Tripoli is the capital of Libya. The nation's socialist-oriented legacy and heavy reliance on the oil sector characterize the nation's economy. The oil sector represents approximately one-fourth of its GDP. The nation's relatively small population (five million) matched with large oil revenues allow for a high per capita GDP (\$6,400), second only to that of Tunisia (\$6,900). Nonetheless, unequal distribution of oil wealth and high unemployment (30%) still plague the nation's economy. Libya's poor soil conditions and severe climate restrict agricultural production, and as a result the nation must import three-fourths of its food. Like other nations of North Africa, Libya has taken steps to reform the economy, while political thawing of its foreign policy in recent years has resulted in the UN-lifted sanctions in 2003 and a US move toward normalized relations in 2004.

With Rabat as its capital, approximately one-fourth of Morocco's economy is agriculture-based. Morocco produces grains, citrus, wine, olives, and livestock. Industry accounted for 36% of the economy,

producing phosphates, food, leather goods, and textiles. Morocco exports clothing, fish, minerals, fertilizers, and petroleum products. Services represent 42% of the nation's economy, and its per capita GDP is \$4,000. Morocco underwent structural adjustment programs—supported by the IMF, World Bank, and Paris Club—and partially privatized the state tobacco company and telecommunications company recently. Morocco also signed a Free Trade Agreement with the United States in 2004, and is seeking to attract foreign investment in an effort to improve the economy and provide jobs.

### The Role of Human Development

Economic development in North Africa is inextricably linked to human development. Issues of public education, social and political freedoms, labor markets, gender equality, and human capacity represent dimensions of North African society that impact development in the region. Past experience in the region has demonstrated that investments in industrial infrastructure and fixed capital alone—such as factories and equipment—do not provide the expected social returns. According to the 2002 *Arab Human Development Report*, human development in the Arab world is suffering from three deficits: Freedom, women's empowerment, and human capacity/knowledge relative to income. Regarding freedom, the region scores the lowest in the world. Popular voice in political processes, civil liberties, political rights, and independence in the media are all lagging behind most of the world.

One of the biggest challenges in North Africa is finding effective means to build human capital in such a way that will translate into a productive society that can compete in the twenty-first-century context of globalization. At the very foundation of the human capital-building effort lies education. Strides in the expansion of education have been made in the past thirty-five years. Primary education enrollment reached approximately 90% for boys and 75% for girls a decade ago. Over half of secondary-school-age children are enrolled in school while tertiary enrollment is among the highest in the developing world. Over the past three decades, literacy has expanded significantly. Between 1960 and 1995, illiteracy rates were cut in half while female literacy increased threefold in the Arab world.

Despite these successes, the quality of education in the Arab world is still poor. Many children continue to lack access to basic education. In 2000, enrollment for girls in Morocco was only 45% while class sizes in

some rural regions averaged more than forty-five students. Across the region, enrollment in higher education is on the decline, and public expenditures on education have decreased since 1985. Adult illiteracy is still high, with female illiteracy rates the most extreme. North Africa's two largest countries, Morocco (32 million people) and Egypt (76 million people), suffer the lowest literacy rates of men and women over the age of fifteen: 52% and 58%, respectively. Only 34% of Moroccan women can read and write compared with 47% in Egypt. Algeria, also with a population of about 32 million, has a literacy rate of 70% (61% for women), while 74% (64% for women) of Tunisians and 83% (72% for women) of Libyans can read and write.

Aside from mechanical indicators of educational achievement, such as enrollment, completion, and literacy, a more pragmatic issue haunts the region: lack of relevant education. A huge disconnect exists between products (graduates) of Arab education systems and realities of the labor market. In Egypt, the education system does not prepare the average graduate for prospects of increased earnings in the labor market. Parents who allow their children to abandon education at early stages in the Arab world commonly cite school's lack of relevance to their child's future. In a rapidly changing environment of globalization and accelerating technology, existing education systems have been slow to react. Effective links between education and training systems, and realities of the labor market have yet to be established. To address the information gap, the 2002 *Arab Human Development Report* recommended attitudinal changes in knowledge-acquisition strategies, including a greater respect for science and knowledge, greater creativity and innovation, and the application of new discoveries to increasing productivity and income.

Education, economy, and politics are mutually dependent, and therefore the need for education reform is tied to economic and political reform. Improvements in education must prepare students with the technical skills to compete in the labor market while simultaneously developing a workforce that can make economic and political achievements that place a nation in position to compete in an environment of globalization. Equally important as the provision of technical skills, the responsibility of providing the capacity to solve problems, think critically, and demonstrate the cooperation needed to build democracy and civil society falls to education systems.

In many ways, knowledge production and dissemination is stagnant in North Africa. With the exception of Algeria, gaps in scientific knowledge are represented by low enrollment in scientific disciplines

in tertiary education. Scientific research and development (R&D) also suffers, while advanced research in information technology and molecular biology is almost nonexistent. Public and private investment in R&D is extremely low, while state spending in R&D barely covers salaries. The number of scientists and engineers who work in R&D in Arab countries is slightly more than one-third of the global rate. Half the full-time researchers in the Arab world work in Egypt, and women are severely underrepresented in R&D. Research conducted in institutions often lacks a clear objective. In recent years, some effort has been made in North Africa to link a number of research projects conducted in institutions of higher education and research centers to the realities of Arab society. Egypt, Algeria, and Tunisia stand out as having the highest number of independent research centers in the Arab world.

Information production through the written word is also dangerously low in the region. While translation from foreign languages serves as a solid medium for information sharing, communication with the rest of the world, and cutting-edge advances, the number of books translated into Arabic in the first five years of the 1980s was slightly more than four books per million people as compared to 519 books in Hungary and 920 in Spain. Given the paucity of translated materials, a lack of clearly-defined policies regarding foreign language instruction within education systems has failed to bridge the gaps. In the postcolonial milieu of North Africa, efforts at Arabization have faced the realities of the prominence of the French language in government school curricula. Still, Algeria begins teaching French only at third grade, while Tunisia and Morocco begin French language instruction at fourth grade.

Access to books is another shortcoming. Although Egypt is one of the two hubs of book production in the Arab world (Lebanon being the other), as a whole Arab countries only produced 1.1% of the world's published books while constituting 5% of the population. Censorship often hampers book production and distribution. Of the total number of published works, 17% of the books are on religion—over three times the number for other parts of the world.

Access to other sources of information and media is also among the lowest in the world. Only fifty-three newspapers were produced per thousand people—less than one-fifth the rate of other developing countries. While limited access to the written word can be partially linked to low literacy rates, there are other indications of sluggish or stagnant development. For instance, there are five times as many telephone lines in other developing nations as there are in the Arab world. In addition, only 1.6% of the Arab population

has access to the Internet, and there are only eighteen computers per one thousand people—about one-fourth the global average. Ratios of televisions are also low in the region. Compared with 641 televisions per one thousand people in high-income nations and 275 for middle-income nations, Tunisia has 198 per thousand people and Egypt but 189.

Lack of gender empowerment in Egypt, Tunisia, Algeria, and Morocco is also an obstacle to development. While advances have been made in education for females, particularly in higher education, women's participation in political organizations is still lagging well behind. Politically, women are underrepresented. Few women are found in parliaments and cabinets. In economic terms, women also fare poorly. Arab society as a whole suffers from lower family incomes and standards of living because women do not receive their full legal and citizenship entitlements. Gender inequality is apparent in the workforce as evidenced in employment status, wages, and gender-based occupational segregation. In Tunisia, some progress in bridging the gender gap has been attributed to progressive government initiatives taken in the 1950s, including the adoption of a more liberal interpretation of Islam.

Existing shortcomings in economic and human development have created a labor market in which job creation has been unable to keep pace with the expanding workforce in some cases. Libya's unemployment rate is approximately 30%, Algeria's 26%, Morocco's 20%, Tunisia's 14%, and Egypt's 10%. During the 1990s, Egypt and Tunisia actually experienced slight declines in unemployment as job creation outpaced expansion of the workforce. Algeria, on the other hand, registered the largest increase in unemployment during that period. Job seekers, including an increasing number of women, entered the labor force at a quicker rate than employment opportunities were created. The introduction of pro-employment programs also encouraged more entrants into the job market. In Morocco, urban unemployment drove a slight increase in the jobless rate for the 1990s.

Large public sectors in North Africa serve to absorb workers and offset unemployment. Non-agricultural, public-sector employment in Morocco is 21%, Tunisia 28%, Algeria 39%, and Egypt 70%. Large, sluggish bureaucracies, however, traditionally discourage productivity and efficiency, and serve as a constraint to economic development. Egypt's large agricultural and public sectors contribute to low productivity while Tunisia enjoys the highest in the region.

The bulging youth demographic across North Africa presents further challenges to development

through an increased strain on the education systems and economies in a variety of ways, including a higher demand for jobs and public services. Approximately one-third of the population is age fifteen and under. Over the next decade and a half, the population aged fifteen and above will continue to increase at about 2.5% per year. Unemployment rates are highest among first-time job seekers, particularly secondary school graduates. In Morocco, some 40% of college graduates fail to find jobs. Shortcomings in the education systems often prepare graduates for highly coveted public-sector jobs but poorly prepare them for the private sector. Much has been written about the connection between the shifting demographics, disenfranchised youth, unemployment, and Islamic militancy in the Arab world. Future development efforts in the region will necessitate strategically designed programs that nurture the employability of Arab youth.

North Africa faces considerable development challenges over the next decade. Meaningful success will rely on economic, political, and education reform that is carefully crafted in such a way to develop and utilize human capital to meet the needs of the evolving global economy of the twenty-first century. Issues of youth employability, gender empowerment, and relevant education lie at the center of the long-term development strategies.

(Note: The views expressed in this essay are solely those of the author and do not reflect official positions of the US Department of Labor.)

### NORTH AFRICA: INTERNATIONAL RELATIONS

The North African states are Algeria, Tunisia, Morocco, and Libya. The first three are also commonly known as the Maghreb, or Maghreb, countries—the Arabic term for North Africa. This definition actually pertains only to the area between the high ranges of the Atlas Mountains and the Mediterranean Sea. In 1989, Algeria, Libya, Mauritania, Morocco, and Tunisia established the Arab Maghreb Union (UMA) to promote cooperation and integration among the Arab states of North Africa. Often, therefore, the term "Maghreb" includes Libya and Mauritania. During the colonisation period, Algeria, Tunisia, and Morocco shared a common history as French colonies that had been influenced by French culture and political values. Libya was an Italian colony from 1912 to 1951 and was influenced by Italian culture and politics.

Two factors have shaped the international relations of North African states: decolonisation and the relations of the various states with each other. At the end of World War II a growing resentment toward colonial powers characterised all North African states. The upsurge of Arab nationalism, coupled with the establishment of the Arab League (1945), motivated the North Africans to oust colonial powers from their countries. The subsequent struggle for independence, which marked the decolonisation process in the Maghreb states and Libya, shaped North African states' domestic and foreign policies. Despite their geographical homogeneity and cultural similarities, each of the Maghreb countries developed its own unique political identity, which in turn influenced its international relations. Morocco and Tunisia embarked on a moderate path, while Algerian politics have been characterised by radicalism. Libya has likewise embraced radicalism. Territorial disputes and

political rivalries amongst the North African states themselves have also influenced their domestic and foreign policies.

## Morocco

Morocco, a French protectorate since 1912, gained its independence in 1956. France at first strongly resisted the nationalist movement and, in 1953, exiled Sultan Mohammed V after he had joined forces with the nationalists and refused to cooperate with the French government. France tried unsuccessfully to make Thami al-Glaoui, the Berber Pasha of Marrakech, into the new ruler of Morocco. In 1955, facing growing social unrest all over the country, France allowed Mohammed V to return. Although this was a great victory for the nationalist movement, it did not quell the unrest. By November 1954, violent uprisings in neighbouring Algeria, coupled with widespread Marxist insurgency in Southeast Asia, induced France to abandon its struggle against Moroccan nationalists. In March 1956, Morocco became officially independent under the leadership of Mohammed V. Spain followed suit the following April, handing over most of the Moroccan territory that it had colonised.

Relations between Morocco and France were initially tense because the French government maintained a military presence in Morocco. It was only in March 1961 that France withdrew its troops and vacated its military bases. Another bone of contention was the issue of private property owned by the French and European settlers who had left Morocco after independence. The issue of compensation was finally resolved on August 2, 1974, when the Moroccan government agreed to pay the French government a lump sum to compensate the owners for the loss of their properties.

After a difficult start, relations between Morocco and France gradually improved. France, which had envisaged enjoying a special relationship with the Moroccan government, became frustrated when this expectation failed to materialise. Although cultural and commercial ties remained strong (e.g., French language continued to be part of the school curriculum), politically Morocco never granted France special status. France's hopes of entertaining a privileged relationship with Morocco were part of an overall strategy to maintain a strong influence in North Africa, primarily for geopolitical reasons. For example, the North African air corridor was France's gateway to Africa and Paris was determined to ensure that this access was free from any hostile influence.

French interests in North Africa more recently have taken on a predominantly economic focus, for example, securing access to the oil and gas fields of the region (mainly in Algeria) and to North African importers—France's key export partners. Tensions between Morocco and France have become confined to the issue of immigration. Legal and illegal Moroccan immigrants cross into France almost daily. This phenomenon creates ongoing social tension inside France, where significant sectors of society resent North African immigrants. Immigrants consequently feel marginalised and excluded. Attempts to solve this problem have so far had limited success.

Relations with Spain have been equally important for the Moroccan government, because of the close historic ties between the two countries. Spain at one point controlled most of the North African coast, from Tangier to Tunis. There has been an ongoing territorial dispute between the two countries over five small Spanish enclaves—Ceuta, Mellila, Penon de al-Huceima, Penon de Velez, and Islas Chafarinas—on the Moroccan Mediterranean coast. Both countries claim sovereignty over these enclaves. Spain has on the whole kept a low profile in its relations with North African countries, trying to downplay its colonial past and emphasising its economic interests in the region. It was one of the major players in the early phases of the Western Sahara dispute, attempting to mediate between Morocco and Algeria (see below). Morocco's relations with Algeria were initially marked by cooperation; for example, Morocco supported Algeria's war of independence from France. However, relations between the two countries deteriorated over a territorial dispute concerning Mauritania. This dispute motivated Morocco to join the "Casablanca bloc"—a somewhat nebulous radical anti-Western union of Egypt, Ghana, Guinea, and Mali (formed in 1961).

Since independence Morocco has generally adopted a moderate, conciliatory, and pro-Western foreign policy, becoming a member of the United Nations in 1956. Despite establishing diplomatic relations with the USSR and China in 1958, the conservative monarch Mohammed V never sought a close relationship with communist countries. In 1960, however, he requested—and obtained—arms from the Soviet Union, and officially recognised North Vietnam in 1961. Morocco has also looked toward the United States. In general the United States perceives Morocco as a political asset in the region because of its moderate policy toward the Arab-Israeli dispute. Morocco has endeavoured to mediate between the Israelis and the Palestinians. In 1986 King Hassan II took the daring step of inviting Israeli Prime Minister Shimon Peres for talks, thereby becoming the second

Arab leader, after Anwar Sadat, to host an Israeli leader. Morocco has also taken a strong stand against Islamic radicalism and terrorism. One result of the diplomatic dialogue between the United States and Morocco was the signature, in June 2004, of a comprehensive bilateral Free Trade Agreement (FTA)—only The United States' second such treaty with an Arab country (the first being with Egypt).

## Tunisia

Tunisia, a French protectorate from 1881, gained independence from France in 1956. On July 25, 1957, the National Assembly overthrew the last vestiges of the monarchy by deposing the Bey, proclaiming Tunisia a republic, and electing Habib Bourguiba as president. France had granted Tunisian independence reluctantly, under mounting pressure from the insurgencies in Southeast Asia and in neighbouring Algeria. Tunisia's relations with France thereafter deteriorated in the late summer and autumn of 1957, and were marred by sporadic clashes between their respective forces along the Tunisian-Algerian border. These clashes occurred when French troops, pursuing Algerian rebels, crossed the border into Tunisia. The Tunisian government strongly opposed the use of French troops, who were still stationed on its soil, against the Algerian rebels. The major bone of contention with France post-independence was therefore the continuing presence of these troops. In 1962, following the intervention of the United Nations, an agreement was reached and France withdrew its forces.

Tunisia has generally adopted a moderate, pro-Western line in foreign policy. However, it has also been careful to maintain an independent stance and to demonstrate to other Arab states that it is not subservient to Western policies. Tunisia supported the development of the Arab Maghreb Union (UMA) along with Algeria, Morocco, Mauritania, and Libya. (Progress on Maghreb integration has, however, been affected both by political instability in Algeria and by Libya's anti-Western stance and perceived support for terrorism.) On the other hand, Tunisia has avoided joining any extreme left-wing blocs such as the "Casablanca bloc." Originally it had forged some links with the Soviet Union and China; however, these relationships deteriorated in the 1960s and were not fully resumed until 1972. Bourguiba's relations with Gamal Abdul Nasser, the Egyptian leader, were somewhat tense in the late 1950s, because of the former's neutral stance towards the Arab-Israeli conflict. At a time when none of the Arab states was willing to recognise Israel, this unusual

stand created tensions with several radical Arab states. In the early 1970s, Bourguiba officially advocated the establishment of a Palestinian state to coexist with Israel. Since Bourguiba's replacement as leader in 1989, Tunisia's relations with radical Arab states have improved, though its moderate neutral policy remains unchanged.

Since independence, Tunisia has sought to maintain good relations with its neighbours; however, relations with Algeria have occasionally been tense due to border disputes. In 1993 the two countries reached an agreement to begin cooperating on the construction of a natural gas pipeline across Tunisian territory, to convey Algerian gas supplies to Italy.

Tunisia's relationship with the United States could generally be defined as cordial. In 1957 the United States provided economic and technical assistance to Tunisia under a bilateral agreement. This agreement provided \$2.5 billion of development assistance to be deployed over a period of thirty-five years by the United States Agency for International Development (USAID). In 1991, however, Tunisia's stand against the US role in the First Gulf War led to the temporary deterioration of its relationship with the United States and with many Arab states. Thereafter Tunisia has played a moderating role in the negotiations for a comprehensive Middle East peace. In 1993 it was the first Arab country to host an official Israeli delegation as part of the Middle East peace process.

## Algeria

The path to Algeria's independence was long and bloodstained. France ruled Algeria, unlike Morocco and Tunisia, as one of its metropolitan departments (*departements*) and not as a protectorate. Since the 1830s this had resulted in significant settlement by French citizens who, after World War II, accounted for about 10% of the Algerian population. These people regarded Algeria as their home. The Algerian War of Independence began in 1954 and lasted until 1962, when Ahmed Ben Bella became the first president of the Algerian Republic. About one million Algerians died in what was one of the most violent and ruthless wars of the postwar decolonisation period.

After independence, Algeria speedily established relations with most Western European countries, although at times these were marked by major disagreements. Algerian policy tended to be uncooperative, and at times even hostile, to Western politics, which it regarded as hegemonic toward African and Arab countries. In 1965, for example, it severed diplomatic relations with the United Kingdom over the issue of

Rhodesia; however, these were restored in 1968. By far the most important relationship of the newly independent country was that with France. Surprisingly perhaps, there were few major bones of contention between the two countries. One such was the question of France's nuclear experiments in the south of Algeria—a region known as the French Sahara. Other problems were the nationalisation of former European property and the position of Algerian workers in France, a very socially disadvantaged group. There was also tension over the exploitation of Algeria's natural resources, such as oil and gas, which were controlled by French companies. In 1970 the Algerian government nationalised the oil industry, a move that created a serious rift with France. The dispute was resolved in April 1987 when the Algerian government agreed to release assets of former French settlers. In return the French government agreed to provide financial assistance to Algeria for a period of three years. By May 1991, two French oil companies had been granted new concessions in the Sahara. Despite these problems, Algeria's relations with France on the whole have been quite satisfactory. France continued to supply economic and technical assistance, including training and equipment, to Algeria's armed forces.

Algerian relations with Spain were until 1986 cool and, at times, even hostile. This was for two reasons: (1) Algeria claimed that Spain supported Morocco in the conflict in Western Sahara; and (2) Spain suspected that Algeria harboured members of the ETA (*Euskadi Ta Askatasuna* in Basque, Basque Fatherland and Liberty)—a leftist group that used terrorism in the hope of forming an independent Basque state in parts of northern Spain and southwestern France. In 1987 the two countries signed a treaty providing for Algerian officials to be stationed in Spain to monitor the activities of Algerian dissidents, in exchange for closer supervision of members of the ETA within Algeria. Since then, and following the reconciliation with Morocco, relations between Algeria and Spain have improved and normal diplomatic exchanges between them, as of this writing, now take place.

Algerian relations with the Arab world have been marked by radicalism. In the first years of independence, Ben Bella joined the more radical section of the non-aligned bloc and took an extremist stance toward the Arab–Israeli conflict and on disputes within Black Africa. He established close relations with Egypt, Iraq, and especially Syria. Algeria refused to accept the cease-fire after the Arab–Israeli Six-Day War of 1967, and rejected UN Security Council Resolution 242 calling for mutual recognition of the rights of Palestinians and the right of Israel to exist, and for the dispute to be resolved by diplomatic means. In the

1970s, Algeria hosted several Arab armed groups. It supported Yasser Arafat in 1971, when Jordan expelled the PLO (Palestine Liberation Organization) from its territory, and severed diplomatic relations with Amman. Algeria was also a prominent supporter of radical factions in disputes within the African continent, providing training bases for several guerrilla movements. Relations with the Soviet Union and Cuba were also close and Algeria was one of the first countries to recognise Communist North Vietnam and North Korea.

After the death in 1978 of President Houari Boumediene, who had ruled Algeria since 1965, and his replacement by Colonel Chadli Benjedid, Algerian policy became more pragmatic and less driven by ideology. This shift was apparent in its relationship with the United States. After the Six-Day War, Algeria had been critical of the United States and hostile toward its pro-Israeli stance. However, while diplomatic relations may have been tense, economic cooperation remained strong. Algeria's militant line on the Arab–Israeli dispute, and its support for Arab and African armed groups, did not prevent it cooperating economically with Western countries, including the United States. US oil companies invested in Algeria's oil industry and these interests had to be guaranteed. Algeria played a role in the negotiations for the release of US hostages in Iran, leading to their release in 1981. However, diplomatic relations remained overshadowed by US sympathies for Morocco in the Western Sahara conflict. The most important shift in Algeria's stance in international relations came in 1999 when Abdelaziz Bouteflika was elected president. He made two visits to the United States in 2001, heralding a new era in relations between the two countries. This new approach was demonstrated after September 11, 2001, when Bouteflika immediately offered Algeria's support in the "war on terror."

## Libya

Libya was an Italian colony from 1912 until 1951, when it gained independence under the leadership of King Idris. Initially, after independence, the country adopted a moderate pro-Western stance. It joined the Arab League in 1951 and in 1955 it became a member of the United Nations. It also participated in the Sterling Zone, a sphere of trade cooperation, and in 1953 signed a pact with Britain that allowed the latter to maintain its military bases in Libya. A similar agreement was reached with the United States in return for US financial aid.

Libya's pro-Western stance provoked tension with Egypt, which took a more radical anti-Western approach. Aware of his vulnerable position, King Idris tried to reinforce the country's neutral policy and to avoid emphasising relations with the West. However, there was growing pressure from the Libyan population to take a less conciliatory and more hostile approach toward the West. There were demands for Britain and the United States to evacuate their military bases (an agreement to this effect had been signed by Britain and the United States in 1964).

On September 1, 1969, Colonel Muammar Qaddafi staged a coup. This event provoked a complete *volte-face* in Libya's political stance. Qaddafi closed US and British bases and partially nationalised all foreign oil and commercial interests inside Libya. He played a key role in the strategy of using oil as a political weapon against the West, participating in the 1973 embargo in retaliation for United States support for Israel. Qaddafi ostensibly rejected both communism and capitalism in favour of a "middle course." Three factors characterised the Libyan revolution: fundamentalism, authoritarianism, and fanaticism. Qaddafi's policy appeared arrogant in its disregard for external considerations; hence, his regime did not establish close ties with any other countries, though formal diplomatic relations with some were maintained. Nonetheless, Western countries tended to treat him with "kid gloves," partly because of Libya's oil resources and partly because of the country's strategic position in the Mediterranean area.

Libya established relations with the USSR, recognised Communist China in 1971, and had full diplomatic relations with East Germany from 1973. It also had relations with Yugoslavia and received arms supplies from the Soviet Union. Despite his friendly relations with the Soviet Union, Qaddafi continued to declare his hatred for communism. Libya's use—and loss—of Soviet-supplied weaponry in its war with Chad was a notable breach of an apparent Soviet–Libyan understanding not to use the weapons for activities inconsistent with Soviet objectives. As a result, Soviet–Libyan relations reached a low level by mid-1987. Libya also took a radical stance in its policy toward the developing world, supporting the guerrilla movement in Chad, giving its leader refuge, and allowing the rebels to launch raids from Libyan territory. In 1980 it even intervened militarily in the dispute. Qaddafi's stance in the Arab world was also regarded as extreme: he seemed willing to support and assist any resistance or terrorist movement, opposed any peaceful solution to the Arab–Israeli conflict, and declared himself in favour of the destruction of the State of Israel.

In addition to using oil as a weapon of foreign policy, Qaddafi at one time sought to destabilise weaker governments and to promote terrorism, providing refuge and finance for groups that shared his revolutionary and anti-Western views, for example, the Japanese Red Army, radical Muslim groups such as the Popular Front for the Liberation of Palestine-General Command, and Abu Nidal's Fatah Revolutionary Council. Relations with the United States became very tense in the 1980s. In 1981, the United States shot down two Libyan aircraft that had challenged its warplanes over the Gulf of Sirte, which Libya claimed as its territory. Then, in 1986, US planes bombed Libyan military facilities, as well as residential areas of Tripoli and Benghazi—including Qaddafi's house—killing 101 people. The United Kingdom broke off diplomatic relations with Libya in 1984 after a British policewoman was shot dead outside the Libyan People's Bureau, or embassy, in London during anti-Qaddafi protests. Tension between Libya and the West reached its apogee after a Pan Am airliner was blown up over the Scottish town of Lockerbie on December 21, 1988, killing 270 people. In 1991, two Libyan intelligence agents were indicted by federal prosecutors in the United States and Scotland for their involvement in this bombing. In January 1992, the UN Security Council approved Resolution 731, demanding that Libya surrender the suspects, cooperate with Pan Am, pay compensation to the victims' families, and cease all support for terrorism. Libya's refusal to comply led to the approval of a further UN Security Council measure, Resolution 748, in March 1992, imposing sanctions designed to bring about Libyan compliance. Continued Libyan defiance resulted in the passage of UN Security Council Resolution 883 (November 1993), providing for a limited freeze of Libya's assets and an embargo on selected oil equipment. However, Libya persisted in its non-compliance until 1999, when it handed over two suspects for trial by a Scottish court convened in the Netherlands. UN sanctions were subsequently suspended, and lifted altogether in September 2003 following an agreement between the United States, the United Kingdom, and Libya over the Lockerbie issue. A shift in Libya's attitude became evident in August 2003, when it sent a letter to the United Nations accepting responsibility for the actions of the Libyan officials involved in the Lockerbie case and agreeing to payment of appropriate compensation, as well as renouncing support for terrorism. Later that year, Libya signed a compensation agreement worth \$2.7 billion with lawyers representing families of the Lockerbie/Pan Am victims. In December 2003, Qaddafi further announced his abandonment of programmes to develop weapons

of mass destruction. This paved the way for a visit to Libya by British Prime Minister Tony Blair, in March 2004, and for his meeting with Qaddafi at that time.

### **Relations with the European Union**

North African states attach great importance to relations with Europe as a whole, and especially with those bordering on the Mediterranean. Western Europe has traditionally been the greatest trading partner for the Maghreb states, and more recently also for Libya. North African states have regarded France, Italy, and Spain as major gateways for their trade and exports. The foundation, first of the European Economic Community, and later of the European Union with its growing political and especially economic power, has caused the North African states to seek a closer relationship with the European Union. Most of the states manifested an interest in evolving a Mediterranean consensus on various issues. A cooperation agreement between the European Union and the Maghreb countries was signed in April 1976, enabling certain trade provisions to come into effect as early as July 1976. This was followed by a full trade agreement in January 1979, according to which the North African states' industrial products were granted immediate duty-free entry to the European Union, while customs preferences were awarded for certain of their agricultural products. The agreement also included some improvements in conditions for migrant workers from North Africa. However, Morocco's application to join the European Union in 1987 was rejected on the grounds that it is not a European country. The European Union has not hesitated to use its financial leverage on some of the North African countries, for instance, on Morocco in 1992, in protest of Morocco's activities in the Western Sahara; and on Algeria, making financial aid conditional on progress toward democracy. In June 1992, the European Union approved proposals for bilateral relations with the Maghreb countries. Relations with Algeria have, however, been adversely affected by Algeria's internal instability. Tunisia, Morocco, and Algeria are also parties to the Barcelona Declaration of 1995, which aimed to increase Euro-Mediterranean cooperation and agreed to establish a comprehensive partnership amongst the participants by means of political, cultural, and economic ties. An Association Agreement, concluded in February 1996, sets clear targets for the further development of the already close political relations of these states with the European Union, and for a Free Trade area to be

established by 2010. The Agreement entered into force on March 1, 2000.

Unlike Algeria, Morocco, and Tunisia, Libya has had no such close relations with the European Union. The European Union's Foreign Ministers have only recently agreed to lift sanctions, including an arms embargo, against Libya. (Italy had argued for the ending of the eighteen-year-old arms ban, so that it could supply Libya with hi-tech equipment intended to curb illegal migration.) Libya now has the opportunity to become a full member of the Barcelona Process if it accepts the Barcelona *acquis*. Several European Union member states already have extensive trade relations with Libya: Italy, Germany, the United Kingdom, and France are Libya's four leading suppliers of manufactured goods and food products.

### **North African Associations and Inter-State Relations**

Despite their geographical and cultural similarities, relationships between these states have not always been easy and have been the subject of frequent disputes. Clear differences exist in the approaches taken by these states toward the West, the developing world, and ideologies such as communism and Islamic fundamentalism.

Relations between Tunisia and Morocco have generally been good as they have no common border, both states tend to adopt moderate policies, and both have at times felt threatened by their more radical neighbours, Algeria and Libya. In the 1950s and 1960s, there was widespread discussion of a so-called Greater Maghreb scheme; this aimed to achieve greater cooperation amongst the states but was hampered by their political differences and economic problems. Each country tended to be suspicious of its immediate neighbour. Relations between Algeria and Morocco have long been characterised by rivalries and occasional hostility. Immediately after Algerian independence, Morocco laid claim to stretches of southern and western Algeria that had been under Moroccan sovereignty before the French gained control over the area in the nineteenth century. In a series of sharp engagements in the disputed territory in October 1963, the Moroccan professional army consistently outperformed Algerian regulars and local guerrillas. Although mediation sponsored by the OAU (Organisation for African Unity) brought an end to the fighting, the success of the Moroccans demonstrated their potential threat to Algerian security in the event of a more serious dispute. In addition to their territorial disputes, both countries vied for primacy in

the Maghreb region. Their respective claims were rooted in history and in ideology: Morocco's claim to regional leadership derived from its centuries-old national identity, whereas Algeria's stemmed from the prestige of winning its war of independence from France. The inherent ideological differences between the new socialist republic, on the one hand, and the ancient kingdom, on the other, were sharpened when almost immediately after independence, Ben Bella proclaimed his country's socialist revolutionary doctrines and its opposition to conservative governments such as Morocco's. Relations improved after Boumedienne came to power, as both countries concentrated on their domestic problems. In 1972 a treaty was signed defining the border between them. However, the Moroccan government deferred its official ratification of the treaty until 1989, pending a final resolution of the difficulties over the Western Sahara question.

The dispute over the Western Sahara had originated in 1974, at which time the territory was still under Spanish control and was known as the Spanish Sahara. Morocco began attempts to annex the territory which, after a series of diplomatic initiatives, culminated in a march by 350,000 Moroccans across the territory's northern border. Spain signed a treaty turning over the northern two-thirds of the Western Sahara to Moroccan administration and the rest to Mauritania. By mid-1975 the Algerians were providing supplies, vehicles, and light arms to the Popular Front for the Liberation of Saguia el Hamra and Rio de Oro (Polisario). Polisario was the strongest of several indigenous national liberation movements active in the Western Sahara. Algeria thus became the principal foreign supporter of the Polisario in its long-running desert war to oppose Moroccan control of the disputed area.

Despite their military strength, the Algerians avoided direct confrontation with the more experienced Moroccan troops. However, in January 1976, the Moroccans defeated two battalions of Algerian troops and took prisoners in clashes within the Western Sahara. Following this incident, Algerian regulars refrained from venturing into the Western Sahara (despite Moroccan claims to the contrary) while the Moroccans, for their part, refrained from pursuing rebel troops into Algerian territory. Fighting in the Western Sahara initially featured attacks by Polisario's light mobile forces against isolated Moroccan outposts. By 1982, however, the struggle had shifted in Morocco's favour with the Moroccan military dominating the battlefield. Morocco's military success in the Western Sahara was one factor in the rapprochement between the two nations, achieved in 1988. This followed a twelve-year hiatus in diplomatic relations precipitated by Algeria's recognition of the

Polisario government. By the late 1980s, Algeria was preoccupied with its own internal security problems and was no longer willing to devote arms and support to the independence movement. Algeria's resumption of diplomatic relations with Morocco, accompanied by the opening of borders and a number of joint economic initiatives, eased the security situation on its western flank. Morocco's acceptance of the United Nations peace plan for the Western Sahara, and the conclusion of the UMA treaty in 1989, further helped to abate remaining tensions between the two states.

Whereas Morocco had long been viewed by Algeria as a potential threat, Muammar Qaddafi's Libya was regarded as somewhat more friendly. The Algerian-Libyan security relationship was based on a common antipathy for the Western-dominated economic order and deep hostility toward Israel. However, this relationship suffered several setbacks during the 1980s. In 1984 Morocco and Libya announced that they had secretly negotiated an alliance. Although the alliance's effect was short-lived, Algeria interpreted the agreement as upsetting the strategic balance in the Maghreb. Libya's unilateral annexation of a section of neighbouring Chad, together with its military intervention in Chad, hardened Algerian attitudes against Libya. There were also suspicions that Libya was linked to unrest instigated by Islamist (also seen as fundamentalist) groups in Algeria. Libya's subsequent participation in the UMA, however, appeared to lay the foundation for more stable relationships between itself and Algeria, as well as with the other states of the region.

The 1980s witnessed a successful attempt to bring the countries together. On February 17, 1989, a treaty was signed in Marrakech by the leaders of Algeria, Libya, Mauritania, Morocco, and Tunisia. It was modelled on the European Union and was named the Union of the Arab Maghreb (UMA). Its main aim was to enable its members to negotiate as a bloc with the European Union and to encourage trade, economic cooperation, and freedom of movement across borders. In his efforts to shape a more pragmatic foreign policy, Algeria's Benjedid had succeeded in moderating the stresses in his country's relationships with the West. At the same time, Algeria's concerns shifted in the direction of improving regional stability, which had long been disrupted by the festering disputes with Morocco and Libya. Hence, the formation of the UMA in 1989 heralded a new phase of improved relations between the states of the region. Under important security clauses contained in the treaty, the signatories affirmed that any aggression against one member would be considered as aggression against all the member states. In an apparent allusion to the Western Sahara conflict, member

states pledged not to permit any activity or organisation on their territory that could endanger the security or territorial integrity of another member state.

## NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA)

The United States, Canada, and Mexico signed the North American Free Trade Agreement (NAFTA) in 1994, following a US–Canada free trade agreement in 1988. In the 1990s, Canada and Mexico were the largest and third-largest US trading partners, respectively (Japan was second). The great benefits

predicted by NAFTA supporters did not materialize, but neither did the disasters predicted by opponents.

## Mexican Perspective

NAFTA was the culmination of a process set in motion by two Mexican presidents, Miguel de la Madrid Hurtado and Carlos Salinas de Gortari, in response to the Mexican economic crisis of the 1980s. The collapse of world oil prices and the failure of Mexico’s long-standing efforts at import substitution had left the country facing a crushing foreign debt, staggering deficits, soaring inflation, high unemployment, and collapsing standards of living. Mexico was effectively bankrupt, and in 1982 announced that it could not pay its foreign debt. In response to this crisis, de la Madrid and his successor, Salinas, strove to liberalize the Mexican economy. Salinas oversaw a radical liberalization of the Mexican economy, above all in international trade. The Mexicans lowered tariff barriers on many products. The maximum tariff rate fell from 100% to 20%; the fraction of imports that required permits had fallen from 93% to less than one quarter. Salinas sold off numerous government-owned enterprises, and signed the General Agreement on Tariffs and Trade (GATT), an international accord aimed at opening the world market. Salinas negotiated debt relief with the United States, cut public expenditures, relaxed laws that had inhibited foreign investment, and privatized the largest Mexican banks. These reforms had succeeded in restoring Mexico to the favor of international investors, who have poured huge sums into the Mexican economy since 1990. But the reform had not yet delivered convincing results where it counts: improved living standards among ordinary Mexicans. After eight years of stagnation, in 1990 the Mexican economy began to grow again. The growth, however, barely kept pace with labor-force expansion. Unemployment remained far higher and real wages lower than in 1980.

For President Salinas, the only way to attract the foreign capital necessary to stabilize the exchange rate and to fund the current account deficit was to provide hesitant potential investors with guarantees of continuity of economic policy and access to the US market through an ironclad agreement with Washington. NAFTA, it was hoped, would satisfy both requirements. The sustained economic growth generated by NAFTA would narrow income differentials by creating jobs. President Salinas’ anti-poverty program would ease the transition from stagnation to NAFTA-fueled high growth. Investment from abroad

would enable the economy to grow while introducing new technology and efficiency and modernizing Mexican society. Salinas was desperate to attract new foreign investment, and because 85% of Mexico's manufactured exports are shipped to the United States, stable access to the US market became increasingly important to the Mexicans.

In June 1990, President Salinas requested a free trade agreement with the United States. He discarded the national tradition of keeping a suspicious distance from the "colossus of the north." Small-scale industrialists and grain farmers expressed fear that they might be destroyed by US competition, and some intellectuals mourned the imminent demise of the nation's economic sovereignty and cultural pride. However, Salinas stressed his determination to push his country into the first world. NAFTA would be an instrument of economic change and a powerful symbol of the commitment to liberalism that is Salinas' most important legacy.

## US Perspective

The first Bush administration (1988–1992) was at first hesitant about free trade with Mexico, but a number of political and economic factors ultimately led the United States to pursue NAFTA. Bush was frustrated with the slow pace of GATT negotiations, wished to do something to address the growing problem of illegal immigration, and had an interest in buttressing liberalizing forces and a friendly president in Mexico. Carlos Salinas de Gortari's government was not a model of democratic virtue. From the US point of view, however, it was the best Mexican government in either nation's history. Salinas' market-oriented reformers had done their best to break with the long tradition of anti-US rhetoric. While Mexico had not had a truly free presidential election, the trend was clearly toward greater openness and democracy. Not long ago, US intelligence analysts worried that a Mexico hammered by the debt crisis and plunging oil prices might become a radicalized national security nightmare.

The health of the Mexican economy is extremely important to the United States. The countries are increasingly interdependent, as was evidenced in 1982 when Mexico's announcement that it could not repay its international debts put seven of the nine largest US banks on the brink of bankruptcy. Bush hoped that the Salinas policy would strengthen the Mexican economy in ways that would avert future crisis, and that economic vitality would buttress political order there. The Bush administration also

wanted to assure the United States of increasing access to petroleum from Mexico, one of the five leading sources of US imports (Mexican shipments in the late 1980s and early 1990s were roughly half as large as those from the topmost source, Saudi Arabia). Furthermore, NAFTA would provide the United States with an important bargaining chip in its trade negotiations with Europe, Japan, and the General Agreement on Tariffs and Trade. Finally, the United States wanted to consolidate diplomatic support from Mexico on foreign policy in general. As demonstrated by disagreements over Central America during the 1980s, this had long been a source of bilateral tension. But with NAFTA in place, Mexico became unlikely to express serious disagreement with the United States on major issues of international diplomacy.

In September 1990, President Bush announced that he would begin talk with the Mexicans. The administration first won "fast-track" authority from Congress, which meant that legislators would have to vote yes or no on the deal as negotiated by the Bush administration and representatives of the Mexican and Canadian governments—members of Congress were prevented from picking apart any trade package to insert exemptions for constituents. The Bush administration claimed that without fast-track, it would have been impossible to negotiate NAFTA, because the Mexicans and Canadians would have feared that the deal would unravel in the legislative process in Washington. The three nations finalized the agreements in August of 1992, laying the foundation for a trading bloc of 358 million citizens and economies with GDPs totaling \$6.2 trillion.

The North American Free Trade Agreement, which takes up more than 2,000 pages, established schedules for reducing tariffs and non-tariff barriers to trade over a five- to ten-year period in all but a few hundred of some 20,000 product categories. Despite its length and complexity, NAFTA's goal is very simple: to eliminate or lower barriers to trade in goods and many services, and create a limited common market "from the Yukon to the Yucatan."

## Canadian Perspective

The move for Canada to request a comprehensive Free Trade Agreement came from the MacDonald Royal Commission Report in September 1985. Although 85% of Canadian exports were already free of duty, it was recognized that given the dominance of the direction of Canadian exports to the United States, Canada was exposed to the unilateral actions of the application of US trade laws. As a result,

Canada needed a guarantee with respect to continued access to US markets and greater certainty over the conditions of this access.

The Free Trade Agreement represented the further integration of two very close trading partners who experienced significant and ongoing cross-border capital flows and whose capital markets were becoming increasingly aligned. In addition, policy makers expected that the increased specialization, inter- and intra-industry within Canada, would lead to increased competitiveness, not only with respect to the United States, but to redress its large trade imbalance with the rest of the world. NAFTA had the potential to provide greater specialization and efficiency gains.

Canada was at first reluctant to request negotiating status as its trade with Mexico was quite small. Nevertheless, policy makers argued that, if only on defensive grounds, Canada had to seek negotiating status to ensure its continued accessibility to the US market.

### The Basics

The agreement has two major elements: it reduces or eliminates US, Mexican, and Canadian tariffs on many goods produced in North America, and facilitates investment across borders on the continent. But it is important to note that NAFTA does not eliminate all trade barriers—the agreement contains provisions protecting economic interests in all three countries against free trade.

First, NAFTA will eliminate tariffs on approximately nine thousand categories of goods sold in North America by the year 2009. Also under NAFTA, many previous restrictions on foreign investments and other financial transactions among the NAFTA countries will end, and investment in financial services operations (such as advertising, banking, insurance, and telecommunications) will flow much more freely across borders. This is particularly important to Mexico. Before NAFTA, Mexico had much higher tariff and non-tariff barriers in place than the United States, so the Mexicans have made far more significant tariff reductions. Beginning in 2000, US banks, which had been virtually banned from operating in Mexico before NAFTA, were able to hold 15% of the Mexican market. Truck and bus companies now have largely unimpeded access across borders, and starting in 2000, US trucking firms were allowed to become majority owners of Mexican trucking companies. While Mexico continued to prohibit foreign ownership of oil fields, in accordance with its constitution, US firms became eligible to compete

for contracts with *Petroleos Mexicanos* (PEMEX) and operate, in general, under the same provisions as Mexican companies.

Only goods adhering to NAFTA's "rule of origin" move across North American borders duty free: goods must be produced in North America to qualify for duty free treatment. Goods that are wholly obtained or produced in North America are considered to originate in North America. Goods containing no North American content, however, must be substantially transformed through further processing in a NAFTA country to qualify for duty free entry. In practice, this means they must undergo a change in tariff classification. Goods containing non-North American content also may be treated as North American if they have sufficient (60%) regional value content, as determined by either the transaction value or the net-cost method. The nationality of a factory's owners is irrelevant under the agreement—Nissan may ship automobiles from its modern Mexican facility to the United States duty free, as long as those cars meet NAFTA's requirements for North American content.

Second, NAFTA protects the property rights of those who invest across borders in North America, and eliminates practices that long discouraged foreign investment in Mexico. NAFTA requires each signatory country to treat foreign investors no differently than domestic investors, and prohibits governments from imposing any special "performance requirements" on foreign investors. For example, before NAFTA, Mexico often required foreign-owned firms to buy certain inputs locally, or to export a specified percentage of their goods. Such requirements, which act as "non-tariff barriers" to trade, violate the free trade agreement; businesses confronting them may appeal to a three-nation panel for damages. Further, in another provision aimed directly at Mexico, NAFTA discourages the nationalization of private enterprises by requiring governments to pay immediate and fair compensation to the nationalized firm's owner. Mexico is hungry for foreign investment, and the protections offered to investors by those provisions will undoubtedly increase investment there.

Again, while NAFTA lowers many trade barriers, it offers protectionist safeguards for certain domestic products in all three countries. First, there are the so-called "snap-back" provisions, which allow governments to impose tariffs temporarily to protect specific economic sectors suffering substantial losses due to import surges. For example, if Mexican tomatoes flood the US market and drive down prices, Washington can throw up tariffs against imported tomatoes while US growers adjust to the new competitive environment. Second, each country insisted on

protecting certain domestic industries, and the agreement contains many such arrangements. For example, Mexico protected its oil- and gas-drilling enterprises, and the United States its shipping industry. Third, many protectionist provisions emerged from the political process in the United States. President Clinton made many concessions to individual members of Congress, especially those presenting agricultural interests, and the Mexicans agreed to reinterpret some of the original language of NAFTA to allow those concessions. One such agreement empowered the United States to impose steep tariffs on orange concentrate if Mexican exports rise and the price drops to a specified level for a period of five days. These provisions violate the spirit of free trade, but they were necessary to complete the free trade agreement—legislators withheld support for NAFTA until these arrangements were made.

While these are NAFTA's major elements, the deal has many other crucial components. There are provisions (aimed at Mexico) requiring each country to protect rights in "intellectual property" like copyrights and trademarks, and rules that will allow US and Canadian banks to penetrate the Mexican market for financial services. Perhaps more significantly, the original text of NAFTA, later supplemented by "side agreements" negotiated by the Clinton administration, contained important provisions on health and the environment. NAFTA does not require the three countries to adopt the same regulations protecting the food supply or the environment. The three countries made a nonbinding pledge to seek the "highest standard" of protection, but there is no way to force any country to raise its standards.

### **Arguments for and Against NAFTA**

NAFTA precipitated strenuous debate within the United States. The opponents, including various US labor unions and environmental groups, criticized the low wages and poor labor laws in Mexico, which they feared would drag down US labor standards. Environmentalists similarly criticized Mexico's lax environmental laws and saw NAFTA as giving US corporations licenses to pollute by moving south of the border. In the heart of the 1992 presidential campaign, Democratic candidate Bill Clinton pledged to support NAFTA on condition that there be effective safeguards for environmental protection and workers' rights; by September 1993 the governments reached "supplemental" or side agreements on labor and the environment. As the US Congress prepared to vote on ratification, Texas billionaire Ross Perot led the

charge against the treaty. Perot warned that US workers would hear "big sucking sounds" as their jobs disappeared south of the border. Proponents insisted that NAFTA will make Mexico more appealing to American investors—giving them permanent rights to full control of Mexican subsidiaries and protecting them against any future reversal of Mexican investment rules. Under NAFTA, Mexico would be a better place to do business—with lower financial costs, an improved infrastructure, and a larger pool of trained bilingual personnel. For outside investors, there would also be an intangible comfort factor in knowing that Mexico was somehow legally linked to the United States. In short, NAFTA removes many of the obstacles, perceived or real, that have kept hundreds of companies from ever considering expansion into Mexico.

Disregarding vociferous opposition from unionized labor, a historic bastion of support for Democrats, President Clinton lobbied tirelessly on behalf of the treaty. And after Perot stumbled badly during a memorable television debate with Vice President Al Gore, the House of Representatives finally supported the NAFTA accord by the surprisingly lopsided margin of 234–200; the Senate followed with a vote of 61–38.

### **Supplemental Agreements**

As noted earlier, concerns about the effects of free trade on US labor and environmental standards clouded NAFTA's prospects for acceptance by the Congress. During the 1992 presidential campaign, Governor Bill Clinton endorsed NAFTA, rejected any renegotiation of the text, and enumerated important qualifications. However, he stated his intention to negotiate three supplemental agreements that would be submitted to Congress in parallel with NAFTA implementing legislation. The prospect of supplemental agreements raised hope among US labor and environmental activists that Clinton might push for new international standards in these areas. The supplemental agreements negotiated by the Clinton administration set up new mechanisms to encourage the three countries to enforce existing environmental and labor laws, and to apply sanctions against those that try to use lax enforcement to attract investment and create competitive advantage for their firms.

The first agreement would set up an environmental commission, headed by Vice President Gore, which would have substantial power and resources to prevent and to clean up water pollution; encourage the

## NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA)

enforcement of the country's own environmental laws through education, training, and commitment of resources; and provide a forum to hear complaints. The environmental provision strengthened NAFTA and enhanced the protection, conservation, and management of natural resources throughout the region in a manner that would set the standard for future international agreements.

A second supplemental agreement would create a labor commission that would have powers similar to those of the environmental commission to protect worker standards and safety. A Ministerial Council, consisting of the labor ministers of each nation would oversee the activities of the labor commission. They would supervise the implementation of the side accord, including the activities of the International Coordinating Secretariat. They would also establish working groups and committees as deemed appropriate.

Finally, a supplemental safeguards agreement would be negotiated to deal with instances where an unexpected and overwhelming surge in imports from a partner country required temporary protection beyond that provided by the "snap-back" causes enumerated in the NAFTA text. The rationale for such a provision would be to provide an additional avenue for temporary import relief to deal with the aftershocks of regional integration.

President Salinas of Mexico grudgingly agreed to these proposals. The Canadians were a good deal more positive than the Mexicans about the supplemental agreements. They well understood that Canada was not the object of concern.

### Assessing NAFTA

NAFTA appeared to achieve the economic goal of expanding commerce. Two-way trade between Mexico and the United States climbed from \$83 billion in 1993 to \$108 billion in 1995 and \$175 billion in 1997. By 1997 the three-way trade of \$348 billion represented nearly \$1,000 in trade for each of NAFTA's 380 million consumers. Trade among the three partners increased somewhat faster than before the accord. By this time the United States was exporting more to Mexico than to China, Korea, and Singapore combined, and Mexico displaced Japan as the second-largest trading partner of the states (Canada remained in first place). Still, both optimistic and pessimistic forecasts for NAFTA fell short. Few job losses or gains could be traced to NAFTA.

Besides trade and jobs, NAFTA had other effects. Mexico tightened environmental protection while NAFTA was being negotiated and kept the controls

in place despite the 1995 financial crisis. The US–Mexico border region flourished following the agreement. Mexican shoppers spent an estimated \$22 billion in the United States over the next five years.

Although several US presidents had talked about extending NAFTA to other countries in the Western hemispheric free trade agreement, NAFTA provisions are very vague regarding the requirements countries must meet to become members. Both the lack of clear-cut procedures and making decisions concerning new members by consensus could pose significant obstacles to enlargement. Indeed, the US Congress has been reluctant to give the president fast-track authority in negotiations to extend NAFTA to Chile and other Latin American states.

## NORTH ATLANTIC TREATY ORGANIZATION (NATO)

The North Atlantic Treaty Organization (NATO) is a Brussels-headquartered military and diplomatic alliance of twenty-six countries in Europe and North

America. NATO members attempt to preserve peace and international security around the world. They also collaborate on economic policies in the effort to further economic and political stability. The organization's interest in the developing world began when the collapse of the Soviet Union in 1989 forced NATO, a product of the Cold War created as a safeguard against communism, to find a new reason for its continuing existence.

NATO traces its roots to 1945 when Europe sought to recover from the devastation caused by World War II. The democratic nations of Europe feared that they had been so weakened by the economic and military costs of the conflict that they did not have the strength to fend off an attack by an increasingly aggressive Soviet Union without US assistance. The United States feared that the loss of democratic countries would drastically reduce trade and badly damage the US economy. Europe and US policy makers cooperated to develop an organization that would preserve the stability of the North Atlantic region. This region has its northern boundary at the North Pole, past the Northwest Territories of Canada, while the southern terminus is located at the Tropic of Cancer, which runs between Florida and Cuba.

The treaty establishing NATO was signed in Washington, DC, on April 4, 1949, and then subsequently ratified by its member countries. The NATO signatories agreed that, if an armed attack occurred, each NATO member would assist the victimized state by regarding an attack upon one as an attack upon all. NATO would respond to aggression by taking all necessary actions, including the use of armed force, to restore and maintain international peace and security. The vagueness of the treaty meant that the exact mechanisms of the alliance would develop over time. Policy makers hoped that the threat of US involvement would act as a particularly powerful deterrent to the Soviets.

The collapse of the Soviet Union in 1989 removed the chief reason for NATO's existence. On November 19, 1990, NATO achieved its historic mission when the Charter of Paris formally ended the conflict with the Warsaw Pact. It also offered former Soviet satellite states the opportunity to join the organization. To most countries, European Union membership is the real goal, with NATO membership serving as a proving ground. The members of NATO are: Belgium, Bulgaria, Canada, Czech Republic, Denmark, Estonia, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Lithuania, Luxembourg, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Turkey, the United Kingdom, and the United States. As of this writing, Albania and Macedonia are pursuing membership.

With the Soviet threat gone, NATO began focusing on preserving global security as it struggled to remain relevant. The alliance changed from being a collective defense organization to a self-appointed police officer. Economic, social, and political difficulties, including ethnic rivalries and territorial disputes in Central and Eastern Europe, were identified as likely to cause regional instability and it planned to settle these disputes.

In 1999, NATO sent military forces into action for the first time, in the Kosovo province of Serbia in the Balkans. In Operation Allied Force, the alliance attempted to achieve a political solution to the Kosovo crisis and acted only after negotiations with the Kosovo Serbians and the Kosovo Albanians had failed. Incidents of ethnic cleansing of the Albanian population had already occurred and NATO publicly stated that it feared inaction would lead to a greater humanitarian catastrophe. Additionally, an escalation in the fighting would likely have triggered a massive refugee flow. A great movement of displaced people had the potential to destabilize surrounding countries with a delicate ethnic balance such as Macedonia and Albania. Conflicts between Muslims and Christians might prompt nearby NATO members Turkey and Greece to again come to blows. Regional stability required NATO action but this action came without approval from the Serbian government or the United Nations (UN). NATO violated the provisions of the UN Charter by invading Kosovo without the approval of the UN Security Council.

NATO has subsequently reached outside of its traditional boundaries to protect the North Atlantic region. Since the security of Europe is closely linked to security and stability in the Mediterranean, NATO initiated talks with Algeria, Egypt, Israel, Jordan, Mauritania, Morocco, and Tunisia in the early 1990s. It offered training and technical knowledge but no troops.

The terrorist attacks on the United States in 2001 forced NATO to pay more attention to terrorism. The NATO-Russia Council, established in 2002, is identifying opportunities for joint action in all areas of mutual interest but especially in the use of the military to combat terrorist attacks. In 2004, NATO agreed to send an International Security Assistance Force to Afghanistan to help stabilize the country. Afghan instability is believed to have created a climate in which Islamic nationalist terrorism could develop.

NATO, dominated by the United States, became involved in the US efforts to establish a democratic government in Iraq in 2004. It sent a training mission to help the new government of Iraq address the security needs of the Iraqi people. It did not send troops. Instead, NATO offered training and education and

planned to coordinate offers of equipment and help from individual NATO countries. It is not clear how European reluctance to participate in Operation Iraqi Freedom and the subsequent weakening of historic ties between Western Europe and the United States will affect NATO.

NATO has emerged from the Cold War as a global police agency. As the military arm of democratic Western nations, it plans to play an increasing role in establishing and maintaining the security of developing countries. The alliance contends that such activism will fulfill its mission of maintaining North Atlantic stability, but the future of the Atlantic Alliance is in doubt, as it may not have the broad support needed for a radically new agenda.

## NORTHERN SOUTH AMERICA: HISTORY AND ECONOMIC DEVELOPMENT

Northern South America is composed of the independent nations of Colombia, Venezuela, Guyana, and Suriname, plus the French overseas department of French Guiana. Although the region is blessed with rich agricultural land and abundant minerals, the post-1945 period has revealed a number of fundamental flaws in the countries' respective economic systems. After the devastating experience of the Great Depression revealed the negative effects of relying on the liberal, export-led variety of economic

development, most of Latin America pursued an economic path based on import-substitution industrialization. Import-substitution industrialization, however, was not the panacea for economic development that its proponents heralded. During the 1980s, while much of North America, Europe, and East Asia was experiencing an economic boom, Latin American nations were experiencing an economic depression that lasted until the end of the decade. As a consequence, most Latin American nations were forced to readjust their economic strategies. They departed from the import-substitution industrialization path, opened their economic systems to free trade, encouraged foreign investment, began the privatization of state-run industries and companies, and pursued the neoliberal, export-led path of economic development. Although most Latin American economies began to revive during the 1990s, social and political instability, coupled with growing economic disparity between the social classes, offset many of the economic gains.

## Colombia

The majority of Colombia's people live in the valleys and mountain basins that lie between the ranges of the Andes Mountains. Eleven of Colombia's fourteen major urban centers lie in these valleys. The remaining three urban centers are on the Caribbean coast. Travel between Colombia's centers of population was quite difficult during the colonial period. As such, Colombia's people lived in quite distinctive communities and developed their own specific economic paths based on agriculture, livestock, and mining. Following independence at the beginning of the nineteenth century, Colombia's elites, divided into antagonistic Liberal and Conservative factions, spent most of the century fighting fratricidal civil wars that greatly dislocated the political economy. During the 1880s, the Liberal Rafael Nuñez encouraged the expansion of Colombia's coffee industry. Although production never reached the levels of Brazil's coffee production, the Colombian coffee was of a higher quality and fetched a higher world market price. Nuñez's death in 1899, however, tossed the nation back into the all-too-familiar pattern of civil war. One of Colombia's most destructive civil wars, the Thousand-Day War (1899–1902), ruined the economy, destroyed the nation's infrastructure, left one hundred thousand dead, and weakened the nation to such an extent that the United States was easily able to sever the province of Panama from Colombia. The demoralized Colombians needed a leader capable

of reuniting the nation and rebuilding the national economy.

Using dictatorial powers, the Conservative Rafael Reyes (1904–1909) was able to restore fiscal stability, rebuild the nation's infrastructure, and encourage the reorganization of Colombia's nascent coffee industry. Although coffee became the driving force of the Colombian economy, a brief depression hit the nation in the aftermath of World War I. During the 1920s, Colombia's elites began to centralize their power around coffee exports. In 1927, they established the National Federation of Coffee Growers (FNC), a cartel that controlled the export of coffee. Eighty percent of Colombia's coffee was grown by small coffee farmers who sold their coffee to the FNC for marketing. The FNC convinced the government to establish the National Coffee Fund, a state-run agency dedicated to improving coffee production and the transportation network necessary to export Colombia's coffee. While the Colombian elites were investing in coffee production, foreigners, especially the United Fruit Company (UFCO), were establishing export enclaves for banana and oil production. The Great Depression, which caused coffee prices to fall and unemployment to rise, was a direct challenge to elite control of the political economy.

During the 1930s, two outspoken politicians emerged: Jorge Eliécer Gaitán, who represented the radical wing of the Liberals, and Laureano Gómez, who represented the ultra-conservative wing of the Conservatives. Gaitán's assassination in April 1948 ignited a massive riot known as the *Bogotazo*. It unleashed a wave of violence, known as *La Violencia* in Colombia, that took the lives of hundreds of thousands of people and had a negative impact on the development of the national economy. The Conservative Gómez was elected in fraudulent elections in 1950, but was overthrown by former colonel Gustavo Rojas Pinilla in 1953. Rojas Pinilla, who ruled until 1957, encouraged industrialization and developed his own political following. In 1957, Liberal and Conservative elites put aside their differences, established a power-sharing arrangement known as the National Front, and sent Rojas Pinilla into exile. Foreign investment poured into Colombia. Although manufacturing output increased and coffee production also increased with the introduction of new tree varieties, domestic food production declined greatly.

During the 1970s, as demand for Colombian coffee grew and coffee prices rose significantly, international demand for cocaine, especially in North America and Europe, skyrocketed. Although the Colombians are the world's largest producers of cocaine, many of the coca leaves are grown in Ecuador, Peru, and Bolivia. Colombia was flooded with narco-dollars, which

drove up the inflation rate. The informal economy, based on the production and smuggling of refined cocaine, generates more wealth than the formal economy based on agriculture. By the 1980s, over 80% of all cocaine consumed in the United States came from Colombia. Farmers gave up planting traditional crops and turned to the more lucrative production of cocaine. With the drug trade came an excessive level of corruption. To make matters worse, a new round of leftist political violence was unleashed during the 1970s. The military, as well as the paramilitary death squads, unleashed a war of retribution against the leftists and drug lords, which left thousands dead. In an attempt to gain popularity, the drug lords offered to pay off Colombia's entire foreign debt. The US government pumped millions of dollars into Colombia to fight the war on drugs. By 1999, the United States was spending almost \$300 million annually to combat the drug trade. Meanwhile, the violence continued.

Despite renegotiated debts, new oil discoveries, vast mineral deposits (especially gold, copper, lead, mercury, and uranium), privatization of state-run industries, an expanded flower industry (especially roses), and greatly increased trade with Venezuela (Colombia's second-largest trading partner after the United States), Colombia's economy continued to falter and unemployment increased. By the 1980s, in terms of industrialization and gross national product, Colombia was one of Latin America's wealthiest nations. The wealth, however, was very unevenly distributed. A small group of elites, based on the nineteenth-century families that had made their money in mining, as coffee barons, and merchants, had meshed with a small group of new elites, whose money came from industry, banking, and illegal drug exports. These elites controlled the majority of Colombia's wealth. The lifestyle of the nation's elites is supported by a private security force of over 250,000 armed guards. Colombia's resources are quite capable of supporting its population without the cocaine industry, but numerous problems, especially unequal distribution of wealth and incessant violence, must be dealt with before Colombia can achieve and maintain major economic gains.

## Venezuela

Venezuela was an economic backwater until the second half of the eighteenth century when the Bourbon Reforms liberalized trade. During this period, cacao exports were the driving force of the colonial Venezuelan economy. The landed elites, who based their

wealth on cacao exports and cattle ranching, imported thousands of slaves from Africa to work on the cacao plantations, which changed the ethnic makeup of the nation. During the nineteenth century, after independence, the elites introduced coffee cultivation in the fertile Andean foothills. Coffee was Venezuela's primary export until the discovery of oil in 1914. Large-scale oil production began in 1922 during the regime of Juan Vicente Gómez (1908–1935). Oil quickly surpassed coffee as Venezuela's major export and provided the financial basis for Gómez's dictatorship. By the 1950s, when oil production reached over one billion barrels per year, Venezuela was the third-largest oil producer in the world. Oil exports turned Venezuela into an urban, semi-industrialized nation.

Gómez received a one-eighth *regalía* (fraction) of the well-head price of crude oil. This was more than enough money to pay off the nation's foreign debt. Creole (a subsidiary of Standard Oil of New Jersey), Shell, Gulf, Texaco, and Mobile dominated the Venezuelan oil industry. The foreign oil companies took millions of dollars in profits out of the Venezuelan economy. The increase in wealth caused by oil production led to the development of a middle class as well as organized labor organizations that challenged the elite's domination of the political economy. After Gómez's death, he was succeeded by two of his cohorts, General Eleazar López Contreras (1935–1941) and Isaias Medina Angarita (1941–1945). These post-Gómez governments allowed a democratic opening in the political sphere, while simultaneously laying the groundwork for diversifying and industrializing the economy. In 1943, Medina Angarita passed a new petroleum law that raised the *regalía* to an amount that equaled 50% of the foreign oil companies' profits. In addition, in 1945 the Venezuelan government, interested in pursuing the import-substitution industrialization path of economic development, created the *Corporación Venezolana de Fomento*, a government-run development corporation to oversee economic diversification and industrialization projects.

In 1945, a coalition of civilians and young military officers who wanted greater political and economic power staged a successful coup against the Medina Angarita government. The coup was led by Rómulo Betancourt, his supporters in *Acción Democrática* (AD), and a group of young military officers led by Marcos Pérez Jiménez. Betancourt led the civilian-military junta until elections were held in 1947. During this period, AD introduced a controversial 50/50 petroleum law. Betancourt's petroleum plan was actually less radical than Medina Angarita's plan. The new law limited Venezuela's share of the profits to

50%. Regardless, Betancourt was able to call the new legislation nationalistic. However, elites and military generals, fearful of AD's populist rhetoric, overthrew the AD government in 1948. Pérez Jiménez used the oil wealth to fund his dictatorship. His dictatorship was very favorable to US business interests, especially oil interests. Skyscrapers, massive highways, and public housing were built during the oil boom of the 1950s. Oil production doubled during the 1950s and foreign investment dramatically increased. In 1957, an economic recession hit Venezuela when the United States restricted foreign oil imports. A popular civilian-military uprising overthrew Pérez Jiménez. Interim President Admiral Wolfgang Larrazabal increased Venezuela's share of the oil profits to 60% and scheduled democratic elections in December 1958, which were won by Betancourt. Betancourt took over a nation that had both tremendous oil revenue and great economic disparity. Refusing to nationalize the foreign oil holdings in Venezuela, Betancourt initiated gradual economic reforms. In an effort to gain greater control over oil prices, Venezuela was in the forefront of organizing the Organization of Petroleum Exporting Countries (OPEC) in 1960. By 1960, oil exports accounted for over 90% of Venezuela's export earnings. In 1960, however, an economic recession worse than that of 1957 hit Venezuela. Betancourt responded with repression.

In an attempt to deflect criticism of unusually high degrees of corruption, during the 1970s the two main political parties, AD and the Independent Electoral Political Organizing Committee (COPEI), increased their populist rhetoric and actions. The 1973 Arab-Israeli War led to an oil embargo by Arab producers, which resulted in quadrupled petroleum prices in the United States. Although Venezuela did not participate in the embargo, it did benefit from the increased revenue. High prices for oil changed Venezuela's perception of its role in international affairs. In 1975, AD President Carlos Andrés Pérez (1974–1979) nationalized, with compensation, the extensive foreign iron ore holdings in Venezuela. In early 1976, the Venezuelan government nationalized the foreign oil holdings in Venezuela. The foreign oil companies were paid \$1 billion. The Venezuelan government established *Petróleos de Venezuela* (PDVSA), a state-run oil company. With the increased petroleum revenue, the Venezuelan government increased educational programs, raised wages, and implemented industrialization projects. In an effort to increase the pace of modernization and economic development, Pérez negotiated high-interest loans based on projected oil revenues. At the end of the 1970s, however, oil prices plummeted, which sent the Venezuelan

economy into an economic disaster. During the 1980s, the government implemented International Monetary Fund (IMF) austerity measures, which led to a noticeable decline in the standard of living of many Venezuelans.

Pérez's second term as president (1989–1993) was even more corrupt than his first administration. Pérez discarded his populist rhetoric and implemented neo-liberal economic policies, privatized numerous state-run enterprises, and held wages down. In May 1993, Pérez was impeached by the Senate on charges of embezzling \$17 million in government funds. Rafael Caldera, who won the 1993 elections, was unable to pull the nation out of economic chaos. Despite decades of oil revenues, Venezuela was an economic disaster. In the 1998 presidential elections, Hugo Chavez, who had led an abortive coup against Pérez in 1992, promised the voters that he would implement economic reforms that would revitalize Venezuela's faltering economy. Although Chavez promised to revamp the political economy and lessen the influence of the United States on Venezuela, over 50% of Venezuela's world trade is transacted with the United States. Oil wealth once gave Venezuela one of the highest standards of living in Latin America, but inflation, corruption, and faulty economic planning have eroded it. Oil wealth brought only temporary prosperity. In 2000, Venezuela had a lower per capita income than it did in 1974. Venezuela did not become a rich country and missed many opportunities to turn its oil wealth into real economic development.

## Guyana

The Dutch were the first settlers in what today is known as Guyana. They arrived in 1596 and began to settle along the banks of the Essequibo River. They initiated a land reclamation policy that entailed draining swamps and lagoons, as well as building dikes and canals, which made the land habitable and suitable for agriculture. This narrow band of land, no more than ten miles wide and much of it below sea level, extends along Guyana's entire two hundred-mile coastline. Today, this is the nation's primary agricultural area and where most of Guyana's people live. The hinterland, which is sparsely populated and has poor soil, is blessed with significant quantities of diamonds, gold, and bauxite.

The British took the Dutch lands in 1796 and officially re-named the colony British Guiana in 1831. During the nineteenth century, the British were primarily interested in rice, sugar, and cotton

plantations along the coast, as well as some timber felling in the hinterland. Since the Dutch and British found few Indians to work the plantations, they imported African slaves to work the plantations during the seventeenth and eighteenth centuries. After slavery was abolished in 1830, the British imported large numbers of people from South Asia. Descendants of the Africans tend to live in the urban areas and work as merchants, mechanics, and tradesmen, while the descendants of the South Asians tend to work on the farms and live in the rural areas along the coast. The descendants of these two groups make up the majority of Guyana's population today.

During the nineteenth century, the British developed the nation's infrastructure and attempted to open up the interior for settlement and exploration of minerals. Few people, however, were willing to leave the coastal areas. At the same time, the British began to expand the colony westward, at the expense of Venezuela. In 1899, following the 1895 Venezuelan Boundary Dispute, an international tribunal in The Hague awarded the United Kingdom most of its territorial claims in eastern Venezuela. Today, much to the chagrin of the Venezuelan government and people, that land constitutes half of Guyana's territory. The fact that much of Guyana's gold is found in this contested region makes the Guyanese government unwilling to discuss the Venezuelan claim. In 1962, Venezuela declared the 1899 tribunal decision void.

The British began planning for Guyana's independence in the aftermath of World War II. Self-government, which had been planned for 1962, was postponed until 1966 because of racial tensions between the Indo-Guyanese, led by Cheddi Jagan, and the Afro-Guyanese, led by Forbes Burnham. Burnham became the first leader of independent Guyana in 1966. To reduce the mono-cultural dependence on sugar exports, Burnham encouraged the expansion of other agricultural products. In 1970, Burnham began to move ideologically toward the left. He declared Guyana a cooperative republic and established over one thousand worker cooperatives. In 1971, he began the process of taking over the nation's foreign-owned bauxite mines, which were incorporated into a state-run enterprise called Guybau. During the 1970s, the Guyanese government nationalized the British-owned sugar plantations. The government also took control of the banking industry, the rum factories, and the insurance companies. By 1980, the government owned virtually the entire Guyanese economy. Burnham's pro-Soviet rhetoric and dreams of a Soviet-funded socialist experiment in Guyana died with him in a Moscow hospital room in 1985. Soon after, Burnham's vice president, Desmond Hoyte,

began the process of privatization and began to court US foreign investment in Guyana.

In 1992, Jagan was elected with a majority of the vote. Jagan, who had discarded his Marxist rhetoric and socialist pretensions from the 1960s, portrayed himself as a moderate progressive dedicated to neo-liberal economic policies and privatization of the state-run industries. Within four years of taking power, Jagan reduced the nation's inflation rate from over 100% to less than 5% a year. He lured foreign investors to Guyana's agricultural, mining, and timber sectors. Following Jagan's death in 1997, his US-born wife, Janet Rosenberg Jagan, was elected president. Despite her life-long devotion to Marxism, Janet Jagan continued Chedi Jagan's privatization plans. At the end of the 1990s, the national airline and the bauxite mines were privatized. The nation's largest gold mine, Omai, is owned by two Canadian companies. Although Guyana's economy rapidly improved during the 1990s, its per capita GDP of less than \$500 makes it one of the poorest countries in Latin America.

## Suriname

In 1667, the Dutch received Suriname from the United Kingdom in exchange for their colony of New Netherlands (what is today New York). Dutch farmers initiated a land reclamation policy that entailed draining swamps and lagoons, as well as building dikes and canals, which made the land habitable and suitable for agriculture. This narrow band of land, no more than ten miles wide and much of it below sea level, extends along Suriname's entire 230 mile coastline. Today, this is the nation's primary agricultural area and where most of Suriname's people live. The hinterland, which is sparsely populated and has poor soil, is blessed with significant quantities of bauxite and timber.

During the Napoleonic Wars (1799–1815), Suriname was occupied by the British. After Napoleon was sent into exile, the entire region of Guiana, as it was then called, was divided into English, Dutch, and French zones. Following the emancipation of slaves in Suriname in 1863, the Dutch imported people from South Asia and Indonesia. In 1948, the colony became a self-governing component of the Netherlands, responsible for its own internal affairs. In 1975, the Dutch granted independence to Suriname. The Dutch government promised \$100 million per year for ten years to help the new nation develop its economy. As aluminum production declined during the first decade of independence, the Dutch annual stipend became

the basis of economic stability in Suriname. Regardless, virtually none of the Dutch aid was used to develop the nation's infrastructure. In 1980, the military overthrew the civilian government and installed Lieutenant Colonel Desi Bouterse as the new leader of Suriname. The Dutch government immediately cut off all economic aid. The situation was further complicated by declining aluminum prices.

In 1988, the Dutch restored aid payments to Suriname, but not enough to suit Bouterse, who continued to govern until the free 1991 election, which greatly diminished the military's power in governing. Bouterse's personal power further fell when it was learned that he engaged in drug trafficking, for which, in 1998, he was sentenced in absentia in the Netherlands for transporting cocaine. By the end of the 1990s, the Dutch had again resumed aid payments, albeit at the diminished amount of \$65 million per year. Ronald Venetiaan, who came into power in 2000, initiated an austerity program, raised taxes, and attempted to limit government spending. Regardless, Suriname remains dependent on aluminum exports, which provide over 90% of the government's tax revenues. Notwithstanding nationalist rhetoric, the aluminum industry continued to be owned by Suralco, a subsidiary of Alcoa. Rice remains the chief agricultural crop and food staple. The continued reliance on aluminum exports and foreign aid, coupled with the lack of significant attempts at industrialization or agricultural product diversification, does not bode well for Suriname's political or economic future.

## French Guiana

In 1946, after more than three centuries as a French colony, French Guiana was transformed into an overseas department—*département d'outremer*—of France. In theory, French Guiana was to be equal and identical to any other French department. As a result of their non-independent status, the people of French Guiana enjoy a standard of living vastly superior to the people of the former Dutch and British Guianas. The people of French Guiana receive generous social security and medical benefits, wages are higher than in the rest of the Eastern Caribbean, and the infrastructure is vastly superior. With its mineral resources and potential for hydroelectric energy, especially the Petit-Saut dam project on the Sinnamary River, French Guiana has great potential to develop its economy.

The traditional colonial economy was based on gold prospecting, forestry, subsistence agriculture,

and sugar production. Gold was discovered in 1853. By 1960, gold accounted for almost 70% of French Guiana's exports. Over 70% of French Guiana is covered with tropical forests, which are mostly owned by the state. By 1960, timber accounted for 20% of French Guiana's exports. There is a limited amount of land along the narrow coast suitable for farming. The traditional method of subsistence agriculture is called *abattis* (cultivation for a few seasons in a forest clearing created by slash-and-burn agricultural techniques). This method is only practical in areas of low population density.

During French President Charles De Gaulle's Fourth Republic, the power of the *Préfet*—the local representative in French Guiana of the central government—was increased, giving the position total responsibility for defense and security, as well as a central role in economic affairs. Thus, beginning in 1958 and culminating in the 1970s, French Guiana underwent a significant economic transformation. The traditional agriculture-based productive economy of the colonial era was replaced by a skewed consumer-oriented economy based on massive cash infusions from France. By 2000, over three-fourths of the population was involved in the service sector. Between 1958 and 1978, food production declined by over 50%. As a result, in later years most foodstuffs were imported. Although cattle-raising and rice cultivation have been introduced, the most dynamic sector of French Guiana's economy is the fishing industry. By 2000, shrimp exports represented 60% of French Guiana's total exports. Gold, timber, and rice exports each account for about ten percent of total exports. Regardless, exports remain minimal when compared to the substantial imports, which has perpetuated a negative trade balance.

## NORTHERN SOUTH AMERICA: INTERNATIONAL RELATIONS

Northern South America is composed of the independent nations of Colombia, Venezuela, Guyana, and Suriname, plus the French overseas department of French Guiana. The five states have experienced a number of significant border disputes, many of which are still unresolved. Since 1945, one of the most dramatic changes in the region has been the integration of these nations into the global community. Prior to 1945, foreign relations were dominated by relationships with the United Kingdom and the United States. In the post-World War II world, Canada, Japan, Germany, France, Italy, Spain, and the Netherlands have reinforced their influence in the region through cultural programs, economic aid, and support for political parties allied with their predominant ideologies. Regardless, the United States remains an important trading partner and continues to view the Caribbean Basin as its backyard. This trend has been reinforced by US economic and military aid packages. Notwithstanding continued hegemonic assumptions on the part of the United States, the nations of northern South America have pursued foreign policy initiatives that have been, at times, at variance with US foreign policy goals and objectives.

## Colombia

In 1822, Gran Colombia (present-day Colombia, Venezuela, Ecuador, and Panama) was the first Latin American nation to receive US diplomatic recognition. Prior to World War II, however, the most pressing concerns for Colombian diplomats revolved around boundary disputes and territorial integrity. Although Colombia and the United States had cordial and friendly relations during the nineteenth century, the secession of Panama from Colombia in 1903 was a major source of friction in US–Colombian relations during the first two decades of the twentieth century. Despite the US government’s support of the Panamanians in their independence from Colombia, economic ties with the United States were of great importance to Colombia even in the early twentieth century, since the United States was the largest importer of Colombian coffee. For over a decade, from 1922 to 1934, Colombia feuded over its common boundary with Peru in the Leticia area. The League of Nations agreement provided for Leticia becoming a permanent part of Peru. Brazil and Colombia agreed to a definitive frontier in 1928. Border disputes with Venezuela, especially over offshore exploratory drilling rights in the Gulf of Venezuela, caused great tension in Colombian–Venezuelan relations during the last quarter of the twentieth century. This tension was heightened by the hundreds of thousands of undocumented Colombians who fled the intense violence in Colombia for the relative safety of Venezuela. The most vociferous dispute, however, involved repeated claims by Nicaragua’s Sandinista government concerning ownership of San Andrés Island. During the 1980s, the Sandinistas argued that San Andrés, which lies off the coast of Nicaragua, should be controlled by Nicaragua. The Sandinistas claimed that Nicaragua’s acquiescence to Colombian ownership of the island in 1928 was not valid since the agreement was made when US marines were stationed in Nicaragua. The Colombian government considered the 1928 agreement binding.

Colombia broadened its foreign policy initiatives after World War II. It was an active participant in the San Francisco Conference that created the United Nations (UN) in 1945. Colombia also played an important role in creating the Organization of American States (OAS) in Bogotá in 1948. Former Colombian President Alberto Lleras Camargo was the OAS’s first secretary general. Colombia’s approach to national and international security issues has been characterized by a willingness to settle disputes through regional and international security organizations, rather than resorting to force. Throughout the early Cold

War period, Colombia’s foreign policy was based on consistent support of the United States against the Soviet Union and its allies. Believing that international communism was partially responsible for the violence unleashed in the wake of the 1948 *Bogotazo* (a civil uprising in the capital city over the assassination of Jorge Gaitan, a popular spokesman for the poor), Colombia severed relations with the Soviet Union. Colombia was the only Latin American nation to contribute militarily to the UN Peacekeeping Force in the Korean War. Although the Colombians only contributed one battalion and one battleship, the *Almirante Padilla*, this symbolic gesture strengthened US–Colombian friendship. In addition, Colombia provided the only Latin American troops to the UN Emergency Force in the Suez conflict. Colombia was thus rewarded with generous US economic and military aid packages.

Colombia voted fairly consistently with the United States in international security forums during the 1950s and early 1960s. Because of Fidel Castro’s assistance to the *Ejército de Liberación Nacional* (ELN) guerrillas fighting the Colombian government, Colombia actively supported OAS sanctions against Cuba in 1962 and the expulsion of Cuba from the OAS in 1964. Its willingness to follow the US lead in the inter-American system, however, had diminished by the end of the 1960s. In 1968, diplomatic relations were reestablished with the Soviet Union, and in 1975 President Alfonso López Michelsen resumed diplomatic relations with Cuba. In addition, López Michelsen refused to condemn Castro’s intervention in the Angolan civil war. In 1981, López Michelsen’s successor, Julio César Turbay Ayala, a fervent anti-communist, broke diplomatic relations with Cuba after Castro admitted supporting the M-19 terrorist group in Colombia. Turbay reestablished close relations with the United States and affirmed President Ronald Reagan’s thesis that Cuba and Nicaragua were the principal sources of subversion and turmoil in Latin America. Colombia was one of the few Latin American nations not to support Argentina’s invasion of the Falklands in 1982.

Belisario Betancur, who won the 1982 presidential elections, reversed Turbay’s anti-Argentine position in regard to the Falklands invasion, supported Bolivia’s aspirations for territorial access to the Pacific Ocean, argued that the Sandinistas were not a menace to harmony in Central America, took Colombia out of the pro-Reagan camp, and joined the nonaligned movement. Concerned about the possibility of US military intervention in Central America and the escalation of Central American civil wars, Colombia joined with Mexico, Venezuela, and Panama in

January 1983 to form the Contadora Group to seek a solution to the Central American crisis. Betancur was afraid that Central America was turning into a battleground for the Cold War. Betancur became less sympathetic toward the Sandinistas as a result of their alleged involvement in supporting the M-19's 1985 *Palacio de Justicia* takeover and their renewed campaign to acquire San Andrés. Economic problems at home, coupled with domestic criticism of his foreign policy initiatives, convinced Betancur to move away from his nonaligned movement agenda.

Colombia's most difficult issue in foreign relations concerned drug trafficking. By 1980, Colombia was the major source of illegal cocaine and marijuana smuggled into the United States. The bilateral Extradition Treaty between Colombia and the United States, signed by both countries in 1979, provided for the extradition of suspected drug exporters to the United States. At first, Betancur, flush with his nonaligned movement rhetoric, refused to extradite Colombians as a matter of principle. By 1984, however, Betancur launched a war on the drug cartels and began extraditing drug traffickers—including cartel kingpin Carlos Lehder Rivas—to the United States. The drug lords responded by bribing officials, kidnapping prominent people, killing judges, and funding revolutionary movements. The demand for cocaine in the United States had turned Colombia into the most dangerous place in the world to live during the 1980s. Betancur's successor, Virgilio Barco, also declared war on the drug smugglers. The drug lords did not want to be extradited to the United States; they preferred to stay in Colombia, have a quick trial, and bribe the judges to dole out limited sentences. In 1987, the Colombian Supreme Court declared the law enforcing the extradition treaty unconstitutional. It was not until 1997 that the Colombian government allowed the extradition of suspected drug traffickers to the United States. The Clinton administration rewarded the Colombians by lifting the ban on military aid. In 1998, for the first time in three years, the US government "certified" Colombia as an ally in the war on drugs.

## Venezuela

Two themes—oil exports and, to a lesser degree, border disputes—have dominated Venezuelan foreign policy initiatives for most of the twentieth century. Maintaining good relations with the United States has been a crucial part of this agenda. Although Venezuelan governments, such as Hugo Chavez's regime since 1999, have intermittently expressed the

desire to create and implement foreign policy independent of that of the United States, they have not deviated significantly from the US agenda nor have they threatened oil exports to the United States. Frequently, Venezuelan governments have looked to the United States for leadership and help in solving their border disputes. Venezuela has long-standing border disputes with Colombia and Guyana, some of whose roots can be traced back to the nineteenth century. The disagreement with Colombia is primarily a maritime dispute over the Gulf of Venezuela. In the late 1980s, Colombian attempts to initiate oil exploration projects in the Gulf of Venezuela led to an impasse in Venezuelan–Colombian relations. Through diplomatic negotiations, and a meeting of the presidents of both nations at the border, the conflict was diffused. As of this writing, Venezuela continues to control the oil rights in the Gulf of Venezuela. The dispute with Guyana is much more problematic. Venezuela claims over half of Guyana's national territory. The dispute has its origins in Britain's attempts to expand its territorial holdings in British Guiana during the nineteenth century. Much to the chagrin of the Venezuelans, in 1899 an international tribunal awarded most of the disputed territory to the British.

During World War II, while Brazil and Mexico formally declared war on Nazi Germany, Venezuela merely broke off diplomatic relations with the Axis powers in 1941. Much more significant, however, is the fact that Venezuela provided a steady flow of petroleum to the United States during the war. In addition, the Venezuelan government froze all German assets in Venezuela. In 1947, as the threat of international communism was gradually revealed, Venezuela, like the rest of independent Latin America, signed the Inter-American Treaty of Mutual Assistance (the so-called Rio Treaty), which committed its members to a joint response should an attack be made against any of them. From 1948 to 1958, the military government in Venezuela was involved in a close relationship with the United States. Marcos Pérez Jiménez was an ardent anticommunist and acted quite favorably toward US business interests. During his dictatorship, foreign oil companies received generous concessions. US support for Latin American dictators, however, greatly decreased during the late 1950s. In 1958, members of Rómulo Betancourt's *Acción Democrática* (AD), Jóvito Villalba's Democratic Republican Union (URD), and Rafael Caldera's Independent Political Organizing Committee (COPEI) met at Caldera's home to sign the Pact of Punto Fijo, a civilian plan to avoid inter-party conflicts, strengthen constitutional democracy, and establish a government of national unity to ensure that all political forces (with the notable exception of

the communists) were represented in the political system. As such, it was the groundwork for a two-party representative democracy somewhat similar to that in the United States. Venezuela also felt a close political affinity to European democracies. AD governments pursued close ties with the socialist and social-democratic parties and governments in Europe, while COPEI administrations established close ties with the Christian democratic governments of Europe.

The first two presidents of the democratic era, Rómulo Betancourt and Raúl Leoni, were supporters and beneficiaries of President John F. Kennedy's Alliance for Progress. Once Juan Bosch's democratically elected government was overthrown by the Dominican Republic's military in September 1963, Venezuela stood as the brightest beacon of Kennedy's idea of a "showcase for democracy." Betancourt and Leoni, both representing the AD, took aggressive stands against nondemocratic regimes in Latin America. Both presidents were equally critical of Cuba's left-wing totalitarian dictator, Fidel Castro, and the Dominican Republic's right-wing authoritarian dictator, Rafael Trujillo, who plotted to assassinate Betancourt in 1960. Both administrations enforced the Betancourt doctrine, whereby Venezuela refused to maintain diplomatic relations with governments formed as a result of military coups. Unfortunately, during the 1960s and early 1970s, this doctrine gradually isolated Venezuela from the rest of Latin America, which was increasingly dominated by governments that came to power through military coups. During the 1970s, Venezuela abandoned the Betancourt doctrine and even restored diplomatic relations with Cuba in 1974.

Venezuela was in the forefront of organizing the Organization of Petroleum Exporting Countries (OPEC) in 1960. The 1973 Arab-Israeli War led to an oil embargo by Arab producers that resulted in quadrupled petroleum prices in the United States. Although Venezuela did not participate in the embargo, it did benefit from the increased revenue. High prices for oil changed Venezuela's perception of its role in international affairs. During the 1970s, Venezuela provided support to the Sandinistas who struggled to overthrow Nicaraguan dictator Anastasio Somoza Debayle. During the 1980s, Venezuela initiated the San José Accords, an agreement designed to supply oil at greatly reduced prices to economically challenged nations in the Caribbean Basin. In 1982, however, Venezuela suspended the discounted oil sales to the Sandinista government. The suspension was as much a result of the Nicaraguan government's failure to pay its massive oil debt as it was Venezuela's disappointment with the lack of progress toward implementing a democratic government in Nicaragua.

The Venezuelan government was supportive of Violetta de Chamorro when she won the 1990 elections in Nicaragua. The Nicaraguan oil debt to Venezuela was canceled and oil exports were immediately resumed. Venezuela strongly supported (and justified) Argentina's invasion of the Falklands in 1982. Venezuela's government, like most of the Latin American governments who argued for hemispheric solidarity at the time, was critical of the US invasion of Grenada in 1983. In 1983, Venezuela, Colombia, Mexico, and Panama met on the island of Contadora to design a regional strategy to obtain peace in war-torn Central America. Venezuela supported the establishment of democratic systems in the Caribbean Basin as the most beneficial solution for the countries involved as well as for Venezuela's own political and economic interests.

## Guyana

Since gaining independence in 1966, Guyana's foreign policy has undergone a series of ideological changes in foreign policy making. From 1964 to 1969, Forbes Burnham's People's National Congress (PNC) was pro-Western. This was in marked contrast to Chedi Jagan's People's Progressive Party (PPP) whose leftist platform had prevailed until Burnham came to power in 1964. Beginning in 1969, Burnham began to move Guyanese foreign policy into the nonaligned camp. He also vocalized support for socialist causes in international forums. Guyana established diplomatic and economic ties with the communist governments in Eastern Europe, China, the Soviet Union, and Cuba. For example, in 1975, China agreed to provide interest-free loans to Guyana and to import Guyanese bauxite and sugar. Nevertheless, when Desmond Hoyte succeeded Burnham in 1985 he began to move Guyana back into the pro-Western camp. The fall of communism in the early 1990s accelerated this trend. In 1992, when Chedi Jagan returned to power, he abandoned his socialist rhetoric and continued the pro-Western approach of the Hoyte administration. Foreign relations with the United States, Venezuela, Suriname, and the English-speaking Caribbean states frequently dominate Guyanese foreign policy making.

US-Guyanese relations have ranged from cool to cordial. From 1964 to 1969, Burnham had the support of the United States. The US government was convinced that Burnham's government had no intention of pursuing Jagan-style socialism or of nationalizing foreign-owned industries. Whereas prior to 1964 the US was concerned that Jagan might transform Guyana into a "second Cuba," the United

States believed, all too simply, that Burnham would continue to follow the pro-Western path in foreign affairs. After 1969, when Burnham began to support socialism both domestically and internationally, relations between the United States and Guyana cooled significantly. When Burnham established a cooperative republic in 1970 and nationalized the sugar and bauxite industries in the mid-1970s, he placed Guyana firmly within the nonaligned movement. To retaliate, U.S. President Ronald Reagan excluded Guyana from participation in the Caribbean Basin Initiative (CBI). Burnham, who had ties to Grenada's New JEWEL Movement, was especially critical of the US invasion of Grenada in 1983. After Burnham's death in 1985, relations with the United States improved. President Hoyte energetically sought Western aid and investment in Guyana.

Venezuelan-Guyanese relations have been dominated by a persistent border dispute that dates back to Guyana's pre-independence period. During the nineteenth century, Guyana's colonial masters, the British, began to expand the colony westward at the expense of Venezuela. In 1899, an international tribunal in The Hague awarded the United Kingdom most of its territorial claims in eastern Venezuela. Today, that land constitutes five-eighths of Guyana's land mass. Complicating the situation is the fact that the disputed region is quite rich in minerals, especially gold. In 1962, Venezuela declared the 1899 tribunal decision void. In 1966, British, Guyanese, and Venezuelan representatives signed an accord that established a new tribunal, consisting of two Guyanese and two Venezuelans, to reevaluate the border dispute. Although the commission failed to reach an agreement, both nations promised to refrain from a violent resolution of the dispute. In 1969, Venezuela supported an ill-fated uprising in the southern sector of the disputed zone. Guyana's military crushed the rebellion and Venezuela was criticized by the other Latin American nations. In 1970, because of international pressure, Venezuela and Guyana signed a twelve-year moratorium on the dispute. The protocol was not renewed by Venezuela when it expired in 1982. Fearful that a precedent would be set, the Guyanese government harshly criticized Argentina's invasion of the Falkland Islands in 1982 and the U.S. invasion of Grenada in the subsequent year. As of this writing, although Venezuela still claims the disputed territory, there is little threat of a Venezuelan invasion.

Guyana's relations with Suriname have also been plagued by a border dispute. In 1969, Suriname sent troops into southeast Guyana to occupy a parcel of disputed territory. After the Guyanese defeated the invaders there were no subsequent attempts to take

the disputed territory by force. Another problematic issue in relations with Suriname concerns the forced repatriation of Guyanese people living in Suriname. During the 1980s, Suriname's leader Desi Bouterse blamed Guyanese immigrants for Suriname's economic woes and began the forced repatriation.

Although its relations with Spanish-speaking Latin America are limited, Guyana has encouraged greater unity among the English-speaking Caribbean nations. Guyana is a member of CARICOM (the Caribbean Community) and CARICOM's headquarters are located in the capital of Guyana, Georgetown. By 1991, CARICOM's membership included all independent English-speaking nations in the Caribbean Basin. Relations with CARICOM member states were especially problematic in the aftermath of the US invasion of Grenada. Burnham accused Eugenia Charles, Dominica's prime minister, of complicity in the invasion. Tensions with CARICOM members diminished after Burnham's death in 1985.

## Suriname

Since gaining independence in 1975, Suriname's foreign policy has been dominated by a series of conflicts regarding its borders with Guyana, Brazil, and French Guiana. These disputes, which trace their roots back to the colonial period, are exacerbated by the sparse population and lack of natural boundaries in the hinterland regions. Although Suriname has resolved its border dispute with Brazil, the border disputes with Guyana and French Guiana remain unresolved. Relations with the former colonial master, the Netherlands, have played a prominent role in Suriname's foreign relations. The Surinamese government has been dependent on continued infusions of economic aid, often totaling over \$100 million annually. The continued flow of economic aid has frequently been conditioned by the actions of Suriname's government at home and abroad. When Suriname became independent, its large Asian population feared that it would lose political and economic privileges to the even larger African population. As a result, about 140,000 people (virtually 25% of the population) fled to the Netherlands. The Dutch government has consistently made the giving of aid conditional on the willingness of the Surinamese government, which is dominated by people of African ancestry, to move steadily along the path toward democracy.

Since independence, the most prominent and controversial figure in Suriname's history has been Desi

Bouterse. In 1980, a group of noncommissioned officers overthrew a civilian government led by Henck Arron. After an initial period of confusion, Lieutenant Colonel Bouterse emerged as the center of power. Bouterse greatly expanded the size of the military and experimented with the idea of forming an alliance with Cuba. Realizing the risks involved in this plan, especially in the aftermath of the US invasion of Grenada in 1983, Bouterse quickly disengaged from his foreign policy initiatives with Cuba. Nevertheless, the Reagan administration was suspicious of Bouterse, and the Dutch government cut off economic aid to Bouterse's increasingly brutal regime. In an attempt to regain the desperately needed Dutch economic aid, Bouterse, with varying degrees of success, worked to construct a veneer of democracy for his regime.

In 1986, Ronnie Brunswijk, who represented about fifty thousand descendants of runaway slaves who lived in the interior of Suriname and who were annoyed by Bouterse's attempts to alter their lifestyles by resettling them in urban areas, launched a civil war. US and Dutch government officials condemned Bouterse's tactics to combat the rebels, but stopped short of imposing further sanctions against Bouterse's regime. Thousands of Brunswijk's supporters fled to neighboring French Guiana, which complicated relations with France. Although the civil war continued, Bouterse's efforts to provide a facade of liberalization of the political system convinced the Dutch to resume economic aid by the end of the 1980s.

In 1990, after large quantities of cocaine began to arrive in the Netherlands, an investigation revealed that Bouterse was involved in the export of Colombian cocaine. Once again, the Dutch suspended their massive aid infusions. In 1991, Dutch economic pressure brought about democratic elections that resulted in the removal of Bouterse as commander of the military. In late 1997, Bouterse was tried *in absentia* in a Dutch court for drug smuggling and found guilty. Regardless, as of 2005, Bouterse remains free in Suriname. Since 2000, the democratically elected government of Runaldo Venetiaan has encouraged more Dutch and U.S. investment in Suriname, especially in the bauxite industry, and Suriname has become an active member of CARICOM (Caribbean Community).

## French Guiana

Unlike its independent neighbors, French Guiana is still a part of France. As such, foreign policy

emanates from Paris. French Guiana became a French colony in 1667. The colony was best known for its infamous prison on the *Ile du Diable* (Devil's Island), which was eventually closed in 1945. Unfortunately, French Guiana has never fully escaped its negative image as a former penal colony with an unhealthy climate and an impenetrable hinterland. In 1946, French Guiana was transformed into an overseas department—*département d'outremer*—of France. Unlike the peoples of other European colonies in the Caribbean who loudly clamored for independence during the post-1945 era, the people of French Guiana saw the economic benefits of remaining part of the French nation. In 1958, the power of the *Préfet*, the local representative in French Guiana of the central government in Paris, was increased, giving him total responsibility for defense and security. Regardless, foreign policy is still controlled by the French government. Since 1980, the French government has encouraged French immigration to the territory. As of the early twenty-first century, Continental French make up over 30% of French Guiana's population of 140,000 people.

## NYERERE, JULIUS

Julius Nyerere (1922–1999) was president of Tanganyika from 1962–1964 and the co-founder and first president of Tanzania (1964–1985), first president of TANU (Tanganyika African National Union), and the founder and chairman (1977–1990) of the *Chama Cha Mapinduzi* (Revolutionary Party of Tanzania). Nyerere, known as Mwalimu (teacher) in Tanzania, was one of the greatest of the first generation of leaders of independent African states. As president of Tanzania, he directed one of the most widely studied—though little imitated—development efforts in the developing world. While some of the efforts he oversaw bore limited fruit, there is continuing interest in Nyerere’s analysis of development issues, and especially in his ideas concerning education in the developing world.

Nyerere thought the goal of development efforts should be “man-centered” (Nyerere 1968). By this he meant that development should be aimed at establishing equity, self-reliant economic growth, and political order. Nyerere held that this would only be achieved through socialist policies. He identified socialism, however, not with specific institutions but with “an attitude of mind” (Nyerere 1968). Attitudes supporting non-exploitive relationships—whether economic, political, or social—should be the motivating force for development plans and reinforcing them should be a major policy goal. This required Tanzania to follow policies aimed at rural development, self-sustaining industrial growth, increased educational attainment, and political democracy within a one-party framework.

The development program was only partially successful. It had two prongs: Increased agricultural production was to take place through concentrating rural populations in so-called “ujamma” (familyhood) villages based on cooperative agriculture and application of agronomic techniques. While the ujamma villages did make delivery of government services more efficient, they were not generally successful. Tanzania has a long tradition of peasant agriculture based on ethnic and clan ties. The exploitation of these cultural bonds by local entrepreneurs and a relentlessly bureaucratic organizational structure combined to produce, at best, mixed

success. The second prong was an ambitious industrial development program, based on cash crop agriculture, import substitution industries, and increased infrastructural investment. The failure of the ujamma village scheme, while not fatal to this effort, made it more problematic. Cash crop production never attracted the level of investment to become the engine of development Nyerere envisioned during his lifetime. Resource constraints, especially for petroleum products, had negative effects as well, given Tanzania’s meager natural endowments. Finally, the lack of governmental planning capacity was never effectively overcome while Nyerere ruled Tanzania.

Nyerere’s legacy has been more favorable in the area of social and human capital. Tanzania’s commitment to democracy within a one-party framework was successful and paved the way for the adoption of multi-party democracy in 1995. While occasional human rights abuses have arisen (Saul 2000), the country has maintained political unity and made an easy transition to elective democracy. Tanzania has also managed to avoid the military takeover that has afflicted so much of Africa. Here the experience of the Ugandan War and the subsequent intervention of Tanzania in the insurrection in Mozambique are illustrative. In the course of the war, the Tanzania People’s Defense Force (TPDF) transformed itself from five independent battalions to a divisional structure, increasing its size fourfold. The TPDF defeated the Ugandans and their Libyan allies and militarily occupied Uganda for two years. The subsequent demobilization of this force, including the diminution in rank of most of the officer corps, followed by the partial deployment of the TPDF to support the army of Mozambique, speak volumes about the stability and legitimacy of the government Nyerere created.

It is Nyerere’s emphasis on educational policy, however, that is his main legacy. He insisted on reforming the education policies inherited from the colonial period to more closely fit the goal of increasing knowledge relevant to individual economic and political self-reliance. This meant attempting to extend primary education to all and reforming it to emphasize economically useful skills. Adult education was to be increased as well and refocused on eradicating illiteracy and, again, teaching useful skills. Secondary and collegiate education was to be reformed to tie advanced degrees to development goals and to eliminate its elite character. While, again, resource constraints have prevented full realization of these ideas in Tanzania, Nyerere’s thoughts on these subjects are now received wisdom among development policy makers.

Tanzania is one of the few developing countries that has consistently attempted to promote growth with equity. While remaining poor, the country has created, largely due to Nyerere's influence, an environment (political participation and stability, government capacity, and macroeconomic stability) conducive to sustained, internally directed development (Helleiner 2000). As such, Tanzania and Nyerere's ideas should remain of interest to all concerned with the developing world.

## **OCEANIA: HISTORY AND ECONOMIC DEVELOPMENT**

Most people take “Oceania” to mean the Pacific basin, comprising the geographical areas of Micronesia, Polynesia, and Melanesia (originally proposed by the French explorer and writer Jules-Sébastien-César Dumont d’Urville in 1832). For many researchers, Oceania also includes the large island-continent of Australia. Australia, however, is treated separately in most sources, except when dealing with its Aboriginal, pre-1788 inhabitants. Papua New Guinea (Melanesia) and Aotearoa/New Zealand (Polynesia) are prominent places in Oceania; these places are often excluded from the region because Papua New Guinea is large and Aotearoa/New Zealand, like Australia, has mainly a European settler population.

The mainly Austronesian-speaking discoverers and settlers of this vast region (excluding the much older arrival of humans to Australia) have their origins in southern China and Taiwan. For more than five thousand years, these voyaging peoples spread their language and culture from Madagascar in the west to Hawaii and Rapanui (Easter Island) in the east in what was the most extensive geographical coverage of any language group, until the epoch of European colonialism, commencing a little more than five hundred years ago.

Particularly in the first millennium of the Common Era, it is likely that extensive trading but not territorial empires existed; trading linked all these dispersed peoples in networks of commercial and social interaction. Evidence of this can be found in the distribution

of natural resources, such as obsidian (a volcanic product), much-valued red bird feathers, and hard basalt, throughout the region. Older Oceanic genealogies show, for example, that Fiji, Tonga, and Samoa share a number of ancestors with spouses who traded extensively. The firmest evidence of this region-wide trade is found in the distribution of Lapita pottery, which is found on nearly every island that people had settled, even after its manufacture had ceased. This epic voyaging and contact diminished with the radical climate change of the “1300 Event,” so-called because it can be detected in the archaeology of Oceania (and the rest of the planet, of course) at around 1300 AD and is frequently termed The Little Ice Age. This age broke long-distance contacts, reducing trade to local archipelagos, and the trade eventually became curtailed with the intrusion and imposition of European webs of alliance and control.

There have been speculations that Chinese and South Asian navigators may have explored Oceania extensively during this yearly period. These speculations are largely based on inference from early European sources, but nothing substantial has been found to date of any expeditions that may have come from those places.

The first European explorers in Oceania were Spanish, Dutch, and Portuguese who were seeking new wealth and fields of exploitation. Apart from settlements on the rim, these ventures used Oceania as a pathway for shipping their riches between New World and Asian ports for two centuries, with imprecise maps and occasional reports of new peoples (and

possibilities) found. For that early time, shipping and piracy were the main forms of economic development; only Guam had a foreign settlement as an outfitting and repair station for the Spanish galleons plying the waters between the Philippines and the Americas.

The eighteenth century saw new Europeans seeking to replace old empires in the Americas, often bringing their home rivalries with them to battle in distant colonial lands. France and Britain were the superpowers of the eighteenth and nineteenth centuries, and both countries sponsored complex and well-provisioned expeditions for scientific, economic, and, as always, military advantages. James Cook and the Comte de La Pérouse charted new lands (to Europeans) to be sure, but they also developed strategically important ways of finding such places that soon became part of naval armaments in recurring conflicts in Europe and around the world. European explorers and military investigators of this era are often erroneously called in the older literature “discoverers” of various places; some cases document Europeans arriving on uninhabited (when they arrived) places, but mostly Europeans mapped places already discovered and settled by indigenous peoples for centuries.

Whaling and exotic commodities, such as *Bêche-de-Mer* (a sea slug valued in Asia for medicinal properties) and sandalwood, were early exploitations in Oceania, with colonial settlement following soon after. Whaling not only provided wealth for German, English, and American whalers, it gave the peoples of Oceania a way to escape their own islands and to seek advantage as crew and missionary assistants on a larger stage. Crews were multiethnic, with Asians and Europeans jostling Oceanians from north and south. The major whaling ports of Lahaina (on Maui in the Hawaiian chain), Bay of Plenty (New Zealand), and Sydney were cosmopolitan capitals with Oceanians from all over the region, many meeting one another for the first time in centuries. Such crews also brought back to their islands cash capital and new goods, often weaponry, altering local power balances forever.

Even the visits of these whaling expeditions changed power structures as one side of an island provided safe harbour and acquired European gunnery, whilst another side languished in outsider material neglect. Although not the case everywhere, on the whole islanders favoured shallow lagoons, rich in easily exploited shore life, with abundant rainfall for crops. The outsider navigators sought deep harbours, safe from disturbing storms, that before had been the less affluent areas for islander settlement.

The great early impulse in the economic development of Oceania was the quest for the Great South Land, where fabulous peoples and wealth were meant to exist. After it was shown that such a place did not

exist, the next obsession was for a northwest passage that could connect the European Atlantic with the rich pickings of the Asian Pacific. That, too, proved to be a forlorn hope.

The products of the whale, from its blubber to features of its body, provided the world with many products that in more recent times have been replaced by petroleum-based fuels and plastics. Sea voyages of three and four years were common in nineteenth-century Oceania, and small places with new ports developed from remote communities were becoming part of a vibrant network of trade, resource exploitation, migration, and communications. People in Honolulu were in regular contact and exchange with family and associates in Auckland, New Zealand. Sydney, Australia, and Levuka (later removed to Suva), Fiji, exchanged goods, letters, and news with Santiago, Chile, and San Francisco, California, part of the growing northern Pacific power, the United States of America (San Francisco was once in northern Mexico).

The peoples of the Pacific Islands, with new belief systems through missionaries and new nationalities through colonial conquest, also learned new skills in manufacture, trade, and habit that profoundly altered their societies. Most notably, islanders who lived inland were encouraged to gather around the trader’s outpost, then the church, and later the administrative centre. Cities became a dominant form of living; in the twenty-first century, Oceania, including Australia, is one of the most urbanised regions on the planet.

Although never as much a scourge as in Africa, there were episodes of forced labour in Oceania by Europeans of the relatively small populations of the Pacific islands. Rim countries sought labourers. Agricultural and domestic workers were dragooned into a short-lived trade from Eastern Oceania into Peru in 1862–1863; similarly, field hands were imported into Australia to solve a sugar industry labour shortage. “Blackbirding,” an Australian term signifying the historic practice of separating out and discriminating against aborigines, as well as discriminating against people of non-European origins through immigration policies, was a general and single entrepreneurial enterprise that was condemned by authorities but welcomed quietly by plantation owners.

Blackbirding came about in various forms after the abolition and general condemnation of slavery, early in the emerging republics of Latin America, later by half a century in the United States. Blackbirding, whether by force, deceit, or lures of wealth, supplied a good part of agricultural labour in Fiji (until South Asian immigration schemes developed from 1879) and, especially, in Australia. So-called “Kanakas” (from the Hawaiian word for “human” or “person”) were the

foundation of plantation development in Australia's tropical north until the practice was ended in 1901 by the first Act of the New Commonwealth of Australia: the "White Australia" policy called for residues of those former migrants to be forcibly repatriated, and only a handful of descendants of those tens of thousands remaining in the country today.

Whaling waned, and sun-dried coconut meat ("copra") as well as sugar became less important economic activities, with military colonialism taking over in the twentieth century as the dominant mode of production. Troop installations, weapons testing by various powers, and two major conflicts (World Wars I and II) brought economic development to Oceania, often at a very high cost in lives and the destruction of fragile environments.

As the twentieth century's most extensive wars closed, military testing and the construction of military bases slowed down, and tourism came to prevail as the prime mode of economic development for

Oceania. No state or territory of Oceania today lacks its tourism development plan, with islanders pinning their hopes and skills on people from the developed world coming to spend their leisure time (and much larger wealth) in resorts and on beaches throughout the region. Whilst there are various devices for telling one "brand" of island tourism from another, the image continuity in beach, sun, and languid days is pervasive; most brochures show a poolside/beachfront folding lounge chair with a waving palm. An occasional Oceanic face or body may be added for decoration.

The exploitation of primary resources remains a watery feature of Oceanic economic development, with fisheries being a major industry at present. Terrestrial resource development is a feature of the larger Melanesian lands of Papua New Guinea, New Caledonia (still the largest nickel mine in the world), and the Solomon Islands; there is even a small but thriving gold industry in Fiji.

Table 1: 2004 Pacific island populations, areas, and densities

Country, state, or territory	Population estimate in mid-2004	Land area (km <sup>2</sup> )	Exclusive economic zones (EEZ) (000s km <sup>2</sup> )	Population density (land)
American Samoa	62,600	200	390	313
Cook Islands	14,000	237	1,830	59
Easter Island (Rapanui)*	4,446	166	2,930	27
Federated States of Micronesia	112,700	701	2,978	161
Fiji	836,000	18,272	1,290	46
French Polynesia	250,500	3,521	5,030	71
Guam	166,100	541	218	307
Kiribati	93,100	811	3,550	89
Marshall Islands	55,400	181	2,131	306
Nauru	10,100	21	320	481
New Caledonia (Kanaky)	236,900	18,576	1,740	13
Niue	1,600	259	390	6
Northern Mariana Islands	78,000	471	1,823	166
Palau (Belau)	20,700	488	629	42
Papua New Guinea	5,695,300	462,840	3,120	12
Pitcairn	47	39	800	1
Samoa (formerly Western Samoa)	182,700	2,935	120	62
Solomon Islands	460,100	28,370	1,340	16
Tokelau	1,500	12	290	125
Tonga	98,300	650	700	151
Tuvalu	9,600	26	900	369
Vanuatu	215,800	12,190	680	18
Wallis and Futuna	14,900	142	300	105
South Pacific	8,620,393	551,649	33,499	128
South Pacific (excluding Papua New Guinea)	2,925,093	88,809	30,379	139

Note: All data from Secretariat, Pacific Community (<http://www.spc.org.nc/demog/>) published July 2004.

\* Rapanui (Easter Island) population is based on genealogical fieldwork of Grant McCall, carried out in 2001–2002 and projected at an approximate growth of fifty persons per year. EEZ is based on the Chilean Navy for Rapanui alone with a 12-mile limit. With a 350-nautical mile limit ("continental shelf"), the figure is 1,934,433 square kilometers including neighbouring and uninhabited Salas y Gomez, part of the Chilean Province of Easter Island.

A major source of economic development for some of the island Pacific is through remittances sent from rim states to relatives in home villages. This has led to the famous concept of MIRAB by Bertram and Watters, whereby some dependent economies are analysed as consisting of **M**igration, **R**emittances, **A**id, and **B**ureaucracy, to form the sometimes contested MIRAB acronym. MIRAB is not solely an Oceanic mode of economic development, but the conception derives from that part of the world.

The future of Oceania lies in the development of its potential in human and natural resources. Given the rate of exploitation, fish stocks already are declining at the beginning of the twenty-first century. Marine exploitation has discovered rich caches of mineral resources in Oceania that are still too costly to exploit: the area around Pitcairn Island, for example, may contain one of the largest diamond deposits in the world. Similar deep-sea mining has already been imagined in the ministries and boardrooms of Pacific rim nations, a kind of twenty-first century version of the fabled “Great South Land” sought so eagerly centuries before but submerged under costly megalitres of ocean water.

The people of Oceania as a group are amongst the most literate in the developing world and speak some of the most important world languages for the present and future, such as Chinese (Mandarin and Cantonese), English, French, Hindi, and Spanish, along with their own nearly one thousand indigenous tongues. Oceanic governments through the Forum and the Secretariat of the Pacific Community are moving rapidly to increase cooperation and the development of their people’s potential to face the challenges for inhabitants of one-third of the Earth’s surface, Oceania!

GRANT MCCALL

### OCEANIA: INTERNATIONAL RELATIONS

Few geographic areas in the world are as diverse in terms of peoples, environments, and cultures as Oceania. The vast region contains thousands of contrasting islands, more than six million inhabitants, and hundreds of languages. Composed of Micronesia, Melanesia, and Polynesia, it stretches north from Australia and New Zealand to Alaska and west from the South American coast to the Philippines. Population centres within this expanse range from large urban hubs to isolated atolls whose only outside contact is an occasional freighter entering the port.

Oceania is as culturally as it is geographically heterogeneous. Anthropologists have described Micronesia and Polynesia as retaining a relatively high degree of social stratification and centralised political authority. Melanesia has been perceived as different; traditionally, there was greater egalitarianism and more decentralised politics through multiple clans; an array of chiefs and little chiefs; and familial, adoption, and marriage processes that were primarily group affairs.

Although Oceania was one of the last areas to be “discovered” by European explorers, Pacific islanders have coped with varying levels of Western contact since the early sixteenth century. The cultural divergence found within Oceania is important but less so for contemporary peoples than the region’s rapid entry into the development processes engendered by globalising capitalist societies. The historic domination of colonial powers restructured indigenous societies, and Oceania was one of the last areas to enter the post-World War II period of decolonisation and development. Its contemporary societies are experiencing similar transformations in their respective adaptations to neocolonial and postcolonial forces of change. Consequently, most island societies can now be understood within a postcolonial framework that clarifies the political narratives, authorities, and loyalties of colonial repercussions.

Commentators note that once independence in most island-states in the region had been gained, the fundamental opposition between indigenous people and colonial powers was displaced by a more disparate array of local divisions. Differences between diverse indigenous populations, the exacerbation of conflict and suppression of warfare during the colonial period, uneven development, and corruption have found their expression in many conflicts, the most obvious that of the Bougainville war. Because Bougainville's copper was a major source of income for Papua New Guinea (45% of national export earnings), its people's aspirations for self-determination were met with violent repression. Resentment over the loss of control of hereditary lands, the transfer of mining revenues to the central government, and concern for environmental damage led to a separatist rebellion that forced the mine to close in mid-1989.

Its astonishing diversity of cultures ensure that Oceania as a region, an imagined world, and a conglomeration of island-states whose peoples are constantly evolving within an increasingly globalising economic and political environment, is never static. Anthropologists claim that, occasionally, the scenarios they study become history before their observations are printed, particularly when tribal societies encounter the modern world and then change rapidly. What continues, what has been modified, and what is discarded can be noted, but how does one describe a society in which some practices change while others continue? The Massim region is used as an example to show how people continue to participate in *kula* exchange but in contexts radically different from those first reported. Whereas people once traveled by outrigger canoe and communicated by conch shell, they now use outboard launches and telephones.

Despite Oceania's cultural variety and the diffusion of a cash economy, commentators note that certain classes of objects remain important in the maintenance of interisland and local international relations. Objects vary greatly from one place to another. They range from strings of button-sized seashell discs arranged in tyre-like coils to ochre crescents cut from pearl-shell valves and from elaborate ornaments of dogs' teeth to enormous decorated yam tubers, but the contexts in which people transact their goods and the principles underlying their exchange are similar. Oceanic peoples use objects as culturally evocative and powerful symbols to construct new identities and relationships in and through "traditional" celebrations. They create new realities through ongoing and vital ideas and practices that are used to provide continuity with, and contrast to, their indigenous views of the past.

Observers also propose that the larger ethnic categories that have resonance for contemporary Oceanic peoples are not the new concepts of nation-state but are of the older geographic, ethnological, and cultural divisions of Melanesia and Polynesia, an important understanding for development planners and theorists of international relations. It is argued that Melanesia, Polynesia, and present archipelago nations such as Vanuatu are historical categories that evolved in the nineteenth century from the discoveries of peoples and places and have been legitimated by use and further research in the region. Although, as categories, they consist of linguistic, biological, and cultural affinities that create a sense of sameness, this does not mean there is cultural uniformity. Nonetheless, cultural uniformity can be constructed for political purposes. In Papua New Guinea, for example, Bernard Narakobi aimed to define "a Melanesian way" to support his ideology for postindependence rule, as did Jean-Marie Tjibaou in his appeal during the 1980s to Kanak people to agitate for New Caledonian independence from France. Indigenous leaders' appeals to commonality frequently do not correspond with contemporary island-state borders but with wider cultural regions that bear European names and were formed by precolonial trading relationships.

## Oceania and International Powers

The myth of Oceania has been part of the French imagination since the eighteenth century, and, in the twenty-first, it continues to influence both the Fifth Republic and development policies for Oceanic islanders. For many French artists and writers, however, it was the Polynesian islands rather than Oceania *en masse* that crystallised their dreams and fueled their sexualised desires. Historians write that Bougainville's reports of his voyage to Polynesia were so compelling that his perceptions shaped metropolitan imaginings for more than 200 years. From a more pragmatic perspective, Britain rivaled France throughout the nineteenth century for commercial supremacy in Oceania. Captain Cook aimed to bring commerce and civilisation to the known world via *pax britannica*. In contrast to Polynesia, Melanesia has generated less interest, even though French colonies were established in the archipelagos of New Caledonia and Vanuatu. In contemporary times, many islanders identify strongly with their own island or region, but sharp contrasts remain between the dynamism and mineral wealth of Melanesian countries and the picturesque Pacific atolls that lack basic resources.

Late to be colonised, except for the Spanish intervention in Micronesia, Oceania was among the last of the world's regions to enter the cycle of decolonisation. Decolonisation began in 1962 when Western Samoa achieved independence from New Zealand and continued throughout the 1980s and 1990s, with the political independence of French Polynesia and New Caledonia still unresolved in the twenty-first century. Since the end of World War II, the international movements toward decolonisation and the recognition of the rights of indigenous peoples have framed the questions Oceanic communities have posed about their future in relation to sovereignty, self-determination, and indigenous rights. In American Samoa and the Northern Mariana Islands, for example, decolonisation movements have influenced the United States perceptions of its obligations as an administering power, and indigenous rights have fueled political and legal moves in Hawaii for the peoples to gain recognition as original islanders.

Following World War II, the 1947 Canberra Agreement led to the creation of the South Pacific Commission and provided a focus for Australia and New Zealand to offer technical assistance to Oceanic island-states. In contrast, US policies have been erratic; from 1962 to 1976, the United States was not attentive to Oceanic peoples' needs. The United States altered its treatment of Oceania in 1977 when the Carter administration reacted to Soviet initiatives and to accelerating socioeconomic change in the region. Consequently, the first comprehensive Pacific policies were generated. But once again, US awareness vanished in 1981 and throughout the Reagan administration until 1987. During this period, the US image was damaged through perceived and actual neglect of Oceania's island-states and continuous disputes over fishing rights. Concerns remain about the adequacy of US involvement and goodwill in Oceania.

Most development in relation to French power in Oceania since World War II has been driven by nuclear testing. When the war in Algeria ended, France had to reduce its program in the Algerian hinterland. The establishment of the nuclear testing centre in French Polynesia introduced profound economic and social changes, not just to the atolls of Moruroa and Fangataufa, as significant financial aid was introduced to the whole territory. When the test sites were closed in 1996, French Polynesia laboured to reintegrate with the broader Oceanic region.

New Caledonia, an archipelago and French overseas territory, has endured a more erratic development process. During the events of the mid-1980s, when indigenous Kanak peoples barricaded roads to and from the capital Nouméa and agitated for political

independence, France developed a policy for New Caledonia that began to focus on the islanders' needs. Critics now argue that New Caledonians suffer from political neglect as policy has since fluctuated, is dominated by short-term interests, is heavily dependent on the whims of succeeding waves of French politicians, and is usually treated as a low priority.

New Caledonians, like many Oceanic peoples, are experiencing rapid social change generated by globalisation processes. There has been an increase in the number of indigenous Kanak people who squat in makeshift cabins on the outskirts of Nouméa, and there have been changes to the way Kanak people dress. In addition, many young people listen to Radio Kanaky, a station that informs them of events taking place in their rural communities and that plays an array of Pacific island music. Many Kanak people also discuss their aspirations for items considered desirable in the West, such as a car and a home with modern conveniences, and they express a need for leisure time, such as watching television or engaging in sports such as volleyball or windsurfing.

Although rapid local development has been anchored in a history of colonisation that was racist and denigrating to Kanak peoples, the peoples have nonetheless appropriated the foreign and the new. Their ways of being have been shaped by their recognition of their location in international and regional relations, such as Japan's use of New Caledonia's waters for tuna fishing and France's appropriation of the main island's nickel reserves. They have adapted and acted within the changing social relations wrought by industry and tourist development. Some social commentators argue that the serious problem New Caledonia has faced over the final two decades of the twentieth century, and that has also worked toward political and administrative independence, is rooted in two opposing conceptions of life. The conceptions of progress and development, in contrast to that of tradition and custom, go beyond the ethnic cleavage of the French settler and Kanak indigenous person.

Social change is a concomitant to development in Oceania as is also true elsewhere. Researchers show how the rhetoric and the structure of relations concerned with marriage have been transformed under the direct influences of colonialism and are now being changed by urbanisation, Western-style education, and the introduction of a cash economy.

Yet, as occurred in many Oceanic islands, traders, settlers, ex-convicts, and rural police often cohabited with island women. The resulting children were assimilated into the indigenous or the settler communities. In contemporary Oceania, people of mixed heritage now work to provoke a different awareness, that of the

opportunities and problems that challenge Pacific peoples through their contribution to global *and* local communities. Researchers trace the historical process whereby a specific marriage system is being converted into another, changing in relation to its context. In addition, mixed heritage people discuss the ways they traffic between urban, European-educated ways of being and indigenous community customs, of changing relationships between women and men, of intergenerational differences, and of people's need for space for individual creativity while retaining links with their community.

### Oceanic Elites

In comparison to the growing numbers and potential influence of mixed heritage, Oceanic peoples' Tongan writer Epeli Hau'ofa refers to the evolution of transnational Pacific rulers. These are described as elite groups that are locked together through their privileged access to and control of resources in the region and through the resources moving between Oceania and other regions of the world. Commentators note that Oceania's ruling classes are increasingly interdependent and culturally homogenous, as many have studied together at prestigious universities in Fiji, Hawaii, Australia, and New Zealand. Other privileged people work in administration, technical, or bureaucratic branches of government and the private sector. In addition, intermarriage amongst educated islanders from different countries has provoked a pan-Pacific awareness and culture that links with music, literature, song, video, and mass media communications to generate a growing sense of Oceania as a coherent region.

It is argued that many contemporary young New Zealanders also strongly self-identify as members of Aotearoa, a Pacific nation. This is in contrast to Australians who have experienced a different history, culture, and geopolitical relations. The large Maori population has prompted demands for recognition of indigenous rights and culture in New Zealand's parliament, legislation, and consciousness, and many Maori have continued to ally themselves with their fellow Polynesians in French Polynesia.

The armed forces of France, New Zealand, and Australia cooperate on maritime surveillance of the small island states of the region, with a May 1993 joint agreement of aerial surveillance flights of Exclusive Economic Zones. Yet Australians tend not to self-identify as Oceanic people. Older residents speak with nostalgia of their sense of Australia as a British

enclave. Younger residents identify more closely with being citizens of a multicultural country that should develop by engaging more profoundly with the dynamic economies of Asian nations. Furthermore, development processes in Australia have largely ignored the social construction and constraints of racism, through Australian colonisation practices that were driven by a fear and ignorance of the intricate logic of Australia's indigenous peoples and through assimilation policies that negated ethnic and cultural differences until the 1970s.

As Australia and New Zealand have operated with conservative governments in the mid-1990s, support for indigenous rights and self-determination has fluctuated. Just as significant is that development practices that are generated by Western perceptions of social good have introduced little positive change in indigenous Australian communities. Anthropologists describe how the worldviews of indigenous Australians are shaped by embodied and intangible realities—bodies and places are perceived as defining indicators of social identity. Their countries are sung into tangible present reality through mnemonic song lines. Landscape maps social relations that are recreated through sand designs, body paintings, dance, and story to recall places people have walked, hunted, and visited.

Local "big men," chiefs, and the rise of women's groups offer a noteworthy contrast to pan-Pacific elites. Those who make attempts to redress the deterioration of processes of tribal decision making can face problems in that most indigenous Oceanic peoples, like other members of diverse communities, have been acutely affected by processes of modernisation. Questions now arise about how traditional authority is accepted by those who have moved beyond its present reach and how it can be adapted to meet the new needs of local administration in a globalising world. Monetisation of island economies and decreasing reliance on subsistence agriculture are driving social change within Oceanic communities and internationally, as is the increasing importance of trade unions in labour-management relationships and as a political force.

The ongoing conflict between modernisation and traditional authority is potentially greatest in Tonga, where all political power and most wealth has been customarily reserved to the king and a few nobles. Despite some reforms, the local ruling class effectively restricts commoners' potential political, economic, or social advancement, except through out-migration. Fiji offers a subtle contrast. A gradual return to the path of constitutional rule following several coups based on indigenous Fijian rights is showing that a commitment to living in harmony is being only

reluctantly implemented by those in power. Despite generations of occupation and commitment to the country, the exclusion of people not ethnically Fijian continues.

### **Oceanic Nationalisms**

The tenuous character and embryonic evolution of national cultures in Oceania mark the region as being of interest. The societies and cultures of Oceanic island-states are vital because of the will and energy of their populations. Oceanic peoples are not cultural objects but are active actors in an unceasingly moving and dynamic reality. They are frequently denied the power to direct their future because of their feeble numbers and the constraints of their living space. But these perceptions are those of a continental rather than an islander vision. It has not stopped them from being and from thinking in their own ways and of reclaiming their value in the twenty-first century.

Researchers argue that nationality or national consciousness is becoming more significant in comparison to what is more readily recognised as “nationalism.” People perceive themselves as members of a nation and as similar to other nationals, without necessarily possessing the loyal or civic consciousness considered desirable by Western theorists of nationalism. For example, the growth of tourism in the Cook Islands has led to culture and national identity becoming a commodity. Rather than constructions of nationhood being generated by citizens, new representations are born as a result of tourist presentations for foreign consumers. These, it is argued, may produce a more explicit sense of being a member of a collective group than one emerging from an identification with the common use of betelnut, drinking local brands of beer, or using currencies with national signatures.

Nonetheless, the contradictory character of island-state formation is amplified in postcolonial countries where political elites are pursuing Western goals of emancipation and nation building while intentionally maintaining an anti-Western stance by founding their project on local traditions. Commentators have noted how this ambivalent discourse poses special problems and challenges to women. The language of a nation based on “custom” has adopted a masculine character in spite of constant references to the traditional worth of women. It is argued that women’s best strategy is to adopt, adapt, and indigenise the language of human rights while asserting their “traditional” power as women of the land.

### **Oceanic Women**

In many island-states, constructions of gender and identity are entwined with concepts of development and progress. The South Pacific Commission, for example, published a Pacific Women’s Directory in 1993 and 1997 to provide details about women’s organisations and their activities to aid local interventions in the twenty-two island countries and territories that are part of the Commission.

Health care is one arena in which Oceanic peoples create meaningful interpretations of development processes. Massive outbreaks of diseases, such as dysentery that was prevalent until the 1950s, have been curtailed. Dispensaries conduct basic medical care, and hospitals offer surgery for many villagers of outlying islands. Local people cite telephones, helicopters, aircraft, and European medication as some of the benefits of modernisation in relation to health care. In French territories, the state provision of welfare benefits and sophisticated forms of inter-island transport are appreciated as aspects of modern life that enhance well-being.

The transfer of technology and knowledge that often characterises “development,” however, is a cultural and political action that can reinforce international and local inequalities. Wider economic and historical changes can produce local cultural and political consequences that are different from the benefits assumed to flow from development. Although many researchers describe how Oceanic women discuss their ownership, access to, and use of property; their strengths in household and small business management; and their affirmation of regional women, it is important to acknowledge women’s added economic responsibility for children. Many Pacific islander women are active agents in shaping their social identities, and their move into creating income is an important social change. They manage their households through local perceptions of women’s power that are anchored in their labour on their land or in their garden, on their ability to sell the varied produce of their labour, or on their broader commercial skills. Village women frequently manage the markets where they sell their horticultural produce, distributing the profits at the end of the morning’s trading.

Critics suggest it is necessary to include Oceanic women’s use of property in development planning. Gender should be used as an analytical prism that recognises changes to local practices and shows how women actively invoke and manipulate notions of development and progress to their benefit. Research by female scholars clarifies women’s different yet socially important roles as producers and distributors

of wealth. Interpretations of women's power, ritual importance, and social status contingent on a specific event or celebration add local context and complexity to analyses of the ways that gender is socially constructed and enacted in different Oceanic societies.

Land and local concepts of property are important signifiers of elaborate and varied social relations such as reciprocal duty. Through reciprocal duty, the complex dynamics of women's roles in exchanges of produce and property can be analysed. Women have a productive role in providing yams that are distributed through male status ceremonies. Their role needs to be acknowledged and celebrated as an essential component of, rather than mere support for, male festivities. Although some researchers have noted that the role of producer is less prestigious than that of transactor in many Melanesian societies in particular, Oceanic women are generally energetically involved in both types of activities. As the *Wok Meri* organisations developed by women in Papua New Guinea to redress their economic grievances also exemplify, women's skills and diligence are socially respected.

Women's land ownership, their ability to sell their surplus produce, and their authority as household managers illustrate their social power. Many decide how household money should be spent and enact power within family and clan contexts through a range of social interactions. Their practices show how women control some cultural resources defined as their own and therefore enact social power that differs from male social power. This recognition should be used to contest simplistic Western perceptions of a single structure of hierarchic domination operating in all Oceanic societies, to identify the equal value of women and men when it occurs, as well as to acknowledge how social inequalities can be constructed. Because many Oceanic peoples entwine gender with judgments of youth and elder status, concepts about the use of property, and social interactions shaped by evaluations of power, the peoples show how concepts of "global development" can misinterpret the nuances of local ways of being.

As the preceding discussion illustrates, there is a subtle yet damaging irony in theoretical frames that portray Oceanic societies as passive victims or receivers of globalising social and technological changes, rather than as constituted by people who actively negotiate social change, local and international relations, and development processes. Too frequently Oceanic peoples are perceived to be an homogeneous group of subsistence-oriented victims, with physical survival their most demanding issue, a view that discounts the diversity of their lived experiences and

their proactive engagement with their societies and environments.

### OKELLO, JOHN

John Okello was born on October 6, 1937, in Lango district, Uganda. He was reputedly the mastermind behind the Zanzibar Revolution in 1964. He arrived on Pemba Island (the second largest island of the Zanzibari isles) in 1959 as a migrant clove picker. On Pemba, Okello worked various jobs (clove picking, brick making) while becoming involved in nationalist politics. He remained on Pemba, working for the Afro-Shirazi Party (ASP) until 1963. When the

Zanzibar Nationalist Party (ZNP) won the 1963 election over the ASP, Okello moved to Zanzibar Island. The British granted the islands independence in December of 1963, leaving the ZNP in charge.

When the ZNP came to power, it fired many of the police officers who originally were from the mainland of Tanganyika and who the ZNP perceived to be ASP supporters. Whether these police officers were ASP or not, they were unhappy about losing their jobs. Okello secretly recruited members from the ASP's youth wing and among the newly laid-off police force. These two groups were already trained in fire-arm usage, and the former police officers were knowledgeable about the interiors of the police barracks and armory in the capital city of Zanzibar.

There has been considerable debate about whether John Okello informed the ASP leadership before he conducted the attacks on the police barracks and armory. Most scholarship points to Okello having acted alone. Around 3:00 AM on January 12, 1964, Okello and three hundred men attacked the police facilities. Within a few hours, they had captured all of the weapon caches in the capital Zanzibar and had taken control of the radio broadcasting system. Okello declared the ASP the party of the revolution and christened himself Field Marshal Okello. He formed the Revolutionary Council, which consisted of members of the ASP and the Umma Parties. Okello decided which leaders should be ministers and chose Abeid Karume as president of the new nation.

Okello's glory was short-lived. Within months of the revolution, ASP leaders, concerned about the chaos that followed Okello and his brutal lieutenants, tricked Okello into visiting mainland Tanganyika. There he was imprisoned by President Julius Nyerere for several months until he was declared an unwanted person and put onto a plane for Nairobi. In Kenya, the government watched him with suspicion and soon required that Okello leave the country. Over the next decade, he bounced between African countries and was variously imprisoned by the governments of Malawi, Tanzania, and Kenya for illegal entry as well as by his home country of Uganda. He published his memoir *Revolution in Zanzibar* in 1967.

Okello was eventually killed in the Lango district of Uganda during the reign of Idi Amin, probably out of concern that he would lead a revolt against Amin. Throughout the early postcolonial years, Okello was feared by East African leaders because of the ease with which he had led the Zanzibar Revolution. Even after his death, rebel leaders in Uganda used the pseudonym "John Okello" as a rebel moniker.

## OMAN

The Sultanate of Oman is located in the southeast corner of Arabia. It emerged over the last two hundred years and incorporates parts of ancient Oman and Dhofar in the south. Until 1970, the Sultanate of Oman was justifiably regarded as the "Tibet of Arabia" so complete was its isolation from the rest of the world. Its population, however, was markedly heterogeneous and included an elite merchant class with pronounced cultural and trade links with India and the coast of East Africa. Along the coast, subsistence fishing settlements prevailed, and in the valleys and mountains parallel to the coastline, terraced farming communities were common. A few towns of the interior of the country were the centers of local and regional trade and some religious learning. These communities were a reflection of Oman's once large and successful colonial empire that incorporated Baluchi, Persian, and East African elements into the dominant culture. In the central desert of the country were a number of nomadic pastoral tribes with cultural and social links that were derived from the Arabian Peninsula.

Prior to 1970, it was reported that only 3.1 miles (five kilometres) of tarmac roads existed within the country. Schooling was limited to three modern units that took in a total of one hundred boys, who were personally selected by the sultan. Many families resorted to smuggling their young men out of the country to be educated in Bahrain, Bombay, Cairo, Kuwait, or Mombassa. Whole families went into exile and raised a generation of Omanis in East African Indian and even British contexts. After Sultan Qabus bin Sa'id came to power in 1970 by overthrowing his father, the state moved rapidly to make up for lost time. Whereas the previous ruler had been wary of "modernization" and progress, preferring to carry out only those developments he could actually pay for in cash, his son, Qabus, set about commissioning schools, clinics, and hospitals and laying down the infrastructure of a modern state.

The sultan is the head of state and head of government. His position is hereditary. There are few checks

on his power, and his decrees form the basis of law. He appoints a council of ministers and can dismiss ministers without explanation. There is no prime minister. Senior members of the sultan's family routinely receive important government positions. More distant members of the family serve as ministers, other government officials, and the equivalent of governors throughout the country. Other ministers and senior government officials are chosen by merit and family or tribal connections. There are no political parties, and a limited electorate chooses candidates for the *Majlis al-Shura*, a consultative council that deals with social issues.

Omani culture, furthermore, remains based on a hierarchy built on family connections (tribal ties), relative wealth, and religious education. At the top is the sultan and his immediate family, the Al-Sa'id. This top level is followed by a large tribal group, the Al-Bu Sa'id. Prior to the discovery of oil in the country, the wealthiest sector of the population was arguably made up of the merchant families, many of them Indian in origin, language, and culture. Certain families and tribes had built reputations for religious learning and mediation skills, and they often represented the government in the interior of the country. In the late twentieth century, wealth spread somewhat, and a few more Omani families joined the ranks of the extremely wealthy. Oman has a small but growing middle class, and, while the vast majority of its population outside of the capital area is engaged in subsistence agriculture, fishing, or animal husbandry, the population drift from the countryside to the capital is growing. Out of a population of approximately 2 million (1993 Omani National Census), only a quarter are expatriates mainly from the Indian subcontinent.

Oman is an oil-producing nation, and revenues from petroleum products have been the backbone of Oman's dramatic development during the last three decades of the twentieth century. But oil resources are not extensive, and natural gas reserves are becoming more prominent, with liquefied natural gas exports expected to provide significant new income in the early twenty-first century. Agriculture and fishing, however, are the traditional economic activities in Oman. Fish and shellfish exports create a steady income of roughly US \$40 million.

A large percentage of Omanis live in rural areas, and many others own land and property in the countryside even though they live and work in the towns. Many of those in the countryside are self-sufficient farmers and fishermen. Both men and women engage in agricultural activities: men work the date gardens, while women tend to the fields of wheat, barley, and alfalfa. Men fish, while women often mend fishing

nets. Children as young as eight or nine years old take on domestic agricultural and fishing tasks. The elderly are greatly respected and are often relieved from any physical work, but their opinions and ideas are eagerly sought by the middle-aged and young.

Gender roles are shaped by the demands of the economic realities of peoples' lives. In the desert interior of the country, women contribute very actively to work associated with raising livestock and have significant social and political power. In the agricultural oasis settlements, the economic role of women is not as conspicuous, and this is reflected in reduced social and political power. In urban centers and towns, however, many women teach in formal schools and in religious preschools (*kuttaib*) as well as work in the private sector. From the early 1990s, the government has made great efforts to include women in government. Women were nominated to run for election to the consultative council in 1997, and several speeches of the sultan emphasized the importance of integrating women into public life. Two women were elected to the consultative council in 2000.

Education has been a major focus of government activity. Primary education for both boys and girls is encouraged. In the later intermediary and high school years, however, attendance by girls, particularly in rural areas, declines, largely due to a persistent pattern of early marriage. Many boys also leave school before the end of their secondary education to seek jobs, thus contributing to a large low-skill sector of the workforce. In 1986, Oman opened its first university modeled on an Anglo-American vision of higher education. The first colleges were of medicine, engineering, science, Islamic studies and education, and agriculture. In the 1990s, several more colleges were opened including a faculty of commerce and economics and a faculty of law. Enrollment in the university is nearly equally split between male and female students.

## OPERATION BOOTSTRAP

Operation Bootstrap attempted to shift the Puerto Rican economy from dependence on low-paying agricultural jobs to dependence on high-paying industrial jobs. From its beginning in 1947, the program took advantage of Puerto Rico’s freedom from federal taxes and stable political climate to attract a range of industries. Upon its demise in 1996, Operation Bootstrap had succeeded in industrializing the island and increasing its standard of living.

## American Governance

Long a colony of Spain, Puerto Rico became an American possession following the victory of the United States in the Spanish-American War of 1898. Congress made the island the first unincorporated territory in United States history. As a consequence, it was not eligible for American statehood yet it remained part of the United States. On April 2, 1900, President William McKinley approved the Organic Act of Porto Rico (amended to “Puerto Rico” in 1932), which established civil government on the island. It provided that all the laws of the United States would have the same force and effect in Puerto Rico except for the internal revenue laws.

The aftermath of the Spanish-American War left the Puerto Rican economy in shambles. The replacement of the peso by the dollar had reduced the net worth of many Puerto Ricans, and a heavy tax on coffee made it unprofitable to grow what had once been the main export crop. Americans, seeing an opportunity to acquire cheap land, bought coffee plantations and converted them to producing sugar. The result of this shift was the marginalization of a substantial part of the Puerto Rican workforce since sugar growing is only a six-month long job. While sugar workers had historically spent the non-growing period in the manufacture of sugar, Congress had mandated that sugar production would only occur on the mainland United States.

In 1921, Congress attempted to assist the Puerto Rican economy by passing a law that eliminated federal taxes for businesses operating in the island.

The legislation permitted Puerto Rico to offer a 100% tax exemption to industries, unlike any state in the Union. Essentially, Puerto Rico now had all the political benefits associated with the United States but not the financial obligations.

## Puerto Rican Control

A succession of governors, all Americans from the mainland, saw Puerto Rico as an overpopulated mess that would forever be mired in poverty. The Chardon Sugar Plan of 1934 identified the economic problems of Puerto Rico as landlessness, chronic unemployment, and steady population growth. The Plan proposed that the US government buy the most productive sugar lands and redistribute them to small Puerto Rican growers. Congress refused to endorse anything that would threaten private property rights and, instead, added to the Puerto Rican troubles by restricting the amount of sugar that could be exported into the United States.

In 1941, Rexford Tugwell became governor of Puerto Rico. An economist and former member of President Franklin D. Roosevelt’s brain trust, Tugwell was a New Yorker known for his progressive views on economic recovery. Between 1941 and 1946, Tugwell worked closely with Luis Muñoz Marín and the Popular Democratic Party to change the political and economic structure of Puerto Rico. Tugwell’s and Muñoz’s efforts led to the changes in the Foraker Act permitting Puerto Rico to elect its own governor as well as the establishment of a Puerto Rican Planning Board. Muñoz believed that the economic transformation of the Puerto Rican economy would result in political independence.

## Industrialization as a Cure

Muñoz became the first Puerto Rican-born governor of the island, winning the election in 1948. He believed Puerto Rico’s problems could not be halted without addressing population growth. He aimed to bring up the minimum family income to \$700–\$800 annually, which was the economic level in the 1940s when the birth rate decreased and the population stabilized. Since agricultural businesses could not provide the money needed, Muñoz argued for industrialization as the only way to raise living standards.

Muñoz appointed Teodoro Moscoso to oversee the industrial development of Puerto Rico. A University

of Michigan graduate who had returned to Puerto Rico to run the family pharmacy, Moscoso knew well both the United States and Puerto Rico. He created and ran Fomento, Puerto Rico's Economic Development Administration; but the agency had been in the plans of the Popular Democratic Party since 1940. Muñoz gave the agency the nickname of Operation Bootstrap when speaking before a US congressional committee in July 1949.

Moscoso had no specific job description other than to improve the island. Like Muñoz, he saw industrialization as the only solution to the problems of underemployment and low wages, but Moscoso differed from his mentor in his belief that political independence was economically impossible. Muñoz would subsequently decide in 1952 to abandon hopes of independence and join Puerto Rico to the US commonwealth as a means of ensuring the continued success of industrialization.

To industrialize Puerto Rico, Moscoso had to change a deeply ingrained view held by Puerto Rican leaders that industrialization was impossible in such a small area of 2 million consumers and producers. He also broke with established thought by conceiving industrialization as more than simply an extension of agricultural production through such industries as rum and sugar. Moscoso believed that he had to transform every part of Puerto Rico to make industrialization succeed.

Historically, the standards of living and education in Latin American countries had been serious limitations to the expansion of a producing market and a consuming market. Broken-down shacks, a lack of clean water, and sewage running in the streets did not entice skilled Americans to move to the island. A skilled base of Puerto Ricans did not exist. The island lacked the trained engineers to run factories and the technicians to fix broken equipment. Moscoso persuaded the Puerto Rican government to improve living conditions, but had less success with raising educational standards.

To bring about industrialization, Puerto Rico needed free access to the US market. This market was the largest and richest in the world at the mid-point of the twentieth century, as well as one protected against Puerto Rico's competitors. Without free access to the American market, Puerto Rico could not accumulate the capital through exports that was needed for industrialization. It received such access from Congress. Puerto Rico's export-led economy industrialization program began much earlier than similar programs in other Caribbean nations because of the stimulation of this free access to the US market.

## Promoting Puerto Rico

Yet free trade in itself would not bring industry to Puerto Rico. The island needed a powerful magnet, and both Muñoz and Moscoso suggested full tax exemption. On May 13, 1948, the Puerto Rican legislature approved Act No. 184 granting tax exemption on income, property, excise, and municipal taxes to new industries for a period of ten years, with an additional three years of partial exemption. Any new industry was eligible for this tax benefit as long as it manufactured a product not being produced on the island as of January 2, 1947. Forty-two specific industries then in existence were also eligible.

Moscoso began to promote Puerto Rico through a public relations campaign. Many American businesses did not realize that the island enjoyed political stability and honesty in government. One businessman came to the island prepared to offer bribes to legislators, as he believed was standard practice in Third World countries. Moscoso consistently stressed that Puerto Rico was the only part of the United States where industry could operate with 100% tax exemption.

In 1948, Textron became the first company to take advantage of Operation Bootstrap. Eager to use the textile company to give credibility to the program, Moscoso required that it make only a relatively small investment. He gave it a lease and a loan with extremely generous terms. Unfortunately, Textron came from New England as part of the flight of textile companies to low-wage areas in the south. New England legislators accused Puerto Rico of using unfair tactics to lure "runaway" industries away from the United States. Moscoso was charged with robbing U.S. workers of their jobs by means of the federal tax exemption. Muñoz was forced by the threat of a loss of the exemption to declare that Puerto Rico would not grant such benefits to runaway companies. No other business would again receive such advantageous terms.

Textron had proposed to build six mills in Puerto Rico. It only built two by 1951. In that year, Textron management publicly announced that the move to the island had been a mistake. The company complained that Puerto Rican workers took too many holidays, lacked technical skills, and that women had too many children which caused associated increases in child care demands. Textron shifted production to the southeastern United States by the mid-1950s. Moscoso acknowledged these problems by telling companies that they had to send their best people and latest technology to Puerto Rico.

## Success and Termination

Designed in an era in which policymakers did not see women as breadwinners, the industrialization program was initially designed to provide employment solely to men. However, the labor intensive industries attracted to Puerto Rico, such as textiles and food processing, traditionally employed more women than men. In the first stage of Operation Bootstrap, women were the main beneficiaries of the program. Growing male unemployment, higher wages, and the increasing cost of transportation were factors that prompted the inauguration in the mid-1960s of the second stage of industrialization. This stage focused on capital intensive industries, such as petrochemicals and pharmaceuticals, which tended to employ more men than women. In the third stage in the 1970s, Puerto Rico welcomed high-tech and electronics industries that employed younger workers of both sexes.

Moscoso had no long-term strategy for industrialization. He simply sought good paying jobs. He brought over 631 industries to Puerto Rico, as well as such companies as General Electric and the Hilton hotel chain. Much of the industry centered in San Juan and other heavily populated cities. The hope of good paying jobs enticed many people to migrate from the country into the exploding city. The resulting slums prompted heavy migration into the United States, especially New York City.

In the 1980s, Operation Bootstrap began to collapse. Puerto Rico lost its competitive advantage to countries that offered tax incentives and even lower wages. Mexico and other Caribbean countries took much industry away from the island. When the island lost its labor and other cost advantages, it became increasingly difficult to promote Fomento. Operation Bootstrap ended in 1996 when Congress terminated the tax exemption.

By most measures, Operation Bootstrap was a resounding success. It transformed Puerto Rico from an agrarian to an urban, industrial economy with a ten-fold increase in per capita Gross National Product (GNP) between 1950 and 1980. In practically all economic and social indices, from per capita income to life expectancy, Puerto Rico joined the ranks of the developed countries of the world. Yet even with massive migration to the United States mixing with industrial achievement, Puerto Rico failed to provide sufficient income or jobs to sustain continued heavy population growth. Sharp inequalities in income remain in existence on the island.

## ORGANIZATION OF AFRICAN UNITY (OAU)

Established on May 25, 1963, in Addis Ababa, Ethiopia, by thirty-two independent African nations, the Organization of African Unity (OAU) was Africa's premier body for political and economic cooperation. The organization grew gradually over the years—to a total membership of fifty-three in 1994, when South Africa joined—until it was formally disbanded and replaced by the African Union (AU) in July 2002. Founded at the time when African leaders were experiencing their first taste of freedom from colonialism and were understandably anxious to consolidate their leadership, the OAU aimed to promote the unity and solidarity of African states; coordinate and intensify their cooperation and efforts to achieve a better life for the peoples of Africa; defend their sovereignty, territorial integrity, and independence; eradicate all forms of colonialism and neocolonialism in Africa; and promote international cooperation, with due regard to the Charter of the United Nations and the Universal Declaration of Human Rights (OAU Charter Article II).

The signing of the OAU Charter was quite an achievement at a time when Africa was sharply split into three rival blocs—the Casablanca group, spearheaded by radicals such as Ghana's Kwame Nkrumah and Morocco's King Mohammed V, who favored the political integration of Africa; the Monrovia group, led by President Tubman of Liberia, who opposed the union of African states for fear of it being dominated by some overambitious leaders; and the Brazzaville Twelve, made up of mostly French-speaking nations that usually found themselves sandwiched (ideologically) between the other two groups.

In pursuance of its objectives, the founding nations pledged to coordinate their policies in such areas as international politics and diplomacy; economic development; education, and culture; health sanitation and

nutrition; science and technology; and defence and security. The underlying principles of OAU, as contained in Article III of its Charter, included adherence to noninterference in the international affairs of states; respect for the sovereign equality of all member states; respect for the sovereignty and territorial integrity of each state; peaceful settlement of dispute; unreserved condemnation of political assassination and subversion; dedication to the total emancipation of Africa; and affirmation of a policy of nonalignment in international affairs.

## Institutions

The leading institutions of the OAU were the Assembly of Heads of States and Governments, which met annually, and had all the decision-making powers of the organization; the Council of Ministers, which included a foreign minister (or any other minister designated by member states) and was charged with the responsibility of implementing the decisions of the assembly; and the General Secretariat, which was the main administrative organ of the organization, with the responsibility of serving and coordinating the meetings of all other OAU institutions and drawing up OAU programs and budget.

The General Secretariat, located at the headquarters in Addis Ababa, was headed by the secretary general, who was elected by the assembly for a term of four years. In addition to these institutions, the OAU had a number of specialized commissions, the most notable of which were the Economic and Social Commission; Defence Commission; Educational, Scientific, Cultural and Health Commission; the Commission of Fifteen on Refugees; and the Mediation, Conciliation, and Arbitration Commission. These commissions generally met irregularly, depending on the issue at hand, and their meetings were subjected to a quorum of two-thirds majority. Although not provided for in the charter, the OAU Coordinating Committee for the Liberation of Africa, created by a 1963 resolution on decolonization, understandably became a powerful institution of the organization, as the liberation struggle and the fight against apartheid heated up over the years. In addition to these commissions, several specialized agencies in Africa operated under the auspices of the OAU; these included the Pan-African Telecommunications Union (PATU); Pan-African Postal Union (PAPU); Pan-African News Agency (PANA); Union of African Railways (UAR); Organization of African Trade Unions Unity (OATUU); and the Supreme Council for Sports in Africa. In recognition of the polyglot

character of Africa, the OAU conducted its official activities in four languages: Arabic, English, French, and Portuguese.

## Contribution to Africa's Development

There are many Africans, both on the continent and in the diaspora, who candidly feel that the OAU did not accomplish much, given the persistence of geopolitical conflicts, ethnic cleansing, poverty, famine, HIV/AIDS afflictions, and other daunting development problems on the continent. However, it must be said that despite its many weaknesses, the OAU deserves some acclaim, especially in the settlement of interstate conflicts and the fight against colonialism and apartheid.

Armed with Article Two of its charter, which sought to eliminate all forms of colonialism from the continent, and working through its Coordination Committee for the Liberation of Africa, the OAU organized diplomatic support and channeled financial, military, and logistical aid to the liberation movements in such places as Angola, Namibia, South Africa, Mozambique, Guinea Bissau, and Rhodesia. Arguably, no other issue received the same unreserved attention, devotion, and unanimity of OAU members than that of decolonization and the fight against apartheid and international racism. The OAU managed to have the United Nations (UN) legitimize its liberation struggle, including the recourse to violence by Africans and other native people, and to obtain the rights proclaimed in the UN Charter and the Declaration of Human Rights. Hence, Salim A. Salim, the former secretary general of the OAU, once noted that "By all accounts, it [decolonization] is a monumental achievement of which the OAU is justifiably proud" (Salim 1996, 230).

For decades, the OAU waged a relentless fight against the apartheid system in South Africa. With the help of like-minded nations and international organizations, the OAU compelled the United Nations to condemn the apartheid system as a crime against humanity, years before its demise in 1994. With this condemnation, South Africa was forced out of many international organization and sporting activities. In as early as June 17, 1963, less than a month of its inception, the OAU initiated a protest against South Africa at the International Labour Organization (ILO) that culminated in the withdrawal of South Africa from that body in March 1964. Similarly, on September 1963, intense protest by African and Asian delegates prevented South African delegates from speaking at the UN General Assembly; similar action, with

homologous result, was taken by the African group at the International Association of Tourism Agency in Rome and at the International Atomic Energy Agency Conference in Vienna the same year. The barring of South Africa from the Olympic Games and from the International Tennis Tournaments owed much to the efforts of the OAU and its sympathizers in the international scene. Following the dismantling of the apartheid regime in South Africa, the OAU offered its services for the smooth transition of political power in that country by sending observer missions to oversee South Africa's first democratic elections in April 27, 1994.

The unity that the OAU managed to garner, through its fight against apartheid, decolonization, and international racism, gave it a moral standing that no African regional bloc or single country could possibly match (Cervenka 1977). With this moral clout, the OAU often provided the necessary mechanism for the peaceful settlement of disputes amongst its members. For instance, when the Biafra civil war flared up in the 1960s and threatened the Nigerian federation, it was the OAU's unequivocal stand for a solution that preserved the territorial integrity of Nigeria by preventing any big power from siding with the Biafra insurgents. Indeed, there is hardly any African conflict regarding the OAU in which it did not play a major mediating role in its resolution. Using certain African leaders as emissaries and agents of arbitration and pacification, the OAU helped settle many geopolitical disputes across the continent. Notable examples in this regard include the mediatory roles played by Emperor Haile Selassie of Ethiopia and President Modibo Keita of Mali in the Moroccan-Algerian conflict of 1963; by President Ibrahim Abboud of Sudan in the Ethiopian-Somali conflict of 1964; by President Nyerere of Tanzania in the Kenya-Somali conflict of 1965; and by President Eyadema of Togo in the 1974 border dispute between Mali and Upper Volta (now Burkina Faso). The OAU was also instrumental in the settlement of the Liberian civil war through its support for the Economic Community of West African States Cease-Fire Monitoring Group (ECOMOG) of the Economic Community of West African States (ECOWAS).

In 1980, with the liberation struggle almost over, the OAU turned much of its collective attention to economic development problems facing Africa, with the adoption of the Lagos Plan of Action that served as the organization's blueprint for Africa's development at its Economic Summit. Among other things, the Lagos Plan sought to provide Africa with rapid, self-sufficient economic development. With poverty, famine, and ethnic violence still ravaging the continent a decade later, the OAU, in yet another historic

session in 1990, revisited the Lagos Plan of Action and reaffirmed its resolve to play an active role in finding lasting solutions to the internal conflicts and socioeconomic problems of Africa. This move, culminating in the 1991 signing of the Abuja Treaty, called for the establishment of the African Economic Community (AEC). Following the ratification of the Abuja Treaty in May 1994, the OAU operated on the basis of two legal instruments and changed its official name to OAU/AEC, until July 2002 when it was disbanded and replaced by the African Union (AU) at the Durban Summit.

The formation of the AU was first proposed by Muammar Qaddafi at the Fourth Extraordinary Summit of the OAU/AEC held in Sirte, Libya, in September 1999. The Sirte Declarations, which emerged out of this summit, aimed at effectively addressing the new social, political, and economic realities in Africa and the world; fulfilling the African peoples' aspirations for greater unity; eliminating the scourge of conflicts; and harnessing the human and natural resources of the continent to improve the living conditions of its people. With the establishment of the AU, the African leaders hope to ascertain the political and economic integration of the continent, with initiatives that are different from and, arguably, far more ambitious than those pursued under the erstwhile OAU/AEC. The AU asserts an explicit shift from the pursuit of mere unity among African nations to that of a political union and asserts an equality explicit acceptance of the tenet of the New Partnership for Africa's Development (NEPAD), which was launched concurrently with the AU at the OAU/AEC Summit in Lusaka, Zambia, in July 2001.

As the main socioeconomic program of the AU, NEPAD's objective is to eradicate poverty in Africa by establishing the necessary conditions for peace and security, promoting sustainable economic growth and development, and enhancing Africa's participation in global political and economic issues. Unlike the OAU/AEC (which focused mostly on decolonization and interstate conflicts and keenly respected the political boundaries of Africa), inherited from colonialism, the AU is primarily aimed at the elimination of Africa's colonial borders, with an eye toward the political integration of the continent. The AU's integration process is anchored in democracy, popular participation, and a conscious effort to mobilize all African regional economic blocs and people, including those in the diaspora. The AU hopes to create, by the year 2030, a prosperous United States of Africa, "driven by its own citizens and representing a dynamic force in the international arena" (African Union Commission, 2004: 26).

## ORGANIZATION OF AMERICAN STATES (OAS)

A regional security organization was created at the conclusion of the Ninth Pan-American Conference held in Bogotá in 1948 to replace the Pan American Union. The Organization of American States (OAS) was founded as a continuation of the idea that the nations of the Western hemisphere share a unique identity, historically expressed as Pan-Americanism, Bolivarianism, or the Western Hemisphere Idea. More immediate factors included inter-American cooperation that had developed during World War II coupled with global tensions due to the advent of the Cold War. The original charter listed five purposes: (i) to provide peace and security of the Western Hemisphere; (ii) to prevent possible causes of difficulties that may arise and ensure a peaceful settlement among the member states; (iii) to provide for common action on the part

of member states in the event of aggression; (iv) to seek the solution of political, juridical, and economic problems that may arise among the member states; and (v) to promote by cooperative action their economic, social, and cultural development. Twenty-one nations signed the original charter (Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, United States, Uruguay, and Venezuela). As of 2004, there are fourteen additional members: Barbados, Trinidad and Tobago (1967); Jamaica (1969); Grenada (1977); Suriname (1977); Dominica, Saint Lucia (1979); Antigua and Barbuda (1981); Saint Vincent and the Grenadines (1981); Bahamas (1982); St. Kitts and Nevis (1982); Canada (1990); Belize (1991); and Guyana (1991).

The charter was later revised by protocols signed at Buenos Aires (1967) and went into effect in February 1970. For Cartagena (1985), it was effective in November 1988; for Managua (1993), it was ratified in March 1996; and for Washington (1992), it took effect in September 1997. The annual General Assembly was created by the Buenos Aires Protocol. The Permanent Council, the Economic and Social Council, and the Council for Education Science and Culture were given equal status within the organization. The Cartagena and Managua Protocols greatly strengthened the role of the secretary general and provided procedures for the peaceful resolution of disputes as well as called for greater economic and social development throughout the hemisphere. The Managua Protocol also created the Inter-American Council for Integral Development (CIDI) to replace the Economic and Social Council and the Council for Education, Science, and Culture. The main goals of CIDI are to promote development activities, to strengthen hemispheric partnership, and to assist in the elimination of extreme poverty in the Americas. The Washington Protocol established the OAS as the first regional political organization to provide for the suspension of a member-state whose democratically elected government is overthrown by force.

The OAS attempts to achieve its objectives through seven subunits, including the General Secretariat, the Meeting of Consultation of Ministers of Foreign Affairs, the General Assembly, the Permanent Council, the Inter-American Council for Integral Development; the Inter-American Juridical Committee, and the Inter-American Commission of Human Rights. In addition, there are specialized committees and commissions established by the General Assembly.

The permanent organ of the OAS is the General Secretariat that is headquartered in Washington, DC. The secretary general, the executive for the

organization, is elected by the General Assembly to a five-year term. The Meeting of Consultation is the arm of OAS tasked with handling security crises as provided for by the Inter-American Treaty of Reciprocal Assistance (Rio Treaty) and also is the unit responsible for a joint response to military aggression against a member state by a non-American state power. The General Assembly meets annually but can also be called into special session to consider urgent matters. The Permanent Council, composed of an ambassador from each member state, implements decisions and resolutions assigned by the General Assembly, the Meeting of Consultation, and the secretary general. Its most notable function includes a role in the peaceful settlement of disputes through the Organ of Consultation as provided for in the Rio Treaty. The remaining councils and committees promote cooperation among the Latin American states in their respective areas of expertise and hold annual meetings as mandated by the OAS charter.

One early achievement of OAS members was the establishment of the Inter-American Development Bank in 1959. The Inter-American Development Bank was created out of concern that the World Bank was not meeting the needs of Latin American members for social lending and was overly concentrated on infrastructure improvements. The creation of the bank was followed by the Act of Bogota in 1960 that called for members to commit to economic and social development. This was followed by OAS endorsement of the Alliance for Progress.

Before 1990, the Cold War cast a long shadow over the cooperative ideals of the Organization of American States and resulted in different visions of regional security between the United States and some members, most notably Cuba and Mexico. However, in the aftermath of the Cold War, the OAS initiated conventions against corruption, illegal drug and arms trafficking, and violence against women. These missions were largely formulated at the 1994 Summit of the Americas in Miami when the organization was challenged by the Western Hemisphere's heads of state to strengthen democratic values and institutions.

The promotion of peace and democracy is the responsibility of the OAS Unit for Promotion of Democracy (UPD), which acts under the authority of Resolution 1080. Resolution 1080 was passed by the 1991 General Assembly to deter threats to legitimate democratically elected governments. The resolution calls for the general secretary to convene the Permanent Council followed by a meeting of the hemisphere's foreign ministers within ten days of a *coup d'état* or other actions against an elected government. The resolution has been enacted four times: in Haiti in 1991, Peru in 1992, Guatemala in 1993, and Paraguay in 1996.

The OAS was instrumental in seeking a peaceful resolution after the *coup* that removed Haitian President Jean Baptiste Aristide from power in September 1991. OAS foreign ministers met as required and sought economic and political sanctions against the illegitimate government. In cooperation with the UN, the joint International Civilian Mission (ICM) was founded to monitor human rights abuses. These measure in part led to the restoration of the Aristide government in 1994.

On April 5, 1992, President Alberto Fujimori of Peru declared an auto *coup* and suspended the constitution. The OAS Permanent Council condemned the *coup* and called for an immediate restoration of the democratic process. At the request of the hemisphere's foreign ministers, the secretary general headed a mission of foreign ministers to start a dialog between the government and other political forces in Peru. As a result of OAS interest, Fujimori agreed to call elections for a new Congress to draft a new constitution. The OAS sent two hundred observers to monitor the elections. In this instance, OAS actions proved only marginally effective as Fujimori used the new constitution to extend his power in Peru.

A more successful example of OAS promotion of democracy occurred in Guatemala when President Jorge Serrano suspended constitutional democracy on May 25, 1993. Resolution 1080 was invoked, and Secretary General Baena Soares was dispatched to Guatemala. The condemnation of Serrano's auto *coup* helped lead to his removal and Guatemalan Congress's constitutional election of Ramiro de Leon Carpio as president.

The fourth instance of the use of Resolution 1080 involved an attempt to force the resignation of Paraguay's President Juan Carlos Wasmosy by the Paraguayan Army Commander in April 1996. After the OAS Permanent Council called for a meeting of foreign ministers, Secretary General Gavaria traveled to Paraguay in support of Wasmosy. Buoyed by OAS, other international support, and the Paraguayan people, Wasmosy remained in office.

Another aspect of promoting democracy is monitoring of elections. The first instance of election monitoring occurred in Nicaragua in 1990. In the following years, OAS teams have expanded the mission of observing elections. The most recent example was in the August 2004 recall election in Venezuela. OAS certification of the electoral process has helped to boost public confidence in the electoral process throughout the Western Hemisphere. In addition, the UPD conducts education programs, exchanges, and conferences on the democratic process. It has developed peacebuilding programs and has supervised the eradication of land mines in the Western Hemisphere.

In 1993, the OAS created the Committee on Hemispheric Security to assist in the peaceful resolution of disputes between member nations. The purpose of the committee and other conferences is to decrease historic rivalries and suspicions and create an environment of mutual trust. In 1997, OAS members negotiated the Inter-American Convention Against the Illicit Manufacturing of and Trafficking in Firearms, Ammunition, Explosives, and other Related Materials—the first legally binding regional agreement on illicit firearms trafficking. In October 1999, the Counterterrorism Committee (CTC) was established to promote cooperation on counterterrorism issues.

The OAS has played a key role in monitoring elections to ensure they are fair and open. This includes initiating educational programs at the local and regional level to foster democratic ideals. The organization has sent special teams to support the peace process in Guatemala, Nicaragua, Haiti, and Suriname and has been a key participant in clearing land mines in Central America. The Washington, DC-based Inter-American Commission on Human Rights and the Inter-American Court of Human Rights, located in San José, Costa Rica, monitor the status of human rights in member countries and also provide a legal recourse to individuals and groups that have suffered abuses. Special attention is given to the rights of indigenous peoples and women. The OAS is supporting the Free Trade Area of the Americas by providing technical support and working closely with the Inter-American Development Bank and the United Nations Economic Commission for Latin America and the Caribbean. The Inter-American Drug Abuse Control Commission was established to curb the illegal trafficking in narcotics that has resulted in violence and instability in a number of member states. The commission's objectives include assisting countries in strengthening laws, improving law enforcement, and encouraging the cultivation of alternative crops. It also evaluates each country's progress in meeting its antidrug goals. The OAS is committed to promoting sustainable development and administers a variety of programs in this area, including river basin management, conservation, dealing with climatic changes, and assistance during natural disasters.

The Organization of American States has continued to promote cultural programs, and this, perhaps, is its most enduring achievement. The OAS headquarters in Washington houses the Art Museum of the Americas as well as the Columbus Memorial Library. In addition, *Américas*, a fully illustrated popular magazine, depicts the rich mosaic of the peoples and cultures of the Western Hemisphere. Other specialized organizations managed by the OAS

include the Inter-American Children's Institute, the Inter-American Commission on Women, the Pan American Institute on Geography and History, the Inter-American Indian Institute, the Inter-American Institute for Cooperation on Agriculture, and the Pan American Health Organization.

## ORGANIZATION OF ARAB PETROLEUM EXPORTING COUNTRIES (OAPEC)

Arab states had a fourth of the world's 160 trillion cubic meters of gas in 2001, but they supplied only 13% of the world's demand. The states also produced two-thirds of the world's 653 billion barrels of oil, with new discoveries exceeding increased production. In 2004, OAPEC planned an \$84.5 billion expansion, with \$43 billion of that committed to natural gas.

### Structure

In 1968, the Organization of Arab Petroleum Exporting Countries (OAPEC) came into being with headquarters in Kuwait. It serves to support the Arab oil industry through cooperation by member producers. It is a regional, intergovernmental development agency. Only Arab countries with significant gross domestic product (GDP) from petroleum are allowed to join. The OAPEC meets with the Arab League every four years on energy matters. Its operating assumption is that the cornerstone of future economic development in the Arab countries is petroleum. Thus, the use of the resource must be effective, including joint ventures. OAPEC also wants equity in the market and a favorable climate for investment in petroleum. It works to make the policies and laws of the members compatible and to train and employ citizens of members. OAPEC activities take place cooperatively

## ORGANIZATION OF ARAB PETROLEUM EXPORTING COUNTRIES (OAPEC)

because OAPEC coordinates those activities, promotes exchange of information, and hosts seminars with both regional and international participation. The seminars allow dissemination of the latest technological news and problems of member countries. The OAPEC information exchange program also includes the Arab Energy Conference.

Initial signatories to the January 9, 1968, agreement were Kuwait, Libya, and Saudi Arabia. In Beirut, Lebanon, the three established OAPEC and headquartered it in Kuwait. By 1982, the organization had eleven member exporters, an agreement that established the OAPEC. The three founding members agreed that the organization would be located in the State of Kuwait. Subsequently, other states joined OAPEC: Algeria (1970), Bahrain (1970), Qatar (1970), Iraq (1972), Syria (1972), Egypt (1973), United Arab Emirates (1970), and Tunisia (1982). In 1986, when Tunisia requested to withdraw, the Ministerial Council decided that Tunisia would be suspended from the rights and obligations of membership until such time as Tunisia chose to resume active participation.

Oversight lies with the Ministerial Council, composed of the oil ministers or comparable officials from each of the member countries. Providing budget and regulation and other inputs to the council agenda is the Executive Bureau. Administering the policies and programs is the General Secretariat, which accepts staff from all Arab countries, not just the producing ones. The Secretariat includes the Arab Center for Energy Studies. The enforcement component is the Judicial Tribunal, which arbitrates disputes with oil companies as well as between members. Judgments are binding and final.

The OAPEC publishes annual reports in Arabic and English; the quarterly *Oil and Arab Cooperation* in Arabic with English abstracts; the *Arabic Energy Resources Monitor* (an annual statistical report in Arabic and English); and various papers, proceedings, and studies.

The Council of Ministers reviewed the OAPEC General Secretariat's performance in 1987 and established ideas for improved efficiency and rationalization of expenditure. It urged maximum use of its companies, particularly APICORP. It transferred projects previously under the General Secretariat to APICORP. It also decided that at least three interested members should approve any project and that each of the three should bear 10% of the costs of the study.

Under OAPEC are four independent companies and a training institute:

- The Arab Maritime Petroleum Company (AMPTC) was established in January 1973

after members signed the formal agreement on May 6, 1972. The AMPTC had a fully subscribed capital of \$500 million. It was to be involved in all operations pertaining to marine transport of petroleum and its products. Shareholders in the company included Algeria, Bahrain, Egypt, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Tanker demand shrank, however, and the company took losses until its authorized capital was \$200 million, subscribed at \$150 million.

- The Arab Shipbuilding and Repair Yard Company (ASRY), agreed to on December 8, 1973, is headquartered in Bahrain and counts as shareholders Bahrain, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. In December 1974, ASRY incorporated with capital of \$100 million. This increased to \$300 million in 1976 and \$340 million 1977. ASRY was to build, repair, and maintain the various vessels of the petroleum fleet. It established a dry dock in Bahrain in 1977 to service and repair tankers. It also added two floating docks and related facilities. The three docks allowed ASRY to take care of medium and supersized tankers and ships. Its level of productivity made it competitive with other dock facilities.
- The Arab Petroleum Investments Corporation (APICORP) was formed in Dammam, Saudi Arabia, in November 1975. All OAPEC members had shares. Authorized capital was \$1.2 billion, but only \$400 million was subscribed. The subscription was increased to \$460 million in 1996 by tapping APICORP's general reserve. APICORP helps members to finance industry-related projects, most of which require substantial investment. The corporation's twelve projects were in Bahrain, Egypt, Iraq, Jordan, Libya, Saudi Arabia, and Tunisia. APICORP partners with the OAPEC-sponsored Arab Petroleum Services Company in two subsidiaries: the Arab Drilling and Workover Company (ADWOC) and the Arab Geophysical Exploration Services Company (AGESCO). APICORP has equities of 20% and 10% in the respective companies as well as a 32% equity in the Arab Company for Detergent Chemicals (ARADET), capitalized in Baghdad, Iraq, on March 12, 1981, at \$72 million ID. The company worked from its Linear Alkyl Benzene Complex, but sanctions and then war hampered its activity severely.
- The Arab Petroleum Services Company (APSCO) was founded in Tripoli, Libya, in

January 1977 by all member states. Capital was \$100 million Libyan dinars. The company provides petroleum services through subsidiaries specialized by type of service. The company has three subsidiaries, one of which is the Arab Drilling and Workover Company (ADWOC), established in Tripoli in February 1980 to deal with onshore and offshore drilling operations, water well drilling, well maintenance, and other technical operations associated with member and other countries. The company's fourteen rigs operate in Jordan, Syria, and Libya. ADWOC has workshops and storage facilities for maintenance and testing of equipment and production of oxygen and nitrogen. Another wholly owned subsidiary is the Arab Well Logging Company (AWLC) established in Baghdad in March 1983, which logs, perforates, and does the other technical things necessary to discover and develop. The AWLC was largely dormant during the sanctions and war, but Iraq attempted to revitalize it in 2003. The Arab Geophysical Exploration Services Company (AGESCO) is in Tripoli. APSC has 40% of this company, chartered in 1984. Halliburton Geophysical Services Company also owns 40%. AGESCO performs geophysical surveys.

- The Arab Petroleum Training Institute (APTI), established in Baghdad in May 1978, was to research and publish studies on industrial organization and training theory. APTI performs research and studies concerning modern industrial organization and training theory. It also provides a central information and documentation resource. The 1990–1991 crisis in the gulf precluded APTI's handling of its mission, and not until 2003 did Iraq request a reopening of the institute.

## Impact

Oil is the world's primary energy source. It is a commodity, and as a commodity its price is volatile. Developed and undeveloped nations share the world's wealth unequally. Undeveloped nations get the highly variable price of the raw commodity, a price determined largely by the buyer rather than the seller. The developed ones get the more stable income from transport, manufacture, packaging, and the other processes—and jobs—that make a finished product. Developing nations want greater control over the processes that occur once their raw material—petroleum, for instance—leaves the ground. Developing nations recognize that they have to move into industrialization

and manufacturing and control of the entire life of their product if they are ever to achieve reasonable economic development and stability.

Before the 1950s, the Middle East was of interest for a potential location of strategic military bases just as much as for its petroleum. Much of the region remained predominantly agricultural. Then, in the 1950s, multinational petroleum companies began exploration and development of Arabian Gulf oil resources under leases, contracts, or concessions by the local governments.

In 1959 and 1960, the petroleum companies unilaterally decided to lower prices. The Arabian producers protested. At the Baghdad Conference of September 10–14, 1960, Saudi Arabia, Iraq, and Kuwait—supported by Venezuela and Iran—founded the Organization of Petroleum Exporting Countries (OPEC). Prices stabilized until the end of the 1960s. In the late 1960s, the third Arab-Israeli War took place. One reaction to this war was the creation of the Organization of Arab Petroleum Exporting Countries (OAPEC).

Initially, the member countries were predominantly agricultural, but the rising oil revenues of the 1960s allowed governments to invest heavily in industry and infrastructure. Economic growth was marked, and members of OAPEC raised prices and taxes. In 1971, some went so far as to nationalize majority shares of Western oil concessions. Then, the fourth Arab-Israeli War began on October 6, 1973. With OPEC support, Arab petroleum exporters embargoed oil shipments to Western countries that had supported Israel. At this point, the OPEC countries, not the oil companies, controlled price shifts. As supplies shrank, prices rose 400% over six months. Shortly after the embargo, Henry Kissinger of the United States established the International Energy Agency (IEA), composed of just about all of the Western industrial nations. IEA was to establish ways to ensure that an OAPEC embargo could not happen again. The IEA established a formula for sharing in the event of a supply disruption. It was the Emergency Sharing System, which obligated members to buy and sell oil at fixed prices for a set amount. The United States began filling its Strategic Petroleum Reserve, the salt mines of Texas and Louisiana. In 1976, oil was on average 74.4% of GDP in the OAPEC countries. Qatar and the United Arab Emirates hit 100%. GDP per capita increased from \$433 US dollars (USD) in 1970 to \$1,916 (USD) in 1976. The range among countries was from \$424 in Egypt to \$15,323 in the United Arab Emirates in 1975.

The increased revenues allowed the OAPEC countries to repay foreign debt, increase foreign exchange reserves and financial stability, and continue investing in internal improvements and social programs. In the late 1970s, the Arab petroleum producers began

shifting from merely producing crude oil to producing and exporting refined oil products, petrochemicals, and gas. Libya opened a methanol plant, Saudi Arabia opened a lube-oil plant, and Qatar opened a steel mill. Iran began smelting copper, producing fertilizer, and expanding its refining capability. Other ventures produced steel and aluminum and fertilizer in Iran, Iraq, Dubai, Qatar, Algeria, and Egypt. The OAPEC oversaw this attempt to overcome the area's colonial history.

### Numbers (1970–1995)

The increase in income during the booms was due to increased output rather than more efficient production. In addition, the types of infrastructure projects that the states spent their money on were large-scale mass employment projects that encouraged low productivity instead of efficiency. When the boom faded, the social welfare costs were difficult to bear.

In the mid-1980s, oil prices declined. OAPEC countries were slow to adjust their economies to the reduced income. Growth was weak between 1984 and 1995. The Seventh Arab Energy Conference took place in Cairo on May 11–14, 2002. Arab energy conferences take place every four years. The first came from a 1977 agreement between the OAPEC ministerial council and the Arab Fund for Economic and Social Development. After the first, the OAPEC incorporated the Arab League's Arab Petroleum Conference, held since 1959. Another sponsor was the Arab Industrial Development and Mining Organization.

At Cairo, the members discussed ways to raise the \$84 billion anticipated for 2002–2006 energy projects. Members indicated an increased willingness to let the private sector join their national companies in these ventures. The inclusion of international oil companies was anticipated to increase chances for funding from international banks rather than from regional sources, historically small and undercapitalized compared to the international banks. Still, more than 40% of the money was from regional sources. At the time of the seventh conference, the globalizing world was moving increasingly toward regional economic organizations, and the Greater Arab Free Trade Area was six years old. A 2004 estimate was that a \$1 million increase in exports increased GDP by \$4 million, and a \$10-a-barrel increase raised the European fuel bill by 4 million euros.

### ORGANIZATION OF EASTERN CARIBBEAN STATES (OECS)

On June 18, 1981, representatives of seven English-speaking states in the Leeward and Windward Islands—Antigua and Barbuda, Dominica, Grenada, Montserrat, St. Christopher (St. Kitts) and Nevis, St. Lucia, and St. Vincent and the Grenadines—signed the Treaty of Basseterre to promote unity and solidarity. The Treaty of Basseterre, named in honor of the capital of St. Kitts and Nevis, where the treaty was signed, created the Organization of Eastern Caribbean States (OECS). The treaty was signed by Deputy Prime Minister Lester Bird (b. 1938) of Antigua and Barbuda, who became the first chairman of the OECS; Prime Minister Mary Eugenia Charles (b. 1919) of Dominica; Prime Minister Maurice Bishop (1944–1983) of Grenada; Minister of Education Franklyn Margetson of Montserrat; Premier Kennedy Simmonds (b. 1936) of St. Kitts and Nevis; Prime Minister Winston Cenac (1925–2004) of St. Lucia; and Deputy Prime Minister Hudson Tannis (1928–1986) of St. Vincent and the Grenadines. Anguilla and the

British Virgin Islands became associate members of the OECS in 1995 and 1994, respectively. The headquarters of the OECS are located in Castries, St. Lucia.

In 1947, the groundwork for an association of English-speaking Caribbean colonies was laid by British authorities at a regional conference held at Montego Bay, Jamaica. The British suggested that the creation of a political federation of British colonies in the Caribbean would eventually culminate in the political independence of the region. The West Indies Federation (1957–1962) united ten island territories: Jamaica, Trinidad and Tobago, Barbados, Grenada, St. Kitts-Nevis-Anguilla, Antigua and Barbuda, St. Lucia, St. Vincent and the Grenadines, Dominica, and Montserrat. In 1961, Jamaica, the most economically significant of the member states, withdrew from the West Indies Federation following a dispute over the implementation of a customs union. In 1962, the West Indies Federation collapsed when Trinidad and Tobago withdrew from the group. Simultaneously, in 1962, Jamaica and Trinidad and Tobago became the first Anglophone Caribbean countries to achieve independence. Barbados achieved its independence in 1966. In 1966, the remaining nonindependent members of the defunct West Indies Federation formed the West Indies States Association (WISA). Designed to give greater autonomy to the British colonies in the Windward and Leeward Islands, the creation of WISA resulted in the independence of Grenada in 1974; Dominica in 1978; St. Lucia and St. Vincent and the Grenadines in 1979; Antigua and Barbuda in 1981; and St. Kitts and Nevis in 1983. Led by Premier Paul Southwell of St. Kitts and Nevis, representatives of WISA met in St. Lucia in May 1979 to discuss the need for greater regional cooperation. The result was the Treaty of Basseterre and the creation of the OECS.

The OECS has sought to promote cooperation among the members at the regional and international level; defend their sovereignty, territorial integrity, and independence; adopt common positions on international issues; arrange for joint overseas representation; and promote economic integration among the members. The OECS is charged with assisting member states to maximize the benefits of their limited resources to achieve sustainable development. The OECS's four major advisory and regulatory activities are the Eastern Caribbean Telecommunications Authority (ECTEL), which regulates the telecommunications sector; the Directorate of Civil Aviation (DCA), which provides guidance and direction on airport development and adequacy of air services; the Eastern Caribbean Central Bank (ECCB), which monitors the common currency of the member states; and the Eastern Caribbean Supreme Court. In 2002, the OECS, in

an effort to facilitate travel within the region, declared that all OECS citizens could travel in the region with a valid photo identification card, such as a driver's license. There are plans for the creation of a common passport.

Notwithstanding the high literacy rates of the member states, the potential to expand tourism, and valid efforts at economic diversification, there are significant challenges to development in the region. The small population of the OECS states (less than 1 million people collectively); the high rate of HIV/AIDS that poses a serious health challenge; vulnerability to natural disasters that disrupt agriculture and tourism (such as hurricanes); the decline in access to preferential markets, especially for bananas, during the 1990s; increased competition in the tourism industry from other Caribbean states, especially the Dominican Republic that has offered all-inclusive vacation packages at greatly reduced rates; and the impact of the events of September 11, 2001, on global tourism continue to inhibit development. Moreover, foreign debt increased dramatically during the 1990s.

The leaders of the OECS also sought to insulate their region from the vagaries of the Cold War during the 1980s. In October 1982, the governments of Antigua and Barbuda, Barbados, Dominica, St. Lucia, and St. Vincent and the Grenadines signed a regional security accord—the Regional Security System (RSS)—that allowed for the coordination of defense efforts and the establishment of paramilitary units drawn from the islands' police forces. On October 19, 1983, Prime Minister Bishop of Grenada was murdered by a faction of Grenada's government that wanted to implement a more rigorous policy of Marxist-Leninism. The OECS supported the US invasion of Grenada on October 25, 1983. National defense forces from Antigua and Barbuda, Dominica, St. Lucia, and St. Vincent and the Grenadines assisted in the US-orchestrated event. After the end of the Cold War, the primary security concern of the OECS was no longer socialism. The new threat was drug trafficking. The United States provided training, two C-26 Metros (decommissioned U.S. Air Force jets), and spare parts to help the OECS monitor the region against drug traffickers.

Notwithstanding attempts at greater regional integration, it is conceivable that one or more of the multiple-island states, such as St. Kitts and Nevis or St. Vincent and the Grenadines, might split into separate entities in the future.

## ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES (OPEC)

The Organization of Petroleum Exporting Countries (OPEC) officially came into existence as a result of a conference held in Baghdad, Iraq, on September 14–19, 1960. OPEC's founding members, five of the principal oil exporting countries, were Saudi Arabia, Iran, Kuwait, Iraq, and Venezuela. The five founding members were later joined by eight other countries: Qatar (1961), Indonesia (1962), Libya (1962), United Arab Emirates (1967), Algeria (1969), Nigeria (1971), Ecuador (1973–1982), and Gabon (1975–1994). OPEC had its headquarters in Geneva, Switzerland, during the first five years of its existence. The headquarters were moved to Vienna, Austria, on September 1, 1965.

The founding members have veto power over admission of new members, but otherwise all full members have equal rights within the organization. Any country that is a “substantial net exporter” and whose petroleum interests are “fundamentally similar” to those of member countries is eligible to join. Trinidad and Tobago, Syria, and Congo have applied for membership but have not been accepted.

OPEC's objective is to coordinate and unify petroleum policies among member countries to secure fair and stable prices for petroleum producers; to provide an efficient, economic, and regular supply of petroleum to consuming nations; and to enable fair return on capital to those investing in the industry.

OPEC derives its power from the fact that its members own two-thirds of known petroleum reserves and

that their extraction costs are minimal. Members of OPEC export 40% of all oil moving in international trade, primarily because their reserves are large and extraction costs are low. However, OPEC is not a perfect cartel because there are inherent conflicts of interest among its members. OPEC is not an Arab organization, as is sometimes mistakenly believed. Only three founding and four new members are Arab. In all, they are geographically dispersed over three continents and an island and vary considerably both in population and land area. It is not even true that all member countries are wealthy; per capita output and petroleum reserves vary enormously.

### Brief History of OPEC

Long before OPEC was formed, the international oil industry was dominated by seven major companies (Exxon Corporation, Mobil Oil Corporation, Texaco, Standard Oil Company of California, Gulf Oil Corporation, British Petroleum Company, and Shell Petroleum Company), that controlled more than 90% of the world oil production outside the United States and the Soviet Union in addition to owning most transportation, refining, and marketing facilities. The US majors also controlled the sizable part of the US oil industry. As early as 1928, representatives of Exxon, Royal Dutch Shell, and British Petroleum met at the Achnacarry Castle in Scotland to form an “as-is” agreement. The agreement established principles to correct overproduction, reduce competition, and freeze individual market shares of their 1928 levels. They also agreed to sell crude oil and products at a fixed price regardless of source or production cost. Prices in the US Gulf (of Mexico) Coast terminals constituted the basis for price quotations throughout the world.

The oil companies persuaded oil-producing states to adopt a series of regulations controlling oil production by prorating the estimated demand for crude oil among all producing fields and wells. Demand was estimated on the basis of current prices so that additional production would not undermine the existing price structure. It should be noted here that because of this control system, consumers in Iraq were charged prices based on quotations at the US Gulf Coast, despite that (i) the crude oil was produced in Iraq, (ii) it was produced at low cost, (iii) it was refined in a nearby refinery, and (iv) the products were marketed by a local company.

The oil companies, whose goal was an orderly development of oil production through market allocation and price stabilization, were able to solidify

their control through the utilization of two important strategies. The first was the joint ownership of oil-producing companies in the Middle East and Venezuela. This strategy helped major oil companies to coordinate and direct output to meet corporate oil requirements and avoid excessive output. Second, to allow new oil to enter the world market through the major's integrated channel, long-term contracts were concluded between certain majors. The provisions of these contacts, which specified where crude oil was to be marketed and the terms of its sale, had the effect of tightening the joint control of the majors over the international oil industry.

As World War II was coming to an end, it became clear that the United States would no longer continue to be a major exporter of oil and that the Middle East would be called upon to meet the rising needs of the world. The United States and the United Kingdom signed an agreement in 1944 to enable U.S. oil companies to have access to Middle East oil and to have virtual control over international petroleum trade. In 1948, the Arabian American Oil Company (ARAMCO) was formed by Esso (now Exxon), Texaco, Socal, and Mobil to develop Saudi concession. Huge deposits of oil were soon discovered, and the US companies reaped profits from supplying low-cost oil to Europe and Japan and later to the United States. Other American companies gained access to concession in Kuwait, Iran, and other important Middle East oil producers.

Although the short-lived Iranian nationalization of Anglo-Iranian Oil Company in 1951 presented a temporary challenge to the majors' authority, by 1954 the majors had almost total control over the oil produced in Iran, Kuwait, and Saudi Arabia. As a result, the majors held enormous power over the political and economic destinies of these countries.

The oil-producing countries resented the fact that the foreign oil companies were given a free hand to exploit the oil reserves under concessions granted by the local rulers. Those agreements required the companies to pay only a nominal royalty, an average of twenty-one cents a barrel, to oil-producing countries. In return, the oil companies were exempted from taxes and were given a blank check to determine production and pricing policy.

The oil-producing countries were satisfied with these arrangements prior to World War II, when demand was low, prices were fluctuating or dropping, and prospect for discovering oil was uncertain. These oil-producing countries eventually decided to get their share of the oil being produced in their countries. Venezuela was one of the first countries to challenge these arrangements, when in 1945 the government demanded and received an even split in oil profits

with companies. The Venezuela oil minister, Juan Pablo Perez Alfonzo, later a founder of OPEC, formulated the new rules and tax system.

In subsequent years, the oil-producing countries of the Middle East, which had been getting royalties of 12.5% of oil profits, adopted the Venezuela sharing plan. By the early 1950s, all the oil-producing countries had negotiated agreements providing for a 50/50 split of the profits with the oil company or consortium producing the oil.

The entry into the oil-production business in the 1950s of many new and independent companies put downward pressure on prices. The seven major corporations (the so-called Seven Sisters) discovered that smaller, more aggressive companies were eager to produce at high levels. The Seven Sisters had in the past reduced overseas production when the world oil market was saturated, thus preventing a drop in price.

By the end of 1957, prices were dropping. US producers felt turmoil when sales of oil from domestic wells were undercut by cheaper foreign oil. In an attempt to protect US oil producers, President Dwight D. Eisenhower asked the suppliers of foreign oil to limit their imports voluntarily to about 12% of US production. The effort failed, however, and President Eisenhower decided in 1959 to impose mandatory oil import quotas. Venezuela and Arab producers suddenly found themselves unable to expand their share of the world's biggest oil market.

Producing countries were also angered by a price cut in August 1960 by Esso and other companies. In September 1960, Iraq called a meeting of oil-producing governments to discuss the situation. Saudi Arabia, Iran, Kuwait, and Venezuela responded quickly and favorably. Leaders of the group were Perez Alfonzo of Venezuela, whose country was then the top world producer, and Sheik Abdullah Tariki, the oil minister of Saudi Arabia. The participation at the Baghdad Conference of September 10–14 decided to establish OPEC. The initial goal of OPEC was to return oil prices to their earlier levels and to gain the right to consult with oil companies on future pricing decisions. In June 1968, OPEC held a conference at its Vienna headquarters that produced a declaration of principles asserting the right of member nations to control world oil production and prices—a goal that at that time seemed unlikely to be realized. The 1969 revolution in Libya tilted the balance of power toward the producing countries, making it possible for OPEC to press for further authority. In September 1969, a group of officers headed by Muammar Qaddafi seized control of the Libyan government. He successfully pressured OPEC to cut oil production and to demand higher oil prices and a greater percentage of profits in the form of taxes.

In the early 1970s, OPEC countries were able to band together so effectively that the United States and other major industrial powers were forced to pay almost whatever OPEC decided to charge for oil. OPEC countries were able to control most of the supply and hence the price of one or more products. In February 1971, the Persian Gulf States of Abu Dhabi, Iran, Iraq, Kuwait, Qatar, and Saudi Arabia met in Tehran with oil company officials. Following the precedent set by Libya, they demanded and won what was considered at the time a major price increase of thirty to fifty cents a barrel. The Tehran agreement also raised the minimum tax rate on oil profits from 50% to 55%.

As a result of OPEC's controlling power, two so-called oil shocks hit the world in the 1970s. The first oil shock concerned Arab oil embargoes that were imposed against United States and Western Europe as a result of the 1973 Arab-Israeli conflict. The embargoes sent oil prices skyrocketing from three to twelve US dollars per barrel. The embargo was said to have cost the United States about 2 million barrels of oil a day. A 1974 Federal Energy Administration report estimated that the five-month embargo cost half a million American jobs and a gross national product loss between \$10 billion and \$20 billion. Hardest hit were Japan and Western Europe, areas most dependent on foreign oil. Most of northern Europe suffered from the embargo against the Netherlands because the Dutch port of Rotterdam was Europe's largest oil-refining and transshipment center. The second oil shock was caused by the Iranian revolution of 1979. The Iranian Revolution of February 1979 reduced Iran's crude exports to a trickle. Revolutionary turmoil, strikes in the oil fields, and other disturbances caused oil output to decline from a peak of 6.1 million barrels a day in September 1978 to virtually nothing in December and to an only partial recovery in March 1979. Even though Saudi Arabia and others increased production, there still was not enough oil to meet the strong world demand. The upward pressure on prices prompted OPEC to decide in March to move at once to a price of \$14.54 a barrel, the level originally scheduled for October. The organization also agreed to allow countries to add surcharges to the official price. This was the first time OPEC had authorized members to set prices individually. Meanwhile, global oil markets fell into total disarray. Despite Saudi Arabia's 2 million barrels a day, extra output to compensate for the Iranian shortfall, spot crude prices escalated upward to \$40 a barrel. Panic buying was largely to blame. The outbreak of the Iran/Iraq war on September 22, 1980, and a sudden loss of almost 4 million barrels a day, pushed up spot prices once again beyond \$41 a barrel. In December 1980, the official price of the market crude was set at \$32 a barrel, with a

maximum of \$36 a barrel for the same quality oil. The maximum price of any OPEC crude was fixed at \$42 a barrel.

### Oversupply and OPEC

Many observers predicted that OPEC would remain powerful forever or that the world would run out of oil by the early 2000s. These predictions did not materialize for several reasons. First, the global demand for oil plummeted to 53.5 million barrels a day in 1982 from 62.9 million barrels a day in 1979. OPEC's output, however, fell to about 18.7 million barrels a day, down from 30.5 million barrels a day—a drop of 40%. A large percentage of this drastic fall was generally believed to be due to the recession itself, a decrease in commercial energy consumption through conservation and use of oil substitutes. Second, after the 1970s, new oil was discovered in several parts of the world. In addition, non-OPEC countries helped push global supply levels to the point when prices started to drop. For example, oil production in Mexico, China, Egypt, Malaysia, Britain, Norway, and other countries all helped increase global supply. In the early twenty-first century, even more oil is expected to be pumped from wells in the Caspian Sea and other locations around the world, including Eastern Siberia, the Gulf of Mexico, Canada's tar sands deposits, and Venezuela's Orinoco Belt. Second, by the 1990s, most OPEC members were pumping out more oil than they were supposed to. This occurred in part because most of the world's oil-rich countries were struggling economically. The economies of the OPEC countries relied—and continue to rely—almost exclusively on oil; for many, oil accounts for about 75% of their national incomes. In the case of Kuwait, more than 90% of its revenues were coming from oil. Even Saudi Arabia, the leading oil producer in the world and the political leader of OPEC, faced debt problems and economic recession. In 1997, for example, Saudi Arabia earned about \$45 billion from oil exports. In 1998, it earned only \$30 billion. This helped put the Saudi budget of \$13 billion in debt. As a result of the economic difficulty in oil-producing states, each individual OPEC member had an incentive to sell more oil. According to the dynamics of supply and demand, if countries produce more oil, then world oil prices should drop. This is exactly what happened in the 1980s and especially in the 1990s. In short, many OPEC countries simply could not afford not to pump more oil. Due to excessive production by both OPEC and non-OPEC producers throughout the 1990s, prices remained weak. Oil prices in the summer of 2000 were still

about one-third below what they were in 1990 and half of 1981 prices.

## Future of OPEC

In the 1990s, many observers concluded that oil prices will stay, on average, at less than \$20 per barrel for the next decade and that supplies will be maintained beyond 2020. This, however, changed as a result of the US invasion of Iraq. The price of oil shot up to almost \$55 per barrel in October 2004. By their military action in the Gulf War and invasion of Iraq, the United States and its allies demonstrated that they consider Middle Eastern oil vital to their national security and economic interests. The United States and many other nations of the world sorely need access to Middle Eastern oil. US reliance on foreign oil imports had been increasing and seems likely to keep increasing. The main threat to energy security now seems to come from internal strife among Middle Eastern nations themselves. Both the Iran-Iraq War and Persian Gulf War emphasized this lesson.

Although Saudi domination of OPEC and of the world market was almost as strong in 2004 as it had ever been, there are no guarantees it will continue. It seems possible that other nations such as Iran, or former Soviet republics, could gain or regain status as major producers. Despite price fluctuation and rivalry among Middle Eastern nations, the importance of OPEC and the Middle Eastern oil remains unquestioned. The three biggest Persian Gulf countries—Saudi Arabia, Iran, and Iraq—could potentially supply 50% of oil in world trade. If they cooperate with each other, as they have in the past, they could dominate the world oil market. However, what is certain is that world oil prices and supplies will continue to fluctuate.

## ORGANIZATION OF THE ISLAMIC CONFERENCE (OIC)

After World War I, the idea of the Organization of the Islamic Conference (OIC) was born and aimed at establishing a pan-Islamic organization to defend Islamic interests in the international arena and to enhance the inter-Islamic countries relations as well. The first step of formalizing the OIC was in 1969 in the aftermath the Zionist assault on Al-Aqsa Mosque. The leaders of Muslim states met in the Moroccan capital of Rabat to discuss a reasonable strategy. They decided to lay the foundation of an organization that would coordinate their relations in the future. In 1972, the Organization of Islamic Conference was formally established after approving the charter, which became a legally binding document. The membership was thirty countries in 1972 and increased to fifty-seven countries in 2004. In conflict management, OIC played a crucial role in some conflicts concerning Muslim countries, such as the Arab-Israeli issue and the Bosnia-Herzegovina war.

The headquarters of OIC were supposed to be Jerusalem, but due to the Israeli policies and occupation of the city, the leaders decided to locate the headquarters in Jeddah temporarily. Under the charter, the organization has three main aims. First, it must strengthen Islamic solidarity among member states and support the struggle of all Muslim people to safeguard their dignity, independence, and national rights. Second, the OIC must coordinate action to

safeguard the holy places as well as support the struggle of the Palestinian people and assist them in recovering their rights and liberating their occupied territories. Third, the OIC must work to eliminate racial discrimination and all forms of colonialism.

Five principles of the OIC were also enumerated by the charter: full equality among member states; observation of the right to self-determination and noninterference in the internal affairs of member states; observation of the sovereignty, independence, and territorial integrity of each state; the settlement of any dispute that might arise among member states by peaceful means; and a pledge to refrain, in relations among member states, from resorting to force or threatening to resort to use force against the unity and territorial integrity or the political independence of any state.

In addition to secondary organs and institutions, the Conference of Kings and Heads of State and Government, The Conference of Foreign Ministers, and The General Secretariat are the three main bodies that compose the OIC.

## OVERSEAS PRIVATE INVESTMENT CORPORATION (OPIC)

In 1971, the US government established the Overseas Private Investment Corporation (OPIC) to help US businesses invest overseas. OPIC, an independent agency in the executive branch of the federal government, attempts to foster economic development in new and emerging markets in the developing world, assist the US private sector in managing the risks associated with foreign direct investment, and support the basic tenets of US foreign policy. OPIC officials evaluate project proposals on the basis of their contribution to economic development and their potential for success. OPIC provides qualified investors with project financing, investment insurance, and a variety of investor services in some 150 developing nations and emerging economies throughout the world.

OPEC-supported projects have the potential to generate political and economic stability in the developing world, while simultaneously creating jobs in the

US market. OPIC, which is based in Washington, DC, and has a staff of about two hundred employees, charges user fees for its services and operates on a self-sustaining basis at no cost to US taxpayers. OPIC clients are US companies. Unlike other governmental development agencies, OPIC does not provide direct aid or grants to foreign governments. In 2004, OPIC had about four hundred active clients, including small, medium, and large US businesses. In the post-Cold War world, demand for OPIC services has rapidly increased due to the demand for large-scale private sector infrastructure projects in the developing world. US companies engaging in infrastructure projects in the developing world have the potential to increase US exports to those nations.

OPIC can offer up to \$400 million US dollars in total project support for any one project. Project support can come in two forms: project finance and political risk insurance. No more than \$250 million can be spent in any one of these two areas. Although direct loans for any single project cannot exceed \$250 million, most development projects receive between \$2 million and \$30 million. OPIC political risk insurance protects U.S. companies against currency inconvertibility, expropriation, and loss of assets or income due to war, revolution, insurrection, or politically motivated civil strife, terrorism, or sabotage. Rather than relying on foreign government guaranties, OPIC looks for repayment from revenues generated by the OPIC-funded development project. Thus, OPIC can finance infrastructure projects in countries where traditional financial institutions are reluctant to lend.

The OPIC Investor's Information Gateway Country Link Database allows potential investors to search the World Wide Web (WWW) for economic, political, and social data about all of the countries where OPIC operates. OPIC operates in virtually all countries in the developing world, with the noticeable exceptions of Cuba, the People's Republic of China (PRC), North Korea, Burma, Libya, and Sudan.

OPIC supports development projects in virtually every industrial and economic sector, including agriculture, energy, construction, natural resources, telecommunications, and transportation. Since 1971, OPIC has supported more than three thousand projects throughout the developing world, and the organization has funded almost \$150 billion worth of investments that have helped developing countries generate over \$11 billion in host-government revenues and create over seven hundred thousand host-country jobs.

OPIC supported transportation infrastructure improvements in Ecuador and Brazil that will update Ecuador's main airport and Brazil's railway system, setting the stage for economic growth in each country. OPIC granted \$200 million in OPIC financing to a US

corporation for the construction of a new international airport in Quito, enabling Ecuador to move the Mariscal Sucre airport out of the center of Quito and thereby accommodate greater commercial air traffic and improve safety. OPIC provided a \$2 million loan to a US corporation for the purchase of used railway cars from US suppliers. These used railway cars will be leased to users of the Brazilian railroad system, helping the country meet growing transportation needs. OPIC also provided \$50 million to a US corporation to expand a wireless telecommunications network, which has expanded Bolivia's telecommunications infrastructure.

## OXFAM

Oxfam is a nongovernmental development organisation that began in England in 1942 as the Oxford Committee for Famine Relief to support civilian populations in Europe during World War II. After the war, Oxfam's attention shifted to the needs of people in developing countries. Oxfam also spread to Canada (1963), Belgium (1964), the United States (1970), and Hong Kong (1976). Secular, welfare-oriented aid agencies were independently established in other countries with similar objectives; for example, Community Aid Abroad in Australia (1953), NOVIB in the Netherlands (1956), and Intermon in Spain (1956) were established. In 1994, this loose network of Oxfams and like-minded organisations decided to formally establish a confederation for greater impact

in cooperatively addressing the global causes of suffering and injustice. Oxfam International is an international group of independent nongovernmental organizations whose mission is fighting poverty and related injustice around the world. In 2004, the confederation was composed of twelve affiliates working in more than one hundred countries.

Oxfam affiliates collectively govern Oxfam International, set policy, and create plans that align their work. However, affiliates take independent responsibility for managing their work, and they retain autonomy and distinctiveness. The affiliates vary considerably in size, budget, geographical focus, thematic emphasis and proportions of long-term development, and humanitarian and advocacy work. Over the years, the approach of each organisation has evolved, reflecting a maturing understanding of the development challenge. The initial emphasis on relief shifted to long-term development working through local non-government organisations as partners and operating in a tradition of innovation and solidarity.

Recognising "development" as involving social and political as well as economic and technical obstacles, Oxfam has led a campaign on behalf of the people they work with overseas. The organization attempts to influence the larger forces that perpetuate poverty and to shape government, private sector, and multilateral policies on a range of relevant issues. An abiding challenge for developing countries is the need for greater trade and export opportunities. Besides lobbying for a fairer world trade regime, many of the Oxfam organisations have established alternative trading operations that sell goods handmade by producer organisations and fairly traded commodities.

Several things distinguish the Oxfam approach. These are the commitment to addressing the structural causes of poverty and related injustice; a focus on oppressed and marginalised people, especially women and indigenous people; the principles of "partnership" (working as equals with democratic, accountable local organisations) and investing in local organisational capacity; making interconnections between the local and the global; and also making links between networked organisations. Beyond their own work and the way it enhances the impact of partners' efforts, Oxfam organisations attempt to leverage wider change by building people's movements through advocacy based on (i) experience and closeness to poor and dispossessed communities and (ii) a broad constituency of supporters in their own communities.

Each Oxfam has a rights-based approach to development, seeking to enable people to exercise their rights and manage their own lives. Their work is integrated around five aims: the right to livelihood,

the right to basic services, the right to life, the right to be heard, and the right to identity.

## **PACIFIC ISLANDS FORUM**

The Pacific Islands Forum has a membership of sixteen countries of the region: Australia, Cook Islands, Federated States of Micronesia, Fiji, Kiribati, Nauru, New Zealand, Niue, Palau, Papua New Guinea, Republic of the Marshall Islands, Samoa, Solomon Islands, Tonga, Tuvalu, and Vanuatu.

The Forum is similar to the Secretariat of the Pacific Community (SPC; formerly, the “South Pacific Commission”), but differs in important respects in terms of its history and composition. In 1972, the Forum was founded as the Trade Bureau, and it continues to act as a bureau in the twenty-first century with representative offices in Auckland, Beijing, Sydney, and Tokyo. Many people still refer to this Suva, Fiji-based organisation as the South Pacific Forum, this original title being approved by member governments only in 1988. The current name, Pacific Forum, was established in 2000 and reflects the projection of the organisation into the region, both north and south of the equator.

Most commentators will say that the South Pacific Forum began as a more closed organisation than the much older (founded in 1949) South Pacific Commission, itself renamed in 1999 as the Secretariat of the Pacific Community. One of the prime movers of the project, the late Ratu Sir Kamisese Mara, was explicit with his colleague Sir Michael Somare that emerging and about-to-be independent nations wanted an organisation where they could be free to speak about regional matters, away from the eyes of the withdrawing colonial powers that they believed dominated the older institution.

Australia and New Zealand are prominent members and financial supporters of both the Forum and the SPC. In contrast to the sixteen-member Forum, the SPC has a total of twenty-seven members. They are divided into two groups: the five founding members of Australia, France, New Zealand, United Kingdom, and United States of America, and the countries where the SPC programs take place. These countries are American Samoa, Cook Islands, Federated States of Micronesia (FSM), Fiji Islands, French Polynesia, Guam, Kiribati, Marshall Islands, Nauru, New Caledonia, Niue, Commonwealth of Northern Mariana Islands (CNMI), Palau, Papua New Guinea (PNG), Pitcairn Islands, Samoa, Solomon Islands, Tokelau, Tonga, Tuvalu, Vanuatu, and Wallis and Futuna.

Apart from their different membership and history, the two organisations differ in terms of what they do in the Pacific. Broadly speaking, the forum is conceived as a place for political and economic debate, whilst the SPC is known for its role advising on aspects of development, such as health and education. There are abiding overlaps.

There are four divisions of the Forum Secretariat in Suva, which is located near the University of the South Pacific. These four divisions are Development and Economic Policy, Trade and Investment, Political International Legal Affairs, and Corporate Services. The Pacific Islands Forum also chairs another regional organisation called the Council of Regional Organisations in the Pacific (CROP), consisting of ten institutions: Fiji School of Medicine (FShM), Forum Fisheries Agency (FFA), Pacific Islands Development Programme (PIDP), South Pacific Board

for Educational Assessment (SPBEA), South Pacific Regional Environmental Programme (SPREP), South Pacific Applied Geoscience Commission (SOPAC), Secretariat of the Pacific Community (SPC), South Pacific Tourism Organisation (SPTO), the University of the South Pacific (USP), and itself.

It is likely that in line with other name changes over the last few years, many of these organisations will drop the “south” part of their name since they all, just like the Forum and SPC, have activities in both the North and South Pacific.

All of the CROP institutions are autonomous and have governing bodies, funding sources, and programs of their own. It is for cooperation, sharing resources, and convenience that CROP exists under a Forum meeting structure. Two of the CROP organisations, FFA and SOPAC, though, grew directly out of the Pacific Islands Forum in earlier years, and one, SPREP, began its life as an arm of the SPC. SPREP is located in Samoa, just outside Apia, the capital city of that island country.

Notable in the CROP group is the Pacific Islands Development Programme (PIDP), which with its head Tongan-born Dr. Sitiveni Halapua is part of the East-West Center, a US State Department funded educational and advisory institution adjacent to the Manoa campus of the University of Hawaii. Like the Forum, the PIDP is meant to be a meeting of heads of government. A quite likely heading for a new name is the Pacific Islands Conference; the PIDP meets every three years, convening the heads of twenty states and territories, including the US state of Hawaii.

The Forum Fisheries Agency (FFA) is located in the Solomon Islands. Its headquarters were damaged during the civil turmoil in the Solomons in 2000, but it soon after began operating once again. Given the crucial importance of fisheries to the Pacific Islands countries, it is not surprising that the FFA occupies a central role in the Pacific Islands Forum’s expenditure and activities. SOPAC is located in Suva and takes as its role the need to keep up on “nonliving” resource development by which minerals and especially future seabed mining prospects can be understood.

One of the most sensitive matters in the early twenty-first century has been the growing Australian insistence for the country to have a greater role in the actual running of regional institutions to which it is a substantial contributor. A fraught meeting in 2003, followed by another in 2004, reluctantly led to the appointment of Australian-born, career diplomat Gregory Urwin as the Secretary-General of the SPC.

For the future is the prospect of old colonial-established borders breaking down. After all, could not Japan and the Philippines be called the “Pacific

Islands”? And, if Pacific Rim countries, such as the United States and New Zealand, hold membership in Pacific regional bodies, why could Latin American states bordering on the Pacific Ocean not hold membership as well? In fact, Chile has been gaining observer status progressively, first at the SPC and more recently at the Forum. The first instance was made possible by virtue of Rapanui (Easter Island), its province of 2,237 miles (3,600 kilometers) from the Chilean coast claimed in 1888; the early twenty-first century has brought with it interest in the island.

### PAHLAVI, SHAH MUHAMMED REZA

Known as “The Shah of Iran,” Muhammad Reza Pahlavi (1919–1980) was the last leader of Iran before the fall of the monarchy and the establishment of an Islamic republic under the Ayatollah Ruhollah Khomeini.

The Shah’s father, Reza Shah (1878–1944), was a military officer who overthrew the Qajar Dynasty in 1921 and established his own, which he named Pahlavi, in 1925. The name was significant: Pahlavi was the language of Iran’s pre-Islamic religion, Zoroastrianism. Reza Shah was a secular modernizer whose policies were anathema to the clerical establishment.

Muhammad Reza was five years old when he became Crown Prince. In 1931, he was sent to a finishing school in Switzerland after which he spent three years (1935–1938) in a military school in Tehran. In 1939, he married a sister of King Farouk I of Egypt. They had a daughter (b. 1940) but no heir to the throne. Reza Shah had wrested partial control of Iran’s lucrative oil industry from the British, introduced modern schooling, and begun construction of Iran’s first railroad. He had also leaned toward Germany in its looming confrontation with Britain and Russia. However, British and Russian forces invaded Iran in August 1941, deposed Reza Shah, and placed Muhammad Reza, then twenty-one years old, on the throne. The two allied powers occupied Iran for the remainder of the war.

The confrontation between the Shah and Ayatollah Ruhollah Khomeini began immediately. Khomeini

denounced the Shah's "dictatorial regime" and called on the nation to "rise up for God." The Shah became dependent on US support, which grew stronger as the Cold War developed. Stalin withdrew Soviet troops from northern Iran in May 1946 only under severe pressure from Washington, DC. The main threat to the Pahlavi Dynasty now seemed to come from the Tudeh (Communist) Party, not from the clerics. After a February 1949 assassination attempt, the Shah imposed martial law and banned the Tudeh Party.

A power struggle between the Majlis (parliament) and the Shah became entangled with Cold War politics. In March 1951, Prime Minister Muhammad Mossadeq passed a bill nationalizing the Anglo-Iranian Oil Company. The Shah tried to remove Mossadeq from power but was forced to flee Iran on August 16, 1953. The US Central Intelligence Agency (CIA) financed street riots against Mossadeq, and three days later the Shah was back on his throne but with the stigma of foreign sponsorship. Mossadeq was imprisoned, and the nationalization of oil industry was reversed. In 1954, the Shah rigged parliamentary elections, and in 1955 he joined the Baghdad Pact. The United States greatly increased foreign aid to Iran while urging internal reform. The Shah's secret police received training from the Israeli Mossad.

In 1959, the Shah married his third wife Farah Diba, who bore a son in 1960. The dynasty now appeared secure. The 1960s was a decade of progressive reform in Iran. Secular education was greatly expanded, and voting rights were extended to women. These innovations offended the ultraconservative Shi'a religious establishment, and the Shah's land reform program, begun in 1961, threatened their financial base. Ayatollah Khomeini denounced the government in such vitriolic terms that the Shah's men arrested him in 1963 and jailed him for three months. Ayatollah resumed his verbal attacks immediately upon his release. By now the Shah had disbanded parliament and was ruling by decree. Khomeini was forced into exile. All political opposition was now channeled through the clergy. The Shah pushed ahead with his economic reforms, which he called his "White Revolution." The reforms included building roads, initiating irrigation projects, and establishing public health programs.

His throne seemingly secure, the Shah's megalomania grew. He staged a royal ceremony in 1967 that included dropping 17,532 roses from air force planes, one rose for every day of his life. His wife was designated Empress. The anger of the clerics simmered. In 1971, the royal couple spent hundreds of millions of dollars on a lavish festival in Persepolis, commemorating 2,500 years of monarchy (traced back to the

Persian king Cyrus). The deliberate emphasis on Iran's pre-Islamic past enraged the clerics.

In 1973, the Organization of Petroleum Exporting Countries (OPEC) quadrupled the price of crude oil. In response, the Nixon Administration sought to repatriate capital by selling a panoply of advanced weapons systems to Iran, with the understanding that the Shah would protect the Persian Gulf from Soviet threats.

The Shah was at the height of his power in 1974 when he was diagnosed with lymphatic leukemia and began secretly to undergo medical treatment. Corruption was rampant within his government. Political opponents could only be held in check by the secret police, who routinely resorted to torture. American President Jimmy Carter, inaugurated in January 1977, urged respect for human rights on the Shah, who, as he grew sicker, wavered between liberalism and repression. Students in Tehran rioted in December 1977, demanding Khomeini's return from exile. The Ayatollah was living outside of Paris, dictating fiery sermons into a tape recorder. His messages, reproduced by the hundreds, were played over loudspeakers in mosques throughout Iran.

On January 16, 1979, the Shah, now very ill, left Iran, never to return. Khomeini arrived on February 1, and declared Iran an Islamic republic two months later. The US government pressured other countries to provide the Shah with refuge. His final *hegira* took him to Egypt, Morocco, the Bahamas, and Mexico before finally being admitted to the United States for medical treatment. Muhammad Reza Pahlavi died on July 27, 1980, in Cairo, Egypt.

## PAKISTAN

The present Islamic Republic of Pakistan is bounded by Afghanistan on much of its western border and by Iran on the southwest portion of it. Its entire eastern border is bounded by India. On the south, the country opens to the Arabian Sea, and in the extreme north it abuts China. Roughly twice the size of California,

much of its land is a hot, dry desert. A more temperate climate is found where the northern piedmont begins its rise toward some of the world's highest mountains in the Hindu Kush and Karakorum ranges. All five rivers that give the Punjab its name feed into the Indus, making it one of the world's great rivers and providing irrigation waters to support Pakistan's agriculture, which centers on wheat and cotton.

However, when the country gained independence in 1947 as a homeland for the Muslims of the Indian subcontinent, it included East Bengal, bounded on three sides by India and by the Bay of Bengal on the fourth, which caused the two "wings" of Pakistan to be separated by about 1,500 miles of land or 2,500 miles of sea. The two regions were utterly different in most physical aspects. East Pakistan (which broke away in 1971 to become Bangladesh) consists largely of a fertile alluvial plain laid down by the revered Ganges and the broad Brahmaputra rivers, both of which originate in the Himalayan Mountains. East Pakistan, which is now Bangladesh, was only about one-sixth the size of West Pakistan, but it contained far more people. Its hot and humid climate favors a riot of subtropical vegetation where agriculture emphasizes rice and jute. Lacking stone, its roads have been made from burnt bricks laboriously broken by hand to make artificial gravel, and many of its rural houses have been sited on human-made earthen plinths to raise them above the expected crests of annual floods.

At Independence, only Lahore in West Pakistan and Dacca in East Pakistan were major cities; Karachi, chosen as the first capital, was a small port city that had served as an *entrepôt* for the produce of the Punjab during the British colonial period. Later, as government buildings for the new capital, Islamabad, were being constructed on the Potwar Plateau during Ayub Khan's rule, so were new capital buildings being erected in Dacca in the expectation that meetings of the National Assembly would alternate between the two cities. Such double expenditures in the interest of maintaining parity between the two wings continued to drain the resources of this poor country until 1971. Then, with the intervention of India in what had started as a civil war resulting from a disputed election, East Pakistan became the sovereign nation of Bangladesh. Painful as the separation was, in the view of many observers since, the dissociation has been a positive benefit for both.

Chronic political instability underlies most of Pakistan's development problems. In fifty years, the country has had fifteen different prime ministers, and for more than half of its brief history it has been under military rule. Such turmoil has also made it difficult to root out endemic corruption and put in place a just

system of taxation. It is believed that taxes collected represent less than 50% of taxes owed; kickbacks are customary in most business transactions, whether with the government or with private firms. One finance minister estimated that illegal payments extracted by government officials amounted to about 60% of the total the government was able to collect in taxes. As a consequence of such practices, Pakistan ranks among the most corrupt nations in the developing world.

Mohammed Ali Jinnah, founder of Pakistan who was given the honorary title Quaid-i-Azam (Great Leader), served as governor general along lines derived from British rule, but he died in 1948 after barely a year in office. His Prime Minister Liaquat Ali Khan was assassinated in 1951, and the tenures of those prime ministers who followed him were of short duration. During this first decade of independence, the *Mohajir* immigrants from India, who dominated the government, largely maintained the secular, democratic state envisioned by the Quaid-i-Azam and favored industry over agriculture in their development investments. But by the mid-1950s, the economy was stagnant, and the country was unable to feed its population, increasing at the rate of more than 3% each year.

General Mohammed Ayub Khan's martial law regime (1958–1969) brought political stability and enabled the country to embark on a planned economy that made real progress, resulting in an average 5.5% growth rate, but it was also during this period that wealth became concentrated in twenty-two families of industrialists and bankers. Meanwhile, as a result of the Green Revolution, Pakistan approached self-sufficiency in food and fibers, but productive agricultural lands also became concentrated in the holdings of a few "feudal" landlords.

After the brief rule of General Agha Mohammed Yahya Khan (1968–1971), which ended with the creation of Bangladesh, Zulfikar Ali Bhutto was elected to power on a populist platform that promised an *Awami raj* (people's rule). Even though a large landowner himself and the scion of an aristocratic Sindhi family, Bhutto promised land reform (which proved to be ineffective) and did nationalize ten basic industries as well as the banks and insurance companies. Then, as the inefficient state-owned enterprises created budget deficits, the Bhutto government (1971–1977) became more and more dependent on foreign loans and the remittances of overseas Pakistani workers, an economic situation further exacerbated by the perceived need to counter the threat posed when India detonated a nuclear device in 1974.

Following a bitterly contested election in 1977, Bhutto was ousted by his own appointee to the top

military post, General Mohammed Zia ul-Haq, and eventually was hanged by Zia as the outcome of flimsy criminal charges. Longest lasting of the Pakistani governments, the government of Zia (1977–1988) brought back martial law, did little to tamper with the status quo of the economy, but did introduce a program of austere Islamization. Of special interest to the Zia government was an attempt to free the financial system of *riba* (variously defined either as usury or interest). “Interest-free banking” has been a chimera pursued ever since by successor governments, while the bankers themselves have dragged their heels about implementing so-called profit sharing to replace interest. It has never been clear how a country that depends so heavily on external interest-bearing loans can meet its obligations should the desired financial utopia ever be achieved.

After the violent end of Zia in the explosion of his airplane that also killed the US ambassador, Benazir Bhutto, the daughter of Zia’s nemesis, came to power as prime minister in an ineffectual coalition government. As the first woman to hold such a lofty position in a Muslim country, Bhutto was never able to carry out the ambitious reform measures she had campaigned for. Caught between the demands of the ever-powerful military leaders and the cunning self-serving interests of officials of the provincial government of the Punjab, Pakistan’s most populous province, she was unable even to quell spreading social unrest and the growing ethnic violence in Sindh, her home province. Mian Nawaz Sharif, Governor of the Punjab, succeeded in persuading the president in 1990 to dissolve the National Assembly and to dismiss Benazir Bhutto for failing to maintain law and order. She and her husband also were under a cloud of unspecified charges of corruption.

From 1990 until 1999, the government seesawed between Nawaz Sharif and Benazir Bhutto, with four different caretaker prime ministers serving as the powerless fulcrum between them. As had now become traditional, Bhutto and Sharif took turns getting each other dismissed on charges of corruption. Despite their disparate backgrounds—Bhutto from a Sindhi “feudal” family and Sharif a Punjabi industrialist—both managed to continue the process of privatizing the industries that the elder Bhutto had nationalized. During this period, investment in development decreased while military costs increased, and the country was unable to meet the fiscal targets demanded by the International Monetary Fund (IMF). When Pakistan removed all doubt that it had attained nuclear capability by testing a nuclear device on May 28, 1998, in the Chaghi hills in Balochistan, it incurred the punishment of economic sanctions that left it in an even worse financial condition. Once again, the

military became involved, this time in a bloodless *coup d’état* on October 12, 1999, that resulted in Nawaz Sharif being sent into exile in Saudi Arabia and General Pervez Musharraf taking over as chief executive, a title he exchanged in less than a year to that of president.

At great hazard to his own continued tenure, since so large and so vocal a portion of the population opposed the policy, Musharraf sided with the United States and its allies in the military strike against Afghanistan in the War on Terrorism. The reward for this decision was the lifting of economic sanctions on his country and a renewed generosity on the part of Pakistan’s creditors to pump fresh money into the economy.

During all this hectic period of political instability, there has been a steady increase in life expectancy and a decline in infant death rates. Encouraging as these trends are, they nevertheless have exacerbated the population problem. As more and more people crowd into the cities, whose infrastructure cannot keep pace, public health has suffered and social unrest has increased.

Public safety, both in urban and rural areas, has declined for a number of reasons, principal among them being increased ethnic and sectarian disputes that end in greater violence as a result of guns diverted from armaments funneled through Pakistan during the 1980s to assist the Afghan *Mujahedin* fighting the Soviet occupation army. Adding to Pakistan’s problems were some 2 million Afghans who crossed the border seeking refuge and either have remained in squalid camps or migrated to little less squalid slums in the cities. At this time, too, Pakistan became a major pipeline for hard drugs to the West. Just as thousands of AK-47s were diverted from their intended destination in Afghanistan, much of the heroin was diverted and remained in Pakistan. No known heroin addicts were reported for Pakistan in 1980, but eight years later there were 1.2 million.

Public education has never received adequate funding, but from 1960 to 1990, it did increase from 1.1% of the gross national product (GNP) to 3.4%, yet even the latter figure must be contrasted with at least 30% of the GNP that went into defense. There has been a tendency, too, to build the educational system from the top down. Having inherited only one university from undivided India—Punjab University—Pakistan rushed to erect universities, first in every province, then to accommodate demands in every large city, while neglecting primary and secondary schools. To some extent, this lack was met by the organization of private schools at all levels, including colleges for undergraduates. As a result of the thrust of Islamization of the Zia administration, *deeni madaris*,

religious schools, sprang up all over the country to give free primary education to poor students, especially orphan boys, who otherwise would have had none. These schools later became breeding grounds for the fanatical Taliban.

For a country where once the attitude prevailed of "let government do it," it is heartening to see that since the 1990s there has been a proliferation of non-governmental agencies (NGOs) devoted to various sectors of social and human betterment, human rights, democratization, women's empowerment, and low-income housing. One of the earliest of these was the Fauji Foundation, established to help the more than 9 million ex-military personnel and their dependents lead satisfactory lives in civil society. Under the direction of retired officers, the foundation funds educational institutions and awards scholarships and manages hospitals and dispensaries; it carries out these activities with income it generates by its own industrial operations ranging from the manufacture of corn flakes to cement and fertilizer. Looking to the future, the foundation has pioneered in training young people to write software for computers.

Equally inspiring is the Edhi Foundation that began as a one-man affair when a peddler in Karachi named Abdul Sattar Edhi saved up enough from his earnings to open a modest dispensary to serve the poor. When others contributed money to help in his work, the foundation he then established grew to the point that it fields more than four hundred ambulances (and can even provide air ambulance service), has two hundred welfare centers scattered throughout the country, operates a blood bank, provides maternal and child welfare services, supplements the scanty food provided to prisoners in jails, and arranges a decent burial for indigents who die on the street. Combining the compassionate virtues of Mahatma Gandhi and Mother Teresa, Edhi himself drives his ambulances and helps to prepare the dead for burial.

### PALAU, REPUBLIC OF

The Republic of Palau, a nation of more than 250 islands (7° 30' N latitude, 134° 30' E longitude) in the western Pacific, lies 650 kilometers southeast of the Philippines. The islands (land area 458 square kilometers or 177 square miles), mostly fringed by coral reefs, vary from low-lying coral atolls to islands with mountains of high altitudes; Mount Ngerchelchhuus reaches the highest altitude at 242 meters (790 feet) above sea level. The regional climate is tropical, hot, and humid throughout the year with a wetter season from May to November. Typhoons, although rare, may occur over the islands from June to December. Tropical forests cover most of the islands, and littoral zones have mangroves interspersed with white, sandy beaches. On Babeldaob (also referred to as Babelthau) there are extensive areas of savanna and grasslands. The capital is Oreor (formerly Koror), but a new site is under construction twenty kilometers to the northeast.

Migrants, probably from Indonesia, first settled the islands of Palau around 3,500 years ago. The Spanish explorer Ruy López de Villalobos visited the islands in 1543, but the islands, although notionally belonging to Spain, were not colonized until late in the nineteenth century. Spain sold the islands to Germany in 1899, and the German colonists established coconut plantations and phosphate mining. The islands were seized by Japan during World War I. The League of Nations mandated the islands to Japan in 1920. During this period, the Japanese population grew to more than twenty-five thousand and significant development occurred in Oreor with paved roads, water supplies, and schools established. However, Palauans lost much of their traditional lifestyle and inheritance patterns as their lands were confiscated by Japanese colonists. In the late 1930s, the Japanese closed Palau to the outside world and began building military bases and fortifications.

During World War II, fighting between the United States and Japan occurred on the islands of Peleliu and Angaur. The United States took control of the islands in 1944, and in 1947, the islands became a part of the United Nations Trust Territory of the Pacific Islands administered by the United States. Palauans voted in 1979 not to become part of the Federated States of Micronesia, and a new constitution was adopted in 1980; Palau became self-governing in 1981. In a transitional period, marked by the violent deaths of Presidents Haruo Remeliik (assassinated in 1985) and Lazarus Salii (committed suicide in 1988), Palauans negotiated terms of the Free Association Compact with the United States that was finally approved in 1993. On October 1, 1994, Palau became an independent nation and was admitted to the United Nations on December 15, 1994.

Under the Free Association Compact, Palau is a sovereign nation, conducting its own foreign relations, but the United States is responsible for its defense. Palau is a democratic republic with directly elected executive and legislative branches. The president and vice president are elected every four years, and the bicameral legislature consists of a house of delegates (one member for each of the sixteen states) and a Senate with nine members. Each state government has an elected governor and state legislature. A council of chiefs advises the president on traditional customs. Tommy Esang Remengesau, Jr., was elected president in 2001.

In 2004, the population of twenty thousand had a growth rate of 1.46% and a life expectancy of 66.6 years (males) and 73.2 years (females). The population is dominated by Micronesians (70%), with Asians (28%, mainly Filipinos, Chinese, Taiwanese, and Vietnamese) and white people (2%). English and Palauan are the official languages, but other official languages are recognized in certain states: Sonsorol (Sonsoralese and English), Tobi (Tobi and English), and Angaur (Angaur, Japanese, and English). Most Palauans are Christians (Roman Catholics, Seventh Day Adventists, Jehovah's Witnesses, and Assembly of God parishioners). Approximately one-third of the population follows the indigenous religion known as *Modekngei*.

The economy is based on tourism, subsistence agriculture, and fishing. Tourism is focused on scuba diving and snorkeling over pristine coral reefs and war wrecks, and this sector accounts for more than half of the country's gross domestic product. Major tourist attractions are the Rock Islands, forest-clad limestone pinnacles that seem to rise out of the sea; Jellyfish Lake (a marine lake with dense jellyfish populations); and limestone caves with stalactites and rock art. The majority of tourists come from Japan, Taiwan, and the United States. The principal crops are coconuts,

cassava, sweet potatoes, taro, and bananas. Industrial activities include garment making and production of tourist artifacts from shells, wood, and pearls. Major exports are shellfish, tuna, and copra.

Environmental problems include inadequate disposal sites for solid waste and threats to marine systems from sand and coral mining, illegal fishing practices (with use of dynamite), and overfishing in areas with high human population densities.

The service sector employs 75% of the workforce, with the government providing over one-quarter of all jobs. Per capita income is high for the region, being approximately double that of the Philippines and much of Micronesia. Economic aid, largely from the United States but also from Japan, Australia, and New Zealand, provides significant budgetary support, and a major challenge for the country is reducing its reliance on this foreign assistance.

## PALESTINE

Palestine has never been and is not yet a state. It has never been governed fully and completely by Palestinian-Arab leadership. Yet, for decades, it has existed, if only in the hearts and minds of the Palestinian people and others who sympathize with their cause.

The Arabs moved from the Arabian Peninsula into the region of *Filistin*, the land of the biblical Philistines, in the middle of the seventh century AD. Under Umayyad and then Abbasid control, Palestine was but one of several provinces of the Islamic caliphate, located on the eastern shores of the Mediterranean Sea. The region held limited importance within these empires; its capital, Jerusalem, held Islamic religious significance but was never a city of political strength or economic power.

In the eighteenth and nineteenth centuries, Great Britain began to establish a sphere of influence in the Palestinian region as Ottoman strength in the Middle East began to wane. For the British and other Europeans, including the French and the Russians, Palestine was attractive for two primary reasons. First, it was strategically located at the crossroads of Africa and Asia and offered potential land and sea access to other major interests in the Far East, including India and China. Second, the region held Christian religious

value. The biblical cities of Jerusalem, Bethlehem, and Nazareth were home to numerous holy sites. Palestine also included the Galilee region and other areas of Christian interest, all of which attracted Christian pilgrims and others hailing back to the Crusades.

The fall of the Ottoman Empire at the end of World War I saw the dissection of the Middle East and a redistribution of sections of the region to the Great Powers. Arrangements between the French and the British, such as the Sykes-Picot Agreement of 1916, allotted parts of the former empire to the victorious Europeans. Britain was awarded Palestine, which was placed under British Mandate in 1917.

The purported purpose of the Mandate was to serve as an interim governing authority. The British would remain in Palestine only until a Palestinian leadership could develop and was capable of running its own affairs of state.

While governing Palestine, the British allowed Jewish immigration from Europe on a large scale. The November 1917 Balfour Declaration stated unequivocally that the British supported the creation of a Jewish national home in Palestine and that they would abet its development. Yet the indigenous Palestinian community feared the immigration of Jews, who identified with the Zionist movement that sought to create a Jewish homeland in their historic Jewish home. Increasingly, it became clear that the Jews were coming to stay and that their intention was indeed to take a part, or all, of Palestine as their own for the purpose of creating a separate Jewish state on Palestinian soil.

From 1936 to 1939, the indigenous Palestinian community rose up against the Jewish immigration. This period, known as the Arab Revolt, was similar to later uprisings (*intifada*). The revolt represented indigenous Palestinian efforts to stave off Jewish immigration and to press the British to rein in the flows of Jewish immigrants from abroad. The 1939 White Paper, issued by the British Mandatory authorities, resulted, with the goal of limiting and further restricting Jewish immigration to Palestine. While immigration was largely stymied, however, Jewish efforts to come to Palestine from Europe continued unabated.

## **The Creation of Israel and the Destruction of Arab Palestine**

With the end of World War II, war-torn Britain saw the need to divest itself of many parts of its empire, including Palestine. The departure from Palestine was no simple task, however; two leaderships with two conflicting sets of interests and both with compelling

historical and cultural connections to the same land now sat poised ready to take control of Palestinian governance. The answer, the United Nations (UN) determined, was to partition Palestine into two states, one Jewish, the other Arab.

The UN Palestine Partition Plan of 1947 sought to equitably resolve the problem of Palestine. Palestine was to be divided into seven parts; three for the Arabs and three for the Jews, with Jerusalem remaining in a unique state separate from the rest, given that it was the home to Jewish, Muslim, and Christian holy sites and therefore held international interest.

While the Jews saw the Plan as an opportunity to legitimize their land claim and provide the basis for the future Jewish state, Arab Palestinians saw the plan as a capitulation to illegitimate foreign colonial interests. World guilt resulting from the European Jewish Holocaust was, the Arabs feared, playing a role in the invalidation of their own long-held historic claim to the land of Palestine. Thus, their response was clear: not an inch of Palestine could be sacrificed to Jewish national interests.

Yet throughout this period (1946–1948), Jewish interests had already begun to mobilize militarily and otherwise conquer Palestine, pushing Arab residents out in the process whenever and however possible. Through land purchases, paramilitary activity, and the fostering of an atmosphere of fear, the *Yishuv* (the Jewish settlement governance structure) slowly succeeded in methodically overtaking Arab Palestine and replacing it with what would soon be a Jewish state. The development of a huge Palestinian Diaspora resulted, part of the larger catastrophe (*al-Nakba*) that befell the Palestinians as a result of Israel's creation.

The State of Israel was declared in Tel Aviv on May 15, 1948. Immediately thereafter, surrounding Arab states attacked the new state. The goal of these Arab states was presumably to push the Jews out to reassert the authority that was due to the indigenous Palestinian-Arab leadership. Yet, upon the conclusion of the war, a war won by the Israelis, most of the regions of Palestine that had been designated by the UN Partition Plan as the territory of Arab Palestine were now under Jordanian and Egyptian control. Arab Palestine had been destroyed, divided into three parts by three countries: Israel, Egypt, and Jordan.

## **The Role of Terror/Freedom Fighting in Palestine's Independence Struggle**

The struggle to reassert sovereignty over all of Arab Palestine was not initially fought by the Palestinians themselves. From 1948 until 1964, the Palestinian

Arabs were in a state of chaos and disarray. While some efforts to attack Jewish interests in the new Israeli state were made, the outside Arab states (primarily Egypt and later Syria) played the most significant military role in seeking to destroy Israel. But of course, in every instance, they failed.

It was in this context that a liberation movement created by the Palestinians themselves began to emerge in 1964. The purpose of the Palestine Liberation Organization, the most significant group to arise at this time, was to liberate Palestine from Israeli control. When Israel conquered and then occupied the West Bank, East Jerusalem, and Gaza from the Jordanians and Egyptians in 1967 (that is, the parts of Palestine that these countries had taken during the 1948 war), the whole of historic western Palestine became the center of Palestinian-Arab liberation activity.

The primary mode of operation utilized was terror—that is, the use of surprise attacks on civilians in nonmilitary locations in an effort to instill fear in the enemy while at the same time attract global media attention to the Palestinian plight. While many such attacks occurred within Israel, others were carried out against Israeli interests in Europe and elsewhere. El Al Airline flights became a regular hijacking target.

Perhaps the most notorious Palestinian terrorist attack, however, was the capture and eventual murder of eleven Israeli athletes and coaches during the 1972 Olympic Games in Munich, West Germany. The attack was carried out by a group calling itself Black September, in reference to the many Palestinian deaths that had occurred in Jordan in September 1970 as a result of civil conflict between the Jordanian military and the Palestinian refugees who had fled there in 1948 and 1967. Covered by the media internationally, the Munich attack put a new and terrifying face on the Arab-Israeli conflict, although it did little to change world public opinion in favor of the Palestinian people. This face of terror dominated world public opinion for years and only began to soften following the outbreak of the Palestinian *intifada* (uprising) in 1987.

## The Two-State Solution Revisited

In September 1988, at the height of the Palestinian *intifada*, Yasser Arafat as chairman of the Palestine Liberation Organization renounced terror and accepted, pending further discussions and negotiation, a two-state solution in which Israel would be accepted alongside a State of Palestine. Arafat's statement essentially redefined the meaning of the word "Palestine"; from that moment forward, Palestine

meant the West Bank, Gaza, and East Jerusalem. After four decades of war, terror, and bloodshed, Palestine had effectively been divided, bearing an intended outcome that would not differ that greatly from the UN Partition Plan of 1947.

This change paved the way for negotiations between the George H. W. Bush Administration and the Palestine Liberation Organization. Soon thereafter, Israel began negotiations with the Palestinians as well. Secret meetings between the Palestinians and the Israelis in Oslo, Norway, led to the signing of a Declaration of Principles on September 13, 1993. The Declaration called for a ceasing of hostilities between the two sides, and discussed ways in which the Israeli occupation of the West Bank and Gaza would be phased out to make way for Palestinian Authority control of Palestinian Arab land. This would be the first time that the Palestinian people would be able to run their own affairs, govern their own citizens, and protect their own domestic and international interests.

And yet, the slow implementation of Oslo and the obvious oversights in moving toward complete Palestinian sovereignty led to its breakdown and, eventually, the al-Aqsa Intifada, which began at the end of September 2000. This uprising in many ways mirrored previous Palestinian terror activities carried out between the late 1960s and the late 1980s although its primary terror tactic, suicide bombings, was an innovation in Palestinian liberation activity.

Although the al-Aqsa Intifada served to slow the progress of a movement toward Palestinian self-rule, the Palestinian people are unlikely to give up on their goal of some day achieving a fully independent sovereign state in at least part of historic Palestine. Indeed, the death of Palestinian Authority President Yasser Arafat in late 2004 only served to catalyze Palestinian resolve to finally achieve the creation of a reconstituted Palestine, revitalizing what was, to that point, a moribund peace process between Palestinians and Israelis. Thus, the question to be asked when referring to the creation of the State of Palestine is not *if* it will eventually occur but *when*.

## PALESTINE LIBERATION ORGANIZATION (PLO)

The Palestine Liberation Organization (PLO) has served as a key actor in the Palestinian-Israeli conflict since its founding at the first Arab Summit in Cairo in 1964. From its creation, it has presented itself as the soul legitimate representative of the Palestinian people. Global recognition of this role, however, and of the PLO's ability to pursue the true interests of the Palestinian people took decades to be achieved. Indeed, some would argue that this status never was attained and that in the end, the PLO only served to pursue its own interests and not those of the Palestinian community it claimed to represent.

The PLO was created initially as an umbrella organization of *fedayeen* guerilla groups committed to the liberation of Palestine from Israeli control. Its stated goal in its early years of existence was the destruction of Israel as a state and people. The illegitimate and illegal creation of Israel was, from the PLO's perspective, more than adequate justification for its elimination at any cost.

Although the PLO consisted of several factions, al-Fatah, directed by Palestinian activist Yasser Arafat, was the core group of the PLO from the outset. In 1969, Arafat was elected as the PLO's chairman due to the significant role he played in the al-Fatah movement.

Throughout the late 1960s, the PLO operated out of Jordan, where its leadership coordinated *fedayeen*

raids across the border into Israel. Jordan was a natural staging ground of Palestinian operations against Israel, both due to its geographic proximity and to the demographic makeup of the country, which became a majority Palestinian following the Arab-Israeli War of June 1967.

The PLO carried out its operations from Jordan until September 1970, a key turning point in the history of the PLO. At that time, a civil war took place as King Hussein moved against the Palestinian leadership in the belief that a continued PLO presence in Jordan was proving too destabilizing for the future of his regime. The PLO leadership fled, taking up residence in southern Lebanon.

Throughout the early 1970s, the PLO became increasingly infamous for its use of international terror as a mode of fighting for the liberation of Palestine from Zionist control. While many attacks were carried out within Israel itself, many also took place outside of the Middle East, primarily in Europe, in the belief that such acts would garner greater media coverage and would draw the West into the conflict in the hopes that these powers, in turn, would be motivated to press for Israeli concessions.

In many instances, some of the most heinous acts were carried out by leftist groups and other factions within the PLO and not by al-Fatah. The Popular Front for the Liberation of Palestine, the Democratic Front for the Liberation of Palestine, and the Popular Front for the Liberation of Palestine-General Command each became known for the bombings of European airports, hijackings of El Al Airline flights, and similar acts. In 1970, three planes were hijacked to Jordan, emptied, and blown up. It is the contention of some that this incident served as the final impetus that precipitated the expulsion of the PLO from Jordan in September of that year.

One of the most well-known attacks occurred during the 1972 Olympic Games in Munich, West Germany, where eleven Israeli athletes and coaches were captured and eventually murdered. The attack was carried out by a PLO splinter group calling itself Black September, in reference to the many Palestinian deaths that had occurred in Jordan during the PLO expulsion.

In another well-known attack in 1974, twenty-one Israeli schoolchildren were killed in the Israeli town of Ma'alot. That same year, the United Nations recognized the PLO for the first time as the rightful representative of the Palestinian people. Yasser Arafat was allowed to speak before the United Nations (UN) in New York on behalf of his people's plight. The speech allowed the PLO the final global recognition it had long sought although a holstered pistol at Arafat's side throughout the speech did little to

counter the PLO's reputation for violence and acts of terror.

By the early 1980s, the PLO had again begun to strengthen and finally recover from the blow dealt by its expulsion from Jordan. From an Israeli perspective, however, the existence of a mini-state of "Fatahland" within southern Lebanon and just north of its border (which, like Jordan before it, was regularly used as a staging ground for terrorist attacks against Israel) became increasingly intolerable. In June 1982, the Israeli army under then-Defense Minister Ariel Sharon's direction moved into southern Lebanon, destroying the PLO infrastructure there and eventually pressing the Palestinian leadership to flee once again, this time out of the region altogether to Tunisia, the only state willing to take them in at the time.

The PLO leadership was greatly weakened as a result of its expulsion from Lebanon. At the same time, an indigenous Palestinian grassroots movement in the West Bank and Gaza Strip, embodied in the *intifada* (uprising) that erupted in 1987, began to develop, revealing that the PLO was no longer the soul legitimate representative of the Palestinian people. It also became evident that the interests of those residing in these territories under Israeli occupation differed greatly from those who, like the PLO leadership, had resided outside of Palestine for some decades.

Thus, in 1988, the PLO declared Palestinian independence but only in the West Bank and Gaza, effectively surrendering the remainder of historic Palestine to Israeli sovereignty. In 1993, as a result of the Oslo negotiations with Israel, the Palestine National Charter's clauses calling for the destruction of Israel were finally abrogated although no replacement for this document with these clauses removed was ever disseminated thereafter by the PLO leadership.

In 1996, soon after the signing of Oslo Accords and the creation of the Palestinian Authority (PA) to rule over the West Bank and Gaza, elections were held in which Arafat was chosen as Palestine's first President. The Palestinian Council has eighty-eight members, and twenty ministers oversee twenty-three ministries.

Although the PA, in theory, should have replaced the PLO as a representative mechanism for the Palestinian people, most PA governmental positions created by agreements made at Oslo, as well as the Prime Minister's position itself, were held by ministers who were al-Fatah members or who had strong commitments to Yasser Arafat and his movement. Indeed, until the day he died, Yasser Arafat's al-Fatah faction continued to strongly influence and dominate virtually every aspect of the Palestinians' political aspirations.

That said, it remains to be seen how and to what extent Arafat's death will impact the PLO as well as how it will affect future hopes of Palestine achieving self-rule and, ultimately, independent statehood that the PLO has long sought to achieve.

### PALESTINIAN DIASPORA

The term of "Palestinian Diaspora" refers to the major displacement of refugees that occurred during the Arab-Israeli war of 1948, known today as the *naqba* (the catastrophe). An estimated 600,000 to 760,000 persons fled or were forced to flee in four waves (Morris 1987), confronted with fierce battles between Jews and Palestinians, Israelis, and Arabs. While the educated and middle class managed to settle in Beirut, Naplouse, Damascus, or Amman, the peasants found their ways to more than fifty camps in the surrounding Arab countries. In 1949, the United Nations (UN) created the UN Relief and Works Agency for Palestine (UNRWA) with the purpose of rehabilitating the refugees. Since then, what were meant to be temporary refugee camps became permanent. The UNRWA administers close to 4 million registered refugees of whom approximately two hundred thousand are original refugees. While 15% of the Palestinians remained on the land of Israel, nearly 60% ended up on the West Bank and in Gaza, under the trusteeship of Jordan and Egypt.

### **Jordan: Civil Integration and Diaspora in the Making**

The Jordanian Kingdom opened its doors to the refugees in 1948 and did so again in 1950 after the annexation of the West Bank and East Jerusalem. Close to 450,000 refugees were under the hospices of the UNRWA. With the occupation of these territories by Israel in 1967, approximately 210,000 Palestinians were displaced to the East Bank (Kodmany-Darwish 1997). Today, the monarchy is home to 1.5 million Palestinians, to whom all rights have been extended, including citizenship. Although the camps' residents considered integration (*tawteen*) a taboo and dreamed of *awda* (return), many found their way into the market place, education, the private sector, and civil services. The relative openness of the Jordanian society is due to a nationalizing state, which tried to create a new nationality by absorbing the Palestinians in a modernizing society. These efforts have indeed alleviated the destitution of the refugees leaving the camps and starting a process of rehabilitation, without forgetting the trauma of their uprooting (in the early twenty-first century, only 20% of the refugees remain in thirteen camps). An estimated one hundred thousand refugees from Gaza, however, encounter deprivation and hardship as they detain Egyptian travel documents (Lindholm Schulz 2003).

Symbolic settling in Jordan is still a matter of contention according to political allegiances, social class, and networks. Many Palestinians are represented in parliament and running the state, while others constitute the backbone of the educated middle class in a society in which Palestinians are an absolute majority. Until the defeat of the PLO in 1970, they were excluded from the army, but they were admitted in 1973. Jordan tried to speak out on behalf of the Palestinian people but has relinquished any assimilation scheme after the signing of the peace accords with Israel in 1994.

The territorialization of the Palestinian Authority has closed the circle in many ways. The middle class experienced the "condition of diaspora," while maintaining its language, family ties, and social mobility and would be at peace with a double citizenship. The poorest in the camps or in the cities wish to reenact their right of return to villages that no longer exist. They prefer their estrangement and "Jordanian-ness" until the crux of the refugee problem is solved between the state of Israel, their nation, and their host country.

### **Lebanon: A Reluctant Diaspora**

Lebanon admitted 104,000 Palestinians in 1948 (Sayigh 1994) who constituted at the time one-tenth

of the country's population. Particularly the Maronite community depicted them with distrust. Most of them had fled coastal cities and Galilee and settled in the southern regions until they were displaced to the Bekaa valley and the suburbs of Beirut. According to the UNRWA in 1949, 380,000 persons were recognized refugees, living in twelve camps. In most fields, this population experienced exclusion and marginalization. They could not work without permits, own a property, or have free access to education and social security. Their quasi-majority was barred from citizenship. A happy few managed to become Lebanese through marriage or being wealthy Christians. The sectarian divisions within Lebanon have reinforced the hopelessness and humiliation of the refugees and led later to their radicalization by the PLO. Indeed, the headquarters of their national organization were hosted in Beirut in 1970, after being rejected by Jordan. The PLO rapidly established a quasi-state in the camps where it delivered, in cooperation with UNRWA, education, work, and social services. The peasant refugees became proletarianized and socialized to be revolutionaries, *fedais* (fighters), for the redemption of the land of a romanticized Palestine. They were intent on resisting assimilation, which in practice was almost impossible in Lebanon (Peteeer 1996).

The rivalry between confessional and/or political groups exploded in the civil war of 1975. Camp battles turned into messy alliances between Palestinians and other religious groups. Christians but also poor Shiites resented the role played by the PLO in Lebanese politics until the conflict was crushed by the Israeli invasion in 1982. With the ruled departure of the leadership of the organization to Tunisia, the subeconomy it had installed declined. The refugees became powerless, unstable, and unemployed. The economic and political insecurity prompted the wealthy and educated to migrate to Europe, the Americas, and Kuwait. In the twenty-first century, the population is estimated to have dropped to two hundred thousand. These refugees are the most destitute (together with those of the Gaza Strip).

### **Syria: A Quiet Social and Economic Integration**

Syria has had uncertainties about its borders, as reflected in its relationships with Israel and Lebanon or with the Palestinians. While supporting the Palestinian struggle, the state tried to integrate the one hundred thousand refugees of 1948 and to watch closely their political activities. The refugees who fled the north of Palestine are estimated to total 280,000, and

part of them live in ten camps. About 70% of them left the camps to settle in towns, and their positions in the social and economic spheres are proof that they have been able to take advantage of the same opportunities as the overall population. They remain hosts and foreigners, however, waiting for their resettlement. With time passing, a relative “Syrianization” has occurred. Their future is tied to the conclusion of a peace treaty with Israel and the recognition of the new Palestinian state by Syria. Many refugees will then have to face a dilemma: to live in a Palestinian state that no longer resembles their home or to stay in Syria, without giving up their moral right of return or their memories of a lost home.

### **Egypt: A Small and Silent Diaspora**

The settlement of Palestinians in Egypt has been limited from the outset and has counted both migrants and refugees. As a community of seventy-five thousand persons, they have been closely monitored under the different regimes. Afforded with more rights in education and the labor market under the aegis of Nasser, they have experienced restrictions and rights according to regional politics and the reasons of the state under the Sadat and Mubarak presidencies. Any end of the conflict could lead to a more secure position of these refugees or resettlement in the Palestinian state, notably in Gaza from where many among them originate.

### **The Gulf and Kuwait: From Migrants to Refugees**

Until the first Gulf war, this diaspora was the third in importance of the disseminated Palestinian people. In 1990, they numbered around 450,000 persons. Most of them had migrated from Jordan and other Arab countries to seek work and education during the expansion of the oil economy.

Peasants became unskilled laborers and servants. Many professionals were in great demand for the state machinery. A member of the educated middle class with capital, knowledge, and social cohesion would be easily integrated in the service of this annuity-economy. Cautious in their allegiance, they maintained a distant relation to the PLO. Prosperity was viewed as a venture every Palestinian could seek, though for many purposes the migrants remained foreigners with no chance to become part of the citizenry. Their aspirations were shattered in two phases. The first was the drive of the monarchy to

“nationalize” the Kuwait economy and to put aside the feared Palestinian rebels, notably in unions. Second, with Arafat’s blessing of the annexation of Kuwait by Saddam Hussein, the rulers reacted with a clear-cut revenge: the *manu militari* mass expulsion of three hundred thousand Palestinians, without any complaints from the UN or other human rights advocates. Most of them found refuge, for a second time, in Jordan and a minority in the West Bank. Those who disposed of cultural and economic capital pursued their journey to Europe and the Americas. In this case, an analogy is depicted with the tribulations of the Jewish diaspora, who knows more than any other group what “scapegoating” means: to be on the move, uncertain about place and state, in perpetual exile.

### **Israel: Exile in the Homeland**

Approximately 150,000 Palestinians stayed within the borders acquired by Israel at the end of the war. Many were internally displaced, while others were dispossessed of their land for security reasons or to make place for the settlement of new Jewish refugees and migrants from the Arab world—nine hundred thousand Arab Jews were forced or induced to seek refuge in Israel following the Israeli–Arab wars. While recognized as citizens and allocated the right to vote since 1950, these Palestinians were closely watched by a military regime until 1966. Their quality of life has been reduced, as compared to Jewish citizens, due to expropriations, discrimination, and lack of higher education. They have assisted the renaming of villages and the transformation of the landscape (Benvenisti 2000). For some time, however, they stayed voiceless, separated from their brethren, and were regarded as a submissive remnant by those outside. Their process of integration into civil society and later into politics was gradual and hectic, with the emergence of a new generation of leaders asserting their right to the land with “the day land” in 1976 (Ghanem 2001). Furthermore, from the first *intifada* to the Oslo Agreements, their Palestinization became open and vocal. Since the beginning of the second *intifada*, they have manifested outbursts of solidarity with the struggle within the occupied territories. They have formed new political parties and are conscious of the power of demographics: at 1.2 million, they constitute 18% of Israeli society and have reasons to believe they will change the contours of the state. Their future struggle for equal rights is epitomized in the transformation of Israel into a state for all its citizens. Its practical meaning remains to be seen in terms of rights, obligations (conscription), and meaningful alterations of the

symbolic emblems of the Jewish-Israeli nation. Here lies a formidable challenge to Israel in the best-case scenario of lasting peace with the nascent Palestinian state.

### **West Bank and Gaza: From Occupation to State-Building**

West Bank and Gaza have 2.4 and 1.25 million Palestinians of whom respectively 608,000 and 853,000 are registered refugees. Each society still carries the influences that marked their domination by Jordan and Egypt.

The West Bank has been characterized by a diversified economy and a vibrant civil society, with deeply divided elites from 1967 until the first *intifada*. After 1967, many Palestinians became rotating migrants, both in the settlements and in Israel, securing employment and being confronted with Israel's democracy and repressive state measures, such as the confiscation of land for ideological and security purposes. Repressive actions addressed the attitude of the *sumud* (resistance) against expropriation, expressing the West Bank's national identity. While increased confinement, closures, and checkpoints became the means to curb the rebellion, a new generation of leaders emerged, ready to use limited violence and civil disobedience to deadlock the expansion of the settlement policy. The community feared that the time was running against its hope to achieve an independent state. This may explain why the PLO, encumbered by its disastrous collusion with Saddam Hussein, had to find a way to hijack the peace process following the Madrid international conference and to supplant the "insiders" with the "outsiders" from Tunisia to conclude the Oslo Agreements.

Gaza is a densely populated and impoverished strip of land with refugees from Lydda, Ramla, and Ashkelon. The Egyptians envisioned no real development. The Israelis opened their labor market to rotating migrant workers and exchanged services and goods. The high unemployment rate of this fast growing population, their isolation from the West Bank, and the dispossession of land have led many to frustration and alienation. It is no coincidence that the first *intifada* was ignited there in 1987. Arafat's 1994 actions and the pouring of international aid encouraged investments by wealthy Palestinians from the diaspora, and many residents felt an improvement of their socioeconomic condition that would not last (Roy). The community's disillusion had to do with sheer patronage by the Authority and "internal closures" by the Israelis following attacks on its

settlements and even more so with the rampage of suicide bombers within Israel. The Authority did not supplement the gradual and permanent loss of employment in Israel. The result is that after four years of deadly *intifada*, 64% of the population (57% in the West Bank) live below the poverty line and find solace and services with Hamas and Islamic Jihad. The eschatological millenarism of these two terrorist groups has deepened after the collapse of the Camp David negotiations in 2000. More than ever, the refugees supported the militarization of the al-Aqsa Intifada that has shattered their dreams, created more repressive measures, and brought an electronic fence by the Israelis.

In both occupied territories, however, a turning point could be witnessed, from resistance to erotization of death by the *shaheed*, the martyrs who die to liberate the land. Blood and land are the mystification needed to create an "imagined community" where the 1967 borders are not considered an end to the conflict.

### **Palestinians' Many Diasporas: The Americas and Western Europe**

Palestinian migration to Latin America and the United States began at the turn of the last century, notably by Christians. Headed to many countries in 1936, and from 1948 to 1967, the migrants left behind them Bet-leheim, Ramallah, and Haifa. They formed close-knit communities in Chile, Argentina, Uruguay, and Honduras. Economic success made them a "wealthy diaspora" that was well integrated in their host societies. In the United States, there are about two hundred thousand Palestinians who are more politicized than their southern counterparts. Many are former students or exiles from the civil war in Lebanon, and the *ghurba* or the collective memory of strangeness is present in their minds. The most Americanized among them have no desire to return to an undeveloped state and economy. They would rather lobby in favor of a more impartial US position to ground the path to a just peace between Israel and Palestine.

In Western Europe, the settlement of migrants has occurred since the 1980s, and no reliable data are available. According to some authors, there could be two hundred thousand Palestinian expatriates, most of them having first arrived as students or liberal professionals. Later, with the collapse of the PLO in Jordan and Lebanon and the mass expulsion of Palestinians from Kuwait, more found their way through family networks to Europe. The most populous community has settled in Germany (approximately eighty thousand, a few thousand coming from Socialist countries

after 1989). There is also a professional and business community in Great Britain, while twenty thousand Palestinians have found a home in Sweden (Lindholm Schulz 2003).

These many diasporas have one of the most learned intelligentsias of the Arab world and could constitute a formidable engine for the new Palestinian state. For some of those who have returned to the occupied territories since 1994, the experience was inconclusive; the refugees who had suffered viewed them as “others.”

### The Right of Return, Nation-Building, and the Conditions of Exile

The PLO has initiated institutions of nation-building in exile. It has been the architect of a memory and the inventor of an identity through many icons: the peasant (the land), the refugee (the victim), the *fedai'* (the fighter), the *sumud* (the resistant), the *shaheed* (the human bomb, the martyr), and the returnee (the subject). On the long march toward recognizing the state of Israel, the PLO has in fact substituted state to land without stating clearly the consequences of this transition in its mythological rhetoric.

The PLO had from its inception inscribed the “right of return” as the pillar of its charter, ideology, and politics. In doing so, it designed the refugees to be the vessel of the liberation of the land for the Palestinian nation. With the Oslo Accords and later the Clinton parameters, it became clear that the stumbling block of the “right of return” was not only a matter of principle but of rewriting the imagined community. The negotiations in Taba in 2001 were implicitly based on the fact that most of the refugees would be resettled or rehabilitated. Moreover, the Palestinian Authority was not willing to absorb massive waves of refugees. Loss and bitterness afflicted many individuals and communities who in Lebanon or in many other camps resented the PLO’s compromising stance, while others understood that the failure of the Arafat-Barak negotiations was tied up with the solution of the refugee problem. The upsurge of the al-Aqsa Intifada was the symbol of the agonizing stress to build a state that would not be the home to all refugees and a reminder that the Palestinians’ collective identity is an undesirable pilgrimage in other settings. For many refugees, the loss has been internalized. For others, “returning” to the West Bank and Gaza is not experienced as coming home but arriving in a “non-place.” Many prefer to wait “until the last sky” (Said 1995) or to embrace the Hamas rhetoric.

Many Palestinian individuals and communities are now on the move in the cities of the West—Athens, London, New York, and Paris—but also of the Arab world: Dubai and Amman today, Beirut and Kuwait yesterday. As Jews before them, but still in the diaspora, they feel how important it is to maintain religious, linguistic, and family ties together with the landscape of memory.

### PAN-AFRICANISM

The Pan-African movement is subject to many claims of precisely what it is. The movement is related to anticolonial movements in the former European colonies in Africa, but it is also seen as a sense of unity of all persons of African descent. The first organized descriptions of Pan-Africanism had their emphasis

on Americans of African descent; the early leaders of this movement were W.E.B. Du Bois, Marcus Garvey, and Booker T. Washington, each of whom had his own ideas on what Pan-Africanism was.

The original focus of Pan-Africanism was one on race or color as a unifying factor, much as the Hindu Nationalist movement in India sought the unifying factor of religion in attempting to determine what it meant to be Indian. In both cases the vast diversity (of being African, or Indian) made identity complex. In the case of Pan-Africanism, racial identity was seen as a unifying factor and not one that divided people of African descent from others.

However, in Africa, black Americans were not considered to be African. This division would become more complex as persons of African descent in Europe and the Caribbean became involved in the Pan-African movement, particularly in the attempts of some American interests to encourage migration of African-Americans back to Africa in the late nineteenth and early twentieth centuries. Marcus Garvey, one of the original American supporters and definers of Pan-Africanism, created a "Back to Africa" movement that failed; Garvey himself never went to Africa, but instead died in Europe.

In addition to the attempts to unify people of African descent and to bring Western political ideals of freedom to Africa, a literary genre called *négritude* developed in Europe. This was also an expression of unity between Africans in Africa and those who had been taken from their continent.

The African Diaspora, as the forced migration of Africans to other continents is known, was equated to the Jewish Diaspora, with the difference that Africans had no single unifying religious identity. The US intellectual efforts to establish an African identity attempted to provide this missing basis for unification. However, another difference was that throughout history, Jews had been cast out of their homeland and of most other countries where they had settled; Africans were taken away from their homelands.

Initial efforts to develop and define this African identity were held in Europe and the United States. The First Pan-African Congress was held in London in 1900, organized by H. Sylvester Williams, a lawyer from Trinidad. In 1912, Booker T. Washington organized an International Conference on the Negro at Tuskegee University. Although the conference was supposed to examine the common ties between persons of African descent, most attendees at this conference were black America missionaries concerned about how to spread Christianity to Africa.

A Second Pan-African Congress was held in Paris in 1919. This meeting was headed by W.E.B. Du Bois, and the focus of the conference was on the prevention

of further exploitation of Africans in Africa by the former colonial powers. A Third Pan-African Congress in London and Brussels in 1921, also headed by Du Bois, placed its emphasis on self-government by Africans and the spread of democracy.

Two years later, a Fourth Pan-African Congress in London and Lisbon addressed a continued emphasis on self-government, and also expressed a desire for black people to be treated as equal to whites.

The Fifth Pan-African Congress in New York in 1927 was a major break from these earlier meetings, and recognized that the growing Communist movement in the world was not necessarily a source of support for Pan-Africanism. It was recognized at this conference that Communists saw Pan-Africanism as nationalism, which was contrary to the internationalist view of the Communists. In addition, white Communists were not seen as a source of support for Pan-African efforts.

By the mid-1930s, with the global difficulties of the economic depression and reduced focus on internationalism in the United States, enthusiasm for Pan-Africanism had declined there. However, Italian intervention in Ethiopia in the 1930s, followed by World War II (which was seen by some as a "white people's war"), brought about renewed attention to Pan-Africanism.

A Sixth Pan-African Congress was held in Manchester, England, in 1945. This conference raised demands for political autonomy in Black Africa, and its speakers suggested an acceptance of socialism as an economic model for Africa. Equally as significant, a new generation of leaders was more influential than the aging leaders like Du Bois. These new leaders included Dr. Kwame Nkrumah of Ghana, Jomo Kenyatta of Kenya, H.O. Davies of Nigeria, and others.

In the early 1950s, after the end of World War II, the newly freed colonies of the European powers and Japan met in Bandung, Indonesia, to form what would become known as the Non-Aligned Movement (NAM). While not directly associated with the Pan-African movement, the NAM countries rejected colonialism much as the formerly colonized African countries had and sought to avoid postcolonial exploitation and ties to either side in the Cold War. Later that decade, an attempt was made to combine the postcolonial movements of Africa, some Arab countries, and Asia through the Afro-Asian Solidarity Movement. However, the reluctance of some countries, notably Egypt, from joining what might be seen as an alternative international bloc to the East and West kept this association from prospering. In April 1958, the First Conference of Independent African States (which excluded South Africa) met in Accra, Ghana. This conference included countries

from black Africa (Liberia, Ghana, and Ethiopia) and from the Arab Muslim states of Tunisia, Egypt, Sudan, Libya, and Morocco. This meeting showed that color was not the only factor on which unity in the postcolonial world could be based.

Later that year, a similar meeting was held in Accra, and this first conference of the All-Africa Peoples Organisation (AAPO) was followed by others in Tunis in 1960 and Cairo in 1961. At the first and second AAPO conferences, whites from South Africa attended, but they were excluded from the conference at Cairo, as were people of Indian descent. The motto of “Africa for the Africans” adopted by the organization at its first meeting (taken from the title of Joseph Booth’s book by the same name) was nevertheless intended to be anticolonialist, not a statement of racial exclusion.

In 1960, the Second Conference of Independent African States was also held in Addis Ababa, Ethiopia. This conference was divided between those countries that sought to build a Pan-Africanist consensus (led by Nigeria) and those that sought to lead African countries to power (led by Ghana). Kwame Nkrumah, of Ghana, did not want to wait for incremental change.

That same year in the United States, a conference organized by the American Society of African Culture (AMSAC) met to discuss Pan-Africanism. This conference primarily included participants from the United States (many of African descent) as well as participants from West Africa and the Caribbean. The primary division at this conference was between the academics (who were not from Africa) who encouraged a unified Africa (and who saw nationalist movements as “Balkanization,” a reference to the traditional trouble spot in eastern Europe) and the Africans who recognized that the first step in independence was the establishment of nation-states in Africa. This latter view was expressed best by George Padmore, who had years before been an advisor to Kwame Nkrumah. His Padmore Dictum, which called for nationalist movements in Africa, was seen as a necessary step before a broader African unity could be established.

The conflicting forces of nationalism (based on the many artificial boundaries drawn up by the European colonial powers) and Pan-Africanism (which was the result of the common colonial and postcolonial experiences of the African peoples, both black and Arab) resulted in the establishment of the Organization of African Unity (OAU). The OAU, like the NAM, sought to avoid association with the major sides in the Cold War.

Colin Legum described the nine points of the Pan-African Movement of the mid-twentieth century as:

1. “**Africa for the Africans**” refers to a complete independence of the whole of Africa and a total rejection of colonialism in all its forms, including white domination.
2. **United States of Africa** is the ideal of a wholly unified continent through a series of interlinking regional federations where there would have been a limitation on national sovereignty.
3. **African renaissance of morale and culture** means a quest for the “African personality,” a determination to recast African society into its own forms, drawing from its past what is valuable and desirable and marrying it to modern ideas. Modernism is heavily accentuated.
4. **African nationalism** replaces the tribalism of the past: a concept of African loyalty wider than “the nation” to transcend tribal and regional affiliations.
5. **African regeneration of economic enterprise** replaces colonial economic methods: the belief in a nonexploiting Socialist or *communalistic* type of socialism. International Communism is rejected outright.
6. **Belief in democracy** at the most desirable method of government is based on the principle of “one man, one vote.”
7. **Rejection of violence** is a method of struggle, unless peaceful methods of struggle—*positive action*—are met with military repression.
8. **Solidarity of black peoples everywhere** and a fraternal alliance of coloured peoples are based on a mutual history of struggle against white domination and colonialism.
9. **Positive neutrality** (as it was then called) refers to noninvolvement of partisans in power politics but “neutral in nothing that affects African interests.”

In examining Pan-Africanism in the modern context, Ali Mazrui distinguishes several branches: sub-Saharan (black Africans in the nations south of the Sahara Desert), trans-Saharan (black Africans as well as Arabs in the north), and transatlantic (Africans, Caribbean people of African descent, as well as African-Americans). Mazrui noted that the Pan-Africanism thought developed not in Africa but among those Americans and Caribbean people of African descent, the “Black Diaspora.”

The negative effects of Pan-Africanism in the modern world are the breakdown of national identities in African countries, leading to a rejection of “nationalism” and a resurgence in tribal identities. This is shown through the breakdown of civil order in Somalia (where tribal conflict led to the dissolution of effective governmental order in the 1900s), genocide

between Hutus and Tutsis in Rwanda at the same time, and the ethnic conflicts in Nigeria and the Congo.

**PANAMA**

Panama is a Central American republic that occupies the southeastern end of the isthmus that connects North and South America. Panama encompasses 77,381 square kilometers (29,762 square miles); the terrain is mountainous (highest elevation is 3,475 meters or 11,468 feet) with a tropical wet/dry climate that produces more than one hundred inches of annual rainfall. The population in 2001 was estimated to be 2.9 million with an ethnic composition of Mestizo 70%, West Indian 14%, Caucasian 10%, and Indian 8%. Panama compares favorably with most of Central America with a per capita gross domestic product (GDP) of \$3,699 and an overall GDP of \$12.3 billion; the life expectancy is seventy-five years and infant mortality rate is 20 per 1,000. The economy centers on services that account for 78% of GDP and includes banking, insurance, health and medicine, transportation, telecommunications, tourism, and the Panama Canal with related maritime services.

Panama’s geography has been the key element in its development. As a long slender country that would stretch from New York City to Cleveland in the United States, Panama is the narrowest point between the Caribbean Sea and the Pacific Ocean and forms

the land bridge that links North America to South America. Panama’s modern history has been shaped by its famous canal. In 1903, with assistance from the United States, Panama gained independence from Colombia and signed the Hay Bunau-Varilla Treaty with the United States. The treaty enabled the United States to build the Panama Canal, which was completed in 1914. The treaty granted the United States rights “as if it were sovereign” in the Canal Zone, an area approximately ten miles wide and fifty miles long that bifurcated Panama. While Panama benefited from the commerce generated by the canal and received rent payments from the United States, the issue of US sovereignty over what Panamanians considered their greatest resource was contentious. Successive Panamanian governments, however, sought more favorable terms with the United States without challenging its control over the Canal Zone.

In 1968, a *coup d’état* staged by Panama’s National Guard eventually established Colonel Omar Torrijos Herrera as Panama’s dictator. Torrijos was determined to gain full sovereignty of the Canal and its zone that he saw as the key to Panama’s future development. Torrijos was more assertive than previous leaders, but for nine years, the United States would not consider relinquishing its control over the strategic waterway. In 1977, President Jimmy Carter ordered that talks be resumed, and the Panama Canal Treaties were signed on September 7. Panama ratified the treaties in a plebiscite, and the US Senate approved the treaties by a vote of sixty-eight to thirty-two. The treaties provided for a twenty-year phased withdrawal of US military forces and the turnover of all territory and facilities to Panama by December 31, 1999.

Torrijos also promoted a new offshore banking industry in an attempt to make Panama the Switzerland of Latin America. His efforts brought much needed cash deposits, and international banks built gleaming skyscrapers to house their operations in Panama City. Panama’s lax banking laws also made it a haven for money laundering and other illegal activities. Torrijos won over the urban poor by establishing schools and clinics in slum areas. Torrijos died in a 1982 plane crash. By 1982, real power in Panama was in the hands of General Manuel Noriega. Noriega was a venal and corrupt dictator who used repression to maintain his power and to cover his involvement in narcotics trafficking. In May 1989, Noriega annulled the election of opposition candidate, Guillermo Endara, and assumed complete control of the country. He was removed from power in 1989 when the United States invaded Panama, arrested Noriega, and brought him to the United States to stand trial on charges of drug trafficking. Noriega was found guilty and sentenced to forty years in prison.

Panama has functioned under democratic governments since Noriega's removal. President Guillermo Endara took office promising economic recovery, civilian control of the military, and stronger democratic institutions. A civilian "public force" replaced the military and consisted of four branches, with the Panamanian National Police being the largest. The new police force proved a welcome replacement for the thugs of the Noriega era but was unable to curb a rising crime rate. The Endara government proved to be a disappointment; in 1994, Ernesto Pérez Balladares of the *Partido Revolucionario Democrático* (PRD), translated as the Democratic Revolutionary Party, the political arm of the former military regimes, won the presidency. Pérez Balladares proved to be a moderate who governed with the support of other parties. He carried out economic reforms and worked with the United States to implement the Panama Canal treaties. His quest to seek a second consecutive term was denied in a referendum.

On May 2, 1999, Mireya Moscoso was elected in a close election as the first female president of Panama. Moscoso, the widow of Arnulfo Arias Madrid, a former president and perennial candidate, was from the opposition *Partido Arnulfista* (PA), or Party Arnulfista, and seemed to solidify Panama's emerging democratic course.

The United States honored its agreements under the Panama Canal Treaties and turned over assets valued at \$15 billion on December 31, 1999. Panama has made a number of improvements since gaining full control of the Panama Canal assets. Some of the former canal and defense sites have been converted to tourist accommodations, including golf courses and luxury hotels. One former US Army post is being refurbished as a city of knowledge and houses offices for companies that research tropical diseases or are engaged in bioprospecting. The Panama Railroad had been upgraded and offers expanded freight and passenger services. Panama is also studying plans to expand canal operations through the construction of larger locks. Panama's newfound political tranquility has enabled expansion of tourism, which now generates more revenue than the Panama Canal. In 2004, Martin Torrijos, son of the late dictator, won the presidential election as the candidate of the PRD.

### PANAMA CANAL TREATIES, 1977

Also known as the Carter Torrijos Treaties, the Panama Canal Treaties, signed in 1977 and ratified in 1979, provided for the turnover of the Panama Canal by the United States to Panama on December 31, 1999. The relationship between Panama and the United States began on November 3, 1903, when the United States supported the Panamanian Revolution against Colombia. On November 18, the two countries signed the Hay-Bunau-Varilla Treaty, which gave the United States a ten-mile wide zone in the middle of Panama for the purpose of constructing an interoceanic canal in exchange for a payment of \$10 million, \$250,000 annual rent, and a guarantee of Panamanian independence. The treaty also granted the United States the right of eminent domain in the cities of Panama and Colon to make sanitary improvements necessary for the construction and maintenance of the canal. Construction of the Canal began in 1904, and the waterway was opened in August 1914.

The Panama Canal proved to be a mixed blessing to Panama's economic development. The greatest early benefit was the eradication of tropical diseases and other sanitary improvements made under the direction of Dr. William Crawford Gorgas. The Panama Canal was the greatest engineering feat of the era, and the United States built modern port and industrial facilities, defense sites, schools, and housing areas. Lake Gatun, at the time the largest human-made lake in the world, provided the country with an abundant supply of fresh water and electricity. The United States upgraded Panama's firefighting capability and introduced the automobile. However, the Canal Zone bifurcated Panama, inhibiting the development of a countrywide transportation system and isolated the western interior from the capital. Moreover, few Panamanians were employed in the construction of the canal or its later operation. The vast majority of the construction workers were imported from the West Indies, and many remained and settled in the Canal Zone. The West Indian immigrants spoke English, largely practiced the Anglican faith, and considered themselves part of the Canal Zone rather than Panama. The Canal Zone became a self-sufficient US government enterprise with all proceeds from Panama Canal tolls being reinvested in maintaining the Zone and the Canal. Other than the \$250,000 annual rent, Panama's economic benefit was minimal.

The Canal became an issue to Panamanian nationalists who felt that Panama was not receiving its fair share of the revenue generated by the waterway. In 1932, Harmodio Arias, Panama's president, sought concessions from the United States. The result was a 1936 treaty that eliminated Panama's protectorate status, increased the annual rent on the canal to \$430,000, ended the right to the arbitrary acquisition of land, placed limitations on the use of military and zone stores by non-US personnel, permitted the operation of radio stations, and promised equal treatment of US and Panamanian canal employees.

Panamanian President José Remón presented new demands during a visit with President Dwight D. Eisenhower in 1953. Subsequent negotiations resulted in the Treaty of 1955 that granted further economic concessions, including the right to tax non-US canal employees, an increase in the annual annuity to \$1.93 million, the construction of a bridge over the canal to link western Panama to Panama City, equal pay rates for all employees, and an extension on the lease of the air base at Rio Hato. Under this treaty, the United States retained sovereign rights over the Canal Zone.

The central disagreement between the United States and Panama centered on the issue of sovereignty in the Canal Zone. This issue erupted in the January 1964 flag riots that left twenty-four Panamanians and six US soldiers dead. In 1962, the United States agreed to fly the Panamanian Flag side by side with the US flag at fifteen sites in the Canal Zone; however, implementation of the agreement was delayed by lawsuits. When tensions mounted over the flag issue, the Canal Zone governor ordered that no flags be raised at certain sites including the US Balboa High School, which was not far from Panama City. On January 7, 1964, US students defied this restriction and raised the US flag on school grounds. On January 9, Panamanian students marched to the school to protest and demand that Panama's flag also be raised. During the confrontation, the Panamanian flag was torn, and several students were roughed up. News of this event led to larger demonstrations on the open border between the Canal Zone and the Republic. Canal Zone and Panamanian police were unable to control the crowd, and the commander of the US Southern Command took over and called in troops. The incident resulted in Panama breaking diplomatic relations with the United States. In the aftermath of the flag riots, President Lyndon Johnson agreed to begin negotiations to revise the 1903 Treaty including the issue of sovereignty.

In 1968, a *coup d'état* staged by Panama's National Guard eventually established Colonel Omar Torrijos Herrera as Panama's dictator. Torrijos was determined

to gain full sovereignty of the Canal and its zone, and in 1973, he skillfully arranged a meeting of the United Nations Security Council in Panama. The Council voted thirteen to one for a resolution that recognized Panama's right to eventually have sovereignty. The United States vetoed the resolution, but this tactic backfired as Panama appeared more and more to be a victim of imperialism. Panama sought three outcomes from the treaties. First was the establishment of sovereignty over the Canal Zone, an area that it had always considered part of its national domain. Second was the removal of US military forces from Panama so that the chances of intervention by the United States in Panama's internal affairs would be lessened. Third was to gain the full economic benefit of the Canal, which was viewed as the key to improving Panama's economy.

In 1977, President Jimmy Carter ordered that talks be resumed, and treaties were signed on September 7. Panama ratified the treaties in a plebiscite. After a difficult ratification process, the US Senate approved the treaty by a vote of sixty-eight to thirty-two. The main treaty provided for a phased withdrawal of the United States to be completed by December 31, 1999. In the interim, the Panama Canal Commission was established to replace the Panama Canal Company. The United States agreed to train Panamanian employees to replace US employees at all levels of canal operations. A second treaty established the neutrality of the canal as an international waterway and assigned defensive responsibilities to both Panama and the United States, with Panama accepting full responsibility by the year 2000. Drafted by Arizona Senator, Dennis De Concini, an amendment to the second treaty extended the right of the United States to defend the canal if Panama proved incapable. The treaties were fully complied with on December 31, 1999, when all US military forces were withdrawn and all territories and facilities were relinquished to Panama.

Panama has made a number of improvements since gaining full control of Canal assets. Some of the former canal and defense sites have been converted to tourist accommodations, including golf courses and luxury hotels. One former US Army post is being refurbished as a city of knowledge and houses offices for companies that research tropical diseases or are engaged in bioprospecting. The Panama Railroad had been upgraded and offers expanded freight and passenger services. Panama is also studying plans to expand canal operations through the construction of larger locks. The Panama Canal Treaties have proven to be a very positive factor in Panama's recent economic and social development.

## PAPUA NEW GUINEA

Papua New Guinea comprises the eastern half of the island of New Guinea; the large islands of Manus, New Britain, New Ireland, and Bougainville; and some six hundred other small islands. The country (6° S, 146° E) lies to the north of Australia, east of the Solomon Islands, and south of the Philippines. The land area is 463,000 square kilometers (179,000 square miles). The Indonesian province of Papua (formerly Irian Jaya) fills the western half of New Guinea. The population in 2003 was estimated at 5,295,000. Major cities and their populations are the capital, Port Moresby (200,000), Lae (90,000), Madang (28,000), Wewak (25,000), and Goroka (18,000). The population growth rate in 2003 was 2.3%, and 39% of the population was between zero and fourteen years old. Birth and death rates are 31 per 1,000 and 7.6 per 1,000, respectively, and life expectancy is sixty-two years (males) and sixty-six years (females). Major causes of morbidity and mortality are infectious diseases: pneumonia, malaria, and tuberculosis. Infant mortality is high. Diseases related to changes in diet and lifestyle are increasing and include HIV/AIDS, cardiovascular disease, diabetes, strokes, and cancers (from smoking and betel nut chewing). The population is made up of 5% Anglican, 58% Protestant sects, and 33% Roman Catholic; the remainder follow local tribal beliefs and customs.

The main island is dominated by a central cordillera rising (in Papua New Guinea) reaching more than 4,000 meters (the highest peak is Mt. Wilhelm at 4,509 meters or 14,790 feet above sea level). Broad, deep upland valleys covered in rainforest or grassland dominate the highlands. The Sepik, Ramu, and Markham Rivers drain the highlands to the north and the Fly, Strickland, Kikori, and Purari Rivers are the principal rivers flowing south into the Coral Sea. The lower Sepik and Fly Rivers flow through extensive, low-lying floodplains with numerous oxbow and tributary lakes. These rivers are navigable by shallow-draft vessels for some distance inland. The

southern coastline is dominated by mangrove swamps lining the estuaries of the major rivers and by coral reefs in areas away from rivers with heavy sediment loads. The northern coastline is undergoing significant geological uplift, and this is reflected in the rugged, coastal terrain. The coral reefs in Papua New Guinea are amongst the most diverse in the world, and scuba diving is a major tourist attraction.

The islands are tectonically unstable, and earthquakes and volcanic eruptions are common. The Matupit Volcano erupted in September 1994 and destroyed the town of Rabaul; in July 1998, an earthquake-triggered tsunami off the north coast killed around 1,500 people and left thousands injured and homeless.

The climate is tropical and in the coastal lowlands is hot and humid throughout the year. Along the southern coastal region near Port Moresby, the climate has a long dry season from April to November (southeast monsoon) and a wet season from December to March (northwest monsoon). Annual rainfall elsewhere exceeds 39.37 inches (1,000 millimeters) and in the highlands generally varies between 2,500 to 3,500 millimeters, but some areas of the country receive as much as 10,000 millimeters per year. Seasonality in rainfall is generally muted. Average lowland temperatures throughout the year range from 26°C–32°C. Temperatures decline with altitude. Frosts may occur in the highlands, and snow occasionally falls on the higher peaks. High temperatures and rainfall lead to generally high humidity and cloudiness with only moderate rates of evaporation.

It is estimated that 85% of the population lives as subsistence farmers, with sweet potato, taro, sago, bananas, and leafy vegetables being the main food crops. Pigs and chickens are kept as livestock. Agricultural exports (copra, rubber, coffee, cocoa, tea, palm oil, and minor high value products such as vanilla and cardamom) are increasing, but mining of silver, copper, and gold accounts for over two-thirds of export earnings. Oil production began in 1992, and natural gas reserves are being tapped. Tropical hardwood timbers are harvested for export, and timber is also harvested for plywood and wood chip production. Tuna, crayfish, prawn, and other fisheries are minor components of the economy. The gross domestic product (GDP) was estimated at \$10.86 billion in 2002, and the country receives approximately \$400 million in annual aid (most for Australia). Major trading partners are Australia, Japan, China, Singapore, and New Zealand.

The government is a constitutional monarchy with a governor-general representing the British Crown. The country has a Westminster-style democracy with a prime minister, cabinet, and an elected, unicameral

parliament with 109 members. Politically, the country is divided into nineteen provinces and the National Capital District. English is the official language, but Tok Pisin (Pidgin) and Motu (trade language of the southern coast) are *lingua francas* in a country with more than 700 distinct languages.

Humans colonized New Guinea more than forty thousand years ago, and the early inhabitants, isolated by the dissected terrain and tribal conflicts, developed enormous cultural and linguistic diversity. Archaeological evidence suggests that the early inhabitants developed agricultural techniques some ten thousand years ago and did so independently from the rest of the world. The eastern half of New Guinea was explored in the sixteenth century by the Spanish and Portuguese. In 1828, the Netherlands annexed the western half of the island (now the Indonesian province, Papua). In 1884, Germany annexed the northern coast and offshore islands, and Britain took control of the southern sector of Papua New Guinea. In 1906, British New Guinea was transferred to Australia, and the area became the Territory of Papua. Australian troops invaded German New Guinea (called Kaiser-Wilhelmsland) at the start of World War I and gained control of the territory under a League of Nations mandate. The highlands were considered by European settlers to be too inhospitable for habitation; but in the 1930s, explorers in search of gold discovered more than 1 million people, with Stone Age cultures, inhabiting the fertile valleys of the central highlands.

The Japanese invaded New Guinea in 1942, and following their defeat by US and Australian forces in 1945, the Territory of Papua New Guinea became a United Nations trusteeship administered by Australia. The country was granted limited self-governing powers in 1951, autonomy in internal affairs in 1960, and full independence as Papua New Guinea on September 16, 1975. Michael Somare was the first Prime Minister. In 1976, ethnic secessionist threats led to the establishment of decentralized provincial governments. Papua New Guinean politics are characterized by frequent changes in leadership through parliamentary maneuvers and fluid loyalties to political parties. Julius Chan succeeded Somare as Prime Minister in 1980, only to be replaced by him in 1982. Somare led the government until 1987.

In 1988, ethnic unrest in Bougainville resulted in fighting between government forces and the Bougainville Revolutionary Army (BRA). This led, in 1989, to the closure of the Bougainville Copper Mine and significant reduction in export earnings. In 1991, the government signed a peace treaty with the Bougainville rebels that established a South Bougainville Interim Authority although unrest continued. In 1992, the government launched an offensive on Bougainville

that resulted in the capture of Arawa, the provincial capital.

In April 1988, Prime Minister Paias Wingti suspended Parliament in an attempt to halt a pending vote of no confidence; however, in the July election, he was deposed. Wingti was replaced by Rabbie Namaliu who initiated political and economic reforms. In July 1991, legislation was passed that limited the number of no-confidence motions against an incoming government for its first twelve months in office. In June 1992, Prime Minister Namaliu was defeated in general elections and was succeeded by Wingti. In September 1993, Wingti resigned but was reelected almost immediately, thereby outmaneuvering his opposition and minimizing the possibility of a vote of no-confidence. Chan led the government from 1994 to 1997.

In July 1999, Prime Minister Bill Skate resigned following repercussions from his recognition of Taiwan as a separate political entity from mainland China. Mekere Morauta became prime minister, and in 2002, after an election marred by violence and alleged vote rigging, Michael Somare became prime minister for the third time.

The country is home to an impressive variety of birds, including most of the known species of birds of paradise. Other animals include marsupials (opossum, wallaby, tree kangaroo, and echidna), two species of crocodiles, monitor lizards, flying foxes and bats. Insect diversity is enormous and includes the world's largest butterflies (birdwings). Plant diversity is also high with probably more kinds of orchids than any other country. Major environmental challenges include deforestation to satisfy demand for tropical hardwoods and to provide land for agriculture. Water pollution with waste rock and tailings from mining projects is a problem in many parts of the country but particularly in the Fly and Strickland River catchments with wastes from the Ok Tedi and Porgera mines.

## PARACEL AND SPRATLY ISLANDS

The South China Sea region has become a hot spot of conflicting historical and legal claims over the sovereignty of islands and areas of maritime jurisdiction among its neighbouring states, mainly on account of their potential oil and gas riches. Not surprisingly, China has described the South China Sea as “the second Persian Gulf,” estimated to have possessed 130 billion barrels of oil and natural gas and a proven 7 billion barrels of oil. Given this, the Paracel and Spratly Islands, located in the South China Sea, have emerged as a focal point of fierce contest among rival states to bolster their claims to sovereignty either by occupying the islands or reinforcing their military presence there by stationing garrisons on a small scale. There are six major parties—Brunei, China, Philippines, Malaysia, Vietnam, and Taiwan—staking their claims over the Spratly Islands either fully or partly. With respect to the Paracel Islands, the parties interlocked in the dispute are Vietnam, China, and Taiwan.

The Paracel Islands lie 300 nautical miles south of Hong Kong and 145 nautical miles east of the Vietnamese port of Danang. China has been claiming the Paracel Islands as part of its tropical island province of Hainan since ancient times, while Vietnam claims its sovereignty on the legal and inheritance grounds. In 1932, the islands were annexed by French Indochina. During World War II, they were occupied by Japan and, after its defeat in the War, Japan renounced its sovereignty under the San Francisco Peace Treaty of September 1951. On the other hand, the Chinese claim to the islands was rejected at the 1951 San Francisco Conference. Despite this decision, China ignored all the principles and norms of international behaviour and annexed the Paracel Islands from Vietnam in 1974 by using military force. Since the 1970s, they have been in China’s complete control. Going one step further, China announced its plan in 1997 to open the islands for a tourist centre on Yongxing Island, the largest of the Paracel Islands. In July 2003, China stationed its troops in the Paracel Islands although protested vehemently by Vietnam and Taiwan but to no avail.

The Spratly Islands, consisting of 100–230 islets and coral reefs, possess less than five square miles as landmass. They are scattered 215 nautical miles south of the Paracels and in the middle of the South China Sea. The Spratlys have strategic significance since they are located close to the main supply lanes in the central South China Sea. Of the six disputant nations, China, Vietnam, and Taiwan are claiming an exclusive sovereignty to the islands, while Malaysia, Philippines, and Brunei are claiming control over some of their parts on the basis of the continental shelf under

the Law of the Sea Convention. China’s claim over the Spratly Islands, which it terms the Nansha islands, is based on historical and archeological grounds arguing that it had undertaken naval expeditions during the Han Dynasty in 110 AD, and the Ming Dynasty (1403–1433). Vietnam stakes its claim to the Spratlys as the natural inheritor of the French who withdrew from Indochina in 1956, and Vietnam declared the islands as part of its Phuoc Tuy province in 1973. Taiwan’s claim is similarly based on China’s historical argument. The Philippines has been developing oil between the Spratly Islands and the island of Palawan since 1976 and had stationed its troops on seven of the islands in 1978. Malaysia, interlocked in the territorial dispute since 1979, has claimed three of the islands. Brunei is claiming the territory and resources in the southern part of the Spratly chain. It established an exclusive fishing zone in 1984 in the southern Spratly Islands. Claimant states have stationed their forces in about forty-five islands, such as China (about 450 soldiers), Malaysia (70 to 90), the Philippines (about 100), and Vietnam (about 1,500).

Given the mutually conflicting claims, China demonstrated its military offensive when its naval vessels entered the islands and sunk Vietnam’s two naval ships in February 1988, killing more than seventy Vietnamese sailors. Another instance of China’s “military intimidation” became manifest when it occupied the Philippine’s Mischief Reef in 1995. However, this occupation was due to the mounting US pressure that China agree to resolve the Spratly Islands dispute with the Philippines and Vietnam peacefully. But the Chinese government did not commit to return the Mischief Reef to the Philippines. Besides, China has been conducting naval exercises in the South China Sea to project its military power projection vis-à-vis its Southeast Asian neighbours.

The continuing impasse over the Paracel and Spratly Islands has caused serious security concerns to the member countries of Association of Southeast Asian Nations (ASEAN), given China’s overwhelming military capabilities as well as its dominant position in the South China Sea that might threaten peace and stability in the region. To resolve the territorial disputes in a peaceful manner, ASEAN had issued a declaration at Manila in 1992 “urging all parties concerned to exercise restraint in order to create a positive climate for the eventual resolution of all disputes.” Moreover, ASEAN’s Regional Forum, since its inaugural meeting in Bangkok in July 1994, has undertaken several diplomatic initiatives to promote confidence building as well as to work out preventive measures to conflicts among disputant states. Because of ASEAN’s initiative at its ministerial meetings in

1996 and 1999, the member nations had agreed to a “regional code of conduct” for the South China Sea to resolve disputes through peaceful dialogue. China had also agreed to a draft code of conduct laying down principles and norms of “state-to-state-relations.”

The Declaration of the Conduct of Parties in the South China Sea was signed by the Foreign Ministers of ASEAN and China at the ASEAN-China Summit in Phnom Penh in November 2002, pledging “to resolve their territorial and jurisdictional disputes by peaceful means.” However, ASEAN members refused to include any “code of conduct” with regard to the Paracel Islands since the dispute is considered a bilateral one between China and Vietnam. Be that as it may, with the easing of tension between Beijing and Hanoi, both the countries are engaged in finding a political solution to the lingering dispute. This apart, ASEAN’s collective approach to resolve the territorial disputes through peaceful dialogue might help restrain China from establishing its “hegemony” over the Spratlys and the South China Sea.

## PARAGUAY

Paraguay is a land-locked country located on the upper reaches of the Plate River system in South America’s Southern Cone. It is divided into two distinct regions by the Paraguay River. The vast majority of the population lives in the region to the east of

the river. Mixed forests, swampy pasturelands, and low ridges are typical of this part of the country. The climate is subtropical, with hot and humid summers, mild winters, and regular rainfall. To the west of the river lies the Chaco, which is increasingly arid and inhospitable as one moves west toward the Bolivian border. This territory was won in a brutal war with Bolivia from 1932 to 1935. In spite of its small population and lack of resources, the Chaco figures importantly in Paraguayans’ aspirations for national development and as a symbol of the national struggle to survive.

Paraguay’s history has been structured by the country’s relationship to Argentina and Brazil. Although Paraguay gained its independence in 1811, Argentina did not formally recognize Paraguay’s sovereignty until 1856. Paraguay’s defeat at the hands of the Brazilians, Argentines, and Uruguayans in the War of the Triple Alliance (1864–1870) left it as a buffer state between Argentina and Brazil. Paraguay’s foreign policy ever since has been characterized by the “pendulum politics” of balancing Brazilian and Argentine ambitions. Paraguay’s political history is one of authoritarianism, marked by alternating periods of long-lived dictatorships and extreme instability. Political and economic development through authoritarianism has been a nearly permanent feature of Paraguayan politics since independence.

In the twenty-first century, the World Bank classifies Paraguay as a middle-income developing country. Its major exports are soy, cotton, and electricity. Textile production and food processing are the most important local industries. Transborder trade, much of it unregistered, is an important source of income, especially in Ciudad del Este on the Brazilian border.

At the end of World War II, Paraguay was a predominantly rural society. The state’s presence in the countryside was limited. Economic activity centered on agriculture and forestry. Trade was primarily conducted by river through Argentina. After a civil war in 1947, the regime became highly unstable because of intense partisan and intraparty factional conflict. Ultimately, General Alfredo Stroessner came to power in 1954. By the early 1960s, Stroessner had pacified the country through clientelism and repression.

The United States contributed much in the 1950s and 1960s to the development of state institutions capable of directing development strategies. Stroessner proved a reliable Cold War ally for the United States although the United States began to pressure the regime to implement political reform in the mid-1980s. While Paraguay under Stroessner could not be considered a bureaucratic-authoritarian regime, Stroessner did preside over a growing bureaucratic structure in which professionals worked to implement

the state's development priorities. Nevertheless, corruption and cronyism channeled through the Colorado Party remained important features of the regime. The regime extolled the "granite-like unity" of the military, the party, and the strongman that served as the basis for authority.

In the rural sector, development after 1963 focused on frontier settlement through colonization, directed by the Institute of Rural Welfare. Tens of thousands of peasants were encouraged to settle in official colonies in the eastern region along the borders with Brazil and Argentina. Tens of thousands more joined this migration without official government support. From the east came some three hundred thousand Brazilian settlers who capitalized on the sale of lands in Brazil and purchased cheap land and machinery in Paraguay. This policy failed to relieve the problem of landlessness or pressures for land reform.

The Stroessner regime promoted "outward directed development" (*desarrollo hacia afuera*) in which foreign investment and export agriculture were encouraged. Production of agricultural commodities boomed, beginning first with cotton in the 1970s. Cotton is a crop usually grown by peasants, who benefited for a time from high international prices. However, thanks to government policies, the primary beneficiaries of the cotton boom were intermediaries and currency speculators, including Colorado Party members and high-ranking military officers. As the cotton boom subsided in the 1980s, soy became the primary commodity export earner. Soy is generally produced on mechanized farms often owned by Brazilians or managed according to foreign agribusiness concerns.

Stroessner also employed pendulum politics to decrease dependence on Argentina and strengthen ties with Brazil. Transportation routes were opened across the Brazilian border, which became the primary route for commodity exports. Brazil and Argentina competed for influence in Paraguay, especially for agreements to build huge hydroelectric complexes on the Parana River. Although treaties were signed with both neighbors in 1973, the Brazilian-Paraguayan project at Itaipú came on line only in 1983 and the construction of the Yacyretá Dam, built in condominium with Argentina, began only in 1985. Paraguay exports almost its entire share of the electricity, with the Itaipú production sold by treaty arrangement only to Brazil and at below-market prices. In 1991, Paraguay joined the regional economic integration organization, MERCOSUR, along with Argentina, Brazil, and Uruguay.

Since 1989, when Stroessner was overthrown in a military *coup d'état*, Paraguay has struggled to establish functioning democratic institutions and reverse a

long-term economic decline. While the 1992 constitution describes a democratic regime in which legitimate authority is established through direct elections, power is often obtained through bitter and often violent intra-elite extraconstitutional struggles. This was seen in the Colorado presidential primary elections of 1992 and again in 1998, the civil-military conflict of 1996, and the assassination of the vice president and removal of the president in 1999. Civil society has been a positive actor in these crises, but the country has not seen the development of stable institutional channels for demand making by society and positive response by government. Presidential elections in 2003, won again by the Colorado Party, were considerably more orderly and the freest and fairest in the country's history.

Paraguay's economy has been stagnant since 1989, and contracted between 1997 and 2002. The per capita annual growth rate for the 1990s was -5.4%, making Paraguay the third worst performer in Latin America for the decade, after Ecuador and Venezuela. At the same time, inequality in the distribution of income, always marked, has increased. The economy continues to suffer from distortions caused by high levels of corruption and unregistered trade, including drug transshipment and money laundering.

### PARK SYSTEMS, NATIONAL

As the industrial society expanded throughout the world during the nineteenth century, urban areas were growing more and more. The demand for natural resources like coal and wood was crucial for the development of the factories that powered the growth of the new society. Although the human pressure over the resources was still fairly low, the quick pace at which industries expanded was a potential danger for many natural areas. Out of concern about the possible destruction of wilderness for the benefit of industrialization and urbanization, the idea of establishing a protection on green areas was born. The first protected areas were created with this objective: the preservation of the natural resources by forbidding all kinds of commercial exploitations in those areas.

The first national park in history was created in the United States (US). Yellowstone National Park was founded in 1872 in the states of Wyoming and Montana to preserve the hot springs and geysers. From then on, the concept of National Parks spread to other countries: Canada created its first in 1885, then New Zealand in 1894, and Australia and South Africa followed; Mexico established its first El Chico Forest Reserve in 1898, Argentina established in 1922 the South National Park (now the Nahuel Huapi National Park), and Chile created in 1926 the Vicente Pérez Rosales National Park. Ecuador established the Galapagos National Park in 1936, and Brazil and other Latin American and African countries created their own national parks soon after.

National Parks were set up primarily to preserve vast areas of natural beauty and resources from industrial exploitation. First, the idea was to preserve the areas by isolating them from any contact with the civilization, that is, by leaving the area on its own without any human intervention whatsoever. In 1933, the Convention on the Conservation of Flora and Fauna, at a meeting in London, defined National Parks as the following:

1. Areas reserved for the protection and conservation of animal and vegetal life, the conservation of objects with an geological, historical,

archaeological, or scientific interest and the benefit and recreation of general public

2. Areas under the control of the government and whose limits cannot be altered
3. Areas where hunting and destruction of fauna or flora are prohibited

As years went by, it became impossible to keep these areas isolated from the activity in their surroundings, and the vision had to change. From a perspective of *preservation*, environmentalists changed to a perspective of *conservationism*. This new approach implies that National Parks and all kinds of protected areas should not be isolated from their contexts. With this idea came the concept of “zoning,” which means creating different areas within the reserves and parks to allow visitors and activities that are not so harmful for the environment.

Therefore, in the last decades of the twentieth century, the functions of the National Parks became wider. National Parks have the following functions in the twenty-first century: (i) to conserve the natural environment on a dynamic basis; (ii) to promote the ecotourism in the parks and allow sustainable development in the areas where the parks are located; (iii) to educate visitors with an environmentalist perspective that teaches them the complexity and beauty of the ecosystems; (iv) to preserve the biodiversity; (v) to protect endangered species, either animal or vegetal, from becoming extinct; and (vi) to protect the ecosystems.

As stated, the maintenance of national parks is very important because they do not only conserve a beautiful landscape but are a vital part of the world's environment. Deforestation, the permanent extinction of species, and the consequent reduction of biodiversity are all global problems that affect all mankind. In this way, National Parks are like a refugee camp that should be supported to help mankind itself.

### The International Parks System and the Quest for Sustainable Development

After World War II, capitalist economies went through an unprecedented growth process with industry as the leading sector. This meant the destruction of habitats at an unknown scale that troubled specialists in the field. Therefore, an international organisation was created to keep surveillance and to coordinate efforts to conserve areas. In 1948, the International Union for the Protection of Nature (IUPN) was created, which changed its name to its present one in 1956: the Union for the Conservation of Nature and Natural

Resources (IUCN). This organisation pointed out that conservation was not a rival of production but that industry and environmental groups could work together.

The creation of the IUCN provided the states with international support, but much earlier, many developing countries had already established national parks. For instance, in Africa, a most important continent with great needs of protection, the Addo Elephants National Park was created in 1931, and in Kenya the Marsabit Federal Reserve was established in 1940.

Although some parks were established during the early decades of the twentieth century, most of the National Parks systems worldwide, in both developing and developed nations, were set up during the 1960s and 1970s. Botswana established in 1968 the National Parks Act, and in Namibia the Nature Conservation Ordinance was declared in 1975; in South Africa the National Parks Act dates back to 1976, in Tanzania the Wildlife Conservation Act dates from 1974, and so on. In northern Eurasia, although natural reserves date back to the early beginnings of the twentieth century, national parks were established only during the 1970s.

In general, this period brought an increased awareness of ecology, and international environmental organizations such as Greenpeace and the World Wildlife Fund (WWF) were founded. The latter organization, the WWF, was fundamental in the creation of national parks and reserves worldwide by using a powerful weapon: education through publicity. The WWF became famous for their panda bear logo. One of the major accomplishments of the WWF was the organization of the *Project Tiger* in 1973 to help the Indian government protect the tiger and its natural habitats. Just as important was the WWF's role in the creation of the Cross River National Park in Nigeria in 1991, whose aim is to establish an area where gorillas are protected. The WWF, often in partnership with the IUCN, has played an important role in Pakistan, Indonesia, Nepal, and Malaysia.

The establishment of the national parks systems in most developing countries occurred in times of relative economic welfare. However, the global crisis inaugurated in the mid-1970s resulted in budget cuts that affected the parks' budgets as well. The economic crisis also had a severe impact on the population, which became poorer in many cases. The worsening of the social conditions of people who lived near protected areas resulted in the use of the parks for hunting or otherwise use of the resources. These problems are common in African or Asian National Parks, especially in the poorest countries like India or Kenya. The parks located in those countries often suffer from

poachers who hunt endangered species like the India tiger or the black rhino to get its horn and export it. Hunters capture live animals to trade them in the black market and sell them as pets or as animals for a circus. The poaching business moves around \$5 billion annually worldwide.

However, the existence of poachers is not the only major threat to the national parks. Unlike national parks in developed countries, illegal deforestation, mining activities, and pasturage are activities that can be seen in many national parks in developing countries. These are large-scale activities that cause serious and irreversible damage to the protected areas. South America provides excellent examples. For instance, the Amazon Rain Forest contains enormous biodiversity as well as species of plants whose medicinal properties are valuable to fight conditions such as cancer and heart disease. The rain forests are also important in the conversion of atmospheric carbon dioxide to oxygen. However, deforestation continues to be rampant in the Amazon.

Another example is provided by the Selva de las Yungas (Yungas Rain Forest) Biosphere Reserve in the north of Argentina. This rain forest is the home of the *yaguarete*, a family member of the tigers that is suffering from the effects of deforestation caused by the encroachment of the agricultural frontier by multinational agribusinesses; the felled trees are also used to produce paper.

### **The Future of National Parks and Some Recommendations**

Since the creation of the first national parks, there has been an increasing conscience of supporting and promoting protected areas. In the international arena, the first international organization was founded on October 5, 1948, as the International Union for the Protection of Nature (IUPN). This organization later on changed its name to the International Union for Conservation of Nature and Natural Resources (IUCN) in 1956. In 1990, it was shortened to the World Conservation Union (though retaining the IUCN acronym). This organization's aim is "to influence, encourage, and assist societies throughout the world to conserve the integrity and diversity of nature and to ensure that any use of natural resources is equitable and ecologically sustainable." The IUCN also organizes the World Congress on National Parks and Protected Areas where specialists from all over the world meet to exchange information and to produce documents and recommendations useful for governments.

Eleven years after the World Congress was held in Caracas (Venezuela), the most recent World Congress took place in the city of Durban, South Africa, in September 2003. As a result, the Closing Plenary of the Congress delivered the Durban Accord and an Action Plan consisting of thirty-two specific recommendations, spurring conservation in Africa. However, the alarming levels of poverty, HIV/AIDS, diseases, and civil wars that destroy the African continent make it very hard for the ecosystems and the national parks to achieve the goals of sustainable development. To help the conservation of national parks in developing countries, it is also necessary to fight against poverty, unemployment, and the lack of education.

### PARTY OF THE INSTITUTIONALIZED REVOLUTION (PRI)

The Party of the Institutionalized Revolution (*Partido Revolucionario Institucional*, PRI) constituted the most influential political force in the evolution of modern Mexico, governing the country uninterruptedly from 1929 to 2000. Emerging from the instability and violence of the Mexican Revolution, the PRI initially functioned as a mechanism of compromise that absorbed the various conflicting factions contesting power to create a “revolutionary family” where interests could be balanced out equitably and disputes could be settled through political means. The PRI was initially successful in integrating the voices of the dispossessed classes into its official ideology, especially through the enactment of laws that favored the peasant

and urban working classes. Yet, the PRI’s overall vision for Mexico’s development underlined a fundamentally capitalist project that favored both national and international economic elites and eventually made them key partners of the PRI’s mode of governance. As the PRI consolidated its power in the aftermath of civil war and bloodshed, it gradually transformed itself into an all-encompassing force in Mexican politics and often resorted to authoritarian means to retain power and undermine potential opposition.

### The Origins of the PRI: Compromise, Nationalism, and Authoritarian Rule

The civil conflict that erupted in Mexico in 1910 involved several players that opposed the long-standing dictatorship of Porfirio Díaz, most notably middle class reformers led by Francisco Madero and populist forces led by Emiliano Zapata and Francisco “Pancho” Villa. Not only were those leaders disposed of in the bloodshed and confusion that eventually engulfed the Mexican Revolution, but also the lack of assertive political leadership and the constant recreation of unresolved conflicts between the main revolutionary factions submerged Mexico into a cycle of violence that lasted until 1928. The leadership of Plutarco Calles was successful in advancing a systematic “elite settlement” based on compromise and power-sharing, convincing all the major surviving factions that endless uncertainty was inevitable without a centralized authority that could settle ongoing disputes through peaceful means. Calles founded the National Revolutionary Party (*Partido Nacional Revolucionario*, PNR, the predecessor of the PRI) as the vehicle to achieve that compromise.

The Mexican masses were subsequently incorporated into the PNR by Calles’ successor, Lázaro Cárdenas, a progressive-minded politician who served as Mexico’s president from 1934 to 1940. Cárdenas encouraged the formation of worker and peasant organizations as a way to advance the underlying populist and reformist ideals of the Mexican Revolution and the Constitution of 1917. Cárdenas implemented a package of sweeping reforms that promoted socioeconomic development among the lower classes, awarded them official representation by creating peasant and labor sectors within the party, and nationalized key industries, including oil. Within this context, the crucial dichotomy for a successful national compromise occurred: Calles gained the cooperation of the elites, and Cárdenas galvanized the support of the masses behind the regime.

In 1938, Cárdenas renamed the PNR as the Party of the Mexican Revolution (*Partido de la Revolución*

*Mexicana*, PRM). One of the most significant achievements of the Cárdenas presidency was the implementation of a comprehensive program of land reform. More than fifty million acres of large-estate land holdings were transferred to Mexican peasants through a system of communally owned lands known as *ejidos*. This was the first major agrarian reform in Latin American history and was instrumental in destroying Mexico's semi-feudal landholding system. Moreover, a series of labor and socially progressive laws were introduced by Cárdenas to further consolidate the support of the working class, including higher wages, social housing, and subsidized credit. Popular organizations were fostered and supported by the party leadership, such as the Confederation of Mexican Workers (*Confederación de Trabajadores Mexicanos*, CTC) and the National Peasant Confederation (*Confederación Nacional de Campesinos*, CNC). The establishment of these organizations gave a voice to popular classes, but they also allowed the PRM to control its organizational and ideological structures. Cárdenas also established a state oil monopoly, PEMEX (*Petróleos Mexicanos*), after the assets of Western oil companies were expropriated. By the early 1940s, the PRM had consolidated its national political leadership by relying on the support of four key sectors of Mexican society: labor, the peasantry, the middle classes, and the military.

In 1946, the PRM was renamed the Party of the Institutionalized Revolution (*Partido Revolucionario Institucional*, PRI). The idea that a revolution could be "institutionalized" signified a fundamental shift in the PRI's ideology and practice. In theory, the interests of the lower classes were to be guaranteed through the election of representatives to all levels of party and government structures, but in practice, the post-Cárdenas PRI leadership gradually abandoned this inclusive character in favor of probusiness and elitist modes of governance. An increasingly entrenched alliance between the party elite and the economically powerful classes eventually appropriated the party's decision-making apparatus. This new emphasis on business allowed the PRI to achieve sustained economic growth during the 1950s and 1960s but at the cost of reversing many of the early achievements of the post-1928 period.

### **Increased Repression and Economic Slowdown**

By the 1960s, the PRI had become the only and unchallenged force in Mexican politics at the levels of government. Elections were periodically held, but

very few or no opposition candidates were to be found on the ballots. Moreover, the tight control that PRI officials exercised over the electoral processes and the leadership of popular organizations guaranteed a generalized consent whereby the regime's candidates would get easily elected. As the PRI's supremacy began to decline, the party resorted to more coercive methods, including electoral fraud and explicit intimidation tactics, to preserve its grip on power. From the 1940s to the mid-1980s, only one other party, namely the National Action Party (*Partido de Acción Nacional*, PAN) was allowed to participate in national or local elections, never posing a clear challenge to the hegemony of the PRI.

One political feature that characterized the PRI's governing style was that of a very powerful and overriding president. All major decisions and conflict mediation revolved around the judgment of the president, who had virtually unrestricted power and was generally insulated from any form of democratic scrutiny. Even if the Constitution theoretically provided for a formal separation of powers within the state, both the legislative and judicial branches were controlled by the directives coming from the president. It became a tradition for the president to appoint his successor (a process colloquially called *dedazo*, or finger-pointing) without resorting to any process of internal consultation. At the same time, it is important to note that within the PRI there is a degree of heterogeneity whereby *camarillas* (political groups of factions) engage in intraparty competition and diverge on ideological and policy matters. Although these internal rivalries do not threaten the unity of the party, every presidential term was initially judged on the basis of what *camarilla* was represented or who had more influence.

A turning point in the PRI relationship with Mexican society came on October 2, 1968. On that tragic day, a rally of students protesting against government corruption and the rather wasteful organization of that year's summer Olympic Games was met by military authorities with brutal force. An order to disperse was allegedly ignored, and the police began shooting directly at the crowd, killing hundreds of protesters in the process. The Massacre of *Tlatelolco*, named after the main square where the students had congregated, shed light on the moral and political bankruptcy of the PRI, but it also sent the chilling message that challenges to the PRI's political dominance would be answered with merciless repression.

Even in the face of increasing political decadence, Mexico under the PRI managed to register an impressive economic record in the post-World War II period. Adding to the nationalistic policies that laid a socioeconomic foundation for further growth, the

strategy of import substitution industrialization (ISI) enabled Mexico to increase its overall economic output, diversify the employment base, and boost purchasing power for the masses. A favorable currency rate resulted in considerable levels of foreign direct investment, tourism flourished, and balance of payments deficits were substantially reduced. Between the early 1950s and the late 1960s, Mexico's annual growth rate averaged 6%. However, by the early 1970s, the economic boom began to dissipate mainly due to spiraling inflation, dependence on expensive technological imports, and decreasing productivity. The PRI leadership tried to go back to the nationalist style that had characterized the party in its early years, but changing times, both domestically and internationally, left little maneuvering room for allegedly outdated strategies. As the 1980s approached, the Mexico that the PRI had built was heading toward crisis and significant multifaceted transformations.

### **Neoliberalism, Technocrats, and Political Decline**

In 1982, Mexico declared its inability to service its foreign debt, paving the road for a radical transformation of socioeconomic direction. As Mexico had to comply with structural adjustment programs imposed by foreign creditors to reschedule old debts, the PRI turned to its increasingly influential technocratic *camarilla* to lead the way toward a painful reconfiguration of national development strategies. It was Miguel de la Madrid, governing the country from 1982 to 1988, who oversaw the shift from a largely protectionist economy to one espousing free-market and export-oriented principles. Miguel de la Madrid substantially reduced the size of the public service, began the systematic privatization of state enterprises, and implemented significant cuts in the national budgets for food subsidies and social services.

As the economy changed course, so did the unchallenged stand of the PRI in national politics. In the presidential elections of 1988, a PRI breakaway faction led by Cuáhtemoc Cárdenas, son of former president Lázaro Cárdenas, posed a serious threat to the PRI's electoral domination. Despite largely substantiated accusations of massive fraud, the PRI candidate, Carlos Salinas de Gortari, was declared the winner with 50.3% of the votes. The systematic use of fraudulent methods by the PRI to retain power, coupled with a growing discontent of an electorate

that supported opposition candidates with half of the votes, signified the beginning of the end of the PRI-led one-party rule in Mexico. The PRI also lost power in state and municipal elections as well as seats in the Chamber of Deputies and the Senate.

Salinas de Gortari consolidated Mexico's shift toward market economics, expanding deregulation and privatization policies and negotiating the entry of Mexico into the North American Free Trade Agreement (NAFTA) with the United States and Canada. To facilitate Mexico's membership in NAFTA, Salinas amended Article 27 of the Constitution, whereby state protection of the *ejido* was removed and the door was opened for multinational corporations to buy *ejido* land to expand agrobusiness ventures. As the *ejidos* lost official support and small producers failed to compete with cheaper grain coming from the United States, a deep crisis in the Mexican countryside ensued. On January 1, 1994, the day when NAFTA entered into force, an indigenous uprising in the southern state of Chiapas, led by the Zapatista National Liberation Army (Ejército Zapatista de Liberación Nacional, EZLN), erupted as a stunning manifestation of protest from those left behind by the neoliberal transition.

The PRI survived the 1994 elections, but not without controversy. Salinas de Gortari's handpicked successor, Luis Donaldo Colosio, was assassinated during a campaign stop in Tijuana, an event that revealed the ferocious internal power struggles within the PRI. Ernesto Zedillo was chosen to replace Colosio, winning comfortably due to the implosion of the opposition's campaigns. Zedillo refused to continue with the old-style politics of the PRI, introducing important measures to democratize the party and the political system as a whole. Zedillo dropped the *dedazo* tradition and allowed party primaries to choose the PRI's candidate for the 2000 elections, electoral reform policies were put forward to make elections more transparent, and the executive stopped using extraconstitutional means to impose the president's desires. In July 2000, and as a result of a general atmosphere of awakening democracy combined with the ripe mood for change among the electorate, the PAN's Vicente Fox won the first-ever presidential elections by an opposition party in seventy-one years. Despite losing control of the executive branch in 2000, the PRI remains an extremely powerful and influential force in Mexico's state, legislative, and municipal politics.

## PATHET LAO

Pathet Lao (PL) means “Lao Nation” or “Land of the Lao.” It was the name given to a clandestine, nationalist, anti-French organization created in August 1950 by Prince Souphanouvong (1909–1995), a French-educated member of the Lao royal family and Kaysone Phomvihane of the Indochina Communist Party (ICP). The PL was inspired by Prince Phetsarath's formation of the nationalist *Lao Seri* (Free Lao) group and later the underground *Lao Issara* (Independent Lao) quasi-government cell in the late 1940s. The PL was based on Marxist-Leninist principles.

During the final years of French rule in Indochina, PL cadres were formed nationwide. They were supplied and trained by the Vietminh. After the French withdrew from Indochina, PL leaders met at Sam Neua on March 22, 1955, and formed the Lao People's Revolutionary Party (LPRP), also known as the People's Party of Laos or *Phak Pasason Pativat Lao*. In January 1956, supported by the Democratic

Republic of Vietnam (DRV), the PL created a covert branch called the Lao Patriotic Front or *Neo Lao Hak Sat* and the Lao People's Liberation Army (LPLA). Copying the Vietminh model, PL cadres moved into the countryside, forming party cells and people's action committees. Like the Vietminh, their programs focused on social change, land reform, curbing the power of business elites, and expelling Westerners.

In 1957, Souphanouvong and his half-brother Prince Souvanna Phouma (1901–1984) tried to create a coalition government with a national election. Initially, it seemed the PL had won thirteen of the twenty-one contested seats. Widespread fraud and ballot-box stuffing on all sides further clouded the results. Conservative Prime Minister Phoui Sanaikone contested the election by having some PL leaders in the Laotian capital of Vientiane arrested and by attempting to disarm LPLA. They fled to hideouts in the jungles.

US leaders provided Souvanna Phouma with material support to fight the PL, but he was unable to hold the diverse coalition government together. In 1959, the United States turned its support to Lao/Thai forces led by General Phoumi Nosavan (1920–1985) who captured Vientiane, forcing Phouma's neutralist government to the Plain of Jars. Soon, Souphonouvong and Phouma joined forces against Nosavan, leading to the Laotian Crisis of 1961.

President John F. Kennedy, seeking a diplomatic settlement, approved the Convention of 1962, which restored Phouma to power and, in theory, gave the PL a lesser role in the new coalition government. However, the tenuous nature of the settlement led US intelligence agencies to expand covert operations against PL forces. In hindsight, it is easy to see how this action eventually drew Laos into the expanding conflict in Indochina and provided future sanctuaries for communist forces. Instead of defeating the PL, US policy drove the PL deeper into the arms of its mentors, the People's Army of Vietnam (PAVN).

The LPLA was a gathering of various ethnic, political, and racial groups with one thing in mind: rid Laos of US influence. By 1970, this once rag-tag force of the early 1960s, numbered over fifty thousand well-trained and intensely dedicated troops.

Among those fighting this formidable foe was the Royal Lao Army (RLA), an ineffectual force with an overabundance of often-corrupt officers. It is worth noting that the marshal arts had never been part of Buddhist Laotian cultural traditions. However, with PAVN leadership and supplies, the LPLA proved adequate guerilla fighters, most often supporting the PAVN within Laos or near the border. Given the rugged mountain-jungle terrain, LPLA units most often operated in units of one hundred and no larger than five hundred.

Beginning in 1964, the LPLA's primary role became the construction and maintenance of the ever-expanding labyrinth of truck parks, supply centers, hospitals, paved roads, foot paths, streamlets, and raging rivers known as the Ho Chi Minh Trail. In 1965, in an effort to close this massive resupply route into South Vietnam, the United States began an extensive covert bombing campaign sponsored by the Central Intelligence Agency (CIA) and dubbed the operation "Barrell Roll." In the meantime, with the RLA avoiding confrontation with the LPLA and PAVN, the United States decided to support a forty thousand-man force of ethnic Hmong peoples led by General Vang Pao. They enjoyed periodic success, especially during the dry season when they could count on air cover. However, the covert nature of the war and the fits and starts of US involvement meant that US supplies were not always available when needed. This coupled with concerted PAVN offensives against the Hmong during the rainy season meant that by the early 1970s, the Hmong were in a tenuous position.

Many writers have argued that much of Vang Pao's motivation for supporting the CIA had to do with his desire to maintain the profitable flow of raw opium out of the Laotian part of the Golden Triangle to Saigon via Air America, the CIA's airline. Some of these authors claim that the money from the sale of this opium was used to fund the "Secret War." Most of these authors base their claims on anecdotal evidence that does not convincingly link the CIA to such activities. Indeed, there is very hard evidence to suggest that the DRV and PL were the "godfathers" of the opium trade in this area.

In February 1973, only days after the Paris Peace Accords were signed, a cease-fire was signed in Laos. Even so, the war continued until the US abandoned Laos in April 1975. By this time, the PL dominated the government. All anti-PL forces soon collapsed without US support. Several hundred Hmong, including Vang Pao, were relocated to the US state of Montana. During the succeeding twenty-five years, many thousand Hmong and other minorities suffered severe persecutions and even death at the hands of the PL. Phouma fled Laos in April 1975, and the last commander of the RLA, General Oudone Sananikone, formerly surrendered on May 8, 1975.

On December 2, 1975, PL leaders established the Lao People's Democratic Republic. Souphanouvang became the president, while Kaysone Phomvidane became Prime Minister and Secretary of the ruling LPRP. In 1986, Souphanouvang died of a stroke. He was succeeded by Phoumi Vonguichit. In 1991, Phomvihone took control of the government only to die a year later. He was succeeded by Nouhak Phoumsavane.

Less doctrinaire than their counterparts in Kampuchea, the PL leaders had greater success in restoring order to Laos after 1975. Even so, their international isolation and lack of economic skills left them much dependent on the Vietnamese. Their economy languished until the late 1980s when they began to open their doors to foreign, even US, tourists and investors. While many conservationists fear the uncontrolled exploitation of their natural resources, clearly these moves have made Laos more prosperous. Still, the country's woeful human rights record, especially the continued persecution of its minorities, have kept Laos from the socioeconomic renaissance enjoyed by the more democratic states of Southeast Asia.

## PEACEKEEPING OPERATIONS, REGIONAL AND INTERNATIONAL

Peacekeeping responds to a practical necessity of stabilizing violent conflict situations, either interstate or internal. Traditionally, peacekeeping has been introduced when the belligerent parties are willing to accept a cease-fire and agree to the separation of forces with a shared interest in at least limited settlement. Military deployment can be made to prevent renewed violence or to stop further escalation of violence where conflict is in progress. A multinational military and police force under the authority of the United Nations (UN) or a regional organization can intervene

between the warring parties in a conflict. Prior consent of the belligerent parties is normally essential for peacekeeping operations other than humanitarian intervention. In general, the mandates are related to the enforcement of the terms of a negotiated cease-fire and the advancement of peaceful resolution of conflict.

Between its inception in 1948 and 2001, the UN has undertaken 54 operations, and two-thirds of these operations have been established since 1991. A growing demand for UN peacekeeping operations surged with the increase in the number of internal conflicts and their negotiated settlement since the end of the Cold War. Peacekeeping activities have been extended geographically from the Middle East and other traditionally recognized hot spots in Southeast Asia, Southern and Eastern Africa, Central America, and Southeastern Europe. The wide use of peacekeeping, ranging from small-scale observation to enforcement, reflects the necessity to intervene in an increasing number of civil wars.

Most peacekeeping efforts adopt diverse approaches to their respective tasks with an *ad hoc* nature of operations in a unique environment (illustrated by Somalia, Cambodia, and Liberia).

## Objectives

Traditionally, peacekeepers have served as neutral observers in conflict zones, but the function of peacekeeping can be adaptable to different situations. The control or stabilization of violent conflicts has been known as the most classic function of peacekeeping. Lightly armed forces position themselves to help manage relations between hostile forces without being part of the conflict. The deployment of neutral troops with the consent of the conflicting parties is regarded as a confidence-building measure, as it decreases tensions and allows time for negotiated settlement. Dispatch of peacekeepers most commonly follows a cessation of active violence. In addition to maintaining a cease-fire, peacekeeping also means verifying the withdrawal of troops. Through observing and reporting any cease-fire violations, peacekeeping can be used for reduction in tensions and mistrust rather than imposition of its own conceptions of peace on the warring parties.

As neutral parties, peacekeepers are not supposed to be allies of any participants in the conflict. While serving as a buffer zone, peacekeeping troops police truce lines and prevent recurring violence through the observation of any violations of a cease-fire or truce

lines. The peacekeeping can also be used to maintain order in the establishment of a new government in post-conflict situations. Force as self-defence or to maintain law and order is used only when the peacekeepers are attacked. The presence of peacekeeping is based on consent or at least tolerance of the disputing parties.

Given that peaceful resolution of conflict is not possible without the cessation of hostilities, the cycle of hostilities ought to be neutralized. Peacekeeping can buy time for building trust between belligerents for negotiated settlement by containing violent conflict. However, durable solutions to conflicts should be sought by direct negotiation between the adversaries or through mediation involving a third-party facilitation.

Since the operations by themselves do not provide solutions to hostile relationships, they are seen as temporary measures and are intended to be provisional.

## Evolution of Operations

There are different international circumstances under which peacekeeping has been introduced. The majority of peacekeeping during the Cold War period was limited to separating national armies in ending hostilities between belligerent states. Since then, the roles of peacekeepers have been diverse with the rise of demand for new functions of the international military forces in response to hostilities among ethnic groups. If any enforcement actions are necessary in internal conflict situations, the rules of engagement and use of force need to be flexibly adjusted to humanitarian needs and protect civilians. Civilian police and the military observers monitor human rights abuses as well as protection of relief workers and distribution of aid. Peacekeeping operations in internal conflicts promote confidence building by being involved in logistical support as well as maintaining law and order.

The majority of conflicts in the last decade are characterized by physical and psychological abuses involving heavy civilian casualties. Internal conflicts in many ethnically divided societies have destroyed social and economic infrastructure, and overcoming deep divisions is a paramount task. Military forces are expected to provide support for the implementation of conflict settlement agreements. As peacekeeping in post-conflict settings is oriented toward rebuilding war-torn societies, the troops have to assist and support displaced people and other victims of war as well as provide security for them. To perform these functions better, social-psychological skills and other skills

for the management of communal relationships need to be incorporated into military missions.

### Traditional Peacekeeping Roles

Most peacekeeping operations during the Cold War period were limited to monitoring truces following intrastate wars. Peacekeeping initially started with small-scale unarmed observation units dispatched to Palestine (1948), Kashmir (1949), Lebanon (1958), and Yemen (1963–1964). The United Nations Mission in Ethiopia and Eritrea was organized to monitor the cessation of armed hostilities following the civil war in 2000.

Examples of regional intervention (the Organization of African Unity) exist in the Chadian civil conflict of the early 1980s. Although it was designed to enforce the cease-fire, its success was limited to establishing a security zone, temporarily giving a reprieve from destruction and violence, but the intervention failed to establish peace throughout the country. The three thousand peacekeeping forces were outnumbered by more than ten militia groups with thousands of combatants who refused to cooperate.

The first large military peacekeeping forces were organized during the Suez War to contain the escalation of the crisis in November 1956. The six thousand troops under the United Nations Emergency Force (UNEF) I created buffer zones around the Suez Canal and facilitated the withdrawal of Israeli, French, and British armies that invaded Egypt. Whereas UNEF I was terminated by the request of Egypt, resulting in the Six Day War, the second United Nations Emergency Force II was deployed in Sinai following a cease-fire. UNEF II sustained the cease-fire long enough to allow negotiated settlements at Camp David in 1979. The two operations are viewed as classic peacekeeping examples of supporting interstate conflict management by stabilizing the situation in the region. The UNEF II, in particular, successfully forestalled the competitive intrusion of the United States and the Soviet Union into the Middle East, thus managing an explosive global confrontation.

One of the longest armed peacekeeping operations is the UN Force in Cyprus (UNFICYP), which was placed in 1964 and still remains to manage explosive conflict on the island. Although the immediate dispatch of UN peacekeeping forces prohibited the direct intervention of Turkish and Greek governments and created stable conditions, their sustained mission has not accomplished peace due to the continuing hostilities between the Turkish and Greek communities. The unintended adverse effect of the operations

has been the maintenance of the status quo without resolving the underlying causes. Political accord has become an elusive goal despite the presence of peacekeepers in Cyprus for over thirty years.

The UN Interim Force in Lebanon (UNIFIL) was given a mandate that could not be fulfilled since it was deployed in early 1978 following the Israeli invasion of Lebanon. It was not able to stop the powerful Israelis from attacking the territory and failed to restore the authority of the disintegrating Lebanese government. The continuing presence represents the maintenance of status quo because of the fear that withdrawal would precipitate further chaos.

Even during the early period of the UN's peacekeeping efforts, there were variations in peacekeeping operations adjusted to different local conflict dynamics. The UN's peacekeeping mission in the Congo (1960–1964), known as *Opération des Nations Unies au Congo* (ONUC), was sent to control a major secessionist movement in the country's civil war, distancing from the traditional neutral roles of international peacekeeping. To achieve its goal, the Congo operation had twenty thousand troops from twenty-nine countries, the largest unit before 1992. The troops were involved in heavy fighting, including the use of air strikes against the secessionist forces. The change in the nature of UN operations within the Congo is characterized by enforcement actions with the goal of achieving stability and preservation of the unity, but any serious peace-building work was not introduced, leaving the prewar situation almost the same.

Before the end of the Cold War, peacekeeping made a contribution to preventing further escalation of regional war into a major crisis between the two superpowers. On the other hand, peacekeeping can become controversial if impartiality is questioned by an international community. UN Operation within the Congo was seen as an attempt to install a Western-supported government by the Soviet Union and some African states.

### Post-Cold War Operations

Controlling unpredictable conflict situations between hostile communities within a state requires different operational imperatives. With the rise of civil wars and ethnic rivalries (replacing geostrategic conflict between the Socialist and Western countries around the globe during the Cold War period), the functions and scopes of peacekeeping have been redefined. Peacekeeping serves a variety of purposes, ranging from conflict prevention, humanitarian intervention, to peace building.

*Preventive Deployment*

A preventive military response includes positioning military observers, troops, and related personnel before the actual breakout of a violent conflict. Its goal is to control the escalation of an emerging threat of conflict into armed conflict. The intervention is designed to prevent the imminent escalation of violence where there is an emerging threat. Observers may prepare reports on development that undermine stability and confidence in the vicinity of conflict zones. Other activities include monitoring local authorities in the protection of minorities and other vulnerable populations by maintaining law and order. Early warning signs can be developed based on an insufficient supply of essential services, such as water and power, as well as human rights violations.

The North Atlantic Treaty Organization's (NATO's) quick response to escalation of violence in Kosovo in the spring of 2004 included strong pressure on the community leaders and politicians to control their ethnic constituents. The United States, Canada, and France sent troops to Haiti to control chaos following the overthrow of the government that spring. French intervention was made in the Ivory Coast (Cote d'Ivoire) in 2003 to control further escalation of violent conflict, bringing about a peace agreement. The most noticeable and successful examples of peacekeeping for preventive purposes were the operations in Macedonia devoted to curbing violent civil war between Albanian militia forces and the Macedonian government in the late 1990s.

The Organization for Security and Cooperation in Europe (OSCE) promotes early warning and confidence building as a strategy for prevention. The OSCE used fact-finding missions in Estonia and Latvia as tension arose between Estonian and Latvian governments and the Russian speaking populations. OSCE observer missions were also sent to Moldova, Georgia, and Nagorno-Karabakh to explore strategies to effectively deal with conflict over minorities. Other regional organizations, including the Organization of American States (OAS) along with the UN, were actively involved in the negotiations of ending violent conflicts in Central America.

*Quasi-Enforcement*

The quasi-enforcement functions are oriented toward the relief of suffering among the civilian population and restoring order. Forces can be used to protect the convoys of humanitarian aids and the movements of refugees. The UN peacekeeping force in Somalia (UNOSOM) II was involved in disarming the militias

and maintaining order needed to deliver humanitarian aid. The moral imperatives are often related to reducing human sufferings with the protection of human rights of unarmed civilians under attack.

A response to an act of aggression or campaign of genocide may involve a costly and difficult option of forceful intervention. Some missions failed to provide security (such as in Rwanda) in the mid 1990s and, in fact, even reduced their strength in the face of escalating violence. The early NATO operations in Kosovo failed to protect minority populations, such as Gypsies and Serbs, due to the refusal of some national contingents to directly intervene in arson and killings by Albanians. Political realities combined with the difficulty of formulating objective criteria to be applied on a case-by-case basis may deter timely intervention in violent armed struggles. In the absence of well-organized military preparation, peacekeeping operations may invite disastrous outcomes, as we saw in the failure of UN troops to protect "safe havens" in Bosnia and to prevent genocide in Rwanda. It is more appropriate for better-armed regional forces to intervene to control violent situations. Humanitarian intervention is largely involved in internal conflict and differs from collective security actions that aim to punish an aggressor state. The use of force is a stop-gap measure to induce diplomatic negotiations rather than deterrence of aggression.

In its long involvement in the bloody internal wars of Liberia during the early and mid-1990s, the Economic Community of West African States Cease-Fire Monitoring Group (ECOMOG) had to take military enforcement actions, especially following a chaos created by the failure of warring factions to implement peace agreements. Especially in internal wars, it is not easy to find blurred boundaries between different types of military operations. ECOMOG chose the course of aggressive intervention with a vague and open mandate. ECOMOG tried to revive the communication and transportation infrastructure that broke down as well as tried to transport refugees and protect relief supplies. The capital city of Monrovia has to be secured to support an interim government. ECOMOG oscillates between traditional peacekeeping and peace enforcement to be adaptable to the prevailing political and military situations in Liberia.

*Peace Building*

When peacekeeping is introduced as part of political settlement following a civil war, troops may get engaged in weapons collection, resettlement of refugees, disarmament and demobilization of combatants, and creation of logistical support for elections.

Multidimensional operations are designed to support comprehensive settlements following lengthy periods of civil wars in such countries as Cambodia, El Salvador, Mozambique, and Namibia.

Whereas overseeing the withdrawal of hostile forces was a major focus of the UN verification mission in Angola, it became a critical task in Mozambique and El Salvador to arrange for the return of refugees as well as disarming rebels. A monitoring operation sent to the Iraq-Kuwait border at the end of the Gulf War became engaged in the policing and relief activities for the Kurdish populations in northern Iraq. International Commission for Support and Verification, the first UN-authorized mission in the Western Hemisphere, successfully disarmed the Nicaraguan Contras with demobilization of twenty-two thousand combatants during April and June 1990 and enabled the reintegration of former combatants and their family members with social and economic support.

For a lasting peace settlement, facilitating transitions to a stable government has become an important priority. In conjunction with UN civilian personnel, transitional authority was set up in Bosnia-Herzegovina and Cambodia to temporarily run the government preceding popular elections. The implementation of a comprehensive settlement is also made possible by the reconstruction of governmental functions and rehabilitation of a civil society assisted by civic education as well as military and police retraining programs.

## Deployment Procedures

In the UN-mandated operations, various missions are generally set up by the UN Security Council that consists of the United States, Russia, France, Britain, and other major powers. UNEF I was a unique exception to this latter rule since the Security Council was inactive due to the involvement of two Security Council Permanent Members in the armed conflict. The management of UN activities was authorized by the UN General Assembly, whose resolution required the invading forces, including France and Britain, to withdraw from the Egyptian territory.

In general, based on the guidance of the UN Security Council, the Secretary-General can mobilize troops with contributions from UN member states on a voluntary basis. The Secretary-General has the authority for the appointment of the force commander and selection of national contingents and other activities related to assembling troops, while he is required by the Council to provide regular reports. The power of the Secretary-General in directing UN

peacekeeping forces was curtailed following a more dominant role played by Dag Hammarskjöld in the management of a crisis in the Congo in July 1960. Since then, the Security Council began to have more control over such aspects of operations, such as setting time limits on the deployment of forces. In integrated peace settlement missions, which have become important in the recent decade, the Secretary-General's authority has been broadened again to instigate and direct force activities within the overall framework of the UN Security Council's mandate.

In a response to tenuous cease-fire situations characterized by a lack of trust between parties, the contingents are organized in a hurry, often without much preparation and briefing. While the military personnel were mostly offered by small neutral states during the early period of peacekeeping, the contributing countries have become diverse with the involvement of regional organizations with the end of the Cold War. NATO troops to the Balkans include the United States, Britain, Germany, the Netherlands, and Denmark. Regional powers such as Nigeria led ECOMOG operations in Liberia, and troops sent to Sierra Leone were dominated by other African countries. Difficult logistic issues created by a lack of coordination with soldiers from different countries can be more easily solved by the troops that belong to a regional alliance.

Regional organizations such as the Organization of American States (OAS), the Economic Community of West African States, or a group of allied states can execute a military operation with international authorization by the UN Security Council. The quasi-enforcement operations in Haiti and Somalia were commanded, both politically and militarily, by an *ad hoc* coalition, under a loose UN Security Council mandate. In Haiti, the regional intervention led by the United States was approved by the OAS, and the removal of the military dictatorship and control of violence allowed the initiation of United Nations work for reconstruction of the country. The OAS had also made a serious contribution to the disarmament and demobilization of the rebel forces following the Contra War in Nicaragua. A Western alliance carried out a mission to provide humanitarian assistance to Kurds in northern Iraq at the end of the Gulf War with the authorization of the UN Security Council. On another occasion, the Nigeria dominated quasi-enforcement peacekeeping operation in Liberia was retrospectively endorsed by the UN Security Council in 1992.

Subcontracting with regional organizations is a new phenomenon to meet with the operational needs to back up, or replace, traditional peacekeeping. On the other hand, variations exist in the cooperative

arrangements between regional organizations and the UN, given that different types of forces are available under regional and UN commands. In the earlier Bosnian operation, NATO provided air support for the UN ground troops and later replaced the UN forces with stronger contingents following the peace agreement, while the UN's contribution remains with the provision of civilian police forces.

In Liberia and Georgia, regional forces conducted military operations although the civilian aspects of the missions belonged to the responsibility of UN observers. The Contonou Peace Agreement of July 1993 for Liberia contained provisions for the involvement of UN observers in the disarmament and elections process. Because the presence of the United Nations Observer Mission (UNOMIL) in Liberia did not help bring about a peaceful solution, the UN Security Council requested in September 1994 that ECOMOG protect UNOMIL personnel.

## Challenges and Future Directions

Although peacekeeping is considered a tool for active conflict containment and management in an era of growing communal violence, it has limitations without full international support. Because the UN capacity has been outstripped by the demand for peacekeeping, a lack of a sound financial basis poses a particularly serious challenge for large operations that involve more than ten thousand troops. The rising costs of several big operations are well illustrated by the following examples: peacekeeping operations in Cambodia cost US\$1.65 billion; Mozambique required US\$541.7 million; and the annual cost of UNPROFOR in the former Yugoslavia was US\$1.1 billion.

UN resources were exhausted with the two largest missions (overseeing the rebuilding of war-torn Cambodia and monitoring the cease-fire in former Yugoslavia) simultaneously organized in early 1990s. While the successful mission for Mozambique is attributed to the devotion of Western donors, the failure of a peace process and a renewed war in Angola, to a great extent, are explained by a lack of enough commitment from the international community. Sometimes the interest in avoiding instability motivates regional or neighboring countries to get involved in peace operations to control chaos, which can generate refugees. While Australia led the operations in East Timor, Japan played a major role in Cambodia.

With respect to internal operations of peacekeeping, as some national contingents were criticized for being corrupt and abusive, concerns have been raised

about a lack of ethics. The Economic Community of West African States' intervention in Liberia (with 66% of the force being made up of Nigerian soldiers) served as the Nigerian military regime's foreign policy tool to assert its regional influence and promote commercial interests. Some Nigerian commanders even took part in clandestine economic activities, such as trade of goods obtained by looters and exploitation of rubber resources. Military operations, in particular, by regional alliances need more international scrutiny and supervision so that peacekeeping will not serve to legitimize the political interests of the intervening states.

Success or failure of peacekeeping should be judged within a given mandate, such as halting a recurrence of hostilities. Coordination often proves vital to success of multilateral military operations. The UN Department of Peacekeeping Operations developed Civilian Unit and Deming Unit in a response to emerging needs. In addition, task forces were created to respond to field operations. Further reform may need to be made to include more improved coordination between regional and UN-sponsored operations.

## PEASANTS, IMPACT OF DEVELOPMENT ON

Peasants are smallholder farmers who have been incorporated into the politics and economies of large-scale societies. Found throughout Latin America, Asia, Africa, and in parts of Europe, peasants are oriented toward villages rather than cities and towns. Though most commonly associated with Europe of the Middle Ages, peasants have been around for thousands of years, since the origins of the state. It may be safe to assert that a majority of the world's peoples could still, in some way, be considered peasants.

Compared to the capital-intensive, highly mechanized operations of large-scale farming in industrial societies, peasants utilize relatively simple technology and labor-intensive production methods. The family is the basic unit of production and consumption. Saul and Woods (1987) state that peasants are "those whose ultimate security and subsistence lies in their having certain rights in land and in the labour of family members on the land, but who are involved, through rights and obligations, in a wider system which includes the participation of non-peasants."

The terms of their incorporation into this wider system are mostly disadvantageous. Peasants grow food that supports urban dwellers, and their taxes sustain the government; however, they usually do not receive commensurate rewards in return. Generally, peasants have not benefited from development efforts thrust upon them by governments, multinational corporations, and international agencies (Barker 1989; Richards 1985). In the 1960s, the Green Revolution, which began decades earlier with the discovery of new, higher yielding varieties of grains (wheat, rice, and maize), was heralded as the chance to solve the developing world's food-related problems. Tremendous success occurred initially on experimental agricultural stations in Mexico and the Philippines, followed by their dissemination to parts of India, Pakistan, and Indonesia. Although overall yields doubled and in some cases tripled, it was not long before skeptics began questioning the value of the Green Revolution for peasants. Major criticisms of the Green Revolution included that (i) it is

dependent on the use of chemical fertilizers and pesticides, irrigation, and other inputs that poor peasant farmers cannot afford, thereby exacerbating inequality; (ii) it may be ecologically harmful (e.g., chemical contamination of groundwater); and it promotes monocultures and hence contributes to a loss of genetic diversity. Franke (1974) examined the Green Revolution's effects in central Java and found that, despite potential yield increases of up to 70%, only 20% of farming households in the village joined the program. The chief beneficiaries tended to be farmers who were already better off, who owned most of the land, and who had adequate water supplies. The poorest families did not adopt the new miracle seeds. Instead, they made do by working part-time for the well-off farmers who lent them money to buy food. Furthermore, because they were afraid of losing their supply of cheap labor, richer farmers prevented their part-time workers from adopting the new seeds. For their part, poor farmers feared that if they cut themselves off from their patrons, they would have no one to turn to in cases of sickness or drought. Franke concluded that the theories behind the Green Revolution were really rationalizations for elites who were to achieve economic development without engaging in the social and political transformation their societies needed.

*Structural adjustment policies*, multifaceted programs designed to correct decades of mismanaged centralized economies and mandated by the International Monetary Fund and World Bank as conditions for continued loans, have taken a high toll on peasants. Their effects have been especially devastating on women (Gladwin 1991). As both producers and consumers, peasants suffer doubly—the minimal producer prices once assured by grain/cereal boards have disappeared, as have price caps on purchased staple consumer goods such as flour and cooking oil.

Among urban elites, even in the developing nations in which they are encapsulated, derogatory stereotypes about peasants abound (peasants are inordinately conservative, are bound by tradition and superstition, and are lazy and stupid). An alternative view is that peasants, by virtue of their relative lack of power, are forced to adapt to risky circumstances, most of which are out of their control. As such, they behave in ways that are very different from people who hold greater degrees of political and economic power.

As a result of the unfavorable terms through which they have been incorporated into state systems, peasant communities often chose to bind together, in what Eric Wolf (1966) has termed *closed corporate communities*. These groups emphasize community identity and discourage outsiders from settling within by

restricting land-use to village members and prohibiting the sale or lease of property to outsiders. Often the community, not the individual, has ultimate control of land. Parts of the Valley of Oaxaca in southern Mexico exemplify closed, corporate peasant communities. Peasants there are often seen as economically conservative, suspicious of change, and pessimistic about the future. George Foster (1967), who studied the village of Tzintzuntzan, called this view the *image of the limited good*. This position sees all good things in the world as existing in limited supply, and an individual's success occurs only at the expense of others who soon become envious. Even those who are moderately successful experience social pressures to share the wealth. This comes in the form of sponsoring lavish *fiestas* to honor the patron saint of each village. Fiesta sponsorship rotates among the people of the village, and individuals take great pride in doing a good job of sponsorship. These fiestas, sometimes referred to as the *cargo system*, along with exchanges of labor and goods across households, act as *levelling mechanisms* and function to lessen wealth differentials. Rather than see these kinds of practices as inhibiting progress, anthropologists like Foster and Wolf have generally concluded that, given their lack of capital and lack of political power, these types of customs are adaptive practices that help to enhance group solidarity and ensure cooperation in the face of uncertainty.

In certain historical contexts, most conspicuously twentieth century examples such as Mexico, Russia, China, Vietnam, Algeria, and Cuba, peasants have openly rebelled (Hobsbawm 1963; Wolf 1969), leading to massive social upheaval, if not genuine social change. However, perhaps more commonly exhibited are what James Scott (1985) called *weapons of the weak*, everyday forms of resistance that are manifested by individual social actors in both symbolic and material ways, such as feigning confusion, slowing down work, pilfering, performing shabby work, tampering, lampooning, performing sarcastic mimicry, or evading work.

Peasants produce primarily for subsistence and household maintenance rather than for profit. This *subsistence first economic orientation* is not necessarily the product of an inherent antimarket bias; rather, it derives from the reality that in most cases, peasants are fortunate simply to break even. Peasants must use part of what they produce to feed themselves, but there are other uses to which any surplus must be put. Eric Wolf (1966) identified these as: (i) *the ceremonial fund*—that portion of the budget that is allocated to social and religious activities; (ii) *the replacement fund*—that portion of the household budget that is allocated for repair or replacement of

materials depleted by wear and tear; and (iii) *the rent fund*—that portion of the budget that must be allocated for payment of rent for the use of land and/or equipment. Hence, in general by the time all of these expenses are met, the peasant household has little left over to invest in profit-making enterprises.

Johnson (1971) found that Brazilian sharecropper peasants face *multiple sources of risk* emanating from both the physical environment (for example, rainfall variation, pests, illness) and economic environments (such as uncertain land tenure, or externally controlled market prices). In response, they engage in a number of practices that may help reduce this uncertainty, such as accumulation of subsistence needs first; tilling of multiple small, scattered plots rather than one larger consolidated field; careful experimentation with new crops and methods; creation and maintenance of interhousehold dyadic relations between equals and with patrons; and further diversification through off-farm sources of employment (Johnson 1971; Ortiz 1973; Barlett 1980). Entrepreneurs, business people who are able and willing to take risks in new economic ventures, do not fare well among the sharecroppers Johnson studied. In Zinacantan, Mexico, Frank Cancian (1972) found a curvilinear relation between rank and risk taking, with the middle class being especially conservative during the early stages of change, when uncertainty is greatest. On the other hand, those at the top and at the bottom were more willing to endure the risk associated with adopting changes. In Nigeria, Sara Berry (1985) found that, among Yoruba farmers, the tendency to diversify was very strong and that people engage in a number of activities besides farming to generate income. Trained as an economist, Berry goes on to claim that there is no inherent conflict between safety-first orientation and profit maximization. It seems imperative, therefore, to try and understand peasant economic systems on their own terms first before implementing changes.

After decades of studying peasants firsthand in Europe (Switzerland) and West Africa (Nigeria), Netting suggested that there are clear reasons why the smallholder peasant farming mode of production, and the various social formations that accompany it, persist across space and time.

Smallholders are not as rich as landed aristocrats, the higher officialdom of government, the commercial elite, or urban professionals. What they do have is their experience, their fertile land, their livestock, and their diversified production strategies as a set of defenses against the uncontrollable vagaries of weather, prices, and war. Smallholders may not always live well, but they are seasoned survivors. They may moonlight as craftsmen, petty traders, field hands,

or factory workers, but they do not keep one foot on the farm out of sentiment or stupidity. And the society that dispossesses smallholders in favor of factory farms, plantations, or socialistic communes simultaneously risks a decline in agricultural production, increase in rural unemployment, and an ecological deterioration (Netting 1993).

The course of the twentieth century saw the deleterious consequences resulting from the dispossession of smallholders by large-scale plantation agriculture in Latin America and the Caribbean and socialist/communal farms in Europe and Asia. In the twenty-first century, the dispossession of smallholders by factory farms proceeds around the world, even in North America with agribusiness. What long-term repercussions will ensue from these processes, and how will governments deal with them?

#### PEOPLE'S LIBERATION ARMED FORCES (PLAF)

The People's Liberation Armed Forces (PLAF) was the military arm of the National Front for the Liberation of South Vietnam (NFLSV), better known to US citizens as the National Liberation Front (NLF). Most of the world knew the PLAF as the "Viet Cong" (VC), a contraction of the Vietnamese term *Viet Nam Cong San*, or Vietnamese Communist. It was slang term of derision conjured by Ngo Dinh Diem, who used the term to describe his political opponents, many of whom were not Communists, starting after the 1954 partition of Vietnam between the Republic of Vietnam (RVN) in the south and the Democratic Republic of Vietnam (DRV) in the north. The NLF and the PLAF never referred to themselves as VC and always asserted that they were a national front of all anti-RVN forces, Communist or not. US and allied soldiers in Vietnam used the term and even added to the jargon the term "Charlie."

The leaders of the NFLSV formally established the PLAF at a meeting of insurgent leaders in early 1961, based on a decision by North Vietnamese communists to escalate the level of armed struggle in South Vietnam. Like its predecessor, the Vietminh, which had fought successfully against the Japanese in 1941–1946 and French in 1946–1954, organized the PLAF on three levels: fully trained and equipped regular forces ("main force") ostensibly operating under the command of the southern leadership, primarily the Central Office for South Vietnam (COSVN); full-time guerrillas organized in companies and serving under provincial or district leaders; and part-time self-defense militia, composed of units organized in squads and platoons and used mostly for village defense. In truth, at times, they resorted to intimidation to gain their ends.

Throughout the early 1960s, the PLAF grew rapidly in strength and numbers, reaching an estimated thirty thousand by August 1964, around the time the North began the full-scale infiltration of regular People's Army of Vietnam (PAVN) troops into the South; only a few months before, the United States, based on the Gulf of Tonkin Resolution, began to build up its forces in earnest. While a few leading PLAF cadres and officers infiltrated from the North to the South along the Ho Chi Minh Trail, the vast majority came from villages, towns, or cities in South Vietnam.

Especially in the beginning, the PLAF used classic guerilla tactics and initiated a series of hit-and-run attacks on government installations, military outposts, convoys, strategic hamlets, and even district towns throughout the RVN. Its most noteworthy victory occurred in the village of Ap Bac in early

January 1963, when Viet Cong guerrillas engaged the Army of the Republic of Vietnam (ARVN) regular forces flown in by US helicopters. The day-long battle resulted in heavy casualties for ARVN units. Most experts reported it as a PLAF victory.

Between March 1965 and January 1968, as the role of US combat troops increased, the role of PLAF units was gradually superseded by regular PAVN forces. Whereas the PAVN bore the brunt of the fighting with US troops, in such major battles as the Ia Drang Valley in November 1965, Communist leaders most often assigned PLAF units to combat against less well-armed ARVN units.

The PLAF, however, assumed the primary role in the Tet Offensive, launched in January through February 1968. PLAF troops attacked villages, towns, and cities throughout the RVN. The offensive began at 3:00 AM on January 31, 1968, when VC sappers entered the US Embassy compound in Saigon, which had seemed to be a safe haven. US television accounts of the devastation and carnage throughout the RVN, especially in places like the old imperial capital of Hue, shocked and disheartened most US citizens. While the attackers suffered heavy casualties—between twenty-five thousand and forty thousand depending on your source—and it was a tactical Allied victory, Tet eventually had the strategic impact of leading to the end of direct US involvement.

Many historians have argued, and certainly the military did at the time, that as a result of Tet Offensive, the PLAF, which totaled between 150,000 and 200,000 on the eve of Tet, declined as a major battlefield factor after Tet. Some have speculated that the communist leadership in the North deliberately ordered PLAF units into the fighting to reduce southern influence within the movement, but there is no absolute evidence to support this assertion.

Others, especially ethnic Vietnamese scholars, have argued that the PLAF was not as damaged as first believed and that they suffered more casualties in the follow-up campaigns of late 1968 and in the Allied Pacification Programs of 1969–1970 and eventually recovered to pre-Tet strength by the Spring Offensive of 1972. In 1969, the NFLSV formed the Provisional Revolutionary Government (PRG) of South Vietnam that technically assumed power briefly after the fall of Saigon in 1975.

However, the viewpoint expressed in the latter paragraph is not held by the majority of scholars who believe PLAF was badly hurt by the Tet defeats and subsequent set-backs. In any case, the final reunification struggles were led by Northern Communists, and PLAF played a lesser role in the 1975 offensive that led to the fall of South Vietnam. After the war, PLAF units were disbanded or integrated with

the PAVN in a nation dominated by Northern Communists.

### PÉREZ JIMÉNEZ, MARCOS

Marcos Pérez Jiménez (1914–2001), a career soldier who joined the army at age seventeen, was the military dictator of Venezuela from 1952 to 1958. The death of military dictator Juan Vicente Gómez in 1935 unleashed a wave of democratic outpouring in Venezuela. *Acción Democrática* (AD), a middle-class reformist party formed in 1941, repeatedly called for a transition to electoral democracy. On October 19, 1945, a coalition of AD political supporters and young military officers that included Pérez Jiménez overthrew the military dictatorship of Isaías Medina Angarita. Although initially supportive of AD's political agenda, the young military officers began to criticize the increasingly leftist rhetoric of AD politicians Rómulo Gallegos and Rómulo Betancourt. In 1948, the military overthrew Gallegos's AD government and implemented a three-man military junta. Although the United States had initially supported the transition to civilian democracy in Venezuela, the advent of the Cold War convinced the US government that the reckless statements issued by Venezuelan politicians could provide an opening for communism in Venezuela. By 1952, Pérez Jiménez, who had been part of the military *junta*, had eliminated the other members of the *junta* and proclaimed himself the military dictator of Venezuela. The Eisenhower administration, which actively supported the Pérez Jiménez dictatorship, awarded the dictator the Legion of Merit medal.

Pérez Jiménez implemented a brutal, corrupt authoritarian regime. He maintained power by suppressing internal dissent by unleashing his security forces on Venezuelan dissidents. Once in power, he rapidly increased Venezuela's infrastructure. Pérez Jiménez's

massive construction projects, funded by a greatly expanded petroleum industry controlled by foreign capital, were responsible for building roads, expanding tourism, and appeasing the military. The construction of an extravagant Military's Officers Club was designed to appease the Venezuelan Armed Forces. These extravagant construction projects, plus rampant corruption, fostered rapid inflation that facilitated his overthrow in 1958. Pérez Jiménez fled to the United States.

Pérez Jiménez, however, had left behind a briefcase full of documents that detailed his illegal activities. In 1963, he was extradited to Venezuela and sentenced to four years in prison. After his release in 1968, he moved to Generalissimo Francisco Franco's Spain. Pérez Jiménez, however, still maintained a base of support in Venezuela. Although elected to the Venezuelan Congress, the AD government never allowed him to take his seat. His attempt to run for the Venezuelan presidency in absentia was also foiled by the AD government. Although invited to attend the inauguration of Hugo Chavez in 1999, Pérez Jiménez declined. He died of a heart attack on September 20, 2001, in Madrid, Spain.

### PERÓN, JUAN DOMINGO

From the fertile pampas to the rugged Andes Mountains, no figure dominated twentieth century Argentine political life as that of Juan Domingo Perón (1943–1974). On June 4, 1943, a cadre of nationalist armed forces officers known as the United Officers' Group overthrew the corrupt government of President Ramón Castillo. Among these officers was the former military attaché to Italy and Mussolini admirer, Colonel Juan Domingo Perón. As a clever manipulator, Perón, who was appointed as head of Secretariat of Labor, would use his post to launch his political career by granting workers innumerable rights and siding with them in labor disputes.

Concern over his political ambitions as well as with the rising popularity of his companion, Eva Duarte, prompted his fellow officers to remove him from his post on October 9, 1945, and confine him to the island of Martín García. Eight days later, massive workers' demonstrations on his behalf resulted in his release.

After his return, Perón was unstoppable. In the presidential election of 1946, Perón, aided by the vote of the *descamisados* (working-class supporters) scored a decisive victory over a coalition of different political groups. Immediately, he set out to fulfill his promise of social justice, economic independence, and national sovereignty.

A believer in the corporate state, Perón used this philosophy to transform Argentina's politics, economics, and society. Through the government-controlled Argentine Institute for the Promotion of Trade, Perón used revenues from Argentine agricultural exports to materially benefit the workers. Laws expanding minimum wages, workmen's compensation, health insurance, paid vacations, and social security were promulgated. Peronist-controlled labor unions gained unprecedented power as Perón expanded the national civil service.

In 1946, Perón's five-year plan for development, based on the creation of state-owned enterprises, was initiated. Perón addressed his promise of economic independence by nationalizing the public utilities in 1946 and the British-owned railways a year later. Since Perón viewed industrialization as an important ingredient of economic independence, projects ranging from power plants to steel mills were given top priority in the plan. Ironically, Perón would finance his grandiose industrialization scheme through Argentine grain and beef sales.

The *descamisados* were not the only ones who benefited from Perón's policies. Women were given the right to vote in 1947 and the right to hold public office in 1949. The military also saw its budget increased, while the Catholic Church exerted its influence in public education.

In terms of foreign relations, Perón's "Third Position," a policy of nonalignment between the Cold War superpowers, brought Argentina prestige throughout the Third World. His economic and diplomatic support for Generalissimo Francisco Franco's Spanish regime was proof of Argentine defiance of both the Soviet Union and the Western powers.

Under the emblem of *justicialismo*, Perón won another presidential term in 1951. His second term, however, proved to be a stormy one. Although he enjoyed unlimited popularity among the *descamisados*, Perón's second five-year plan would collapse amid a devastating drought, exorbitant inflation, dismal industrial productivity, and bureaucratic inefficiency.

Moreover, he never recovered from the devastating impact of losing the charismatic Evita to cancer on July 26, 1952.

Dissatisfaction with Peronist policies among land-owners, business leaders, intellectuals, and a portion of armed forces officers galvanized in 1955 when Perón struck at the Catholic Church. Angered at Perón's legalization of divorce and proposed legislation to end the Church's involvement in public education, the hierarchy began to criticize the regime through pastoral letters. Overzealous Peronists responded by burning churches. On September 16, 1955, armed forces officers staged a revolt that culminated in Perón's departure three days later.

In spite of "de-Peronization" campaigns on the part of subsequent military and civilian governments, Peronism remained a major factor in Argentine politics. Unable to stop the rising tide of discontent, the military government of General Alejandro Lanuse allowed free elections in 1973, which were won by Héctor Cámpora, an avowed Peronist. Cámpora, however, resigned; on September 23, 1973, the aging Juan Perón, who had returned from his exile in Madrid in 1973, won another presidential election with his third wife Maria Estela "Isabelita" as his running mate.

For this occasion, Perón had no time to implement another five-year plan. His heart condition worsened throughout his brief presidential term and on July 1, 1974, he died at seventy-eight. Perón has been dead for years, but Peronism is still alive in Argentina.

### PERSIAN GULF WAR, 1991

The Persian Gulf conflict of 1991 began at 1:00 AM on August 2, 1990, with the movement of 120,000 Iraqi troops and 1,800 tanks over the Kuwaiti border. Within thirty-six hours, Iraqi forces had succeeded in

overcoming Kuwait's military defences and driving its leadership into exile. The occupation of Kuwait was to last 210 days and ended with the overwhelming defeat of Iraq by a US-led United Nations (UN) coalition force on February 27, 1991.

### The Causes of War

The invasion and annexation of Kuwait took many states by surprise, including Kuwait and those in the United States. However, with hindsight, there were a number of factors that in combination provided motives for the invasion. First, there is evidence to suggest that the invasion was partly motivated by the desire to improve Iraq's economic position through the appropriation of Kuwait's vast financial resources and its oil wealth. The Iran-Iraq war of the 1980s had left the Iraqi economy close to collapse. At the end of the war, Iraq faced reconstruction costs estimated at around \$60 billion and a foreign debt of \$70 billion, the latter being owed mostly to the Gulf States, including Kuwait, which had been eager to counter the revolutionary threat posed by Iran. The war had also resulted in high inflation and a substantial drop in living standards, which reversed a twelve-year positive trend. As 50% of the population was in some way employed by the state, the inability of the Ba'ath regime to raise or at least maintain living standards for the general population and to provide economic benefits to the party elite threatened its very survival. With four military *coup* attempts against the regime between 1988 and 1990, finding a solution to this problem became essential for the Hussein regime.

Second, at such a time of economic crisis, the Iraqi government was particularly dependent on generating as much income as possible from its oil revenues. In 1990, oil prices fell from \$22 per barrel in January to \$16 per barrel in June, with every \$1 drop in the price of oil costing Iraq \$1 billion in revenue. This was due in part to the general trend toward using alternative fuels in demand countries; the discovery of new sources of oil in Alaska, the North Sea, and the former Soviet Union; and to overproduction by Organization of Petroleum Exporting Countries (OPEC) countries such as Kuwait and the United Arab Emirates. The actions of Kuwait in disregarding oil production quotas set by OPEC and refusing demands by Iraq to forgive Iraq's war debts provided the proximate causes of the war. From February to July 1990, Iraq declared that Kuwait was waging economic warfare against it, issued a series of verbal threats, and began to move troops toward the Kuwaiti border in mid-July 1990.

Third, the invasion of Kuwait can be seen as part of a long-standing territorial dispute in which Iraq has claimed that Kuwait's territory should have formed part of Iraq. Its claim reached back to the days of the Ottoman Empire, when Kuwait had formed part of the province of Basra in 1971. Whilst Iraq's 1963 regime formally recognised Kuwait as an independent sovereign nation, its government and its people have continued to hold a historical grievance.

Fourth, on a personal level, President Hussein had for many years expressed an ambition to lead the Arab world. His pursuit of a nuclear weapons capability formed part of the broader goal to challenge Israeli power in the region. The invasion of Kuwait would allow Iraq to dominate the oil wealth of the Persian Gulf and possibly the Arab world by giving it control of more than 22% of the world's known oil reserves, second only to Saudi Arabia's with 28%. With a large military capability and significant oil resources, Iraq would have been able to exert significant influence within OPEC and therefore on global oil prices. With the dependence of industrialised countries on OPEC oil, and the experience of the oil-price shocks of the 1970s still in memory, this situation was unlikely to be allowed to continue.

## **The International Response**

The invasion of Kuwait by Iraqi forces was immediately condemned internationally. On August 2, 1990, the UN Security Council unanimously passed Resolution 660 (UN Security Council Resolution or UNSCR) that declared the invasion and occupation of Kuwait a threat to international peace and security and demanded an immediate Iraqi withdrawal. With no withdrawal being forthcoming, on August 6, economic sanctions were imposed under UNSCR 661 encompassing a ban on the import and export of goods, financial resources, and arms to Iraq or Kuwait. The United States and United Kingdom set up a naval blockade of the Persian Gulf to enforce the sanctions, as a form of collective-self defence under article 51 of the UN Charter and later authorised under Chapter VII by the UN Security Council on August 25.

The international military response initially took a defensive form known as Operation Desert Shield. In response to the fear that an invasion of Saudi Arabia could be next, the Saudis were easily persuaded to allow US forces to be deployed onto Saudi territory from August 8. Operation Desert Shield was to become one of the largest military deployments ever made. It included an alliance of twenty-eight member

nations, which grew to thirty-seven by the end of the war and included more than half a million soldiers, with a ten thousand-soldier brigade from the Arab Gulf states, seven thousand Kuwaiti soldiers, fifteen thousand Syrian troops, forty-three thousand British, and sixteen thousand French.

Despite the international response, President Hussein made his intent to hold onto Kuwait clear, announcing the annexation of Kuwait as part of Iraq's nineteenth province on August 8. On August 18, Iraq added to its outlaw status by taking sixty American, British, German, and French citizens from Kuwait as hostages to be used as human shields who would be released on the withdrawal of US forces from Saudi Arabia and the lifting of sanctions. Hussein threatened to deliver the "mother of all battles" to any attacking coalition force, to destroy Kuwait's and Saudi Arabia's oil infrastructure, and to draw Israel into the conflict.

Preparations for military action intensified in November, with US Secretary of State James Baker traveling to Bahrain, Saudi Arabia, Egypt, Turkey, the Soviet Union, Japan, Germany, and France to maintain the resolve of the coalition states to pursue the matter until Kuwait was liberated. On November 29, UNSCR 678 was passed by unanimous vote, authorising the use of "all necessary means" to force Iraq to withdraw from Kuwait if it did not withdraw by January 15, an ultimatum that was not met.

## **Operation Desert Storm**

On the night of January 16, 1991, the US-led coalition began Operation Desert Storm with an intense air bombardment targeting Iraq's known weapons of mass destruction (WMD) and arms production facilities, troop formations, defensive fortifications, supply lines, air defences, command and control network, bridges, railroads, major roads, and much of Iraq's electricity, water, and oil production facilities. This attack was to last for thirty-nine days. The hitherto unseen technological superiority of the US air force, with its stealth fighter jets, Tomahawk cruise missiles, and advanced "surgical strike" capabilities ensured that the coalition air forces achieved air supremacy with relative ease. Iraq responded on January 18 by firing al-Hussein Scud missiles at Israel and Saudi Arabia to test the resolve of Arab nations within the coalition and to sabotage world oil supplies. Israel, however, was persuaded not to respond by the United States.

With Iraq's air force effectively suppressed within one week, Iraq was given a further chance to withdraw unconditionally from Kuwait. On February 22, Iraqi

forces set more than six hundred Kuwaiti oil wells alight. With the passing of the deadline for acceptance of the cease-fire conditions on February 23, the US-led ground war commenced on February 24, 1990. In the first stage of the attack, Iraqi troops were targeted with by bombs and artillery to create confusion and undermine morale. The second stage of the attack consisted of a diversionary amphibious assault off the coast of Kuwait by eighteen thousand US marines who succeeded in drawing Iraqi divisions away from a surprise attack to the west. Under the cover of the allied air attack, 240,000 coalition troops engaged in a major flanking maneuver three hundred miles west of the Iraq-Kuwait border, which was undetected. On February 24, the third stage of the attack began with US marines and Saudi troops attacking across the Kuwaiti-Saudi border toward Kuwait City. Both the attack from the West and that from Saudi Arabia proved to be highly successful. Thousands of Iraqi troops chose to surrender rather than be killed by the clearly better trained, equipped, and rested coalition forces. Within two days, the Iraqi defensive position had been broken, and on February 25, Baghdad announced the withdrawal of Iraqi troops from Kuwait. On the evening of the same day, large numbers of Iraqi troops attempted to escape from Kuwait with their equipment and stolen goods, coming under attack from the air. Whilst it was possible to continue the attack against Iraqi forces, particularly against its elite Republican Guard divisions, President Bush chose to call a cease-fire. The following day, Iraqi Foreign Minister Azziz announced his country's willingness to rescind its official annexation of Kuwait, release all prisoners of war, and pay war reparations in exchange. Finally, on February 27, Iraq announced that it would comply with all 12 UN Security Council resolutions that had been passed.

The decision not to march on Baghdad to depose President Hussein was one that was regretted by future US administrations in the 1990s. However, the mandate given to the coalition forces was limited to the goal of liberating Kuwait, rather than that of regime change, a policy that was unlikely to have mustered support within the Arab world. The decision was based also on the assumption that Iraq's WMD capabilities and conventional armed forces had been significantly degraded and that it was highly unlikely that Saddam Hussein could remain in power after suffering such a comprehensive and humiliating defeat. Lastly, the United States was unprepared for the difficulty and expense of undertaking a nation-building exercise in Iraq, a country already split among three disparate ethnic and religious groups that had not experienced democracy in recent times.

The terms of the cease-fire set out in UNSCR 687 sought to ensure Iraq was unable to threaten its neighbours again. Under these terms, Iraq agreed not to acquire or develop a nuclear weapons capability; to declare and destroy its nuclear, chemical, and biological weapons arsenal and any ballistic missiles with a range greater than 150 kilometers; and to compensate Kuwait for any loss or damage suffered at a set percentage of its petroleum exports. A comprehensive weapons inspection regime was set up to verify Iraq's disarmament with economic sanctions to be lifted on compliance with all terms of the cease-fire. The disarmament of Iraq was expected to take less than a year. However, in the period between 1991 and 1998, the Hussein regime proved to be resilient and defiant amidst the breaking down of consensus in the UN Security Council concerning the threat the regime posed to the international world community.

### The Significance of the War

The Gulf War of 1991 is primarily remembered as the first real demonstration of the proper working of the UN collective security mechanism. With the end of the Cold War, the UN Security Council was able to function as intended with nations from all around the world joining together to defend a weak state against an aggressor. The broad-based support for military action as well as military, financial, and political terms demonstrated the resounding legitimacy with which the core principles of nonintervention, sovereignty, and the peaceful resolution of disputes were viewed by a majority of states. Here, the world saw a brief glimpse of a possible "new world order" in which states would demonstrate their shared commitment to these principles and their intolerance for blatant aggression. The level of cooperation reached within the UN Security Council was to set a high benchmark for future collective action to restore international peace and security that unfortunately has not been replicated. The action is also remembered as the benchmark for US leadership internationally, creating the expectation that US leadership in security matters would be exercised multilaterally through the UN Security Council. These expectations continued during the 1990s, whilst US foreign policy increasingly began to display unilateralist tendencies.

## PERSIAN GULF WAR, 2003

### Background to the Conflict

The seeds of a further conflict in the Persian Gulf were sown in the years following the 1991 Persian Gulf War. Following Iraq's comprehensive defeat in this war, the United Nations (UN) Security Council imposed a range of disarmament obligations on the country as a condition of cease-fire set out in UN Security Council Resolution (UNSCR) 687. This resolution provided that Iraq agree not to acquire or develop a nuclear weapons capability, destroy its chemical and biological weapons arsenal and any ballistic missiles with a range greater than 150 kilometers, as well as compensate Kuwait for any loss or damage it had suffered. To verify Iraq's agreement to disarm a UN weapons inspection team was created, known as the UN Special Commission for the Disarmament of Iraq (UNSCOM), which together with the International Atomic Energy Agency (IAEA) were to conduct inspections on Iraqi territory. Economic sanctions and restrictions on Iraq's ability to sell oil and to use the proceeds were to be lifted should Iraq comply with these terms.

It is now believed that UNSCOM and the IAEA made good progress in uncovering and destroying a substantial portion of Iraq's WMD stockpiles and ballistic missiles, despite the efforts of the Iraqi regime to obstruct and deceive them. However, from 1993 to 1998, Iraq began a sustained and largely successful

campaign to impede disarmament by the UN. During the same time period, consensus among the permanent members of the UN Security Council began to unravel in relation to whether Iraq continued to pose a grave threat to international peace and security. A split emerged, with the United Kingdom and the United States believing the threat to be real and continuing, sufficient to warrant military action in response to Iraq's determined policy to obstruct, restrict, and finally to refuse to allow weapons inspections to continue. France and Russia, on the other hand, pushed for a relaxation of the sanctions regime, which was causing great suffering among the Iraqi people and opposed the use of force to punish the Iraqi regime when a crisis was reached in 1997 and 1998. By the end of 1998, despite an unauthorised punitive bombing raid by the United Kingdom and the United States (Operation Desert Fox), Iraq succeeded in expelling UN weapons inspectors from its territory and gaining a significant relaxation of economic sanctions, a state of affairs which continued until 2002.

### The US Push for Iraqi Disarmament

The Bush Administration indicated its intention to put Iraq back on the agenda internationally in January 2002 with the deployment of approximately eighty-six thousand troops, military aircraft, and warships to Kuwait and the Persian Gulf. Whilst at the start of his administration, President Bush took an anti-interventionist line, the terrorist attacks of September 11, 2001 on the Twin Towers and the Pentagon, convinced the administration that the United States could not afford to be disengaged with the world. Whilst al-Qaeda was clearly America's most immediate threat, the possibility that Saddam Hussein's Iraq could join forces with fundamentalist Islamic terrorist groups was thought to be an extremely dangerous prospect that required preventive action.

In his January 29, 2002, State of the Union Address to Congress, President Bush declared Iraq, Iran, and North Korea as members of the "axis of evil" and threatened preventive action against them. During the next few months, in a series of speeches and interviews, the president explained why Iraq was a threat like no other and how September 11 had demonstrated a more urgent need to confront it. In September 2002, President Bush made his case to the UN General Assembly that Iraq continued to pose a serious danger to international peace and security, detailing evidence of Saddam Hussein's aggression, his attempts to acquire and develop weapons of mass

destruction, his use of chemical weapons against segments of the Iraqi people, his defiance of the UN itself, and finally his support for terrorism.

On November 8, 2002, on the initiative of the United States and the United Kingdom, the UN Security Council unanimously passed Resolution 1441, which proclaimed Iraq to be in “material breach” of its cease-fire obligations under Resolution 678 of 1990; offered Iraq “a final opportunity to comply with its disarmament obligations”; demanded Iraq prove that it no longer possessed weapons of mass destruction; provided for weapons inspections to resume by the UN Monitoring and Verification Commission (UNMOVIC) and the IAEA; provided that it cooperate fully with the inspectors; required the UN Security Council to convene immediately if Iraq failed to comply fully; and warned of “serious consequences” should it not do so. All permanent members reiterated that the resolution did not automatically authorise the use of force should Iraq be found to have breached its obligations. However, in its post-vote statement, the United States made clear its intentions to act alone if necessary.

On November 25, 2002, the inspection teams began their difficult task. On December 7, Iraq delivered a large number of documents to the UN as proof that it held no weapons of mass destruction (WMD). The United States analysed the documents and announced that they contained no new information than was already known through previous inspections. On December 19, 2002, President Bush declared Iraq to be in “material breach” of Resolution 1441. Whilst the United States did not believe that a further resolution was necessary to support military action, Tony Blair’s labour government was coming under direct popular pressure to return to the UN for further authorisation.

On March 7, the head of the UNMOVIC inspection team, Hans Blix, stated that the Iraqis were cooperating more fully with UNMOVIC but not to the point of full disclosure as required under Resolution 1441. Whilst the UN Security Council was in agreement that Iraq needed to be disarmed, Russia, Germany, and France argued that the inspectors should be given more time. In justifying the planned use of force against Iraq, the United States and the United Kingdom stated that military action was authorised by the UN Security Council through a revived authority to use force under resolution 678, the resolution that authorised the use of force against Iraq in the 1991 Persian Gulf War. Under this argument, Iraq’s repeated failure to prove it no longer had WMD or missile delivery capability represented a material breach of its cease-fire obligations under Resolution 687. Resolution 1441 reaffirmed that

Iraq was in material breach of its obligations under Resolution 687 and gave it one last chance to comply. With its failure to do so, the basis of the cease-fire was removed, which revived authority to use force under Resolution 678, making a further resolution unnecessary.

This legal argument was largely not accepted by a number of other members of the UN Security Council. Within Europe, a rough split between old and new Europe emerged, with France and Germany opposed to military action and with newer members such as Spain, Poland, Hungary, Bulgaria, and Romania in support of military action. Large antiwar protests were held in France, Germany, and even in the United Kingdom, where it is estimated that one million people took to the streets. In the open UN Security Council debate on Iraq held on March 26–27, 2003, the broad majority of state representatives who spoke (sixty-eight in total) emphasised that the war was a violation of international law and the UN Charter and was thus found to be illegitimate both in terms of its goals as well as the mode of its prosecution. The lack of support for military action was also evidenced by the small number of states that took an active role with the United States, United Kingdom, and Australia.

## Operation Iraqi Freedom

On March 20, 2003, coalition troops launched Operation Iraqi Freedom with US and UK forces invading Iraq from positions in Kuwait. Within two days, combined forces had taken control of the Rumaila oil fields, the second richest oil field in Iraq (located in Southern Iraq), with little resistance. On March 22, the main bulk of US forces moved north, with a mixture of US and British forces moving up the Fao peninsula and taking the port of Umm Qasr and the Iraqi naval base of Zubayr. On March 23, the forces split, with British forces laying siege to the Shi’ite city of Basra. A full-scale assault was launched on April 6, with British troops taking control of the city the same day and having suffered few casualties. In the northern regions, a coalition of Kurdish *peshmerga* fighters, a coalition of Special Forces, and conventional US troops easily took control of the countryside and major northern cities.

The US forces began their advance on Baghdad with the First Marine Expeditionary Force (MEF) advancing along major roads via Jalibah, Nasiriyah, and Kut before heading to Baghdad from the southeast. A second force, the Third Infantry Division, traveled up the Euphrates valley over the desert

before swinging back onto main roads for an advance on Baghdad via Karbala from the southwest. US forces met strong resistance in Nasiriyah from Iraqi *fedayeen fighters*, a mixture of Ba'ath Party militias and Muslim extremists from other Arab countries, but took control of the city by the end of March. Separate coalition forces assaulted and took control of Najaf on April 1 and Samawah on April 4, sites on-route to Baghdad. Further north, the Iraqi Republican Guard put up fierce fighting to defend the city of Hillah, being defeated after eight days on April 10. Up to this point, the US forces had achieved a speed of advance never seen before with the loss of little equipment and few soldiers. Unexpectedly, the invasion had met little strong resistance, with most regular soldiers deserting their positions.

The final objective was the assault on Baghdad, where a fierce defence by Iraq's elite Republican Guard divisions was expected. On April 3, after two days of heavy fighting, US troops took control of Karbala and secured the necessary bridge crossings to allow them into Baghdad. After overcoming attacks by a mix of *fedayeen fighters*, the Republican Guard, and regular army troops, US troops gained control on April 5 of the Baghdad (Saddam) International Airport, an objective of strong logistical and psychological value. The attack then pressed on toward central Baghdad through the southern suburbs, with US forces taking control of the "regime district" of ministries and residential palaces by April 7. From the southeast, marines crossed the Diyala River into Baghdad on April 7–8 and succeeded in securing important targets, such as the Atomic Energy Commission, the Ministry of Defence, *fedayeen* headquarters, and one presidential palace with little difficulty. On April 9, the marines reached Firdos (Paradise) Square, and here they famously assisted a group of Iraqis in pulling down a statue of Saddam Hussein, an image which became symbolic of the fall of the regime.

## Occupation and Reconstruction

The defeat of Saddam Hussein's regime was achieved with a surprisingly low level of coalition fatalities—122 US and 33 British soldiers, and some were killed by accident or by "friendly fire." It has been harder to estimate the number of casualties on the Iraqi side, but with the desertion of most conscripts and the avoidance of heavy combat by the Republican Guard, the most serious fighting and death affected the *fedayeen*, Saddam loyalists, supporters of the Ba'ath Party, as well as foreign Islamic fighters from Syria, Algeria, and other Muslim countries.

Whilst the coalition's victory over the regime proved to have been relatively easy, the reconstruction of Iraq as a multiethnic democratic state has proved far more difficult and complex. Internationally, the illegitimacy with which military action was viewed has led few states to offer to substantially share the financial and military costs of occupation and reconstruction, despite UN endorsement of a temporary occupation and the setting up of a peace-keeping force. Domestically, the failure of weapons inspectors to find WMD stockpiles in Iraq has led to damaging political inquiries in the United States, United Kingdom, and Australia about the use of intelligence prior to the war. Within Iraq, the United States has been unable to shift its image as a foreign occupier. Throughout 2003 and 2004, an insurgency against the occupying forces has gathered intensity that has hindered the ability of US forces and interim Iraqi governments from maintaining security, a prerequisite for political and physical reconstruction. Insurgent groups have ranged from ex-Saddam militiamen and Ba'ath Party members, foreign terrorist organisations including al-Qaeda (in the Sunni areas), and followers of the radical Shi'ite cleric, Moqtadr al-Sadr in the South. Since the occupation, terrorist acts have occurred with regularity, targeting individuals and groups seen to be assisting the United States to restore order, including the occupying forces themselves, new army and police recruits, interim Iraqi government leaders, the United Nations, and foreign workers, and sabotaging oil pipelines and essential services has also occurred with regularity. With nationwide elections held in for January 2005, it remains to be seen whether the United States's nation-building experiment can succeed in replacing Saddam Hussein's dictatorial regime with a stable, multiethnic democracy.

## PERU

Peru is a large country (1,285,216 square kilometers) located on the west central part of South America, bordered by Ecuador and Colombia in the north, Brazil in the east, and Bolivia and Chile in the south. Its long coastal area, on the west, is on the Pacific Ocean. Peru's population is over 26.8 million with an estimated rate of annual population growth of 1.48%. Close to seven million live in the capital, Lima, located on the coast; the port of entry, however, is Callao. Three main regions with different climatic conditions can be found in Peru: the semidesert coastal plain; the Andes, also called Andean highlands, which run north to south; and the Amazon jungle in the east with its tropical rainforests.

In this ethnically diverse country, more than 45% of the population identifies as Indigenous (Quechua, Aymara, Ashaninka, and others), 37% as Mestizo (mixed white/Native American blood), 15% as White (of European descent), and the rest as Black, Asian, or other minorities. If religiously speaking, the country is still predominantly Catholic (90% of the population); both Spanish and Quechua are official languages, with other indigenous languages such as Aymara, Campa, and Aguaruno also being used in some regions. Ethnicity is still, unfortunately, a high predictor of socioeconomic status, with indigenous Peruvians forming the majority of the poor in Peru.

## Historical Background

The Inca Empire occupied an important part of what is now contemporary Peru at the time when the Spanish conquered the territory in the 1500s. After three centuries of colonial rule, Peru became an independent nation in 1824 after the Battle of Ayacucho was won over Spanish troops. A constitutional republic since 1860, Peru's postcolonial economy was

structured early on around large agroindustrial plantations in the coastal area, some mining enclaves in the highlands, and survival agriculture in most of the country. Sugar, cotton, fish, and fish products as well as silver, gold, copper, zinc, and petroleum have historically been the main country exports. In the twenty-first century, coffee and other food crops have also joined the list of primary exports, while sugar has declined. The coca leaf is one of Peru's most important export crops although mostly produced and sold illegally for drug trafficking.

From a "Republican Aristocracy" in the early part of the twentieth century, where a limited democratic system ensured the domination of the Peruvian oligarchy and the continuing exclusion of the majority of the population, the country entered into a phase of mass-based party politics through the formation of the *Alianza Popular Revolucionaria Americana* party (American Revolutionary Popular Alliance, or the APRA) in 1924. The latter, seeking the inclusion of lower and middle classes in national politics, was a central political actor throughout the rest of the century but only won state power in 1985, through the election of Alan García as President. In the meantime, the often-banned APRA challenged a closed political system that only held free and fair democratic elections with universal suffrage in 1980. By then, however, the APRA had already been legalized for some decades and had gradually moved away from its original platform, choosing to ally with elite groups at different points in time. A number of left-wing parties emerging in the 1960s replaced the APRA as the representative of labour and popular classes.

The military regime, which took power in 1968 through a *coup d'état*, was the breaking point of the old oligarchic order that had remained deeply entrenched in politics and in the economy even if importantly challenged since the mid-1920s. President General Juan Velasco Alvarado implemented a number of key social and economic reforms and led the first serious attempt at building a state-led model of development supported by new state institutions. Mounting social protest and rising economic difficulties, however, led the military to return power to civilians in 1980. This coincided with the launching of an armed insurrection by a Maoist guerrilla organization, *Sendero Luminoso* (Shining Path), which managed to sustain a war against state security forces until the early 1990s. The conflict caused a massive death toll, with close to seventy thousand deaths or forced disappearances and numerous human rights violations committed by the state as well as by insurgents.

Alberto Fujimori, a political unknown who won the 1990 presidential elections, completely reshaped

the Peruvian political, economic, and social landscape during his ten-year rule. After applying one of the harshest structural adjustment programs of Latin America, Fujimori perpetrated a “self-coup” in 1992 in alliance with the military. Following his shutting down the Congress and the Judiciary, Fujimori reconfigured entirely the country’s institutions. A new Constitution was drafted in 1993 where powers were further concentrated in the hands of the President and that allowed him to run for a second term; the bicameral Congress was transformed into a single house, and many social and economic rights protected by the 1979 Constitution were abolished to facilitate the implementation of Fujimori’s trade liberalization agenda.

New elections were held in 1995 and won easily by Fujimori, who had managed to redress the economy and put the leader of the Shining Path under arrest. The second term of Fujimori, however, was marked by increasing encroachments on civil liberties, executive control over the Judiciary and Electoral Bodies, and the President’s intent on running for a third term. After intense opposition from civil society and stronger scrutiny by the international community, the 2000 elections were decisive in revealing the Fujimori regime’s corrupt and repressive nature. Soon after these highly questioned elections, the regime broke down, and Fujimori went into self-exile in Japan, where he was granted protection due to his Japanese citizenship. Vladimiro Montesinos, the Head of Intelligence Services who is said to have been the real power figure in the regime, was arrested and put in jail.

After a transitional regime led by Valentín Paniagua (2000–2001), Alejandro Toledo was elected President in 2001. Toledo, an economist trained in the United States, was the first President of indigenous origins to assume power in Peru. His party, *Perú Posible* (Possible Peru), faced important difficulties in governing the country due in part to the many different political tendencies of its leading members. Low presidential popularity and numerous accusations of corruption dominated Toledo’s term.

### **Economic Situation**

Peru has been slowly recovering since the early 1990s from the worst economic crisis of its history, which built up in the 1970s and was at its peak in 1990, with hyperinflation ranging as high as 7,482%. From a negative gross domestic product (GDP) annual growth rate of –7% in 1990, the country’s economy was growing at a rate of 6.39% in 1995, before coming

down again to 1.33% in 2000 with a slight increase to 2.44% in 2003. Its GDP per capita was 5,010 purchasing power parity (PPP) US dollars in 2002.

The more stable macroeconomic framework since the 1990s has not been successful in addressing Peru’s socioeconomic ills from the point of view of sustainable employment and social development. Informal sector employment has continued to grow, from 52.7% of the economically active population in metropolitan Lima in 1991 to 59.2% in 2000. Meanwhile, the unemployment rate was 7.4% of the total labour force in 2000. The share of national income of the lowest 20% population was 2.9%, while the share of the highest 20% was 53.2% in 2000. It is estimated that 54% of the population is poor, while 14.8% is extremely poor, and 20% of the population still does not have access to an improved water source. Life expectancy at birth was 69.7 years in 2002. Only 59% of births are attended by skilled attendants (compared to the average of 83% in Latin America and the Caribbean), and 410 Peruvian women die for every 100,000 live births (compared to 190 on average in the region). An estimated 85% of the population above the age of fifteen was said to be literate, with around 95% of young females and 94% of young males attending primary schools.

### **Peru’s Development in the Post-World War II Period**

In comparison to the other main South American countries, Peru can be described as a late “industrializer,” with the predominance of the primary-export sector being explained as both a function of the diversity of natural resource exports and a greater penetration of US foreign investment from the late nineteenth century up to the late 1960s.

From the years of post-World War I to the end of the 1960s, with the brief exception of a failed attempt at adopting import-substitution policies during the government of President Bustamante in the mid-1940s, state intervention was confined to investing in infrastructure and promoting foreign investment and loans to support the primary-export sector. After a decade of growth and economic expansion in the 1950s, the 1960s were dominated by the need to undertake major structural changes to accommodate a growing middle class, a vibrant labour movement, and increasing mobilization by peasants seeking access to land and credit. An important process of migration to cities had also created a new sector among Peru’s major cities, mainly Lima, calling for

state intervention at the local level to organize the new settlements.

From the 1960s onward, a new model of state-led development took hold, with the promotion of import-substituting industrialization being implemented in response to the exhaustion of the export-based model. This late shift to an inward-looking industrialization strategy in the 1960s was a daunting task in light of the fact that Peru had remained one of the more open Latin American economies for foreign investment up to then. Moreover, state institutions had no previous experience of development planning and there was no central financial institution managing the economy. Only in 1963 was the *Banco de la Nación* (National Bank) created as a revenue collector and treasurer for the state.

The process of building state institutions that would manage the economy began under the government of Fernando Belaúnde Terry (1963–1968), head of the center-right party *Acción Popular* (Popular Action), who installed a set of measures seeking to bring Peru more in line with the Latin American industrialization level. Yet, Belaúnde's policies remained at the level of developing the first stage of import-substituting industrialization, that of consumer-durable industries. State policy making in general was still very weak as a result of extensive patronage and corruption within the bureaucracy.

More fundamental macroeconomic change and institutional reform was brought about by the reformist military regime in 1968–1980. Long overdue reforms that involved the state in major redistributing schemes were implemented for the first time in Peruvian history. This included one of the most generous land reforms of Latin America, with land redistribution as well as the formation of agricultural cooperatives. In total, about 30% of all peasants and agrarian producers were allocated 9,672,017 hectares of land out of a total of 23 million. Even if the land reform can be credited for having ended the domination of the landed oligarchy, the overall policy framework favoring cheap food prices for urban consumption was not positive for agricultural development.

Other important reforms included the nationalization of petroleum and mining industries, worker participation in industrial ownership, and the creation of numerous state agencies and programs seeking to foster greater participation and reduce social inequalities. On the side of civil society, that period is also recalled as one of extensive popular mobilizations with the rise of new left-wing parties, increased labour mobilization, and the formation of local community organizations, some of which were originally founded by the state.

On the side of economic policy, the same fundamental defects that had marked Belaúnde's first

government were reproduced under the military regime: an over-reliance on external borrowing and a lack of adequate fiscal and tax policies to ensure that expanding state spending could be financed on a sustainable level by domestic resources. The second half of the military regime was marked by its more conservative orientations with the replacement of General Velasco by General Francisco Morales Bermúdez in 1975. A growing popular and labour unrest was met with repression, and the military was soon forced to proceed to a transition to democratic civilian rule, which was initiated in 1978. The 1980 democratic elections saw the return of Fernando Belaúnde Terry as the new president.

The “lost decade” of the 1980s was marked by deep economic crisis and rising political violence, and ended with a debt crisis, hyperinflation, and political chaos. As an indication of the transformation of Peruvians' living conditions, in 1984 the minimum wage in Peru was 46% of what people had received ten years earlier. By 1990, real incomes had fallen to 20% of the levels achieved ten years earlier. These losses were accompanied by a dramatic drop of state social spending, which only started to resume in the early 1990s, together with the shift towards a new export-based model of development. These were founded on a new openness to foreign investment and compliance with international financial institutions' macroeconomic policy prescriptions.

## PETRODOLLARS

Petrodollars commonly refer to US dollars earned from the sale of oil. The term originates from the worldwide custom of quoting oil prices and clearing oil transactions in US dollars. Therefore, the term “petrodollars” can also be used synonymously with the oil revenues of members of the oil producers’ cartel Organization of Petroleum Exporting Countries (OPEC) and non-OPEC oil producers’ countries.

### Petrodollars Surpluses

In October 1973, following the fourth Arab-Israeli conflict, the Organization of Arab Petroleum Exporting Countries (OAPEC) declared an oil embargo against the United States and the Netherlands—countries judged too friendly with Israel. The embargo caused severe energy shortages during the winter of 1973–1974 and a sudden and sharp rise in oil prices. At the same time, OPEC, which includes OAPEC plus Algeria, Indonesia, Ecuador, and Venezuela, sharply increased the price of crude oil. OPEC’s decision was dictated by economic considerations. During the early 1970s, the value of petrodollars had fallen because of the devaluation and depreciation of the US dollar. Oil prices had not kept up with other commodities’ prices. From 1960 to 1973, the price of oil had increased a mere 25%, much less than prices of other commodities. OPEC was also convinced that underpricing had caused oil to be wasted. To protect resources from depletion, price increases and production cuts were necessary.

From October 1973 to January 1974, the price of crude oil shot up 300%. The sudden surge in petroleum prices generated trade imbalances between oil importing and exporting countries. Because of the sudden and exceptional higher prices, oil-importing countries had no time to adjust to the new prices and accumulated huge trade deficits, and import expenditure greatly outstripped export revenues. Oil exporters faced the opposite phenomenon: oil export

revenues soared while imports remained unchanged; this phenomenon generated vast current accounts surpluses. The additional petrodollars produced by the 1973–1974 price hike became to be known as petrodollar surpluses.

### Petrodollars Recycling

While oil importers faced a cash shortage because they accumulated huge import bills that they could not honor, oil-exporting countries had to deal with cash surpluses, as they were unable to spend all the extra petrodollars generated by the price rise. The best solution to this imbalance would have been for oil-producing countries to increase their imports from oil-importing countries, mostly industrialized Western countries. However, this was unfeasible because several OPEC members had small populations, and many were still at early stages of industrialization. They simply could not import enough products to keep from accumulating enormous petrodollars surpluses.

The most serious consequence of these imbalances was the short- to long-term impact on the world economy. If petrodollars surpluses were not spent or loaned to someone else to be spent, there would be a serious shortage of liquidity, and the world economy would contract. It was apparent that while oil exporters needed investment outlets for their petrodollars, oil importers needed to borrow money to keep importing oil. The economic mechanisms used to match these two monetary flows became known as petrodollars recycling.

“Petrodollars recycling” can be defined as the economic process through which the excessive dollar inflows (surpluses) of the current account of the balance of payments of oil-producing countries are reversed with dollar outflows from the capital account. These dollar outflows are used to finance the current account deficits of oil-importing countries. The mechanism is described as the following. OPEC countries deposited their petrodollars surpluses into a foreign Western bank. The bank then loaned the money to governments in need of financing their balance of payments deficits. These countries used the borrowed money to buy more oil and other imports, keeping the economy flowing.

Petrodollars recycling also took place through the International Money Fund via an *ad hoc* lending mechanism: the Oil Facility. The fund was created using money from oil-exporting countries and other lenders and was used by countries with balance of payments problems caused by the oil price rise.

## Petrodollars Recycling Problems

Recycling petrodollars through the banking system alleviated the contraction of world economy. Large sections of petrodollars surpluses were invested in the stock market in industrialized countries and therefore sustained Western economies. However, the recycling created vast repayment problems, especially in developing countries, which kept accumulating vast debts to meet their energy imports demand. From 1973 to 1977, the foreign debt of one hundred developing countries (excluding oil exporting countries) increased 150%.

From the mid-1970s, higher oil prices led to mounting inflationary pressure placed on debtor countries, while soaring debts inevitably slowed down growth. By 1979, this unprecedented combination had a new name: “stagflation.”

## New Patterns of Petrodollars Recycling

The 2004 oil price increases have recreated a sudden surge in dollars earned by oil-producing countries. Since the first oil crisis, oil-importing countries have successfully introduced energy-saving schemes to reduce the impact of sudden oil price increases, yet the problem of petrodollars surpluses persists, especially in Arab oil-exporting countries. New patterns of recycling have emerged, however. Petrodollars surpluses are not any longer exclusively invested in the West or used to fund current account deficits of oil-importing countries but are invested in the Arab world. Gulf investors are pouring additional liquidity generated by higher oil prices into equities and stocks of Arab public companies. By the end of 2005, it is estimated that \$9 billion will be raised through several public offerings in the six Gulf Cooperation Council states (Saudi Arabia, Kuwait, Bahrain, Oman, Qatar, and the United Arab Emirates).

Record corporate performance of Arab stocks coupled with psychological fear of investing abroad are at the root of the new phenomenon. Post-September 11 fears persist, and Persian Gulf investors now prefer to invest at home rather than in the United States or other Western countries.

## Petrocurrencies

The depreciation of the dollar also contributes to the reluctance of several oil-producing countries to recycle their petrodollars in dollar-denominated

investment. In addition, the weakening of the dollar is reducing oil revenues net revenues and increasing the net cost of European imports for oil-exporting countries. At the same time, the strengthening of the euro is appealing to commodity traders who see the new common European currency as the future reserve currency. Commodity trading to and from Europe has increasingly been conducted in euros and not dollars. Against this background, oil-exporting countries that trade with European countries may decide to denominate their oil sales in euros, ending the custom of quoting and trading oil in US dollars and paving the way to the advent of petrocurrencies, that is, more than one currency to clear oil transactions.

## PHILIPPINES

The Republic of the Philippines, an archipelago situated between the Philippine Sea and the South China Sea, east of Vietnam, comprises approximately 7,100 islands; Luzon, Mindanao, and Visayas are the largest islands. With a total landmass of 115,831 square miles (300,000 square kilometers), the republic is roughly the size of Arizona. The terrain is largely mountainous, creating narrow coastal plains and interior valleys and plains. The climate is tropical with two distinct seasons: a northeast monsoon season (December to February) and a southwest monsoon season (May to October). Annual rainfall varies significantly by region. Mountainous regions receive approximately 195 inches of rain annually, whereas the more sheltered inland regions receive as little as 39 inches. The population is estimated at 76.5 million with an estimated growth rate of 2.36% annually.

The Negritos were the first peoples to inhabit the Philippines. They are believed to have come to the islands thirty thousand years ago from Borneo and

Sumatra, utilizing then-existing land bridges. Subsequently, people of Malay ancestry migrated to the islands from the South, utilizing then-existing land bridges and boats called “baranguays.” The Malays settled in scattered communities, also known as “baranguays.” Baranguays were ruled by local chieftains, called “datus.” In the ninth century, the Chinese merchants and traders arrived. In the fourteenth century, Arabs migrated from Indonesia, thus introducing Islam in the South and to a lesser extent to Luzon in the North. The Malays were the dominant group until the arrival of the Spanish in the sixteenth century.

The first European-recorded sighting of the Philippines occurred on March 16, 1521, during Ferdinand Magellan’s circumnavigation of the globe. He landed on the island of Cebu and claimed it for King Charles I of Spain. Eager to display his supremacy, Magellan initiated the Battle of Mactan in which he was struck and killed by a poison arrow. The islands were given their present name in honor of Philip II of Spain, who ruled from 1556 to 1598.

Filipinos were restive under Spanish rule, and there were numerous uprisings. The revolutionary leader, Emilio Aguinaldo, who proclaimed Philippine independence on June 12, 1898, headed the most important uprising. Aguinaldo was able to unify historically disparate groups into one national voice. The revolution against Spain was increasingly successful by the time the Americans arrived. Their arrival, however, culminated in the defeat of Spain. Soon thereafter, Spain ceded the islands to the United States pursuant to the terms of the Treaty of Paris (December 10, 1898).

On July 4, 1946, the Philippine Islands became the independent Republic of the Philippines. In 1962, the official Independence Day was changed to June 12 to commemorate Aguinaldo’s original declaration of independence from Spain in 1898.

Ramon Magsaysay was the first post-independence president of the Philippines. His first success was the suppression of the communist-inspired Huk Rebellion (1945–1953) that had complicated recovery efforts. Magsaysay died in an airplane crash in March of 1957. His vice president, Carlos P. Garcia, who was elected to office shortly thereafter, succeeded him. Garcia was instrumental in negotiating the relinquishment of large areas of land initially reserved for American military forces and that were no longer needed. As a result, the United States turned over to the Philippines the town of Olongapo on Subic Bay, which was previously under the jurisdiction of the United States Navy. Diosdado Macapagal (1961–1965) was elected president in 1961. He sought to expand Philippine ties with its neighbors. In 1963, he convened a summit meeting in Manila consisting of Malaysia,

Indonesia, and the Philippines (MAPHILINDO). The goal of MAPHILINDO was to bring together the Malay peoples. However, continuing disputes between Malaysia and Indonesia and the Philippines’s controversial claim to Subah, a territory in the north-eastern Borneo that had become a Malaysian state in 1961, ended the summit. In the election of 1965, Ferdinand E. Marcos (1917–1990) defeated Macapagal. Marcos was in office for the next two decades, winning the presidential election again in 1969. His first term in office was ambitious and marked by numerous public works projects designed to improve the Filipino quality of life. He also lobbied vigorously for US military and economic aid. His second term in office was less idyllic. Economic growth slowed, and quality of living deteriorated, especially in the urban areas. The Communist Party, formerly the Huks, reestablished a visible communist presence. Crime rates and random violence were spiraling out of control. On August 21, 1971, nine people were killed, and grenade explosions wounded one hundred during a Liberal Party rally. Marcos blamed leftist guerillas and suspended *habeas corpus*. However, evidence eventually surfaced that implicated the administration as having some involvement in the attacks. Marcos declared martial law on September 21, 1972.

The martial law period persisted from 1972 to 1981. Under Marcos’s command, the military arrested opposition figures, including Benigno Aquino, journalists, student and labor activists, and criminal elements. Approximately thirty thousand people were incarcerated at various military compounds run by the army and the Philippine Constabulary. Weapons were confiscated, and individuals connected with opposition politicians and other figures were broken up. Newspapers were shut down, and the mass media were severely restricted. Moreover, Marcos closed the Philippine Congress and assumed its legislative responsibilities. During the martial law period, Marcos issued hundreds of presidential decrees; few of these were ever published. On January 17, 1981, Marcos issued the Proclamation 2045, which formally ended the period of martial law. While some controls were loosened, Marcos’s New Society was a liberalized version of the crony capitalism that defined his administration.

One of the first arrested was long-time Marcos opposition figure, Benigno Aquino. Aquino was found guilty of subversion and sentenced to death by a military court in November 1977. While in prison, he led the *Lakas Ng Bayan* (LABAN) or “Strength of the Nation” Party campaign to win seats in the 1978 legislative election. Despite being unsuccessful at gaining seats, he managed to get 40% of the metro Manila vote. In 1980, Aquino was allowed to travel to the

United States for medical treatment. Accompanied by his wife, he remained in the United States for three years. Aquino feared the Philippines were headed toward civil war. Despite warning from Imelda Marcos about the dangers of returning to the Philippines, Aquino's love of country was more powerful. On August 23, 1983, Aquino was shot in the head when he was escorted off an airplane at Manila International Airport. The soldiers of the Aviation Security Command (ASC) shot him. The government claimed he was killed by a lone gunman named Rolando Galman, who was conveniently killed by the ASC immediately after he shot Aquino. Finally, on September 28, 1990, the courts convicted General Luther Custodio and fifteen members of the ASC of murdering Aquino and Galman.

Aquino's assassination would be the downfall of Marcos. His public credibility and support were waning, as was support from the United States. The United States was becoming increasingly uncomfortable with the Marcos regime. Finally, on February 22, Enrile and General Fidel Ramos, commander of the Philippine Constabulary, issued a joint statement demanding Marcos's resignation. They established their rebel headquarters inside Camp Aguinaldo and the adjoining Camp Crame in Metro Manila, which was guarded by several hundred troops. In response, Marcos ordered units to suppress the uprising, but Cardinal Sin, broadcasting over the Catholic-run Radio Veritas (which became the voice of the revolution), appealed to the people to bring food and supplies for the rebels and to use nonviolence to block pro-Marcos troops. On the evening of February 25, 1986, Marcos was forced from office in a bloodless revolution.

Corazon Aquino became the seventh president of the Philippines. Aquino's presidency was armed with a mandate to undertake a new direction in the country's economic policy. Her initial cabinet contained diverse individuals from across the political spectrum. Over time, however, the cabinet became increasingly homogeneous, particularly with respect to the economic perspective, reflecting the strong influence of the powerful business community and international creditors. The businesspeople that directed the Central Bank and headed the departments of finance and trade and industry became the dominating voices in the economic decision-making process. Foreign policy also reflected this power relationship, focusing on attracting more foreign loans, aid, trade, investment, and tourists.

Aquino's immediate concern was to get the economy moving, and a turnaround was achieved in 1986. Economic growth was 1.9%. It was minimal but positive. For the next two years, growth was at 5.9% and

6.7%. In 1986 and 1987, consumption led the growth process, but then investment began to increase. In 1985, industrial growth was at 40%. By mid-1988, however, industries were working at near full capacity. Investment in durable goods grew almost 30% in both 1988 and 1989. Moreover, the international community was supportive. Foreign investment did not respond immediately after Aquino took office. In 1987, however, it began to pick up. The economy also was helped by foreign aid. The 1989 and 1991 meetings of the Multilateral Aid Initiative, also known as the Philippine Assistance Plan, a multinational initiative to provide assistance to the Philippines, pledged a total of US\$6.7 billion. The Aquino administration was successful at restoring respect of civil liberties and revitalizing democratic institutions. However, many viewed the administration as weak and fractious. During Aquino's tenure, there were numerous coup attempts by disaffected members of the Philippine military. This affected the overall return to full political stability.

Fidel Ramos succeeded Corazon Aquino as president of the Philippines on June 30, 1992. He won a 23.6% plurality in the May 11, 1992, general election. Ramos' victory was based on his platform for stability as well as his commitment to the Aquino administration policies. Ramos was instrumental in reconciling with his opponents, most notably the Communists. He legalized the Communist Party and created the National Unification Commission, which laid the groundwork for peaceful talks with communist insurgents, Muslim separatists, and military rebels.

Joseph Estrada, a well-known film star, was elected in May of 1998. He was elected with overwhelming popular support based on his promises to alleviate the suffering of the poor. Despite his promises, his administration was among the most corrupt. During his tenure in office, Estrada illegally amassed an excess of \$80 million, mostly from bribes from illegal gambling operations and skimming taxes. He was removed from office on January 20, 2001. Estrada was succeeded by his Vice President, Gloria Macapagal-Arroyo.

The Philippine economy has progressed slowly over time. Prior to the 1970s, agricultural and mineral products were the primary export. The agricultural sector employed approximately 60% of the workforce. In the 1970s, however, manufactured commodities (garment and electronic products) began to take increasingly larger shares of the export market. By the mid-1980s, manufactured commodities equaled 75% of the total value of all exports. The economy has evolved, such that by 1990 agriculture only employed 45% of the workforce, while the manufacturing

sector employed 12%. The service sector, which employed 25% of the workforce in 1960, became the residual employer and by the late 1980s employed 40% of the workforce. In 2002, the services sector employed 47% of the workforce; agriculture 37%; and industry 16%. Per capita gross domestic product (GDP) was \$962 in 2002, and 52% of the population lived at or below the poverty line. In 2002, the infant mortality rate was 25.7 per 1000. The life expectancy was 66.9 years for males and 72.2 years for females.

The Philippine economy suffers from poor infrastructure. While there is a vibrant industrial production sector of the economy (for products of food, beverages, tobacco, and pharmaceuticals), it is concentrated primarily in the urban areas. Poor transportation and communications infrastructure hinder any significant linkages to the provinces. The Philippines are rich in agricultural potential as well. However, inadequate infrastructure, lack of financing, and government policies have hindered growth. Moreover, the Philippines are endowed with vast mineral and thermal energy resources. High production costs, low metal prices, and a lack of infrastructure investment have caused the industry to decline in growth.

Despite a slow maturing economy and relatively high unemployment rates, the Philippines have a literacy rate of 92%. One of the most serious problems in the Philippines in the 1980s and early 1990s concerned the large number of students who completed college but then could not find a job. If properly utilized, these new graduates could spur economic development. However, when left idle or forced to take jobs beneath their qualifications, this group could be a major source of discontent.

### PINOCHET UGARTE, AUGUSTO

On September 11, 1973, the Chilean armed forces overthrew the democratically elected Marxist president Salvador Allende Gossens in a bloody coup *d'état* that ended Allende's life. The coup signaled the end of Chile's democratic tradition and the beginning of General Augusto Pinochet Ugarte's seventeen-year authoritarian rule.

General Pinochet (b. 1915) is probably the most controversial figure in Chilean political history. His enemies have portrayed him as a repressive dictator and violator of human rights, responsible for the murders of his political opponents. His advocates, on the other hand, have depicted him as the crusader who rescued Chile from communism and the visionary who paved the way for Chile's economic recovery.

The son of middle class parents, Augusto Pinochet Ugarte was born on November 25, 1915, in the port city of Valparaíso and entered Chile's Army Academy in 1933. After his graduation in 1937, he rose through the ranks, and on August 23, 1973, President Allende appointed him as Army Commander.

Since being elected president by the Chilean Congress—no candidate received a majority of the vote in the September 1970 elections—Allende began a radical program for Chilean development consisting of land reform, nationalization of the banking and copper mining industries, and social welfare programs. Allende's program ran into difficulty as copper prices plummeted in the world market, inflation skyrocketed, import prices rose, and food shortages were common. Lacking a clear majority in Congress, Allende angered the Christian Democratic Party majority in the Chilean Congress when he threatened to replace the said body with a Popular Assembly. In response, the Christian Democrats sponsored a resolution in the Chamber of Deputies on August 22, 1973, calling for the military to establish law and order.

An exasperated Allende appointed General Pinochet as Army Commander. Presumed to be apolitical, Pinochet, as Army Chief of Staff, had put down a short-lived coup against Allende carried out by disgruntled military officers on June 29, 1973.

When public discontent against the Allende regime increased, the military decided to act and on September 11, 1973, staged a blood coup that toppled the Allende government. The coup's principal architects were Navy Commander, Admiral José Toribio Merino Castro, and Air Force Commander, General Gustavo Leigh Guzmán. Yet Pinochet, soon emerged as the leader of the military *junta* that was to rule Chile, for he commanded the Chilean armed forces' most numerous and powerful branch.

Pinochet's assumption of power marked the beginning of what he termed as "Authoritarian Democracy." Under this system, Congress was dismissed, the *junta* assumed control of all legislative and executive powers, press censorship was established, and labor union activity was curtailed.

Pinochet's seventeen-year rule was a repressive one. Chileans and foreigners presumed to be leftist sympathizers were arrested, exiled, or physically eliminated. In addition, political activism was banned. When in 1978, for example, fellow *junta* member General Leigh Guzmán declared in a newspaper interview his hopes for the return of democracy, Pinochet dismissed him from the *junta* and replaced him with General Fernando Matthei.

While the Pinochet regime was characterized by political repression, economic liberalization became its trademark. Pinochet's economic plan conducted by the Chicago Boys—disciples of American economist Milton Friedman's supply-side economics theory—consisted of anti-inflationary measures, reduced state spending, privatization of state-owned enterprises, and economic diversification. An example of this economic liberalization was Law 600 that placed no limits on foreign investments and allowed for immediate repatriation of profits. The program brought such positive results that Chile became the most economically sound nation in Latin America.

Pinochet's political philosophy was best revealed in the 1980 Chilean Constitution, parts which remain in effect today. Holding to his firm belief that political factionalism was responsible for Allende's advent to power and that political pluralism was an obstacle to progress, Pinochet's 1980 Constitution granted the executive branch numerous powers while reducing Congress's traditional legislative role. Furthermore, the constitution granted the military an unprecedented role in Chilean politics by denying the president the right to remove military commanders and by granting the military budgetary autonomy.

In terms of international relations, the Pinochet regime was often cited as a frequent violator of human rights by organizations such as the United Nations General Assembly, the Organization of American States, and Amnesty International. Furthermore, relations with the United States deteriorated during Jimmy Carter's presidency because of the latter's insistence on human rights. Trade with the United States, however, grew during the Reagan administration—Reagan, like Pinochet, was a firm believer in supply-side economics—to the point that the United States became Chile's largest trading partner and primary investor.

During Pinochet's regime, a major diplomatic crisis occurred, ironically, with the right-wing Argentine military *junta*. Both nations almost went to war over sovereignty of the Beagle Channel in 1978. Only the mediation of Pope John Paul II prevented war between the two Southern Cone neighbors.

An interesting feature of the 1980 Chilean Constitution was its provision for a plebiscite, whereby voters could choose between the continuance of the governing *junta* for another eight years or a plebiscite that elections be held for a new government. In October 1988, seventeen parties known as the *Concertación* rallied Chilean voters for a 54.7% vote against eight more years of *junta* rule. To his credit, Pinochet respected the plebiscite vote and even chose not to become a presidential candidate in the December 14, 1989, elections, which were won by Christian Democrat Patricio Aylwin, a *Concertación* candidate.

On March 11, 1990, Pinochet handed power to the civilian president. The end of his presidency, however, did not mean an end to his involvement in Chilean politics. Due to a 1980 constitutional provision, he remained Commander of the Armed Forces until 1998, and as a former president, he retained the right to appoint nine of the thirty-eight senators in Congress as well as to remain a senator for life.

In October 1998, while undergoing medical treatment in London, Pinochet was arrested under a warrant issued by the Spanish judge Baltasar Garzón. The judge demanded Pinochet's extradition to Spain on grounds of human rights violations against Spanish citizens in Chile during his regime. After tense negotiations between Chile and Great Britain, the British allowed Pinochet to return to Chile on humanitarian grounds. In March 2000, Pinochet received a warm welcome from the Chilean military, and thousands of his supporters lined the streets from the airport to his home. A few months later, however, Pinochet was ordered to stand trial for human rights violations. In 2003, the Chilean Supreme Court ruled that the aging general was mentally unfit to stand trial.

In May 2004, a Chilean appellate court opened hearings for Pinochet to stand trial for his role in Operation Condor, a plan implemented by Latin American right-wing regimes to eliminate leftist sympathizers during the 1970s and 1980s. While arguments persist regarding his ability to stand trial, there is no doubt that Augusto Pinochet Ugarte has left an indelible mark in Chilean history.

## PLAN COLOMBIA

Plan Colombia was formally unveiled in 1999 and implemented in 2000 by the United States, under the administration of President Bill Clinton, and by the Colombian government, under the administration of President Andrés Pastrana Arango. There is some dispute over Plan Colombia’s authorship and whether it is primarily Colombia’s or Washington’s plan. Over the years, there have been several versions of the plan, and even the English and Spanish texts of the final 1999 document differ. Despite variations in the official rhetoric, in effect the plan’s central goal has been to combat drug trafficking, narcoterrorism, and drug-fueled guerrilla insurgencies in Colombia. It has since developed into an ambitious multiyear foreign aid and antidrug program.

The lengthy 1999 Colombian document, entitled *Plan Colombia: A Plan for Peace, Prosperity, and the Strengthening of the State*, detailed a comprehensive, ten-point strategy to demonstrate Colombia’s commitment to achieving “lasting peace,” to securing extensive international economic assistance to rebuild the country, and to increasing military support to

fight the “war on drugs.” In order of funding priority, however, the plan had several specific targets that it sought to realize over a five-to-six-year period: curb overall drug trafficking; reduce coca cultivation by 50%; restore the Colombian government’s control over its territory; strengthen democracy; promote economic development; protect human rights; and provide humanitarian assistance. The Colombian government, despite the greater resources that were dedicated to the military components of the plan, preferred to emphasize its social and political aspects, especially when seeking contributions from the European Union (EU).

As announced by the Colombian government in September 1999, Plan Colombia optimistically projected an overall budget of \$7.5 billion for antinarcotics control and development assistance over five years. President Pastrana pledged more than half or \$4 billion from Colombian resources, and the remaining \$3.5 billion was to be raised in loans and credits from the United States and the international community, including the EU, Canada, Japan, the International Monetary Fund (IMF), the World Bank, Inter-American Development Bank, and the Andean Development Corporation. Despite three donor’s conferences by 2004, the actual commitments have fallen far short of the amount initially hoped for by the United States’ and Colombian governments.

In June 2000, the US Congress made good on the US pledge and approved a one-time, emergency supplemental \$1.3 billion aid package to Colombia (in addition to funds of more than \$330 million approved earlier). A tiny portion of these funds was meant for counternarcotics programs in the Andean region as well. Most of the funds, however, were earmarked for military and intelligence support in Colombia during the next two years with around a quarter of a billion dollars dedicated to social development programs. This funding package represented the largest military aid to Latin America to date (making Colombia the third highest recipient of US aid worldwide in 2001 and the fourth highest in 2004). Specifically, the military assistance bought fourteen Blackhawk and thirty Huey helicopters and provided advanced training for Colombia’s counter-narcotics battalions, and it paid for stepped-up forcible eradication and extensive aerial glyphosate fumigation of coca leaf and opium poppy crops. At the time, Colombia was supplying 90% of the cocaine that entered the United States, as well as most of the heroin.

Critics of this militarization blamed US influence for shifts in the Plan Colombia’s priorities. Earlier versions of the plan had placed greater emphasis on economic and alternative development and

nonmilitary support for the peace process. And a review of the 1999 plan's ten strategies reveals economic activation and fiscal reorganization at the top of the list and counternarcotics and international drug control strategies listed sixth and last, respectively. Especially by 2001, Plan Colombia also marked a distinct shift away from counternarcotics enforcement to an emphasis on counterinsurgency and anti-terrorism. This redefinition of the enemy was partly a result of the September 11 terrorist attack on the United States, but it was also a consequence of the escalation in terrorist and criminal activities by Colombia's largest Marxist guerrilla group, *Fuerzas Armadas Revolucionarias de Colombia* (Revolutionary Armed Forces of Colombia, FARC). Most of Colombia's coca and poppy crops were being grown in the so-called "liberated" or "demilitarized" zones under the control of Marxist guerrillas, primarily the FARC, but also under the control of the smaller *Ejército de Liberación Nacional* (ELN) or the National Liberation Army.

By 2003, the US State Department described Colombia as "home to three of the four US-designated foreign terrorist organizations" in the hemisphere. Intelligence evidence had been mounting, according to US and Colombian military sources, that the FARC had strengthened or established connections with other terrorist groups from the Irish Republican Army (IRA) to the Islamic fundamentalists such as the Taliban in Afghanistan, Osama bin Laden, and Al Qaeda. Also, after the September 11 attacks, the Colombian Army routinely replaced "narcoguerrillas," their term for the rebel force, with that of "narcoterrorists," and the definition of the threat both in Colombia and in the United States shifted from one of insurgency to one of terrorism. Critics of US policy, however, tended to discount these global terrorist connections and viewed the linkage of drugs and terror as a way to "sell" to the US public and Congress the unprecedented military funding and more aggressive US role in Colombia and the Andes region.

Moreover, the Colombian military was linked to rightist paramilitary forces—the United Self-Defense Forces of Colombia or the AUC—and has been complicit in human rights violations. Human Rights organizations and progressive foreign policy lobbies, such as the Washington Office on Latin America, described the Colombian army as "one of the most abusive in the hemisphere." Critics feared that Plan Colombia, by training and arming thousands of Colombian troops against guerrillas, would further enmesh the United States in Colombia's intractable forty-year civil war and undermine peace initiatives by the Pastrana and (since August 2002) Alvaro Uribe

governments. The Colombian document itself ignores the compromised role of the security forces. It limits the armed conflict to three protagonists: the guerrillas, with roots in an agrarian and Marxist movement; the self-defense groups that want an armed solution to the leftist insurgency; and the majority of Colombians, who have been forcibly displaced and victimized by the violence, kidnapping, and extortion of both groups.

Officially, the US support for Plan Colombia emphasized five components: human rights and judicial reform; expansion of counternarcotics operations; alternative economic development; increased interdiction; and assistance for Colombian National Police. In theory and sometimes in practice, US policy provided for human rights protections in implementing Plan Colombia. Under US law, the Leahy Amendment provided that no aid could be given to any Colombian police or military units involved in gross human rights violations, unless the Secretary of State certified that the Colombian government had taken significant measures to improve human rights. Nevertheless, the critics countered that the aid package was inconsistent and did not do enough to curb military collusion with the paramilitaries. The plan entrenched military control over civil society, and aerial fumigation increased the forcible displacement of the population deeper into the country's jungle. As a result, Colombia has over a million internally displaced persons, one of the largest such populations in the world.

In spring 2001, the incoming administration of President George W. Bush announced a new Andean Regional Initiative that attempted to defuse some of the criticism of Plan Colombia and also to address the plan's spillover effects in neighboring countries. To some extent, the Andean Initiative represented a more regional and balanced approach to counternarcotics control. Funding increased to Peru, Bolivia, and Ecuador, and more than \$730 million was requested for 2002 to support social and economic assistance. These are only supplementary, and Plan Colombia programs and funding, however, have continued.

After five years of implementation, Plan Colombia's achievements are mixed. The plan remains, primarily, a bilateral rather than multilateral approach. The United States provided more than 90% of the military funding and \$4 billion in aid to Colombia during 2000 to 2005, while much of the promised European commitments (even "soft-side," nonmilitary aid) have not materialized. And 80% of this US aid has been for military, police, and aerial eradication programs. Despite a 30% decrease in coca acreage and less poppy production, the plan has not reduced drug trafficking or the price of drugs. With

hundreds of thousands of acres of production fumigated and eradicated annually since 2000, environmental and health concerns have also increased proportionately. And alternative development programs have not kept apace, pushing desperate farmers who have lost their livelihoods to restart illegal cultivations in more inaccessible regions of Colombia and continue the cycle of poverty and drug activity.

There has been a significant increase in the size and capabilities of Colombia's armed forces but at a price. Despite drops in violence levels and greater security in Colombia's cities and towns, a majority of the countryside remains a no-man's land in the hands of guerrillas and paramilitaries, who are more squeezed but also more desperate and violent. Civilians bear the brunt of this "sociopolitical violence" by both state and antistate groups. In the uneven balance of forces, the paramilitaries now hold greater power and continue to traffic in drugs, assassinate labor leaders and human rights workers, and kill peasants. Out of a total population of 36 million in Colombia, two million are internal refugees, many of these children. These children flood into the cities, and without hope or education become fodder for drug gangs. The humanitarian costs, therefore, have also been excessive. There have been rumors of widespread corruption and alleged drug trade connections at the top levels of the Colombian government. Repeated identification of Colombia with the "global war on terror," for example, when President Uribe called the military the "defenders of terrorism," has further polarized the country.

As Plan Colombia completes its term, critics fear that a new "Plan Colombia 2" could be approved in 2006. They warn that defense contractors and companies that profit from Plan Colombia have a stake in continuing military assistance to Colombia. The multinational oil industry, especially, hopes to benefit by greater security for pipelines and civilian contractors. The expectation is that these corporations will lobby US Congress and the president to renew Plan Colombia when it ends in 2005. In October 2004, Congress approved the Bush administration's request to raise the cap on troops and private US contractors present in country under Plan Colombia. Given the controversial history of Plan Colombia, there are real concerns that the military and eradication gains that have been achieved cannot be solidified as long as most social and developmental needs remain unmet.

## POLAND

Poland is a medium-sized European country with a total surface area of 120,728 square miles (312,685 square kilometers). The population is estimated at 38,626,439 (CIA July 2004). It is divided into sixteen provinces (*voivodeships*). For more than 98% of the citizens, Polish is a mother tongue. Ethnically, Poland is 97% Polish, with small Belorussian, Ukrainian, and German minorities. About 95% of population is Catholic, with about 75% practicing. Beyond them, 1.5% is Orthodox and about 1% is Protestant. The economic centres are Warsaw (the capital, with

almost 2 million of citizens); Lodz (with approximately 1 million citizens); and Cracow, Poznan, and the Silesian with an agglomeration of Katowice, Wroclaw, Gdansk (with Gdynia), and Szczecin. The most important Polish universities are Warsaw University founded in 1816 (the largest in the country) founded in, Jagellonian University founded in 1364 (the oldest one), Warsaw Technical University, Academy of Mining and Metallurgy–Technical University in Cracow, Agricultural University in Warsaw, and the Military Technical University.

Poland borders on Russia, Lithuania, Belarus, Ukraine, Slovakia, the Czech Republic, and Germany. The gross domestic product (GDP) per capita according to the power purchase parity is about \$11,100 US dollars (2003 estimate). The level of the economic development is average. The sector of services produces more than 65% GDP, with industry at 31% and agriculture at 4%. The main Polish export goods are average and low-processed industrial articles, such as chemicals and mineral materials (copper, pit-coal), and agricultural products. Poland exports highly processed goods to its developing Eastern European neighbours and mostly low-processed products and raw materials to markets of well-developed countries. Recently, the level of processing and the technological advancement of the exports to markets of the Western countries have grown. Similarly, types of goods imported by Poland depend on the same geographical criteria. The import of raw materials from Russia and Ukraine predominates, mainly energetic ones, such as petroleum and earth gas or iron ore. Highly processed products with large technical advancement are imported from the Western Europe countries. Poland is a member of the European Union (EU, since 2004), the North Atlantic Treaty Organization (NATO, since 1999), the West European Union, the Organization for Economic Cooperation and Development (OECD), the Council of Europe, and other organizations. It is a long-standing member of the United Nations (UN).

The political-economic situation of Poland has been heavily influenced by geopolitical issues, primarily its position in the central part of the Europe between Russia and Germany. Poland became its own region in the tenth century as a result of the connection of Slavic tribes between the Oder, the Vistula, and the San (the largest Polish rivers). The first historical ruler of Poland, Mieszko (Dagobert), converted to Christianity in 966 AD. The first “modernization” of Poland was initiated by Kazimierz (the Great) in the 1300s. He improved the Polish defense system, reformed the country’s economy and money turnover, and ensured solid treasury incomes. Moreover, he introduced the uniform legislation and the transparent

political system. In addition, he founded the University in Cracow in 1364.

Under Jadwiga Andegaweńskiej, the female ruler of Poland who in 1386 married the ruler of Lithuania, Jagiello Wladyslaw, to form a union with Lithuania, a parliamentary democracy (albeit limited to the noble classes) was founded. The Polish Sejm (the lower chamber) and the Senate (the upper chamber) created legal binding solutions for the King who, together with his own ministers (foreign affairs, the chancellor) and internal administration (the marshal, the treasurer), performed the executive power. Following the last ruler of the Jagiellonian dynasty, the Polish Congress also chose the king.

Traditionally, the Polish army was professional. However, in the beginning of the eighteenth century, this approach was replaced by the “levy of mass,” meaning every gentleman had a duty of defense. Twenty-first century Poland retains a period of mandatory military service for all males at the age of eighteen.

In 1772, Russia, Austria, and Prussia took under occupation parts of Polish grounds (about 30% of Polish territory). In 1791, the new Polish Constitution was announced. This caused immediate Russian military intervention and, in consequence, further territorial changes. About half of the territories were occupied by Russia and Prussia. The national uprising led by General Tadeusz Kosciuszko also ended with defeat, and in 1795, Poland ceased to exist.

During the Napoleonic period, Poland appeared again on a European map (1807). After the fall of Napoleon and the Viennese Congress in 1815, Poland became dynastically joint with Russia. However, unlike Russia, its political system was the constitutional monarchy with a liberal character. In 1831, after a period of significant economic development, Poland was released from Russia. Uprisings in 1830–1831 and 1863–1864 began encroachments on Poland’s independence, and the Polish state was reabsorbed by Russia in 1865.

Large firms and banks were established in Poland, and soon, they were able to operate at a very strong position on Russian markets. In the part of Poland under German administration, local societies tried to defend against “Germanization” pressure. The self-organization of Polish communities grew up as a reply of German actions; similar events took place in the Austrian-controlled areas. That process took place with the strong cooperative movement and founding of the first Polish cooperative banks. In 1866, Polish representatives took official seats in the Viennese Parliament.

The Austrian part of Poland was one of the most neglected economically (comparably only with the Russian part). Situations improved after the

development of the petroleum industry. At the end of nineteenth century, this part of Poland provided circa 10% of world oil production.

Poland regained its independence in 1918 and was accepted by the United States, France, and England. After the Polish army's victory in 1920 over the Red Army, a truce with Russia was established until 1939. Though Poland suffered great destruction during World War I, the interwar years were a period of standardizing and modernization; women were given suffrage and a number of modern social policies were introduced. In 1939, Poland was one of the most developed countries in the world with a stable and modern legal system, a stable financial system and a stable currency, and a large industrial sector, including then-modern aircrafts and an electronic industry.

The political situation, however, was less stable. There was a great deal of fragmentation of political parties, leading to a military revolution in 1926. Until 1939, the military played a large role in the Polish government.

The international situation was also unstable. Germany was encroaching on the western border. On the other hand, Soviet Russia did not acknowledge Poland as a stable state. In addition, Poland had border conflicts with Czechoslovakia and Lithuania. In September 1939, World War II exploded.

The Polish nation went to war both abroad and within the country against Germany and Russian hegemony and suffered persecution and terror both on the part of Russia and Germany. On the Polish territory in Nazi death camps, Germans perpetrated the Holocaust of the European Jewish population.

In Poland grew an armed resistance movement with approximately four hundred thousand members. On both European fronts more than five hundred thousand soldiers fought (not to count members of the resistance movement) on the side of the Allies. After the war, the agreement of the Western Powers and counterfeit elections (1947) began a Polish period of forty-five years under a Communist regime and dependence on Russia. The economic system was an essential modification of the Soviet system. Many legal solutions, characteristic of free market economies, were kept; these included stock companies law, drafts, promissory notes, and Bills of Lading (documents used in the transportation industry). Unfortunately, they were seldom used. Private property existed in agriculture (where it predominated) and in microindustry or crafts. Many cooperatives operated. Metallurgical and machine industry as well as mining predominated. The inventory of consumptive goods was quite weakly developed. The technological gap, little diversity of enterprises, and cost of foreign debt had driven the economy to fall in 1980s.

The Communist regime was not popular, and social protests exploded in 1956, 1968, 1970, 1976, and 1980. However, the Communist period did bring many social changes. Basic education for all eight years of primary school was made obligatory. This caused the practical elimination of illiteracy. Unfortunately, until 1989, only 10% to 15% of the young population attended secondary school, and in consequence, only about half of them went onto higher education. The political and economic systems gave a minimal amount of encouragement to continue education on an average or higher level.

In the Communist period, previously existing social structures were violated by the higher material position of members of the Communist Party. Simultaneously, with a bad economic situation, violations were also caused by social anxieties.

In 1980, worker strikes brought the beginning of the organized social movement Solidarity. The short carnival of freedom ended with the martial law in December 1981. However, a falling economic position, a high external debt, and the lack of the support of the society for Communist authorities forced Poland into negotiations with the opposition. On the basis of negotiations in 1989, partly free and democratic Parliamentary elections took place. The breakup of the Soviet Union (1991) accelerated the process of the democratization, and the next elections (1991) were fully democratic. In 1990 began the difficult Balcerowicz-Sachs Plan of economic reforms. These led to privatization of the economy and to quick economic development in the second half of 1990s. In 1999, Poland joined NATO, and the country joined the European Union in 2004.

## POLITICAL CULTURE

### The Term Political Culture

The term “Political Culture” is particularly used in political science but is also employed in the analysis of problems in sociology, psychology, history, philosophy, anthropology, and other such subjects. This term appears in academic writing in the 18th century. However, scientific research into political culture truly flourished after World War II.

Some authors define it as basic *characteristic of a nation's character*. Others define it as a specific *trait of individual political behavior*. Still others emphasize on its *moral aspect* and so on. Regardless of the diversity of opinions, the idea that political culture is people's *way of political life* and at the same time it is a *product of their political behavior* is a prevailing opinion. It represents a complexity of *beliefs, values, habits, and behavior regarding political matters* existing in society.

Political culture may be classified in accordance with a variety of indicators. So, for instance, some authors define two types of political culture—integrated culture, which builds upon trust and consensus among members of society, and fragmented culture, which is defined by a lack of agreement and trust among the stakeholders in the political process. According to one of the most popular political classifications, political culture falls into three categories: (i) patriarchal or local political culture, manifestly centered on specific local values, local patriotism, and familial loyalty; (ii) the political culture of the subjects, characterized by respect and recognition of political institutions but in combination with a passive attitude to political change; (iii) participative political culture typified by the proactive behaviour of the populace in political life and a high level of political awareness.

Most authors share the opinion that there are sub-cultures within the frames of the political culture. Thus, they distinguish between two types of political culture. The first type is called “General Political Culture,” and is related to the beliefs, values, habits, and political behavior of the prevailing entity of people. The other type is “Elite Political Culture,” and is related to the political behavior, beliefs, and values of the authorities and of influential individuals and groups.

Each country is characterized with its typical (national) political culture, and in this sense, in scientific literature one can talk about American political culture, British political culture, Japanese political culture, French political culture, and others. Some authors tend to differentiate the political cultures even by geographical and other features.

### Changes of Political Culture

Culture is dynamic and constantly changing due to a couple of factors. The **first source** of change is related to *the level of general economic development*: the advanced economy of a given country sets up the economic conditions necessary for the development of common culture and political culture in particular. The **second factor** for cultural change is related to *the technical progress and the development of new technologies*. The **third source** of the change must be looked for in *the nature of culture itself*: just like authors of genius whose work can accelerate the development of culture, the appearance of great political leaders can bring forward political culture in much the same way. The constant collision and *conflicts* between the different social groups and countries represent the **fourth factor** for the changes in the political culture in a given society. A **fifth factor** can be pointed out: the “pressure from the outside” due to different types of *pressure* from outside forces; a given country can change its political structures, which can lead to a change of the existing political culture. Usually, the change in the master cultural model is an evolutionary process, but it can be accomplished through revolution. With regard to this, revolution can be classified as the **sixth factor** for the change in political culture.

The process of changing the old political culture with a new one in Eastern Europe during 1989 was done in different manners due to the different factors that existed. First, each country had its typical cultural model, which included its specific national psychology, traditions, mentality, and other such factors. Second, each Eastern European country had reached its own level of economic development. Third, some of those countries had tried to change their political

situation in the past (The Hungarian revolution of 1956, The Prague Spring in Czechoslovakia of 1968, and other such revolutions). Fourth, in some Eastern European countries, some political structures had already started trying to change the existing political system (the nonformal movements of the “Greens” and “Solidarnost” in Poland). Fifth, in some Eastern European countries, dissident leaders (such as L. Valensa, V. Havel) appeared on the political scene. Sixth, the Eastern European countries had different historical commitments with the former USSR. These and some other reasons have helped make the change in the cultural model and encourage the development of the political culture to take on different paths in the different countries. For example, in some countries, the process was accompanied with a modification of their government model: the previously existing USSR, Czechoslovakia, and Yugoslavia fell apart and new states were formed instead. The German Democratic Republic (GDR) and the Federal Republic of Germany (FRG) united into one state. In some countries, the change of the old political culture with a new one was accompanied with wars and ethnic conflicts, while in others it took place in a peaceful manner.

### **Similarities and Differences in Political Cultures of Developing Countries**

There are similarities as well as differences in the political cultures of the developing countries. The similarities between the countries are as follows. First, there is a common tendency for change of both the political culture of the masses and the political culture of the elite. Second, the political culture of the ruling elite changes more intensively than the general political culture. Third, at the beginning of the twenty-first century, the so-called “image of the enemy” present in the political cultures of the developing countries have changed. After the terrorist acts in New York on September 11, 2001, the political culture in the developing countries is forming a uniform image, and this is the image of terrorism.

Along with these common tendencies in the political culture of each developing country, there are specifics that differentiate each country’s culture from the others. For example, due to the specific characteristics of their historical development, the political cultures of most countries from Latin America are characterized with the so-called *paternalism*. *Authoritarianism* is another characteristic of the political culture of the developing world. “*Machoism*” is a valid

characteristic for the political culture in most Latin American countries. It is related to the idea that the political leader has to be a man (“*macho*”), who has to be distinguished, strong, and handsome, and women should like him. A significant characteristic of the political cultures of the developing countries is the *tolerance of corruption*. Corruption among the political elite in the Latin American countries is taken for granted. This is due to the fact that during the Spanish colonization of South America, the administrative positions in the newly formed Latin American countries were not earned, but bought by the rich representatives of the Spanish upper class. In that sense, the common people have seen the position of a high government official as an investment, from which dividends will be gained in the future. Such mechanism is the basis for understanding corruption as something natural for the political elite.

### **Peculiarities of Political Culture in Asian and African Countries**

The political cultures of Asian countries are dominated, in varying degrees, by the great civilizations of China and India, which explains some similarities therein. Individual regions on the continent have been directly influenced by the cultural traditions of Confucianism, Islam, and Buddhism, creating a complex miscellany of political cultures. So for example, Confucian cultural tradition dominates in China, Japan, South Korea, Vietnam, Singapore, and Taiwan; Islamic cultural tradition dominates in Indonesia, Malaysia, and Brunei; and Buddhist cultural tradition dominates in Thailand and Cambodia. In the Philippines and Burma, there is a mixture of all these traditional influences.

By and large, Asia is far too diverse economically, socially, and politically, which determines the diversity of political cultures in the different countries. Although there are differences in the political cultures among countries on other continents, these differences are particularly striking in Asia. For instance, Asia is home to four of the world’s five remaining Communist countries: China, North Korea, Vietnam, and Laos. Whilst there has been an encouraging rise of democracy at the end of twentieth century in South Korea, Taiwan, Thailand, and the Philippines; authoritarian regimes are firmly in power in Pakistan and Burma; and the governments in Malaysia and Singapore practice forms of “soft authoritarianism.” The Asian version of a political culture is distinguished by the dominance of local tradition. India

may serve as a case in point, having inherited a sufficiently advanced political system, parliamentary institutions, and much else from Great Britain's colonial rule. Nevertheless, the political behaviour of voters in this country is determined by the opinions of chieftains in the villages, heads of the clan aristocracy, and by religious leaders and others rather than by the election platforms of the relevant political parties.

One of the salient features of the region is the change in political culture. With the exception of North Korea, where Communist ideology has remained firmly embedded for decades, all other Asian countries exhibit a trend favoring change in political culture in the positive direction. Major political reform has taken place in the 1980s and 1990s in various countries; some has been carried out in the Philippines, there were constitutional changes in Thailand in the late 1990s, and there was the introduction of political pluralism in Mongolia in the 1990s.

Political culture in African countries is similarly multifaceted. Typically, it is defined by the dominance of a variety of symbols, beliefs, images, and ideologies, some clearly traditional and others European in origin. Pride of place is allotted to the following factors: partiality for the values of the traditional community—the family, the commune, the tribe, and the clan; mythology-based vision, combined with the view that man is intricately linked to animals and plants; the immense polyethnicity of societies; dependence on traditional values; and Afrocentricity associated with attaching superior value to African culture. Three countries, Nigeria, Ethiopia, and the Republic of South Africa (RSA), are representative of this region and may serve as illustrations of the state-of-affairs and developmental trends in political culture in Africa.

The political culture of twenty-first century Nigeria is characterized by a peculiar blend of traditional/collective and modern individualist precepts. This is a political culture that reflects the political behaviour of a population of 110 million, consisting of more than two hundred ethnic groups. Although lack of economic growth, underdevelopment, and illiteracy prevail among the population, the country is experiencing a positive tendency in political culture development. In the late twentieth century, Nigeria saw a resurgence in the election process: elections were held for the position of Governor, for Parliament, and for President.

The ethnic factor plays an important role in Ethiopia, and all attempts to accomplish some political reform lead to the emergence of a distinctive "ethnic democracy" that is totally dependent on the interests of the relevant ethnic group. Until 1991, the country was dominated by an artificial political culture model imposed by the extant communist regime. Following

that year, however, and in the aftermath of the regime's ousting a distinctive "ethnic democracy," a "broad ethnic federalism" was enforced, supported by political forces with a conspicuously regional practicability.

RSA is a typical example of the fundamental change in political culture. Following the decades-long struggle to abolish apartheid, elections were held in that country in 1994. For the first time ever, the representatives of all races and ethnic communities participated on an equal footing. These elections were won with a sweeping majority by the African National Congress (ANC)—the party that represents the broad popular masses. For the first time in its history, the country democratically elected its president: President Nelson Mandela had spent twenty-seven years in prison for participating in the liberation struggle. At the subsequent elections in 1999, the election victory of the ANC was even more pronounced, opening the gate for positive socioeconomic reform that fundamentally changed political culture in that country.

## POLLUTION, AGRICULTURAL

### Types of Agricultural Pollution

Agricultural activities are strongly connected with the environment. Throughout the history of humankind these activities have resulted in changes in the environment, although until the twentieth century, there were few cases of negative effects on nature and wildlife caused by agricultural activities. Farms were small, and agriculture was based on natural processes. Livestock farming and soil cultivation were integrated in a single farm, which supported stability and sustainability in farming activities.

Heavily industrialized agriculture appeared after the Second World War when new applications of science and technology were introduced in agricultural activities. This has resulted in the mechanization of farms, which became larger, fewer in number, and reliant on the use of chemicals and inorganic fertilizers. Farms started to be more specialized either in crops or livestock. As a result, crop residues and animal manure that were natural fertilizers in the past have brought new problems of waste disposal to agricultural activities (Conway and Pretty 1991).

The intensification of agriculture was accompanied by an increase in environmental pollution. This is true both for point and nonpoint source or diffuse source pollution. According to the definition of the United Nations Environmental Program (UNEP), point source pollution is “any pollution from a confined and discrete conveyance” (UNEP 1996). Examples of point source pollution could be the leakage of chemicals from containers, banana washing activities, and waste from sugar processing factories.

The same source also defines nonpoint source (or diffuse) pollution as that which “emanates from unconfined sources, including agricultural runoff, drainage or seepage, and atmospheric deposition” (UNEP 1996). This kind of pollution could be the result of the use of pesticides and fertilizers, of soil erosion due to intensive cultivation practices and livestock production, or of the inappropriate disposal of waste from agricultural activities. The introduction of Genetically Modified Organisms (GMOs) may also cause pollution if their possible crossbreeding with natural varieties is considered.

The main environmental problems caused by agricultural activities reviewed in this article are the following:

- Water pollution
- Air pollution
- Soil degradation
- Loss of biodiversity and degradation of natural habitats
- Impact on human health

Although environmental pollution from agriculture is a global problem, its effects in the developing world are even worse. The lack of appropriate regulations and control over the listed environmental issues, the absence of knowledge and information about the proper use and disposal of pesticides and fertilizers that are being introduced to the agricultural lands, and finally the improper management of both agricultural and nonagricultural lands have resulted in the presence of significant agricultural pollution in the environment. Thus, the joint statement of the World Health Organization (WHO) and the Food and Agriculture Organization (FAO) of the United Nations (UN) says that the “amount of poor quality pesticides sold in developing countries is alarmingly high” (WHO/FAO 2001). According to the same statement, around 30% of pesticides marketed in developing countries do not meet internationally accepted quality standards. This percentage is counted without taking into account the quality of labeling and packaging, which are often the only source of product information for consumers and the only guarantee of the safe and proper use of chemicals in the field.

Agricultural production, and especially the export of so-called “cash crops,” is the key component of economies in many developing countries. As a result, large quantities of fertilizers and pesticides are being introduced to secure the expected yield of such crops as sugar cane, coffee, cocoa, pineapple, oil palm, rice, cotton, bananas, and many other economically important crops. Moreover, in almost all countries of the developing world, agricultural pollution takes place also because of inadequate education and ignorance of potential hazards. Farmers in these countries identify pesticides and synthetic fertilizers with modern agriculture. For example, in the Philippines, the frequent application of synthetic pesticides by rice farmers was believed to guarantee higher yield (Conway and Pretty 1991).

There are several internationally approved conventions, treaties, and protocols relating to the reduction of the pressure from agricultural and related activities to the environment; these include the Stockholm Convention on Persistent Organic Pollutants, the

Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade, and the Cartagena Protocol on Biosafety to the Convention on Biological Diversity. Despite international attention to the issues of agricultural pollution, projections suggest that due to the increase of food demand and, consequently, the further intensification of agricultural activities, the pressure on the environment will continue to increase in developing countries. For example, by 2030, emissions of ammonia and methane from the livestock sector of developing countries could be at least 60% higher than at present (FAO 2002).

## Water Pollution

Agricultural water pollution mainly arises from the introduction of nutrients in the form of fertilizers and farm wastes, containing both nitrate and phosphate, that enter waters and cause changes to the ecology by enrichment known as “eutrophication.” The main sources of phosphorus are raw sewage from livestock and fish farms and from arable lands. These discharges also include nitrogen. Nitrogen is mostly introduced to water bodies from cultivated lands through fertilization activities and soil disturbance. It may also come from the atmosphere if biomass burning took place (Moss 1998).

Although the eutrophication of surface waters can be the result of various natural and anthropogenic activities, agriculture remains one of the key contributors to this kind of water pollution. Eutrophication can lead to algal blooms, some of which may even be toxic, when they cover the surface of the water. After the blooms’ death, the bacteria that decompose them require so much oxygen from the water that the conditions created are anaerobic, causing organisms that cannot tolerate the environment to die. Eutrophication of surface waters due to inputs from agricultural activities is not so well documented in the developing world as it is in developed countries, but it is a serious environmental problem in many tropical and subtropical rivers and lakes, where the load of nutrients is accompanied by favorable weather conditions. Eutrophication may also occur on a smaller scale when paddy fields are flooded (Conway and Pretty 1991).

Agriculture is the largest user of freshwater resources. It uses around 70% of all surface water supplies (Ongley 1996). This issue becomes even more significant for developing countries when considering the shortage in fresh water resources and the fact that most irrigated lands are situated near those

areas. Since the increase in world population is taking place mostly in developing countries and there is a need to produce more food, more and more land is being used for agricultural activities with a consequent increase in irrigational projects and fertilization. The irrigation water is returned to the water bodies, is heavily eutrophicated, and there are also significant losses in evaporation. The shortage in freshwater supply has already caused many serious conflict situations not only at community level but also between nations. For example, Israel and its Arab neighbors have had disputes over the Jordan; Ethiopia, Sudan, and Egypt have struggled over the Nile; and Turkey, Syria, and Iraq have argued over the headwaters of the Tigris and the Euphrates (Moss 1998).

Agricultural water pollution also results from the introduction of pesticides to waters from leaching, runoff, or direct introduction to the water bodies and from soil losses that may carry pesticides and fertilizers absorbed in soil particles. In general, the application of pesticides in large quantities can directly or indirectly pollute water resources, affecting water quality. Pesticides may be carried to surface waters through spreading, settling, and rainfall, causing pollution (Li 1991). Water pollution from pesticides in developing countries varies from region to region. While in large parts of Africa there is almost no water pollution from pesticides, in some intensive agricultural areas in Brazil and Central America, extremely heavy contamination is taking place (Ongley 1996). Groundwater is being polluted also by nitrates and heavy metals from fertilizer use and direct discharges of wastes from intensive livestock units. The issue of groundwater pollution is of great importance in many developing countries where groundwater is the major source of drinking water.

## Air Pollution

Air pollution largely arises from suspended particles of pesticide from spraying or dusting of crops and vegetables as well as from insect vectors of medical importance. Pollution also comes from the vaporization of pesticides from crops in soil and water (Richardson 1991).

Another source of air pollution is intensive livestock production. Some gases such as carbon dioxide, methane, ozone, nitrous oxide, and other trace gases produced by livestock waste serve as a basis for the formation of greenhouse gases and contribute to global climate change. Although the concentration of intensive livestock units is not widespread in developing countries, there is a trend for their number to

increase. For example, in some South American countries, industrial-scale chicken farms are becoming more and more common, with a corresponding increase in the negative impact on the environment (Sustainable Agri-Food Production and Consumption Forum 2002).

Some of the polluting gases are also being generated by other intensive agricultural practices. For example, rice paddies are one of the key contributors of methane emissions to the atmosphere. The introduction of nitrogen fertilizers or the conversion of forests to agricultural land may cause an immediate increase in atmospheric emissions of nitrous oxide. However, the major source of air pollution from agricultural activities is biomass burning (Conway and Pretty 1991).

Biomass burning is in common use in almost all the developing world to clear land for cultivation, to convert nonagricultural land into land suitable for cultivation, or increase productivity of lands by removing other plants. It is probably the quickest and most economic way of dealing with the disposal problem. These activities are widespread especially on the African continent, in the Amazon basin, and in Southeast Asia. The result of biomass burning is the release of aerosols that are an important source of trace gases and atmospheric particulate matter that have a negative impact on air quality and human health (Seong *et al.* 2004). Practices of burning farm wastes in developing countries are most common in sugar cane and pineapple plantations although as already mentioned, burning rice straw is also a big problem in the lowland regions of Asia (Conway and Pretty 1991).

Thus, agricultural activities are the major source of air pollution. Paddy fields, livestock wastes, and biomass burning together produce gases that affect atmospheric processes, causing a direct negative impact on human health and the environment as well as contributing to global climate change.

### Soil Degradation

Although soil erosion is a natural process driven by the displacement of soil particles through rainfall, flowing water, or wind, agricultural activities increase the rate of erosion by irrigation, improper use of land for cultivation or grazing, and by deforestation (UNEP 1998). The reasons for soil degradation and their significance vary from country to country. Summarizing these reasons by continent reveals that soil degradation in Africa results from overgrazing, water, and wind-borne erosion; in Asia and South America,

degradation is caused mostly by deforestation, combined with water and wind-borne erosion (in Asia) and chemical deterioration (mainly in South America) (Varallyay 2004). Soil pollution due to pesticides results mainly from the application of pesticides to control pests and weeds, which in turn leads to direct soil pollution. Pesticides that are not lost by volatilization or in runoff enter the soil. This kind of pollution is associated with intensive agricultural activities; therefore, its contribution is significant in intensively cultivated areas of Asia, South America, and Africa.

Irrigation projects are commonly used in arid and semiarid regions of the developing world to increase food production. For all its benefits, irrigated agriculture also has a negative impact on the environment due to the development of soil salinity and accumulation of salts in soils and shallow groundwater. An example of such degradation could be the Aral Sea disaster in Central Asia. The Aral Sea basin includes Southern Russia, Uzbekistan, and Tajikistan and partly Kazakhstan, Kyrgyzstan, Turkmenistan, Afghanistan, and Iran. Almost all cultivated lands in those areas are irrigated. The increase in irrigation areas and water withdrawals due to extensive monoculture and the increase in the use of pesticides and fertilizers have led to degradation of land that was productive before the introduction of intensive agricultural activities. Although there are many other impacts on water quality, the main cause of the Aral Sea disaster was poor management and planning of agricultural activities in the region (Ongley 1996).

### Loss of Biodiversity and Degradation of Natural Habitats

The use of pesticides is essential for maintaining food supplies. But the concern is that they affect not only targets, such as insects, fungi, bacteria, weed, or other unwanted organisms, but they also kill nontarget organisms that are similar to the target pest organisms, thus contributing to the degradation of natural habitats and loss of biodiversity. Moreover, after this immediate effect, pesticides remain in the environment and continue to degrade for a long time, as very few pesticides break down into nonharmful constituents after being introduced to the field. This is especially true in the case of Persistent Organic Pollutants (POPs), such as dichlorodiphenyltrichloroethane (DDT) and chlordane. These are chemicals that are “extremely toxic, resistant to degradation, characterized by their ability of bioaccumulation, and can be transported through air, water, migratory

species and accumulated in terrestrial and aquatic ecosystems” (Stockholm Convention 2001).

This kind of contamination often includes the entire food chain. In many developing countries, the pesticides that are banned by international regulations are being introduced for agricultural purposes but more often for securing human health from epidemics such as malaria and other vector-borne diseases. These chemicals affect not only organisms and food chains but also directly damage the habitats and resources on which other organisms rely. For example, in Malaysia, rats treated with rodenticides have caused owl deaths; in Surinam, spraying pesticides on an intensive rice-growing region near the coast caused extensive bird and fish deaths (Conway and Pretty 1991).

Due to lack of knowledge and appropriate information in developing countries, some pesticide users do not apply pesticides according to manufacturers’ instructions. Incorrect dosages could result in increasing resistance in the target organisms, destruction of nontarget organisms, contamination of soil, and accumulation in other species that provide an opportunity for movements of hazardous residues through the food chain, thus having a negative impact on wildlife in general.

Fertilizers are believed to be less dangerous for wildlife than pesticides. Although fertilizers have no direct toxic impact on wildlife, they can also damage natural habitats, and especially plants, by causing excessive growth. The most serious problem is associated with eutrophication, as described previously. The increase in phytoplankton crops results in the development of anaerobic conditions in water bodies with an increase in sulphide concentrations. These kinds of waters are not suitable for some fish groups, such as salmonids. By contrast, the fish groups tolerant of lower oxygen concentrations may increase in number as other groups disappear. This unbalance may be further developed by intensive algal growth that may cause changes in marginal aquatic plant beds and, therefore, result in loss of structure in the ecosystem. These changes can result in a decline of fish-eating and plant-eating bird populations, leading to the degradation of the entire habitat (Moss 1998). Another source of water pollution that affects biodiversity is the use of antibiotics or hormones in intensive livestock units, which causes the emergence of drug-resistant strains of bacteria and, in some cases, also anomalies in water fauna.

Conversion of wetlands into cultivated lands, deforestation, introduction of pesticides and fertilizers, inappropriate disposal of farm wastes, and inadequate soil management techniques are serious threats to biodiversity and natural habitats. It can be

concluded that intensification of agriculture causes losses in many species and entire habitats through fragmentation and reduction as well as through the decline in plant species populations. Loss of forests takes place notably in the Amazon Rain Forest in South America; the forests of Columbia (one of the richest countries in biodiversity); the Gir Forest in India; and the forests of the Philippines, Ethiopia, Costa Rica, Madagascar, and many other places in the developing world. These areas are marked by poverty and inadequate management in natural resources, resulting in a loss of biodiversity and degradation of natural habitats (Tuba *et al.* 2004).

### Impact on Human Health

Modern agricultural activities have a direct impact on human health. The biggest health problems in developing countries are caused by pesticides, both occupationally and through food and polluted drinking water. Although water pollution can arise from different sources, agriculture remains one of its main contributors due to the introduction of pesticides, fertilizers, and farm wastes. Moreover, many pesticides that are banned internationally or severely restricted in developed countries are freely available in many developing countries, causing serious health problems. Some developed countries continue to produce them not for internal use but for export to developing countries (Gore 2000).

In many developing countries, a major hazard to human health comes also from locally marketed food. Pesticide poisoning is more common than in developed countries because of ignorance, inappropriate control, poverty, and poor living conditions (Conway and Pretty 1991).

Although fertilizers are not designed to kill organisms and are not directly toxic to the environment and humans, they can serve as components for chemical reactions that cause significant pollution. If fertilizers are properly applied and absorbed by target crops, there may be no contamination. But farmers usually apply more than the optimum quantity to secure their yield and maximize the profit (Conway and Pretty 1991). The contamination arises from redundant use of fertilizers, taking place mainly due to rainfall or irrigation. Both avenues of pollution are very typical of developing countries because most irrigated lands are situated there and rainfalls are crucial in tropical regions. Fertilizers can leach to surface waters, causing eutrophication, and to groundwater, contributing to the contamination of drinking waters in many developing countries.

The increase in the use of inorganic nitrogen fertilizers is the major source of rising nitrate levels in many water supply sources. There is a risk that nitrates may cause methemoglobinemia in infants and even some forms of human cancer through the formation of N-nitroso compounds (Conway and Pretty 1991).

The other threat to human health comes from improper disposal of farm wastes. Runoff from livestock production may lead not only to the water problems described earlier but could also transmit animal diseases to humans. A number of pathogenic bacteria that cause many dangerous diseases can be found in untreated wastewater (UNEP 1998).

There are also many serious accidents during pesticide and chemical fertilizer production, distribution, and disposal activities that affect human health and the environment. One of the catastrophic examples is the gas leak from a pesticide plant in Bhopal, India, in 1984. Around half a million people were exposed to toxic chemicals during the accident. More than seven thousand people died within days and another fifteen thousand died in the following years (Amnesty International 2004).

## POLLUTION, INDUSTRIAL

### Introduction

Since the beginning of time, humankind has transformed raw materials and produced all kinds of useful goods and tools. The massive production of weapons to equip the primitive armies, the manufacturing of clothes or uniforms, and even the manipulation of minerals to produce jewelry or bullets are all different and ancient ways of the industry. The early stages of industry began during the Stone Age, and followed during the Copper Age (6000 BC) and Bronze Age (2500 BC), when technology was still very elementary. Industrial activities were rudimentary, relatively small scale, and handmade. First, the wheel was invented, and then many industrial fittings were invented that helped humans to make products, such as clothes or weapons, on a larger scale.

It was not until the Industrial Revolution during the eighteenth century that the manufacturing sector went through a major quality change. This revolution turned upside down most of the traditional ways in which people produced most goods. It introduced the assistance of machines powered by coal and the extended division of labour as Adam Smith described it. These new methods of production revolutionized the prices of products, changed the scales of production, increased productivity enormously, enhanced largely the benefits of capitalists, and changed the landscapes of towns and turned them into cities.

But one of the most important changes was the appearance of *industrial pollution*. The massive industrial processes carried out in factories create large amounts of waste that contaminate the resources of the environment in different measures. If not properly treated, these wastes can contaminate all of biosphere's elements: water, air, and soil, sometimes in an irreversible way.

The twentieth century has been one of the most environmentally conflictive centuries due to the boom of the industrial sector. During and after World War II, industrialization took place around the world on a larger scale than ever before. Large factories following Henry Ford's assembly-line model were built to supply the increasing demand, mainly in the Western developed countries but also in the developing ones.

As a consequence, during this period, the industrial pollution reached new levels. It remains a severe issue today. For instance, air pollution is one of the most crucial topics in the international agenda. The release of industrial gases into the atmosphere for many years has provoked two major global environmental issues: *global warming* and the *greenhouse effect*. Both effects are said to be provoking the rise of the world's temperature at a worrying pace, which could cause the rising of the sea level, floods, and heat waves, among other disastrous consequences.

The pollution generated by the industrial sector is a global problem. However, responsibilities are not the same. Industrialized countries like the United States, China, Russia, Japan, and Great Britain have been responsible for the release of most industrial pollutants. The amounts of pollutants released by nondeveloped and nonindustrialized countries are minimal compared to those of developed ones. The worldwide list of the most carbon dioxide-emitting countries shows that the superpowers contaminate the most. The list reads as follows, with the most polluting nation as number one: (1) United States, (2) Russia, (3) Japan, (4) Germany, and (5) Great Britain.

Pollution not only affects the atmosphere but also the water and the soil. All this information raises the question whether sustainable development is a sound and reasonable option for humankind and what should be done to stop industrial pollution from endangering the next generation's future.

### **Industrial Pollution and Effects on the Environment**

In the twenty-first century, industrial activity is one of the most important sources of pollution worldwide, causing damage to water, air, and soil.

### ***Water Pollution***

Together with untreated sewage waters and agricultural chemicals such as fertilizers and pesticides, industrial wastes are the main cause of *water pollution*. Pollutants from industrial sources many times pour out directly from the outfall pipes of factories or may leak from pipelines and underground storage tanks. Polluted water may also flow from mines where the water has leached through mineral-rich rocks or has been contaminated by the chemicals used in the process. All around the world, the pollution of water implies contamination of streams, underground water, lakes, or oceans by substances harmful to living things. This turns into a major global problem when considering that only 3% of the world's water is fresh, and only half of that percentage is drinkable. Therefore, the pollution of fresh water is not only a contemporary threat to the living creatures that consume it but is also a potential source of future conflicts and wars.

The major water pollutants are chemical, biological, or physical materials that degrade water quality. Among the most common are *thermal pollutants* and *industrial pollutants*, such as petroleum products, heavy metals, and hazardous wastes. All these can cause serious damage to the health of living beings and to humans. For instance, heavy metals, such as copper, lead, mercury, and selenium, get into water from many sources, including industries, automobile exhaust, and mines. In this way, these metals reach animals or plants that drink or take in water and finally reach humans who eat those plants and animals. The regular introduction of these toxic nondegradable chemicals released by industries in large amounts provokes the killing of large numbers of fish, birds, microorganisms, and the ecosystem where all creatures live. When they reach high levels in the human body, heavy metals can be immediately poisonous or can result in long-term health problems similar to those caused by pesticides and herbicides. Consequently, people who ingest polluted water can become ill and, with prolonged exposure, may develop cancers or bear children with birth defects.

Until the Minamata Bay incident during the 1950s and 1960s, the dreadful effects of chemicals on water pollution were not known, and most hazardous wastes were legally dumped in solid waste landfills, buried, or dumped into water. As effects were not known, toxic chemicals freely contaminated surface and underground waters, which were later consumed by people. However, during those decades, more than four hundred residents living near Minamata Bay in Japan died before authorities discovered that a local

industry had carelessly released mercury into the bay's waters. This highly toxic element had accumulated in the bodies of local fish and eventually in the bodies of people who had consumed the fish; the people developed nervous disorders, tremors, and paralysis, which caused many to die. Scientific research has revealed that many chemical pollutants, such as dichlorodiphenyltrichloroethane (DDT) and polychlorinated biphenyls (PCBs) interfere with the human body's reproductive and developmental functions. These substances are known as *endocrine disruptors*; when they reach high levels in the human body, they can cause death.

In the twenty-first century, legal regulations restrict how such materials may be used or disposed, and many corporations publicize their support of environmental efforts and compliance with environmental laws. However, such laws are difficult to enforce and are often contested by industry. Many multinational companies have decided to move their factories to nondeveloped countries where the regulations are flexible and full enforcement may not be possible.

### ***Air Pollution***

The US Environmental Protection Agency (EPA) defines an air pollutant as "any substance in the air that can cause harm to humans or the environment. Pollutants may be natural or man-made and may take the form of solid particles, liquid droplets or gases." Industrial activity generates a lot of gases that are released into the atmosphere through chimneys, some with filters and others without them. These gases are usually a mixture of chemical compounds, with carbon dioxide and different sulphur dioxides being the most common. Together with the gases released by automobiles (motorbikes and buses to some extent, but mostly privately owned cars), planes, and the construction industry, the industrial-related gases contribute to the formation of the *smog* that is a peril for citizens' health in modern cities like Mexico City, Beijing, Cairo, Jakarta, Los Angeles, Sao Paulo, and Moscow, the most contaminated cities in the world.

The emission of large amounts of carbon dioxide, however, not only directly affects human health but causes a more important and harmful effect: *the greenhouse effect*. The greenhouse effect is a warming of the Earth's surface and lower atmosphere because certain gases (for instance, water vapour, carbon dioxide, nitrous oxide, and methane) trap energy within the atmosphere.

In the natural process, the energy that the sun emits travels through space and through the Earth's atmosphere until it reaches the Earth's surface and heats it. Then, a part of it is reradiated by the Earth's surface in the form of long-wave infrared radiation, much of which is absorbed by molecules of carbon dioxide and water vapour in the atmosphere, and the rest escapes back into the space. However, the excess and concentration of these so-called "greenhouse gases," like carbon dioxide, in the upper layer of the atmosphere create a barrier that refrains the reradiated energy from escaping and provokes the overheating of the Earth's surface. The permanent industrial activities and the incineration of wastes together with the reduction of the forests and rain forests in the world have contributed to the increasing concentration of carbon dioxide in the atmosphere that creates this effect.

Although the topic is controversial, most experts and laypeople accept that emission of these greenhouse gases have a great deal of responsibility in the increasing of the global temperature, a phenomenon known as *global warming*. This has occurred mainly in the last thirty years with different effects worldwide. For instance, the change in seasonal temperatures has caused an increase in the frequency and quantities of rainfall in South American countries like Argentina.

Global temperature is expected to increase from 2°F–10°F in the twenty-first century. This is likely to provoke serious catastrophes, among them the flooding of lower parts of the planet and many coastal cities. Again, the primary responsible countries for releasing excessive emissions are the most industrialized ones: the United States, those of the European Union, and Russia.

Another effect provoked by industries is *acid precipitation*, or acid rain. Acid precipitation is rain, snow, or fog that is polluted by acid in the atmosphere and damages the environment. Two common air pollutants, sulphur dioxide (SO<sub>2</sub>) and nitrogen oxide (NOX), are the primary causes of acid rain. When these substances are released into the atmosphere regularly and in large amounts, they can be carried over long distances by prevailing winds before returning to earth in acid rain, snow, fog, or dust. Acid rain occurs when these gases react in the atmosphere with water, oxygen, and other chemicals to form various acidic compounds. This type of rain has a variety of effects, including damage to forests and soils, to fish and other living things, structures, and also to human health. Acid rain is mainly caused by the indiscriminate emission of acid gases by industries. For instance, in the United States, about two-thirds of all sulfur dioxide (SO<sub>2</sub>) and one-fourth of all

nitrogen oxide (NOX) come from electric power generation that relies on burning fossil fuels like coal.

### ***Other Types of Industrial Pollution: Soil and Water Bodies***

Industrial activities create other types of pollution: the pollution of soil and water bodies due to hazardous wastes and the thermal pollution.

As industrialized society generates more hazardous wastes, there is an increased need to find a way to dispose of them. Prior to the 1970s, the industrialized countries disposed of these wastes within their own countries, often with little regard to the environmental impact of disposal. Incidents of improperly disposed of waste, such as the Love Canal affair in the United States, in which a fifteen-acre working-class neighborhood (including over one thousand residences and three schools) was built over the site of a toxic-waste landfill near Niagara Falls, began to create serious health and ecological problems. Public awareness of the consequences of improper disposal increased. Eventually, this awareness led to people in industrialized countries expressing an increasing unwillingness to have waste disposed of at home. This new awareness led to an increase in the export of hazardous wastes to developing nations. Many of these countries had neither the technical expertise nor the facilities to dispose of the waste in an environmentally sound manner. Often, these wastes were simply dumped on properties in leaking barrels, with environmentally devastating results. Ultimately, the waste would leach into the soil and water table, causing health and environmental problems for the local areas. This *waste trade* is not well observed by the general public, but many times governments will agree to accept hazardous materials for disposal because of money or other benefits offered by the exporting country.

*Thermal pollution* is another effect derived from the industrial activity. This type of pollution is a rise in the temperature of rivers or lakes that is injurious to water-dwelling life and is caused by the disposal of heated industrial wastewater or water from the cooling towers of nuclear power plants. Even small temperature changes in a body of water can drive away the fish and other wildlife that were originally present. Thermal pollution can accelerate biological processes in plants and animals or deplete oxygen levels in water. The result may be fish and other wildlife deaths near the discharge source. Thermal pollution can also be caused by the removal of trees and vegetation that shade and cool streams. Obviously, this type of industrial pollution occurs in those countries that are most dependent on nuclear energy:

France, Lithuania, Belgium, Slovakia, Ukraine, and Sweden, among others.

### **International Agreements and Sustainable Development**

Concern has grown around the world regarding the pollution of the Earth's resources, the deforestation processes, the permanent emissions of carbon dioxide, and global heating effects. In 1992, the United States and other nations met at the United Nations Earth Summit in Rio de Janeiro, Brazil, to agree on policies on how to fight against the greenhouse effect. In that year, they agreed to voluntarily reduce greenhouse gas emissions to 1990 levels by the year 2000, among other proposals in the quest of a *sustainable development*. Ten years later, in the Johannesburg Summit 2002 (Rio plus 10), the results were not very encouraging as many institutions, such as the World Watch Institute, showed that the destruction of forests, the emission of greenhouse gases, the reduction of the biodiversity, and the expansion of transgenic crops were still issues; global warming was still a factor. Because the Rio Treaty was not legally binding and because reducing emissions would likely cause great economic damage, most nations did not meet the goals.

Another attempt to gather forces with the aim of reducing the air pollution occurred in December 1997, when representatives from around the world met at a conference in Kyoto (Japan), the Third Session of the Conference of the Parties (COP 3), to sign an agreement that legally bound signing countries to reduce the emissions of six gases, the main one being carbon dioxide. The aim was to stop the global warming. The Kyoto Protocol was signed by most industrialized countries. However, the United States, a country that in 1997 emitted about one-fifth of total global greenhouse gases, decided to quit the protocol in 2001. In December 2004, the Tenth Session of the Conference of the Parties (COP 10) took place in Buenos Aires (Argentina), and most industrialized countries, including Russia and the European Union nations, confirmed their adherence to the protocol. Once again, the United States did not ratify its commitment to reduce the emissions of gases.

All these controversies and problems created by industrial pollution worldwide prove that a *sustainable development* is not an easy option. In spite of the international attempts to reach agreements to reduce the emission of greenhouse effects or other conventions to prevent the pollution of water or soil,

industrial pollution is still contaminating the planet's resources. In times when the fossil-fuel era is entering its sunset years, the use of alternative, clean, and renewable energies, like wind energy or hydrogen energy, is very little developed. Many critics believe that a key factor in the minimal use and the underdevelopment of clean energy is the reduction in profits it would mean for oil companies. It is cheaper for developed countries to export hazardous nuclear wastes to the Third World than to build disposal sites in their own territories or stop using nuclear energy.

**POPULAR MOVEMENT FOR THE LIBERATION OF ANGOLA (MPLA)**

The *Movimento Popular de Libertação de Angola* (MPLA), or the Popular Movement for the Liberation of Angola, was the main liberation movement opposing the Portuguese in Angola. It took power at independence in November 1975 and eventually won the long civil war that followed. It remains the ruling party in Angola today.

The MPLA was founded in December 1956 when, under the influence of students in Portugal, two small Nationalist coalitions merged in Luanda, capital of the Portuguese overseas territory of Angola. An urban-based movement, the MPLA attracted support from the small native elite that was assimilated to Portuguese culture (*assimilados*), people of mixed race (mestizo or Afro-Portuguese), intellectuals who had studied abroad, and Marxists in Portugal itself. It was hard-hit by the Portuguese secret police in 1959 and 1960, when many of its leaders were arrested and imprisoned. MPLA militants urged peasants and workers to take up the armed struggle in response, and February 4, 1961, is commemorated as the beginning of the national liberation struggle against the Portuguese. The MPLA opened exile offices in Conakry, Guinea, in 1960, in Kinshasa in the former Belgian Congo in 1961, and in Brazzaville, Congo, in 1963. Its first national conference, held in Kinshasa in 1962, elected Agostinho Neto as president; he was a poet, medical doctor, and Marxist who had been a political activist against the Portuguese in Luanda from the 1940s, and he succeeded Mario de Andrade as president. Neto was to remain president until his death in 1979, when he was succeeded by José Eduardo dos Santos, still president in 2005.

From 1966, the MPLA faced competition from the rival *Uniao Nacional de Independencia Total de Angola* (UNITA), or the National Union for the Total Independence of Angola, under Jonas Savimbi. The MPLA denounced UNITA as an ethnic (*Ovimbundu*) and regional (southern) organisation, as anti-national and nonrevolutionary. UNITA in turn accused the MPLA of being sectional (Kimbundu) and wedded to an alien ideology. For a time, the MPLA claimed support in the South, where Daniel Chipenda worked for it in Lobito, but in 1973, Chipenda was accused of plotting take over Neto's position, and he soon broke away.

Factionalism almost destroyed the MPLA, but it retained the support of the Organisation of African Unity Liberation Committee, which recognised it as the legitimate national movement, and of Cuba and other Socialist countries. When the struggle between the rival Angolan Nationalist movements reached a head in 1975 and the South Africans sent in a military force to try to prevent the MPLA from coming to power, Cuban forces, arriving in large numbers, saved the day for the MPLA, which took over the institutions of the state on November 11, 1975, and raised the red, yellow, and black flag of an independent Angola. Later that month, Nigeria recognised the new government, and other states followed but not the United States. There was to be no election for another seventeen years. A large Cuban military force was to remain in the country for more than fifteen of those years to help ensure the MPLA remained in power. For most of that period, the MPLA had effective control over the western and northern parts of the country only. But though the MPLA took over the state, it never became a national party and remained dominated by Kimbundu and Afro-Portuguese. When in 1977 the Nito Alves faction came out in favor of a more African-centred focus for the party, the faction was purged from the MPLA central committee and the armed forces. At its congress held in December that year, the central committee of the MPLA voted to transform the movement into a Marxist-Leninist party of militants, and it now called itself MPLA-Partido dos Trabalhadores (MPLA-PT), the party of workers.

The MPLA was sympathetic to the struggle being waged by the South West Africa People's Organisation (SWAPO) against the South African occupation regime in Namibia, and SWAPO was allowed to operate from bases in southern Angola. This led the South African Defence Force to raid into southern Angola from the late 1970s, and for much of the 1980s, the South Africans occupied the most southernmost part of Angola and gave massive support to UNITA, which launched an economic sabotage campaign against the MPLA-PT government as well as military attacks. Under pressure, the party's second congress, held in December 1985, began the move away from strong support for the Soviet Union. In 1988, the MPLA government agreed to a settlement of the Namibian issue, which involved the total withdrawal of the Cuban forces and the independence of Namibia.

After the Cubans left, an election was held in 1992 under the auspices of the United Nations. By then, the MPLA had gotten rid of much of its Marxism-Leninism and had come out in favour of a multiparty system. But when the MPLA was declared the winner

with 53.74% of the vote, UNITA refused to accept the result, and the civil war began again, this time at even greater intensity than before; UNITA-held cities such as Huambo and Cuito were reduced to ruins. In the long fight against UNITA, the revenues from the oil being pumped off the coast at Cabinda in the north was indispensable to the MPLA. It was not until 2002 that, with the death of Savimbi, the war came to an end, and the MPLA was able to further consolidate itself in power in the new era of peace. There was talk of an election being held in 2006, but problems such as the resettlement of hundreds of thousands of refugees and the removal of millions of landmines hampered preparations for such an election. Meanwhile, the MPLA remains in power, its leadership having enriched itself by siphoning off much of the oil revenues, and most of Angola's population continues to be mired in poverty despite the wealth of the country.

## POPULAR SECTORS

In the developing world, popular sectors are identical with *meaningful participation*, a distinctly cultural proposition, observable within the creative aims of representative organizations.

Conventional working definitions are interested in how activities in the popular sectors occur outside the spheres of the state and the market. This focus proves inadequate for the developing world for the following reasons. It overstates sectoral independence and masks complementarities across the three social sectors. It inaccurately implies internal homogeneity as opposed to the *array* of groups—often with antagonistic aims—that characterizes the popular sectors. It also relies on a veiled hypothesis that popular sectors are a democratic power-balancing agency, which was central to the thought of Talcott Parsons (1902–1979), who saw ties between social sectors as a “moving equilibrium,” based on a disprovable premise of evenness and symmetry of power.

For the developing world, an adequate working definition needs to characterize the *functional* role of popular sectors as power relationships with the state and the market. Interdependency is characteristic, but

the state and market play dominant roles. Second, the definition needs to identify the relationship between sectors as based on conflict and on inherent differences between the aims of individuals and society. Third, there needs to be acknowledgment of the diversity of aims *within* the popular sector. The sector is a pluralized concept encompassing an array of agencies that include such organizations as church groups, universities, environmental organizations, volunteerism advocates, and women's crisis groups. Fourth, its causal principle transmits cultural achievements: as history is the collective memory of society, and literature and arts its popular imagination, the popular sectors enact collective vision. This description points to a distinctive cultural value and the crucial role of *meaningful* participation. Ultimately, it substantiates the proposition that the causal principle of popular sectors is a creative, constructive force.

Three particular social thinkers expound on these systemic qualities of popular sectors. The first, Ibn Khaldun (1332–1395 CE), born in Tunisia, is celebrated for producing social science four centuries before its start in the “North.” Viewed as *the systematic study of society encompassing human experiences*, social science began in the North in the eighteenth century. Elsewhere, it was in the fourteenth century that Khaldun wrote on the factors contributing to the rise and fall of successful societies in the Arab world. He remains an exemplary figure for Egypt's embryonic popular sectors, where a research centre bears his name with a mission to develop democracy through popular sector organisations. Characteristically, in Egypt and across the developing world, the relationship between the state and popular sectors is vitreous. This is illustrated by long jail terms that the director and other staff of the Khaldun Centre have served more than once for advocating universal suffrage.

During the time of his work, Khaldun encountered a crisis in creative participation. He observed how urbanisation alienated nomads as it increasingly drew them in. Khaldun was concerned that *asabiyah* (group feeling demonstrated by participation) noticeably declined, when compared with prestate communities. Khaldun arrived at the view that participation is the problem of power centralised and tilted against the popular sectors.

The second writer of note is Antonio Gramsci (1891–1937). From Sardinia, his work undertook to clarify the social consequences of an overabundance of popular sector organizations. Previously, G.W.F. Hegel (1770–1831) saw this as reason for more state power to navigate social ethos in the absence of the popular sectors, which were inattentive due to infighting. On the other hand, Gramsci saw differentiation as an inevitable attribute of the buffer against

autocratic civic norms and traditions. This struck a chord during the 1970s and 1980s with resistance movements in Latin America and with others in this millennium, particularly in Chile and the Philippines. They favoured Gramsci's thinking above the “liberal” notions that underpin contemporary constructions of “social capital” propounded by Alexis de Tocqueville (1820–1840). They preferred Gramsci's understanding of conflict. Whereas de Tocqueville wanted to eliminate conflict by protecting the popular sector against state domination, Gramsci saw conflict as an inextricable part of the social contract.

Criticism of Gramsci surrounds his idea that the popular sectors are independent of changing power relationships. This is seen as underestimating the creative force and inherent fragility of the sector. Since power relations are the primary concern in the developing world, at issue are the contemporary uses of the popular sectors. Whereas the struggle against totalitarianism defined their former role, they now implement policy indifferent to social transformation within a market system unresponsive to their ethical mission. Since popular sectors grew and flourished in the developing world as sovereign agencies effective at transforming oppression, any decline in meaningful participation is deeply troubling for democratic societies of every kind and at every stage of development.

The next thinker, Mikhail Bakhtin (1895–1975) from central European Russia, took up the challenge of clarifying the social necessity of meaningful participation. He undertook to locate typical sites of meaningful participation and how to observe participation. Bakhtin found that popular sectors sustain themselves through practices of belief that are in marked conflict with official interpretations of reality. He saw this as observable in activities within situations of cultural friction between official and unofficial codes. This signaled a major shift in theoretical understanding, overturning the long-standing belief of Emile Durkheim (1858–1917) who argued that cultural conflict indicates the *loss* of group feeling. Bakhtin showed how individuals express social experience in symbol systems that meaningful participation generates. He pointed out the irreconcilable differences between personal and social aims, explaining that the collision of interests operates as the causal principle in social identification. Bakhtin's findings affirm the social necessity of meaningful participation by the popular sectors.

The discussion now turns to an example of an emergent popular sector, with its members (youths) remaining relatively unorganized. The example involves musical expressiveness in contemporary Melanesia against a backdrop of twenty-first century urbanization.

From the perspective of official urban culture, contemporary music in Melanesia is “noisy music.” While elders are mostly content with traditional themes and styles from their respective ethnic groups, contemporary youths have a more adventurous, free, and culturally diverse taste in music. This is expressed in a blend of locally traditional and borrowed Western themes, lyrics, instruments, and styles. The music most heard, and most played by youths, represents their response to official codes.

What constitutes these unofficial symbols, which their more patriotic, conservative elders perceive as “noise” rather than music with aesthetics and poetry? The range of instruments is diverse. They can be divided into two main categories, local and imported. Most are imported and adapted, that is not official. Local instruments include wooden gongs (*garamut*), wooden drums with reptile skins on either end (*kundu*), panpipes (flutes), shell rattles, conch shells, and nutshell rattles. Imported instruments include guitar, *ukulele*, piano, keyboards, flutes, horns, trumpets and trombones, and other innovations. Nearly all these instruments feature in the music of the region. Diversity is also a key characteristic of the range of songs. (Readers may recall the Hegel/Gramsci debate about how to deal with diversity when ethical irresponsibility results).

Regarding musical preferences, Melanesian elders prefer locally traditional sounds. These include the archetypal Pacific dance *hula hula (tamure)*, specifically among coastal *Motuan* and Central Province villages of Papua New Guinea. These performances allude to closer historical links with Polynesian ethnicity and demarcation from neighboring Melanesian traditions of the Western Pacific. Other themes of romance, adventure, deceit, ambush, and robbery have a significant place in official prestate community codes. Similarly, songs that tell the tale of colonialism and those that attest to the increasing prevalence of Christianity, which overlay unmistakable Melanesian variations on original Western sounds, also have a significant place in the society.

Contrasting vividly with the official sounds of prestate and urban societies is the more recent music of youths. The predominant sounds are a mix of *reggae* and heavy metal blended with local tunes in vogue. *Rap* also has an integral role, with its “ugly, blunt” sounds about poverty, destitution, and deprivation in a harsh urban environment. The songs belt out a message on marginalization by waves of state and market forces. An undercurrent of alienation focuses on rejection by partners, parents, and/or the state.

The artists themselves are role models. They show youths that despite being deprived and pushed to the margins, they can survive in their own world within

their own confines and rules. Their attire shows rebellion against mainstream expectations, helping shape a lean but frail and fragile human frame moving precariously across the neighborhood, smoking local tobacco and sometimes marijuana, faces unkempt, bearded, dreadlocks, balaclavas, caps with hoods twisted to the sides or the back, torn jeans, and slack belts pulled well below the accepted waist line level almost exposing pubic hair.

It is the voiced codes that predominate, though noisy, expressing a right to be heard. Indicative of an emergent popular sector, Melanesian youths see themselves as a group. Their code is meaningful to them and amplifies their belief they are a potential political force, despite rejection and marginalization by state and society. Unlike dissenting middle-class youths in the developed world who reject society rather than being rejected by it, mainstream urban environments reject Melanesian youths. This is shown by unemployment statistics and how they fall out of the mainstream education process. And they view the state as paying lip service under the rubric of youth groups.

In Papua New Guinea, the informal economic sector has become a haven for some urban youths, where unemployed women and men till vacant lands and sell vegetable produce to city markets. Most lack the enthusiasm to do this work and spend much of their time idling along the streets, blasting music boxes as they drift into social oblivion. These are the “Street Boys” or “Home Boys.” The labels identify their preoccupation with home-brewed alcohol. Abuse of alcohol, marijuana, and local tobacco is enmeshed with daily petty criminal activities, which destines them for confrontation with the official law. Youths are adamant there is no other way to alleviate their ever-deteriorating social condition. They perceive the efforts of elders, media commentators, donors, and personnel from nongovernmental organizations (NGOs), who engage in isolated media articles and workshops, as well intended but misguided. They are skeptical of NGOs and church groups that are seen as swooping down on opportunities to promote the lost cause of youths whilst gaining publicity from their charitable intentions.

Contemporary music is a source of solace for many Melanesian youths. They quickly identify with songs that realize their daily predicaments and lack of opportunities, which promote their rejected lives, and that alienate elders and the state by mirroring the experience of rejection. Discotheques and clubs provide a safety net with music loud enough to shut out the world and to induce illusions of outer acceptance. It is important not to overgeneralize, since youths do not all believe and behave alike. But

many share the need to say these things to the world, and music is the way they want to say it. It is their code, and it constructively transfers the threat of being marginalized by rapid urbanization. It enables unofficial voices to be counted and recognized against a backdrop of meager economic promise.

Most youths are economically impoverished. But this does not exhaust the significance of music as an indicator of meaningful participation and of broader sectoral participation because also included in this social grouping are significant numbers of youths from well-off families. They not only share the same taste for *reggae*, *rap*, heavy metal, and rock and roll, but they also often take the lead in the construction of the unofficial code, which encompasses attire, gestures, moves, tempo, and volume. The music is noisy. It draws attention and portends power. It mirrors marginalization, blending frustration, and inspiration in a demonstration of strength. It is offensive, and heralds change while transferring estrangement. It is creative, consistent with the origins of a popular sector.

The example of Melanesian societies enables several propositions to be examined: first, it further explains Bakhtin's hypothesis that transformed the idea that cultural conflict implies the *loss* of group feeling. It clarifies how popular sectors nourish themselves through practices of belief that conflict with official construal of reality. It shows how conflicting values generate unofficial symbols, which reject but also express felt rejection, while beginning the longer task of building social identity. And, by focusing on the creative principle in the popular sectors, it highlights the social necessity for meaningful participation. Equally, it shows that when the constructive element of participation collides with rather than promotes the social good, alienation can be traced. Khaldun explained this more than seven centuries ago with his finding that urbanizing society marginalizes individuals who leave prestate society. While the Melanesian example shows participation persists, it also demonstrates that constructive quality depends on interdependency between social sectors and, consequently, on decentralization of power.

## POPULATION GROWTH: IMPACT ON DEVELOPMENT

### Human Resources

Population is a key variable in any discussion of development. When assessing human resources within a country, the demographics of the population under study provide indicators of the probable level of its development. Larger populations, with high concentrations of the very young and the elderly, tend to be concentrated in less developed countries. During the initial years of the twenty-first century, the developing

world accounted for approximately 80% of the total world population. According to Coast in “Population Trends in Developing Countries,” the population growth rate in these countries has slowed down since reaching its peak of 2.04% in the late 1960s. In the 1990s, the growth rate was at 2.0% for low-income countries while only 0.6% for high-income countries. Between 2000 and 2005, the World Bank projected a 2 billion person increase in the world population, with 97% of it occurring in developing countries. A large percentage of that population will be young, the consequences of low-life expectancy rates and high fertility rates in many parts of the world. The British Department for International Development (DFID) research indicates that as of the first few years of the twenty-first century, 44% of the world’s poverty is concentrated in South Asia, 24% in Sub-Saharan Africa, and 23% in East Asia and the Pacific. These statistics provide a picture of some of the challenges and status of development in certain regions.

A key component of development is the human factor, that is the availability of human resources. As the term implies, “human resources” refers to the population and both its potential and actual contributions to development. Selected scholars and researchers describe three components to the human side of development: life sustenance, self-esteem (self-respect and independence), and freedom. Using this paradigm for analysis, a country cannot be considered fully developed if all of its people are not provided with such basic needs as housing, clothing, food, and minimal education. Poverty directly impacts nourishment, which in turn impacts survival rates of a people and that people’s capacity to engage in initiatives that foster sustainable development. In Africa, for example, high rates of poverty and hunger are directly related to low per capita agricultural income, consequently forming a vicious, recurring cycle that results in what the United States Agency for International Development (USAID) describes as “a low-growth trap.” Approximately one-third of all the world’s undernourished people reside in sub-Saharan Africa. Poverty limits people’s ability to purchase food. The lack of food results in malnutrition and poor health. The poor health limits their ability to earn income. The inability to earn income leads to still deeper poverty, and what emerges is a never-ending cycle that inhibits development and sometimes dissipates a people.

Continuing with this paradigm, a country cannot be considered fully developed if it is being exploited by other countries and/or cannot conduct economic relations on equal terms. There must be independence, freedom, and the ability of a people to determine its own destiny.

## Population Size

Population size is critical in the level and direction of development. The larger the population, the more limited the resources available for development and the more limited the development in that society. According to *demographic transition theory*, societies move from high birth and death rates to relatively low birth and death rates as a result of technological development. There are four stages in this evolution. In the preindustrial stage, there is little population growth. High death rates (mortality rate) offset high birth rates (fertility rate). The transitional stage, also known as early industrial stage, is characterized by the continued high birth rate but a decline in the death rate because of technological advances.

In the advanced industrialization/urbanization stage, the birth rates decline because fertility is controlled through various contraceptive methods, and death rates decline because of advances in health care technology. These advances help control disease, provide cures, and control chronic and acute disease. The fourth stage is the postindustrial stage in which there is a decreasing birth rate coupled with a stabilized death rate. Using this theory for analyses, the developing world is in the second stage of development. The fertility rates remain very high while the mortality rates are decreasing. As a result, more resources are necessary to meet the basic survival needs and age-specific demands of the society.

In terms of the cause-effect relationship between population, development, and social conditions, such as poverty, there are varying views. One popular view is the “survival and assurance of continuity” perspective. When life expectancy is low and mortality and morbidity are high, there is a tendency to have large families with a larger young population. Families choose to have a higher number of children so that they can be assured that at least a few of the children will survive to adulthood. In addition, agrarian-based economies need the larger populations to maintain a reasonable labor force. On the other hand, some scholars have chosen a different viewpoint. They suggest that poor people are not poor because they have large families, but rather they have large families because they are poor. In countries where there is limited or no viable welfare or social security/pension program for the elderly, the larger families ensure that there will be relatives who can care for the elderly. In addition, males tend to have a higher mortality rate and a lower life expectancy rate than women. This causes widowhood to be high. In patriarchal societies with gender inequality, opportunities for females to do well are extremely

limited, if existent at all. The consequence of the higher male mortality rate is the destined poverty of the widow.

### Population Movement

Population movement is another important variable in development. In developing countries, there are four major motivations for the movement, be it internal (migration) or international (emigration). Examining the movement in the context of a “push-pull” relationship, the push is what makes the persons leave, the pull is what encourages them into a particular direction and encourages them to remain. The first motivational category for population movement has an economic base. It arises from the need for certain members of the family, primarily males, to seek employment outside of the community. Limited employment opportunities (the “push” factor) inhibit those seeking economic security and advancement at home and encourage movement to more urban areas since there is broader job availability (the “pull” factor). Those who are able will follow employment to other countries where even more opportunities for economic advancement exist. One example is found in the seasonal West Indian sugar cane workers who, for more than a half-century, have come to Florida regularly during certain times of the year; a second example is found in the seasonal migrant workers from both the Caribbean and Latin America who follow the agricultural growing seasons in the United States. Income is generated, and improved familial economic status occurs; however, major hardships are placed on many of those workers. There is the need to maintain two households, and there is the minimal or absence of family interactions during major parts of each year. This seasonal emigration also impacts the workforce population within the home country because it reduces the total number of available labors. One positive outcome of this arrangement is the system of return remittances; that is, paychecks are sent home to support the family back home. The seasonal workers and temporary imported workers improve the conditions of the family and sometimes the economy of the region from which the workers come. From an economic perspective, another positive outcome is temporary emigration influences the direction of foreign direct investments. This encourages the flow of enterprise, ideas, and knowledge across borders.

The emigration, however, is not always legal. Sometimes estimated to be as large as one-third, a number of temporary immigrants engage in immigration

through illegal channels. The destination country sometimes tacitly tolerates this illegal immigration because it meets that country’s labor needs. Indirectly, this illegal immigration also induces petty corruption, encourages profitable smuggling opportunities for criminal networks, and perpetuates unfair treatment of the immigrants. Illegal trafficking of human cargo is a lucrative and an established profession in many parts of the world. The number of cases is rapidly increasing in both the developing and the developed worlds. Some people die en route or soon after arrival to the destination country. If they survive the smuggling phase, they are vulnerable to exploitation, intimidation, and abuse (physical, emotional, and sexual) since they are usually isolated and have no one advocating for or protecting them. They tend to have limited (or no) education, a limited capacity to speak and understand the predominant language of the destination country, and cannot go to authorities when exploited or abused because they will be discovered to be illegal. The status of “illegal” also discourages their effective integration into the fabric of the host country. They frequently live in fear of discovery and will attempt to remain invisible in this foreign setting. From the perspective of the developing country, the potential negative outcome of this migration is the increasing economic dependency of the country, and its inhabitants, on those remittances.

The second motivational category of population movement is a combination of economic needs and the need for personal development. This combination is manifested in youth flight from rural areas to urban areas because of the lack or limitations of economic opportunities and the desire to advance socially and economically. In general, there is a large economic gap between the rural and urban populations. The economic base in rural areas is often very fragile, with residents dependent on nature for products and younger generations to provide the labor. Often the youth do not want to follow the paths of their parents. Since opportunities for professional and personal growth are very minimal (the “push”) and the social and professional outlets as well as the “glamour” of the urban areas are tempting (the “pull”), youth flight and minimal return to the area is common. Rural areas are left with a smaller and limited labor force that cannot provide the economic stability necessary for development. The depletion of the labor pool results in reduced production of goods that would generate income. The lack of income results in limited availability of services and resources because resources are not there to pay for the services. New initiatives and opportunities are not forthcoming, so there are virtually no professional and personal growth opportunities for the younger generations.

The third category of population movement involves migration and, more often, emigration to acquire education (the “push”). When the citizens are sent to more developed countries for education, the tendency is for them, when possible, to remain in the host country after the completion of their education. Reasons for this vary from opportunities for economic advancement that often result in remittances to home to the acquisition of knowledge and skills inappropriate or not viable in the home country (the “pull”). For example, a highly skilled advanced computer programmer would have difficulty finding employment in rural Thailand where electricity, if available, would be limited and sporadic, and phone lines may not exist. The longer these original students stay away from their home countries, the more likely they will establish permanent residency in the host country. The result is what is commonly known as “brain drain.” The developing country loses its citizens who could contribute significantly to the development of that country. This problem became rampant in the mid-twentieth century. Developing countries were voicing serious concern and, at times, opposition to the practice of permitting their residents to come to the more developed countries for education and training. It took a period of time for aid donors to effectively address this problem related to educating individuals from the developing countries. The most effective approach was the creation of a training model that emphasized in-country training and/or “training trainers” rather than removing large numbers of citizens from their home country to acquire training and education.

A fourth category of population movement involves infrastructures that enfranchise some and disenfranchise others. Rural residents are forced to leave the area because of overpopulation, lack of empowerment, and limited space. In various parts of Central America, for example, poorer migrants who move from the rural areas to the urban areas are sometimes driven from the lands they once owned for many generations because of the expansion of land estates or the redistribution of lands. Frequently, the redistribution of the land results in a division of plots into such small sizes that subsistence farming is impossible. In El Salvador, this situation has been rampant for a while. The country has the most intense population pressure on the land. The majority of the country’s land is privately owned and devoted to export crops. Since 2003, El Salvador was classified as the country with the highest population growth rate in the world, and there is no unpopulated land left in the country. Many people migrate to the cities, and overpopulation occurs there. Others choose to cross the borders into Honduras in hordes that

ultimately resulted in restrictions on immigration and wars at the border between the two countries.

In deeply depressed rural areas where emigration is large, those people who remain either do not want to leave their birthplace and heritage, despite the insurmountable obstacles, or cannot move to town. The absolute poorest of the poor are often bound to the rural areas and are destined to a life of abject poverty because, by law or custom, they have to work off old family debts that they cannot pay off. They usually have limited or no education and cannot compete with those more educated town dwellers. They also do not have a support system that could sustain them in the town until they could earn enough to be self-sufficient. They have limited or no access to health care, sanitary environments, or infrastructures that enhance or encourage development.

Measures are being introduced to encourage the retention of rural residents. A number of donor organizations are providing fiscal and technical assistance to the rural areas with the intent of improving the living conditions, increasing life chances, and refining (or developing) their entrepreneurial skills and resources.

### **Ethnicity and Cultural Heritage as Factors in Development**

A frequently overlooked aspect of development is ethnicity, with its corresponding cultural heritage and traditions. The beliefs and values of the people directly influence the level of acceptance of new and different approaches to development. Since culture is generally dynamic, there is room for the inclusion of new and innovative approaches to development. The nature and form of the introduction to the people, however, is critical to ultimate acceptance. Vignettes of “lessons learned” and “what not to do” can be cited by most scholars and development agencies. Very often, the connecting thread in these vignettes is the lack of understanding of, and sensitivity to, the cultural heritages of peoples receiving the development initiatives. Without that understanding, initiatives fail, are misinterpreted, or are ineffective. The people do not benefit, the resources are often wasted, and the donors are frustrated.

The culture and demographic characteristics of the population influence the nature, level, and direction of the development. For example, Max Weber, in his seminal work *The Protestant Ethic and the Spirit of Capitalism*, suggested that there is a direct relationship between the religion of a society and the level of

development that society achieves. According to his analysis, Western Protestant societies are more technologically advanced because of their national religion. Unlike some of the other major religions, the Protestant religions placed emphasis on smaller families; a work ethic that encouraged tireless effort, self-sacrifice, and deferred gratification; and a separation of religion and work. With the emphasis on work, accumulation of wealth, and deferred gratification, the larger families become obstacles to development because more resources must be provided for human development, that is for the survival of the people. Fewer resources are available for technological development.

Cultural heritage and traditions also affect the view of birth control. While the expansive need to have a larger family to ensure that some of the members reach adulthood may no longer exist in many developing countries, religious and cultural beliefs often mitigate against effective birth control, thus population control. Numerous religions view fertility as a gift from a deity, and thus something that should not have interference. Families with many children are considered blessed, and efforts to limit the number of children are in direct conflict with religious beliefs and practices. Scholars such as Paul and Anne Ehrlich point out that population increases will occur, and they are determined directly by cultural factors.

### Natural Resources

An obvious outcome of population size, population needs, and development is the impact on natural resources. The larger the population, the more natural resources consumed and the greater the demand on the natural environment and resources. Often the infrastructure must be so concentrated on meeting the basic needs for survival and maintaining order. Throughout the developing world, numerous instances can be cited where the excessive use, and at times exploitation, of the natural resources have resulted in natural disasters. Rapid deforestation in some areas causes the depletion of the necessary topsoil to maintain fertile lands. Extensive soil erosion, sometimes resulting in massive landslides, sometimes follows. The deforestation is often more the result of basic survival than wanton disregard for the environment. In Haiti, for example, where the population is large, the primary source for cooking is charcoal. For the poor, few alternative methods exist for cooking. In the wealthier areas, people are able to buy cooking fuel or use electric/gas stoves; however, the majority of the people in many parts of Haiti do not have

access to these alternative methods. There are areas without electricity, and the people cannot afford cooking fuel. Coupled with the exploitation and destruction of the natural environment is the rapid consumption of endangered resources for basic survival. All of these situations combine to facilitate a rapid decrease in the level and speed of development in the region. An observer needs only to examine countries such as Bangladesh and Haiti for examples. The land is intensively cultivated and, as it becomes depleted, agricultural employment decreases and unemployment increases.

### Summary

There is a clear relationship between development and the characteristics of the population. This relationship is affected by the size as well as the ethnic and cultural characteristics. The three are intertwined. They determine the direction of the development of the economic, natural (environment), and physical resources. Scholars have studied, and continue to study, the variables that impact development. They examine cause-and-effect relationships and provide strategies for altering the existing paths of development. Critical in all of those strategies must be consideration and incorporation of the human factor in all development. It is the human factor, meaning the population with its characteristics and patterns of growth, that determines the rate and level of development because, after all, without people there is no need for or possibility of development.

## POPULISM

### Populism Defined

Populism as an ideology and movement arises in transitional societies experiencing rapid expansion of industrialization and urbanization. Industrialization induces social differentiation, increasing the gap between the rich and the poor, migration of peasants to the cities, and the permeation of urban culture and values. On the one hand, these developments usher in increasing rates of literacy, social awakening, politicization, and mobilization of the masses; on the other hand, they invite the centralization and bureaucratization of power. The destruction of feudal and semi-feudal political and social structures engenders decline of communal bonds and traditional sources of identity. Hence, the increasing integration of global economy and commercialization of culture and its export as a commodity by the countries of the global North induce the loss of autonomy and cultural alienation. Thus, populism with different variations emerges to respond to the popular aspirations for increased political participation and the empowerment of the powerless as well as to provide a resolution to the identity crisis and the affirmation of perceived national "authenticity."

Populism as a movement and an ideology is a multiclass as well as a cross-class phenomenon. In so far as its base of support is drawn from different strata (although the lower classes often constitute the broader and the more solid core of this

base), and in so far as it purports to speak on behalf of "the people" as a whole rather than a distinct class (Marxism), Populist appeal cuts across class lines.

Accompanying this multiple base of support is a monist and Unitarian ideological thrust. In response to the fragmentation and alienation in modern life, the Populists call for a unifying vision that would make the creation of an organic society possible. Populist ideologies tend to glorify the common people and advocate supremacy of the masses over the elite. They also call for the revival of traditional values, defying foreign economic and cultural domination. These salient characteristics of populism are complemented by its eclectic sources of ideological inspiration.

Populists consider the ordinary people and their collective tradition as the source of virtue. Hence, the power that stems from "the people" is perceived to be the only legitimate source of authority. Populists represent a moral outlook rather than a systematic ideology or program. They tend to be antiintellectual, antiestablishment, and aspire to revive the traditional culture. As such, Populists are intensely nationalistic. They oppose foreign domination and "alien" cultural influences. They often promote the revival of folk culture, traditional art forms, and conservative social values. They also romanticize the lower classes as the social groups that personify the authentic national culture and embody superior moral virtues. For example, the Russian Populists, the *Narodniks*, developed a romantic image of the peasantry, envisioning them as pure and the true agents of national salvation and the cornerstone of the future utopia. Similarly, US Populists glorified the farmers and their traditions as the true representatives of unspoiled moral values of an earlier age, uncontaminated by the dross of modernity and urban life. Mexican Populists took a strong interest in Indian culture, glorifying it as the true heir to Mexican national culture and identity. Idealization of traditional culture and celebration of purported superior moral virtues of the poor grounds populism in history and lends Populists legitimacy and a popular following.

Populist ideologies in the Third World are partially evoked by the economic and cultural impact of the West, thus engendering reactive Nationalist response. One of the major manifestations of the Nationalist thrust of Populist movements is demonstrated by the affinity toward traditional cultural values. As a common cultural denominator and the source of primordial loyalties, evocation of such values (including religion) is particularly helpful in unifying the masses, thus, enhancing their mobilization.

The mythical glorification of “the people” as the repository of the noble virtues lends Populist ideologies a messianic aura. Populists promise a new utopia in which the alienated and the oppressed would find a new heaven in the organic and egalitarian society of the future. No longer living a fragmented existence, the individual can become whole again by embracing the new creed, “the political religion,” that would make deliverance and salvation possible. While Williams Jennings Bryan in the United States, Perón in Argentina, Echeverría in Mexico, and Vargas in Brazil (each to a different extent) all drew from Christianity to legitimize their political message, Nasser in Egypt, Ben Bella and Bomedien in Algeria, Qaddafi in Libya, and Khomeini in Iran utilized Islam (again to different extent) to mobilize the masses and wrap themselves in the flag of cultural authenticity.

In order to solidify their base of support, the Populist leaders thrive on patron-client relationships found between the landlord and peasants in agrarian societies. By implementing reforms that would benefit their client groups and political constituency, they establish a dependent paternalistic relationship that ensures them a continued base of support. Perón's dependence on trade unions' unconditional support, Qaddafi's dependence on “people's committees” to keep his political opponents at bay, and Khomeini's support of *Mostazafeen* (dispossessed) all are indicative of this client relationship. Thus, Populist leaders' rhetoric abounds with calls for economic reform, equality, and social justice to ensure the mobilization of their base of support.

Another characteristic of Populism is its purported third path of development between and beyond Capitalism and Communism. The Narodniki's Peasant Commune of Russia in the 1870s, Perón's *Justicialismo* in Argentina in the 1940s and 1950s, Nasser's Arab Socialism in the 1950s and 1960s, Qaddafi's Third Universal Theory and his People's *Jamahiria* in the 1970s and 1980s, and Khomeini's Neither East Nor West policy in the 1980s all attest to this common ideological attribute.

Economically, Populist leaders are opposed to laissez-faire policies. They favor nationalization of major industries and opt for interventionist, regulatory, and egalitarian policies to benefit the poor. This includes land reform, imposition of high tariffs on the imports, bolstering of the domestic industries, state guided growth, protectionism, provision of subsidies, public work programs to cope with unemployment, low-income housing, and other welfare policies. While they borrow from some Socialist principles, they do not favor abolishing of private property (with the exception of Russian Populists).

Their economic policies attempt to soften some of the harsher impacts of Capitalist development rather than abolishing it.

While populism could be economically progressive and forward looking in so far as it promotes economic reform and some measure of equality and protection for the poor, culturally it could be backward looking and reactionary in so far as it gets its source of inspirations from the past and its archaic values.

While ideologically populism advocates rule of the masses over the elite, in reality democratic representation of the people is not necessarily an attribute or a function of Populist movements. The mass mobilization and rule by the majority vote, the two characteristics of populism, is no guarantee for implementation of democratic principles. Indeed, many Populist leaders of the past have been authoritarian demagogues who are masterful in the art of manipulation of the masses. They often replace mass mobilization, initiated and controlled from above, for genuine democratic political participation from below. But in so far as they need to validate their leadership through popular vote, they allow formal political participation, and they favor electoral politics.

What abounds in Populist movements is the emergence of charismatic leaders. Perón, Echeverría, Vargas, Nasser, Ben Bella and Bomedien, Qaddafi, and Khomeini are a few examples. Charismatic leaders often emerge in a crisis milieu, and they are perceived by their followers to have answers to national problems. Their ability to articulate national frustrations as well as suppress mass aspirations and portray an alluring image of a future utopia is the key to their popular appeal. The messianic aura surrounding them and their message, and the use of mass mobilization to intimidate the political opponents, all serve to insulate Populist leaders from the vulnerabilities of mundane politics and keep their charisma intact.

## Populism in Comparative Perspective

Populism as an ideology and movement has had different forms and manifestations in different parts of the world. The discussion that follows attempts to present a selective survey of some of the more prominent Populist movements to date. Russian and American populism emerged in the latter half of the nineteenth century in reaction to dislocations caused by accelerated pace of industrialization and urbanization. In Latin America in contrast, where the process of industrial development occurred later, Populist movements did not appear until the early twentieth

century. In the Middle East, where gaining independence and industrial development came later, populism is a post-World War II phenomenon.

In Russia, the term “populism” referred to the movement of the *Narodniks* in the 1870s. Populism in Russia was closely related to an idealized vision of the peasantry in general, and the peasant commune in particular. In its quest for a uniquely Russian path of development, the Russian intelligentsia romanticized the peasantry as the class that represented superior and pure Russian national virtues. Liberation of peasants from the oppression and exploitation of the Czarist absolutism would put Russia on the path of peasant socialism. Peasant socialism would usher in a third path of development separate from Capitalism and classical socialism. It would overcome Russia’s backwardness without succumbing to the individualism, materialism, and pervasive corruption found in Western societies. The peasant commune would give birth to equality, social justice, harmony, and spiritual wholeness.

As they became aware that their leisure and education had become possible by the toil of impoverished masses, many Russian intellectuals were filled with the feelings of guilt and a sense of moral responsibility and obligation. Many students, for example, left their schools and went to the villages to “join the masses,” experience their sufferings, and shed their “decadent” middle-class values. By joining the masses and arousing their political consciousness, Russian Populists sought to fulfill their moral obligation. By arousing the masses to political action, they aspired to overthrow czarism and to liberate society from the stifling grip of absolutism, thus emancipating themselves as a persecuted minority as well.

The major paradox of Russian populism was that it was not a movement of “the people,” that is of the peasantry that constituted the vast majority of Russian population. Rather, it was a movement of radicalized and alienated intellectuals who projected their hopes and dreams unto a perceived revolutionary potential of peasantry.

Populism in the nineteenth- and early twentieth-century United States was the ideological banner of a declining peasantry whose prominence and livelihood as a class was threatened by the insurgent forces of industrial capitalism. It was the ideological banner of farmers and small producers. The main base of support for the Populists was in the South and the Midwest. The two antecedents of American populism were centralization of power in the commercial and political centers of the northeast and the domination of the South by the North. On the cultural level, the old values were disappearing, yet the new ones were still alien. This identity crisis and cultural alienation

induced a longing for the past folk traditions among farmers and more traditional social layers. US populism expressed the agrarian sentiment for a return to social wholeness, self-government, and public authority. Industrialization and centralization of power in the Northeast meant that the agrarians, who were extolled as the backbone of the United States by its founders, romanticized by Jefferson, and glorified by Jackson, now faced the danger of economic ruin and political decline.

Although Russian and US populism were two entirely different movements—one a populism of the intelligentsia and primarily an urban movement and the other an agrarian movement—both can be regarded as agrarian populism. Russian populism was inspired by the image of peasantry, and the majority of recruits to US populism came from the ranks of farmers. One major difference between these two diverse forms of agrarian populism was that the US Populists, unlike their Russian counterparts, were not socialistic in their view of private property. Furthermore, the religious nature of populism in the United States was far stronger than its Russian counterpart.

William Jennings Bryan, the most distinguished leader of the Populist Movement in the United States, was deeply religious. Bryan’s message was always moral, and his followers were primarily “the bible people.” Biblical metaphors abounded in his writings, and he often accused his political opponents of being “sinners.” But beyond its religious form, US populism combined agrarian radicalism, a tradition of Jeffersonian grassroots democracy and Jacksonian faith in the common man.

Although US populism as an organized movement did not last more than fifteen years, many regard the legacy of US populism to be the source of reforms enacted later by the Progressives during the period of 1901 through 1914. Hence, the watering down and the adaptation of the platform of the people’s party (1892–1900), the major Populist Party in the United States, by the Democratic Party did not hinder the assimilation of many of its programs and agenda as the major fixture of US politics for years to come. Neither did it prevent the emergence of such a local strong man as Huey Long, the Populist senator and the governor of Louisiana who emerged as the powerful leader of the South in 1930s. Long attacked the big corporations and promised to distribute their wealth among the poor. He was intolerant of criticism and had a strong contempt for the constitutional and judicial processes.

Latin America also has a rich tradition of Populist politics. Latin American history from the 1920s through the 1960s has been deeply influenced by Populist movements and ideologies. Among the most

## POPULISM

renowned Populist leaders of Latin America are Perón from Argentina, Vargas from Brazil, Echeverría from Mexico, Haya de la Torre from Peru, Ibarra from Ecuador, and Estensorro from Bolivia; these men and their policies are a few examples of the rich Populist tradition of the region.

Latin American populism was induced by the economic prosperity of the 1920s, which led to the acceleration of the metropolitan revolution throughout the region from the end of the nineteenth century onward. Urbanization and the expansion of literacy heightened the level of interest in politics and ushered in the entrance of the lower classes in the political arena.

There are two distinct periods in Latin American populism. First is the period between World Wars I and II. Second is the post-World War II period. In the first phase, Populist movements were concerned with legitimate representation, thus characterized by reformist politics. In the next phase, the Populist movements became more radicalized, addressing issues such as distribution of wealth, economic growth, and political development. Hence, policies that would promote aid for the poor, social integration in the face of differentiation in modern societies, equality, social justice, and democracy became widely popular.

Vargas, the Populist leader of Brazil from 1930 to 1945, launched a campaign that encouraged mobilization of workers and peasants and introduced a welfare program to benefit them. Vargas was highly authoritarian and strongly opposed the Communists as well as Western influence. He revived traditional values and encouraged patriotism and nationalism. Having suppressed his liberal and left-wing domestic foes successfully, he developed an elaborate network of patron-client based relationships on the local and state levels. The beneficiaries of this new client system guaranteed his regime a solid base of support. Consequently, the consolidation of power in this way made the use of force less necessary.

Perón, the president of Argentina from 1946 to 1955, drew his base of support primarily from the workers and peasants. His political opponents, for the most part, came from the ranks of the middle and the upper classes. He enacted several reforms that benefited the urban and rural poor and campaigned against big business and foreign imperialists. Perón termed his philosophy *Justicialismo*, or the “third position,” between capitalism and communism that favored neither the Yankees nor Soviets. *Justicialismo* not only grounded Perónism in Argentine nationalism but also distinguished it from fascism.

Middle Eastern populism is primarily a post-World War II phenomenon. While the region had experienced Islamic Revivalist, Constitutionalist, and

Nationalist movements in the late nineteenth and early twentieth centuries, only with the postindependence political and cultural awakenings and the acceleration of the urban revolution does one witness the systematic emergence and popularity of Populist ideologies since the 1950s.

Middle Eastern populism synthesized nationalism, anti-imperialism, elements of socialism, and Islam (to varying degrees). As such, it provided a nativist ideology, a third path of development that would distinguish the region from the Eastern (Communist) and Western (Capitalist) ideological and political hegemony.

Nasser, the charismatic Populist leader of Egypt in the 1950s and 1960s, came from peasant origins and was passionately committed to improving the condition of the poor. His ideology synthesized anti-Imperialism, Nationalism, Pan-Arabism, and “Arab Socialism.” Although he was a secular leader, when necessary, he used Islamic symbolism to wrap his political message in the flag of cultural authenticity. For example, after the Egyptian defeat in the 1967 war against Israel, Nasser chose to address the crowd from the pulpit of the al-Azhar Mosque in Cairo.

Domestically, Nasser nationalized the major industries and collectivized some of the land of the richest landowners. While not opposed to private property, he was against “exploitative ownership.” While he opposed the sector of the Capitalist class that was dependent on foreign capital, he supported the gains of the domestic Capitalists.

Internationally, Nasser promoted the idea of positive neutralism and nonalignment. He negotiated with the British to gain Egypt’s independence in 1954, and in 1956 after nationalizing the Suez Canal, he fought the combined armies of the British, the French, and the Israelis in which he lost the battle but won the hearts and minds of the popular masses throughout the Arab World. Consequently, Nasser emerged as the strong advocate of Pan-Arabism. He wanted to restore the Arab pride and national identity as well as foster Pan-Arab unity. His firebrand Nationalist rhetoric evoked an overwhelmingly positive response throughout the Arab World. It provided a remedy for the sense of wounded dignity that many Arabs had experienced due to a history of colonial and semicolonial domination.

His immense popularity notwithstanding, Nasser was intolerant of his political opponents on the Right (Muslim Brotherhood) and the Left (the Communists). He had several leaders of both parties executed and many of their members imprisoned and tortured. He was the prototype of Arab Populist charismatic authoritarian leaders who followed him. Indeed, “Nasser’s Revolution” inspired other movements in

the Arab world, such as the Algerian Revolution of 1954 and the Libyan Revolution of 1969.

The Algerian revolution of 1954–1962 was a Nationalist movement against French Colonial rule. On assuming power, Ben Bella, the first Populist leader of the revolution, implemented a system known as “Autogestion,” a system of workers’ management through popularly elected representation. Autogestion was designed to transform the colonial economy into a “socialist economy.” The new leaders declared compatibility of Islam, nationalism, and Marxism.

Ben Bella like his predecessor, Nasser in Egypt, banned all political parties. In 1963, he drafted a new constitution that gave him enormous powers as the head of state, the commander in chief of the armed forces, and the General Secretary of the National Liberation Front or the *Frente de Liberacion Nacional* (FLN), the party that led the Algerian Revolution. Ben Bella’s attempt to consolidate all the power in his own hands and curb the influence of the army, led to a *coup d’état* in 1965 by Minister of Defense Houari Boumédiène.

Boumédiène dissolved the national assembly and suspended the constitution. The eleven years of rule by decree that followed effectively began the era of authoritarian populism in Algerian politics. From 1965 until the election of the national popular assembly in 1977 and the creation of FLN political bureau in 1979, all executive and legislative powers were concentrated in the Algerian Council of Revolution and the Council of Ministers, both headed by Boumédiène. Hence, it was only in 1976 that a new constitution was approved by a referendum; Boumédiène, as the sole candidate of the only legitimate party, the FLN, was formally elected as president for six years. Boumédiène began an extensive campaign, nationalizing the major industries and banks. To expand the state penetration of the civil society, in 1967 Boumédiène established communal (township) assemblies. These institutions were complemented by Waliya (provincial) assemblies in 1969. In 1971, he initiated extensive land reform, silencing the land owners’ resistance in the process. These reforms were designed to improve the lot of the impoverished masses.

Internationally, Boumédiène opted for nonalignment and Third World solidarity, supporting the movements of national liberation. In an attempt to give Third World nations better control over their resources, Algeria played an active role in creating the Organization of Petroleum Exporting Countries (OPEC) and developing its policies. Algeria also took a leading role in the North–South dialogue, calling for a new international economic order.

In 1969, a young army officer named Muammar Qaddafi led a revolt of “free officers” that overthrew King Idris and abolished the monarchy, replacing it with the People’s Republic. Qaddafi’s political philosophy, referred to as the Third Universal Theory, is articulated in his Green Book. The Green Book criticizes Capitalism and Socialism and presents an alternative path.

Qaddafi’s Populist message has endeared him particularly among the lower classes. Qaddafi’s charisma is rooted in his humble origins and his strong identification with Islamic and Arab identity. He mingles freely with the masses, often resides in a tent, and drives his own car. He admires the virtues of rural Libya and is a champion of Arab unity and solidarity.

Once in power, Qaddafi banned all political parties and created a single monopolistic political party called the Arab Socialist Union. To mobilize his base of support, he created People’s Committees and their armed detachments, People’s Militias, as instruments of “Direct Democracy.” But, in reality, these organizations came under the direct control of Qaddafi and his supporters. When these committees became organs of independent power, they were dissolved.

Economically, Qaddafi implemented extensive nationalization of major industries and imposed state control and regulation. Private property was tolerated as long as it remained “nonexploitative.” He proposed abolishing the wage system in favor of granting workers a share of production proportionate to their contribution to the production effort. He also promoted workers’ control and self-management of many industries and created state-controlled supermarkets in an attempt to prevent the escalation in rising food prices. Qaddafi’s other reforms included reducing rents, providing affordable mass housing, doubling the minimum wage, and converting foreign banks into Libyan joint stock companies.

In 1973, he launched his Cultural Revolution. He declared the Islamic law, the Shari’a, to be the only source of law and himself as the sole arbiter and interpreter of religious issues, thus elevating himself as the political as well as the spiritual leader of his people. By closing the nightclubs, banning alcohol, and restricting the non-Muslim religious institutions, he gained the critical support of the clergy. Qaddafi, however, has proven to be highly intolerant of both secular and Islamic opposition, and he does not hesitate to use repression to silence them.

When the Islamic Revolution of 1979 brought the clergy to power, they drafted a new constitution that defined the goal of the revolution as a movement aimed at the triumph of all “the oppressed over the oppressors.” This Populist tone not only reflected the

composition of the movement that overthrew the monarchy but also the ideology of its leadership led by Ayatollah Khomeini. After the revolution, the new regime confiscated the property of those who fled the country and nationalized major industries, including banks, factories, insurance companies, foreign trade, and undeveloped land. Hence, a housing foundation was created to build affordable accommodations for the poor. Some of the shanty town residents were allowed to take over the luxurious houses of the prominent members of the former regime.

The new regime also built a wide array of institutions to buttress its support among the popular masses. Among such institutions were revolutionary committees (*komitehs*) that were spontaneous mass-based organizations that sprang up throughout the country right after the revolution. Another important institution was the revolutionary guards. They became the main alternative to the regular army, which was mistrusted by the regime. If the revolutionary guards provided the regime with a military arm, *bonyAd-e mostaza'fan* (the foundation of the dispossessed) became the financial arm of the regime. This organization confiscated and administered the property of the royal family and other officials of the Shah's regime on behalf of the downtrodden and provided many financial services for the poor. Hence, the institution of Friday Prayer (*Imam Jom'ae*) allowed Ayatollah Khomeini to appoint his relatives, former students, and associates to key positions of power. They in turn informed him of mass sentiment in the provinces and took his messages directly to the people in an attempt to expand and consolidate his base of support.

Ayatollah Khomeini's charismatic authority and his credentials as the spiritual and political leader of the revolution legitimized these institutions as the organs of people-clergy power. His effective use of Shi'ite mythology and sacred traditions rendered his message communicable to the ordinary people. For the laity, he personified the link of historical continuity with their past and resolved their cultural anxiety and identity crisis in a rapidly changing world. Many of them identified with his simple lifestyle, religious vision, and traditional values. His politicized interpretation of Shi'ite Islam proved to be a potent political force. As a common cultural denominator, it could be used to unify and mobilize the people. Hence, his forceful personality kept the heterogeneous clerical coalition together. His depiction of the descending utopia as a "unitarian classless Islamic society," in which justice and virtue reign, and worldly and heavenly salvation can be attained, created hope in the midst of a hopeless situation. He repeatedly referred to the "dispossessed" as the people who have

sacrificed the most for the revolution and are its true heirs. By championing their cause, Khomeini developed a sense of mutual identification between himself and the popular masses. Khomeini's populism, however, was decidedly authoritarian, as he consolidated much of the power in his own hand. He was the ultimate interpreter and implementer of the Islamic law, the commander in chief of the armed forces, and the ultimate authority on all religious and policy matters. Under his theocratic rule, political opponents were suppressed, and civil and democratic rights were restricted.

In the realm of foreign affairs, Khomeini's Neither East, Nor West policy grounded him in nationalism and nonalignment. Whereas Iran's relation with the West deteriorated, its economic and political relations with the Third World nations in general and Islamic nations in particular expanded considerably. Khomeini also promoted Pan-Islamism in an attempt to export Islamic revolution elsewhere in the region. These policies changed considerably in the post-Khomeini era.

## POVERTY: DEFINITION AND TRENDS

### Conceptualizing Poverty

The concept of poverty has many interpretations. The diversity of interpretations is caused by time and space factors, culture, and conventions of the society (Hobsbawm 1972) and philosophical worldviews. "Poverty" expresses many connotations and has always had a relevance to notions like deprivation, insufficiency, deficiency, and the like. It is viewed as an age-old social malaise, a complex socioeconomic state that characterizes any particular individual or families in a given society. Poverty takes different forms in different societies and varies over time and across cultures. Since all societies are, more or less, stratified according to some criteria, the consequence is that somebody always has to be at the bottom; whether this bottom layer is an expression of poverty and the people inhabiting this bottom layer are considered poor, depends on indigenous definition of poverty (Oyen 2003). However, the understanding of poverty and its measurement and analysis is crucially important for a number of purposes. The main purposes are to understand the situation of poverty, to find the factors that determine that situation, to design interventions best adapted to the issue, and to assess the effectiveness of current policies and determine whether the situation is changing (World Bank 2002).

### Worldview of Poverty

Poverty is seen from different worldviews. In one worldview, poverty is seen as lack of distribution of income with equity. This is mostly the case with developed countries where poverty occurs due to problem of distribution of income or resources rather than total amount of national income. In an opposite worldview, poverty in poor or developing countries is seen as lack of creation of income coupled with economic underdevelopment. Another worldview of poverty involves "moneylessness" and "powerlessness." Moneylessness means not merely an insufficiency of cash but a chronic inadequacy of all types of resources to satisfy such basic human needs as nutrition, rest, warmth, and bodily care. Powerlessness, however, means a lack of opportunities and choices open to the poor whose lives seem to be governed by forces and persons outside their control, such as by people in position of authority (Tussing).

However, the dominant worldview of poverty that has attained much attention in poverty literature regards "absolute" and "relative" poverty. Absolute poverty means absolute deprivation or starvation. It illustrates a people or family who simply does not have enough to eat and sustain itself. People living in absolute poverty are usually characterized as undernourished, illiterate, and prone to diseases and have high infant mortality and low life expectancy. Absolute poverty is common in the poorer Third World countries. Relative poverty, on the other hand, refers to a low standard of living compared to the average standard. In industrial countries, relative poverty is essentially a measure of inequality. Thus, relative poverty varies from country to country and from time to time.

A different worldview of poverty is moral poverty. It goes beyond material well-being and emphasizes the holding of a value system for equal access to opportunities and egalitarianism. It means the abolition of social inequalities along with the universal elevation of a standard of material life attained by the upper strata of the society.

### Definition of Poverty

Based on different worldviews, the definition of poverty may vary. Interestingly, however, sociologists, economists, and philosophers also might not come under a common umbrella in defining the concept of poverty. The problem in defining poverty has further been aggravated with widened ideas attached to it.

Before attempting to define poverty, it is necessary to distinguish those who are poor from those who are not poor. The common method is to classify an individual as poor based on a set of consumption norms that he or she cannot meet. However, it is not simple either conceptually or empirically to specify a set of such norms. Even if there were the agreement that the minimum amount of food, clothing, and shelter needed to sustain life should constitute a universal set of norms, these minimal requirements could not be either unambiguously defined or easily quantified. Besides, the minimum energy from food needed to sustain the basic bodily functions of an individual of a given age, sex, height, weight, and activity is not a constant (ADB 1992). This inability to identify a constant is the reason why it is often argued that universal poverty norms are not feasible to develop and, rather, that they are very time, space, and culture specific.

Still scholars have attempted to define poverty with a universalistic approach. One such universally

accepted notion is that poverty is “a matter of deprivation” (Sen 1981). The deprivation is premised on social norms and varies substantially as noted earlier through time and space. With this view in mind, poverty in developing countries can indicate absolute deprivation, infringing on basic sustenance of life, whereas poverty in developed countries can indicate relative deprivation, meaning a lack of ability to afford a standard of living enjoyed by a reference group with higher incomes (Quibria 1991).

The concept of deprivation, however, has evolved through time. With rapid industrial growth and advancement in communication and technology, the global economy has changed remarkably. This increased global economy has given birth to the notion of deprivation in its relative sense. At the beginning of the twentieth century, the prevailing notion in today’s developed countries was one of failure to meet basic nutritional and biological requirements for the sustenance of life. Rowntree (1901) noted that “primary poverty . . . [means] earnings insufficient to obtain the minimum necessities for the maintenance of merely physical efficiency.” This definition of poverty relates to a concept of absolute poverty as it is employed in developing countries today. In developed countries, with increasing material wealth, this definition has lost a good deal of its significance. The specter of hunger and poverty has been, more or less, banished from most of these economies. Poverty, in most advanced industrial nations, is now a matter of deviation from social and economic norms. In other words, as the threat of starvation has receded from the scene, poverty is being interpreted in advanced countries in relative terms.

Some contemporary scholars have also attempted to redefine poverty as incorporating the issues of gender, environment, and easy access to private and public goods. Lipton and Maxwell write that the concept of poverty has:

Been broadened, beyond the notions of inadequate private income or consumption, toward a more comprehensive perspective: absence of a secure and sustainable livelihood . . . [which] allows us to measure and evaluate the level and vulnerability—and freedom from bias by gender and age—of individuals’ access to privately and publicly provided goods and services and to common property. (1992: 10)

However, in a different light, poverty is also viewed as a politically sensitive theme while compared to the concept of inequality. Inequality is a relatively safe theme, for after all there are many positions, philosophical and political, in relation to inequality. It may be viewed as necessary, inevitable, or even beneficial in relation to a particular mode of progress.

According to a classic liberal view, inequality of outcomes may be acceptable as long as there is equality of opportunity. Poverty, on the other hand, is politically sensitive and challenging, for it undermines social cohesion; hence, the conceptualization and measurement of poverty are matters of political dispute (Wilson 1996).

### Measuring Poverty and the Poverty Line

There are many standards available to measure poverty both at country and global levels. Measurement of poverty in a systematic fashion was pioneered by Booth and Rowntree in the late nineteenth century. Later on, some other scholars like Galbraith (1958), Harrington (1960), Orshansky (1965), and A.K. Sen (1973) as well as various international organizations like International Labour Organization (ILO), World Bank, and United Nations Development Programme (UNDP) have done much research to devise more appropriate measures for accurate and scientific quantification of poverty.

At first, obtaining a measurement requires drawing a poverty line. The poverty line is defined as the minimum acceptable standard of living for the society. It is essentially a cut-off point that separates those in poverty from the rest of the population. A poverty line generally comprises two elements: (i) the expenditure necessary to buy a minimum standard of nutrition and other basic necessities and (ii) a further amount that varies from country to country, reflecting the cost of participating in the everyday life of society. The first element can be calculated in a straightforward manner. The cost of minimum adequate caloric intakes and other necessities is estimated from the prices of the goods that constitute the consumption bundles of the poor. The second element, however, is subjective and varies with per capita income—that is, the richer a country, the higher is its poverty line (Nixon 1996). For example, in the United States, since the 1960s, the federal government has established a poverty line to designate people officially regarded as poor. The line is fixed by calculating the average cost of food that average-sized families need for minimum nutrition. This figure is then tripled to cover the minimum cost of clothing, housing, medical care, and other necessities. The official poverty line for a family of four in 1996 was set at \$16,036. By that measure, in that year, about 14% of the population—about 36.5 million people—were defined as living in poverty (US Bureau of the Census, 1998).

However, to measure poverty at the global level, the same reference poverty line is used, expressed in a common unit across countries. Therefore, for the purpose of global aggregation and comparison, the World Bank uses reference lines set at \$1 and \$2 per day, more precisely at \$1.08 and \$2.15 in the 1993 Purchasing Power Parity [PPP] terms (World Bank 2005). The most common measure of poverty is the head-count measure, often expressed at  $H$ , given by the proportion of the total population that happens to be identified as poor and as falling below the specified poverty line income. If  $q$  is the number of people who are identified as being poor and  $n$  the total number of people in the community, then the head-count measure  $H$  is simply  $q/n$  (Sen 1999). The  $H$  ratio makes a nondiscriminatory, “gross-category” approach in measuring the number of people who are below the poverty line (Ghosh 1994). In view of the shortcomings of the  $H$  ratio, Sen uses the  $P$  index to measure poverty. Sen examines the income shortfall of each person from the poverty line. A weighted norm of the income shortfalls of the poor can be viewed as a measure of poverty. Sen uses a simple method in which he takes the rank values of the poor in the income ranking as the weights to be put on the income shortfalls of different persons within the category of the poor. It is an absolute measure of poverty using “rank order weights” on the basis of gaps in the income of the poor, where more weight per unit is attached to lower incomes (Sen 1973). Another frequently used measure of poverty is the Gini coefficient that basically measures the level of inequality within societies and applies on a global scale as well.

### Trends of Poverty

Poverty has always been associated with humanity throughout many civilizations. With the advance of time, industrial growth, and scientific and technological innovations, the trends of poverty have shifted their routes with many ups and downs in different epochs of human history. “Poor,” as is considered of some people in society, is perhaps the result of stratified societies where upper and lower strata coexist and have direct contact with each other. In medieval legal terminology, poverty is seen as lower strata, and people belonging to those strata are regarded as *arme liute* (poor people). Before the turn of twentieth century, the changes in trends of poverty were basically conceptual. For example, in preindustrial societies, poverty (more specifically pauperism) was seen as abnormal and called for remedial action. In fact, the

traditional “policy of provision” that imposed on the public authorities the duty to provide regular food supplies at reasonable prices, rather than the “poor law,” is the ancestor of modern welfare policies (Hobsbawm 1972). This perception was slightly changed in the industrial era, during which the lower and upper strata of the society were recognized as socioeconomic classes. In this time, the poor, often recognized as the working class (proletariat) who were employed for wages, developed a specific form of supralocal organization that called for the protection and advancement of living standards insofar as these depended on employment. The early phases of industrialism saw an unusual crisis of extreme poverty. The trend in perception of poverty in this period was that the actual needs of the poor lied in the formulation of public policy. Before this time, no criterion of poverty was usually recognized other than destitution and positively asking for relief.

Beginning in the late nineteenth century, a socialistic approach slowly took its roots with an emphasis on pro-poor policy formulation that abandoned self-regulated capitalist economy. Due to growing political influence of the poor and the appearance of planned Socialist economies, the problem of extreme poverty in that period was considered a wider social problem, which gave emphasis to providing all citizens with a minimum standard of living at all levels. Thus, special “poor laws” that existed in that time disappeared, as in Britain in 1929 (Hobsbawm 1972). However, quantification of “poor” or inquiring into the “state of the poor” was started in Britain in the late eighteenth century and has received impetus with a firmer statistical base since the 1830s. From the late nineteenth century, the trends of poverty started to be identified with a statistical quantification, and poverty measure and the official poverty line began to take shape.

The trends of poverty in the twentieth century are characterized by rapid industrial growth and speedy technological advancement yet a huge gap between the lower and upper strata of the society. The basic factors responsible for such gaps or global inequality in the second half of the twentieth century were, according to UNDP, (i) rapid economic growth in already rich countries in Western Europe, North America, and Oceania relative to most of the rest of the world; and (ii) slow growth on the Indian subcontinent until the late twentieth century and consistently slow growth in Africa (UNDP 2002). Poverty during this period was reduced in an accelerated pace, and the per capita income jumped to a high status compared to any other time in history, but the status of inequality did not lessen but rather increased with big strides.

Summarizing the findings of an econometric study for the World Bank, Pritchett notes “the ratio of per capita income in the richest versus the poorest country (between 1870 and 1989) has increased by a factor of six and the standard deviation of GDP per capita has increased between 60% and 100%. (Pritchett, 1995).” If the distribution of wealth between countries continues to diverge, Castells observes, the average living conditions of the world’s population, as measured by the United Nations Human Development Index, overall have improved steadily over the past three decades since 1970s (Castells 2000). This improvement is due, primarily, to better educational opportunities and improved health standards, which translate into a dramatic increase in life expectancy that in developing countries went up from 46 years in the 1960s to 62 years in 1993 and 64.4 years in 1997, particularly for women (UNDP 1996). But the evolution of the income gap presents a different picture from a global perspective as well as from a comparative perspective when looking at specific countries.

The first major overall gap in human inequality emerges in the wake of the Industrial Revolution and has been widening ever since. Estimates of income gap between the fifth of the world’s people living in the richest country and the fifth in the poorest are as follows: 1820: three to one; 1870: seven to one; 1913: eleven to one; 1960: thirty to one; 1990: sixty to one; 1997: seventy-four to one (UNDP 1999). Since 1970s, globally speaking, there has been inequality and polarization in the distribution of wealth at a very fast rate. According to UNDP’s 1996/1999 Human Development Reports, in 1993 only \$5 trillion of the \$23 trillion (US dollars, USD) global gross domestic product (GDP) were from the developing countries even if they accounted for nearly 80% of total population. The poorest 20% of the world’s people have seen their share of global income decline from 2.3% to 1.4% in the past thirty years. Meanwhile, the share of the richest 20% of people in the world has risen from 70% to 85%. In 1994, the assets of the world’s 358 billionaires (USD) exceeded the combined annual incomes of countries with 45% of the world’s population. The concentration of wealth at the very top accelerated in the second half of the 1990s: the net worth of the world’s two hundred richest people increased from \$440 billion to more than \$1 trillion (USD) between 1994 and 1998.

Thus, in 1998, the assets of the three richest people in the world were more than the combined gross national product (GNP) of the forty-eight least developed countries, including 600 million people (UNDP 1999). The gap in per capita income between the industrial and the developing worlds tripled, from \$5,700 in 1960 to \$15,000 (USD) in 1993 (UNDP

1996). Between 1960 and 1991, all but the richest quintile (of the world’s people) saw their income share fall, so that by 1991, more than 85% of the world’s population received only 15% of its income—yet another indication of an even more polarized world (UNDP 1996). This polarization and the trend of inequality continue to increase even after the world reached a new millennium. Milanovic finds some startling statistics, taking into account inequality within countries and using PPP exchange rates. The most recent available estimates are for 1993, but stagnation in the poorest countries and robust growth in many of the richest countries imply that these are unlikely to have improved. Milanovic estimated that the world’s richest 1% receive as much income as the poorest 57%. The richest 10% of the US population has an income equal to that of the poorest 43% of the world. Put differently, the income of the richest 25 million US citizens is equal to that of almost 2 billion people. His calculation also estimates that the income of the world’s richest 5% is 114 times that of the poorest 5% (Milanovic 2001).

However, the statistics of intracountry inequality also show considerable disparity in different areas of the world. Since the 1980s, income inequality has increased in the United States (Fischer *et al.* 1996), United Kingdom (Townsend 1993), Brazil, Argentina, Venezuela, Bolivia, Peru, Thailand, Russia (UNDP 1996), Japan (Bauer and Mason 1992), Canada, Sweden, Australia, Germany (Green *et al.* 1992), and Mexico (Skezely 1995), just to cite a few relevant countries. But income inequality decreased in the 1960–1990 period in India, Malaysia, Hong Kong, Singapore, Taiwan, and South Korea (UNDP 1996). In addition, according to data elaborated by Deininger and Squire, the level of income inequality can be compared, measured by the Gini coefficient, among the major regions of the world between the 1990s and the 1970s; in 1990, it was much higher in Eastern Europe, somewhat higher in Latin America, but lower in all other regions when analyzed at a highly aggregate level (Deininger and Squire 1996). The Gini coefficient remained for Latin America as a whole at about 0.58 throughout the 1990s, thus reflecting the highest level of inequality among major regions in the world (Castells 2000).

Yet, while allowing for a certain range of trend variations in different countries, a predominant trend toward increasing inequality has been shown between the late 1970s and the mid-1990s. In examining the level of inequality, Castells observes the United Kingdom to be the fastest growing. But what is particularly striking is that the two other countries with rapidly increasing inequality are Sweden and Denmark, which were until recently egalitarian

societies. If Japan is added to the same category of fast-growing inequality in societies with low levels of inequality, this observation would suggest the hypothesis of a structural trend toward increasing inequality in the network society. On the other hand, Finland, a very advanced network society, did not follow the trend of its Scandinavian neighbors, and Italy significantly reduced inequality. If Spanish and Portuguese data were included in the table, they would show a pattern of stable, moderate inequality. Transition economies in Eastern Europe and the Commonwealth of Independent States (CIS) experienced, in the 1990s, the fastest rise in inequality ever. By the end of the twentieth century, the income share of the richer 20% was 11 times that of the poorer 20% in Russia (UNDP 1999).

In the mid-1990s, taking as the extreme poverty line a consumption equivalent of \$1 a day, 1.3 billion people, accounting for 33% of the developing world's population, were in misery. Of these poor people, 550 million lived in South Asia, 215 million in sub-Saharan Africa, and 150 million in Latin America (UNDP 1996). In a similar estimate, using a \$1 per day dividing line for extreme poverty, the ILO estimated that the percentage of the population below this line increased from 53.05% in 1985 to 54.4% in 1990 in sub-Saharan Africa and from 23 to 27.8% in Latin America; the percentage decreased from 61.1 to 59% in South Asia and from 15.7 to 14.7% in East/Southeast Asia (not including China). According to the UNDP, between 1987 and 1993, the number of people with incomes of less than \$1 (USD) a day increased by 100 million to reach 1.3 billion. If the level of income of less than \$2 a day is considered, another 1 billion people should be added to this list. Thus, at the turn of the millennium, well over one-third of humankind was living at subsistence or below subsistence level.

In addition to income poverty, other dimensions of poverty are even more striking: in the mid-1990s, about 840 million people were illiterate, more than 1.2 billion lacked access to safe water, 800 million lacked access to health services, and more than 800 million suffered hunger. Nearly one-third of the people in the least developed countries—mainly in sub-Saharan Africa—were not expected to survive to the age of forty. Women and children suffer most from poverty: 160 million children under five were malnourished, and the maternal mortality rate was about five hundred women per one hundred thousand live births (ILO 1995). The largest concentration of poverty was, by far, in the rural areas: in 1990, the proportion of the poor among the rural population was 66% in Brazil, 72% in Peru, 43% in Mexico, 49% in India, and 54% in the Philippines (ILO, 1994). As for

Russia, the CIS countries, and Eastern Europe, a report issued by the World Bank in April 1999 calculated that there were 147 million people living below the poverty line of \$4 (USD) a day; the equivalent figure for 1989 was 14 million.

Thus, overall, the ascent of informational, global capitalism is indeed characterized by simultaneous economic development and underdevelopment as well as social inclusion and social exclusion, in a process very roughly reflected in comparative statistics. There is polarization in the distribution of wealth at the global level and differential evolution of intra-country income inequality, albeit with a predominantly upward trend toward increasing inequality and substantial growth of poverty and misery in the world at large and in most—but not all—countries, both developed and developing. However, the patterns of social exclusion, and the factors accounting for them, require a qualitative analysis of the processes by which they are induced.

## POVERTY: IMPACT ON DEVELOPMENT

The term "poverty" can be used in relation to a wide range of phenomena that relate to a lack or deficiency. In relation to development issues, the meaning of "poverty" is most often confined to material poverty in respect of money, goods, and services (such as education or health care). In everyday usage, the term "poverty" is used to mean a shortage of income.

More accurately, one could say that poverty is a condition where an individual is unable to secure the things that he or she needs to survive. Development literature stresses the multidimensionality of poverty; in addition to material consumption, the aspects of health, education, social life, environmental quality, and spiritual and political freedom all make up human well-being. In other words, poverty is pronounced deprivation in human well-being: to be poor is to be hungry, to lack shelter and clothing, to be sick and not cared for, to be illiterate and not schooled, and to be socially excluded. Poor people are also more vulnerable to adverse events outside their control. In most cases, poor people are unable to plan for the future with any degree of certainty, and they are often mistreated by the institutions of state and society and excluded from voice and power in those institutions. In some sense, poverty could then be seen as the contrast to development, though development and poverty are not opposites. Poverty is a condition, while development is a process or, rather, a set of processes; and "development" refers often to processes that aim to reduce "poverty."

Nevertheless, the processes of economic development (such as the development of industries, the creation of new jobs and forms of employment, the extension of global trade, and the transition from rural to urban life) have not been able to overcome the global inequalities between the world's rich and poor. Poverty still remains a problem of huge proportions: of the world's 6 billion people, 2.8 billion live on less than \$2 (USD) a day and 1.3 billion live below the World Bank's poverty line, that is, on less than \$1 a day. Each year, some 18 million of them die prematurely from poverty-related causes. About eight out of every one hundred infants do not see their first birthday. This is one-third of all human death, about fifty thousand every day. It is estimated that nine of every one hundred boys and fourteen of every one hundred girls who reach school age do not attend school. Nearly 900 million adults still cannot read or write. Poverty is also evident in poor people's social exclusion and in their extreme vulnerability to ill health, economic dislocation, personal violence, and natural disasters. The scourge of HIV/AIDS, the frequency and brutality of civil conflicts, and rising disparities between affluent countries and the developing appear to further widen the gap between the rich and the poor.

### Absolute and Relative Poverty

The question remains of how such severe and extensive poverty can exist while there is great and rising

affluence elsewhere. The average income of the citizens of affluent countries is about fifty times greater in purchasing power than that of the global poor. The latter 2.8 billion people together have about 1.2% of aggregate global income, while the 903 million people of the “high income economies” together have 80%. Shifting merely 1% of aggregate global income, \$312 billion annually, from the first group to the second could eradicate severe poverty worldwide. Instead, developed countries spend \$600 billion a year on defense and \$300 billion in direct and indirect agricultural subsidies, while official development assistance from all nations of the Organization for Economic Cooperation and Development (OECD) during 2002 represented only \$56 billion (about 0.22% of total gross domestic product or GDP of those nations).

The paradox of wealth and poverty leads us to the question concerning the relativity of poverty. Poverty can be understood both in absolute as well as in relative terms. “Relative poverty” is the comparison of one person’s wealth with another. When poverty in affluent and developed nations (though not all) the concern is relative poverty. People might be, or at least regard themselves, as poor in comparison to their more affluent neighbors who may own more material assets. They might have low self-esteem and feel they do not meet the expectations of their communities, despite the fact that their income may be well beyond the minimum needed to survive and their material wealth is ten times greater than that of the world’s poorest people. Most citizens of the industrialized countries in comparison to people in the developing world are very wealthy. For example, gross national product (GNP) per capita in the United Kingdom is around \$8,460 (USD), while in Ethiopia the amount is closer to \$110. This would make the average person in the United Kingdom around seventy-six times wealthier than the average Ethiopian.

While people live in absolute poverty in every country of the world, the numbers and proportions are far greater in the developing world. In the global context, and particularly in relation to the development of poor nations, a discussion of poverty means “absolute poverty.” If the focus is on the poorest quarter of humanity (including very few indeed in Europe or North America), then the poverty is one of an absolute sense of severe deprivation of, for example, food, shelter, education, and health care; these people are living on the verge of survival. Absolute poverty prevents people from meeting their most basic biological needs for food, clothing, and shelter. This type of poverty and lack of purchasing power can threaten an individual’s very existence.

## Multidimensional Poverty and Human Well-Being

Poverty means having insufficient money and other resources when these are needed; it also refers to standards of consumption that are below those judged by the community at large to be acceptable or adequate to sustain a full and meaningful life. This definition of poverty shows the multidimensional nature of poverty and its direct relation to the concept of “human welfare” as well as “human well-being.” Taking into account the multidimensionality of poverty enables an understanding of the complex nature of poverty and allows the appreciation of “the poor” as a heterogeneous group. However, arguments against this approach of “multidimensional poverty” and in favor of emphasizing income poverty (i.e., lack of material well-being) as the “correct” definition of poverty first claim that there is high correlation between income and other measures of well-being, such as health and education status. Second, these arguments claim that governments and other organizations can implement effective poverty reduction programs by supporting economic growth, providing social services, and controlling markets and taxing systems, hence improving levels of income; however, it is less desirable for government or external agencies to interfere with, for instance, people’s spiritual well-being.

Recognizing the multidimensionality of poverty also reflects the viewpoints of the poor, who often rank other dimensions besides income as important to the quality of life. In the World Bank 2000 study on world poverty, for instance, people in poor countries were asked to define what “well-being” and “ill-being” meant for them. Well-being was in general described as “happiness,” “harmony,” “peace,” “freedom from anxiety,” and “peace of mind.” Ill-being was seen as a “lack of material things,” as “bad experiences,” and as “bad feeling about oneself.” The interpretations of well-being and ill-being often vary between people and cultures and conditions. A 1988 study in India showed that the well-being of the poor in India had risen by measures they considered important, such as wearing shoes and having a separate accommodation for people and livestock, even in cases where the surveys showed their actual income had fallen.

The concepts of “well-being,” “quality of life,” and “standards of living” have a direct relation to the concept of “development.” While two of the main principles in various development programs (United Nations Development Program [UNDP], United Nations Children’s Fund [UNICEF], and United Nations Education, Science, and Cultural Organization

[UNESCO]) are cultural integrity and multiculturalism, human well-being is still the programs' main goal. However, if participatory approaches to poverty measurement rely merely on individual views of poverty or well-being, there is a danger of relativism that can justify vast global inequality. While it is essential to plan what people can do with particular goods and commodities, rather than giving material wealth intrinsic value, it is also important not to let the idea that humans' needs are relative to their environment, culture, or existing resources lead to the acceptance of global imbalance in resources distribution. Nobel Prize economist and development ethicist Amartya Sen has pointed out that in the attempt to measure and compare human well-being in various cultural and geographical contexts, one should pay more attention to the actual capabilities of people in different environments and situations gained from their resources. The material resources and commodities should then be seen as means to well-being rather than as a goal in themselves (Sen 1984).

As Daniel Little has noted, in previous years economists did not feel a need to formulate a particular theory of poverty because it was possible to address issues of poverty from perspectives arising out of other theories that explain demand management, production economics, fiscal policy, the gains for trade and exchange, or the cause of the wealth of nations. Poverty was then dealt with in a manner that by implication depicts it as the result of failure, a consequence of circumstances that are deficient in the essential requirements for economic progress. Poverty in economics was largely associated with an absence of growth and an absence of wealth creation. As a result, since 1945, countries of the nonindustrialized world have made major efforts at stimulating modern economic growth. Economic development processes have resulted from a number of forces, including the domestic government's economic policy, the private activities of national and multinational corporations, the influence of industrialized-nation governments, and a variety of bilateral and multilateral development agencies. The outcomes of economic development strategies are at least as varied as the strategies themselves; some parts of the less developed world have experienced tremendous economic growth since the 1960s. For instance, South Asia's growth has been slightly lower than 2% per capita per year since 1965, but East Asia has grown at a much faster rate. During this period, per capita in India has grown 1.8% and in China 5.1%. Portions of sub-Saharan Africa, for their part, have witnessed falling per capita GDP since the early 1980s.

How has economic growth affected the poor in the developing world? Have the benefits of economic

growth been broadly distributed over all income levels? The geographical and gender divisions in poverty give a partial answer to these questions. The profits of economic development are unequally divided between the rich Northern Hemisphere and the poor Southern Hemisphere. The northern industrialized countries, located mostly in Europe and North America but also including Australia and New Zealand, live in abundance while the southern countries, mainly in Asia and Africa, remain deprived. In addition, currently more than 70% of people living below the poverty line live in rural areas. Asia has the highest proportion of the rural poor with some 633 million, followed by 204 million in sub-Saharan Africa, and 76 million in Latin America and the Caribbean, with the balance in the Near East and North Africa. Finally, of all the poor, the rural women tend to be the poorest, most marginalized and most vulnerable.

Thus, in spite of more than fifty years of growth in many of the economies of the less developed world, problems of poverty are as severe as ever. The inequitable distribution of income has direct effects on the well-being of the poor: malnutrition, disease, inadequate water, low educational levels, high infant and child mortality rates, and depressed longevity statistics. Environments are suffering severe degradation throughout the world, and conditions of poverty and rapid economic development alike intensify pressure on the environment. Extreme and moderate poverty creates one set of pressures on environment, as poor people seek out ways of satisfying their needs that have harmful environmental effects (firewood harvesting, over cultivation, destruction of forests). Governments in developing countries may take "shortcuts" with respect to the environment. If securing foreign currency to pay foreign debts or if securing imports from foreign markets take priority, environmental side effects of industry or agriculture may be ignored. Moreover, poor countries may be exploited by rich countries: they may be more willing to receive pollutants from wealthier ones to receive financial benefits, and the governments of developing nations may ignore environmentally suspect practices by foreign-owned corporations and industries. At the same time, a child born in rich, industrialized countries will consume, waste, and pollute more in a lifetime than that of fifty children in developing nations. All in all, intensive processes of economic growth can pose even greater risks for environmental quality through rising rates of fossil fuel usage (and the subsequent production of greenhouse gases), intensive unsustainable agriculture (and the pesticides and herbicides that this requires), and the exhaustion of nonrenewable natural resources.

## How Is Poverty Measured?

Current attempts to measure deprivation take the multidimensional nature of poverty into account in an attempt to relate poverty to development and permit an overview of poverty that goes beyond individual experiences. Reliable ways to measure poverty present an aggregate view of poverty over time. This enables a government, or the international community, to set measurable targets for judging actions and policies in relation to the realization of the international development goals.

At the time when poverty was seen merely as an economic problem, the most commonly reported development statistic was a country's GNP per capita. While a case may be made for using GNP as an overall measure of development, it is not a fine measure of poverty for two reasons. First, as an average, the statistic takes no account of distribution. Hence, two countries can have the same level of GNP per capita, but in one of the two, a far greater proportion of the population will fall below the poverty line if income is less equally distributed. Second, GNP is of course an income measure, which ignores other dimensions of poverty.

The World Bank has been estimating global income poverty since 1990. It measures consumption and income data through household surveys. Consumption is conventionally viewed as the preferred welfare indicator because consumption is thought to better capture long-run welfare levels and current income. To compare consumption levels across countries, however, requires an estimate of price levels. Calculations referring to \$1 (USD) per day refer to the purchasing power of \$1 a day in terms of domestic goods. Interpreting the information on income and consumption as a measure of well-being requires many assumptions, such as allowing for measurement errors and accounting for household size and composition in converting household data into measures for individuals. Moreover, income or consumption data collected at the household level have a basic shortcoming: they cannot reveal inequality within the household, so they can understate overall inequality and poverty. In particular, the conventional household survey approach does not allow direct measurement of income or consumption poverty among women. Thus, data on education and health, which can be collected at the individual level, are valuable since the data allow a gender-disaggregated perspective on key dimensions of poverty.

Over the years, a number of composite measures of development and poverty have been proposed. The previously used Physical Quality of Life Index (PQLI)

has been superseded by the Human Development Index (HDI) of the United Nations Development Program (UNDP). The HDI is a composite of statistics regarding GDP per capita, life expectancy, and education attainments (which are an average of literacy and mean years of schooling). UNDP has also proposed a Human Poverty Index (HPI) that focuses on deprivations. Specifically, the HPI is calculated as the average of the percentage of the population not expected to live to forty, the percentage who are illiterate, and what is called the "deprivation in living standard" (the average of those without access to water and healthcare and the percentage of children under five years of age who are underweight) (White 2002; World Bank 2004a).

Taking health and education dimensions into account in poverty measurement can be traced back to classic economists such as Malthus, Ricardo, and Marx. And while these dimensions are currently well reflected in international development goals, collecting data on these nonincome indicators is problematic. For instance, infant and children under-five mortality rates derived mostly from census and survey information are available in the majority of countries only at periodic intervals, and life expectancy is not often measured directly. In data on education, the most commonly available indicator, the gross primary enrollment rate, suffers from serious conceptual shortcomings, particularly since school enrollment is only a proxy for actual school attendance. Social exclusion (voicelessness and powerlessness) is usually measured using a combination of participatory methods, polls, and national surveys on qualitative variables, such as the extent of civil and political liberties. Measuring "vulnerability" is especially difficult because the concept of "vulnerability" does not only indicate the risk of a household or individual experiencing an episode of income and health poverty over time, but it also refers to being exposed to a number of other risks, such as violence, crime, natural disasters, being pulled out of school, as well as social exclusion. Thus, the concept is dynamic, and it cannot be measured merely by observing households once and needs panel data in the form of surveys that follow the same households over several years.

Multidimensionality of poverty has also raised the question on how to measure overall poverty in comparison to achievements in the different dimensions of well-being. One dimension might move in a different direction from another; for example, health could improve while income worsens. Or one country might show greater improvement in education than in vulnerability, while another shows the converse. This brings to the forefront the relative values of the different dimensions: how much income are people

willing to give up for, say, a unit of improvement in health or in voice? In other words, what weights can be assigned to the different dimensions to allow comparisons across countries, households, or individuals over time? According to World Bank, one approach to addressing comparability is to define a multidimensional welfare function or a composite index. An alternative is either to define as poor anyone who is poor in any one of the dimensions—without attempting to estimate tradeoffs among dimensions—or anybody who is poor in all dimensions and to measure the intensity of poverty accordingly.

### **Moral Dimensions of Poverty and Poverty Reduction**

While poverty undoubtedly is a phenomenon that has existed through human existence in one form or another, a central developmental question is the persistence of poverty and the increasing mass-poverty in certain parts of the world in the twenty-first century despite technological, scientific, and economic advancements. While one single cause for the persistence of poverty cannot be named, continuing issues include justice, equality, and moral responsibility. While environmental problems contribute partially to poverty, the geographical location of countries; their respective levels of economic, scientific, and political development; the relationships of global and local power structures to colonial history; and various problems of a globalized economy (unfair trade relations, foreign investments that do not benefit poor countries, the overwhelming foreign debt from which many developing nations suffer) leading to economic dependence are to a large extent to blame. And simultaneously, while the physical environment of most poverty-stricken regions is highly relevant (especially to agricultural productivity as well as conditions of disease and hardship), there are many other components that are particular to each region's culture and its political structures and social hierarchies.

To alleviate persistent poverty in the year 2000, the World Bank committed more than \$6.8 billion (USD) in concessionary loans targeted directly at facilitating economic development in the world's poorest countries. Nongovernmental organizations (NGOs) provided another \$6.9 billion in grants to developing countries. Despite this funding, the gap between rich and poor is not diminishing. The already affluent are getting even richer, and the poor remain at or below the subsistence minimum. This gap is partly a result of the developing world's debt, and for many poor developing countries, the repayment of their debt may

involve around 8% of the country's GNP each year. This means that the poor countries have to devote much of their production to the export market and set their emphasis on "cash crop" production instead of crop production to meet the needs of the country's own population. This is one reason why even in many developing countries with abundant natural resources, people are not benefiting from production but live in poverty, and their citizens are suffering from hunger and malnutrition.

Hunger, for its part, is both a cause and consequence of poverty. World hunger is not merely an issue of supply and demand; the problem lies in distribution and access. Imbalanced distribution means that increases in food production do not prevent people from dying of starvation and malnutrition. In addition, while during the next twenty-five years 50 million people will be added to the population of rich countries, over the same period, about 1.5 billion people will be added to the population of poor countries.

Many countries, on principles of justice and equality, have adopted strategies to deal with poverty, and there has been a reduction in poverty in various parts of the world. However, great inequities still exist throughout the globe. There are three particularly persistent assumptions given to explain this phenomenon.

The first argument claims that preventing poverty deaths is counterproductive because it will lead to overpopulation and hence to more poverty deaths in the futures. However, there is abundant evidence that birth rates tend to fall dramatically when poverty is alleviated, and women gain better economic opportunities, more control within their households and communities, and better access to reproductive information and technologies. Accelerated progress against poverty and the subordination of women may actually be the best strategy against overpopulation and toward an early leveling-off of the human population at around 10 billion.

Second, world poverty has often been seen as so massive a problem that it simply cannot be eradicated in a few years, at least not at a cost that would be bearable for the rich societies. One main doubt against the eradication of world poverty has been that helping the global poor would require extreme sacrifices from the rich. Redistribution of world prosperity and wealth may require those who are well-off to lower their standards of living considerably (to reduce their access to material commodities: fashion, entertainment, hobbies, and latest technology) and thus to radically lessen their "quality of life." This presumption ignores, however, the enormous extent of global inequality. The aggregate shortfall of all the people living under the \$2 (USD) per day poverty line

amounts to some \$300 billion annually, which is just 1.2% of the aggregate annual gross national incomes of the high-income economies. In other words, eradication of severe income poverty worldwide would require those who are well-off to accept only a 1.2% reduction in their annual incomes.

The third argument made is that world poverty cannot be eradicated merely by throwing money at the problem. The official Overseas Development Assistance (ODA) appears to have done little to overcome persistent poverty and even less for increasing equality and social justice. This, however, could be based on an unjust distribution of aid. Politicians from the wealthy donor countries focus often on strategically important developing states rather than on the poorest ones. They also tend to use aid—or loans—as forms of investments that are expected later on to profit the affluent donor countries and that are given with strict conditions. While the complaints about local corruption are often justified, the problem could be more efficiently dealt with in the example of more transparent and just global economies. Altogether, if global order and markets were instead restructured to be more hospitable to a democratic government, economic justice, and growth in developing countries, poverty could be significantly alleviated across the globe.

### Poverty Reduction Strategies

Despite its vast scope and persistence, until very recently, poverty reduction had not been the main goal of global development policies and of “economic development” in particular. Development as “modernization” has relegated poverty reduction to a lower priority. While sustained economic growth has been a constant priority in the development plans of developing countries, poverty reduction driven by policies for equitably distributed economic growth has not been the main aim in contemporary development programs. Only since the early 1990s has mainstream thinking stressed the importance of pro-poor growth in local development policies as well as in global economy. “Pro-poor growth” is growth that is the result of poverty-reducing economic activities, and it is taken into account in such development programs as Heavily Indebted Poor Countries Initiative (HIPC), which promises to cancel debts of poor countries that commit themselves to reduce poverty locally by preparing national poverty reduction strategies in the form of Poverty Reduction Strategy Papers (PRSP). Rich countries, however, have been slow in granting debt relief under the HIPC initiative.

Other international steps in poverty alleviation have been taken in the twenty-first century; for instance, the United Nations and donor countries have agreed to a set of international Millennium Development Goals (MDGs) to reduce poverty by half by 2015. The social development targets aim toward universal primary education for all, eliminating gender disparities in primary and secondary education, reducing infant mortality and maternal mortality by two-thirds, and enabling access to reproductive health services for all, among other such goals. These goals have established not only benchmarks against which progress can be measured, but they also acknowledge an unequivocal link between development and poverty reduction.

When the multidimensional nature of poverty is taken into account, it becomes evident that policies in combating poverty have to be integrated and their influence on each other recognized; improving health outcomes not only improves well-being but also increases income-earning potential. Increasing education not only improves well-being, but it also leads to better health outcomes, to more active social and political participation, and to higher incomes. Providing protection for poor people (reducing vulnerability in dealing with risk) not only makes people feel less vulnerable, but it also allows them to take advantage of higher risk opportunities with a higher return. Increasing people’s voices and participation not only addresses their sense of exclusion, but it also leads to better targeting of health and education services to their needs.

### Conclusion

Poverty causes individual suffering and death, but from a wider perspective, it can also have harmful environmental impacts, which can be a source for further poverty, disease, and death. Poverty may also lead to social unrest, civil strife, and wars, especially where poverty is so abject that people feel they have nothing to lose.

Due to imbalanced power relations, the course of social and political development is important in order for resources and economic development to benefit the poor. Lack of access to education as well as obstacles in the way of democratic participation prevent equal shares of the profits of economic development. The patterns of gender disparity and severe limitation of opportunities and freedom of women found throughout the world have marginalized women to be “the poorest of the poor” in many developing countries.

Alleviating poverty and avoiding its negative impact on development requires direct action and serious political commitment to sharing resources. Markets must be accessible to poor countries, state institutions must be more responsive to poor people, and social barriers must be removed that exclude a vast number of people from participation (on grounds of gender, ethnicity, race, and other such factors). To help those living in poverty there is also a need to enhance security by providing mechanisms to reduce the sources of vulnerability that most poor people face and by providing them opportunities for self-help. These initiatives must be set in a global context. Global actions need to complement national and local initiatives to achieve alleviation of poverty and maximize benefit for poor people across the globe.

#### PRAGUE SPRING, 1968

The political situation of Czechoslovakia was quite different from other Central and Eastern European countries under Soviet rule. This was a result of a special connection between the Czechoslovakian government and Stalin. During World War II, the Czechoslovakian president Eduard Benes had good relations with the Stalinist regime and could count on special treatment by the Kremlin. The Czechoslovakians accepted the Red Army with goodwill, in anticipation of future benefits.

The immediate period after World War II made these expectations seem realistic. Benes came back to Czechoslovakia in March 1945. His first step was to form a coalition government, including the Communist, National Socialist (with himself as leader), Catholic-folk, and Social Democratic parties, with Zdenek Fierlinger as prime minister. At the same time, two other main parties, the Agrarian Party and Slovak Folk Party, were declared illegal. The official program of the new government, a parliamentary democracy, promoted alliance with the USSR, agricultural reforms, and nationalization of industry.

In the elections of May 1946, the Communists won with a 38% plurality and went on to play a crucial role in the new government. They took control over positions of the Prime Minister and the Ministry of Internal Affairs (the key element of administration because of the control over the secret police). The ministry of defense also gave them great influence on the army. It was after the elections that a process of limiting the number and political strength of Democratic parties began. With the cooperation of President Benes, the Communists declared the Slovak Democratic Party as illegal. Finally on February 20, 1948, Communists executed a *coup d'état* supported by the army. The non-Communists ministers were excluded from the government. In May 1948, the Communists dissolved all independent social organizations and political parties. On May 9, they resolved a new Constitution, and Czechoslovakia became a Communist state.

After unsuccessful attempts at resistance, President Benes accepted the political changes and retired. Czechoslovakian democracy was liquidated. In 1949, approximately thirteen thousand people were imprisoned for political reasons. The new President, Klement Gottwald, became a symbol of Stalinism.

Even after Stalin and Gottwald's deaths in the same year, the policies of the Czechoslovakian Communist Party did not change. The new party leader was Antonin Novotny, and Antonin Zapotocky was nominated as the new President. Curtailment of civil liberties continued. In May 1956, authorities suppressed student's revolts. In November of that year, after Zapotocky's death, Novotny became President. Student protests of October 1967 did not have any significance either.

Nevertheless, the liberal faction within the Communist Party became stronger. In January of 1968, Alexander Dubcek became the leader of the Communist Party. The idea of "Socialism with a human face" appeared, and the country seemed to be taking steps towards democratization, despite the disfavor of the Russian Communist Party. In March 1968, Ludwik Svoboda, a popular leader famous for the Slovak Uprising, became president. In March 1968, the censorship was limited. Two months later, the government set free all political prisoners. The political police was reorganized, foreign travel was permitted, and new economic reforms were proposed. In April, the ban on independent Democratic political parties was lifted. The government prepared for deeper economic reform, though within the framework of the current system, and established bases for future sound relations with the Catholic Church. A Communist Party convention was planned for the following September to execute these changes.

The Liberal activists within the Communist Party announced the changes in a manifesto known as Two Thousand Worlds. This manifesto was criticized by Moscow, which then formulated its policy in relation to dependent countries in a doctrine known as the Brezhnev Doctrine after the Soviet leader at that time. It stated that "we can not be inactive on the fate of the socialism in a different country" and threatened direct military intervention within the Soviet bloc. In the policy, the Kremlin had many allies, such as leaders of the dependent states that were afraid of changes. This anxiety had become sharper. From May to July on the terrain of southern Poland, Czechoslovakia, and Eastern Germany, Warsaw Pact armies gathered. Because of the pressures of other Communist countries and their own fears, Russians began military intervention. On August 21, 1968, the armies of the countries of the Warsaw Pact crossed the borders of Czechoslovakia. The forces were made up of 170,000 Soviet troops, 40,000 Polish, 15,000 German, 10,000 Hungarian, and 5,000 Bulgarian. The Soviet armies occupied the key points of Prague very quickly. Afraid of extensive civilian casualties, the Czechoslovakian army did not offer resistance. The military action was completed with a full occupation

of the country. Dubeck and other key leaders were arrested and brought to Moscow.

This did not solve the Kremlin's problem. The Liberal's position was still strong. Within the general population, outbursts of vandalism, defacement, and derision of the occupiers signified the opposition to the invading forces. In January 1969, as a sign of protest, a student named Jan Palach committed suicide by self-immolation in a public square and became a national hero. Dubcek returned to Prague from Moscow after agreeing to resign from the party leadership.

However, changes slowly occurred in the direction desired by Kremlin. Gustaw Husak became the new leader of the Communist Party. The purges and the persecution of leaders of the Prague Spring began. In 1970, the prime minister was replaced. In 1969 and 1970, five hundred thousand Communist Party members were removed. Most of the students and academics involved in the Prague Spring were sentenced to hard labor. More than 280,000 lost their jobs, and 150,000 were forced to emigrate. The development of democratic opposition was made nearly impossible. The formulation of the Brezhnev Doctrine intimidated dissidents from engaging in direct and open confrontation with local powers.

### PREBISCH, RAÚL

Argentinian economist Raúl Prebisch (1901–1986) played a significant role in outlining and spreading the once influential ideas of Dependency Theory and the Latin American Structuralist School of Development. Prebisch served as executive secretary from 1948 to 1962 for the Economic Commission for Latin America (ECLA, renamed ECLAC in the

early 1980s), a United Nations agency established in 1947. Prebisch's work concentrated on the analysis of the main obstacles that hindered Latin American development and on the formulation of alternate policies to overcome them. During the 1960s and 1970s, the ideas coming out of ECLA were widely studied in Latin American academic circles and influenced the economic and developmental policies of national states in the continent.

The contributions of Prebisch to the Structuralist School can be encapsulated in three major ideas. First, Prebisch introduced the centre-periphery paradigm, which describes the economic relation between prosperous, self-sufficient industrialized countries and those that are backward, isolated, and dependent. In essence, this paradigm formulates the idea that inequalities between centre and peripheral countries emerge from the dynamics of international trade, in which the former's command of technological and economic power facilitates development in all areas of the economy, whereas the latter must depend on primary exports and the imports from the centre, creating in the process systematic relations of dependence. Moreover, Multinational Corporations (MNCs) from centre countries penetrate peripheral economies under extremely favorable conditions, enabling them to extract surplus from nature and labor and to repatriate the profits back to the center countries, reinforcing unequal exchange and dependence.

Second, and to remedy the aforementioned disparities, Prebisch argued that peripheral countries had to promote Import Substitution Industrialization (ISI) to curb the gradual deterioration of their terms of trade in relation to centre countries. Unfavorable terms of trade referred to the tendency of primary exports to lose value in international markets in comparison to the increasing value of centre-based finished products. For Prebisch, ISI would allow periphery countries to create an economic base to manufacture those finished products locally, not only reducing dependence but also decreasing unemployment through a diversified industrial labor market and boosting purchasing power at home through higher wages. Furthermore, national states had to establish protective tariffs to shield local infant industries from foreign competition.

Finally, Prebisch's model also called for Latin American states to invest heavily in social programs to empower their population and prepare them for the challenges of domestic industrialization. These three sets of ideas influenced many countries in Latin America and Africa; however, inflation and technological dependence on centre countries, coupled with the sweeping consequences of the debt crisis

of the 1980s, diminished the viability of Prebisch ideas as long-term developmental alternatives.

Prebisch also headed the United Nations Conference on Trade and Development (UNCTAD) from 1964 to 1969. With the return of democracy to Argentina in 1984, Prebisch was appointed personal advisor to president Raúl Alfonsín. Prebisch remained closely associated with ECLA's work in Santiago, Chile, where he died in 1986.

### PRIVATE PROPERTY RIGHTS

Private property rights refer to the acquisition of goods from nature, the creation of material things, and the willful definition of objective ownership. These classic philosophical notions informed Western political thought about democracy that underscored the transition from feudalism to capitalism. Modern democratic revolutions broke the power of aristocratic privilege and royal lineage and eroded the basis for despotic rule in Western European societies. The development of individual rights forged a link between private property and democratic citizenship.

The English philosopher John Locke believed that the right of private property stemmed from individuals' daily labor to extract from their natural surroundings that which they need to survive. Individual entitlement rested on the common consent of all citizens that shaped the relationship between society and authority. Therefore, the creation of private property promoted the welfare of the community at large. The French scholar Alexis de Tocqueville viewed the widespread private ownership of land as a pillar of democracy in the United States. The relative egalitarian structure of property rights reflected republican practices and equality before the law. Of course, Karl Marx insisted that private property motivated the owners of capital to use forceful and fraudulent

means to exploit the working classes (Rosen and Wolff 1999).

Western ideas about development after World War II identified the right to property as a fundamental human right. Article 17 of the Universal Declaration of Human Rights (General Assembly 1948) states that “everyone has the right to own property alone as well as in association with others” and “no one shall be arbitrarily deprived of his property.” However, most areas of the developing world had not experienced fundamental changes in the exercise of power and the control of wealth determined by kinship, class, race, and ethnicity. European colonial rule and settler communities introduced private landed property into sub-Saharan Africa where customary land tenure once prevailed. The struggle for independence and liberation (by Nationalist liberation movements) lacked the progressive force of indigenous Capitalist interests (Kiamba 1989; Herbst 2001). The property clause of the Constitution of post-Apartheid South Africa contemplates a legal balance between individual freedom and collective justice (Constitutional Assembly 1997).

In Latin America, the vagaries of the Cold War and conservative resistance from plantation owners and peasants foiled the genuine attempts of revolutionary and radical Nationalist parties to execute comprehensive agrarian reform. Peace accords and democratic elections in Central America brought longstanding disputes over property rights into full relief. The uncertainty surrounding legitimate ownership of land became particularly complex in Nicaragua and Guatemala in the 1990s after decades of repressive dictatorship and social violence (Everingham 2001; Sieder 1998). The Second Summit of the Americas, held in Santiago de Chile in 1998, emphasized the regularization of registration and titling to ensure that all valid property rights are formally recognized in accordance with national legislation. The General Assembly of the Organization of American States, held in Windsor, Canada, in 2000, proposed the Inter-American Declaration on the Rights of Indigenous Populations that supports the legal challenges of indigenous communities to mining concessions and land claims that date as far back as the Spanish conquests (Summit of the Americas 2001).

The dominant neoliberal ethos assumes that the protection of private property rights is essential for economic growth. Gwartney and Lawson assert that “individuals have economic freedom when . . . their property acquired without the use of force, fraud, or theft is protected from physical invasion by other [s] and they are free to use, exchange, or give their property to another as long as their rights do not violate the identical rights of others (2001). Yet, the

definition of property rights has a complex political dimension. The importance placed on individual rationality in the marketplace often does not acknowledge the imperative of collective demands expressed by working-class urban groups, the rural poor, and other economic actors who seek to defend their precarious rights to property.

Debates over public policy intended to modify the rules that govern property rights are contingent on interaction among organized political interests and bureaucratic agencies. The transition to democracy from various forms of authoritarian rule shaped the institution of private property across the developing world in the late twentieth century. Bargaining over the privatization of assets in the former Soviet republics and Communist countries of Eastern Europe gave rise to legal ambiguity that hampered economic growth (Comisso 1991; Weimer 1996). Furthermore, Communist regimes in China, Vietnam, and Cuba continue to resist international pressures toward the restitution of prerevolutionary rights to private property.

### PRIVATIZATION

Driven by a combination of factors, such as the scarcity of financial resources in private hands, a sense of social welfarism, a surge in economic nationalism,

and a strong belief that the state should serve as the primary “engine” of growth, many countries around the world invested very heavily in public enterprises. They invested in a plethora of manufacturing and service enterprises ranging from pencil, furniture, and automobile factories to water, hotel, and transport and telephone companies. In many countries, roads and buses, rail lines and trains, as well as airports and airlines either attracted substantial state investments or were the exclusive preserve of the state.

Often set up with lofty developmental goals and viewed as integral parts of the nation’s drive for true independence, national self-sufficiency, technological advancement, and rapid industrialize growth, such enterprises were often forced to operate according to political and social imperatives rather than sound economic and financial management principles. Governments often ran them down as they used them to perpetuate themselves in office by dispensing favors and privileges to supporters and families. In addition, the enterprises suffered from bloated payrolls as well as rampant inefficiency in their management and productivity. The net result was that by the 1980s, it had become very clear that, generally, most of such enterprises were not only performing poorly but also had become major drains to national financial coffers as they required annual state subsidies just to stay afloat.

### **Privatization: Definition and Meaning**

Typically, the word “privatization” is used to denote one of two ideas: (i) the shifting of a company’s ownership structure from being publicly traded in the open market because of the repurchasing of the company’s entire stocks by its employees or a private investor and (ii) the process of moving government-owned or government-controlled enterprises to privately owned or run firms. The task of this discussion is limited to the second definition. Specifically, this review seeks to examine some of the critical issues around public enterprise reform programs that achieved the level of orthodoxy during the 1980s.

The intent and principal impetus for privatization derives from reactions in the West against the growing role and perceived interventionist inefficiency of government and the public sector. Privatization means different things to people in different parts of the world and countries. This is because each country’s position within the global economy often helps in determining the likely buyers of the privatized assets. Whereas for citizens of the more advanced economies privatization of state-owned enterprises is seen as falling primarily under the gambit of domestic

policy (because the likely buyers are predominantly nationals of those countries), for people of the developing world, privatization signifies something vastly different because it often means the actual or possible transfer of state-owned assets to foreign investors and managers. Therefore, for citizens of countries in the developing world, privatization programs are seen not only as the denationalization of state assets but also are often shrouded in deep suspicion, controversy, resentment, and recrimination. This emotive reaction may be better understood within the context of the original intention of state ownership of the assets, which was usually driven by national self-assertion, concern for public access and welfare, and a commitment to equitable distribution of economic benefits. As such, the decision to privatize such assets by selling them to foreigners or without due regard to whom would get them locally is often seen as a betrayal of national interests and economic policy due to external coercion.

Such a response should neither be surprising nor understood as different from Western responses to the perceived excessive role of foreigners in their political economies. The negative reactions are worse when a country’s growing dependence on foreign investment creates concerns or Nationalist passions about erosions of its sovereign independence and authority. Beyond the foreign angle, privatization also triggers similar emotional responses frequently in countries that are experiencing severe societal cleavages. Race, ethnicity, class, religion, and region have also served as bases for challenging national privatization programs around the world. Due to these factors—collectively and singularly—privatization policies are repeatedly challenged, blocked, or delayed until the needs of citizens, domestic firms, and significant sectional interests are addressed. Specifically, this often means the setting aside or delineation of special rights to assets or shares of publicly offered companies for citizens and sectional interests.

### **The Logic and Scope of Privatization Programs**

During the past two and a half decades, the idea of privatization has taken center stage in domestic and international political economic circles as many governments (particularly in developing countries) struggled to make their policies and macroeconomic performance effective. Since 1980, more than fifteen thousand state-owned enterprises have been privatized in more than one hundred countries from Argentina

and the Czech Republic to Indonesia and Zambia. As already noted, privatization often followed decades of miserable economic results, which, despite some differences across a wide-range of states, were marked by a number of common characteristics. They include the following:

- Pervasive government participation in the domestic economy not only through widespread ownership of land, infrastructure, and industry but also through extensive regulatory frameworks that monitor day-to-day economic activity;
- Poorly developed and often disarticulated financial institutions and services;
- The use of money creation by government to finance activities rather the use of taxes and domestic borrowing;
- Government reliance on and use of fixed exchange rates and capital controls or direct controls of foreign exchange transactions; and
- The recourse to extensive foreign borrowing to finance current account deficits.

In examining the characteristics in the bulleted list, international financial institutions such as the International Monetary Fund (IMF) and the World Bank concluded that economic inefficiency, rampant protectionism, extensive government subsidies, and public ownership of key industries were crucial contributory factors to the pervasive economic underdevelopment and underperformance. As such, they advocated economic restructuring or an adjustment strategy in which the government would disentangle itself from direct interventions in the market. In its place, the invisible hand of the market would take sway and reallocate resources rationally and more efficiently. The net result would be economic growth and development.

Generally without other viable alternatives, affected governments found themselves needing refinancing and the good graces of the creditor community to avoid costly default. However, since refinancing and technical assistance involves not only the provision of external resources but also the monitoring and restructuring of the debtor's macroeconomic affairs, this meant that the countries found themselves accepting the policy influences of either the IMF or the World Bank. Although the lines of focus have become less rigid, the IMF provides the premier institutional framework for debt management—new credits, demands for austerity measures, and a two-phase debt renegotiation function. Anchored on an ideological rejection of the activist state, the reform policies compel states to adopt minimalist and noninterventionist postures that encourage economic

stabilization, liberalization, and the privatization of state-owned assets.

Typically, the IMF and World Bank economic recovery packages have three component parts: (i) stabilization, which is a monetarist instrument that seeks to prevent chronic inflation by checking demand through the control of fiscal spending and money growth; (ii) structural adjustment, which seeks to effect a positive shift in the supply curve by enhancing market and trade incentives and eliminating gross productive inefficiencies; and (iii) growth conditionality, which seeks to free market forces by attracting investments and improving access to productive technology. The classic conditionality program focuses on the cutting of public and private spending, general public sector reforms, devaluation of the national currency, deregulation of financial sectors and interest rates, agricultural sector reforms, liberalization of trade and payments regimes, removal of subsidies, and the privatization of public enterprises.

In many ways, privatization represents one of the principal focus areas of a typical structural adjustment program. It is also one of the most politically sensitive issues that faces a reforming government in the developing world. Its requirement that national assets and icons be sold to individuals or companies who will then run such enterprises on the basis of market principles and the profit motive, however, runs counter to preferred and often-stated national social and economic objectives, which is one of the reasons it is such a sensitive issue. Furthermore, the effects of privatization are often not neutral because they touch quite directly on matters of who benefits or who loses from the reforms. Quite aside from the possibility that the sale of such enterprises may have politically sensitive ethnic, religious, or regional implications, there is also the possibility of class sensitivities as labor groups worry about potential job losses and price increases in the company's products or services as the new owners make critical decisions such as what and how much to produce, which suppliers must be abandoned or retained, whether to mechanize or use a labor-intensive production system, and whom to lay off or retain.

The sensitivities surrounding privatization may explain the general political controversies, conflicting attitudes, and half-hearted implementation of the program in different countries and regions around the world. In the Middle East, the implementation of privatization programs has been very slow in countries such as Iraq, Iran, Syria, and Saudi Arabia. In Eastern Europe and Central Asia, the privatization experience has been generally controversial and mixed; there has been very slow progress in Azerbaijan, Belarus,

Tajikistan, and Turkmenistan, while very rapid progress has been made in much of the rest of the region, including in Armenia, Bulgaria, Croatia, Czech Republic, Estonia, Georgia, Hungary, Lithuania, Russia, and Slovak Republic.

In East, Southeast, and South Asia, privatization has been implemented with variable enthusiasm in a number of countries, such as Malaysia, Singapore, and Thailand. In a number of other countries, such as in India, Indonesia, Philippines, South Korea, and Taiwan, the implementation of the program has been far more controversial and tumultuous. In India, for instance, protests against privatization reportedly attracted more than 50 million protesters on May 21, 2003. By contrast, and despite being a relatively closed economy, China has shown a strong desire to push its capitalist reform agenda very vigorously. With more than one hundred thousand state-owned enterprises, the Chinese government has moved aggressively to open up a wide range of firms for privatization. China Telecom and China Unicom, two of the country's biggest telecommunications companies, are among the companies slated for divestiture. This directly bucks the trend around the world toward protecting large state-owned firms. Furthermore, while many privatization programs around the world are weakened by lack of political resolve, the Chinese government has dismissed millions of workers since the late 1990s as part of its preparation to streamline state enterprises to make them easier to sell to foreign investors.

In Latin America and the Caribbean, privatization programs have often proven to be more political landmines than visionary initiatives for governments. In Haiti, Prime Minister Smarck Michel was forced to resign in September of 1995 after popular demonstrations and parliamentary opposition dogged his privatization and economic reform program. In other countries such as Argentina, Bolivia, Brazil, Chile, Colombia, Cuba, Peru, and Venezuela, privatization programs have also faced stiff public opposition. Although historically more open and diverse than other developing regions and perhaps driven by stiff opposition, several Latin American governments have sometimes taken backward steps from the global trend toward privatization. Forced by the failures of some important privatization efforts, many Latin American countries have attempted to make amends by actually establishing new state-owned firms or retaking control of previously privatized enterprises. For instance, for the first time since 1967, Argentina created a state-owned firm in 2004. The government also took over a troubled mail company and an airline; Uruguay not only conducted a plebiscite that reversed the privatization of the country's water

services but also amended its constitution to mandate permanent state-ownership of water companies; and Bolivia and Venezuela have both moved to reimpose strong public interest and to oversee rights over their respective oil and gas companies.

In Africa, whereas some of the privatizing countries embarked on the program with considerable excitement (Togo, Guinea, and the Ivory Coast or Cote d'Ivoire), many others did so with huge public outcries and recriminations (Kenya, Nigeria, South Africa, Tanzania, and Zambia). The reason for the variation was simple. Although many supporters of privatization in Africa are attracted by the efficiency logic for the disorganized and highly unproductive parastatal (owned or controlled at least partly by the government) companies, the political support for privatization has been very weak in most countries due to deep fears about the makeup of the likely beneficiaries. In other words, a privatization policy has been severely hampered by a widespread belief that the process would lead to a great concentration of economic power in the "wrong hands."

Specific national outcomes or the outlook toward privatization can be accounted for by a number of internal factors. They include ethnic, racial, and regional considerations; social structure and class factors; and state capacity and ideological propensity. It is hard to generalize about the continent or subregions as a whole; nevertheless, all three of these sets of variables are relatively similar within the main subregions. For instance, the social structures in East Africa consist of small indigenous business classes and comparatively large non-African commercial groups (Indians, Pakistanis, and Greeks). Similar patterns can be detected in the social structures of Central Africa and much of Southern Africa, where the economic power of ethnic and racial minorities (Indians, Pakistanis, and Europeans) has served sometimes to inflame emotions and seriously complicate privatization exercises. Because of fears about these groups becoming more deeply entrenched, official state doctrines in the subregions have tended toward interventionism. Not surprisingly, privatization has received lukewarm support or outright opposition in many of those countries.

By contrast, the situation in West Africa is somewhat different despite Indian and Lebanese presence. Though the non-African commercial groups are significant in some countries within the area, the indigenous commercial class is much larger and more confident than its East, Central, and Southern African counterparts. Moreover, a stronger tradition of probusiness ideologies is prevalent among many significant ethnic groups in West Africa despite the entrenchment of non-African elements by deliberate colonial policy. The conditions for privatization also

have been more propitious because of the prevalent promarket state doctrines in the subregion. Pressured by local groups to privatize, many West African governments have embraced the policy with greater enthusiasm than their counterparts in other regions. This is with the notable exception of Nigeria, where ethnic political competition has served to create a highly sensitive and politicized privatization environment.

In essence, in countries where there are differences in the racial or ethnic composition of the bureaucratic and entrepreneurial classes, privatization tends to be resisted because of perceptions that it serves either to transfer national wealth and power from one group to another or that it helps to entrench or exacerbate group inequalities. In this sense, privatization is not neutral for social groups since the exercise results in winners and losers. Thus, governments are often unable to implement privatization programs without significant attention to potential beneficiaries as well as the social and economic consequences of the program.

## The Case for Privatization

Basically, the case for privatization pivots around six specific arguments as described here:

- **The Efficiency/Profitability Argument** maintains that overwhelming evidence in both developed and developing countries demonstrate that ownership is a crucial determinant of company performance. As in developed countries such as Britain, Japan and New Zealand, privatization has produced strong results during the end of the twentieth and beginning of the twenty-first centuries in developing countries such as Argentina, Chile, Cote d'Ivoire, Jamaica, Mexico, Niger, and Singapore. According to proponents, the reason for this improved performance is the role individual incentives play in human use of scarce resources. Private ownership entails several inducement rights, such as the rights to use an asset; to change its form, substance, and location; and to transfer it in whole or in parts. Therefore, any restrictions to such rights would have a tranquilizing effect on activities that seek to maximize the utilization of an asset. In other words, individuals will work harder to grow and nurture their properties the more they stand to gain by doing so. On the other hand, individuals are less motivated to use their assets productively when they are faced with regulatory frameworks that severely

restrict or weaken their property rights. As such, whereas private ownership clusters rights and economic rewards, public ownership actually weakens them. Although modern firms often operate without the direct involvement of their owners, managers are often controlled through the workings of the market and the mobility of shareholders who may sell their shares as a signal of their unhappiness with management performance and inability to produce adequate returns on investment. The fear of losing their jobs due to poor performance will stimulate management into working harder to produce satisfactory results. By contrast, with no real checks on their dissipation of value, public enterprises lack a similar incentive system and, as such, are prone to underperformance.

- **The Political Interference Argument** contends that even when governments have good intentions and work hard to restructure poor performing state enterprises, the efforts frequently come to naught soon after things appear to have turned a positive corner due largely to endemic political interference. Lawrence Summers notes the following concerning the subject:

While it may be true in theory that a properly managed public enterprise can be as productive and efficient as a private one, the reality is that politics, usually of a virulent nature, intrudes, and efficiency is sacrificed. Public enterprise managers are rarely permitted to shed labor to produce at minimum cost. Moreover, procurement is often treated as a way of enriching contractors and procurement officers. (1992: 8)

- **The Deregulation as Panacea Argument** insists that privatization contributes toward macroeconomic stabilization by getting rid of losses and the need for subsidies to keep the enterprises afloat. Privatization also enables governments to reduce budget deficits and economic monetary overhang as individuals use accumulated cash to purchase shares in the enterprises being sold. Beyond those, it also serves as a useful mechanism for weaning governments of developing countries from serving as the locus for primitive capitalist accumulation for those either in state office or with access to the corridors of power. In countries such as Nigeria, Romania, and Russia, where proximity to state officeholders often is critical for the accumulation of wealth, the resultant struggle or associated corruption can impose destabilizing influences on the polity. In such countries, privatization can serve as a panacea to the productive incompetence of the elite clusters.

- **The Growth of the Private Sector Argument** holds that privatization of state assets will help grow and nurture not only the private sector but also a robust and competitive environment for the productive sectors of the economy. This will serve to ensure the creation of job opportunities as well as the direct involvement of citizens in economic activities of the country.
- **The Expansion of Foreign Partnership and Participation Argument** maintains that privatization can be very instrumental in attracting not only highly needed foreign and domestic financial investments but also cutting-edge managerial and technical know-how. This will have the positive effect of creating an atmosphere of confidence for actors in the domestic economy while also boosting opportunities for export trade due to more efficient and competitive production processes.
- **The Reduction or Elimination of Costly Government Role in the Economy Argument** sees privatization as an important mechanism for ensuring a more efficient government by pruning its role in the economy and its expenditures and budget deficits as well as by improving its budgetary structure, the allocation of resources, and the taxation and revenue collection system.

## The Case Against Privatization

The case against privatization is centered on six primary arguments:

- **The Efficiency/Profitability Argument** is frequently discussed by opponents of privatization who contend that economic efficiency has little to do with the ownership of the factors of production since there can be huge inefficiencies in the allocation of resources in both the public and private sectors. It all depends on the institutional checks and balances that are put in place to thwart or control potential problems such as graft, corruption, and abuses of public trust that can occur in both private and state-owned firms. Just as officials of state-owned enterprises have been known to run government firms for private ends—not for public good—officials of private companies have been known to engage in scandalous behaviors in pursuit of personal gains (at the expense of their shareholders). Indeed, empirical evidence from some studies across dozens of countries on the singular relevance of change in ownership as a decisive factor

in achieving positive gains in economic performance seem to demonstrate that other factors are very important. Factors such as market competitiveness, regulatory framework, and institutions to address agency issues are indispensable if privatization is to result in positive economic performance.

- **Fear of Renewed Foreign Domination Argument** represents one bitter source of unhappiness about privatization, that is the belief that it would result in the sale of national assets to foreign individuals and businesses and that it would result in entrenched neocolonial relationships. A corollary to this is often the belief that the program is an externally dictated imposition by the IMF, the World Bank, or Western governments.
- **Fear of Ethnic or Racial Domination Argument** is described by the fear that privatization would open or encrust economic domination by a rival ethnic or racial group. This may also serve to open the door for political domination by the now privileged group.
- **Social Justice Argument** describes the battle against the policy as literally a battle between good and evil, a fight between ill-gotten wealth and abject poverty. To these opponents, privatization represents another economic channel used by the Capitalist class to deny other citizens of their national patrimony by taking over ventures, often with resources earned largely by dubious means. Some proponents maintain that rather than sell off state assets at heavily discounted prices to a few wealthy persons or groups, it would be preferable to open up the terrain to competition. This would not only allow the would-be-buyers of the state assets to use their finances to build new and more efficient companies, but it would boost the economy by creating jobs and a more competitive and efficient economic environment.
- **Protection of Jobs Argument** is yet another argument of opponents of privatization. Although divestiture programs have an overarching aim of improving the efficiency of state-owned enterprises to free up scarce resources for social services and for economic expansion and national modernization, governments have been severely challenged by the impact of privatization on labor. Usually, there are fears that privatization will cause a massive amount of job losses as the state readies the target companies for privatization and as the new owners look to rationalize their payrolls to improve efficiency by shedding excess labor. The

potential of devastated lives due not only to unemployment and the loss of benefits but also to the absence of social safety nets for jobless workers have the regular effect of galvanizing workers and trade unions into rabid opponents of privatization.

- **Consumer Welfare Argument** refers to the critique that the benefits many state-owned enterprises often provide through their socially conscious pricing policies really seek to ensure that their products and services are accessible to broader segment of the citizenry; proponents of privatization point to poor service records and substandard goods often provided by these state-owned enterprises. Many such benefits, such as access to potable water, health care, and better nutrition, are so fundamental to improved human existence and economic productivity that their value cannot be properly factored into simple calculations. In a privatized economic environment grounded on simple profit calculations, many people will not only lose access to such basic services and jobs but also will be ravaged by a sense of hopelessness and inhumanity.

## Conclusion

In much of the developing world, privatization has come under severe domestic and external attacks for a variety of reasons, ranging from corrupt deals to unacceptable levels of social welfare losses and punitive impact on the poor. Yet, the reform of state-owned firms is often necessary—regardless of the decision on whether to privatize them—given the encumbering effects that loss-making and inefficient firms impose on the political economies of many developing states, which must divert scarce financial resources as subsidies to such ventures. Studies point to several areas of beneficial results for the privatized enterprises, such as improvements in operating efficiency and output, capital spending, state revenues, choices and prosperity for both consumers and employees, access to private finances, and profitability. Nevertheless, the net evidence on performance after privatization suggests mixed results depending on a variety of factors around the context of state capacity and the reform exercise. Among the key national variables are per capita income levels, the level of capital market development, government and foreign investors' shares in the privatized companies, and the timing and size of the issue.

## PUBLIC HEALTH

While developing countries have seen improvements in overall health and well-being, public health in most developing countries is problematic. This is due in large part to the very issues that challenge development

itself: economic difficulties, demographic changes, the environment, education, infrastructure, and food security. Together, these overlapping issues magnify common public health difficulties and create new difficulties in developing countries.

Just as development is a broad concept, so are the concepts of health and public health. In its definition of “health,” the World Health Organization (WHO) emphasizes not only the absence of disease but also the positive health of well-being. Public health is part of this, but it is not synonymous with health care or curative medicine. Public health focuses on the health of communities rather than individuals. As Garrett (2000) explains, public health fights “on behalf of the community, placing special attention on the poorest, least advantaged elements of that community, for it [is] amid conditions of poverty that disease usually arose.” In countries like the United States, public health has come to also mean, at least popularly, health care for the poor. This misperception carries over into the developing world and into the literature on health and development. The two are related, obviously, but not the same. When poverty-stricken populations experience difficulty in gaining access to health care and appropriate curative treatment, individual illness may create community health issues.

As a broad term, public health concentrates on the general well-being of a community and the means to that end. Because of the focus on society as whole, public health systems, like defense or roadway systems, become the responsibility of governments. Public health activities include the keeping of vital statistics; community prevention of and responses to infectious disease outbreaks; societywide prevention and education programs for chronic diseases; standard settings and regulations regarding water, food safety, and injuries; and assessment of environmental hazards and their effects on community health.

In developed and developing countries alike, public health systems face a number of challenges: limited financial resources, lack of political will, tension between community and individual rights, and moral or cultural obstacles. In developing countries, these challenges are magnified, and additional challenges are present. The magnified challenge of limited financial resources is obvious, particularly in the poorest of countries where governments can spend only a few dollars per person per year on health. Leaders of developing countries face many opportunity-cost choices for the revenue they do have; public health and health more generally are all too often at the bottom of the list.

For young democracies, governmental support for individual rights is often weak; public health measures may complicate efforts to strengthen these rights and

indeed may present a threat to individual rights during situations such as quarantines. In nondemocratic societies, where oppression is present, individual rights are often severely limited. This can, ironically, allow for effective public health interventions such as immunization campaigns. However, the lasting effects of associations between public health and oppression can be extremely detrimental to public health. The overall well-being of the Russian population, as a transitioning country, has dropped drastically since the break up of the Soviet Union due in part to its public health legacy.

In the immediate post-World War II period, the Soviet public health system was effective at reducing incidence of infectious diseases and other community health hazards. The public health system was one arm, albeit a successful one, of the repressive state. As time moved forward, however, the situation deteriorated. After 1991, Russians and Westerners alike learned that the Soviet Union’s mortality and life expectancy rates had worsened. Societal well-being suffered even more as the Soviet Union broke up and the Russian Federation faced serious economic problems. Russian citizens were suspicious of immunizations and other public health programs because of the negative associations with Soviet repression. Governmental funding for health care and public health has all but disappeared. Patients have become responsible for providing their own pharmaceuticals, if medicines are available at all. Hospitals lack basic infection-control tools, such as gloves and clean needles. Rates of infectious diseases, including drug-resistant tuberculosis or TB in prisons, have soared. With incredibly steep inflation, access to proper nutrition has become limited; estimates range widely but suggest as many as three-quarters of all Russian children may be malnourished. By the mid-1990s, Russia was in the unique position of having seen its male life expectancy drop by nearly ten years, due in part to alcoholism, drug use, and violent crime.

Moral and cultural challenges to public health exist as well. With the emergence of HIV/AIDS and the presence of other behavior-related diseases, communities face prevention methods that could collide with moral and cultural values. Campaigns promoting condom use to prevent HIV/AIDS remain controversial in the United States; they could hardly be less so in developing countries, particularly those with strong religious influences. Successful public health practices, imported from elsewhere in the world, can also disrupt traditional cultures or be ineffective in the face of cultural values. Again with regard to HIV/AIDS prevention, the cultures of many developing countries limit women’s rights and thus their ability to insist on condom use by their spouses or partners.

In addition to the problems they have in common with industrialized countries, developing countries face challenges that make public health problematic. Conflict, political instability, and governmental corruption all have deleterious effects on public health. Conflict damages what public health systems do exist. For example, Kim *et al.* (2000) write that in early 1990s Haiti, the *coup d'état* overthrowing Aristide disrupted measles vaccinations. Despite WHO and UNICEF intervention, immunization rates were already low, at about 40 percent. Rates dropped to 24% overall, and as low as 4% in some regions. Consequently, a major measles epidemic occurred. Kim *et al.* (2000) also write about conflict in El Salvador and document that one region, isolated by fighting, went without government health services for thirteen years. Through battlefields and existence of refugees, conflict also creates the potential for public health crises, such as infectious disease outbreaks.

It is important to note that a reciprocal relationship exists: public health crises can lead to conflict as well as be caused by them. As Price-Smith (2002) argues, severe infectious disease outbreaks and other public health situations can lead to internal conflict through the placement of blame on ethnic or socioeconomic groups or even to external conflict if a government seeks to turn society's focus outward, away from societal weaknesses due to a health crisis.

Even short of outright conflict, political instability limits the often already debatable political will for attention to public health. Government corruption leads to misappropriated funds and poorly regulated medical, water, environment, and public safety standards. Through poor regulation or overt corruption, patients in developing countries may find themselves in possession of counterfeit drugs—little more than vials of water, in some instances. Pharmaceutical companies may take advantage of poor governmental regulation to “dump” in developing countries drugs banned by industrialized countries (Phillips and Verhasselt 1994).

Developing countries lack support networks to mitigate the impact of not only conflict and instability but also other human-made or natural public health crises. As development begins, urbanization increases. Hundreds of thousands of people may live in inadequate housing with no safe water or sanitation—the very breeding ground of disease that led to the development of public health in late nineteenth and early twentieth centuries in cities like New York or London. Earthquakes, floods, mudslides, or typhoons only further magnify these conditions that are so damaging to public health. Moreover, as development occurs, populations encroach more and more into

undisturbed environments. The emergence of new infectious diseases is a public health crisis that can result from expanding communities and deforestation. Remote areas may lack medical personnel and surveillance mechanisms, thus allowing disease to spread.

Weak economies mean weak infrastructure. Lack of health infrastructure limits health services and the number of clinics, which in turn limit surveillance and data gathering. Vital statistics, such as birth and death rates, in developing countries have been difficult to obtain and frequently unreliable. The absence of electricity complicates primary health care and public health efforts, such as vaccination campaigns reliant upon cold storage. Lack of physical infrastructure, such as roads and railways, and lack of communication infrastructure limit individuals' access to health care as well as to public health information and immunization campaigns. Media reports present images of health care workers and volunteers traveling on foot or mule as they seek to immunize children house-to-house in remote regions of developing countries.

Garrett (2000) also argues that, given globalization, *community health* applies not only to localities but also to the nation-state and the world as a whole. In this world of rapid air travel and trade, the problematic public health of developing countries impacts the entire world. For this reason, international organizations such as WHO are active in addressing the public health of developing countries. WHO services to developing countries include information gathering and dissemination, surveillance, technical assistance, and emergency response. Other international organizations such as United Nations Children's Fund (UNICEF), Joint United Nations Programme on HIV/AIDS (UNAIDS), and the World Bank as well as national agencies, such as the United States Centers for Disease Control and Prevention (CDC), give attention to public health crises and campaigns throughout the developing world. Nongovernmental organizations (NGOs) are also quite active in the areas of health services and public health in developing countries.

International efforts to eradicate poliomyelitis from the planet serve as an example of a global public health campaign. Following the example of successful eradication of smallpox, various international public health partners seek to eradicate polio by 2005. Begun in 1985, the campaign involves Rotary International, WHO, UNICEF, CDC, and numerous governments as key partners. In addition to arranging massive vaccination efforts, the campaign raises money and supplies, provides education and communication regarding immunizations, and has developed new techniques and tools for vaccine delivery. Volunteers are

crucial to the success of the global public health campaign, as illustrated in 1999 when more than 1 million Indian Rotary members and their families joined the government of India in immunizing more than 130 million children in one day, signaling the largest public health event ever in the world.” The campaign has so far succeeded in reducing the number of countries experiencing polio infections from 125 (1985) to 20 (2001). Incredibly, the global partners have succeeded in arranging for cease-fires in war-torn countries, such as the Democratic Republic of the Congo and Afghanistan, to hold National Immunization Days. The campaign is currently on track but faces continued challenges to vaccinating children in countries experiencing conflict and in the poorest of nations (Rotary International 2002).

Global and local public health campaigns throughout developing countries have engendered some success. Indicators of public health in developing countries include overall societal well-being, as measured by statistics such as life expectancy or infant mortality. These statistics are problematic due to data availability and methodological questions but are nonetheless commonly presented. The world, developed and developing, has seen significant improvements in life expectancy and decreases in infant and adult mortality during the twentieth century. WHO’s *World Health Report 1999* provides the example of life expectancy improvements in Chile: a woman born in 1910 could expect to live to the age of thirty-three; a Chilean woman born in 1998 could expect to live to the age of seventy-eight. WHO data suggests that similar improvements in life expectancy have or soon will occur in most developing countries.

Though undeniably positive, these global improvements in life expectancy as well as decreases in mortality disguise considerable disparities between and within countries. In its 1999 report, WHO notes that the increases in life expectancy are being reversed in Africa, where HIV/AIDS is taking its terrible toll. Due to various factors, including alcohol and crime, the former Soviet-bloc countries have experienced drops in male life expectancies as they undergo transitions to democracy. Despite general global progress, developing countries as a group still experience higher proportions of infant and adult mortality rates than industrialized countries. As infant and under-five mortality decreases, more people live into adulthood but then die at a relatively young adult age due to a combination of poor nutrition as well as communicable and noncommunicable diseases.

Just as there are differences between countries, however, there are also differences within countries. The wealthy people of a society are better able to avoid weakened health because they have access to

good nutrition, adequate sanitation, and health care to prevent and/or treat infectious and noninfectious disease. What the history of public health teaches, however, is that wealth is an imperfect barrier to disease. Interactions between the upper classes and lower classes occur through domestic servants, for example, and so infectious diseases can affect all segments of society. However large the rich-poor gap is within a country, it is simply not broad enough to provide health safety to the rich. Public health should thus be the concern of all segments of society.

As measured by statistics such as life expectancy, the overall health of many developing societies is improved relative to their own history. Studies of these improvements suggest policies for further progress in societal well-being. Increases in life expectancy came from improved nutrition, water safety, and sanitation resulting from the industrial revolution and related emphasis on infrastructure improvements. Income and education levels also affect mortality, as does access to medical knowledge and technology. “Because ill-health traps people in poverty, sustained investment in the health of the poor could provide a policy lever for alleviating persistent poverty” (WHO 1999) and, thus, a policy lever for improving public health.

Other measures of overall societal well-being include a community’s or country’s ability to respond to public health emergencies. The capacity of developing countries to respond to infectious disease, for example, remains inadequate for both ever-present problems such as malaria and for more urgent outbreaks. This inadequacy is due to the various challenges to public health listed previously. International actors have proven vital to dealing with outbreaks of the Ebolavirus in Zaire/Democratic Republic of Congo, Uganda, and Gabon. The public health systems of these developing countries were wholly unable to deal with the emergencies. The WHO and US CDC were especially vital to primary care, epidemiology, and prevention of further infection. Here, also, is seen a reciprocal relationship between health and development; lack of development has limited public health care and required international intervention in these infectious disease emergencies. But, as quarantines affected local trade and thus local development in Gabon, citizens blamed and turned against the foreigners in their midst. International public health teams had to withdraw, for a time, for their own safety.

In addition to infectious disease, developing countries face chronic, noninfectious diseases as well. The term “epidemiological transition” developed to explain the shift, in industrialized countries, from prevalence of infectious to chronic, noninfectious problems, such as cardiovascular diseases, cancers, and diabetes.

As their economies prospered, industrialized countries no longer faced widespread malnutrition or poor sanitation and could afford public health interventions, such as immunizing their populations against infectious diseases. They moved beyond general concern for communicable diseases and turned their focus to noncommunicable diseases. Developing countries, however, face what WHO (1999) calls the “double burden of emerging epidemics and persistent problems.” Developing societies still face the persistent problems of poor nutrition, lack of water safety and sanitation, and infectious diseases. At the same time, however, the process of development itself and even increased life expectancy open the doors to the chronic diseases and age-related mental illnesses associated with industrialized countries.

Tobacco-related illnesses provide a clear example of an “emerging epidemic” of chronic and preventable diseases. Production of tobacco products is a big business globally and, thus, the related illnesses form a global public health crisis. WHO (1999) estimates that roughly 4 million people worldwide died from tobacco use in 1998. One-third of the world’s smokers are Chinese, and China has the highest rate of smoking-related deaths in the world. More men than women smoke worldwide, but tobacco-use rates among women in developing countries are increasing. Public health campaigns against tobacco and smoking are commonplace and effective in industrialized countries. WHO (1999) reports that the percentages of US adults using tobacco products declined by not quite half between 1964 and 1997. This trend is visible in other industrialized countries as well. Tobacco control programs in industrialized countries include taxes, government regulation of tobacco sales and advertising, and antismoking public health campaigns focusing on health hazards.

While tobacco use in industrialized countries decreases, it increases by 3% to 4% per year in developing countries; among men in developing countries, tobacco use is at about 40% (WHO 1999). As the tobacco industry loses consumers in industrialized countries, it becomes more aggressive at marketing its product in developing countries, where tobacco control efforts are limited or nonexistent. In Africa, for example, the health consequences of smoking are little known (Elder 2001). Among developing country governments, misperceptions exist about the potential negative economic consequences of tobacco control measures, such as taxes and regulations. Many governments fear a reduction of revenue due to increased taxes as well as unemployment if cigarette makers go out of business. Tobacco companies, which make huge profits and wield considerable influence, often reinforce these misperceptions.

The WHO has instituted its “Tobacco-Free Initiative” to encourage tobacco control mechanisms such as taxes and regulations and increase public education campaigns throughout the developing world. Thailand is one success story. It banned smoking in many public venues, banned cigarette advertising, and engaged in antismoking public health campaigns. Smoking rates have dropped by about 4% in Thailand. Many Latin American countries now regulate advertising, and Brazil and Mexico both have national tobacco control programs (WHO 1999). The political will to engage in tobacco control is, however, lacking in many developing countries, which further demonstrates the challenges to improving public health worldwide.

Challenges to public health systems—limited financial resources, lack of political will, tension between community and individual rights, and moral or cultural obstacles—that are present in industrialized countries are even more difficult for developing countries to manage. In addition, developing countries must contend with conflict, political instability, lack of infrastructure, and other obstacles to public health. While there has been progress toward overall societal well-being in developing countries, the situation is still extremely serious in many areas. HIV/AIDS is reversing progress in life expectancies, infectious diseases continue to take their toll, and developing countries must now also contend with chronic, noncommunicable diseases. Global public health efforts and the involvement of international actors in developing countries support these countries’ public health. The development of strong public health systems in these countries requires just that: development. The level of development of a country complicates public health through simple economics, political stability, distribution of resources as reflected in the rich-poor gap, and conditions such as water safety and nutrition. The very issues that challenge development also challenge public health; bringing about successful development in developing countries will also bring about overall societal well-being and the means to protect public health.

## PUBLIC SECTOR REFORM

Determining how states should be organized and structured is the most common and intractable problem in politics. It is especially vexing in the formative years of states. New polities, even when supported by well-established political cultures, often find the difficulties in ensuring that state organizations are reliable agents hard to overcome. The problem is further aggravated when, as is the case in many developing countries, political identity is fragmented and the state's capacity to meet demands is limited. Since the middle of the twentieth century, however, the general recognition of popular sovereignty and steadily increasing demands for accountable, transparent governments has placed reform of the public sector at the apex of public policy in the developing world.

Ideally, state organizations are agents of politically relevant populations. Controlling the actions of states requires, at a minimum, an elite consensus concerning the goals of state policy and structural designs calculated to direct the actions of both institutions and governments to achieve those goals (Posner 1999). It is just these conditions, however, that have proven problematic in developing countries. Elite consensus has proven hard to maintain as the goals of state policy have changed over time due to difficulties in building state capacity, demands for increased political participation, and pressures from an increasingly integrated global capitalist economy. This, in turn,

has led to cyclical efforts to reform states to meet these changing priorities and concomitant dangers of structural instability.

There have been two waves of public sector reform in the developing world since the middle of the twentieth century. The first occurred with the achievement of independence by the remaining colonial dependencies after World War II. The newly independent nations of Africa and Asia inherited governmental structures ill-suited for tasks of nation-building and promoting self-sufficient economic growth. Indeed, colonial institutions, both public and private, had been specifically created to nip independent political and economic action by the "native" population in the bud. Further, governments in the new states found themselves under considerable international pressure to adopt regimes compliant with existing international political blocs.

There was a general consensus concerning needed changes in the inherited public sector. First, state institutions needed to be reformed to ensure that they could take steps to promote self-sufficient and rapid economic growth. Faced with dependent economies, dominated by foreign firms, financed by foreign banks, and tied to foreign markets, public sector reforms were undertaken to provide organizations capable of accumulating capital and planning its investment for economic growth. Building on earlier examples of import substitution strategies, public sector institutions were restructured to increase the regulatory, planning, and extractive capacities of governments (Lewis 1955).

Second, there was a concerted effort made to increase popular participation in government. New election laws, more truly representative legislatures, stronger local presence by central governments, and reformed civil services were all put into place. Party organizations established in the colonial period were expanded and dedicated to political agitation in favor of government development policy. Bold attempts were made to tie increased government capacity to increased electoral participation as well (Weiner 1967).

Unhappily, many of these initiatives fell afoul of the legacy of economic underdevelopment and authoritarian politics left by the colonial era. As participation increased, the capacity of governments to deflect demands that would siphon off development capital for more immediate benefits became harder to resist. Directing economic development programs proved, in many cases, beyond the talents and means available. In response, governing elites often took refuge in the bureaucratic traditions of colonial times (Seidman 1972; Fitch and Oppenheimer 1966). Party regimes, ostensibly established to quell "tribalism,"

began the slow decay of the relevance of representative institutions and, finally, of parties themselves (Torres 1967). The reform efforts accompanying independence began to collapse into debt-ridden kleptocracy in much of the developing world (Andreski 1969).

A second wave of public sector reform in developing countries began to gain momentum in the final decades of the twentieth century. Paradoxically, the impetus for this new reform effort has been the indebtedness caused by the first. As desperate governments turned to the International Monetary Fund (IMF) and the World Bank for financial assistance, they found a new round of public sector reform being forced on them in return. Here the focus was on actions that would enable governments in developing countries to meet their international debt obligations.

The international agencies recommended reversing the initial reforms that followed independence. In place of planning and regulation, governments were counseled to unleash market forces by decreasing regulation of financial transactions and foreign trade, abandoning domestic control of investment, and retreating from planning. Economic subsidies of all sorts were to be cut drastically or eliminated. Infrastructural projects were to be scaled back to more reasonable goals. Finally, services and benefits providing a “social wage” were to be severely restricted and the remaining funds were to be focused on education and provision of basic services (World Bank 1991).

In addition to these steps, the international organizations expressed strong support for political liberalization, including the establishment of multiparty regimes and regular elections. Anticorruption efforts were recommended and tied to stabilization of state finances. Independent court systems and police organizations supporting effective protection of property rights and the rule of law were also promoted (World Bank 1992). While no developing country has fully adopted this “Washington consensus” on public sector reform, enough measures have been instituted by various governments for this to be considered a second wave of public sector reform.

States adopting the new reforms have become more adept at obtaining foreign investment and have generally improved on their capacity to deliver services. The promised spurt in economic growth, however, has failed to materialize (Easterly 2001). Further, while corruption and organizational decay have been reduced, no one would assert that the second wave of public sector reform has ended these problems.

What is missing from both reform prescriptions is a commitment to the participatory imperative in

economic development. Both reform efforts were erected at the expense of popular mobilization; post-independence reforms smothered it under top-down planning and one-party regimes, “neoliberal” reforms under economic dependency, and constitutional restrictions on public policy. Unless public sector institutions can provide substantial communication concerning development laws and regulations between mass publics and legislatures and administrators, reform efforts are unlikely to bear full fruit (Ferguson 1994; Seidman 1978). With the encouraging purchase of democratic institutions in developing countries, future efforts may be more likely to succeed at this task.

### PUERTO RICO

The Commonwealth of Puerto Rico sits at the easternmost part of the island chain that forms the Greater Antilles in the Caribbean Sea. It is the smallest of these islands with a size of about thirty-five miles by one hundred miles and an area of 3,435 square miles. The Commonwealth consists of the island of Puerto Rico plus the adjacent islets of Vieques, Culebra, and Mona. Generally viewed as a colony of the United States, Puerto Rico is one thousand miles from

Miami, and it is part of the eastern gateway to the Panama Canal. Puerto Rico has a tropical ecosystem with coastal flatlands and mountainous central highlands. Small deposits of copper and nickel are its only mineral resources although there is the potential of onshore and offshore oil drilling. Spanish and English are the official languages of Puerto Rico, but English is a compulsory second language in schools, and it is widely used in business, industry, research, and education. The capital, San Juan, has an estimated population of 433,412, while the entire Commonwealth is home to about 3,897,960 people. More than 90% of the population is of Spanish ancestry.

Christopher Columbus claimed Puerto Rico for the Spanish upon his arrival in 1493. The Spanish chiefly regarded Puerto Rico as a military bastion, and they never concerned themselves much with agricultural or industrial development. Puerto Rico remained economically undeveloped until 1830, when sugarcane, coffee, and tobacco plantations were gradually developed. After Puerto Ricans began to press for independence, Spain granted the island broad powers of self-government in 1897. But during the Spanish-American War of 1898, American troops invaded the island, and Spain ceded it to the United States as part of the resulting peace treaty. Puerto Rico has remained an unincorporated US territory. Its people were granted US citizenship under the Jones Act in 1917 but essentially remain as the last colonists in the world. United States laws apply to the Puerto Rican people without their consent, and the US government contends that sovereignty over Puerto Rico resides solely in the United States and not in the people of Puerto Rico. In the Caribbean, Latin America, and the United Nations, Puerto Rico is widely regarded as a colony of the United States.

In 1940, industrialization was almost nonexistent. The tourism industry had not yet developed, with San Juan possessing only one adequate hotel. Government services were deficient. Few towns had sewer service, while running water and electricity were absent from most of the countryside. Puerto Rico, however, had all the stability of the US government as well as an exemption from federal taxation. The tax policy had developed in 1921 when US investors in the Philippines requested that Congress grant them a tax exemption for the Philippine business investments. Congress did not want to discriminate against its colonial investors, so it gave both the Philippines and Puerto Rico an exemption. Puerto Rico's tax laws, political stability, and supply of cheap labor led to a burst in industrialization in the late 1940s through the 1970s.

When World War II ended, Puerto Ricans began to press for independence from the United States.

Luis Muñoz Marín and his Popular Democratic Party, after pushing for independence, decided in 1946 to accept a Commonwealth status that essentially changed nothing in the relationship between Puerto Rico and the United States. Under the commonwealth formula, residents of Puerto Rico lack voting representation in Congress and do not participate in presidential elections. As US citizens, Puerto Ricans are subject to military service and most federal laws. Residents of the Commonwealth pay no federal income tax on locally generated earnings, but Puerto Rico government income tax rates are set at a level that closely parallels federal-plus-state levies on the mainland.

Muñoz became Puerto Rico's first elected governor in 1948 and remained in the position until 1964. Puerto Rico's governor is elected directly for a four-year term. A bicameral legislature consists of a twenty-seven-member Senate and a fifty-one-member House of Representatives, all elected for four-year terms. The enormous power entrusted to Muñoz and his party made possible a long-range program of economic and social change in the form of Operation Bootstrap.

Under the control of Teodoro Moscoso, Operation Bootstrap attempted to improve the lot of the Puerto Rican people by industrializing the economy. From the 1940s to the 1960s, Puerto Rico was transformed, largely by local initiative, from a rural to an industrialized society. Moscoso brought every type of industry that showed any interest in Puerto Rico to the island. He brought pharmaceutical, electronic, apparel, food product, and tourism industries. Such employment would provide better paying jobs and a steadier income than agricultural work. Puerto Rico continued to produce agricultural products, chiefly sugarcane, coffee, pineapples, plantains, and bananas; the country also offered livestock products and chickens, but people flocked to the cities to take advantage of industrial employment. Operation Bootstrap succeeded to the extent that by 1957, the United States boasted that Puerto Rico had become the showpiece of the Caribbean and a model of how free enterprise could transform a nation once thoroughly rooted in agriculture. While still poor by US standards, Puerto Rico stood ahead of the rest of Latin America and the Caribbean.

Moscoso could not provide enough jobs for the people who wanted them. Unemployment actually increased during the 1948 to 1963 heyday of Operation Bootstrap. It remains at the level of 12% among the 1.3 million-person labor force. Moscoso did succeed in creating one of the best educated labor forces in Latin America, but an estimated 2.5 million Puerto Ricans have moved to the shores of the United States in search of better opportunities.

The Puerto Rican rate of growth is now well behind that of many other developing countries. The school dropout rate before the twelfth grade is 30%. The homicide rate is three times that of the United States. The island has also been designated by the United States Justice Department as having particularly severe problems with drug trafficking and is considered the prime point of entry for the South American drug cartels. Puerto Rico remains a major hub of Caribbean commerce, finance, tourism, and communications, but its future is unclear.

---

## **QADDAFI, MUAMMAR**

Qaddafi was born in 1942 (the exact date is uncertain) in a tent in the Libyan desert. His nomadic Bedouin family belonged to the Qadhdhafa tribe. The boy was tutored privately and then sent to an elementary (Koranic) school in the coastal town of Surt from 1953 to 1955. Qaddafi absorbed passionate Libyan nationalism from his father, who had once been jailed by the Italian colonial authorities. Qaddafi was fourteen years old at the time of the 1956 Suez crisis when Egyptian President Gamal Abdel Nasser electrified radio listeners across the Arab world with fiery speeches. He attended the Sebha Preparatory School in the Fezzan region for five years but was expelled in 1961 for pan-Arab political agitation. After two years of high school in Misrata, he entered the Royal Libyan Military Academy at Benghazi in October 1963. There he organized a secretive Free Unionist Officers Movement. After graduating in 1965, the young officer was sent to Beaconsfield Military Academy in England for a nine-month training course.

Qaddafi organized revolutionary cells among fellow officers in the Royal Libyan Army. These plotters overthrew King Muhammad Idris al-Sanusi in a bloodless coup on September 1, 1969, and proclaimed a Libyan Arab Republic. The previously unknown Qaddafi emerged as president of the Revolutionary Command Council. He expelled Italians and Jews from Libya and forced the United States and Great Britain to vacate air bases in the country.

Qaddafi's idiosyncratic ideology is codified in his *Green Book*. He admired some aspects of Maoism and called for a Libyan "Cultural Revolution" to eliminate foreign influence, but he rejected both atheistic Marxism and Western representative democracy. Qaddafi proclaimed his "Third Universal Theory," which embraced pan-Arab nationalism, "true Islam," and "natural socialism." Islam is Libya's state religion, but Qaddafi forbids politicized sermons in Libyan mosques.

The official name for Libya is the Great Socialist People's Libyan Arab Jamahiriyya. Its unique political system is, in theory, a populist "government by the masses." No regional or class interests are recognized, and there is no role for traditional tribal leaders or modern urban entrepreneurs. The people are involved directly, indeed compulsorily: When elections are held for "Revolutionary Committees," all schools, shops, and factories close. The committees elect three thousand delegates to a national "People's Congress" that meets for only one week every year.

All real political power emanates from Qaddafi himself, who long ago renounced official titles and simply styles himself "Brother Leader." The government controls the media. There are no political parties or labor unions. Qaddafi has survived at least eight coup attempts, and he dispatches hit squads to assassinate exiled political opponents. Public administration is chaotic, especially since Qaddafi forced all government ministries to move their headquarters

## QADDAFI, MUAMMAR

from Tripoli to Surt and then replaced them with “people’s communities.” More confusing still is Qaddafi’s unique Libyan calendar, which counts the years from the Prophet’s birth, or sometimes from his death. The months July and August, named after Julius and Augustus Caesar, are now Nasser and Hannibal, respectively.

Qaddafi’s economic policies are intended to create “true socialism.” Rent is considered exploitative. Finance, commerce, and industry are largely nationalized, but in 2003, Qaddafi proposed privatization of the public sector. In fact, almost everyone is on the government payroll. Living standards are fairly high, thanks to oil revenues, which Qaddafi tries to distribute equitably. The government has built many schools, clinics, and public housing projects.

Colonel Qaddafi’s most ambitious development scheme is his Great Man-Made River Project, begun in 1984. The plan is to irrigate 185,000 acres of farmland along the Mediterranean coast with water drawn from underground aquifers in the southern desert and pumped through 2,500 miles of concrete pipe thirteen feet in diameter. Phase I was completed 1991 at a cost of \$3 billion. Tripoli began receiving water in 1996. The cost reached \$12 billion by 2000. American military analysts note that the pipe is large enough to accommodate military vehicles, and that it runs through a mountain where Qaddafi is thought to have built an underground chemical weapons factory.

Qaddafi’s foreign policy is quirky and dangerous, but not without its own principles of anti-imperialism and nonalignment. He refuses all contact with Israel. Qaddafi has attempted to merge Libya with Egypt, Syria, Tunisia, Chad, and Morocco, but these initiatives foundered, perhaps because other leaders feared Qaddafi’s penchant for military adventurism. He supported rebels in Chad for twelve years (1975–1987) and has encouraged coup plotters in Egypt and Sudan.

Since 1998, Qaddafi has directed his attention southward. The Libyan radio service was renamed the Voice of Africa. Qaddafi sent economic aid to Ghana, Zimbabwe, and Kenya and opened Libya’s borders to Africans, who came in great numbers to take even the most menial jobs. This policy proved highly unpopular among the citizenry, and race riots ensued.

In 2001, Colonel Qaddafi condemned the World Trade Center attacks and declared his opposition to terrorism, a surprising reversal for a man whose record includes support for the IRA, Basque separatists, Filipino secessionists, the Black Panthers, and various Palestinian factions. President Reagan claimed that Qaddafi tried to assassinate him, and after a 1986 Libyan-sponsored bombing of a West Berlin nightclub that killed two US soldiers, Reagan

sent jet fighters to bomb Qaddafi’s tent. The bombs missed Qaddafi but killed his five-year-old adopted daughter. The British Secret Service allegedly tried to assassinate Qaddafi in 1996 by using members of the Libyan Islamic Fighting Group, an organization linked to Osama bin Laden.

In 2003, Qaddafi seemed on his way to rehabilitation in the eyes of Western countries eager for normal trading relations with oil-rich Libya. Blame for the 1988 bombing of Pan American Flight 103 over Lockerbie, Scotland, which killed all 270 people aboard, settled on a lower-level operative. Blame for the 1989 bombing of UTA Flight 772 over Niger, which killed all 170 people aboard, was pinned on Libyan intelligence chief Abdullah al-Sanusi, Qaddafi’s brother-in-law. Libya paid compensation to survivors but stipulated that this was not an admission of guilt.

The Libyan population will double in the next twenty-five years, and the government needs to create thirty thousand new jobs annually. Qaddafi recognizes the need for foreign investment. United Nations trade sanctions, which had seriously damaged the Libyan economy, were lifted in 1999.

There currently appears to be no viable domestic political opposition to Muammar Qaddafi. Muslim fundamentalists linked to Osama bin Laden operate from caves in eastern Libya but pose no serious threat to his continuation in power. The leader would like to bequeath power to his four sons.

## QATAR

Qatar is a small peninsular state in the Persian Gulf, covering 4,427 square miles. Its only land border is with Saudi Arabia. Almost entirely desert, a mere 1.27% of its land is arable. Rain is rare, and temperatures in the summer average 48°C. Qatar underwent a

long-running dispute with Bahrain over the Hawar Islands, which they ended by referring the case to the International Court of Justice (ICJ). The ICJ ruling in 2001 gave the main island to Bahrain, with Qatar receiving significant maritime areas and resources.

Roughly 750,000 people live in Qatar, over 90% of them in urban areas. A sizeable proportion of the citizenry is part of the ruling al-Thani family. Four-fifths of the population are foreign workers, and immigrants must be residents for a minimum of twenty years (for Arabs) or thirty years (for non-Arabs) before being eligible for citizenship. Arabs comprise 40% of the population, Indians and Pakistanis each comprise 18%, Iranians comprise 10%, and the remaining 14% are other nationalities. Sunni Islam is the dominant faith, and Qataris subscribe to the strict Wahhabi sect also practiced in Saudi Arabia.

The area has been inhabited for several millennia, although its harsh conditions kept the population to a minimum. The Ottoman Empire ruled the territory for four centuries, beginning in 1538 when it wrested control from the Portuguese. During the nineteenth century, the al-Khalifa family—now the ruling family in Bahrain—dominated Qatar, until the British helped negotiate an end to tribute payments in 1872. The British replaced the Ottomans as the governing power, signing a treaty in 1916 that traded British protection for Qatar's pledge not to surrender territory or enter into relationships with foreign governments without British consent. The al-Thani family assumed absolute political control.

Britain's decision to withdraw east of the Suez Canal initially led Qatar to seek federation with Bahrain and the seven trucial states (now the United Arab Emirates). When such plans showed little progress, Qatar proclaimed its independence on September 3, 1971. Within six months, Shaykh Khalifa bin Hamad al-Thani, the kingdom's de facto ruler since the 1950s, replaced his cousin Shaykh Ahmad bin Ali al-Thani, who had formally assumed power in 1960. Ahmad's lax attitude toward governance and extravagant spending—his personal allowance represented 25% of Qatar's annual oil revenues—both contributed to Khalifa's decision to seize power. Khalifa immediately clamped down on the spending of the royal family, which often failed to draw a distinction between their personal finances and those of the state.

In 1995, Hamad bin Khalifa al-Thani overthrew his father in a bloodless coup and embarked on an ambitious program of political and economic liberalization. Qatar became the first Gulf state to adopt universal suffrage in 1999, and despite its conservative and traditional society, women are playing a more visible role. In 2003, Hamad appointed a woman as

Cabinet minister—the first woman to serve in a ministerial capacity in the Gulf; a woman was elected to the Central Municipal Council; and a woman is president of the University of Qatar. Elections were held in 1999 and 2003 for the Central Municipal Council, which aims to improve the provision of municipal services; the twenty-nine-member body has consultative powers. A new constitution was overwhelmingly approved in an April 2003 public referendum. It grants some legislative powers to and increases the membership in the Advisory Council; thirty of the Council's forty-five members will be elected, and the emir will appoint the remainder. Hamad abolished official censorship in 1995, leading to the creation two years later of al-Jazeera, the outspoken and influential satellite news outlet. However, al-Jazeera rarely criticizes the al-Thani family or covers local news. Political parties are still not permitted.

Until oil was discovered in 1940, the economy was traditionally based on pearling, fishing, and herding. Commercial exports began in 1949. Oil revenues brought dramatic social improvements to Qatar. Health care, education, utilities, and housing are free to Qatari citizens. The formal school system opened in 1956, and the education budget grew 31% per year over the next decade. By 1970, eighty-eight schools had been established, including forty for girls, and the university opened in 1973. The literacy rate in 2002 was 84.2%. Women have fared well in the educational system, enjoying a literacy rate roughly equal to that of men, and markedly higher enrollments in tertiary educational institutions. Education and the workplace are segregated. The private Qatar Foundation has developed branch campuses of several leading American universities, including Carnegie-Mellon, Cornell, Texas A & M, and Virginia Commonwealth University, allowing students to study a Western curriculum in Qatar. The health system also has shown marked improvements. The first state hospital opened in 1959, and by 1970, Qatar led the Arab Middle East in terms of availability of services. Life expectancy rates increased from 62.1 to 72.2 years between 1970 and 2000, as infant and child mortality rates fell substantially.

Qatar's economy is dominated by the oil and gas sectors, which account for 55% of gross domestic product (GDP), 70% of government revenues, and 85% of export earnings. As its oil fields are expected to run dry by 2023, Qatar has begun to shift its economy from reliance on exports of oil to natural gas. It boasts the world's third largest natural gas reserves, and its North Field is the world's largest unassociated field. Qatar is participating in the multi-billion-dollar Dolphin Project, which will interconnect the natural gas grids of Qatar, the United Arab Emirates, and Oman, providing gas for both export

and domestic use. Hamad borrowed billions of dollars in the 1990s and restricted government spending so that he could devote resources to upgrading the oil and gas sectors. Qatar was rewarded with robust growth, a 9.9% average annual GDP growth between 1992 and 2002, driven by a sharp increase in exports of natural gas, increased oil production capacity, and increased refinery capacity. It produced between eight hundred thousand and nine hundred thousand barrels per day in 2002 and 2003.

### QUALITY OF LIFE: DEFINITION

*Quality of life* is not a term that can be simply defined. This is because quality of life is to be able to determine for oneself what quality of life actually means.

Development ethicists have argued that development theory should have at its core a concern to make assessments and devise a theoretical framework for how quality of life can be achieved for and by everyone. At its basis, there is a concern with equality as the principal constituent element of justice; the Nobel Laureate Amartya Sen states, for example, that “every normative theory of social arrangement that has stood the test of time seems to demand equality of something—something that is regarded as particularly important in that theory.” Therefore, the question becomes what equality should consist of and how this can be brought about in practice. Sen’s proposal is that this equality lies in the equal freedom to pursue a life that “we have reason to value” (Sen 1992). The philosopher and public intellectual Martha Nussbaum takes this one step further and states that it is necessary to ground this in more concrete notions of

human quality of life. Nussbaum and Sen’s work in this area has fostered the development of the capability approach, which uses the language of functionings and capabilities to designate a theoretical framework from which to develop policies to improve the quality of life of individuals in developing countries. A functioning is an activity or state of being; a capability is the capacity or ability to exercise a certain functioning. For example, a person has the capability to eat healthfully if they have the capability to exercise the functioning of taking up and digesting food, coupled with the capability to exercise the functioning of accessing food that is nutritious.

Going beyond measurements of a state’s Gross Domestic Product, other factors such as distributive measurements of wealth (such as per capita income), the purchasing power of a currency, and a person’s access to goods and services are deemed absolutely central for any serious analysis of quality of life of the individual. The individual is the core unit of analysis of the assessment of quality of life. Yet a person’s access to political power, emotional health, and spiritual well-being are equally important components of this approach.

This necessitates a theory that can make prescriptions about procedures and desired outcomes, as well as criteria for measurement and evaluation. To do this, one needs to address the existence of different and supposedly irreconcilable value systems in the world today, an issue that has become more acute due to the ever-increasing interdependence of human beings worldwide. People from different backgrounds are more likely to interact with each other, which, in turn, is more likely to bring conflict (but also similarities) to the fore. Any list of what a human being requires to live a life that is said to have quality needs to be sensitive to this.

Key theorists tackling quality-of-life questions have sought to resolve these tensions in different ways. Some have started from a deliberation about “human needs”(see, for example, Goodin); others, such as Sen, have tried to develop approaches that do not necessitate agreement in the absolute but allow for unfinished agreement and overlap where synthesis in certain elements, known as capability sets, can be found; this method is more suited to making assessments of existing structures, rather than designating ideals to strive for. On the other hand, Nussbaum, for example, has opted for a more prescriptive approach with a more definite list of functionings that people must be able to exercise as capabilities. She holds these out as ideals that secure power for each person to pursue their own interpretation of the “good life” and has devised a list of capabilities of which all components are deemed of equal importance: life;

bodily integrity; bodily health; senses, imagination and health; emotions; practical reason; affiliation; symbiosis with other species; and control over one's own environment, political and material.

One critique of this is that even the basic premises of this approach—their starting points, such as equality, freedom, and autonomy—cannot be regarded as universally justifiable, and their roles might vary quite substantially in different societies. This makes it difficult to determine concrete impediments to freedom and choice, to determine where oppression occurs, and to make a moral case for injustice, if one wishes to respect cultural life in the forms that it is currently expressed. Related to this is the concern about when preferences have been adapted and capabilities compensated for (i.e., a determination of when a person has real freedom and real choice or when a person is constrained and socialized by factors that could be designated as wrong or alleviable). This has a bearing on the methodology of detecting what people really want and need and how this is to be measured. Questions posed relate to whether people's own personal preferences are to be the measure for capabilities and what a preference should be based on: desire and overall happiness of people taken together to form a society, justice, stability, or need. Likewise, going beyond autonomy and taking into consideration the

affiliative aspect of human life, one needs to define what the relationship between individual freedom and societal duties is, and lastly, it needs to be ascertained what all of this means for the socioeconomic structure of societies, local and global.

For these reasons, quality of life is not a straightforward concept. However, it is a crucial one in improving development policies beyond a one-dimensional economic assessment of a country's productivity.

## **RAFSANJANI, ALI AKBAR**

Born in the town of Rafsanjan, province of Kerman in 1934, Ali Akbar Rafsanjani has been, and remains, one of the most influential figures in postrevolutionary Iranian politics. He studied Islamic jurisprudence under Ayatollah Ruhollah Khomeini beginning in 1951. He was active in the anti-Shah forces prior to the revolution and was jailed for his association with the Mujahedin e-Khalq. In 1979, the year the Shah was deposed, Rafsanjani formed the Islamic Republican Party. In 1980, he was elected to parliament, and since then has filled every major political position in the government since the revolution, including Speaker of the Parliament (1980–1989), Commander-in-Chief of the Iranian Armed Forces (1988–1989), and president (two terms, 1989–1993, 1993–1997).

He has been characterised as a pragmatic conservative, and his efforts towards reform in Iran should be seen in this light. During his time as speaker and his two terms as president, he sought a rapprochement with the West. As a result, Iran renewed diplomatic relations with France and Canada in 1988, the Soviet Union in 1989, and the United Kingdom in 1990. He was also instrumental in brokering the release of Western hostages from Lebanon during the same period. This reestablishment of links was part of an attempt to engage with the West as a necessary requirement to alleviate economic pressures felt by the Republic.

Rafsanjani has been closely aligned with both Supreme Leaders, and many of his appointments have grown out of this close link. This was the case with his

appointment by Ayatollah Khomeini as his representative on the war committee during the Iran-Iraq war, and subsequently as the Commander-in-Chief. This was also the case when Khomeini appointed him to the position of Chairman of the Expediency Council. He has been a proponent of reform within Iran, although this has been nearly exclusively applied to economic, rather than political, matters. On becoming president, Rafsanjani needed to address issues that were causing significant economic hardship to the people. A war-ravaged economy resulting from years of fighting Iraq, economic sanctions from the West, and a burgeoning, increasingly urbanised population put pressure on the system. Rafsanjani instituted successive five-year plans designed to revive the moribund economy. The emphasis was on a move towards a market economy, seeking both foreign and private investment, reducing government subsidies, and an increase in private ownership of economic assets. The first of the five-year plans put particular emphasis on the privatisation of state-controlled enterprises.

The economic reforms were only partially successful, given allegations of corruption over the privatisation of some enterprises, and the emergence of differences between the political factions within the parliament who were ultimately responsible for the passage of the reforms. On the positive side, agricultural output was increased, and a growth in privatised industrial production geared to exports was developed. These attempts at economic reform, however, have not been matched by any similar move towards political reform. While he has been characterised as a

pragmatist, willing to ally himself with conservatives or technocrats, depending on the issue he was confronting, he has generally been considered an opponent of political liberalisation. During the 1999 student riots against the nature of clerical rule, for example, Rafsanjani sided with the Supreme Leader and the conservatives, condemning the students for providing encouragement to what he claimed were United States efforts to regain influence in Iran.

### RAHMAN, TUNKU ABDUL

Known by his honorific title *Tunku*, Abdul Rahman (1903–1990) was Prime Minister (PM) of the Federation of Malaya (1957–1963) and Malaysia (1963–1970). The *Bapa Kemerdekaan* (“Father of Independence”) was born Abdul Rahman Putra Al-Haj, prince of the Sultan of Kedah. Educated in England, he claimed that racial discrimination there motivated his Malayan nationalism. He joined the civil service before returning to England for further studies, but was interrupted by World War II. Like many nationalists, Rahman saw the war as a definitive turning point. Malaya came under Japanese occupation in early 1942. Some Malays heralded this as the end of British imperialism. Most, however, realized Japanese brutality, and by 1945, accepted gradual independence under reinstated British rule. Britain’s “Alliance Plan” organized Malayan territories into an ethnically diverse union—formally cast as the Federation of Malaya in 1948.

Rahman became Chair of the nationalist United Malay National Organization (UMNO) in 1949, and its President in 1951. Malaya avoided the divisive nationalism endured elsewhere in Southeast Asia but was not without problems. There were secessionist movements, and between 1948 and 1960, the “Emergency”—a communist insurrection led by ethnic Chinese. Rahman worked with the British to suppress the insurgency. He also forged the multi-ethnic anti-communist Alliance Party with Chinese and Indian leaders. Emphasizing cooperation, he guaranteed minority rights in exchange for support backing Malay-led independence.

Some Malays opposed Rahman. They regarded UMNO as an elitist organization, or insufficiently Muslim. They also resented Chinese economic power. However, Rahman’s alliance worked, and on August 31, 1957, Malaya declared independence. Rahman was its first leader. He won additional elections in 1959, 1964, and 1969.

In September 1963, Rahman negotiated British-held Sarawak and Singapore into the Federation of Malaysia. Indonesia, and Philippines opposed the move. Clashes with Indonesian troops followed, but Rahman avoided war. He did the same when Singapore declared independence in 1965. As PM, Rahman also gained Malaysia an elected seat on the United Nations Security Council (1965) and helped form the Association of Southeast Asian Nations (ASEAN) (1967).

Critics see Rahman as dictatorial in ignoring his party and Parliament. They also believe that he exacerbated ethnic tensions, culminating with violent race riots following May 1969 elections. The riots seriously divided UMNO. Future PM Mahatir Mohammed and others were expelled for denouncing Rahman as pro-Chinese. Some members defected to PAS—the opposition *Parti Islam se Tanah Malaya* (Pan-Malayan Islamic Party). Under pressure, Rahman resigned as PM in September 1970 and as UMNO President in June 1971. His multi-ethnic alliance collapsed.

Rahman later chaired the Organization of Islamic Conference (OIC), and headed *The Star* newspaper, often criticizing the government. PM Mahatir banned the newspaper in 1987. Rahman tried dividing UMNO to oppose Mahatir, backing the splinter group *Parti Melayu Semangat 46* (Spirit of ’46 Malaysian Party) in 1990 general elections.

Some argue that Rahman spent too much time focusing on racial harmony and not enough time developing the economy. However, others note that without his attempts to unify ethnicities, economic prosperity could never have been achieved.

## RAIN FOREST, DESTRUCTION OF

Rain forests constitute the richest, most productive, and complex ecosystems on earth.

Tropical rain forests can be found in the Amazonian basin, South Asia, Australia, and Africa; Australia also has temperate rain forests, which can be found on the northwest coast of North America, New Zealand, Ireland, Scotland, and Norway as well.

### Rain Forest: Definition and Status

Rain forests cover less than 2% of the earth's surface; (or 6% of its land mass) they originally covered twice the current area. As some of the earth's richest natural reserves, the tropics contain the oldest living ecosystems of our planet. Southeast Asian forests can be traced back for 70 million to 100 million years. Rain forests receive four to eight meters of rain per year (Myers, Norman, *The Primary Source*). Without a dry or cold season, the tropical forests absorb as much as five times more rain than forests in a moderate climate. (Myers, Norman, *The Primary Source*)

Despite the small land area they cover, rain forests are home for about half of all life forms on our planet—as many as 30 million species of plants, animals, and insects. A typical four-square-mile patch of rain forest hosts as many as 125 mammal species, 400 species of birds, 100 of reptiles, 60 of amphibians, and 150 different species of butterflies, as well as 1,500 species of flowering plants and 750 species of trees. Rain forest species do not spread easily beyond their native habitats, and hence are found nowhere else in the world.

### The Extent of Destruction

The global rate of tropical deforestation has increased rapidly by more than 50% over the past decade. Many

scientists believe that nearly all tropical rain forest ecosystems will be gone by the year 2030.

Southeast Asian countries such as Indonesia, Thailand, Laos, and the Philippines lost 88% of natural forests. Nearly all the primary rain forests in India, Bangladesh, and Sri Lanka have been ruined. The rain forest in Ivory Coast has been almost completely logged; however, the Congo, Cote D'Ivoire and other African countries have gone through the most severe rain forest destruction. More than 60% of Mexico's woodlands have fallen while Haiti rain forests have been completely destroyed. In contrast with other regions, South America still maintains a relatively high percentage of natural ecosystems, particularly in the Amazon and the southern tip of the continent. Unfortunately, however, these pristine areas are being degraded at an alarming rate due to disturbance by human activities.

### The Amazon

South America contains some of the world's largest remaining blocks of tropical rain forests, blanketing millions of square miles with the Amazon, Orinoco, and Paraguay Rivers (considered among the largest freshwater systems on earth). A vast expanse of the Amazon River Basin covers an area nearly the size of Europe (stretching over 2 million square miles). The Amazon River Basin retains the most extensive system of flooded forests on earth covering nearly 116,000 square miles. As the world's largest river basin, its streams and rivers supply 20% of the earth's fresh water. A dynamic ecosystem is maintained by yearly patterns of water levels creating and demolishing land along with the constant erosion of riverbanks. Annual fertilization comes from the deposited soil eroded from the Andes carried by annual flooding.

The Amazon is endowed with a variety of ecosystems containing an astonishing array of wildlife. One-third of the world's tropical woods (2,500 tree species) are known to exist only in the Amazon. The forests and freshwater ecosystems of the Amazon Basin host an extraordinary seasonal migration of aquatic and terrestrial animals in and out of the flooded forests. Animals and plants (found nowhere else in the world) thrive along the slopes of the Andes and Guayanan mountains. Rich aquatic and wildlife colonies abound along much of its coastlines.

The Southwestern Amazonian forests of western Brazil, northern Bolivia, and southeastern Peru (covering more than two hundred thousand square miles) form part of the world's largest intact rain forest region (with its distinctive oxbow lakes), cooled by

winds sweeping down from the Andes and warmed by a jungle blanket. The eco-region's forest types (considered to be among the earth's most biologically rich) are comprised of lowland tropical moist forests, unique flooded savannas dotted with palm trees, as well as an extensive area of bamboo-dominated forests (covering more than sixty-nine thousand square miles—an area the size of England) (World Wildlife Fund 2002). This extraordinary eco-region is maintained by high rainfall, complex topography and soils, and the meandering river systems that create habitat mosaics.

The region has an incredible array of freshwater fish, birds, and butterflies, many of which are found nowhere else. As many as 1,200 species of butterflies have been recorded. In addition, the Southwestern Amazonian forests remain one of the last refuges of the highly threatened jaguar, howler monkeys, pumas, ocelots, bush dogs, the harpy eagle, pink freshwater dolphins, the giant river otter, tapirs, and black caimans.

Many plant species (giant kapok trees, the forests' symbols, and the virola) in these flooded forests face extinction from exploitation due to the region's tripled human population since 1950. Logging the kapok tree and virola is accelerating deforestation over vast regions for biodiversity conservation in flooded forest ecosystem. The open floodplains are threatened by conversion to cattle ranches and the widespread introduction of water buffalo, which are not native to the region and cause damage to the shoreline vegetation and fish nursery areas. Overfishing, to supply the region's growing urban centers, could result in the localized extinction of prized species and the consequent loss of subsistence fishing for traditional river dwellers. Hydroelectric dams for the region disrupt such ecological processes as the migration of catfish, which travels from the estuary at the mouth of the Amazon upstream to Colombia and Peru to spawn.

### **The Effects of Rain Forest Destruction**

Human capacity for meeting material needs is seriously undermined by the elimination of diverse rain forest systems. Natural ecosystems provide genetic resources for improving human well-being. The supply from the rain forests includes a wide assortment of edible fruits and nuts as well as numerous plant products. Many of our favorite foods (avocado, banana, eggplant, fig, lemon, orange, peanut, pineapple, tomato, and countless others) were originally found in the rain forests. Many plants contain genetic materials essential to fortify our existing agricultural stock.

Medicinal plants from tropical rain forests were long used by native tribes. According to the National Cancer Institute, 70% of the plants useful for developing cancer treatment medicines are available only in the rain forests. Many medicines for other serious conditions such as heart ailments, arthritis, and Hodgkin's disease come from rain forest plants. The chemical compounds of fewer than 1% of tropical forest species have been thoroughly studied. We still do not know completely which plant species may contain the properties for curing various human diseases.

Many of the world's most biologically diverse regions are affected by rain forest destruction with the loss of rare species (tree, birds, fish, reptiles, amphibians, and mammals). Rapid lumbering has devastated native tribes. Timber-cutting and the building of dams and other industrial infrastructure has infringed upon or destroyed indigenous villages; overdevelopment of rain forest areas has also contributed to loss of food resources, contamination of drinking water, the spread of disease and loss or damage to archeological sites. Six to nine million indigenous people inhabited the Brazilian rain forest in 1500, but less than two hundred thousand remained by the end of the last century. Several uncontacted indigenous tribes living in biologically rich areas were exposed to a whooping cough and influenza epidemic that killed an estimated 50% of their population.

Forests fulfill human needs by performing ecologically balancing roles or functions, including the protection of soils, preservation of water, and provision of timber. The disappearance of forest (deforestation) causes various environmental consequences such as soil erosion, flooding, and climate changes. Forests control soil erosion by reducing flooding and replenishing groundwater supplies. The soils experience erosion within a few years after rain forest clearance and become unproductive without the nutrients provided by the vegetation.

Photosynthesis of plants within rain forest ecosystems plays a critical role in maintaining the earth's atmosphere: 50% of all oxygen comes from rain forests. By converting carbon into cellulose and releasing oxygen through photosynthesis, forests keep increases in carbon dioxide in check. Throughout past millennia, this has maintained a balance between oxygen and carbon dioxide levels in the air.

However, the consequences of human activities in the rain forests have interrelated and cumulative effects in the environment. Loss of the forests undermines the long-term ability of the earth's atmosphere to neutralize greenhouse gases. Tropical deforestation eliminates our planet's ability to absorb excessive atmospheric carbon since forests absorb and store

atmospheric carbon through photosynthesis. Rain forest loss, and hence increased levels of atmospheric carbon dioxide which contribute to global warming, has an impact on global climate patterns: the warmer temperatures cause melting of the polar ice caps and a rise in sea levels.

More carbon is being released into the atmosphere than ever, but fewer forests exist to remove it. About half the world's forests were removed over a thousand years ago; the concentration of carbon dioxide in the atmosphere has been increasing steadily since 1850 with changes in the composition of the atmosphere caused by human activities.

In addition to coal, oil, and gas (which emits the most carbon dioxide into the atmosphere), the burning of vegetation in deforestation is the second largest contributing factor to the greenhouse effect with the release of huge amounts of carbon into the atmosphere (including carbon dioxide, methane, ozone, and nitrous oxide) through burning and decaying trees. According to some estimates, 23%–30% of all carbon dioxide in the atmosphere comes from deforestation taking place in Brazil, Indonesia, Burma, Mexico, Thailand, and other tropical countries.

## Causes of Destruction

The economic pressure on the developing world is difficult to reverse, and thus it is difficult to prevent the exploitation of rain forests for economic purposes. Timber extraction by clear-cutting results in wholesale environmental destruction. Destruction of rain forests is mainly attributed to various human activities, including logging, mineral exploration, and setting up plantations of rubber, coffee, and other crops.

Logging and clearing land for farming have proved the biggest causes of deforestation in places like Cameroon, which experienced the fastest deforestation rate in Africa in the late 1990s. Most tropical timber (teak, mahogany, rosewood, ebony, and iroko) consumed in the United States comes from in Indonesia, Malaysia, and other Southeast Asian countries that dominate world trade in tropical hardwoods. A growing timber trade encourages logging, and the majority of the globe's forests do not receive much protection.

Political corruption often feeds the destruction of rain forests, with bribery leading to lucrative logging concessions that generate exceptional profits for private contractors. Government policies have even contributed to excessive forest depletion

with tax and credit subsidies for wood-processing industries.

A direct and immediate process of depredations involves slash-and-burn farming, expansion of ranchland, and unsustainable logging of hardwoods. The uneven distribution of wealth and land is one major factor in the destruction of tropical forests; in the Amazon region, for example, people living on infertile land have traveled to the Amazon basin to practice slash-and-burn agriculture. With the arable land concentrated in the hands of a small, wealthy class, the Brazilian government has encouraged landless peasants to convert the Amazonian forest into small farms and ranches. Rapid population growth often is linked to forest destruction through pressure on new land by small farmers.

Large tracts of rain forest are in danger of being replaced by monocultural plantations of fast-growing, nonindigenous trees for paper-pulp production. Brazil may become one of the world's largest paper-pulp producers at the expense of rain forests. In addition, expansion of ranch land for beef production is responsible for rapid forest conversion, especially in the Amazon and Central America.

Agricultural expansion is not planned in a sustainable fashion, and economic gains have mostly been short-term and concentrated in a few hands. Land development and settlement schemes create monocultures of cash crops. The activities of multinational corporations, engaged in logging, mineral extraction, and agribusiness, emphasize use of chemical fertilizers and specialization in a few crops.

In addition, oil drilling, gas explorations, and mining, large-scale development projects also take their toll on the Amazon's wealth of forests. Exploration and production of oil represents one of the greatest threats to large areas of rain forest in Papua New Guinea, Africa, and the Amazon Basin. Forests are also depleted by the infrastructure, such as dams and highways, which must be built to support these enterprises. Critics have accused multinational corporations and international lending institutions of contributing directly and indirectly to the destruction of the rain forests and indigenous peoples through unregulated investments and tax incentives for projects that contribute to deforestation.

Unmanageable debt, lending policies of international financial institutions, fiscal incentives, and consumerism in affluent societies in Europe and the United States in particular all contribute to rapid deforestation and conversion of tropical land to other purposes. Large-scale, export-oriented commodity production for foreign exchange are driven by the need to service huge debt burdens.

## Efforts to Mitigate Deforestation

The forest supports many communities of indigenous people whose livelihood depends on the sustainability of the forest. Many indigenous systems of knowledge recognize the relationship between the forest and its human inhabitants. Sustainable use of resources for indigenous communities is dictated by religious teachings and sheer necessity and derives from an intimate familiarity with the workings of their habitat. Although the concept of sustainable development has been adopted by some national governments and nongovernmental conservation organizations, it is an ancient way of life for most traditional cultures. Indigenous populations make use of everything they harvest in the forest for food, clothing, medicine, and construction materials, and hence are able to take advantage of their resources without depleting them.

Advocates of rain forest preservation argue that income from extractive reserves set aside for use by their original inhabitants actually exceeds revenues generated from lumber and grazing on the same land. When harvested properly, these reserves will produce sustainable supplies of rubber, nuts, fruits, and other products. While maintaining a sustainable income, the reserves also are used to maintain native species. This system has been successfully implemented with the establishment of forest and lake reserves in Brazil, Peru, and Guatemala. Rubber tappers have been strong advocates for conservation and are helping prevent conversion of forest to pasture and agriculture. Local movements led by internationally known activist Chico Mendes and others attempted to save the Amazonian forests by helping inhabitants make a sustainable living. The oppression of the groups drew strong opposition from human rights, environmental, and indigenous groups around the world.

## Forest Management Programs

Sustainable use can generate a synergy between environment and development. Farmers can be more productive on smaller portions of land by using more effective agro-forestry methods. A variety of crop species and trees produce higher yields with organic farming than the usual methods of commercial agriculture. Though this small-scale farming is not yet widely practiced, it provides a hope for easing pressure on the rain forests. Logged land can be reclaimed to grow plants that support the subsistence of local people and help reduce the pressure on nearby primary forests.

Additionally, lifestyle changes by consumers can reduce demands on rain forest resources. Conserving energy reduces the need to for petroleum drilling. Recycling reduces waste of paper, aluminum, and tin products that, in many cases, come from the rain forests.

## International Efforts

A number of NGOs have engaged in various methods of preserving the rainforest. Some, including the Nature Conservancy and the Rainforest Preservation Foundation, have simply purchased large tracts of rain forest in order to keep them untouched. The Rainforest Preservation Foundation drew international attention by establishing the Mampiraua Sustainable Development Reserve, the largest Brazilian protected area for the conservation of flooded forests. Additionally, nonprofit organizations in Brazil and elsewhere have been established to help the indigenous populations manage the land.

International efforts also include support of the establishment of public preserves of rainforest land. For example, in return for financial assistance, Brazil agreed to preserve 10% of its remaining forest. However, this agreement was undermined by loosening of legal controls on the development of other parts of the Amazon by the Brazilian Congress. Additionally, the positions taken by Western governments and corporations have not been consistent. While the European Union supports rain forest conservation in Brazil, it also has funded the construction and rehabilitation of roads into the forests. The International Tropical Timber Organization also took some initiatives to slow deforestation in Malaysia and other countries, but without cooperation of member states, the measures have not been effective.

## RAMOS, FIDEL

Fidel Valdez Ramos, the twelfth president of the Republic of the Philippines, was the first military professional to be president of the country.

Born on March 18, 1928, to Narciso and Angela Ramos in Lingayen, Pangasinan, Ramos joined the military on 1951, where he was Second Lieutenant. He then served in the Philippine Expeditionary Force to Korea in 1952 and in the Philippine Civic Action Group to Vietnam from 1966 to 1968.

During the Marcos era, he headed the Philippine Constabulary, now known as the Philippine National Police, and served as Vice-Chief of Staff of the Armed Forces of the Philippines. From February 22, 1986, Ramos, together with Defense Minister Juan Ponce Enrile, led the People Power movement that lasted for four days. The movement was successful and Corazon Aquino became president of the country. She at once promoted Ramos to full General and Chief of Staff. When Ramos retired after having served thirty years in the military, Aquino then appointed him as her Secretary of National Defense. In 1991, Ramos declared his candidacy for the presidency.

Endorsed by Aquino, he won the election and was sworn in as president on June 20, 1992. As president, his leadership of the country has been guided by his five planks. These five points are as follows: (1) peace and stability, (2) economic growth and sustainable development, (3) energy and power generation,

(4) environmental protection, and (5) streamlined democracy.

Ramos addressed the problem of the power shortage in 1992 and 1993 by building power plants. Known as Mr. Fix-It, he later built and renovated roads and infrastructure, knowing that this is one of the basic components of development. He also has liberated telecommunications and built the Light Rail Transit (LRT). Because of these renovations, investors have increased their presence in the nation. These developments helped the country's economy recover dramatically; the gross national product grew 5.5% in 1994. *Newsweek* magazine then hailed the Philippines as the world's first "green tiger" country.

But Ramos's crowning achievement was the signing of the peace agreement between the government and the Moro National Liberation Front (MNLF), which was led by Nur Misuari. After four years of careful negotiations, the peace agreement was finally signed on September 2, 1996. This treaty finally ended a longstanding uprising in Mindanao.

Toward the end of his term, Ramos wanted to amend the Constitution to allow him a second term. Public protests forced him to drop the demand. He stepped down from office after the end of his term in 1998.

Ramos became the country's third president of Ilocano descent and the first Protestant. He is married to Amelita and has five daughters.

## RASTAFARIANISM

Rastafarianism is a social movement that arose among poor Jamaicans in 1930 during British colonial rule. As a revitalization movement with religious aspects, it brought hope to the poor people who adopted it and served as both protest and resistance to colonial rule, racism, and class differences that characterized the society at that time. From its inception it has served as an alternative to mainstream Jamaican society, politics, and religion. It became a repository of African values and practices in Jamaican culture. Later, it emerged as a broad cultural

## RASTAFARIANISM

movement that spread beyond Jamaica to the rest of the Caribbean, Canada, England, the United States, and Africa.

The name of the movement derives from Ras Tafari, which means “Duke Tafari,” the title and given name of the Ethiopian Emperor, Haile Selassie I (often referred to as Jah Ras Tafari). Central to the development and meaning of the movement is the belief that Ras Tafari is the black messiah or even the incarnation of *Jah* (God). Rastafarians believe that black people are the descendants of King Solomon and the Queen of Sheba, and therefore the modern incarnation of ancient Israel.

Rastafarians place an emphasis on Pan-African values, and the movement can be seen as a means of retaining important Jamaican cultural elements devalued by the larger society. They see establishment Jamaica and other parts of the world as Babylon, places of oppression, and Ethiopia or Africa as the Promised Land, or even as heaven, to which blacks should return. The idea of repatriation has been a strong sentiment within Rastafarianism from its beginnings. Most scholars acknowledge that the movement is patriarchal in its sentiments and treatment of women. Although some Rasta men have embraced the equality of women, others cite biblical sources for their subordination.

Typical of the Rastafarian way of life are a number of customs and rituals. Rastafarians tend to work and live communally; they wear dreadlocks, long and matted coils of hair; they employ the ritual use of *ganja* (marijuana); they use a special language/dialect as a marker of identity; many Rastas are vegetarians; and they prize self-reliance. Reggae music and its messages of protest and resistance are emblematic of the role that Rastafarianism has always played in the developing world. The lion, which symbolizes Ras Tafari, is a common symbol, along with the symbolic colors of red (blood of martyrs), black (the people), and green (the plant life).

### Colonial Origins of Rastafarianism

In 1930, Jamaica, like the rest of the world, was experiencing the Great Depression, which came in the wake of great changes in the world of Jamaican peasants: the shift from agriculture to wage labor with the coming of industrialization and the shift from rural to urban life. In addition, Jamaica was racially stratified with black peasants at the bottom of the social order and mostly living in poverty. All of these conditions led to the formation of the new movement,

making it nativistic in many of its elements, recapturing traditional practices and values of the Jamaican peasantry that were disrupted with the coming of industry.

Some scholars suggest that Rastafarianism can trace its roots back to the Maroon tradition of Jamaican slavery in which escaped slaves set up autonomous communal enclaves, which served as havens for other escaped slaves and repositories of African culture. And while there is certainly historical continuity in the maintenance of their African heritage and the use of religion as a means of unity, most scholars of the Rastafarian movement see a more direct connection between Rastafarianism and Garveyism, an earlier movement that arose around charismatic leader Marcus Mosiah Garvey (1887–1940) in the 1920s. Although Garvey had more followers in the United States, his movement began in Jamaica.

Garvey formed the Universal Negro Improvement Association (UNIA) in 1914. Central to the goals of the UNIA was the unity of blacks everywhere, the reclaiming of the African heritage and repatriation to an African homeland. The flag of the UNIA was red, black, and green, the colors that would later become symbols of the Rastafarians. Ethiopia also was central to Garveyism as was the African homeland. Marcus Garvey has endured as a key figure in Rastafarian thought and is seen by some as a prophet of Ras Tafari.

Rastafarianism had its inception with the crowning of Haile Selassie I in 1930, and the recognition and celebration of this event by ministers who worked in the poorest parts of Kingston constitute the actual beginnings of Rastafarianism. Some believed that he should replace the British monarch as the head of Jamaica. Early leaders of Rastafarianism, such as Leonard Howell, Joseph Hibbert, Archibald Dunkley, and Robert Hinds were all ministers and probable followers of Marcus Garvey. Of these, Leonard Howell may have had the most impact on the movement and its development.

### The Development of Rastafarianism

From the beginning, Rastafarianism posed a threat to the established political, religious, and social order in colonial Jamaica, so much so that its leaders were arrested and jailed with relative frequency. In 1940, Howell purchased land in rural Jamaica and started a commune called The Pinnacle. It was there, living much as the Maroons had, that many of the characteristics of the Rastafarian movement emerged and became fixed.

The 500–1,600 people in Howell's group lived communally, engaging in the growing and sale of a variety of crops. The Pinnacle allowed Rastafarians to recapture part of their lost affection for the land through this small-scale agriculture. It was also during this time that men began letting their hair grow long and began smoking *ganja*. This rural stage of Rastafarianism ended in 1954, when a final raid on the Pinnacle closed it down permanently.

The suppression of the Rastafarians forced them back into urban life, but they maintained many of the characteristics that they had developed in the country. Intensely anti-establishment and anti-authoritarian, they constituted a steady voice of protest against the conditions of colonialism under which they lived and generally refused to become involved with its politics. The movement entered a period during which it took firm root among the poor of Kingston, manifested itself in continual clashes with the establishment, and experienced a couple of abortive attempts at repatriation to Africa. However, changes in both the understanding of Rastafarianism by outsiders and increased activism on the part of Rastas themselves began after Jamaican independence came on August 6, 1962.

### Post-Colonial Resurgence of Rastafarianism

In the 1960s and 1970s Rastafarianism grew and branched out into formal associations, became linked to reggae music, and transformed itself from a local movement to an international one, largely due to its persistent voice against oppression and the state powers that be. The movement was also galvanized by a visit from Emperor Haile Selassie in 1966 and by his later offer of five hundred acres of land in Ethiopia for the repatriation of people of African descent.

After Jamaican independence, Rastas became embroiled in the political machinations of the competing political parties and in the political violence that ensued. These parties adopted Rasta symbolism as a connection to the poorer classes and, in so doing, legitimized Rastafarianism to a certain extent. Some formal religious associations emerged, each embodying a slightly different approach or ideology, such as the Ethiopian Orthodox Church; the Ethiopian Zion Coptic Church; and the Twelve Tribes of Israel.

Much of the controversy that continued to surround Rastafarianism centered on the use of *ganja* and the widespread sale and distribution throughout the Caribbean, whether or not the Rastas were directly involved. The Ethiopian Zion Coptic Church became known for its attempt to establish the legal use of marijuana in the United States. Perhaps the most

important element in the spread of Rastafarianism came from its association with reggae music, which became an internationally recognized form of protest. Its best-known practitioner, Bob Marley (1945–1981) engaged in political activism, much of it on behalf of African causes.

Because of its roots in protest and resistance, Rastafarianism grew from a local to an international phenomenon that took hold in parts of the world where people of African descent struggled to not only maintain their identities and values but to end the racial oppression to which they had been subjugated.

## REFUGEES

### Defining Refugees

The flight of people from situations of danger to places of safety and refuge has been a constant feature

of human history. All world religions contain some notions of asylum and protection, and churches and other religious institutions have frequently provided refuge for people in flight. Throughout history, people have fled either individually, as a family, or as part of a group to escape persecution and acts of violence. In the first half of the twentieth century, however, the large-scale movements of people across international borders within Europe as a result of war and the persecution of minorities, meant that refugees became matters of international politics for the first time.

In the aftermath of World War II, and in an attempt to control the flow of some four hundred thousand mainly Jewish European refugees fleeing the Third Reich and Fascism, the 1951 Geneva Convention Relating to the Status of Refugees came into force. While initially concerned with the post-war European refugee crisis, the Refugee Convention provides the global definition of a refugee and sets out the responsibility of states in an international legal framework that is current today. That framework places an obligation on states and governments to guarantee people fleeing violence and persecution the right to asylum, and the right not to be returned to a country where his or her life or freedom would be threatened (non-refoulement). The United Nations (UN), through its specialised refugee agency, the UN High Commission for Refugees (UNHCR), is tasked with assisting governments to meet their Refugee Convention obligations, and provide international protection and assistance to people in flight.

The Refugee Convention defines a “refugee” as any person who:

Owing to a well-founded fear of being persecuted for reason of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable, or owing to such fear, unwilling to avail himself of the protection of that country. (Article 1A)

The diplomats who drafted the Refugee Convention anticipated the limitations of their work and by urging states to “apply the Convention beyond its strictly contractual scope, to other refugees in their territory” recognised that the definition adopted was restrictive and would not cover every refugee (Goodwin-Gill 1996:19). In recognition of this, and in response to changed circumstances, the scope of the Refugee Convention was broadened beyond events in pre-1950 Europe by the 1967 Protocol Relating to the Status of Refugees to include refugees anywhere in the world. However, the definition of a refugee has remained unchanged and has been incorporated into most states’ municipal laws. It is on the basis of this definition that the international community decides

which people should be entitled to protection and assistance from the UN, and which should be granted refugee status and the benefits of citizenship in a country of asylum; and conversely, which people should be excluded.

## Recent Refugee History

The postwar response to the refugees in Europe was relatively successful. Most who fled or were forcibly removed from Nazi Germany and other refugees from Fascism, were able to integrate into the refugee receiving countries of Western Europe and North America, and in an era of postwar reconstruction, these new populations found their skills in demand. Beyond Europe, however, following World War II and throughout the period of the Cold War, the refugee situation became far larger and more complex politically, institutionally and practically.

Decolonisation, which brought an end to British, French, and other European empires in the 1950s and 1960s, was associated with a series of national liberation wars. Particularly in Africa with conflicts in Zambia, Zaire, and Guinea-Bissau in the 1960s, but also civil war in Latin America, triggered large exoduses of people within countries and across borders into neighbouring states. These large, unplanned and chaotic movements of people brought about unprecedented political, economic, and humanitarian challenges for countries receiving refugees, and for the international system responding to those crises.

Further conflicts in the 1970s in Mozambique, Ethiopia, Sudan, Afghanistan, and Indo-China, generated even larger movements of people and demanded a proportionate international humanitarian response meeting immediate needs for food, shelter, medical care, and clothing. Solutions also had to be found for refugees in the medium and long-term. Camps created in countries of first asylum provided short-term protection and permitted the provision of assistance, but did not offer a long-term solution. The UN and refugee-receiving governments evolved three main strategies: (1) refugees returning home once conditions had improved, (2) local integration in the country of asylum, and (3) resettlement in another country prepared to take refugees on a permanent basis. The majority of refugees do return home once conflict has ended, and only around 1% find permanent resettlement in Europe, Australia, or North America.

The legal status of refugees fleeing liberation wars and other Cold War era conflicts was unclear. The

majority of refugees was not fleeing individual persecution at the hands of a state, but rather was fleeing generalised violence, insecurity, and poverty. Conflicts in the 1970s and 1980s were complex, involving many parties within states, but also with regional and international involvement. The nature of those conflicts meant that refugees found it increasingly difficult to meet the Refugee Convention requirement to prove individual persecution.

Protracted refugee emergencies in Africa in the 1980s and in Central America resulted in new regional approaches to improve the situation of refugees and to make clear the obligations of states and the international community. The 1984 Cartagena Declaration, for example, signed by Central American governments meeting in Colombia, accepted a broadened definition of refugees to reflect the more complex situation. The new refugee definition included people who fled their country, because their lives, safety, or freedom were threatened by generalised violence, foreign aggression, internal conflicts, massive violation of human rights, or other circumstances seriously disturbing public order. The Declaration, building on the earlier 1969 Organisation of African Unity Convention on Refugees, was a response to the new phenomena of the sudden mass influx of refugees, and the prolonged nature of conflicts. The new regional approaches also took into account the evolution of international human rights law throughout the 1960s and 1970s, and the relevance of human rights for the refugee response.

Despite expectations to the contrary, the end of the Cold War brought about greater political instability and a sharp increase in internal conflicts. Cross-border refugee influxes and internal displacement as a result of conflict in Northern Iraq, the Great Lakes region of Central Africa, Chechnya, and in Sri Lanka increased refugee numbers from a few million in the 1970s to more than 25 million in the 1990s. Human rights abuses, most notably through “ethnic cleansing” in Bosnia and Kosovo, became a deliberate strategy of conflict and the creation of refugees a deliberate war goal. Added to the cross-border population were a fluctuating number (but generally exceeding 7 million) of Internally Displaced Persons (IDPs). The UN, and in particular the UNHCR, recognised that IDPs were people in “refugee-like situations” and UNHCR practice extended its mandate to include IDPs as “people of concern to the organisation.”

The contemporary refugee challenge remains unchanged—how best to respond to sudden movements of people against a backdrop of complex conflicts in a manner that guarantees refugee protection, provides short-term assistance, and offers a durable

solution to their plight. The challenge is made more difficult, however, as refugee receiving countries in Europe, North America, and Australia apply ever more restrictive asylum policies, sometimes blocking asylum seekers access to territory, reducing welfare rights, and making more stringent the determination of asylum requests. Countries of asylum are concerned about the increasing number of people on the move globally, the costs of hosting refugees, the perceived misuse of asylum procedures by “economic migrants,” and security threats. Proposed solutions to improve the management of refugees and general forced migration emergencies, include greater sharing of the “refugee burden” between states, increased funding for UNHCR and other agencies, the addressing of root causes of refugee flight, and the adoption of new legal instruments.

However, the main responsibility for responding to refugee needs and the main burden of costs is borne by countries in the Developing World that host refugee populations for long periods of time. More than 70% of people of concern who fall under the mandate of UNHCR and, therefore, are in need of protection and assistance are in Asia and Africa. Over the past ten years, the quality of asylum for refugees in those countries of first asylum has deteriorated. Wars have spilled over into camps, which have become recruiting grounds for new soldiers, and a resource for the continuation of war. Assistance in camps is in decline, and access across borders between developing countries is increasingly denied. The so-called “CNN effect” has tended to mean that international attention on refugee situations is short-term, resulting in funding shortfalls. Refugee movements, the creation and maintenance of camps, repatriation, and reintegration, pose a range of challenges for security and development in the Developing World.

## Explaining Refugee Movements

In seeking to explain the causes of refugee flight, there is a tendency to over-generalise, and it is often the case in such analysis that cause and effect are confused. While it is typically the case, as UN High Commissioner for Refugees, Mrs. Ogata stated in 1995, that “refugees are a direct result of conflict, which is often aggravated by poverty and social inequities” (Olaf Palme Memorial Lecture, June 14, Stockholm), academics have sought to uncover the underlying processes that result in poverty and conflict in any given situation.

It is clear that the immediate factors that precipitate refugee flight are diverse. For example, in the

1990s they ranged from violent struggles over the control of the illegal diamond market in Sierra Leone, the forced resettlement of villages with the intent of ethnically realigning populations, famine and drought, or what appears to be ethnic conflict between rival groups in a situation of resource scarcity. A number of theories have been advanced to explain forced migration episodes by making linkages between identified underlying processes and forced migration.

Aristide Zolberg (Zolberg 1983; Zolberg, Suhrke and Aguayo 1989) contends that mass refugee flows are a likely result of nation-state formation, which is frequently accompanied by political crises, the generation of victimised groups, and interstate wars. Together, Zolberg argues, these processes lead to persecution and the creation of three “types” of refugee. The *targeted* refugees who are singled out for violent treatment because of their membership in a particular group; *activists* who are the dissenters and rebels forced to flee the regimes to which they are opposed; and the *victims* who are accidentally caught in a violent situation.

Anthony Richmond, however, believes that this categorisation is insufficient to account for different behaviour under similar violent conditions, or for the compelling circumstances inducing migration which are not necessarily “violent” in the physical sense, but which are nonetheless extremely coercive (1993:9). Richmond has developed a “multivariate typology of reactive migration,” and a “systems model” that seek to explain the relationship between predisposing factors, structural constraints, precipitating events, and enabling circumstances in a given refugee movement.

In Richmond’s model, predisposing factors increasing the probability of “reactive migration” (refugee flight) are similar to those identified by Zolberg, and include extreme inequalities in wealth, new state formation, decolonisation and ethnic nationalism, the global military-industrial complex, and processes of economic, political and cultural globalisation. Structural factors constraining the movement of refugees include border enforcement and immigration control. Precipitating events include sudden changes in the economic, political, social, or environmental situation through for example genocidal programmes or internal revolution. Finally, enabling circumstances may include government policies that facilitate migration, and access to resources to organise flight.

Richmond’s multivariate model goes some way to identifying the multiple events and factors that combine at any given time to create conditions in which refugee movements are likely. However, refugee flight continues to be sporadic and unpredictable. Not all situations of violent social change, extreme poverty,

and repressive government generate refugee flows—South Africa, for example, was noticeable in the 1980s and early 1990s for the very low levels of cross-border refugee movement despite the considerable instability. Sri Lanka, on the other hand, during the same period generated more than five hundred thousand refugees, mainly Tamils from the North and East of the island who sought asylum in Europe and North America.

A number of authors and international organisations such as the World Bank make causal linkages between processes of underdevelopment, poverty, and refugees. J.K. Galbraith, for example, argues that the more widespread occurrence of political oppression and persecution in developing countries is part and parcel of the vicious cycle of poverty. It is certainly the case that the majority of refugees in transit or in camps in developing countries are drawn from the poorest segments of society. It also is the case that countries generating the largest number of refugees are those with the lowest per capita gross domestic product, most notably Ethiopia, Sudan, Eritrea, Somalia, and Afghanistan. Poverty alone, however, does not generate refugees, it is generally thought that only when other factors combine with poverty, for example, drought and famine, conflict, repressive government, and human rights violations, that large-scale refugee movements are likely to occur.

## Refugees: Development and Humanitarianism

The current international response to refugee crises is sometimes criticised for addressing the symptoms and ignoring the root causes of forced population displacement. The main components of the humanitarian response to forced migration emergencies include, temporary protection in refugee camps, the meeting of basic needs through provision of food, water, sanitation, health care and shelter, resettlement in third countries, and the repatriation of refugees to their countries of origin. These strategies, however, are frequently ameliorative measures that provide no long-term solutions to the problems of refugees or for the countries that generate refugees. In extreme cases, international assistance, for example, through the creation of insecure camps, the providing of food aid to combatants, repatriation programmes without safeguards for protection and livelihood re-establishment, may even exacerbate the conditions that precipitated flight in the first place. Others argue that that politically-driven humanitarian assistance “does harm” by delaying the resolution of conflicts, and commonly cite the role of aid in “sustaining a genocidal leadership

and its supporters in the refugee camps of Eastern Zaire” (in 1994) and by so doing dramatically increase the vulnerability of refugees.

In a bid to improve the response to refugee crises, there have been calls for a substantial increase in development aid to countries with refugee populations. Both to assist countries of origin and countries playing host to refugees, particularly in areas of poverty alleviation, education, good governance, and respect for human rights, and health care. Correlations are drawn between the reduction in official development assistance (aid from Western nations to poorer less developed nations) over the past ten years, and the increase in refugee numbers during the same period. However, others are more skeptical, arguing that “pro-poor growth” strategies pursued by donor governments in partnership with less developed countries since the late-1980s have failed to break the cycle of poverty and are unlikely to impact positively on the conditions that create forced migrants.

Elsewhere, it is argued that processes of globalisation, particularly through international trading arrangements that benefit advanced industrialised nations driven by the telecommunications revolution, have actively disadvantaged less developed countries, excluding them from the advantages of the global market and worsening the conditions that lead to oppressive government, poverty, and conflict. Lobbyists from the nongovernmental sector tend to argue that too much globalisation is the cause of deepening underdevelopment. While organisations such as the World Trade Organisation and the World Bank argue conversely that greater integration and inclusion of less developed economies in the global economy is the solution to poverty and good governance, and will lead to a reduction in refugee flows.

Agencies engaged in humanitarian assistance to refugees initiated a number of reforms in the 1990s to improve the situation of refugees. These included improved coordination between the main players leading to a speedier and more relevant response, targets for the quantity and quality of material assistance were agreed upon, and the increased involvement of displaced people in assistance operations was promoted.

A more significant development, however, since the end of the Cold War that has significantly shaped the response to forced migration emergencies has been the readiness of UN Security Council member states and other states to undertake humanitarian operations in ongoing civil wars for substantially humanitarian objectives. The first of these operations took place in April 1991 to create Safe Havens for displaced and persecuted Kurds in Northern Iraq, later interventions included the January 1992 creation of UNPROFOR in the former Yugoslavia and the December 1992

deployment of US troops in Somalia as part of the United Task Force operation. However, the success of these operations was extremely limited, and the beneficial impacts on refugees and IDPs minimal.

Post-Cold War humanitarian intervention, however, has proven to be selective, marked by a reluctance to intervene to halt human rights abuses in certain countries (for example, in Indonesia or Chechnya), and preferring a policy of refugee containment (that is, maintaining refugee populations close to the country of origin). In addition, poor countries perceive the international community as failing to share the burden imposed by refugees, whether in the form of compensation for impacts on the host areas or in ensuring that refugee camps include only bonafide refugees. The principle of voluntary repatriation is also being increasingly overridden: twenty countries expelled refugees from their territory during 1996. The starkest case was the repatriation of 1.2 million Rwandan refugees from Zaire and Tanzania in late 1996. The consequence according to the Overseas Development Institute in London, is that civilians fleeing conflict are now much more likely to remain within their own country than to cross the border as refugees. The September 11 attacks on the United States, and US-led military action in Afghanistan in 2001 and 2002, and the changed World Order will once again reshape “conflict management” and the “conditional approach” to intervention. The implications for forced migrants, however, are unclear.

## Refugees and Human Rights

Over the past decade, there has been an attempt, initiated in part by the UN, to strengthen the international legal framework for the protection of refugees. One initiative seeks to integrate international human rights law, refugee law, and humanitarian law into a comprehensive single body of law. Proponents point to the commonalities between the three historical streams, notably the shared roots in the aftermath of World War II and a determination that the Holocaust should not happen again; and common values reflected in a commitment to the inalienability of rights, the dignity and worth of the individual, and freedom and equality. It is argued that such integration would strengthen refugee policy and practice by making clear states legal obligations to refugees, and the rights to which refugees are entitled. Others are concerned, however, that in the absence of a fully-functioning, trusted, and independent judicial system in many developing countries, a rights-based approach would not be effective.

## The Refugee Experience

As refugee numbers have grown in the 1980s and 1990s, so academic and literary interest also has grown. Studies of the refugee experience have tended to focus on the impact on individuals and families or being uprooted from one's home and familiar surroundings, the risks and dangers of flight, and the difficult transitions involved in creating a new home. The refugee experience has provided a source of inspiration for authors, poets, and artists.

Academic work has focused on the success or otherwise in the "adaptation" of refugees and refugee communities in their place of resettlement. Adaptation relates mainly to refugees' participation in the economic, political, and social life of their host communities. It includes questions about social identity in the new setting, the retaining of language, and the continuation or discontinuation of values, traditions, and social habits characteristic of their culture. Particular attention has been paid to understanding the social worlds of refugees, which comprise the dense networks of social relationships in which they are enmeshed, the social forces that impinge on them, and the changes to these worlds brought about by displacement and resettlement.

For anthropologists in particular, the experiences of refugees have contributed to knowledge and understanding of the impact of rapid change, culture clash, the social construction of boundaries, conflicts between generations, and livelihood concerns in both the developing and developed world. A less developed area of research examines the psychological costs associated with forced uprooting. This includes attempts to better understand the significance of trauma arising from the direct experience of violence where refugees are either witnesses or participants to violence and the effects of such exposure on women and children, and the development of new approaches to psychological support.

### Refugees: Burden or Benefit?

The environmental impact of some refugee camps, reception centres and settlement schemes impose serious costs on developing countries playing host to refugee populations and have resulted in opposition to refugee influxes from certain countries and host communities. Camps with extremely high population density are frequently located in marginal or ecologically sensitive areas, and without environmental management, they rapidly become depleted as a result of tree

clearing for firewood and shelter construction. Whole lakes have been drained for camp consumption, and other water sources permanently contaminated. As attitudes towards the environment changed in the 1990s, so efforts were made to minimise the negative impact of refugee populations. Particular attention is now paid to the improved management of shelter construction, water and sanitation provision, and the development of new cooking stoves and fuel types.

Concerns also have been expressed by populations and states playing host to refugees about the socioeconomic impact of sudden and large-scale refugee influxes. Host communities frequently contend that refugee populations are temporary and unstable and do not share the indigenous population's commitment to the land and its natural resources. There is fear that refugee populations pursue short-term livelihood strategies and unsustainable resource use methods that degrade the land. It is feared that foreign aid used to establish and maintain camps inflates prices for all goods, and introduces a reliance on expensive imported produce. Development country governments are concerned that international aid is insufficient to cover recurrent costs of providing for refugee populations, and there is a danger that the sudden introduction of foreign NGOs creates alternative structures of government. Security concerns arise when refugee camps become a site for the continuation of a conflict and a recruiting ground for combatants—particularly where this leads to instability among the host society.

However, there also are examples where refugees have been able to play a more positive role in the local development process. The UNHCR cites the case during the 1980s, for example, where the large number of Ugandan refugees who fled to southern Sudan were able to contribute to a massive expansion in the area of land under cultivation. As a result, a number of refugee settlements that had initially been dependent on international assistance were soon able to provide the commodities which the World Food Programme needed for its projects in other parts of the country. More recently, the UNHCR claims, the presence of Mozambican refugees in southeastern Zambia also had many positive consequences for the local economy.

### Other Forced Migrants

#### *"Development Refugees"*

In academic analysis, and less so in policy discussions, there are attempts to consider the whole range of circumstances that create different types of forced

population displacement, interconnections between them, and how best to respond to them. This recognition of different domains of forced displacement has generated new categories of refugees, “environmental refugees,” “disaster refugees,” and “development refugees.”

The second largest group of forcibly displaced people in the world behind Refugee Convention defined refugees comprises people uprooted to make way for planned infrastructure development projects in developing countries. In 1994, the World Bank, following a review of World Bank-funded projects that involved the involuntary resettlement of populations, estimated that between 9 million and 10 million people are displaced each year as a direct result of hydro schemes (dams, reservoirs, and so forth) and road and other transport construction. The actual number is far greater when one adds to that total the numbers of people displaced by urban projects (such as slum clearance programmes and industrial developments), conservation programmes (for example, game parks and forestry initiatives), and schemes to promote the commercialisation of agriculture. Many more are indirectly displaced by planned development initiatives (for example, fisherfolk living downstream of a newly created dam which diverts rivers and removes livelihood opportunities).

While “development refugees” have not crossed an international border and are not considered “people of concern” to the UN, evidence suggests that the majority of people displaced and involuntarily resettled by planned development share many similarities with refugees and IDPs. Michael M. Cernea (2000) argues that the experience of involuntary resettlement is cumulated deprivation leading to multifaceted and persistent poverty. Cernea’s Impoverishment Risks and Reconstruction model suggests that the key impoverishment risks confronting development displacees are associated with the loss of land, jobs, housing, food security, and common property resources, and these losses are exacerbated by morbidity and mortality, social disarticulation, and marginalisation.

Further seminal longitudinal research by Thayer Scudder (1993) and Elizabeth Colson among people displaced by the construction of the Kariba Dam on the border between Zambia and Zimbabwe, reveals negative psychological, physiological, and sociocultural impacts over a number of generations. These include the undermining of community institutions and leaders, trauma, grief and anxiety, and declining health.

The numbers of people displaced by planned development is likely to increase dramatically over the coming decades as the need grows for irrigation, electricity, and infrastructure necessary to satisfy the demands of growing and increasingly urbanising

populations. At the same time, there is likely to be increased organised opposition to large projects on the grounds of environmental damage. As water scarcity becomes an issue of political tension between a number of countries (that is, Ethiopia, Sudan and Egypt; Turkey and neighbouring countries who share the Euphrates River) and directly affecting minority populations in sensitive border areas, future hydro-schemes will be highly contested.

### *‘Environmental Refugees’*

Since the early 1980s, evidence has been accumulating to suggest that environmental change leading to natural resource depletion, particularly land degradation, is creating conditions in certain areas of developing countries that are hazardous for human habitation. As a result, people are leaving these areas and without alternative land for resettlement, enter a refugee-like situation and require assistance. The number of people who could be categorised as “environmental refugees” is difficult to estimate. Some reports predict there will be as many as 25 million environmentally induced forced migrants by 2020. Kibreab, however, argues that while environmental change may be one of the reasons for mass displacement, particularly in arid and semi-arid areas, displacement is more often a result of deliberate political actions that remove the capacity of people to manage predictable periods of environmental change, than the degraded conditions alone.

Recent scientific understanding has shown that emissions of greenhouse gases from developed countries have risen steeply over the past three decades, and international action, such as the 1997 Kyoto Protocol, have sought to reduce emissions and halt global warming. It is thought that global warming is contributing to the creation of environmental refugees as a result of more and increasingly erratic rainfall, and an increase in the frequency and severity of tropical storms. Such changed conditions directly threaten tens of millions of people who live in low-lying coastal areas and are dependent on coastal resources for their livelihoods.

## RELIGION

Religion has had a significant and profound effect on development since the end of World War II. Consequently, churches have been key players within developing nations and civil society in a Western context, and accordingly made efforts to further their religious intentions. As political regimes changed, democracies emerged, and development occurred, the churches throughout the world have responded to meet the challenges faced in the new societies. Development occurs, and democracies arise out of any number of historical and cultural contexts that pose a unique set of circumstances for every developing nation and thus for the responding religious establishments. While some religious movements and churches have sought the betterment of their communities through peace, justice, and equality, others have done their fair share of contributing to, legitimating, and sustaining authoritarian and repressive political regimes. What is important is the commonality of responses by the churches and religious organizations, not the specifics of the processes of democratization and development, since every country that is developing does so

in different ways and under different political, economic and social conditions that cannot transcend the contexts in which change is occurring.

Religion and the churches have been involved in the political arena and in situations of change throughout the ages. The examples are numerous and continue into the modern era. Some churches have been prominent in liberation struggles throughout the world, responding to the political reality, from the Civil Rights Movement in the United States to liberation movements against authoritarianism in Latin America, communism in Eastern Europe, and the Soviet Union, and colonialism and despotism in Africa.

## Religion and a Developing Society

From a religious perspective, church leaders throughout the world have argued for the necessity of churches' involvement in politics. Kyril, the Archbishop of Smolensk and Kaliningrad as a representative of world church leader believes that the churches must not refrain from participating in lawmaking and the political process. They must formulate positions on issues that affect society, including: individual and social morality, politics, economics, ecology, culture, education, international relations, the rearing of children, marriage, and much more.

Churches are important actors in transitioning societies and can be effective in responding to newly emerging democratic civil societies. They have a unique access to the grassroots and can help in building a political culture of tolerance, reconciliation, and democratic values.

During periods of transition, the churches redefine their missions in response to the change occurring in the political, social, and economic contexts. This redefinition of mission and the dilemmas that arise from change have been prevalent among churches and religious ideologies throughout the world as they find themselves in changing and developing political situations. While transitioning political realities, historically, have not always led to democratization, emerging democracies (either liberal or popular, with varying degrees of success) are the order of the second half of the twentieth century. Within this democratization context, distinct according to a nation's history and cultures, some common global responses from the churches can be discerned.

As realities change, churches tend to experience a "crisis of identity," in which they are compelled to respond to a new situation with innovative political, social, and economic analysis, at the same time considering the appropriateness of their own pastoral

functions. With democratization, there often is an increase in secularization. With this, churches are confronted with a weakening of their influence and must address issues that accompany a more open, free, and competitive society, all the while preserving their constituencies. Interconnected with the churches' "crisis of identity" and an increase in secularization is their concern for the "common good." As the rich/poor, North/South divide increases, as ethnic wars continue, the environment is dissipated, and the poor struggle to be heard, churches are looked upon to provide a moral voice and sense of social responsibility. Further, they provide a civil society venue for debate and resources as democracies emerge and societies require reconstructing and reconciliation from a destructive past.

## Latin America

The majority of the literature dealing with the role of religion and church change in development comes from Latin American analyses of the relationship between religion and politics. One predominate theme emerges from Latin America. As the churches have responded, specifically to democratization, they strive to maintain their position in society and their influence among their members. They do this, however, in a variety of ways that are contingent upon and intricately interwoven with the historical and cultural context in which the churches function.

For example, as democracies emerged in Venezuela and Colombia in the early 1960s, the Catholic Church in these two countries responded differently because of the position and influence it held within each society. Venezuela is one of the more secular societies in Latin America. Here, the Church, historically poor and weak, consequently has had less influence on the populace than the Church in neighboring countries. It has been reluctant to alienate potential members by engaging in the political debates that are prevalent in a democracy, thus remaining focused on its internal spiritual and pastoral functions. The Catholic Church in Colombia, on the other hand, traditionally very powerful with a broad network of organizations and a great tradition of leadership had been at the forefront of innovative change in relation to the democratic political reality. It has acted in partnership with the government to further democratic values. The churches in both countries, however, work to build better communities as reflects their social and cultural contexts through pastoral activities. This has meant everything from striving for the consolidation of democracy, unifying the structures of the churches, and

working to alleviate the pressures of the poor and oppressed, all the while dealing with the questions of its identity, secularization and the common good.

Throughout Latin America a number of divergent responses with the churches have occurred due to democratization and development. One such response, expressed by the most conservative and corporatist social and political elements of various Latin American populations and supported by similar elements within the Catholic Church, has sought to establish a social and political order suffused with Christian principles in the name of Christendom. An alternative response to the conservatism of the Christendom advocates is that of Neo-Christendom, manifested by the Christian Democratic political parties. This element within the churches seeks to reform the world while giving more autonomy to the laity, relying on the laity to help the churches fulfill their missions, as opposed to relying on the sole authority of the priesthood.

A more radical response within the churches as they struggle for democracy is found in Liberation Theology, which brings together human and salvation history with the temporal and spiritual dimension of life. This response emphasizes the need for participation, involvement, and action in the here and now, while revealing the social and political implication of the gospel to the oppressed. It is a response to authoritarianism, springing from the churches' efforts to bring about a just and democratic society. Finally, those churches that hold the Evangelical-Pastoral position, in the "center" between the Christendom/Neo-Christendom and Liberation Theology emphasize the unity of the churches, building community and fraternity, revitalizing the message of the gospel, and disengaging from partisan politics in favor of a more general denunciation of injustice. The churches in Latin America have responded to democratization or the move towards democracy away from authoritarianism in all of these ways. In essence, these responses are manifested in the churches' pastoral actions, which strive for a community in the interest of the common good.

## Europe

Shifting focus from the Catholic Church in Latin America to a mixture of Protestant and Catholic churches in Europe, from countries that are highly religious to those that are more secular, similar patterns of change can be found. The power and influence of mainline churches fluctuates as the political and social reality of a nation changes. In Germany, for

example, the mainline churches held prominent and influential positions in the first decade after World War II as democracy emerged and developed after the fall of fascism. In the 1960s and 1970s, value changes in the people's priorities toward personal and social development left the influence of the churches in decline, especially in the political arena. The churches have responded to the increased secularization inherent in a democracy by going into a self-preservation mode while maintaining their influence in the traditional rites of passage (baptism, marriage, and death).

Contrary to the churches' limited position in West Germany, the churches in the former East Germany are held in high esteem by the citizens, in part due to their contribution to the opposition movement leading up to and during the 1989 revolution, which resulted in democratic transition. Nevertheless, these churches have experienced a period of disillusionment and a subsequent reorientation of their mission. This redefinition of mission, in a period of democratic transition, includes the acknowledgement that the churches have a continuing responsibility to be a witness in the public dimension (political, social and economic) and strive for reconciliation of the victims of the changing reality.

Other examples from Europe provide insight into the role that religions and churches can have when faced with changing political and social realities. In the Netherlands after World War II, with the ravages of fascism and the rebuilding of society, the value of democracy was strongly asserted in the churches. Later, as the society became more secularized and church membership declined, the importance of the laity in shaping religious life was emphasized. In Italy, reconstruction was a priority after World War II. The Catholic Church struggled between endorsing modernization and maintaining traditional religious values, while placing a moral expectation on society that economic and cultural opportunities would be promoted, along with a guarantee of democracy. Yet the church in Italy has been caught between taking definitive stands on social issues and losing political support. It has responded to the political reality by compromising itself on political problems and by adopting an attitude of moderation regarding development. As a result, it has isolated itself and is judged more for its actions than its statement of morals and beliefs.

While these individual cases provide examples within specific democratic contexts, they do not address religious and church responses to the changing reality in contemporary Europe: as the Common Market and the European Community become consolidated; as democratic structures are extended to

the international arena; and as the nations in the former Eastern bloc struggle to become more developed and democratized. From meetings held by the European Ecumenical Assembly in May 1989 (the first time since the Reformation that delegates from all the Christian churches on the continent met to examine the contemporary reality of their position within society), and the Central Committee of the World Council of Churches in August 1992, a number of themes emerge as the churches respond to the changing political reality in Europe.

Functioning within a secular social context where the churches suffer from weak influence and the non-involvement of the population, there is the recognition for continuing conversion efforts—maintaining and increasing church memberships. In an effort to accomplish this, the churches realize they must continue in social, economic, political and cultural analysis, developing positions on economic justice, peace and security, ecology and the environment, and immigrants and refugees. They must be a voice of brotherly love and justice for the “other”—the Third World and oppressed whom Europe continues to tower above. They must examine themselves while defining the terms of the public debate on issues of democracy and social morality, acknowledging that what is good for civil society is also good for the churches.

## Africa

As with Latin America and Europe, the churches and religious movements throughout Africa have responded to political change and development, as independence movements succeeded, colonialism ended, and democracies emerged, in specific ways that are unique to their historical and cultural experiences. Generally speaking, churches throughout Africa responded to the oppressive political reality and the hopes for democratic justice with the theological doctrines of inculturation (African cultural rejuvenation) and liberation (freedom from oppression). While emphasizing different things, these are simply two names for the same process—mainly the empowerment of the black African in the face of oppression and domination, calling on spiritual and cultural aspects of the past and looking with hope toward the future. These religious movements, being affected by and contributing to the political reality, have been manifested within society in a number of different ways.

The first manifestation of church participation within civil and political society is dependent on the degree to which a religious movement or organization seeks ideological purity. In other words, high levels

of ideological purity and focus on sectarian customs and rituals will lead to a low degree of political involvement. Whereas religious groups that are multifaceted and open to diversity are more inclined to be activist and politically involved. Those religious groups with a greater commitment to ideological purity, with charismatic leaders, with closed recruitment patterns and which place a heavy emphasis on one particular issue or custom, will be less likely to become involved in political activity.

A second manifestation of African church involvement in society, responding to the political reality while striving for democracy, is one of accommodation. Succumbing to the White-dominant colonial regime in the hopes that eventually it would fall in the face of pleas for Christian morality. This describes the mainline English-speaking churches, yet the tendency toward accommodation had been embarked upon with considerable ambivalence, especially in the church environments that were predominately African, as opposed to European. In such churches, the Africans have struggled to maintain their equality in the face of White domination, claiming that all men are created equal before God. They have consistently refused to accommodate the political regime in their own oppression. Unfortunately, African accommodation and pleas for Christian morality and democratic justice, repeatedly fell upon deaf ears, often meeting with increased repression.

A third manifestation is seen in considering the differences between institutional (established) and independent and indigenous churches and how they engaged in political action in response to political change. Institutional churches, those arising from the European missions, are thought to be more accommodationist, working for change within the established power structure. Independent churches, those that have severed ties with the European mission churches and exist independently from the establishment, are thought to be more revolutionary and liberationist in their beliefs. The African indigenous churches, those with primarily traditional African religious elements but exhibiting many characteristics of Christianity, tend to be isolationist in their behavior—not engaging in the secular realm, but nevertheless political by being pastorally active.

### Religion's Involvement in Change

These examples show that religion, as embodied by churches have effected and are affected by development and political, social, and economic change in a variety of ways depending on the context in which

they function. A society that is developing and transitioning to democracy will experience more freedoms and, consequently, more forces competing for a voice, a condition inherent to democracy. In changing political contexts, churches either choose to continue to have a political voice or retreat into a purely spiritual realm, or function somewhere in between, as they grapple with the myriad of social issues that arise in a more open, modern, developing and democratic society. Some religions and their corresponding churches, as seen here, have positively contributed to development through the advocacy of peace, equality, and liberation. However, it is important to remember that others have often failed to live up to the ideals of justice and peace, while acting as coconspirators with the political elite to maintain authoritarian power structures.

## REVOLUTIONARY ARMED FORCES OF COLOMBIA (FARC)

The Revolutionary Armed Forces of Colombia (known by its Spanish acronym, FARC) traces its origins to a power-sharing compromise between Colombia's two main political parties in the early 1960s. Although the agreement ended more than a decade of political violence, Fidel Castro's nationalist revolution in Cuba inspired the formation of the FARC in 1964, and its intellectual founders were loyal followers of the Colombian Communist Party. Communists and dissident liberals originally constituted the organization, but the leadership now insists that it represents the rural poor against the influence of wealthy landowners and the United States over natural resources and national politics. The FARC is governed by a secretariat, led by Manuel Marulanda, and several senior military commanders. It consists of about eighteen thousand armed members. In FARC's early years, its guerrilla founders concentrated on expanding their bases of support in rural areas where centuries of colonization, exploitation and forced migration had impoverished the peasant population. Its main areas of operation were the southern provinces of Caquetá, Putumayo, Huila, Cauca, and Tolima, in the central regions of Magdalena Medio and Santander, and along the Antioquia-Córdoba northern border. FARC presently operates mostly in the jungles of the southeast and the plains at the base of the Andes mountain range, though it now includes several urban fronts.

During the late 1960s and early 1970s, the FARC was one of several guerrilla groups that included the National Liberation Army, the Popular Liberation Army, and the M-19. Though torn by internal disputes in the late 1970s, resulting in a diminished military capacity, the FARC received funding from the Soviet Union and support from Cuba during the Cold War and now maintains offices in Cuba, Mexico, and various European capitals. Experts blame FARC for 10%–15% of the approximately 3,500 civilian deaths that occur yearly in Colombia's civil war, which has killed some two hundred thousand people since 1964.

From 1982 to 1984, the government of conservative Belisario Betancur negotiated a ceasefire with the FARC and two other guerrilla groups. Hundreds of political prisoners, including many guerrilla leaders, received amnesty. In March 1984, the FARC signed a peace accord with the National Peace Commission and renounced the armed struggle. However, a paramilitary movement formed to break the ceasefire while Betancur took action against drug traffickers. These factors ended the peace process in 1986 when the guerrillas retreated to withstand the force unleashed

against them by the drug traffickers and right-wing paramilitary groups. By the mid 1990s, paramilitaries and drug traffickers had penetrated FARC-controlled areas of coca cultivation in the south, buying land, recruiting peasants, and organizing campaigns of terror and massacres against the civilian population.

Over the course of the 1990s, the civil war shifted from an ideological battle against a Marxist insurgency to a major conflict over control of territory and the drug market. In 1998, just before his inauguration as president, Conservative Andrés Pastrana visited FARC leader Manuel Marulanda to explore the possibility of peace talks. Pastrana agreed to withdraw army troops from five towns in guerrilla-controlled territory ceding an area twice the size of New Jersey. However, in February 2002, Pastrana ended peace negotiations after a plane hijacking and kidnapping of a Colombian senator from the aircraft and ordered the military to retake FARC-controlled zones. Alvaro Uribe Vélez won a landslide victory in Colombia's May 2002 presidential election by promising to crack down on the FARC. In August 2002, the FARC launched a mortar attack on the Presidential Palace where the new president was being inaugurated.

With the fall of the notorious Medellín and Cali cartels, the FARC gained greater access to lucrative sources of income in coca and heroin. The FARC generates income of \$200 million to \$400 million annually from the illegal drug trade, in addition to profits from kidnappings, extortion schemes, and unofficial taxes that it collects in the countryside for protection against government raids and right-wing paramilitary forces and the provision of social services. Poor farmers began to grow coca in neglected areas of the country under the protection of the FARC. However, some peasants complained of being ordered by local guerrilla commanders to grow coca and sell their harvests to a guerrilla-controlled monopoly. Colombian traffickers eclipsed their competitors in Peru and Bolivia but also captured part of the heroin market from interests in Southeast Asia and Afghanistan who deal in the United States market.

The Clinton administration proposed a \$1.6 billion military aid package for Colombia in January 2000 to eradicate the cultivation of the coca plant and eliminate the alliance between the FARC leadership and the producers of cocaine and heroin. In response, the FARC launched armed resistance in the southern department of Putumayo where the US anti-drug offensive was centered and demanded a halt to the so-called Plan Colombia's military component. The FARC has carried out dramatic ransom kidnappings of wealthy landowners, foreign tourists, and

prominent international and domestic officials. For example, the FARC kidnapped a presidential candidate, Ingrid Betancourt, who was traveling in guerrilla territory in February 2002. In March 1999, the FARC killed three American missionaries working in Colombia. The US State Department placed the FARC on its list of foreign terrorist organizations during this period.

## REVOLUTIONARY ARMY OF THE PEOPLE

The Argentinian Revolutionary Army of the People, or the *Ejercito Revolucionario del Pueblo* (ERP) was the militant arm of the Revolutionary Workers' Party, or the *Partido Revolucionario del Trabajo* (PRT), and the most active guerrilla group in Argentina in the early 1970s. Inspired by the success of the Cuban Revolution, Latin American guerrilla movements of this period grew in response to the instability of their governments and the effects of their faltering economies. From the late 1960s through the 1970s, there were more than a dozen guerrilla groups operating in Argentina alone.

The PRT-ERP shared in the belief that violent armed struggle could bring socialism to state power, envisioning a government responsive to working-class needs and liberated from North American imperialism. Yet the ERP distinguished itself from other guerrilla organizations by the level of its military development, by maintaining a separate political party that directed its armed struggle, and by its specific revolutionary principles, manifest in the organization's slogan: For the working class, Latin American and socialist revolution.

The PRT was founded in 1965 through a union of the IndoAmerican Popular Revolutionary Front, a socialist organization that both supported local indigenous sugar workers' protests and was influenced by a vision of Latin American revolutionary unity, and the Worker's Word, a Trotskyist organization with ties to the Peronist Resistance. In 1968, PRT leader Mário Roberto Santucho cited the need to move from theoretical discussions to more concrete practices and formed the branch of PRT that later organized the ERP as a "popular army." These early influences on the PRT-ERP marked its most salient characteristics: a Marxist focus on and incorporation of the working class, an internationalism that led to continent-wide collaboration (concretized in the Latin American Revolutionary Coordinating Council), an anti-intellectual tendency and emphasis on militant action, and a conviction in the need for armed struggle to replace capitalist structures with socialism.

Created in 1970, the ERP began its armed tactics with small actions for provisioning and "propaganda actions" meant to popularize its cause. In 1973, it changed its strategy and began attacking Argentinian Army bases and in 1975 fought in the largest military-guerrilla battle in Argentina at Mount Chingolo. With this armed activity, the ERP became more popularly recognizable than its political party, the PRT. The ERP's guerrilla actions, combined with the organizing work of the PRT, led to the height of the organization's membership in 1975, when the PRT-ERP counted five thousand to six thousand militants.

The PRT-ERP provided dispossessed and working-class Argentinians with a revolutionary and international alternative to the widespread populist Peronism. But military response to guerilla groups led to the annihilation of the ERP's armed ranks by 1976. Mário Roberto Santucho and other PRT-ERP directors were killed by the army in July 1976. Yet despite the virtual elimination of the militant left by the time of the 1976 coup, the military *junta* in power used the threat of rebel groups as a pretext for the brutal violence and ruthless repression that lasted from 1976 to 1983 and became known as the Dirty War.

## REVOLUTIONARY DEMOCRATIC FRONT (FDR)

The Revolutionary Democratic Front (Frente Democrático Revolucionario, FDR) was the largest group representing the political left in El Salvador during the 1980s. On April 1, 1980, the FDR was established by the Revolutionary Coordinator of the Masses (Coordinadora Revolucionaria de las Masas, CRM), an umbrella group representing a plethora of leftist political groups that included the social democrats. Until the presidential elections of 1988, however, political groups were excluded from the electoral process. Leftist political parties had been repressed since the late 1970s by right-wing paramilitary groups supporting the military dictatorship. By the mid-1980s, political violence had declined considerably, which allowed for greater political mobilization on the left.

In October 1980, the FDR joined the Farabundo Martí National Liberation Front (Frente Farabundo Martí de Liberación Nacional–FMLN), a militant leftist guerilla group. The new political/military alliance, the FMLN-FDR, represented five guerilla groups: the People's Revolutionary Army (Ejército Revolucionario del Pueblo, ERP), the Popular Liberation Forces (Fuerzas Populares de Liberación, FPL), the Armed Forces of National Resistance (Fuerzas Armadas de Resistencia Nacional, FARN), the Communist Party of El Salvador (Partido Comunista de El Salvador, PCES), and the Revolutionary Party of Central American Workers (Partido Revolucionario de Trabajadores Centroamericanos, PRTC).

The FMLN-FDR was a Marxist-Leninist movement with a pro-Soviet and pro-Cuban orientation. They committed themselves to seizing power through a two-pronged military strategy of economic sabotage and a prolonged guerilla war of attrition based on a combination of Maoist, Vietnamese, and Guevarist principles. The FMLN-FDR sought to entrench its rural guerilla forces, while simultaneously developing urban support bases in preparation for overthrowing the Salvadoran government. From 1980 to 1982, politically-related violence in El Salvador increased dramatically as the FMLN-FDR increased its activities. The FMLN-FDR used kidnapping, torture, and murder to achieve its agenda. The guerilla groups armed their forces with US-made weapons captured from the Salvadoran army.

The FMLN-FDR focused international attention on El Salvador and became a formidable force both politically and militarily. In August 1981, the governments of France and Mexico recognized the FDR as a representative political force and called for a negotiated settlement between the rebels, and the government. FDR representatives carried on a political campaign abroad, while the FMLN forces continued their organizational and operational efforts in the field.

As the FMLN-FDR began to grow in strength and size, with the assistance of Nicaragua and Cuba, the Salvadoran army became less able to control the guerilla groups. The FMLN-FDR, however, was put on the defensive in 1984 when the United States sent substantial military aid to support the Salvadoran Army. On January 16, 1992, the administration of President Alfredo Cristiani (of ARENA, the right-wing Nationalist Republican Alliance) signed a peace treaty with the FMLN-FDR, formally ending the twelve-year civil war that killed seventy-five thousand Salvadorans.

## RHEE, SYNGMAN

As the first president (1948–1961) of the Republic of Korea (South Korea), Syngman Rhee is considered the "Father of Korea" and is credited with transforming South Korea from agricultural society to an industrial power. Politically, Rhee parlayed South Korea's status as a victim of Communist aggression into financial and military support from the United States that secured the transformation of the South Korean economy. Eventually his authoritarian rule, mismanagement of the Korean economy and his obvious rigging of the 1960 presidential election led to mass demonstrations that led to his forced resignation in April 1960 and subsequent exile to Hawaii.

He was born April 26, 1875, in Kaesong, Hwanghai Province, Korea. He entered the American

missionary Paejae High School in 1894, and worked as a reporter for the newspaper *Hyopsung* in 1896. During his teens, he became an ardent nationalist, advocating the independence of Korea. He was imprisoned in 1897 for leading demonstrations against the Korean monarchy. He was released from prison and moved to the United States in November 1904, where he studied at both Harvard and Princeton Universities, eventually earning a Ph.D. In 1911, Rhee returned to Korea as a YMCA teacher-evangelist. Forced into exile in 1904, Rhee was educated in the United States and was elected president of the Korean Government in Exile in 1919. He lived in Hawaii from 1913 to 1940, where he was principal of a Korean school and the leader of a Korean expatriate faction called *Tongjihoe* (Comrades' Society).

In 1919, Rhee was elected president of the Korean Provisional Government in exile. He served as president of the provisional government in 1921 and waged an independent movement for Korean independence in the United States.

Rhee returned to Korea on October 16, 1945, and became president of the Central Independence Promotion Council. Upon his return, Rhee called for the immediate independence of Korea. Following highly disputed elections in the south, Rhee was installed as the first President of the Republic of Korea in 1948. Rhee continually called for the reunification of the Korean Peninsula, by force if necessary. Shortly thereafter, the outbreak of the Korean War divided the Korean Peninsula into the capitalist South and communist North. For the duration of the Korean War, Rhee continually tried to sabotage armistice negotiations hoping to reunify the Korean Peninsula by force under his rule.

Faced with the task of building a nation that had been torn apart by a brutal civil war that divided the Korean Peninsula, Rhee succumbed to the temptation faced by leaders of emerging democracies: the centralization and consolidation of power. Rhee centralized his control over the state through the perpetuation of the buildup of the armed forces and control of the government apparatus. In order to consolidate power over government apparatus, Rhee aligned himself with the business and land-owning classes and oversaw the suppression of political dissent. He promulgated laws meant to intimidate and imprison political opponents.

Politically, Rhee parlayed Korea's status as a victim of Communist aggression into support from the United States. In 1953, Rhee signed the *United States–Republic of Korea Mutual Security Treaty* that secured long-term economic and military aid meant to rebuild South Korea's economy and military. Economically, Rhee mismanaged the development aid meant to

kick-start the South Korean economy. Instead of channeling foreign aid into industry, money went to the armed forces. Rhee also subsidized the import of various consumer goods such as food and beverages, clothing, and footwear. He also gave government protection to huge conglomerates (*chaebols*) that continue to dominate the Korean economy today.

Eventually, Rhee's heavy-handed centralization of power, political corruption, and continued military expansion alienated him from the Korean populace. Rhee was forced from power on April 26, 1960, largely in part to student-led demonstrations.

Syngman Rhee died in Honolulu, Hawaii, on July 19, 1965, at age ninety.

## ROCKEFELLER FOUNDATION

The Rockefeller Foundation (RF) is a philanthropic institution established by John D. Rockefeller, a North American industrialist, one of the so-called

robber barons of the late nineteenth and early twentieth centuries. In June 1909, Mr Rockefeller donated seventy-three thousand shares of the Standard Oil Company (at that time it represented a sum of \$50 million) to the creation of the Foundation. His son, John D. Rockefeller, Jr., his son-in-law Harold Mac Cormick, and his usual partner Frederick Gates received the funds and started the organization. However, only in May 14, 1913, New York Governor William Sulzer approved the charter for the foundation, and soon that same year, it began operations, because of which many people claim that it was created in 1913.

Since its beginnings the Foundation set clearly its objectives: it was destined to promote the well-being and progress of the United States (US) and foreign citizens, to acquire and diffuse knowledge, and to promote the prevention and relief of all kind of human suffering. Its motto has since then stated: "To promote the well-being of mankind throughout the world." Its slogan ran: "We Are a Partner, Not a Patron."

In 1913, the Rockefeller Foundation was endowed in several installments that totaled about \$250 million. But by the end of 2001, the market value of the Rockefeller Foundation's endowment was \$3.1 billion. It has given more than \$1.8 billion to thousands of grantees worldwide and has assisted directly in the training of nearly thirteen thousand Rockefeller Fellows.

Its headquarters were established in New York City, but the Foundation has had an increasingly global presence with the establishment of regional offices in Bangkok (Thailand), Nairobi (Kenya), San Francisco (US), and a also conference and study centre in Bellagio (Italy).

Through the years the Foundation has given assistance to all the aspects that encompass the concept of development. Therefore, it has financed projects related to the public health, medical education, increasing food production (agricultural and natural sciences division), scientific advancement, social research, the arts and humanities, international relations, and other fields formerly more focused on the US but then also all over the world.

During its early years the Foundation focused its actions on Public Health issues. Therefore, it participated in a worldwide campaign against the hookworm (a parasitical disease acquired by walking barefoot on polluted ground) until 1954. As a means to fight against the disease, the people were educated to change their environment and their habits so as to suppress the fatal animal agent. For that they used public health workers. The cure for hookworm, besides wearing shoes, consisted of capsules of thymol and salts. The RF acted through illustrated lectures and pamphlets to create the necessity among the

people to maintain sanitary conditions and defeat the illness. The main efforts were conducted in the rural areas of the southern US led by Dr. Wickliffe Rose but also important campaigns were carried out in India, Puerto Rico, and Colombia. Having recognized the success of the Rockefeller Sanitary Commission for the Eradication of Hookworm Disease in the US, the Foundation formed the International Health Board (IHB) to extend its public health work overseas in 1913.

A similar campaign was held by the RF against the yellow fever in 1935. That year, a breakthrough was achieved when Dr. Max Theiler and his associates in the International Health Division (IHD), under the supervision of Dr. Sawyer, managed to develop a successful yellow fever vaccine. Although it was a team work, Dr. Theiler himself was honored in 1951 by receiving the Nobel Prize in medicine for this discovery.

Another accomplishment of the RF in the health medicine was the formation of nurses and the establishment of the first Public Health Schools. To accomplish that, the Foundation financed the creation of Public Health Nursing Schools in more than fifty countries besides the US. From 1921 on, Public Health Schools were installed in Prague, Toronto, London, Budapest, Copenhagen, Ankara, Madrid, Rome, Tokyo, Stockholm, Athens, and other cities. Also important was the Foundation's role in organizing the Public Health system in the postrevolutionary Mexico with, first, the campaign against the yellow fever and then with the establishment of Permanent Sanitary Units and the award of scholarships that allowed the training of Mexican professionals in the US.

The Foundation also established the China Medical Board (CMB) in its first years (1911) to develop a system of modern western medical education in China. In 1919, a formal Medical Education Division was established to carry out a program of medical education outside the US. The General Education Board (GEB), a separate Rockefeller philanthropy, was responsible for US medical education. Within this program, grants were made to related fields such as nursing and hospital and dispensary development. Fellowships in physics and chemistry through the National Research Council became a continuing interest in 1919. From 1919 to 1923, a Division of Studies within the RF was responsible for projects not covered by the IHB, CMB, or Medical Education Division.

The Foundation also financed scientists who fought battles against the Kyanasur disease (Kyanasur Forest Fever) in India in 1957, mainly in the Indian state of Mysore and against the Influenza virus. Besides, the Foundation played an important role in the development of medicine to fight malaria. In 1915, it

supported Sir Ronald Ross' experiments in the US to find a cure for malaria until he found a way to control it. By 1944, malaria had been eradicated from the US. Besides infectious diseases, the Foundation also supported research and advances in psychiatry, such as in the field of Biology of Behaviour at the University of Cambridge, the study of physiological psychology at the Polish Academy of Sciences, and the establishment of a department of Psychiatry at the University of Ibadan.

The RF carried the programs overseas. It favoured, together with the Brazilian government, the installment of the Belem Laboratory in Brazil, devoted to the study of viruses transmitted by mosquitoes, ticks, and other arthropods. The Foundation also created the Peking Union Medical College in China in the 1920s.

The Foundation also supported research in the genetics field mainly in the US but also in universities in Japan, Sweden, and Italy.

All this was part of the RF's early interests. In its early years, the Foundation's interest was concentrated on medicine and public health, as the hookworm and yellow fever campaigns prove. Later on, the Foundation's interest was more concerned with the development of agriculture and the agricultural sciences, in the US and overseas.

In 1951, the International Health Division was merged with the medical sciences program, and public health activity was deemphasized. Population studies, international relations, legal and political philosophy, institutional support of the arts, historical research, and agriculture were the main areas of grants during the 1950s.

During the 1960s, a formal population program was established. Grants were made to various institutions for the purpose of improving race relations. In 1968, the RF convened US and foreign experts at an international symposium, "Strategy for the Conquest of Hunger," to develop a plan to eradicate world hunger. Significant contributions were made by the Foundation to the modernization of agriculture in the developing countries, a fact known as the "Green Revolution."

During that decade, the Foundation began supporting research activities in Chile as part of Chile's Ten-Year Plan of Economic Development. The aim was to increase agricultural production by a more efficient use of existing farmlands. Therefore, the RF supported the building of two experimental stations, one near Santiago (Chile's capital) and the other near Temuco.

The Foundation also was present in Colombia in a project to increase the agricultural production. The main objective was to carry out laboratory and

field work so as to train skilled Colombian personnel to develop the programs. Also, in Mexico (University of Nuevo Leon in Monterrey) and Colombia (University of Andes), the Foundation has provided grants and funds. In Mexico, the scientists who worked under the Foundation's support developed the so-called "Green Revolution" in the country, which helped to increase the production of corn, the main alimentary Mexican resource, reducing the imports of this product.

Also, in India, the RF sponsored studies in native agricultural research, specially with the creation of the postgraduate school of the Indian Agriculture Research Institute in New Delhi, which the RF has helped with funds and by providing advisors and visiting professors. In 1959, it also established the International Rice Research Institute in Philippines.

In Africa, the Foundation has aided universities to deal with critical food and disease problems in the continent, and also in order to train personnel to staff governments and institutions.

Besides the agricultural sector, the Foundation also devoted resources to the promotion of the social sciences. For instance, in 1962, it provided a large amount of dollars to create the Institute of African Studies at the University of Ibadan and also to the University of Karthoum (Sudan) with library assistance in all disciplines.

The Foundation has helped developing countries by supporting the building of centers of academic excellence, such as the University of Ibadan (Nigeria); the University of East Africa, a complex of three separate growing colleges in Uganda, Kenya, and Tanganyika; and the University of Valle in Cali (Colombia).

In the field of Social Sciences and Humanities, the RF contributed to the archaeological digs and excavations in the Agora zone, Greece. The Foundation also has supported the works of significant authors who were winners of the Nobel Prize, such as Ralph Bunche (winner in 1950), T. S. Eliot (1948 Nobel in literature). Other great achievements of the RF were providing a grant for the building of Oxford's world-famous Bodleian Library and the making of photographic copies of the complete card catalogues of the Library of Congress.

In the field of Arts and Culture, a remarkable work was the construction of the Art Conservation Centre of the Institute of Fine Arts in New York University, whose purpose is to explore and arrive at standards of conservation that can be disseminated to museums and other repertories. The Foundation also helped in the establishment of the Lincoln Centre in New York City and the Berkshire Music Festival at Tanglewood in Western Massachusetts.

During the 1970s, cooperative efforts with the Ford Foundation included the Consultative Group on International Agricultural Research (CGIAR), and regional research programs to improve understanding of population development links in Third World countries. Social history, including women's history, family history, and the use of oral history and film to document America's cultural heritage, was another new area in which the RF made grants. Grants in the humanities continued, including a fellowship program.

More recently, the Foundation has kept on contributing to the development of many countries by sponsoring the African Agricultural Technology Foundation to help farmers in sub-Saharan Africa gain access to hunger-reducing agricultural technologies. The Foundation also has financed the Public Sector Intellectual Property Resource for Agriculture (PIPRA) to make agricultural technologies more easily available for humanitarian purposes in the developing world.

One of the most valuable contributions was, during the 1990s, the resources spent on the International AIDS Vaccine Initiative, a research project destined to speed the search for a vaccine to prevent HIV/AIDS all over the world. In relation to that research, the International Partnership for Microbicides Program was established to accelerate the discovery, development, and accessibility of microbicides to prevent transmission of HIV and other sexually transmitted infections.

Within the medicine research field, the Foundation is currently financing the Global Alliance for Tuberculosis Drug Development, which seeks to accelerate the discovery and development of faster-acting and affordable drugs to fight tuberculosis.

Among the 170 Nobel Prize winners who developed their work under the Foundation's support (more recently also working in the Rockefeller University), we could name Werner Heisenberg (1932, Physics), Enrico Fermi (1938, Physics), Sir Hans Krebs (1953, Medicine), Edward L. Tatum (1958, Medicine), Emilio Segré (1959, Physics), Christian De Duve (1974, Medicine), John Harsanyi (1994, Economics, together with John Nash), Günter Blobel (1999, Physiology or Medicine), Paul Greengard (2000, Physiology or Medicine), and Roderick MacKinnon (2003, Chemistry).

## ROMAN CATHOLIC CHURCH

Throughout its long history of two millennia, the Catholic Church, in addition to carrying out its religious mission, has served as a builder of basic institutions that have been fundamental to the development of Western civilization and many prosperous societies. Institutions of law, local governance, education, and economic and social welfare were established and maintained by bishops within the diocesan structure of the Church, by individuals pursuing their own apostolic endeavors, and by religious orders that established semi-independent monastic foundations. As the largest single religious organization in the world today, the Church continues to call its membership to action. It has developed many relief and social welfare arms.

### Some Historical Considerations

The Catholic Church has served as a primary mechanism for institution building, first in the history of Western Europe and then in more recent centuries throughout the entire world. Christians of the first centuries established hospitals for the sick, hospices for weary travelers, and orphanages for abandoned children as part of the call to good works. As the Roman Empire collapsed under the weight of successive incursions by the competing tribes of Northern Europe, the Church, which was organized along ancient Roman territorial lines into diocese governed by bishops, served as the means through which law and civil organization was preserved. Bishops throughout

Europe established schools in association with their cathedrals to educate priests, and from these emerged eventually the first universities of Europe, which began forming in the eleventh and twelfth centuries. These centuries also saw the rise of the guilds, medieval precursors to unions, in which various trades and industries were organized to protect the interests of various groups of artisans and to encourage spiritual awareness in the context of labor and production.

Another influence on the development of Europe during the early Middle Ages commenced as early as the sixth century, when Western monasticism took firm hold in Italy and Ireland. From these two centers of monasticism, monks radiated out into the furthest reaches of Europe to establish monasteries, which became institutions not only of prayer, but also islands of settled economic activity, centers of agricultural industry, and hives of education and preservation of scholarship. Monks invented books, kept libraries, set up schools, pharmacies, and hospitals. In the Benedictine tradition, monks worked in the fields, promoting settled agricultural industry in areas previously inhabited by nomadic tribes. Various monastic reform movements, including notably the Cluniac and Cistercian reforms in the tenth, eleventh, and twelfth centuries, served as engines of commerce, trade, and economic development. The wealth generated by these monastic establishments garnered the attention and often the jealousy of local leaders, princes and kings, thus provoking conflict and contest over control of these important centers of learning and prosperity. During these times, the Roman Catholic Church served as a kind of transnational organization that knit various budding nations into an overarching cultural unit known as Christendom. However, under the pressure of growing nationalism and the Protestant Reformation, the Church's influence declined in Europe as nation-states emerged to claim control over activities once dominated by churchmen and religious orders. However, even as the Church lost its luster as a political actor on the European stage, its missionaries continued to practice evangelism throughout the world. This missionary activity followed the older familiar pattern not only of preaching and church-building, but also establishing Western-style schools, hospitals, orphanages, and social welfare organizations.

Throughout much of human history, charity and concern for the poor was the work of churches and private action, and only rarely as the primary work of national governments. Only in recent centuries, and most particularly in the last half of the twentieth century, did governments establish what are today called economic development or social welfare programs. While the governmental role in these activities

has increased substantially in modern times, a large part of the charitable work done in the world still remains in the hands of private bodies, chiefly religious institutions.

### Contemporary Activities

Through the Church's diocesan and parish structures and its hundreds of religious orders for men and women, bishops, pastors, and religious workers in every corner of the world continue to raise revenues for charitable redistribution, supporting religious schools and universities, food banks, orphanages, battered women's shelters, homes for unwed mothers, hospitals, health clinics, community development centers, AIDS hospices, emergency relief centers, and refugee assistance programs, among many other activities. One example is the St. Vincent De Paul Societies, active in distribution of food to the poor. These organizations were a product of action by Catholic laymen in honor of the founder of the Vincentians and the Sisters of Charity, St. Vincent de Paul, who in the seventeenth century founded the first Catholic religious orders to be free of cloister rules, so that they could work directly with the poor and orphaned children. A more recent example is the work of Mother Teresa of Calcutta, whose work among the poor in the slums of India has become legendary, and whose establishments now exist throughout the world offering care to millions of desperately poor and sick individuals. During the recent war in Kosovo, the principal agent of support to displaced persons and refugees, whether Serbs or Kosovar Albanian Muslims, was the local Mother Teresa Society.

Catholic action on behalf of the poor has spawned a growing number of private assistance agencies, which are motivated by Church teaching and serve as relief arms of national bishops conferences. The largest of these is Catholic Relief Services (CRS), which is the international relief arm of the US Catholic Conference of Bishops, with ties to other national Catholic bodies through Caritas Internationalis. CRS budgets for development and humanitarian assistance programs in nearly seventy countries typically exceed \$300 million annually. On the development programming side, its programs emphasize community development, agriculture, and water development programs and nutrition projects. CRS also serves as one of the main NGO collaborators with the US government in distribution of food aid throughout the world in famine emergencies. Caritas Internationalis, established in 1951 as the umbrella organization

for Roman Catholic national relief and development agencies in more than 150 countries, which include such bodies as the Catholic Fund for Overseas Development (CAFOD), which was founded by the Catholic bishops of England and Wales in 1962. This work is truly global in nature, and contributes handsomely to the resource base available globally for work in humanitarian relief and development efforts. Catholic NGOs are among the largest, most numerous, influential, and reliable NGOs participating in the global development arena, many enjoying consultative status with the United Nations.

The Holy See also is engaged in activities related to the relief and development needs of the poor. There emerged as early as the eighth century in England a tradition of collecting and sending Alms to Rome for the special charitable intentions of the poor. This tradition rapidly spread throughout the European Church, and today is known as the "Peter's Pence" collection, which in modern times is undertaken throughout the universal church. Revenues collected in this global effort are redistributed to the most needy diocese and to emergency relief efforts. The Holy See also is a regular participant in international conferences dealing with international relief and development activities.

### Church Social Teaching

The modern papacy as well as modern materialist ideologies have contributed substantially to modern thinking about social and economic development. The nineteenth century saw the rise of two competing materialist conceptions of human economic development: capitalism and communism. In his landmark encyclical of 1891, *Rerum Novarum (On the Condition of the Working Classes)*, Pope Leo XIII offered a vision of human development emphasizing the spiritual nature of the human being in contrast to the view that human beings were but a factor in the processes of production and consumption of material goods. The rich and poor were seen by Leo as being bound by mutual obligations of respect and dignity. The worker was obliged to give a fair day's labor, the employer a fair day's wage. Workers were not to be exploited, worked beyond their capacity, exposed to corrupt influences, deprived of savings, or denied periods of rest and recreation. At the same time, Leo called on governments to recognize the rights of individuals to organize into associations, including not only unions, but also religious associations for mutual aid. He decried attempts by government to invade the

primary and natural rights of families, churches, and local associations to function at the local level for the benefit of persons.

Pope Pius XI, writing forty years later, at a time when fascist and communist systems of government were well-entrenched, reiterated many of the principles laid out by Leo XIII, attempting to advance a humane and just conception of human and economic development. In more recent times, Pope John Paul II, in his encyclical *On the Hundredth Anniversary of Rerum Novarum*, reflected on the themes treated by his predecessors in light of the then recent collapse of the Communist system. These and many additional papal encyclicals asserted the principles of solidarity and subsidiarity. The principle of solidarity calls human institutions to bring people together at various levels of cooperation to support peace and prosperity. The principle of subsidiarity demands that each level of cooperative endeavor respect and support the rights of the more immediate, intimate, particular, and local levels of cooperation to their independent spheres of action. No local government should usurp the proper role of families and local religious bodies to supply mutual aid and assistance, but rather local government should facilitate and complement such activity. Similarly, national government and international bodies should support the capacity of local governments to tend to their local activities, by complementing and facilitating such action through stimulating cooperation to help when local institutions and bodies require aid.

## ROMANIA

Romania is located in southeastern Europe, bordering with Moldova in the east, with Ukraine in the north, Hungary and Serbia in the west, Bulgaria in the south, and bounded on the southeast by the Black Sea. The country has a land area of 237,500 square kilometers, comparatively its territory slightly smaller than the state of Oregon in the United States.

The population of Romania was estimated at 22,356,000 in 2004. It is a moderately urbanized country with about 52% of the people living in cities and towns. The country's capital city, Bucharest, is home to 2.4 million people (2004 est.) or 12% of the population. Romania has a negative population growth rate of  $-0.6\%$ , and the population steadily declines due to a low birth rate and emigration. Its official language is Romanian; Hungarian and German also are widely spoken. The population is 87% Eastern Orthodox Christianity, with 6.8% other types of Protestant, 5.6% Catholic, and a small 0.4% Muslim population.

For centuries, the territory of present-day Romania was contested by the Ottoman Empire, Hungary and Poland. In the eighteenth century, the Russian Empire stepped into the political arena in an attempt to establish its influence in the region. Romania entered the nineteenth century as a backward, feudal country with most of the population engaged in subsistence economy. The local elite waged a war for independence from foreign powers, and in 1857, the councils of the two major regions—Moldavia and Walachia—were united under the name of Romania. However, Romania was not recognized as a fully independent kingdom by the Congress of Berlin until 1878.

The most major economic and social changes arrived in the late nineteenth and early twentieth centuries, when the rulers of the country introduced limited economic reforms, including the land reform that broke up large estates. During World War I, Romania joined the Allies and acquired Transylvania and some other areas from Hungary, Bukovina from Austria, and Bessarabia from Russia. In the 1930s, however, the country moved away from the Allies and came under the influence of Nazi Germany. It entered World War II as a Nazi ally, but in 1944, the country surrendered to the Soviet Army and declared war on the Nazis. In 1947, the monarchy was abolished and the communist government came to power.

The communist government introduced a number of radical political and economic changes, and established the state control over all types of economic activities and a central state planning. In the 1950s and 1960s, the government introduced the program of collectivization and nationalized most of the

industrial enterprises. During the post-World War II period, the government emphasized the state-led industrialization that focused on building of heavy industry, light industries, mining, extraction of oil, and large-scale agriculture. However, unlike most of the socialist countries, Romania asserted some degree of economic and political independence from the Soviet Union and Soviet dominated economic block. Until the 1990s, Romania remained one of the poorest countries in Eastern Europe due to the economic mismanagement, distortions in economic planning, and authoritarian policies of the Romanian leadership.

Major changes came in 1989 as the regime of Nicolae Ceaușescu, the Romanian authoritarian leader, collapsed and a new leadership came to power. The new government relinquished the centrally-planned economy and introduced limited democratization and economic reforms. The economic changes were inconsistent, however, and the country experienced a severe economic decline in the early 1990s. Many industrial enterprises and mines lost state subsidies and were gradually closed. The unemployment rate skyrocketed, and many people moved to western Europe in search of jobs and a better life.

## Recent Development

Romania introduced its new democratic constitution in 1991, and the Romanian government promised to conduct major political and economic changes. Several factors, however, undermined the post-communist development in the country. One was the inconsistency of the economic reforms and privatization. Inflation remained high throughout the 1990s. Many enterprises and newly created private farms remained inefficient, and a significant proportion of the population expressed its anger and disapproval of the government's policies. The other problem was the ethnic tensions between the Romanians and some ethnic minorities, such as Hungarians, Roma, and Germans. There also was a deep disagreement within the ruling political coalition. All together, this led to political instability and consequently made the country less attractive for foreign direct investments.

Agriculture, industries, and services are the three main pillars of Romanian economy, contributing 13.0%, 37.9%, and 49.1%, respectively to the gross domestic product (World Bank estimate 2003). The county exports raw materials, textile, metals, and some manufactured products to international markets. Romania imports machinery, fuel, industrial

## ROMANIA

consumer goods, and food products. Due to the transitional recession and the loss of traditional markets for Romanian goods, the country's economy increasingly relies on foreign assistance and credits. Total external debt has reached about \$20 billion (World Bank estimate 2003).

In the early 2000s the country achieved macroeconomic stability and stabilized the living standards among the population. The government continued to negotiate full membership in the NATO and European Union. Yet, Romania remains one of the poorest countries of the southeastern Europe, with about 25% of the population living below the poverty line (World Bank estimate 2004) and a sizeable number of people leaving for other countries in search of jobs. In 2004, the United Nations Development Programme's Human Development Index put Romania in sixty-ninth place out of 177, behind neighboring Bulgaria and Hungary but ahead of Moldova and the Ukraine.

## RUSSIA

Historically, economic development in Russia has faced major natural handicaps: isolation from world markets, vast distances, and a harsh climate (in northern regions, the soil is poor, while in the fertile black-earth belt, the short growing season and inadequate precipitation make harvests uncertain). Until the 1860s, peasant cultivators toiled under serf-like conditions that restricted entrepreneurial initiative, while the urban merchant class was relatively weak. An industrial spurt, aided by foreign capital, in the 1890s was interrupted by war and revolution (1904–1906); thereafter the economy revived on a broader

base but collapsed under the immense strains of World War I. This touched off another violent revolution and three years of civil war, famine, and disease that cost 10 million lives. Reconstruction under the Bolshevik (Communist) regime was rapid but marred by tension between the favored industrial workers and supposedly “backward” peasant smallholders. The town–country divide deepened after 1929, when Joseph Stalin imposed the Socialist Economic Model involving brutal agricultural collectivization and centralized planning (what Westerners call a “command economy”). Emphasis on the expansion of heavy industry (including armaments) engendered an endemic shortage of consumer goods; 5 million died in the catastrophic famine of 1932–1933; millions more Gulag convicts toiled until they dropped. Stalinist totalitarianism left no place for autonomous civic organizations or human rights; the individual was just a cog in a faceless administrative machine. Even so, ordinary folk did manage to express their preferences indirectly, for example, by resisting imposition of higher work norms and distrusting exaggerated claims by regime propagandists. They appreciated improved provision of health and educational facilities. In many scientific and technological fields, expertise reached a high level. The “Soviet intelligentsia,” officially categorized as a social stratum distinct from the working classes, lacked physical security yet was granted material advantages to keep it loyal. Its aspirations posed an implicit long-term threat to the viability of the dictatorship.

In 1941–1945, the command economy proved its worth as the State Defense Council mobilized human and material resources on a massive scale to boost the war effort. In threatened areas, factories were evacuated for reassembly in the rear. By 1944, output of aircraft was four, and output of tanks was ten times 1940 levels. In 1945, the USSR had 11.6 million men and women under arms; 60% of the labor force was female. Agricultural production plummeted, because much land was lost to the enemy and able-bodied workers were scarce; peasant women sometimes pulled the ploughs themselves. State controls were somewhat relaxed, and private allotments informally allowed to expand. Most people went hungry. The rationing system, which operated erratically, entitled nonessential workers to only 400 grams of bread a day (1944). Food also was received, along with arms and equipment, from the Western allies and made a significant contribution to victory. The war cost the USSR dearly: casualties were enormous (9.1 million troops, ca. 27 million overall), among them, over 2 million people, mainly Jews, massacred by the Nazis and some 3 million prisoners of war who died in German captivity. More than 1,700 towns, seventy thousand

villages, thirty thousand factories and 65,000 kilometers of railroad track were reduced to rubble.

In the postwar years, Stalin reasserted traditional controls and priorities. During the Fourth Five-Year plan (1946–1950), heavy industrial output more than doubled, while that of consumer goods grew by less than a quarter. The urban labor force was swollen by the resumed influx from the countryside, where in 1946, drought and infrastructural damage led to another serious famine. By 1953, the Gulag population topped 5 million (including “settlers,” mostly deported non-Russians, but excluding Axis POW). The abrupt cessation of Lend-Lease (August 1945) dashed hopes of obtaining Western capital, but some was derived by looting resources in Germany and eastern Europe, where “joint-stock companies” provided the USSR with raw materials, machinery, and manufactures at nominal prices. More important were the funds squeezed from the peasantry. Private plots were scaled down and confiscatory taxes levied on the revenue they generated; quotas for compulsory delivery of farm produce were raised. These impositions helped to bring about the famine. In 1952, the actual grain harvest (kept secret!) was lower than in 1940, when there had been fewer mouths to feed. Another source of state funds was a currency reform (1947) which wiped out nine-tenths of people’s wartime savings—a means of reducing inflation while goods were scarce—and the practice of deducting state loan contributions from workers’ pay packets. Ceaseless campaigns of “socialist emulation” helped to keep wage-earners compliant. At first, many willingly bore sacrifices for the common good, but this mood evaporated.

The post-Stalin leaders realized the need for economic reform yet wanted to keep the Stalinist command economy fundamentally unchanged. G.M. Malenkov, identified with a shift of effort towards consumer goods production, was worsted by N.S. Khrushchev, who claimed expertise on agricultural problems. Collective farmers received higher prices, while quotas and taxes were reduced; yet no encouragement was offered to the private sector, with which 3% of the sown area provided nearly half the country’s meat and milk (1958–1965). Instead of increasing incentives for producers in the European heartland, the regime launched a bold campaign to sow grain on “virgin and idle land” (actually used by natives as pasture) in Kazakhstan and elsewhere. Hundreds of thousands of “volunteers” went east, but the authorities underestimated the operation’s costs and disregarded scientists’ warnings of the high ecological risks. Another campaign, which later had to be abandoned, fostered the cultivation of corn (maize) as fodder, even in unsuitable areas. Artificial

fertilizer output rose from 7 million tons in 1953 to 31 million in 1965 and 112 million in 1985, but here, too, careless application resulted in environmental damage. Food output increased under Khrushchev (cereals from an annual average of 82 million tons in 1949–1952 to 132 million in 1961–1964, milk from 36 million to 63 million tons), but the main beneficiaries of constant meddling were not farmers but omnipotent local officials in the party *nomenklatura*.

Leonid Brezhnev (1964–1982) and his immediate successors pursued a more consistent long-term agricultural strategy, boosting investment, which in the 1970s ran at 26% of total state outlays, over twice the proportion under Stalin. Despite these subsidies, which the state could ill afford, many weaker farms ran into debt, notably because managers had too little power or incentive to think in terms of profitability: livestock raising, for example, was uneconomic at official prices, and by international comparison, Soviet cattle were skinny beasts. Even so, annual per capita consumption of dairy products rose from 251 to 323 kg. (1962–1985); for eggs the corresponding figures were 124 and 260 units, while bread and flour consumption declined (156 to 133 kg.), signifying a shift to a more wholesome diet. But in the 1970s, statisticians were told to stop publishing data on cereal output, as harvests were embarrassingly low, and in the worst years, grain had to be imported from the West.

Khrushchev tried to devolve the cumbersome system of industrial management but ran into bureaucratic obstruction, so that after his fall in 1964, power was again concentrated in Gosplan and central (all-Union) ministries for various branches (including “medium machine-building,” the code word for nuclear weapons manufacture). In the late 1960s, A.I. Kosygin’s name was associated with another administrative reform that gave managers and workers bonuses if their enterprise made a profit. But since prices were still fixed centrally, it was hard to establish profit levels, and the bonus system lent itself to abuse. The output of staple producer goods grew exponentially: steel from 45 million tons (1953) to 91 million in 1965 and 155 million twenty years later; iron ore rose from 72 to 153 and then 248 million tons. The figures for cotton fabrics, characteristically, were less spectacular: 4.2, 5.5, and 7.7 million square metres; for footwear 271, 486, and 787 million pairs. Most significant was the shift in the fuel balance from coal to oil, and especially natural gas, vast reserves of which were discovered and exploited in western Siberia. By 1985, this source contributed 35.5% of total energy consumption. Nuclear power, a relatively “late developer,” stood at 10.8%. Soviet reactors had serious design flaws, which were one factor in the Chernobyl disaster (April 26, 1986). Nuclear waste often was

disposed of casually, and serious environmental pollution also occurred from leaky oil pipelines, chemical factory emissions, and the like: Arctic regions, the Aral Sea, Lake Baikal, and the Kazakh steppe were among the hardest hit areas. An informal “Green” movement emerged in the 1970s but made little impact on the thinking of industrial officials concerned with fulfilling their plan targets for physical output, cost what it may.

Road transport and automobile production were relatively neglected, but the railroad system expanded, and by 1985, one-third of the network had been electrified. Much effort went into constructing an alternative to the Trans-Siberian route, the 3,500-kilometer Baikal-Amur line through the eastern Siberian taiga, where permafrost posed tough problems. Civilian air transport became an important means of communication over long distances and in more remote regions. By 1980, the state enterprise Aeroflot carried 100 million passengers; fares were uneconomically cheap, so that Armenian fruit-growers, for instance, could fly to Moscow to market their wares.

Soviet town dwellers enjoyed inexpensive subsidized housing, although average apartment size (“living space”) was only nine square metres per capita. From the 1950s onward, rows of standardized apartment blocks, built of prefabricated materials by modern techniques, appeared in city suburbs. Though aesthetically unappealing, they represented a pragmatic solution to the acute accommodation shortage among the burgeoning urban population—a factor that strained family cohesion. The divorce rate grew alarmingly. Most wives had to combine jobs with household chores, including endless queuing for scarce commodities. Women usually earned lower wages and held positions with lesser status than men, who enjoyed more leisure—and drink. Statistically, alcoholism cost fifty thousand lives (probably an underestimate) in 1980; five years later, 4.5 million addicts were receiving medical treatment. Young people preferred Western-style “pop” culture to unimaginative officially sponsored offerings; their parents’ political views, at least in private, were often unorthodox. Cynicism became widespread, behind a mask of conformity; people with means shopped on the black market (“second economy”), which the regime had to tolerate *faute de mieux*. Workers sometimes grumbled about wages or conditions or even the lack of independent trade unions, but most were reconciled to a system that provided full employment, “free” health care, and the prospect of social promotion for those who regularly fulfilled their norms. Peasant earnings were at last catching up on those of urban workers.

Benefits also accrued to elites in developing countries that Moscow sought to wean away from

“imperialism.” Initially, policy was liberal: loans were repayable in locally produced goods or soft currency at low interest rates, but from the 1960s, as debts mounted, there was a shift towards greater discrimination (and the supply of military hardware). According to US estimates, from 1954 to 1985 the USSR supplied \$97.9 billion in aid. About half went to Cuba and Vietnam; smaller amounts reached India, Turkey, Ethiopia, Iran, Angola, and Syria; the last-named country received mostly arms transfers. Soviet “third world” aid was much smaller than that from Western sources, but its political and psychological impact was often greater. These foreign investments had to be unceremoniously abandoned once priorities changed after 1985.

Mikhail S. Gorbachev (1985–1991) was the first Soviet leader to tackle the economic “stagnation” (his term) resulting from long-standing neglect of vital problems, notably the decline in growth and productivity rates. The drying up of the labor supply as rural overpopulation eased made it essential to use manpower less wastefully. Behind these dilemmas lay disenchantment among the Soviet intelligentsia, which now formed a sizeable “middle class,” at the ruling party’s ideological dogmatism and at bureaucratic incompetence. Gorbachev’s “acceleration” drive encouraged managers to modernize equipment and adopt information technology while simultaneously boosting output and improving the quality of goods. This overambitious campaign engendered inflationary pressures and budgetary deficits. The extra currency put into circulation rose from 4% (1985–1986) to 11.8% in 1988 and 28% two years later; by 1989, the state debt reached 42.8% of gross national product (GNP). “Restructuring” (*perestroika*) was broadened in scope to endorse the formation of producers’ cooperatives and, more generally, the emancipation of civil society from ideological constraints. From 1987, stimulated by the new “openness” (*glasnost*), thousands of informal organizations appeared, some of which adopted political goals. Pressure from below—it was mainly a “middle-class” phenomenon—forced Gorbachev to adjust his thinking further and come out in favor of market socialism and (quasi-) constitutional government, thereby reluctantly yielding the party’s monopoly on state power. National minority leaders vociferously sought control over regional resources, which undermined economic relationships across the Union. The elected Russian president, Boris Yeltsin, and several teams of professional advisers recommended rapid transition to free-enterprise capitalism, with extensive privatization, but Gorbachev held back. He knew that such radical ideas were unpopular; the general public associated them with profiteering, criminality, and vast income

differentials that offended entrenched egalitarian sentiments.

Initially, the Soviet collapse (1991) held out the prospect of a flourishing market economy based on extensive foreign investment in Russia's immense natural resources and skilled labor force. However, "transition" turned out to be a slow, painful process, and a depression ensued; one can even speak of "demodernization." In 1992, Egor Gaidar's "shock therapy" led to a sudden twenty-six fold increase in prices. Hyper-inflation wiped out people's savings and devalued wages and pensions. Privatization made little headway in agriculture, but industrial assets were given away to insiders (managers and other employees) under a voucher system which, although designed to empower ordinary people, ended up enriching a new class of "oligarchs," as they pejoratively came to be called. In later years, privatization was handled more discreetly by selling state enterprises via the new commercial banks. These financial institutions mushroomed but remained under-capitalized, since ordinary Russian savers distrusted them and preferred to keep their money under the mattress (or in the state savings bank), as they had done before, while businessmen transferred their profits to safe offshore locations, taking advantage of lax exchange controls, instead of investing them productively at home; meanwhile foreign investors were deterred by the prevalent corruption and red tape. Irresponsible banking practices, e.g. loans with inadequate security, were factors in the August 1998 crash, when the government declared a moratorium on its payments and the twenty largest banks were wiped out. Many new entrepreneurs faced ruin; fortunately, less damage was done at lower levels, and after a few months, the economy began to revive. Yet market reform had been badly discredited, not least because it went hand in hand with rampant crime. Mafia bosses built villas with high-security installations and indulged in other forms of conspicuous consumption, while one fifth—and after the crash one third—of the population was reduced to subsistence level. They survived by petty barter trade and transactions on the margin of the law that went unrecorded in official statistics. In 1999, average life expectancy sank to 65.5 years (men 59.9, women 72), one year lower than in 1998. Health spending per capita was minimal, and the population shrank by 5%–6% per annum.

Still more ominous was the decline in manufacturing. Numerous large Soviet-era plants, no longer economic, fell idle. In 1996, total employment stood at 4.2 million (1985; 8.3 million); output of trucks and tractors amounted to 134,000 and 14,000, respectively (1985; 688,000 and 261,000). Spending on research and development all but collapsed. The Russian

economy was living largely on its Soviet inheritance. Oil and gas output, much of it exported—Gasprom, the giant consortium, became a major player in international markets—held up relatively well, but here, too, the industry's capital stock was not renewed, storing up problems for the future.

In 2000, a new president, V.V. Putin, set out to overcome the unplanned attrition of state power and prestige. This entailed *inter alia* reforming the notoriously inefficient system of tax collection, which imposed a heavy burden even on privileged large enterprises. Harsh police measures had proved ineffective in the face of a "fiscal evasion culture". Another problem was the competition for resources between the center and the regions. Faint signs appeared of a possible turnaround. In 2000, GNP grew unprecedentedly by 8.3%. In May 2001, the Duma approved a legislative package, long advocated by the IMF, strengthening the Central Bank's powers over insolvent financial institutions and providing incentives for the repatriation of fugitive capital (estimated at \$24 billion in 2000 alone). The stock exchange rallied, and optimists hoped that Russia might yet find a middle way between the Scylla of the Stalinist command economy and the Charybdis of Yeltsin's "market bolshevism."

## RUSSIAN ORTHODOX CHURCH

The Eastern Slavs were converted to Christianity at the end of the tenth century of our era. The Church was organized on the Greek pattern, being under the canonical authority of the Patriarch of Constantinople. The Russian patriarchate did not establish its autonomy, i.e. its separation from Constantinople, until 1589.

Peter the Great abolished the patriarchate in 1721 and established a synod composed of prelates and presided over by a layman. The Holy Synod was housed with other lay ministries in the new capital Peter built, St. Petersburg. Ordinary Russians, however, continued to see Moscow as their spiritual home.

### The Church and 1917

The February Revolution of 1917 undermined the Orthodox Church, but the Provisional Government did not try to crush it by force. Rather, they illegitimated all church rituals and adopted the Gregorian calendar used in the West. The government also interfered with the old Cyrillic alphabet by dispensing with some of the familiar letters.

What affected it most in the new era proclaimed after the October Revolution was the separation of church and state on February 5, 1918. Among other things, schools still under the Church's administration were taken away; however, the Church, for a brief period, was no longer under the state's control, enabling it to summon a council and re-establish the Patriarchate.

Vladimir Lenin (1917–1925) considered the Orthodox Church a contemptible form of "fideism." However, more tolerant Marxists argued that socialism would naturally undermine the "superstructure," and religion would peter out by itself. But the revolutionary regime did not hesitate to seize Church property.

During the Civil War, most of the clergy took sides against the Bolsheviks. A Temporary Ecclesiastical Administration emerged in southern Russia, then controlled by the Whites. When the Red Army forced their retreat, this body moved to Sremski Karlovci in Serbia. Calling itself the Church in Exile, it refused to recognize the Moscow patriarchate which appointed Evlogii (Vasilii Georgievsky, 1868–1948) as the Metropolitan of the Russian Church in Western Europe. Russians abroad had to choose between the Karlovci Synod, which refused to recognize the Soviet controlled Moscow patriarchate, and Evlogii's metropolitanate, which did. In the United States, despite the breakdown of the USSR, authority still

remains divided between the Church in Exile and the Orthodox Church of America (OCA).

The Soviet regime also backed a movement called the "Living Church," which had been set up by liberals and enjoyed the support of parish priests who wished to curb the power of monks and bishops. With the help of the secret police, which infiltrated it, the "Living Church" was able to take over close to a third of the Orthodox churches in Russia.

In 1925, a gathering of bishops nominated Metropolitan Sergei to lead the "Patriarchal" Church, which was recognized in 1927 by a regime no longer interested in the "Living Church." By then, it has been estimated that, despite the church's setbacks, it was functioning on a scale not much smaller than in 1917.

### The Church in Stalin's Shadow

The census of 1937, which included a question about religious belief, was suppressed—in part because of the population deficiency they recorded following collectivization and the purges. Another rumored reason for the suppression was that no less than 40% of the population had declared their religious conviction. But the leadership of the Orthodox Church had by now been cowed, and the coming of the war further complicated its position.

In a dramatic reversal of Soviet policy, Stalin promulgated a truce with the Church. Churches were reopened, and in return, Metropolitan Sergei publicly announced in 1942 that Stalin was "the divinely anointed leader of our armed and cultural forces leading us to victory over the barbarian invasion." Stalin reciprocated by restoring the patriarchate, to which the wily Sergei was duly nominated. Along with this official resumption of relations between Church and State, the government retained strict control over ecclesiastical property and personnel.

During the war, the leadership of the Orthodox Church of Georgia, the Armenian Church, the Baptists and Evangelical Christians, and the Moslems accepted a similar status to the Orthodox Church, although some clergymen—such as the Roman Catholics and the imprisoned prelates of Solovetsk—refused to accept it. Jews suffered more than any other religious group.

During the de-Stalinization campaign that began three years after Stalin's death, convicted clergymen were—like political prisoners—released from the camps. But Nikita Khrushchev (1953–1964), for all his compassion, is said to have been responsible for the closing down of more than ten thousand churches.

## Dissent and Freedom of Worship

Leonid Brezhnev (1964–1982), who led a plot to oust Khrushchev from power in 1964, was more tolerant than his predecessor on matters of religion and permitted about five hundred Orthodox churches to be reopened. The convergence that occurred in the Brezhnev years between literary dissidence and religious protest was not surprising, although it seemed so at the time. The dissidents did not call for the overthrow of the Soviet system, but for the elimination of abuses, “socialist legality,” and enforcement of the provisions of the Constitution and of other laws dealing with freedom of conscience, speech and press.

By its cynicism and lack of conviction either in Communism or in any viable alternative, the worn-out *apparatchiks* around Brezhnev paved the way for the surprising revival of the Orthodox faith, which came with Mikhail Gorbachev (1985–1991). *Pere-stroika* and *glasnost*, the twin policies of renewal and openness which he advocated, did not at first include the Church as such, but its authority was brought in to lend Gorbachev’s reforms legitimacy. Under the present post-Soviet constitution, Orthodoxy shares its recognition as an official religion of state together with Islam and Judaism.

Whether the external revival of Orthodoxy, as manifested in the building of hundreds of churches and ecclesiastical foundations of various sorts and the generous publication of Christian literature, represents a genuine religious revival with deeper roots, it is perhaps still too early to tell. Urban and educated Russia is, for obvious reasons today, a largely secular society, but Orthodoxy appears to have become a part of the cultural identity even of citizens whose attendance at church is limited to Easter and Christmas (newly restored as public holidays, and now nationally celebrated under the old Julian calendar).

## Numbers

In 1996, the overall number of Orthodox worshippers was estimated at 182 million. Of these, 70 million to 80 million are to be found in the Russian Federation. Of Ukraine’s population, close to 30 million are Orthodox. Next in size is Rumania with 20 million and Greece with 9.5 million. The United States has close to 7 million Orthodox citizens, which is about the same number as the Orthodox population of Serbia and Monte Negro. Poland has 800,000; Finland, 56,000; Estonia, 300,000; Latvia, 400,000; Lithuania, 150,000; Georgia, 2.8 million; Kazakhstan, 4 million;

Uzbekistan, 900,000; Belarus, around 5 million; Bulgaria, 6 million; Moldavia, around 3 million; Macedonia, 1.2 million; Germany, 550,000; United Kingdom, 440,000; France, 260,000; Austria and Switzerland, about 70,000 each; and Australia, 480,000.

## RWANDA

The “Land of a Thousand Hills” is situated in East Central Africa, bordering to the North with Uganda, with Tanzania to the East, Burundi to the South, and the Democratic Republic of the Congo to the West. The total territory is 26,338 square kilometers (24,948 square kilometers land area). The country is landlocked. Most of the country is savanna grassland, mostly grassy uplands and hills, with declining altitude from west to east. Climate is mild, with frost and snow possible in mountains; there are rainy seasons between November and April. Rwanda is the most densely populated African country with an estimated 8.24 million residents (2004), comprised of the dominating ethnicity Hutu (84%), minority Tutsi (15%), and pygmoid Twa (1%). The capital is Kigali, founded in 1907 (with a population close to four hundred thousand).

In the fourteenth century, Tutsis settled massively into what is now Rwanda and, under King Ruganzu Ndori, removed the indigenous Twa and Hutu peoples. About the end of eighteenth century, Tutsi King Kigeri Rwabugiri established a centralized military state. In 1890, Rwanda became part of German East Africa, but in 1916, Belgian forces occupied it. After the World War I, League of Nations granted Belgium mandate to govern Rouanda-Urundi—transferred in 1946 by the United Nations (UN) as trust territory, ruled indirectly by Tutsi. In 1957, Hutus called for a change in Rwanda's power structure to give them a voice, and formed political parties. In 1959, they overthrew the Tutsi King Kigeri V, forcing him with tens of thousands of Tutsis into exile in Uganda. Within the next years, thousands of Tutsis were killed, and some 150,000 were driven into exile.

In 1961, Rwanda separated with Urundi, later Burundi, and was proclaimed a republic. The next year, it became independent with a Hutu president, Gregoire Kayibanda; another Tutsi exodus. Following an incursion by Tutsi rebels from Burundi, in 1963, twenty thousand Hutus were killed. In 1973, Kayibanda was ousted in military coup led by Juvenal Habyarimana. He was elected president in 1978, and a new constitution was ratified. In 1988, some fifty thousand Hutu refugees fled from Burundi following ethnic violence there. The Tutsi exiles formed a rebel group, the Rwandan Patriotic Front (RPF), to invade from Uganda in 1990. In the next year, new multiparty constitution was promulgated. In 1993, President Habyarimana signed in Arusha, Tanzania a power-sharing agreement with the Tutsis. In April 1994, Habyarimana and his Burundian homologue were killed after their plane was shot down near Kigali. RPF launched a major offensive; extremist Hutu militia and elements of the Rwandan military began massacre of Tutsis. Within one hundred days, around eight hundred thousand Tutsis and moderate Hutus were slaughtered.

Fearing Tutsi retaliation, Hutu militias fled to neighboring countries, taking with them around 2 million Hutu refugees. Later, most of them returned home, but about ten thousand remaining formed an extremist insurgency in the neighboring Zaire. In 1995, UN-appointed international tribunal began charging and sentencing those responsible for the atrocities. In 1996, Rwandan troops assaulted Hutu militia in Zaire. In 1997, Rwandan- and Ugandan-backed Zaire rebels deposed president Mobutu; Laurent Kabila replaced him and renamed the country the Democratic Republic of Congo. Next year, however, Rwanda switched to support rebel forces against Kabila for failing to expel Hutu militias. In March 2000, Rwandan President Pasteur Bizimungu, a Hutu, resigned after a feud

regarding the cabinet composition and after parliament began anti-corruption investigations against Hutu politicians. Vice President Paul Kagame became the new president. In October, traditional *gacaca* courts started to clear the 1994 genocide cases. A new flag and national anthem were unveiled to promote national unity and reconciliation. In April 2002, former president Bizimungu was arrested and charged with illegal political activity and threats to state security. In July, Rwanda and the Democratic Republic of Congo signed a peace deal. In May 2003, a draft constitution designed to prevent another genocide, banning the incitement of ethnic hatred, was adopted. In August, Paul Kagame claimed a landslide victory in the first presidential elections since the 1994 genocide, and his Rwandan Patriotic Front won absolute majority in the first multiparty parliamentary elections, marred by irregularities and fraud. In March, French reports accused President Kagame of ordering an attack on the president's plane in 1994, which sparked genocide. In June, Bizimungu was sentenced to fifteen years in jail for embezzlement, inciting violence and associating with criminals.

Increasing power centralization, intolerance of dissent, the rigid Hutu extremist insurgency across the border, and involvement in two wars in the neighboring Democratic Republic of Congo continue to hinder Rwanda's efforts to escape the violence. Despite UN peacekeeping and political leaders' efforts to end hostilities, localized clashes persist. Tutsi, Hutu, Hema, Lendu, and other adverse ethnic groups, guerrilla fighters, armed gangs, and various government forces continue fighting in the Great Lakes region, transgressing the boundaries.

Rwanda is a poor rural country, with about 90% of the population engaged in mainly subsistence agriculture. Tea and coffee are main export commodities. The 1994 genocide practically wiped out Rwanda's fragile economic base, gravely impoverishing the population. Rwanda succeeded in stabilizing and recovering economically to prewar levels, although poverty persists. World prices' decline deprived Rwanda of desperately needed hard currency. A fertile ecosystem fails to meet the needs of the fast population growth. Imports exceed about three times export revenues. Rwanda qualified for debt relief in 2000, but high defense expenditures make international donors limit the program. Strife restricts prospects for tourism.

The economic infrastructure of Rwanda is extremely inadequate. There are less than one thousand kilometers of paved roads from a total of about eleven thousand kilometers. Only one airport is capable of hosting contemporary aircrafts. There are no railroads. The adult literacy rate is 70.4% (2003). According to the World Health Organization data,

there are approximately twenty-one nurses and 1.9 physicians per one hundred thousand persons. Life expectancy is slightly less than forty years for males and about year and half more for females (2004 estimate). The population growth rate is of 1.82% (2004 estimate), while infant mortality (101.68 deaths per 1,000 live births) is among the highest in Africa. Rwanda began economic reforms in 1995, focusing on trade, privatization, improvement of public administration, the budget, and financial management, as well as private-sector development.

## **SADAT, ANWAR**

Muhammad Anwar al-Sadat (1918–1981) became the president of Egypt in 1970, succeeding Gamal Abdel Nasser. During the eleven years of his presidency, until his assassination, Sadat was involved with war and then peace with Israel, for which he was a joint winner of the Nobel Prize, as well as negotiating with the Soviet Union and other Arab states for support of the economic development of his country.

Born into modest circumstances, Sadat entered a country ruled as a colony by the British. A new constitution was adopted in 1922 which set in place a monarchy and a parliament. However, the British found themselves required to make accommodations with the nationally popular Wafd party for the sake of order. One such accommodation was the creation of a military school and it was here that Sadat received crucial formative education. He graduated in 1938 and, during World War II, plotted with fellow officers to drive the British out of Egypt. He was captured and imprisoned but subsequently escaped and went on to join Nasser's Free Officers group. In the revolution of 1952, Sadat was an active participant and the status he gained led to his enjoying high office under Nasser, although it was far from clear that he would emerge as the designated successor.

Under Nasser, pan-Arab socialist policies were favoured which led to an import-substitution growth model which featured significant levels of trade protection. Sadat's administration faced the problems caused by this model, which failed in Egypt because of the inability to develop sufficient exports and export

markets, as well as improving the level of human capital. Facing problems of internal unrest and sporadic violence, Sadat introduced a new *intifah* (openness) policy which led to progressively higher levels of foreign trade and which was continued by his successor Hosni Mubarak. These policies have struggled to overcome the problems of embedded interests benefiting from existing barriers, together with persistent failures to develop the labour market, partly resulting from cultural and religious factors. The ability of Middle East Muslim states to establish suitable methods for economic cooperation.

However, Sadat is better known for his foreign policy actions than his very limited amount of domestic success. During the Cold War period, Egypt had accepted Soviet support to counter American backing for the state of Israel. However, Sadat felt the thousands of Soviet technicians present in the country were insufficiently productive and a drag on his foreign policy freedom. Consequently, they were all expelled shortly after he became president. In the following year, a joint invasion of Israel with Syria led to the 1973 Arab–Israeli War, which was a limited success in that Sadat became the first Arab leader to reclaim territory lost to the Israelis—in the Sinai Peninsula in this case. After this war, Sadat changed his policy and worked instead for peace, despite the great unpopularity of such a change in Egypt. He visited Israel in 1977, traveling to the Knesset in Jerusalem to outline his plans for peace. This subsequently gave rise to the 1978 Camp David Accords between Sadat and Israeli Prime Minister Menachem Begin which

were mediated by the US President, Jimmy Carter. The fruits of the Accords included the first treaty between an Arab country and Israel and, in 1978, the joint award of the Nobel Peace Prize for Sadat and Begin. Sadat's actions were in part motivated by the desire to secure badly needed US aid for the Egyptian economy. This began in 1975 and had reached flows of more than \$1 billion US per year by the 1980s. Sadat was also concerned by the slow progress of negotiations with the Israelis: two agreements about the Sinai Peninsula had been signed in 1974 and 1975 but many problems remained unresolved. The Palestinian issue was prominent among these but so too were the status of the West Bank and the Gaza Strip. Popular belief in Egypt that Sadat had failed to do enough to promote Palestinian interests fuelled economic protests and, early in 1977, riots throughout the country led to nearly one hundred dead and thousands wounded or else arrested.

The inflows of economic assistance only slowly provided assistance to the Egyptian people, since a great deal was inefficiently used in trying to promote uncompetitive industries. At the same time, there has been something of a brain drain of Egyptian intellectuals to many of the oil-producing states of the Middle East.

However, continued inability to provide sustained growth in the domestic economy coupled with unrest among religious groups arising from the peace process made Egypt an increasingly dangerous place for Sadat. His attempts to suppress dissent were only partly successful and, reviewing the troops in 1981 on the anniversary of the Arab–Israeli War, he was assassinated by members of the armed forces.

Anwar Sadat was a transitional political figure on a road to the future that has not yet, five years into the twenty-first century, arrived for the Egyptian people. He demonstrated some fleeting Arab military success against the US-backed Israeli military and he opened the economy to development methods more suitable for the time but without being able to ensure that these were sufficient or sufficiently well sustained. His pan-Arab internationalist brothers and cousins failed him and failed to follow the vision he was able to enounce.

### SALINAS DE GORTARI, CARLOS

President of Mexico from 1988 to 1994, Carlos Salinas de Gortari's administration carried out major transformations in the social and economic structures of the country by opening its once-protectionist borders to international markets and transnational forces. By embracing the neoliberal recipes of privatization, liberalized trade, and deregulating economic governance, Salinas de Gortari increased Mexico's international competitiveness; however, social polarization, inequalities, and political conflicts also increased. Controversy and corruption also plagued his presidency, making him and several of his closest collaborators the targets of various criminal investigations.

Salinas de Gortari was born in 1948 and grew up in a family closely associated with Mexico's Institutionalized Revolutionary Party (PRI for its acronym in Spanish) at that time the unchallenged centre of national political rule. Salinas de Gortari received a doctoral degree in political economy from Harvard University in 1978, and using his active militancy in the PRI as a springboard managed to occupy high-ranking positions in key financial and planning departments of the public service. Capitalizing on a growing reputation as an efficient and assertive public servant, Salinas de Gortari played an important role in Miguel de la Madrid's presidency (1982–1988), especially in the drafting and implementation of drastic austerity measures and structural adjustment that followed Mexico's almost catastrophic period of foreign debt repayment crises (1982–1984).

Salinas de Gortari's technocratic character and unwavering party loyalty earned him the PRI's presidential nomination for the 1988 general elections. His main opponent was Cuauhtémoc Cárdenas Solórzano, the charismatic son of former PRI revered leader Lázaro Cárdenas, who had broken ranks with the PRI after unsuccessfully leading a campaign for democratic reform within the party. On election day controversy ensued: as early results projected favorable results for Cárdenas, the electronic system that tallied the votes suffered a sudden technical breakdown. At the end of the impasse, Salinas de Gortari was declared the winner with barely 50% of the votes. Cárdenas and his followers accused the PRI of perpetrating an electoral fraud of massive proportions, and although the evidence supported their claims, the country's electoral authorities validated the results.

These accusations of fraud and corruption would taint Salinas de Gortari's administration, while shedding light on the growing political decadence of the PRI and fueling the development of a national multi-dimensional movement pushing for nationwide political reform.

Salinas de Gortari was determined to transform Mexico from a largely protectionist country to one espousing market-oriented principles that embraced international capital and dealt on the basis of free trade. Three sets of reforms constituted the basis of this ambitious project. First, Salinas de Gortari set out to privatize the country's entire banking system. In essence, the administration claimed that this campaign of privatization would eliminate inefficiency and provide the state with funds to finance pressing socioeconomic needs. Eventually, the drive to privatize went beyond the banking sector and touched all publicly owned corporations and institutions, from telecommunications to drinking water facilities. By the end of Salinas de Gortari's presidency, more than 90% of the country's formerly public enterprises were totally or partially owned by private hands.

Second, Salinas de Gortari amended Article 27 of the 1917 Constitution, one of the pillars of socioeconomic justice that resulted from the Mexican Revolution. Article 27 guaranteed state protection and assistance for small agricultural cooperative communities, or *ejidos*, that were established during the comprehensive land reform campaigns of the 1930s and 1940s and played a major role in securing the country's supply of staple foods. Salinas de Gortari claimed that these protectionist agricultural measures curtailed the competitiveness and productivity of the Mexican countryside given the allegedly large percentage of land used for "unproductive purposes." The reform of Article 27 allowed private capital to buy and/or rent *ejido* land, while eliminating all public programs that assisted *ejidos* in the attainment of inputs, credit, and market access. Moreover, this constitutional amendment was seen as a prerequisite for Mexico to successfully negotiate its entry into the North American Free Trade Agreement (NAFTA) in order to enable multinational corporations (MNCs) to buy previously protected land for the development of agribusiness ventures.

Finally, Salinas de Gortari intensified the outward-oriented, export-based model of economic development by multiplying Mexico's free trade agreements. The most important of these was NAFTA, which entered into force in 1994. Moreover, Salinas de Gortari also signed free trade agreements with most Central American countries, Colombia, Venezuela, Chile, and Bolivia, and managed to obtain membership in transnational economic organizations, such as

Asia-Pacific Economic Cooperation (APEC) and the Organization for Economic Cooperation and Development (OECD).

Undoubtedly, the substantial changes undertaken during Salinas de Gortari's administration enabled Mexico to diversify its economic base, increase its exports, receive more foreign direct investment (FDI), and create jobs in key sectors of the economy, such as the manufacturing and auto assembling industries. However, these market reforms also provoked major disruptions for millions of Mexicans at the middle and lower strata, especially for the small producer agricultural sector given its inability to compete with cheap grain coming from the United States, the impacts of the rise in prices for basic services due to privatization, and the fall in real wages due to recurring monetary crises that neoliberal policies allegedly helped to trigger. In December 1994, just a few days after Salinas de Gortari had left power, the national currency, the *peso*, lost 60% of its value. All fingers pointed to Salinas de Gortari's economic policies as the main cause of the crisis. Furthermore, the growing displacement and poverty in the Mexican countryside due to the liberal agricultural policies implemented by Salinas de Gortari have been identified as the elements that catalyzed the 1994 indigenous uprising in the southern state of Chiapas, which was led by the Zapatista National Liberation Army (EZLN).

Since leaving office Salinas de Gortari has been burdened by several criminal charges that range from murder to embezzlement of public funds. Taking advantage of Ireland's lack of an extradition treaty with Mexico, Salinas de Gortari has resided in Dublin since 1996 and has managed to avoid prosecution.

## SALVATION ARMY

The Salvation Army traces its origins as a Protestant home mission begun by the Reverend William Booth in London's East End in 1865. But its post-World War II growth has occurred mainly in the developing world. When his mission's growth faltered in the 1878, Booth developed strategies to save it: a military system of command; employment of women ministers (officers); and by 1890, social services to appeal to the poor and urban ethnic minorities. And he opened overseas missions in Asia, Africa, and Latin America.

Before 1945, the Salvation Army followed Britain's Union Jack into British colonies, and after the colonizer's retreat, it turned over most leadership to nationals. Booth's commissioner Frederick St. George de Lautour Tucker, a third generation member of the Indian Civil Service, arrived in Bombay in 1882. As Fakir Singh (prince of religious mendicants) he tried to convert Indians to evangelical Christianity by dressing as a wandering fakir. But he found few to join his Army. Other Christian missions had already partitioned India, and Tucker only enrolled malcontents from other missions.

Finally he found that the Army appealed to India's outcasts and "criminal tribes." Starting with these poor "soldiers" and farm colonies, schools, hospitals, and other social services, his Army grew. By January 2000, India had 227,133 soldiers. In Asia, the Army had 357,057 soldiers, 35% of its international membership. In Africa it had 422,721 soldiers, 41.5% of its membership. In Latin America there were 17,492 soldiers. Thus 797,270 (77.5%) of all 1,019,137 Salvationists live in developing nations, with its largest membership in India, Kenya-Uganda, and Zimbabwe. However, it is unclear how accurate these statistics are. According to a Salvation Army leader, they vary by national culture. An Indian born into a religion may be inactive, but s/he may not be removed from the register even upon death. What is clear is that most Salvationists live in the developing world of the Army's 108 countries and territories. (Membership statistics are from *The Salvation Army 2004 Yearbook* [London: The Salvation Army International Headquarters, 2004]).

In each country the Army's churches are largely self-supporting, but schools, hospitals, and other social services receive financial support from funds the Army

raises from governments and public contributions in the developed world. Prior to 1947, nearly all Salvation Army leaders were Europeans, North Americans, or from Australia-New Zealand. By 2001, most in Africa and South Asia are native-born. The transition came as African and Asian Salvationists insisted on leading their post-colonial countries, and developing world governments refused to accept foreign leaders. No longer would the leaders speak only English, nor would Salvationists pray, as one Indian officer put it, to "our father who art in London."

Salvation Army history in the developing world is written or edited by officers in the West. And the Army has not yet elected a General, its sole international commander, from a developing country. But there are now new voices in the Army's high councils who represent the developing nations.

## SAMOA

The Samoan archipelago, which stretches across more than three hundred miles of the South Pacific Ocean, is divided into two political entities, the Independent State of Samoa (formerly Western Samoa, now known generally as "Samoa") and American Samoa. The people of both countries are linked by extended familial ties, owing to the two countries' long-standing but now discarded reciprocal free immigration policies, but political and economic distinctions still divide the two countries.

Samoa consists chiefly of the two large islands of Savai'i (656 square miles) and Upolu (430 square miles), the latter including the capital city of Apia. American Samoa occupies the archipelago's seven eastern islands, the largest of which, Tutuila (fifty-six square miles), hosts the country's capital, Pago Pago. The island chain lies on the South Pacific's primary

hurricane corridor, with major storms regularly forming each year between November and April, and devastating cyclones regularly destroy crops, damage infrastructure, and disrupt economic activity. The larger islands have high mountain peaks that drop off sharply to the sea, with few plains and little cultivable land area. The population of Samoa is 160,000, while American Samoa has approximately 68,000 citizens. Both countries have an average annual population growth rate of 2%.

In the late nineteenth century, the Samoan islands were the focus of intense competition among the Great Powers, which needed Pacific coaling stations for their fleets. In 1899, the archipelago was partitioned at the 171st meridian. Germany took possession of the larger western sector, while the United States obtained the smaller eastern islands. After Germany's defeat in World War I, its Pacific possessions were placed under a League of Nations mandate administered by New Zealand. Wellington enforced its authority against an independence movement in 1920s, but after World War II it promoted measured progress toward autonomy for Western Samoa. The country became independent in January 1962.

The economy of Western Samoa, traditionally dependent upon intensive plantation-style cultivation of coconuts and copra, has remained heavily oriented toward agricultural exports. As a result, domestic budgets are vulnerable to commodity price fluctuations, a fact that inhibits long-term economic development planning. Since the mid-1980s, a relatively new industry has emerged, that of tropical hardwood harvesting, processing, and export. Although profitable, the industry has caused widespread environmental damage, including the deforestation of 40% of the country's total land area. With United Nations aid money, the Samoan government has designated several zones as "conservation areas" where tree harvesting is banned. A small environmental movement is growing, and both the government and commercial entrepreneurs are beginning to promote eco-tourism as a new source of hard currency revenues.

To curb its welfare expenses and as a mechanism to reduce overcrowding, the Samoan government encourages emigration, and Samoan youth regularly leave the country in search of employment. New Zealand accepts 1,100 Samoan immigrants annually, and during periods of prosperity many times this number are allowed in on "guest" visas, on the assumption that young Samoans will accept unattractive low-wage jobs. Hundreds more Samoans are believed to enter New Zealand and Australia illegally each year, merging into the underground economies of the host countries. Samoans regularly move to American Samoa, attracted by relatively high-wage cannery jobs. Remittances

from family members working abroad support many Samoan households. The government also relies upon international development aid, particularly for financing large infrastructure projects.

After the 1899 partition, the American sector of Samoa was administered by the US Navy, which established coaling facilities at the deep water harbor of Pago Pago. During World War II, Tutuila island saw the construction of air fields, storage depots, and training facilities to support Navy and Marine forces in the Pacific. Nonetheless, central features of traditional Samoan political culture remained intact, including communal land ownership and the relaxed administration of social affairs by local familial chiefs, known as "matai." In 1951, the Navy transferred its authority over the territory to the US Department of the Interior, and consultations began on the introduction of a constitution. The new document, introduced in 1960, provided for a bicameral legislative body with special roles for senior matai, but all foreign affairs issues remained under the control of Washington, DC. In 1980, American Samoa elected its first non-voting delegate to the US House of Representatives.

During the early 1960s, President John F. Kennedy ordered that federal educational, welfare, and infrastructure development programs be implemented in American Samoa. Roads, schools, harbor and airport facilities, electricity production plants, and medical clinics were built, welfare and educational benefits were introduced, and new jobs were created in the construction and operation of large tuna canneries near Pago Pago. Funding cuts in the 1970s and 1980s reduced benefits paid to individuals supported by federal programs, and public facilities went without regular maintenance or improvements. In the early 2000s, more than half the government's revenue was supplied by direct grants from the United States.

As a US territory, American Samoa has absorbed American popular culture through radio, television, music, and films. Traditionalists and nationalists pointed to these influences to explain the rising incidence of juvenile delinquency, alcoholism, and illegal drug usage during the 1990s, stimulating a movement for a return to "fa'a Samoa," or traditional Samoan folkways. Local legislative initiatives placed restrictions on foreign investment and land purchases by non-Samoans.

Over 90% of American Samoa's populace resides on Tutuila, concentrated around the harbor at Pago Pago. Unemployment regularly exceeds 10%, and it is estimated that each year, half of the country's high school graduates move to the United States, particularly to Hawaii and the West Coast, in search of better educational and employment opportunities.

Most make permanent homes in the United States and regularly remit cash to family members remaining in American Samoa.

Tuna canning and fish processing are the largest industries in American Samoa, with agricultural products a distant second. The largest market for all exports is the United States. The canneries at Pago Pago attract migrants from Western Samoa and Tonga. For many, moving to American Samoa presents the possibility of obtaining permanent resident status in the territory, and thereby eventually gaining the right to legally enter the United States.

## SANCTIONS, ECONOMIC

In recent decades, economic sanctions have become a household phrase as they have been imposed more frequently on a number of countries—Cuba, Iraq, Libya, Haiti (1991–1994), Iran, North Korea, and South Africa (before it abandoned apartheid) to name a few—although some of these date back 40 years. Economic sanctions involve one or more countries, referred to as *sender(s)*, who inflict or threaten to inflict on another country, the *target*, economic and financial costs in order to change that country's behavior. The action by the sender consists of but is not restricted to boycott, restriction of access to financial resources, denial of trade, and blocking of

assets. The offending behavior of the target country could be in the sphere of military (occupation of Kuwait by Iraq), human rights (South Africa during apartheid, Poland in 1981, China), hostage taking (Iran), support for terrorism (Libya), the economy (countries who restrict their markets), or environmental concerns. Sanctions are unilateral when there is only one sender and multilateral when there are a number of senders or are even imposed by the United Nations. The target is usually a single country although there have been cases where several countries were targets of economic sanctions. As a result of sanctions both the sender and target incur costs, and the costs to the sender may be even greater in absolute magnitude. Yet because usually the sender is a powerful country and the target a smaller nation, the relative costs to the target are more pronounced. Sanctions are usually applied to the government, companies, and citizens of the target country or to companies and citizens of the sender country who trade with or invest in the target country. Cases exist, however, where sanctions acquire extraterritorial character and are imposed on third-country companies who deal with the target.

Sanctions have a long history and date back to 432 BC when Athens imposed a trade embargo on Megara. In their modern reincarnation during the twentieth and twenty-first centuries, economic sanctions have been imposed close to 170 times on different countries. What is interesting is the proliferation of economic sanctions in the past two decades. Between 1914 and 1990, the number of sanctions is estimated at 115, but since 1990 more than fifty sanctions have been imposed.

The rate of success of sanctions in achieving their publicly stated goals—that is, to change the offending countries political behavior—is low. The best estimates put it at 25% to 30%. One has only to look at four decades of sanctions on Cuba and more than ten years on Iraq for the confirmation of their ineffectiveness. Sanctions are more effective when multilateral and when third parties—countries or blocks of countries which are neither senders nor targets—do not thwart them. It is not unusual for the neighbors of the target country or nations with which it has had trade and investment relations to continue their dealings clandestinely or even openly and reap financial benefits. Nevertheless, these considerations should not be taken to mean that economic sanctions do not inflict economic costs on the countries under sanctions. Indeed, such costs can be quite substantial and cripple an economy. Therefore, some have argued that economic sanctions have a broader purpose, that they send a signal to the world as to the resolve and power of the sanction-imposing country. Others have sought

to explain the rationale for sanctions and the recent surge in their number by the actions of interest groups and by public choice theory. We present three rationales for imposing economic sanctions. None of these explanations are applicable to all cases. Nevertheless, individually or in combination, they account for the majority if not all instances of economic sanctions. Empirical work on the study of sanctions and their impact has just begun. Work on econometric models specifically designed to quantify the effect of sanctions on both sender and target countries would be a desirable avenue of research.

One explanation for the proliferation of economic sanctions observes that sanctions are something between war and no action at all. Faced with an international situation that is morally objectionable or politically unacceptable—for instance, apartheid in South Africa, ethnic conflict in Yugoslavia, human rights violations in Haiti, Iraq's intentions toward its neighbors, and state-sponsored terrorism of Libya—other countries have a number of choices. Warfare is costly in human and financial terms and may not be popular at home. Passivity, on the other hand, could be politically damaging and morally unacceptable both at home and abroad. Economic sanctions are a happy medium. But this does not explain why in the face of the lackluster performance of sanctions, governments still resort to them. The problem is that this view does not consider the signal or expressive value of sanctions.

A second explanation may be that in reality sanctions have been more successful than raw statistics show. First, there have been many successful episodes, albeit small ones, while a few prominent unsuccessful cases have grabbed headlines. Second, sanctions prevent the recurrence of the offending behavior by other countries. For example, it has been noted that by imposing an embargo on Cuba, the United States discouraged other Latin American countries from becoming communist. Thus, a country facing a situation where its principles are trampled upon has to make a stand. Failure to do so or follow through with economic sanctions (even if the stated goals of the sanctions are not achieved) would be to invite further encroachments. It also may earn the sender a reputation of being a paper tiger, and serve as a signal to other countries that they too need not take warnings seriously. The target on its part may refuse to budge because to submit once may invite blackmail. The sender may demand more and more concessions. Thus, regardless of the costs, the target may refuse to change its behavior. Furthermore, it may turn the sanctions into a national cause and try to rally the populace around the flag. The upshot of all these reactions would be two countries in a

locked-horn position and with no end in sight. Such episodes of sanctions could be considered successful in achieving their aims, because their prolonged histories stand as a reminder to other nations and relieve the sender of the need to impose further sanctions.

While the previous view seems sound and has explanatory value, it requires econometric validation. We cannot believe in a theory based on an event not happening, unless we clearly specify what might have happened and show evidence as to its likely occurrence. This may be a tall order in the case of sanctions, but it should be possible to specify a behavioral model along the lines of models dealing with self-selection in labor economics, and subject it to empirical testing.

A third view of economic sanctions is based on the observation that a nation consists of many interest groups with different and sometimes opposing objectives. Thus, for simplicity, we can divide voters in the sender country into three interest groups; one group may benefit from or be in favor of sanctions, another may be harmed by or oppose them, and the third be neutral or unaffected. The same division could be applied to people in the target country. Now each of the first two groups in the sender country would try to advance their own agenda through influencing the elected officials. Each group would try to elect candidates sympathetic to their cause and find allies among the neutral group. Elected officials, in turn, would try to curry favor with influential interest groups. When the group in favor of economic sanctions gets the upper hand, sanctions will be instituted against the target country, and when those opposed to it muster the necessary votes, they will prevent them from going into effect or if they are already in place remove them. For its part the interest group in the target country which benefits from sanctions will do its utmost to prevent any softening on the part of its own government that could lead to the removal of the sanctions. Hence, members of the group rally around the flag and organize demonstrations against foreign meddling in the internal affairs of the homeland. In this game, third parties—that is, governments, companies, and citizens of the countries that are neither senders nor target—will try to maximize their own gains. This may entail trying to circumvent or even remove the sanctions, or to make lucrative deals with the target country.

As an example, observe that groups concerned about terrorism in the Middle East and the proliferation of weapons of mass destruction as well as supporters of Israel work hard to keep the Iran-Libya Sanctions Act (ILSA) in place. While as a result of the prohibition of trade with and investment in Iran many businesses and particularly oil companies stand

to lose. On their part, Iranian people and their elected representatives have sought rapprochement with the United States while the unelected conservative officials have spurned even dialogue with America. Conservatives have both financial and political vested interests in confronting the United States. Third parties have also been at work. When the American company Conoco had to withdraw from a deal with Iran, the French company Total took its place. Similarly, European countries and Russia have tried to benefit from trade with Iran.

A parallel situation exists regarding Cuba. The large Cuban community in the United States is against any dealing with the Castro regime, while many businesses would like to trade with that country. European firms, on the other hand, are against the provision of the Cuban Liberty and Democratic Solidarity (LIBERTAD) Act of 1996 that imposes sanctions on companies who benefit from the use of properties of Americans, including naturalized citizens, confiscated by the Cuban government.

This theory too helps us to better understand the reasons for imposing sanctions through an analysis of the political process. Nevertheless, the model should not be taken too literally. The two co-sponsors of the LIBERTAD Act, Helms of North Carolina and Burton of Indiana, could not be said to have been influenced by the Cuban community in America, as neither state has a large presence of Cuban-Americans. Their motives may have been ideological opposition to communism and promotion of international recognition of and respect for private property rights. One may surmise that it is more likely for an interest group to succeed in enacting its legislation when its goal is in line with a broader consensus. Also one has to be skeptical of the rallying-around-the-flag argument if it is based only on demonstrations in the target country. Petty dictators run many target countries and the populace may have no choice but to participate in these public shows of support for the government.

The communications revolution has brought people around the globe ever closer to each other. Any conflict, civil rights violation, or terrorist act immediately attains the character of an international problem. The global village calls for the observance of rules of civil society by all, and since this is not going to be the case, the need and calls for sanctions will increase. In the absence of an international body to enforce human rights and the rules of civil society, powerful countries individually or in coalitions will find it necessary to enforce compliance. The use of military force will not always be desirable or even possible. Therefore, sanctions will become the weapon of choice on many occasions. Moreover, globalization

has resulted in the growing interdependence of markets and economies. This, in turn, requires that all participants submit to the discipline of the market and play the game fairly or, at the least, refrain from flagrant violations. It is unlikely that in the foreseeable future all nations will give up on export subsidies and protectionist policies, the World Trade Organization (WTO) and its rules notwithstanding. Economic disputes too will add to the cases of sanctions. On the other hand, many in the business community consider sanctions an interference with free trade. Fearful of their abuse by interest groups, a trend to oppose sanctions as frivolous acts has taken shape. Thus, for the foreseeable future, economic sanctions will remain an important issue of our time. A rigorous theoretical and empirical analysis of this subject is vitally needed.

## **SANDINISTA NATIONAL LIBERATION FRONT (FSLN)**

The Sandinista National Liberation Front (FSLN) led a successful insurgency that ousted Nicaraguan dictator Anastasio Somoza Debayle on July 19, 1979, then ruled the impoverished Central American country until 1990, when it was defeated in democratic elections. It remains the main opposition political party in the country, winning nearly half of the seats in the National Assembly in the 2001 elections. Since 1990, its support has been fairly constant at about 30%–40% of the vote, despite the defection of certain key leaders such as former Vice President Sergio Ramirez.

### **Origins and History**

The FSLN takes its name from Nicaraguan hero Augusto César Sandino, a Liberal reformer who held US forces at bay for six years, leading to their departure in 1933, following a relatively fair election won by fellow Liberal Juan Sacasa. Sandino's philosophy was, above all, nationalistic, and he even broke ties with Augustín Farabundo Martí—who led a failed rebellion in El Salvador in 1932—because of the latter's adherence to communism. Sandino was double-crossed and killed in 1934 by then head of the newly created National Guard, Anastasio Somoza García, who later became president and founded the familial dictatorship overthrown by the self-declared heirs to Sandino's nationalist cause in 1979.

The FSLN, according to the sole surviving founder Tomás Borge, was an historical response to this dictatorship and its ties to the United States. Its primary goal was to defeat the Somoza dictatorship via armed struggle, and to take political power in order to achieve democratization and progress in Nicaragua. It drew not only upon the nationalism of Sandino but on certain aspects of Marxism-Leninism and Christian humanism, borrowing the latter from Liberation Theology, which resonated throughout Latin America. Founded in 1961, the FSLN was an obscure guerrilla movement that took its inspiration from the successful insurgency led by Fidel Castro in Cuba. Its principal leader until his death in 1976 was Carlos Fonseca, whose writings continue to inspire the movement. The Sandinistas resisted, however, the temptation to build a cult of personality around any one leader, relying instead on a nine-man National Directorate that represented equally the three "tendencies" within the movement—the Prolonged Popular War tendency, the Terceristas (of which Daniel and brother Humberto Ortega were leading members), and the

Proletarian tendency. In theory, as well as in practice, these nine men made decisions based upon discussion and consensus.

### **The Sandinista Revolution**

When the Sandinistas triumphed over the National Guard and Somoza in 1979, they had built a broad opposition coalition that included twenty existing political parties and groups in Nicaragua. At first, a five-person junta was named to govern the country, including Ortega, Ramirez, Alfonso Robelo, Violeta de Chamorro, and Moisés Hassan. But the FSLN moved quickly to strengthen its own base of support by creating a number of affiliated organizations, including the Sandinista Workers Central (CST) labor union, the Association of Rural Workers (ATC), and the Sandinista Defense Committees (CDS), the latter of which were neighborhood groups criticized for allegedly silencing dissent, though their primary purpose was to attend to peoples' immediate needs. Despite the defection of several of its coalition members, the Sandinistas continued to tolerate a political opposition, even after evidence of US influence emerged. The Reagan administration, upon taking office in early 1981, was openly hostile to the FSLN-dominated government and financed a covert war to overthrow it. Undeterred, the Sandinistas carried out sweeping economic and land reforms, aimed primarily at the country's impoverished population. Private investment was tolerated and even encouraged in what was declared to be a mixed economy.

The Sandinistas held their first elections in November 1984, despite the ongoing proxy war. Six political parties to both the left and the right of the FSLN agreed to participate, while four others opted to boycott, claiming the conditions did not meet their demands. The United States used that boycott to contend that the elections were a sham, but most observers present concluded that, given the circumstances, the voting was as free and fair as could be expected. Daniel Ortega was elected president with 67% of the popular vote, while the FSLN captured sixty-one of the ninety-six seats in the new National Assembly. By 1987, Nicaragua had a new constitution, but its economic situation was deteriorating rapidly in the face of the US embargo and covert war. By the late 1980s, inflation had reached 675% and more than two-thirds of the government's budget was being devoted to defense.

It was under these trying conditions that the Sandinistas submitted to another election in 1990, facing off against former junta member Chamorro and the United Nicaraguan Opposition (UNO), which

## SANDINISTA NATIONAL LIBERATION FRONT (FSLN)

enjoyed US backing. Ortega lost to Chamorro, 55% to 41%, and the FSLN agreed to hand over power. But they captured thirty-nine of the ninety-two National Assembly seats and, with the dissolution of UNO soon after the election, the Sandinistas continued to exercise considerable influence and power. They worked to minimize the impact of neo-liberal reforms (neo-liberalism) on workers while defending other aspects of their revolution, such as land redistribution and education. In the most recent elections, on November 4, 2001, Ortega again ran for president and again lost, this time to Enrique Bolaños of the Constitutionalist Liberal Party (PLC). But the FSLN won forty-three of the ninety assembly seats and claimed victory in that regard.

## SAUDI ARABIA

The Kingdom of Saudi Arabia extends from the Red Sea in the west to the Arabian Gulf in the east; bordered on the north by Jordan, Iraq and Kuwait, on the south, by Yemen and Oman, and on the east by the United Arab Emirates (UAE), Qatar and Bahrain. Almost all of Saudi Arabia consists of semi-desert and desert with oases, where half of the total surface is uninhabitable desert. The two major desert regions are, in the north, the An Nefud Desert, and in the south, the great Rub al-Khali desert also called the

Empty Quarter due to its lack of inhabitants. Between those lie the Nejd massif central plateau and the plain of El Hasa, the country's only fertile region.

Most of the western parts of Saudi Arabia are plateau; the east is lowland, with a very hot climate. With the exception of the province of Asir with its towns of Jizan on the western coast and Najran, Saudi Arabia has a desert climate characterized by extreme heat during the day, a sudden drop in temperature at night and erratic rainfall. The two main extremes in climate are felt between the coastal lands and the interior. Along the coastal regions of the Red Sea and the Persian Gulf temperatures seldom rise above 100°F, but the relative humidity is usually more than 85% and frequently 100% for extended periods.

The inner part of the country includes the Nejd, and the great deserts. The average summer temperature is 113°F, but readings of up to 129°F are common. The heat becomes intense shortly after sunrise and lasts until sunset, followed by comparatively cool nights. During winter, the temperature seldom drops below 32°F, but the almost total absence of humidity and the high wind factor create a cold atmosphere. In the spring and autumn, temperatures average 84°F. All over the country there is very little rain. There are no permanent rivers and lakes. Although the average rainfall is four inches per year, whole regions may not experience rainfall for several years. When such droughts occur affected areas may not be able to sustain either livestock or agriculture with great losses as happened in the 1957 droughts.

The population is currently estimated at 25.1 million and has a growth rate of 3% annually. The total area of the country is estimated at 829,995 square miles with a population density of 30.3 persons per square mile. The boundaries of the Kingdom are not clearly determined in desert areas, especially the border with the Sultanate of Oman and the UAE. The city of Riyadh, located in the Nejd plateau, is the capitol and largest city with an estimated population of 3.5 million, which accounts for 14% of the total population.

Besides the capitol, major cities are located in the west side of the country. They include Jeddah, the religious centres of Makkah al-Mukarrama (Mecca) and Medina. On the east coast, are located the cities of Dammam, Al-Khubar and Dhahran, the oil industry capitol. In a similar way to other countries that possess lots of desert land (for example, Libya), most of the population lives in the cities, making 86% of the population urban. The geographical concentration of the population in the cities is the result of the disappearance of the Bedouin way of life as the Kingdom was united in 1932.

The Muslim tradition in the Arabia peninsula originated with Muhammad, the prophet of Islam, who was born in Mecca around 570 CE. He started the Islamic traditions when the Qur'an (or Koran) was revealed to him, which later was written and considered the holy book of the Muslims. After conquering the Mecca in 630 CE, Muhammad died two years later but left behind him an Islamic Community ruled by caliphs as political leaders who spread the Islam. However in the year 661 CE the caliphs moved the political centre of the Islam to Damascus (Syria). The Muslims wouldn't gain a total control of the country until the eighteenth century. The Kingdom's origins lay in the eighteenth century with the ancient Wahhabi movement, which gained the allegiance of the powerful and traditional Saud family of the Nejd, in central Arabia. Supported by a large Bedouin following, the Sauds brought most of the peninsula under their control. It was Abdulaziz bin Abdelrahman Al-Saud (also known as Abd al-Aziz ibn Saud or more simply as Ibn Saud) who laid the basis of the present Saudi Arabian state. After facing some conflicts, Ibn Saud took Riyadh in 1902 to become master of the Nejd by 1906. He later conquered the Al-Hasa region from the Ottoman Turks and soon extended his control over other areas.

Finally on September 23, 1932, that region was combined with the Nejd to establish the *Kingdom of Saudi Arabia*, an absolute and united monarchy, ruled under Islamic law. The Holy Qur'an was established as the constitution and Ibn Saud became the king and prime minister. Saudi Arabia became a hereditary monarchy. It was then when King Ibn Saud compelled most of the Bedouins to abandon traditional ways and encouraged their settlement as farmers. During his time, Ibn Saud initiated the real process of nation building as he began the development of the country's infrastructure by first establishing roads, basic communications systems, improving education, national health care and agriculture.

His three sons continued his work: Saud, Faisal, and Khalid. The eldest son of King Ibn Saud, Saud acceded to the throne upon his father's death in 1953. He instituted the Council of Ministers and established the Ministries of Health, Education and Commerce. A large number of schools and the Kingdom's first institute of higher education, King Saud University, were opened in Riyadh in 1957. In 1960, the Organization of Petroleum Exporting Countries (OPEC) was formed and Saudi Arabia became a stable and strong member until the present days. Faisal bin Abdulaziz became king in 1964. While his father had shaped the Kingdom, Faisal built and consolidated the country. Following the assassination of Faisal in 1975, King Khalid's reign (1975–1982) began.

Stressing Islamic orthodoxy and conservatism while expanding the country's economy, Khalid continued developing social programs and educational structures. Later on, due to an illness Khalid died in June 1982 and King Fahd bin Abdulaziz took over the government.

For thousands of years, the economy of the Arabian Peninsula had been determined by autonomous clusters of people living near wells and oases, under the Bedouin way of life. Until the middle of the 1930s, the recently united Kingdom's economical structure was based on agriculture, including nomads who raised livestock by moving their animals to the limited forage produced by infrequent rains. Production was limited to serve very small markets and existed essentially on a subsistence level. Trade was limited primarily to camel caravans. As cities formed, the main sources of income were trade and fishing on the Red Sea coast, the annual influxes of income derived from pilgrims who visited the holy places and the growing of products mainly on the eastern coast. Imports on several alimentary products were necessary to satisfy the demand.

However, in 1938, the discovery of huge reserves of oil by a United States company provoked the most structural change for the economy of Saudi Arabia. Initially, the newly established oil industry had only an indirect impact on this primitive economy. The establishment of the Arabian American Oil Company (Aramco, predecessor of Saudi Aramco) triggered major changes in the economy of the kingdom, especially in the Eastern Province. Development of the oil fields required ancillary construction of modern ports, roads, housing, power plants, and water systems.

The discovery of oil ended the kingdom's isolation and introduced new ways to organize the production and distribution of goods and services. Nowadays, the oil industry located in the northeast along the Persian Gulf dominates the Kingdom's economy: the petroleum sector accounts for roughly 75% of budget revenues, 45% of the gross domestic product (GDP), and 90% of export earnings. In 2004, Saudi Arabia's GDP was estimated at \$287.8 billion with a per capita income of about \$11,800. Major trading partners are the United States, Japan, Great Britain, and other European Union countries. Saudi Arabia contains about one quarter of the world's known reserves. The dynamics of the oil industry encouraged the development of other sectors in the Kingdom. Since 1962, Saudi Arabia has increasingly been producing natural gas liquids along with the exploitation of petroleum. Also some minerals are extracted and exported such as limestone, gypsum, marble, clay, iron ore, copper, gold, bauxite, and uranium. Agriculture only represents 4% of the GDP and consists mainly

of wheat, barley, dates, citrus fruit, vegetables, and livestock products. Agriculture is a growing economic sector and the country is approaching food self-sufficiency.

Due to the large incomes provided by the oil sector, the country has gone through considerable social development. During the last four decades the health standards have improved significantly with the establishment of a network of public primary health care centres and clinics throughout the country, which provide preventive, prenatal, emergency, and basic health services. The number of health centres and clinics rose from 591 in 1970 to over 3,300 by 2000.

This is complemented by a network of hospitals and specialized treatment facilities, located strategically in major urban areas such as Riyadh or Makkah. The results of the program have been to lower the infant mortality rate from 105 per 1,000 births in 1975 to 25 per 1,000 live births in 2000. Consequently, the life expectancy at birth rose from fifty-four years in 1975 to seventy-two in 2002. Also the mortality of children under age five has significantly been lowered from 141 per 1,000 births in 1975 to 30 per 1,000 in 2000. However, despite having increased the number of hospitals and beds, Saudi Arabia's ratio of one hospital bed per 440 people is among the lowest in the world.

The Saudi government also cares for social welfare having instituted during the 1980s some programs that provide social security pensions, benefits, and relief assistance to the disabled, the elderly, orphans, and widows without income. The government has also been active in housing policies by financing construction and building the infrastructure to enable housing development. Substantial housing has been built for low-income Saudis, public employees, and students. An important government policy has been to provide interest-free, easy-term loans for home construction. For this purpose, the Real Estate Development Fund was established in 1975 to provide financing to individuals and private companies. However, despite the large number of foreign workers within Saudi Arabia, only Saudi citizens are allowed to own property.

As for education, the formal primary education began in Saudi Arabia in the 1930s. By 1945, King Ibn Saud had initiated an extensive program to establish schools in the Kingdom. By 1951, the country had 226 schools with 29,887 students. Today, Saudi Arabia's nationwide public educational system comprises eight universities, more than twenty-four thousand schools, and a large number of colleges and other educational and training institutions. The first university, now known as King Saud University, was founded in Riyadh in 1957. Other universities such as the Islamic University of Imam Muhammad Ibn

Saud in Riyadh, the Islamic University at Medina or the King Fahd University of Petroleum and Minerals were later founded.

Since the government extended public education to girls in 1960, the public educational system is open to every citizen and provides students with free education, books and health services. Although school is not compulsory, 59% of children were attending primary school in 2002 and the secondary school enrollment ratio reached 53% in 2002. A noticeable increase in literacy over the last decades of the twentieth century is one indicator of the success of the government's efforts. According to 1970 data, the Saudis had one of the lowest literacy rates in the Middle East: 15% for men and 3% for women. In 1990, 66% of the adult population was literate while in 2002 it reached 78% for both men and women.

#### SELASSIE, EMPEROR HAILE

Haile Selassie (1892-1975), Conquering Lion of Judah, Elect of God, King of Kings, and 225th emperor of the Ethiopian dynasty was born on July 23, 1892. Until his official coronation at age thirty-eight he was known by his birth name, Tafari Makonnen. His father was a cousin of the progressive Emperor Menelik II. He received a modern education from French missionary tutors. In Tafari's youth, Ethiopia used a feudal system of land tenure. Speakers of the Amhara

language controlled the economy, the established Coptic church and the political system. Most administrators were large landowners. Peasant farmers were taxed up to 90% of their harvest.

By age twenty, Tafari had married Woizero Menen (with whom he eventually had six children). In 1913, Menelik II died and was succeeded by his grandson, Lij Yasu. Yasu sided with Ottoman Turks in World War I, and converted to Islam. Tafari deposed Yasu in 1916. Menelik's daughter Zawditu was named Empress, and Tafari became her regent, and heir apparent, with the title *Ras* (prince). For the next decade Ras Tafari built up his own military force while maneuvering between conservatives and reformers. His heart lay entirely with the latter faction, especially after he returned from his first visit to Europe in 1924. In 1928, he forced Zawditu to crown him as *Negus* (king) and two years later, after Zawditu mysteriously died, he became Emperor with the throne name Haile Selassie I.

Ethiopia, with very few roads across its mountainous terrain and with more than eighty local languages, was nearly ungovernable. Haile Selassie promulgated a constitution in 1931, but this was hardly a move toward democracy, as it provided that "the person of the Emperor is sacred, his dignity inviolable, and his power indisputable." The real purpose was to centralize power. That meant installing relatives as provincial governors and rotating them frequently.

Haile Selassie wanted Ethiopia to have modern schools, clinics, and banks, but his reforms were halted by the Italian invasion of October 1935. He is best remembered for his eloquent but futile appeal to the League of Nations to resist Fascist aggression. He spent five years in London before returning to Addis Ababa with British troops in May 1941.

In the postwar period, Haile Selassie continued, but at a slower pace, his cautious program of modernization. He abolished slavery but was unable to implement land reform. He steered effectively through the shoals of international politics, granted base rights to the United States Air Force, and annexed Eritrea. He held elections for the lower house of parliament in 1957, but continued to rule as an absolute monarch.

From 1960 onward, the Emperor's life grew increasingly difficult. In that year, one of his sons was implicated in a coup attempt. In 1962, his wife died. The seventy-year-old man sought respite from his loneliness by frequent foreign travel (including a visit to Jamaica, where members of the Rastafarian sect greeted him as Jesus Christ) but his government ground to a halt when he was gone. By 1970, he had become isolated, and seemed oblivious to the coming storm. A terrible famine in 1973 and 1974 took the lives of an estimated two hundred thousand people. In

February 1974, a general strike called to protest unchecked inflation spread to all sectors of the population, including teachers, taxi drivers, Coptic priests, and even prostitutes. The aged emperor's response was to hand out cash from the window of his limousine.

Haile Selassie was deposed in a military coup on September 12, 1974. He lived out his days under house arrest, still believing, or pretending, that he was in power. The new military government announced on August 27, 1975, that he had died in his sleep, but they hid his remains under a toilet in the palace, where they were discovered in 1992. In November 2000, the emperor was reburied alongside his wife in Addis Ababa's Trinity Cathedral.

## SELF-DETERMINATION

Self-determination consists of the political and legal processes and structures through which a people gain and maintain control over their own destinies. With the creation of the United Nations (UN), self-determination of peoples became an established principle of international law. The principle is embodied in the Charter of the United Nations and in both the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights. Common Article 1(1) of these Covenants provides that: "All peoples have the right of self-determination. By virtue of that right they freely determine their political status and freely pursue their economic, social and cultural development."

The UN General Assembly invoked this principle in its 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples, in which it stated that subjection of peoples to alien domination constitutes a denial of fundamental human rights and violates the peoples' right to freely determine their political status and pursue their economic, social, and cultural development. In accordance with the principle of self-determination, the UN supported the independence of colonies in Africa, Asia, and elsewhere.

Although there is no international legal definition of "peoples," who are entitled to the right of self-determination, the term is generally used to describe

a population who shares the following characteristics: (1) a common historical tradition; (2) self-identity as a distinctive cultural or ethnic group; (3) cultural homogeneity; (4) a shared language; (5) a shared religion; and (6) a traditional territorial connection. In practice, however, the United Nations and its member states have been reluctant to extend the right of self-determination of peoples beyond overseas colonized territories. Even the former colonies (now independent states) are reluctant to recognize their own ethnically distinct citizens' full right to self-determination, fearing it might lead to demands for separation and secession.

Today, many indigenous communities throughout the world are claiming the right to self-determination. These are peoples, such as American Indians and Australian Aborigines, who constitute a "first people," with a prior history of territorial occupation and an ancestral attachment to their land before it was conquered and occupied by others. They now live within existing states as subordinate peoples. They are determined, however, to preserve and transmit to future generations their ancestral territories and their ethnic identity, as the bases of their continued existence as peoples with their own cultural patterns, social institutions, and legal systems.

Indigenous peoples see their situations as being identical to those of colonized peoples who have been conquered and then ruled by others. They argue that the so-called "salt water test" (which limits the rights of self-determination to colonized lands that exist across the oceans from the colonizing country) should not apply to them. Other conquered peoples claiming the right to self-determination include the Chechens, who are dominated by Russia; the Palestinians, whose land is occupied by Israel; the Kurds, living in Turkey, Iraq and Iran; and the Catholics of Northern Ireland. The first three of these peoples want to establish their own independent states, while the Northern Irish Catholics want to become part of Ireland.

The right of self-determination conflicts with the principle of preserving the territorial integrity of sovereign states—a principle also found in the UN Charter. Although the exercise of self-determination can include secession from an existing state and the creation of a new one, it also includes other less dramatic choices. The UN General Assembly's 1970 Declaration on Principles of International Law concerning Friendly Relations and Cooperation among States explains that implementation of the right to self-determination need not conflict with the territorial sovereignty or political unity of a state. The Declaration provides that a people exercising their right of self-determination may choose to form a federation with an existing state, integration into an existing state as

an autonomous region, or "any other political status freely determined by a people" short of secession.

The Declaration goes on to explain the conditions under which peoples are not justified in seeking secession and independence from a sovereign state. It states that independent countries possessing a government that effectively represent the whole of their population (ethnic minorities included) are considered to be conducting themselves in conformity with the principle of equal rights and self-determination of peoples. For example, if an indigenous people or ethnic minority reside in a democratic state that enables them to participate effectively in the political process and economy and to practice their religion and culture, then they are exercising their right of self-determination and have no cause to secede. When this is not the case, however, peoples have the right to act to control their own destinies.

The right to secede is an option of last resort, justified by serious government violations of human rights, persistent discrimination, and other grave injustices. Self-determination examples of succession in recent decades include the dissolution of the Soviet Union and Yugoslavia, the separation of East Pakistan from West Pakistan to form Bangladesh, and the separation of East Timor from Indonesia. In each of these cases, distinct peoples created independent states and thereby shattered the federations or unitary state of which they had been a part.

Examples of self-determination within an existing state include Italy's five special autonomous regions with extensive local powers defined by the constitution: Trentino–Alto Adige (containing the German-speaking people of the South Tyrol), Friuli–Venezia Giulia (containing Slovene and Friulian speakers), Val d'Aosta (containing French speakers), as well as the islands of Sardinia and Sicily. Each of these regions has unique, "non-Italian" cultural, linguistic, and historical characteristics that have justified extensive delegations of powers from Rome to the regional authorities to permit decision-making on local educational, economic, cultural, and budgetary issues.

Some other autonomy arrangements include the Sami Parliaments in the Nordic countries, the Nunavut territory in Canada, and the ancestral territory of indigenous people in Panama.

The trend in world politics has been for enlightened states to attempt sincerely to accommodate the self-determination aspirations of their ethnic minorities, while other states continue to suppress and deny their minorities or subjugated peoples this fundamental right.

## SENEGAL

The Republic of Senegal is a coastal West African country just south of the Sahara Desert, bordered by Mauritania, Mali, Guinea, and Guinea-Bissau. The country has about 310 miles of Atlantic coastline. The Gambia constitutes a sliver of territory about twenty miles wide and two hundred miles long that extends from the coast eastward along the Gambia River, separating the southern region of the Casamance from the rest of Senegal. The climate is predominantly tropical, with a rainy season, lasting from June through October, followed by a cool dry season. The greatest amount of rainfall occurs in the south, which receives about seventy inches annually, compared to twenty inches in the far north along the Senegal River. The nation is drained by the Senegal, Sine, Saloum, Gambia and Casamance Rivers. Flat, rolling plains and sandy soil characterize much of Senegal except in the Casamance region which has some forest areas. The population is estimated at approximately 10 million, with an estimated growth rate of 3.3% annually. The capital, Dakar, situated on the Atlantic coast, has a population of about 1.7 million.

Prior to French occupation and the consolidation of colonial rule in the middle to late nineteenth century, the Senegal region was dominated by a series of Muslim Wolof and Fulbe kingdoms and some non-Muslim Serer states. Wars among the various states produced significant numbers of slaves for the trans-Atlantic trade. With abolition of slavery in the early nineteenth century, the French shifted their emphasis to the production and export of peanuts, creating a monocrop colony. Throughout the colonial period, Senegal occupied a special place in the Federation of West Africa. In 1960, the country achieved independence under the leadership of Leopold Sedar Senghor, a prominent intellectual as well as politician.

Senghor maintained close ties with France, which continued to supply considerable technical, financial, and military assistance to the country. He also courted the powerful Muslim brotherhoods whose support was critical to his electoral victories and the dominance of his Socialist Party. The country was often hailed as one of the few democracies in Africa with an enviable record of religious toleration and ethnic cooperation. The military was kept in check and did not interfere in politics. However, the monocrop economy, centered on peanut production, was vulnerable to world market fluctuations and the severe Sahelian droughts of the 1970s. The state intervened directly in the economy, with poor results. When Senghor voluntarily handed over power in 1980 to his chosen successor, Abdou Diouf, the country faced a serious economic crisis. Diouf continued his predecessor's policies of strong ties to France and close cooperation with the Muslim leadership. Diouf attempted to diversify the economy by promoting fishing and tourism. He also announced a plan to privatize state-owned firms, but economic progress was minimal. Falling export values, rising costs of living, periodic droughts, and growing unemployment, especially among secondary school and university graduates, led to some unrest among students and the urban population in Dakar, most notably in widespread riots in 1988. Diouf also faced a mounting secessionist movement in the largely non-Muslim and non-Wolof southern region of the Casamance. In 1989, ethnic tensions with Mauritania erupted into massacres and mass repatriation between the two countries. Despite these problems, Diouf and the Socialist party continued to dominate national politics throughout the 1980s and 1990s.

In 1994, the devaluation of Senegal's currency, which is tied to the French franc, caused serious economic disruption, especially in the urban areas. Inflation, falling living standards, rapid urbanization and population growth, and a decline in agricultural production led to increased discontent with the regime. In the late 1990s, Senegalese intervention in a coup d'etat in neighboring Guinea-Bissau and a harsh crackdown on Casamance separatists further eroded popular support for the regime. In the elections of 2000, Abdoulaye Wade, a long-time leader of the Senegalese Democratic Party and the candidate of a coalition of opposition parties, defeated Diouf who retired from politics. Wade has promised economic reform and privatization, political liberalization, and a peaceful resolution to the secessionist crisis in the Casamance. Progress in all these areas has been slow. The secessionist movement in the Casamance has continued with mounting casualties on both sides. Much of the nation's trade is dominated by Lebanese and French merchants who deposit their profits overseas. While

some peace talks have been initiated with Casamance rebels, violence has dramatically curtailed the tourism industry, one of the region's few economic prospects.

Senegal's economic infrastructure, which at independence was relatively advanced for the region, has deteriorated somewhat since the 1970s. Some roads have been constructed but the railroads, built during colonial rule, are antiquated and unreliable. Plans for a bridge across the Gambia River to link the northern and southern regions remain at a standstill. The port at Dakar needs modernization to accommodate larger vessels, and the fisheries industry has not been actively developed. Senegal has some phosphate deposits but advances have been slow in exploiting the resource. The country does have two universities, one in Dakar and one in Saint-Louis, and numerous secondary schools. During the Senghor and Diouf years, the schools were periodically closed to prevent unrest. The adult literacy rate averages less than 50%, and is markedly lower in the rural areas. Modern health care is accessible to only a small, urban elite group. France continues to provide large amounts of aid, as do some oil-rich Muslim states. Another important source of income is remittances from Senegalese living in Europe and the United States. Migration from the rural areas to Dakar, and out-migration to other countries, pose serious problems for the country. Although over 90% of the population is Muslim, there is no militant Islamic movement of note in the country. Lack of noticeable improvement in the nation's economy may lead to serious political and social disruption in the future.

## SÉNGHOR, LEOPOLD

The founding father and first president of the Republic of Senegal in West Africa from 1960 to 1980, Leopold Sedar Senghor is one of Africa's outstanding intellectual and political figures. A Roman Catholic and member of the Serer ethnic group, he led a predominantly Muslim and Wolof nation. Although an intellectual, his greatest appeal was to the peasants. He is also a renowned poet and the main promoter of the concept of *negritude*. In 1983, he was the first African elected to the prestigious *Academie Francaise*. He retired to France in the 1980s.

Lepold Sedar Sénghor was born October 9, 1906, in Joal, a coastal town in central Senegal. His father was a Serer Catholic and his mother a Fulani Muslim, but Senghor was raised as a Catholic in predominantly Muslim Senegal. The country is also dominated by the Wolof ethnic group, making Senghor a "double minority." He was also the major political figure not to come from the "Four Communes" where Africans could get French citizenship and special privileges. He attended the Ngasobil Catholic Mission School and prepared for the priesthood at Libermann Seminary in Dakar but he transferred to the Public Secondary School in Dakar (later Lycee Van Vollenhoven). By all accounts, he was an exceptional pupil. In 1928, he went to France to study at the Lycee Louis le Grand where one of his classmates was Georges Pompidou, later president of France. They remained lifelong friends.

In France in the 1930s, inspired by the romantic vision of Africa in Harlem Renaissance authors and early European ethnographers, Senghor began to produce poetry that helped launch the concept of *negritude*. He contrasted African ways with all that he considered wrong with the West—rationalism, mechanization, capitalism, materialism, bourgeois values, individualism, competition, and a stiff, cold ugliness. He became one of the first Africans to express discontent with the French colonial policy of assimilation. He retained an intense and lifelong admiration for French culture, especially in the fields of language, literature, and philosophy. He married a Frenchwoman and always spent considerable time in France.

In 1931, Senghor received his *licence es lettres*. In 1935, he became the first African to pass the *Agregation* competitive examination, but only after he had become a naturalized French citizen. The following year he was drafted into the French army. After military service, he taught in Tours and outside of Paris. At the start of World War II, he was again called up. After being captured and nearly killed by German troops, he spent two years as a prisoner of war and upon his release in 1942, he returned to teaching near Paris and worked with the French resistance.

With the end of the war, his literary career reached fruition with the publication of his first volume of poetry, *Chants d'Ombre*. In 1945, he entered politics and was elected a deputy to the French Assembly with the support of the French Socialist Party. In 1948, Senghor formed the *Bloc Democratie Senegalais* which promoted a type of "African socialism," based on traditional village cooperation, religious faith, and a new nationalism. That same year, he and Alioune Diop launched *Presence Africaine*, a Paris magazine devoted to the promotion of African culture and *negritude*. He was also appointed professor at the *Ecole nationale d'Outre-Mer*.

When given the choice in 1958 to vote for autonomy or continued association with France, Senghor argued strongly for autonomy and continued close ties with France. But in 1960, as the French ended colonial rule in West Africa, Senghor negotiated independence for the Mali Federation (Senegal and French Soudan, later Mali) which became independent in June. The federation quickly fell apart and Senghor declared Senegal an independent republic. He was elected president and he appointed Mamadou Dia prime minister. Senghor quickly nationalized peanut marketing, initiated rural cooperatives, and instituted a national system of agricultural credit, extension services, and cooperative administration. He also carefully courted powerful Muslim leaders.

In 1962, a constitutional crisis erupted and Mamadou Dia and his top allies were arrested and imprisoned for treason. The constitution was rewritten to provide for a single, strong executive, and Senghor ruled with an iron hand for the next eight years. Opposition parties were eliminated through banning or absorption, and freedom of the press and association were severely limited. Senghor overcame political unrest in 1963 and student riots in 1968 by force. He was reelected president unopposed in 1963, 1968, and 1973. His strong political position allowed him free reign to promote African culture. The Festival of Negro Arts in Dakar in 1966 crowned his promotion of *negritude*. He helped set up various regional development associations, winning him respect as an elder statesman. However, Senegal's economic base did not expand, the national debt increased and infrastructure deteriorated. The Senegalese peasants, however, never wavered in their admiration for Senghor.

In 1970, Senghor felt confident enough to reintroduce the position of prime minister and appointed Abdou Diouf, an obscure young technocrat. Two opposition parties were legalized in the 1970s but Senghor still won the 1978 election in a landslide. He changed the name of his political party from the *Union Progressiste Senegalaise* to the *Parti Socialiste* (PS). The 1970s were a particularly difficult period for

the Senegalese economy with a major drought in the mid-1970s and declining prices and demand for peanuts, the country's only real export. Many of the socialist policies promoted by Senghor were clearly not working. Even large amounts of international assistance, especially from France, did not improve economic conditions. Senghor appeared increasingly distant and aloof from politics, with Abou Diouf taking over the running of the daily government and international affairs. Senghor continued to write poetry. In 1974, he won the Apollinaire Prize for Poetry and he published volumes of poetry in 1979 and 1980. On December 31, 1980, Senghor resigned in favor of Diouf who ruled the country for the next twenty years. Senghor thus became the first African leader installed at independence to resign voluntarily.

In 1983, he was the first African elected to the *Academie Francaise*. He continued to pursue his career as one of Africa's most respected statesmen, remaining on the international scene for many years being involved with the Socialist International and the Palestine Liberation Organization. In 1988, he published a philosophical memoir, *Ce que je crois* (What I Believe). He also published some poetry in the 1990s. He now lives in Verson, France, the home of his wife, and is rarely seen in public.

### SERBIA

The largest of former Yugoslavia's republics, and currently a partner with Montenegro in a loose union known as Serbia and Montenegro, Serbia is located in the heart of Southeastern Europe. Its location plays an important role as a traffic corridor between Western Europe and Asia. In terms of physical geography,

the country has an ideal combination of Panonian and Kosovo lowlands in the north and south, separated by uplands that reach elevations exceeding seven thousand feet. Although technically landlocked, Serbia has a direct connection with the global sea through the Danube River. The climate is continental with cold, occasionally harsh, winters and hot summers. The population is 7.5 million, without Kosovo and Metohija province. If this province is included, the population is estimated to be approximately 10 million. The capital, Belgrade (1.57 million), is a modern city that grew from an ancient settlement. It is situated at the juncture of the Sava and Danube rivers.

Serbia's ethnic and religious composition is rather complex. Serbs, people of South Slavic origin and generally practitioners of Eastern Orthodox Christian religion, constitute two thirds of the population. Ethnic Albanians, who are overwhelmingly Muslim, and for political reasons boycott the census, are the largest minority group. They number approximately 16% to 17% of the population and are found primarily in Kosovo and Metohija. Hungarians are a Roman Catholic minority with significant numbers in the province of Vojvodina.

As is true of its neighboring states, Serbia's history began during medieval times when it emerged as a kingdom under the rule of the Nemanjić dynasty. Before falling under control of the advancing Ottoman Empire, the Serbian kingdom reached its greatest extent during the period of Dušan Nemanjić's reign (1331–1355). Although he built a strong empire, it crumbled soon after Dušan's death. For the next four centuries, Serbia was a province of the Ottoman Empire. It often became a war torn area during the endless conflicts between Ottomans and Habsburgs over their quest for domination of Southeastern Europe. This conflict, in fact, slowed the pace of development that was occurring in other parts of Europe at the time. When it finally achieved independence from the Turks in 1878, Serbia lagged far behind much of the remainder of Europe in terms of both political and economic development. It was primarily an agricultural country with a dominantly peasant population and with very little urban industrial development. In addition to its historical lack of development, economic growth was further hindered by the country's involvement in several wars. After World War I, the South Slavs joined the new country known since 1929 as Yugoslavia. The Serbian dynasty, Karaorević, ruled the country.

Until World War II, agriculture remained the leading economic activity. Yet in the war's aftermath, the situation gradually began changing with the implementation of new economic policies in the late 1940s and early 1950s. Communist revolutionaries gained

power and abolished the kingdom. They promoted rapid urbanization and industrialization wherever possible. A Socialist self-management economic policy, involving worker-managed enterprises, was implemented. It proved to be both different and more effective than the Soviet-style management and was largely responsible for the improved economic growth and living conditions experienced during the 1950s, improved the conditions and growth during the 1950s. Unfortunately, additional reforms that could have reduced inflation and limited the mounting external debt were blocked in the 1960s, because of fear that reforms might undermine communist ideology and weaken communism's strength and importance. Serbia suffered limited economic growth under the burden of communist control, while both the rate of inflation and unemployment increased during the following decade. Many citizens, rather than being unemployed at home, emigrated westward to more developed republics, or elsewhere in Europe.

At the time of President Tito's death in 1980, Serbia and other former Yugoslav republics were suffering severe economic difficulties, including high foreign debt. As a country that relied on imports for its energy, Serbia was further crippled economically by soaring oil prices. Internal ethnic problems were at the same time fueling the rise of nationalism and separatism in Kosovo and Metohija province, Serbia's least developed region. A great majority of the province's residents were ethnic Albanians who believed that their rights were endangered. Poor economic conditions, high unemployment, exploding population growth, and sharp cultural differences increased antagonisms between Serbs and ethnic Albanians who agitated for Kosovo and Metohija's elevation to the status of a republic independent from Serbia. In 1987, by riding the wave of reactionary Serb nationalism, Slobodan Milošević became a leading figure in Serbia's governing body, the League of Communists. Immediately, he began to implement hard measures on Kosovo and Metohija. Two years later he was elected president of Serbia which, in the aftermath of former Yugoslavia's 1991 breakup, formed a union (also called Yugoslavia) with Montenegro in 1992. Because of direct involvement in ethnic conflicts in Croatia and Bosnia and Herzegovina, Serbia suffered both politically and economically from the sanctions implemented by the international community. Inflation, measured in thousands of percent, skyrocketed to some of the highest rates ever recorded. International trade relations almost disintegrated and the local economy underwent restructuring. Yet the country continued to fall into an ever deeper crisis.

By the end of the twentieth century, the gross domestic product (GDP) had plummeted more than

50% below the 1990 level. In addition to the already existing crisis, NATO's attack against Serbia in 1999 destroyed much of its still functioning infrastructure. An air campaign conducted to prevent hostilities in Kosovo and Metohija targeted communications, factories, bridges, power plants, and administration buildings throughout the country. In the years that followed, Serbians ousted Milošević—who ruled as president of Serbia and Yugoslavia for over a decade—elected a new government, and was able to finally remove the long-standing economic sanctions. Even though the military conflict is now over, economic hardship continues. Inflation is under control, but the unemployment rate is close to 30%, with the underemployment rate standing much higher. Drastic budget cuts that were necessary to manage fiscal deficits allow hardly any additional spending. The government continues to rely on foreign assistance in order to prevent yet another crisis, a situation hardly conducive to the development of a stable, long-term economic policy.

## SEX TRADE/TRAFFICKING

Descriptions of how the bodies of women and children can become sexual commodities to be traded and trafficked range from compassionate elucidations of Geisha values and practices to examinations of the socioeconomic basis for using children for sex. Understanding how people's bodies become sexual commodities through development processes can be gained by focusing on Asia and Eastern Europe. Although different geographic regions they are enmeshed in similar global relations of power.

Many texts examine how clients from First World countries, who use impoverished people's bodies for sex, frame their social values in terms of racial and economic dominance. And, within economically disadvantaged countries, sex trade workers can experience profoundly different work encounters due to social prejudice, unequal privilege, and class difference.

Many poor Asian countries, for example, are shaped by ambiguous yet powerful notions of economic 'development' that are predicated on the use of women and children's bodies in particular. Since World War II, Asian peoples' exposure to military bases, the unequal distribution of wealth and employment opportunities, and social perceptions of women's family role, have placed acute pressures on women to earn an income. Despite their gains towards social, political, and legal equality, impoverished Asian and Eastern European women and children also remain the targets of sexual violence. Class and caste-based prejudices are forged by perceptions of their social and sexual inferiority in societies that are intensely patriarchal in structures, relations, and ideologies.

Sex trade workers should not, however, be conceived solely as "victims." Researchers note the real physical dangers of sexually transmitted diseases among sex workers but many also show how sex workers negotiate their daily experience. It is important to acknowledge the diversity of people who work in the global sex trade, their differing motivations, and the variation in how they may be coerced. A singular notion of the prostitute is reductive for "the prostitute" does not exist. Rather, there are different women, men, and children whose bodies are marketed as commodities within an assorted range of circumstances and for a variety of purposes. Examining the difficulties of their lives within the context of the social, economic, and political constraints of class and country enables a more complex and compassionate understanding of their experiences to be portrayed.

## The Sex Trade and Sex Tourism

In the past twenty-five years, there has been a substantial rise in mass tourism, particularly to "developing" countries. Immediately after the 1940–1945 war, most travel trafficked between North America and Western Europe. A change then occurred in the mid-1970s: from 8% of tourists who travelled to third world countries, the figure rose to 17% in the mid-1980s. Mass tourism was promoted by international power brokers such as the World Bank and the International Monetary Fund as an integral part of modernisation and development processes. To promote growth and social transformation, tourism was marketed as an industry that would metamorphose poor countries' poverty into an unspoiled paradise that would draw desirable foreign currency.

Tourism now provides a conduit for foreign currency that Third World countries require in order to operate in the global marketplace. Yet the ways that

tourism is organised can range from benign indifference to deliberate economic and political exploitation. Critics argue that media images, tourist brochures, and airline advertising have exhorted the yielding promise of the “Singapore girl,” Thailand as the “Land of Smiles,” or Lauda Air’s offer to “Fly Your Dreams” through the naked body of a woman of color. Images of women as uni-dimensional objects are associated with corporate male adventure and domesticated female availability, selling Third World tourism while simultaneously constructing women and young children as unspoiled and powerless resources, ready to be acquired.

Acquisitive economic power relations are linked with women and children’s impoverishment as key factors that shape the sex trade, for destitution affects women and men differently. Researchers argue that the social myths that women do not acquire financial responsibilities during their lifetimes are simplistic, given that more than a third of the world’s households are headed by women who are solely responsible for all their household production and needs. Women are further disadvantaged when life circumstances dictate they become head of household, because they lack the necessary social support and training.

Inequalities in development become clear when recognising that women and children from poorer countries are trafficked to wealthier. Thai women have increasingly been trafficked to Japan since the 1970s. The trade peaked during the early 1990s, with estimations that there were about one hundred thousand Filipino and Thai sex workers in Japan. It is important to recognise also that trafficking is not limited to impoverished Third World countries. A Belgian court has sentenced eight people for participating in a criminal ring that trafficked pre-pubescent girls from Hungary and Romania to Belgium for forced sex work. The example shows that there are multiple suppliers and many destinations for women and children drawn into the global sex trade and how raw relations of economic, physical, and gendered power have shaped “sex” into an international industry.

The international and gendered nature of sex trafficking is also manifested in rich nation-state men crossing borders to purchase the use of other’s bodies. Eighty-five percent of tourists into the Philippines are male. Further, the growing trade in Eastern European women to destinations such as Germany, the United States, Switzerland, Japan, and Macau supports substantial criminal involvement, with most trafficking businesses owned or protected by criminal groups. Inhabitants from European Union affiliated countries are legally able to start businesses in the Netherlands, so that criminal groups may use lawful opportunities to enter the sex trade.

## The Sex Trade and Free Choice

The common structural factors to the sex trade and trafficking as connections to development are the impoverishment of women, social, and cultural perceptions of women and children’s bodies as profitable commodities, and the increased acceptance of capitalism as the primary economic and political frame. So why do perceptions of sex work as profitable enterprise and protestations that women and children assert free choice when entering the industry exist? Critics argue that “choice” encompasses negotiating and enforcing contracts on terms that also suit the sex worker. But there are reports that some clients use impoverished children *because* they are seen to eroticise extreme powerlessness. The reports suggest there is little public recognition that conditions of work can constitute modern slavery and provide opportunities for sadistic practices.

Critics allege that the sex trade mirrors relations of domination, subordination and exploitation between First and Third Worlds. Men travel from bordering countries, such as Malaysia with Thailand, and Middle Eastern countries where religious censure restricts sexual practices. Consumers in countries such as Thailand or Sri Lanka exploit the permissive attitude towards sex with children. They are individuals, small groups of friends, and larger groups of men travelling as a company bonus. They enjoy the novelty of a different experience and an escape from the constraints of the social codes and customs of home. Although many travel specifically to use impoverished women and children’s bodies for sex governments maintain an ambiguous standpoint, arguing that any tourist is welcome due to their expenditure of foreign currency.

Significantly however, and in contrast to Westerners’ profession of an ideology that favours and protects children until their late teenage years, research has exposed the conflicting reality of indigent children. Undercover agents have been offered children of four, five, or six years of age for sexual use. Rather than discussing sex work as consensual acts of sexuality between adults, researchers have analysed how well-bred squeamishness and crosscultural blindness to behaviour outside First World countries means that the global criminalisation of the use of children for sex is resisted. Prejudices of race, age, class, and gender intersect to culturally sanction sex with children that do not safeguard their psyches and bodies. Such work shows how the notion of worker control is a conceptual delusion for impoverished children who have nothing other than their bodies to sell in order to survive, and who are enmeshed in relations where powerlessness has sexual value.

There is a “need” that drives a consumer-oriented society that works on the principle of supply and demand, in which the growth of child prostitution can occur only because there are people who want such services. Indeed, estimates suggest that 1,380,000 children are presently working in the commercial sex trade in Asia and the Pacific Islands, more than 702,000 in Latin America, in the United States one hundred thousand to three hundred thousand. Global profits from trafficking in children for sexual exploitation reach approximately \$5 billion per year.

Pragmatists argue that while community responses must be examined and enacted, there are strong arguments for global society to guarantee the safety and interests of its most vulnerable members. They propose a deeper political awareness of the problem in terms of creating relevant legislation, effective implementation of the law, and adequate penalties such as mandatory jail sentences rather than fines of a few hundred dollars. However, because legislation is rarely written with a consideration for children it can conflict with customary law that maintains patriarchal control. Community organisations consequently need to develop educational programs aimed at children, parents, and community leaders, particularly stressing the strong social bonds of rural communities so that children are not merely exchanged for consumer goods.

It is proposed that parliamentarians must also recognise that: (1) rising gross national product in many third world countries is produced through the bodies of women and children as merchandise in the sex trade; (2) tourists are not above a host country's law and that traffic in children is as malignant as traffic in drugs; and (3) countries that are targeted as destinations for paedophiles should not bear the educative burden of local communities alone. Social commentators argue that an international effort to make the child sex trade a crime against humanity must be conducted and, as is the case in Australia, internationalising the crime would ensure that nationals are tried in their home country.

Researchers' analyses of the sex trade in the impoverished countries of Eastern Europe and Asia argue that development processes, travel, and sex trafficking are profoundly gendered. Male capacity to control women and children's sense of security and self-worth is at the heart of the sex trade's power relations. Yet women and children's personal and physical lives cannot be separated from the increasingly complex, globalised, and commodified relations of power generated within development processes. Authors argue that sex workers should not be judged but that ethical boundaries should be imposed upon the use of sexual labour.

## SEYCHELLES

The Republic of Seychelles is an archipelago in the Indian Ocean off the East-African coast north of Madagascar. Consisting of 115 islands—partly granitic, partly coralline—Seychelles are scattered over 1.3 million square kilometers of ocean. The total landmass adds up to 454 square kilometers. Only thirty-three islands are inhabited. The main island, Mahé, has an area of 154 square kilometers and rises to over nine hundred meters at its highest point. Of the approximately eighty-one thousand inhabitants about 80% live on Mahé, most of them in the capital, Victoria. Being located outside the cyclone belt, Seychelles have a most favorable tropical climate with average maximum temperatures around 30°C and average minimum temperatures around 24°C.

Originally uninhabited, Seychelles were claimed by the French in 1756 and named after the influential French family de Séchelles. The first settlement was

established in 1770 and some rather unsuccessful efforts were taken to cultivate rice and maize based on slave labor. When a British Naval squadron took possession of Mahé in 1794 total population was less than two thousand. In spite of the British claim French administration continued, the status of the islands being uncertain for two decades. In 1810, the British invaded the Île de France, and in 1814 British sovereignty over the islands in the south-west Indian Ocean, including Seychelles, was established by the Treaty of Paris. Britain's interest in the southwest Indian Ocean Islands rather followed strategic considerations than developmental concerns. Hence Seychelles, administered from Mauritius, comprised a rather neglected part of the British Empire throughout the nineteenth century. When Seychelles took up copra production in the late nineteenth century living conditions improved, however, with the opening of the Suez Canal the route around Africa became less important and Seychelles lost their strategic position and were virtually cut off from shipping routes. In 1903, Seychelles was separated from Mauritius becoming a colony of its own. Colonial legacy is reflected in the official languages of modern Seychelles, English, French, and Seselwa. Seselwa—or simply Kreol—a French based creole-language is spoken by over 95% of Seychelois.

First elections for four of the twelve seats in the Legislative Council were held in 1948; however, franchise was restricted to literacy and property. Universal adult franchise was introduced only in 1967, when two newly established parties, the *Seychelles Democratic Party* (SDP), led by James Mancham, and the *Seychelles People's United Party* (SPUP), led by France-Albert René, won four respectively three of the eight elected seats. Subsequently a new constitution was adopted, widening the government's responsibilities. New elections in 1970 resulted in a victory of the SDP and Mancham became chief minister, a position he held until independence in 1976. Following independence Mancham became the first elected president of the newly formed Republic of Seychelles, with René being prime minister in a coalition government. In 1977, Mancham was overthrown in a coup d'état, when Tanzanian trained Seychelois rebels took over power and made René president. It is hardly disputed that the coup was engineered by René and Tanzanian president Julius Nyerere. However, while René's personal ambitions must not be neglected, Marcus Franda points to the possibility that Mancham's international reputation as a playboy, spending more time abroad than governing his country while his duties were left to information minister David Jaubert, a notorious man-about-town, may have furthered events (Franda 1982:49 ff.). As of 1978 Seychelles

was declared a single-party state governed according to "socialist" principles. However, the government managed to avoid any deeper involvement in the east-west conflict. At the same time the SPUP merged with other, smaller parties and was renamed *Seychelles People's Progressive Front* (SPPF). In 1979 and successive elections, René was confirmed in office by more than 90% of the votes in each case. A failed coup in 1981 led to prosecution and imprisonment of the alleged mercenaries in Seychelles and South Africa. According to their leader, Michael Hoare, the mercenaries were supported by South African military and intelligence officials; however, this involvement was not officially confirmed. In 1991, the SPPF declared an end to the one-party state and drafting of a new constitution was initiated. After rejection by the electorate in 1992, a revised constitution was approved in a 1993 referendum. Accordingly the president is both head of state and head of government. The cabinet is appointed by the president and has to be approved by the parliament. In subsequent presidential elections René was reelected president with 59.5% of the votes. Parliamentary elections held at the same time yielded twenty-eight seats for the SPPF, four seats for Mancham's reestablished SDP, and one seat for the newly founded *Parti Seselwi*, later renamed *Seychelles National Party* (SNP), originally founded as an underground movement by the Anglican priest Wavel Ramkalavan. Freedom of press and independence of the national broadcasting corporation were granted in 1992 and at the same time the state of emergency, declared after the 1981 coup attempt, was abolished. In the latest presidential elections in 2001, René was reelected with 54.19% while Ramkalavan gained 44.95% of the votes. In April 2004, René stepped down in favor of vice-president James Michel. The latest parliamentary elections in 2002 yielded 54.3% and twenty-three seats for the SPPF and 42.6% and eleven seats for the SNP.

Regarding economical and social development, major improvements have been achieved only within the last thirty years. Despite governor Percy Selwyn-Clarke's attempts in the late 1940s to improve public schooling, housing, and health service which were quickly canceled when Selwyn-Clarke was removed from office in 1952, no progress worth mentioning was gained during the last colonial decades. With construction of the international airport on Mahé in 1971, however, the foundation of the country's most important economical resource—tourism—was laid. Following the 1977 coup, measures were taken to develop fishing industry and agriculture in order to diversify the economic basis. For this purpose a number of parastatal companies were founded. Most important trading partner is the EU. As of 2002, the per capita gross domestic product was \$18,232 PPP—the

highest rate in sub-Saharan Africa while life expectancy is estimated at seventy-one years. Medical care is free for all citizens. While in colonial times primary education was provided either privately or by the church, following independence the educational system was nationalized, improved and a polytechnic and several training centers for post-secondary education were established. As of 2002, 99.1% of citizens between fifteen and twenty-four years of age are literate. The tsunami of 2004 is reported to have caused relatively minor damage.

## SHINING PATH/SENDERO LUMINOSO

The Shining Path was founded in the 1968 as a splinter group of the Communist party of Peru, headed by Abimael Guzmán Raynoso ("Presidente Gonzalo"), a professor of philosophy at the Universidad Nacional San Cristóbal de Huamanga in Ayacucho. It has been described as one of the most effective, terrifying, and elusive armed organizations in Latin America. Because of its indiscriminate use of violence, it has been compared with Pol Pot's Khmer Rouge. But Sendero is a unique phenomenon. Unlike most revolutionary movements in Latin America, it managed to be virtually independent of foreign support. It was also the first military organization to gain a broad following among the urban, marginalized poor, while attracting sections of the upper classes and significant numbers of women militants, thus penetrating all walks of Peruvian life.

### Brief Chronology of the Movement

From its beginnings through the late 1970s, Sendero confined its activities to Ayacucho and the neighboring

provinces of Huancavelica and Apurímac, and remained a university based, unarmed movement. In April 1980, on the eve of the first democratic elections in seventeen years, Sendero began pursuing the armed struggle to overthrow the Peruvian government and its institutions. It also began its geographic expansion. By the mid-1980s, it controlled about two thirds of the highlands and had spread out to Lima and to other areas of the Peruvian hinterland, mainly the Upper Huallaga Valley and Amazonia. In 1983, the Peruvian army entered the conflict. The "dirty war" escalated plunging Peru into a cycle of brutal repression, increasing violence, killings, and disappearances. It is estimated that as a consequence of the conflict between Sendero and the army, approximately thirty thousand people, mostly civilians, died and six hundred thousand became internal refugees. After Alberto Fujimori came to power in 1990, local officials and peasants, angered by some of Sendero's tactics, shifted their allegiance back to the government. Rural paramilitary units, created and armed by the army to defend the countryside against Sendero, greatly weakened the movement. Support decreased even further following Guzmán's capture in 1992, arrests of Shining Path leaders in 1995, defections, and Fujimori's amnesty program for repentant terrorists which saw more than six thousand Sendero members surrendered to the authorities. In 1993, when Guzmán declared an end to the armed struggle, a Sendero faction continued armed opposition conducting sporadic attacks. The movement seems to have settled in for a long period of low-level conflict.

### Goals, Ideology, and Strategies

Sendero's stated goal is to destroy existing Peruvian institutions and establish the "People's Republic of Peru," a united front based on the alliance of the working classes and the peasantry and led by the Communist Party. Its ideology, known as "Gonzalo Thought" is an adaptation of Marxism-Leninism-Maoism to the concrete conditions of Peruvian reality. It is particularly influenced by the doctrines of Mao Zedong and José Carlos Mariátegui. From Maoism it embraced the strategy of a protracted "people's war," that envisaged developing base areas in the countryside to eventually take control of the cities by combining attacks from the outside with insurrections from within. From Mariátegui, it adopted the analysis of Peru as a semi-feudal society. Mariátegui, the founder of Peru's first communist party, believed that Marxism would open "a shining path to revolution." It is from this line that the name of the movement derives.

## Social Appeal

A number of factors contributed to create a fertile ground for revolutionary change in Ayacucho during the 1960s and 1970s. One important factor was the extreme poverty of the region. Among Peru's most underdeveloped provinces, plagued by continuing economic problems, with little commerce and scarce resources, the Ayacucho people lived in pre-industrial conditions. Another factor is the dramatic growth of Huamanga University in Ayacucho, a result of the educational efforts that Peruvian governments carried out during that period. In 1977, the university population constituted more than a quarter of the overall population of Ayacucho, and at its peak half of the students were actively involved with the movement. Thus Sendero appealed initially to peasants and students, angered by Peru's racial and class division and by the region's economic depression. Sendero is not an indigenous organization. Although it made inroads into many of the Indian communities of the area, it did not identify with the struggles of the indigenous populations. It is rather a mestizo organization in a nation where mestizos are a majority discriminated upon and excluded from status and power. In the cities, Sendero was active in developing a broad base, which included impoverished shantytown dwellers, different sectors of the working class and some sectors of the middle class.

## Revolutionary Activities

Once the armed struggle began, Sendero employed mainly guerrilla tactics, including the blowing up of bridges and power lines, bombing campaigns, selective assassinations, terrorist actions against state officers, army and police personnel, foreign interests, and groups accused of cooperating with neocolonialists, such as NGOs, peasant and labor leaders and community organizers. It is widely believed that these activities were financed by Sendero's links with the drug trade, allegedly developed following its expansion into the Upper Huallaga Valley, the most important coca leaf growing region in the world. According to many sources, Sendero charged drug runners and coca growers for protection and taxed producers, thus gaining a multi-million dollar source of revenue, used to finance arms and training programs. Sendero has strenuously denied this accusation.

In 1985, Sendero began developing "base areas" in the countryside, controlled by "people's committees." In these areas, Sendero performed all government

functions, including collecting taxes, distributing land, setting production targets and prices, running schools, dispensing justice, and providing welfare for the elderly. Women were given ownership of land and were equally represented by the local people's committees. Abuses against women, such as rape and domestic violence, were not tolerated. In some of these areas, peasants noted a marked improvement in public services and safety. But Sendero eventually alienated initial supporters with its attempts to institute collective farms, forced recruitment, and "popular trials" of local officials.

Similar attempts to organise all aspects of social life at the neighbourhood level were carried out in the impoverished urban areas, either by infiltrating existing local associations or by destroying them and replacing them with front organisations. Thus, Sendero tried to dominate every aspect of social activity in both countryside and cities. The aim was to create a shadow state led by Guzmán, which would emerge openly in due time and replace the Peruvian government. Sendero's decline brought an end to this plan. Whether the movement will ever recover is doubtful, particularly given present events in the world focussed on terrorism as the major enemy of civilised people.

## SIAD BARRE, MOHAMMED

Mohammad Siad Barre ruled Somalia from 1969–1991, and presided over the country's economic and political disintegration. His rule was marked by repression, civil and international wars, an intensification of divisive clan loyalties, and economic crisis.

Born in 1919, Siad Barre belonged to the Mareehaan and Ogadeni clans. He joined the police in 1941 and rose through the ranks of the Somali National Army (SNA) to become commander-in-chief in 1965. After the army took power in October 1969, Siad Barre became president of the ruling Supreme Revolutionary Council (SRC). One year later, he declared Somalia a socialist state. His pursuit of socialism was more pragmatic than ideological, and was heavily influenced by Islam. He employed the feared National Security Services to stifle dissent and instituted a cult of personality, styling himself the "Victorious Leader."

The SRC initiated a sweeping program of economic and social development. It promised to attack corruption and diminish the strength of clan loyalties; resettled 140,000 nomads in agricultural settlements; promoted the rights of women; restructured local government; introduced a script for written Somali; and launched a crash literacy campaign. Somalia's literacy rate rose from an estimated 5% to a reported 55% in the mid-1970s, but had slid back to 24% by 1990. The SRC emphasized state control of the economy and central planning, and its program produced some modest success. However, by the late 1970s, massive military spending, corruption, and drought were dragging the economy down.

The Somali army nearly quintupled in size from 1969–1977, as the Soviet Union and its allies poured military aid into Somalia. In 1977, Siad Barre ordered an invasion of Ethiopia aimed at seizing the Ogaden region. Viewing Ethiopia as the more strategic state, the Soviets switched sides, and cut off arms supplies to Somalia. Siad Barre expelled all Soviet bloc personnel in November and turned instead to the United States for assistance. The SNA suffered devastating losses before withdrawing in March 1978, and the war brought exports to a halt. Forced to borrow to cover the military's losses and the cost of food imports, Somalia labored under an enormous debt burden. Throughout the 1980s, real gross domestic product (GDP) declined at 1.7% a year.

The humiliating Ogaden defeat sharpened clan conflicts, which in turn intensified the regime's repression. As a result of an unsuccessful coup in 1978 and the emergence of armed opposition led by the Majeerteen, the government took severe reprisals against the clan. The settlement of 250,000 Ogadeni refugees in the Isaaq-dominated northwest helped spur the creation the Somali National Movement (SNM), which also took up arms against the regime. Siad Barre's government waged a ruthless scorched earth campaign against its enemies; in addition to murder, rape, and torture, it destroyed water sources and grazing grounds, and looted and killed animals. Full-scale civil war erupted in 1988 when the SNM tried to capture

Hargeisa and Burao. The regime responded with ferocity, leveling the two mainly Isaaq cities. The regime's brutality alienated the Hawiye, which dominated the Mogdishu area, and the clan joined the struggle against Siad Barre in 1989. Siad Barre fled Mogadishu for Nigeria in January 1991, and the Somali state collapsed. Siad Barre died in Nigeria on January 2, 1995.

## SIERRA LEONE

Sierra Leone was founded in 1787, by British abolitionists as a refuge for freed slaves from London, Jamaica, and the United States. The number of so-called "Poor Blacks" had increased dramatically following the American Revolution, leading to clashes with White unemployed. The Sierra Leone settlement was to be a self-governing agrarian commune, modelled on a romantic vision of ancient Israel. The initial settlers consisted of four hundred freed slaves, mainly male, and sixty White prostitutes, to be reformed through marriage.

The enterprise was reorganised as the Sierra Leone Company in 1791, and the settlement replenished in 1792 by Nova Scotian "Black Loyalists." Former slaves who fled their American revolutionary masters, they were evacuated with other "loyalists" to Canada, where they pioneered homesteads in Nova Scotia. Swindled out of their farms by unscrupulous Canadian land speculators, they sent a delegation of England, where they were persuaded to move in Sierra Leone.

Exactions by the Company led to a Nova Scotian rebellion in 1800. The uprising was put down by the unexpected arrival of a British squadron bringing Maroon ex-slaves, transported to Sierra Leone following a protracted rebellion in Jamaica.

Following the British abolition of the slave trade in 1807, the bankrupt Sierra Leone Company sold the settlement, now called Freetown, to the Crown as an

anti-slave trade naval station. During the following decades, thousands of recaptives from slaving ships were liberated and settled in rural villages around Freetown, under the supervision of missionaries. The humanitarian vision was of Christian, Western-educated peasant communities under the authority of the vicar and supplying produce to Freetown.

In 1827, the Church Missionary Society established Fourah Bay College to train African clergy to evangelise “heathen” Africa. By 1854, Fourah Bay College was offering Durham University degrees: ex-slaves rose to become doctors, lawyers and even an Anglican bishop—Bishop Samuel Ajayi Crowther, a Yoruba recaptive. The settlers and recaptives gradually intermarried to form a Creole elite. However by the 1880s, racism was undermining Creole opportunities: excluded from the colonial senior service and unable to compete against powerful European trading companies.

In 1896, the hinterland was incorporated as a British protectorate but imposition of a hut-tax sparked a bloody rebellion by indigenous peoples two years later. The need to raise revenue to pay for British colonisation was a problem as Sierra Leone had limited resources. Diamonds were then discovered in 1930.

In 1933, Sierra Leone Selection Trust (SLST), linked to De Beers, was granted ninety-nine-year exclusive prospecting and marketing rights, with a percentage of profits going to the colonial government. By 1937, SLST was exporting over £1 million in diamonds, however the real expansion came after World War II.

From the start, SLST had problems of protecting its monopoly. Alluvial diamonds could be recovered by simple technology. The 1936 Diamond Industry Protection Ordinance prohibited strangers from entering diamond areas but was difficult to enforce.

By the mid-1950s, illicit diamond dealing was a major problem. Sierra Leone nationalists denounced the SLST monopoly, the local Kono people resented receiving little from the diamond wealth, and the colonial authorities found it politically difficult to move against illicitly diamond-mining peasants. Illicit diamonds were sold to unauthorised Lebanese merchants, who smuggled them to the growing Middle Eastern cutting and polishing industry. In 1955, territory and lease-time held by SLST were greatly reduced but by then independence for Sierra Leone was rapidly advancing.

Milton Margai’s Sierra Leone People’s Party (SLPP), an alliance of southern Mende and the Creole elite, formed the first government, in 1961. When Milton died in 1964, his half-brother Albert Margai took power but alienated the Creole civil servants by his Africanisation policies. The opposition All-People’s Congress (APC) of Siaka Stevens, a trade

union leader supported by northern Temne, won the 1967 elections. The army staged a coup but civilian rule was restored in 1968, with Siaka Stevens as prime minister.

In 1970, the government acquired a 51% stake in SLST, restructured as the National Diamond Mining Company (DIMINCO). Official exports of Sierra Leone diamonds fell dramatically, from over 2 million carats in 1970 to less than six hundred thousand carats in 1980 to less than fifty thousand carats by the end of the 1980s, with an escalation of illicit diamond dealing. Stevens exploited popular resentment against Lebanese traders, while doing deals with Jamil Mohammed, one of the leading illicit diamond traders.

Another attempted coup in 1971 led to Stevens declaring Sierra Leone a republic, however discontent mounted as the economic situation deteriorated. The peasant majority survived on a subsistence economy, supplemented by sale of vegetable oil-seed (peanuts and palm oil) for exports, produce such as rice for the domestic market or meagre wages in mining—in addition to diamonds, there was the development of iron mining and rutile—one of the world largest suppliers of titanium oxide used on non-stick frying pans and heat shields on space craft. However, Sierra Leone suffered from declining terms of trade and corruption.

Stevens retired in 1985 and was succeeded by the incompetent General Joseph Momoh. Plagued by conspiracies and strikes, he ruled under a state of emergency until overthrown in 1992 by Captain Valentine Strasser.

Meanwhile, popular discontent coalesced around the militant Revolutionary United Front (RUF) under Foday Sankoh, allied with the Liberian rebel Charles Taylor. RUF degenerated into banditry and illicit diamond dealing. In 1993, Strasser, with the support of peasant *Kamajor* militia trained by Executive Outcomes mercenaries, launched a campaign against RUF. However, the Sierra Leone army fragmented and Strasser was overthrown in a bloody coup in 1996, by Brig. Maada-Bio, a Mende with links to RUF.

Under international pressure, Maada-Bio held a presidential election, won by Ahmad Tejan Kabba of a revised SLPP. When the army attempted another coup in 1996, President Kabba sought protection from the Nigerian ECOMOG forces, based in Freetown for operations in Liberia. RUF, under pressure from the Nigerians and the *Kamajor*, signed a peace accord.

In May 1997, Major Johnny-Paul Koroma, with the support of RUF, staged a coup and sought to drive the Nigerian-led ECOMOG forces out of Freetown. President Kabba fled to Guinea.

In February 1998, ECOWAS forces, supported by the *Kamajor*, defeated the Koroma junta. By mid-1998, President Kabbah was back in Freetown and

RUF forced back to negotiations. The Lome Accord of 1999 imposed a fragile “government of national unity,” including RUF, who began demanding the withdrawal of the United Nations peacekeepers (UNAMSIL). RUF attacks on UNAMSIL led to British military intervention.

On July 5, 2000, United Nations Security Council passed Resolution 1306, prohibiting “the direct or indirect import of all rough diamonds from Sierra Leone,” except diamonds certified by the Sierra Leone government. Tejan Kabba was elected president in 2002; SLPP won 83 of 112 Parliamentary seats. The UN established a Special Court for crimes against humanity; however, Foday Sankoh died in a hospital in 2003.

## SIHANOUK, NORODOM

Preah Bat Samdeeh Prea, better known by his royal name of Norodom Sihanouk (b. 1922), was born in Phnom Penh on October 31, 1922. Between 1930 and 1940 he received his primary schooling at Francois Baudin School in that city, and then traveled south to Saigon for his secondary training at Chasseloupe-Laubat School.

He assumed the throne of Cambodia at age nineteen in April 1941 when he was elected king by the

Council of the Crown. Throughout the rest of his years his actions have often caused him to be portrayed in the West as erratic and flighty. However, the intent behind his frequent reversals of policy was to keep his nation neutral and to avoid the power struggles of larger and stronger countries.

He has been a man of wide-ranging interests, trying his hand at writing, producing, directing, and acting in movies. He wrote songs and was a sufficiently competent musician to play clarinet and saxophone. He dabbled at cooking, promoted sports for his people, and was a fair horseman. He wrote books, one of which was *My War with the CIA: Memoirs of Norodom Sihanouk* (New York: Pantheon, 1973). He is the father of fourteen children.

His political efforts were often fruitful. As a result of his lobbying in 1952 and 1953, Cambodia won its complete independence from France without a shot fired. Shortly afterward, in April 1955, he abdicated the throne in honor of his father, Norodom Suramarit. He then founded the People's Socialist Community, a political party that received 82% of the vote in the next election. Thus Sihanouk—no longer king—became prime minister and was again at the helm of Cambodia. In the 1950s and 1960s, he was the dominant figure in Cambodian affairs, giving rise to the saying that “Sihanouk is Cambodia.”

In 1956, along with Josip Broz Tito, Gamal Abdul Nasser, President Sukarno of Indonesia, and Jawaharlal Nehru, Sihanouk—always desirous of neutrality in world affairs—became one of the founders of the Movement of Nonaligned Nations. In 1960, upon the death of his father, the Parliament elected Sihanouk as Head of State.

In the years of the Vietnam conflict, Sihanouk's greatest concern was to keep his country out of the violence engulfing his eastern neighbor. The two countries had long been enemies in a contest that went centuries into the past. Already Vietnamese troops and settlers were in eastern Cambodia, even moving boundary markers. Sihanouk came to believe that if he helped the Vietnamese revolutionaries, they might be more willing to respect Cambodian independence after their victory. Thus he allowed them to set up bases on Cambodian soil and to bring supplies into the region through the port city of Sihanoukville. Sihanouk also did not object when troops of the Viet Cong and the northern People's Army used the eastern portion of Cambodia as a sanctuary, safe from US bombings. Such actions, however, infuriated the government of the United States. For Cambodia the consequences were severe.

From March 18, 1969, to May 26, 1970, the United States pursued a top secret bombing campaign in Cambodia known as MENU, supposedly to deny

sanctuary to enemy forces in the eastern portion of the country. Try as he might, there was little Sihanouk could do about it, and even after the secrecy was lifted the bombing continued.

As the MENU bombing came to an end, with the country in turmoil, Sihanouk chose an army officer, General Lon Nol, to head a new right-wing Government of National Salvation. For a time he and Sihanouk were able to work together but Nol became increasingly agitated when Sihanouk objected to some of his policies. On March 18, 1970, while on a visit to the USSR, Sihanouk became a victim of a *coup d'état*. Lon Nol established the short-lived Khmer Republic (1972–1975). Despite massive injections of advisers, equipment, and financial aid from the United States, however, Lon Nol was unable to quiet the unrest rampant in Cambodia. Warring factions continued to clash and the communists began to emerge as the strongest political force in the land.

Following the coup d'état that had unseated him, Sihanouk joined forces with the communists (Khmer Rouge) who had become increasingly active and powerful, and he soon headed their National United Front.

Civil war continued to engulf the land, ending only with Pol Pot's emergence as leader of the Cambodian communist National United Front, headed by the Sihanouk government in exile that sought to overthrow the Lon Nol government. On April 17, 1975, Pol Pot's regime decreed a new constitution providing that the old kingdom be abolished in favor of the Democratic State of Kampuchea, a communist experiment in which Pol Pot wanted to destroy Cambodian culture so that he and his party could start from year zero to build a resilient communist state. The communists murdered about one-third of the Cambodian people. Sihanouk resigned as president of Pol Pot's Democratic State of Kampuchea after a year's service. He did, however, still retain his royal title. The troubles that beset his country so preyed upon Sihanouk's mind that on August 11, 1997, he offered to abdicate (again) and objected to the Khmer Rouge government's recent ouster of his son as prime minister in a bloody coup, calling it an illegal act. Pol Pot was not influenced by such behavior. His devastating rule lasted until the Vietnamese invaded in 1978 after months of escalating quarrels. The Vietnamese entered Phnom Penh in January 1979, forcing Pol Pot to flee, and they remained there as occupiers for ten years. Sihanouk also departed that year, flying out of Phnom Penh into self-imposed exile just ahead of the Vietnamese Army.

In 1982 he again became president of his nation for a short time before once again leaving office. In 1991, returning from thirteen years in exile, and convinced he could play a part in healing the wounds caused by

years of civil war and societal unrest, Sihanouk returned to Cambodia as "head of state" to govern until elections could be held in 1993. That year, at the head of a new party, the United Front for an Independent, Neutral, Peaceful, and Cooperative Cambodia, Sihanouk won a narrow electoral victory. Shortly thereafter, a new constitution restored the monarchy with Sihanouk as king, a position he had abdicated thirty-eight years earlier. This time, however, his kingship became a constitutional monarchy in which Sihanouk reigned but did not rule.

The turmoil of the Cambodian government and people continued in the following years. Still, as of the date of this writing (2004) Sihanouk, aged eighty-one and in fragile health, continued his efforts to serve his people. Royalty for six decades and living in a palatial guesthouse in Beijing, the mercurial Sihanouk announced that he would (again) abdicate.

### SIKHISM (SIKHS)

A striking feature of Sikhism is that its development can be traced closely with historical events. The roots of Sikhism can be traced to the fifteenth century, to its founding by Guru Nanak (1469–1539 CE). Nanak hailed from the Punjab, which before the partition of India and Pakistan in 1947, belonged to a single region.

The word "Sikh" derives from Sanskrit, from the word *sisya*, meaning "disciple." The Sikhs are the followers of the ten Gurus whose teachings are compiled in the *Adi Granth* later known as the *Guru Granth Sahib*. It is a composition of hymns of which 974 hymns have been composed by Guru Nanak. His compositions resonate with the teachings of spiritual Gurus of the *Bhakti* tradition of the time such as Kabir (1440–1518 CE), Ravidas (1500 CE) and other *Bhakti* reformers. Nanak communicated his divine revelations through songs and poems. His message to his followers included: faith in one true God; worship of *satnam* (true name), which was synonymous with the nature and being of God; importance of the Guru's instruction in the realization of God;

faith in *karma* (good deeds); attainment of *moksha* by serving others and on the Guru's grace. In the words of Guru Nanak, "Words do not the saint or sinner make. Actions alone are written in the book of fate." He condemned the caste system of Hinduism as folly and irrelevant in the attainment of *moksha*, and disapproved of the practice of asceticism and renunciation of family life. According to him only in community life could one practice righteous living in a meaningful way. His *Janam Sakhis* (life stories) tells us how he was called into God's presence.

The institution of what can be termed Guruship, founded by Guru Nanak, was continued under the succeeding nine Gurus, whose contributions preserved and enhanced the Sikh faith. The fifth Guru, Arjun Dev completed the construction of the Golden temple at Amritsar and installed in it the holy scripture known as *Adi Granth*. His martyrdom in 1606 by the Mughal Emperor Jahangir, marked the militarization of the Sikhs. The sixth Guru, Hargobind established the *Akal Takht* (Timeless Throne) from which he issued edicts in his role as the spiritual and military leader. The Sikhs fought several battles to preserve their faith. The ninth Guru, Tegh Bahadur was executed in 1675 by the orders of the Mughal Emperor Aurangzeb. The tenth Guru, Gobind Singh established the brotherhood of all Sikhs through their commitment to the *Khalsa*, which was intended to protect the Sikh faith. Members of the *Khalsa* were required to adopt *panj kakke* (the five Ks): *kesh* (uncut hair), *kangha* (comb), *kirpan* (sword), *kachha* (cotton breeches), and *kara* (bangle). After Guru Gobind Singh the authority of the Sikh faith was vested in the Sikh community and on the scriptures which were placed in the *Gurdwara*, the sacred sanctuary of the Sikh community.

The disintegration of the Mughal empire at the end of the eighteenth century, led to the creation of a Sikh kingdom in the Punjab under Ranjit Singh (1780–1839). Though successful in building a large army, his successors were unable to withstand British pressure and in 1850, Punjab was annexed to British India. The Sikhs earned a distinction as outstanding soldiers in the British army. However, the Jallianwala Bagh massacre in 1919 was a major turning point in the relation between Sikhs and the British. By the orders of General E H Dyer ten thousand people who were holding a protest meeting were fired on. This massacre fueled anti-British sentiments and added strength to the freedom movement.

Throughout its history the Sikh community has been struggling to maintain a distinct identity from the dominant Hindus. In 1909, the *Anand Marriage Act* recognized distinctive Sikh rites in order to distinguish it from Hindu practice. Between the years

1920–1925, the Sikh movement was led by a Sikh leadership known as the *Akali Dal*. By the *Sikh Gurdwara Act* of 1925, control of *gurdwaras* was conferred on the *Shiromani Gurdwara Parbandhak Committee* (SGPC) which continues to be the most powerful elected body of the Sikhs. The independence of India from British rule and the consequent partition in 1947 divided the Sikh homeland of Punjab between India and the new state of Pakistan. Most Sikhs and Hindus fled to the Indian side of the border.

The Sikhs in the Indian Punjab campaigned for a new state of Punjabi speakers to be created from the existing Punjab. The state boundaries were redrawn in 1966 and Punjab became the majority Sikh state. In 1973, the *Anandpur Sahib* resolution was issued. However, the Indian Government did not accept the *Akali's* religious and economic demands as put forth by the resolution. Frustrated with the situation the followers of a militant Sikh preacher Jarnail Singh Bhindrawala (1947–1989) espoused violence as the path for Sikh autonomy. Their demands for greater political autonomy culminated in "Operation Bluestar" in June 1984, when Indian troops attacked the Golden Temple complex in order to flush out the militants from within the confines of the holy temple. Sikhs saw this attack as a persecution of their faith. This was followed by the assassination of Prime Minister Indira Gandhi by her Sikh bodyguards on October 31, 1984. Anti-Sikh rioting followed in India for four days. Sikh politics was dominated by anger and frustration until the mid-1990s. Indira Gandhi's son and successor Rajiv Gandhi reached an agreement with the moderate Sikh leader Sant Harchand Singh Longowal and conceded much of what the Akalis had all along been demanding. In 1999, Sikhs worldwide celebrated the three hundredth anniversary of the Sikh *Khalsa*, the community of saint-soldiers. Currently the Punjab is peaceful. However, the rise of Hindu nationalism have given Sikhs cause for alarm as they continue to be vigilant about maintaining their distinct identity.

## SILVA, LUIZ INÁCIO “LULA” DA

Born in the Northeast Brazilian city of Garanhuns, interior of the state of Pernambuco, on the October 27, 1945, Luis Inácio “Lula” da Silva, nicknamed “the son of Brazil,” was one of eight children. The family was not well off, and “Lula” da Silva began working at age seven as a vendor of peanuts and oranges on the streets of Santos, São Paulo, while attending primary school. At the age of fourteen he landed a new job with Armazéns Gerais Columbia. Afterwards, “Lula” da Silva transferred to the Fábrica de Parafusos Marte and at the age of fifteen, he was admitted to the Senai—Serviço Nacional da Indústria (National Industry Service) where he studied for the next three year and graduated as a metal worker.

During the 1960s at the height of the Brazilian authoritarian government, “Lula” da Silva landed a new job in the city of São Bernardo do Campo, part of the ABC *paulista* (formed by the cities of Santo Andre, São Bernardo do Campo, and São Caetano located in the State of São Paulo), where he began his involvement with politics. “Lula” da Silva’s involvement in politics was a matter of coincidence rather than aspirations. His brother, José Ferreira da Silva, better known as Frei Chico, had been invited to run for office for the worker’s union but he declined passing that responsibility to “Lula” da Silva who gladly accepted.

In April 1980, “Lula” da Silva and the worker’s union led a worker’s strike that paralyzed the industrial heart of Brazil: São Paulo. The military regime in power along with the industrial elite retaliated against the workers. Several union workers were detained under Brazil’s National Security Law. Among the detainees was da Silva, who was sentenced to three years and six months in prison. But, the following year the Brazilian Supreme Court overturned the conviction. Convinced that the workers needed their own representation in Congress, da Silva on February 10, 1980, founded the *Partido dos Trabalhadores* (Workers Party or PT) together with other union workers, Brazilian intellectuals, politicians, and members of Brazil’s social movements.

The following year, in August 1983, da Silva founded the *Central Unica dos Trabalhadores* (CUT), an organization to advance the rights of workers without the tutelage of the state, as it was commonly practiced in Brazil. In 1984, da Silva participated in one of the most important events in the history of Brazil: the movement for “*diretas-já*” [*direct elections now*]. The movement, which took millions of Brazilians to the street, demanded that the military step down and return democracy to Brazil, after twenty-one years of military dictatorship. “Lula” da Silva ran

for governor of São Paulo in 1982 but lost; in 1986 he ran for senator (federal deputy) and became the most voted senator in the history of Brazil with 651,763 votes.

In 1989, the PT launched “Lula” da Silva as their presidential candidate. “Lula” da Silva ran against the unknown candidate Fernando Collor de Mello from the state of Alagoas. “Lula” da Silva lost in his first attempt to win the presidency, receiving 47% of the votes. In 1993, “Lula” da Silva began his campaign for human rights and citizenship for all Brazilians regardless of their socio-economic status or ethnicity, which would later become the cornerstone of his presidency (Programa Fome Zero or Program Hunger Zero). “Lula” da Silva attempted again the office of the presidency running in 1994 against Senator Fernando Henrique Cardoso. Cardoso received 44% of the vote against da Silva’s 22%. In 1998, da Silva made another attempt for the presidency against Cardoso, who had modified the Constitution to allow him to run a second term. The results were almost identical to 1994. However, in 2002, da Silva was elected president, defeating José Serra, the government candidate, in a run-off election.

The Brazilian government under “Lula” da Silva has been pressing for enhanced international cooperation to combat international terrorism; da Silva was, however, fiercely opposed to the 2003 invasion of Iraq led by the United States. Brazil is also arguing for an expansion of the United Nations’ Security Council, to which it desires addition as a permanent member.

President “Lula” da Silva’s administration has given priority to strengthening of the scientific and technological infrastructure. However, the *Bolsa Família* (Family Assistance Program) is perhaps its most ambitious program. The *Bolsa Família* provides up to R\$100 (\$50 US) per family per month in addition to health care, education, and other social programs. Another program started by the “Lula” da Silva government was *Programa Fome Zero* (Zero Hunger Program) which has as its main objectives the total eradication of hunger and social exclusion in Brazil. The program’s initial efforts were geared towards emergency relief, but the program’s long-term goal is to create long-term food security throughout Brazil via agrarian form and support of family farms, with the aim of making Brazil self-sufficient for its food supplies. Vouchers for poor families are also part of the program, along with food banks, school meals programs, and programs aimed at pregnant women and mothers with infants.

The da Silva administration has faced criticism regarding its environmental policies. Despite da Silva’s reputation as a supporter of environmental causes,

deforestation in Brazil continues to increase. He has also expressed support for a bill that will lift Brazil's ban on genetically modified crops. There have also been allegations of corruption within both the Worker's Party and da Silva's inner circle; nevertheless, da Silva's popularity remains high.

## SINGAPORE

### Singapore's Early Era: The Challenge of Poverty and Insecurity

The Republic of Singapore is an island located in the middle of Southeast Asia at geographical coordinates 1°17'N 103°51'E, its land area of 648 square kilometers. It is home to 4,185,000 people, of whom 3,437,000 are Singapore citizens. Foreign guest workers and their families, who occupy 25% of the country's jobs—mainly in low productive sectors such as services and construction and high productivity sectors such as high tech manufacturing and information technology—comprise the remainder of the population. The island is at sea level and its climate features hot, humid monsoon rainy periods without pronounced rainy or dry seasons. Singapore's diverse ethnic composition is 77% Chinese, 15% Malay, 6% Indian, and 2% persons of mixed ethnicity. Four official languages exist: English, Chinese, Malay and Tamil. The population's religious composition includes persons who practice Buddhism, Islam, Christianity, Hinduism, Sikhism, Taoism, and Confucianism.

The small but complex city-state achieved its independence from Britain in 1963 as part of the Federation of Malaysia, an arrangement doomed not to last because of ethnic tensions involving Chinese dominated Singapore and the remainder of Malaysia. It was expelled from the Federation in 1965, a time

when Singapore's economy was in shambles and its national and regional security was tenuous.

### Early Singapore's Poverty and Insecurity

Singapore's maritime infrastructure had barely been able to sustain the island's fragile and one-dimensional economy, which was stagnating from wartime damages. The island's once pre-eminent role in Britain's Asian defense strategy had come to an inglorious end due to its defeat at the hands of the Japanese. Singapore's ethnically diverse population was segregated throughout the island. A severe housing shortage went unabated. The existing housing stock was decaying, and the concentrated and fragmented nature of land ownership inhibited housing development. A rapidly growing population was putting increasing pressures on the economy's dwindling capacity to satisfy housing requirements and other basic needs, particularly for education and health care. Only one in five housing units had a sewage connection and consequently water-borne communicable diseases were epidemic. Malaria and tuberculosis were rampant and cholera was part of everyday life throughout the island. Rat infestation plagued schools, health clinics and opium houses alike. Medical facilities were woefully inadequate to deal with the widespread public health problems that these conditions produced.

Unemployment and underemployment abounded and poverty was widespread. Education, civic participation, and business and employment opportunities were reserved mainly for the Chinese elite—this was a legacy of British colonial rule. Ethnic chauvinism persisted throughout the island pitting Chinese against Malay against Indian, and eventually leading to inter-racial rioting—a phenomenon that ultimately separated Singapore from Malaysia. Ethnic antagonism produced student militancy and gave rise to a climate of bitter antagonism among the young of Singapore. The ethnic conflict, combined with ideological dogmatism and inflexibility, exacerbated the chaos and ultimately caused Singapore's expulsion from the Federation. It was up to the country's leadership both in the Government and within the People's Action Party to find Singapore's "own way" to pursue economic development and maintain national sovereignty.

### Singapore's Pursuit of Development and Sovereignty

In 1965, the government began to design and to apply policies aimed at eradicating poverty by promoting

economic growth that would provide the basis for social development and security. The government's key objective was to maintain social order within the country's multi-racial society. It pursued its objectives via policies that collectively had a three-fold focus: educating and training people, maintaining peace with Singapore's regional neighbors (particularly Malaysia and Indonesia) and gaining the confidence of investors from developed market economy countries. The systematically applied policies and administrative practices sought to create internal social order, more educated and productive workers, regional security, and a positive investment climate.

Specific policies and practices centered on developing a sound saving and investment system, an outward looking free market orientation, a superb education and training system, a substantial commitment to invest in research and development, and above all, an honest and efficient government and bureaucracy. Government operated on the conviction that policies and practices need to be combined in a way that formed an organic whole where the key to success would always be a capable, non-corruptible, development-oriented government and bureaucracy.

From the onset of nationhood, Singapore's relatively small national economy has been highly open to trade and foreign investment and its growth exported. Monetary and fiscal policies continue to face constraints in the form of financial leaks into the global economy. As a consequence, macroeconomic stability has always been pursued via a combination of handling imports and re-exports efficiently and promoting exports of domestic origin effectively through exchange rate policies and wage and salary controls that have kept the country's prices competitive in global markets.

In its committed pursuit of material progress, internal stability, and national sovereignty, the government gave lower priority to other goals such as equity in the distribution of economic benefits. Virtually no public attention was paid to promoting non-economic values such as individual freedom, intellectual, and artistic creativity and political competition. The road chosen by Prime Minister Lee Kuan Yew and the authoritarian leadership of the People's Action Party and the government has been widely criticized as harsh and careless when it comes to paying attention to the non-economic costs of Singapore's material progress. Despite the criticism coming from abroad and from some citizens at home, Lee Kwan Yew and his associates have been unquestionably successful in furthering Singapore's economic development. From 1965 onward, almost miraculous material progress began to take place. Throughout the four decades that followed independence, Singapore was one of the world's fastest growing economies.

## A Modern, Developed Market Economy

Progress took place because the aforementioned policies were put into place effectively and efficiently. The result was an economy that was transformed from a trading entrepot to a balanced, multi-segment economic structure. The new structure featured a basic transportation and financial infrastructure to support the economy's growing external sector and a manufacturing sector that shifted from low value added, basic labor intensive items to higher value added items that were more sophisticated and consequently were more capital and highly skilled labor intensive.

Material progress was not the result of a "miracle." It came about through a combination of human effort and public policies based up this important recognition: Singapore has a small domestic demand and attempts to improve macroeconomic performance through monetary and fiscal policies have little domestic impact because the "foreign leakage" is too large. Instead, the government has employed micro economic policies in the form of wage and salary controls that have a direct impact on the cost of exports. Flexible wages and salaries keep employment levels high, assure that export prices remain competitive, and when price regulation is introduced into the policy mix, the domestic consumption of basic need items is sustained.

Production has been continually aimed at progressively higher value added exports destined for markets in North America, Europe, and Asia. Production processes continue to combine foreign capital and technology and domestic investment with a continually improving domestic human resource base augmented by critically important expatriate labor. Efforts to continue gaining and maintaining access to markets abroad has always been a key feature of the country's foreign economic policy mix. Singapore became a member of the Association of Southeast Asian Nations (ASEAN), the Asia Pacific Economic Cooperation (APEC) group, the Pacific Economic Cooperation Council (PECC) and, at the global level, the World Trade Organization (WTO).

Singapore's sustained material progress was so pronounced that by the late 1990s its capita income was among the highest in the world and it is now classified as a "developed market economy country." In addition to Singapore's high per capita income, the indices measuring the personal quality of material life and the state of human development place contemporary Singapore within the higher echelon of the world's economies. From 1976 to the onset of the Asian financial crisis of 1999–2000, the country's gross domestic product (GDP) grew by an average

7.8% in real terms while the annual rate of inflation was only 1.6%. The growth and price stability that the economy experienced during the period was based on exports that on average made accounted for 51.6% of Singapore's GDP during the period.

By the year 2000, per capita national income in Singapore grew to \$25,000 US annually. The infant mortality rate dropped to four per one thousand births and life expectancy rose to seventy-eight years. Primary and secondary school participation rates for male and female students reached 92% while the literacy rate exceeded 95%. The United Nation's human development index (HDI) that measures a nation's progress based on the above factors rose to 0.876 placing Singapore among the top fifteen high performing countries based on this measure. The financial crisis temporarily put a stop to Singapore's progress but by 2002 economic growth and social development resumed their upward swings.

Other evidences of domestic progress include a superb international airline, a "state-of-the art" convention center and a clean and safe environment that attracts millions of professional visitors and tourists to the island republic each year. On the professional front, not only was the first Ministerial Meeting of the World Trade Organization held in Singapore, but also it is home to the Secretariats of both APEC and PECC. The country's infrastructure is strong. The Port of Singapore ranks along side the ports of Hong Kong and Rotterdam as the world's largest in terms of dockings, tonnage, and values handled. The Singapore Monetary Authority, operating on the bases of both prudential financial practices and the principle of transparency, oversees a finance and banking system that provides financial services to countries throughout the region. Because of its sound financial system, Singapore was less seriously affected by the recent Asian financial crisis. Because of this, the International Monetary Fund uses Singapore as a base for training bankers and financial service personnel from other countries.

### **Consequences Arising from Singapore's Road to Progress**

The road to progress chosen by Singapore's founding and current leaders not only produced domestic economic progress and national sovereignty but it contributed to regional stability. Home ownership is at 80%–85%, homelessness is rare, and high-quality basic health care is universally accessible. The educational system is superb. Singapore's Central Provident Fund (CPF) provides support for older Singaporeans. It is also the

financial means via which people purchase housing. The CPF continues to grow and it is managed in a sound and prudential fashion so that it continues to provide the people of Singapore with a superb social-financial system. In 1997, the CPF was modified to add an important new feature—the CPF Investment Scheme that permitted individuals more opportunities to choose patterns of individual investments within a set of government approved companies.

The firm guiding hand of government that propelled Singapore's economic development process has not been highly successful in furthering other social values such as open competitive politics and individual freedom. There has arisen a clear and profound dichotomy between Singapore's material and social progress and its authoritative government and non-competitive political system: along the road to material success, official Singapore became suspicious of real and perceived threats both external and internal.

The seeds of suspicion were sown during the period 1963 to 1965 when the government responded to an external environment that was perceived to be hostile, unstable, and threatening. At that time Singapore's leadership chose a social and political governance structure that was based upon three principles. First, it created a climate of political and social discipline that was to become the cornerstone to government policies and practices. The intent was to assure that no internal threat would develop in a way that permitted outside influences to challenge the leadership and the government. Second, it spawned a willing group of followers who would acquiesce to being governed tightly regardless of any inequities and unfairness associated with the government's actions. Third, it fostered an environment wherein authoritarian social engineering was practiced in an effort to assure social and political stability.

The key question facing contemporary Singapore is whether a government and political system based upon suspicion has outlived its usefulness. Even with broadly based acquiescence and support, during future elections the ruling People's Action Party (PAP) will have to confront this basic issue as well as others including the gaps in income distribution and wealth. The wealth and income distribution gaps are serious and widening. From the government's perspective this is a natural consequence of globalization. However, a growing number of citizens see distribution inequities as the result of reliance on expatriate labor and favoritism among the local economic elite. While the PAP continues to receive some 65% of the vote, one out of every three citizens voted for a minority party candidate, which could cause the ruling party's magnitude of control over the Parliament to dissipate.

## SINGLE-PARTY STATES

Single-party states are those in which one political party, which goes largely unchallenged, enjoys a monopoly on power within the state structures. The ruling party has a wider variety of functions than is usually the case in a multi-party competitive democracy. The ruling party may serve as the primary mechanism for determining access to decision-making authority, staffing the bureaucracy, distributing political goods, articulating and channeling interests, maintaining security, and articulating state ideology, as well as organizing and contesting elections. These elections may not offer real choices to voters, but serve important legitimizing functions for the regime.

Such a party may still have competitors for control of government functions. These competitors might include the military, the bureaucracy, and the authoritarian leader. The party is generally independent from these non-party actors. For instance, the Brazilian military regime (1964–1985) did not permit any real autonomy to the Alliance for National Renovation (ARENA), its political party vehicle, and would therefore not be considered an example of a single-party state. Likewise, a system such as Iraq under Saddam Hussein, in which the party serves primarily as a vehicle for a personalistic leader, is not properly considered a single-party state.

Within the category of single-party states there is considerable variation in regime characteristics. Some regimes have a constitutionally mandated role for the party, often describing the party as the leading force in society and prohibiting all other political parties. These are typically Communist party-states, but this was also true of many African regimes. Other states, including Communist Poland, permitted the existence of other parties, but only those that were supporters of the ruling party's right to govern. Still others, such as Mexico and Senegal (except from 1966–1976), permitted various parties to contest elections but did not permit any but the ruling party to win them. This differentiates the single-party state from a dominant party in a democratic system, as found in Japan and Sweden throughout much of the same period. In these last two cases, the governing party had no guarantee of continued political dominance, opposition parties could expect to form a legitimate opposition in the legislature, and the party system's primary role was to legitimize government through elections.

The historic origins of the single-party state lie in Marxism-Leninism, although fascist parties in Europe in the twentieth century also employed the party-state regime model. Marxism calls for the dictatorship of the proletariat to govern the state until the state itself withers away. V. I. Lenin articulated a model for the exercise of this dictatorship based on a centralized political party made up of cadres acting as the vanguard of the proletariat. Many single-party states adopted the Leninist model, including non-Marxist regimes. The Kuomintang in the Republic of China is a particularly interesting example of a non-Marxist party organized along Leninist principles. Many of Asia's nationalist movements did adopt Marxist ideology along with Leninist organizational principles as they successfully fought their way to power, as in China, North Korea, and Indochina.

For much of the post-World War II period, the single-party state was the most widespread regime type in the developing world. Communist party-states were established in Central and Eastern Europe, China and North Korea in the late 1940s, and North Vietnam in 1954, joining the two pre-war Communist party-states, the Soviet Union and Mongolia. Non-communist hegemonic party-states were established in Mexico in 1938 and Paraguay in 1947. Depending on how one classifies different cases, some eighteen single-party states were established in the 1960s, mostly in Africa. The only new Communist party-state established in the 1960s was in Cuba. Numerous other African states moved effectively towards single-party status, although formal establishment of such a regime may not have taken place until the 1970s. By 1988, some fifty-seven countries had single-party

regimes. These included the Soviet Union and the eight Communist states in Central Europe and the Balkans; fifteen of the seventeen countries in East and Central Africa; seven countries each in Southern Africa and in West Africa; five Arab countries; ten countries in Central, East, and Southeast Asia; and four countries in Latin America.

Lenin's theories of imperialism were compelling to many of the leaders of the newly independent states of the 1950s and 1960s, who articulated justifications for the adoption of the single-party model to overcome the legacies of colonialism. Kwame Nkrumah in Ghana and Sékou Touré in Guinea, for example, sought to nationalize their nations' economies in order to prevent the repatriation of profits to Europe, to promote industrialization, and to allow for the distribution of wealth. The movement of all the people, represented in the single mass party and led by the vanguard elite, was needed to break the power of particular interests that enjoyed special links to the metropolitan state and benefited from neo-colonial relationships. The Chinese referred to these local agents of the metropolitan bourgeoisie as the comprador class, whose interests were inherently anti-national.

However, relatively few single-party regimes adopted a fully developed class analysis as part of their ideology. In Africa and the Arab world, various versions of African and Arab Socialism became official regime ideology. Sékou Touré argued that African class structure did not resemble that of Europe, and as parties represent class interests, the Democratic Party of Guinea (PDG) was not in fact a party because it represented the nation, not any single set of class interests. Arab or African Socialism took on even more flexible ideological shapes in the hands of Gamal Abdel Nasser in Egypt and Kenneth Kaunda in Zambia. While Sékou Touré denied the existence of classes and internal class conflict, Nasser saw the creation of a single-party as a means to contain the potential for class conflict in Egyptian society. Similarly, Zambia's United National Independence Party (UNIP) promoted Kaunda's official ideology of "Humanism" rather than a more rigorously socialist ideology. African Socialism was usually conceived to be a revalorization of pre-colonial communitarian norms, modernized by the activity of the Party. The local committees of the PDG in the early period after independence in Guinea may not have behaved much differently from traditional village councils.

In many African states, the mass-based independence movement led by a Western-educated elite became the base for the post-independence single-party. The goals of this party were to provide national unity, political stability, and social and economic development. The concern for national unity was not

unfounded, as multiparty systems in Africa have tended to reflect ethnic divisions, with tragic consequences in several cases, such as in Nigeria and more recently the Republic of Congo. As Nkrumah said, "A multi-party system introduced into Africa results in the perpetuation of feudalism, tribalism and regionalism, and in inordinate power struggle and rivalry." Many parties in single-party regimes adopted national symbols as their own and denied the use of these symbols to others. Indeed, the possibility of loyal opposition is denied to other parties, for in the nationalist formulation of the single-party ideology, to oppose the ruling party is to oppose the nation itself. On the other hand, single-party systems have also provided political cover for ethnic-based interests that have sought to dominate the state, as in Kenya and Malawi.

The Leninist model was particularly well suited to the developmentalist state that characterized the developing world from the 1950s to the 1970s. Mobilizing resources for what was envisioned as a rapid, dramatic, and revolutionary change in society required institutions capable of communicating directly with the masses and subordinating opposition embedded in either neo-colonialist or traditionalist structures to the general will of the new nation. Tanzanian president Julius Nyerere argued that:

The Party has to help the people to understand what the government is doing and why; it has to help the people to co-operate with their government... But the Party has also to ensure that the government stays in close touch with the feelings, the difficulties and the aspirations of the people. It has to speak for the people. And it has to educate the people and help them to see what the government's actions mean in terms of their own future security and their own future opportunities.

The role of the party in actual implementation of development policies varies greatly among single-party states. The strong role of the Tanganyika African National Union (TANU) in Tanzania contrasts markedly with the role of the Kenya African National Union (KANU) in Kenya, which played almost no part in policy implementation. As states adopted extensive economic planning, including cooperativization and in several cases collectivization of agriculture, party militants became essential promoters of state goals on the ground. In some cases the party acted as the state bureaucracy, while in others it served as a check on the bureaucrats who actually implemented policy. In Syria, for example, the Baath party under Hafiz al-Asad had the power to review and influence the formulation of policies as they were developed through regular institutions of government. Many single-party states found that administration through the party was often inefficient, and sought eventually

to separate the party from the bureaucracy and administration. This was particularly characteristic of the Communist-party states in the late 1970s, including Cuba, China, and Vietnam.

Single-parties also played more non-ideological roles in many states. Party membership was often essential for participation in distributional alliances controlled by the party or the national leader. States that permitted opposition parties, such as Mexico, Paraguay, and Senegal, used elections as a means to determine access to divisible goods among competitive patron-client networks. However, this was also true in Côte d'Ivoire and Kenya during periods when opposition parties were prohibited and competing networks operated as factions within the party. The relatively prosaic distribution of largesse has had at least as great an impact on patterns of development, for good and for ill, as have great schemes based on central state planning.

The overall impact of the single-party state on political and economic development has often been negative. While these regimes have arguably contributed to national unity and have created periods of political stability, most of them have fallen well short of the goals they set for themselves. The single-party model has suffered several problems. These include personalism, corruption, inflexibility, irrationality, authoritarianism, and human rights violations. In short, these regimes suffer from the ills of dictatorship, and while some have been less abusive than others the tendency for abuse is inherent in the regime design itself.

Few single-party regimes were able to overcome the tendency towards personalistic decision-making. While some, such as Mexico and Vietnam, were able to achieve a degree of rotation of elites and avoid cults of personality, personalistic and capricious decision-making is still found in regimes without external checks. While competitive multi-party systems may be as corrupt, the combination of unchecked corruption and inflexibility in an authoritarian state is more likely to lead to disasters, as Amartya Sen has famously observed. Likewise, while single-party regimes are not alone in authoritarianism and human rights abuses, they have generally not been good performers on these measures, contrasting notably on these grounds with competitive multi-party systems.

The economic crises and adoption of neoliberal ideology in the 1980s accompanied the abandonment of both Marxist political economy and Leninist political organization in much of the world. Between 1989 and 1992, twenty-nine single-party regimes were replaced by either multi-party democracies, military regimes, or, in several cases, anarchy. By the end of 2001, only fourteen of these regimes survived, and of these, only five, all Communist party-states, retained

the constitutional mandate for single-party hegemony. The commitment to single-party rule as the means for national development has been completely abandoned, except in Cuba and North Korea. In virtually no part of the world is the single-party model today celebrated as the appropriate means for the developing world to achieve development.

### SLOVAKIA

A new, land-locked Central European nation of approximately 5.3 million, Slovakia, or the Slovak Republic, is bordered by Poland to the north, the Ukraine to the east, Hungary to the south, and Austria and the Czech Republic to the west. Thirty percent of its 18,922 square miles is mountainous in the north; 20% of Slovakia is forested. The Danube is the nation's major river. Slovakia's two largest

cities—Bratislava, the capital in the southwest, and Kosice, in the southeast—dominate the otherwise agricultural lowlands. One-third of the country's land is under cultivation. Slovakia has a continental climate with cold, dry winters and hot, humid summers. Temperatures in the capital range from 30°F in the winter to 70°F in the summer; rainfall averages 25.5 inches annually.

## Political History

For centuries, Slovakia was a small part of much larger empires. It first was part of the Great Moravian Empire (830–907), then under Hungarian rule from the eleventh until the early twentieth centuries. Under the Hapsburgs, Slovakia was called Upper Hungary. As part of the Austro-Hungarian Empire, Slovaks were pressured to relinquish their national identity. Despite these efforts to eradicate the Slovakian identity, a nationalist revival occurred in the late eighteenth and nineteenth centuries.

Partial sovereignty was realized after World War I under the leadership of Thomas G. Masaryk, the founding first president of the Republic of Czechoslovakia (1918–1935). Despite his democratic leadership, some Slovaks were frustrated by a unitary state directed from Prague. The dissatisfaction of Sudeten Germans within the newly created state, as well as its noted industrial capacity, provided Adolf Hitler with a pretext for occupying Czechoslovakia after the Munich Agreement of 1938. A puppet fascist Slovak state was established in March 1939 under the national cleric, Monsignor Josef Tiso. In contrast to the passive resistance of the Czechs, the Slovak National Uprising began in August 1944 and continued for several months before it was quashed.

Czechoslovakia was restored after the end of World War II, with some concessions to Slovak demands for autonomy by means of a regional legislature and an executive. The Communists seized power in 1947–1948, ending this federal experiment for twenty years. Alexander Dubcek (1921–1992), a Slovak, was made head of the Communist party of Czechoslovakia in January 1968. His immediate reform movement, known as the Prague Spring—in part a delayed de-Stalinization program—was crushed on August 21, 1968. Czechoslovakia, however, continued one of the reforms that led to the country's federalization in 1969, again giving Slovaks some national institutions that enjoyed limited autonomy. Ironically, both fascism and communism contributed to Slovak nationalism.

Dubcek's replacement was his early supporter and fellow Slovak, Gustav Husak (1913–1991). Husak

was jailed from 1940–1943 by the Nazi-backed Slovak puppet government and afterward played a role in the 1944 Slovak uprising. In 1951, he was purged from the Communist party on charges of “nationalism.” While serving a subsequent six-year sentence, Husak wrote a history of the 1944 revolt. His prison sentence was declared illegal in 1963 when he was politically rehabilitated.

Historically an agricultural region, Slovakia began to industrialize after the 1948 communist takeover. Enormous heavy industry and armament plants were constructed, creating dependence on the Soviet Union as a customer for the products. Husak's government was one of the sternest in east Central Europe, but it helped to improve the Slovak standard of living.

## Independence

Communist Czechoslovakia unraveled within the twenty-three days of the “Velvet Revolution” of late 1989, leaving opposition forces unprepared for the sudden transition to parliamentary democracy. Economic, political, and ethnic tensions between the Czechs and the Slovaks overwhelmed the new leadership, and the seventy-four-year-old union crumbled, despite public-opinion polls that suggested that a majority of both Czechs and Slovaks were against independence. The Slovak Republic gained its independence on January 1, 1993, largely because of Vaclav Klaus and Vladimir Meciar. Klaus, Czechoslovakia's ideological prime minister with a Ph.D. in economics, saw himself as the Margaret Thatcher of Central Europe. Meciar, Slovakia's first prime minister, is sometimes referred to as the Huey Long of the Danube. Political inexperience coupled with ideological inclinations in both leaders led to the split.

A former amateur boxer, corporate lawyer, and an authoritarian populist, Meciar slowed the pace of privatization of the economy. He dominated foreign policy and aggravated tensions with Hungary. His demagogic methods—exploiting ethnic fears, efforts to control the media and corrupt political practices—led to his public rejection in the fall of 1998.

## The Anti-Meciar Coalition

For the past three years, opposition political parties to Meciar's Movement for a Democratic Slovakia (HZDS) have provided stability for the nation and moved it in a progressive direction. In 2000, The Organization for Economic Cooperation and

## SLOVAKIA

Development (OECD) for the first time classified Slovakia as having a functioning market economy. A majority of the population favors entry into the European Union (EU). Also in 2000, Slovakia received more foreign investment than in the previous seven years combined. And in late 2001, the governing coalition initiated the process to decentralize state authority, a goal popular among Slovaks and urged by the EU. Public administration reform is scheduled to be completed in 2004, the date by which Slovaks hope to be eligible for EU entry. The European Union is Slovakia's largest trading partner; more than 60% of its exports go to the EU.

Despite many reforms, the unemployment rate hovers near 19%, the highest in Europe. Polls show that Meciar's HZDS with 28.1% of the public remains the single most popular party. National elections are scheduled for fall 2002, creating a challenge for the smaller opposition parties to stay united against Meciar. All parties, however, lack leaders of the stature of the late Dubcek. Even Meciar has been forced to favor integration with the EU and NATO, supported by nearly half of the Slovakian public and which the Czechs joined in 1999.

## SLOVENIA

The Republic of Slovenia lies at the crossroads called the Balkans—sandwiched between the remnants of the Hapsburg Empire to the north, the Ottoman

Empire to the south and east, and the Venetian Republic to the west. The small nation, of about 7,800 square miles in area, has long been known for its alpine vistas and pleasant climate. Ninety percent of the nation—lined by the Karawanken Mountains along its northern border with Austria and the Julian Alps and Kras (Karst) Plateau along its western border with Italy—lies above one thousand feet elevation, with a range of above nine thousand feet in the mountains to sea level along the Adriatic coast. More than 60% of the landscape is forested; 30% is classified as agricultural land, according to Slovenia government statistics. Climate is mild and humid—no dry season. Temperatures in the capitol city of Ljubljana, for example, typically range from 24°F in the winter to 80°F in the summer. Precipitation—snow in the winter and rain at other times of the year—is plentiful year-round. Slovenia has approximately 2 million residents—the largest cities are Ljubljana (250,000 residents) and Maribor (ninety-five thousand residents).

The Slovene people first settled in the Danube Valley and eastern Alps in the sixth century CE. Shortly afterward, Germanic rulers, the Carolingians in the eighth century, assumed control of what is now Slovenia. Rule then passed to another line of Germanic rulers, the Holy Roman Emperors in the ninth century, and to the Hapsburgs in turn in the fifteenth century. The Hapsburgs retained control of Slovenia for most of the next four centuries—with a brief interruption during the Napoleonic Wars. The Hapsburg Empire began to fragment in the nineteenth century, with subject peoples—including the Slovenes—clamoring for more autonomy. The empire collapsed following its defeat in World War I, and the Slovenes in 1919 joined the Kingdom of Serbs, Croats and Slovenes—which was later named the Kingdom of Yugoslavia in 1928. Shortly after the start of World War II, Axis powers (Italy and subsequently Germany) invaded and ruled the region from 1941 to 1945. A Soviet satellite state, the Federative People's Republic of Yugoslavia (later the Socialist Federal Republic of Yugoslavia), was established following the end of World War II.

While Soviet strongman Joseph Stalin intended Yugoslavia to be a subservient, vassal state, Yugoslav strongman Josip Broz Tito, who was elected president of the republic in 1953, had other intentions and managed to keep Yugoslavia free of Soviet dominance. Tito also managed to suppress separatist movements throughout Yugoslavia, and the disparate peoples—including the Slovenes—managed to get along reasonably peacefully until Tito's death in 1980.

Following Tito's death, Serb politicians began to assert more control over the affairs of the other peoples that comprised Yugoslavia. Nationalist

rhetoric by Serb strongman Slobodan Milošević did little to encourage most of the other peoples to remain a part of Yugoslavia. Despite pressure from the United States and the many European nations that Yugoslavia should remain united, the General Assembly of the Yugoslav Republic of Slovenia declared the right to secede from Yugoslavia. Eighty-eight percent of the Slovene people voted to do so on December 23, 1990. The republic then declared its independence on June 25, 1991, and won that independence in a ten-day war in which the Yugoslav army withdrew in the face of stiff resistance from the Slovenes. The Slovenes escaped Yugoslavia at relatively little cost.

The Vatican was the first to recognize Slovenia, which has a majority Roman Catholic population. Germany likewise recognized the new nation, and the European Economic Community and the United States followed suit early in 1992. The new Slovene republic then joined the United Nations on May 22, 1992. Slovenia was determined to be an active member of the European and world communities, and, after years of preparation, joined both the North Atlantic Treaty Organization (NATO) and the European Union in 2004.

The Slovenes quickly established a stable democracy after declaring independence in 1991. Milan Kučan was elected its first president on December 6, 1992. Kučan was reelected in 1997. Janez Drnovšek was elected Slovenia's second president on December 1, 2002.

Slovenia was one of the former Yugoslavia's most advanced and prosperous republics. As a result of its nearly bloodless war of independence, its democratic government, and its close ties to the West, Slovenia has been able to remain relatively prosperous. Its economy has kept growing, even though many other nations in transition from communist or socialist economist have experienced slowdowns. In March 2004, Slovenia's prosperity allowed it to change roles from a borrower nation to a donor nation at the World Bank.

Slovenia's estimated gross domestic product in 2003 was \$37 billion, which amounts to about \$19,000 GDP per capita. The nation boasts of abundant natural resources, such as forest products, hydro-power, coal, and metals. (It likewise suffers from environmental problems as a result of developing these resources, but is making more progress than similar states in mitigating those problems.) Despite Slovenia's natural wealth, the biggest sector of its economy is the service sector, which comprises 57% of Slovenia's GDP. The industrial sector is second at 40%. Both inflation and unemployment are something of a problem, with the inflation rate in 2003 estimated Inflation (in consumer prices) was estimated to be a little more than 5% in 2003. According to government

statistics, unemployment was estimated to be about 6.6% in 2003, with the highest rate for adults being among those aged between twenty and twenty-four (14.8%). Slovenia enjoys a slight trade surplus with other nations.

The population is fairly stable, with the growth rate essentially at 0%. Fourteen percent of the population is younger than fifteen years of age. Fifteen percent is older than sixty-five. The median age is about forty. Average life expectancy at birth is seventy-six years (seventy-two for males; eighty for females). Death rates per one thousand population slightly exceed birth rates (10.15 to 8.9).

Slovenia was much more fortunate than its sister nations in escaping the bloodshed visited upon its sister nations following the breakup of Yugoslavia. It enjoys many advantages—in terms of human, economic, and natural resources—that bode well for the republic's future.

### SMAZE

Smaze or smoke haze is defined as a heavy atmospheric condition that offers reduced visibility because of the presence of suspended particles. Air pollution is placed in two general categories: indoor and outdoor. Indoor air pollution is created by cooking and heating inside, while outdoor air pollution results from the combustion of fossil fuels for human consumption. Smaze is a type of outdoor pollution that causes public health problems, such as respiratory

infections, and increases the burden of disease within a country.

In the developing world, since 1945, a rapidly increasing birth rate, coupled with a decreasing death rate, has caused a population boom that has resulted in rapid urbanization and exacerbated the phenomena of smaze. For example, Mexico City has a population of 22 million people and approximately 3.5 million automobiles. Automobiles are a primary cause of smaze in Mexico City and throughout the developing world. The World Health Organization (WHO) recommends that cities have ninety milligrams or less per cubic meter of suspended particles in the air. The WHO estimates that the air of Mexico City has double the recommended number of suspended particles. These suspended particles cause respiratory conditions, increased disease prevalence, and contribute to higher infant mortality rates. Smaze also causes adverse environmental problems, such as acid rain and corrosion.

The Mexican government has responded to this crisis by implementing legislation during the late 1980s to combat the problem. The General Law of Ecological Balance and Environmental Protection (LGEEPA) of 1988 aimed to reduce all environmental pollution. In 1996, the LGEEPA was amended to include sustainable development projects. These projects included the creation of the Center for Sustainable Transport in Mexico City (CSTMC), which aimed to create sustainable transportation infrastructure, such as a rapid transit bus system and retrofitting older diesel engines on vehicles and trucks to reduce air pollutants. In addition, the Mexican government enacted a five-year National Environmental Program (1996–2000), which invested over \$10 million to reduce air pollution in Mexico City. This program included tax incentives to purchase pollution control equipment and alternative fuels, while requiring catalytic converters on all automobiles.

Another reason for smaze was increased deforestation caused by slash and burn agriculture and increased logging activities. Throughout the developing world, agricultural expansion, exasperated by food insecurity issues of the rural Third World poor, has decreased the size of the rain forests as peasants move deeper into the rain forests. The rain forests, however, have traditionally served as natural filters to eliminate pollutants from the air. As the size of tropical rain forests decreases, smaze levels increase. In addition, deforestation leads to increased drought conditions, which makes forests more susceptible to fire, which also increases smaze.

## **SOCIAL REVOLUTION**

Social Revolution is a complex phenomenon and an elusive term. Generally the concept is subsumed within the sociological literature under the category of collective behavior, or that group behavior which is less predictable, less formal, and less subject to routine human activity. Social revolution represents the “extreme situations” in human behavior when the relatively stable social order has been disrupted and even irreparably shattered. As a phenomenon, social revolution incorporates many aspects of societal change including the political, the economic, the cultural, and the social structural. As *social* revolution rather than simply revolution, the phenomenon may incorporate uprisings, rebellions, and insurrections but is never limited to these violent events alone.

There are many competing definitions of social revolution and of revolution in general. Key disputes include the following: the kind, extent, and persistence of social change; the means of effecting change, that is, whether violence and the threat of force are essential components of social revolution; and the ideological direction of that societal change. Social revolution in contrast to simple revolution implies broad and fundamental change in all or most aspects of societal life from values to institutions. Also, social revolution is considered more than an attempted change; the revolutionary process and subsequent societal change must succeed or persist—how long remains in dispute. Thus, a revolutionary uprising that fails or a process of social change that is not consolidated cannot be a true revolution or a social revolution.

Most theorists of revolution, such as the sociologist, Chalmers Johnson, also tend to agree that such widespread societal change can only be effected by the threat or use of force and violence, so that a non-violent social revolution is not only a contradiction in terms but impossible in the real world. Nevertheless, briefly in the 1960s, the idea of a non-violent, cultural revolution, or “revolution in the minds of men” represented a popular alternative to this view.

Although, there have been no historical cases of a non-violent, cultural revolution, some theorists of revolution, such as Dale Yoder and Rex Hopper, focused on normative and cultural change, however effected. They described revolution as “the change in the social attitudes and values basic to the traditional institutional order.”

Finally, some theorists, such as Hannah Arendt, insisted that all revolutions must be progressive ideologically and/or incorporate “the struggle for freedom” and “the sense of a new beginning.” This last “democratic” revolution theory posed some difficulties in meshing the theoretical literature with the historical cases of social revolution in the twentieth century. Major social revolutions of the twentieth century, such as the Russian Revolution of 1917, the Chinese Revolution of 1949, and the Cuban Revolution of 1959 were Marxist revolutions. In one sense, these revolutions used violence, in Arendt’s words, to institute a “different form of government.” However, most scholars of revolution would agree that these historical cases did not meet Arendt’s test to create a “new body politic, where the liberation from oppression aims at least at the constitution of freedom.”

Despite the debate over the exact components of social revolution, and the means by which an astute observer can determine if it has indeed occurred, several definitions of revolution and of social revolution are especially helpful. Chalmers Johnson views revolution as expanding concentric circles of violent change “in government, and/or regime, and/or society.” Although this broad definition does not distinguish between societal revolution and mere insurrections, Johnson notes that “total” revolution, in contrast with “simple” revolution, recasts a society’s entire structure of values and division of labor, or society’s norms and institutions.

The most comprehensive description of social revolution is that of Samuel P. Huntington. “A revolution,” he writes, “is a rapid, fundamental, and violence domestic change in the dominant values and myths of a society, in its political institutions, social structure, leadership, government activity and policies.” His definition clearly distinguishes among lower-level, and perhaps unsuccessful coup d’etats, rebellions and insurrections, and “social” or “great” revolutions. In the latter category Huntington includes the French, Mexican, Chinese, Russian, and Cuban revolutions, but notably excludes from his list of historical cases the American Revolution of 1776. Huntington insists on the distinction between wars of independence, or “a struggle of one community against rule by an alien community,” and a social revolution which necessitates major changes to the social structure.

As important as determining *what* constitutes social revolution, is explaining the *why* or the causality of social revolution. In the literature of revolution theories of revolutionary change abound with little distinction between the “simple” revolution and the “total,” or “great,” or “social” revolutions. A shared, central assumption of theorists is that causality of human rebellion remains operative in all types of revolution. Some theorists, however, accord this dimension greater importance than others. For example, in the view of leading political theorist, Ted Robert Gurr, revolution can be best understood as but one of many expressions of civil strife and collective violence.

Theories of revolutionary causality can be grouped into four main categories: psychological and social psychological; social systemic and structural; power-conflict; and international systemic. Gurr is an exponent of the psychological explanation of civil violence, which includes simple revolution and great or social revolutions. Another related theorist is James Davies who incorporates a social and historical dimension. The psychological and social psychological explanation for revolution focuses on “the minds of men” or states of mind of individuals and groups. The psychological theory which triggers individual and group rebellion is that of frustration-aggression activated by perceptions or feelings of relative deprivation. It is important to note that relative deprivation is distinct from absolute deprivation, which describes the actual conditions of poverty, inequality, repression, or injustice, as opposed to perceptions of these conditions. When individuals become frustrated by relative deprivation, which is a perceived and comparative sense of discrepancy between their expectations and capabilities to achieve “the goods and conditions of life” to which they believe they are rightfully entitled,” they respond with aggression. If the government is blamed for this frustration, then aggression is most likely to take the form of civil or political violence against the government and its political leaders. The degree of politicized discontent, therefore, influences the magnitude and forms that political violence can take, ranging from turmoil to full-scale social revolution.

James Davies relies upon this relative deprivation model to propose the J-curve theory of rising expectations. In his words, “revolution is most likely to take place when a prolonged period of rising expectations and rising gratifications is followed by a short period of sharp reversal.” It is the suddenness of the reversal in social conditions after a prolonged period of improvement that triggers insecurity, fear, and discontent. Davies terms this period of sharp reversal the “intolerable gap” between a person’s expectations and gratifications. This gap provokes individual and

societal-wide frustrations, and when it becomes intolerable may explode into violent action or revolution. The Davies theory of revolutionary causality ostensibly places a greater emphasis on collective behavior and societal factors as induced by economic downturns and tragic historical events. Both the Gurr and Davies' psychological explanations of revolution, however, have been difficult to test or verify empirically, in large part, because neither theory has successfully measured, as opposed to inferred, qualitative factors, and individual or collective states of mind.

A number of the social systemic and structural explanations of revolution focus on either or both the "lag" and "disharmony" effects believed to exist in the complex process of social change. Theories in this category generally assume that extensive and rapid social change is disruptive and breeds discontent and strain which feed social turmoil. To some degree these theories imply a type of "systemic frustration" or systemic failure as the necessary preconditions for social revolution. Although reminiscent of the relative deprivation and J-curve effects of the psychological theories, certain social systemic explanations (for example, Ivo and Rosalind Feierabend and Betty Nesvold) rely more on structural conditions and their wider impact in creating "the revolutionary state of mind."

Modernization and the conflict between traditional societies and transitional and modernizing ones, especially the tensions between the values and structures of an old or receding social order and a new and emergent one are often identified to be at fault. A classic in this genre is Barrington Moore's *Social Origins of Dictatorship and Democracy*, which describes social revolution as one outcome of the challenge of modernization and the process of capitalist economic development. Employing the Marxian historical dialectic, Moore argues that the transformation of traditional agrarian and pre-capitalist societies into a new capitalist and industrialized economic order unleashed class conflict and social revolution. Democracy resulted out of this struggle, either peacefully or via social revolution, when the bourgeoisie or capitalists emerged as the dominant class in the modernization process. Social revolution of the peasant type, however, led to an authoritarian or totalitarian outcome.

The anthropologist, Eric Wolf, proposes a similar theory linking social revolution and the diffusion of "North Atlantic capitalism." Historically, the process of capitalist development inflicted an alien cultural and economic system on wide geographical regions of the world which precipitated internal strife and social revolution. This diffusion of capitalist values and structures of economic organization reduced the value of man into that of an economic actor and alienated him

from the production and creative process and eroded his social and communal ties. The insidious process of societal subversion in the transition from an old to new social order created social conflict and intolerable strain, which was ultimately expressed in social revolution.

Perhaps the culmination of this social subversion explanation for revolution is found in the social systemic theory of revolutionary change of Chalmers Johnson. In the sociological literature, Johnson is a structural-functionalist, or one who views the social system as analogous to a living, adaptive organism with established structures, processes, goals, and functions. The main purpose or goal of all these structures and processes is to preserve and maintain vital functions and the viability of the social system. Society as a system must maintain itself in a steady state or adaptive equilibrium. Social revolution occurs when the components of society are unable to "preserve system structure in the face of changing environmental conditions." In short, society can no longer adapt to the forces of change, so that, in his terms, the social system falls into disequilibrium. Social revolution, therefore, represents the complete breakdown of a "disequilibrated social system."

Despite the jargon, Johnson's schema of social revolution is an elegant process model that moves from longer term environmental and social causes to medium-term political and more immediate strategic causes of revolution. "There are two clusters of mutually-influencing necessary . . . causes of any revolution," he explains. "First there are the pressures created by a disequilibrated social system—a society which is changing and which is in need of further change if it is to continue to exist." Then a "second cluster of necessary causes revolves around the quality of the purposeful change being undertaken while a system is disequilibrated." And lastly, he writes, "the final, or sufficient, cause of a revolution is some ingredient, usually contributed by fortune, which deprives the elite of its chief weapon for enforcing social behavior (accelerator)." Terms, such as "power-deflation" in the decision-making arena and "status protestors" describe attempts by policy elites to correct or rebalance the system and to control polarization of pro- and anti-system interest groups. Finally an "accelerator" or an event that provides hope to the insurgents and undermines and prevents authorities from using force to reestablish order, leads to the loss of authority of the elites and a revolutionary insurrection.

The Johnson model serves as an effective organizing device to explain the key elements of major social revolutions. The theory explains revolution within a holistic framework, emphasizing the important relationship between values and structures and between

objective conditions and evaluations of these. Nevertheless, Johnson's model of social revolution has not served as a predictive theory. Moreover, some critics argue that the theory distorts social reality and exaggerates the degree of social stability that generally exists in most societies.

The competing explanation of social revolution by Charles Tilly, in contrast to Johnson's assumptions of social stability, holds that the norm in social and political behavior is power struggle and conflict. Ultimately revolution can only succeed because of supportive political conditions and power relationships. Developed in reaction to the complex conditions for revolution imposed by the social systemic theorists, the power-conflict approach redefined revolution as primarily a political phenomenon and an endemic struggle over scarce resources, power and influence. Thus the focus is not on social revolution but on revolution generally and challenges to the established political order and its monopoly of coercive force.

Conflict is endemic because not all groups enjoy access to power and influence, and political actors must compete constantly for access to the state. Government is defined as the organizational structure which controls the principal means of coercion. The non-governmental actors are the contenders in the struggle for power and influence. These include the polity, or the groups which interact with the government and are generally successful in realizing their political demands; and the challengers which are excluded from the polity and compete unsuccessfully in the political struggle. A third group, the non-contenders, are not active participants in the political system. The patterns of interaction among these actors, much like competing interest groups, create potentially conflictive political behavior that can readily escalate into revolution. Indeed revolution occurs when the government controlled by a single polity becomes the object of struggle by contending groups. Because threat and conflict are constant features of political participation, no special psychological or motivational factors of rage or deprivation are necessary to explain revolution. In a sense, this "realist" theory reduces revolution to an innate, instinctual struggle for power, comparable to realism in the international relations theory of Hans Morgenthau.

Although within this conflict tradition, Marxist-Leninist explanations of social revolution focus on another set of key actors: classes, the state, and the international system. Karl Marx's classic theory describes social revolutions as "the locomotives of history" or as the product of inevitable historical forces driven by the mode of production within any given society and the violent clash between the owners and non-owners of the means of production or property.

In the capitalist stage of production these opposing classes are the capitalists or bourgeoisie and the workers or the proletariat, respectively. As the relations of production in capitalism deteriorate and workers misery intensifies, workers develop class consciousness and launch a "national struggle," which spontaneously "breaks out into open revolution" against the bourgeoisie.

Lenin, the famous Russian revolutionary, internationalized the Marxist theory of social revolution and adapted it to the particular reality of medieval Czarist Russia. Through the creation of a Marxist-Leninist party and a broad class alliance of workers and peasants, Lenin defied classic Marxism and proved that social revolution could also engulf Russia, a backward, pre-capitalist, and pre-industrial society. His greatest contribution to social revolution, however, was his theory of imperialism as "the highest stage of capitalism." Mature capitalism, Lenin argued, had extended its lease on life by exporting its system abroad to colonies, opening up new markets and new sources of cheap raw materials. In the process, the world capitalist revolution which Marx predicted to begin in the most highly developed and industrialized countries instead shifted to the underdeveloped, Third World countries. The Russian Revolution became the vanguard in this chain of international social revolution. Joseph Stalin extended this Leninist theory: "Formerly, it was the accepted thing to speak of the existence or absence of objective conditions for the proletarian revolution in individual countries. . . . Now we must speak of the existence of objective conditions for the revolution in the entire system of world imperialist economy as an integral unit." Thus, revolution will begin "where the chain of imperialism is weakest."

In *States and Social Revolution*, Theda Skocpol adapts both the class struggle and internationalizing dimensions of the Marxist-Leninist theories of revolution by redefining and emphasizing the role of the state as a central autonomous actor. "Social revolutions," she argues, "should be analyzed from a structural perspective, with special attention devoted to international contexts and to developments at home and abroad that affect the breakdown of the state organizations." Skocpol views the state as a power broker between dominant and subject classes in society, sometimes reflecting dominant class interests, but fundamentally independent of class and motivated by the goals of internal order, efficient governance and resource extraction, and survival in the competitive international system.

In the final analysis, social revolution is caused by a crisis of state that is both domestically and internationally induced. Social revolution involves

the “intersection between international conditions and pressures ... and class-structured economies, and politically organized interests.” In other words, a powerful and effective state and a supportive international system translate into the absence of social revolution. Skocpol’s explanation of the causes of social revolution clearly exemplifies an international systemic theory. Her theory departs from the traditional view of revolution as an exclusively internal or sub-national phenomenon, and demonstrates the correctness of Lenin’s logic that social revolution remains internationally conditioned.

Indeed, the most significant trend in theories of social revolution in the twentieth and twenty-first centuries has been in the international dimension. Skocpol’s focus on the international environment of the state and on its structural properties represents a necessary conceptual shift, long implied, but never as explicitly and convincingly elaborated. Social revolution exclusively conceptualized as “internal war,” the innovative term of Harold Eckstein, no longer resonates in this era of globalization when the theoretical and actual boundaries between revolution and war are less defined. In the twentieth century, the term revolutionary war favored by Mao Zedong and Ho Chi Minh in their Marxist social revolutions in China and Vietnam, respectively, exemplified this growing elision of revolution and war. Today, for example, global terrorism operates extraterritorially and serves both the ends of internal and external war.

Nevertheless, an essential lesson learned in the most recent historical cases of social revolution in Nicaragua and Iran is that causality is fundamentally internal. National societies and people make social revolutions because the causes are rooted in internal, domestic conditions. External influences and intervention may temporarily tip the scales in revolutionary strategy, but have been unsuccessful in promoting lasting reform or stability. Internationalization or globalization of social revolution through intervention has confounded local and regional problems with global power conflicts—earlier East-West tensions, today North-South tensions. Global terrorism, to the extent that it may have become an instrument of social revolution within countries, as well as within specific world regions, or the world system as a whole, appears to have fallen into a similar trap. Perhaps this meshing of internal and external war has become the face of social revolution today.

### SOCIALISM

In Marxist doctrine, Socialism is the stage of society that comes between the capitalist stage and the communist stage, in which private ownership of the means of production and distribution has been eliminated. Socialism established itself worldwide to the extent of receiving global acceptance in the twentieth century not so much because it was built into a system by such profound thinkers as Marx and Engels; nor even because it was espoused by a devoted and brilliant activist like Lenin, who applied the theory, with such variations as were necessary, to a concrete situation. Those were certainly important, but the main reason for the spread of socialism was that it answered some specific needs. It was only because the prevailing social order, capitalism, was unable to meet these needs, or the contradictions, to use the Marxian jargon, which it had generated, that an alternative system was conceived, and, that is why, most importantly, it was widely accepted.

Two consequences follow from this. First, socialism as a social order which seeks to supplant capitalism can succeed only as long as it needs, or resolves the contradictions of capitalism, to the satisfaction of the people, specifically the articulate section thereof,

and does not itself generate contradictions which alienate the people. Second, socialism can retain its competitive advantage over capitalism, which continues to exist as a parallel order, as long as the latter does not, by suitable modifications of its system, resolve by itself the grosser forms of contradiction it had earlier generated.

Karl Marx is sometimes criticised for having built his system round the basic conflict between the owners of the means of production, the industrial bourgeoisie, and the industrial workers, the proletariat. On this basis, he foresaw socialist revolutions taking place in the highly industrialised countries where the proletariat was or could be well organised. This did not happen. The criticism of the Marxian thesis is, therefore, legitimate. The system that Marx built was, however, not vitiated, because the contradiction which he had identified did exist in reality between the owners of the means of production and the private profit motive which inspired them, on the one hand and the interests of the property-less masses on the other. In fact, where Marx erred was to take a narrow view of the contradiction and emphasize the conflict between the industrial bourgeoisie and the workers only.

Another illusion that early communists cherished was that of a world revolution. Trotsky, for instance, regarded socialism in only one country as an anomaly. As a consequence, an element of competition was introduced which led to the ruinous Cold War. The Cold War exhausted both sides, the United States and the Union of Soviet Socialist Republics (USSR). It converted the former into the biggest debtor country in the world. The United States also lost some of its competitive edge to its allies, and industrial rivals like Japan and Germany. It, however, not only survived, but with the help of the entire capitalist bloc, was able to inflict a mortal blow on the Soviet Union and the then socialist countries of Eastern Europe. Engaged in a financially exhausting arms race with the United States and concentrating all its energies on such areas as space research, missile technology, *et al.*, the socialist group lagged behind in industries and manufactures.

The contradictions of capitalism, which were the *raison d'être* of socialism were indeed to an extent resolved by the socialist regimes. The health and education services were superior to any in the capitalist world. As a consequence, there was a certain amount of leveling down. The glittering shop windows catering for the rich, the luxuries of five-star existence in the developed capitalist countries were markedly absent in the socialist states. This was not inconsistent with the socialist philosophy and would have presented no insuperable contradiction if the cardinal

mistake had not been made of denying democracy to the masses. In fact, not only was democracy denied, but the state resorted to violence and terror in enforcing its diktat. This certainly reached its height under Stalin in the Soviet Union, but was accepted as a principle of state policy by all communist regimes, even in the post-Stalin Soviet Union and in all Eastern European states.

Two consequences followed from this. First, the masses, denied all participation in governance of the country and often forced to accept decisions handed down from above, developed no understanding of the socialist system. They regarded the benefits they received in social affairs as gratuitous, while they not only resented such high-handed measures as forced collectivisation, but nursed grievances against some of the development measures of the five year plans that were handed down to them without consultation. In these circumstances, socialist consciousness did not develop and when socialism was in peril, there was no mass upsurge to defend it.

Second, a more serious contradiction developed from the denial of democracy. In the name of the vanguard role of the Party, power was appropriated by Party cadres, and shared by them with the government bureaucracy which grew in strength with the implementation of centralised plan. A new class thus developed in what should have been a classless society, which exercised the immense powers of the state. And it was here that the time-tested dictum, that power corrupts and absolute power corrupts absolutely, operated. The Party and government bosses lived in luxurious dachas, moved about in limousines and generally threw their weight about. This not only alienated the masses, but what was perhaps worse, distorted the vision of the young aspiring Party cadres and government bureaucracy who, with no allegiance to the concept of socialistic equality, were lured by the luxuries of the developed capitalist countries. It was this class of people, executives in state undertakings, Party and government officials, who started the drift, some by physical migration to the West.

Stalin is generally blamed for having introduced dictatorial and terrorist methods in state administration. The blame is not undeserved except that these practices were not introduced, but only carried to an excess by him. The seeds of Stalinism were sown when pleas for democracy by leaders like Rosa Luxemburg were not heeded and concepts of democratic centralism and dictatorship of the proletariat were sponsored by Lenin himself, the architect of the Revolution of 1917. It is possible that the circumstances immediately following the Revolution compelled him to do so, and that had Lenin lived longer, he would have introduced real democracy. This is, however, a matter

of speculation. The fact remains that the humanistic aspect of socialism which was not only the reason for its emergence as a social system, but its basic strength is replacing the then unjust social order, was overlooked in the popular mind, and socialism came to be identified with denial of democracy, dictatorial methods and even violence.

The second factor, namely, readjustment of mature capitalism to meet the contradictions generated in the earlier phase, also operated. With technological advancement, the needs for exploitation of local labour as in nineteenth century Britain, or of slave labour as in the United States, or even of the colonial masses as practised by several of the West European countries for primary accumulation of capital, ceased to exist. Enough was produced for the employers to share a part of it with the workers. This was reflected not only in better conditions of service, but in welfare measures and social security systems. Roosevelt's New Deal in the United States during the Great Depression of the 1930s, and the Beveridge Plan in Britain, as also Welfareism in the Nordic countries during the post World War II period, represented this changing face of capitalism.

These measures undoubtedly lacked stability. They depended on the decisions of capitalists of what could be spared after providing the necessary incentives to risk capital and attracting managerial talent. An industrial recession, as at present, has witnessed such measures being slashed. Social security has suffered with the rise of unemployment, again as at present. With "jobless growth" on account of technological advances, the future holds little prospects of improvement.

Nevertheless, the improvements offered to the standard of living of the workers in the developed capitalist countries have lured them to demand more out of the present system rather than change it. Economism has taken the place of revolutionary fervour in these countries.

It is not within the purview of this essay to undertake a detailed analysis of the immediate circumstances that led to the collapse of socialism in the erstwhile Soviet Union and the East European combines. Obviously, no leader firmly rooted in socialist values appeared who had sufficient stature to make the much-needed changes in the prevailing regimes. In retrospect, Khrushchev who exposed excesses of Stalin at the Twentieth Congress showed no understanding of the basic malaise. The system continued, though the excesses were avoided. The last attempt to change the system was by Mikhail Gorbachev with his *perestroika* and *glasnost*. They were ill-conceived, and ended in disaster, throwing doubts about his credentials as a devoted socialist. The collapse was complete both in

the heartland of the erstwhile Soviet Union and in East Europe. Socialism was replaced by the primordial instincts of ethnicity, regionalism, and religious fundamentalism. But socialism is not dead beyond revival.

### SOCIALIST ECONOMIC MODEL

There are many types of socialist economic models; however, all share the key principles of collective ownership of the means of production, egalitarianism, and public provision of social services.

The oldest and most widespread type is the Marxist one, based on the philosophies of German radical philosopher Karl Marx. He considered communist society, an association of free men acting as one collective, yielding a great social workforce which is used consciously and in a planned manner to achieve the society's common goals.

The Marxist theory is based on the classical economic theory of labor value adjusted to modern capitalist production methods. The only source of value is the work itself, the value of each demanded good is directly proportional only with the amount of labor used to produce that good. In capitalism the workers sell their labor as a commodity. The capitalists, who own the means of production, sell goods at higher prices than they have paid for the labor. This extra value enriches the capitalist, who profits without working, just by owning the means of production which are also the result of previous exploitation.

Capitalists can better exploit their workers if they put them to work on machines, hence producing more goods for the same labor costs. The "relative surplus

value” of each good grows. The hopes of higher profits will result in competition, which can increase to that extent when too much is produced, exceeding demand. This extra production capacity, leads to crises, which lead to massive layoffs and bankruptcy of smaller firms. This subsequently fosters the concentration of capital as the large firms survive. These firms, taking advantage of the large pool of available labor versus the small number of jobs, can drive down the wage level. The reduction of labor costs and the reduced competition, paralleled with the crisis, cause the devaluation of capital goods which in turn favors the increase of the production until the process repeats itself ending into a new depression, after a shorter cycle by this time. As the main ideology of capitalism is the struggle for permanent, unlimited growth, the system draws itself into collapse by its inherent nature, since unlimited growth cannot be sustained. Thus wages become smaller and smaller to increase profits. Classical Marxism affirms that this decadence is continuous, the process can be delayed but the final collapse cannot be avoided. Therefore the “inherently rotten” capitalism is speeding its way towards self-destruction. The socialist revolution wipes out the roots of the establishment—the private ownership, the capitalist class—but maintains at the same time its achievements: the high productivity, educated worker class, and the economies of scale. Thus according to Marx, the order of achieving perfection looks as it follows: capitalism as the thesis, socialism as the antithesis and communism as the synthesis.

In Lenin’s vision of this accelerated process of self-combustion, capitalism cannot be satisfied with the existing resources; therefore, in the highest stage of its evolution, it turns into imperialism. The continuing growth can be maintained only through conquests and other ways of extended control and domination. This will result in leading capitalist countries trying to control the world’s resources, causing large scale wars. Because wars destroy production factors, there is need for another successful war to repair or complete the depleted resources. In this case, war prospects eliminate competition and gearing up production, causing growth and excess supply of goods. However, this will cause price levels to plummet, and therefore yet another war will be needed to create proper demand. The resulting high prices yielded by the shortage will increase revenue levels to satisfy the ever growing capitalist hunger for profits. So capitalist states will destroy each other in the end—a vision Stalin firmly believed.

Stalin continued the societal transformation started by Lenin, but in a radical style Marx or Lenin couldn’t have imagined. The Stalinist model meant the total nationalization of all the means of

production, including land, services, and commercial activity. Thus the state became the one and only capitalist, having a complete monopoly not only in the economy but in the society as well, in the form of totalitarianism.

The economy operated according to the will of its central planners. In five-year plans, bureaucrats forecast the needs of the economy and population for five years ahead. The price system was determined by the state, by planners who made forecasts regarding production targets and consumption patterns. This socialist model involved a huge bureaucratic apparatus without feedback from the markets. This in turn avoided the influence of business cycles; thus the model would ideally achieve macroeconomic stability mostly due to its closed character. Since markets and the price mechanism were nonexistent or could not play their regulatory role, planners created a rigid system based on dirigisme. This resulted in an economy of shortages due to forced savings and industrialization.

The ownership and control structure of the socialist enterprise has three pillars: the paternalist leader (the party), the state bureaucracy, and the corporate management. In the Stalinist model, the greatest role was played by the paternalist leader; in the central European model, by the corporate management. The state paternalism was expressed by the securing of markets for the products.

When socialism was first introduced, it was beneficial to the poorer strata of society, as it leveled incomes and wealth through reallocation of the existing resources. Countries who adopted it virtually put an end to unemployment, although at the costs of giving up competition as well as productivity requirements. As the surplus value and previously seized capital stock vanished, accompanied by fading enthusiasm on the part of workers, most of the socialist companies stayed in a situation of permanent bankruptcy governed by the state. Due to central planning an economy of shortages followed, certain categories of consumer goods, especially basic ones like food and energy had to be rationed leading to severe malnutrition (Stalinist Soviet Union, Ceausescu’s Romania) and famine (Ukraine after WWI and currently North Korea).

After de-Stalinization, market socialism emerged. Market socialism, as with all socialist models, relies on public ownership of the means of production, but the decision-making and information structure are decentralized and the economy is coordinated by the market forces. Labor incentives are pecuniary. In the event of shortage or surplus, prices are adjusted to reach macroeconomic equilibrium. This control of pricing can be used to correct market failures like

externalities or to lessen the impact of business cycles. The income of the economy can be viewed as “social dividend” and is used to finance investment to achieve growth and distributional goals.

The cooperative version of market socialism differs from the prototype (Lange) model in that that decisions at the enterprise level are taken by the workers, which in turn leads to an equitable income distribution. This resembles more a market system as the prices are set by markets, not by the planners, and the labor market is liberalized. Cooperative market socialism eliminates capitalist dichotomy between management and labor and achieves greater social justice, but can lead to misallocation of labor and resources, resulting in unemployment.

Some leaders of Central European countries tried to turn the socialist model into “socialism with human face.” The Hungarian model of welfare communism, “goulash communism,” adopted in compensation after the crushing of the anti-Soviet Hungarian revolution in 1956, aborted partially the forced industrialization path. The economy became more open, allowing private entrepreneurship in form of small cooperatives or economic workgroups. The quasi-socialist model couldn’t overcome the inherent difficulties of the system; growth and the standards of living were maintained at the heavy cost of foreign debt.

In the former Yugoslavia, Marshall Tito introduced a cooperative type of socialism, based on worker ownership and open economy where foreign trade wasn’t used only to correct planning failures. The Yugoslav model inspired neighboring socialist countries. The country replacing central planning with bottom-up and informational indicative planning. The economy became open and integrated into the world economy, with non binding macroeconomic targets. Fiscal or monetary policy was used at a minimum level to stabilize economy. Ongoing decentralization led to enterprise autonomy, allowing workers to control the use of their profits. Private entrepreneurship was allowed as in Hungary, but if a workforce exceeded five people, it must be organized as a workers’ cooperative. In cooperatives, workers elected the workers’ council which acted as a board of directors. Governance structures resembled that of a capitalist firm. In spite of worker management of the enterprises, however, investment remained highly centralized and saving was forced especially through high taxes. The government would over invest and routinely bail out failing enterprises.

Fidel Castro remained faithful to total isolation. The Cuban model was inspired also by pre Colombian cooperative labor and was based on a combination of national pride with social dignity, augmented by strong fears of total social and economic annihilation

by the United States. The paternalistic regime has survived, and has gradually opened its markets without changing its ideology.

The isolationist stance was followed by Ceausescu, who turned Romania into a model Stalinist economy mixed with nationalist socialist ideology. National-communist Romania adopted an almost complete autarky compensated by a state fueled aggressive nationalism—denying the key principle of communism, the brotherhood of the nations.

All these routes to communist socialism converged to a common and nearly simultaneous end—the mostly peaceful collapse of the Soviet Union, its European satellite regimes, and most of its third world allies. This was the consequence of the adoption of the human-face socialism in the Soviet Union under party leader and president Mikhail Gorbachev. As the Soviet Union’s status as a superpower vanished, the forces of international solidarity were proven too weak to withhold the system from economic and political collapse.

One reason for the failure of the socialist economic model was the political ideology that promised better standards of living than in capitalism, but which failed to deliver. The other reason was purely political and mostly cultural: former communist societies in Europe and Eurasia were fed up with dictatorship and longed for democracy, which was seen as inextricably linked to capitalism. Some nations, such as China, maintained their communist political establishment but loosened their markets, leading to a state-controlled capitalist development path.

Vietnam abandoned its mixture of national ideological unity and orthodox socialism and has adopted market economy with socialistic orientation. After twenty years of reforms, or “doi moi,” Vietnam has accepted market mechanisms and international economic integration as the means to build-up socialism. In spite of the successes, the necessary market—economy institutions are not fully established and lack transparency. The economy does not provide a level playing field for private enterprises and is largely dominated by big state-owned monopolies.

The Chinese model of socialism evolved on Marxist foundations, settling on extreme uniformization and canceling individual initiative. Mao Zedong envisioned development based on agriculture, given the rural nature of most of the country, but the Cultural Revolution tried to wipe out every traditional value and thus make way for rootless modernity. Witnessing the reform process and the downfall of socialism in the Soviet bloc, China developed a socialist market economy, becoming more of a developmental economy without much social concern. The Chinese socialist market economy model maintained the classical

planned economy structure allowing for privatization, small private enterprise creation and foreign direct investment, while heavily subsidizing large state companies in order to develop successful Chinese multinational corporations in strategic sectors. The economy is controlled from the top; leading enterprises are founded or owned by important party officials, while the general population is given small investment and entrepreneurship opportunities. The country has embarked on a breakneck pace of industrialization, transforming the mainly rural society into the factory of the world. Although producing outstanding growth and posing serious economic challenges to other market leaders, the Chinese production is mainly low-tech assembly-line output of components, while the developed world's companies own the intellectual property rights. This situation may change soon as China tries to follow a similar technological development path like Japan and the earlier "tigers." On the other hand the uneven income distribution affects the masses heavily and lack of democratic freedom makes the foundations of this third way quite fragile.

A noncommunist socialist economic model was developed by Sweden which preserved private ownership and markets but leveled the inefficiencies of the resulting income distribution by differentiated taxation, regulating the labor market, and providing a social security net for every employee, creating a successful welfare state.

### SOLIDARITY UNION

**Solidarity** (*Solidarnosc* in Polish), Polish trade union that initiated the beginning of political reform in communist Poland. Founded in Gdansk in September 1980 as a coalition of trade unions, Solidarity's original goals were to protest sharp inflationary pressures in the 1970s, particularly of high price increases for food.

Like much of the industrialized world in the 1970s, increased energy and material costs imposed inflationary pressures that damaged the Polish economy. Furthermore, contractual agreements with the Soviet Union favored supplying Moscow with raw materials and food at lower than any reasonable market rate. Poland and other countries within the Warsaw Pact essentially subsidized some of the Soviet Union's costs. Though the system was packaged differently, it economically resembled some of the unfair trading practices that Britain and France had imposed on their colonies during their imperial eras. Moscow routinely issued demands with regard to trade, production, and distribution on its satellite countries. Locals had virtually no input and national governments in many ways performed as provincial or state governments. This Soviet command economy system was inefficient and resulted in tremendous shortages in essential products such as food, toilet paper, and soap.

Economists frequently blame the lack of a market mechanism in determining price and value for the collapse of the communist system. Black markets, which inevitably benefit the wealthy and the well-connected, flourished under such conditions. It is an economic paradox in that a government-controlled price system would create black markets that would benefit the elite. Solidarity emerged as a movement that sought to correct such injustices. The government-controlled market adjusted prices upward to reflect the growing costs endured by the state agricultural board. By the mid-1970s, serious protests emerged from workers who endured increasingly difficult conditions. After a food strike in 1976 that resulted in the arrest of thousands of workers, a group of intellectuals decided to form the Workers' Defense Committee (*Komitet Obrony Robotnikow; KOR*). The KOR provided assistance to the families of those that were imprisoned.

Gdansk, a large industrial port city, was the geographic center of the Solidarity movement. Lech Walesa, an electrician by trade, became one of the leaders of the effort to improve living conditions for workers. By the summer of 1980, Walesa was widely perceived as a “moderate” leader who sought to negotiate better pay and lower prices for workers. As protesters grew in size (from the thousands to tens of thousands) and in scope (they began to spread throughout Poland), Walesa obtained stronger bargaining powers with the government. On August 30, 1980, the Polish government signed an accord that allowed unions to be free and independent from the national communist party, gave them the right to strike, and allowed limited freedoms of religious and political expression. These reforms were substantial for the time in Eastern Europe. In many ways, these reflected the efforts of the Czechoslovakian government in spring 1968 and in Hungary during 1956 to develop a more democratic version of communism.

On September 22, 1980, a delegation of thirty-six regional trade unions met and Solidarity was formally founded as a national political entity. The formalization disbanded the KOR as members became part of a legitimately recognized group. After viewing heavy industry’s success, a group of over a thousand farmers met in Warsaw on December 14, 1980, to form Rural Solidarity (*Wiejska Solidarnosc*) to assist the agricultural sector in voicing opposition to national communist production and pricing policies.

The Polish government under the leadership of Premier General Wojciech Jaruzelski played a difficult balancing act in trying to keep Polish workers satisfied and maintaining the confidence of the Soviet government. Throughout 1981, the Solidarity efforts increased. Walesa and other moderates continued to struggle between the militant wing of their movement and continual negotiations with Jaruzelski’s regime. The Soviet government openly and covertly interfered with Solidarity’s negotiations. Jaruzelski was constantly reminded by the Soviets of the consequences (a Soviet invasion such as in Czechoslovakia in 1968 and in Hungary in 1956) of his inability to restrict the Solidarity movement. The pressures increased too much for Jaruzelski. Fearing military intervention by the Soviets, martial law was imposed on December 13, 1981. For over nineteen months, the Polish military ran the daily affairs of the government. Walesa and most of the leadership were imprisoned during this crackdown. Polish martial law continued until after the political climate in Moscow softened (with the deaths of Soviet leader Brezhnev in November 1982 and the terminal illness of longtime KGB director and succeeding Soviet leader Andropov). By the summer of 1983, conditions slowly became

normalized. Throughout the remainder of the 1980s Solidarity functioned as the voice of opposition to the national communist party. In 1989, political reforms due in part to Soviet leader Gorbachev’s increasing tolerance, allowed open elections. Walesa became the first democratically elected leader of Poland by the end of 1989.

Solidarity’s chief contribution to development was that it functioned as a type of evolution within the communist system. The organization also underscored the paradox of the communist system established under Stalin after WWII. The political system was supposed to represent the interests of the workers and yet when the workers expressed an opinion different from the establishment, they were suppressed. Solidarity serves as a reminder of the non-democratic nature of Polish communism. Ideologically, the movement was compromised of many types. The organization’s power was based in its opposition to tyrannical conditions. The movement functioned more as a social democratic movement. However, there were other minor coalitions or special interest groups within (such as Catholics, small farmers who sought privatization, and intellectuals seeking more freedom of speech) Solidarity that gave it national and international appeal.

The martial law crisis of 1981–1983 reminded the world of the essential communist imperialism that Stalin and his agents had established. This coincided with Ronald Reagan’s rise to the US presidency with his accusations of the Soviet Union as “an evil empire.” The martial law and other suppressive actions used against Solidarity played right into President Reagan’s portrayal of the immoral Soviet Union. Many authors cite Solidarity’s civil disobedience as the beginning of the end of Soviet control of Eastern Europe. However, it was new Soviet leadership under Gorbachev (not within Poland) that allowed significant reform to occur. Solidarity can be viewed as a product of the elitist form of communism constructed during the Cold War. The workers sought better living conditions against a government that claimed to guarantee them.

## SOLOMON ISLANDS

The Solomon Islands are a constitutional monarchy with the English monarch as Head of State, represented by a Governor General appointed by the Parliament for five years. The National Parliament comprises fifty members elected by first past the post vote for a four-year term. The Prime Minister, elected by the Members of Parliament for a four-year term, selects a Ministry who are officially appointed by the Governor General. The country is divided into nine provinces, each with a local Assembly elected by popular vote and a Premier. The Provincial Assemblies have local responsibilities in the fields of health, education and communications.

In late 1998 a violent conflict erupted between the inhabitants of the island of Guadalcanal and thousands of migrant-settlers, mainly from the neighbouring island of Malaita, who were attracted to the economic opportunities offered by the capital, Honiara. A *coup* by the Malaita Eagle Force in June 2000 ousted Prime Minister Ulufa'alu. A peace agreement signed in Townsville in October 2000, failed to end the violence and armed groups are still active in Honiara and elsewhere in Guadalcanal. In late August 2002, a Cabinet Minister was assassinated on the Weathercoast of Guadalcanal for which rebel leader, Harold Keke claimed responsibility. The Solomon Islands cabinet has been criticised by donor countries for failing to curb militia members and Cabinet Ministers themselves have been responsible for attacks on a local newspaper office and threats to kill. Many of the police are reported to be running illegal businesses and have refused to hand in weapons stolen from police armouries. A ceasefire was signed between warring ethnic groups on August 5, 2000, followed by the Townsville Peace Agreement on October 15, 2000,

and the Marau Peace Agreement on February 7, 2001, which was facilitated by Australia and New Zealand. An International Peace Monitoring Team was forced by ex-combatants to withdraw from most of its outposts, illustrating the failure of the agreements to bring about sustainable peace.

The social, economic, and political complexities of resource extraction are common to conflicts about development in the Solomon Islands, to which must be added the difficulties generated by in-migration. The conflict resolution process that was used to diminish the 1998–2000 conflict in the Solomon Islands was critiqued for failing to address underlying governance related problems that were focused on decentralisation and internal migration. The central government failed to respond effectively to demands for better distribution of resources to the different provinces; failed to address problems that had arisen from internal migrations, in particular the settlement of Malaitans on Guadalcanal Island; and failed to ameliorate confusion regarding the applicability of the traditional practice of compensation payments, which meant that the people of Guadalcanal did not have access to clear channels to seek redress for their grievances.

The Solomon Islands Alliance for Change party's *kastom* feast in Honiara, held to try to settle the conflict, was also deemed ineffective because opposition party members were not present, and issues raised by people from Guadalcanal were not addressed. However, the government did establish a committee to review the existing government system, and the Honiara Peace Accord called for an investigation into land that had allegedly been illegally acquired by Malaitan settlers. Nevertheless, as the conflict escalated, resolution efforts were concentrated on stopping the violence, attention to underlying issues dissipated, and progress towards the implementation of constitutional reform and discussion of internal migration was slowed. Hence, it is likely that conflict about development will continue in the Solomon Islands due to the problems generated by an incapable and failing state, young male unemployment, in-migration, and patriarchal attitudes towards women, combined with ineffective internationally based conflict resolution processes that do not respect local concerns.

Indeed, Australia perceives the Solomon Islands' inherent political instability as providing a potential site for terrorist activities. But inequitable distribution of resource extraction benefits link to ethnic tensions, the subordination of women, and youth unemployment and warrior constructions of masculinity to limit potential benefits from development.

Solomon Islands women, in particular, have faced the many challenges of ethnic conflict and then

lawlessness as armed gangs held sway before 2003's Australian-led intervention. Solomon Islands men, used to the status gained from war and weapons, had difficulty reintegrating into fragile postwar societies, which offered few employment opportunities. As frustration led to battering of wives and children, violence and lack of respect for girls and women are now considered key human rights issues throughout Pacific countries.

Significantly, the capacities of Solomon Islands women are also unrecognised. Women interposed themselves between the two militias in the capital Honiara for weeks in an effort to end conflict, and formed the Bougainville Women for Peace and Freedom (BWPF) group, which worked with militia groups, the government and others to promote peace in 2000. Recent publications recount the stories of women who fled their homes for the jungle to escape violence, living on the run, giving birth in leaf shelters and caring for the frail and the elderly, and using customary knowledge and self-reliance to rebuild community structures in their bushland.

Also unrecognised by development project designers and practitioners in the Solomon Islands is the social significance of the Christian church. The organisation is a key to effective policy implementation and potential political stability in many south Pacific nations where significant proportions of the population self-identify as Christian. Church institutions play both positive and negative roles, sometimes generating strong connections between peoples and a constructive sense of nationhood, at others denominations become sources of division and members mobilise around their ethnic and religious identities. Another important oversight is that women's groups created by churches which are active in townships and rural areas, conduct important group activities, and serve their community's needs, are barely acknowledged.

Currently a mosaic of post-conflict societies, Solomon Islanders have significant work ahead to ensure all citizens receive the benefits of development.

### SOMALIA

Somalia is an arid country in the northeast Horn of Africa. The plains between the Jubba and Shebelle rivers, south of the capital of Mogadishu, are the only significant farming areas. Most Somalis were traditionally nomadic camel and goat herders, organised around clan and lineage ties. The limits of clan territory were that which they could successfully defend amidst constantly shifting clan alliances. Somali perceived no boundaries in the Western sense of tenure or fixed territory. There are Somali communities in Djibouti, Kenya, and the Ogaden region of Ethiopia, as well as Somalia.

Today many educated Somali have moved to the towns seeking employment. The main export trade is livestock through the northern ports of Berbera and Bossaso to the Middle East market and across the southern border into Kenya. However, the main sources of income for many are remittances, some \$1 billion US per year, from relatives in the Somalia diaspora. In November 2001, many Somalis suffered when the United States froze the assets of al-Barakaat, the main international exchange institution

in Somalia, on the grounds of possible links to al Qaida.

Arab traders established coastal towns, which came under Omani rule in the sixteenth century, though pastoral Somali nomads of the interior were little affected. Egypt claimed northern Somalia in 1875, but withdrew in 1884. In 1885, Britain declared a protectorate over northern Somaliland to safeguard access to the Red Sea and the Suez Canal but largely ignored it. Italy claimed the southern Indian Ocean coastline in 1889 and established cotton, sugar, and banana plantations in the Jubba.

After Italy's defeat in 1941, southern Somalia was briefly occupied by British forces but returned to Italy as a United Nations (UN) trusteeship in 1950, in preparation for independence. The nationalist Somali Youth League (SYL) won the election in Italian Somaliland in 1956. Elections in British Somaliland in 1960 were won by the Somali National League (SNL), which advocated reunification and independence, achieved on July 1, 1960.

Somali reunification proved difficult. The new republic was built on two quite different colonial experiences and lacked a national infrastructure. There were irredentist claims against Ethiopia, French Somaliland (became Djibouti in 1977), and the Somali-populated Northern Frontier District of Kenya, as well as internal clan rivalries reflected in the proliferation of political parties. An unsuccessful war with Ethiopia in 1964, over the irredentist claims to the Somali region of Ogaden in Ethiopia, exacerbated internal tension, culminating in the assassination of Pres. Shermakhe. A week later on October 21, 1969, a military coup brought Maj.-Gen. Mohammed Siyad Barre to power.

The Revolutionary Council under Siyad Barre adopted a policy of "scientific socialism," close ties with the Soviet Union, and nationalism through the use of Somali as a written language. Yet the country remained desperately poor. Barre sought to rally popularity by launching an attack on Ethiopia over the Ogaden in 1977. The Soviets changed sides and Cuban-backed Ethiopian forces routed the Somali army, leading to an attempted coup. The autocratic one-party government held elections in August 1979, in an attempt at legitimacy against the clandestine opposition Somalia Salvation Democratic Front (SSDF), founded in 1979. In 1981, the Issaq-separatist Somali National Movement (SNM) began demanding regional autonomy for former British Somaliland. When Ethiopia and Somalia signed an accord in 1987, alienated Ogadenis formed the rebel Somali Patriotic Movement (SPM).

In August 1990, the SPM, SNM and Hawiye-based United Somali Congress (USC) formed a loose

alliance against Barre, who fled to Kenya in January 1991. A short-lived government of national reconciliation ruptured when Ali Mahdi Mohamed was named interim president, reigniting clan rivalries. Ali Mahdi was forced to flee Mogadishu in November 1991, after an assault by USC forced under Gen. Mohammed Farrah Aydid, who proclaimed himself head of state.

The Issaq separatists formed a breakaway Somaliland Republic under SNM leader Abduraham Ahmed Ali, who was ousted as president by SNM rival Mohamed Ibrahim Egal in May 1993. Egal died in 2002, succeeded as president by Dahir Riyale Kahin.

Civil war raged, infrastructure collapsed and drought hit, putting 1.5 million at risk. UN Secretary General Boutros Boutros Ghali berated the UN Security Council for inaction. Ali Mahdi pleaded for UN intervention, opposed by Aydid. The airlifts of food aid sparked fresh clan violence, forcing the withdrawal of aid workers.

In December 1992, some twenty-eight thousand US troops, plus contingents of the French Foreign Legion, Italy, Canada, Australia, Nigeria, Zimbabwe, and a host of other countries, arrived in Somalia, though their mission was unclear. While the US administration insisted they were there simply to secure humanitarian aid, the UN Secretary-General pushed for a more interventionist disarming of hostile factions and pacification. Short-term military and aid objectives took precedence over any Somali political resolution.

The US-led military and UN failed to understand the shifting alliances of Somali clan politics. Many Somalis saw US policy of blaming Aydid as anti-Hawiye clan and pro-Majerteen/Darod. When the US helicopter attacked an alleged Aydid munitions base, killing numerous Somali clan leaders who had gathered for negotiations, opposition to the US/UN presence broadened, leading to a military withdrawal in 1995, amidst mutual accusations and self-justifications.

In June 1995, Aydid was ousted as head of the United Somali Congress-Somali National Alliance (USC-SNA) by rival kinsmen Osman Ali Ato, though Aydid's son, US-educated former Marine, Hussien 'Aydid,' eventually assumed control of the USC.

In January 1997, leaders of 26 Somali factions met at Sodere in Ethiopia to form a National Salvation Council, boycotted by Hussien Aydid. In December 1997, another peace accord based on a federal structure was formulated in Cairo. A third Somali National Salvation Council meeting in Addis Ababa, Ethiopia, in January 1998, but few were prepared to surrender parochial power. An interim Somali government of national unity under Abdulkassim Salat Hassan was proclaimed at Arta, Djibouti, in August 2000, only to be challenged by a coalition of southern Somali warlords backed by Ethiopia.

Failure of the Cairo accord led to the creation of a Harti/Darod clan-based state of 'Puntland' in 1998, under strongman Abdullahi Yusuf Ahmed of the Somali Salvation Democratic-Front. In 1992, Yusuf had thwarted an incursion from the south by Aydid's Hawiye-based United Somali Congress and crushed the Islamic fundamentalist in the northern port of Bosasso, thereby earning the support of the Americans, channeled through their ally, Ethiopia.

In 2004, a new federal government of national unity was negotiated in Nairobi. The parliament was based on clan allegiances, the four major clans—Digil-Mirifle, Darod, Hawiye, and Dir, with sixty-one seats each, with thirty-one seats divided amongst the lesser clans. Abdullahi Yusuf of Puntland, a Harti-Darod, became president. The speaker of the Parliament went to Shariff Hassan Sheikh Adan, of the Digil-Mirifle clan, with a Hawiye as Prime Minister. Somaliland has refused to join the new government. While the international community has tended to cautiously welcome the new government, to many educated Somalis it merely rewards the warlords.

### SOMOZA DEBAYLE, ANASTASIO

Anastasio Somoza Debayle, the second son of Nicaraguan dictator Anastasio Somoza García, was born on December 5, 1925. He was educated at Saint Leo Preparatory College in Florida (at present Saint Leo University), and on Long Island before graduating

West Point Military Academy in 1946. The following year his father appointed him as a head of the National Guard. At this position, he was able effectively to hold enormous power.

Following Somoza Senior's murder in 1956, Anastasio's elder brother, Luis, accepted the presidency, according to a special provision in the constitution for the possible sudden death of the president. He was politically-oriented, educated at Louisiana State University, the University of California, and the University of Maryland. Luis wanted to promote modernization of Nicaragua. He tried to keep lower family profile, and to bring new leaders to rise in the Liberal party. He created new jobs, but they failed to help the poor. This provoked mutinies that were strongly suppressed by the National Guard under Anastasio. Luis despised the idea of his younger brother becoming president, even kept him from running in 1963. After Luis died from a heart attack, just few months later in a rigged election Anastasio won the presidency. Anastasio stepped down from the presidency in 1972, due to the legal provision that barred immediate re-election.

One of the most notorious incidents of corruption in Somoza's regime occurred in 1972 after an earthquake that killed and wounded hundreds of thousands of Nicaraguans. By imposing the martial law, Somoza—as head of the National Guard—became again the country's leader. Thirty million dollars in international relief supplies were seized and sold to the highest bidder.

These circumstances did not prevent Somoza from re-election as a president in the following elections in 1974—even after the powerful Catholic church joined opposition against him. By the late 1970s, human rights groups were reproving the sad record of human rights violations by Somoza's government. Support for the opposition Sandinista National Liberation Front (FSLN) was growing all over the country, and resistance reached the point of a rebellion. This forced Somoza to escape on July 17, 1979, and to fly off initially to Miami, Florida, and later to Asunción, Paraguay, where he was assassinated by Sandinista agents on September 17, 1980.

## SOMOZA GARCÍA, ANASTASIO

Anastasio Somoza García (1896–1956) was born in 1896 to a relatively well-off coffee grower in San Marcos. He was educated at the National Institute of Oriental Studies to earn his degree from the Pierce School of Business Administration in Philadelphia. He married Salvadora DeBayle to enter one of the country's most important aristocratic families. In 1933, he was appointed as the first Nicaraguan commander of National Guard, he skillfully used it to seize power. On February 21, 1934, he induced the popular hero, Augusto Sandino—who had earlier signed a truce and put down his arms, ending years of armed battle that caused an US intervention, to attend a special dinner, where he was executed.

Three years later, following the assassination of President Juan Bautista Sacasa, Somoza seized control of the country to initiate a dynasty of dictators that ruled country with US support for forty-three years.

Somoza managed to stay in power by applying a triple rule. The first element of the Somoza strategy was keeping the National Guard sated, pleased, and loyal. With Somoza's encouragement the guardsmen ran gambling houses, prostitution and smuggling rings in order to bring in profits. The next element, keeping the United States happy, involved as first priority backing the US policy, at least nominally. During World War II, Nicaragua allowed the United States to use national territory as a staging ground for international operations. After eliminating the Sandino threat, Somoza began to give out political appointments to his more powerful opponents in exchange for making them silent. Somoza was the authentic ruling power all over his career; even while sometimes he yielded others take the presidency as puppet leaders for an appearance of legitimacy. He maintained this system for twenty years, that turned Nicaragua in a family venture, and his sons continued it after him. Although Somoza succeeded in enormously increasing his personal wealth while in office, he also encouraged certain economic policies that strengthened the national infrastructure and wealth of the nation to a certain extent.

Somoza García had many political enemies, and coups against him were attempted periodically, even

within the National Guard. For protection, he constructed a secure compound within his residence and kept private bodyguards. Nevertheless, on September 21, 1956, while attending a PLN party in Leon to celebrate his nomination for the presidency, Somoza García was fatally wounded by Rigoberto Lopez Pérez, a twenty-seven-year-old poet. The dictator was flown to the Panama Canal Zone, where he died eight days later.

## SOROS FOUNDATIONS NETWORK

Soros Foundations Network (SFN) is a group of autonomous foundations established by the Hungarian American philanthropist, George Soros. The Network is committed to promote open society throughout the Central and Eastern European countries, the Commonwealth of Independent States, and a number of developing countries in Africa and South East Asia, as well as to strengthen the existing open society in the United States.

## The Idea of Open Society

The term “open society” was coined by the Austrian British philosopher Sir Karl Popper in his monumental study *Open Society and its Enemies*. Being Popper's disciple George Soros has adopted this concept, provided it with further meanings, and began working on its implementation into practice. According to Soros, open society recognizes all positive aspects of democracy. Open society is opposed to the closed societies of various dictatorial types. Closed society preaches unjustified optimism and “offers certainty and permanence but denies individual freedom” (Soros 2000). On the other hand, individual freedom is the highest value of open society but the later does

not promise certainty and permanence to its citizens. Soros builds his whole conception upon the notion of fallibility meaning that there is no guarantee any of human projects will succeed. Criticism is the main characteristic of open society, that is, individual expectations are constantly corrected by criticism forming a near-equilibrium relationship with reality. While dogmatism belongs to closed society characterized by far from equilibrium relationship between individual expectations and reality. At present, the most serious threat to open society is not closeness but disintegration featuring dynamic disequilibrium of chaos and disorientation due to rapid change of economic and social reality entirely out of government and citizen control.

The core principal of open society is social justice as a matter of international concern. It is viewed not as equality but in Rawlsian terms holding that the increasing wealth must also benefit the disadvantaged in the developing countries, as well as those in the industrialized ones. This principle and the principles of individual freedom and human rights constitute the seven conditions of an open society:

- Regular, free, and fair elections;
- Free and pluralistic media;
- The rule of law upheld by an independent judiciary;
- Constitutional protection of minority rights;
- A market economy that respects property rights and provides opportunities and a safety net for the disadvantaged;
- A commitment to the peaceful resolution of conflicts; and
- Laws that are enforced to curb corruption (Aryeh Neier as cited by Soros 2000).

## Soros Foundations

The first Soros foundation, Open Society Fund began in South Africa in 1979 and then continued in Hungary in 1985. A number of foundations were established in Central and Eastern Europe and former Soviet Union after the Communist Parties started losing power there in 1989. At the end of 2000, Soros foundations included twenty-eight national foundations, two sub-national foundation in Yugoslavian province of Kosovo and in Yugoslavian Republic of Montenegro, and two regional foundations—one for Southern Africa, another for West Africa. They all share the common mission to promote the development of open society but they are autonomous institutions and structure their activities according to the specific conditions in the given country or region.

The foundations in the ten Central and Eastern European countries that are candidates for European Union membership shifted their focus in 1999 from developmental approach to public policy. They promote membership criteria that are also essential for the open society mission: (1) protection of the rights of Roma and other minorities, (2) criminal justice reform, (3) the reduction of corruption, and (4) strengthening civil society participation in policy-making.

Another part of Europe that is covered by the Soros foundations is the Balkans, recently named South East Europe. Immediately after the 1999 NATO's humanitarian military operation in Yugoslavia, the European Union countries, the United States, Canada, and Russia decided to establish a Stability Pact (SP) for South East Europe aiming at coping with the war destruction in Montenegro and Serbia, including Kosovo, as well as creating conditions for democratization of the Yugoslavian nation. The SP was designed with the wider scope to support the economic development and foster civil society in the entire region of South East Europe. Along these lines, Soros foundations are working to enhance "European integration through the development of peaceful, lawful, tolerant, and democratic states" (*Building Open Societies* 2001).

Activities of the foundations in Russia are directed to "facilitate the country's political, economic, and social development" (*Building Open Societies* 2001). An issue of special urgent actions is public health deteriorated significantly after the collapse of the Soviet Union. In the other nations of the Commonwealth of Independent States the foundations "are attempting to persuade the governments and institutions to adopt the international standards of good governance, human rights, and economic policy" (*Building Open Societies* 2001).

Open society has being promoted in Africa by two regional foundations—for Southern Africa and Western Africa and one national foundation—for South Africa. All three of them are "working for peace and stability, human rights, fair elections, independent media, and the rule of law" (*Building Open Societies* 2001). They support public radio as a powerful means for education about issues of public health and reconciliation. Another topical issue here is crime prevention in South Africa.

## Network Programs and Other Initiatives

There are a number of issues across the countries where Soros foundations operate, which are

addressed by the network programs. Each particular foundation participates in these programs on its own discretion. The activities of the programs are divided into three categories: those that provide assistance to foundations' initiatives, others that provide services outside a specific foundation operation area, and scholarship and fellowship competition programs. Network programs are administrated by the Open Society Institute (OSI), a private operating and grant making foundation, with offices in New York City, Budapest, Brussels, Paris, and Washington, DC (closed in June 2001). The offices in New York and Budapest also secure administrative, financial, and technical support to the network foundations (the New York office administrates the US programs, which are not discussed in this entry). The Budapest office organizes certain programs throughout Central and Eastern Europe and the Commonwealth of Independent States centered on human rights, ethnic and minority issues, civil society, and women's issues. The Brussels office maintains relations between Soros Foundation Network (SFN) and the European Union (EU) and the Paris office is involved in bilateral cooperation with France and other West European countries.

Network programs include among others Arts and Culture Program, Constitutional and Legal Policy Institute, Economic and Business Development Program, International Higher Education Support Program, Local Government and Public Service Reform Program, and Public Health Programs. The Art and Culture Program is committed to work for autonomous and innovative arts sector, to support international cooperation in the field of art and culture, and to encourage structural changes in cultural policy. Constitutional and Legal Policy Institute operates in Central and Eastern Europe, Central Asia, and Mongolia. It assists developing the rule of law, respect for human rights, and democratic institutions. Its activities deal with criminal justice, anticorruption, juvenile justice, access to justice and legal aid, judicial reform, media legislation, and legal education. Economic and Business Development Program aims at helping to introduce market economy and create more jobs. It concentrates on small businesses development, microfinance, retraining the former military staff, and business education. International Higher Education Support Program has as its strategic goal institution building and faculty development. It also creates new opportunities for students from Central and Eastern Europe and the Commonwealth of Independent States. The objective of the Local Government and Public Service Reform Program is to enhance effective and democratic local governments and public administration,

as well as to assist public policy research in the all countries where the SFN is active. Public Health Programs are developed in Central and Eastern Europe. Before 1999, the Programs were attempting to improve the individual health care but later they began dealing with the relationship between the development of society and the health level of its citizens. Now, the programs center on new approaches in medical service delivery, development of nongovernmental organizations (NGOs) working on health care issues, and training medical and social care professionals.

Other initiatives of the SFN treat topics or regions of common importance beyond the reach of its national or regional foundations. They consist of Belarusian Initiative, the Burma Project/Southeast Asia Initiative, Central Eurasia Project, Landmines Project, Project Syndicate, and Roma Program. Belarusian Initiative encourages various grassroots activities aiming foremost at empowering the NGOs. Here preparation of a new generation of leaders, training programs, and projects promoting rights of women are included. The Burma Project provides scholarships and internships for Burmese students worldwide. It also helps creating electronic newspapers and web sites in several local languages. The principal nation to benefit from the Southeast Asia Initiative is Indonesia. In this case, OSI does not build its own structures but tries to work with local organizations that share its mission and commitment. The Central Eurasia Project attempts to increase the respect for the rule of law, the free exchange of ideas and information, and tolerance for different cultures. This Project extends over Turkey and Iran. Fostering civil society is the core objective in Turkey and in Iran; the goal is building closer relations between Iran and the United States through exchange of scholars, writers, journalists, and publishers.

SFN established an institution of higher learning, the Central European University (CEU) in 1991. Now, CEU has campuses in Budapest and Warsaw. It is committed to advance open society in the former Soviet block countries through outstanding level of graduate studies in fields of social sciences, humanities, and comparative and international law.

### **The Open Society Alliance**

Soros foundations have been working for promotion of civil society and other elements of democracy as an alternative to the totalitarian societies. Within ten years, they became a substantial factor in building open society throughout the post-totalitarian

countries of Europe and Eurasia and in other places that have suffered of dictatorial regimes. In late 1990s, George Soros concluded that the main enemy of the open society is not the dogmatism of closed societies anymore but the dogmatism of market fundamentalism. According to the later, common good can be described in the terms of market values and all social and political problems can be resolved by the free market. In fact, market values constitute only one part of common good; another very important part of it is sustained by social values. NGOs on behalf of civil society and governments can be very useful in developing market and social values all over the globe. Nevertheless, they are not sufficient to strive for the common good since more often than not they are run "like businesses, generating revenues by advocating a case" (Soros 2000). A new international organization is needed to be committed solely to working for common good through developing open society worldwide. It is described as the global alliance for open society and ought to be led by the most developed democracies.

The goal of the Alliance would be to coordinate the activities of member countries in promoting a global open society. There are two distinct but interconnected objectives to be accomplished: One is to help evolution of open societies within individual countries; the other is to foster the development of international law and international standards of behavior (Soros 2000).

The first step forming this Alliance was founding an intergovernmental body, Community for Democracies (CD) in Warsaw, Poland in June 2000. Foreign ministers and other high officials from about 100 countries were the founders of this organization. The funding for CD is expected to come from the governments to support the intergovernmental activities and from OSI for NGO's that would enhance CD in its mission to develop open society. Many of the CD countries participate in the Stability Pact for the South East Europe. The fate of the Stability Pact will be a test for CD and the development of global open society. SFN participates in the Pact's Working Tables on Democratization and Human Rights and on Security Issues.

SFN have planed both the foundations and the global alliance to become self-sustainable by 2010 when Soros support will cease.

## SOUTH AFRICA

South Africa is the southernmost country in Africa. On its western, southern, and eastern sides, it has a long coastline bordering the South Atlantic and Indian Oceans. It is bordered on the northwest by Namibia, to the north by Botswana, and to the northeast by Zimbabwe, Mozambique, and Swaziland. The nation of Lesotho is enclosed entirely by South Africa, situated in South Africa's eastern central plain.

South Africa's climate varies throughout its regions, which include mountains to the west, east, and south; grasslands on the central plateau; and coastal regions along the ocean. However, temperatures remain temperate to tropical most of the year, though the mountainous regions and parts of the plains experience cold weather during the winters. The dry season is from May to August. The population is estimated at 42,718,530, with a negative growth rate of -0.25% annually due to AIDS and emigration. The administrative capital, Pretoria, is located in the northeastern part of the country, and has a population of about 2 million. Cape Town, located on the southwestern coast on the Cape of Good Hope, with a population of about 3 million, is the legislative center, and Bloemfontein, in the middle of the central plain, with a population of about 750,000, is the judicial center.

*South Africa is divided into nine provinces:* Eastern Cape, Northern Cape and Western Cape in the west and south; Free State in the central region; Limpopo and North West in the north and northwest; KwaZulu-Natal in the eastern region; Gauteng and Mpumalanga in the northeast. There are eleven languages spoken in the country. The major categories of indigenous inhabitants of the region are the Nguni,

including various Ndebele (Western Cape and North-West), Swazi, Xhosa (in the Eastern Cape), and Zulu (KwaZulu-Natal) peoples, the Sotho-Tswana (Free State), and the *Venda* (North).

Beginning in the seventeenth century, streams of immigrants began to arrive to the country. Many were either seeking economic advancement or fleeing persecution. Key groups were the Dutch, the British, the Hugenots, and East Indian. Currently there are four major ethnic categories. Traditionally the most powerful group was the Whites, which could be sub-divided into Afrikaner (highest ranked) and the British. Next are the Coloureds, the South African term for multiracial people. Third are the Indians. Fourth are the indigenous Black African Tribes. The Cape (especially Cape Town) is considered the locus for the Coloured and Natal is the locus for the Indians.

## The History of South Africa

Cape Town was the first European settlement in South Africa. The British initially decided not to settle in the Cape area. The Dutch, on the other hand, recognized the strategic value of the area and began emigrating there in 1652. The Dutch East India Trading Company, which commissioned the first settlement in the area, was instrumental in the development of the Cape region. More Dutch immigrants, commonly called as the Boers and Afrikaners, settled in the area. As the port city developed, the need for labor rapidly became intense. Initially slaves and exiled Indonesians were imported.

In 1671, the first Huguenot refugee, Francois Vilion (later known with the last name Viljoen), arrived to the Cape. The major stream of Huguenots, fleeing France to escape religious persecution, arrived between 1688 and 1689. The Dutch East India Company encouraged emigration because it would provide needed labor. It preferred Dutch immigrants because they possessed desired qualities, common religious beliefs, and were trained as craftsmen or farmers. As the Dutch settlement expanded, the Huguenots found themselves being forced to recede from their original lands. In 1695, they rose up against the Dutch, but were defeated. They retreated to the northern part of the country.

With the increasing presence of abolitionist missionaries and the emancipation of the slaves in 1834, approximately twelve thousand Afrikaner farmers (known as the Trek Boers) began to expand their territories toward the north and the east into lands occupied by the indigenous populations and

Huguenots, seeking grazing lands for their cattle. The Huguenots resisted the attempted conquest, so the Trekkers then attempted to conquer the indigenous Xhosa people living in the east. The Xhosa engaged in skirmishes against the Trekkers and finally, in 1779, wars erupted.

The Colonial government was weak, and two short-lived Dutch republics were established. The power struggle continued until the arrival of the British to the area and the resulting annexation of the colony into the United Kingdom in 1795. Battles occurred between the Whites (both British and Afrikaners) and the indigenous peoples. Two key Zulu leaders in some of these battles were King Shaka and military leader Mzilikazi. The Boers initially attempted to settle in Natal, occupied by the British, but moved on to establish the Free Orange State and the South Africa Republic (Transvaal or ZAR: Zuid-Afrikaansche Republiek) to the north.

The Cape colony, still a British territory, was evolving. Tacit steps had been taken to develop a system of political equality among races. In theory it was to be based upon economic qualifications, but in practice it excluded the majority of Africans and multiracial people. This was due, in part because of the discovery of diamonds. The Natal region was more conducive to sugar production and as the crop prospered the need labor needs increased. Indian laborers were imported to work in the fields.

In 1877, the Transvaal was taken over by the British, however, soon after there was a major rebellion. Several years later, pro-Afrikaner Paul Kruger had been elected as president of the republic. In 1886, gold was discovered in Witwaterstrand. Two wars were fought for possession of key territories. The first Anglo-Boer War was fought from 1880 to 1881. The second Anglo-Boer War, also known as the South African War, started on October 11, 1899. After ultimate defeat of the British, the Union of South Africa was established on May 31, 1910.

## The Apartheid System

### *Introduction of the Apartheid System*

In 1910, the policy of consistent racial separation was introduced via a group of laws that seriously curtailed the rights of the Black majority. The "Mines and Works Act" of 1911 limited black workers to only menial work. In the "Native Land Act" of 1913, approximately 7.3% of South African territories were designated as reservations for Blacks. They were barred from purchasing any lands outside these

areas. The only province with a non-racial franchise was the Cape, and there Blacks were barred from being members of parliament. At the establishment of the Union, there was an estimated 6 million inhabitants with 67% being Black African, 9% Coloured, and 2.5% Asian (Indian). Under General Louis Botha, the Afrikaners maintained power as a result of the merger of two Afrikaner parties into the South African Party. Soon thereafter, White supremacy became permanently entrenched as a result of the passage of the Masters and Servants Act, the restriction of skilled work to Whites only, the implementation of the pass laws, the institution of the Native Poll Tax and the 1913 Land Act that ensured white ownership of 90% of the country.

Independence was achieved in 1934 by South Africa. Soon thereafter, in 1936, Blacks were further disenfranchised when they were removed from the common voters roll in the Cape. During 1937, laws were passed to stem Black urbanization and municipalities were compelled to segregate black African and white residents. In 1946, Jan Smuts introduced a bill that limited the movement, property ownership, residence, and empowerment of Indians.

As of 1948, the apartheid (literally “aparthood” in Afrikaans) system became the official policy of the country with the election of the Nationalist Party. D.F. Malan coined the concept of “apartheid” and consistently enforced the policy. The separation of the “races” was not limited to the economic sector. Marriage or any conjugal relationship between members of different racial groups were strictly forbidden. Racial segregation was introduced in all public institutions and offices, in public transport, and on public toilets. Until the 1980s, Blacks were expected to step off of the sidewalk when a White person approached. Under this Party, such laws as the Group Areas Act which rigidly specified the racial division of land and the Populations Registration Act classifying people based upon race were passed in 1950. What is commonly referred to as the “petty apartheid” practice on buses and in post offices was introduced with the passage of the *Separate Amenities Act* of 1953.

After members of the ANC ratified the Freedom Charter which endorsed non-racialism and human rights in 1955, 156 leaders were arrested and charged with high treason. Their trial continued until 1961 when they were acquitted. In 1958, the foundation for the establishment of homelands was laid with *The Promotion of Black Self-Government Acts*. The homelands, or “bantustans,” established in the harshest, driest, and least fertile areas in the country, were designed to alienate the indigenous African Blacks from their traditional lands. The National Party and its policies remained in power until 1994.

### ***Resistance to Apartheid***

The resistance to apartheid occurred both internally and globally. In the 1940s, the government of India seized many opportunities to bring attention to the disenfranchisement of Indians in the General Assembly of the United Nations. The Defiance Campaign began in 1952 and took a non-violent approach. Yet the outcome was the imprisonment of thousands of participants.

During the 1960s and 1970s, anti-apartheid protests occurred both within South Africa and in other countries. The 1960s ushered in massive resistance to apartheid and even greater repressive measures imposed by the South African government. On March 21, 1960, a peaceful demonstration in Sharpsville changed to a massacre when police killed sixty-nine and injured 160 unarmed demonstrators. A State of Emergency was declared giving the government the opportunity to introduce the new “right to detain without trial.” The African National Congress (ANC) and the Pan-African Congress (PAC) and other empowerment organizations were declared illegal.

The indigenous peoples organized grassroots organizations and widespread resistance, but the worldwide outcry against the massive violation of human rights did not occur until the Soweto Massacre occurred on June 16, 1976. Children who were peacefully protesting the imposition of Afrikaans as the official language for instruction were struck down. In response, groups around the world mounted major anti-apartheid initiatives. Marches, demonstrations, and boycotts against corporations that did business with and/or had investments in South Africa organized worldwide. Embassies were picketed and ships headed to South Africa were physically blocked by demonstrators. Some demonstrations were peaceful and others became violent. The United Nations constituencies began to call for economic sanctions against South Africa. Resolution 1761 was passed in November 1962, and subsequent resolutions at the World Conference Against Racism in 1978 and 1982 were also passed.

### ***The Demise of the Formal Apartheid System***

During earlier periods in the twentieth century, various countries contributed to the South Africa’s development through financial assistance and donor aid. From an economic perspective, the various countries benefited from the South African system, and an intricate system of interdependence developed. For example, South Africa has traditionally been the

primary source for diamonds worldwide. As technology evolved, the need for diamonds increased. In addition to the traditional use of diamonds as a luxury item, industries began to design tools and equipment using diamonds because of its strength. Countries found themselves in a dilemma. While they may not have supported the apartheid system, overt pressure and interference could result in the denial of critically needed minerals found in abundance in South Africa. Thus, for a long time South Africa had the leverage to prevent major interference with the social structure. As time passed however, the constituency pressures within many countries, including the United States, became too great and national governments were pressured into taking stances against the continuation of the apartheid system. In the 1980s, the apartheid system began to crumble and a movement to end strengthened.

On February 2, 1990, South African president F.W. de Klerk lifted the ban on thirty-three major activist human rights groups including ANC and PAC. After 27 years of imprisonment, Nelson Mandela, the leader of ANC, was released on February 11, 1990. The first democratic election was held April 26–29, 1994, with Nelson Mandela being inaugurated as the first indigenous South African president on May 10, 1994. Both F.W. de Klerk and ANC's Thabo Mbeki were inaugurated as deputy presidents. The country's second democratic election on June 2, 1999, brought Thabo Mbeki to the office of president.

### Education

After the dismantling of the apartheid system, a new educational system was established that permits intermingling between the various ethnic groups, although the major institutions continue to have the ethnic specific concentrations of past eras.

The major education spans approximately thirteen years (grades). Of those, grades 10–12 and the reception year (grade 0) are not compulsory. Students have access to higher education, but the vast majority of the minority groups cannot afford it. There are twenty-two universities/colleges, sixteen technikons, and an evolving community college system.

### Concluding Comments

Since established as a colony, South Africa has had a deeply divisive and destructive legacy of inequality and severe human rights violations. Yet, its oppressed peoples have shared their cultures with the world

through their music, traditional dress, food, and artwork, making the world richer. With the transition from an all white apartheid system to an inclusive pluralist democracy, the world will follow its evolution with anticipation. In its new configuration, it is a young country with tremendous potential. As it evolves, it could become a model for inclusiveness, or it could return to its old path. The leadership, attitudes, and commitment of the people will determine this beautiful and unique country's fate.

### SOUTH ASIAN ASSOCIATION FOR REGIONAL COOPERATION (SAARC)

The South Asian Association for Regional Cooperation (SAARC) was established on December 5, 1985, by the leaders of seven South Asian countries—Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan,

and Sri Lanka—to address the issues of regional peace and development in South Asia. The first concrete proposal for establishing a framework for regional cooperation in South Asia came from the late president of Bangladesh, Ziaur Rahman on May 2, 1980. Prior to this, the idea of regional cooperation in South Asia was discussed in at least three conferences: the Asian Relations Conference in New Delhi in April 1947, the Baguio Conference in the Philippines in May 1950, and the Colombo Powers Conference in April 1954. During his visit to India in December 1977, the Bangladesh President Ziaur Rahman discussed the need for a framework of regional cooperation with the newly elected Indian Prime Minister, Morarji Desai. At the same time, in his inaugural speech to the Colombo Plan Consultative Committee, which met in Kathmandu in December 1977, King Birendra of Nepal called for close regional cooperation among the South Asian countries in sharing river waters. Welcoming the King's call, President Ziaur Rahman further pursued the discussion of regional cooperation informally with the leaders of the South Asian countries during the Commonwealth Summit meeting in Lusaka in 1979 and the Non-Aligned Summit meeting in Havana in 1979. After his visit to Sri Lanka and discussion with the Sri Lankan President J.R. Jayawardene in November 1979, the Bangladesh president finalized a proposal of regional cooperation among the South Asian countries.

President Ziaur Rahman's initiative to establish a regional organization in South Asia during 1975–1979 was shaped by the following factors: (1) Ziaur Rahman's need for Indian support to legitimize his coup d'état regime after the assassination of Bangladesh's first and most popular President Mujibur Rahman in 1975; (2) change in the political leadership in the South Asian countries and the new leaders' willingness to embrace accommodative diplomacy; (3) the second oil crisis in 1979 and its adverse impact on the balance of payment situations of all the South Asian countries; (4) assurance of economic assistance for multilateral cooperative projects on sharing water resources of Ganga and Brahmaputra by the US President Jimmy Carter and British Prime Minister James Callaghan during their visit to India, Pakistan and Bangladesh in January 1978; (5) the rapid deterioration of the South Asian security environment as a result of the Soviet military intervention in Afghanistan in December 1979; and (6) the publication of a background report by the Committee on Studies for Cooperation in Development in South Asia (CSCD), identifying many feasible areas of cooperation.

The Bangladesh proposal was promptly endorsed by the smaller states of South Asia—Nepal, Sri

Lanka, the Maldives, and Bhutan. Initially, India and Pakistan expressed skepticism for the proposal. India's main concern was the proposal's reference to the security matters in South Asia and the inclusion of all bilateral disputes with India on the SAARC agenda for discussion. Indian policy makers were strongly opposed to such an idea because of their fear that discussions on bilateral conflicts in a multilateral forum will eventually lead to India's isolation, and will provide an opportunity for South Asian neighbors to “gang up” against India. Pakistan assumed that it might be an Indian strategy to create a regional organization that would ensure India's economic and military dominance in the region. After a series of quiet diplomatic consultations at the United Nations headquarters in New York from August to September 1980, the South Asian foreign ministers agreed to ask Bangladesh to prepare the draft of a working paper for discussion among the foreign secretaries of the South Asian countries. After intense discussion on the issue of security provision with the foreign secretaries of India and Pakistan, the new Bangladesh draft paper dropped all references to security matters and suggested only noncontroversial areas for cooperation. After three years of preparatory discussion at the foreign secretaries level, the first South Asian foreign ministers' conference was held in Delhi from August 1–3, 1983, where a formal declaration on regional cooperation was adopted establishing an organization known as the South Asian Regional Cooperation (SARC). Following the New Delhi meeting, three more meetings of the foreign ministers were held at Male (July 10–11, 1984), Thimpu (May 13–14, 1985), and Dhaka (December 5, 1985) to finalize the details of the areas of cooperation. At the Dhaka meeting, the South Asian foreign ministers decided to change the name of the organization from South Asian Regional Cooperation (SARC) to South Asian Association for Regional Cooperation (SAARC). The change in the acronym was based on the thinking that while SARC refers to the process of South Asian regional cooperation, SAARC marks the establishment of an organization to promote and develop such cooperation. Following this change in the name, the first SAARC summit meeting of the heads of state or government of the seven South Asian member countries was held at Dhaka from December 7–8, 1985.

Since 1985, SAARC has evolved slowly in terms of institutions and programs. In 1987, a permanent SAARC Secretariat was established in Kathmandu, Nepal. Four SAARC regional institutions have been established so far: SAARC Agricultural Information Center (Dhaka/ Bangladesh); SAARC Tuberculosis Center (Baktapur/Nepal); SAARC

Meteorological Center (Dhaka/Bangladesh); and SAARC Documentation Center (New Delhi/India). Four regional conventions/agreements have been signed: Agreement on Establishing SAARC Food Security Reserve (Third SAARC Summit, Kathmandu, 1987); SAARC Regional Convention on Suppression of Terrorism (Third SAARC Summit, Kathmandu, 1987); SAARC Convention on Narcotic Drugs and Psychotropic Substances (Fifth SAARC Summit, Male, 1990); Agreement on SAARC Preferential Trading Arrangement (Seventh SAARC Summit, Dhaka 1993). Three SAARC Funds have also been established: SAARC Fund for Regional Projects (1991); SAARC-Japan Special Fund (1993); and South Asian Development Fund (1995).

SAARC's slow growth can be attributed to the following factors. First, the Indo-Pakistan tension remains the most important reason for SAARC's modest growth since 1990s. The root of Indo-Pakistan tension lies in the Kashmir issue and India's overwhelming military and economic domination in the region and Pakistan's continuing challenge to achieve military power parity with India. With the acquisition of nuclear bombs in May 1998 by both India and Pakistan, the latter's objective of balancing India's military power may have been partially fulfilled. But the strategic military balance of power achieved by Pakistan does not alleviate South Asia's so called "security complex" and does not guarantee peace or growth of cooperative activities in the region. The unresolved Kashmir issue and an increase in cross-border terrorism have further deepened the political divide between India and Pakistan, limiting the growth of multilateral cooperation in South Asia. One discernible consequence of Indo-Pakistan tension is the frequent cancellation of SAARC annual summits since 1998. It is important to note that one of the critical objectives of the SAARC annual summits is to facilitate the so called "courtesy call" meeting between the political leaders of South Asian countries. This informal courtesy call meeting allows the leaders to carry on dialog outside the SAARC forums in order to deepen their mutual understanding of each other's problems. But since SAARC's inception in 1985, only twelve summits have been held, limiting the opportunity for the leaders to meet at frequent intervals and engage in multilateral cooperation. In fact, while the first six SAARC Summits were held annually, the rest six Summits were held without any regular annual interval. The eleventh SAARC Summit, which was scheduled to be held in 1999, was cancelled many times due to Indo-Pak tension, triggered by a regime change in Pakistan in 1999, when General Pervez Musharraf deposed prime minister Nawaz Sharif in a military coup. The Indian

initiative, led by the former prime minister A.B.Vajpayee, to improve relations with Pakistan did not produce any positive result due to the failure of Agra Summit in 2001, where Pakistan raised the Kashmir issue much to the disliking of India. Eventually, after four years of the tenth summit, the eleventh summit was held in Kathmandu in 2002. Similarly, the twelfth SAARC Summit at Islamabad was eventually held after two postponements caused by India's refusal to confirm Pakistan's earlier proposed dates of Summit on January 11–13, 2003.

Second, South Asian countries do not share a common external threat perception, which makes it difficult for the leaders of these countries to work toward common regional security strategies. Most South Asian countries perceive their main threat to be India. India, on the other hand, perceives an external threat to her regional security concerns by Pakistan's military challenge with the support of external powers. The narrow political base of the South Asian ruling elites provides few opportunities for them to ignore regional security threats or to transcend the necessity of support from their dominant domestic groups. Thus, scapegoating has become a preferred policy choice for the South Asian ruling elites, making regional accommodation a difficult goal. It is not surprising, therefore, that SAARC-related policies and programs have received low priorities by the South Asian ruling elites over the past decade.

Third, SAARC's progress has remained limited during the past decade due to the emergence of two types of mutually competing ruling coalitions, i.e., a weak liberalizing coalitions in India and a nationalist-fundamentalist coalitions in Pakistan. India's weak liberalizing coalitions since early 1990s have come under greater pressure to accommodate the varying demands and interests of their coalition partners to ensure their political survival. It has become difficult for weak liberalizing coalitions to downplay regional security threat and to ignore scapegoating (blaming external enemy) as an instrument of their national policies. Thus, India's weak liberalizing coalitions remain tentative about regional cooperative initiatives, although they do not demonstrate the same degree of antipathy toward regional cooperation policies as the nationalist-fundamentalist coalitions.

The nationalist-fundamentalist ruling coalitions in Pakistan since 1990s and the military regime after 1999 have often shown more preference for domestic-oriented and extra-regional-oriented policies than policies with a regional thrust in order to ensure Pakistan's strategic significance to extra-regional powers and maintain their political clout in domestic politics. Needless to say, such policies of externalization and external mediation of bilateral problems have

prevented close and continuous regional interactions between India and Pakistan, making regional cooperation goals difficult to achieve.

Fourth, intra-regional trade among SAARC countries is quite modest, which has contributed to a limited interdependence among the South Asian countries. India's trade with SAARC members amount to only 2% of its total global trade, while Pakistan's trade with the region is less than 5% of its total trade. The low level of intra-regional imports and exports of India and Pakistan indicate how little these two relatively developed economies in South Asia depend on the region's markets. On the other hand, the industrialized countries remain the major trading partners for the SAARC countries. Also, the SAARC countries' trade with the developing countries and other Asian countries far outweigh the trade among themselves.

One major reason for this limited intra-regional trade is that SAARC countries, with the exception of India and Pakistan, do not have a diversified product base. Being primary producers, they tend to export similar items and thus compete with each other. The existence of a high rate of tariff and nontariff barriers in South Asian countries, with some modest exception of Sri Lanka, has become an important constraining factor for the expansion of intra-regional trade. Second, the fear of Indian goods dominating regional market has prevented South Asian countries, and most notably Pakistan, to increase the volume of intra-regional trade. Third, the lack of adequate transport and information links among the South Asian countries poses serious problems for the expansion of intra-regional trade. Finally, although most SAARC members have pursued economic liberalization policies after the early 1990s, these paths have not led to an increase in intra-regional trade because of political differences and a lack of willingness to create trade complementarities among the leaders of the South Asian countries.

Following the example of ASEAN (Association of Southeast Asian Nations), the SAARC member countries signed a framework pact for the creation of South Asian Free Trade Area (SAFTA) on January 6, 2004, in order to reduce or eliminate tariffs among the SAARC member countries. The SAFTA is scheduled to come into force at the start of 2006. Besides contributing to an increase in the volume of trade among the South Asian countries, the SAFTA would also enable SAARC member countries to obtain production inputs from each other at lower costs. The savings on logistics due to shorter distances and storage times would result in huge savings for South Asian manufacturers and consumers. Despite the potential of substantial economic benefits, the success of

SAFTA will depend largely on the rapprochement between India and Pakistan.

### SOUTH WEST AFRICA PEOPLE'S ORGANIZATION (SWAPO)

The South West Africa People's Organization (SWAPO) was the leading liberation movement in Namibia's long struggle for independence from South African rule. It has been Namibia's ruling party since 1990.

SWAPO traces its origins to the Ovamboland People's Congress, founded in Cape Town, South Africa, in 1958 by Toivo ya-Toivo and others, as a body to resist the system of contract labour introduced into the north of Namibia by the South African rulers. At about the same time, the young Sam Nujoma tried to organise workers in Namibia itself, and was one of those responsible for the founding of the Ovamboland People's Organisation (OPO) in 1959. It was the Windhoek massacre of December 1959, in which the police killed twelve unarmed protesters in the territory's capital, that persuaded Nujoma and others of the need for a broad-based liberation movement that would, if necessary, take up arms to resist the South African occupation regime. In the aftermath of the massacre, Nujoma and other leading activists fled from Namibia to raise the cause of their country's independence from South African rule at the United Nations (UN), which recognised the special status of the territory as a former mandate of the League of Nations.

In April 1960, the OPO changed its name to SWAPO, the new name reflecting the desire on the part of Nujoma and others to bring together all the people of the territory to oust the South Africans. Though SWAPO did always have supporters from other ethnic groups, its dominant support has always come from the Ovambo-speaking people of the north, who make up over half of the country's population. Nujoma became president of the organization, a position which he has retained since its founding. Though the UN adopted the name "Namibia" for the country in the late 1960s, in place of the colonial "South West Africa," used by the South Africans, by then the name SWAPO was so well known that the organization decided to retain it. Though its leadership was based first at Dar es Salaam, then Lusaka and then Luanda in Angola, SWAPO always retained a significant presence inside Namibia. Though never banned by the South Africans, SWAPO was treated very harshly by the South African authorities, and most of the internal leadership was detained at one time or another. For much of the 1970s and early 1980s it was hardly able to operate above ground in Namibia, and with mass mobilisation within the country virtually impossible, it was the external leadership that drove the struggle, both militarily and diplomatically.

In the early 1960s, SWAPO competed for support both within Namibia and internationally with the South West African National Union (SWANU), which drew most of its support from the Herero people and developed links with the Chinese. Though SWANU was regarded as more radical than SWAPO at that time, it was SWAPO that was able to gain the crucial support of the Organisation of African Unity's liberation committee. SWAPO was recognised as the sole and authentic representative of the Namibian people, first by the OAU and then by the General Assembly of the United Nations.

SWAPO gained this recognition largely through armed struggle. Until mid-1966, the SWAPO leadership hoped that the International Court of Justice in The Hague would rule that South Africa's rule of Namibia was illegal. When it did not, SWAPO announced that it was launching its armed struggle, and in August 1966 the first clash took place in northern Namibia between SWAPO guerrillas and the South African police. By the end of the liberation war twenty-three years later, SWAPO had lost over ten thousand fighters in a conflict that over time began to resemble a conventional war rather than a guerilla conflict and was fought mainly in southern Angola rather than in Namibia itself. In the single bloodiest encounter, over six hundred SWAPO supporters were killed when the South African Defence Force raided

the SWAPO settlement at Cassinga in southern Angola on May 4, 1978.

In the achievement of Namibia's liberation, SWAPO's diplomatic activity was as important as its armed struggle. Through constant lobbying at the UN and in other fora, SWAPO forced the Namibian issue onto the international agenda. In 1977, the key Western powers negotiated with SWAPO and the South Africans to compromise on a plan providing for UN involvement in the transition to independence. The compromise was not popular within SWAPO, but it accepted the agreement in July 1978, only to find that the South Africans would then not implement the plan for a UN-led transition to independence. There followed a decade of waiting for that plan to be implemented, years in which SWAPO was traumatised by a so-called spy scandal, in which those alleged to be spies were detained and tortured, sometimes to death, in southern Angola. Finally, as a result of negotiations for the withdrawal of the Cuban forces from Angola, the transition plan was implemented from April 1, 1989. In early April 1989, over three hundred SWAPO fighters were killed by the South Africans in northern Namibia before the UN arrived, but after the UN's arrival, the country was able to engage in peaceful preparations for an election in November.

In the November election, SWAPO gained 57% of the vote for the Constituent Assembly (CA) to draw up a constitution for the new country. By then SWAPO had dropped much of its earlier socialist rhetoric, initially adopted in part because of the support it obtained from the Soviet Union, and had accepted that the economy would remain mixed and there should be a multi-party democracy. The CA chose Nujoma to be the country's first president, and after a liberal democratic constitution was adopted, Namibia became independent in March 1990 and the first SWAPO government was sworn in. In subsequent elections, SWAPO increased its support to over two-thirds of the electorate, and it changed the constitution to allow Nujoma to run for a third term as president, on the grounds that he had first become the country's president as a result of the wishes of the CA rather than the people. In 2004, he was persuaded not to run for a fourth term. He then in effect chose his successor, Hifikepunye Pohamba, who was elected the new president of the country in the November 2004 election.

## SOUTHEAST ASIA: HISTORY AND ECONOMIC DEVELOPMENT

To refer to Southeast Asia as a single region is a relatively recent phenomenon stemming from its new-found strategic importance during World War II. Research has identified historical links between the countries and commonalities in traditions such as the governance of kingdoms and the rise and fall of empires. However, in general Southeast Asia is regarded more as a political and geographical concept than a region defined by cultural similarities. From Myanmar (formerly Burma) in the west, to the Philippines and Indonesia on its eastern side, with Thailand, Cambodia, Laos, Vietnam, Malaysia, Singapore, and Brunei in between, the area is marked by diverse histories, religions, languages, ethnicity, geography, political, and economic systems.

For example, Indonesia is the fourth most populated country in the world (2004), with 219 million people living on six thousand of the more than seventeen thousand islands that make up this archipelago. It is also the country with the largest Muslim population (82%) in the world. In contrast to Indonesia, Laos' 5.6 million people are predominantly Buddhist. This landlocked country is the lowest ranked in the region on the UNDP's Human Development Index (2004, ranked 135/177). Political systems in the region range from the authoritarian regime of Myanmar, to centralised socialist states such as Vietnam, the absolute monarchy of Brunei, to the constitutional monarchy of Thailand and the presidential democracy of the Philippines. Countries such as Indonesia, Malaysia, and Laos are relatively modern states with their borders determined by colonial occupation in the nineteenth century and in the case of Malaysia, a federation formed after WWII.

Over 8% of the world's population (548 million in 2004) live within Southeast Asia's 1,735,448 square miles. Thirty-one percent of that population is under the age of fifteen years and 38% live in urban areas. Four of the world's major religions, Islam, Buddhism (both Mahayana and Theravada), Hinduism, and Christianity are widely practiced. Generational change, population growth, urbanisation and subsequent environmental challenges, ethnic and

communal conflict and health concerns such as AIDS and the outbreaks of new diseases such as Severe Acute Respiratory Syndrome (SARS) are increasingly important issues in the region, impacting on its economic development.

Climatically, Southeast Asia is predominantly a tropical zone, affected by two monsoons that bring heavy rains during October to February in the east, and between April and August in the western parts of the region. Monsoons can bring with them devastating storms, but when the rains are weak, the area is subject to drought and declining agricultural production. In recent years, dry conditions have also led to massive bush fires (in Malaysia and Indonesia in 1998, for example). The region's geography ranges from mountain ranges to forested hillsides, flat river valleys and coastal plains. One of the world's major rivers, the Mekong, runs from Tibet through the heart of Southeast Asia, crossing Myanmar, Thailand, Laos, Cambodia, and Vietnam.

Despite their diversity the countries of Southeast Asia have been linked for centuries by trade and the movement of people. Stories of colonialism, struggles for independence, and the economic and social challenges within the region post-World War II continue to thread the countries together. The following sections will briefly overview the history and economic development of the region, beginning with the decline of European colonialism. Southeast Asia's colonial past still influences the economic, political, and social structures in the region today.

### Colonialism in Southeast Asia

Southeast Asia's strategic position on the trade routes between Europe and China, and its own production of attractive commodities such as spice, led to increasing contact with European traders. By the eighteenth century, the region consisted of some forty states, principalities and kingdoms with European control of various regional maritime trading posts (Osbourne 1997). But by the nineteenth century new international boundaries became established and new political institutions were created as European states exerted their power. All of the countries of present day Southeast Asia were under the control of a European state, with the exception of Thailand: the Dutch in Indonesia, the Portuguese in what is now Timor L'este, the French in Cambodia, Laos and Vietnam, the British in Brunei, Malaya, Myanmar, and Singapore, and Spain and the United States in the Philippines. While Thailand was the only country to escape direct rule, its royal family did make diplomatic concessions

and lost control of parts of their territory to the French and British.

The impact of colonialism was uneven. Writers such as Osbourne (1997) argue that the Dutch were of little importance to the majority of the Indonesian population until the mid-eighteenth century. The Spanish on the other hand, in the Philippines from the seventeenth century, embedded Christianity into the country and created strong links between church and state. Europeans were not the first foreign influences in Southeast Asia. India and China had for hundreds of years impinged on the region, from outright Chinese incursion into Vietnam, to the spread of India's Buddhism across Myanmar. Contact with traders from the Arab states led to the relocation of Islam throughout the Malay peninsula, Indonesia, and the Philippines by the thirteenth and fourteenth centuries. However, European colonisation coincided with the industrial revolution which created rapid changes in economic organisation.

The transformation of the economies of the region, and the establishment of a new economic relationship with Europe began in earnest in the nineteenth and twentieth centuries. New industries such as rubber production were established, and traditional ones such as rice, sugar, and copra were expanded to meet European demands. Agribusiness in the form of plantation farming was introduced and economies re-oriented towards producing exports. These changes disrupted economic patterns and at times impoverished local, rural populations. The result was at times rural unrest, for example, in Cambodia in 1915 and 1916, as many as one hundred thousand farmers protested against economic change (Osbourne 1997).

Some of the adjustments included the introduction of a cash economy as opposed to former practices of bartering; wage labour as opposed to feudal labour and subsistence farming; the availability of consumer goods for those now with disposable incomes; the growth of retail businesses; and the expansion of infrastructure and communications such as road and rail. New institutions such as banking were introduced. New taxes were imposed in some areas, and new authorities inserted into village structures. At the same time, a process of urbanisation was taking place and the major trading cities of the colonial period became cosmopolitan centres with a mix of European, local, Indian, and Chinese communities.

While rapid economic transition was taking place between the latter half of the nineteenth century and up to WWII, it was also at this time that the colonial regimes began to feel the impact of the growing nationalist independence movements. Nationalism was fuelled by an awareness of political domination and the accrual of the economic benefits of development

to European countries rather than to nationals within Southeast Asia itself.

## The Rise of Nationalism

There were many incidents of resistance and rebellion against the colonial powers (the wars fought against the Dutch as they expanded their control over Indonesia, for example, and the British "pacification" of Myanmar). However, following WWI, these struggles began to develop new approaches, based not only on the idea of removing European control, but also instituting new forms of government once they had gone. The period between the World Wars saw the coming to prominence of some of the most well-known Southeast Asian leaders, such as Sukarno in Indonesia and Ho Chi Minh in Vietnam.

Ideas relating to socialism, communism, and localised variants of democracy were proposed, stemming from a new class of intelligentsia. The Japanese defeat of Russia in 1905 and the Chinese Revolution of 1911 provided inspiration. Religions such as Islam in Malaysia and Indonesia, and Buddhism in Myanmar were also rallying points for ideas of national unity. At times these movements were designed to differentiate 'nationals' from immigrants who were a source of economic competition, such as the Chinese community in Indonesia and the Indian community in Myanmar.

The independence movements in each country found themselves facing different challenges and developing diverse responses as a result. In Cambodia and Laos, the French had retained the traditional ruling class under their administration and, according to Osbourne (1997), there was therefore less nationalist sentiment than in neighbouring Vietnam. In the Philippines, the United States, who had seized control from the Spanish in 1898, found themselves in another conflict with forces of the new Philippine Republic that had declared independence. In 1901, most hostilities ceased when America stated they would grant independence, although it wasn't until 1935 that internal self-government was granted, and full independence came in 1946. The response of the French and the Dutch towards resistance in Vietnam and Indonesia was repression, exile, and imprisonment of leaders. Even Thailand, so far untouched by large scale effects of colonialism, underwent something of a revolution in 1932, when it was declared that the King would be a constitutional monarch rather than an absolute ruler.

World War II was a turning point in the history of Southeast Asia. There was both collaboration and

resistance by existing colonial rulers, local elites, and nationalist movements. The French brokered a deal with the Japanese where they would retain nominal control in return for Japanese use of Indochina as a training, supply and staging area. This agreement lasted until 1945 when the Japanese finally took control. The British and Dutch were defeated and lost Malaya, Singapore, Myanmar, and Indonesia in 1942. The Philippines fell a few months later. Only Thailand, again, escaped occupation by brokering a deal with the Japanese, allowing troops to move across its territory in return for maintaining its independence.

At the end of the war, Thailand was relatively unscathed but the same could not be said for the former colonial powers. Britain was counting the cost of keeping its empire and one by one its former colonies achieved independence. Myanmar (1948), Malaya, and Singapore had relatively smooth transitions to independence over the next twenty years. Malaya gained its independence in 1957 and formed the Federation of Malaysia in 1963, incorporating the last of the British empire's Southeast Asian outposts (Singapore, Sarawak, and Sabah). Singapore separated and formed its own state in 1965 primarily as a result of communal tensions and unresolved administrative issues.

The transfer of power, however, was not without a degree of conflict. There was factional fighting and dissidence in Myanmar. In Malaya, an Emergency was imposed by the British between 1948 and 1960 as a communist inspired insurgency threatened the state. In the Philippines, Huk insurgents, another Communist-led group that had fought against the Japanese, began a rebellion post-1946 independence, after elected representatives were refused their seats in parliament. The insurgency was defeated by the 1950s. In Brunei, a revolt following the only elections to ever be held in the country in 1962 (won by a party who opposed the monarchy but whose demands were rejected by the ruling elite) was quickly overcome by British troops. Brunei became self-governing in 1959 but remained a British protectorate until its independence in 1984.

Two major conflicts in particular marked the post-World War II period. From 1946, the Dutch fought a loose coalition of anti-colonial forces for control over Indonesia, eventually relinquishing power in 1949. Vietnam's conflict lasted much longer. While France granted independence to Cambodia and Laos in 1953, attempts to reassert their authority in Vietnam were met by resistance and war from 1945 until 1954, when the country was eventually partitioned at the 17th parallel. In the following decade United States military involvement in the region increased until an overt war was being fought with communist forces in the

south that lasted until 1975. This conflict spilled over into neighbouring Cambodia and Laos.

## Post-Independence Development

During the immediate post-World War II period, agriculture still dominated the economies of Southeast Asia, however there were changes taking place that would see a new phase of economic and social reorganisation. The countries in the region faced similar challenges post-Independence: the transfer of control over resources and commerce to new governments; poverty alleviation; increasing population growth that was threatening to erode economic gains; the need for social infrastructure such as education and health care; maintaining national unity and the management of immigrant and minority ethnic communities (particularly in those countries which prior to annexation by colonial forces or prior to independence did not exist, such as Indonesia, Malaysia, and Laos); and in the case of Indochina, ongoing conflict and civil war.

To address these challenges, according to Hussey (1996), there were four key elements of the dominant development model of the 1950s and 1960s that were applied to Southeast Asia: the need to promote savings and investment; the need to support agriculture as a resource for the generation of capital to invest in industrialisation; the need to promote domestic production and nascent industries through adopting policies of import substitution and tariff protection; and the need to encourage national governments to direct development to prevent market failure. However, different countries again took different paths, with varying degrees of success.

In terms of governance, three dominant political systems were adopted in the region: first, institutions influenced by British- or United States-style democracy with a preference for more market oriented economies; second, the instituting of centralised, authoritarian government with a preference for command economies; and third, the installation of a military regime or a form of government with close ties to the military, also with a more centralised economic framework. An inherent uncertainty in some countries saw nascent democracies overthrown by military coups. This degree of insecurity was not surprising. Old orders were threatened by new ideas, and deep inequalities and disparities in wealth and power still existed throughout Southeast Asia despite the promise of a better future once independence was gained.

Ferdinand Marcos, leader of the Philippines from 1965 to 1986, adopted a policy of 'constitutional

authoritarianism' after he declared martial law in 1972. Myanmar, following a coup in 1962, ushered in a new totalitarian regime that remains one of the most repressive in the region. Until the 1990s, Myanmar continued to prefer to look inwards, developing policies of self-reliance and shunning foreign alliances. In 1965 in Indonesia, after a failed coup attempt involving the Communist party, the army installed General Suharto as President and massacres of suspected communist and communist sympathisers followed. It is conservatively estimated that at least 250,000 people were killed at this time (Osbourne 1997). South Vietnam's American sponsored President, Ngo Dinh Diem, was overthrown in a coup in 1963. In the 1970s and 1980s, Thailand had a succession of military and authoritarian governments.

The former monarchies of Southeast Asia provided a sense of continuity although in less powerful formats in Malaysia, Thailand, and Indochina. The monarchy in Brunei, however, has maintained a more absolute authority. The former king of Cambodia, Norodom Sihanouk, who abdicated to form his own political party and rule the country as a politician from 1955, espoused a form of "Buddhist Socialism" (Church 1999). He was later overthrown in a right-wing coup in 1970. A civil war ensued, with United States military involvement. Vietnamese communist forces assisted the newly formed Khmer Rouge in their fight with Cambodia's new government. In 1975, the Khmer Rouge, under the leadership of Pol Pot, gained control and began their return to "year zero," a policy that removed technological development and intellectual life from Cambodia in the name of removing foreign and capitalist influences. The country was forcibly returned to an agrarian society. It is believed that up to 1 million people were executed and a million more died as a result of the Khmer Rouge's policies between 1975 and 1979. The regime only came to an end when Vietnam retaliated over Khmer incursions into their territory, invading the country in 1978 and installing a new regime. China in turn attacked the northern borders of Vietnam in 1979. Vietnam had undergone its own process of agrarian collectivisation following the 1975 fall of Saigon and the instigation of the Socialist Republic of Vietnam. Its economy declined, exacerbated by natural disasters (in particular, floods in 1977–1978), and a United States trade embargo. Industrial and agricultural output fell and food rations were instituted.

Indochina, that is, Laos, Vietnam, and Cambodia, was shattered by its regional and civil wars. As a result, by the 1970s there was a clear division between these countries and Myanmar, still languishing in terms of social and economic indicators, and those

with stable government and increasing economic growth; countries such as Malaysia and Singapore, led by the iconic figures of Dr. Mahathir Mohamad (1981–2003) and Lee Kwan Yew (1965–1990) respectively. Mahathir and Lee at times espoused the idea of an "Asian Values" approach to development, based on traditions of elite governance and bureaucratic administration, in opposition to western ideas of "liberal democracy." While regular elections are held in both Malaysia and Singapore, there are tight restrictions on media, freedom of speech, political opposition and the management of communal diversity. Whether there is a link between this more authoritarian approach to governance and economic growth is debatable but certainly by the 1990s, there was considerable development in these countries; Singapore, in particular, which is the only Southeast Asian country regarded as industrialised.

## Reform and Economic Growth

Economic development has been uneven in Southeast Asia, not only between countries but also within them, between urban and rural areas in particular and between ethnic communities. Lubeck (1998) argues that differing combinations of social class, ethnicity, and gender contributed to the varying experiences of economic development, but the impact of wars, internal strife, and political ideology that ravaged Southeast Asian states cannot be discounted either.

In 1967, the Association of South East Asian Nations (ASEAN) was formed to promote economic cooperation among its members (at that time, Indonesia, Malaysia, the Philippines, Singapore, and Thailand). As is evident from the inaugural membership, the ASEAN was originally a grouping of countries opposed to communist expansion in the region. Its expanding membership however, reflects the changing status of those communist states. Indochina, while still heavily dependent on subsistence farming and international aid, has moved towards hybrid models including private production. Laos, as with Cambodia, had begun a policy of agricultural co-operativisation in 1978 that was ended in 1979 after resistance from local farmers. It began a 'New Economic Management' program in 1986, but development has been hindered by its landlocked geography and lack of resources for industrialisation. Cambodia emphasised private sector development in its 1986–1990 Five Year Plan, introducing foreign investment laws in 1989. Since 1993, market-based economic practices began to dominate but political unrest and uncertainty

throughout the 1990s has hampered growth and reconstruction. As with Laos in particular and Vietnam to some extent, the economy is supported by foreign aid and loans, and hindered by inadequate infrastructure and opaque governance.

The end of Cold War support from the former Soviet Union helped to drive economic reform in Vietnam. Thirty percent of Vietnam's state budget had been aid from the former Union of Soviet Socialist Republics (USSR) (Church 1999). Vietnam's centralised economy began to waver in 1986, when, in line with the reforms taking place in Russia, a policy of *doi moi* or 'renovation' began. By the mid to late 1990s, relations were re-established with regional neighbours, and the United States lifted its trade embargo. Contemporary Vietnam has free market enterprises alongside state owned ones, although there are some concerns that prosperity, concentrated in the south, is again dividing the country.

Myanmar also announced a new economic regime, an "Open Door" policy, in 1988, but as with all aspects of life in this country, the economy remains under tight state control. Various countries have called for a boycott of trade with Myanmar, to add to embargos on arms sales, visa bans and asset freezing, as a result of the state's repression of the democracy movement. However, data in 2003 would indicate that there is a still a willingness on the part of international companies, particularly from the Asia region, to develop trade relations with this resource rich country. Myanmar maintained its non-aligned stance until 1997 when it too joined ASEAN, following on from Brunei (1987), Vietnam (1995), Laos (1997), and Cambodia (1999).

In 2003, agriculture was still the largest sector of gross domestic product for the Indochina countries and Myanmar although Vietnam's manufacturing sector was almost equal to that of its agricultural production. On the other economic side of Southeast Asia, Malaysia, Indonesia, Singapore, and Thailand were racing ahead in terms of economic development, with rapid growth and diversification during the 1970s and 1980s, and measurable declines in poverty. By the 1990s, they were experiencing booming economies with manufacturing the largest sector of their gross domestic product (2003 data). Capital cities such as Bangkok and Kuala Lumpur became major global financial and trade centres. Reorienting their economies towards exports and foreign direct investment (FDI) played an important role in accelerating growth rates (Hussey 1996). Thompson (1998) argues that the region also benefited from the international trade and investment regime established by such bodies as the IMF, the World Bank, and the World Trade Organisation.

New technologies, including high yield varieties of rice, revolutionised agricultural production. Indonesia, for example, by 1983 had its first rice surplus in a hundred years (Church 1999). As with the industrial revolution that came with European colonialism, the impact of post-independence agrarian reform was not always positive, creating social dislocation for often the poorest, most vulnerable sectors of Southeast Asian society and driving rural migration to cities (Scott 1985). Promised land redistribution after Independence was not as wide spread as had been hoped by many farmers who had become landless under colonial rule (Mackerras 1995). However, it can be argued that the agricultural reforms did provide a basis for contemporary economic development. The Indonesian economy was subject to continuous financial growth from the 1960s. Agricultural development was followed by industrialisation, then international investment and export oriented manufacturing, particularly in consumer goods.

Malaysia's New Economic Policy (NEP) was instigated in 1971, motivated by Malaysia's new leaders and the idea that economic and social disparity fuelled ethnic and communal tensions. The policy saw a massive increase in government intervention in the Malaysian business sector. Between the 1970s and 1990s, the economy grew on average 6.8% per year (Church 1999). The privatisation of public enterprises began in the 1980s and exports were diversified from primary products such as rubber and tin to include manufactured goods (electronics, chemicals, foods, textiles) and increasingly the services sector.

By the late nineteenth century Singapore was an important warehousing, distribution and shipping centre for British companies operating in Southeast Asia. By 1960, at least 70% of its workforce was employed in the services sector (Church 1999). Under Lee Kwan Yew, the next thirty years were spent building Singapore's manufacturing base and establishing massive government owned enterprises. The city-state has subsequently transformed itself from a fishing village to a financial and services sector hub for Asia with one of the highest rates of per capita income in the region. It is, in the twentieth century, positioning itself as a centre for research and development and the export of high- and bio-technology.

Thailand, having avoided colonial rule and contemporary war, and having had only an occasional political crisis, maintained high growth rates throughout the 1980s, fuelled by foreign investment from Asian powerhouses such as Japan and also from the United States. Japan has had an influential role in the development of Southeast Asia viewing the region as both a source of raw materials and a market for Japanese goods. Thailand's economy, once based on

rice growing, now included diversified agricultural and manufacturing products, and Bangkok had become another important financial centre in the region.

The Philippines on the other hand saw its economic development stagnate. According to Church (1999), in the 1960s the Philippines was one of the most successful and prosperous manufacturing countries in Southeast Asia. Major family controlled conglomerates grew but as a whole the country's economic growth was not sustainable. According to Hussey (1996), declining growth rates were largely due to unwillingness within the Marcos government to create social and economic reform. After Marcos' exile in 1986, and the return of democracy, the economy has again improved but the country still faces serious social and economic challenges. Manufacturing is the dominant sector of its gross domestic product but the economy is supported by remittances from foreign nationals working in other parts of Asia, the Middle East, and North America (approximately 7% of gross national product, 2003). A rural-urban divide has underpinned unrest in the country and Islamic insurgents continue to clash sporadically with government forces.

Collectively, the countries of Southeast Asia have maintained a commitment to promote cooperation in the region. Apart from ASEAN, another economic grouping, Asia Pacific Economic Cooperation (APEC), was established in 1989, to further support economic growth and cooperation in the region by lobbying to reduce tariffs and trade barriers. It has twenty-one members, including all ASEAN states except Cambodia, Laos, and Myanmar. ASEAN itself is expanding to incorporate cooperation with China, Japan, and South Korea (becoming ASEAN + 3). Since 1992, six of the ASEAN countries have signed a Free Trade Agreement, incorporating almost 96% of ASEAN trade, reducing and eliminating tariff and non-tariff barriers within the region in an attempt to create a trading bloc. Vietnam, Laos, Myanmar and Cambodia are yet to be in a position to sign on to the agreement but are expected to do so by 2010.

By the 1990s, Indonesia, Malaysia, Singapore, and Thailand had maintained extremely high levels of growth over several decades. Even the Philippines and Vietnam were showing signs of recuperation. The speed of economic development, however, brought with it inevitable stresses: an overburdened infrastructure (particular in mega-cities such as Manila or Bangkok); deforestation and environmental degradation; depopulation of rural centres; and questions around labour rights were prominent issues. The rapid pace of change also created tensions within the economic system itself. As a result newly industrialising Southeast Asia's growth was to come to a shuddering halt in 1997.

## The Asian Economic Crisis and Beyond

In 1997, the Thai government, in the face of market-driven pressure on the currency, floated the Baht, which had previously been fixed to the US dollar. The economy was already showing signs of strain as a result of high rates of borrowing and a large current account deficit. The financial sector had been liberalised during the 1990s but safeguards had failed to keep pace, and weaknesses in the banking system were exposed. The combination sent the currency into freefall, halving its value and causing the stockmarket to lose three quarters of its worth. The impact on the economy resulted in estimated job losses of over a million initially and more followed when the International Monetary Fund imposed strict conditions on its 'bailout' package (Church 1999).

The crisis in Thailand triggered similar events in neighbouring countries and as far away as Korea and Japan, sending Southeast Asia region into recession. The impact of the crisis varied from country to country but Indonesia was worse affected with its currency at one point just one-sixth of its pre-crisis value (Arndt and Hill 1999), inflation increasing and its gross domestic product severely declining. In Malaysia, the Ringgit's value was halved and the share market decimated. Unemployment and poverty rose throughout the region, particularly among urban poor. The agricultural sector was less affected, being less exposed to the financial system and export crops benefiting from currency devaluations.

Vietnam, Singapore, and the Philippines were the least affected countries but the crisis in general augured the need for reform. Structural problems were highlighted, in particular a lack of good governance and investment in unproductive infrastructure and speculation. The crisis also led to a questioning of the international financial system as foreign speculators profited from the falling markets in Asia.

In Indonesia, the economic downturn impacted on the legitimacy of the Suharto government. Ruling for over thirty years, corruption and lack of transparency had been tolerated while the economy was stable but as increasing numbers of people suffered they looked to the government for accountability. Public protests led to Suharto's resignation in 1998. This is generally regarded as the beginning of the introduction of wider political reform in Indonesia.

While it could be argued that the crisis of 1997–1998 resulted in stronger economic accountability, there are still issues that need to be addressed that will impact on development in the region in the future. The environment is a particularly contentious issue as regional leaders have argued that they be

allowed to develop as industrialised nations in the West have done, without restrictions due to environmental factors. Environmental groups continue to lobby for greater implementation of sustainable development strategies, control of green house gas emissions and an end to logging of rainforests. A related issue is that of energy security. Countries whose natural resources are the mainstay of their economies, for example, Brunei's oil and gas supplies, are beginning to look for alternative means of productivity. Brunei's investments in other countries will no doubt assist in maintaining its high standard of living. On the other hand, Indonesia, a major supplier of petroleum, has not been able to translate the wealth from this resource into the wider well being of its population. It is argued by writers such as Hussey that this is because the benefits are dissipated by Indonesia's population growth.

Population growth is another issue for the region. Indonesia had a population of 8.5 million in 1800 but 219 million today. The population of Thailand has increased by almost 50% in the thirty years since 1975. The demographic composition of the region is also shifting. The youth population (fifteen to twenty-five years) has become the largest segment, driving changing consumption patterns and social attitudes. The population is increasingly urbanised, educated, and middle class, increasing the impetus for political change.

The likelihood of conflict increases as populations grow and pressure is placed on arable land and urban centres. There are deep divisions still between rural poor and urban affluence that also feeds into black markets such as "the Golden Triangle," one of the world's major narcotics producing areas, linking Myanmar, Laos, and Thailand. Issues of national unity have become particularly pertinent post-September 11, 2001. There has been a resurgence of Islamic fundamentalism in the Philippines and Thailand, and bombings of western tourist sites and embassies in Indonesia (2002–2004). Indonesia finally relinquished Timor-L'este in 2002, but is still attempting to overcome communal violence in another of its provinces, Aceh. Countries such as Myanmar have outstanding unresolved conflicts with their indigenous ethnic minorities. Internationally, there is also a degree of underlying tension between China and its smaller neighbours over the Spratly Islands (South China Sea), claimed by Malaysia, the Philippines, Brunei, Vietnam, Taiwan, and China.

Health issues, such as AIDS, are likely to impact on future development in particular areas. Almost 1% of people between the ages of fifteen and forty-nine (some 5 million) are living with HIV/AIDS in Southeast Asia (2004). A new deadly virus, SARS

(Severe Acute Respiratory Syndrome), spread from China in 2003 to other parts of the region including Hong Kong and Singapore (and as far away as Canada). The disease impacted heavily on tourism, one of the region's growing economic sectors.

In terms of economic development, the newly industrialising countries of Southeast Asia continue to adapt to changing global conditions. The region has been a supplier of raw materials for European markets, then a manufacturer of materials for export, and in the future economies could be restructured yet again as the services sector, including tourism and business process outsourcing (call centres, for example), becomes dominant. The Philippines and Malaysia have already established outsourcing as a viable sector of the economy, although it is still a small industry compared with India. While trade ties with India and China have existed for over 2,500 years this relationship is also taking on a new form. The growth of the Indian and Chinese economies is drawing in resources from Southeast Asia and creating competition particularly in the manufacturing of cheaper consumer goods. However, transformation is a hallmark of post-World War II economic development in Southeast Asia. Enmeshed in increasing interconnections of trade and the movement of people, the region will maintain its historical position as a central point of global contact and change.

## SOUTHEAST ASIA: INTERNATIONAL RELATIONS

Southeast Asia is one of the most politically and ethnically diverse regions of the world. As a result, international relations within the region and with countries from outside the region are particularly complex and intricate. Few of the ten countries considered have such a dominant political constituency that there is not widespread opinion about relations with almost any external actor.

In the past, critical external relations were with China and with trading representatives of India, Persian, and the Arab states. Subsequently, European and then American involvement became increasingly important as trading gave way to colonisation. International relations then became subject to international geostrategic concerns, such as World War II, the spread of communism and forces such as international terrorism. States within Southeast Asia have also increasingly become important actors in their own right, moving from passive to active participants on the international stage.

### Historical Background

State formation in Southeast Asia has historically concerned the creation of loose networks of small, often city-based states. Population density has always been low and there have been insufficient people to fill up the whole of the landscape. Kings and rulers throughout history, therefore, have treated people (including people of other states) as valuable resources to be maintained or acquired from elsewhere, by force if necessary. Consequently, the long history of warfare between states within the region has been characterized not by the desire to gain territory—for there have never been enough people available to hold on to large swathes of land for more than a few years but, rather, the desire to obtain slaves and to

destroy the works of rival states. Slaves as well as domestic labour were used to build monuments and religious works to demonstrate the vigour and merit of rulers.

Most states, therefore, consisted of comparatively small areas of land surrounding a central city, with a few villages acting as a network to the next small state. In archipelago Southeast Asia, states would mostly be based on coastal sites and be linked together with other islands by convenient shipping lanes. Alliances to counter the threat of external aggressors were possible (for example the famous three way alliance established in northern Thailand to resist the Mongol advance) but these were limited in scale and in time.

At one stage or another, almost every state in the region accepted the nominal or actual suzerainty of the Chinese emperor. This was advantageous in that it permitted access to trade networks with China—often conducted under the guise of providing tribute to the emperor—and connecting the states with those as far away as the Mediterranean and even the Americas. The spice trade linking locations as remote as the Moluccas Islands has a history of thousands of years and involved numerous intermediaries at different stages to make it feasible. Consequently, most states had a more or less permanent contingent of international merchants to help organise trade and in some cases these foreigners were permitted to achieve high office. Relations were more or less friendly over the long-term, therefore, although local incidences of xenophobia and racial tension have erupted from time to time. The smooth organisation of a cosmopolitan population was assisted by the general practice of allowing foreigners to cohabit with local women on a formal, contracted basis (in addition to the numerous informal occasions) in a social system in which the woman concerned did not lose any status after the end of the arrangement and, indeed, may have gained some by access to material goods provided by the foreigner.

Southeast Asian states were originally passive providers of accommodation for international traders but, eventually, goods produced in the region did obtain popularity and Southeast Asian nations took more active roles in commerce. However, this active role ceased when the arrival of European traders to participate in the system changed into colonizers who sought to dominate the political and economic systems completely. Prior to colonisation, accounts of Southeast Asia depict a healthy, wealthy population equal in stature to Europeans. After several generations of colonisation, most Southeast Asians have become known as short of stature, short-lived and short of money.

## The Legacy of Colonisation

The Philippines were colonised by the Spanish and subsequently by the United States; Vietnam, Laos, and Cambodia were colonised by the French; Indonesia was colonized by the Dutch, with some continuing Portuguese enclaves, such as East Timor (now Timor Leste); Malaysia, Singapore and Burma (now Myanmar) were colonised by the British. Only Thailand (previously known as Siam) was able to avoid formal colonisation and even then this was achieved through lengthy bouts of diplomacy and provision of concessions, willingly or unwillingly provided.

Just as there were various colonizers, so too were there various colonial experiences. Former French and Dutch possessions, for example, consider the experience to be wholly negative and destructive and people in those countries still harbour a significant amount of resentment and ill-will towards the colonisers. The attitudes of former British colonies, on the other hand, are more complex because of the British policy of divide and rule, which set one class or ethnicity within a country to rule or administer others and, as a result, some local people certainly gained as a result of colonisation. Nevertheless, every country was involved in its own struggle for independence and self-determination which intensified during the twentieth century as first communism provided a different ideology offering ostensible freedom and secondly the victories of Japan in World War II demonstrated that Europeans were not invincible after all. While the British ceded their empire at the conclusion of WWII, the French and Dutch were more reluctant to do so and attempted to re-establish their dominance in Indochina and in Indonesia—both of which actions led to bloody wars and the eventual expulsion of the Europeans, in the case of Vietnam, the expulsion of the French opened the way for communism and the subsequent American War.

## The Communist Threat

In the early years of its manifestation, Communism was seen as an immensely attractive form of ideology which demonstrated a logic for the operations of colonisation but also showed how it would ultimately wither and be defeated. The eventual victory of the Chinese Communist Party in expelling Chiang Kai-Shek's foreign backed Nationalists and the Japanese invaders alike through purely local efforts, particularly through the efforts of apparently disempowered

rural people such as were to be found throughout Southeast Asia, only hardened the resolve. As a result, it attracted adherents in nearly every country of the region. In most cases, a fierce struggle ensued as the nationalist governments sought to eliminate an ideology that they believed would result in their countries again being dominated by a foreign power. Most notably, the northern part of Vietnam turned to Communism and this sparked the invasion of the United States and allied troops, which only resulted amidst terrible casualties and destruction in the fall of the west-looking South Vietnamese government and massive outflows of refugees and migrants. Subsequent international relations were hugely affected by this war, which resulted in the imposition of sanctions upon the country by the United States and the locking of Vietnam into the Communist world, where aid and assistance could be most commonly obtained either from the Soviet Union or China, which introduced a new twist into a long and generally problematic relationship.

The US War in Vietnam had many other consequences. The presence of large numbers of US and allied troops in the region stimulated the industrial level development of bar and sex industries in friendly local cities such as Bangkok, Taipei, and Singapore. It also brought alliances with various ethnic minorities who had been encouraged to make common cause with the Americans in return for future autonomy that the Americans were not able to grant. This subsequently led to the large-scale relocation of the Hmong people from their homes in upland Laos and Thailand into the United States in a process that has so far lasted decades.

Communism was also victorious in Laos, which was dragged into the conflict in Vietnam and has the dubious distinction of having the most heavily bombed population per capita in the world. Domination of Laos by Vietnamese subsequently ensured that almost all of the former's relations with the outside world were mediated on the official level by Vietnamese trained sensibilities. This even extended to having a significant impact on cross-Mekong contacts between the Laotians and the millions of ethnic Lao living in the northeastern part of Thailand. The situation was even more extreme in Cambodia, where the Communist-inspired Khmer Rouge swept to power and launched a campaign of ideological purification that led to the deaths of millions and the almost complete absence of contact with the outside world. Refugees on the Thai border, for example, were sent back to Cambodia. The Vietnamese invasion of 1979 that ended the Khmer Rouge reign led to further sanctions against Vietnam and a brief border war with China. The frozen atmosphere with China

followed by the collapse of the Soviet system led to the almost complete absence of badly needed overseas assistance and effectively drove the return to a market-based system.

The struggle against Communism in Malaya, Singapore, and Thailand, was ultimately successful and helped to cement relations with western powers. However, measures taken were often extreme and, in Malaysia, involved an extensive internal war (labelled an “emergency” by the British state prosecuting it for insurance reasons). These actions further distanced the pro- and anti-communist positions of states and actors within the region and led to further disunity.

### **Irredentism and Autonomous Movements**

Southeast Asian states have in common, therefore, multiethnic populations distributed unevenly across their territories. State borders have been arbitrarily drawn in many cases by colonial powers and in others borders are not yet fully demarcated. Low levels of population in most parts of the region have reduced the need to maximize geographical territory and this has meant that disputes over ownership of some remote areas have emerged with the discovery of important resources located near them. One example of this is the Spratly Islands, which are a chain of almost uninhabitable island tops spread over a wide expanse of ocean but which are nevertheless claimed and partly occupied by forces from China, Vietnam, and Taiwan in full and Malaysia, the Philippines and Brunei in part. Establishing a diplomatic process to determine ownership has required a difficult and lengthy effort that is not yet complete. However, it has offered some guidelines for future negotiations.

Irredentism is the desire of fragmented communities to reintegrate into their own state. It is related to the desire for autonomy, which involves the desire of a community wholly administered by a state of which it is part to rule itself with a greater degree of independence. Many states fear these phenomena because of the danger to stability to security and indeed to access to resources. In recent years, the former Portuguese colony of Timor Leste (East Timor) has managed to gain independence from Indonesia in the face of determined opposition and at the cost of the almost complete physical destruction of its infrastructure. The presence of offshore reserves of oil and gas are partly responsible for the bitterness of much of the opposition to independence. Other areas within Indonesia also wishing to

obtain independence include Aceh on Sumatra, which has been the result of years of revolt suppression by central state forces and which has continued despite the recent devastation following the earthquake and tsunami disaster of December 26, 2004. Other areas in which these movements are of importance include the Moros islands in the Philippines, the southern provinces of Thailand that were once Pattani and the Shan states of Myanmar. In each of these cases, acts of terrorism by insurgents and government reprisals in response have become an almost daily phenomenon.

These movements have had numerous impacts on international relations. Firstly, cross-border conflict or the use of border regions as hiding places divides neighbouring states. Secondly, other regions may be drawn into the conflict; both from within or without the region and this can lead to intensification of disputes, especially if the all-important loss of face becomes a reality. Dealing with these actual and potential issues was an important spurring force for the creation of the Association of Southeast Asian Nations (ASEAN), which has become the main forum for international discussion.

### **ASEAN**

International relations within the Southeast Asian region have been dominated by the creation of the Association of South-East Asian Nations (ASEAN), which provided a forum for debate that was previously lacking. Despite the numerous apparent problems with the debates produced, which frequently appear to be greatly abstracted from real life, the importance of ASEAN has been to provide a place where Southeast Asian leaders can communicate with each other informally and, at the beginning of the twenty-first century, sufficient commonality of purpose has been established for ASEAN to undertake negotiations on a bilateral and multilateral basis with economic partners such as China, South Korea, Japan, and Australia.

In a region lacking political forums and much commonality of purpose, it was both essential and highly problematic that an association of nations be formed to create a space in which issues of mutual importance may be discussed, even if public discourse necessarily remained drenched in rhetoric. The first incarnation of the Big 5 that constituted the early ASEAN were, in 1967, a disparate group united by a few common concerns. Singapore, Malaysia, Thailand, Indonesia, and the Philippines were a collection of largely post-colonial societies fearing the spread of

Communism and the outbreak of ethnically based violence. As autocratic societies, they were unwilling to participate in international discussions in which their own undemocratic nature could be criticised. Hence, a *modus operandi* was developed in which no public discussion of what were considered to be each other's internal affairs was considered acceptable. Deals, when possible, were done strictly behind doors. Those numerous technocrats and diplomats who devoted years to negotiating agreements could find their efforts apparently cast aside by the effects of a grandstanding speech. Yet, nevertheless, the scope of agreements between ASEAN members has both broadened and deepened.

In subsequent years, the five remaining Southeast Asian states have also joined ASEAN: Brunei joined in 1984, Vietnam in 1995, Laos and Myanmar in 1997 and, finally, Cambodia in 1998. Only tiny new East Timor remains outside the fold. There are few if any other organisations in the world in which military autocracies can rub shoulders with communist states, absolute monarchies, and democracies. While ASEAN is far from perfect, it is a great deal better than the alternative. The original declaration of association read in part that:

The Association represents the collective will of the nations of to bind themselves together in friendship and cooperation and, through joint efforts and sacrifices, secure for their peoples and for posterity the blessings of peace, freedom, and prosperity.

This was restated slightly in 1995 in the following terms: "Cooperative peace and shared prosperity shall be the fundamental goals of ASEAN." It is true that no large scale warfare between ASEAN members has broken out since its inception, although genuine peace has always been and remains a fragile vision. Areas of considerable tension include the *konfrontasi* between Indonesia and Malaysia, rivalry between Malaysia and Singapore and access to water resources, the destruction of East Timor by Indonesian forces, the sporadic outbreaks of violence on the Thai-Myanmar border as Myanmar forces battle against various ethnic groups seeking autonomy and, perhaps most significant of all, the Vietnamese invasion of Cambodia in 1979 intended to rid that benighted country of the scourge of the Khmer Rouge.

Ethnic Vietnamese suffered greatly during the Khmer Rouge domination of Cambodia and the fact that the two states can now co-exist in ASEAN without either publicly demanding reparations or trials points to a possibly sustainable model of international relations in one of the more problematic areas of the world.

Within the ASEAN region, a number of specific issues exist which have particular impact upon international relations and these will now be dealt with individually.

## Migration Issues

The most important migration issue in Southeast Asia has been the presence of Chinese migrants within the region. Chinese have been present in almost every part of the region since at least the sixth century CE. While most may never throughout history have been to mainland China or know anyone there individually, nevertheless the link to the antecedent village or province has remained strong. The claim of the central state upon the loyalties of emigrants has also, of course, historically been of great importance. This has led to a variety of implications of a more or less positive nature. On the positive side, the remittances of money and trading relationships established with ancestral villages and regions has been economically beneficial, while the practice of exporting Chinese women for marriage to migrants has in some case prevented integration into local societies. Resentment against ethnic Chinese has been easy to foster in times of economic or political distress and, during the 1997 financial crisis, for example, ethnic Chinese were attacked with particular savagery in Indonesia.

The low level of public and political discourse throughout most of the region has meant that it has become very easy for ethnic violence to flare very quickly. For the sake of rumours and gossip, there were intense although short-lived riots against Thais and Thai interests in Cambodia, for example, while Burmese migrant workers have been persecuted by Thai citizens and authorities, as too have Indonesian migrant workers been persecuted in Malaysia. Migrant workers, central figures in most modern economies, have proved themselves to be vulnerable to various types of abuse across border and negotiations concerning their fair treatment has constituted an important issue in some state relations.

## The Role (Post-War) of Japan

Having been part of the lengthy struggle for independence, many sections of Southeast Asian society were reluctant to welcome the large scale arrival of Japanese corporations investing in their economies. While governments welcomed the prospect of employment

opportunities and possible technology transfer, they were also wary of possibly giving away economic sovereignty to organisations that seemed unwilling to accept local people among the management structure. The Japanese government was slow to accept a political leadership role and, partly as a result, overseas development assistance (international aid) was often considered to have an ulterior motive. This coloured relationship between Southeast Asian nations and Japan that is only in the twenty-first century that Japanese government agencies began meaningfully to take a leadership role in economic reform and integration within the area, leading to more openness about the intentions of the Japanese state.

The globalisation of popular media and of many consumer goods markets has meant that aspects of Japanese culture (as well as those from various other countries) have become much more prevalent in Southeast Asia and this too has assisted in promoting friendly relations, as have also various exchange schemes.

## Religious Issues

State relations in the premodern world were often influenced by religion and their legacy has continued until the current day. The Islamisation of many of the island regions of Southeast Asia has meant that states in those areas frequently look west to their Islamic brothers in the Arab world rather than north to their rather closer neighbours in mainland Southeast Asia. This has become more important in recent years as the internationalisation of religious teaching in Malaysia, the south of Thailand and Indonesia, as well as southern regions of the Philippines, has been associated with the rise of fundamentalist beliefs and a possible link with terrorism. Certainly, movements seeking autonomy from a non-Islamic state government have taken on a more violent nature which has included targeting western people and interests.

## Development Implications

The concept of statehood came late to most Southeast Asian nations and so the practice of conducting international state relations that are binding on all actors within a state was also only lately developed. Centuries of treating with other states from a position of often supine weakness further influenced the nature of the discourse and intention of state leaders.

Cultural factors have also played a part. The result has been a frequent degree of defensiveness and obfuscation when dealing with the world. State leaders neither wish to reveal facts about their home countries nor accept criticism of their policies or state of development. As previous *de facto* spokesperson for ASEAN, Malaysia's Dr. Mahathir Mohammed was not averse to bringing up the ills of the colonial past caused by western powers both to explain present imperfections and to turn the tables of criticism.

Generally, therefore, the level of political discourse in public, together with the low level of meaningful public participation in policy formation, has meant that not only has international dialogue been of an inefficient manner but also that decisions taken at governmental level have little or no ownership at lower levels and hence are difficult to implement.

The use of minority peoples as proxies by external states as also increased internal fragmentation and led to some punitive policies taken against them. In the case of international development assistance, the additional agenda issues brought to negotiations by international partners has led to a short term approach to development priorities and unevenness in application.

ASEAN has proved successful within the very limited remit that it has provided for itself. While co-operation has slowly evolved, a more open and wide-ranging discourse would have provided more development opportunities for the people of the region. In any case, greater openness to cultural influences within the region should have helped to promote understanding and tolerance and would have saved a great deal of misery for put upon minorities.

## SOUTHEAST ASIA TREATY ORGANIZATION (SEATO)

The Southeast Asia Treaty Organization (SEATO) was inspired by President Dwight D. Eisenhower and forged by Secretary of State John Foster Dulles in 1954. In that year, following the Geneva Conference, the United States (US), led by Dulles, who feared communist advances in Southeast Asia, began negotiations with indigenous states and colonial powers in the region in an effort to form a regional defense system. On September 8, 1954, eight signed the SEATO treaty as part of the Manila Pact. The organization, which ostensibly paralleled the North Atlantic Treaty Organization (NATO), officially began operations on February 19, 1955, following ratification of the treaty by the US Senate.

The founding members included Australia, New Zealand, Pakistan, the Philippines, Thailand, the US, Great Britain, and France. Of note were those nations not included: Taiwan, because the treaty did not accept countries north of 21°30' North latitude; neutral states such as India, Burma, and Indonesia, which refused membership; and Cambodia, Laos, and South Viet Nam, which were denied membership by the tenets of the Geneva Accords. Indeed, France, still smarting from its humiliating defeat at Dien Bien Phu and its resulting loss of Indochina, opposed full membership for her former colonies—Cambodia, Laos, and South Viet Nam.

While the agreement created a council to provide for consultation and it allowed "for the common defense" of all the treaty partners, promising action "to meet the common danger," unlike NATO, it did not form a unified military command. At the same time, the SEATO Treaty contained a separate protocol that designated Cambodia, Laos, and South Viet Nam as "vital" to regional security. As such, SEATO nations were obligated to place a "security umbrella" over these states. In spite of the questionable legality of this protocol, which essentially countered the tenets of the Geneva Accords, Dulles insisted that it was

essential to assure the "tranquility and safety" of the treaty signers.

Following the Gulf of Tonkin Incident in mid-1964, President Lyndon Baines Johnson cited this protocol as the basis for the Gulf of Tonkin Resolution and the expansion of America's military commitment to what became the Second Indochina War. In fact, he never consulted his SEATO partners in this matter. Ironically, by March 1969, his successor, President Richard M. Nixon had reinterpreted this very same protocol, declaring that it did not justify or require the commitment of US military forces to the region. This led to the initiation of Nixon's "Vietnamization" policy.

By 1971, many SEATO nations, especially France and Thailand, had become very uncomfortable with America's handling of the war in Viet Nam, Cambodia, and Laos. These escalating tensions reached a climax with the fall of Sai Gon in 1975. With the advent of detente and the beginning of US policies that would eventually end the Cold War, most SEATO states no longer saw a need for the organization. On June 30, 1977, the alliance was formally dissolved during laconic ceremonies in Bangkok, Thailand.

Clearly, SEATO did little for the development of states in Southeast Asia since it was a Cold War political creation, mostly designed to protect US interests in its broader struggle against the Soviet Union and China. One could argue that SEATO retarded the growth of nations such as Kampuchea, Laos, and Viet Nam. One thing it did contribute was to inspire indigenous leaders to seek an alternative organization made up of regional states. Indeed, over the past thirty years, the Association of Southeast Asian Nations (ASEAN), comprised of, and led by regional nations, has successfully facilitated significant economic growth and social stability in Southeast Asia.

## SOUTHERN AFRICA: HISTORY AND ECONOMIC DEVELOPMENT

### The Region Defined

The Southern Africa region has been defined as including as few as nine nations and as many as fourteen. The principal organizing group since 1979 has been the Southern African Development Community (SADC). The SADC deals with political and economic development, but it is also concerned with social and cultural issues. When the SADC first organized it included nine states, but in 1992 it expanded to fourteen: Angola; Botswana; the Democratic Republic of the Congo; Lesotho; Malawi; Mauritius; Mozambique; Namibia; Seychelles; South Africa; Swaziland; Tanzania; Zambia; and Zimbabwe. This essay will discuss the joint historical and economic development of the fourteen state region.

### Early Residents

Southern African history began with the arrival of the San and Khoikhoi who inhabited each of the fourteen nations. The Khoisan (Khoikoi and San) arrived long before other African migrants and Europeans. For the pre-historic period archaeologists and anthropologists have uncovered fossil remains that show that *Homo sapiens* had arrived in Southern Africa from the North around 50,000 BCE, long before San hunter-gatherers and Khoikhoi herders. The Khoisan, later termed “Bushmen” and “Hottentots” by Europeans, came from the North around 14,000 BCE. Bantu followed in the first century CE and gradually displaced most of the Khoisan by intermarriage or force. Africans at this juncture were multi-ethnic as was apparent in the numerous languages they spoke.

The region’s history and economy were influenced by its semi-tropical/temperate climate and its location in the Southern half of the African continent. By the fifteenth century the Cape of Good Hope, at Africa’s southern tip, became a port on a route that tied Europe to East Africa and Asia until the completion of the Suez Canal in 1869. The climate on the Atlantic and Indian Ocean coasts made the Cape an ideal market for Portuguese, Dutch, French, Spanish, Belgian, and British ships to restock food and fuel stores en route to valued Asian and East African spices, cloths, exotic foods, and slaves. In the fifteenth to nineteenth centuries European immigrants began to

arrive in Southern Africa where they established spheres of influence and political hegemony.

European migration and economic interest in Southern Africa began when Portugal’s Bartholomew Dias rounded the Cape of Good Hope in 1488 after navigating the southwestern Atlantic coast. Vasco da Gama’s 1497 expedition sailed up Africa’s east coast to present-day Kenya where he established a port at Melinda before he continued on to Arabia, then eastward to India. Portugal dominated the trade route to Asia throughout the sixteenth century and built forts in what are now the Southern African states of Angola and Mozambique. Most of Southern Africa had direct or indirect trade with the Portuguese.

At the end of the sixteenth century English and Dutch merchant-sailors challenged Portugal’s economic monopoly in Southern Africa and bartered with Africans of the Cape to replenish their ships with meat, water, and timber for the ships’ broken masts. English trade with the Khoisan continued until 1652, when they decided not to build a permanent fort at the Cape. In place of the English, the Dutch East India Company set up a supply station at Table Bay and encouraged trade with the Khoisan and Dutch settlers. At the same time as the Dutch increased their presence during the seventeenth century, Bantu-speaking Africans were moving south and French Huguenot (Reformed Protestants) arrived to escape religious persecution in France and melted into the Dutch Protestant Afrikaner community. Germany colonized Namibia and Tanganyika (Tanzania) in 1884. The Asian influence in southern Africa was most pronounced in Madagascar and Zanzibar and began 2,000 years ago. Madagascar’s population is primarily Malayo-Indonesian, but its official languages are French and Malagasi. It became independent of France in 1960.

Southern Africa was thus distinguished by a mix of people who gathered there. By the twentieth century southern Africans spoke eleven official languages and many local dialects. After 1945, this polyglot of people threw off the European yoke and formed democratic states. Events that abolished apartheid (racial separation) marked the region’s greatest success as it rejected laws and customs that marked a brutal political, economic, social, and cultural history in the pre- and post-World War II era.

### Precursors of Post-1945 Economic Development

The post-1945 Southern African economies evolved out of early nineteenth century clashes between rival

Bantu-speaking communities due to increasing population and decreasing water supply that depleted grain and hunting resources. The African population increase that began at the end of the eighteenth century came as a result of the introduction of corn (maize), a crop that the Portuguese brought from America where native people grew it. Because corn was less drought-resistant than indigenous grains it caused periods of famine that paralleled what happened in Ireland as a result of the failure of another Native American crop, the potato, in the 1840s. The Portuguese ivory trade drew Africans to Mozambique and increased the need for food and water.

Economic conditions led to political tensions, with large tribes fighting to dominate the land and food supply. The arrival of Dutch Afrikaans-speakers, French Huguenot, British, Portuguese, Belgian, German, and Bantu, further disrupted the lives of the generally peaceful Khoisan. When Africans refused to work for Europeans on the land and in mines, the whites imported slaves from West and East Africa, as well as India and China. Wars between Africans and Europeans, and African and African, were over land with scarce water resources, but also over valuable mineral resources.

European states in the nineteenth century drew boundaries that did not take into consideration religious, cultural, and language differences. African states with no cultural core found it difficult to resist service to European economic interests. Therefore Southern African wars fought since 1945 over land, mineral wealth, and ethnic dominance were ignited by a European scramble for Southern Africa's land and wealth. As a result, post-1945 African independence movements were complicated by internal and external ethnic struggles for dominance. Southern Africa, as much as any African region, provides historical insight into problems of balkanization, ethnic tensions, and control of land and wealth that have elevated the grasping for power. To discuss wars and treaties in Southern Africa is beyond the scope of this essay. More specific information is covered in essays on the fourteen nations in the region. This essay deals with the regional history and economies.

### **South Africa, Zimbabwe, Zambia, Namibia, Malawi, Lesotho, Swaziland, Mauritius, Seychelles, Tanzania, and Namibia**

Eleven of the fourteen nations in the South African Development Community are former British colonies. They are sufficiently similar to discuss them together.

The dominant nation in 2005 in terms of economic and political leadership, size, and population, is the Republic of South Africa. South Africa was the base from which Britain launched its expansion in Southern Africa and Asia. From South Africa it conquered the territories of present-day Zimbabwe, Zambia, Malawi, Botswana, and Indian Ocean islands of Madagascar, Mauritius, and the Seychelles. Britain received former German colonies of Tanzania and Namibia after World War I as League of Nations mandates. Two states within the borders of South Africa, Lesotho and Swaziland, were Native Reserves, later Homelands. These states became members of the British Commonwealth in the post-1945 period. South Africa continued to dominate the region after 1945 in spite of the fact that it was the last to gain African majority rule (1994).

In 1890, the British South Africa Company (BSAC), a commercial enterprise headed by diamond czar Cecil John Rhodes, moved to conquer what are today Zimbabwe, Zambia in 1890, and Malawi (Nyasaland Protectorate) in 1891. Rhodes' dream was to create a Cape to Cairo British economic corridor—to take minerals from Africa and such other wealth as his BSAC could develop. Missionaries, mainly Protestant evangelicals, followed the union jack in the name of Western Christian civilization. Zimbabwe was under imperial rule till 1880; Zambia and Malawi gained independence in 1964. European political rule was supported by white settler economic, social-cultural domination. Malawi, visited by the Scottish missionary David Livingstone in 1859, became a British Protectorate in 1891. The BSAC ruled Zimbabwe (Southern Rhodesia) until 1923, when it turned the government over to white settler regimes.

South Africa has 1,219,912 square kilometers of land (about twice the size of the American state of Texas). The Republic, composed after 1984 of four provinces: Cape, Natal, Transvaal, and the Orange Free State, includes in its territory several islands in the Atlantic and Indian Oceans. It borders on six independent nations: Botswana; Lesotho; Swaziland; Mozambique; Namibia; and Zimbabwe. Like most Southern African nations, 12% of South Africa's land is arable and even that land is susceptible to prolonged droughts. Its interior is a large plateau (veldt) surrounded by rugged hills and a thin coastal plain along the Atlantic and Indian Oceans. A new multi-ethnic African-led federal democracy took over in 1996 under President Nelson Mandela. Its 42,718,530 citizens wrestle with criminal and ethnic violence in their quest for peace, justice, and prosperity. The struggle is reflected in books by Nobel Prize winner Nadine Gordimer and Booker Prize

winner J. M. Coetzee. While South Africans are not alone in working out economic, racial, and language differences, they are doing so with people from three continents—Africa, Europe, and Asia, another phenomena they share with the other Southern African states.

Modern South Africa's economic history began with a discovery of rich mineral deposits in 1860–1880. In 1867 prospectors found diamonds and by 1869–70 the claims produced a rush of prospectors. The British annexed the fields and denied the claims of Dutch Afrikaners in the area. By the 1880s, Cecil Rhodes' DeBeers Consolidated Mines had bought the original mines and most small claims. Diamonds, South Africa's largest export, provided employment and subsidiary industries that fueled economic growth. By 1900, exports grew to £15 million; £4 million came from diamonds. A growing economy spurred immigration and produced a lust for more diamonds and gold, and attacks on African tribes in Shona and Ndebele territories to the north where there were more mineral deposits, but not the large gold and diamond deposits that Rhodes BSAC sought.

Africans had mined gold in southern Africa for centuries and traded it with the Portuguese and Arabs. After Afrikaners discovered gold in South Africa about fifty thousand Africans migrated each year to mines around Kimberley and Johannesburg. African farmers in Basutoland (Lesotho), the Cape and Natal, supplied growing populations around mines, interior cities and coastal ports. "Coloureds" (mixed African and white) and Indians prospered as skilled tradesmen and shopkeepers. When there was a gold strike near Johannesburg in Witwatersrand (the Rand) in 1886, English businessmen, enriched by diamond mining, bought the claims. Gold output increased to almost £8 million in 1895, 20% of the world's production. By 1900, Europeans had invested more in South African diamond and gold mines than in all the rest of Africa. Gold mines employed one hundred thousand Africans; diamond mines about twenty thousand.

In 1945, diamond and gold still dominated the mining industry. In 2005, South Africa maintained its position as the world's largest producer of platinum, gold, chromium. Minerals dominated its combined exports of \$33.8 billion. Its major trading partners were the European Union, United States, and Japan. Its gross domestic product (GDP) was \$456.7 billion, an estimated \$10,700 per capita. The 12% of its land that was arable produced corn (the staple food of its African population), wheat, sugarcane, fruits, and vegetables. Meat products included beef, poultry, mutton, wool, and

dairy products. Of its 17 million workers, 45% worked in service industries, 30% in agriculture, 25% in industry and commerce, but 37 % were unemployed. Service industries in Southern Africa include many low paid domestic servants from villages who are seeking cash income for school fees and other necessities.

Six of the countries in the former British colonies of Southern Africa are landlocked: Zimbabwe, Zambia, Malawi, Botswana, Swaziland, and Lesotho. They are therefore dependent on neighbors, particularly South Africa, for access to markets. In 2004, the estimated populations were: Zimbabwe, 12,671,860; Malawi, 11,906,855; Zambia, 10,462,436; Botswana, 1,561,973; Lesotho, 1,864,040, and Swaziland, 1,167,241. In the area approximately 98% of the people are African; the other 2% are European and Asian. Between one and 11% of the land was arable and produced maize, tobacco, sugarcane, tea, coffee, cotton, chocolate, rice, and peanuts (ground nuts). While the principal livestock was cattle, which had a social value in bargaining for brides for sons (bride price), they also grew sheep, goats, and pigs. Zimbabwe, Zambia, and Botswana are rich in mineral resources: copper; chromium; nickel; there were deposits of gold, diamonds, coal, asbestos, cobalt, zinc, and lead in the six countries. In each country, approximately 86% of the population is at least partially employed, but most rural farmers are operating on subsistence basis of virtually no cash income. A primary concern, most notably in Zimbabwe and South Africa, was the uneven distribution of land between the majority African farmers, and the minority of white commercial farmers. Options facing the governments are: compensation to white farmers and redistribution to Africans; and confiscation without compensation based on the taking of the land in the nineteenth century by Europeans with no compensation to Africans. Funds for compensation would to come from outside the region, mainly Europe and America.

Lesotho and Swaziland, former African Homelands (and before that Native Reserves), are surrounded by South Africa. They gained independence from Britain in 1966 and 1968. Apart from a few diamond deposits in Lesotho they have few minerals. Lesotho's GDP was estimated at \$5.5 billion, \$3,000 per capita in 2003. Seventy percent of its trade was with the United States; 24% with South Africa. Eighty-six percent of its workers were subsistence farmers, many of whom also worked in South Africa. Swaziland had an estimated GDP of \$5.7 billion in 2003; \$4,900 per capita. Its principal industries were asbestos and coal mining. Seventy-two percent of its exports went to South Africa.

The island nations of Madagascar, Mauritius, and Seychelles, located in the Indian Ocean, have characteristics that differ from the six former British mainland colonies. Madagascar has an area of just 226,656 square miles, but a three thousand mile coastline. On the 4% of its land that is arable, it grows coffee, vanilla, sugarcane, and cloves. Its 17,501,871 people are of mixed ethnicity: Malayo-Indonesian, African, Arab, French, Indian, Creole, and Comoran. In 1964, it received independence from Britain. It had a 2003 estimated GDP of \$13 billion, \$800 per person and few natural resources. Mauritius has an area of just 718 square miles, and a 110 mile coastline. But 49% of its land is arable. Its population of 1,220,481 is 68% Indo-Mauritian, and 27% Creole. The official language is English, but the largest religious groups are Hindu (52%), Christian (28%), and Muslim (16.6%), where most nations in the region have a majority Christian population and a significant number of indigenous religions. It gained independence from Britain in 1968. The Seychelles area is 27,699 square miles, with 250 miles of coastline. Seven percent of its land is arable. Its population was 5,883,889 by a 2003 estimate and its people were a mix of Asians, Africans, and Europeans. English and French are both official languages. The GDP was \$626 million, \$7,800 per person, in a 2002 estimate. Tourism was its largest industry. Seventy-one percent of its workers were employed in service industries; only 10% in agriculture. Ninety-four percent of its people were Christian.

The former Portuguese colonies of Angola on the Atlantic Ocean and Mozambique on the Indian Ocean received their independence in 1975, due to turmoil in the Portuguese government. Angola has a territory of 481,352 square miles (nearly twice the size of Texas) and a coastline of 994 miles. Only 2% of its land is arable. Its 2004 population estimate was 10,978,552. Ninety-seven percent came from African ethnic groups, 2% mestizo, and 1% European. Eighty-five percent of the population was engaged in subsistence agriculture; 15% in industry. Agriculture includes sheep grazing, bananas, sugarcane, coffee, sisal, corn, cotton, tapioca, and vegetables. It is rich in natural resources, including petroleum, diamonds, iron, phosphates, and copper. Its GDP in 2003 was \$20.5 billion, \$1,900 per capita, with 41% of its exports going to the US and 14% to China. Mozambique had a population estimated at 18,811,731 in 2003, 99% of whom were African. Only 4% of its 309,494 sq. miles of land are arable. Its crops are cotton, cashew nuts, sugar, tea, and its natural resources are coal, natural gas, and titanium. Forty-one percent of its imports come from South Africa.

### **Post–World War II: Apartheid Laws (1948–1976) and the Freedom Struggle (1948–2005) in Southern Africa**

In 1913, the Union of South Africa passed a Natives Land Act, limiting Africans to Native Reserves (the United States called their restricted areas “Indian Reservations”). This was the first of many apartheid (separation) laws of the 1913–1948 period. The dominant political parties were Afrikaner coalitions, with little British interference. Africans organized the African National Congress. These policies increased after World War II throughout southern Africa.

From 1948 to 2005, Southern Africa moved from white-run minority governments, many of whom opposed racial mingling, to one-person-one-vote rule majority-run democracies. The change was accompanied by both physical violence and heroic gestures of line-crossing on the part of Africans and whites to accommodate the interests of all parties. The 1910–1948 apartheid laws in Southern Africa rested on assumptions that placed race above class, religion, education, or other distinctions. By 1948, the Afrikaner South African National Party had gained the support of both Afrikaans and English-speakers and retained political and economic dominance for four decades. (For the history of separation in other thirteen Southern African states see the entries on each state).

South Africa’s Population Registration Act (1950) separated races into white, coloured, and native (Bantu). Identity cards insured apartheid’s enforcement. A 1950 Group Areas Act updated the Natives Land Acts, in spite of the 1954 Tomlinson Commission finding that African areas could support only two-thirds of their populations. Rather than provide more land in Native Reserves, the government removed more Africans from white areas. A Prohibition of Mixed Marriages Act (1949) disallowed interracial marriages; and an Immorality Act (1950) banned interracial sexual relations. Under a 1951 Bantu Authorities Act, the government appointed chiefs and headmen as tribal, regional, and territorial authorities and abolished elected Natives Representative Councils.

There was little opposition to apartheid in South Africa. The Afrikaner National Party won reelection in 1953 and 1958 with increasing majorities. In 1958, Hendrik F. Verwoerd, the leading exponent of apartheid, became Prime Minister, and in 1961, based on a referendum, declared South Africa to be a republic, independent of Britain. In 1965, when independent African nations of the British Commonwealth, supported by Canada and India, attacked South Africa’s

ethnic agenda, the National Party withdrew South Africa from the British Commonwealth. On September 6, 1966, an attendant stabbed Verwoerd to death, but his successor, B. J. Vorster, carried the apartheid legacy from 1966 to 1978.

### **The Birth of Democracy in Southern Africa, 1961–2005**

Apartheid died a slow death in the 1970s and 1980s. Black South Africans, the international community of nations, and a few South African whites led the way. The freedom struggle, begun in the 1950s in Britain's southern African territories, was encouraged by the independence of Kwame Nkrumah's Ghana in 1957. It grew in the 1960s as the African National Congress (ANC), Pan-African Congress (PAC), and South African Communist Party (SACP), turned in frustration to violent means to overcome apartheid. Strategic targets included power plants, police stations, and chiefs and headmen who collaborated with the government. By 1964, many black leaders were arrested, including Walter Sisulu and Nelson Mandela, who went to prison for life. Oliver Tambo escaped capture and led the resistance from Zambia. African leaders in other southern African colonies were suffering the same fate. But Tanzania gained independence in 1961 and united with Zanzibar in 1964, the year Zambia and Malawi won independence.

Several forces pressured white regimes while black leaders were in prison. African Trades Unions led strikes for better working conditions and pay. Workers racial consciousness was partly due to economic growth and international support. In 1973, the United Nations (UN) declared apartheid to be a "crime against humanity." In 1976, thousands of South Africa's black school children revolted against teaching in Afrikaans, the language of their oppressor. In 1977, police killings of black civilians climaxed with the death of student leader Steve Biko while in police custody. Other blacks went to neighboring African states for military training. In 1975, Mozambique and Angola gained independence from Portugal, and in 1979 Rhodesia's white government was on the verge of yielding power to Robert Mugabe's Patriotic Front that led to Zimbabwe's independence in 1980.

In the 1980s, economic problems caused white government and business leaders to reevaluate South Africa's isolation. Following boom years in the 1960s and 1970s, GDP was declining. Many whites were becoming poorer and skilled labor was leaving the country. Apartheid had become expensive to administer and

the black population was growing much faster than the white. In 1977, the UN embargoed the sale of arms to South Africa and the American civil rights movement made significant progress. In 1978, Prime Minister Vorster resigned under corruption charges and P.W. Botha replaced him.

Two forces nudged South Africa away from apartheid. Black trades unions grew to over 1 million members and demanded accommodation. Prime Minister Botha, in a 1994 constitution, reached out to Coloureds (those of mixed African-white ancestry) and Indians, by setting up a tricameral legislature: a 178 member white House of Assembly; eighty-five member coloured House of Representatives; forty-five member Indian House of Delegates; all democratically elected. Africans, 75% of the population, remained unrepresented. But in 1986 Botha gave in to demands to rescind pass laws and repeal bans on multiracial political parties and interracial sex and marriage, but he stopped short of desegregating schools, closing disparities in health and welfare services, and allowing Africans to own property outside "homelands" (formerly Native Reserves). In 1985, British Prime Minister Margaret Thatcher of Britain and US President Ronald Reagan opposed sanctions, but in 1986 the US Congress passed an Anti-Apartheid Act over Reagan's veto, as other nations put pressure on the South African government.

In 1989, F.W. de Klerk succeeded Botha as National Party head and State President, and in 1990 de Klerk unbanned three African parties, the ANC, PAC, and SACP, and released Nelson Mandela and other political prisoners. In 1991, after the de Klerk government repealed most apartheid laws, white voters supported a resolution to negotiate with African leaders. In 1992, South Africa joined the Southern African Development Community (SADC) with Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, Tanzania, Zambia, and Zimbabwe. In 1993, de Klerk and Mandela, with eighteen other party leaders, endorsed an interim constitution under which South Africa would be ruled pending a permanent constitution. In 1994, the African National Congress (ANC) won South Africa's first democratic, nonracial election under an interim constitution. Nelson Mandela became president on May 10.

Foreign governments lifted economic sanctions. South Africa rejoined the British Commonwealth and negotiated cooperative agreements with Southern African states of the SADC. In the 1999 election, the ANC won 66% of the vote and the Democratic Party replaced the National Party as the official opposition. Mandela had retired after his five-year term and Thabo Mbeki, his Deputy President, became President. This completed the transition from white

colonial-era governments to fourteen majority-led democratic states. Not all of the states are stable, nor are all of the economies viable. An HIV/AIDS pandemic is producing huge death tolls and millions of orphans. Much of the Southern African economy is in subsistence farming as Africans are farming minimally productive arid land prone to devastating droughts. White commercial farmers are on the best land, which their families inherited from white colonial government grants in the nineteenth century. Land reform and health are the obsessions of Southern African governments in 2005.

## SOUTHERN AFRICA: INTERNATIONAL RELATIONS

### Brief History and Background

Arguably, contemporary Southern Africa is Africa's most diverse subregion in terms not only of geography but also of the people who populate it. Sandwiched between the Indian and the Atlantic oceans and spotting great landmarks in the Drakensburg Mountains and the Kalahari Desert, the subregion includes Angola, Botswana, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe. Although other countries such as Burundi, Democratic Republic of Congo, Seychelles, and Tanzania are sometimes included in some scholarly definitions of the subregion, they are perhaps more properly located in other continental subregions. This is despite their economic links to the subregion through membership (previous

in the case of Seychelles) in the Southern African Development Community (SADC). Madagascar and Mauritius are included despite their comparatively more distinct contexts. With a population of approximately 127.5 million people and over 6.5 million square kilometers of territory, Southern Africa is a vast region.

Although their broad areas of differences can easily separate Southern African states, they are linked and united by their common historical experiences, cultures, and challenges. Artificial creations of former colonial powers—Britain, France, Germany, and Portugal—they show remarkable similarity in the diversity of their peoples who include the numerically dominant Bantu groups as well as the variously significant Khoisan, European, South Asian, and Malay-Polynesian communities. In many ways, this diversity has helped to define and give shape to the internal and external relations of virtually all member states of the subregion.

The human similarities notwithstanding, it is the differentiating characteristics that punctuate the nature and contours of Southern African intra-regional and non-regional relations. Southern African states vary widely in terms of size, ranging from Lesotho and Swaziland at less than thirty-one thousand and eighteen thousand square kilometers respectively to Angola and South Africa, which are far larger with more than 1.2 million square kilometers each of total land area. At between 1.1 million and 2 million people, Swaziland, Botswana, Lesotho, and Namibia are considerably much smaller than Mozambique with 19 million people or South Africa with more than 42 million people.

In many ways, Southern Africa's unique historical and cultural contexts as well as its recent colonial and post-colonial political and economic activities have coalesced to transform the subregion from Africa's most conflict-ridden and troubled area before the 1990s to one of the continent's most stable and prosperous subregions (along with North Africa). It is also probably the most integrated and harmonized subregion in Africa not only in terms of the linkages between the national economies but also in terms of the transport and communications infrastructure, and the human migration patterns centering on the mining of one of the world's most resource-laden areas.

Attracted by the resources of the subregion as well as more congenial (European friendly) climatic conditions, Southern Africa was completely colonized by European states before the beginning of the twentieth century—thus culminating a process that began during the fifteenth century. Unlike West Africa, with its less friendly climatic conditions, Southern Africa

experienced a significant demographic transformation that saw the entrance and resettlement of significant numbers of Europeans and South Asians in the area. The resultant white minority rule, which followed or coupled European colonialism, shaped not only the political and cultural experiences of much of the subregion but also the nature and development of its economies. By the middle of the twentieth century, European presence and rule had created severely segmented societies in much of Southern Africa in which whites were given special privileges and rights. By contrast, Africans were explicitly denied extensive array of rights—including that of citizenship in extreme cases. Although European colonialism was often harsh everywhere, it was especially so in many parts of Southern Africa. Africans lost their land, cattle, and human dignity more extensively and with far greater intensity and purpose than occurred anywhere else in Africa or Asia. Although European colonial and minority rule brought certain benefits to Southern Africa, particularly in the form of technology, technical know-how, and capital, the racism and highly exploitative labor system which characterized the use of Africans in both the mining and agricultural sectors combined to trigger violent eruptions and resistance to white domination. Although military progress and complete success were forestalled for decades due to the vast superiority of European military technology, the last bastions of white minority rule in Angola, Mozambique, Namibia, South Africa, and Zimbabwe finally gave way to majoritarian rule by the mid-1990s.

Nevertheless, the period of European minority domination also coincided with both the linking and deepening of Southern African incorporation—rather than integration—into the global political economy as a peripheral producer of raw minerals and unprocessed agricultural products. With the solitary exception of South Africa, spared because of its vast mineral resources and white control, the rest of Southern Africa states also became reservoirs of cheap migrant labor and effectively (more or less) indirect outposts of South African economic hegemony. For its part, South Africa—riding on its mineral wealth and designated semi-periphery status—developed a significant industrial capacity, which is not only crucial for the Southern African subregion but also has become increasingly important for the rest of Africa and the world. As the premier mineral producing subregion of Africa, Southern Africa produces and exports a wide variety of mineral resources such as coal, chrome, diamonds, gold, petroleum, platinum, and uranium to Europe, North America, and Asia. The subregion receives value-added consumer goods and capital equipment.

### **Intra-Southern African Relations**

In many ways, South Africa is the one country whose activities in the subregion serve to define and shape regional relations. Without a doubt, South Africa is by far the pivotal state in Southern Africa. In no other subregion of Africa is one country's fate so closely woven to the prospects of its regional partners. With superior transport and communications infrastructure, educational and research institutions, modern manufacturing, mining and agricultural sectors, and an overall economy that dwarfs the combined output of its subregional neighbors, South Africa dominates Southern African economic relations. With a gross domestic product (GDP) that is 60% larger than the combined GDP of the other subregional states, large trade surpluses with every Southern African state, and with widening import and export trade ratios with the subregion, post-apartheid South Africa is a reluctant hegemon in Southern Africa.

However, with a checkered apartheid history that was marked by aggressive and hostile attitudes towards its neighbors, post-apartheid South Africa is still grappling to find its non-economic niche in Southern Africa. Although other states within the subregion need South Africa's industrial output, economic strength, and technology, they remain deeply weary of its intentions and commitment to mutually beneficial and cooperative relations. Chastened by the apartheid-era policy and vision of subjecting the subregion to serving South African interests through ambitious cooperation proposals that envisaged South Africa at the center of a constellation of states. This was not only Pretoria's brazen response to the breaching of the formerly impervious white buffer zone around apartheid South Africa due to Angolan and Mozambican independence from Portugal but also a desperate attempt to woo neighboring states away from Soviet influence and from giving support and sanctuary to both the African National Congress (ANC) and the South West African People's Organization (SWAPO).

The Southern African subregion was not only caught in the crossfire of the anti-apartheid struggle but also was deeply affected and devastated by the political, economic, and military destabilization policies that constituted South Africa's "total onslaught" strategy against them. Southern Africa shouldered the bulk of the burdens associated with apartheid South Africa's desperate attempts to maintain white minority rule. As such, Southern African subregional relations were particularly marked and blighted by apartheid. This legacy, along with negative perceptions about post apartheid South Africa's aggressive

economic expansion in the subregion and political arrogance, has continued to inform and shape Southern Africa relations. This is despite Pretoria's deliberate efforts to allay concerns through policy pronouncements and indications about its benign intentions, and about shared regional destiny and the imperative of integration. To drive the point home, South Africa's ruling ANC party has been forced to explicitly reject any hegemonic ambitions for South Africa.

Top government leaders have reaffirmed this position as has the Department of Foreign Affairs with its outline of government's new priorities in Southern Africa: promotion of peace and security; promotion of intra-regional trade and investment; promotion of regional tourism; poverty alleviation; promotion of health; promotion of all people to people contacts between South Africa and its neighbors; human resource development; promotion of human rights; inter-regional co-operation aimed at combating crime.

Despite such efforts at reassurance, the rapid expansion into other parts of Southern Africa by South African corporate capital has awakened new concerns about the country's evolving status as an economic hegemon. This is not helped by the historical asymmetry between South Africa and the rest of the subregion in terms not only of population size, technical know-how and technology, economic and financial capacity, transport and communications infrastructure, and energy-production capacity. Furthermore, South Africa's domestic imperatives, which have contributed to its reluctance to concede commercial terrain to its neighbors in their areas of comparative advantage as well as her slowness to actively adopt unfavorable SADC policies, have fuelled suspicions and perceptions that it continues to harbor hegemonic ambitions in Southern Africa.

Also facilitating Southern African relations are a number of institutions and organizations including Common Monetary Area (Lesotho, Namibia, South Africa, and Swaziland), Southern African Customs Union (Botswana, Lesotho, Namibia, South Africa, and Swaziland), and SADC. Of these, SADC is the largest and potentially most important for each of the member states. However, both the Common Monetary Area (CMA) and Southern African Customs Union (SACU) provide vital services for the member states. For instance, the CMA not only links and places at par the currencies of Lesotho, Namibia, and Swaziland to the South African rand but also allows the rand to circulate freely within the other countries. The net effects of the arrangement include the following for the affiliated countries: access to the South African capital markets, fully convertible

currencies, and greater and easier trading links with South Africa.

The peoples of Southern Africa have been interacting for hundreds of years. Relations in the modern era have been defined by both the anti-colonial struggles and the war against the white minority rule in Namibia, South Africa, and Zimbabwe as well as the civil wars in Angola and Mozambique. As noted previously, the anti-apartheid conflict imposed huge costs on the entire subregion in terms of damaged and lost lives and property.

### **Relations with Other African States**

Contemporary relations between Southern Africa and other parts of the continent were defined primarily over the past fifty years by the struggle to rid the continent of white minority rule in the subregion. Various, other African countries assisted in a number of ways; they contributed scarce financial resources, provided travel documents and used their diplomatic offices, extended educational grants and scholarships, provided arms and military training to Southern African resistance fighters, and took the causes to other governments and internal forums for external political, financial, diplomatic, and military support. These efforts were necessary because Southern Africa was the last region to be liberated politically from European domination.

Although post-liberation relations have centered on economic linkages, particularly the New Partnership for Africa's Development (NEPAD), important relationships have also evolved around the civil wars, political struggles and instability, and issues of human rights violations around the continent. NEPAD has contributed towards building a general understanding that the subregional and regional integration is vital if Africa is to deal successfully with the long-term challenges facing the continent. This has reinforced the Abuja treaty of 1991, which envisioned subregional integration as crucial parts of the puzzle for the development of the African Economic Community. Through the various activities of NEPAD, Africa is gradually moving closer to articulating fully the goal of an integrated and complementary subregional infrastructure, with skills development and exchange, import substitution, and diversified production and markets.

Amongst the major contestations have been the land reform controversy in Zimbabwe; human rights violations in Nigeria's Niger Delta; coups attempts in Equatorial Guinea, Sao Tome and Principe, and Togo; and conflicts in Angola, Burundi, Cote d'Ivoire,

DRC, Rwanda, Somalia, Sudan, and Western Sahara. Through the good offices of the African Union, ECOWAS, SADC and other regional and subregional organizations and institutions, Southern African countries have been interacting with other African countries on issues of mutual interest. Together, they have also worked to address continental relations with other parts of the world. With the leadership of President Thabo Mbeki (South Africa) and his colleagues Presidents Olusegun Obasanjo (Nigeria), Abdelaziz Bouteflika (Algeria) and Abdoulaye Wade, (Senegal), through their articulation and work on NEPAD, Africa's developmental challenges have received and stimulated global attention and growing commitment. The commitment to address common economic and political issues, including sticky problems around conflict management and resolution as well as good governance, transparency, and accountability have served not only to transform public and intellectual discourse about the nature of African leadership but also elevated issues about external links and responsibility for many African problems.

### **Relations with Global Powers and Beyond the Continent**

Given its large number of Europeans and persons of South Asian and Southeast Asian background, it is not surprising that Southern Africa states generally have strong links with Europe and Asia. France, Germany, Greece, India, Indonesia, Netherlands, Pakistan, Portugal, United Kingdom, United States, and the Scandinavian states are some of the states with which Southern Africa states have built strong ties economic, political, and cultural ties. These ties have also been reinforced by the historical links between the various countries. While some of the ties, especially the South-South links, have been largely fraternal, the relationships with members of the OECD tend to reflect the realities of interactions between unequal partners. In the main, Southern African states (including South Africa) are very dependent on external transaction flows to maintain their economic viability. Furthermore, with the exception of a few counties such as Botswana, Mauritius, and South Africa, the member states of the subregion require (and attract) substantial levels of concessional aid flows, particularly from the OECD states, to tackle serious developmental challenges. Unfortunately, such flows fall way short of actual needs. For instance, Angola, Mozambique, Zambia, and Zimbabwe have struggled to deal with problems inherited from preceding colonial

governments without the necessary support from relevant or other Western aid donors. Indeed, the little amount of aid flows that came through could be subjected to the policy preferences of the donor states. As Zimbabwe discovered with its controversial land reforms, aid flows can be interrupted abruptly when national policies run afoul of donor imperatives.

Indeed, as with other African countries, Southern African countries not only inherited unfavorable social, political, and economic circumstances from their colonial rulers but also they lack the capacity to restructure their future. A postcolonial international environment that is dominated by the West exacerbates this situation. The net result is that collectively, they are finding it extremely difficult to have relevance in a fast changing and globalizing international environment.

### **Southern African International Relations: Prospects for the Future**

Southern Africa is a subregion on the mend despite a series of very serious challenges, particularly the world's highest incidence of HIV/AIDS infection. With serious conflict now contained in Angola, Mozambique, Namibia, South Africa, and Zimbabwe, the subregion has gone from Africa's problem area in 1980 to one of its most stable subregions in 2005. There is now a need to move forward and build on the gains from the resolution of some of the world's more sticky conflicts. Addressing and winning the battle against the HIV/AIDS pandemic and subregional integration should be high on the list. Although the battle against HIV/AIDS seems to be on, the failure to tackle the problems aggressively has not only retarded many of the gains made within the health fields over the past two or three generations as life expectancy has crashed within the southern African subregion but also threatens to impinge on other efforts aimed at fostering transformative processes of development.

In regard to subregional integration, there is a bit of a lull in the struggle to wrestle with the challenge. Perhaps, at the base of the problem is South African inability to develop a stable and mutually acceptable relationship with other SADC and Southern African partners. Lingering problems have persisted on a number of issue-areas: immigration policies, differing views on armed conflicts, the question of land reforms in Zimbabwe, and South African role as a subregional economic power. South Africa's decision to sign a separate agreement with the European Union as well as its foot dragging on liberalizing its trade regimes

within SADC stipulations have caused serious consternation and protests among other SADC members.

These problems notwithstanding, Southern Africa is well placed to further build and consolidate the historical lines of interactions of the communities and peoples of the subregion. For this to happen, however, South Africa would have to play a more positive role of engaging its subregional partners in a way that builds confidence in its leadership. As the most capable and the country with the most to gain from subregional cooperation, South Africa must assume the burden of effective leadership, which may entail commitment of resources and willingness to forego certain short-term gains. The positive political roles that South Africa is now playing through its active mediation efforts in Burundi and Cote d'Ivoire are positive signals, which must be sustained and extended to concrete economic activities in Southern Africa and the entire continent.

## SOUTHERN AFRICAN CUSTOMS UNION (SACU)

SACU being the oldest Customs Union in the world came into existence in 1910 through a multilateral union agreement between South Africa, Botswana, Lesotho and Swaziland. On December 11, 1969, following the independence of the later countries in the 1960s, a new agreement was entered into between the four contracting parties which amongst others reformed the revenue sharing arrangements. Namibia became part of the agreement formally in 1990 after her political independence. Before independence, Namibia was regarded as a de facto member of SACU even though BLN never recognised this de facto membership.

The aim of SACU is to establish free trading area in goods among the member countries and to impose a common tariff on imports from non-member countries. In this regard the customs union is therefore intended to provide wider and unhindered market access to members. The BLNS countries are believed to not have fully maximised this benefit of expanded market access both in terms of population and income. South Africa is believed to have been utilising this advantaged offered by the Customs union. The situation of the BLNS inability to compete with the South Africa can be explained by the following factors:

- *South African predominance in terms of economic size and industrial development driven at times by strong nationally pursued industrial development schemes;*
- *South Africa's and consequently, SACU isolation from foreign trade due to sanctions being applied to South Africa during the apartheid era;*
- *South Africa's unilateral use of tariff rebates to certain domestic industry (notably the motor vehicle assembly and textile industries) giving it a one-sided advantage vis-à-vis BLNS;*
- *BLNS limited use of infant industry concessions in the 1969 agreement due to stringent and onerous provisions;*
- *However, it can be equally stated that the BLNS have rarely and seriously attempted to penetrate the South Africa and each other's markets, despite the protected trade environment by the customs union.*

Apart from the fact that SACU provides a common excise tariff (CET), which are at the moment set unilaterally by South Africa, South Africa also remained the custodian of the SACU revenue pool. Therefore all customs and excise duties collected are paid into the South African national revenue fund. The revenue is shared among the member states according to the formula as stipulated in the 1969 agreement. Each member state's share was therefore calculated accordingly, except for South Africa, which received the residual.

For the BLNS countries, SACU revenue constituted a greater share of their state revenue and therefore that is why SACU is viewed by the member states especially the BLNS to be of such an utmost important to them.

Against this backdrop, with South Africa receiving the residual and setting the common external tariff amongst others, the 1969 agreement was viewed to be undemocratic and non-transparent as the concentration of all discretionary powers was given to South Africa. In addition, it was established that BLNS have not been fairly compensated. Another shortcoming within the 1969 was the fact that there were no formal structures established except for the SACU commission. This situation called for the renegotiation of the agreement. The renegotiation started off in 1994, following the political independence of South Africa, with the objectives of democratising the governance of SACU, setting new institutional arrangements, setting of a new revenue formula amongst others. After a length and protracted renegotiation process, the new SACU agreement was finally signed in October 2002.

The 2002 agreement ensured that each member country has equal powers in terms of trade policy formulations, tariffs determination, duties, and rebates determination. In this light the following institutions are provided for:

**Council of Ministers:** It is a supreme decision making authority made up of member states' ministers responsible for SACU affairs. It is responsible for the overall policy direction and functioning of SACU institutions.

**SACU Commission:** Consists of permanent secretaries of departments/ministries responsible for SACU affairs. It is responsible for the implementation of the new agreement, ensuring that decisions taken by the council are implemented and in addition oversee the management of common revenue pool and supervises the work of the Secretariat.

**The Secretariat:** It is located in Windhoek, Namibia and it is responsible for the day-to-day administration of the SACU.

**The Tariff Board:** An independent institution made up of experts from member countries, it makes

recommendations to the Council with regard to tariffs and customs.

**Technical Liaison Committees:** These are sector specific committees responsible to advice the Commission on sector specific issues. They are Agricultural Liaison Committee, Customs Technical Liaison Committee, Trade and Industry Liaison Committee, and Transport Liaison Committee.

**The Tribunal:** Settles disputes arising from the applications of the agreement.

Apart from the above institutions as specified in the new agreement, another notable development is the introduction of the new SACU revenue sharing formula. The new formula dictates that the share accruing to each member state will be calculated from the following three components:

**The Customs Component:** Each country share is derived from the proportion of the country's Cost-Insurance-Freight (CIF) intra-SACU imports to the total intra-SACU imports of Common Customs Area.

**The Excise Component:** It is set at 85% of total excise duties and each member's share shall be calculated from the value of its GDP in a specific calendar year as a percentage of total SACU GDP in that specific calendar year.

**The Development Component:** It is set at 15% of excise duties, however this rate is subject to change from time to time. The share accruing to each member country is calculated based on the country's GDP per capita compared to the average of SACU's GDP per capita. The development component ensured that poorer countries, that is countries whose GDP per capita falls below per capita SACU average, are compensated by the other relatively well do member states.

In the era of globalisation, SACU is also involved in several free trade talks with MERCOSOUR, EFTA, and the United States. Whereas it is expected that upon finalisation of these negotiations, SACU will be able to extend its own markets and have improved access to the world's largest markets such as United States, China, and South American states. The challenge that is facing SACU at the moment is the capacity of being able to negotiate with the other parties, for an agreement that would be able to accommodate the wider interests of all the SACU member countries. In addition, upon completion of the FTAs is the anticipated fall in the revenue accrued to SACU countries as a result of trade liberalisation. This should raise a concern to SACU countries in particular the BLNS, as SACU receipts contribute considerable amount to their fiscal revenue.

In the midst of these however, it is hoped that with the introduction of the new agreement and the free

## SOUTHERN AFRICAN CUSTOMS UNION (SACU)

trade agreements that SACU is involved in will enhance trade promotion both within SACU and without SACU so as to increase standard of living, economic growth, and poverty alleviation for the SACU states.

## SOUTHERN AFRICAN DEVELOPMENT COMMUNITY (SADC)

Established in 1992 to replace the Southern African Development Coordination Conference (SADCC), which had been in existence since 1980, SADC is now one of the major regional economic blocs in Africa. Its forerunner, SADCC, was founded by the Frontline States, to foster economic development and political solidarity among members, and to reduce their dependence on apartheid South Africa. Accordingly, SADCC's integrative strategy deliberately avoided competition and duplication, and favored the coordination of economic projects among member states. The transformation from SADCC into SADC was prompted by several factors, including the release of Nelson Mandela (in 1990) and the ensuing negotiations within South Africa to end apartheid; the proliferation of trading blocs; and the intensification of global economic competition. By the early 1990s, the leaders had realized that while SADCC had served them well, there was the need to shift their focus from mere coordination of development projects and opposition to South Africa to the more complex task of integrating their economies, hence the signing of the

SADC Treaty at Windhoek, Namibia, in August 1992. In 2005, SADC had fourteen members: Angola, Botswana, Democratic Republic of Congo (DRC), Lesotho, Malawi, Mauritius, Mozambique, Namibia, Seychelles, South Africa, Swaziland, Tanzania, Zambia, and Zimbabwe.

### Objectives

SADC's objectives, as contained in Article Five of its Treaty, are to

... achieve development and economic growth, alleviate poverty, enhance the standard and quality of life of the people of Southern Africa and support the socially disadvantaged through regional integration; evolve common political values, systems and institutions; promote and defend peace and security; promote self-sustaining development on the basis of collective self-reliance, and the interdependent of Members States. (SADC 1992)

Other expressed goals are to achieve complementarity between national and regional programs; promote productive use of the region's resources; foster environmental sustainability; and strengthen the cultural ties among people in the region (SADC 1992). In 2000, SADC added the explicit aim of combating HIV/AIDS to its objectives, in cognizance of the devastation wreaked by this disease in Southern Africa. In pursuance of these objectives, SADC proposed to harmonize political, social, and economic policies of members; mobilize people of the region to take initiatives to enhance their socio-economic and cultural ties; to promote the free movement of capital, labour, goods and service across the region. The guiding principles of SADC, according to its Treaty, entail a respect for the sovereign equality of all members; the promotion of peace and security in the region; and adherence to democratic principles such as rule of law and respect for human rights.

### Institutional Structure

SADC started with a decentralized institutional framework, with which all members were given responsibility to coordinate projects in specific sectors throughout the regions. This structure was to avoid the pitfalls of many regional blocs in Africa, by which centralized bureaucracies alienated some members. However, by the late 1990s, it was clear that this decentralized system was not working, due to the lack of staffing and resources in some member states

to handle their coordinating responsibilities and the differences in administrative procedures, qualifications, and performance criteria for staffs involved in the management of regional programs. Consequently, at an Extraordinary Summit in Windhoek, in 2001, a centralized structure was adopted, and the exiting Co-coordinating Units were grouped into four clusters (or Directorates)—Trade Industry, Finance and Investment; Infrastructure and Services; Food, Agriculture and Natural Resources; Social and Human Development and Special Programs. The main institutions, following this restructuring, are the Summit, which is the ultimate policy-making body, made up of Heads of States and Governments; the Secretariat, which is headed by the Executive Secretary at the headquarters in Gaborone, Botswana; the Troika, which consists of the Chair, Incoming Chair, and Outgoing Chair; and the Organ, which is responsible for politics, defense, and security. Others are the Council of Ministers, which oversees the implementation of SADC programmes; and the Tribunal, which settles SADC-related disputes.

## Contributions to Development

To help meet the challenges and economic competition engendered by globalization, SADC has focused much of its attention on its regional economic integration initiatives, with a major thrust of its activities dealing with the development of infrastructure to facilitate factor mobility across member states. More specifically, SADC has upgraded and developed regional roads and airports in several cities in the region (for example, Gaborone, Lilongwe and Mastapa), and developed direct air travel and satellite telecommunication links between all capitals. In March 2004, SADC launched a Strategic Plan, setting out specific measures and timeframes for bringing down trade barriers: these include the elimination of exchange controls on intra-SADC transactions by 2006; the creation of a Free Trade Area by 2008; and the establishment of a Custom Union by 2010. Also, SADC launched its Regional Indicative Strategic Development Plan (RISPD) in 2004 to intensify its efforts toward the alleviation of poverty and hunger; democratic governance; conflict prevention and resolution; and the fight against HIV/AIDS. Other RISPD initiatives relate to the development of science and technology; the creation of effective disaster preparedness mechanisms; and the consolidation of international cooperation with other regional blocs. The Summit has also signed a Declaration on Gender and Development, calling for the equitable representation

and involvement of men and women in all SADC operations.

Despite its accomplishments, SADC still needs to grapple with several difficult problems in Southern Africa if it is to bring its current initiative to fruition. These include the huge disparity in economic development among its members; the dominance of South Africa; the biting poverty and HIV/AIDS pandemic in the region; and the political crisis in countries such as Zimbabwe, Angola, and DRC. There is also the need to expedite land reforms in Namibia and South Africa to prevent Zimbabwe-style land invasion; to resolve the dialectical tensions and overlaps between SADC and other blocs in the region (for example, Southern African Custom Union and the Common Market for Eastern and Southern Africa); and, to build alliances with such pan-African organizations and initiatives as the African Union and the New Partnership for Africa's Development.

## SOUTHERN CONE COMMON MARKET (MERCOSUR)

### Introduction

MERCOSUR (MERCOSUL in Portuguese), or Common Market of the South, is the name used for the free trade agreement among the countries of the Southern Cone of South America, namely, Argentina, Bolivia, Brazil, Chile, Paraguay, and Uruguay. Bolivia and Chile are associate members. MERCOSUR is designed to increase the levels and range of products traded amongst these neighboring countries. Indeed, the MERCOSUR includes approximately 44% of Latin America's territory, and 59% of its gross domestic product (GDP).

As we discuss later, the MERCOSUR should also be seen in a strategic context, as a means of bolstering the negotiating strength of the region vis-à-vis the United States, the European Union and Japan in international trade talks. In that regard, the timing of the MERCOSUR is clearly tied to the development of the North American Free Trade Agreement in 1992, from which every Latin American country except for Mexico was excluded. MERCOSUR countries still constitute a small amount of the overall international economic activity, with a combined GDP of approximately \$1.9 trillion as of 2002 versus \$10.4 for the US, \$5.7 for China, and \$3.6 for Japan alone. Still, the common market fulfills a long-standing dream within Latin America to create greater intra-regional connections, particularly in terms of economic ties. In this sense, MERCOSUR is a bold experiment both in Latin America, given a long history of trade integration failures in the region, and globally, in the sense of being only one of a few trade integration regimes among developing countries. Indeed, a basic calculation of intra- vs. extra-regional trade from 1994–2000 shows significant increases in the share of intra-MERCOSUR trade, with the lone exception of Uruguay. However, much of the trade has involved bilateral increases in trade with Brazil and Argentina and between those two countries.

### Origins of MERCOSUR

The development of MERCOSUR must be understood in the context of the transition of military to civilian rule which took place through most of the region in the early 1980s. Significant military expenditures had been created on the premise of national

security risks from neighboring countries. Indeed, the sub-region has historically been convulsed with high international tensions, including devastating wars between Peru, Bolivia, and Chile; Paraguay and Uruguay, Brazil, and Argentina; and Bolivia and Paraguay.

In 1985, Jose Sarney became the first civilian Brazilian president in over two decades. Meanwhile, his Argentine counterpart Raul Alfonsín had taken over as the first civilian President since a 1976 coup. These two Presidents met in 1985 to sign the *Foz de Iguazu* Declaration establishing the High-level Joint Commission spur on binational integration. In July 1986, Argentina and Brazil signed the Integration and Economic Cooperation Program and 12 protocols were approved. Special importance was given in the agreement to the capital assets sector, wheat, foods, the iron and steel industry, and the automobile industry. In 1988, the Integration, Cooperation, and Development Agreement was created. The Agreement aimed at creating a common market between Argentina and Brazil over a ten-year period. The Agreement focused on tariff reductions, and was signed in 1990 by both parties, with an expected date of implementation of December 1994.

On March 26, 1991, Paraguay and Uruguay joined the Agreement under the Treaty of Asunción, with the idea of creating a regional common mkt. The preamble to the agreement states that the purpose of MERCOSUR is the expansion of domestic markets, through integration, in order to achieve economic development and social justice. The Treaty mentions the integration of other regions in the world as a motivating factor. It also states that integration is an important way to improve economic efficiency, environmental preservation, infrastructure linking the countries, and macroeconomic coordination. It also emphasizes gradualism, flexibility, and balance, as guiding principles, and these help to explain the nature of MERCOSUR's historical development, as described below.

There are several important amendments to the MERCOSUR. The Brasilia Protocol was signed in 1992 to set up a dispute settlement mechanism. On December 17, 1994, the Ouro Preto Protocol was signed, creating a common external tariffs and some basic institutional architecture, both set to take effect in January 1995.

While MERCOSUR has an elaborate formal structure, in practice, much of the MERCOSUR's activity appears to operate through informal negotiations and meetings, through "Grupos de Trabajo," or working groups that focus on particular issues. As of 2003, there were working groups in the following areas: commercial issues; customs issues; technical

standards; fiscal and monetary policies relating to trade; coordination of macroeconomic policies; inland transport; maritime transport; industrial and technological policy; agricultural policy; and energy policy. For example, the Brasilia Protocol has yet to be fully enforced. In practice, the Trade Commission has negotiated solutions for emerging problems, rather than relying upon the formal dispute resolution mechanism.

Similarly, the main focus of MERCOSUR in substantive terms has been on tariff reduction, and the transition period of the agreement should have led to a progressive liberalization. In practice, however, an "Adaptation System" was established for cases in which tariff reductions were not completed by August 1994 or where appeals were made for protection clauses. Through this system, countries obtained an additional time to for tariff reductions and significant exemptions for sensitive sectors have been continued.

### **Problems Within MERCOSUR**

It is important to note that, historically speaking, the MERCOSUR economies have had limited internal trade owing to a number of differences within the region. As Spanish colonies, the countries of the Southern Cone generally developed with a limited number of products and a heavy reliance on commodity exports. Moreover, geographic obstacles, including the Amazon jungle and the Andes have created major obstacles to the creation of dense internal infrastructure that would allow for trade within and amongst the various trade partners. The political regimes in the region are also at different stages of development. While democracies seem stable in Argentina, Brazil, and Uruguay, there is more volatility and military presence in Bolivia and Paraguay.

MERCOSUR also has serious internal differences in the size and nature of the different economies. Brazil has the tenth largest economy in the world. Argentina's economy is about one quarter the size of Brazil's and Chile about 10% of Brazil's. Uruguay, Paraguay, and Bolivia are each only about 2% the size of Brazil's economy. Moreover, while Brazil, Argentina, and Chile have diversified economies, Uruguay and Paraguay's are concentrated in services and agriculture, and Bolivia in mining. This has naturally led to tensions along two axes: between Brazil and Argentina on the one hand, and between these big two and the smaller economies of the MERCOSUR on the other. In a sense, we can surmise that the enticement of the Brazilian market, with its population of approximately 180 million, and a rapidly

growing middle class, is the main attraction for other partners to the agreement.

Unlike the rest of the countries of South America, MERCOSUR has not been as dominated in its trade relations with the United States. Instead, MERCOSUR countries have historically traded equally with the European Union. However, because Chile's neo-liberal economic policies, including a recently signed free trade agreement with the United States, have set it apart from the rest of the members in the sense that it has a more liberalized economy and a number of separate free trade agreements with other parties. Therefore, Chile has remained an associate and not integral member. Bolivia is also an associate member as it is also a part of the Andean Pact free trade association, with a different set of rules and interests.

In fact, the MERCOSUR countries still have a strong dependency on outside investment, technology, and markets. MERCOSUR countries, particularly Argentina, Brazil, Bolivia, and Uruguay have huge external debts, so that they are continually in negotiations with the International Monetary Fund and private lenders to ensure the continuing flow of external investment. Major differences and ongoing crises in fiscal policy make the next logical step, a move towards monetary union, highly unlikely for the foreseeable future. Furthermore, given the economic crisis in Argentina and Uruguay, it is even unlikely that further tariff reductions in sensitive sectors will take place.

On the other hand, Brazil also has needs for its growing economy. For example, Brazil has recently developed a multimillion dollar gas pipeline to move natural gas from Bolivia to meet the growing energy demands of its population centers. It is noteworthy that Bolivia and Chile have had increasing tensions over Bolivia's desire for access rights to Chile's northern ports, dating back to the nineteenth century when the territory was seized by Chile from Bolivia. Brazil, like Argentina, also shares hydroelectric dams with Paraguay and Uruguay.

On an external level, Brazil has become an important player in terms of international trade negotiations. As noted previously, a rapprochement between Brazil and Argentina occurred in 2003, following the Argentine devaluation. The new Argentine government, after the nadir of the crisis, seems attuned towards a foreign policy more independent of the United States and more pro-active towards further developing MERCOSUR. A vibrant and coordinated MERCOSUR can strengthen each of the members' bargaining positions, which is crucial to the outcomes of negotiations for subsequent multilateral trade rounds and for a Free Trade Agreement of the Americas in particular. Ongoing negotiations on a free trade agreement with the European Union remain a possibility, however, the

large potential agricultural exports from MERCOSUR have been a stumbling block. Indeed, there are continuing discussions of the possibility of extending MERCOSUR to other countries in the region, however, the level of liberalization, geographic boundaries (the Amazon), and even lower levels of trade across the continent have historically inhibited trade across the continent.

The MERCOSUR has wider implications for development. MERCOSUR seeks to increase internal trade amongst developing countries, creating a method of development that allows some time for the member countries to reach international levels of competitiveness while continuing to grow. MERCOSUR is one of the few global examples of successful “horizontal” or “South-South” trade. In sum, MERCOSUR is an important step forward not only for creating internal solidarity, but also for reducing, if not replacing, external dependency.

## SOUTHERN CONE (LATIN AMERICA): HISTORY AND ECONOMIC DEVELOPMENT

### History and Economic Development

The Southern Cone refers to the countries of Argentina, Brazil, Chile, Paraguay, and Uruguay, which are located in the southern half of South America and resembles a cone shape, with the tip pointing towards Antarctica. The Southern Cone has had quite a distinctive development trajectory from other Latin American regions. To begin with, because it is located much farther away from the United States, there has

been less interference from the superpower to the north. Moreover, while encompassing a wide variety of geographical regions, a large part of the Cone has a very temperate climate and extremely fertile plains growing areas, where massive amounts of wheat, cattle, and coffee are produced for export. Equally important is the fact that most of the indigenous population of the region was wiped out by war and disease, so the development dynamics are quite distinct from the rest of Latin America. With the exception of Paraguay and parts of Brazil, the Southern Cone is largely a region of European immigrants. The military has been a ubiquitous actor in the region, with frequent coups and takeovers of governments. Similarly, the economic development of the region has been highly volatile. Both of these factors have roots in both geography and historical developments. Unfortunately, the periodic economic spurts have not led to any equitable growth in the region. Despite these commonalities, we should also note that Brazil has quite distinct characteristics and a different development trajectory within the region.

In terms of geography, we must discuss Brazil separately from the rest of the region. Brazil covers a vast amount of territory, some 3.3 million square miles, and has a population of around 159.7 million. This dwarfs the size of other members of the region. Argentina has a population of only 35.4 million and 1.1 million square miles. The territory of Chile, Uruguay, and Paraguay is considerably smaller in each case. Chile has 14.6 million people; Paraguay 5.1 million, and Uruguay just 3.2 million. Brazil also has an incredible variety of geographic features and biodiversity. Brazil is famous as the home of most of the Amazon rainforest, which is considered an international treasure for its biodiversity and the significant contribution to oxygen in the Earth’s atmosphere. The Amazon river itself is one of the longest in the world. However, much of the Amazon so far remains underdeveloped. Because of the difficulty of the terrain and the tropical climate, as the Brazilian government paves roads in the rainforest, there is the spread of slash-and-burn agricultural techniques. By these practices, the rainforest is burned down, and cattle or other agricultural crops are grown in the soil. Experience has shown that the rainforest soil tends to leach its nutrients rather quickly, so that the rancher is forced to move on to another stretch of the rainforest. Unfortunately, once the rainforest is burned down, in many cases, it is lost forever. International organizations, the Brazilian government, and non-governmental organizations are all trying to preserve portions of the Amazon, but they seem to be fighting an uphill battle, since Brazil’s poverty so overwhelmingly motivates new waves of migration and forest development.

Because of the inhospitableness of the Amazon area, there is a feeling that Brazil is still a frontier country, slowly expanding into the unknown territory of the jungle. The southwest area of the country includes the pantanal, an area of swamps, and the Brazilian highlands, where the capital, Brasilia, is located. Brasilia was created as a planned city in 1960 to try to redirect Brazilians' attention towards the vast untapped interior of the country. The majority of the country's population and activity have traditionally been concentrated close to the Atlantic coast, in the cities of Rio de Janeiro and São Paulo, which dominate Brazil's economy and politics. The Northeast, which contains rich agricultural land as well, producing much of the world's oranges and sugar, has in modern times lagged behind the rest of the country for a variety of historical and political reasons.

As we move south from Brazil in the region, the climate and topography change considerably. Paraguay is, geographically speaking, a country with two regions. The northwestern part, called the Chaco, is part steppe and part desert. The southeastern part is an area of rich agricultural and cattle-raising land, and the home to the majority of the population. Paraguay's population is somewhat unique in that a large majority have some Guarani blood, from the indigenous groups that inhabited the region. Guarani is still the major language spoken in Paraguay, along with Spanish. The capital of Paraguay, Asunción, is a major port. The two major rivers of the region, the Paraná and the Paraguay, pass from Brazil past Paraguay and then form the incredibly rich soils of the Río de la Plata river basin, which empties into the Atlantic Ocean between Argentina and Uruguay. The areas around the rivers in each of the countries are home to a significant portion of the world's wheat and cattle production. Much of Uruguay's economy has been based upon the export of meat from cattle raising, and its capital city, Montevideo, is an important port. Uruguay is largely a flat plains area, but its coast line boasts fantastic beaches.

Argentina's capital city, Buenos Aires, is the main port city for the Río de la Plata and home to about half the country's population. Buenos Aires has dominated the country's political and economic decision making. The other main pole of development in Argentina has been northward along the river in the cattle-producing and industrialized cities of Santa Fé, Rosario, and Córdoba. To the west is the wine-producing area of Mendoza, which is on the eastern side of the towering Andes mountain chain. The Argentine national symbol, the gaucho, represents the cowboy rancher from before the nineteenth century, who worked in the vast pampas, or plains, moving cattle along to new grazing spots. Argentina has newfound

wealth in this area in terms of rich sources of natural gas, as well as in the area farther south called Patagonia. Along with Bolivia, Argentina has become the main fuels supplier to the Southern Cone. Patagonia in the south is a cold but generally dry area that ends with the famous Straits of Magellan area and then Antarctica.

Across the Andes mountains to the west is Chile. Because of the quite formidable obstacle of the Andes, and the sparsely populated Atacama desert to the north, where it borders Peru and Bolivia, Chile has had an isolated historical development. Chile occupies a narrow area of land from the Andes to the Pacific ocean. Being on the fault line means that Chile suffers from occasional earthquakes, some of which have been quite devastating. The northern part of the country provides much of the copper and other mining that has been the backbone of the Chilean economy. The central valleys around Santiago are the home to a large proportion of the population as well as the wine making industry and cattle and agricultural producers. Santiago has been the center of political and economic decision-making and is the home to much of the country's manufacturing and service industries. Farther south is the Swiss-like lake district where much of the important fruit industry is located. The South also hosts the important port cities of Concepción, Temuco, Valdivia, and Puerto Montt. These ports serve as an important conduit for the vast quantities of timber, some of it grown in the largely undeveloped areas to the south, that Chile exports each year. Chile's main outpost close to Antarctica is Punta Arenas. Though most of Chile's indigenous population was wiped out, there are important remaining concentrations in the South, mostly of the Araucanian group. In sum, in Chile, as elsewhere in the Southern Cone, significant geographic obstacles exist to both national and regional economic development.

Brazil's historical roots also put it apart from its neighbors. First, Brazil was a Portuguese, not a Spanish colony, and Portuguese remains the official language. Second, Brazil passed through a largely peaceful transition from colony to independent country, unlike its neighbors who fought for their freedom from Spain. Third, Brazil has a large population of African descendants who were an important part of the sugar cane boom of the eighteenth century in the northeast and the coffee boom of the nineteenth and early twentieth centuries. Slavery was abolished in Brazil in 1888, but the legacy of slavery continues to haunt Brazil. Fourth, Brazil has been a much more centralized country in terms of economic and political decision-making with a high level of government planning.

From the turn of the twentieth century, there is some convergence between Brazil's history and the rest of the Southern Cone. In Brazil, Argentina, Chile, and Uruguay, (but not Paraguay) there were massive waves of European immigration. Some estimates have increases of more than 500% in the population of the major cities from the 1890s to the 1920s. These waves of immigration changed the politics, economics, and identity of the nations. The new wave of immigrants included vast numbers from central and southern Europe, including Germany and Italy. The new immigrants brought new ideas, including socialism, anarchism, communism, and fascism. With the new wave of immigration, labor unionization really took off. The unions provided a backbone for a long historical struggle between leftist adherents of a socialist vision and more conservative elements who wanted a limited democracy and economic growth without major redistribution of income or wealth.

The new politics of the 1920s in the region was one of a transition from a landed agricultural oligarchy, whose power was based on control of the primary agricultural exports, including mining, cattle, and wheat, to a broader-based political and economic structure. It is quite ironic to note that it was the success of the agricultural boom in exports, along with the new immigration wave, that created the new economic base for the middle class. The new middle class consisted of businessmen, state bureaucrats, and skilled laborers who worked in mining and in new infrastructure. While the military has been a long-standing feature of the region as a bulwark of conservative oligarchy, in the 1920s it was "progressive" military officers who carried out coups on behalf of "radical" political leaders who promised the growing middle class new access to political decision making through increasing voting and other rights. These reforms faced significant resistance to them by the agricultural elite. Thus, in Argentina, Brazil, and Chile, the 1920s were marked by great uncertainty as the radical parties attempted to consolidate a new political order, but conservative elements, backed by other parts of the military, launched operations, including coups, to stop these changes.

In Paraguay, by contrast, the agricultural oligarchy was never effectively challenged. In good part, this is because Paraguay remains a largely agriculturally-based economy. Thus, the industrialization process and the large waves of immigration never really hit Paraguay as it did in the neighboring states. Moreover, the Paraguayan military was effectively united for long stretches under a series of iron fist dictatorships, culminating in the Stroessner regime from 1954 to 1989. During this time the Colorado Party of Stroessner allowed token elections, but the press and

dissent were tightly controlled. In 1989, Paraguay joined the democratic transition of its neighbors but its problems remain somewhat idiosyncratic.

Uruguay also had a unique historical feature in the rise of José Batlle y Ordóñez (or Batlle for short). As in Argentina, Uruguay's gaucho base had undergone a severe transformation in the end of the nineteenth century, moving from free-range cattle to the forceful fencing in of ranches. After a series of civil wars involving the military between rival Blanco and Colorado factions in good part related to these changes, Batlle, a Colorado leader, was elected in 1905. Batlle then presided over a long period in which he was able to utilize the political stability and economic boom of Uruguay's growing cattle and wool exports to create an extremely unusual socioeconomic experiment in the history of development. Batlle presided over a period in which, with moderate exaggeration, Uruguay became known as "the Switzerland" of Latin America. This term referred to the highly developed social legislation and state direction of Batlle's government. Batlle enacted strong labor protection laws, initiated basic social welfare programs, and began a legacy of state led corporations that continue today, albeit in a more fragile state.

The export boom as well as Batlle's experiment were brought to an abrupt halt with the onset of the Great Depression in 1929. Since colonial times, like other developing countries, Southern Cone countries' economies have been centered around primary product exports. When the prices and/or demand of those exports (see entry for Trade Policies and Development) decline, every economy falls into a tailspin. With the Great Depression, Southern Cone exports faltered initially but recovered when demand during World War II resumed. However, the economies remained cut off from new imports of manufactured and industrial goods. This started a necessary transformation of the Cone economies that would lead to a new set of political and economic relationships.

The 1930s and 1940s in Argentina and Brazil were marked by the rise of a new kind of dictatorship—one based on popular support. While in Chile and Uruguay the period of new middle class participation was carried out democratically, Argentina and Brazil were dominated by the personal rule of Juan Perón and Getulio Vargas. Peron and Vargas shared the unusual role of both organizing the middle class and then limiting its participation through channels they established in the state. Both used the military to achieve power and to repress enemies. Both initiated a strong program of state-led domestic industrialization through a policy now called import substituting industrialization (ISI, see entry for Trade Policies and Development). As a result, Vargas and Perón can be seen as the key

figures that consolidate the transition from an agricultural oligarchy to a centralized and industrialized state. In order to consolidate this transition, both set up strong state bureaucracies that planned and managed their economies. In political terms, both dictators also set up strong political parties that were linked to state-created unions. In effect, both had the ingenious idea of undercutting union support for Marxist parties by creating their own. However, centralization of power has its costs. In the case of Vargas and Perón, both were overthrown by the same military that had supported their initial efforts.

While both dictators consolidated power and changed the political and economic trajectories of their countries, there have been important differences in their legacies. The Peronist political party, linked initially to the dictator, but with its base in the labor unions, continues to be a major force in Argentine politics. Peronists were able to attract most disaffected sectors of Argentina's middle class, thus usurping and consolidating support away from Marxist parties. Because of the blocking power of the Peronist party, Argentina has had a hard time carrying through on neoliberal (see entry entitled "Neoliberalism") economic reforms. In Brazil, meanwhile, though there are a number of important unions, after Vargas, the unions never really coalesced into a major political force. It is interesting to note that in both Argentina and Brazil, the agricultural oligarchy, though defeated for control, continues to play a major role in decisions.

Throughout the Southern Cone, with the exception of Paraguay, the 1960s and 1970s was a period of civil war. While some countries, such as Chile, managed to maintain democracy at least initially, the outcome of the political polarization of the times was military dictatorship. We should remember that the key event in Latin America was the Cuban Revolution in 1959, which symbolized and inspired Marxist parties throughout the region to move decisively from attempts to gain power through elections to guerrilla actions. The 1960s was a period of polarization between Left (Marxist) and Right (Conservatives) throughout the world. The leftist guerrillas seem in hindsight to have been quite naïve about the difficulties and levels of resistance that they would face in attempting to institute a socialist revolution. Unlike the inept and corrupt Bautista regime in Cuba, there was not the same level of popular anger at existing regimes. Moreover, once the Cuban Revolution had occurred, the military in Latin America became more vigilant to prevent the surprise turn to Marxism and the Soviet Union that Castro had pulled off. The Soviet Union also became reluctant to put forward the substantial resources needed for successful military campaigns to counter the vastly increased training and

funding that the United States began to provide to Latin American militaries.

The military governments that took over in the 1960s and 1970s were authoritarian, but of a different nature than the previous regimes. Guillermo O'Donnell, an Argentine, coined the term "bureaucratic authoritarianism" to describe these regimes. Rather than relying solely upon a personalistic dictatorship, they built up bureaucracies. While the initial motivation of these regimes was to wipe out leftist guerrillas, their purpose came to include leading the economic development process. O'Donnell explained that these two purposes were related through repression of labor in order to keep wages down during the import-substituting industrialization phase of development (see Trade and Development entry). Thus, some parts of the bureaucracy were designed towards repression, such as the secret police, and others towards economic planning. The Southern Cone's experience roughly fits O'Donnell's description, but with some important caveats. First, in both Paraguay and Chile, there was more of a military dictatorship. Second, the military showed that it was not necessarily wedded to the planning model, since, in Chile and Argentina in the 1970s and the rest of the region in the 1980s, the military began to endorse Neo-Liberal (see entry) ideas, involving the removal of the state from economic planning.

In Chile, the Left took a unique step in actually winning an election, albeit by a small fraction, and then attempting to institute socialism, at times extra-constitutionally. Salvador Allende, the Socialist elected President of Chile in 1970, seemed to move back and forth with the multiparty factions of his coalition. As in other countries, the Chilean Left was highly fragmented among those who wanted an immediate revolution, and those who thought it was important to work more gradually. Once in power, Allende was not able to follow through on the sketchy economic plans he had for Chile. While expropriating the US-dominated copper interests was a huge popular success, the dispute over compensation solidified US enmity towards the Allende regime. After a good first year, a major decline in copper prices, uncertainty about which other companies would be taken over by the state, and hyper-inflation, led to a period of economic chaos. Ironically, it was middle class workers and unions' actions, such as a trucker's strike, that landed the decisive blow to the regime. The chaos was ended by a military coup led by Augusto Pinochet in 1973, who then instituted one of the most severe repressions in the region's history.

In Uruguay and Argentina, the urban guerrilla warfare of the Left brutalized the population. While the guerrillas were able to gain an occasional big

victory, for the most part, in hindsight clear victory seems unlikely against a well-organized and fortified foe such as the military. Moreover, the chaos that the guerrillas brought to both the economic and political situation wore on the general population, some of whom eventually openly supported military intervention. We should remember that the classic guerrilla campaigns of Mao in China and Castro in Cuba involved rural areas, where there was popular support, continual cover in the topography and foliage, and outside support in the form of funding and arms from the Soviet Union.

The military victory in Chile was eventually repeated in Brazil, Argentina, and Uruguay. However, the brutality of both the guerrillas and the military, and the ensuing economic chaos left a deep scar on the region. The generation who grew up amidst the chaos are still dealing with the fact their families were divided in the civil wars, that loved ones “disappeared,” and the brutality of both sides. Much of the activist portion of the Left went into exile, often in Europe, an experience which moderated their view on revolutionary change and the desirability of socialism à la the Soviet Union.

The military governments’ economic legacies are decidedly more mixed. While Chile’s neoliberal policies have been hailed as an economic miracle and a model for the rest of the region, Chile has had some very rough economic periods. Chile experienced a major recession from 1975–1977 and another as well as a series of bank failures in 1982. Nonetheless, Chile’s macroeconomic stability is remarkable among developing countries and some of its economic reforms, such as the privatization of pension funds, have attracted international attention. In Argentina, the Argentine military’s inability to control inflation led initially to a handover of power to former arch-rivals, the Peronists in 1973. The military took over again in 1976, this time half-heartedly following macroeconomic reforms similar to those in Chile. Paul Lewis, among others, described this as the “cyclical crisis of Argentine capitalism.” The cycle describes the attempt to set up economic pacts across the important labor and industrial groups in society when a new government takes over. At some point, one of the members of this coalition is unable or unwilling to keep their end of the bargain, and the attempt to maintain economic reform falls apart, leading to another crisis. This model seemed to describe well the inflationary cycles in Argentina for the past three decades until democratic President Carlos Menem took power (see entries for Argentina and Menem, Carlos) in 1989. A Peronist, Menem turned his back on the labor and domestic industry base of the party in a turn towards neoliberalism. The Argentine

economy went through an almost decade-long growth spurt with low inflation, albeit with continuing unemployment, and seemed poised to break out of the cycle. Unfortunately, amidst severe pressure on the fixed exchange rate and with the collapse of the Brazilian currency in 1999, the Argentine economy went into a tail-spin from which it has yet to recover.

Paraguay, under Stroessner, experienced economic stability, but much of the country remains backwards in terms of basic indicators of the quality of life, such as access to education and health care. Besides basic agricultural exports, the Paraguayan government depends on the large Itaipú and Yacretá dam projects by which they sell most of their share of the hydroelectricity to Brazil and Argentina respectively. In Uruguay, the military was able to restore some confidence to the economy following the civil war, and Montevideo became an international financial and trade services center. However, economic growth never approached the glory days of Batlle. Brazil’s military, by contrast, prides itself on the bureaucratic planning of industrialization. In the early years of the dictatorship in the 1960s, Brazil was being hailed as a “miracle” growth economy among developing nations. During this decade the Brazil managed to build a strong industrial base which allowed it to diversify its exports away from agriculture, a feat Argentina never came close to matching to the same degree. Today, Brazil is a world-leading exporter of armaments, airplanes, steel, and a leading assembly site of automobiles. Thus, there remains some lingering nostalgia today for the economic achievements of the military government as well as the high growth rates of that era. In 1994, Brazilian democracy seemed consolidated with the victory of former dependency theorist Fernando Henrique Cardoso (see Brazil entry). A former socialist, Cardoso was elected on the basis of his successful fight against inflation as Finance Minister in the former Administration. Cardoso’s successful management of Brazilian macroeconomics, controlling inflation for the first time in decades, earned him re-election in 1998. By the Constitution, Cardoso could not run again. Moreover, by the time of the next election in 2002, there was a growing desire by many Brazilians for a change in direction. Not only did the middle and upper classes feel that their opportunities had stagnated, but representatives of marginalized groups, such as the MST (*Movimento sem Terra*, or Movement of the Landless) had become more active in their demands. The result was the election of Luis Ignacio “Lula” da Silva, who promised a new era in Brazilian politics. Coming from humble origins, Lula had worked his way up the union and Workers’ Party (PT) hierarchy in Brazil. After several unsuccessful campaigns, Lula finally

succeeded through moving towards the political center, in particular promising financial stability. However, this promise seemed to become a greater priority to some than his efforts to reduce poverty, including a “War on Hunger.”

These economic developments have had major effects on the politics of the region. In every case, economic growth was accompanied by increasing inequality of distribution. Moreover, a lot of the growth of the 1970s, with the partial exception of Chile, was based upon international borrowing. A good portion of the borrowing in the region went to pay for increased oil prices, as every country in the region at the time was heavily dependent upon oil imports. With the exception of Argentina and Paraguay, that remains the case today. Therefore, when international interest rates were raised by double digits in the early 1980s by US monetary policy, the debt crisis hit the region hard. With the exception of Chile, every country in the region experienced major inflationary pressures and a recession. A combination of the consolidation of the civilian opposition towards a centrist coalition and the ongoing inability of the military to get their economies jump-started led to an overwhelming pressure for the return of democracy by the mid-1980s.

However, the circumstances of the transition varied greatly from one country to another. With the exception of Argentina, the military seems to lurk in the shadows of the new democratic governments. In every case but Argentina, the military was able to guarantee itself amnesty for its human rights abuses. In Uruguay, the population, fearing further military intervention as well as social polarization, passed a plebiscite granting the amnesty. As a result, Uruguay seems to be moving back towards a more stable democratic base. In Argentina, the resounding failure of the military in economic affairs as well as the Malvinas War (see later) led to a much clearer renunciation of their role. Brazil had an unusual transition to democracy as the military went through a series of attempts at creating a stable but “responsible” two party system to be slowly introduced that it called “abertura,” or opening. The military government’s attempts seem to have failed, as Brazil’s political parties remain highly fragmented. Brazil’s attempts to create a more stable democracy resulted in a new Constitution in 1988, but the new political rules, including a partly proportional representation voting system, seems to have even further exacerbated the situation. In Chile, Pinochet and the constitutional restrictions he placed upon democracy remain in place. The famous attempt at bringing Pinochet to trial for war crimes in London during a visit in 1999 seems to have failed to bring any closure to the dark period of military rule. In Paraguay, the

democracy remains equally fragile, with the military interfering directly and indirectly in political decision making. Lacking any history of democratic rule, Paraguay seems to be struggling in its transition.

In general, the greatest threat to the new centrist democracies of the Southern Cone continues to be slow economic growth. Even Chile, the star pupil of neoliberal policies, slowed down by the late 1990s. The ongoing monetary crises in Brazil (1998–1999) and Argentina (beginning in 2000) equally wreaked havoc in Paraguay and Uruguay, whose economies are so dependent upon their larger neighbors. In sum, it remains to be seen whether the current economic malaise will create a serious problem for the continuation of neoliberal policies. With staggering levels of external debt on one side and domestic economic disquiet on the other, Southern Cone governments find themselves in exceedingly difficult positions regarding development strategies.

## International Relations

Unlike other developing regions, the Southern Cone has a limited history of international warfare. Almost all the most significant wars took place before the twentieth century. The War of the Triple Alliance (1864–1870), in which a dispute between Paraguay and Uruguay resulted in Brazil and Argentina joining Uruguay, reportedly wiped out half the Paraguayan population and more than 80% of the males. Among them were Chile’s seizure of Bolivia’s only seaport and occupation of Lima, Peru, in the War of the Pacific (1879–1883) centered around control of the then booming nitrate resources located in that region. The only significant recent war was the Chaco War (1932–1935) in which Paraguay defeated Bolivia for control of a disputed desert territory which supposedly contains large petroleum reserves. While there have been ongoing border disputes among many of the countries in the region, these disputes seem to have died down considerably with the democratic transition and the strengthening of regional economic ties in MERCOSUR (discussed below).

The major international war that involved outside powers was the Malvinas War (1982), in which the Argentine military invaded the Falkland Islands (called the Malvinas by Argentina), which had been controlled for some time by the United Kingdom. Given the naval superiority of Britain and the help of the United States, the result was predictable. The invasion was a spectacular failure, with the main result being the complete loss of face of the Argentine military at home.

While Argentina and Uruguay had achieved virtual First World economic levels early in the twentieth century, the period after World War II has been one of steady decline. By contrast, Brazil's territorial size and immense relative population, coupled with high economic growth rates and successful industrialization over the same period have placed it in a position of regional superpower, eclipsing its one-time regional rival in Argentina. With the consummation of the North American Free Trade Agreement (NAFTA) in 1992, in which Mexico gained unencumbered access to the US market, the economic dynamics of the Southern Cone shifted towards Brazilian economic leadership.

While every country in the region has traditionally looked to Europe and to a lesser extent, the United States as the main trading partner, there was a growing fear that the successful integration experiments in both the European Union and the NAFTA would leave the Southern Cone left without competitive access to its main markets. Moreover, when US President George Bush began raising the ideas of a Free Trade Agreement of the Americas (FTAA), the traditionally protectionist Southern Cone countries began to consider banding together in order to improve their bargaining position with the United States. The result is a free trade agreement for the Southern Cone, called the MERCOSUR (Common Market of the South) which began in 1994. MERCOSUR revolves around free trade between Brazil and Argentina, but Paraguay and Uruguay are also partners. Bolivia and Chile are associate members. Though intra-regional trade increases have been spectacular, there have been important limits to the MERCOSUR process. First, there are several key sectors, such as autos and footwear, that have exceptions to open trade. Second, unlike NAFTA, MERCOSUR does not have a clear dispute mechanism settlement. Third, MERCOSUR is really just a forum for national-level negotiations. There are working groups who attempt to negotiate new agreements in MERCOSUR, but they can not be considered part of a regional institution. With ongoing currency crises in Brazil (1999) and Argentina (2001), the prospects for further agreements in the MERCOSUR seem unlikely, at least for the short-term. Given domestic US opposition, the FTAA process seems equally stalled. In the long-run, however, the ongoing increases in trade and investment among the MERCOSUR countries, such as those in energy, may revive progress.

### SOUTHERN CONE (LATIN AMERICA): INTERNATIONAL RELATIONS

Latin America's southern cone is composed of the independent nations of Argentina, Brazil, Chile, Paraguay, and Uruguay. Prior to 1945, foreign relations were primarily dominated by relationships with the United Kingdom. It was not until after 1945, however, that the United States became significant economically or politically in the region. The military governments that ruled the southern cone nations during the Cold War were vehemently anti-communist and received generous US economic and military aid packages. The southern cone nations, because of their distance from the United States and their European outlook, however, have often pursued foreign policies independent of US policy goals and objectives. The most important foreign policy initiatives in the post-Cold War period revolve around economic issues. The formation of MERCOSUR—a regional program of economic integration and cooperation

between Argentina, Brazil, Paraguay, and Uruguay—in the early 1990s is an essential component of the foreign relations of those nations.

## Argentina

After achieving independence from Spain in 1816, Argentina was marked by a bitter struggle for national self-determination between two contending elite factions: the Liberal elites in the Buenos Aires region, who wanted a strong central government, and the Conservative elites, who wanted a federal government based on regional control. The ensuing political confusion allowed Paraguay and Uruguay, once part of the Viceroyalty of La Plata, to achieve their independence. In addition, the British and French were able to take advantage of Argentina politically and economically. For example, in 1833, the British occupied the Falkland Islands.

The Liberal elites were able to implement a stable political and economic system in 1862. They attempted to create a national identity and a foreign policy based on Argentinian exceptionalism and European civilization. They also implemented an export-led economy based on beef and wheat exports. During the last quarter of the nineteenth century, the Argentinian government promoted the immigration of millions of Europeans, especially from Italy, to help develop the beef and wheat industry. These Europeans, known as *Inquilinos*, were promised land in return for clearing the pampas grass from the large estates of the elites. The *Inquilinos*, however, were denied their land and Argentina lost its chance to develop a large rural middle class. Nevertheless, the Argentinians created a viable economic system, based on beef and wheat exports to the British, that thrived until the Great Depression. During the first three decades of the twentieth century, Argentina accounted for 30% of British foreign investment. The entire meat packing industry was dominated by US and British investors.

During the 1930s, the Conservative elites and their supporters in the military eliminated democracy, repressed labor, and led the nation out of the Great Depression by reinforcing economic ties to the British. The 1933 Roca-Runciman Treaty secured a market in England for Argentinian exports while maintaining Argentina's dependent relationship on the British. In 1943, reacting to elite domination, labor unrest, and Argentina's economic dependence on England, a group of middle level military officers, who called the elites *vendepatrias* (country sellers), led a military coup that demanded a new domestic and foreign policy

geared to restore Argentinian pride and prosperity. The new government, composed of officers who were members of the Group of United Officers (GOU) and favorable towards Fascism, declared neutrality in World War II. In response, the United States froze Argentinian gold reserves in the United States, recalled the US ambassador, and restricted trade with Argentina. US pressure convinced the Argentinian government to break diplomatic relations with the Axis powers in 1944. Nevertheless, although Argentina eventually declared war on Germany, after the war Argentina became a refuge for Nazi war criminals.

In 1946, Juan Perón, a member of the military government since 1943 who had been openly sympathetic to the Nazis, ran for president of Argentina. On the eve of Argentina's 1946 presidential elections, US Assistant Secretary of State for Latin American Affairs Spruille Braden spearheaded an anti-Perón campaign. The US government published a "Blue Book" charging Perón with pro-Nazi activities. Perón responded by charging the US with imperialism and easily won the elections. An ardent anti-communist, Perón initiated a government based on economic nationalism. He nationalized most foreign companies in Argentina and established state-run industries. Because of his export earnings, he was able to offer economic advantages to the workers. Perón's popularity with labor was enhanced by his wife, Eva "Evita" Duarte. Declining export prices in the early 1950s meant, however, that his concessions to labor could not be sustained. In 1955, the Argentinian industrialists, supported by the military, ousted Perón, who went into exile.

From 1955 to 1973, Argentina abandoned its nationalistic economic and foreign policy. The civilian-military administrations, which were vehemently anti-communist, de-nationalized Argentinian companies and encouraged foreign investment. By 1968, the US had over \$1 billion invested in Argentina. Argentina's economy, however, failed to recover and the foreign debt, all but eliminated by Perón, rose to over \$3 billion during the 1960s. Disgruntled workers, however, continued to clamor for Perón's return from exile. Economic and political chaos, enhanced by increased left-wing revolutionary activity, convinced the military to allow Perón to return from exile in 1973 and assume the presidency. Returning with his third wife, Isabel Martínez, Perón was unable to address Argentina's economic and political woes. In 1974, he died and Isabel took over, but chaos ensued and she was deposed by a military coup in 1976.

The new military dictatorship instituted a reign of terror, the so-called Dirty War, against all leftist forces. Thousands of people disappeared, which placed Argentina in the international spotlight of

human rights agencies such as Amnesty International. The military, inept at running the economy, attempted to divert attention by invading the Falkland Islands in 1982. Argentina's military generals, believing that the British would not resort to force to regain islands that were militarily and strategically unimportant, miscalculated the determination of British Prime Minister Margaret Thatcher. To compound the situation, the Argentinian military government, which was ill-prepared to fight a war, lied to the Argentinian people that they were winning the war. Argentina's defeat led to the return of civilian government in 1983.

Since 1983, US–Argentinian foreign relations have been excellent. Argentina was the only Latin American nation to participate in the 1990–1991 Gulf War and all phases of the 1994 Haiti operation. Argentina, however, was reluctant to contribute troops to the coalition forces in Iraq in 2003. Eager for closer ties to industrialized nations, Argentina abandoned the non-aligned movement in the early 1990s. In 1999, Argentina and the United Kingdom agreed to normalize travel between Argentina and the Falkland Islands. A strong proponent of enhanced regional stability in South America, Argentina has revitalized its relationship with Brazil and settled border disputes with Chile. Argentina's most important trading partners are the MERCOSUR members and the European Union (EU).

## Brazil

Brazilian independence in 1822 was bloodless and much less turbulent than the destructive wars of independence in the rest of South America. Whereas the former Spanish colonies in South America splintered into numerous nations and spent decades searching for a form of government that would have legitimacy in the eyes of its populace, the Brazilians, who remained united, had the Portuguese royal family, the Braganzas. In 1821, when Portugal's João VI returned to Lisbon to quell a rebellion, he left his son Pedro I in Brazil to lead the Brazilian independence movement. Although the constitutional monarchy served the Brazilians well and the nation grew economically and geographically during the nineteenth century, in 1889, after Emperor Pedro II became debilitated by diabetes, the military, and the elites, who viewed the monarchy as an archaic institution, sent the Braganzas into exile and established a republic. During the twentieth century, because of its size—the seventh largest economy and the fifth largest nation in the world—Brazil has played an important role in

hemispheric relations. Although critics of US foreign policy frequently refer to the United States as the Colossus of the North, many Brazilians approvingly refer to their nation as the Colossus of the South.

In 1808, when the Braganzas first arrived in Rio de Janeiro, the United States was the first nation to establish a consulate in Brazil. It was, however, not until after World War II that the United States became Brazil's primary trading partner and foreign investor. In addition, the US has consistently supported Brazil's impressive attempts at industrialization. In 1941, the United States, fearful of expanding German economic activity in South America, facilitated the construction of Latin America's largest steel mill at Volta Redonda, which became the cornerstone of Brazil's import substitution industrialization strategy. The US has also sought Brazilian support for US foreign policy initiatives. Although the Brazilians have frequently pursued an independent foreign policy, US–Brazilian relations have, for the most part, been close.

During the presidency of Enrico Dutra, which maintained very friendly relations with the United States, Brazil outlawed the Brazilian Communist Party (PCB) and broke off diplomatic relations with the Soviet Union. In 1947, Brazil hosted the conference that established the Inter-American Treaty of Reciprocal Assistance, the so-called Rio Treaty. When Getúlio Vargas returned to power in 1951, relations with the United States cooled. Vargas, who blamed the United States for his removal from power in 1945, pushed for a more independent foreign policy and supported nationalistic policies such as the creation of Petrobrás, Brazil's state-run oil company. After Vargas's suicide in 1954, however, friendly relations with the United States were resumed.

During Juscelino Kubitschek's administration, the Brazilians lured US investors to Brazil with very favorable terms. By 1960, US investments in Brazil were over \$1.5 billion. Relations with the US cooled after Jânio Quadros took office in 1961. Quadros renewed relations with the Soviet Union and criticized Kennedy's failed Bay of Pigs invasion. Citing his inability to deal with Brazil's elite-dominated congress, Quadros resigned in 1961 and was replaced by his vice president, João Goulart. Goulart's populist rhetoric and attempt at centrist politics alienated the increasingly vocal forces of the left and right wings of the political spectrum. In 1962, the Brazilian government passed a law that severely restricted profit remittances from foreign investment in Brazil, which caused new foreign investment in Brazil to disappear by 1964. In late 1963, to show its disfavor, the US reduced foreign aid to Brazil. Although the US was not directly involved in the overthrow of Goulart on March 31, 1964, it

immediately recognized the military dictatorship established by Humberto Castello Branco.

Castello Branco, the first of a series of military presidents, received generous economic and military aid packages from the United States. Between 1964 and 1970, Brazil received over \$2 billion in US aid. In return, the Brazilian government adopted a policy of total alignment with the United States. Brazil broke diplomatic relations with Cuba, sent Brazilian communists into exile, and compensated foreign investors who had their investments expropriated. In 1965, the Brazilian army contributed two thousand troops to the OAS force sent to the Dominican Republic to end that nation's civil war. Subsequent military presidents, although maintaining friendly relations with the United States, pursued a more independent course in foreign policy, especially in the aftermath of the failure of the United States to contain communism in Vietnam. For example, the Brazilians refused to sign a nuclear non-proliferation treaty. Relations chilled when the Carter administration published a report citing human rights violations in Brazil. Relations were further strained during the early 1980s by Brazil's \$5 billion trade surplus with the United States.

Following Brazil's return to civilian government in 1985, the Brazilians have opened their economy to increased international participation through privatization of state-run industries and neo-liberal economic reforms. Since the nineteenth century, Brazil's greatest rival in Latin America has been Argentina. In 1991, however, Brazil and Argentina, along with Uruguay and Paraguay, signed the Treaty of Asunción, which resulted in the formation of MERCOSUR, a regional economic integration program in the southern cone. Plans are under negotiation to also incorporate Chile and Bolivia.

Trade between the EU and Brazil is also extensive. By 1995, German investments in Brazil were second only to the United States. In December 1995, the EU signed an important free-trade protocol with MERCOSUR, the first protocol ever between two regional trading blocs. Since 1995, Brazil has used the potential to expand trade with the EU to pressure the United States to grant more favorable trade relations with Brazil. Since the EU members do not require visas from Brazilians, the Brazilians do not require visas from EU members. The US, however, requires Brazilians to have a visa to enter the United States. As such, the Brazilians, citing reciprocity, insist that US citizens purchase visas before entering Brazil.

Brazil attaches great importance to its foreign relations with Japan. Since Brazil established diplomatic relations with Japan in 1897, there has been a large influx of Japanese immigrants to Brazil. Brazilians of Japanese descent constitute one of the largest ethnic

segments of Brazil's population. Brazil is also home to Japan's largest expatriate community. Beginning in the 1960s, Japan began to invest heavily in Brazil's mining, steel, aluminum, telecommunications, manufacturing, and agricultural sectors. As a result, mineral and agricultural exports to Japan increased dramatically. Currently, 250,000 Brazilians of Japanese descent work in Japan. Their remittances to family members in Brazil comprise a significant component of the Brazilian economy.

## Chile

During the nineteenth century, Chile's foreign policy was characterized by close economic ties with the British and territorial expansion against the Mapuche Indians in the south and the Bolivians and Peruvians in the north. Since independence, Chilean elites had invested in the vast nitrate fields of the Atacama Desert, then belonging to Bolivia and Peru. The Atacama Desert had the world's largest deposit of nitrates, which were used by the Europeans as a fertilizer to increase food production. The British were the largest importers of nitrates from Chile and the largest supplier of manufactured goods to Chile. During the 1870s, Bolivia increased taxation on the Chilean mine owners operating in Bolivia, while the Peruvian government nationalized the Chilean-owned nitrate mines in Peru. Although the mine owners were compensated with Peruvian government bonds, the Chilean government launched the War of the Pacific (1879–1883) against Bolivia and Peru. The superior Chilean forces, which defeated Bolivia and Peru, conquered the Atacama Desert for Chile. Bolivia became a landlocked nation and Valparaiso, Chile replaced Callao, Peru as the main port on South America's Pacific coast. During the war, however, British speculators, such as John Thomas North, purchased the virtually worthless Peruvian government bonds. At the end of the war, therefore, the Chilean government decided that the British speculators were the legal owners of the nitrate mines. The result was a Chilean economy dependent on exports and imports to and from England.

The Chilean nitrate boom, however, was short-lived. During World War I, the Germans discovered a way to produce nitrates by fixing nitrogen from the air, which signaled the end of Chile's Liberal export-led economy based on nitrates. Although Chile had limited foreign relations with the United States during the nineteenth century, after World War I copper became Chile's leading export and the United States replaced England as the dominant economic power in Chile. Chilean copper was a strategic metal used

in airplanes and bullets by the Allied powers during World War II. Despite strong internal pressure in Chile to support the Axis powers, the Chilean government eventually broke diplomatic relations with Germany.

During the early post-World War II years, the Chilean government supported the US struggle against international communism. The growing influence of the Marxist left in Chilean politics, however, led to an increase of anti-US public sentiment in Chile. This resentment was exacerbated by the decline of international copper prices after the Korean War, opposition to US intervention in Vietnam, and US meddling in domestic Chilean politics. As part of President John F. Kennedy's agenda of presenting Latin American nations as models of democratic development to counteract the popularity of Fidel Castro's Cuban Revolution in the Third World, in 1964 the US CIA financially supported the candidacy of political centrist Eduardo Frei Montalva. The CIA funding, which amounted to over \$20 million, facilitated Frei's victory over Marxist presidential candidate Salvador Allende. During the 1960s, Chile received more US aid per capita than any other Latin American nation.

The US government viewed Allende's 1970 presidential victory as detrimental to the struggle against international communism. US National Security Adviser Henry Kissinger was especially concerned about the implications for European politics following the democratic election of a Marxist in Chile. The US government, failing to keep Allende from taking office, initiated a covert campaign to destabilize his government after Allende's inauguration. Allende's government nationalized the Chilean holdings of International Telephone and Telegraph (ITT) and copper giants Anaconda and Kennecott. In 1971, Castro toured Chile, often accompanied by Allende. Much of Chile's press, controlled by the elites, condemned Allende's actions and called for his overthrow. Although the United States did not directly overthrow the Allende regime, it welcomed Augusto Pinochet's 1973 military coup and provided extensive economic and military aid to Pinochet's military regime. Pinochet's dictatorship was responsible for the disappearance of almost 3,000 Chileans. Although this number pales in comparison to the number of disappeared people in Argentina at the same time, human rights activists labeled Pinochet's regime a brutal authoritarian dictatorship. Nevertheless, Pinochet introduced neo-liberal economic reforms that revived Chile's economy.

Although relations between the US and Chile were strained during Jimmy Carter's presidential administration, Ronald Reagan's 1980 election restored amicable US-Chilean relations. During Reagan's first

administration, US officials argued that anti-communist authoritarian regimes, such as Pinochet's government, were needed to stop the spread of international communism. By 1984, however, facing increased criticism for US actions against Nicaragua's Sandinistas, US officials, cognizant of human rights abuses in Chile, began to worry that Pinochet was no longer a solution to a potential threat from the radical left, but part of the problem. The US and Western European nations welcomed the October 5, 1988, plebiscite by Chilean voters that rejected the continuation of Pinochet's government into the 1990s. The 1989 election of Christian Democrat Patricio Aylwin to the presidency once again restored the amicability of US-Chilean relations. The US welcomed Chile's commitment to free-market economic policies while praising the Chilean government's commitment to democracy. The US has indicated a willingness to sign a free-trade agreement with Chile in the aftermath of the successful implementation of the North American Free Trade Agreement (NAFTA) with Mexico and Canada. Although the US continues to be an important trading partner for Chile, in the post-Cold War period Japan has replaced the United States as Chile's largest trading partner.

## Paraguay

Since independence in 1812, Paraguay has been a buffer state between Brazil and Argentina, the two largest nations in South America. As such, Paraguayan foreign relations have been conditioned by its relations with its larger neighbors. Being one of Latin America's two landlocked nations has caused Paraguayan foreign relations to oscillate between periods of isolationism and expansionism. Paraguay's first leader, José Gaspar Rodríguez de Francia, established a strong, centralized state that attempted to develop independently of its stronger neighbors. In 1864, however, Paraguayan leader Francisco Solano López, in an attempt to expand and reinforce Paraguay's northern frontier, declared war on Brazil. The War of the Triple Alliance (1864–1870), fought against Brazil, Argentina, and Uruguay, resulted in the death of over half of Paraguay's population and the loss of over 25% of Paraguay's territory to Brazil and Argentina. Subsequent Paraguayan leaders sought to strike a balance between the influence of its two larger neighbors. Nevertheless, since the port of Buenos Aires provided the only access to external markets, Paraguay depended heavily on Argentina for trade, which caused many Paraguayans to resent their dependence on Argentina.

During the Chaco War (1932–1935), Paraguay expanded westward into Bolivian territory. In the aftermath of the conflict, war hero Colonel Rafael Franco attempted to establish a democratic regime, but Liberal elites overthrew his government in 1937. The Liberal government, facing mounting pressure from the US government, surrendered the oil-rich land that it had won during the war with Bolivia. During World War II, the military government of Higinio Morínigo, although favoring German economic interests, supported the Allied cause in return for generous US loans and military hardware. After World War II, liberal forces launched a civil war in 1947 that resulted in economic and political pandemonium. Alfredo Stroessner, a veteran of the Chaco War, established a military dictatorship in 1954 that lasted until 1989.

Stroessner's foreign policy was based on two principles: nonintervention in the affairs of other countries and no relations with nations ruled by Marxists. In 1959, Stroessner severed relations with Cuba after Fidel Castro's revolution. In 1980, Stroessner broke diplomatic relations with Nicaragua after the Sandinistas came to power. Like most Paraguayans, Stroessner resented Paraguay's dependence on Argentina. In an attempt to lessen Paraguayan dependence on Argentina, Stroessner encouraged increased ties with Brazil. During the 1950s, Brazil granted Paraguay free-port privileges on the Brazilian coast at Parana-gua and built the Friendship Bridge over the Río Paraná, which linked Asunción, Paraguay's capital, to the Parana-gua coast. The signing of the Treaty of Itaipú in 1973, which eventually resulted in the construction of the world's largest hydroelectric dam, epitomized the growing relationship between Paraguay and Brazil.

Stroessner benefitted politically and economically from his new relationship with Brazil. The infusion of money and jobs associated with the Itaipú dam project caused the Paraguayan economy to grow rapidly during the 1970s. During the 1980s, Brazil provided most of Paraguay's military equipment and training and Brazilian banks financed much of Paraguay's foreign debt. Since Paraguayan energy consumption was limited, the Treaty of Itaipú authorized Paraguayan sales of excess electricity to Brazil. Although the electricity was sold at discounted prices, it generated millions of dollars for the Paraguayan government. Notwithstanding Brazil's transition to civilian government in 1985, Paraguayan-Brazilian relations remained friendly. The Brazilian government, content with the stability that Stroessner provided, refrained from criticizing the aging dictator. In 1986, however, Brazil's president met with Argentina's president to discuss increased economic cooperation in the southern cone. The Brazilian and Argentinian leaders

insisted that only democratic nations could participate in the proposed regional economic integration program. Although participation in the proposed program could have helped the Paraguayan economy, Stroessner refused to consider the democratization of the Paraguayan political system.

During the 1980s, diplomatic relations between Paraguay and Argentina were increasingly strained. During the 1983 Argentine presidential elections, Paraguayan civilian opposition leader Domingo Laíno campaigned for Radical Civic Union (UCR) candidate Raúl Alfonsín among the thousands of Argentine citizens of Paraguayan descent. After Alfonsín's election, the Argentinian president allowed Laíno to stage anti-Stroessner rallies in Argentina. Stroessner also refused to respond to Argentina's requests for the extradition of former Argentinian military officers accused of human rights violations during the so-called Dirty War of the late 1970s.

From 1945 to the late 1970s, foreign relations between Paraguay and the United States were conditioned by the Cold War. The US was concerned about anti-communism and security interests, while the Stroessner government desired economic aid. As such, Stroessner was one of the staunchest supporters of US security policies in the hemisphere. In the OAS and the UN, when security issues were raised, Paraguay voted with the United States more consistently than did any other South American country. Paraguay was rewarded with generous economic aid packages and one of the largest Peace Corps contingents in Latin America. The human rights agenda of Jimmy Carter's presidential administration, however, signaled an end to overtly friendly US-Paraguayan relations. US concern over continued human rights abuses in Paraguay continued after the election of Ronald Reagan. US-Paraguayan relations were also strained by the involvement of some members of Stroessner's government in narcotics trafficking, especially the participation of certain sectors of the Paraguayan military in the operation of cocaine laboratories. Critics claimed that Stroessner's sons Gustavo and Alfredo, Jr. were heavily involved in the narcotics trade. Nevertheless, in 1988, the Reagan administration certified to the US Congress that the Paraguayan government was cooperating with US drug enforcement officials.

In 1988, when Chilean voters rejected Augusto Pinochet's attempt to extend the Chilean military dictatorship into the 1990s, the possibility of implementing a democratic government in Chile in 1990 served to further isolate Stroessner from the democratic tide sweeping through South America. In 1989, Stroessner's youngest son Alfredo's father-in-law, General Andrés Rodríguez, overthrew the aging dictator. Stroessner retired to a fortified home in Brazil,

safe from possible extradition attempts in the future. Rodríguez initiated the transition to democracy in Paraguay. As a result, Paraguay was admitted to MERCOSUR, the regional common market phasing out tariffs between Argentina, Brazil, Uruguay, and Paraguay. In addition, the US rewarded Paraguay with preferential trade arrangements and increased amounts of foreign aid.

## Uruguay

Uruguay's foreign policy has been shaped by its status as the second smallest country in South America, its location between Argentina and Brazil, its history of being a victim of foreign intervention, and its long democratic tradition. Although traditionally a part of the Spanish empire in the New World, Uruguay was seized by Portuguese forces from Brazil in 1817. Uruguayan revolutionaries, supported by Argentina, launched an invasion of Uruguay in 1825, defeated the army of newly-independent Brazil, and declared independence in 1828. The British government, eager to preserve Uruguay as a buffer state between Argentina and Brazil, convinced Uruguay's neighbors to accept Uruguayan independence. Nevertheless, England, France, Italy, Argentina, and Brazil frequently intervened in Uruguayan politics during the nineteenth century.

Beginning with José Batlle y Ordóñez's government in 1903, Uruguay has actively pursued democratic government and been active in international and regional organizations. US-Uruguayan relations have been based on a common dedication to democratic ideals. Although Uruguay initially attempted neutrality in both world wars, it ultimately sided with the Allied powers. In World War I, Uruguay broke diplomatic relations with Germany in October 1917. In 1941, Uruguay allowed the United States to build naval and air bases in Uruguay. US military training and supplies helped the Uruguayan military deter Argentina's expansionist agenda during the 1940s. In January 1942, Uruguay broke diplomatic relations with the Axis powers. The US responded with increased loans. In February 1945, Uruguay declared war on the Axis powers. Uruguay joined the UN in 1945 and has been a member of most UN specialized agencies. In 1947, Uruguay signed the Rio Treaty, a regional alliance that established a mutual defense system in the Americas.

During the post-World War II period Uruguay underwent rapid industrialization and urbanization. Although the government made great advances in social welfare reform, the elites, allied with foreign

investors, continued to dominate the political economy. During the 1960s, however, industrial production dropped by 50% and agricultural production stagnated. At the same time, increased left-wing guerrilla activity exacerbated the ensuing political and economic chaos. The violent Tupamaro urban guerrillas—middle class Marxists, for the most part—attacked businesses, government buildings, and foreign embassies. Although the Tupamaros wreaked havoc on the national economy and committed numerous atrocities, during their raids the guerrillas uncovered numerous documents that revealed excessive corruption at national and international levels.

The Tupamaros, attempting to change the political system democratically, called for a cease-fire in 1971. Meanwhile, the Brazilian military plotted a military coup with the Uruguayan military in the event of a leftist victory in the 1971 presidential elections. The election of ultra-conservative Juan María Bordaberry, however, shelved the Brazilian plan while simultaneously increasing the radicalization of the Tupamaros. In 1973, with the support of the Brazilian military and President Bordaberry, the Uruguayan military, opposed to communist insurgency and liberal democracy, established a military dictatorship that lasted until 1985. During the military dictatorship, US economic and military aid increased dramatically. At the same time, the Uruguayan government, in an attempt to reestablish economic stability, signed a series of economic agreements with Brazil and Argentina designed to increase Uruguayan trade with its larger neighbors.

In 1985, following the return to civilian rule with the presidential election of Julio María Sanguinetti, Uruguay's foreign policy underwent an abrupt change. Although disagreeing with their political systems, Sanguinetti renewed foreign relations with Cuba, Nicaragua, the People's Republic of China, and the Soviet Union. Despite Uruguay's criticism of US military interventionism in Nicaragua, Libya, and Panama, US-Uruguayan relations after 1985 were excellent. In 1986, Sanguinetti received a warm welcome at the White House during an official visit to the United States.

The key to Uruguay's new foreign policy, however, was Sanguinetti's desire for regional integration in the Río de la Plata basin. Sanguinetti's efforts at promoting regional integration, built on the protocols signed by the military government during the 1970s, were facilitated in the late 1980s by the demise of military dictatorships in Argentina, Bolivia, Brazil, Chile, Peru, and Paraguay. Sanguinetti was especially eager to establish a closer economic relationship with Argentina, Brazil, and Paraguay. The presidents of Argentina, Brazil, and Uruguay met in 1985 to advance their

integration process, which resulted in the creation of MERCOSUR, a regional economic association that was eventually joined by Paraguay when the four nations signed the Treaty of Asunción in 1991.

### SOVIET BLOC

The Soviet Bloc was an affiliation of Eastern and Central European nations, led by the Union of Soviet Socialist Republics (USSR) that emerged from the destruction and chaos of World War II. The core nations included the Soviet Union, Poland, East Germany, Czechoslovakia, Hungary, Bulgaria, Romania, and, for nearly fifteen years, Albania.

Following the end of WWII, the Soviet Red Army found itself in a dominant position in most of Eastern and Central Europe with the exceptions of Yugoslavia and Albania. The Soviets aimed to transform East-Central Europe into a buffer zone that would impede any future aggression from Western Europe. In addition, significant ideological differences worsened relations between the Western nations (Western Europe and the United States) and the emerging Soviet Bloc.

Following the partition of Germany into military zones of occupation by the Allies, which was ratified at the Yalta and Potsdam Conferences in 1945, the Soviet Union pursued a policy of political intervention that began with the formation of East Germany in 1948. Encouraged by the power vacuum created by the defeat of Nazi Germany, Soviet forces moved into much of East-Central Europe. The leaders of Romania, for example, had expected the Western Allies to fill the void in Eastern Europe after WWII and did not anticipate the arrival of the Red Army. The Soviets helped to transform East-Central Europe into a series of pro-Soviet regimes that would take their cues from Moscow.

Outside this immediate core of the Soviet Bloc were two ideologically allied states—Yugoslavia and Albania. In Albania, under the leadership of Enver Hoxha, a highly repressive Stalinist regime was established and an initially close relationship with the Soviet Bloc was reversed in favor of increased isolationism and a tacit alliance with China by 1960. Marshall Tito of Yugoslavia had initially expected Yugoslavia to be directly integrated into a greater Soviet Union and yet, because he had come to power without Soviet aid, Tito turned Yugoslavia into the only neutral and independent Communist state in Eastern Europe that remained outside of the orbit of the Soviet Bloc. The core Soviet Bloc survived these peripheral events, and the member states cemented their relations economically and politically through the formation of Comecon (Council for Mutual Economic Assistance) in 1949 and the Warsaw Pact in 1955.

The Soviet Bloc found itself the main rival of an alliance of nations led by the United States. During a period of hostile relations referred to as the Cold War, the US-led Western Allies and the Soviet Bloc vied for power in post-war Europe and came close to war on a number of occasions such as with the crisis caused by the Soviet blockade of Berlin in 1948 to 1949. This act resulted in the Berlin airlift that prompted the USSR to back down from a direct confrontation with the Western Allies. The USSR installed a socialist post-war government in neighboring Austria, but Austria evolved (with covert US assistance) into an officially neutral state outside the Soviet Bloc.

The US and its allies formed a defence pact in 1949 called the North Atlantic Treaty Organization (NATO). President Truman's Marshall Plan (initiated between 1949 and 1951) helped to rebuild and revitalize Western Europe in order to maintain a prodigious front against the Soviet Bloc. The US remained the economic and industrial superpower and initially was the sole nation with the atomic bomb, until the Soviets also developed nuclear weapons in 1949. This situation developed into a nuclear arms race between the two superpowers of the United States and USSR that resulted in a military standoff, as both sides feared mutual nuclear annihilation. This also kept the two sides divided along what came to be referred to as the Iron Curtain, which separated the Soviet Bloc states from Western Europe.

The nations of the Soviet Bloc did not always exist in a harmonious and unified manner and periods of internal unrest often required Soviet Bloc military intervention (or threats) in order to maintain governments favorable to Moscow. The 1956 Hungarian Revolution was a direct challenge to the Soviet Bloc and in particular its ideology of totalitarianism. The Soviet army moved against the Hungarian uprising and forcibly brought Hungary back into the Soviet Bloc. This challenge to Soviet Bloc unity was repeated with the Prague Spring of 1968. Most of the countries of the Warsaw Pact participated in an invasion of Czechoslovakia in order to insure that the Soviet Bloc would remain intact. The USSR justified its intervention with a policy that came to be known as the Brezhnev Doctrine, following a speech by Leonid Brezhnev that specified that any nations that sought to reverse the "socialist" ideology of communist states would become a concern for all communist states (and thus be subject to military intervention).

The intervention by the Soviet Bloc was not universally praised even by its own member states. The most pronounced opposition to this incursion was Romanian President Nicolai Ceausescu who refused to support the invasion of Czechoslovakia, but stopped short of attempting to leave the Soviet Bloc.

Romania did in fact pursue a semi-independent course that included renewing relations with Albania and China even though both states were no longer amicable towards the Soviet Bloc as a whole. Despite his defiance, Ceausescu's brutally repressive policies appear to have placated Soviet leaders.

Another serious challenge to the unity of the Soviet Bloc came in the early 1980s, when Poland saw the ascension of the Solidarity Movement led by Lech Walesa. The Solidarity Movement agitated against the Soviet-backed Polish puppet regime, but was quelled in 1980 by the invocation of martial law and fears by the Polish government that the build-up of Soviet Bloc troops, along the Polish border, signified a possible military intervention. By contrast, Bulgaria and East Germany maintained stable pro-Soviet regimes and remained unwavering members of the Soviet Bloc.

The Soviet Bloc began to disintegrate in 1989 following the reforms of Mikhail Gorbachev in the USSR. With the USSR transforming itself from a totalitarian nation to a more democratic one, the Soviet Bloc states of East-Central Europe instituted rapid reforms and began to move away from communism. Many of the Soviet Bloc nations have since joined the West through such organizations as the European Union and even NATO.

### SRI LANKA

Sri Lanka is a relatively small developing nation in South Asia with a land area of 65,610 square kilometers. Sri Lanka is located between latitudes 5°55'–9°51' N and longitudes 79°41'–81°53' E, 880 kilometers north of equator, in the Indian ocean to the south of India but separated from the Indian subcontinent by a strip of sea which, at its narrowest, is

about 40 kilometers. Sri Lanka possesses a pleasant tropical climate with average temperature of 25–30°C in the low lands. The temperature goes down with rising altitude. The highest point is Mt. Pidurutalagala (2,524 meters).

Sri Lanka's 19 million (2000) population is diverse both in ethnicity (Sinhalese 74%, Tamils 18.1%, and Moors 7.5%) and religion (Buddhists 69.3%, Hindus 15.5%, Christians 7.6%, and Muslims 7.5%). Sri Lanka is the home of Theravada Buddhism and her Pali chronicles, the *Dipavamsa* (Chronicle of the Island) and *Mahavamsa* (The Great Chronicle) composed in the fourth and fifth centuries CE, the only historical records that prevail in South Asia, give extensive descriptions of the history of Buddhism and its expansion and success in the island and record a history which traces the first Sinhala inhabitants in the island in the fifth century BCE and mentions the first formal introduction of Buddhism to Sri Lanka with the auspicious of the Indian Emperor Asoka in the third century BCE.

Sri Lanka has a complex colonial history extending over four hundred years. The Portuguese colonized some coastal areas from 1505; then the Dutch succeeded in controlling those areas from the mid-seventeenth century and finally, the British ruled the entire country from 1815 until 1948 when Sri Lanka became an independent nation. With the introduction of a new constitution in 1972, the name of the country changed from Ceylon to Sri Lanka.

Natural resources of Sri Lanka are limestone, graphite, mineral sands, gems, phosphates, clay, and hydropower. Arable lands are 14%. Current environmental issues are deforestation, soil erosion, endangered wildlife due to urbanization and increased pollution and threats to freshwater due to industrial waste and sewage runoff. With a strategic location in the Indian Ocean, Sri Lanka has the potential to become an industrialized nation. In 1978, Sri Lanka implemented an "open market" economic policy, which had significant impact in changing the shape of the economy. Though plantation crops were 93% of exports in 1970, they decreased to 20% in 1996; in that year, textiles and garments accounted for 63% of exports. Thus, Sri Lanka's most dynamic industries are food processing, textiles and apparel, food and beverages, telecommunications, and insurance and banking.

While gross domestic product (GDP) grew at an annual rate of 5.5% in the early 1990s due to drought and deteriorating security condition, it declined to 3.8% in 1996. Economy comprises of agriculture 21%, industries 19%, and services 60% (1998). Population below poverty line is 22% (1997). Unemployment rate is 9.5% (1998). As a developing nation, Sri Lanka's

per capita GDP is \$856 US (2000). Five to six percent of GDP goes for military expenses. The economic conditions in Sri Lanka deteriorated rapidly during the last five decades after Independence on February 4, 1948. Before the current ethnic conflict, for many years, Sri Lanka was regarded as a model for development. In 1977, the United Nations (UN) development report scored Sri Lanka as a seven out of ten.

During the last two decades, in particular, Sri Lanka has been struggling hard to survive by facing one of the most feared separatist movements in history costing both human lives and material resources which can be efficiently used for Sri Lanka's economic development. The ethnic conflict between Sinhalese and Tamils has drawn the country backward economically and damaged all aspects of human life threatening to destroy civil society, social structures and harmony on local, regional, and national scales. The most serious hurdle for Sri Lanka's development today is the worst natural disaster, the Tsunami Tidal Waves of December 26, 2004. The tsunami killed nearly forty thousand people, displacing another two hundred thousand and seriously damaging over five hundred miles in coastal areas. This brutal destruction of the livelihood of an already impoverished nation will slow down the development in the years to come.

However, Sri Lanka has some important human resources that are not adequately used for effective development. Literacy rate is 90.2% (male 93.4% and female 87.2%), one of the highest in Asia, second only to Japan, Korea, and Singapore; school enrollment rate is 90% for elementary, 70% for secondary. Sri Lanka has a nationalized higher education system with more than seven national universities where education is free of charge. Three languages—Sinhala, Tamil, and English—are widely used in daily transactions in official business and language of instruction in schools and universities are Sinhala and Tamil. Ten percent of the population speaks English competently. Sri Lanka's life expectancy is seventy-two years; infant mortality rate is 16.5 persons per 1,000. As a social welfare state, Sri Lanka provides basic health-care for 93% of the population.

In terms of female participation in politics, economic development, and social welfare, Sri Lanka has made a remarkable progress. Women have been active in politics and made a mark in world politics. In July 1960, Mrs. Sirimavo R.D. Bandaranaike (1916–2000), widow of Mr. S.W.R.D. Bandaranaike (1899–1959), became the Prime Minister of Sri Lanka becoming the first female to hold such a post. In terms of rural development, Sarvodaya Sramadana Movement (f. 1958) of A.T. Ariyaratne, inspired by Buddhist values, has made a remarkable success. Also the Gam Udava (Village Awakening) Project of

President R. Premadasa (d. 1993) has made a significant contribution for village development.

Important changes that occurred in Sri Lankan politics after 1956 had serious implications on the development of the country. The “Sinhala only” language policy of Mr. Bandaranaike’s government in the late 1950s devastated national harmony, alienating moderate Tamils from the political process by encouraging them to seek alternative solutions to their problems. Party politics with limited vision abused national sensibilities of Sinhalese, Tamils, and Muslims, feeding into a great sense of insecurity, unrest, and distrust towards each other. The decline of the economy had severe impact in intensifying growing distrust among ethnic groups leading to violent and militant armed groups. Growing unrest among the youth expressed by Janatha Vimukti Peramuna in 1971 and later by Tamil youth groups demonstrate that economic conditions are roots of the current civil strife in Sri Lanka. Complicating the unforeseen consequences of ethnic unrest, Sri Lanka has failed to foster harmony among various ethnic and religious minorities who consider Sri Lanka as their home.

In achieving Sri Lanka’s economic objectives for development, Sri Lanka’s burden is seeking resources and strategies in building trust and respect towards each ethnic and religious minorities who live in the island and encouraging them to share country’s resources on an egalitarian basis.

## ST. CHRISTOPHER AND NEVIS

The islands of St. Christopher (also known as St. Kitts) and Nevis, which are part of the Leeward

Islands, are geographically mountainous and volcanic in origin. They are separated by a narrow strait 3.2 kilometers wide. St. Kitts, the larger of the two islands, is 168 square kilometers. It is oval-shaped with a small peninsula at its southeastern end. Mountains extend through the central part of the island. Mount Liamuiga, a dormant volcano with an elevation of 1,156 meters, is the highest point on the island. Nevis, which lies to the south of St. Kitts, is cone-shaped, ten kilometers wide and thirteen kilometers long, and has a total land area of ninety-three square kilometers. Nevis Peak is the highest point on the island at 965 meters. Nevis’s soil is less fertile than St. Kitts’s soil and has experienced much worse erosion. St. Kitts and Nevis was a founding member of the Organization of Eastern Caribbean States (OECS) in 1983. The Eastern Caribbean Central Bank is located in St. Kitts.

St. Kitts was the first English colony in the Caribbean. Although Christopher Columbus discovered the island in 1493, it was not settled by Europeans until 1623, when a party of Englishmen established a colony at Sandy Bay. In 1624, the French established a colony on the other side of the island. The French founded Basseterre, the capital, in 1627. Nevis was colonized in 1628 by a group of English colonists from St. Kitts. In 1713, the Treaty of Utrecht granted the entire island to the British. After furtive attempts at tobacco cultivation, sugar was introduced on both islands during the mid-seventeenth century. Slaves were imported from Africa to expand the sugar industry. The majority of the forty-five thousand people in St. Kitts and Nevis are descended from Africans.

Soil erosion caused by extensive sugar cultivation on Nevis convinced the British to replace large-scale sugar cultivation with small-scale subsistence agriculture on that island. During the colonial period, to simplify administrative tasks, the British attached the somewhat distant Anguilla to the colony of St. Kitts and Nevis. In 1958, the three-island group of St. Kitts-Nevis-Anguilla entered the West Indies Federation, which was dismantled in 1962. In 1967, the British government, which continued to control foreign affairs and national defense, granted St. Kitts-Nevis-Anguilla local autonomy. Anguilla immediately opted out of the association. St. Kitts and Nevis became independent on September 19, 1983. St. Kitts and Nevis supported the October 1983 US intervention in Grenada and dispatched a small force of police to participate in the Caribbean Peace Force on the island.

St. Lucia is a parliamentary democracy based on the British model. The head of state, Queen Elizabeth II, is represented by a governor—Cuthbert Sebastian—who is appointed by the British government. Since the governor’s power is primarily advisory and

ceremonial, real power is vested in the prime minister, who is usually the leader of the majority party in the National Assembly. The National Assembly is composed of eleven elected members (representatives) and three appointed members (senators). Two of the senators are appointed by the governor general on the advice of the prime minister. The other is named on the advice of the leader of the opposition.

The uniqueness of the 1983 Constitution derives from the provisions for the autonomy of the island of Nevis and the establishment of the separate Nevis Island Assembly. The island of Nevis elects representatives both to the National Assembly and to its own Nevis Island Assembly, a body of five elected and three appointed representatives. The Nevis Island Assembly may amend or revoke legislation passed by the National Assembly. At the time of independence, Nevis was also granted the right of secession. Secession from the nation requires a two-thirds vote in the Nevis Island Assembly and the approval of two-thirds of the voters in an island-wide referendum. The Nevis Island Assembly is led by a premier, a position analogous to a prime minister.

The Labour Party, organized by Robert Bradshaw in 1932, dominated the political system until 1979. By 1979, political opposition to the Labour Party had coalesced into two party groupings, the People's Action Movement (PAM) on St. Kitts, which supported economic diversification away from sugar and toward tourism, increased domestic food production, and increased autonomy for Nevis, and the Nevis Reformation Party (NRP) on Nevis. PAM and NRP, who had formed a coalition led by Kennedy Simmonds (b. 1936), came to power in 1979. The PAM/NRP coalition cleared the way for the independence of St. Kitts and Nevis as a two-island federation. The Labour Party, led by Denzil Douglas (b. 1953), returned to power in 1995.

In the mid-1980s, the government envisioned the economic future of St. Kitts and Nevis as dependent on tourism, light manufacturing, and a scaled-down sugar industry. To create a workforce to manage the country's tourist industry, the government invested heavily in the economic and social infrastructure of the nation. The result was an extensive road network, the Golden Rock International Airport that allowed for direct flights from the United States and Canada, and a deep-water port in Basseterre that allowed for an increase in the number of cruise ship calls. The government also encouraged labor-intensive export light manufacturing. Although the potential seemed great, the economy did not keep pace with the rapidly expanding population. As a result, nearly 20% of the population has left in search of employment. Remittances to family members at home became a

substantial portion of the national economy. In addition, natural disasters, such as hurricanes, and man-made disasters, such as the events of September 11, 2001, have impeded the growth of the tourist industry.

### ST. HELENA

St. Helena is one of the United Kingdom's few remaining overseas territories and one of the world's most isolated island settlements. A lone mid-ocean island, volcanic in origin, and a mere 122 square kilometers in size, St. Helena is situated at Latitude 15°55' S and Longitude 5°45' W, 1,930 kilometers west of Angola, its nearest mainland. The nearest land is Ascension Island, 1,125 kilometers away. St. Helena is surrounded by steep cliffs and has a central ridge which reaches 818 meters above sea level. The only inland waters are small streams which are fed by springs in the central hills. Two-thirds of the island is now barren. The vegetation below four hundred meters is very scanty and consists largely of cactus. Above that level, the island consists mostly of pasture, introduced pine forests, and now disused plantations of New Zealand flax. There is little arable land.

St. Helena was uninhabited when it was discovered by the Portuguese in about 1502 and was only settled and fortified by the London East India Company in 1659. The Company's proprietorship of the island continued until April 1834, when St. Helena was vested in the Crown by the Government of India Act 1833. The island has been a British territory ever since. St. Helena's present day community, which is wholly British in character, has its origins in the East India Company's seventeenth century settlement, which consisted of English settlers and an increasing number of slaves, from West Africa initially, but

predominantly from the Indian subcontinent and from Madagascar. By 1718, the island's population amounted to 542 whites (including a garrison of 128) and 411 slaves. The population continued to increase gradually, although the importation of slaves was made illegal in 1792, and slavery was finally abolished in 1832. Immigration to St. Helena had largely come to an end by the 1830s, a period followed by the gradual and by now complete integration of the island's various ethnic groups. The island's population peaked at 5,838 in 1871, but economic depression led to the emigration of more than two thousand St. Helenians to the Cape and to Natal. By 1901, St. Helena's population had sunk to 3,342. At the last census in 1998, St. Helena's resident population numbered 4,916 (including expatriates), of whom over eight hundred lived in the capital Jamestown. In 2004, the population was estimated to have declined to around four thousand, emigration having been boosted by the islander's re-acquisition of the right to full UK passports, as provided for by the British Overseas Territories Act 2002 (the automatic right of entry into the United Kingdom had been lost by St. Helenians under the Commonwealth Immigrants Act 1962).

Under the proprietorship of the East India Company, St. Helena was administered by a governor and council appointed by the Company, a system continued after St. Helena came under the control of Her Majesty's (HM) Government. The first non-official members were introduced onto the council in 1878, and a separate advisory council was formed in 1939. This new council allowed for a small element of popular representation, a measure which was enlarged by reforms in 1956. In 1963, the island's first general elections to a newly constituted advisory council took place. This council was reconstituted as a legislative council in 1966. The island's 1988 constitution enhanced the responsibilities of the legislative council and today both the legislative and the executive council have a majority of non-official members. Island politics is marked by personalities, rather than parties; and there are no unions. Authority over the island is ultimately vested in Her Majesty, while the island's executive authority rests with the governor in council, the latter composed of ex-officio members as well as the elected heads of legislative council committees. A new constitution introducing a ministerial system of government is currently being considered. The governor retains a number of reserved powers, primarily with respect to defence, external affairs, internal security, justice, finance, and shipping. There have certainly never been any moves towards independence from the United Kingdom and if anything, there has been a desire for a closer integration with "the mother country."

St. Helena had originally been intended to serve as a maritime base, rather than as a colony, and its economy was never geared towards self-sufficiency. During the proprietorship of the East India Company and during most of the nineteenth century, the island's economy revolved around the provision of supplies for shipping and for the local garrison. In 1802, a total of 169 ships called at the island, and this figure had risen to 1,044 ships in 1860. Partly due to the advent of steam, the number of visiting ships began to decline in the decade prior to the opening of the Suez Canal (850 ships in 1865), which led to the eventual collapse in shipping by 1910, when a mere fifty-one ships called at the island. This also resulted in the collapse of the island's economy. The establishment of a flax industry, started in earnest in 1907, went a considerable way towards easing unemployment and increasing local revenue in the early half of the twentieth century. But this new industry in turn declined and its last mills closed during the 1960s. Since then the island has had virtually no industry of its own, and is nowadays largely dependent on aid from the United Kingdom. In 2004/2005 this amounted to a grant-in-aid of £5.66 million out of an expenditure of £18.56 million. In addition the island received a shipping subsidy (£2.45 million), development aid (£1.9 million), and technical co-operation (£2.53 million), accounting for a total of £12.56 million in aid. The island's gross domestic product (GDP) for 2002–2003 amounted to £3,076 per capita. In the same period, exports of goods and services amounted to a 7% of GDP, while imports amounted to 76% of GDP. The island's only major export is fish, although a promising new industry is coffee, which has been exported in small quantities since 1989. While the majority of St. Helena's labour force (62% in 1998) are employed by government and its agencies on the island itself, over 1,200 islanders work off-shore, primarily on Ascension Island and the Falkland Islands. 12.7% of the labour force were unemployed in 2001–2002. Educational provision is well developed on St. Helena, which in 1998 had a literacy rate of 98% (population twelve years and older), although there is no local provision for higher/further education. For islanders with overseas qualifications, local wages (especially when compared to wages paid to expatriates) provide little incentive to return to the island. The average life expectancy is seventy-five years, with infant mortality (under five years) a low 0.3%.

Improvements in transport links are now seen as they key to improvements in St. Helena's economy, which suffers, as in the sixteenth century, from the fact that the island's only transport link with the outside world is by ship. The island's London registered RMS

*St. Helena*, a purpose built cargo/passenger vessel of 6,767 tonnes, travels at regular intervals between St. Helena and South Africa (via Namibia). There has never been an airstrip on the island, but plans to construct one have been under serious consideration since the 1990s. It is hoped that an airport will solve some of the difficulties of access which have prevented the development of a larger scale tourist industry, in turn providing local employment and reducing emigration, while providing a more efficient link with the island for those St. Helenians who do work off-shore.

## ST. LUCIA

St. Lucia, which is located roughly in the center of the Windward Islands, lies between Martinique to the north and St. Vincent and the Grenadines to the south. The pear-shaped island is 616 square kilometers and is a typical Windward Island formation of volcanic rock. The island is dominated by high peaks and rain forests in the interior and has a 158 kilometer coastline of sandy beaches. The highest point on the island is Mount Gimie, which is 950 meters above sea level. St. Lucia is also known for its natural deep-water harbors. Castries, the capital city where about one-third of the population lives, is located on the north-west coast and has an excellent natural harbor. The island is named in honor of St. Lucy, the patron saint of blindness and one of the major saints in the Catholic canon. St. Lucia was a founding member of the Organization of Eastern Caribbean States (OECS) in 1983. St. Lucia is also the headquarters of the Eastern Caribbean Telecommunications Authority.

The Carib Indians inhabited the island when it was first sighted by Spanish explorers during the early

sixteenth century. The Indians resisted British, French, and Dutch attempts at colonization until the seventeenth century. The French, however, were able to establish the first permanent settlement on the island in 1660. Nevertheless, during the seventeenth and eighteenth centuries, the British and French fought over control of St. Lucia. Since the island's deep-water harbors afforded protection for naval vessels, control of St. Lucia changed hands fourteen different times during the eighteenth and early nineteenth centuries.

The British established absolute control in 1814 after they defeated Napoleon's armies in Europe. The majority of the island's inhabitants, however, were pro-French and the British government experienced decades of internal conflict before the people of St. Lucia accepted British rule. Although English is the official language and spoken by 80% of the population, the cultural footprint of the early French presence on the island is still evident. Many of St. Lucia's 160,000 people, especially those in rural areas, speak a French patois. In addition, over 90% of the people are Roman Catholics. In 1958, St. Lucia joined the West Indies Federation, which was dissolved in 1962 after Jamaica and Trinidad and Tobago withdrew from the association. In 1967, the British government, which continued to control foreign affairs and national defense, granted St. Lucia local autonomy. St. Lucia became independent on February 22, 1979. In 1983, St. Lucia sent members of its Special Services Unit into active duty in the 1983 US-sponsored invasion of Grenada.

St. Lucia is a parliamentary democracy based on the British model. The head of state, Queen Elizabeth II, is represented by a governor—Pearlette Louisy since 1997—who is appointed by the British government. Since the governor's power is primarily advisory and ceremonial, real power is vested in the prime minister, who is usually the leader of the majority party in the House of Assembly. The bicameral legislature in St. Lucia consists of the House of Assembly, whose seventeen members are elected for five year terms, and a Senate, whose eleven members are appointed by the governor after consultation with political, economic, and religious figures in society. Politics has been dominated by competition between the United Workers Party (UWP) and the St. Lucia Labor Party (SLP). John Compton, the former leader of the UWP, was premier of St. Lucia from 1964 until independence in 1979, when he became prime minister. Shortly after independence, the SLP took control of the House of Assembly. Compton returned to power in 1982 and remained the prime minister until his resignation in 1996. The SLP won an overwhelming majority in the House of Assembly in 1997 and

Kenny Anthony became the prime minister. Anthony and the SLP won subsequent elections in 2001.

During the colonial period, St. Lucia's economy was dominated by sugar production. The importation of African slaves stimulated sugar production and transformed the ethnic composition of the island. Over 90% of St. Lucia's people are descendants of African slaves. During the 1960s, the economy was dramatically transformed from a sugar-based economy to one dedicated to banana production. This transformation initially improved the economic situation of small farmers because banana crops could be produced on small plots. During the 1990s, however, as the Europeans implemented more restrictive trade policies, St. Lucia, faced with declining revenues from banana exports, began to implement a long-term economic development program based on a diversified economy. Particularly ominous for the people of St. Lucia was the European Union's plan to end preferential access to its markets by St. Lucia's bananas by 2006.

Although agriculture is still an important component of the national economy, St. Lucia has made significant gains in developing the manufacturing sector and attracting a greater portion of the West Indies' tourist trade. As of 2004, St. Lucia's manufacturing sector is the most diverse in the Eastern Caribbean. Small-scale manufacturing has benefitted from improvements in roads, sewage, communications, schools, and port facilities. The largest economic transformation has been the construction of a Caribbean Development Bank-funded petroleum storage and transshipment center. Despite a series of devastating hurricanes, the tourist industry continued to grow until the terrorist attacks of September 11, 2001.

## ST. VINCENT AND THE GRENADINES

St. Vincent and the Grenadines, a federation of thirty-two islands in the Windward Islands, lies between St. Lucia to the north and Grenada to the south. St. Vincent occupies 344 square kilometers of the nation's total territory. The Grenadines, a collection of islands between St. Vincent and Grenada, comprise the remaining forty-five square kilometers of the nation's territory. The most notable islands in the Grenadines are Bequia, Baliceaux, Mustique, Petit Mustique, Savan, Petit Canouan, Canouan, Mayreau, Tobago Cays, Union Island, and Petit St. Vincent. Kingston, the capital, is located on St. Vincent. St. Vincent and the Grenadines were founding members of the Organization of Eastern Caribbean States (OECS) in 1983.

The Carib Indians on St. Vincent resisted European conquest until the eighteenth century. Runaway African slaves from St. Lucia and Grenada frequently sought refuge on St. Vincent. The Carib Indians not only gave the runaway slaves shelter, they also intermarried with the blacks, which created a large population of zambos known in St. Vincent as the Black Caribs. Nevertheless, by the 1720s, the French had established settlements on St. Vincent and were using slave labor to grow sugar, cotton, and tobacco. After France lost the French and Indian War in 1763, St. Vincent was ceded to the British. Although St. Vincent was returned to France in 1779, the British resumed authority in 1783.

Whereas the French had been conciliatory towards the Black Caribs, the British were intent on crushing dissent. Following a Black Carib revolt in 1796, the British deported five thousand Black Caribs to Roatan Island off the coast of Honduras. Nevertheless, the French colonial footprint is still evident. Although the country's official language is English and most of the people speak English, a French patois is still spoken in the rural areas of some of the Grenadine Islands. The British abolished slavery in St. Vincent in 1834. To address the resulting labor shortage, the British encouraged the immigration of Portuguese and East Indians during the nineteenth century. In an attempt to establish a unified administration in the eastern Caribbean, in 1958, the British placed St. Vincent and the Grenadines in the West Indies Federation, which was dissolved in 1962 after Jamaica and Trinidad and Tobago withdrew from the association. In 1967, the British government, which continued to control foreign affairs and national defense, granted St. Vincent and the Grenadines local autonomy. St. Vincent and the Grenadines became independent on October 27, 1979, the last of the Windward Islands to gain independence from the United Kingdom.

St. Vincent and the Grenadines is a parliamentary democracy based on the British model. The head of state, Queen Elizabeth II, is represented by a governor—Fredrick Ballantyne—who is appointed by the British government. Since the governor's power is primarily advisory and ceremonial, real power is vested in the prime minister, who is usually the leader of the majority party in the House of Assembly. The legislature in St. Vincent and the Grenadines consists of fifteen elected representatives and six appointed senators. The six senators are appointed by the governor, four on the advice of the prime minister, and two on the advice of the leader of the opposition. The parliamentary term in office is five years, although the prime minister can call elections earlier.

Politics has been dominated by competition between the St. Vincent Labour Party (SVLP) and the New Democratic Party (NDP). SVLP Prime Minister R. Milton Cato led the nation to independence and held power until 1984. In September 1979, militant Rastafarians led by Lennox Charles seized Union Island. Cato requested military assistance from Barbados, which sent detachments of the Barbados Defense Force to capture the insurgents and restore order. NDP Prime Minister James Mitchell held power from 1984 until 2001. In 2001, a revised labor party called the United Labour Party (ULP) took power under Ralph Gonsalves (b. 1945).

St. Vincent's economy is heavily dependent on agriculture. Bananas account for over 50% of the nation's exports. In April 1979, La Soufriere volcano erupted and there was extensive agricultural damage. Hurricanes have also devastated banana plantations. Dependence on a single crop export-led economy has made the nation's economy vulnerable to external factors. Particularly ominous for the people of St. Vincent and the Grenadines is the European Union's plan to end preferential access to its markets by 2006. During the 1980s, therefore, the government encouraged the development of the tourist industry. During the 1990s, tourism replaced banana exports as the chief source of foreign exchange. The Grenadines have become especially popular with yachtsmen. Affordable boat trips within the Grenadines have also increased the number of visitors per year. New cruise ship berths helped to increase the number of tourists to over two hundred thousand annually by 2000. Nevertheless, because of a high birth rate, unemployment, and the negative impact of the events of September 11, 2001, on the tourist industry, thousands of people have emigrated in search of employment.

## **STALIN, JOSEPH**

"Joseph Stalin" was the byname of Josef Vissarionovich Dzhugashvili (born December 21 [9 December, old style], 1879, Gori, Georgia, Russia). Born into poverty, Stalin trained to become an Orthodox priest. In 1900, after leaving the priesthood training due to his communist/atheist beliefs, he joined the Russian revolutionar and earned his name, Stalin ("man of steel" in Russian), by supervising and committing violent acts against the Czarist government.

In 1922, with the support of Vladimir Lenin, he became the secretary general of the communist party. By 1924, Stalin with Bukharin's assistance had contaminated most state documents with fraudulent and revisionist information. After Lenin's death, Stalin formed an unofficial "triumvirate" (himself, Zinoviev, and Kamenev) to control the fledgling communist state. Throughout the mid-1920s, he struggled with numerous political rivals but emerged as the Soviet Union's undisputed leader by 1928. He controlled the population through fear, repressing any dissent through systematic purges, which included imprisonment and executions. His harsh regime and cult of personality soon made communism synonymous with totalitarianism.

Stalin's approach to foreign policy was largely influenced by Zinoviev and Kamenev who advocated "one-state socialism." Under this theory, the Soviet Union would serve as a successful global model of socialism, helping to covertly promote and control satellite regimes. Instead of launching outright revolutionary activities, internal workers' movements were promoted with the assistance of Stalin's secret police and KGB global network. This tactic spurred revolutions against capitalism in Latin America, Africa, and Asia.

The 1939 Molotov-Ribbentrop Non-Aggression Pact briefly allied Stalin with Hitler until the 1941 German invasion. Stalin then switched alliances and awkwardly cooperated with the United States and Great Britain until the defeat of Germany and Japan in 1945. After the war, Stalin's determination to control all occupied lands with communist governments created the Cold War struggle.

Considered the father of the Soviet Union, of which he declared himself General Secretary in 1941, Stalin's greatest achievement, other than defeating Nazi Germany, was rapid industrialization and the construction of an elaborate infrastructure. However, Stalin's impact on the Soviet Union was often profoundly negative: disastrous agricultural reforms that resulted in the starvation of millions; highly mechanized five-year plans that created massive shortages and surpluses of goods; and an enormous network of military, paramilitary, police and secret police networks that eventually consumed over half of the country's gross domestic product.

Though Stalin claimed to be a devout communist, he consistently ignored ideology in his operational concerns. He shifted alliances within the party based on the advantage they would give him. While his rivals were consumed with debate and theories, Stalin focused on the practical matters of expanding and accumulating power. Stalin's quest for power fueled his paranoia, which caused numerous disruptions in the Soviet hierarchy. This included the expulsion, forced exile, and eventual assassination of arch-rival Trotsky in 1940, who was writing a book to expose Stalin as a fraud of communism.

Whether in peace or war, civil liberties were few. During Stalin's roughly thirty years of control, 40–50 million Soviets died due to war and political purges in the 1930s and again in the early 1950s.

Though more Russians died in World War II than any other nationality, the country emerged as the world's second strongest power. Stalin exhibited shrewd diplomatic skills in the allied conferences (Tehran, Yalta, and Potsdam) which resulted in substantial territorial concessions in Eastern Europe and North Korea.

Stalin died in Moscow on March 5, 1953.

## STATE-DIRECTED ECONOMY

Mainly characteristic of the socialist Marxist model, a state-directed economy signifies an economy where production—distribution of the products, prices, output, export-import structure and volume, wages, allocation of resources—are determined by the state, an administrative body through its government, commissions, and public bodies. In almost every country there is some government intervention in the economy—voluntarily or involuntarily—through the tax system, tariffs and non tariff barriers to international trade, credit rationing, subsidies, and separate fiscal and economic regimes for state and private companies.

In its purest form, a state directed economy is the opposite of a free market economy. Production is determined through comprehensive countrywide sectoral and synthetic plans, both for the short term (one to five years) and for the long term in the form of general directives forming a kind of “strategy.” Thus the supply of each product or at least the significant commodities are planned; however, the statistics upon which the planning is based can be unreliable, since there is a tendency to inflate results for the sake of producing growth at the forecasted rate. The central planners also fix the wages and the prices and thus determine the demand for each product, though this is usually not done via any sort of market analysis. By fixing the price of consumer necessities and all other commodities produced by the state, the standards of living can be determined and maintained for long time if shortages do not occur. But it is difficult to plan accurate with so many variables and unknown data.

While consumption of individuals can be forecasted with a margin of error, the consumption of state enterprises is much more difficult to foresee. For an economy to function smoothly, all companies must meet the planned output, costs, and revenues. If the economy is not closed, the fluctuations of supply and demand and prices on the world market will wreak havoc in the raw material and energy supply of the production.

Shortages occurring in a chain can be alleviated by fixing prices of high-demand commodities at high levels, since there are no markets to serve as alternate suppliers. Rationing is done via regulating the delivery of the commodity in question or imposition of administrative barriers for the purchase of that commodity.

The labor market can also be planned: the state will determine how many specialists the work force needs in various sectors, and thus the composition and education level of the work force is determined in advance, according to the economy's needs. This makes a rigid labor force structure which cannot adapt easily to new plans or circumstances.

Changing demands of the world market require readjusting the qualifications structure, including provisions for retraining adults in different fields to keep the economy competitive. Of course, this planning policy creates shortages in certain professions and produces excess number of graduates from others. On the other hand, the employees benefit when education costs are supported by the state; in market economies, such training puts a heavy burden on the individuals' financial and time budgets.

By fixing wages, the state establishes a job hierarchy which reflects the social cost of producing a certain professional and the social importance of his activity. This isn't much reflected in income level differences due to egalitarian policies. Similar salary levels achieve a equitable income distribution, since the basic needs of most people are the same. The central planner may efficiently use the human resources of the society by practically eliminating unemployment and securing everybody a source of income. Thus the use of resources becomes more efficient on a social scale than it would be under purely market considerations. For increasing productivity, more flexible approaches allow for performance-related wage systems and the functioning of market mechanisms in the nonessential goods markets, keeping fixed prices at least for necessities such as food, housing, and energy.

Most of the state directed economies of the developing world have relied on the Solow model of economic growth, favoring accumulation of physical capital, namely industrialization, and using a high savings ratio necessary for large-scale industrial, social, and transportation infrastructure. These planners generally favored the primary and secondary sector, neglecting the tertiary, and became less competitive entering the actual post-industrial phase. Low levels of consumption led to the neglecting of the domestic markets' demand, while the countries found themselves with superfluous industrial capacities both in mining and processing. In spite of their decade-long efforts these economies couldn't reach their steady

state with optimal consumption because of over-investment on one hand and under-consumption on the other.

Another consequence of the fixed price system and non profit orientation of the companies was that even high-performing companies were not allowed to retain their profits and begin the necessary microeconomic investment for increasing productivity and competitiveness. Profits were redistributed among companies with net losses, regardless of whether the loss occurred because the nature of the company's activity was unprofitable, or because the company was mismanaged. Thus, funds were often regularly given to institutions that did not manage them well, and hence lowered productivity even further. In the early 1990s, privatization of the enterprises seemed to be the only solution for the sake of increasing efficiency, productivity inside the firms and competitiveness on the markets.

#### STROESSNER, ALFREDO

Alfredo Stroessner, president of Paraguay from 1954–1989, was born to German immigrant parents in Encarnación, Paraguay on November 3, 1912. He entered the Paraguayan military academy in 1929 and fought in the Chaco War from 1932–1935. He was promoted to major and studied in Brazil in 1940 and then given command of a main artillery unit followed by an assignment to army staff headquarters. He defended Paraguay's capital, Asunción, during the 1947 civil war and became the head of the army in

1951. In 1954, he ousted the sitting president and assumed the office himself. He was re-elected seven times between 1954–1989.

Stroessner presided over one of the longest military dictatorships in Latin American history. Other than rhetorical attention, no effective emphasis was given to social or economic development.

The regime managed the country via the force of the military and the network of the historic, conservative party, the Colorado. Military brutality and political repression were justified based on allegations of threats to national security from communist and leftist subversion.

Paraguay has always been among the poorest countries of the world, with vast social divides between rich and poor. A small elite of Spanish, or other European, descent has held most of the property and assets of the country. It continued to do so under Stroessner with an economy of export agriculture and nascent, elementary industry. The majority of the population, as today, was Guaraní Indian or *mestizo*, people of mixed native and European blood. Even though the majority of Paraguayans spoke Guaraní as their native or first language, this population was marginalized. Any expression of dissatisfaction or criticism by the native or *mestizo* population or by an opposition politician was brutally repressed, the country kept under a stage of siege. Seven presidential elections were staged that dutifully returned Stroessner to power.

Stroessner's power was initially based on his reputation as a military hero beginning in the Chaco War, between Paraguay and Bolivia during the 1930s. He built upon that base, once in the presidency, by regularly purging disloyal officers. He strengthened his hold over the Colorado Party by allowing its many bickering factions to fight among themselves. They progressively eliminated each other and he remained the dominant, stable power. Dominance of the party gave him a massive organization for control of civilian and political life.

The Stroessner regime did not aim to destroy the existing political and/or socioeconomic power structure. Rather, it sought to reinforce it under the control of one man. The fervid anti-Communism of the regime at a time when Marxists such as Cheddi Jagan in British Guyana and Fidel Castro in Cuba were emerging in the region earned Stroessner the support of the United States. Stroessner tolerated widespread illegal activities by military and political leaders and encouraged foreign investment.

He obtained some significant rural support by enticing peasants to move to the northeast of the country with the promise of free public land. These agricultural settlements considerably increased the country's agricultural production and exports yet at

the same time subjected settlers to the uncertainties of world commodities markets.

The highpoint of the Stroessner regime occurred in 1982 with the inauguration of the Itaipú Dam. Built in conjunction with Brazil on the Paraná River, the boundary between the two countries, the mammoth dam was able to supply electricity to all of Paraguay. However, the country was too underdeveloped to use so much energy. The Stroessner regime profited by selling most of it back to the dynamic industrial sector in southern Brazil.

The stagnation of the Paraguayan economy, accompanied by inflation and unemployment, and relentless repression, prompted the military to remove from office in 1989. He was exiled to Brazil, and resides in Brasília.

## STRUCTURAL ADJUSTMENT PROGRAMS (SAPS)

Developing or emerging market economies may be faced with economic instability in the form of either or both external and internal imbalance. The former is manifested in a balance of payments crisis, a falling currency and unsustainable foreign debt obligations. The latter may involve a stagnant or declining economy, high inflation, and large government budget deficits. In these circumstances, member countries may look for financial support from the world's two

main multilateral aid and financial institutions, the World Bank and the International Monetary Fund.

The World Bank consults and lends money for a range of sectoral activities including agriculture, energy, transportation, education, health and nutrition, and urban development. It also focuses on improving economic policies within individual countries. A significant part of its lending is for structural adjustment: to support reforms rather than specific investments. The International Monetary Fund allows member countries to borrow, subject to agreed-upon conditions regarding their economic policies. Adherence to these conditions and reforms is in many cases a prerequisite to obtaining other larger public and private loans.

A SAP provides loans to countries on the condition that they undertake a combination of economic policy reforms measures aimed to improve long-term economic growth outcomes. These programs links disbursements of funds to the meeting of specified conditions (performance criteria) negotiated with the government of the member country. While these programs are often negotiated in the context of economic crisis, and attempt to restore balance of payments viability and macroeconomic stability, they are geared to increasing international competitiveness and improved economic efficiency in the use of domestic resources. Recently, these programs, which frequently involve some combination of higher interest rates, government spending cuts and higher taxes, and the abolition of various subsidies on consumption items have provoked criticism as having negative effects on populations who are already economically and socially disadvantaged. Additionally, environmentalists have objected to the conditions in which natural resources are exploited to meet the productivity and export quotas.

The SAPs often include trade liberalization measures that require fewer restrictions on foreign trade. These include reducing or abolishing tariffs and quotas on imports, a less restrictive stance towards foreign investment, an adjusted exchange rate, and capital account liberalization that reduces controls on any form of capital flows across national boundaries. The internal market-oriented structural reforms promote deregulation of domestic markets and the privatization of government enterprises.

### **The Effectiveness of Structural Adjustment Programs**

The effectiveness of SAPs is a hotly debated issue. One issue relates to the speed of the structural

adjustment required. Should all of these policies be implemented immediately or only gradually? Many economists argue that what is needed are gradual reforms to minimise short-term costs, such as business failure and unemployment. Others argue that the most serious problem with a market liberalisation program is the political resistance that it generates, as the long-term benefits can be difficult to perceive while the short-term costs are all too apparent. Hence the longer the delay, the greater the political opposition to further reform that will arise. In addition, many of the structural reforms implemented may be reversed once the program is over. If the liberalisation measures are expected to be reversed in time, then the government or the public may actually take steps that will undermine the effectiveness of the reform program.

A second issue relates to the sequencing of structural reforms. Many commentators point to the crucial role of foreign capital inflow during the structural reform period to reduce the frictions that will emerge during the transition. However, it may be preferable that controls on foreign capital only be relaxed after trade and other industrial sector distortions have been dismantled. The reason for this is that capital inflow will result in a real exchange rate appreciation that disadvantages exporters. Meanwhile, the tariff reductions will disadvantage domestic producers facing lower-priced imports.

There is also considerable disagreement on the benefits of trade liberalization policies. Have trade liberalisation packages played an important role in the strong performance of outward-oriented economies? A number of countries, such as Japan, Korea, Singapore, and Taiwan have promoted exports but in an environment where imports had not been fully liberalised. The success of the East Asian countries with export-led growth suggests that some selectively determined degree of government intervention played a key role.

Privatization strategies have also been questioned, particularly in the transitional economies of Eastern Europe. Public assets may be sold off below their real value in order to find a buyer and to generate quick cash flow, with a loss of public accountability. Privatization might then mean that income-generating assets are sold, leaving behind all the residual 'unproductive' activities, plus a new layer of watchdog agencies to regulate the newly privatized activities.

Many of these issues have been examined empirically but the results are mixed on the SAPs overall effectiveness. Often the results depend on the characteristics of the specific country concerned. Countries have generated a variety of responses to basically similar SAPs. This seems to reflect the importance of

differences in institutional, social, and historical conditions between countries. In the context of the 1997 Asian Crisis further debate has escalated on the effectiveness of SAPs, particularly the financial deregulation requirements. The impacts of SAPs on social sectors and the poor have been particularly troublesome and the IMF and World Bank are attempting to incorporate social safety nets into their programs.

## SUBSISTENCE LIVING

The seemingly infinite *ways by which human beings could make a living*, especially food acquisition and satisfaction of basic needs such as clothing and shelter, can actually be narrowed down to four basic types: *foraging*, *horticulture*, *pastoralism*, and *agriculture*. It is important to recognize that variation exists within each of these subsistence patterns; thus, the characteristics that are identified for each should be regarded as tendencies, not absolutes.

### Foraging

Foragers rely entirely on *wild food sources*—plants, animals, and fish. Contemporary (and presumably prehistoric) foragers live(d) in small, kin-based nomadic groups called *bands*. Social organization tends toward fluidity and flexibility, as the band size, location and composition are adjusted to both variation in food sources and also social factors such as interpersonal tensions. Resources are freely shared with other group members, an exchange pattern known as *generalized reciprocity* (Sahlins 1972). While

not completely equal, nonetheless foraging groups tend to be the most *egalitarian* societies known cross-culturally (Friedl 1978; Kent 1993).

Division of labor is minimal and usually based loosely upon gender, with men usually doing most of the hunting and women performing the bulk of the gathering. Valued though meat is, it is gathering of plant foods (especially among tropical foragers) that usually provide a larger portion of the diet than hunting (Lee 1992). This is one of the reasons why today the alternative term, *hunting and gathering*, is little used to describe this mode of subsistence.

Long presumed to be an excessively harsh lifestyle, in recent decades foraging has been reassessed by anthropologists (Lee and DeVore 1968). It appears that members of many foraging groups work fewer hours per day/week and have greater amounts of leisure time persons living in agricultural and/or industrial societies. Foragers today are usually found in areas of marginal agricultural potential, e.g., deserts and semi-deserts, arctic regions, and tropical rainforests, often as a result of having been pushed there over time by larger, more powerful societies. A corollary is that contemporary foragers, such as the *San* of Southern Africa, are *not* Stone Age relics; rather, they are modern humans who have been interacting with members of other societies for long periods of time (Gordon 1992).

The coming of the *Neolithic* ("New Stone Age") roughly ten thousand years ago saw humans gradually domesticate certain wild plant and animal species. This seemingly modest development eventually triggered massive changes in human settlement patterns, division of labor, social stratification, as well as political and religious organization (Diamond 1987). The production of surplus permitted some individuals to specialize in non-food producing tasks, including religious and political leadership (Harris 1989).

### Pastoralism

Pastoralism entails subsistence reliance on *domesticated herd animals*, with variation in the species kept depending upon environment. Normally herds will be comprised of mixed species, as different varieties of animals contribute different products and often utilize different sources of forage. Although pastoralism is frequently combined with small-scale cultivation, ideologically animal husbandry is considered to be preferable. If pastoralists do not themselves cultivate crops, then invariably they trade animal products for foodstuffs such as cereals, as well as non-food necessities such as domestic goods or clothing. The Middle

Eastern *Bedouin* and East African *Maasai* are prime examples. Like foraging, pastoralism normally involves a high degree of *mobility* and it too is usually found in areas of marginal agricultural potential, that is, those which are too dry or too high for farming, such as deserts and mountainous areas of the Middle East, savannas of Eastern and Southern Africa, and parts of the Himalayas. In mountainous areas, such as major portions of Iran and Iraq, it usually consists of seasonal vertical migrations, a pattern designated as *transhumance*.

## Horticulture

Though in popular usage it usually connotes flower gardening, in terms of subsistence patterns this term refers to *non-intensive crop production* without the use of animal or chemical fertilizers, irrigation, draft animals, or mechanization. Tools are relatively simple (for example, digging sticks, hoes, machetes) and the primary goal is *food production for self sufficiency*. Horticulture usually relies on the use of *slash and burn techniques*, both to clear land of natural vegetation and enhance soil fertility in the form of ash. Plots are typically intercropped, as multiple species are planted in the same field, for variable lengths of time, depending upon local conditions. These fields are then abandoned and this fallowing allows rejuvenation of natural vegetation. Horticulturalists have excellent knowledge of their environments, often making more taxonomic distinctions than scientists (Conklin 1954). Most often found in tropical forests, given the proper set of conditions—especially abundant land and relatively small populations—horticultural systems *can* be infinitely sustainable, contrary to their prevalent image as wasteful, destructive, and “primitive” practices (Reed 1997). Only recently, with disruption of traditional land-use practices and population controls among horticultural groups, in tandem with exogenous pressures (for example, the influx of urban settlers, cattle ranchers, loggers, and gold miners), have areas such as the Amazon Basin faced such dire threats as exist today.

## Agriculture

Agriculture involves *intensive, continuous use of land* for crop production, at least some of which is marketed. Agricultural intensification has been an ongoing process for thousands of years (Boserup 1965) and today a huge continuum of agricultural production

exists—from the smallholder peasant farms of Latin America, Africa, and Asia to the large, industrialized and commercial farms of Europe and North America. Since they are under almost continuous use, *agricultural fields must be fertilized*. While peasant farmers still tend to utilize animal fertilizer, commercial farmers depend heavily upon petroleum based chemicals for their fertilizers, as well as for pesticides and herbicides. Contrary to the intercropping typical of horticultural systems, with agricultural intensification, especially mechanized production, there is a distinct tendency toward *monocropping*. This is true even in time-tested systems such as the traditional wet-rice cultivation of Southeast Asia (for example, Vietnam and Thailand) and the Indonesian archipelago (Geertz 1963).

## SUDAN

Al-Jumhurriya as-Sudan—the Republic of Sudan—is one of the poorest countries of the world and is rife with ethnic and religious warfare, while social problems such as slavery and disease seriously restrict life expectancy and the possibilities for social and economic development. Life expectancy is low, at fifty-four for men and fifty-seven for women, while per capita gross national income (GNI) was estimated to be \$460 US in 2003.

## Geography and Climate

Sudan is located in north eastern Africa, at approximately 15° N and 30° E. It lies to the south of Egypt,

the west of Eritrea and Ethiopia, the north of Uganda and the east of Chad, among other neighbours. Sudan has a port on the Red Sea at Port Sudan and a large part of inhabited Sudan is located on the valley drained by the River Nile. There are few large settlements apart from the three cities of the capital of Khartoum, North Khartoum, and Omdurman. Regional cities are little more than towns and generally suffer from poor communications and infrastructure.

Sudan is a very large country, approximately the same size as western Europe, occupying some 2.5 million square kilometers. It links the Sahara Desert with the tropical rainforest far to the south. This area includes a wide variety of different types of terrain. Transportation and communications are very difficult on such a scale.

The population was estimated to be around 34 million in 1999, approximately 30% of whom live in urban areas.

### History

The first people to live in Sudan were Africans centred on what is now modern Khartoum, where contact was made with Egypt and other states. Sudanese created the Nubian empire in the north of the country and, with the introduction of the camel around 300 CE, navigation of the desert became possible and trade between African and Mediterranean states was greatly facilitated. In the sixth century, Christian missionaries entered the region and made conversions and built churches among the Nobatae and Beja people living in the north and east.

The Arab Conquest period saw a powerful Arab army invade the country to as far south as Dongola. However, the Arabs could not conquer the land and an arrangement was made to fix the border with Arab-controlled Egypt at its current location and a barrier posted to prevent cross-border movements. This arrangement enabled stability until the invasion of Sudan by Ottoman Egypt in 1820, which resulted in the conquest of a large tranche of the country. The successful occupation was repressive but succeeded in modernizing the country. Western pressure added to local Egyptian control ended some corruption and banned but did not stop the centuries' old practice of slavery.

Resentment of external control, especially the presence of Christian merchants and their importance, led to the emergence of the Mahdi, Muhammad Ahmed, who led a rebellion of religious nature aimed at sweeping away everything considered to be corrupt.

This rebellion led to the defeat of Anglo-Egyptian forces and the independence of Sudan. This did not last long before Anglo-Egyptian forces reconquered the country, ruling it according to a subsequently established Anglo-Egyptian Condominium. This regime aimed at suppressing rebellion and maintaining a light tax burden to avoid arousing more unrest. Nevertheless, nationalism erupted into a fresh revolt in 1924 which was crushed by the British who also took the occasion to expel Egyptian interests from the country, albeit temporarily. It was not until after WWII that British rule over Sudan was finally ended.

The early years of independent Sudan proved to be something of a disappointment to the people as parliamentary rule was insufficient to rid the country of entrenched interests or corruption. In 1958, a military coup brought a new administration that favoured the promotion of Islam and Arabic interests and the rejection of western ideals and indeed missionaries. This was deeply unpopular among the Christian and animist peoples of the south who have spent much of the time subsequently in revolt against government forces. Prosecuting military activities at a distance has proved very difficult for the government and the Sudan People's Liberation Army (SPLA) were able to achieve a number of important successes. However, ethnic differences remain of critical importance to many Sudanese and arming tribes with modern firearms has led to hugely increased loss of life.

### Government and Politics

The parliamentary democracy instituted by the British has fallen into disrepute as a result of military coup and autocratic control of government. Democracy and free speech throughout the country are severely curtailed by government censoring of all media. Poverty and poor communications mean few people have access to alternative sources of news and information. Parliament itself was suspended by presidential decree at the end of 1999. No elections have been held since 1996.

Sharia Law was imposed in 1989 after the military coup that brought Lieutenant-General Umar Hasan Ahmed al-Bashir to power. It calls for strong penalties for offences such as drinking alcohol, fornication, or criticizing Muslim institutions. This law is supported by the Arabic people of the north but alien to the traditions of many other people. As poverty and crime are deeply correlated, many poor people have fallen foul of the amputations required for theft and similar penalties that hugely reduce their future economic and social opportunities.

Resistance to government control in the south has been led by the Sudan People's Liberation Army (SPLA) under the leadership of John Garang, formerly a member of the national military force. The SPLA has received covert material support from the United States, which considers Sudan to be a supporter of terrorism, as the cruise missile strikes against the Al-Shifa pharmaceutical plant in 1998 demonstrated. There have been persistent attempts to link Sudan with the Osama Bin Laden–inspired al Qaeda network.

## **Economy and Industry**

Sudan has very little industry and much of its economy is based on subsistence agriculture, with some 80% of the labour force involved in agriculture. The lack of natural resources, especially potable water, and the harshness of much of the terrain mean that any form of production for exports is very difficult. One of the few exceptions is the breeding of camels which are sent to Arabia for use in racing. Other exports include basic agricultural commodities such as cotton. Philanthropic and charitable giving by Islamic societies and states has replaced the inflows of aid and investment that, in the 1970s, led to a large number of failed projects. A noticeable brain drain was stimulated by the demand for skilled labour in the oil-producing countries of the Persian Gulf and, until 1999, the reliance on imports of oil and many other basic commodities left the country at the mercy of market forces. However, the discovery of oil and the creation of an oil pipeline for exports, together with a program of structural adjustment have stabilized the economy to some extent. Nevertheless, national indebtedness remains a significant problem. So too is a general skilled labour shortage and low levels of literacy and education, especially among women.

## **Health Issues**

Most of the health problems associated with poverty and warfare affect Sudan. In addition, female health is significantly negatively affected by the practice of female circumcision among some peoples. This practice is disastrous for women's health and has a serious impact on reproduction. Cultural practices are instrumental in withholding health treatment for some categories of people, including some with mental health problems. For people living in the desert or jungles of the south, access to health care of any sort is

problematic. Government priorities for healthcare usually do not include older people.

Approximately 2.6% of the population is estimated to be HIV positive while other diseases include Ebola haemorrhagic fever, hepatitis E, shigellosis, and yellow fever. Many forms of foodborne and waterborne disease are considered to be endemic and chloroquine-resistant malaria is prevalent throughout the country.

Mental health is particularly poorly catered for and many healthcare professionals have left the country. Trauma and stress needs caused by warfare and slavery are not currently catered for and government intervention in non-governmental organization (NGO) work is reducing such development aid as reaches Sudan.

## **Ethnic Diversity**

The country is sharply divided between the Arabic people of the north, who are strongly Muslim in faith and mostly derive from nomadic tribes such as the Hadendowa and related Beja peoples, and the African peoples from mostly the south and the west. Fifty-two percent of the population are black, 39% are Arabs, and 6% Beja peoples. Some black African people are Muslims but dislike the Sharia laws, while many are Christians or animists. A wide range of diverse peoples has been placed in the same country for the purposes of administrative convenience on behalf of previously colonizing British. The diversity of peoples and beliefs make nation-building particularly difficult as few have a coherent image of Sudan as a unitary state or even any desire to belong to a larger social structure. The state itself appears to be predatory to many and, at the end of 2004, more evidence is emerging of state attacks on refugee camps inhabited by ethnic minority peoples.

## **Slavery**

Sudan suffers from a slavery trade that is one of the most persistent and pernicious in the world. Evidence suggests that the government itself colludes with slave raiders who capture people during attacks on communities of black Christians or animists or Muslims whose devotion is questioned. It is said that some seventy thousand people have been trafficked into forced labour and sex slavery by these means. The result has been to clear areas considered to be problematic, either because of resistance to the government

or because of proximity to the construction sites of the Greater Nile Oil Project.

## Darfur

The Region of Darfur in the west of Sudan has witnessed tensions for many years between the nomadic Arabs and the sedentary African farmers of the Mas-saleet, Zagawa, and Fur tribes. These have escalated in recent years and armed conflict was initiated by some who claimed the government was supporting the Arab people to the detriment of the black Sudanese. This has been followed by the emergence of the Janjaweed militia force, which has taken reprisals on the black peoples, riding into villages and towns on horses, camels, and vehicles, and engaging in rape, pillage, and slave-taking. It is argued by some that the Janjaweed are supported by members of the government. In any case, some seventy thousand people are believed to have been killed as a result of fighting in the region as of October 2004 and around 1.5 million have fled their homes, leading to a major humanitarian crisis. Aid efforts are being hampered by political considerations as the Sudanese government contends with the allegation made against it by NGOs of genocide.

## Prospects

The Sudanese government is being placed under continuing aggressive scrutiny as a result of its possible support of militia such as the Janjaweed in Darfur, its alleged support of or links with terrorism and its role in promoting slavery in the country. Until transparency is enforced on government actions, it seems unlikely that much progress will be made on developmental goals.

As the US-led "War on Terror" seems set to continue, Sudan would need to distance itself firmly from supposed support for terrorism in order to benefit fully from the international support it so badly needs.

## SUFISM

Sufism is the mystical and esoteric practice of the religion of Islam. It refers to a broad set of various different movements, some founded in antiquity, others of more modern vintage, but all of which trace their roots to the early establishment of the Islamic faith. Sufi orders are found throughout the Islamic world, representing all of the traditions of Islam, and have also been established among Muslims in Western nations.

The most likely origin of the term is in the Arabic word *suf*, meaning "wool," describing the woolen cloak worn by Muslim mystics during the seventh century. Sufis understand Muhammed to be to the originator of the tradition of Islamic mysticism, which was handed down directly and indirectly to several Sufi orders. The early successors Abu Bakr and Ali are said to have been Sufis, and their leadership led to the emergence of several important early Sufi practices laid down by Hasan al-Basri and his students in the eighth century. The movement declined as a result of opposition from religious authorities in the tenth and eleventh centuries by virtue of its perceived heterodoxy and openness to strong drink. It was reinvigorated in the works of Muhammed al-Ghazali (1059–1111), an Iranian scholar living in Baghdad, and Muhyi al-Din ibn al-Arabi (1165–1240), a Spanish scholar who completed his work in the city of Damascus. While these two are among the greatest authorities in the Sufi tradition, neither established his own unique order.

Since the twelfth century, Sufis have been loosely organized into orders called *turuq*, (paths, s. *tariqa*) founded by eminent leaders known as *walis* (saints) or *shaykhs* (leaders). The largest and most significant of these include the Qadiriya, the Rifa'iya, the Shadhiliya, the Mevleviya, the Naqshbandiya, and the Chishtiya. More modern *tariqas* include the Tijaniya, the Ahmadiya, the Sanusiya, and the Khatmiya.

Sufi theology begins with an endeavor to be “drowned,” or to become “extinct” in the Eternal, an attempt to lose one’s finite existence in an experience of divine unity. To this end, individual Sufis consider themselves to be strongly directed: central figures are said to be travelers on their way back to God. It shares many features in common with the mystical traditions of other faiths, including the desire to move beyond mere righteousness toward a closer union with the deity. Sufis argue that their movement is universal in that it is reflective of the general search for God in spirit, and therefore can be informed by other religious viewpoints in its general search for the divine. This has led many to understand Sufi theology and practice to be syncretistic, reflecting a mixture of beliefs to be found in the monastic and mystical life of other religions.

In addition to the usual Islamic strictures placed on Muslims, Sufi practices include direct emulation of the leaders of the order, fasting and prayer, incantation and repetition of the names of God, (*dhikr Allah*), veneration of saints at community celebrations (*mawlid*s) and tombs, attendance at instructional sessions with the head of the order (*dars*), and the practice of retreat or isolation (*khalwa*). The Sufi tradition is one that seeks to emulate spiritual over temporal enrichment, and as a result they are often called by Arabic *faqir* and Turkish *dervish* (meaning “poor”). Some don inexpensive robes known as *khalwa* and use simple wooden rosaries known as *sibha*. One group, the Mevleviya, is particularly noted for the practice of dancing in circular motion, earning them the name “whirling dervishes.”

While most Sufi orders are predominantly male, women have long had an important role to play as Sufis. One woman, Rabi’a al-Adawiya (717–801) was among the earliest and most revered of the Sufis. Many Sufi orders permit women to lead female orders and to participate equally in Sufi rituals and ceremonies.

Sufism was integral to the spread of Islam in many parts of Asia and Africa, particularly in areas beyond the spread of Muslim empires. Given their strict discipline and organization, Sufi orders became natural poles of opposition to colonial powers in many of these areas in the nineteenth and twentieth centuries. In China, leaders of the Naqshbandi order began a revolt against Chinese domination in the late eighteenth century. Shamil (1796–1871), from a Chechen branch of the Naqshbandi order, led a war against the Russian Empire from 1834 to 1859. Muhammed Ahmad (1844–1885), founder of the Sudanese *ansar* Sufi order, known by his followers as the Mahdi, led an independence movement against British authorities in the 1880s. Sufi orders remain important sources of

political authority in Sudan, where the Umma Party remains closely associated the *ansar* and the Democratic Unionist Party is dominated by the *khatmiya* Sufi order. In Libya, the Sanusiya order presented a significant challenge to French and Italian colonial authorities during the early twentieth century.

As a result of opposition coming from orthodox Islamic elements beginning with the Salafist movement of the early nineteenth century, Sufis have been marginalized as representatives of backward and overly syncretistic “folk religion” in some areas of the Middle East. Urbanization and modernization both presented major challenges to the largely rural Sufi movements. However, Sufi orders continue to be significant to social and political life in places such as South Asia, Indonesia, Sudan, and the Sahel, where their tombs and shrines remain important centers of ritual devotion. For example, in the West African states of Senegal and Gambia, the Tijaniya order directs social services such as shelters for the homeless, medical supports, and educational initiatives for poor farmers. Likewise among Pashtuns in Afghanistan, Sufis of the Naqshbandi Qadiriya order take on the role of mediators and arbitrators in many local settings, also being prominent local educators.

Sufi orders often create communal and commercial opportunities for their members, including agricultural collectives and businesses. Sufi meeting houses (*zawiya*) serve as important social centers in small communities and neighborhoods. The magical power attributed to Sufis—they are commonly held to possess the ability to convey a special blessing (*baraka*)—means that they are often approached for healing and spiritual advice. In many locales, Sufi orders have tended to become involved in social development and service projects, such as health care, orphanages, and educational facilities. All of this gives Sufi orders a natural political resonance, and has led to increased regulation and control over their leadership and practices through governing bodies. For example, in Syria, a policy of co-optation by the state has provided room for pro-regime orders such as the Kufitariya while restricting and silencing orders more critical of the state through repression. The increasing politicization and polarization of Islam in the developing world has contributed to the diversification of Sufi orders. They have adapted both by supporting the more radicalized elements in locations such as Iraq and Afghanistan, and in seeking to present a more moderate and popular face to Western audiences.

### SUKARNO

Achmed Sukarno (1901–1970) was the most respected, admired, charismatic, and remembered leader of Indonesia.

After graduating from High School, he studied in his country engineering and architecture at the Bandung Technical College where he first became involved in nationalist activity. In 1927, Sukarno established the Indonesian Nationalist Union, which was later known as the Indonesian Nationalist Party (PNI). This new party's aim was to achieve independence for Indonesia through popular struggle against the Dutch, who had been controlling Indonesia as a colony since the beginning of the seventeenth century.

As years passed, Sukarno managed to gather large crowds who followed him because of his persuasive oratory skills and his ideas of liberation from secular colonialism. He was imprisoned some times during Dutch occupation and then, in 1942, after the Japanese invaded the country, he collaborated with them but only as an opportunity to gain popularity. After World War II and, with the defeat of the Japanese, on August 17, 1945, Sukarno and Mohamad Hatta declared the long-awaited Indonesian independence, and became, respectively, Indonesia's first president and vice-president. He also established the first Constitution which constituted a very important progress for national unity, a long data trouble since Indonesia's territory is composed by hundred of separated islands.

A year later, in 1946, began the *Independence War*, when Dutch and British forces invaded the country; and during those years armed conflicts between the Dutch and Indonesian guerrilla persisted. Due to international pressure, in 1949 the war finished when Netherlands agreed to transfer sovereignty over almost all Indonesia to the federal Republic of the United States of Indonesia (RUSI). On July 5, 1959, President Sukarno decided to put an end to current liberal democracy regime and started what he called *Guided Democracy*, a coalition of very dissimilar

groups in the government. Sukarno had always tried to balance the three primary social forces in Indonesia: the revolutionary nationalistic Army; the popular mass-based Islamic organizations; and the Indonesian Communist Party (PKI), and Guided Democracy was an attempt to do so. It was a delicate balance between Nationalism (NAS), Religion or *Agama* (A), and Communism (KOM) (NASAKOM). Then Sukarno carried out several measures to unify and help develop the Archipelago as a country and a nation.

One of his most important achievements was to adopt Bahasa Indonesia as the national language. This was very important as most of the people who lived on the different islands had developed greatly different dialects and there wasn't a common language for all that created a common identity.

So as to solve his many economical difficulties, several established Dutch banks were nationalized during the 1950s, including the Bank of Java, which became the central bank of Indonesia, in 1953. The five state banks were merged into a single conglomerate, and private banking virtually ceased.

Another of his contributions to development was the installation of democracy as the political regime for excellence. Outside of a small number of urban areas, the people still lived in a cultural milieu that stressed status hierarchies and obedience to authority. Therefore, although his regime was forced to add some dictatorial features, he promoted democracy as the best political regime for the country. Independent Indonesia's first general election took place on September 29, 1955, and Sukarno's PNI won a slim plurality with the largest number of votes, 22.3%.

In spite of all this encouraging measures, Sukarno has often come in for a lot of criticism for not setting economical growth as a priority in the country's development strategy. However, this point is controversial because his attempts to improve the economical situation were often blocked. For instance, he tried to implement a vast land reform but his efforts were blocked by landowners and Sukarno's own bureaucrats.

Notwithstanding the bad economical situation, Sukarno retained enormous popularity among ordinary Indonesians, awakening in them a great sense of pride in being Indonesian. In 1963, having Sukarno proclaimed himself president for life, the PKI announced a policy of direct action and began dispossessing landlords and distributing the land to poor Javanese, northern Sumatrans, and Balinese peasants.

Regarding his foreign policy, he was the president who initiated the historic Asia-Africa Conference at Bandung (Indonesia) in 1955, which encouraged the spread of the *Non-Aligned Movement*. He also turned away from the West by rejecting their financial aid and came closer towards the People's Republic of

China and the Soviet Union for development assistance. Later on in 1965, owing to the creation of the Malaysian Federation, he separated his country from the United Nations and its affiliated organizations, the International Monetary Fund and the World Bank. He argued that the British-supported state (Malaysia) would function as a base from which “neocolonial” forces could exert influence in the region.

This challenging foreign policy was opposed to the United States and other Western countries, which saw his regime as an obstacle for the free exploitation of Indonesia’s valuable natural resources (mainly oil and minerals). Indonesia had also a great value as a strategic position in the South East of Asia. All these reasons account for the permanent interest of the superpowers for the Archipelago, known as the Asian Jewel.

All his inner and foreign policy were resented by the Western countries that considered him as a rival. The weight of superpowers would be very important to disrupt the delicate balance of power he had formed. The end of Sukarno’s regime was suddenly prompted on September 30, 1965, when an alleged communist coup by the so-called September 30 Movement killed six generals and one lieutenant. The next day Maj-Gen. Suharto, seized the situation, including the army’s control and blamed the Indonesian Communist Party as the coup-plotter. Although controversial, many researchers sustain that this incident had been organized and financially supported by the United States Central Intelligence Agency (CIA) in order to end with Sukarno’s communist and hostile regime. In 1967, the Parliament named Suharto acting president and installed him as president a year later. Sukarno’s power over the nation had already been fully diminished until his formal deposition on March 27, 1968. Sukarno finally retired to the island of Jakarta where he died in June 21, 1970.

## SURINAME

Suriname (former Dutch Guiana) is located on the northeast coast of South America between Guyana (former British Guiana) and French Guiana. Brazil lies to the south and the Atlantic Ocean to the north. The land area is about sixty-three thousand square miles.

Suriname’s coastline consists largely of mangrove swamps rooted in alluvial mud from the Amazon River deposited by coastal currents. A strip of low land running along the coast and averaging thirty miles in width contains most of the nation’s agricultural land and population. Inland lies a narrow savannah zone. The interior (80% of the land area) consists of very sparsely populated, largely roadless, upland rain forest. Lying just north of the equator, Suriname is hot year round. There are two rainy seasons, a short one in December and a longer one from March to July.

The population of Suriname (only 430,000 by 2003 estimate) is very diverse. Using official census categories, the largest group (37% of the population) is “Hindustanis,” whose ancestors came from India. The second largest group (31%) is Creoles, Christian of African descent. The Muslim Javanese (15%) are mostly employed in rice agriculture. Maroons (also called Bush Negroes) constitute 10% of the population. They are descended from slaves who escaped and created independent African societies in the jungle. Six Bush Negro tribes are recognized today: the Aluku, Ndjuka, Kwinti, Matawai, Paramaka, and Saramaka. Amerindians (Arawaks, Caribs, Tirios, Akoerio, and Wajana) are only 2.5% of the population. Their traditional way is little affected by the modern world. There are small numbers of Chinese and Europeans. Not counted in any census are illegal Brazilian immigrants, mostly gold miners. There may be as many as thirty-five thousand of these. The religious breakdown of Suriname’s population is Hindu (27%), Muslim (20%), Roman Catholic (23%), Protestant (25%), and animists (5%).

The Guiana coast was sparsely populated when first sighted by Spanish explorers in 1498. British settlers failed to establish viable plantations and by the terms of the Treaty of Breda (1667) the Netherlands

acquired Suriname in exchange for New Amsterdam (New York) and Suriname remained a Dutch colony for the next three centuries. Dutch plantation owners were notoriously cruel to their slaves, many of whom fled upriver. Suriname's rivers are navigable by shallow-draft boats only up to the first fall line; thereafter frequent portages are required. Due to their isolation, the Bush Negroes preserve their synoptic African culture in relatively undisturbed form. This may change, as some now work in Paramaribo and in the Netherlands.

Plantation crops grown for export (coffee, indigo, cacao, cotton, and especially sugar) were by the nineteenth century mostly replaced by food crops grown for internal consumption: rice, plantain, and bananas. Britain re-occupied Suriname in 1804 and banned the slave trade in 1808. The Dutch regained control in 1816. The Dutch abolished slavery in 1863 but bound slaves to their plantations at low wages for another ten years. Almost all slaves left the plantations at the first chance. They were replaced by indentured laborers from India (a total of thirty-seven thousand between 1873 and 1916) and from Java (a total of thirty-three thousand between 1890 and 1940).

Bauxite, the ore from which aluminum is refined, was discovered in Suriname in 1915. During World War II, Suriname supplied the allies with this strategic metal, essential for the manufacture of airplanes. After the war the Dutch granted Suriname progressively greater autonomy, despite the absence of strong pro-independence sentiment among the people. Elections in November 1973 brought to power an alliance of Creole and Javanese parties advocating independence. Suriname became a sovereign nation on November 25, 1975, with Henk Arron, a Creole, as Prime Minister. Approximately forty thousand people of Asian descent emigrated to the Netherlands.

Prime Minister Arron was deposed in a military coup on February 25, 1980. Sergeant-Major Désiré Bouterse emerged as leader of the ruling National Military Council. Bouterse closed newspapers, banned political parties, dissolved parliament, suspended the constitution, and promoted himself to Lieutenant-Colonel. A period of extreme political chaos ensued, including six attempted coups over the next three years. After fifteen prominent opposition leaders were tortured and killed in December 1982 the United States and the Netherlands suspended economic aid. Government social services went into decline. Bush Negro insurgents, led by Bouterse's ex-bodyguard Ronnie Brunswijk, shut down the mining industry around the eastern town of Moengo. In 1987, the military agreed to elections. Bouterse's party won only two of fifty-one seats in the National Assembly but he continued in power,

having by now promoted himself to commander-in-chief. Bouterse "resigned" in 1990 but influenced policy from behind the scenes for the rest of the decade. In July 1999, a Dutch court convicted Bouterse *in absentia* of smuggling nearly two tons of cocaine.

Civil society in Suriname is highly concentrated in Paramaribo. Political parties tend to represent ethnic groups rather than ideological positions. The National Party of Suriname represents Creoles and the Progressive Reform Party represents Hindustanis. The Javanese and Maroons are represented by smaller parties.

Government mismanagement of the economy has brought inflation and unemployment. Nearly half the workforce is employed by the government itself. Agriculture accounts for another 20% of the labor force. Rice is the food staple and the main crop. Food exports include bananas, coconuts, and shrimp. A dam on the Surinam River at Afobaka, paid for by the aluminum companies, creates one of the largest reservoirs in the world and produces electricity needed for aluminum production. Gold mining is carried on illegally and therefore contributes little to the official national budget while generating toxic runoff. Oil production is controlled by the state oil company. There are potentially exploitable deposits of iron ore, copper, nickel, platinum, and manganese. The rainforest contains much valuable timber, but decision-makers must balance receipts from the forestry industry, which it controls, against potential income from eco-tourism. Suriname's rich bio-diversity is now recognized as an economic asset and the government has designated a large area of the highlands as the Central Suriname Nature Reserve.

Health and nutrition are good, with life expectancy at sixty-nine years. Suriname has achieved a 93% literacy rate despite its linguistic diversity. Dutch is the official language but the *lingua franca* is Sranan Tongo, a pidgin consisting of words derived from English, Dutch, and other European and African languages. Hindi, Javanese, and various tribal languages are also spoken. Education is compulsory for ages six to twelve.

Suriname's foreign policy is constrained by the need for economic aid from the Netherlands and the United States. Assistance has been conditionally resumed now that the military has relinquished some of its power and the Bush Negro insurgents have been integrated into the national police force. Territorial claims against Guyana and French Guiana remain active, but neither neighbor is likely to concede territory, as the Armed Forces of Suriname number less than two thousand men.

In elections held in May 2000, the fifty-one-member National Assembly elected Ronald

Venetiaan president. The next elections are scheduled for May 2005. In January 2004, Suriname changed the name of its national currency from the guilder to the dollar.

## SUSTAINABLE DEVELOPMENT

As defined by the United Nations-sponsored Brundtland Report, the objective of sustainable development is to meet the demands of the current generation without compromising the needs of future generations. It is an attempt to be both environmentally conscious and economically productive, two ideals which have traditionally clashed with one another, both in the developing and developed world. This debate is probably most pronounced in the developing world where the rate of increase in environmental change and pollution is highest. While blame for the vast majority of the greenhouse gas emissions to date lies at the feet of the developed world, carbon dioxide emissions from developing countries are expected to pass those from the developed states of the Organization of Economic Cooperation and Development by the year 2025. The differences in the Northern and Southern hemisphere, the developed and developing world, are central to understanding the debate about sustainable development. Yet before broaching this subject and the neocolonial and green imperialism arguments it introduces, it is important to consider some of the fundamental definitional issues that remain in contention regarding sustainable development.

Sustainable development is about development as opposed to growth. The distinction between development and growth is a critical point. While direct tension between these two interests can at times exist (that is, choosing to allow ivory trade by states such as Botswana, South Africa, and Namibia in 1997 and 2002 as those states have viable elephant populations despite the overall threatened status of African elephants and the resulting international ban on African elephant ivory trade in place since 1989), the two are

more accurately described as complimentary. Any viable long term economic development must directly incorporate ecological health. Just precisely how this is done politically, however, remains a highly contentious issue. Short and long term interests often clash. No consensus exists when it comes to implementing the ideas of sustainable development.

Too often, discussion of economic development is wrongly used interchangeably with that of economic growth. Yet the two terms are decidedly not synonymous. Growth is a quantitative measure; development is qualitative. There is a point where growth comes too fast, or there is simply too much of it. Unsustainable development is development without a plan—which, depending on the definition may not be development at all, but instead simply uncontrolled growth. It is a cancer that ultimately hurts the economy as well as the ecological base on which this economy is built.

To avoid this pitfall, scholars such as former World Bank economist Herman Daly and theologian John Cobb advocate restructuring economies so that they live off the interest of the earth without encroaching upon its capital. Again, what is most notable about this definition is the fact that it incorporates both an inter-generational and intra-generational equity dimension. Future generations are left the resources and ecologically viable environment they will need, and the environmental costs and benefits of today are distributed equitably among those living in the current generation. One generation does not shoulder a disproportionate share of burden. And one region or class within the generation does not shoulder more than its share either. This approach shifts emphasis to maintenance of the earth and its resources, encouraging societies to limit the degree to which they borrow from their children's future. Stewardship becomes the *modus operandi* instead of exploitation.

Looking past this theoretical introduction to the diplomatic history of sustainable development offers additional insight here. The term became part of the global discourse in 1980 with the publication of *World Conservation Strategy* by the hybrid non-governmental organization (NGO) and international organization (IO) known popularly as the World Conservation Union and more formerly as the International Union for Conservation of Nature and Natural Resources (IUCN), a serendipitous source considering the central role NGOs play in the sustainable development debate today. By 1987, the earlier mentioned Brundtland Commission, led by Norwegian Prime Minister Gro Brundtland, popularized the term outright with its publication, *Our Common Future*. Often referred to as the Brundtland Report this work sought to establish a foundation for the 1992 Earth Summit in Rio de

Janeiro, Brazil. Officially referred to as the United Nations Conference on Environment and Development (UNCED), this was the largest gathering of state leaders at the time. Held twenty years after the 1972 groundbreaking United Nations Conference on the Human Environment in Stockholm, Sweden, the Earth Summit sought to achieve multilateral agreements in five key areas. These were the Rio Declaration, Agenda 21, Statement of Forest Principles, Climate Convention, and Biodiversity Convention. Despite high prioritization in a number of state delegations and vast press coverage worldwide, delegates came away with little more than non-binding recommendations. Development interests, particularly within the constraints of an overarching Northern-Southern hemisphere conflict, prevented any tangible results from emerging. Thus some charge that nothing more than hot air emerged out of Rio, that the primary legacy of the Earth Summit has been the extent to which the term sustainable development is now a contested political terrain. This continued even in the aftermath of the progressive World Summit on Sustainable Development (WSSD) in Johannesburg, South Africa, in 2002.

Part of the blame here must still fall on a continuing fundamental deficiency in traditional economic thinking. More than just two measures are needed to describe profit. To truly measure development, economists and diplomats alike need more categories than merely net and gross profit. To consider sustainable development, decision-makers require a more elaborate system, one that better incorporates environmental accounting. Proposals on the table include basic measures of environmental “goods” and environmental “bads,” to add and subtract respectively from the gross national product (GNP). Of course, application of such practices raises critical complications in terms of cost-benefit analysis. How does one determine what is good and what is bad? And perhaps just as controversial, precisely who makes this determination? Several genuine efforts to meet this demand do exist. Perhaps the most universally accepted new measure to date is the United Nations’ Human Development Index (HDI). Developed in 1990 by the Pakistani economist Mahbub ul Haq, it has been an integral component of the annual report for the United Nations Development Program since 1993. The HDI incorporates life expectancy, literacy, poverty, and education, in addition to per capita gross domestic product adjusted for purchasing power parity (PPP).

Much of what makes sustainable development complicated today is its truly global nature, that is, the problems of climate change, ozone depletion, and species extinction all rest in unsustainable practices. Globalization shapes this, particularly as the

technological advances in communication and transportation have brought even the most physically distant markets ever closer together. Still other impacts are somewhat more localized yet not region specific, appearing in both developed and developing world communities, for example, hazardous waste disposal, transportation pollution, and urban or suburban sprawl. And some such as over-consumption and rampant population growth are generally considered most problematic in either one region of the world or the other, that is, they are symbolic of the North-South divide. For example, in the North, in the developed world, the major sustainable development issues revolve around consumption and waste—and the impact of these activities on the so-called “green agenda” which targets depletion of water and forest resources. More precisely there is a systemic problem with over-consumption in the developed world, where some 20% of the world’s population consumes roughly 80% of the world’s resources. This, in turn, is tied to a problem with waste, specifically the packaging from the products of this consumption. One should also acknowledge that our original definition of the term sustainable development used the phrase development needs, not wants. Much of the consumption in the developed world fits the latter category instead of the former.

Looking towards the South, in the developing world, local communities deal with a somewhat different subset of sustainable development difficulties, one more often described in the context of the “brown agenda.” These are the “pollution of poverty” issues such as sanitation, soil erosion, and drinking water quality. In essence, this type of unsustainable development is tied to two phenomena. One such phenomenon is burgeoning population in areas ill-equipped to handle this rapid growth, that is, the Sudan’s estimated population growth rate in 2004 was 2.64%. Another phenomenon at work is the simple fact that the developing world is trying to catch up economically to the rest of the world—and to do so quickly in much the same manner as the developed world did. Being relatively late comers to the industrial revolution, the developing world is at a disadvantage in the global trading market. Herein lays partial validity in the charges of neo-colonialism or green imperialism that are, at times, levied against the Northern hemisphere. Those from the rich developed world essentially insist that the developing states not to make the same mistakes the developed states did, that the developing world should be more patient in pursuing the benefits of economic development. One could easily label such advice as hypocritical—unless developed states put their money where their mouth is so to speak and provide the necessary financial assistance

to offset any economic sacrifices made by the developing world. Furthermore, there can be the perception that developed states might not always be offering well intentioned advice. Some developing states fear their sovereignty may be compromised to the benefit of more advanced powers just as during the late nineteenth and early twentieth century heyday of imperialism and its extraction of natural resources for the mother country. But these fears notwithstanding, developing states best interests are indeed served by pursuing a carefully planned development path. The advice to consider long term as well as short term development interests is highly advantageous to both the developing and developed world. Yes the developed world can make a common heritage of humankind argument when it comes to protecting species diversity or the lungs of the planet in the Amazonian rainforests. But this is not a zero-sum game where one player's gain is another's loss. All parties, both developing and developed states alike can benefit here—and all can lose.

It is with this understanding that a handful of international agreements have come into force during the last two to three decades, each seeking to address common interests in fostering global sustainable development. Some examples of these range from the 1997 Kyoto Protocol on climate change to the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer to the 1973 Convention on International Trade in Endangered Species (CITES). Within the United Nations (UN) family, a number of organs often aid in developing both specific international treaties such as these and the larger, more amorphous regimes they foster. Two agencies of particular note are the United Nations Development Program (UNDP) and United Nations Environment Program (UNEP), the latter of which is the only UN agency headquartered in the developing world. Over the last decade, moreover, The Global Environment Facility (GEF) is still another UN-affiliated institution that supports more sustainable development. In short, the GEF helps developing countries with projects by granting funds to decrease environmental impacts of these projects. Managed by the three implementing agencies of UNEP, UNDP, and the World Bank, this institution targets the six environmental issues of biodiversity, climate change, land degradation, international waters, ozone depletion, and persistent organic pollutants (POPs).

From this broad overview a few final concluding comments can be made. First, while some natural resources are renewable, others are certainly finite—and even renewable resources such as water, trees, or fish can be harvested in ways that make their replacement impossible. This means fundamental limits to the

carrying capacity of the earth do exist. Second, most parties agree that communities need to incorporate such limits into the economic, environmental, and social goals they establish. The interdependence of these issues must be fully recognized. Third, thanks largely to the eloquent and concise wording of the Brundtland Report, general agreement on the need for both inter-generational and intra-generational equity now exists. Together these three components represent the common denominator in effective sustainable development programs around the globe. Of course, identifying these characteristics is not meant to suggest that there is one correct path towards sustainable development. While planning ahead is critical, the blueprint model, a one size fits all mentality, will not work when it comes to sustainable development.

### SWAZILAND

The Kingdom of Swaziland is a small landlocked country in southeast Africa, bounded by South Africa on the north, west, and south, and Mozambique to the East. This eastern border coincides with the Lebombo Mountains, a traditional limit to the Swazi. Prior to the arrival of Europeans in the region the various tribes which make up the Swazi people were not bound by national borders but by geography and the presence of competing tribes, particularly the Zulu.

The tribes which make up the Swazi are the Nguni, the Sotho, and the Tonga. Tongaland, part of what is now South Africa, was the home of these tribes until they were forced to the north in the eighteenth century. The earliest recognized ruler of these tribes which make up the Swazi was Ngwane, who led the tribes westward through the Lebombo Mountains to what is now Swaziland. Further definition of the borders was made by his great-grandson, Mswati, who became king in 1840. The Swazi name is derived from King Mswati's.

Mswati attempted to avoid conflict with the arriving Europeans (British and Boers) as well as with the Zulu. He granted lands to the Europeans, and the British helped to remove the threat of the Zulu. Following his death in 1858, a struggle for power within the royal family resulted in the appointment of one of Mswati's sons, Mbandzeni, as king to rule alongside the mother of Mswati's other son Ludonga, who had been killed; because Swazi tradition calls for the king to rule alongside the queen mother and Mbandzeni's mother had died, Mswati's other wife took the post. Mbandzeni reaffirmed the concessions which Mswati had made to the Boers.

The presence of white Europeans caused difficulty for the Swazi rulers, because these foreigners did not respect the traditions and territories of the native population. In addition, the foreigners saw value in such things as minerals (including gold) which would require development for extraction. In exchange for territorial concessions, the Europeans offered relatively cheap trade goods (including firearms) and animals.

Great Britain acquired control over Swaziland as a result of its victory in the Anglo Boer War of 1899.

Under British rule, modern institutions such as money, schools, political redistricting, and taxes were introduced. One of the princes of the royal family, Sobhuza II, was eventually sent to school in the Union of South Africa and would become the first "modern" ruler of Swaziland.

During the first half of the twentieth century, Swaziland was a largely underdeveloped country, with its people torn between traditional ways and the Western ways brought in by the Europeans. During the 1930s, the first efforts were made by Hilda Kuper to document Swazi culture, and her writings provide the basis for much of what is known of Swazi history in the West.

Swaziland's location (nearly surrounded by South Africa) put Swaziland at a disadvantage in trade. Because the country is landlocked it must export through either South Africa or Mozambique, and South Africa was able to effectively control its trade policies. In World War II, some of these restrictions were lifted, and following the war the economic status of the Swazi improved somewhat, since the mining industry made employment opportunities available.

By the 1950s, highways were being built, and even traditional activities like agriculture were being modernized leading to greater productivity.

In 1963, Great Britain imposed the Swaziland Independence Constitution on the nation, establishing legislative and executive councils. While this was in keeping with European institutions of government, it was very much at odds with traditional forms of government in Swaziland. Nevertheless in 1964 elections were held for the Legislative Council, and subsequently the council proposed changes to the constitution leading to the establishment of a Senate and House of Assembly. This constitution took effect in 1967. Swaziland declared independence from Great Britain on September 6, 1968, and a new Independence Constitution took effect; this constitution was suspended in 1973. Other changes were made, and Swaziland currently operates under a constitution put in place in November 2003.

Between the 1950s and 1990s, the population of Swaziland nearly quadrupled, and by 1995 over 1 million people lived in the country. Population growth is expected to moderate in the first decade of the twenty-first century, then drop slightly before the middle of this century.

Swaziland is still a functioning monarchy, although it also has many Western political institutions. One of King Sobhuza II's wives gave birth to the present king, in 1968. The prince was named Makhosetive ("King of All Nations"), and like his father was educated in South Africa. Upon the death of his father in 1982, King Sobhuza II's primary wife

became the Queen Regent. Makhosetive took the title of King Mswati III, and with his own mother began to rule the country.

King Mswati III came under criticism in 2002 over an incident which reveals the degree to which the nation has developed. Traditionally the Swazi king has selected his wives at an annual event, the Reed Dance, at which young women dance for him. In October 2002, one such woman was chosen and taken by the king's agents to one of the palaces, from which she was not permitted communication with her mother. The girl's mother sued the king, and King Mswati III threatened to dismiss the judges hearing the case.

The demand for human rights, particularly women's rights, in Swaziland is very much a modern development in Africa's last monarchy and the king has shown no willingness to change. However, advocates for human rights point out the king's behavior might encourage other men to kidnap their own brides, a procedure unacceptable anywhere but especially in Swaziland, which has a rate of infection with HIV/AIDS which became the highest in the world in 2004.

## SYRIA

Syria had a gross domestic product (GDP) of \$17 billion and a population of 16 million in 2000. About 80% of the population are Arab speaking and about 70% Sunni Moslems. The main sectors of the economy are agriculture and oil. Syria is one of the few economies in the Middle East not to have experienced significant liberalization, privatization, and freer foreign trade. President Bashar el-Assad was appointed after the death of his father, Hafez el-Assad in 2000. They are both from the minority Alawite community. The later took power in a military coup in 1971.

In the 1970s, gross domestic product increased by an annual average of 10% in real terms. Although the 1970s were years of growth, the economy did not experience structural change. In 1970, agriculture accounted for 20% of GDP, industry 25%, and services 48%, in 1980 and in 1990 the shares were virtually unchanged. The increase in the share of industry was due to the development of the oil sector rather than to the industrialization of the economy: the share of manufacturing in the economy hardly changed.

In the early 1970s, the Syrian economy experienced nationalization; import protection; large-scale state investment; expansion of the public sector, restrictions on the private sector; subsidization of many goods and services, a multiple exchange rate system and tight controls over the movement of capital. The banking system was totally controlled by the government.

Economic policy in the 1970s aimed at increasing industrial employment, expanding the role of the public sector, while at the same time, private sector activity was permitted within strict limits. The aim was to transform the country within the ideological framework of Arab socialism, from an agriculturally based economy to an industrial one.

Syria benefited from foreign aid from both the Union of Soviet Socialist Republics (USSR) and the Arab Gulf States. Private remittances also increased as Syrians joined other Arab emigrants to work in the Gulf after the 1973–1974 rise in oil prices. As a result of the decline in Gulf oil revenues in the mid-1980s and disputes with the Syrian and Gulf Cooperation Council (GCC), capital inflows declined. The fall in the oil revenues of Gulf States also reduced the demand for Syrian labor there and remittances consequently declined. These factors, accompanied by bad harvests, due to drought in 1982–1984, led to a near zero economic growth rate between 1982 and 1985. This deterioration led to a series of changes in economic policies, at first in the direction of austerity and later towards liberalization.

Given the country's backward technological state, turnkey projects were imported; whole plants were bought from foreign firms and they supplied personnel to set them up. Syria lacked the skilled manpower to operate many of these plants and the heavily politicized and centralized management systems employed failed to make optimal use of the investments after they were completed. Most economic activity was carried out within the framework of a series of five year plans which were inspired by the Soviet Union's experience. The main aim was to generate fast economic growth through public sector investment. The emphasis of the plans varied, with a larger share of

funds being allocated to industry in the 1970s and 1980s than in the 1960s.

In the 1970s and 1980s, the public sector was dominant. However, the actual amount invested in the public sector was always much lower than planned. This was due to the failure of the government to obtain finance for projects in the plan and its inability to undertake all that it hoped to because of administrative failings. On the other hand the private sector exceeded its share in every plan, suggesting that a more decentralized approach would have been more successful.

The 1980s were much more problematic. Between 1980 and 1990, the economy grew more slowly than the population. Capital inflows from the Arab world declined. It was against this background that Syria began to reform its economy in the late 1980s. This was done on an ad hoc basis designed to cope with increasing internal pressures rather than on the basis of a comprehensive program.

Some of the problems that affected the economy in the 1970s and 1980s continued in the early 1990s. These included rapid population growth; reliance on rental incomes such as workers' remittances and foreign aid; a very small manufacturing sector; formidable bureaucracy and politicization of the public sector; high defense spending and a large military establishment; economic isolation, water and electricity shortages. The government subsidized prices through a complex budgetary system and administered other controls with distorting effects throughout the economy.

The period 1990–1994 was one of fast economic growth, with GDP increasing by an annual average of 7.5%. In 1995–1996, it was 6.5% and in 1997–1999 it was estimated at –3%. The deceleration was due to a number of factors. The manufacturing sector suffered from increased competition from imports that resulted from the partial liberalization of foreign trade. The adoption of more stringent financial policies by the government squeezed demand and thus helped to slow the rate of growth. Crude oil production and refining output declined in 1996. A draught

that had severe effects on agricultural production in 1999 reinforced these trends.

In recent years, oil exports revenues have also played an important role. Changes in aid and remittance as well as oil revenues have had significant effects on the economy, but their levels were largely outside the control of the government. Since 1994 there has also been a significant inflow of capital from Syrian residents abroad who have invested in new projects under Law Number 10 of 1991.

Economic reforms have had ideological significance in that the regime now wants the private sector to play a major role, especially in investment. Private capital has been invested in sectors of the economy that were previously closed to it.

Structural change takes time and it is therefore necessary to measure development over a period of five to ten years. Between 1980 and 1994, agriculture's share in the economy declined by 4.1%; the mining and quarrying sector's share tripled as a result of the expansion of the oil sector. Although, manufacturing increased in absolute terms, it was very significant that its share in the economy declined. In 1998, it accounted for only 7% of GDP, less than in 1985.

## TAIWAN

### Background Information

Taiwan, officially known as the Republic of China (ROC), is an island of thirty-six thousand square kilometres in the Western Pacific and has a population of 22,749,838. The island is located north of the Philippines, south of Japan, and to the southeast of China. Most of Taiwan is composed of rugged mountain terrain, leaving the alluvial plains of the western coast as the major areas of population and urban settlement. The east coast of the island, with the exception of a rift valley extending from Hualien to Taitung, is largely unsuitable for agriculture and is sparsely settled. The Central Mountain Range runs down the centre of the island from north to south. Jade Mountain (Yushan), at 13,113 feet (3,997 meters), is the tallest mountain peak in East Asia. Straddling the Tropic of Cancer, Taiwan has long, hot summers and cool winters. Winters are cold and rainy in the north, but generally remain warm and sunny in the south. Typhoon season lasts from July to September, which can bring violent storms and dangerous floods to Taiwan.

From 1895 to 1945, Taiwan was a Japanese colony. During that time, its economy was based primarily on agricultural exports and industrial processing of agricultural by-products. Major infrastructure projects, including railroads, ports, and hydroelectric dams, were constructed at that time and served as the base

for later development. The island's development under the subsequent rule of the Chinese Nationalist Party (*Kuomintang*, KMT) has thus appeared as nothing short of phenomenal. In 1962, Taiwan had a per capita gross national product (GNP) of \$170 USD, placing its economy between those of Zaire and Congo. In 1999, Taiwan calculated its Human Development Index as twenty-third in the world, including a per capita gross domestic product (GDP) of \$19,197 USD, showing that its economy had reached the standards of Southern Europe. This economic feat has been treated in academic literature as a paradigmatic example of growth with equity.

### The Political Context of Taiwan's Postwar Development

Taiwan's rapid economic development is closely related to the exigencies of the Cold War. At the conclusion of World War II in 1945, the Allies "returned" Taiwan to the Republic of China (ROC) under the leadership of Generalissimo Chiang Kai-shek (1887–1975) and his party, the KMT. The first two years of KMT rule were marked by high inflation, widespread unemployment, and rampant corruption in forms ranging from KMT soldiers stealing from the local population to the government moving entire factories to China.

When local Taiwanese people protested against corruption and undemocratic rule in February 1947,

the KMT state responded by sending troops to Taiwan and killing more than twenty thousand people in the massacre, which is now known as the 2:28 Incident. After the Chinese Communist Party (CCP) established the People's Republic of China (PRC) in 1949, the KMT retreated to Taiwan. The KMT ruled the island—under martial law for forty years—with the claims that only they remained the legitimate government of China and that they would eventually push back the Communists.

Due to its experience in the Korean War, the United States perceived the importance of KMT-ruled Taiwan as an “unsinkable battleship” in the Cold War against Communism and began full support of Chiang Kai-shek. Faced with the spectre of potential domestic opposition and/or invasion from the Communist mainland, the KMT was willing to cooperate with the US government and build Taiwan into a model of successful Asian capitalism.

## Agricultural Development

With US encouragement, Taiwan began implementing “Land-to-the-Tiller” agricultural reforms in agriculture in 1953. Members of the landlord class, still covered by the violent events of February 28, 1947, offered no resistance and accepted stock holdings in nascent state industrial enterprises as compensation for their lands. The state also invested heavily in rural infrastructure and irrigation. From 1954 to 1967, agricultural production maintained an annual rate of 4.4%, a growth that helped check discontentment in the countryside. Overvaluation of the New Taiwan (NT) dollar on world markets, combined with agricultural taxes and policies (such as compulsory procurement of rice at below-market prices), made it possible for the government to transfer resources from agriculture to industry.

## Industrial Development

Taiwan began its postwar industrial development with import substitution policies by establishing public enterprises in fields such as steel, petroleum refineries, and shipbuilding; the island also started protecting and nurturing private investment in textiles, plastics, and synthetic fibres. With US financial support and expert advice, as well as preferential access to US markets, Taiwan by the 1960s was able to begin selective policies of export substitution. The initial thrust was primarily focused on labour-intensive production of textiles, footwear, plastic goods, and bicycles.

Taiwan soon developed an industrial structure combining large, often state-owned, industries in the upstream sectors with dense subcontracting networks of private Small and Medium Enterprises (SMEs) in the downstream sectors. “Mainlanders,” the Mandarin-speaking people who came with Chiang Kai-shek from China in 1949, held most of the key positions in government and large industry. The “native Taiwanese,” who had already lived in Taiwan for generations, were mostly left with positions in labour and in the riskier SME sector.

State campaigns played an instrumental role in the development of these industries. The KMT government, for example, launched a “Living Rooms as Factories” Movement in the 1970s to channel the surplus labour of mothers into subcontracting production in family-owned SMEs. In the larger firms, strong social control, including the placement of security forces in all large factories, ensured a docile workforce with little opposition and no autonomous labour movement.

## Economic and Political Shock Waves

In the mid-1970s through the late 1970s, Taiwan was hit by a number of economic and political shocks. Taiwan responded to the Oil Crisis of 1973–1974 and subsequent inflationary pressures by shifting the emphasis of industrial policies to non-energy-intensive, less polluting, and technology-intensive fields such as machine tools, semiconductors, computers, telecommunications, and biotechnology. In 1980, the Hsinchu Science-based Industry was opened to facilitate cooperation between research units of universities and government institutions as well as between domestic and foreign high-tech firms.

At approximately the same time, as the world began to recognize the existence of the People's Republic of China, the KMT's “Republic of China” of Taiwan lost international recognition. The United Nations (UN) ceased recognition of the ROC in 1971, giving the Chinese seat in the UN Security Council to the PRC. Japan and Canada both shifted diplomatic recognition to the PRC in 1972. The United States followed suit in 1979. Chiang Kai-shek died in 1975. His son, Chiang Ching-kuo (1909–1988), replaced him as chairman of the KMT in 1975 and as president of the ROC in 1978. Throughout these political changes, a democratic opposition arose demanding the end of martial law and independence of Taiwan from the KMT-imposed Republic of China.

In December 1979, a Human Rights Day celebration in the southern city of Kaohsiung ended in chaos after pro-government instigators incited violence, and

police used tear gas against the crowd. The KMT used the incident, known as the Kaohsiung Incident, as an excuse to arrest leading members of the opposition. Many of those arrested, including Annette Lu (Lu Hsiu-lien), continued to build up an opposition movement and the opposition Democratic Progressive Party (DPP) in the years to come.

## Political and Economic Restructuring

In response to demands of a renewed opposition movement, martial law was finally abolished in 1987. Chiang Ching-kuo died in 1988, to be replaced by his handpicked successor Vice President Lee Teng-hui (b. 1923). In 1996, Lee Teng-hui was the first democratically elected and the first native Taiwanese president in the history of the ROC. In 2000, the opposition DPP candidate Chen Shui-bian was elected president with feminist opposition leader Annette Lu as his chosen vice president.

In the 1990s, due to a rise in the value of the NT dollar and correspondingly high cost of Taiwanese labour, Taiwan underwent further industrial restructuring with a shift from labour-intensive to capital-intensive production. Labour-intensive manufacturing processes, such as for shoes and electronic goods, largely shifted production to mainland China and Southeast Asia, with domestic production shifting to high-tech, capital-intensive industries. Those labour-intensive firms that remained in Taiwan began hiring foreign workers from Thailand, the Philippines, and other Southeast Asian countries to cut labour costs. Taiwan thus became a net exporter of capital in the region.

## Rise and Decline of the Information Technology Sector

With economic restructuring, the Taiwanese economy became increasingly dependent on computers and related industries. In 1997, the hardware information technology industry yielded a total production value of \$30 billion USD, making it Taiwan's most important foreign exchange earner. Since 1995, Taiwan has been the world's third largest computer hardware supplier, trailing only behind the United States and Japan. In 2000 to 2001, this dependency brought relative economic hardship to Taiwan as the result of a world downturn in the information technology industries. In the second quarter of 2001, the economy contracted by 2.35%, after more than two decades of more than 6% annual growth. In September 2001,

unemployment rose to 5.32%, bringing hardship and economic insecurity to a population that had enjoyed unemployment rates of around 2% since the 1970s. This negative economic condition was surely exacerbated by rapid movement of industrial production from Taiwan to China.

## Development of Civil Society

Economic development and prosperity in Taiwan have also led to the creation of a vibrant civil society. Women, formerly urged to follow Confucian virtues of submission to men during the "Living Rooms as Factories" campaign, began lobbying for equal rights through feminist groups such as the Women's Awakening Foundation. Independent labour unions, such as the Taiwan Labour Front, were formed to lobby for workers' rights and began holding an annual march on Labour Day. Environmental groups, including the Taiwan Environmental Protection Union, the Green Party, and local chapters of Greenpeace, started working on issues ranging from nuclear waste to the protection of endangered migratory birds. In 2000, the planned construction of the controversial fourth nuclear power plant became one of the main issues in the presidential election. Some Taiwanese industrialists began claiming that vocal labour and environmental lobbies make Taiwan an unattractive place for investment.

An indigenous rights movement emerged to defend the 3% of Taiwan's population who are of Austronesian ethnicity. Systematically marginalized culturally and economically under both Japanese and KMT rule, these First Nations of Formosa are arguably the main losers in Taiwan's economic development. Many of the issues raised by the movement are thus directly related to development. The Tao people of Orchid Island, for example, lobbied for the removal of nuclear waste from their island and limited self-rule. The Taroko people of Hualien County demanded that Asia Cement return land plots that had been illegally transferred from aboriginal farmers. Indigenous rights received institutional recognition through the establishment of a cabinet-level Council of Aboriginal Affairs in 1996 and the inclusion of indigenous rights in a 1997 amendment to the ROC Constitution.

## Relations with China

As many Taiwanese-owned firms transfer industrial production to low-wage China, the economies of

Taiwan and China have become more closely inter-related than ever in history. China, which claims Taiwan as part of its own territory, has isolated the island state diplomatically. China's actions towards Taiwan in recent years have wavered between promises of economic cooperation and threats of military invasion, which have even escalated to a missile crisis during Taiwan's presidential election of 1996. Some Taiwanese people, especially those who came over from China with Chiang Kai-shek in 1949, see in the Chinese economic reform hopes for reviving a united, democratic, and prosperous Republic of China that encompasses both China and Taiwan. The possibility of economic and political union with China has thus become one of the main development debates in Taiwan.

Pro-unification forces argue that only full integration of the two economies will protect Taiwan's high standard of living by making it easier for Taiwanese entrepreneurs to invest in the mainland. Those who argue for the status quo or legal independence argue that it is precisely mainland investment and the related loss of production in Taiwan that have precipitated economic crisis. Surveys conducted by the Mainland Affairs Council in July 2001 showed that 20% of the Taiwanese populace lean toward unification, 16.6% toward legal independence, and the remaining majority prefer to maintain the status quo of *de facto* independence. However, President Chen Shui-bian has been a supporter of Taiwanese independence, and many (including China) think that he will eventually attempt to officially separate Taiwan, which was granted full UN membership in 2001 from mainland China. In early 2005, China passed an anti-secession law, permitting the use of military force should Taiwan attempt to break away. This law has caused great consternation not just for Taiwan but internationally, as the United States has its own legal requirement to assist Taiwan in the event of military action against it, in order to maintain democracy.

### TAJIKISTAN

The Republic of Tajikistan is located in Central Asia, bordering with China in the east, with Kyrgyzstan in the northeast, with Uzbekistan in the northwest and west, and with Afghanistan in the south. This landlocked mountainous country has a land area of 143,100 square kilometers (55,250 square miles) and is the smallest in the Central Asian region.

The population of Tajikistan was estimated at about 6,578,680 in 2001. It is one of the least urbanized countries in the Commonwealth of Independent States (CIS) with around 72% of its people living in rural areas (CIA estimate). The country's capital city, Dushanbe (known as Stalinabad between 1929 and 1961), is home to 550,000 people (estimated in 2001) or 8% of the population. Tajikistan has one of the fastest growing populations in the CIS with the growth rate of 2.12% (33.23 births per 1,000 people estimated in 2001), and its population could double within the next twenty to twenty-five years. The official language is Tajik; Russian is widely used in government and business; and Uzbek is also widely spoken. Sunni Muslims make up 85% of the population, with a 5% Shi'a minority, and 10% of the population follows other religions, such as Eastern Orthodox Christianity, Lutheranism, and Evangelical Lutheranism.

Since ancient times, the Persian-speaking Tajiks were engaged in labor-intensive agriculture, crafts, and servicing trade on the Great Silk Road. They established flourishing city-states in Central Asia and developed sophisticated architectural and irrigation skills. However, these city-states suffered considerably from the thirteenth century onward because of the devastating Genghis Khan invasion and numerous incursions led by various Turkic-speaking khans.

Consequently, the Tajik society entered the nineteenth century as a backward, feudal country with most of the population engaged in subsistence economy. The Great Game—the competition between Great Britain and Russia—established a line of control between the great empires, when one part of Tajik-populated land was given to Afghanistan and the other part was annexed to a Turkistan governor-generalship that was controlled by Russia.

Major economic and social changes were brought to the Tajik society after the Russian Revolution of 1917. The territory of Tajikistan was the last area in Central Asia where the Bolsheviks had established their control after suppressing British-sponsored resistance. In 1924, with Soviet assistance, Tajikistan became a Soviet Autonomous Republic (province), a constituent part of the Uzbekistan Republic. Only in 1929 was it granted the status of the union republic, a constituent part of the USSR, when it was established within its present borders plus an additional territory of Leninabad region. The Communist Party of Tajikistan (CPT) came to power, to remain the single ruling party for the next seventy years.

After establishing full control over the territory of Tajikistan, the Soviet government has made consistent attempts to overcome both the patriarchal nature of the society and the backwardness of the national economy that was mainly based on subsistence agriculture. Although informally the government tolerated some degree of entrepreneurship, it established tight state control over most of the enterprises and directed economic development through central planning. In the 1930s, the government forced all farmers to join *kolkhozy*, or the state-controlled cooperatives (specializing in cotton, silk, and crop cultivation). During World War II, the Soviet government relocated a number of factories from the Nazi-occupied territories and established new industries, including defense, heavy industry (such as agricultural machinery), light industry (such as food processing and textile and garment manufacturing), and mining of nonferrous metals. It also invested in construction of huge hydroelectric power stations, one of the most expensive schemes in the USSR. According to official statistics, Tajikistan's economy grew twenty-one-fold between 1940 and 1984; however, in the 1970s and 1980s, the economy grew at a considerably slower rate due to rising structural and other difficulties in the Soviet-planned economy. The state-led rapid economic development and intensive agriculture led to environmental degradation and erosion of the fragile soil of mountainous oases and valleys.

In the middle of the 1980s, Gorbachev launched his *perestroika* policy that aimed at the stimulation of economic growth through economic decentralization.

This policy split the ranks of the CPT and led to a popular unrest in Dushanbe in 1990. Although the CPT won parliamentary elections in 1990 and its representative, Rahmon Nabyev, won presidential elections, the opposition refused to recognize the results. On the eve of its independence, Tajikistan was sliding into a civil war.

### Late Twentieth and Early Twenty-First Century Developments

Tajikistan declared its independence from the USSR on September 9, 1991. The conservative government resisted any kind of radical political and economic reforms and stuck to the Soviet era policies and ideology. In 1992, the civil war, fueled by a regional rivalry and growing Islamic radicalism, broke out in Tajikistan and led to the ousting of President Nabyev. After numerous clashes in which both sides—the government and the opposition—destroyed infrastructure, properties, and irrigation systems, a coalition of regional elites installed Imomali Rakhmonov as the head of the parliament. In 1994, he won the presidential elections. In 1997, with Russian assistance, he managed to end the war after signing a peace accord with the United Tajik Opposition (UTO). The agreement granted the UTO several governmental positions. In the bitter contested presidential elections of 1999, the UTO candidate lost to President Rakhmonov.

Since 1997, the Tajikistan's government has adopted a program of postwar economic reconstruction focusing on restoration of major sectors of the economy and achieving food self-efficiency. The government welcomes private initiatives, promotes liberalization of its trade, and has opened up the national economy to international investment. It was among the last CIS states to introduce its national currency, the somoni, in October 2000. According to the World Bank, Tajikistan's economy declined at an average annual rate of 10% between 1990 and 2000 due to devastating effects of the civil war. The country increasingly relies on the export of raw materials to the international market, especially aluminum, cotton, and fruits. The country needs considerable foreign direct investments and international assistance to modernize existing technologies and to conduct major economic changes.

Agriculture, industries, and services are the three main pillars of the modern Tajikistan's economy, contributing 19.4, 25.7, and 54.9%, respectively, to the gross domestic product (GDP) (World Bank, 2001 estimate). The country depends heavily on imports of

machinery, fuel, industrial consumer goods, and food products. In 1999 and 2000, the national government appealed to the international community for food assistance, as its population faced hunger and starvation from the devastating drought. Total external debt reached \$922 million (USD) in 2001, and it is expected to grow in the near future.

Due to the civil war and difficulties of postwar reconciliation, there was a steady decline in living standards among all groups of the population, especially women and children. The country remains the poorest country in the former Soviet Union, with average monthly wages equal to \$12 to \$15 USD and with 83% of the population living below the poverty line (World Bank 2001 estimate). At least fifty thousand people per annum leave for other countries in a search for jobs and better standards of living. In 2001, the United Nations Development Programme's (UNDP's) Human Development Index (HDI) put Tajikistan in 103rd place out of 162, behind all the former Soviet countries.

## TALIBAN

The Taliban is a fundamentalist Islamic movement that came to power in the chaos of Afghanistan in the years after the Soviet occupation (1979–1989). The group's most notorious act was to have provided safe havens for Osama bin Laden and his al-Qaeda terrorist organization after the attacks of September 11, 2001 against the United States' World Trade Center in New York and Pentagon in Washington, DC.

## Background

In the 1970s, Afghanistan was a client state of the Soviet Union. Unsatisfied with the leadership of its client, the Soviets staged an invasion on Christmas Eve 1979 and put in place a more compliant government. This brutal invasion inspired a widespread revolt against the Soviet presence. A guerilla war against the Soviets went on for ten years. The guerillas were supported by Islamic states around the world (as well as by the United States, which provided covert aid to the anti-Soviet fighters). The fighters in this war, many of them volunteers from the Islamic world, called themselves *mujahideen* (holy warriors). The war did immense damage to Afghanistan, killing hundreds of thousands and leaving millions homeless. The war also radicalized Islamic extremists who saw the guerilla wars in Afghanistan as part of a larger war between Islamic values and corrupt foreign ideologies.

By the late 1980s, the Soviets had decided that the war in Afghanistan could not be won. In 1989, they pulled out their troops. The Soviet defeat, however, did not end the fighting in Afghanistan. The *mujahideen* spent three more years fighting against the pro-Soviet government that remained in place, finally defeating it in 1992. They then fought amongst themselves as different factions of the *mujahideen*, each backing a different leader and fighting over control of the country. It was in this context of more than a dozen years of turmoil that the Taliban rose to power.

The word Taliban comes from the Arabic word for student, "talib," combined with the Persian plural suffix "-an." This name is appropriate because the Taliban began as a student movement. The roots of the Taliban's ideology are in India. In the nineteenth century, a conservative Islamic movement arose called the Deobandi Movement, named after the Indian town of Deoband, in which its most famous learning center was located. Deobandi *madrassas* (religious schools) taught a very traditional interpretation of Islam in which modern education was disparaged and women were placed in a strongly subservient role. Deobandi-style *madrassas* spread across South Asia but were particularly prominent and influential in Pakistan, a country to which many Afghans had fled during the ongoing wars in their country. Many Afghani returned to their country after spending time in these *madrassas* and were strongly committed to bringing about a traditional Islamic state in their homeland. Starting in 1994 in the southern province of Kandahar, a group of these Deobandi-inspired Afghan students began the Taliban movement.

The students' attempt to retake the country received broad support from many people in Afghanistan who

were tired of the constant fighting between various *mujahideen* warlords. The Taliban was also aided in its rise to power by early financial support from Osama bin Laden, a wealthy Saudi who had dedicated his life to Islamic holy war. From a small group of men, the Taliban quickly expanded into a nationwide movement and spread across the country, defeating most of the Afghan warlords (many of whose troops deserted wholesale to the Taliban forces). By 1999, the group controlled 95% of the country (a small area remained under the control of the opposition warlord named Ahmad Shah Massoud). Afghanistan's civil war was largely over, and the country's new rulers were the Taliban forces.

### **Afghanistan Under the Taliban**

Following ideological roots, the Taliban set about imposing its interpretation of Islam on Afghanistan. Under the leadership of Mullah Muhammad Omar, the Taliban forces attacked anything they interpreted as not in accord with traditional Islamic values. They banned television, ordered men to grow traditionally long beards, and attacked non-Muslim religious symbols. The most infamous of these attacks was the March 2001 destruction of the Bamiyan Buddhas, giant statues carved into a mountainside that were at least 1,500 years old.

The Taliban also targeted the producers of opium and heroin in Afghanistan (both drugs are derived from the poppy plant, which is easily grown in Afghanistan's climate). The Taliban's strict adherence to the Koran, and the group's ruthless methods, led it to successfully ban the opium and heroin trade in Afghanistan. Although this was supported by some foreign anti-drug organizations, it had a negative effect on many Afghans because heroin export was one of their main sources of income.

A key group victimized by Taliban orthodoxy was Afghan women. The Taliban decreed that women be covered from head to toe in a traditional black robe called a chador. Women who wore high heels under their robes were beaten. Most damagingly, women were forced to quit their jobs. In a poor country where many men were dead after the years of fighting and where women were therefore often the primary income earners, this decree was economically devastating. The Taliban's restrictions also extended to young girls who were forbidden from attending school (Deoband orthodoxy argued that girls needed no education after the age of eight).

The Taliban's narrow-minded religious attitudes hampered efforts of international aid organizations

that were making efforts to rebuild the war-shattered country. Female aid workers were often harassed, and some organizations responded by withdrawing their employees. Even those organizations that stayed found it difficult to raise funds for a country that had such anti-Western beliefs.

The Taliban also allied itself with forces hostile to the United States, most notoriously Osama bin Laden. Bin Laden was a close confidant of Afghan leader Mullah Omar and was allowed to establish bases and training camps for his al-Qaeda organization in Afghanistan. By 2001, Afghanistan had become the primary base of bin Laden and al-Qaeda.

Many Afghans were unhappy with the Taliban. Its extremist policies did not suit Afghanistan's relatively more relaxed attitudes toward Islam. Afghanistan's many ethnic minorities also were disturbed by the Taliban's tendency to favor the Pashtun over other ethnic groups. Kandahar, where the Taliban gained their first foothold, was dominated by ethnic Pashtun. The inability of the Taliban to relieve Afghanistan's desperate poverty also alienated many people. Nevertheless, the Taliban had many supporters among conservative Muslims and Pashtun chauvinists.

### **The United States Intervention**

The Taliban's support for bin Laden and al-Qaeda became fatally important after the September 11, 2001, terrorist attacks against the United States. President George Bush, with widespread international support, held the Taliban government partially responsible for the attacks because of its support for Bin Laden. The Taliban refused US demands that bin Laden be extradited for his responsibility in the September 11 attacks. President Bush responded by ordering US forces to overthrow the Taliban. The United States was aided in its efforts by Ahmad Shah Massoud and his Northern Alliance, which had never given up in its war against the Taliban. Backed by heavy US air power and a small number of elite US troops, the Northern Alliance was able to come down out of its strongholds and retake the country in a few months. US bombing began in early October, and by December 7, the Taliban had lost their final base in Kandahar.

Although the US-aided attack was able to overthrow the Taliban, it did not succeed in capturing bin Laden, who was believed to have escaped into the mountainous regions of neighboring Pakistan. Pakistan's government had been one of the Taliban's few international supporters (along with Saudi Arabia). After September 11, Pakistan became officially hostile

## TALIBAN

to the Taliban, but many Pakistanis, including some government officials, were still sympathetic to both the Taliban and Osama bin Laden.

Under US supervision, but also with extensive help from the rest of the international community, a coalition of Afghan groups met in Bonn, Germany, and agreed to the creation of a coalition government. Hamid Karzai was elected president of the first post-Taliban government by representatives from around the country. Karzai was reelected in October 2004 in the new Afghanistan's first national elections (in contrast with the Taliban's attitudes toward women, Karzai's government included three women ministers).

The new Afghan government faced significant challenges, including a country still devastated by war, regional warlords who were reluctant to share power with the central government, and a Taliban force that still had not completely admitted defeat. Thousands of US and other foreign troops continued to operate in Afghanistan, helping Karzai's government to maintain order and track down still active bands of Taliban guerillas. The Taliban's period of rule had left impoverished the country, but some Afghans, particularly in the southern areas, remained sympathetic to its conservative Islamic ideology. The hostility to the presence of foreigners on Afghan soil also helped to give Taliban insurgents some popular support. Even after the 2004 elections, Taliban attacks, particularly in hard-to-reach rural areas, remained a serious problem.

Most Afghans, however, seemed to be generally relieved to be free from the Taliban's onerous restrictions and religious rulings. Taliban government bodies, like the Department to Prevent Vice, were replaced by schools and hospitals (funded, in part, by more than \$2 billion of international aid). A dark lining to this silver cloud is the resurgence of the heroin trade. In 2004, freed from the Taliban's antidrug policies, Afghanistan again became the world's number one exporter of heroin.

## TANZANIA

### Geography, Topography, and Climate

Tanzania consists of Tanganyika, on the African mainland, and the offshore islands of Zanzibar and Pemba. The country is situated in East Africa, bordered by the Indian Ocean to the east and by Lake Tanganyika to the west, and comprises 945,087 square kilometres. From the coast, it rises to high plateaus and mountainous regions. The climate is heavily influenced by the monsoon seasons. The coast has a tropical climate with an annual rainfall of approximately one thousand millimetres, while the highlands have a moderate climate with an annual rainfall of approximately two thousand millimetres. Ecological conditions limit agriculture to a relatively small section of the country.

### Historic Past and Economic Situation

Tanzania is inhabited by the Bantu peoples, with Indian and Arab minorities on the coast. From the first century CE onward, the coast and the islands have had commercial contacts with the Middle East. In part, this has led to the near total Islamization of the coast and islands. Main export goods were raw materials, such as ivory. The coast was occupied by the Portuguese from the beginning of the sixteenth to the middle of the eighteenth centuries and thereafter by the Omanis, many of whom settled on Zanzibar. In 1884, the Germans claimed formal possession of Tanganyika, and in 1890, the British became the hegemonial power in the Omani Sultanate of Zanzibar. After the First World War, Britain received a League of Nations mandate for Tanganyika.

In the 1920s Africans founded local welfare societies to help those whose livelihoods suffered under the colonial economy. One of these societies, the Tanganyika African Association (TAA), gained influence throughout the whole territory. In April 1953, the teacher Julius K. Nyerere was elected president of the TAA. Together with other young Nationalists, he founded the Tanganyika African National Union (TANU) in 1954. The focus of TANU's program was the fight for independence and the establishment of a

democratic state. TANU grew rapidly and became influential in the entire country. Pressure on the colonial government grew; in September 1958 and February 1959, TANU had to concede elections for African members for the Legislative Council, which were overwhelmingly won by TANU. The first free, common and equal elections in 1962 were also won by TANU with an absolute majority.

Tanganyika became independent in 1961 and Zanzibar in 1963; in 1964, Tanganyika and Zanzibar merged into the United Republic of Tanzania. The republic was ruled as a one-party state by Julius Nyerere and TANU. In 1977, TANU and the Afro-Shirazi Party (ASP), which had ruled Zanzibar under the auspices of TANU, formed the Revolutionary Party or *Chama cha Mapinduzi* (CCM). Nyerere surrendered office to his Vice President Hassan Ali Mwinyi in 1985, who ruled Tanzania until 1995. In 1990, the government officially sanctioned political debate on multiparty democracy as an alternative to continued one-party rule by the CCM. This one-party rule had led to a bureaucratic paralysis, though the population largely accepted this. In 1992, Tanzania changed its constitution and introduced a multiparty system. This transition was executed in an orderly fashion. In October 1995, multiparty legislative elections were held for the first time. The CCM achieved a significant majority, particularly because of their omnipresence in the political and social sectors and because the new political parties and their candidates remained weak. Benjamin Mkapa of the CCM was elected President and was easily reelected in October 2000.

Tanzania's economy is still predominantly dependent on agriculture. Main export goods are coffee, cotton, tobacco, and sisal. Main trading partners are the United Kingdom, France, Japan, and India. The government seeks to maintain macroeconomic stability and has received good marks from the donor community for its economic and administrative reform efforts. Foreign direct investment into the industrial sector is relatively high. Significant efforts are being made to develop tourism. However, the disastrous economic and social situations of vast parts of the population have not improved and continue to show a downward tendency. Many people earn their living in the informal sector. The situation has been aggravated by the privatisation of state enterprises, which has resulted in job losses. In addition, occasional droughts have reduced agricultural production and have served to aggravate the already precarious situation. As such, Tanzania is still one of the poorest countries in the world.

The gross domestic product (GDP) per capita was estimated at \$600 (USD) in 2003; the labor force occupation in 2002 included agriculture (80%) and

industry and services (20%). The infant mortality rate was estimated at 102.13 deaths per 1,000 live births in 2004. Life expectancy of the total population amounts to 44.39 years (2004). The HIV/AIDS rate in the country is high: the prevalence of the disease amongst adults was 7.8% (1.5 million people in 2001). In 2001, approximately 140,000 Tanzanians died of AIDS. The *CIA Fact Book* (2003) estimates that 78.2% of the total population aged fifteen and over can read and write English, Swahili, or Arabic.

## Economic and Civil Development Since 1945

In 1945, Africans were nominated for the first time to the Legislative Council in Tanganyika, through which the British administration maintained political control. The number of African members was subsequently increased from two to four, with three unofficial Asian members and four European members. During the second half of the 1950s, the influence of TANU in the council increased considerably, partially through effective co-optation of the Asian minority. In September 1960, a predominantly TANU government took office.

On Zanzibar, only the Europeans and Arabs were represented in the Legislative Council. Though a reform of the Council took place in the mid-1950s, the unrest among local African and Arab political circles increased and was channeled into the formation of political parties. The first was the mostly Arab Zanzibar Nationalist Party (ZNP) created in 1955, whose political program was modeled on the Marxist/Pan-Arabist regime in Egypt. In 1957, the more moderate Afro-Shirazi Party (ASP) was founded. Subsequently, the Zanzibar and Pemba Peoples' Party (ZPPP) splintered off from the ASP. The British finally agreed to allow free elections for six of the seats in the Legislative Council. The elections took place in July 1957; the ASP won five seats, and the small Muslim League won the sixth seat. The ethnic and political hostility among the parties continued to grow, however, and manifested itself especially in the form of the mutual boycotting of the one party by the other. The elections of January 1961 produced a deadlock because of the twenty-two seats; the ASP and ZNP each occupied eleven. New elections took place in June, with the ZNP and ZPPP forming an election coalition. Favoured by the majority voting system, the coalition won thirteen seats and the ASP only ten, though the ASP had the most votes. The ASP smelled electoral fraud; fighting broke out, leaving sixty-eight people dead. The last preindependence elections, which took place in June 1963, confirmed the results of 1961, even

though the ASP again topped the list. In December 1963, Zanzibar became independent under a ZNP/ZPPP government, which, however, was swept away by a “revolution” in January 1964. This revolution was mainly pursued by the ASP under Sheikh Karume, who expelled the Sultan and many Arabs and Indians from the island. TANU and ASP, which had maintained friendly relations since the struggle for independence, formed Tanganyika and Zanzibar into a union on April 26, 1964. However, Zanzibar remained relatively autonomous in respect to its domestic affairs.

Immediately following Tanganyika’s independence, efforts were made to implement a program that depended on foreign investment to support massive, capital-intensive industrialization and agricultural development projects. From 1961 to 1965, the number of manufacturing establishments employing ten people or more increased by almost 160%. However, Tanzania’s economy was mainly governed by the still-existing colonial-style economic structures, namely large tea, sisal, and cotton plantations producing for the European markets. These structures supported a pattern of investment and income distribution that favoured a small number of farmers and foreign entrepreneurs. On the other hand, Tanzania completely neglected its own national food requirements and the diversification of export products.

By the middle of the 1960s, it became apparent that the ambitious plans were not yielding anticipated results and that Tanzania’s economy had to rely mainly on foreign donors. Income differentials increased dramatically, rural-based development was ignored, and local expertise remained inadequate. Facing these imbalances, President Nyerere launched a Socialist development agenda in 1967, outlined in the so-called Arusha Declaration. Priority was now given to the state-controlled development of the agricultural sector through *Ujamaa Vijijini* (Socialism in the Villages). Peasants were moved to newly constructed settlements to promote efficient agricultural production; foreign investment was discouraged to limit the dependence on outside help. These policies of self-reliance, however, provoked a long-term economic downswing and macroeconomic imbalances: since every domestic demand was to be fulfilled by domestic production, Tanzania forced its withdrawal from international markets. Outside factors like severe price fluctuations for coffee on the world market and two oil-price shocks (1973–1974 and 1979) worsened the situation. When the *Ujamaa* policies failed to produce the desired results, Tanzania found itself in a serious economic crisis in the early 1980s. However, by leveling the potentially divisive array of social groups and by promoting Swahili as a national language, *Ujamaa* made Tanzania one of the few African countries that

remained relatively undisturbed by ethnic, racial, and religious conflicts.

In 1986, the newly appointed CCM government under President Mwinyi embarked on a broad-based Economic Recovery Programme supported by the International Monetary Fund (IMF) and the World Bank. The statist *Ujamaa* orientation was gradually abandoned in favour of a market-oriented approach, and the government started to sell off some of its many parastatals.

Once Tanzania changed its constitution and introduced a multiparty system in 1992, the first multiparty elections were held in 1995, first on the islands of Zanzibar and Pemba and then on the mainland. To a high degree, the elections on Zanzibar revolved around the issue of future relations between the islands and the mainland. The ruling party, the CCM, stood for the continuation of the Union status quo, while the Zanzibarian Civic United Front (CUF) wanted greater independence for Zanzibar within the Union. CCM won twenty-six seats in Zanzibar’s Parliament against CUF’s twenty-four. Subsequently, the CCM was accused by CUF of electoral fraud, and foreign observers reported irregularities. For example, in some constituencies, the numbers of votes were counted higher than the number of registered voters. The elections on the mainland were clearly won by the CCM.

The new President, Benjamin Mkapa, represented a break with the past. In accordance with the IMF, he launched reforms aiming at increasing the effectiveness of fiscal policy, promoting the private sector by deregulating investments, divesting parastatals, and paying more attention to basic health care and infrastructure. In 1996, the IMF approved a three-year credit. Though Tanzania still enjoys political stability, the steady growth of the private economical sector and successive job losses endanger the social cohesion of the country. Moreover, in the wake of the formation of political parties, ethnic and religious tensions have increased. In particular, Indians have been under frequent verbal attack by opposition parties on the mainland. For example, in January 1993, the leader of the Democratic Party (DP), Christopher Mtikila, utilizing African resentments against the Asian residents, stirred up aggression against the Asian Tanzanians by accusing them of economically exploiting the African majority. Violence immediately followed Mtikila’s campaign, and Indian Tanzanians were physically attacked by DP supporters.

The Muslim-Christian divide within the Union shows signs of widening because of Zanzibar’s strife for more independence from the Christian-dominated mainland. There exists growing dissatisfaction of African Muslims on the mainland in regard to their continuing discrimination in many sectors of life, and

there are a latent mixture of social problems and religious animosities. The general elections in October 2000 brought a convincing victory for Mkapa and the CCM on the mainland, while the CCM victory on Zanzibar was again suspected by the CUF and foreign observers to have been doctored by the election committee. Subsequent outbreaks of violence by CUF supporters and bomb threats create a tense atmosphere on both the islands and the mainland.

## TECHNOLOGY: IMPACT ON DEVELOPMENT

### The Premises of Transferring Technology and Economic Development

J. Schumpeter (1939), who states that the main cause of the 1929 Depression was too-sudden economic growth, was inspired by the ideas of the economist C. Juglar (1862). As a matter of fact, the rapid increase of entrepreneurs led to the decrease of profits, and when the export markets were overloaded, incentives for innovation dramatically declined; then depression set in. The new phase of economic expansion would begin only with the emergence of new markets, followed by innovations. J. Schumpeter (1954) considers that profit seeking is the heart of the capitalistic system's growth. Profit is the reward of the dynamic and innovative entrepreneur. Profit seeking is thus the

motivator of technological progress, which is the engine of growth. Irregularities in technological progress explain the irregularities in economic growth. Then, innovation develops best in clusters, where complementary innovations bring the dynamic of economic growth. For R. Solow (1956), technological progress comes about with the increase of population, which then increases the work factor; thus, technological progress sustains the rhythm of economic growth. Solow states that these two factors are exogenous: (i) technological progress and (ii) increase in population.

### Technological Progress and Technological Learning for Development

For his work on the Indian Economic Plan in the 1960s, A. Sen (1982) made technological choices, and these choices were represented by the intermediary choice of techniques in terms of capital intensity and were stated to maximize capital and labor strengths.

In general, the question of choice of technology led the economy in a specific direction that is called dualism, with its own distinction between technological progress in the traditional sector and technology in the modern sector. The modern sector has the capacity to attract capital and is characterized by a fixed coefficient of substitution between various sectors with more or fewer techniques incorporated according to the sector. These techniques are determined by the greater or lesser necessity of combining capital and labor resources; technological progress in this modern sector increases the capital-intensive sector. However, in the traditional sector, the production methods are more flexible. There can be substitutions between capital and labor resources. The dominant vision in the 1960s gave preference to technological progress that maximized the capital intensity of the product. This technological progress resulted in accelerating economic growth.

The economist F. Perroux (1961) in his book, *The Economy of the Twentieth Century*, explains that economic growth must not be confused with economic progress. According to the author, the evolution of society does not depend on the increase in the real revenue of the population but rather on living and social conditions, especially health, education, security, and freedom. Economic progress is linked to social progress and technological progress.

In the 1970s, the economic debate on technological progress was centered on the question of intermediate technologies, a question analyzed by I. Sachs (1980) in his book on ecodevelopment. Arguments continued with A. Emmanuel (1981); he analyzed

ecodevelopment with the use of appropriated technologies, mentioning the saving of nature and local technological capacity, enabling the selection of intermediate technologies. For both economists, ecodevelopment signifies respect toward the environment and traditions in an idyllic vision of village organization. Local and imported technology could act as a bridge between traditional and modern techniques and could result in appropriately adapted technology. These adapted technologies formed the pattern used in Southeast Asian countries at the end of the 1970s. But J. Galtung (1978), in his research paper for UNCTAD which became the highlight point for the researchers at the United Nations University, developed a new approach to economics in mentioning the necessary step toward an autonomous technology for developing countries that can lead to development and ecological balance.

Up to the 1980s, technological progress was considered to be an exogenous production factor, which means not being influenced by the behavior of economic agents, or resulted from economic activity. In the following decade, a neoclassical economic current suggests that technological progress and innovation are endogenous variables. Paul Romer (1986), in his article "Increasing Returns and Long-Run Growth," clearly stipulates that technological progress is a decisive factor of growth. In his article "Increasing Returns and New Development in the Theory of Growth," P. Romer (1991) mentions that technological progress is naturally endogenous because it is the result of the behavior of economic agents and especially the behavior of enterprises. As a result, state intervention is also considered to be more legitimate. Governments then support research and development, and technological progress is accepted as endogenous to the enterprise. Government has gained a new legitimacy in its intervention in business affairs, especially in the Newly Industrialized Economies; this new theory of growth comes with technological change and the right institutions. The New Theory of Growth tends to promote knowledge economy as the base to sustain economic growth.

Some economists mention that innovation is often the source of efficient specialization. When top companies are the only ones to master microchip production, they are the ones that particularly benefit because of their specialization and because of the strong demand for data-processing products. In the beginning of the 2000, this industry of high-added value, because of its great innovative capacity, could contribute to effective specialization in the home country and in the producing country.

If governments are to sustain technological progress, the question is: How can governments best

support technological progress? Technological progress is often the condition for the enterprise to maintain its quality competitiveness vis-à-vis its competitors in new promising markets, especially in East Asian countries.

The economic and technological interdependence in East Asia was an important background for the development of the New Industrialized Economies. Innovation was the most important point for the development of these economies, and each country was linked to the "dynamic regional system of innovation and technological learning" (Hobday, 1995). Direct investment and trade linkage to the technological system were the crucial points of the development of these economies. In East Asian countries, high technology start-up companies were the mainstay of frontier innovation. Governments of the East Asian countries were able to foster modern infrastructures to respond to companies that were involved in innovation.

The latecomers have passed through different stages of technological development. At the beginning, firms were producing labor-intensive products by means of joint ventures and subcontracting, and these arrangements were made mainly by Japanese companies and in a lesser degree by US and European firms. However, transnational companies were also attracted to East Asian countries for the reason of low labor costs. These latter companies supplied training and taught manufacturing processes to local engineers, who in turn trained local technicians.

Later, the same companies were set up to produce consumer electrical goods and electronic products. Some local companies at that time set up their own subsidiaries, becoming thus the supplier of transnational companies by upgrading their production process. Then, to meet more complex export demands, these firms were forced to acquire higher technological know-how. They learned to design products under Original Equipment Manufacture (OEM) arrangements. These new companies benefited from the improvement of transportation and communication infrastructures. Furthermore, they took advantage of a well-educated labor force.

Industrial and technological innovations were set up to further new opportunities. New suppliers for local companies learned new skills and responded positively to foreign investment. Technological advance and automation were improved particularly in Singapore; but as labor costs increased, companies relocated to technological parks, such as Batam.

Industrial structures, especially in the electronics industry, comprising transnational companies as well as smaller ones emerged. The vision of technological integration in East Asia was devised in Hong Kong through the interplay of technological learning and

practice by which firms acquired technological excellence. Firms, by this process, could increase their knowledge and improve the skills of their labor force.

The Hobday (2000) thesis was meant to show that the latecomer countries were able to upgrade their way of managing their economies by technological learning. This model consisted in bringing together industry, research, and technological learning to better their production system in stages. This model of the 1980s had to confront and replace the rigid traditional stages of development. In order to bring latecomer countries up to leader country standards, it was imperative to invent new products and simultaneously to combine innovative capacities, low-cost production facilities, and high-range niche markets.

The originality of East Asian subsidiaries was to link technology and export markets in such a way as to avoid technological bottlenecks in some export markets. Thus, the linkage of technological learning and market capabilities had so increased profit margins and markets that new products needed to be introduced through long-term investments in research and development.

This unique system of technological development through innovation in East Asian countries took center stage in development and research. Through the electronics industry, manufacturing technology could be mastered, thereby improving the process of technological production. This pattern of technological innovation is responsible for the dominant development of East Asian countries, through progressively updating the innovative capacities to take advantage of market opportunities.

### **Global Production Networking and Technological Change**

After the financial crisis of 1997, which badly disrupted the Asian and global economies, the process of technological advance and production networking started again under World Trade Organization (WTO) impetus. Furthermore, China's entry in the WTO was also an overriding factor for regional development and the setting up of international networks.

Firms that had developed the OEM have now risen to Original Design Manufacture (ODM) codes and even to Original Brand Manufacture status, which extend to global production networks.

These networks were implemented to level trade barriers; to consolidate such industries as electronics, engineering, and automotive; and to bring geographic proximity to markets. For instance, the production of trucks and passenger cars for East Asian markets has

shifted to Thailand, and now leading automotive companies are choosing China and to some extent Korea as the competitive hub for regional networking. Companies have favored China and Thailand because of lower costs and the better-educated labor force.

East Asian firms are responding to the changes in their market environment by using global production networks, the competitiveness of their technological capacities, and the increase in foreign direct investment.

The export-led growth of development in East Asian countries in the 1960s, spurred by the "Dragons," was followed by other newly industrialized countries (Yusuf, Altaf, and Nabeshima 2004a).

Japanese foreign direct investment and technology have largely stimulated an upward movement of Asian economies (Androuais 2003). Japanese international companies have, starting in the 1960s, built a regional division of labor that has consistently emphasized technology-intensive production in Asia to serve Japanese markets. The East Asian countries won the reputation of a politically stable region with an industrial performance coupled with export competitiveness, all of which has attracted foreign direct investment, especially from Japanese companies but also from US and European firms. By the 1980s, East Asian countries were drawn into an interregional network of trade and direct foreign investment.

Market deregulation and WTO rulings sustaining trade liberalization have favored high-range markets to improve the competitive level of technological changes. The integration of East Asian countries, including China, will extend the dynamics of trade liberalization both for exports and FDI, which in turn will aid the Asian firms to become a part of the global network of competitiveness and technological development.

If the newly industrialized Asian countries have already found the way to rapid industrialization, China is gaining technological capacities even more quickly than her neighbors. The increase of technological capacity is becoming urgent for the East Asian countries because they have to avoid the trap of low-level growth associated with light commodity production.

In the middle of the 1990s, a new element of information technology used in all transactions appeared in production networks, especially in the multinational firms. The assimilation of this new element has been particularly rapid because of the desire to dispatch new technology and establish technological mechanisms in the new markets. Information technology has reinforced competitiveness in the regional and global markets.

Some governments, such as in East Asian countries, have set up policies for the support of technological advance. The major condition required is an educated

labor force; labor migration of educated human capital is a factor in technological advance. In addition, private and public research institutions financed by subsidies, grants, and tax incentives are needed; and finally, technology transfer through foreign direct investment is required. Liberalization of economies is a necessary step for the increase of Research and Development (R&D) capacity (Yusuf, Altaf, and Nabeshima 2004b).

To innovate, sufficient capacity to assimilate and absorb new technology is a requisite. In an analytical framework for understanding the evolution of an innovation, it is essential to have a broad perspective on the economy (Tigre and O'Connor 2003). Then, to consider the innovation, three questions should be asked: (1) What difference will the innovation bring to economy at the national level? (2) What impact will the innovation have on the increase of income distribution and the reduction of poverty? (3) What measures are needed to implement the innovation?

In order to boost research and development, governments usually orient their efforts toward state-of-the-art technology. In technological change and innovation, it is important to work at the macroeconomic level concerning long-term economic development and the internationalization of an economy as well as at the microeconomic level within the firm. Different authors in the 1990s gave a definition of the new technology of knowledge (Kagami, Humphery, and Piore 1998) by singling out five main paths of technological acquisition for developing countries:

1. **Transfer of technology through foreign direct investment:** A multinational company establishes a branch in the developing country to produce, for example, electronic goods by assembling parts and components. Local industries provide the workforce that learns the new production methods, and then these local industries supply standardized parts and components. The multinational companies give on-the-job training to local workers for the assembling process, and the local technicians learn the production process and are aided by foreign technicians. With the new technology information, new forms of capital appear. Joint ventures employ this new technology, reduce costs, and bring up the level of technology in production know-how.
2. **Purchasing new technology:** Technology has a cost, and R&D workshops have to be organized. New technologies must be registered under local patent laws.
3. **Acquisition of new machines embodying new technology:** New machinery produces new products

in which are embedded innovative technologies. Moreover, developing countries disassemble new products and produce new copies equal to the original; this phenomenon is called "reverse engineering." As shown earlier, appropriate products were devised to facilitate the adaptation to local conditions; this process was hotly criticized by developed countries because of violation of industrial property rights and also criticized in developing countries because consumers wanted the upgraded products immediately.

4. **Catching-up efforts on the part of developing countries:** Domestic efforts can be divided into two forms, private sector initiatives and government support. In the private sector, new products are mainly the result of a combination of various factors, such as quality control, design and materials innovations, and management know-how. Foreign direct investment usually provides the major capital needed. As for government support, it is primarily in the form of R&D for the development and dissemination of technology through national institutions by direct financial support and subsidies.
5. **Technological cooperation through Official Development Assistance (ODA):** Other paths for technology transfer are provided by a multinational or binational cooperation. Governmental assistance in technology development takes different forms, such as constructing training centers, dispatching experts, providing financial assistance, and offering information services dealing with technology.

The new strategies for transferring technology in developing countries have had positive results. In the local subsidiaries, the level of skills and knowledge in the production process improved through the transfer of technology. Technology fostered small and medium enterprises to create supporting industries. Many governments in Southeast Asian countries have assisted these enterprises through various programs: (i) financial and fiscal support for new innovative businesses; (ii) assistance in basic technological development; (iii) horizontal networking among small and medium enterprises; and (iv) upgrading of skills.

### The Innovation Cluster Process

The cyclical characteristics of economic activity result from the fact that entrepreneurs tend to associate in new combinations called "innovation clusters,"

grouped around a major innovation or an important new niche. In the beginning of the twenty-first century, in the context of globalization, economists paid great attention to the impact of innovation on economic competitiveness. When state-of-the-art production is reached, innovation and a competitive quality-price ratio are conditions of survival for the company at the global level. Innovation also impacts quality competitiveness by improving product performance.

Spatial networks have been organized to accomplish different forms of clusters. It is possible to identify these clusters through different patterns of activity or innovative capacities. The major clusters benefit from the reduction of distance-related costs and from internalizing the stationary external savings. New forms of clusters are taking place that favor interchanges between local firms and universities.

Another type of effective cluster involves the export-processing zones that exist in developing countries; but these clusters cannot be fully integrated into the local economy because they are merely enclaves and are not linked to the rest of the region. The last type of cluster takes form in science and technology parks; its infrastructure and technological orientation have to generate human resources, knowledge, and capital. This type of cluster is engaged in resource, market, and investment seeking. The best examples are the technological Batam Park in the Riau archipelago of the transboundary experiment of Singapore and Johor as well as the software cluster in Bangalore.

The first growth triangle was established in the Singapore-Johor-Riau archipelago in 1989, combining three competitive areas to attract regional and international investors to the subregion. Three geographic points formed this joint development: Singapore because of its technological and industrial infrastructure that attracted multinational companies; Johor because of its water resources and its proximity to and traditional links with Singapore; and Batam (Riau) because of its ability to profit from the new liberalization of India and attract foreign investments (Chia Siow Yue 1997).

A few years later, the Indonesia-Malaysia-Singapore (IMS) growth triangle (GT) was formed. It was a new form of subregional economic cooperation in the Association of Southeast Asian Nations (ASEAN) countries. This form of cooperation was set up to establish industrial cooperation programs and to enhance their economic clout. The IMS-GT has strengthened the economic complementarities and geographical proximity. This form of subregional process has developed factor endowments, competitive advantages, research allocation, and reduction of costs, all at different levels. The system has enhanced the clustering effect in the region and has developed

infrastructures in commerce, finance, transportation, and telecommunications. It has also, because of the participating governments, organized the education and training of a high quality labor force.

These joint ventures brought about greater cooperation between Indian and foreign software companies. The main elements promoting hi-tech clusters (Saxenian 1983) have been identified by regional economists (Krugman 1992). In the case of Bangalore, engineers came to live in the city next to the university and established links with companies in the software and computer industry. At the same time, state-owned companies in the communications, machine tools, and electronics industries set up research institutions. These combinations have fostered the growth of hi-tech software clusters. High technology parks have also been set up in Bangalore, benefiting from fiscal incentives to attract the most highly reputed firms, which, in turn, attract the best-educated engineers.

Transport cost reduction is also an important element of the cluster concept. Concentration in a specific location gives advantages in cost reduction. Information is transferred globally in real time by satellite between Bangalore enterprises and client companies (Dunning 2002). This software cluster in the city of Bangalore was able to attract a number of knowledge-related industries and succeeded in becoming less isolated because of its networking and the development of its computer software industry that broke into the global economy. The software cluster is designed for human-resource-intensive and knowledge-oriented industry. In Bangalore, clusters consist mainly of the electronics industry, small and medium companies, subsidiaries of larger companies, and joint ventures that were set up in the mid-1990s.

Another example of a knowledge-based economy is in Hong Kong, which has developed a finance and information center for both local and multinational firms. Moreover, Hong Kong has forged linkage with other Asian economies. Its cluster economy, knowledge intensive and research centered, has developed in spite of lack of clear governmental policies. This form of cluster is able to intensify competitive advantage and link the globalization-localization characteristics in the economy.

Because of its cluster economy, beginning in 1995, Hong Kong has surpassed its small-scale geographic situation and has become a motor in the regional economy. Hong Kong's cluster economy has served as a magnet for foreign firms. Although Hong Kong is an enclave, its competitive clusters have evolved from its knowledge-based economy.

In most clusters, cross-border labor flow has contributed to the success of the enterprises. In their field work for the Japan Bank for International

Cooperation, M. Hafiz M., A. Giroud, and K. Koster wrote in 2001 that “the multinational firms have been useful routes for transferring knowledge to East Asian and Southeast Asian workers and companies.” However, this transfer was not done in an automatic way because on the one hand, the multinational firms were not delivering enough technology, and on the other hand, the local companies were not absorbing the transferred technology, meaning that more significant efforts have to be made for improving the transfer of knowledge. Furthermore, recently specific recommendations associated with the transfer of technology through foreign direct investments have been set up to improve mechanisms and find ways for reducing poverty in poor countries in such a way that they can learn from the experience of the new industrialized economies (NIES). Other studies have been started in the form of questionnaire surveys and used to complete research work on the transfer of technology affected by multinational firms. For instance, the surveys conducted in multinational firms in ASEAN countries point out that they need an incentive to establish good-quality support industries for creating an enabling environment for foreign direct investment (FDI). ASEAN countries request the support of multinational institutions especially because of the competitive companies from China in the region. The knowledge-technology base of the ASEAN firms need quite a boost, and multinational firms are able to assist in the transfer of technology.

Case studies, made in Brazil and South Korea, show that innovative products and cluster processes were competitive in the domestic and export markets (Mytelka 1999). But in the two countries, the reasons for innovation linked to competitiveness are different, especially regarding telecommunication products. Mytelka presents five factors to explain the differences between the two countries: (i) opportunities and constraints imposed by the evolution of world technology; (ii) evolution of the characteristics of international competitiveness in the telecommunications sector; (iii) structure of the telecommunications supply sector and enterprises that form the national telecommunications network; (iv) traditional practice of local enterprises in terms of competitiveness and innovation; and (v) impact of governmental actions.

### **Concluding Remarks: Competitive Environment for Technology and Challenges**

Even in highly protected national markets, the new digital technology has rapidly spread in spite of high R&D costs. This new technology encouraged

numerous start-ups in the 1980s and has contributed to modifying production, leading to other advanced techniques and giving developing countries access to these techniques. A competitive environment accelerated the phenomena although national telecommunications monopolies initially constituted an obstacle for the start-ups. Investment in telecommunications equipment, special rules for bidding, and protective practices stimulated local efforts for R&D.

Although technology has a central place in Asian and Pacific economies, poverty has not yet been completely eradicated and remains one of the biggest challenges for these economies (Braga and Chino, 2002). Technological impetus has improved nutrition, health, and livelihood, but some regions and various social groups remain excluded from this promise and progress. Their needs are better addressed because of the diffusion of information technology, and in the twenty-first century, they will hopefully be able to get access to this form of technology.

## TERRITORIAL DISPUTES

Territorial disputes can be defined as conflicting claims over a territory between states or groups being on opposite footing, often recognized as warring parties. The parties are usually states recognized by each other, but frequently one of them is a national community or regional population that had prior statehood on the disputed land (such as Tibet) that is no longer recognized by the occupying power (such as by China). In other cases, the dispute is between a state (Sri Lanka) and a secessionist group that can have or even not have some of the disputed territory under control (such as the group of Tamil Tigers). In other cases, both parties claim exclusive rights on the territory that they possess or control partially (the Koreans). The material object of this political and legal dispute is a territory consisting either exclusively of land or

sea, or the territory has both, such as islands and their surrounding sea (Falklands). Otherwise, the territory's composition may include fresh water surfaces on border lakes and rivers (the Aral Sea or the Danube).

The legal object is the possession or control of such territories for geostrategic, economic, historical, or purely political reasons. Strategic reasons include the right of passage and therefore the right to levy taxes on through traffic (Suez canal, Panama Canal, airspace over the territory), to extend the territorial waters for defense purposes, to extend exclusive mining rights over the continental shelf by the coastal country, or to exert exclusive fishing rights or control of the fishing activities of other countries in the disputed sea area.

Exclusive economic reasons explain the disputes over regions with huge natural resources like fertile farmland, oil, gas, timber, or fresh water (such as from the rivers Tigris, Euphrates, Jordan, Danube, or Ganges). Mixed reasons include the existence of the same or similar ethnicity population (Russians, Slavs, or Kurds), the presence of those with the same religion (Muslims of Kashmir), or the prior statehood over that land (Turkey, Hungary, Greece, or Ecuador). Claims may be open (Palestine) or hidden where the parties try to avoid open confrontation because they fear direct war or negative international reactions (Europe), leading to isolation and subsequently imposed political and economic sanctions. The latter are used many times to deter a party to abandon its claims (such as South Africa in the case of Namibia, Yugoslavia and Serbia in case of Croatia, or Bosnia).

Religion was a major cause of territory disputes during the history leading to crusades, with the *Dzhahads* aiming at control of the Holy Land, Palestine, which is considered the birthplace of many religions. In other cases, the extension of that religion served as a political justification for conquering large territories (Spain for Latin-America, Russia for Eastern Europe and Siberia, or the Arabs for the Middle -East and North Africa). After the nineteenth- and twentieth-century emergence of nationalism, religion became the driving force behind the claims of new territories (Romania, Serbia, and Bulgaria due to Arab and Jewish nationalism) or reclaiming previously lost territories (Germany, Ethiopia, Bolivia, and Japan). The drive for asserting previously lost independence was also a factor in claiming territories (such as in Poland, Ukraine, India, or Vietnam). This claim might have been directed toward one state (Ottoman, Russian, British, French, or Spanish empires) or more states at the same time. In many cases, territorial disputes arouse from contractual ambiguity (the main stream of the river, which changes over time, such as the Danube) concerning boundaries drawn only on the

## TERRITORIAL DISPUTES

map a very long time ago whose exact location is disputed (Persian Gulf states, Latin America countries) or concerning borders through uninhabited and uniform areas, like plains, deserts, jungles, seas, where there are no natural demarcation objects (such as Arabia, Amazonas basin, sea boundaries). Territorial disputes are the most frequent causes of modern day wars (Falklands), and if direct confrontation is too risky for one of the parties because of a lack of adequate military power, terrorism may replace usual military actions (Basque country, Palestine, Chechnya). With terrorism, usually nonstate entities try to influence the leading politicians of the decisive powers (United States, former colonial powers within the European Union (EU), Russia, China, India, or Australia); to influence states having military might (United States, France, or United Kingdom) to withdraw troops (from Iraq, Algeria, Northern Ireland); or to exert pressure on another state to withdraw its troops (Israel, Indonesia). By invasion, a party in a territorial dispute asserts its imagined or real sovereignty over that territory (Iranjaya, Falklands, Cyprus, Aksai-Chin, West Bank of the Jordan River, Golan Heights) in spite of the fact that international law in general and the United Nations charter condemns such actions or threats with the use of force. For the great powers, condemnation is almost absolute for annexations of territories and crushing of political independence of a sovereign country, principles largely ignored.

### Europe

Europe is full of hidden claims—irrespective to the developmental stage of the parties involved. These are based on ethnic, historical, and cultural identity reasons and on nationalism, but nonetheless many have great economic implications. Among the less developed countries, the most virulent disputes arose after the breakup of the Socialist Yugoslavia. The Serbian-Croatian and Bosnian wars served also to define the territorial extent of the newly independent nations as well as to gain as much territory and hence economic power as possible to the detriment of the others. Finally, the administrative boundaries of the former federation have survived, but the disputes have remained.

The most active one concerns the 90% ethnic-Albanian province of Kosovo, which is ardently disputed between Serbia and the local Albanian community. Albanian majority areas neighboring the Albanian border are looking for independence and possibly a later union with the fatherland. Greece and Bulgaria and Serbia are disputing over Macedonia. Greece also

fears possible future territorial claims from an independent Slavic Macedonia on the neighboring Greek province of lower or maritime Macedonia.

Morocco continues to dispute existing Spanish sovereignty over strategic harbors situated on the African (Moroccan) mainland—Ceuta and Melilla, occupied by Spain during the reconquista from the Muslims—and also a small uninhabited rock called Isla Perejil near the Gibraltar strait. Finland has a hidden claim on eastern Karelia, while the ethnic Swedish Alands islands look for more autonomy or even independence from Finland. Border and water management disputes arose between Slovakia and Hungary, Romania, and Ukraine on the Danube. Slovakia unilaterally diverted the Danube in the 1990s for hydroelectric power-generation purposes, and the Ukraine has challenged the Romanian monopoly over Danubian access routes to the Black Sea; in 2004, the Ukraine started to deepen the Chilia border branch of the river.

Turkey has many disputed areas along or inside its borders. It has an inactive claim over minority ethnic Turkish areas of Bulgaria near Istanbul as well as a longstanding dispute concerning the Aegean continental shelf and the pertaining territorial waters, disputes that have twice almost led to war with Greece. After 1923, the Turkish-Greek territorial dispute was focused on Cyprus, which sought union with Greece in a Pan-Hellenic upheaval of the 1970s. To protect its 28% Turkish community, Turkey had invaded Northern Cyprus in 1974, which led to the creation of two puppet states that have been unrecognized mutually. Due to Greek intrigue and Turkish reluctance, the reunification of Cyprus as a federal state was aborted; thus, only the bigger, internationally recognized Greek part joined the EU in 2004, leaving the Turkish part on the sidewalk of the European development.

In eastern Europe after the collapse of the Soviet Union, disputes flared up between and among the successor and former satellite states. The most recent one, between Romania and Ukraine, concerns the Black Sea border and the ownership of the Snake Island, adding to the existing conflict regarding Ukrainian border areas: Northern Bucovina and the small Hertza regions. These and the state of Moldavia are secretly claimed by Romania more or less on ethnic, nationalistic, and historical grounds. Although made artificially part of Moldavia, the secessionist region of Transnistria with its 60% Slavic majority is also claimed by Moldavia and subsequently by Romania. The self-proclaimed Republic of Transnistria is an ideal strategic area for Russia, and in case of annexation attempts coming from the West, the region will surely join Ukraine or choose independence. A bitter and longstanding but now inactive dispute exists over

Transylvania, or at least parts of it, between Hungary and Romania on historical, economic, and ethnic grounds. Hidden claims have also been made for the ethnic Hungarian majority regions along the newly Serbian, Ukrainian, and Slovakian, and former Hungarian territories until 1945. Similar inactive claims also concern former Polish territories in the Ukraine and Belarus.

Ukraine and Byelorussia is entirely and secretly claimed by Russia on historical, economic, and Slavic kinship or “brotherhood” grounds. Russia alternatively looks to form a confederation with these core elements of the former Soviet empire, including the 40% Russian-populated Kazakhstan, to form a “Russian” or “Eurasian” economic union. Thus, almost every valuable region of the former USSR would have been saved, including the nuclear testing facility of Semipalatinsk and the cosmic launch center of Baikonur, both on rent from Kazakhstan. Russia would eventually leave Ukraine to break off and subsequently seize the pro-Russian part of the country. Especially disputed seems to be the Russian-majority Donetsk coal-mining region and the Crimea, where an autonomous Russian republic exists. The countrywide 19% Russian minority forms in Crimea an 80% settler majority, which is a strategic peninsula for international trade and military control of the Black Sea. Sevastopol is the location of the Russian Black Sea Fleet’s naval base, now on rent from Ukraine, and this nearly 3 million person republic asserts openly its Russian legacy and allegiance, leaving almost hopeless the 10% Crimean Tatar community’s claim for resettlement and eventual establishment of an autonomous Tatar Crimea as successor of the historic Crimean Khaganate. The quest for independence in the early 1990s of the middle Volga region oil-rich Tatar Republic of nearly 6 million inhabitants around Kazan had a relatively happy ending, reaching greater autonomy under president Yeltsin but avoiding the bloody fate of Chechnya.

## The Caucasus

The Caucasus itself is a unique region of ethnic and cultural mix and a region full of resources, such as mainly oil, natural gas, fresh water, timber, and agricultural land. The borders were drawn according to Russian imperialist interests, and later, the Georgian Communists led by Stalin carved out a greater Georgia, creating “the small empire” in the big (Soviet) empire. Some of its provinces, however, questioned their status beginning with the dismantling of the Soviet Union in 1991.

Thus, Abkhazia, the tiny former autonomous republic of Georgia, consisting of only 3,320 square miles (8,600 square kilometers), declared its independence in 1992 as a move against the “Georgianisation” of the province. In spite of missing international recognition, it fought a successful war against Tbilisi, with the backing of other Caucasian nations’ solidarity troops and Russian weaponry. The ethically motivated dispute serves also Russian strategic interests at the “backyard borders” of the centuries-old great regional rival of Turkey.

South Ossethia, also *de facto* independent from 1992, is another flashpoint between Moscow and Tbilisi. This tiny republic, with only 1,506 square miles (3,900 square kilometers) and a mixed population, sought union with bordering North Ossethia under Russian rule.

The most long-standing dispute exists over Chechnya, between the Separatist population and the Russian federal government. After 1945, Joseph Stalin ordered the deportation of the whole Chechen population to Asia on charges of Nazi German collaborationism during World War II. Chechnya first declared its independence in the region, but the Russians did not allow for this tiny oil-rich republic of 7,452 square miles (19,300 square kilometers) and 1 million people to break away. More than 250,000 civilians, including 42,000 children, have died so far in this ongoing partisan-style war, leading to the total destruction of the country and setback the development of the whole region.

The enclave of Nagorno-Karabakh is another disputed territory between Armenia and Azerbaijan, with a 75% Armenian majority seeking union with neighboring Armenia. The Armenians had won the war occupying 20% of Azerbaijani territory. Thus, Armenian Nationalist forces tried to redraw the hastily sketched borders by the Soviet commissars in the 1920s and establish a greater national state. In such political circumstances, the overall development of the Caucasus region is vitiated, and a new international order should be set up in this far away “Balkans” of Eurasia.

## The Middle East and Asia

Much of southeastern Turkey or Turkish Kurdistan has been the center of disputes for decades by the secessionist organization *Partiya Karkeren Kurdistan* (PKK), or the Kurdistan’s worker party, which tries to create an independent Kurd state on ethnic, nationalistic, and economic grounds. That state would include the rest of Kurdistan, namely the northern

## TERRITORIAL DISPUTES

border zone of Syria, northern Iraq, and Iran, encompassing the whole 20 million people in the stateless Kurdish nation. None of these states wants to yield, even for Kurdish autonomy, for geopolitical and economic reasons: Kurdistan has plenty of natural resources like oil, timber, and fresh water. Turkey has water management disputes with Syria and Iraq over the Tigris and Euphrates, while Israel disputes the use of the Jordan River and the Sea of Galilee with Syria and Jordan.

The territorial disputes between the Palestine nation and Israel concern survival on a small patch of land where a 10% Jewish minority is gradually being squeezed out by the majority Arab population through immigration and state formation. Both of the parties want the whole of the territory (Palestine) on both historical as well as religious grounds. Israel spends annually 40% of its gross domestic product (GDP) on defense and could not survive without the serious military and financial backing of the United States, which provokes fierce Arab resistance all over the Middle East. Syria has open claims on the geostrategic Golan Heights occupied by Israel during in the 1967 Arab-Israeli War and hidden claims on the Iskenderun coastal region of Turkey on the basis of a local Arab majority and its proper climate. The Iraqi-Iranian war of the 1980s was fought for the control of the other side's Kurdistan and for the annexation of a wider access area to the Persian Gulf for Iraq. Iraq claimed repeatedly the whole of Kuwait, based on former Ottoman boundaries, and unsuccessfully annexed it in 1961 and again in 1991. Iraq has maintained its claims over this oil-rich area, which holds one-third of the most easily exploitable oil resources on the Earth, by constant military pressure or by demanding long-term lease of the strategically located Bubiyan and Warbah islands.

In the Arabian Peninsula, before the coming of the oil era in the 1930s, official boundaries had little significance as was the case elsewhere in the uninhabited desert areas, and organized authority was confined to ports and oases. Arab pastoral tribes felt loyalty to their tribal leaders only and roamed across the sands according to their grazing needs. British-drawn international boundaries were not properly demarcated, so with the coming of the oil era, the exact definition of the ownership rights became inevitable. Thus, after the British colonial withdrawal in 1971, old and suppressed territorial claims became actual again: Iran has claimed Bahrain, on historical and religion grounds, dropping and reiterating it periodically. Iran also claimed and occupied in 1971 three smaller islands named Abu Musa, Greater Tumb, and Lesser Tumb in the Hormuz straits; Iran

reached an agreement with the United Arab Emirates (UAE) over one of them in 1992.

Formal tribal settlement areas and dynastic struggle are at the heart of the often militarized and internationalized disputes between Bahrain and Qatar. The Bahraini claim the Az Zubarah Island on the northwest coast of Qatar, while Qatar claims Bahraini-occupied Hawar situated about twenty-five miles (forty kilometers) off the coast but situated just at its shorelines. After 1955, Saudi Arabia recognized the claims of Abu Dhabi and Oman to the Al Burayami Oasis, and in return Saudi Arabia was granted a land corridor to the gulf and a share of a disputed oil field, ending the long dispute among local pastoral tribes. The border between Oman and Yemen remained only partially defined, leading to border skirmishes, but relations improved after Yemeni unification. Earlier, the southern borders of Oman caused friction with the UAE on the Musandam Peninsula.

In Asia proper, a hotspot is the location of the frontier line across the Aral Sea between Kazakhstan and Uzbekistan. The line also crosses the disputed Vozrojenie Island, highly polluted as the dying sea itself. The once 26,255-square mile (68,000-square kilometer) Aral Lake (Sea) has been separated into two parts: the northern (mainly Kazakh) lake can be saved if proper dams are built in the seabed, but this would stop the overflow of the feeding river to the southern lake, which falls mostly inside Uzbek territory.

Further south there is a border dispute on the Caspian between Azerbaijan, Iran, Russia (Dagestan), and Turkmenistan over oil mining rights on the continental shelf and over caviar-producing sites. Independent Azerbaijan is too weak to claim openly two-thirds of the national territory outside international boundaries, mainly in Iran, home to 20 million Irani Azerbaijanis who hope that the creation of a Turkic state confederation would solve the dispute. A confederation has been long sought by Turkey to assert its leading role and somehow reestablish the Ottoman Empire, but this goal is now more or less based on ethnical kinship grounds. This Turkic world called "Kipchakia" would stretch from Hungary, the Carpathians, and across the great steppes to Uyghuria in the Altays. This Sinkiang region or Eastern Turkestan claims its independence from China on ethnic, geographic, and historical grounds.

In the southern mountainous ridge, in the Himalayas, a set of territorial disputes exists. The northern Turkmen, Tadjik tribes who have liberated Afghanistan from the Taliban rule, seek a greater role for themselves or a federal status and otherwise wish to join their territories with their motherland.

Afghanistan claims a corridor-like territory called Pakuristan, which reaches down to the Indus River.

In the north, the region of Dzhammu and Kashmir is disputed between India and Pakistan, having a *de facto* borderline traced after cease-fire agreements. The two states fought three wars over the territory in the late twentieth century and are even threatening each other with the use of nuclear weapons. Pakistan claims the area on the grounds of Muslim majority, and this claim is refused by India, stating that the ruler (*maharaja*) of this province decided to stay Indian in 1947. In fact, both countries want to acquire a mountainous wetland, with forest vegetation and fresh water reservoirs, which is so badly needed by these mostly dry tropical countries. In addition, India is involved in two main disputes with China. Aksai-Chin was seized by China after the annexation of Tibet in 1950, and the seizure was not recognized by India or by the Tibetan Government in Exile, led by the Dalai Lama. On the other hand, China claims the border zone of the Indian-Aruntschal-Pradesh province and massively colonized Tibet, leading to the local minority status of the oppressed Tibetans.

China and Taiwan (officially the People's Republic of China and the Republic of China) form a pair of claimants for exclusive control of the other's territory, each considering itself to be the sole and real leader of a unitary nation. A similar debate exists between communist North Korea and capitalist South Korea. These disputes are mainly ideological, but the strategic location of Taiwan could boost Chinese economic development in the South China Sea region. China's imperialist ambitions increased significantly after the reannexing Hong Kong and Macao, in parallel with its spectacular economic growth, and looks also farther south to the Paracel and Spratly Islands. In both cases, China is the main claimant alongside Vietnam with whom it had fought and lost a war in the 1980s; the Spratly Islands are also claimed by the Philippines. Vietnam also has ongoing disputes concerning Kokinchina, the Mekong Delta region, with Cambodia.

In addition, China has longstanding territorial disputes with the Soviet Union and some of its successor states, which at the union's height targeted an area totaling 386,102 square miles (1 million square kilometers). The most active concerns the Ussuri-Amur confluence area in the Habarovsk region of Russia. China contests the existence of (outer) independent Mongolia, considering it a Chinese province. China also looks for eventual Siberian independence, which could be its natural resource pool hinterland of its booming economy, a prospect much feared by Europe and especially Russia. In the case of Korea, not only is the legitimacy of the governments and regimes disputed, but the economic future of the peninsula is also in question. Divided actually by

tightest border in the world, North and South Korea have experienced a halted economic development, with prosperous South Korea having no area of extensive development and with the separated Communist North starving to death. Farther east, the Take Shima (Lioncort Rocks) are disputed between the Koreans and Japan because of their strategic significance.

The Indian peninsula is also full of such disputes. The wealthy but divided state of the Sikhs, Punjab, seeks independence from India and eventually a union with Pakistani Punjab. Although this objective seems difficult to achieve, two Indian prime ministers have already fallen as victims of their stance against it. In the east after Bhutan and East Pakistan/Bangladesh went independent, a fragile and volatile situation has developed as neighboring regions may want to follow suit. In the southern areas, there is a strong drive toward an independent and greater Tamil state and perhaps a Dravida confederation. In its quest for independence and union with mainland Tamilnadu, the local Tamil majority of the neighboring big island, named Ceylon, has fought a long guerilla war against the Singhaleze government of Sri Lanka.

In Indochina, besides territorial disputes between Cambodia, Laos, and Vietnam following the collapse of the colonial rule, four minority and mostly tribal nations (the Katshin, the Shan, the Kaya, and the Kotuley) have tried to establish their own states in the border regions of Burma, while the Malaysian province of Sabah is claimed by the neighboring Philippines. Indonesia has annexed Western New Guinea, a former Dutch colony that became independent in 1961 and was renamed Irianjaya. Both the native Papuan population's government in exile and the Papuan Liberation Organization (PMO) claim sovereignty over this rich territory of 162,163 square miles (420,000 square kilometers). Indonesia has also annexed East Timor, which could hardly obtain independence at the turn of the twentieth century; other Indonesian provinces, like the Moluccas and tsunami-struck Aceh, are also on a secessionist footing.

In the north, much of Mongolia (inner Mongolia) with its 6 million inhabitants was annexed by China followed by the annexation of Manchuria in 1945; these annexations revealed hidden claims to the territories from Russian, Mongolian, Japanese, and Manchurian organizations. Japan hotly disputes the four largest (lower) Kurili islands, insignificant territories for Russia, occupied by the Soviet Union after the end of World War II. Japan looks not only at the renewed possession of some small islands but is trying to extend its territorial waters to boost its national pride left in ruins after the shock of losing World War II as well as its Pacific-rim empire.

## Africa

The continent as well the whole world entered into an era of territorial integrity after World War II, as claiming territories became the key principle in guaranteeing the status quo of the new division of the world between the great powers. Newly independent countries accepted this principle worldwide due to their weaknesses, fearing external attack or internal secessionist drives. Therefore, after decolonization, the continent of Africa experienced only few border disputes in spite of the fact that hastily drawn colonial borders had little if any concern for tribal, language, or ethnic unity. Independent sub-Saharan Africa's boundaries changed remarkably little; changes had occurred only following the independence of Eritrea from Ethiopia, that of Namibia from South Africa, and the separation of Guinea-Bissau and Cape Verde.

A long-lasting territorial dispute between Morocco and the Polisario liberation organization of the native Berber tribes concerns the former Spanish Sahara of 100,386 square miles (260,000 square kilometers). Morocco annexed it after colonial withdrawal in 1976, but the Polisario resisted Moroccan troops; the Sahrawi nationality nomads wanted to establish the Sahrawi/Saharan Arab Democratic Republic. At present, the area is largely occupied and entirely claimed by Morocco, without broad universal recognition. Another long-lasting and bloody dispute involved France and Algeria between 1945 and 1962. France has only bitterly accepted defeat and loss of its main overseas territory, which has caused a refugee wave of 1.5 million "black-legs" to continental France.

Similar guerilla-type fights were carried out, with Cuban help however in the former Portuguese colonies of Angola and Mozambique. Sudan is home to the continent's longest lasting bloody civil war, in which the Muslim-Arab North fights against self-determination of the Animist and Christian black South. The civil war broke out in 1962, leading to the South's autonomy in 1972, but the discovery of oil resources in 1983 again fueled the secessionist drive. The rebels joined under the Sudan People's Liberation Army (SPLA) and have achieved an internationally mediated peace deal addressing power and wealth sharing. In the meantime, the western, mainly black region of Darfur also rose against the government and suffered ethnic cleansing transformed into genocide in 2004 by the government-backed Arab *Janjaweed* militias.

Egypt disputes the Hala'ib triangle with Sudan, an area extending to the north and south of the 1899 Treaty boundary, along the Twenty-Second Parallel. In the nonmilitarized conflict, Egypt is effectively

administering the northern part of the triangle, north of the Treaty Line. Sudan has border disputes with Kenya, whose administration still extends into Sudan, in the Ilemi Triangle; Sudan also has disputes with the Central African Republic over water and grazing rights along the border and with Eritrea on border demarcation issues, accusing it with supporting Sudanese rebel groups. Left landlocked after the secession of 1991, Ethiopia claims its former coastal province Eritrea (and Tigre), which actually won its independence in a bloody war after being united with Ethiopia in 1961. Ethiopia has unresolved territorial disputes with its eastern neighbor of Somalia, which has openly claimed Ethiopia's border of the Ogaden plateau region. The standoff resulted in a bloody war in 1977 and 1978 and caused a huge refugee wave and a subsequent crisis, but the territorial status quo was preserved in the end.

Somalia on its own has suffered secessionist drives from its breakaway Somaliland region. Somaliland, the former British colony on the coast of the Gulf of Aden, was united in 1960 with the former Italian colony of Somalia, forming actual Somalia. The province declared its independence in 1991, following a bloody secessionist struggle after the overthrow of the Somali military dictatorship. Somaliland has a *de facto* but unrecognized independence, with a working political system and economy but is also involved in a border dispute with the neighboring autonomous Somali region of Puntland over the Sanaag and Sool areas.

In former Belgian Congo or Zaire, the religious and tribal leaders demanded federalism after the country declared its independence in 1960. The mineral-rich southeastern province of Katanga had seceded successfully for three years, and riots were still flashing in the 1980s, leaving Zaire's future uncertain. White-led South Africa emerged as the regional power and had annexed Namibia from 1979 until 1990, fighting against the Southwest Africa People's Organization (SWAPO) and later against the Communist Popular Movement for the Liberation of Angola (MPLA) in the Angolan civil war. The end of the Cold War led to regime changes that put an end to or stopped many African conflicts, to give birth later to new ones emerging from regional and tribal animosities (such as in Uganda, Rwanda, Malawi).

## Latin America

As did their African counterparts, Latin American states have been formed respecting the legal principle of *uti-possidendi juris*, meaning that states' right to keep what its predecessor colony had possessed.

Land boundary disputes remained mostly inactive for long periods of time due to poor cartography, remote locations, and inaccessibility of the jungle or high mountainous border areas. Population growth, subsequent development pressures, and the use of new technology facilitated penetration into unpopulated areas, triggering sovereignty claims.

The other source of territorial disputes lie in modern international law evolution that allowed for the extension of territorial waters to two hundred nautical miles and secured priority for the exploration of the real or imagined rich resources of the underlying seabed and its marine life. As a consequence, most of the sea boundaries between the Caribbean island states have not been established, provoking fresh disputes. Thus, countries ending their territorial disputes like Colombia and Venezuela in the 1940s ended up with disputes over maritime boundaries in the 1960s, as oil was discovered in the Gulf of Venezuela.

The third source of the disputes is the legacy of the British colonial advance after Spanish-American independence. These disputes since 1966 between Venezuela and Guyana concern more than half of British Guyana's territory; Guatemala and Belize have had disputes since 1981 over the latter's very independence. These disputes are the by-products of decolonization between the Spanish-speaking older and English-speaking newer states.

In spite of these tensions, South America is relatively free of major disputes thanks to the balance of power that developed in the late nineteenth century. South American countries also have a shared identity, and most Spanish-American elites have accepted the idea of being part of a larger cultural and possibly political entity. International hatred was mostly absent from the political ideology due also to common Spanish ancestry and language, which do not provide room for the general idea of "my country's neighbor is my enemy."

The existence of the regional effective conflict resolution system successfully deters territorial pretenders and defuses interstate conflicts. Interstate war remained rare also because both South and Central American countries were relatively insulated from the wider international system. The Cold War also contributed to this regional stability because the United States did not want to have any quarrel in its "backyard" and intervened militarily when necessary. In spite of the US management of such disputes, the Central American subsystem remained unstable because many underlying disputes were not addressed.

Paradoxically, the existence of this collective security system is also a cause for disputes. Aggressor states may refuse to compromise, certain that the inter-American system will not intervene before

the aggressed state would retaliate. Thus, they can achieve concessions from the victimized country without risking high costs and huge military efforts. Conflict generation is thus part of a strategy of coercive bargaining, during which the aggressor state may maintain otherwise normal nonmilitary relations. On the other hand, long-lasting militarized disputes are partly due to their existing domestic political support, fueled by political leaders who want to gather electoral capital and see such nationalistic rhetoric as a cost-effective means of communicating. Nonetheless, existing conflicts can have high opportunity or direct costs due to the uncertainty of long-lasting militarized disputes or threatening intervention by the stronger neighboring state (such as Venezuela), as the case of a high-tech military project's fate showed in 2000.

Colombia's central government has fought for more than half a century, a bloody civil war claiming more than two hundred thousand lives. The war is directed against left-wing guerilla organizations: The Armed Revolutionary Forces of Colombia (FARC) and the National Liberation Army (ELN). The guerillas control a *de facto* independent territory of the size of Switzerland.

Peru also has had wars with most of its neighbors. The century-old dispute with Chile over the mining region of Tarapacas was solved finally in 1999, by securing Peru's access to the Pacific port of Africa. Peru's disputes over the Letitia and Zarumilla regions with Colombia and Ecuador, respectively, ended in war, however.

Peru's dispute with Ecuador clearly shows that if sovereignty and border issues are given higher priority than developmental objectives, then territorial disputes will linger and perhaps worsen. Ecuador lost much of its territory in its 1870s wars with Colombia and during wars in 1939 through 1941 with Peru. The last one has ended with a peace treaty in 1942 (the Rio Protocol) guaranteed by the United States, Argentina, Brazil, and Chile, which institutionalized the role of outsiders in the dispute. Despite these changes, the territorial dispute continues, with Ecuador claiming the Maynas region in the Amazon basin. In addition, a border dispute in the Cordillera del Cóndor ridge region flared up due to its insufficient demarcation. The repeated Ecuadorian challenges ended in a short but violent war in 1995. Finally, the dispute was solved through international mediation in 1998.

Bolivia still claims an access area to the Pacific Coast in the Atacama desert region of Chile, incurring high economic opportunity costs because of its landlocked status as a consequence of previously losing its Antofagasta coastal region to Chile in the War of the Pacific in the 1870s. The longest and bloodiest war of Latin America, claiming 350,000

lives, is the war caused by the Bolivian claims over the Gran Chaco region, lost in the 1930s to Paraguay.

El Salvador and Honduras went to a bloody war in 1969 over disputed boundaries and related cross-border migration issues, following a riot at a binational soccer game. The war caused the collapse of the Central American Common Market; after international mediation and jurisdiction, 80% of the disputed territory was awarded to Honduras in 1992. In spite of this, militarized disputes recurred later due to factual boundary demarcation disputes, and international jurisdiction resumed in 1999.

Nicaragua has militarized all its borders that are dispute, and this became part of the repertoire of international tactics in spite of political changes. Later, as the Nicaragua-Honduras dispute over small islands, cays, and reefs started, the country turned to international jurisdiction.

Chile and Argentina have had twenty-four territorial and boundary disputes; the longest lasting one concerned the Beagle Channel and the southern glaciers. Argentina tried to solve all of these disputes after Chile's democratization cycles, but a long-term history of past conflicts rallied domestic support for diplomatic and military confrontation. In 1971, the two political and ideological adversaries sought British arbitration for the Beagle Channel, but this brought the parties to the brink of war in 1978, which was avoided only by a later Papal mediation, leading to a treaty in 1984. The Laguna del Desierto dispute was settled by international jurisdiction in the 1990s, while the most controversial dispute concerning the delimitation of the boundary through the southern cone glaciers required ratification from the parliaments. Argentina was exacerbating nationalistic feelings amidst its severe economic recession years, claiming the Islas Malvinas/Falklands. Argentina occupied them in 1982, triggering a swift response from the United Kingdom that retook possession after a short war, but Argentina did not abandon its century-long claim.

Brazil used common economic and social development projects in its strategy of solving territorial disputes. Thus, during the last two centuries, Brazil has won almost all territorial disputes peacefully and expanded its territory greatly (the third most successful country in the world to do so) without relying on military force or triggering an encircling coalition of its neighbors. In 1979, Brazil defused existing tensions with Argentina by initiating the joint exploitation of the hydroelectric potential of the Paraná River system, but an inactive dispute with Uruguay remained. The cooperation process culminated in 1991 in the establishment of the Southern Cone Common Market (MERCOSUR).

It is widely believed that democratization is a panacea for solving territorial issues, but the Latin American experience shows almost no evidence for any positive correlation in between. Territorial disputes are permanent, and some vanish while others commence in the ever-changing world, shaping history and the destiny of the peoples and nations forever.

### TERRORISM

The word "terror" is derived from Latin and means "fear." Thus, terrorizing civilians creates fear. "State-sponsored terror" is government by intimidation, as in the French Revolution's Reign of Terror (1793–1794). States employ terror to undermine other states, and internal and international groups use terror to attack hated political, economic, and cultural symbols. Since 1945, the use of terror in the developing world has aimed to achieve political, social, economic, and cultural goals. Since the dawn of history, people have used terror to intimidate civilians through such means as genocide, torture, and incineration.

## Legal Definitions

After World War II, the developed world started developing an international law of terrorism. The United Nations' International Convention for the Suppression of the Financing of Terrorism, 1999, defined "terrorist acts" as "intended to cause death or serious bodily injury to a civilian, or to any other person not taking an active part in the hostilities in a situation of armed conflict;" these are acts that are meant to "intimidate a population, or to compel a government or an international organization to do or to abstain from doing any act." Britain's Terrorism Act 2000 defines "terrorism" as acts "to influence the government or to intimidate the public. . . for the purpose of advancing a political, religious or ideological cause." In the United States Code Title 22, "'terrorism' means premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents, usually intended to influence an audience." In addition, "'international terrorism' means terrorism involving the territory or the citizens of more than one country." The code adds that a "'terrorist group' means any group that practices, or has significant subgroups that practice, international terrorism."

The developed world has defined terrorism for its own protection. In 1946, international tribunals judged war crimes committed by Germany and Japan but not crimes committed by the winners. After the Vietnam conflict, American atrocities did not bring US commanders to justice in the manner the United States had prosecuted Japan's World War II commanders. Under international protocols, developing nations may not possess chemical or biological weapons but developed nations can.

## Terrorism's Tools

The military, police, and courts have tools to defend citizens and institutions. Unpopular regimes employ force to subdue those who oppose their rule. Rogue states terrorize rebels by suppressing civil liberties by illegal searches, arrests, and detentions. Ian Smith's illegal minority Rhodesian regime (1965–1979) and South Africa's apartheid governments silenced the majority through terror. When those out of power cannot defeat such regimes through legal means, they often overthrow them by using crude weapons of terror. This may be done with support from sympathizers outside the country. When Western states did not support African uprisings in the 1950s through the

1990s, Rhodesia's Patriotic Front and South Africa's African National Congress sought aid in African states that had ousted colonial rulers. They received training and weapons from Marxist states in Asia and Eastern Europe that were engaged in a Cold War against what they termed Western "imperialism." They also received aid from the World Council of Churches and other humanitarian organizations. Africans finally gained access to international media that put them on an equal footing with colonial regimes that had termed them "terrorists." With access to media, Africans termed their own soldiers "freedom fighters" and named their enemies "terrorists." International opinion slowly accepted an African claim to one-person-one-vote, economic equity, and equal justice. The United Nations (UN) placed sanctions on the oppressive white regimes. Power to persuade through political and economic appeals, and the use of "terror," turned the tide.

Terrorism's goal is not rational discussion. Its power comes from inducing fear among civilians. Terrorists lack the means to defeat regular military forces. They define "the other" negatively so as to motivate their agents to risk all for a cause. Targets may be political structures, or economic and cultural symbols, that bear the stigma of the hated "other."

## Motives

Why do terrorists do what they do when they do it? The motives test goes beyond the law to political and moral values. When civilizations clash, historians compare and contrast them. In "just" or "holy" wars, religious/cultural terrorists strike at targets with symbolic value. Yahweh commanded Hebrews to invade Palestine in the thirteenth century BCE, often demanding *herem* annihilation of people and property as a *ban* (sacrifice). Medieval Christians limited war, prohibiting attacks on Christian lands and persons (Peace of God) and seasons (Truce of God). But they exempted non-Christians from these protections. Islam initiated *jihad*, holy war carried out under a mufti's decree, to target "evil" places and infidels for destruction.

In 1996, Osama bin Laden offered an Islamic rationale for *jihad* against America. A 1930s Sunni fundamentalist, Sayyid Qutb, had found a way around prohibitions against overthrowing Muslim rulers by declaring them "infidel." Osama bin Laden made the United States an infidel for defending a Jewish state in Palestine and placing military bases in Saudi Arabia, the site of Islam's major shrines. The United States's secular culture profaned God, and it refused to share its wealth with poor developing nations. His ideas

resonated with developing world Muslims who compared their poverty to the United States' riches. Osama bin Laden also condemned wealthy Muslims whose greed and secularism made them targets.

## International Terrorism

International terrorism is not new, but since 1945 a shift has occurred as African, Asian, and Latin American voices have joined the UN to redefine terror. The developing world's political, economic, cultural, and political interests finally had to be acknowledged. Some saw access to oil as a prime motivator for acts of terror, but religious and political motives also had to be discussed. Motives, tactics, and law will be the focus of the twenty-first century. Terrorism studies will no longer ignore the developing world.

## THAILAND

Thailand, formerly Siam, is in the heart of mainland Southeast Asia, with its southern tip extending into the Malay Peninsula. The Chao Phraya River and its fertile rice plain runs north to south through the country, and there is just over three thousand kilometers of coastline on the Gulf of Thailand and the Andaman Sea. Thailand's climate is tropical, with a warm and wet monsoon from May through September and a cool and dry monsoon from November to March. The southern tip, stretching into the Malay Peninsula and including the Isthmus of Kra, is generally hot and dry.

Thailand's population is around 64 million and is ethnically homogeneous, with approximately 75% of the population ethnic Tais, followed by approximately

15% ethnic Chinese, with the remainder of the population being ethnic minorities, including Hmong, Akha, White Tai, and Black Tai. A significant Malay minority exists in the southern part of Thailand. Thailand is also religiously homogeneous, with approximately 95% of the population practicing some form of Buddhism (mostly Theravada Buddhism). The large ethnic Chinese minority in Thailand is well integrated, the royal bloodline is said to have Chinese blood, and conflicts between Chinese and the majority Tais are infrequent and minor compared to some of Thailand's neighbors (Indonesia and Malaysia, for example). The national language is Thai, based on the Bangkok Thai dialect, and literacy is approximately 92%.

Thailand is exceptional among its Southeast Asian neighbors in that it was never formally colonized by a European power, a continuing source of pride for Thais (although it was heavily influenced by both France, from Indochina to the east, and Great Britain, from Burma to the west and Malaya to the south). Thailand's avoidance of colonialism is generally attributed to its strategic location as a buffer between French and British colonies and to the shrewdness of its rulers, beginning with Rama IV of the Chakri Dynasty, King Mongkut (reign: 1851–1868), and his son, Rama V, King Chulalongkorn (reign: 1868–1910). Both kings are attributed with modernizing Siam, including introducing European education, abolishing debt bondage and slavery, forging links to European countries, rationalizing taxes, bureaucratizing the government, and mapping the country. These policies, along with the introduction of cash crops and the increase in rice production, allowed Siam to thrive, and subsequent rulers began to focus on the consolidation of the state through nationalism and centralization.

In 1932, the absolute monarchy came to an end through a relatively peaceful *coup d'état* led by Western-educated elites. The country was given the name Thailand in 1939 as a way to embrace a Thai version of modernity. The monarchy itself was not a target of the coup, and so it retained its prestige. King Rama IX, Bhumibol Adulyadej, was born in Massachusetts, educated in Switzerland, and assumed the throne in 1946. Still in power at the beginning of the twenty-first century, he became the longest ruling monarch in the world. King Rama IX has been generally loved and respected by the people of Thailand for his kingly virtues, his patronage of the Sangha (Buddhist monkhood), and his support of various royal development projects. Disrespecting the king in any way is a crime not tolerated. Despite his lack of formal powers, Bhumibol was the catalyst for the resolution of a *coup d'état* in 1991. By the following year, demonstrations against the *coup* plotter, General Suchinda

Kraprayoon, had become widespread, and the military reacted with violence, killing student protesters. The king convened a meeting between Suchinda and his opponent, Chamlong Srimuang, on national television and ordered them to resolve their conflict, a strategy that proved successful and paved the way for elections and the restoration of democracy.

Thailand's history since World War II has been fraught with several *coups d'état* and periods of military rule interrupted by periods of open democracy. Thailand is considered one of the most established democracies in Southeast Asia, and the king remains an import figure and patron of Buddhism; however, certain policies, such as the unofficial assassinations of suspected drug users and sellers, have called into question Thailand's commitment to democracy. Thailand is also one of the more economically prosperous countries of the region, despite the effects of the 1997–1998 East Asian economic crisis, which had its roots in the devaluation of the Thai currency, the baht. Its recovery from the crisis was led by its export-oriented economy and driven by external demand for its products. The United States is Thailand's largest export market and second largest supplier (Japan is the first).

The roots for Thailand's strong economic development were established in the late nineteenth century, as aforementioned. The military's strong hand in the economy was consolidated following World War II under the influence of Plaek Phibunsongkhram, a former field marshal, who was involved in various *coups* since 1932. The military's discipline and organization, coupled with its system of patronage, has allowed it to be a major player in the Thai economy, in both legal and illegal enterprises. Many of these "vice" oriented ventures, such as bars staying open late, host prostituting, and catering to tourists (often viewed as holdovers from the America-Vietnam conflict), have become targets for current Prime Minister Thaksin Shinawatra; it appears, however, as though little is being done about the corrupt business practices of the military in other sectors.

One of the most striking features of Thailand's postwar economy concerns the timber industry. Positioning itself as anti-communist country, Thailand welcomed foreign investment and participated wholeheartedly in trade with the West. Its forests were some of the victims of these policies; by the time the Thai government instituted a moratorium on logging in 1989, Thailand's forest cover had dropped from 50% to less than 30% of its total land mass (approximately 193,051 square miles or five hundred thousand square kilometers). Rampant corruption betrayed the overall effectiveness of the plan, as evinced in occasional well-publicized scandals. Following the ban,

Thai companies immediately began seeking concessions in neighboring countries such as Burma, Laos, and Cambodia, all of which have laws that are much more lax, weaker law enforcement, and widespread corruption that enables black market business on a large scale.

An increase in manufacturing centered around big cities has also greatly affected Thailand's development. Thailand's cities are swelling at an enormous rate, just as are those of its neighbors, and the swelling is followed by the attendant crime, poverty, and pollution that accompany this change. Traffic congestion, for example, in Bangkok has increased dramatically, leading to production losses estimated in the billions of baht. An increase in the middle class since the 1960s, however, has produced a large segment of society that supports a vast network of nongovernmental organizations (NGOs) with environmental, gender equity, economic, and developmental goals and that subscribes to democratic ideals (although there remain questions about the overall distribution of the benefits of Thailand's economic growth).

Thailand's relatively free press allows for the open debate of ideas, but Thailand's labor organizations and unions remain relatively small and weak. In 2000, the Thai government passed the State Enterprise Labor Relations Act, which allowed public sector employees the same rights as private sector employees, including the right to organize. The East Asian economic crisis has led to the abandonment or postponement of many of the projects that accompanied the early 1990s construction boom in Bangkok although the economy as a whole is well on the way to recovery. The year 2000 brought the opening of Bangkok's above ground rail system, the Sky Rail. The gross domestic product (GDP) of 2002 grew by 6.3%. Under Thaksin, foreign investment has resumed, and exports such as textiles, footwear, rice, fish and marine products, rubber, appliances, and computers continue to fuel the economy. Services, as well as goods, have become a strong point for the Thai economy, and were the highest contributor by sector to the GDP in 2003 (46.3%) although agriculture still employs by far the highest percentage of the population (49%). Tourism is a significant contributor to the Thai economy (about 4%), and mining continues to be another significant contributor.

These shifts in the economy, from manufacturing to high technology and services, present a problem for Thailand. As its traditionally strong manufacturing sector begins to shrink due to competition from its neighbors (most notably Vietnam and China), the demand for a highly skilled labor force increases, but at this time it appears as though the educational system in Thailand is lagging. The illegal production

## THAILAND

and transit of drugs, mostly opium, heroin, and marijuana mostly originating in Laos and Burma, have been decreasing due to stepped up enforcement. Amphetamine distribution and use, however, has become increasingly widespread and problematic and has become a major law enforcement target. HIV/AIDS is also a serious problem for Thailand, especially given the widespread nature of and tolerance for prostitution and given Thailand's role as a destination for sex tourism. The government has aggressively instituted HIV/AIDS education programs and counseling and has been relatively effective in preventing a huge rise in the number of infections (especially when compared to Thailand's neighbors, many of whom ignored or refused to address the problem in its initial stages).

Perhaps the most glaring security problem facing Thailand is the Separatists in the southernmost provinces of Songkhla, Pattani, Yala, and Narathiwat; this group is predominantly ethnically and linguistically Malay and Muslim, and its history of inclusion within Thailand is debated. Exacerbating any claims to sovereignty based on ethnicity or religion is the fact that Buddhist Thais have been relocated to the region, most of the civil service and police are ethnically Thai, and the provinces are among the poorest and least developed in Thailand. As a rubber-producing region, the global downturn in rubber prices in the 1950s worsened the Malays' lot (although rubber prices are going up more recently), and the response to the plight of the Southerners by the Thai central government has generally been apathy or antagonism. Although there are several organized groups with varying goals, violence in the region has been on the increase, and Thailand has been moving to shore up the porous border shared with Malaysia. Although not marked by the violence of the South, various hill tribes echo to some degree their complaints of Thai/Buddhist chauvinism and inequitable development. Moreover, ethnic rebels from neighboring Burma/Myanmar have caused security and diplomatic concerns, some quite serious.

## THIRD WORLD

### Definition of "Third World"

The "Third World" is a catch-all term referring to countries with diverse histories, peoples, and geographic locations—yet they share certain attributes in relation to the countries defined as part of the First World and the Second World. The countries of Third World share a non-Western heritage, have higher population growth rates and infant mortality rates, are generally economically poor, and therefore have a lower standard of living as compared to the countries of the First World and the Second World. Most of the Third World countries share a history of colonial domination at the hands of Western powers. As a rough conceptual category, the Third World consists of all the nations in Asia (except Japan), Africa (except South Africa), Latin America, the Caribbean, and some states of Oceania.

### The Origin of the Term and Its Alternates

The French economist Alfred Sauvy coined the concept Third World—"tiers monde" in French—in a newspaper article penned for the August 14, 1952, issue of *L'Observateur*. The initial usage of the word in French referred to the three-tiered social classification used in the pre-Revolutionary French society, where the third estate was composed of commoners as opposed to the nobility of the first estate and priests of the second estate. The Third World for Sauvy is made up two ideas. First, much as the commoners were exploited in pre-Revolutionary France, the Third World today is exploited. And second, much as the commoners adopted a different kind of political program demanding social justice, the Third

World needed a different political approach for achieving a just global order.

Alfred Sauvy's conception of the Third World came to stand for a group of exploited countries that were economically not in the same league as those in either the First World or the Second World. The First World in this conceptual scheme stood for mostly Western countries (except Japan) that had tried from 1492 to colonize the rest of the world. These countries were focused on a European-centered imperial project, which then passed on to a United States-centered system post-1945. The Second World was composed of countries that espoused state socialism and were oriented to the Soviet Union as their center. The Third World consisted of countries that had been colonized by Europeans to get natural resources for building a world economy that benefited the peoples of Europe.

The industrial revolution first happened in the First World around the 1750s. The industrial development in the Second World was also advanced by the time the countries in the Third World began getting their freedom from European domination. The idea of the Third World is then an idea of countries that were not economically developed and that on the political scale had been exploited by the First World via colonization. In economic sense, this meant that the Third World was made up of countries that lacked industrial infrastructure, had to depend on supplying raw material to the First World, and were therefore poor. On social terms, it meant that these countries because of their poverty had fast-growing populations that suffered from higher infant mortality rates, were less educated in general, and suffered from numerous social problems.

Deployed as a term in public discourse, the concept of the Third World carries negative connotations; indeed, in the common discourse in the First World, the Third World connotes poverty and backwardness. But in more intellectual discussions, since mostly those sympathetic to the Third World used the word, the term became preferred over a number of competing options. One of the competing notions is the notion of "underdeveloped countries." But the concept of underdeveloped countries implies that Third World countries lack development—and that development is measured in reference to the Western model of development. This idea is ethnocentric because it takes the Western model as the eventual goal for everyone on this planet. A number of scholars, such as Ivan Illich, who belong to antidevelopment school have criticized the very definition of development—as measured by an increase in the growth domestic product (GDP) growth—as in fact a form of social regression rather than development.

The countries of the Third World are also sometimes referred to as countries of the South. This derives from the division of world into North and South. The northern countries are mostly white, industrialized, and have higher standards of living, while the southern countries are mostly non-white, are not industrialized, and have lower standard of living. This strategy of dividing the world, however, is criticized because Japan, a non-white country, is in the Northern Hemisphere, while Australia and New Zealand, both industrialized, white countries, are in the Southern Hemisphere. Another alternate term that approximates the concept of Third World is "postcolonial." The concept of "postcolonial," which is another competing term for Third World, suggests that the countries of the Third World were formerly colonized and therefore share a certain uniform experience of history. But the idea of post-colonialism is not accurate because countries such as Canada and Australia, though they were colonized by Europeans and thus fit the definition, differ vastly in almost any social and economic indicator from Third World countries.

### **Cold War and the Rise of Development**

In the Cold War context, with competition between Capitalism and Communism, the Third World came to be playground on which the United States and Soviet Union played out their global conflict. While the Soviet Union supported the decolonization movement in many countries in the Third World, the United States—with its own relative lack of colonial history—took over from the British in establishing hegemony in the Third World. In the case of the United States, the idea of development and foreign aid was proposed for fighting off the increasing appeal of Communism in Third World countries. Supported by big foundations, the United States government undertook a program to economically targets areas in the Third World that were pure and were thought to be more prone to going Communist. For the Soviet Union, its own model of economic and social organization was the best for development, and therefore, it encouraged and pressured Third World countries to follow its model.

The countries of Third World themselves were interested in development as a mechanism for solving myriad social and economic problems. They adopted the language of development marked by a modernistic outlook. This adoption of a narrative of development meant that to develop the Third World, countries had to adopt the ways and means of the First or Second

## THIRD WORLD

World. This essentially meant the choice between Capitalist or Communist modes of organizing economies. Out of this jostling between the first and second worlds came the idea of official development, with each one providing aid and technology transfers to countries in the Third World. This concern with alleviating poverty in the Third World gave rise to the academic field of development studies.

The first school examining the reasons for the Third World's lack of development proposed a cultural theory. The modernization theory school suggested that the Third World countries are poor because their cultures do not encourage modernistic thinking, and therefore, they are not able to give rise to wealth. But the dependency school criticized this school of thought. The dependency school theorists suggested that the reason for the poverty in Third World countries lies not in the cultural mores of populations but in external factors. According to the dependency theory, developed countries—the First World—dictated the condition for exchange in the international markets; hence, the Third World countries were not competitive because the colonial structuring of their economies during European domination left them as just suppliers of raw materials.

The world-system theory, which built upon the dependency theory, continued the dependency theory's stress on external factors, but it did not take the nation-state as a basic system of analysis. The world-system approach looks at the world as a whole unit containing three different levels of countries in it: core, semiperiphery, and periphery. Both the proponents of dependency and world-systems approaches predicted that, given the inability to sustain capitalism, with the passage of time, the contradictions of the present economic order will make it possible for the transition to socialism. Yet another theory to address the question of development of the Third World is that of globalization.

The globalization approach stresses that the Third World is not wealthy because it is not participating in the transnational movements of goods and services. The Third World countries keep their domestic economies protected, and therefore, they suffer from poor governance. The best way to encourage development in the Third World is to follow the model of open economies, an approach named as the Washington Consensus. The other way of conceptualizing this is captured in the idea of neoliberalism, which is the argument for the least intervention of governments in the actions of economic actors nationally. The globalization approach argues that the best way for Third World countries to develop involves the least intervention possible from national governments and the most empowered entrepreneurs.

The debate about the development of the Third World is about whether the international system provides possibilities for upward mobility to the Third World countries. The modernization theory has argued that if people in the Third World change their cultural mores to reflect the mores of northern European Protestant ethics, they will develop. The dependency and world-system approaches argue that there is not much space for the development of Third World countries under capitalism and that only an end of capitalism will ensure development of the Third World. While this debate is to a certain extent still ongoing, the rise of foreign aid agencies and of government agencies concerned with overseas development has made the Third World their target. Most of these programs, however, are dependent on the idea of security for First World countries. The First World countries take part in foreign aid because any instability in the Third World will likely be felt in other parts of the world.

### Politics of the Third World

The establishment of the United Nations (UN) in the aftermath of World War II gave a station to the countries in the Third World to demand independence and decolonization. As the increasing number of countries gained independence in the 1940s and 1950s, the Third World issue became prominent. The French desire for continuing colonial control in Vietnam and Algeria gave rise to wars in both countries, and the United States got involved in Vietnam and other conflicts in the Third World to counteract the rising tide of socialism. The passing of the hegemonic torch in the international system from the waning European colonial powers to the rising power of the United States led to the involvement of United States in the Third World—and because of its rising interventionism, the United States became the new hegemony in Third World countries. The military defeats of France in Algeria in 1962 and of the United States in the Vietnam War were prominent events in Third World history.

The movements and leaders in the Third World against neocolonial and imperial policies of the First World also became prominent during these times. The Cuban Revolution in 1959 brought forth Fidel Castro and Ernesto “Che” Guevara, who as a figure of youthful rebellion is still admired and emulated in the youth culture the world over. The anticolonial war in Algeria led to independence in 1962, with Ahmed Ben Bella as the leader. Franz Fanon, originally from Martinique but active in the Algerian anticolonial

movement, wrote the most definitive Third World manifesto in his *Wretched of the Earth*, arguing that for the colonized to overcome the colonizer, an absolute revolution was needed, even if it required violence. In Africa, the newly independent countries of Ghana and Congo were led by Kwame Nkrumah and Patrice Lumumba, respectively, both who defended their peoples' freedom while risking great harm to their own selves. A number of African and Caribbean intellectuals—Leopold Senghor and Aime Cesaire, among others—began the Negritude Movement to restore the dignity of Africa after centuries of subjugation. The victory of Ho Chi Minh's Vietcong in Vietnam over the United States, the most advanced First World country, inspired peoples in the Third World.

Politically, the idea of the "third world" was adopted by a number of countries that had been formerly colonized, and it was used as an emblem of a distinctive political orientation in the international arena: nonalignment with either of the two poles, the Communists and the Capitalists. This movement came to be known as Non-Alignment Movement (NAM). While the term "nonalignment" was used first by the Indian Prime Minister Jawaharlal Nehru during a speech in Colombo, Sri Lanka, in 1955, it was in Bandung, Indonesia, where the leaders of newly independent leaders from Asian and African countries met, that the foundation for the NAM was laid. Organized by India, Pakistan, Indonesia, Ceylon (Sri Lanka), and Burma (Myanmar), the conference was attended by twenty-nine Afro-Asian countries that announced cultural and economic cooperation in order to oppose colonialism and neocolonialism by both the United States and the Soviet Union.

The Bandung conference set in motion the process that resulted in the formation of NAM at a conference organized by Yugoslavian President Josip Broz Tito in Belgrade in 1961. The NAM—which has 116 members—has never found much of a cohesive identity, but a summit is held every three years to discuss issues relevant to member nations. The initial unity among Third World countries was also exhibited via the formation of the Group of 77 by the UN. The Group of 77 is a loose coalition of Third World nations that intends to defend members' interests and to create an enhanced negotiating capacity. Founded on June 15, 1964, by seventy-seven charter members, the group has expanded at present to include 133 countries.

### The End of Third World?

As a concept and idea of unity, Third World has always existed with tension. While the intellectual

vision of writers and activists in the Third World was one of unity, the political and economic tensions contradicted this vision. India and China, two of the biggest members of Third World, signed an agreement on April 29, 1954, in Beijing that enunciated the Panchsheel Principles, the five principles that stressed noninterference and mutual respect in reciprocal relations and opposition to colonialism and neocolonialism. These principles were incorporated into ten principles of Bandung and were signed by India, China, and Pakistan, among others. But the efforts at formation of a unified policy against Cold War polarities were a failure as a number of countries were incorporated into either the United States-lead North American Treaty Organization (NATO) alliance or the Soviet-led Warsaw Pact. Thus, Pakistan came under the US umbrella, and India sided informally with the Soviet Union. In their mutual affairs, tensions began to corrode the outward unity expressed at the Bandung Conference.

The rising number of conflicts and wars among members of the Third World led to the decline of initial enthusiasm and solidarity that existed among peoples in Asia and Africa. India and China fought a war in 1962, and India and Pakistan fought two wars in 1965 and 1971. In Africa, Cold War conflicts broke out in Angola, Congo, Ghana, Kenya, Sudan, and Nigeria as well as among others. The decades following highlighted the tensions among members of the Third World with wars and festering conflicts between Ethiopia-Eritrea, India-Pakistan, Egypt-Yemen, Algeria-Morocco, Rwanda-Burundi, China-Vietnam, Iran-Iraq, and others. And even oil-rich countries—especially those in the Persian Gulf—that had been counted as Third World members became rich overnight after the oil shock of 1973, and they laid claim to a different kind of status. With the rise of per capita in these countries, outstripping those of even European countries, the Third World appellation did not mean anything in economic terms. But in political terms, these nations remained under the imperial ambit of the Western world, anchored in the US hegemony.

The other problem came with the descent of ruling parties into corruption and authoritarianism. In Algeria, a one-party system and the associated authoritarianism of the National Liberation Front (FLN) led to rising discontent, which took the form of Islamic protest. It resulted in the open rebellion in the beginning of 1990s and led to a decade of bloodshed in the country. In the Islamic world as well in India, the opposition to the order of the day shifted from a secular politics—which, after all, formed the basis of a Third World movement for modern development—to a politics of religion. In the Islamic

world, countries as diverse as Egypt, Iran, Pakistan, Afghanistan, Lebanon, and Sudan became increasingly assertive in Islamic politics. The prominence of religious politics—at the expense of secular politics—also appeared in India, Sri Lanka, and Turkey.

The rise of Newly Industrialized Countries (NICs), also known as the “Asian Tigers” in East Asia—Hong Kong, Taiwan, South Korea, and Singapore—led to demise of dependency principle. These countries showed that although capitalism remained an unequal system, there were economic opportunities for countries that put their efforts in developing certain niche strengths. An example of this improvement is found in the economic fortunes of China, which has become the factory of the world because of its manufacturing capacity; this example has further solidified the case against dependency. To a certain extent, the improvements in India’s economic fortune had made it possible to conceive the world economic system as allowing for the mobility of countries in the Third World.

A number of theorists—Andre Gunder Frank, for example—have argued that the center of world power is slowly returning again to Asia. With the deepening of globalization, it is argued that perhaps the best way to conceive international inequality is not by using a geographic-based approach—of which the Third World versus the First World is a prime example—but a social approach. The presence of Third World within the First World and vice versa has led to arguments that the best way of understanding inequality in the world is by following the transnational chain of those connected to international economy and those who are excluded by this economy. But such areas as sub-Saharan Africa—that in the past had been conceptualized as the Fourth World by some—have remained marginalized even under globalization.

### THREE GORGES DAM

The Three Gorges Dam, the largest hydroelectric project in the world, is one of the most controversial projects currently under construction in China. The Three Gorges are located in the upper regions of the Yangtze River and are among China’s most fantastic tourist attractions. The idea of building the dam was debated and planned for nearly seven decades. The government of the People’s Republic of China (PRC) conducted extensive feasibility research and site selections in the 1950s and 1960s. However, due to budget constraints, the project stayed in the planning stage until the 1980s.

When the project was revived in 1992, widespread opposition forced the government to delay the project once more. After a period of heated debate, the project was finally approved by the People’s Congress, China’s highest decision-making body. The project officially broke ground in 1994. Two phases of construction have already been completed, and the power plant has partially been put into production. The remaining works are scheduled to be completed by 2009.

The project is mammoth in magnitude. Once completed, the dam will create a huge reservoir stretching 350 miles upstream in the Yangtze River. An estimated 1.13 million local residents must be relocated to make way for it. Many urban centers and villages will be partially or completely submerged. The resettlement alone consumes about one-third of the total cost of the project. More than 125 million cubic meters of earth and rocks have to be removed, and 26 million cubic meters of concrete are required for the six hundred-foot-tall dam. A five-level ship lock, the largest in the world, has been built to allow ships to pass through. The total projected cost is over \$24 billion (USD).

The dam will power the largest power plant on earth. The initial scope of the project called for twenty-six seven-hundred-thousand-kilowatt turbogenerators. In 2003, an expansion plan was approved to add six

additional generators. The new plant will be located in an underground tunnel inside a mountain adjacent to the dam. If completed, the total power-generating capacity of the dam will reach 22.40 megawatts at peak time.

The benefits of this project to China's development are evident: the electricity produced will feed industrial development in China's coastal and central regions. The clean energy will replace more than 50 million tons of coal burned at plants, currently the chief source of electricity. The reduction in carbon monoxide emission will help reduce acid rain and minimize the greenhouse effect. It is also hoped that the dam will play a major role in controlling floods, enhancing irrigation, and improving navigation. According to the project planners, the dam will greatly diminish the threat of annual flooding and keep the reoccurring flood damage in the downstream areas to the minimum.

Critics believe that the project's environmental and social costs are too great to justify the benefits. Some observers believe that relocating more than 1 million residents will be difficult or even impossible. Other critics fear that 1,300 known historical and cultural sites may be wiped out; that the sediment problem may eventually render the dam useless; that the costs of the project may outweigh the energy production; that the potential damages to the region's ecological systems have been underestimated; that the quality of the construction may compromise the dam's safety; and that the dam is vulnerable to military attack.

The government maintains that the resettlement project will be part of a poverty relief program helping the displaced persons improve their standard of living. The government plans to invest in new cities and infrastructures to support six hundred thousand urban migrants. However, the government acknowledges that the challenge is indeed tremendous. While there was not great resistance to the mandatory relocation, many individuals and families complained of inadequate compensation. Official corruption may complicate the issue even further. Nevertheless, over seven hundred thousand people have already been relocated as of early 2004. Among them, 160,000, mostly from rural areas, have been relocated to eleven provinces and some metro areas such as Shanghai.

To save the historical and cultural relics in the region, the government organized 60% of the country's archeological workforces to save, excavate, and relocate cultural sites. Since 1997, more than 720,000 square meters of cultural sites have been uncovered, and 7 million square meters of cultural sites have been surveyed. More than 1,074 sites will be protected at a cost of 1 billion Chinese Yuan. A new Three Gorges Museum and several Three Gorges Cultural Protection Centers will be built to house all the

cultural relics discovered in the area. In order to save the historical city of Dachang, for instance, the entire city was removed and rebuilt in its original state. Nonetheless, the number of cultural sites discovered far exceeded the official estimates. In Badong County alone, the number of sites in need of protection has quickly risen from forty-four to two thousand. Because many of the archeological projects were completed hastily, record keeping and classification may not have been precise, and thus many unknown cultural sites will be submerged by water.

Another criticism is the potential damage to the ecological system of the Yangtze River. Some accused the project planners of failing to conduct adequate scientific studies on environmental hydrology; cumulative impacts; biological, physical, and chemical responses; and potential human use patterns of the Three Gorges Reservoir. Some worry that the water quality will deteriorate; others believe that certain fish species might go extinct because the dam will make seasonal upstream migration impossible. Long-term decline in reservoir fisheries is believed to be inevitable since this result is well documented for many similar river dam projects around the world.

Clearly, the Three Gorges Dam is one of the most comprehensive projects ever undertaken by the Chinese. It comprises numerous and varied smaller projects that involve a great deal of planning. Extensive efforts and studies have been made to address these concerns. To ensure water quality, for instance, the government has initiated several large-scale projects, including a long-term reforestation and soil erosion reduction program in the upper Yangtze River. Wastewater processing plants and garbage-processing facilities are being built along the river bank to stop water pollution. The project is also considered an important part of the Great Western Development Strategy initiated in 1990s to narrow the economic gap between the coastal and inland areas.

## TIBET

Any discussion of Tibet is inextricably bound to debates about the governance of Tibetans. The occupation of Tibet by China that began in 1949, followed by the invasion of 1951 and culminating in the Tibetan uprising against the occupying forces in 1959, is the shared experience that links Tibetans in Tibet, the refugee Diaspora communities, and over 1,500 Tibet support groups in Asia, Europe, and North America. Tibet is an occupied country without representation at the United Nations (UN). At the time of China's invasion the Dalai Lama, who ruled Tibet, had asked the UN to intervene, and a dispute was registered between Tibet and China. China is a permanent member of the UN Security Council and uses its veto to prevent discussion of that dispute.

The Tibetan Government in Exile, a constitutional democracy, governed by the *Kashag* (or Cabinet) and led by the *Kalon Tripa* (Head of Cabinet), is based in Dharamsala, India. The vast majority of Tibetans acknowledge the Dalai Lama's leadership, both spiritual and political; but he insisted that his status as the fourteenth Dalai Lama of Tibet should become that of a spiritual—but not political—leader through the development of a new constitution. The first *Kalon Tripa* (or Prime Minister) under that constitution was Samdhong Rinpoche, a Tibetan Lama.

Tibet comprises 2.5 million square kilometers, with an average altitude of thirteen thousand feet (3,962 meters) above sea level. The economy is based largely on intensive agriculture and pastoralism (animal herding). Tibet is the watershed for much of Asia, with the Yarlung Tsangpo River (called the Brahmaputra in India), the Driчу River (called the Yangtze in China), Senge Khabab River (called the Indus in India), Phungchu River (called the Arun in India), Gyalmo Ngulchu River (called the Salween in Burma), and the Zachu River (called the Mekong in Thailand, Vietnam, Cambodia, and Laos). The country's wildlife includes the wild yak, Tibetan gazelle, black-necked crane, giant panda, red panda, golden monkey, wild ass, and Tibetan Argali. Domestic animals include four distinct breeds of Tibetan dog, including the well-known Lhasa Apso.

Prior to occupation, Tibet was divided into three provinces: U-Tsang, Amdo, and Kham. The Tibetan population was about 6 million in 1949. It dropped by about 1.2 million when many perished as the result of Chinese occupation; while reliable information is not available, the population appears to have rebounded to about 6 million. During the 1980s, population transfers, illegal under international law, moved 7.5 million Chinese (mainly Han) into Tibet. While the Chinese still regard moving to Tibet with much the same reserve that citizens of central Russia have about moving to Siberia, many are tempted by the special privileges afforded to Chinese in Tibet. Under Chinese occupation, Tibet's three provinces of U-Tsang, Amdo, and Kham have been divided into new regions: the Tibetan Autonomous Region (consisting in the Tibetan province of U-Tsang and part of Kham; about 1.2 million square kilometers) in Qinghai Province; Tianzu Tibetan Autonomous County and Gannan Tibetan Autonomous Prefecture in Gansu Province; Aba Tibetan-Qiang Autonomous Prefecture, Ganzi Tibetan Autonomous Prefecture, and Mili Tibetan Autonomous County in Sichuan Province; and Dechen Tibetan Autonomous Prefecture in Yunnan Province. When Tibetans in the Tibetan Diaspora refer to Tibet, they invariably mean the three provinces of Kham, U-Tsang, and Amdo because Tibetan refugees come from all parts of all three provinces. When the government of China refers to Tibet, it tends to refer only to the Tibetan Autonomous Region, with a population of about 2 million Tibetans. Most of Tibet, therefore, lies outside of what the Chinese government calls “Tibet.”

Almost all Tibetans are Mahayana Buddhists. Tibetan Buddhism, also called Lamaism, is distinct in its emphasis upon finding the Tulkus, or reincarnations of highly realised or enlightened Lamas. The most important reincarnated Lama is the Dalai Lama, who is believed to be a manifestation of *Chenrasigs* (also called *Avalokitesvara*), the Bodhi-sattva of Compassion. It is difficult to overestimate the symbolic importance of the Dalai Lama himself and the system of Tibetan Buddhism that he represents. The Dalai Lama's personal example and Tibetan Buddhism, with its profound emphasis upon the development of compassion and personal responsibility, compose a central cultural theme for the Tibetan Diaspora community.

Over one hundred thousand Tibetans followed the Dalai Lama, as refugees, to India and neighboring countries after the March 10, 1959 uprising. The Dalai Lama established a government-in-exile in Dharamsala, in northern India, to coordinate efforts to provide for the refugees' needs of and to develop institutions to preserve Tibetan learning and culture

while Tibetans were separated from their country. The occupation of Tibet by China resulted in the destruction of more than six thousand monastic communities, which were the religious, educational, and administrative centers of Tibetan society. China's policies of forced assimilation, exacerbated by massive population transfers from China to Tibet and coupled with human rights violations and the destruction of Tibetan ecology, have caused widespread international concern and do not bode well for Tibet's future development.

The influx of Tibetans to India and other countries continued after the initial exodus, straining resources in India; in 1967, the Dalai Lama appealed to the international community to accept Tibetan refugees. Switzerland was the first nation to offer resettlement, and Canada was the second.

Tibetans inside and outside of Tibet have gained support internationally because of their nonviolent resistance to China's occupation of their country. For his continued commitment to these peaceful means, the Dalai Lama was awarded the Nobel Peace Prize in 1989.

Exiled Tibetans have also developed a parliament-in-exile that includes elected Members of Parliament (MPs) from each region with a population of Tibetan refugees. In 1992, the Canada Tibet Committee established the Canada Tibet Network on the Internet to link the Tibetan-Canadian communities. Subsequently renamed World Tibet Network, the service now serves Tibetans and Tibetan support groups globally.

The human rights situation in Tibet continues to be a serious embarrassment to the government of China; but with the Dalai Lama and the Tibetan Government in Exile asking for negotiations that would lead to Tibetan internal autonomy rather than complete independence, China is being offered a way forward.

### TIANANMEN SQUARE MASSACRE

China has been ruled by the dictatorial Communist Party since 1949, when Mao Zedong led the party to victory over the Nationalists (who fled to the island of Taiwan). In the tradition of Lenin and Stalin, the party allowed no democracy or popular dissent. Resistance was crushed at the cost of millions of lives, the repression reaching a peak during the period known as the Cultural Revolution (1966–1976).

With the death of Mao Zedong in 1976, China began to moderate its commitment to communism. A power struggle between Mao's successors resulted in the victory of Deng Xiaoping, a relative moderate. Deng believed that China's loyalty to traditional socialism was holding it back from maintaining its status as a world power. He advocated economic modernization and encouraged investment by foreign corporations. By the late 1980s, capitalism was taking root in China, and Deng's policies were resulting in record growth in China's gross national product (GNP).

Deng's support for economic reform, however, did not extend to political reform. He maintained the Communist Party's firm control over all of China's political institutions and opposed introducing Western ideas, such as free speech and democracy. Subordinates, such as Hu Yaobang, who advocated a more liberal society, were dismissed. Despite Deng's opposition to certain reforms, the growing economic freedom in China led many, particularly among younger Chinese intellectuals, to desire political and social freedoms to go along with China's growing economic freedom.

Events in China were also influenced by those in the neighboring Union of Soviet Socialist Republics (USSR). Since its birth in 1917, the Soviet Union had been the driving force behind world communist movements. But in 1985, reformist leader Mikhail Gorbachev had come to power, advocating economic and political reforms. By 1989, the beginnings of democratic institutions that would bring down the Soviet Union had formed. In Eastern Europe, starting with Hungary, communist governments were moving (some voluntary, some forced by events) away from communist one-party rule and toward democracy.

## TIANANMEN SQUARE MASSACRE

Chinese intellectuals were watching these events closely, particularly so because in 1989 Premier Gorbachev was due to visit China.

The trigger for the Tiananmen Square demonstrations came with the death of the pro-reform leader Hu Yaobang on April 15, 1989. Although no longer in power, Hu had become a symbol for those desiring greater freedom. A few thousand students marched to Tiananmen Square to demonstrate; ostensibly, they were demanding posthumous recognition for Hu; actually, as would quickly become clear, they were demanding a vast change in government policy in favor of greater freedom. The demonstrations escalated during April, with students, often supported by citizens of Beijing, gathering in tens of thousands in the square despite government prohibitions.

These demonstrations were troubling to Deng Xiaoping and his government, not simply because of their size but also because they were taking place in the heart of China. Tiananmen Square is the largest public square in the world (forty-four hectares, or over one hundred acres) and lies in the center of Beijing. With the Great Hall of the People (which houses the People's Congress) on one side and Mao's tomb on another, any demonstrations in Tiananmen could not help but have historic and international repercussions.

By the middle of May 1989, there was a permanent encampment of thousands of student protestors camped in the square. Other protestors began to arrive from elsewhere in China. International journalists flocked to the square and listened to earnest young students talk about freedom and democracy for China. Some of the protestors staged hunger strikes, demanding democracy and press freedoms. With Gorbachev in Beijing and extensive international press coverage, the government was restrained in its dealings with the demonstrators.

However, after Gorbachev's departure, and with the failure to successfully negotiate with the more moderate student leaders, the government's position hardened. On May 20, the government declared martial law, and on May 21 attempted to move troops into the square. The attempts, however, were blocked by students and Beijing residents, who physically placed themselves in front of military vehicles. The demonstrators, taking heart at this success, became bolder in their demands. On May 30, the demonstrators built a "Goddess of Democracy" statue out of plaster; the statue symbolized their demand for greater freedom and was reminiscent of the Statue of Liberty in New York harbor.

On June 3, government troops again moved against Tiananmen Square, but this time in much greater force. Reports of what happened are conflicting, and Chinese government censorship makes an accurate

account impossible to achieve. Reports do consistently describe Chinese soldiers firing on civilians. They may not have fired indiscriminately into crowds, as has been reported, but clearly unarmed civilians in and around Tiananmen square were killed. During two days of struggle, there was extensive violence. Some of the violence was caused by crowds of Beijing residents who supported the demonstrators and tried to block the army vehicles moving through Beijing's streets. Many military trucks were destroyed in the fighting, and there were some military casualties. There were also some reports of troops acting sympathetically to the demonstrators being fired on by more hard-line forces. Most casualties, however, were civilian. Estimates range from hundreds (the government's figure) to thousands of casualties. The actual figure cannot be known with any accuracy, but probably more than two thousand people were killed during June 3, 4, and 5, 1989.

International leaders, including President George Bush of the United States, condemned the brutal repression of the Tiananmen Square protests but did little else (the United States, for example, maintained full trade relations with China). Human rights organizations were scathing in their criticism. Some protestors escaped to Western countries like the United States to continue their fight for greater democracy, and many more were arrested by the Chinese government. Fairly quickly the disturbances in Beijing and elsewhere in China died down, and the government was able to continue Deng's policies of economic liberalization without granting any political freedom.

It remains difficult to assess the Tiananmen Square uprising's effects. While there are still prodemocracy activists in China, they seem few and are heavily persecuted by government security services. Most Chinese citizens seem to have accepted the government's Faustian bargain of a growing economy and material prosperity without any political liberalization. Many prosperous Chinese regard the Tiananmen demonstrations as an impractical effort by naive students.

However, Chinese prosperity is not uniform. In the countryside, where poor peasants envy the disproportionate benefits enjoyed by the cities, there may be more sympathy for the memory of Tiananmen and more chance for a revival of a similar movement. For people around the world, the image of individual Chinese citizens putting their bodies in front of tanks in the name of democracy remains as an inspirational symbol for those advocating greater freedom in their own countries.

### TITO, JOSIP BROZ (MARSHALL TITO)

A revolutionary, president for life, and internationally respected leader, Josip Broz Tito (Tito was a Communist Party name Broz accepted in 1934) ruled former Yugoslavia for more than three decades, from 1945 to the time of his death in 1980. He is remembered as the most important political figure of the former Yugoslavia, a leader who skillfully kept the country's numerous ethnic animosities contained under the policy of brotherhood and unity while building his own and Yugoslavia's international reputation and prestige.
