonialism, the rise of global capitalism, and the interventions of international development agencies. Women cannot be treated as an homogenous category; there are social differentiations between women according to rank, age, employment, earning capacity, and caste, for example, and women are affected differently in different countries by global capitalist development.

Although women's biology impels many into reproduction and the caregiving duties associated with infant and child socialisation, women's physiology presents different possibilities in different societies. This means that women can engage in the social role of mothering and, depending on the society in which they live, a range of other roles. The possibilities open to women are culturally elaborated, so that even the supposedly natural function of mothering is culturally defined. When focusing on what women do, questions about the sexual division of labour in different societies and about the related divisions of social life into "domestic/female" versus "public/male" domains, are raised. Many scholars argue that although women may be perceived as separate and different from men, in numerous cultures this does not necessarily imply inferiority or subordination to men. Various quality studies have shown that gender relations, that is, social relations between women and men, in many societies have been radically altered due to the impact of colonisation, Westernisation, and global capitalism. A number of studies have noted that development and wage labour make women more dependent on men by undermining local customary systems where women have, in the past, enjoyed a certain amount of control over production and reproduction. Some argue that men take control of women's land, goods, labour, and reproductive capacity by armed force or physical and psychological intimidation. In severe contrast, other studies refer to the "myth of male dominance" in which statements made about women, that is, statements expressing cultural ideologies, often represent women as less powerful than they actually are in their daily lives. They propose that although men have been represented as dominant in many societies, many women possess and wield considerable power and influence. Women may possess power that is complementary to, rather than in overt contestation with, male power. In addition, they argue that cultural valuations of women and men and their respective work in different societies often fail to reflect women's and men's respective access to and control over resources. For example, women may earn significant social respect due to their control over land in matrilineal societies. And women may be the principal food providers for their family due to their agricultural work and their animal-husbandry labours.

## Women and Development

While the focus on women across cultures has produced conflicting reports, women and development is an arena of research and practice that has linked questions about gender and gender relations with an analysis of the social and economic role of the state. Women and development focuses on the characteristics and management of state institutions, economic planning, policy formation, decision making, and the exercise of state power. It examines and questions male dominance and male privilege in relation to access to state resources and political power, and it raises issues concerning gender ideologies and how these ideologies inform planning and policy. In the arena of women and development, the issue of the success or failure of state policies designed to benefit women is discussed in terms of what kind of economic and sociopolitical changes are envisaged and implemented in order to bring about development. This field of enquiry overlaps an analysis of how women organise socially and politically, women's responses to development initiatives, and women's reactions to and perceptions of the state and its agents. Studies demonstrate that development is a complex and difficult field, because it blends theory and practice in ways that can drastically affect people's daily lives. Development is also fraught because it raises questions about relations of power: Who actually benefits from development? How do development project designers know what is best for disadvantaged peoples? How much damage are they causing with their interventions? What strategies are in place to enable disadvantaged peoples, particularly women, to contribute to the design, planning, and implementation of development projects? And how can development project designers judge what "disadvantage" actually means for people in cultures that are different from their own?

The deleterious effects of many development projects on women with regard to their access to and control over land, property, technology, training, and decision making are well documented. And although the effects of agricultural change on women have been diverse, nonetheless, a key trend that has emerged from evaluations of development projects to the end of the twentieth century has been the weakening of women's authority and decision-making powers. This has occurred because of changing roles in production, especially within the increasing commercialisation of agriculture, and the exclusion of women from technology, training, and credit schemes. Early writers on women and development demonstrated that many of the negative effects of development programmes on women were due to a neglect and/or

misunderstanding of women's key roles in all areas of subsistence production. And early development programmes mistakenly presumed that men were the most important workers in food and factory production. More innovative and radical policies and programmes aimed specifically at women have been moderately successful. However, improving women's participation in decision making, bureaucratic institutions, and women's political representation generally, has been judged by many to be a spectacular failure.

The key intellectual and social context for discussing women's role in development is to question why inequalities between women and men exist and why they are maintained in the face of discourses about universal human rights. Social structures; institutions; and values such as norms, customs, rights, and laws link with economic institutions such as markets to shape relationships between women and men, to form their socially expected roles, and to influence what resources women and men have access to, what activities they can or cannot undertake, and how they may participate in broader society and the economy.

While the social and economic institutions that shape and structure people's lives in different societies can be slow to change, they are never static. For example, in developing countries households are fundamental to the way that women and men experience their lives from childhood and how gender relations are transmitted between generations. The ways that tasks are allocated between daughters and sons, girls' and women's degree (if any) of autonomy, and what social expectations are promoted within the household all create, reinforce, and form seemingly rigid differences between genders. But such differences must be explored because different behaviours, social expectations, and perceptions of what is womanly or manly change across and within cultures. Studies note, for example, that although gender disparities tend to be less among elite and dominant classes, in some societies with rigid gender divisions (such as Bangladesh, Pakistan, and Saudi Arabia) wealthy families invest far more of their sense of status, dignity, and prestige in female modesty and seclusion, particularly when they enjoy high socioeconomic status. Female modesty thus becomes a key symbol of their status.

Although gender inequalities persist among both the rich and the poor, they are often greatest among the poor, particularly in terms of household financial investments in education and health. Education is considered to be a fundamental and universal human right and a necessity for enhancing social and economic development. But as a result of different financial investments in education, major differences can be observed between boys and girls, particularly in

terms of the numbers of girls who attend school and for how long.

Nutritional studies show that receiving little or no formal education creates women with high levels of fertility and mortality, poor nutritional status, low earning potential, and little autonomy within their household. Low investments in female education translate into poorer health and nutritional practices by mothers, so that all children feel the effects, and the flow to the health, well-being, and productivity of the next generation may suffer. Low investments in female education are considered to be instrumental in reinforcing the asymmetry of power relations between men and women and, without women's education, a great deal of a country's talent, skill, and energy remain untapped. Conversely, high numbers of educated females and levels of female education are two of many reasons cited as positively contributing to general economic development, social progress, and gender equality. Nevertheless, school curricula and teachers' attitudes may act to reinforce existing gender biases in society. Some studies critique the ways that schools in many countries reflect the patriarchal cultural ideologies that often prevail among the elite and dominant class. Pupils are schooled to conform, and girls are taught to accept authoritarian structures, relations of male domination, and success on male terms.

Low financial investments in health produce high rates of malnutrition and mortality among girls, and can affect whether girls are allowed to be born. In the latter case, adverse female sex ratios in some states of India and China suggest endemic female foeticide (destruction in the womb by technologies such as ultrasound scanning and amniocentesis), infanticide, and neglect of young girls is occurring in cultures and societies where boys are preferred and girls are considered an unnecessary or expensive addition to a family.

### **Women, Gender, and Development**

Issues about women's power and women's capacity for active human agency in cultures and societies that often create significant structural barriers to women's existence as equal social actors have come to the fore as development studies and practices begin to more fully integrate concepts of gender.

As a consequence, it is impossible to discuss the ways in which the concepts of gender and gender relations have changed development without reflecting on the debates that have surrounded women's role(s) in development. Literature about gender and

development in the twentieth century can be categorized into three waves: women in development (WID); women and development (WAD); and gender and development (GAD). The key strategy of WID theory and practice was to progress women's social condition via broader economic growth. WID was concerned with maximising women's access to the modern sector, and opening the border between the traditional and modern sectors, to allow for an equal proportion of women within the latter. WID assessments of social and economic inequalities between women and men presupposed that a gradual process of reform would eventually produce gender equality. Structures such as male bias that were seen to exclude women from development were not perceived as grave, as science and enlightened reason were perceived as antidotes to the vestiges of prejudiced patriarchal superstition and ignorance that located women outside many cultures' ideas about what it is to be properly "human"—that is, male. The strategy sadly failed because development studies, social planning, and project design remained firmly orientated toward men; the concepts of man and men were deemed by Western development planners to be synonymous with all people; and, prior to 1970 it was thought that the development process affected women and men in the same way. These erroneous notions equated productivity with the cash economy and consequently ignored most women's work, which is based in non-cash agricultural labour, caregiving to family members within households, and provision of unpaid social management and community support.

A move then evolved to critically analyse the ways in which received ideas about women within Western epistemologies created discriminatory practices in Western cultures and societies, which were then imposed on other peoples through the frameworks and processes of development. A common assumption among Western development planners was that the social and economic problems of women in developing countries were attributable to their status; for example, the United Nations devised a Commission on the Status of Women. However, the concept of the status of women ignores the enormous variety of situations in which individual women live their daily experiences, and ignores women's diverse and complex cultures. In many cultures the flexibility of interpretation over status gives women and men sufficient leverage to operate relations of power to the advantage of the "self." This social practice suggests women's concerns as individuals need to be considered in tandem with their concerns as members of familial and social collectives. Certainly men and women in many cultures, such as those of Melanesia in the southwest Pacific, do not represent themselves

as separate autonomous beings. However, women's move in the latter decades of the twentieth century to urban environments has attenuated their ties with family, kin, and broader social collectives to the point that women can and do see themselves as individuals, albeit within a complex network of mutual responsibilities and cooperation.

An alternative vision of development *with* women was proposed. The WAD approach worked to integrate women's participation into development processes. It underscored the idea that the rise of globalisation, with its inequitable gender relations and prioritisation of global capitalism, was also inimical to men in developing countries. WAD also attempted to explain male domination and violence. Theorists contended that it is the structure of capitalism that keeps women at home in the domestic arena, not men, and male frustration with the class system was regarded as the determining factor in male abuse of women. But many theorists did not recognise the ways that men benefit from women's domestic labour, nor the extent to which women may also benefit from men's labour, and the complex economic exchanges that occur in the domestic arena. In consequence, WAD practices in development projects were criticised for privileging class over gender, in terms of remaining located in the processes of global capitalism and ignoring the complex social interactions between women and men at the grassroots level of economic production.

WAD failed in many countries because it did not adequately cater to rural and semi-urban women's needs. Many projects did little to change the distribution of household labour or increase women's access to resources, and surveys revealed that women's projects received dramatically less funding and attention than larger developments that employed male labour. The WAD approach failed due to insufficient awareness and sensitivity of planners, inadequate financial support and staff, unrealistic time frames for the achievement of project goals, and the lack of participation of women as the beneficiaries in project design and decisions. In essence, it remained anchored in dominant, powerful Western male modes of thought.

Although Western gender roles too often are used in support of a male ideology that seeks to exclude women from many important areas of modern life, it is equally important to recognise that conceiving of women solely as subordinate to men may provide little information about prevailing female–male relations, as expressed ideas about gender rarely accurately replicate social relations. In some cases women are represented as far more subordinate than they are in actuality. The WID and WAD approaches were condemned for focusing on "women" as a category and

thereby conflating women's diverse experiences into "otherness" as victim.

The newer theories driving gender and development (GAD) address the fundamental structures of inequality between women and men. A GAD approach makes visible the power relations that exist between men and women in most societies and the subordination to male power structures that many women face in a globalising capitalist world. Ideologically, GAD focuses not just on women but on the social relations that exist between women and men, on all aspects of women's lived experiences, and also centres gender and class relations, arguing that gender relations have to be located within hierarchical relations of domination that operate both at the micro and macro level of analysis in order to see clearly how changes may take place. Gender mainstreaming has become a strategy increasingly associated with GAD, for assessing the potential and actual effects of policies and programmes for women and men.

Such theoretical stress on gendered relations of power in many societies has been helpful, as GAD conceives "empowerment" to be the harnessed, self-generating power of women to act in their own interest. Indeed, more recent studies analysing women's agency suggest women are not passive victims of cultural and socioeconomic relations and structures, but rather they actively strategise and negotiate in order to achieve goals for themselves; their children; and extended family, kin, and clan members.

A number of studies have asked whether the diverse experiences of women across and within cultures and societies can be adequately addressed by development projects conceptualised, designed, and implemented by agencies in Western countries. To combat the disparities between theorisations about women, women's actual lived experiences, and women's roles in development, social anthropologists and comparative sociologists concerned with linking empirical data with perspectives of gender have engaged in rigorous inquiries into gender symbolism within and across cultures. As a consequence, they have critiqued Western notions of gender roles. Non-Western anthropologists, writing from within their own communities, show that variations in folk constructs about ideas of "male" and "female," and the probable relationships that exist or are considered socially appropriate between women and men, do not necessarily correspond to Western universalisations of "sex" and "gender" based on notions of hierarchies and oppositions between culture and nature, public and private. For example, decision making may denote some degree of agency, and hence the ability to form goals, commitments, and values. But to judge someone's success as an agent one must know what decisions

the person may, does, or must make; for whom and to what extent her decisions can then be implemented; and by whom the decisions are implemented. Because decisions classified by outsiders as being made exclusively by women may not be considered to be decisions by men, researchers argue that definitions of agency are specific to different cultures, as are concepts of choice and decision making.

Cross-cultural researchers argue that the key element to be drawn from observing how people live with gendered codes about social interactions is to analyse people's active agency in creating, re-creating, and resisting the system from their position within it. They contend that development practitioners need to consider how people, as active cultural agents, negotiate the limitations of their social structures, how different cultural agents experience life, and how they produce and manage various social identities. Development planners may need to rethink their ideas about active cultural agency in relation to the different activities conducted by women and men, because Western definitions of cultural agency are not as important as the social use of the concept in different societies.

The WID, WAD, and GAD debates demonstrate the important theoretical and practical changes that have occurred over time in analysing the topic of women's role in development.

### **Women's Roles in Development: Current Emphases**

Current emphases in theory and research on the topic of women in development recognise the multiple facets of women's activities and therefore pluralise their roles. Classical economic analyses are being radically rethought as their intellectual constraints do not acknowledge most of women's social roles, their work, or the diversity of their work. Globally, women engage in biological reproduction via child-bearing and early nurturing of infants, and perform the bulk of childcare and household maintenance. They also engage in social reproduction via the care and maintenance of the household such as housework; food preparation; and care for the sick, children, and the elderly; and in social management in terms of maintaining kinship linkages, developing neighbourhood networks, and carrying out religious or ceremonial duties in the community. Women in most cultures and societies combine household work with market or non-market work to generate income or raise household consumption. Such work has not been captured in classical economic theory or traditional labour force statistics. Women in rural areas are responsible for

subsistence agriculture. Small animals such as chickens and pigs, which can be fed on household scraps, are kept. Because female smallholders often find it difficult to hire men to undertake heavy physical tasks such as land preparation and pesticide application, they may be forced to leave some of their land uncultivated. The impact on women of the modernisation of agriculture is complex and contradictory, varying according to the crops produced, the size of farm and the farming system, the economic position of an individual farm family, and the cultural and political structure of the society. Women have often been excluded from agrarian reform and training programmes in new agricultural methods because Western experts have assumed a pattern of responsibility for agriculture similar to their own societies, in which men are the main decision makers. This lack of insight has resulted in the failure of many agriculturally based development projects.

Women tend to work significantly more hours than men when both market and household work are calculated. As many women undertake household work at the expense of income-generating activities, their bargaining power and decision-making capacity in the home can be limited, having implications for their overall well-being. Local politics and laws may also perceive women as less worthy of credit than men, thus adding to their difficulties.

Women also frequently head households where men have died, moved away due to marital instability, or migrated. Their households are often among the poorest as they contain fewer working adults than male-headed households and women earn lower wages than men. They may become poverty traps in which children become further disadvantaged because they may have to leave school early to seek paid employment or take over household chores to allow the mother to work outside the home. Maternal neglect and lack of paternal discipline may encourage truancy, delinquency, and perpetuate a family pattern of deprivation.

While these are important issues, researchers are also recognising the multifaceted nature of women's lives and work in impoverished and developing countries. In some cases women choose to establish their own household to gain decision-making independence, or to escape male violence and/or economic reliance on an irresponsible man. Such households can have a positive effect on women's autonomy and, despite frequently being socially stigmatised, they may function successfully as socioeconomic units.

A new phase of scholarship about women and development in the global economy has emerged around processes that suggest changes in the gendered nature of women's social roles, in women's psychology and

subjectivity, and in women's ideas about how they live as members of a nation-state. Research is also focussing on female immigrants, trafficking, and the potential for empowerment of women on the move. Authors argue that migration work is gendered, in the sense that the labour that underlies migration is often unpaid women's work. Women subordinate their own interests to the care of their families, negotiate to obtain resources for the family, link their family to broader society and maintain social networks, give up further education and careers, save money by reducing consumer spending, and rear children.

A key link between issues of migration and women's work in developing countries is the growing presence of women being trafficked across borders. Although cross-border routes are diverse, they share a vital feature, that is, they are profit- or revenue-making routes that are developed from the needs of severely disadvantaged women. Illegal trafficking provides hard currency for individuals and for governments, and provides people for the formal and informal labour markets of nursing, teaching, entertainment, tourism, and prostitution. Women search for work but illegal traffickers and governments contribute to the trafficking of women from developing economies. However, many developing economies can be described more accurately as struggling, stagnant, or failed states that have imposed survival strategies on people living in economies that are enduring the closure of small and medium-sized enterprises, moves to national rather than export markets, and the burden of large government debts.

Quality studies focused on the feminisation of survival in developing countries in terms of planting crops to earn cash and the rise of wage labour in agrarian communities then turned to the feminisation of workers as manufacturing internationalised. A concentration on the price urban women pay for development has been generated by world events. The 1997 Asian financial crisis exposed dangerous weaknesses in regional and global economies, and in development practices, which placed more crisis-induced burdens on women than on men. The impact was not confined to Asian regions but had a global ripple effect. The relative contributions and impediments that globalisation has given to the socioeconomic development of the region, and the extent to which global changes had a different impact on women and men regionally and locally, have created new questions about the impact of development on women. When the perspective of gender is infused into development studies, the existing image of regions such as East Asia as areas of affluence, with strong states, internal homogeneity, cultural cohesion, and a stable social order, must be

reassessed. Studies are showing that the three key processes of development—industrialisation, economic restructuring, and migration—have yielded new forms of women's subordination and inequality in work organisation and in society. Women are now strategising to gain from, and contest the process of, development.

### Women's Networks and Development

As women move from rural to urban areas, they often command improvements in urban services as they work to cope with the problems of housing and access to services for themselves and their children. Women's survival strategies habitually depend on building networks within the community. Some women's groups may provide a focus for the politicisation of women's lives around issues of importance such as rising food costs or the disappearance of their children at the hands of political and military repression, as has occurred in Argentina and Chile. Development agencies are also advocating the spread of grassroots women's groups because they are seen to avoid confrontation with established cultural patterns and prevent the subordination of women's interests and leadership to men. Women's groups affiliated with established churches in the southwest Pacific are increasingly being used by development agencies because they are active in townships and rural areas, conduct important group activities, and serve their community's needs. Several studies argue that the church has become so powerful an institution in many developing countries that development agencies and the state cannot afford to ignore it as an important vehicle for implementing development programmes.

Acknowledging the role of women's groups enables an understanding of the complex, multifaceted, and diverse cultures and societies that constitute developing nations, women's pivotal roles in contemporary societies, and differing ideas about and social uses of the concept of women's active cultural agency, and it offers the opportunity to examine modes of being that are established through alternatives to Euro-American experiences of modernity. The drive toward global homogeneity is constantly undermined as local peoples interpret, adapt, and transform external influences just as readily as they might internalise them and make them their own. Recognising the diversity of local people's cultural strategies is mandatory to expand critical perspectives within development studies, to problematise project design, and to enable researchers and development practitioners to acknowledge the importance of involving local

women in their discussions and planning processes, particularly from sources such as church groups that Westerners typically do not acknowledge as powerful social and political arenas.

Including the church as a significant social institution, and thinking about women and gender as durable but flexible sociocultural concepts, have the potential to encourage possibilities for women's resistance, subversion of oppressive power relations, and freedom. The significant insights about women, gender, and agency generated from non-Western communities should be more widely used in development planning and practice.

### Directions in Theory and Practice

Sad evidence testifies to the fact that development strategies based solely on macroeconomic theories, such as structural adjustment programmes, have failed to solve the problems of poverty in developing countries. Moreover, many have produced the unforeseen consequence of making impoverished women even poorer. This situation has been recognized by some donor agencies including the World Bank, and their policies have broadened to encompass microeconomic aspects of development.

Resources are being channeled to the kinds of organisations that are being initiated and sustained by female workers in the unorganised sector, and by women in organisations where they do not feel threatened by overt male power. Gender planning constitutes one of the ways in which the problems associated with women's roles in development are currently being addressed. The general goal of gender planning is the release of women from social, political, and economic subordination and to achieve gender equity, equality, and empowerment through meeting practical and strategic needs. It includes several critical characteristics: Gender planning is political and technical, assumes there will be conflict in the planning process, involves transformative processes, and characterises planning as debate. Gender planning therefore uses a methodology that emphasises discussion, negotiation, and conflict resolution.

Despite such progressive approaches, structural problems continue to limit women's roles in development. Bilateral technical assistance agencies (from one government to another) and multilateral agencies (from many governments working through the United Nations or global conduits to many other governments) have been instituted and staffed by men as part of established national agencies, foreign policies, and the maintenance of global relations that reinforce

a status quo of powerful male interactions. Women's bureaux, departments, and ministries within these agencies are usually underfunded and understaffed, and operate with limited jurisdiction. Rather than resourcing women for their needs, "gender" can be too easily mainstreamed as a political concession.

Advocates have successfully pressed for incorporating gender into development project design, planning, and implementation, an action that altered the term "women" and symbolised change. However, change has not necessarily been anchored in practice. Gender as a sociological term has been criticised as not translating well into languages other than English. Nonetheless, regardless of the viewpoints of theorists, researchers, and practitioners in relation to development, many are now engaging with the question of whether there can be any development. Should "post-development" be considered as a more progressive mode of working *with* rather than *for* more people, especially women? Authors are addressing the issue and its problems from tentative yet innovative positions and are courageously facing the gaps and silences in existing knowledge.

### WORLD BANK

(See *International Bank for Reconstruction and Development [IBRD]*)

### WORLD CONFEDERATION OF LABOUR (WCL)

A congress at The Hague in 1920 established the International Confederation of Christian Trade Unions—usually known by its French initials, CISC—on behalf of 3.5 million workers in ten European nations. Its policies reflected the social teachings of the Roman Catholic and some Protestant churches, emphasising "spiritual" rather than "material" values, rejecting both radical socialism and liberal capitalism, and promoting cooperative relations among workers, employers, and governments. During World War II the CISC was forced into abeyance.

In 1945 the CISC refused to join the World Federation of Trade Unions (WFTU), formed by the trade union movements of the victorious Allied nations in an effort to continue the East–West collaboration of World War II. Again in 1949, after Cold War tensions caused many Western European and North American union affiliates to break from the WFTU to create the International Confederation of Free Trade Unions (ICFTU), the CISC maintained its separation from both the now patently pro-Soviet WFTU and the equally pro-Western IFCTU. This basic three-way division within the international trade union movement was to remain intact for the next five decades.

Given the already high degree of unionisation in Europe and North America, and the growing clamour by non-Western and colonised peoples for political independence and economic development, all three international trade union groupings concluded that real growth for their organisations could only be found in what was becoming known as "The Third World." It was assumed that this task would be most difficult for the Brussels-based CISC, which, in the post-WWII period had been reduced to just four main unions: France's CFDT, Belgium's CSC, and the Netherlands' NKV and CNV.

Nevertheless, at its 1952 congress at The Hague, the CISC counted twenty member organisations: twelve of them European, six Latin American, one Asian, and one Canadian. Contributing to the 1968 congress in Luxemburg were seventy-four affiliates representing sixty-eight countries, including: twenty-nine from Latin America, twenty from Africa, nineteen from Europe, five from Asia, and one from North America. Such growth was impressive, even if many affiliates were workers' associations rather than full trade unions, and the claimed total membership of 12.7

million was obviously inflated. A key factor in CISC's success in the Third World was its decision to divert significant resources there, much of it from an "International Solidarity Fund" supported by wealthier affiliates. Church charities and the Dutch government likewise funneled overseas aid money through this fund.

Also, the CISC chose to support semi-autonomous regional groupings, the first of which was the Latin American Federation of Christian Trade Unions (CLASC), formed in 1954—though this later became the Latin American Workers Central (CLAT). Other regional organisations established by CISC were the Pan-African Workers Congress (PAWC), begun in 1959 but dissolved in 1974 under pressure from African governments; and the Brotherhood of Asian Trade Unionists (BATU), set up in 1963 with headquarters in the Philippines and which since then has established affiliates in many Asian nations. The absence of the word "Christian" from the latter two titles reflected CISC's pragmatic efforts to attract non-Christian members in regions like Africa and Asia. But this shift in turn encouraged a wider secularisation process, leading to the 1968 CISC congress decision to change the organisation's name to World Confederation of Labour (WCL).

At this time the WCL also was going through an ideological transformation that reflected both an overall reorientation from the First World to the Third World, and the growing presence within the upper levels of the organisation of representatives from less developed nations. New constitutional principles reaffirmed the primacy for the organisation at large of spiritual values, condemned both capitalism and communism as incompatible with humane society; somewhat contradictorily, however, they also advocated "class struggle" and worker control of resources and production, and promoted forms of syndicalist democracy.

In the early 1970s the WCL faced major problems with the dissolution of its own African regional organisation, the loss of its Vietnamese affiliates, and growing pressure on its Latin American membership from authoritarian regimes. Nevertheless, "privileged partnerships" were established with the Organization of African Unity's official union body (OATUU), and with the similarly constituted International Confederation of Arab Trade Unions (ICATU). Around the same time, the WCL was accusing the powerful US union grouping, the AFL-CIO, of "neo-colonial brutality" in Latin America, Africa, and Asia, and was describing itself as being in "a positive state of war" with official ICFTU bodies in Latin America.

Critics of the WCL, meanwhile, were charging it with unhealthy links to corrupt Christian Democratic

regimes in Latin America, and of lacking a clear view of what its slogan, "Solidarity and Liberation," actually meant. On the other hand, some considered this particular labour international to have a more subtle understanding of Third-World realities than either the First World-oriented ICFTU or the Second World-oriented WFTU, especially regarding linkages with groups like the poor, unemployed, women, peasants, and indigenous peoples. In the 1980s–1990s, too, the WCL was more proactive in networking with the new social movements emerging in response to issues like the environment, human rights, and globalisation.

Over time, some core constituencies inside the WCL became alienated by its leftward lurch and Third World-ist reorientation—and, indeed, by its overall failure to match the two giant internationals. Most significantly, its large French affiliate, the CGT, departed in 1977 to join the opposition ICFTU. Other affiliates, mainly Western, pushed periodically for merger talks with that same international, but for a long time such moves were rejected by the WCL's governing body. Finally, in late 2004, while describing itself as "representing some 27 million workers worldwide," the WCL leadership announced that during the coming year the organisation would formally unite with its long-time "free union" competitor, the ICFTU. Given their relative sizes, it is inevitable that the WCL will surrender most in the merger process.

## WORLD COUNCIL OF CHURCHES

### History

The founding of the World Council of Churches (WCC) at Amsterdam in 1948 was the result of numerous attempts to bring together an international

fellowship of churches that had left the Roman Catholic Church at the time of the sixteenth-century Protestant Reformation in Europe. Previous steps toward unity, but not union, had included an 1810 call by the English Baptist missionary William Carey for global mission conferences to discuss evangelistic strategies. In 1946 the Evangelical Alliance met in Liverpool to form a united Protestant front against Roman Catholic advances in Britain and North America. A 1910 Edinburgh Conference met at a time when missionaries from Europe, North America, and Australasia were following imperial entrepreneurs and governments into Africa, Asia, and Latin America. In 1920 the Ecumenical Patriarch of Constantinople appealed for cooperation in a “League of Churches” similar to the post-World War I League of Nations. Protestant church leaders echoed this call, but no action occurred.

As Hitler’s forces moved into Austria in 1937, two ecumenical bodies formed to implement agreements of the 1910 Edinburgh Conference, a Committee on Life and Work, and one on Faith and Order, and elected a provisional committee that met at Utrecht in 1938. That year the International Missionary Council (IMC) also considered the proposal to join a World Council of Churches, but several missionary groups expressed concern that they could lose their autonomy. In 1961 the IMC finally joined the WCC. In 1971 the World Council on Christian Education that had begun in 1907 as the World’s Sunday School Association joined the WCC.

In 1938, American McCreia Cavert suggested a name, “World Council of Churches,” and William Temple, Archbishop of York, became chairman of a provisional committee. W. A. Visser’t Hooft of the Netherlands became the first general secretary. They invited 196 churches—including a personal invitation to the Vatican—to attend a first WCC General Assembly in August 1941, but World War II broke out before they could convene. From 1940 to 1946 the provisional committee met in the United States, England, and Switzerland. It lent support to chaplain services, released prisoners of war and provided refugee assistance, and prepared for postwar reconciliation of the Protestant churches in Europe.

The first General Assembly of the World Council met on August 22, 1948. A total of 147 churches from forty-four countries represented most Christians outside the Church of Rome. Both the Life and Work and the Faith and Order groups merged with the new Council. As the Cold War began, the Soviet Union was claiming hegemony over most Eastern European states and was constructing a wall between East and West Berlin. The WCC basis for membership declared no political agenda, although the term “godless

communism” had already spawned an international ideological war.

The World Council would be a fellowship of national churches that accepted a simple statement of faith in “our Lord Jesus Christ as God and Savior.” By 1961 the Third Assembly at Nairobi would revise that formula to acknowledge fidelity to the trinity and scripture. The new statement held that the WCC professed faith in “the Lord Jesus Christ as God and Savior according to the scriptures,” and sought to fulfill a “common calling to the glory of the one God, Father, Son and Holy Spirit.” Tinkering with the dogmatic basis for ecumenical unity, but not union with an elaborate creed and discipline, continued for the WCC’s first fifty years as it tried to be both catholic (universal) and evangelical, with members who often held diametrically opposed views on both faith and order.

As of this writing, the World Council claims 320 churches, denominations, and fellowships, with membership of about 400 million in over 100 countries. The criteria for membership are that churches have a “sustained independent life and organization” and apply for membership without seeking permission of any other body or person. Members must accept the idea that churches are “interdependent” and need to engage in “constructive ecumenical relations” in their nation and region. A church needs to have a membership of at least 25,000.

As conservative nationalists of the McCarthy era of the 1950s were concerned that the United Nations would become a super-state, some denominationalists worried that the World Council of Churches was becoming a super-church, with Geneva as a Protestant Rome and the General Secretary as a Protestant Pope. Would the WCC impose political, theological, or social dogma that member churches would find unacceptable? Would it make alliances with anti-Christian, anti-democratic, anti-free enterprise political regimes or with religious bodies, Christian or non-Christian, that would violate the sensibilities or doctrines of its members? Could member churches veto actions taken by the General Assembly, Central Committee, or Executive Council? Could WCC leaders embarrass member churches by social-political activities that were unacceptable to church members in the nations that supplied the WCC with most of its funding? For a half-century such issues have arisen regularly in WCC meetings and in the press.

## Theological Issues

World Council staff member Marlin VanElderen wrote: “Had the church continued to resemble the

portrait of the earliest Christian community given in Acts 2:44–47, the World Council of Churches would not be necessary.” Yet he acknowledged that while Jesus’ prayer was “that they may all be one . . . so that the world might believe” (John 17:21), and while the early church “had all things in common” in terms of possessions, “greed, lack of commitment, racial exclusiveness, lust for power, theological differences, personality conflicts, opposition from outside” plagued the church from the beginning. Such quarrels would also cause theological, as well as socio-political strife in the WCC from its earliest days.

Charged debates have occurred around such issues as the admission of churches to World Council membership that did not follow basic Christian or Protestant dogmas, such as those who did not practice the traditional sacraments. How would WCC members share the Lord’s Supper fellowship when they differed in who administered the sacrament and how it was to be done? What about the Society of Friends and the Salvation Army who saw the sacrament as unnecessary for salvation? This matter was tied to ordination—who were the clergy (priesthood) who could administer sacraments, and what was their relationship to the extra-biblical “laity”? Some churches believed in apostolic succession; only a man who was a properly ordained as a priest by a bishop could administer the sacraments of baptism and communion, whereas congregationally based denominations extended priestly functions to the laity and women in the 1950s, and gays in the 1960s, and held that all believers were ministers and equal in function, even if they held different church offices.

Some Protestant denominations complained that the Council was too aggressive in making peace with the Roman Catholic Church and feared that negotiations would lead to merger under papal authority. In 1960 the Vatican established a Secretariat for Promoting Christian Unity and invited Protestant and Orthodox observers to the Second Vatican Council (1962–1965). As a result of a 1964 Decree on Ecumenism, Rome opened discussions with Protestants and Orthodox Christians. In 1969 Pope Paul VI visited the WCC’s Geneva headquarters. The Catholic Church sends observers to WCC Assemblies and has membership on some of its committees. In 1999 John Paul II became the first Pope to visit Orthodox nations, with both warm meetings and chilly receptions in Eastern Europe. Also in 1999 Lutherans and Catholics signed a declaration on the doctrine of justification, the principal theological issue behind Martin Luther’s excommunication that largely resolved their differences on that dogma.

## Political and Social Issues

Political issues also threatened the World Council of Churches fellowship. During the Cold War some Western denominations, particularly in the United States, found it difficult to fellowship with Eastern Orthodox churches that had close ties to communist (atheistic) governments. Along that same line, fundamentalist denominations found the WCC staff to be too liberal (socialist or even Marxist) when it supported 1960s–1990s Third World liberation movements that were receiving weapons and humanitarian aid from communist states. This was particularly true when the WCC involvement was political, as opposed to purely humanitarian. Why did the WCC send funds directly to Marxist guerrilla groups in southern Africa and aboriginal groups in the West rather than provide grants to social programs sponsored by local churches or church councils? The WCC staff and most mainline denominations found colonialism and apartheid to be anti-Christian abominations that could only be wiped out by strong political as well as social action.

Perhaps the most controversial action by the World Council in the political-social arena was the establishment of the Program to Combat Racism (PCR) in 1969. It had already taken a strong stand against racial-ethnic segregation in 1954 when its Second Assembly at Evanston, Illinois, declared segregation to be “contrary to the gospel and incompatible with the Christian doctrine of man and with the nature of the church of Christ.” At the time segregation was commonly practiced in the United States and apartheid was state policy in South Africa. By 1961, when the WCC held its Third Assembly at New Delhi, India, 18 of the 23 new members were from Africa, Asia, and Latin America, and four others were from the Russian, Rumanian, Bulgarian, and Polish Orthodox Churches. At a 1966 World Conference on Church and Society in Geneva, for the first time at a large ecumenical conference Western participants were in the minority. A majority of the 420 delegates were laypersons. The Uppsala, Sweden, Assembly in 1968 witnessed sit-ins, walkouts, pickets, and vigils, with a large number of youth present. Black novelist James Baldwin asked whether the WCC had “the moral energy, the spiritual daring, to atone, to repent, to be born again.” The next year the WCC set up the PCR to combat “institutional white racism, entrenched in social, economic and political power structures, with the understanding that the victims of racism must undertake their own liberation and outsiders play only a supportive role” (VanElderen 1992).

As an example of the rift in WCC member churches and national councils, in 1970 the Christian

Council of Rhodesia voted to support the WCC's PCR program with only two dissenting votes. Following the meeting the international Salvation Army withdrew from the Council, and attacked the WCC for abetting violence promulgated by atheistic Marxists. In June 1978, at the apex of Zimbabwe's independence war, Africans killed two Salvationist female missionaries at a school near Bulawayo. Three months later the WCC-PCR gave Zimbabwe's Patriotic Front guerrillas an \$85,000 grant. A month later the Salvation Army suspended its WCC membership, making the break final in 1981 from membership that extended back to 1948. Fifteen of twenty-six Army leaders who had addressed a 1979 Toronto conference wanted full membership, while twenty-three favored some form of membership. African Salvationists expressed their anger with General Arnold Brown by marching on the Army's Harare headquarters. Few fundamentalist churches belonged to the WCC, and some conservatives in mainline churches voted with their purses not to support its work.

## WORLD FEDERATION OF TRADE UNIONS (WFTU)

At the outbreak of World War II the existing trade union internationals closed down, though their networks were used by resistance groups in German-occupied Europe. With the 1941 entry into the war

of the USSR, the need to coordinate industrial production for the anti-fascist cause led to the All Union Central Council of Trade Unions (AUCCTU) working with the British Trades Union Congress (TUC) to form the Anglo-Soviet Trade Union Council. After the United States joined the Allied cause later the same year, the powerful American Federation of Labour (AFL) agreed to cooperate with the TUC—but not with its own domestic rival, the Congress of Industrial Organisations (CIO), or the communist AUCCTU.

Churchill, Stalin, and Roosevelt strongly supported close cooperation between each government and its national labour movement, and between the trade union centres of their respective countries. During wartime, trade unions were accorded far more status and power than they had enjoyed in peacetime. Then, as the war approached its conclusion, labour movements were considered key players in securing peace, achieving economic reconstruction, and rebuilding civil society. In Britain and throughout Europe, moreover, rank-and-file workers felt a special sense of solidarity with the Soviet people because of their leading role in defeating Nazism.

Consequently, at a Paris conference in October 1945 the World Federation of Trade Unions (WFTU) was born. Its main backers were the TUC, the CIO, and the AUCCTU—with the latter delivering over half the organisation's claimed 65 million members. The main objectives of the WFTU were the eradication of war and fascism; the promotion of democratic institutions; and full employment, decent wages, regulated workplaces, and social security for all citizens. But many British and US union leaders remained suspicious of their Soviet counterparts' ongoing support for "political" trade unionism, especially the spread of "real socialism."

Within the WFTU a major crisis occurred with the announcement of the Marshall Plan in October 1947. This proposal was welcomed by most Western unions as consistent with WFTU policies, but the AUCCTU condemned it as "the weapon of the transatlantic republic of the dollar and the atom bomb to split Europe." A tightening of unity amongst communist elements inside the WFTU followed. This was matched by a consolidation of anticommunist control over most Western national union centres. Finally, in January 1949, the TUC and the CIO led a major walkout from the WFTU; soon after they were joined by numerous other Western union groupings.

The main trade union centres remaining with the WFTU were from countries with Marxist-Leninist governments, but very quickly the organisation began to mirror the political tensions within that bloc. In 1950 the Yugoslav national affiliates were expelled

for, allegedly, letting their country “restore capitalism” and become a base for “imperialist aggression.” Then, in 1953 and 1956, the WFTU supported Soviet crackdowns on popular protests in East Germany and Hungary, respectively. China and Albania were ejected in 1966 after accusing the international of supporting Soviet “expansionism” and “revisionism.” During the 1968 “Prague Spring” uprising, the WFTU secretariat—based in that city and responding to pleas from Czech unions—briefly condemned the Warsaw Pact invasion, as did its affiliated French and Italian unions. But order was quickly re-imposed within the WFTU, and in 1976 when worker protests in Poland were violently suppressed, the secretariat said nothing. Two years later, the frustrated Italian affiliates totally withdrew, although their French colleagues opted to pursue “internal reform” a few years more.

WFTU views on the Third World reflected current East–West relations and the core tenets of Marxist-Leninist ideology. In practice, “development” was reduced to “the struggle of the workers and of the peoples against imperialism, exploitation by the transnational corporations, and an economic system causing a backwardness of the majority of the peoples.” The USSR and its satellites were presented as models of socialist development and proletarian democracy, and Third World labour movements were expected to combine historical materialist analyses and “appropriate” revolutionary strategies to ensure their countries attained similar heights. Especially strong support was given by the WFTU to affiliated unions involved in anticolonial and anticapitalist liberation struggles, such as in Vietnam, South Africa, and Chile.

By 1980 national union centres and affiliates from seventy-five countries, mainly in the Third World, were said to be attached to the WFTU, though the bulk of its claimed 190 million individual members were still in Eastern Europe. The organisation itself was intensely bureaucratic and quite divorced from ordinary workplaces and workers. Unsurprisingly, the collapse of the Soviet Union in 1989–1990 was a disaster for the WFTU. Over the next few years this once-powerful international lost most of its Russian and East European affiliates and members—plus the monies and state support they had long provided. While ostensibly still based in Prague, the WFTU rapidly became a disoriented and decentered organisation.

After a decade of relative inactivity, a World Congress of the WFTU was held in 2000 in New Delhi, funded by Indian unions. It was the first congress in the fifty-five year history of the organisation to be held outside Europe. While the official Web site described attendance by “delegates and observers from seventy-four countries representing a membership of 407 million,” such claims are misleading. Most

illustrative is the inclusion of the 135 million members of the ACFTU, China’s national trade union centre, even though its representatives were attending only as observers. Actual figures for national union centres, individual unions, and individual members directly connected to the WFTU in the twenty-first century must be considerably less than those for the 1980s.

Key ongoing issues, the WFTU says, are “the struggles to defend jobs, social security, health protection, trade union rights, poverty, environmental degradation, exploitation of child labour, etc.” Institutional enemies include “neoliberal capitalist globalisation” and agencies such as the World Bank, the International Monetary Fund, and the World Trade Organisation. Similarly odious are economic sanctions against Third World countries like Cuba, Libya, and Iraq, and military ventures by the United States and its allies. Clearly the WFTU remains committed to “working class solidarity,” “international socialism,” and “anti-imperialist struggle.” The only real changes seem to be that its leadership and agenda are now oriented towards the Third World rather than the (ex-)Second World, and that the “East–West” paradigm of its past has been replaced by the more recent “North–South” debates.

#### WORLD FOOD PROGRAM

The United Nations General Assembly established the World Food Program (WFP) in 1961 for the purpose of providing emergency food aid to areas of the world experiencing famine and disaster. It became fully operational in 1963, working closely with its parent organization, the Food and Agricultural Organization (FAO), which was in turn the brainchild of the Allied Conference at Hot Springs, Virginia, in 1943. The FAO commenced operations in October 1945, and with the establishment of the UN came into close association with the United Nations Economic and Social Council as the lead technical agency

for food issues at the UN. The focus of the FAO, however, was on long-term development planning, and the increasing numbers of food emergencies during the early 1960s argued for creation of a sister agency to focus on the emergency food needs of countries afflicted with famines and disasters reducing local food supplies. WFP, like the FAO, maintains its headquarters in Rome.

### **From Emergency to Development**

The WFP was instituted on a trial basis. In 1966, it gained permanent status as the lead UN food logistics agency in emergency settings. The WFP specializes in tracking food supplies and food shipments globally, and in redistributing food supplies when shortages strike various areas of the world. It relies on in-kind contributions of food from food-producing countries and on voluntary cash contributions used for purchasing and shipping food. About sixty countries contribute to the WFP's assets, while around ninety benefit from its assistance. Swift shipping of food to famine-affected areas is essential for saving lives. The WFP has access to aircraft, ships, and hundreds of trucks, often on charter from governments, in order to distribute food supplies. In-country distribution of food aid is done in cooperation with governments and often with non-governmental organizations, such as CARE, that specialize in food-delivery systems and logistics.

Emergency food aid can have the effect of glutting food markets, reducing local food prices and thus inhibiting incentives for local production of food grains. To avoid this, the WFP attempts to free up available surpluses within the countries and regions where drought, famine, or emergency food needs have arisen. The use of local grains and the infusion of cash into local economies and food markets prior to importation of outside assistance is one way the WFP attempts to respect the integrity of development production. In addition, the WFP has developed food-for-work programs, which involve payment in food for work done on various development infrastructure and public works projects, such as road-building and reforestation programs. An example of a WFP food-for-work program during the 1980s was a collaborative effort with the World Bank and the UN High Commissioner for Refugees (UNHCR) in Pakistan, where the influx of large Afghan refugee populations led to degradation of roads. By paying refugees and local Pakistani workers in food to maintain and develop roads, this program helped to enhance Pakistan's road infrastructure while providing food for workers

who would otherwise have remained unemployed. Such work by the WFP often extends to technical support to governments attempting to enhance food production, food storage, and food-distribution systems.

### **Interagency Collaboration**

Emergency food-aid policies are related to development policies and programs, so the WFP often interacts with other humanitarian aid bodies such as the UN High Commissioner for Refugees (UNHCR) and the International Committee for the Red Cross, as well as the UN Development Program, the World Bank, UNICEF, and the World Food Program's parent agency, the FAO. The WFP's work requires cooperation with UN specialized agencies in both humanitarian and development programs. In Africa, where the lion's share of WFP programming is implemented, the WFP is heavily engaged in development-related food-for-work programs, refugee assistance, and food aid to various complex emergencies, including the major humanitarian emergencies in the Great Lakes Region of Africa, the Congo, and the Sudan. The WFP is a member of the Interagency Standing Committee of the UN Office for Coordination of Humanitarian Affairs (UNOCHA), where it maintains close ties to the various UN emergency-assistance organizations and contributes to Consolidated Appeals for aid to countries facing emergency situations.

### **A Legacy of Effective Action**

The WFP's aid programs reach tens of millions of people every year, saving many lives and improving nutrition throughout the developing world. In recent years its programs have served more than 100 million people in more than eighty countries. It is directly involved in the world's most difficult humanitarian situations, conflict-torn regions, and disaster-affected areas. Additionally, by focusing on the mitigation of hunger in non-disaster areas, the WFP attempts to prevent malnutrition that stunts the full potential of young people as they mature. The WFP promotes school feeding programs to encourage child education programs. It provides food aid to encourage the development of schools, home shelters, and irrigation systems. It emphasizes disaster mitigation by using food as an incentive to build better roads, food-storage capacity, reforestation, and conservation programs. In all these ways, WFP assistance maintains

## WORLD FOOD PROGRAM

a long-term development focus as well as a commitment to rapid humanitarian response.

## WORLD HEALTH ORGANIZATION (WHO)

Established in 1948, the World Health Organization is one of the four most important specialized institutions among the sixteen agencies officially affiliated with the United Nations, together with the United Nations Educational, Scientific, and Cultural Organization (UNESCO); the Food and Agriculture Organization (FAO); and the International Labor Organization (ILO).

Since the middle of the nineteenth century, concerted efforts had been undertaken in the field of international public health, and several international bodies were created. International Sanitary Conferences had been convened, notably to coordinate quarantine measures in times of cholera and later yellow fever, the first in 1851 in Paris, and the eleventh held in 1903. In 1907, twelve states agreed in Rome on the creation of the International Office of Public Hygiene (OIHP), based in Paris. The League of Nations established its own Health Organization in 1920. The two international health organizations coexisted until after World War II. The United Nations Relief and Rehabilitation Administration (UNRRA), added later, took over OIHP's role. Several regional bodies also dealt with health questions, particularly quarantine. The new idea to create a single international organization in all fields of public health emerged in 1945, at the UN Conference on International Organizations, held in San Francisco, and was recommended in a joint declaration submitted by Brazil and China.

The Constitution of the new World Health Organization (WHO) was signed by sixty-one states on July 22, 1946, and entered into force on April 7, 1948. Amendments to it were adopted in 1959, 1965, 1967, 1973, 1976, 1978, 1986, and 1998, of which five became integral parts without, however, touching on

the fundamental principles of the Constitution (Burci and Vignes 2004, p. 18). The principles and functions outlined in the Constitution indicated a clear re-orientation from those of the preceding health organizations, created for the "civilized" countries in order to protect them and establish a sanitary belt around the developed nations (Beigbeder 1995, p. 13). While WHO's objective is stated to be "the attainment by all peoples of the highest possible level of health" (Article 1), the preamble of the Constitution is visionary:

Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.

The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition.

The health of all peoples is fundamental to the attainment of peace and security and is dependent upon the fullest co-operation of individuals and States.

To achieve its objective, WHO is entrusted with multiple functions—both operational and normative—of cooperation, research, training and information. They include technical assistance to governments in strengthening their health services; actions to eradicate epidemic or endemic diseases; emergency aid, promotion of improved nutrition, housing, sanitation, recreation, economic and working conditions, and environmental hygiene; promotion of maternal and child health and welfare; activities in the field of mental health; and establishing international standards with respect to food, biological, and pharmaceutical products.

### Membership and Structure

Membership is based on the principles of universality and statehood. There are now 192 member states and two associate members (Puerto Rico and Tokelau). The structure of the Geneva-based organization is threefold and comprises the World Health Assembly, the Executive Board, and the Secretariat under the responsibility of the Director-General.

The *World Health Assembly* consists of delegates, representatives, and observers. Delegates represent members and their number is limited to three per member state, although they may be accompanied by delegations of varying sizes. Delegates are chosen for their competence in the field of health, and preferably represent health administrations. Associate members are entitled to send representatives. Observers may be invited for a limited period, but there are also "quasi-permanent" observers. The Assembly meets in regular

annual sessions, for about two weeks, while several committees work continuously.

The Assembly's role is to determine the policies of the organization. It elects the Director-General and the members of the Executive Board. Most of the decisions of the Assembly are recommendations to its members, which are not legally binding but nevertheless are important. It has also the normative authority to adopt regulations and binding conventions or agreements on health matters.

The *Executive Board* is composed of thirty-two persons. The selection of board members respects regional criteria, and they serve as government representatives rather than in their personal capacity, as was the case until 1998. The Board meets twice per year and follows an agenda set up by the Director-General. Its role is both technical and political; it prepares the Assembly's work and as such decides on the matters to be discussed (or not discussed); it is responsible for implementing the Assembly's decisions, can decide on emergency matters, and is a determining factor for the choice of the Director-General. The Board also appoints various committees to fulfill its task.

The staff of the *Secretariat* is under the authority of the Director-General and constitutes the third organ of the Organization. Since WHO's creation, five persons have occupied the post of Director-General. The initial five-year appointment can, since 1996, be renewed once only. The Director-Generals have been: Dr. Brock Chrisholm (Canada 1948–1953), Dr. Marcolino Gomes Candau (Brazil 1953–1973), Dr. Halfdan T. Mahler (Denmark 1973–1988), Dr. Hiroshi Nakajima (Japan 1988–1998), and Dr. Gro Harlem Brundtland (Norway 1998–2003). The first mandate of Dr. Jong-Wook Lee (Republic of Korea) started in 2003. The Director-General is “the chief technical and administrative officer of the Organization” (Article 31, Constitution), but the position's responsibilities go far beyond this and the individual's influence is considerable.

## Regionalization

From WHO's beginnings, the historical importance of regionalization was recognized and six geographical areas were delineated on the basis of continental groupings but also considering standards of health and the epidemiological situation in the countries to be included. The regions are Africa, the Americas, Southeast Asia, Europe, the Eastern Mediterranean, and the Western Pacific. The six originally determined regions have not been changed fundamentally, although some countries did change their affiliation to

a specific area. Each region has its own organization consisting of a regional committee and office. In some regions, special arrangements had to be made to account for preexisting regional structures and their relationship with WHO, as was the case for the Pan Arab Regional Health Bureau at Alexandria and for the Pan American Health Organization (PAHO).

## WHO's Relations with States

Relations with states are structured around obligations deriving from their membership and also from a network of agreements, for example, “host country agreements” with countries hosting the headquarters or regional offices; also “basic agreements” for technical cooperation with member states, notably with developing countries. More than 150 member states have concluded such “basic agreements” with WHO.

## WHO's Relations with Intergovernmental Organizations

WHO's primary relationship is of course with the United Nations, since it is one of its specialized agencies, but it also has significant relationships with the international agencies that predated its creation (PAHO, International Office of Public Health). WHO has formal agreements with sixteen organizations, mostly within the United Nations system. Other examples are the African Development Bank and the League of Arab States. There are also less formal, umbrella-type agreements and WHO collaborates on policy issues with the United Nations Economic and Social Council (ECOSOC) (for example, on tobacco control and HIV/AIDS). First with the United Nations Expanded Program of Technical Assistance (EPTA) and later with the United Nations Development Program (UNDP), the relationship has always been characterized by the difficulty to maintain a balance between resisting the United Nations' centralization attempts of technical cooperation by the resident coordinator and the effort to cooperate with the UNDP in order to integrate health programs in development activities (Burci and Vignes 2004, p. 75).

WHO has always had close relations with UNICEF, because of the overlap of the two bodies, particularly UNICEF's emphasis on maternal and child health and nutrition, on immunization, family planning, emergency relief, and so forth. The two bodies also have a Joint Committee on Health Policy (JCHP). First

concentrated on the eradication of a number of diseases, the cooperation became particularly important around the strategy of “Health for All by the Year 2000” and its focus on primary health care (see below). The 1978 Alma Ata Conference on Primary Health Care was indeed organized jointly by UNICEF and WHO. Other examples of close collaboration are the 1979 International Code for the Marketing of Breast-Milk Substitutes and the Children’s Vaccine Initiative, at the World Summit for Children, in 1990.

Several long-term programs are co-sponsored by WHO and other United Nations agencies: the Special Program for Research and Training in Tropical Diseases (TDR); the Special Program for Research, Development and Research Training in Human Reproduction (HRP); the FAO-WHO Codex Alimentarius Commission; and the Joint United Nations Program on HIV/AIDS (UNAIDS).

TDR and HRP are based on the recognized necessity to pool international expertise, the political will of the states concerned, and financial resources. Co-sponsored and executed by WHO, they are mostly financed by extra-budgetary contributions. TDR was established in the 1970s, in a period when biomedical progress facilitated research on the prevention and treatment of major tropical diseases. At the same time, there was also awareness that pharmaceutical companies were not interested in developing medicines for the “diseases of the poor.”

Before the creation of UNAIDS, the reaction of WHO to the pandemic was to establish, in 1987, the Global Program on AIDS, headed by the widely respected Dr. Jonathan Mann who emphasized the social dimensions of AIDS. There was also a parallel Inter-Agency Advisory Group on AIDS as well as a WHO-UNDP Alliance to Combat AIDS. In the early 1990s, the focus shifted to a biomedical perspective. It became clear, however, that the complexity of the growing pandemic brought challenges in various sectors that needed to be addressed by coordinated action. WHO’s Director-General received the mandate, in 1993, to consider developing an inter-agency program in consultation with UNDP, UNICEF, UNFPA, UNESCO, and the World Bank. ECOSOC became involved later and proposed a membership formula. The Health Assembly and the other six co-sponsors agreed to the establishment of UNAIDS in 1995, as a joint and co-sponsored United Nations program on HIV/AIDS. Its secretariat is located in Geneva, headed by an Executive Director who is appointed by the UN Secretary General upon proposal of the six co-sponsors. UNAIDS operates in developing countries through the country-based staff of its co-sponsors. Coordinated action is decided by the UN Theme Group on HIV/AIDS.

### ***International Agency for Research on Cancer (IARC)***

Created by Resolution WHA18.44 in 1965, IARC is a non-statutory body of WHO and is open to participation of all WHO Member States (as of February 2005, it had sixteen participating states: Australia, Belgium, Canada, Denmark, Finland, France, Germany, Italy, the Netherlands, Norway, the Russian Federation, Sweden, Switzerland, the UK, and the USA). Its headquarters are in Lyon, France, because of the French origin of the initiative to create such a body and also because of its closeness to Geneva. IARC has a Governing Council, a Scientific Council, and a Secretariat. Its objective is to promote international collaboration in cancer research. Its functions are the collection and dissemination of cancer epidemiology and research information, the support of cancer research projects, and education and training of personnel for cancer research.

### **WHO’s Relations with NGOs**

From the beginning of the World Health Organization, its interaction with mostly international NGOs has been one of its most important means to accomplish its mandate. From twenty-six, in 1951, their number increased to over 190 in 2002 (Burci and Vignes 2004, p. 89). The working or official relations, as they are called, between WHO and NGOs reach from cooperation in technical matters to operational activities. Related NGOs have a variety of objectives and range from scientific associations, to advocacy and humanitarian organizations, to youth and women’s organizations, to private companies.

### **Relations with the Private Sector**

At the time of WHO’s establishment, the private sector and commercial companies were not considered important partners to international health policy. The relationship with private companies developed gradually, and cautiously, as WHO recognized the role particularly of pharmaceutical companies (for collaboration in research and development of new drugs and vaccines) but was also aware its policies may affect the commercial sector, which in turn might try to influence the outcome of WHO activities. Since the 1980s, WHO has adopted a patent policy by which, depending on the circumstances, the results of funded research are not necessarily placed in the public domain, as might be expected of publicly funded

research, but patent rights and any financial or other benefits associated therewith are used to promote the development, production and wide availability of health technology in the public interest. This permits, for example, the organization to support the development of new drugs in the area of tropical diseases. WHO has also sometimes encouraged donations in kind or money by private pharmaceutical companies to developing countries, monitoring the shipping, distribution, and use of donated drugs, and arranging for research and development. This was for example the case in 2001, when Aventis Pharma made a donation for five years of the drugs Pentamidine, Melarsoprol, and Eflorinthine for the treatment of trypanosomiasis (sleeping disease) in endemic African countries (Burci and Vignes 2004, p. 97).

The multiplication of such relations with the private sector has, however, also raised concerns about WHO's image as an impartial and objective policy agency, independent from undue influences, concerns which recently revised guidelines have not completely dissipated. The proliferation in recent years of longer-term "public-private partnerships" (PPPs) has been both criticized and welcomed, particularly when philanthropic foundations, such as the Gates Foundation, support financially the for-profit enterprises.

### **"Health for All" Strategy**

Immediately after its establishment, during the post-war years, emergency measures against malaria, tuberculosis, and sexually transmittable diseases were WHO's priority, as well as maternal and child hygiene and nutrition. Gradually, a conception of health as an essential element to industrial and agricultural development imposed itself. Social dimensions, prevention, and the necessary training of health care workers shifted to the foreground, together with the importance of sanitation and clean water.

During the 1960s, the fight against transmittable diseases, the strengthening of basic health care services, the training of the needed personnel, and nutrition and environmental concerns were still priorities. At the same time, the arrival of many recently independent state members made the interweaving of health and development obvious. Although the strategy against malaria made some points—except in Africa—large parts of the world's population continued to have no access to basic health care.

By the mid-1970s, no real progress had been accomplished; worse, some sectors were declining and the lack of basic health care services remained the most preoccupying problem. The ways to conceive

of health were more and more questioned; the approach appeared to be fragmented and static. In the developing world, expensive urban hospitals drained national health expenditures. Smaller dispensaries and clinics were rare and had little resources. Millions of people had no access to even rudimentary health care. During this period, WHO initiated a series of studies of successful and innovative initiatives in developing countries. Although the experiences were varied, they had in common a "commitment to universal coverage" (Burci and Vignes 2004, p. 161) and to bring basic health care to those most in need. In 1974, the United Nations General Assembly urged WHO to intensify its international action to improve sanitary conditions in developing countries and to concentrate its actions on prevention and access to basic health care services for collectivities. The Assembly insisted that complicated treatments and high technologies add little to sanitary development where it is most needed and drain precious resources. WHO is asked to reorient its resources and activities.

Probably the most important and long-lasting contribution of WHO to international health policy will be the adoption by the World Health Assembly, in 1977, of the concept of *Health for All by the Year 2000*. The International Conference at Alma Ata (USSR) culminated the following year in a Declaration recognizing primary health care as the adequate approach in order to attain this goal. The United Nations General Assembly expressed its support for the *Health for All by the Year 2000* strategy in 1981. The goal "by the year 2000" was, without doubt, too ambitious; but the policy was revised and reaffirmed in 1998, and continues to orient WHO's activities in the twenty-first century. The strategy is built around five principles, based on the primary health care approach as developed at the Alma Ata Conference. The main components are: (1) the equal distribution of resources and the accessibility of essential health care to everyone; (2) the individual and collective right and duty to participate in sanitary development; (3) equal importance of health promotion, disease prevention, and curative care; (4) scientifically sound technology for all, as economically affordable; and finally, (5) the recognition that the attainment of the highest level of health has to be a concerted effort of all domains of human activity. These guiding principles are further detailed in specific fields, such as education and training, nutrition, clean water, mother and child health, vaccination, and improving access to essential and other medicines. WHO's activities in the field of pharmaceuticals merit special mention. In order to assure rational selection of medicines, low prices, financing on the country level, supply, and delivery, WHO encouraged a policy of differential prices for

poor countries. It also raised awareness of how certain provisions of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) limit the affordability of medicines. A Declaration on the TRIPS Agreement and Public Health was adopted in 2001.

## Challenges

WHO has had its share of criticisms and challenges. Like all inter-governmental organizations, it has to deal with the fundamental contradiction of programs that are international in scope but have to be implemented nationally. Regional differences in WHO's administration have been controversial from its beginnings, as have been administrative problems at the head office. The proliferation of "special programs," each with its own quite independent board, has been considered a factor undermining WHO's central leadership. Competition from other agencies, such as the World Bank, UNDP, or UNICEF, questions its credibility. Both the politicization and the Health Assembly's voting system, where each member has one vote, gave rise to criticism.

Since the World Health Organization's creation, enormous scientific and medical advances have been made while at the same time adverse side effects of certain treatments appeared (e.g., overuse of antibiotics or pesticides). The health gap between the developed and developing world has led to new strategies, but the most serious problems remain and new challenges, such as the deterioration of the environment and the AIDS pandemic, have to be addressed. The "Health for All" strategy with its emphasis on prevention leaves in the dark numerous congenital or accidental afflictions that cannot be prevented. It is also considered by many a "poor man's" approach to health. Finally, the normative function of WHO has often been controversial, most prominently around the International Code of Marketing of Breast-Milk Substitutes.

## WORLD METEOROLOGICAL ORGANIZATION (WMO)

The World Meteorological Organization (WMO) is an intergovernmental agency composed of more than 180 member states and territories, established by the United Nations to foster international cooperation in the collection, sharing, and analysis of meteorological, hydrological, and associated geophysical data.

The WMO's roots lie in the International Meteorological Organization (IMO), which had been founded in 1873. The successor was established by the "Convention of the World Meteorological Organization," a multilateral treaty that was signed on October 11, 1947, and which went into effect March 23, 1950.

The mission of the WMO is utilitarian—to improve human life and promote human activities by improving understanding of the environmental factors that affect those lives and activities the most. By establishing a coordinated network for the gathering and exchange of meteorological, hydrological, and geophysical data, for example, the WMO has provided benchmarks by which potential environmental threats to human welfare can be assessed.

Throughout its history, the WMO has helped scientists and policy makers understand weather-related climate disasters—such as the Sahel droughts that have caused famines throughout West Africa since the 1960s; or El Niño, a cyclical phenomenon that has the potential to disrupt global climate patterns. WMO programs can provide early warning of impending natural and man-made disasters. Such early warnings are necessary in order to provide citizens of

developing and developed nations adequate time to prepare for environmental changes.

Among the major issues of concern to the WMO are climate change, which may occur abruptly, but which have the potential—despite the rate of change—to cause significant disruptions to human lives and activities over the next century; desertification, whether caused by unwise land use or by natural phenomena; natural disasters such as an increase in the frequency or intensity of tropical storms, or climate effects from major volcanic eruptions; maintaining adequate supplies of clean water for growing human populations; pollution; food production; ozone depletion; and climate effects on the incidence and severity of human diseases.

The WMO's major programs include: (1) the Applications of Meteorology Programme, which focuses on development of meteorological services to agricultural, aeronautical, and marine interests; (2) the Atmospheric Research and Environment Programme, which integrates monitoring and research activities concerning, for example, atmospheric chemistry, ozone depletion, tropical meteorology, and weather prediction; (3) the Education and Training Programme, which ensures that member nations have adequate numbers of trained meteorologists, hydrologists, engineers, and technicians; (4) the Hydrology and Water Resources Programme, which is devoted to the monitoring of water resources and mitigation of water-related hazards; (5) the Regional Programme, which focuses on the problems of specific regions; (6) the Technical Cooperation Programme, which facilitates the sharing of relevant knowledge and technologies among member states; (7) the World Climate Programme, which promotes improved understanding of climatic processes; (8) the Space Programme, which supports the development of space-based weather observation platforms and the sharing and utilization of data from those platforms; and (9) the World Weather Watch Programme, which coordinates the acquisition of meteorological and hydrological data and the sharing of that data among WMO members.

## WORLD TRADE ORGANIZATION (WTO)

The World Trade Organization is a global, multilateral intergovernmental organization that promotes, monitors, and adjudicates international trade. Together with the regional and bilateral arrangements, the WTO is central to the overall expectations and practices of states with regard to international trade. The WTO is the successor organization to the General Agreement on Tariffs and Trade (GATT), which was created in 1947 to facilitate free trade on a multilateral basis. For most of its existence, the name GATT was the source of considerable confusion because it was both the name of a treaty and the name of the organization headquartered in Geneva, Switzerland. In fact, the GATT was more of a negotiating framework than an administrative institution. It did not actually regulate trade. That confusion has now ended. The GATT treaty was amended to create the World Trade Organization, which superseded the GATT organization as of January 1, 1995. Therefore, references to the organization now use WTO, and the treaty is referred to as the GATT. Although the GATT was a regime with little institutional infrastructure until the mid-1990s, it did have a small secretariat with headquarters in Geneva, Switzerland. In addition to its main role as a negotiating forum, the GATT helped to arbitrate trade disputes, helped to clarify the rules, and assisted states in observing them.

Since 1995 the GATT agreements on manufactured goods have been subsumed into the WTO framework and then extended to include trade in services and intellectual property. The WTO has some powers of enforcement and an international bureaucracy, which monitors trade policies and practices in each member state and adjudicates disputes that members

bring to the WTO. It is unclear how much power the WTO will eventually be able to wield over states in practice.

Over time the membership of GATT/WTO has grown from the original 23 countries to 148 members as of October 2004. Almost all of the world's major trading states are among the WTO's members. Two notable exceptions, however, are Russia and Saudi Arabia. They, along with twenty-one other countries, are seeking admission to the WTO. The United States and other countries demand, as a condition of membership, liberalization of the trading practices of Russia and other would-be members. The trade of the full members accounts for approximately 90% of all world trade. The GATT and the WTO have played an important role in promoting the meteoric expansion of international trade. The organization has sponsored a series of trade negotiations that have greatly reduced tariffs and non-tariff barriers, such as import quotas.

### A Brief History of the WTO

Since the Industrial Revolution swept across Europe in the early nineteenth century, industrialization and international trade have been closely interconnected. One of the main effects of the Industrial Revolution was the specialization of labor. In the early 1800s, the British economist David Ricardo developed the theory of comparative advantage. This theory holds that individuals, firms, regions, and nations can gain by specializing in the production of low-cost goods. Nations make further gains by exchanging low-cost goods for goods that they can only produce at high cost and others can produce at low cost. This implies that low-cost goods producers use productive resources more efficiently.

In a world consisting of open economies, comparative advantage is a central organizing principle of international trade. International competition makes it possible for domestic producers having a comparative advantage in a particular good or service to compete effectively in foreign markets and to profit from the export of these goods and services. In turn, a country's export revenues generate the necessary purchasing power to import goods and services produced at a lower cost in another country. The result of free trade is an expansion in both output and consumption in domestic markets. Low-cost domestic consumers gain by having a greater choice of lower-cost products.

Historically, nations have erected barriers such as tariffs and quotas to protect domestic jobs. As the

wave of protectionism raged during the 1930s (which may or may not have played a significant role in the Great Depression), international trade simply collapsed. Trade restrictions such as tariffs and import quotas, however, carry a hefty price for consumers. A tariff is simply a tax against foreign imports. An import quota specifies the quantity or value of a good allowed to be imported into a country for a given year. By creating an artificial ceiling on the amount of a product allowed to be sold in the domestic market, prices for the quota-protected product are higher than they would be if the quotas were removed. From the standpoint of consumers, quotas are more costly than tariffs. Tariffs do not limit the supply of imported goods, but quotas do. Trade quotas are the policy of restricting the quantity of traded goods and services. They may be used as a means of observing a bilateral or multilateral previous agreement, such as when some countries agree to limit their competition in certain products in the markets of partners to enable the partners' producers to maintain a certain level of the share of their domestic markets. Trade quotas are also used for political reasons. Since the 1960s, tariffs have been declining steadily as a result of multilateral trade negotiations among nations subscribing to the General Agreement on Tariffs and Trade (GATT). In spite of five decades of consecutive GATT negotiations, during 1990, twenty-one US industries protected by import barriers cost US consumers about \$70 billion paid in higher prices.

The post-World War II era, therefore, brought increasing efforts in developed countries to seek ways to forestall such trade slumps in the future. The United States and Britain, through a series of meetings and conferences, agreed to institutionalize trade policies, which resulted in creating the International Trade Organization (ITO) in 1945. The main purposes of ITO were to lower restrictions on trade and set rules of commerce. Policy planners hoped that this organization could assist in avoiding repetition of the international economic catastrophe that followed World War I. This plan encountered widespread resistance from European nations, developing countries, and domestic US political constituencies concerned with protection of domestic jobs and national sovereignty. Furthermore, its character became so watered down by other countries' demands for exemptions from generalized rules that Congress refused to approve it. In its place, the United States sponsored the General Agreement on Tariffs and Trade (GATT). Although initially designed as a provisional arrangement, the GATT became the cornerstone of the liberalized trading scheme originally embodied in the ITO.

In 1947, the GATT was negotiated by twenty-three countries. Under the aegis of the GATT, states

undertook a series of multilateral trade negotiations, called “rounds,” aimed at reducing tariffs and resolving related issues. The eighth and most recent session (as of this writing), the Uruguay Round, completed in 1994, replaced GATT with a new World Trade organization (WTO), thus resurrecting the half-century-old vision of a global trade organization with teeth. The Uruguay Round started in 1986 in Uruguay. Although the rough outlines of a new GATT agreement emerged after a few years, efforts to wrap up the Uruguay Round failed at five successive G7 summit meetings in 1990–1994. It was estimated that a successful conclusion to the round would add hundreds of billions of dollars to the world economy over the remainder of the decade. But that money was a collective good, which would be enjoyed both by states that made concessions in the final negotiations to reach agreement and those that did not.

An agreement was finally reached in late 1994. In this round the United States and the European Union (EU) settled most of their differences on agriculture. In the end the United States got some, but not all, of what it wanted. The Uruguay Round negotiations were not only designed to reduce tariffs but also to confront more ubiquitous and less tractable forms of new protectionism that have become widespread. Non-tariff barriers are among the most ubiquitous of these.

### Non-Tariff Barriers

Non-tariff barriers (NTBs) to trade cover a wide range of government regulations that have the effect of reducing or distorting international trade, including health and safety regulations, restrictions on the quality of goods that may be imported, government procurement policies, domestic subsidies, and anti-dumping regulations. NTBs comprise one of several new protectionist challenges to the principle of free trade often called “neomercantilist” challenges. *Neomercantilism* is “a trade policy whereby a state seeks to maintain a balance-of-trade surplus and to promote domestic production and employment by reducing imports, stimulating home production, and promoting exports” (Walters and Blake 1992). Neomercantilist practices have assumed greater prominence in US foreign economic policy in recent decades. They are also evident in other countries, as witnessed by the concern among US trade partners about the consequences of genetically engineered agricultural products, of which the United States is the leading exporter.

### The Principles of the WTO

Since its inception, the GATT was based on four principles: most favored nation (MFN), reciprocity, nondiscrimination, and transparency. Members of the WTO, according to the MFN principle, are supposed to grant tariff or barrier reduction to all other WTO members. For example, if the United States reduced import tariffs for German automobiles by 8%, the US import tariffs for all automobile imports from WTO member countries had to be reduced by 8%. In this way, the WTO does not get rid of barriers to trade altogether but equalizes them in a global framework in order to create a level playing field for all member states. States may also extend MFN status to others that are not WTO members, as the United States did with China. President Clinton at first tried to use MFN status, which must be renewed annually, as a form of leverage to induce China to change its rights practices. When this failed, he unlinked human rights and trade relations with China, granting MFN status unconditionally.

Reciprocity bolsters the MFN principle because it implies that a country’s reduction in tariffs, for example, will be reciprocated by other WTO members. In the absence of a reciprocal tariff reduction by other partners, a WTO member is under no obligation to unilaterally reduce import tariffs. The two remaining principles are nondiscrimination and transparency, which means that foreign goods will be treated the same as domestic goods; that is, foreign goods will not be discriminated against. Nondiscrimination holds WTO members accountable for treating imported and domestic products on an equal competitive basis within the national market.

### The Structure and Role of the WTO

The WTO is headquartered in Geneva, Switzerland, and as of 2005 is headed by Director-General Supachai Panitchpakdi, a former deputy prime minister of Thailand, who took office in 2002. Countries can file complaints against one another for violation of the GATT. The WTO has the power to enforce the provisions of the GATT and to assess trade penalties against countries that violate the accord. While any country can withdraw from the WTO by giving six months’ notice, that country would suffer significant economic perils because its products would no longer be subject to the reciprocal low tariffs and other advantages WTO members accord one another. When one country charges another with a trade

violation, a three-judge panel under the WTO hears the complaint. If the panel finds a violation, the WTO may impose sanctions on the offending country. Each country has one vote in the WTO, and sanctions may be imposed by a two-thirds vote. This means, among other things, that domestic laws may be disallowed by the WTO if they are found to be de facto trade barriers.

The WTO judicial process has been busy. From 1995 through January 2004, the WTO handled 305 cases. The first case in 1995 involved a complaint by Singapore against Malaysia related to its prohibition of imports of polyethylene and polypropylene. Case number 305 filed in early 2004 by the United States charged Egypt with maintaining illegally high tariffs on textiles and apparel products. However, most of the cases brought to the WTO between 1995 and 2004 were settled without the need for arbitration. When the WTO was called upon to adjudicate disputes, no government defied any of its rulings. Even though some countries were short-term losers in particular cases, they still abided by the WTO because of the broader and long-term benefits of WTO membership.

The WTO provides a way to resolve the dispute and avoid the bilateral retaliation, counter-retaliations, and occasional wars that have marked trade disputes in the past. When the George W. Bush administration imposed protective tariffs, some countries took quick retaliation against the United States by restricting their purchase of US goods, but the EU, Japan, and most other countries were satisfied to sue the United States in the WTO and to threaten retaliation if Washington lost the dispute and still refused to give way. In the end, that was not necessary. Most observers believe that the US presidents have wisely chosen not to risk major damage to the relatively free trade system and to the WTO, which the United States has been instrumental in creating.

### **The WTO and Its Critics**

The GATT/WTO has been considered by intellectuals and policy makers in Less Developed Countries (LDCs) as an exclusive club of rich nations. Influential economists have challenged the conventional wisdom of free trade. They contend that as exporters of single commodities or natural resources, developing nations are considered to be highly dependent on unstable world commodity markets, while rich industrial nations enjoy the core benefits of trade as exporters of capital.

Conservationist groups such as the World Wildlife Federation (WWF) argue that trade has a destructive impact on the environment because trade facilitates

the over-consumption of natural resources. The WWF believes that strengthening environmental regulations worldwide should take place before seeking greater trade liberalization. Another point made by many environmentalists is that companies will try to evade costly environmental standards in one country by setting up shop in another country where there are lax standards.

The WTO rejects the assumption that there is necessarily a trade-off between the environment and the economy as in the example of low trade barriers to environmental goods and services. In addition, the WTO's secretary general has argued that the real cause of environmental degradation is poverty, not trade.

In 1999, an unusual mix of individuals and organizations went to Seattle to protest a number of issues including environmental degradation, lost jobs, and the lack of accountability of the WTO. Protestors virtually shut down the WTO meeting. One of the common denominators of the protestors was that they were upset about the globalization process. The WTO is the most visible symbol of that process.

More specifically, the two biggest complaints against the WTO were related to environmental and labor issues. Protestors concerned with labor issues focused on the wages of workers in the Third World, where in some places, transnational corporations pay workers a dollar an hour or less, and where working conditions are often inhospitable and even dangerous. Of particular concern to the labor protestors in Seattle was the apparent trend of transnational companies to set up factories in countries with very low wages. Lower wages in the Third World countries, they believe, end up affecting wage levels in the United States. In short, US workers must settle for lower wages in order to keep their jobs from being sent overseas.

### **Assessment and Future Challenges**

From its inception, the GATT/WTO has generally resulted in significant tariff reductions through multilateral agreements. It is agreed that the level of tariffs facing member countries of the WTO are much lower today, in the early twenty-first century, than they have ever been. For LDCs, joining the WTO has enabled them to participate in its various multifarious negotiations, thereby giving them the opportunity to present their multifarious cases to the Developed Countries (DCs). It seems that GATT/WTO has generally been in the interest of LDCs by enabling them to suffer lesser trade barriers than they would have suffered without such a multilateral agreement.

Nevertheless, many of the benefits of GATT/WTO's provision are designed to be more favorable to the DCs than the LDCs. For example, tariff reductions on goods exported by the DCs—industrial goods—far outweigh tariff reductions on goods exported by the LDCs—that is, primary products. Although there exists a GATT principle of preferential treatment of the exports of LDCs, known as the Generalized System of Preferences (GSP), which provides for reduced tariffs on selected manufactured goods exported by LDCs, the countries have not really benefited much from it. This is because many key industrial manufactured products exported from LDCs are exempted from the benefits of the GSP: textiles and apparel, processed raw materials, and a wide range of industrial and labor-intensive products.

Although the WTO has gotten off to a promising start, its future is not clear. The question is: What will happen if one or more member countries, especially powerful ones, refuse to abide by the WTO rules and reject the findings of the judicial process? So far, when Washington and the EU have lost a case, they have quietly given way, as the United States did in 2003 in the face of an adverse WTO ruling on the steel tariffs. What remains to be seen, however, is the reaction when a highly sensitive case is brought before the WTO.

The WTO is facing several major challenges in the future. First and foremost, the WTO must deal with the question of what type of organization it will be. Most observers agree that the WTO will continue to be dominated by governments seeking to hold onto as much national sovereignty as possible. Most of its members are not very interested in granting the WTO too many powers. In addition, there is often no real consensus among WTO member states about how policy problems should be dealt with. One should not get the impression, however, that the WTO is totally hampered by the whims of nation-states. Its members do understand the need for cooperation, and the WTO is heading into an increasingly large number of new areas.

#### WYSZYŃSKI, CARDINAL STEFAN

Cardinal Stefan Wyszyński (1901–1981) led the Polish Catholic Church from 1948, when Pope Pius XII made him primate of Poland, until his death in 1981. He was popular among Poles both religious and not and a great proponent of the Vatican II Council. His legacy is rooted in the tradition of the Polish Catholic Church as not just a spiritual, but also a political and social institution.

Wyszyński was born on August 3, 1901, in the small village of Zuzela near Łomża in northeastern Poland. He received his education in a seminary in Włocławek where he studied philosophy and theology and in the Lublin Catholic University from 1924 to 1929 where he obtained a doctorate in canon law. His dissertation was entitled "The Rights of the Family: The Church and the State in Relation to Schools." After his doctorate he received a scholarship and in 1929–1930 he studied the Christian social sciences in Italy, Austria, France, Belgium, Holland, and Germany. In 1931 Wyszyński was appointed to the

faculty of the Włocławek Seminary and served until the German–Polish War of 1939. During WWII he lived and worked near Warsaw and was briefly arrested by the Gestapo in October 1941. In 1946 he was elected the bishop of Lublin and in 1948 he was promoted to the metropolitan see of Gniezno and Warsaw. In May 1953 he was made cardinal and received the title of S. Maria in Trastevere in May 1957.

A skilled administrator and politician, Wyszyński managed to establish the relationship between the Church and the Communist government in post-WWII Poland. As the primate he navigated the Catholic Church in Poland through years of harsh restrictions mixed with short periods of a more liberal approach. He skillfully created a pragmatic approach to deal with the Communist government. His way of approaching the authorities was criticized by those who expected a much harder line from the Church. The proponents of Wyszyński's politics say that his resistance to communism saved the Polish Church and perhaps also the Polish cultural identity. The critics, on the other hand, say that Wyszyński accommodated the Communist government too much. His position toward the Communist government can be characterized by the concept of the limit of concession stated: "Non possumus"—we cannot yield any more—that

he formulated around 1953. His nonconformist position resulted in house arrest confinement from September 25, 1953, until October 28, 1956. During the period of martial law in Poland he was featured on stamps issued by the Wrocław "Fighting Solidarity" (underground issue).

Cardinal Wyszyński participated in conclaves in 1958, 1963, and 1978. He attended the Vatican II Council from 1962–1965 and was active in the works of the Council from 1967–1979. He died on May 28, 1981, and is buried in the metropolitan cathedral in Warsaw. His brother Stefan Franczak named one of his summer-flowering Clematis varieties of the Jackmanii species, "Kardynał Wyszyński."

## **YAHYA KHAN, AGHA MUHAMMAD**

Agha Muhammad Yahya Khan (1917–1971), was born at Chakwal in February 1917. His father, Saadat Ali Khan, was from Peshawar. Yahya received primary education from Chakwal and Peshawar and later joined the Punjab University. In 1938, Yahya Khan was commissioned in the Indian Army and joined the Indian Military Academy at Dehra Dun. During World War II, he performed his duties in North Africa, Iraq, and Italy. During the Indo-Pakistan War of 1965, he commanded an infantry division. In 1966, he was appointed Commander-in-Chief of the Pakistan Army, with the rank of General.

When Ayub Khan resigned in March 1969 due to massive agitation against his government, General Yahya Khan took power, declared a second Martial Law, and assumed the title of Chief Martial Law Administrator. He terminated the constitution and dissolved the National and Provincial Assemblies. On March 31, 1969, he became President of Pakistan, and on March 29, 1970, through an Ordinance, Yahya presented an interim constitution: The Legal Framework Order. Under the new constitution, in 1970 he held the first fair and free general elections in the history of Pakistan. Two parties won the elections: Awami League under the leadership of Sheikh Mujeeb-ur-Rahman swept 160 of 165 seats allocated to East Pakistan and Zulfikar Ali Bhutto's Pakistan People's Party emerged as the single largest party from Punjab and Sind and managed to win eighty-one National Assembly seats. Both parties failed to get even a single seat from any province of the country.

This split mandate resulted in political chaos, where neither Bhutto nor Mujeeb was ready to accept his opponent as the Prime Minister of Pakistan. In the circumstances, Yahya failed to transfer power to the majority party, and the situation became worse. The people of the eastern wing demanded autonomy, a demand that Yahya's government considered a challenge to the country's solidarity. His inability to manage the political situation led to the outbreak of civil war in March 1971. At that time, Yahya facilitated a secret trip of Henry Kissinger to Beijing in July 1971, which strongly disturbed the Soviet Union. As a result, the Soviet Union and India signed the Twenty Years Treaty of Peace, Friendship, and Cooperation on August 9, 1971, and declared war on Pakistan. During the war of 1971, the Soviet Union stood firmly with India and defeated Pakistan's allies, the United States and China together. Yahya, as President as well as the Commander-in-Chief of the Pakistan Army, failed to prevent war and protect the country. This ultimately resulted in the defeat of Pakistan, dismemberment of the country, and imprisonment of more than ninety thousand Pakistanis. The surrender of Pakistani forces without resistance and the fall of Dacca caused a plummet in Yahya Khan's popularity and authority. Thus, he was left with no other option but to hand over power to the leader of the minority party of the remaining part of Pakistan, Zulfikar Ali Bhutto, on December 20, 1971. Bhutto placed Yahya Khan under house arrest in 1972.

## YEMEN

The Republic of Yemen (ROY) was created on May 22, 1990, by voluntary unification of the Yemen Arab Republic (North Yemen, with its capital at San'a) and the People's Democratic Republic of Yemen (South Yemen with its capital at Aden). The merger went poorly and civil war broke out in 1994. Northern armed forces defeated the southern rebels and reunified the country. The political leader at this writing, President Ali Abdullah Saleh (b. 1942) is a cautious authoritarian modernizer.

The ROY occupies approximately two hundred thousand square miles of the strategic southwestern corner of the Arabian peninsula, commanding the narrow strait of Bab al Mandab at the mouth of the Red Sea. Yemen has three main regions: (1) a hot, arid strip along the Red Sea coast; (2) the central highlands, which receive enough rain to grow crops on steep, terraced mountainsides; and (3) the *wadis* (usually dry river canyons) of the eastern region. Temperature and precipitation depend on altitude. The capital, San'a, although only 15° N of the equator, lies at seven thousand feet elevation and so is pleasant even in the summer.

Yemen is isolated, densely populated, and very poor. Its 19 million people (2003 estimate) are Arabs by race, language, and culture, but tribal and religious cleavages generate internal conflict. Yemen faces serious political, social, and economic challenges, the most basic of which is to create a sense of patriotism. Almost all Yemenis are Muslim, but Shi'ites predominate in the north and Sunnis in the south. The Salafist movement, which preaches a return to life as lived by the Prophet in the seventh century, is believed to have a few thousand followers in Yemen.

Yemen's classical history serves as a foundation for modern nationalism. Most famous of the ancient Yemeni kingdoms was Saba (Sheba). Its wealth was

based on control of caravan routes that brought frankincense and myrrh from Hadramawt to the Mediterranean world. At various times, Yemen was controlled by Persians, Ethiopians, and Egyptians. Yemenis accepted Islam during the Prophet's lifetime. The Shi'ite Zaydi dynasty ruled San'a from the ninth century until 1962. The Turkish Ottoman empire claimed sovereignty over the whole region, but Yemenis have always given primary allegiance to their own tribal chieftains. Great Britain seized the port of Aden in 1839 but exercised only indirect control over the tribal hinterland.

A republican revolution broke out in North Yemen in 1962. For eight years, the country was wracked by civil war as Egyptian President Gamal Abdel Nasser sent troops to help the republicans while Saudi Arabia backed Yemeni monarchists. In 1977, Lieutenant Colonel Ali Abdullah Saleh, formerly the military governor of Ta'izz, declared himself the new head of state. In May 1983, the National Parliament confirmed Saleh as President for another five years. He won subsequent elections by disqualifying his opponents and remains firmly in power today.

South Yemen won independence from Great Britain in 1967 after a bitter guerrilla war. The Marxist leaders of the People's Democratic Republic of Yemen had constant internal conflict. When the Soviets ceased to subsidize them, they opened negotiations with Saleh for national unification.

President Saleh rules through a five-member Presidential Council with the help of his political party, the General People's Congress. The constitution vests legislative power in a 301-member House of Representatives, but President Saleh allows parliament very little real power. The press is best characterized as semi-free.

Yemen remains economically undeveloped. Only a few roads are paved. More than half the labor force is employed in agriculture—the chief crops being potatoes, wheat, barley, sorghum, cotton, coffee, and a wide variety of fruit. In recent years, much arable land has been given over to cultivation of *qat*, a mildly narcotic plant that is popular in Yemen. Pastureland is grazed by sheep and goats. Only 10% of the labor force is now employed in industry, but there are commercially exploitable deposits of iron ore, copper, gold, and other minerals. Hopes for economic progress center on oil deposits of unproven size. Yemen's considerable potential for tourism has been curbed by widely publicized kidnappings of foreigners and the presence of al-Qaeda operatives.

The central government in San'a is unable to control large areas of the country. Yemen's legal system is

based on a combination of British, Turkish, and Islamic (Shariah) law, and tribal custom. Yemen is awash with an estimated 60 million guns, three for every man, woman, and child. Tribal feuds and skirmishes are constant—some tribes even possess heavy artillery.

Education in Yemen is free through the primary and secondary levels, but the public school system is rudimentary, compared with that in more affluent countries. Only half the children of primary school age attend school and the adult literacy rate, particularly among females, is well under 50%. There are few rural clinics, and many tropical diseases are endemic.

Yemen's foreign policy tends to focus on a perceived threat from the Kingdom of Saudi Arabia. President Saleh leaned toward Iraq in the Persian Gulf War and the Saudis retaliated by summarily expelling all 750,000 Yemeni expatriate workers, whose remittances had made up a large part of Yemen's foreign exchange receipts. Yemen has been burdened with an influx of refugees from wars on the Horn of Africa. Foreign aid will be required for the foreseeable future.

The San'a government's inability to control its own territory has created opportunities for terrorist organizations. Al Qaeda is believed to operate training camps in the mountains near Sa'dah. In October 2000, al-Qaeda terrorists blew up the USS Cole in Aden harbor, killing seventeen Americans. After the World Trade Center attacks of September 11, 2001, President Saleh, who fears political Islamists, promised to cooperate with the United States in its war against terrorism.

## YUGOSLAVIA

### Location

Yugoslavia, "Land of the South Slavs," existed from 1918 to 2003 under three different names and two types of government. The Kingdom of the Serbs, Croats, and Slovenes, named Kingdom of Yugoslavia in 1929, existed from 1918 to 1941. It was followed by the Federal People's Republic of Yugoslavia established in 1946, which became the Socialist Federal Republic of Yugoslavia in 1963. In 1992, when four of its six constituents' republics seceded, the remaining part was renamed Federal Republic of Yugoslavia and lasted until 2003.

Located in southeastern Europe, Yugoslavia extended over half of the Balkan Peninsula. The borders were established in 1921–1925 and barely changed until 2003, except for the years 1941–1945. The total land area was 248,987 square kilometers in 1921 and 255,804 square kilometer in 1991. The country was surrounded by Italy, Austria, Hungary, Rumania, Bulgaria, Greece, and Albania and opened on the Adriatic coast.

The population, 11,984,911 in 1921, increased to 23,528,230 inhabitants, according the last census of 1991. World War II took a heavy toll of about 10% of the population between 1941 and 1945. Yugoslavia was home to a mosaic of people. Serbs, Croats, Bosnians, Slovenes, Montenegrins, Macedonians coexisted with numerous minorities, Albanian, Hungarians, Slovaks, Romanians, and others. Belgrade, the capital city remained the same under the different regimes.

### Land and climate

Yugoslavia was a country of contrasts. The Pannonian plain, its most fertile area extended from Hungary into North Central Yugoslavia (Vojvodina, Slavonia). The forests and highlands of the Dinaric Alps run northwest to south east and dominated the center and the west of the country. The Dalmatian coast, rocky narrows stripe stretched along the Adriatic Coast. The limestone ranges and basins of the Balkans Mountains distinguished the southeastern regions.

The main rivers were the Danube and its tributaries, the Sava, the Drina, and the Drava. The Morava and the Vardar valleys bisected South Serbia and Macedonia. Two major lakes, Prespa and Ohrid, are located in Macedonia along the Albanian border. The climate varied from Mediterranean along the Adriatic

## YUGOSLAVIA

coast to continental around Zagreb and Belgrade up to Sarajevo and Skopje with frigid winters and hot, dry summers.

### Origins to 1918

For centuries, the Yugoslav's lands had been occupied, divided, and influenced by political and religious outside powers: the Austrian, Ottoman, Russian Empires, and the republic of Venice. The South Slavs people were affected by their respective regime's main character: Strongly centralized under the Ottoman rule for the Serbs, while the Croats retained autonomy in the Habsburg Empire. Part of the South Slavs (Croats) became Catholic, while the majority chose Orthodoxy and the sense of church belonging left its print in the mentalities. Conversions to Islam occurred mainly in Bosnia-Herzegovina. The situation lasted five centuries until the decline of the Ottoman Empire and the development of nationalism after 1848.

The concept of Yugoslavia that is the unification of the South Slavs people into a joint state arose among Croatian intellectuals in Austria-Hungary. Ljudevit Gaj (1809–1872) and later Josip Strossmayer (1815–1905) defended the idea that South Slavs people were ethnically close sharing a similar language, but history has separated and placed them under foreign rule.

The Yugoslav State is born out from World War I. From 1914 to 1918, the Yugoslav cause gained an increasing support in Serbia and Croatia. Leaders in France and Great Britain also supported the union of the South Slavs in order to defeat Austria-Hungary. In 1917, Prime Minister Nicolas Pasic of the Serb government in exile in Corfu signed an agreement with Ante Trumbic of the Yugoslav Committee, defending the interests of the South Slavs in the Habsburg Empire. The text proclaimed the future union under Peter I Karageorgevic of Serbia, but this was more a declaration of intentions than a political program. In November 1918, delegates from the Croatian National Council representing the short-lived Croatian state signed a “memorandum” with Pasic and Trumbic, emphasizing the bonds among the South Slavs in Serbia, Montenegro, and those of the former Austria-Hungary. Finally, the Kingdom of the Serbs, Croats, and Slovenes was proclaimed December 1, 1918, in Belgrade.

### The First Yugoslavia 1918–1941

The First Yugoslavia was plagued by an open confrontation between its two main people, the Serbs and

the Croats; the former ruled the kingdom highly centralized around the government, while the latter expected the regime to become a federation.

On June 28, 1921, a new constitution was adopted despite the Croatian opposition; the same year, Alexander became King after Peter's death. The text strengthened the power of the royal government. The administration and the army were concentrated into the Serb's hands. The national institutions did not function properly, as the Croats boycotted systematically votes taken in the Parliament. As a result, clashes between Serbs centralists and Croats federalists occurred regularly, and most governments were short-lived. Nicolas Pasic, leader of the Serb Radical Party, dominated the political life until his death in 1926. Yugoslavia joined the “Little Entente” with Romania and Czechoslovakia in 1921–1922. Close to France, the alliance was formed to ensure the borders and to oppose the revision of the Paris peace treaties signed after 1918.

In 1928, the situation deteriorated as a Montenegrin opened fire in the middle of a parliamentary session. He fatally wounded Stepan Radic, head of the Croatian Peasant Party, the main political force against the Serbs party. The incident led to a complete rupture between the Serbs and the Croats. In January 1929, King Alexander established a dictatorship. The kingdom became formally Yugoslavia. In order to solve the national question, Alexander reorganized the country and local administration by breaking up the traditional historical units. A “Yugoslavian” national identity was supposed to replace the ethnic ones.

Opposition to Alexander rose sharply. In 1934, while on a visit to France, he was assassinated by Macedonian agent of the Croatian nationalist movement, the Ustachis (“rebel”). A Regency under Prince Paul tried to hold the country together while under pressure of Germany and Italy. Internal tensions were still more acute as the Croatian issue became untenable. Finally in 1939, only a few weeks before the war started, the government of Milan Stojadinovic agreed with Vlado Macek, leader of the Croatian Peasant Party, to establish an autonomous Croatian province that included part of Bosnia. The regime lasted until 1941.

On March 25, 1941, the Yugoslav government bowed to German pressure and signed an alliance with the Axis powers. Within days, a military coup occurred and the seventeen-year-old Crown Prince Peter was declared king. Less than two weeks later, Hitler's troops occupied Yugoslavia in eleven days. The Yugoslav lands were dismantled between Germany, Italy, Hungary, and Bulgaria. Croatia under the leadership of Ante Pavelic was proclaimed independent but, in fact, remained under the control of the German Reich.

## Yugoslavia in World War II

From 1941 to 1945, Yugoslavia was devastated by a double war. Armed resistance against the German occupation started immediately, as monarchists led by Colonel Draza Mihailovic and communists partisans around Tito (Josip Broz), supported by the USSR, set up two organizations that fought against each other as much as they fought against the Axis troops. A civil war raged with numerous massacres and atrocities on all sides as the Germans turned against the civilian populations.

In 1942, the communists set up the Anti-Fascist Council of National Liberation of Yugoslavia that would, one year later, become and act as a future national government (Congresses of Bihac and Jajce). Mihailovic's Chetnik ("armed bands") were supported by the government of Peter II in exile in London and by the British government. In 1943, the partisans won the support of the British-American forces, and by 1944, the partisans liberated the country from the foreign occupation.

## The Second Yugoslavia 1945–1992

In November 1945, national elections were held despite the opposition abstention, and the newly elected constituent assembly proclaimed a Federal People's Republic. The 1946 constitution, modeled after the Soviet constitution of 1936, established six constituent republics: Bosnia-Herzegovina, Croatia, Macedonia, Montenegro, Serbia, and Slovenia and two autonomous provinces within Serbia, Kosovo-Metohidja, and Vojvodina. In 1947, the Italian peace treaty awarded most of Istria, the eastern part of Venezia Giulia, Rijeka, and Zadar to Yugoslavia. However, a conflict over Trieste lasted until 1975 and ended with a partition agreement.

Until 1948–1949, Yugoslavia was a communist state close to the Soviet Union. A policy of agricultural collectivization, central planned economy, and forced industrialization was undertaken, and opposition was suppressed. The headquarters of the Communist Information Bureau (Cominform) that gathered communist parties under the Soviet leadership was established in Belgrade. However, on June 28, 1948, a crucial break-up between Stalin and Tito occurred as the Communist Party of Yugoslavia was accused of deviation from Communism and was ousted from the Cominform. In fact, Stalin had long been suspicious about Tito's loyalty and his growing independent ambitions in Southeastern Europe.

Tito began a new policy based on a balance between capitalism and communism. He received economic and military assistance from the West. In 1954, Yugoslavia signed a military defense pact with Greece and Turkey, both NATO members. Cordial relations resumed with the USSR under Krutchev in 1955. Tito created the Non-Aligned-Movement, gathering new states, mostly former European colonies, that wanted an alternative or a "third way" between the East and West.

In 1963, a new genuinely federal constitution was adopted and Tito became President for life. Communism was abandoned in favor of Socialism. However, a double-contradictory tendency emerged as further decentralization and reforms were granted to the republics, but the actual power remained in the hands of the Communist Party of Yugoslavia. Introducing a new economic policy of "self-management," councils of workers participated in the management of their companies.

Between 1968 and 1971, agitation and national question revived. Unrest appeared first in Kosovo where the large Albanian population demanded national and cultural rights. Then, in 1970–1971, Croatian intellectuals and students launched a series of manifestations asking for more autonomy. Tito crushed the movement called the "Croatian Spring," perceived as a national Croat opposition. However, the trend toward greater autonomy was pursued, and in 1974, the country's last constitution transformed Yugoslavia into an almost confederation. The Muslims became the six constituent people, while the central government continued to retain the political power. At the same time, the economy began to stagnate. After Tito's death in 1980, his successors were unable to maintain national unity or to undertake the drastic reforms as they clashed over the conflicting interests of their republics.

In 1987, a new leader emerged—Slobodan Milosevic—who began an aggressive campaign to reassert Serbian and communist hegemony over a recentralized Yugoslavia. As leader of the Serbian communist party, he limited the autonomy of Kosovo-Metohidja and Vojvodina and sent troops to Kosovo to suppress the protests (1988–1989). One year later, the disintegration process started, as in January 1990, the Slovenian and Croatian delegates walked away from the Congress of the League of Communist of Yugoslavia, one of the pillars of the Yugoslav regime. The conjunction of prosperity and revival of nationalism gave the Croatian and Slovenian leaders the strength to secede from Belgrade. Later that year, multiparty elections were held in each of the six republics. On June 25, 1991, Croatia and Slovenia declared independence, followed by Macedonia and Bosnia-Herzegovina in 1992.

The secession of the four republics was followed by three wars. The first one occurred in Slovenia in June–July 1991. The Slovenes were determined to secure their borders, and the conflict ended with the retreat of the Federal Yugoslav Army. The second one started in July 1991 in Croatia, in the Serbian-populated regions of Slavonia and Kraijna. Since the elections of the nationalist leader Franco Tudjman, the 12% Serb minority's rights have been restricted. Following Milosevic's orders, the federal army helped the Serbian militia fighting the Croats. The intervention of the United Nations in December froze the front, but the Serbs occupied 30% of Croatian territory until 1995. The third war erupted in Bosnia-Herzegovina in 1992, where Serbs fought first against the Croats and later against an "uneasy alliance Croats-Muslims" concluded under the US auspices. The siege of Sarajevo lasted until 1994. The leaders, Tudjman, Milosevic, and Izetbegovic alternatively fought against each other and negotiated the partition the country. Following the failed interventions of the European Union and the United Nations, the war ended with NATO bombing operations in 1995. The Dayton Agreement sponsored by Washington established that Bosnia-Herzegovina will consist of two entities: the Bosnian-Serb Republic (Republika Srpska) and the Croat-Muslims Federation.

### The End of Yugoslavia

The Federal Republic of Yugoslavia was born during the war in April 1992. It included Serbia and Montenegro as well as Kosovo and Voivodina. Milosevic, who became president in 1997, pursued his aggressive policy toward the Albanians in Kosovo. Tensions rose and battles erupted between a Kosovar guerilla army (KLA) and the Yugoslav troops. In 1999, NATO bombed Yugoslavia for more than two months. Since then, the province is placed under the administration of the United Nations (Resolution 1244). In September

2000, after his defeat in the presidential elections, Milosevic refused to yield power and massive demonstrations took place in Belgrade. On October 5, the regime collapsed. The opposition candidate, Vojislav Kostunica, became president and Zoran Djindic prime minister. Milosevic was arrested and on June 28, 2001, was extradited to the War Tribunal in La Hague where he was charged with genocide and war crimes.

After long and intense negotiations between Serbian and Montenegrins representatives, both parties agreed to establish a loose federal union of Serbia and Montenegro. After the proclamation of a new constitution, in February 2003, Yugoslavia ceased to exist and the name was erased from the European map.

## **ZAMBIA**

### **Geography, Topography, and Climate**

Landlocked Zambia is situated on the Central African High Plateau, with an average altitude of between 1,060 and 1,363 metres above sea level, and covers 464,937 square kilometres. The climate is moderate most of the year, though the river valleys are often tropical and very humid. Annual rainfall in the north averages 1,250 millimetres, while in the southwest, where Zambia borders the Kalahari, it averages 500 millimetres. The environment is favorable for growing crops, vegetables, and fruits in many parts of the country.

### **Historic Past and Current Economic Situation**

Zambia has been inhabited by humans for at least one hundred thousand years. The Bantu peoples, who now make up the bulk of the population, entered the country relatively recently. In 1889, the entrepreneur Cecil Rhodes obtained mining concessions from the Barotse

people and sent British mining specialists and farmers to the area soon thereafter. The territory was extended with the consent of the British government and ruled by Rhodes' "British South Africa Company" (BSAC). In 1924, the British government took over the administration of the colony, which was then called "Northern Rhodesia." The influx of white settlers, especially after World War II, led to the marginalization of many African peasants, since the white population took possession of the most fertile lands. The BSAC, and later the British government, levied taxes on Africans to force them to seek work in the mines. The development of the mining industry and Zambia's concomitant industrialization led to the transformation and urbanization of what previously had been a rural peasant society. The worsening situation of the African population after World War II led to protest and the formation of African political parties. Protests were furthermore triggered by a white-dominated confederation between Northern Rhodesia, Southern Rhodesia, and Nyasaland. Northern Rhodesia became independent in 1964 and was renamed Zambia. It was ruled by Kenneth Kaunda and his "United National Independence Party" (UNIP), most of the time as a one-party state. A long-lasting economic crisis provoked domestic pressure that eventually forced Kaunda to give way to a multiparty democracy in 1990. Elections in 1991 led to the defeat of Kaunda by Frederick Chiluba, chairman of the "Movement for Multiparty Democracy" (MMD), who was reelected in 1996. In December 2001, Levy Mwanawasa of the incumbent MMD emerged as the new president.

Although Zambia is blessed with mineral resources as well as waterpower and fertile land, it is largely dependent on revenues from its copper exports. However, low prices for copper on the world market, ineffective industrial enterprises, and an inflated public sector make Zambia one of the most heavily indebted countries in Africa. For the past decade, the country has been pursuing economic reform programs under the auspices of the International Monetary Fund (IMF) and the World Bank, which has resulted in the reduction of labour in the public sector and the privatization of state and parastatal industries like the giant “Zambian Consolidated Copper Mines” (ZCCM) and the “Roan Antelope Mining Corporation of Zambia” (RAMCOZ). Coupled with these policies is Zambia’s young labour force, which continues to grow. As a result, the unemployment rate is very high (50% in 2003). There is, however, no national strategy to tackle this problem. Real wages of the employees have continued to fall. The situation of the Zambian worker is aggravated by the rapid devaluation of the national currency against the US dollar and the attendant rise in inflation.

Gross domestic product per capita was estimated at \$800 in 2002; the labor force occupation in 2001 comprised agriculture (85%), industry (6%), and services (9%). The infant mortality rate total was estimated at 99.29 deaths/1000 live births in 2003. Life expectancy of the total population amounts to 35.25 years (2003). The country’s rates of HIV/AIDS are still great: the prevalence of the disease among adults was 21.5% (1.2 million people in 2001). In 2001, approximately 120,000 Zambians died of AIDS. The CIA factbook (2003) estimates that 80.6% of the total population aged fifteen years and older can read and write English.

### **Economic and Civil Development Since 1945**

In the late 1920s, extensive copper deposits were discovered in the Copperbelt, and by the late 1930s, about four thousand European and some twenty thousand African laborers were employed there. The Africans protested against the discrimination and ill treatment to which they were subjected with strikes in 1935, 1940, and 1956. The British authorities did not allow African trade unions but did organize self-help “welfare” groups, which brought together persons of diverse ethnic backgrounds. In 1946, delegates from these groups met in Lusaka and formed the “Federation of African Welfare Societies.” Up to that point, Africans were effectively excluded by the colonial administration from any political power: the Legislative Council,

the central political instrument of the Crown Colony, was left to whites only. In 1946, the British created the “African Representative Council,” which was filled by Africans. This council deserved its name, since its members had representative functions only, with no political power. Only from 1948 onwards were a few Africans allowed to sit in the Legislative Council. In the same year, the Federation of African Welfare Societies was transformed into the “Northern Rhodesia African Congress,” the first African political party of the colony.

From 1953 to 1963, Northern Rhodesia formed a federation with Southern Rhodesia and Nyasaland in order to create a political and economic British counterpart to the influence of Boer-dominated South Africa, to reduce costs for administration and to feed bankrupt Southern Rhodesia with Northern Rhodesian export revenues. Protests by Northern Rhodesian African leaders against the Federation were fruitless. In 1956, copper revenues, the main source of income for the Federation, dropped dramatically, and many miners lost their jobs. Many Africans stiffened protests against their barring from political and economic power. In 1958, members of the Northern Rhodesian African Congress founded the “Zambian African National Congress” (later UNIP). The new party, led by Kenneth Kaunda, took a much more radical anti-colonial line than did the Northern Rhodesian African Congress. On December 31, 1963, the Federation floundered, and in October 1964, Northern Rhodesia gained independence as the Republic of Zambia.

After independence, Zambia’s economy was relatively stable and prosperous, since the price of copper rose considerably between 1964 and 1970, and because the government had acquired mineral rights from the BSAC. In 1965, the government concluded projects for social services and education, and slowly the Africans started to dominate the upper ranks of the public sector while the whites dominated the economic sector for a while.

Although Zambia was dependent on railroad tracks and pipelines through neighbouring countries, which were ruled by white minority regimes, Kaunda made Zambia a “frontline state” against these regimes and granted refuge to members of South African resistance movements. As a result, Zambia was cut off from the routes through Rhodesia and Angola. China built a railroad from the Zambian copper belt to Dar es Salaam (Tanzania) instead. This railroad was opened in October 1975.

In 1969, Zambia began to nationalize foreign copper mines. However, in 1970, a harsh economic crisis hit the country, since revenues from the copper export fell, while the price for oil and other import goods increased. Dissatisfaction with Kaunda’s government

grew, which led to the fission of the “United Progressive Party” from UNIP under Simon Kapwepwe in 1971. Kaunda reacted by transforming Zambia into a de facto one-party state (in December 1972), intimidating the opposition and greasing opposition leaders with lucrative posts. He established a sophisticated patronage system, created jobs by inflating the bureaucracy, and kept the ailing urban population at bay by subsidizing food prices. This subsidizing program was financed at the expense of heavy debt burdens and squandered relief funds. The International Monetary Fund (IMF), one of Zambia’s main donors, in return put pressure on the government to cancel food subsidizing. In 1986, Kaunda agreed to stop it, but reestablished it in 1987, provoking the withdrawal of the IMF from the donor community. Kaunda’s second attempt to cancel food subsidizing in 1990 caused major upheavals, particularly in urban areas, which effectively put an end to his regime.

His successor, Chiluba, had promised economic and social reforms as well as a commitment to human rights. However, in terms of “good governance,” his status after two terms in office was negative, particularly with regard to economic reforms. Since the government believed that static development policies during the UNIP era were a major factor in creating the economic problems faced by the country and that any recovery would require the financial support of the IMF and the World Bank, they committed themselves to a hasty privatization of state enterprises. In urban areas, the opening of the economy to foreign investors has caused a high level of unemployment and an expansion of the informal sector. Although the government acknowledges that the agricultural sector should play the dominant economic role, its policies do not give it priority.

MMD’s governing policies are characterized by corruption and xenophobia. Opposition leaders are threatened with forced exile by denying them their Zambian citizenship. The discontent and aggressions of the growing army of impoverished Zambians are frequently directed towards the Asian minority and the 250,000 refugees in Zambia, mainly from Angola and the D.R. Congo.

## ZAPATISTA NATIONAL REVOLUTIONARY ARMY (EZLN)

### Background

On January 1, 1994, following years of clandestine work, a well-organized army of mostly Mayan Indians simultaneously occupied four towns in the southern state of Chiapas. The uprising was led by the Zapatista Army for National Liberation (EZLN), named after Emiliano Zapata’s famous guerrilla band of the 1910s. The revolt was timed to begin with the institution of the North American Free Trade Agreement (NAFTA), which Zapatista leaders thought would further erode their standards of living. The government overreacted by sending a huge contingent of soldiers into the region to suppress the revolt. Under internal and international pressure, former President Salinas agreed to negotiate, by using Catholic leaders as mediators. Ongoing negotiations have been periodically revived with successive Mexican governments without reaching a satisfactory conclusion.

### Causes of the Conflict

Despite being Mexico’s resource-richest state, Chiapas had suffered more poverty, government neglect, lack of basic infrastructure, and landowner abuse than did the rest of the country. A large percentage of the population is composed of descendants from Maya Indians who, over the centuries, have suffered from discrimination and whose demands for a fairer distribution of land and recognition of their basic human rights have been ignored. The decision to take up arms was finally prompted by the government’s attempts to revoke Article 27 of the Mexican

## ZAPATISTA NATIONAL REVOLUTIONARY ARMY (EZLN)

constitution, which protected communal land holdings administered by Indian communities (*ejidos*) from privatization.

### Aims

The Zapatistas have been described by Castañeda as “armed reformists” rather than revolutionaries. Unlike all other armed revolutionary movements, they have not sought to seize state power or become a political party. The armed uprising was part of a larger strategy to promote the struggle for land reform, democracy, and indigenous rights, and to force the government into the negotiating table.

### Structure of the Movement

One remarkable trait that distinguishes the Zapatistas from other armed movements is the subordination of the military to civilian leadership. The highest political body is the Clandestine Revolutionary Indigenous Committee (CCRI), composed of elected representatives from all the Zapatista communities. This body represents the collective decision making of the communities, since decisions are taken by consensus following extensive consultations and approval across communities. The same model of direct democracy applies at every level, from the autonomous municipalities to the local Zapatista communities, combining democratic principles with traditional indigenous assemblies.

### Achievements

Within the communities, the uprising had major consequences. One was the perceived need to redress traditional discrimination against women, which resulted in the Revolutionary Women’s Law. Another major gain was the creation of a partially liberated zone in part of eastern Chiapas, where thousands of Zapatista communities have carried out their own experiment in self-administration by following customary practices. Thus, the uprising instilled a newfound confidence and politicisation among the most marginalised sectors of Mexican society.

In February 1996, the parties signed the San Andres Accord. So far, only the first provision has been completed, recognising the autonomy of Mexico’s 10 million Indians and their rights to multilingual education.

Economic issues, such as control of natural resources and land redistribution, remain unresolved. The demand to demilitarise the indigenous areas in Chiapas is still to be met, but incorporative creative politics continues to flourish in the region.

### ZHOU ENLAI

Zhou Enlai (1898–1976) was born in Huai’an, Jiangsu, China, on March 5, 1898. Educated in China, Japan, France, Germany, and England, he belonged to the group of urbanised and cosmopolitan intellectual leaders of the Chinese Communist Party (CCP). He joined the Communist Party in France in 1921, returned to China in 1924, and soon became a prominent leader of the Chinese Communist movement.

He participated in the Long March (1934–1935), acted as chief liaison officer between the CCP and the Guomindang during the Sino-Japanese War (1937–1945), and became a follower of Mao’s political line in the early 1940s, starting with the Yan’an Rectification Campaign (1942–1945). After 1949, Zhou Enlai increasingly took over the role of handling the every day problems of Communist rule. The many speeches he made in his capacity as premier of the Chinese Communist government and leading member of the CCP reflect his ideas on questions of development in economic, political, and social terms his main concern being the necessity to overcome underdevelopment and poverty in order for China to reclaim its position among the most advanced nations of the world.

In the field of economics, Zhou Enlai first adhered to the Soviet Union model of socialist construction regarding the development of heavy industry as the most important task of the modernising socialist

state. At the same time, private entrepreneurs should be allowed to contribute under the regime of state capitalism to the well-being of society and economy by investing into the light industry. Agricultural production was supposed to gain momentum as a consequence of land reform and cautious collectivisation. He was convinced that China did not need the kind of large-scale state-run agriculture of the Soviet Union, but also believed in the enhancement of agricultural output with the help of a form of collectivisation that would conform with the peasants needs and wishes.

But in 1956 already, Zhou Enlai expressed his doubts about the Soviet model and started to reflect on the rearrangement of priorities in economic development. In this context, he repeatedly underlined the problems of a planned economy, but never lost hope in the possibility to accelerate development by planning on the basis of “seeking truth in facts.” As a consequence of severe problems arising during and after the Great Leap Forward, he finally agreed to regarding agriculture as the foundation of development, serving the light industry with the necessary products the production and consumption of which would provide the sector of heavy industries with the necessary capital. By this, he hoped to overcome the central problem of shortage of capital without having to rely on financial aid from the Soviet Union or other countries of the Socialist block. In terms of speed, this new setting of priorities would slow down the process of modernisation, but it would at the same time prevent the country from suffering under the kind of disproportionate growth it had gone through during the enthusiastic years of the Great Leap Forward. On the top of that, the Great Famine from 1959 to 1961 had shown that without focusing on agriculture, the newly founded People’s Republic would not even be able to supply its population with the necessary amount of grain.

Politically, Zhou Enlai stressed the necessity to integrate as many members of society as possible under the leadership of the Communist Party. Recurring to his experiences gained as head of the liaison office in Chongqing during the war against Japan (1937–1945), he was aimed at slowly convincing as many members of society, even those from so called “hostile classes,” to submit to the leadership of the CCP and contribute to the improvement of livelihood in China. Thus, he emphasized the length of the so-called transitional period and the necessity to allow for different forms of property rights to coexist.

As Zhou Enlai’s development strategies were focused on modernising China so as to enable it to catch up with the highly industrialised countries of the world, he was extremely concerned with mobilising

the intelligentsia for the cause of enhancing the education of the younger generation. He was convinced that China could join the countries with the highest standards in science and technology and strongly argued against anti-intellectualism. As early as 1956, he gave a speech on the role of intellectuals as well as of science and technology in socialist construction asking the whole nation “to march towards science.” After severe persecution and criticism of intellectuals during the Campaign against Rightists (1957–1958), Zhou Enlai used the period of readjustment during the early 1960s to reinforce his policies towards intellectuals, reiterating that the overwhelming majority of intellectuals were patriotic, progressive, and served socialism wholeheartedly, and should therefore be regarded as part of the working class.

It is mainly because of this focus of his modernisation strategy that Zhou Enlai is still acclaimed as a humane socialist without the personal ambitions of many intellectuals in the PRC. Stressing that without him, the economy in mainland China would have collapsed during the tumultuous early years of the Cultural Revolution (1966–1976), many who lived through the chaos of that period commemorate him as the saviour of the country. Zhou Enlai did not submit absolutely to Mao Zedong’s will during the years 1966 to 1976. However, while participating in “class struggle,” he laid the foundation of the reform policy Deng Xiaoping, his successor as premier of the PRC, would later promote as the “four modernisations.” Using his increased influence after the death of designated party leader Lin Biao, Zhou Enlai spent the last years of his life attempting to redefine China’s role in international politics and prepare the ground for the modernisation of agriculture, industry, national defence, science, and technology. He died on January 8, 1976.

**ZIA UL-HAQ, MUHAMMED**

Muhammed Zia ul-Haq (1924–1988) was born on August 12, 1924, at Jalundhar. He was the eldest son of Muhammad Akram, a teacher in the British Indian Army. Zia received his early education in the Government High School Simla and obtained a B.A. Honours from St. Stephen's College (Delhi). He joined the British Army in 1943 and served in Burma, Malaya, and Indonesia during the World War II. At the time of independence of Pakistan in 1947, Zia joined the Pakistan army as a major. In 1963–1964, he went to the United States for a training course in the Commander and Staff College. During the Indo-Pakistan war of 1965, he acted as the Assistant Quarter Master of the 101st Infantry Division, which was posted at Kiran sector. Zia was posted to Jordan from 1967–1970, where he was an instructor in the Jordan military academy. In 1975, he was appointed as Core Commander of Multan, and in 1976, Prime Minister Zulfikar Ali Bhutto appointed him Chief of the Army Staff. In July 1977, he overthrew the democratically elected Bhutto government due to the political uncertainty and declared martial law for the third time in the brief history of Pakistan. Bhutto was imprisoned by Zia's government and was charged with conspiring to murder a party colleague; in April 1979, he was hanged by Zia's military regime. Zia promised to hold elections in the next ninety days, but in 1977, he postponed the elections and decided to start an accountability process for politicians. He established a Disqualification Tribunal that disqualified many politicians during the next seven years.

On September 16, 1978, after the retirement of President Fazl Ellahi Chudhary, Zia assumed the office of President and announced a Nizam-e-Mustafa (Islamization) programme. In 1979, Zia joined the Non-Aligned Movement and also joined the US partnership against the Soviet invasion of Afghanistan in December 1979. The Afghan war enabled Zia to continue martial law and legitimised its military regime. His government received \$3.2 billion and \$4.2 billion in economic and military aid from the United States. The US administration and the Congress waive the Symington amendment and make an exception regarding Islamabad's nuclear programme. Thus, Zia's government's clandestine efforts successfully achieved nuclear weapons capability and produced weapons-grade uranium. In 1980, he introduced a 284-member Majlis-i-Shura (nominated by the president) as an advisory council for the president. In 1985, Zia was declared President through a dubious referendum, amended the constitution, and institutionalised the supremacy of the military in decision-making by the

inclusion of the three chiefs of staff in the National Security Council.

In 1985, Zia announced elections on a non-party basis, and the major political parties boycotted them. The results showed that many victors belonged to local, regional, ethnic, and religious parties. Zia nominated Muhammad Khan Junejo as the prime minister from among the members of the assembly. But before handing over the power to the new government, he introduced the eighth amendment under which the president had the right to dissolve the elected assembly. These measures were endorsed by the parliament before Zia lifted the state of emergency in the country in 1986. On May 29, 1988, he dissolved the National Assembly and removed the Prime Minister under article 58(2)B of the amended constitution due to differences on the issue of parliamentarians' freedom and decision to sign the Geneva Accord (April 1988). Zia again promised to hold elections within ninety days, but before any decision, he died in an air crash near Bahawalpur on August 17, 1988. Zia-ul-Haq was buried in the premises of Faisal Mosque (Islamabad), and later the country celebrated the rule of democracy.

**ZIMBABWE**

Zimbabwe in southern African has a landlocked area of 150,804 square miles, with South Africa, Botswana, Zambia, Malawi, and Mozambique as neighbors. Its 2003 population was 12,890,000 but decreased to an estimated 12,671,860 (CIA) in 2004 due to the HIV/AIDS crisis. By 2050, Zimbabwe's population could fall to 12,658,000 if present trends continue. The United Nations estimates that 34% of the adult population is infected by HIV/AIDS. Another report cites life expectancy as 40.1 years for Zimbabwe

males; 39.7 years for females. But a United Nations (UN) Human Development report places life expectancy at 32 years, compared with 50 years three decades ago, for the Southern African states of Zimbabwe, Zambia, Malawi, Swaziland, Mozambique, Lesotho, and the Central African Republic.

Zimbabwe's largest cities are Harare, the capital, with a population of 1,868,000, and Bulawayo, with 824,000 inhabitants. Approximately 24% of Zimbabwe's workers are employed in service industries. Schooling is compulsory for ages five to 12; literacy is 90.7%. Religion is a syncretic mix of Roman Catholic, Protestant, and traditional African beliefs. African-led churches, often with a mix of charismatic or pentecostal emphases, are increasing.

Nearly two-thirds of Zimbabwe's people live in rural areas, where only 7% of the land is arable. Thus, most rural people are subsistence farmers who depend on irregular rainfall to produce maize, and cotton, tobacco, wheat, coffee, and cotton. Livestock was estimated at 5.70 million in 2002.

South African whites took the arable land from Zimbabwe's Bantu and Ndebele population in 1890. Cecil Rhodes invaded in order to extract mineral resources: gold and diamonds. Zimbabwe also had nickel, copper, chrome, veradium, tin, and platinum.

Eighty-two percent of the natives are of Shona-related ethnic groups; 14% are Ndebele-speakers.

Before Rhodes' British South Africa Company (BSAC) arrived, Shona and Ndebele (a Zulu tribe from the South) ruled Zimbabwe. Portuguese traders and Roman Catholic missionaries had visited from Mozambique long before Rhodes had established his diamond trade in South Africa in 1880. In 1890, Rhodes and his Pioneer Column defeated the Shona and established Fort Salisbury. Rhodes detested African culture and stole African land and minerals after he got Ndebele King Lobengula to sign a phony treaty. Queen Victoria ceded political control of Mashonaland and Matabeleland to the BSAC, which ruled "Rhodesia" from 1890 to the 1920s. Rhodes gave three thousand acres to white pioneers and allowed white farmers and miners to rule.

British and other whites brought capitalism, imperial rule, and Christianity to Zimbabwe. Rhodes awarded grants to missions to impose "Christian" culture in subsidized schools, clinics, and churches. The BSAC granted land and stipends for missionary teachers and doctors. Christian culture included religion, Western dress, marriage customs, English language, and deference to whites. They rechristened the landscape with Christian names. The BSAC and Christian missions married acquisition of wealth to imperialism and faith.

A scramble for African land involved carnal and religious interests that became so intertwined as to be almost indistinguishable. Their interests were to transform African culture and to dominate its people. Africans would become forced laborers in mines and on farms, and they would be transformed into believers with European habits and often Christian names. They would abandon African religious rites for European beliefs.

Professor C. J. M. Zvobgo argues that Christian missions shared two beliefs with Rhodes' BSAC. As a result of early London Missionary Society (LMS) and Jesuit experiences, missionaries believed that success in converting the "heathen" to the Christian ways depended on breaking Ndebele power by force. They argued that the Ndebele were masters of the Shona. The missions were indebted to Rhodes for mission land grants and were willing to support use of force to maintain BSAC rule. By 1925, the BSAC had given missions 325,730 acres, mostly without permission of African chiefs.

Rough white South African miners had little interest in religion. Their interest was in material wealth. Thus, most missions turned to work among Africans when BSAC offered land grants. Few missionaries raised issues of BSAC land confiscation, hut taxes, and forced labor from Africans. And few missions sought African advice on health, education, or church policy. Paternalism held that Africans were incompetent in management matters. On the whole, deaths of whites were seen as "martyrdoms," with no connection to their theft of land or denial of African cultural/political self-determination.

In 1923, white settler government replaced BSAC rule, and in 1965, Ian Smith's settler government unilaterally declared independence from Britain and established a minority white-ruled "republic" to deny the vote to the majority African population. In the early 1960s, Africans had begun to organize guerrilla forces to fight for independence. Warfare lasted until the British negotiated a settlement in 1979. Patriotic Front leaders Robert Mugabe and Joshua Nkomo gained one-person-one-vote democracy and renamed the country Zimbabwe. The new African state was recognized by the United Kingdom, United States, and United Nations. UN sanctions, supported by a World Council of Churches' (WCC) Program to Combat Racism and work of international relief agencies, combined with weapons from Asia and Eastern Europe, helped bring Prime Minister Mugabe's multi-party government to power in 1980.

African and white political parties and white and African churches chose sides in the war. Irish Presbyterians, the Reformed Church, and Salvation Army broke with the WCC over humanitarian grants to the

“Marxist” insurgents. Zimbabwe’s war became an extension of cold war politics for American and British conservatives. But when war ended, Mugabe’s Shona army engaged in a brutal civil struggle with Nkomo’s Ndebele. Later Mugabe sealed an alliance with the Ndebele wing of the Patriotic Front that held to the early twenty-first century in spite of Mugabe’s increasingly autocratic rule.

After a period of peace and relative prosperity under President Mugabe, Zimbabwe experienced political instability and economic crises in the 1990s. Joining a civil war in Zaire (Congo) squandered Zimbabwe’s capital. Inflation reached 900%. Whites emigrated due to attacks on their property by Mugabe’s veterans of the independence war. U.K. and US funds for land redistribution to Africans did not arrive to restore land to Africans. And an HIV/AIDS epidemic broke the spirit of Zimbabweans.

It remains to be seen whether President Mugabe will step aside at the end of his present term and permit a democratically elected government to succeed him. When that occurs, land reform may proceed by legal due process and the international community may offer assistance. In the meantime, Zimbabwe may find a way to heal itself and capitalize on its wealth and cultural heritage.

## ZIONISM

Zionism is a much-maligned concept in the developing world. The word is often misunderstood, and in recent years, has taken on meanings that would not likely be embraced by its originators.

Traditional Zionism may best be defined as “Jewish nationalism.” In essence, the early Zionist movement’s primary goal was to create a Jewish national

homeland in Palestine and to reconstitute Jewish sovereignty over what was the biblical Land of Israel.

While the movement successfully achieved its primary goal with the creation of the State of Israel in 1948, it was simultaneously responsible for displacing and disenfranchising the existing residents of the region, namely the Palestinian Arabs. As a result, Zionism remains a controversial movement, particularly, though not solely, in the Arab and Muslim worlds.

## The Origins and Evolution of Zionism

The father of the modern Zionist movement, Theodor Herzl (b. 1860), was a secular European Jewish writer, thinker and visionary who, in 1896, wrote the book *Judenstaat* (“The Jewish State”). The book’s thesis suggested that the solution to the problem of Jews living as insecure, threatened, and weak minorities in the lands of Europe and elsewhere (the Jewish Diaspora) was the (re)creation of a Jewish homeland in Palestine, with Jerusalem as its political and cultural capital. There, Jews could run their own affairs and determine their own destiny in a safe refuge free of anti-Semitism and other hatreds and dangers.

The First Zionist Conference met a year later, in 1897. Its purpose, and the purpose of succeeding Zionist conferences and meetings throughout the early twentieth century, was to encourage *aliyah*, mass Jewish migration to Palestine. Upon arrival, Jews from throughout the world sought to develop social, economic, and political structures that would facilitate eventual independent statehood. These structures included the creation of mechanisms to acquire and settle the land, to build cities and communal agricultural settlements (*kibbutzim* and *moshavim*), to create a governance structure, and to create and adopt a new common language, *Ivrit*, that is, Modern Hebrew. The Jewish community at this time became known as the *Yishuv*, and its governing structure was known as the World Zionist Organization, later to become the Jewish Agency during the British Mandatory period.

## Anti-Zionist Sentiment in the Developing World

From its earliest beginnings, the actions and ideas of the Zionist movement were opposed by the Palestinian Arab residents of the region, by other Arab and Muslim communities, and by other countries and

groups around the world. Many saw Zionism as a form of European colonialism and imperialism under Jewish guise.

The 1917 Balfour Declaration declaring “sympathy with Jewish Zionist aspirations” marked a significant moment in Zionist history, as a major power, the United Kingdom, openly expressed support to the movement’s cause. And yet, throughout the British Mandatory period in Palestine (1917–1947), local Arabs used both diplomatic and at times military means in an attempt to discourage Jewish immigration to Palestine. The mid-1930s was an especially notable period of Arab unrest against the Jewish presence in Palestine, which ultimately contributed to the issuance of the British White Paper of 1939 that placed limitations on Jewish immigration to the region.

This was a partial victory for the Palestinians, but it was a short-lived success. The end of World War II and the revelation to the world community that millions of Jews had been slaughtered in Adolf Hitler’s concentration camps drew sympathy to the Zionist movement and its goals. This sentiment came to a head when, in late 1947, the United Nations Special Committee on Palestine put forward a partition plan to create a Jewish state alongside an Arab state in post-colonial Palestine.

The Arab community rejected the plan. Soon thereafter, on May 14, 1948, the Jews of Palestine unilaterally declared the creation of the new State of Israel, which was quickly recognized by the United States, the Soviet Union, and other key global powers. Neighboring Arab states did not accept Israel’s existence, however, and initiated a war the following day. The war, which Israelis refer to as their “Independence War,” was won handily, though there were numerous casualties on both sides. The war only further harmed Palestinian interests, as the Zionist claim to Palestine was formalized and consolidated.

And yet the Arab states, the Palestinians, and others who saw the Zionists and their cause as illegitimate, if not illegal, continued to fight for its eradication from Palestine. After years of activity both within the Middle East and around the world, the anti-Zionist movement achieved a diplomatic victory. In November 1975, the United Nations (UN) General Assembly issued Resolution 3379, a proclamation that effectively condemned Israel’s very existence and equated Zionism with racism.

In part, this argument was premised upon the nature of Israel’s “Law of Return,” a centerpiece of Zionist ideology. The law states that a Diaspora Jew may “return” to Israel as an Israeli national, with the full rights that status offers. Non-Jews, on the other hand, cannot effectively achieve this status (although

they may be citizens of the state; nearly 20% of modern Israel’s citizens are non-Jews), regardless of their birthplace.

Only in December 1991—sixteen years later—did the UN retract this resolution with Resolution 46/86. Some Arab and Muslim states, as well as Cuba, North Korea, and Vietnam, expressed their opposition to the repeal of the 1975 resolution.

## Zionism in the 21st Century

The UN World Conference Against Racism in Durban, South Africa, in September 2001 brought the issue of Zionism to the fore once again. Resolution draft language again equated the movement with racism, suggesting that it is “a new form of apartheid” which is inherently discriminatory and based on racial superiority. Protests against this language from the United States, Israel, and other parties were responsible for its eventual removal, and the final draft document made no mention of Zionism in this context.

That said, Zionism remains a controversial movement throughout the developing world and is typically equated with the imperialistic and racist ideologies that fueled the European colonial enterprise throughout Asia and Africa during the eighteenth and nineteenth centuries. Thus, the word “Zionist” often is used as an epithet against those, Jewish or not, who are seen as acting against the interests of Third World peoples.
