Chronology

1556	The first Bridewell opens in London
1608	Captain George Kendall becomes the first recorded execution in the new colonies
1619	Beginning of the transportation of British convicts to the American colonies
1632	Jane Champion becomes the first woman executed in the new colonies
1656	*Hôpital Général* established in Paris, generally considered precursor to modern prison
1682	Great Law enacted (drafted by William Penn for the Pennsylvania Colony)
1764	Cesare Beccaria publishes *On Crimes and Punishments*
1772	Maison de Force founded in Ghent, Belgium
1773	Newgate Prison opens in London
	Walnut Street Jail opens in Philadelphia
1774	First recorded American prison riot occurs at Simsbury, Connecticut
1777	John Howard publishes *The State of Prisons in England and Wales*
1779	England passes the Penitentiary Act
1787	Philadelphia Society for Alleviating the Miseries of Public Prisons, later known as the Pennsylvania Prison Society, is founded
	Arrival of first convicts in Australia
1789	Jeremy Bentham publishes *An Introduction to the Principles of Morals and Legislation*
1790	Renovated Walnut Street Jail opened with a penitentiary wing
1797	Newgate Prison established in New York City
1816	Millbank Prison opens in London, provides a model for penitentiaries elsewhere
1819	Congregate, silent system implemented in Auburn Penitentiary, New York
1821	Western Penitentiary opens
	Work begins on foundations and walls of Eastern State Penitentiary, Philadelphia.
1825	Kentucky becomes the first state to employ a private contractor to manage its entire correctional facility system, and by the end of the Civil War the majority of southern states have followed suit
1826	Construction of Sing Sing in New York State begins; institution is originally known as Mount Pleasant State Penitentiary
1827	Elizabeth Fry publishes *Observations on the Siting, Superintendence and Government of Female Prisoners* in England
1829	Eastern State Penitentiary opens
1830s	**Jacksonian era**
1832	First escape from Eastern State Penitentiary
1833	Alexis de Tocqueville and Gustave de Beaumont publish *On the Penitentiary System in the United States*
1841	John Augustus develops probation in Boston
1842	Pentonville Prison opens in London, based, in part, on Jeremy Bentham's panopticon design; prisoners are initially held in solitary confinement
1844	Women's Prison association formed in New York to improve the treatment of female offenders and to separate them from men

1858	Joliet Penitentiary opens in Illinois
1868	British transportation of convicts to Australia ends
1870–1919	**Reformatory era**
1870	American Prison Congress (forerunner of American Correctional Association)—*Declaration of Principles* enacted
1871	*Ruffin v. Commonwealth* establishes that convicted felons not only forfeit liberty but are slaves of the state; this provides the legal justification for courts to maintain a hands-off doctrine
1873	The first women's prison, the Indiana Reformatory Institution, opens
1876	Zebulon Brockway initiates America's first parole system in Elmira Reformatory
1878	First probation law is passed in Massachusetts
1880	Louisiana State Prison opens at Angola
1890s–1930s	**Progressive era**
1891	Congress passes the Three Prisons Act, establishing federal prison system
1895	Gladstone Commission in United Kingdom ushers in new era of punishment
1899	First juvenile court established in Cook County, Illinois
1904	Parchman Farm opens in Mississippi
1914	Passing of the Harrison Act leads to incarceration of people convicted of narcotic-related offenses
1919	Volstead Act
1920	The American Civil Liberties Union founded
1926	Stateville Penitentiary is founded in Illinois
1927	The federal government opens its first women's institution, the Federal Industrial Reformatory and Industrial Farm for Women at Alderson, West Virginia
1928–1931	Wickersham Commission
1929	Hawes-Cooper Act passed to regulate interstate sale of prisoner-made goods
1930s–1960s	**Medical model**
1930	The Federal Bureau of Prisons is established
1933	The Federal Bureau of Prisons establishes first prison medical center at FMC Springfield
1934	Alcatraz opens
1942	Relocation centers open to confine Japanese and Japanese Americans during World War II
1946	Last of relocation centers closes
1949	Geneva Convention relative to the Treatment of Prisoners of War adopted
1950	Youth Corrections Act passed to create rehabilitative treatment for offenders under the age of 22 in the federal system and the District of Columbia
1958	Gresham Sykes publishes *The Society of Captives*
1960s–1970s	**Community model**
1961	*Monroe v. Pape* resurrected 19th-century post–Civil War legislation (Title 42 Section 1983) allowing federal litigation against those acting under color of state law for depriving of civil rights; provides the basis for prisoner civil rights litigation
1963	Alcatraz closes and U.S. Penitentiary Marion opens
1964	*Cooper v. Pate* overturns *Ruffin*, formally recognizing the constitutional rights of prisoners
1965	Congress passes Title IV of the Higher Education Act, which provides for Pell grants for prisoners to pursue college education
	President Lyndon Johnson creates the President's Commission on Law Enforcement and the Administration of Justice
1966	*In re Kent,* "essentials of due process" required for juveniles
	The Black Panther Party (BPP) forms in Oakland, California
1967	*In re Gault,* Supreme Court rules that juvenile offenders are entitled to state-provided counsel and due process guarantees

	Report of the President's Commission on Law Enforcement and the Administration of Justice is published with 200 recommendations for changes to the criminal justice system
1970	Eastern State Penitentiary closes
	Through the efforts of Jerome Miller, Massachusetts becomes to first state to start closing all of its reform schools; all are closed by 1972
1971	Attica rebellion
	The first black warden is appointed in the federal prison system
	David Rothman publishes *The Discovery of the Asylum: Social Order and Disorder in the New Republic* that critically reevaluates the treatment of the mentally ill in the United States
1972	*Furman v. Georgia,* Supreme Court effectively voids 40 death penalty statutes and suspends the death penalty as "cruel and unusual punishment"
	President Richard M. Nixon declares the initial "war on drugs"
	ACLU founds the National Prison Project to strengthen prisoners' rights
1974	*Wolff v. McDonnell* allows inmates certain due-process rights in prison disciplinary hearings
	Robert Martinson's article "What Works?" appears in *The Public Interest*
	The Juvenile Justice and Delinquency Prevention Act passed
1975	Michel Foucault publishes *Surveiller et Punir*, translated into English as *Discipline and Punish* in 1977
1976	*Gregg v. Georgia* reinstates death penalty
	Estelle v. Gamble deliberate indifference to medical needs violates constitutional rights
	Maine is first U.S. state to abolish parole
	The first female officer is appointed to work in a male federal prison at Lompoc, California
1977	Leonard Peltier imprisoned
	Coker v. Georgia establishes that death penalty is an unconstitutional punishment for rape of an adult woman when the victim is not killed
	Gary Gilmore is put to death by firing squad, the first person executed since the reinstatement of the death penalty
1979	*Bell v. Wolfish* signals a return to a hands-off approach by the courts
	Prison Industry Enhancement Certification Program repealed Depression-era limitations on the interstate commerce in prison-made goods
	Organization "Stop Prisoner Rape" is founded by survivors of prison rape
	The Bureau of Justice Statistics is founded within the U.S. Department of Justice
1980s–present	**Crime control model**
1980	*Ruiz v. Estelle* establishes that conditions of confinement in entire Texas state prison system are unconstitutional
	New Mexico Prison riot
1981	The first woman warden of a men's federal prison is appointed at Butner
	Pat Carlen publishes *Women's Imprisonment* in Britain, one of the first critical sociological studies of a women's prison
1982	President Ronald Reagan declares a "war on drugs"
	Federal Bureau of Prisons establishes residential staff training program at Glynco, Georgia
	Federal Bureau of Prisons establishes first mandatory literacy program
1984	Congress passes the Sentencing Reform Act of 1984, as part of the Comprehensive Crime Control Act and creates the U.S. Sentencing Commission
	Velma Barfield becomes the first woman executed since reinstatement of the death penalty
	Congress passes Young Offender Act
	Hudson v. Palmer, Supreme Court rules that prison administrators are obligated to provide an environment for inmates and prison employees that is both secure and sanitary

	The state of Tennessee ushers in the new age of privatization by contracting Hamilton County Jail facility to be run by Corrections Corporation of America
1985	Nicole Hahn Rafter publishes *Partial Justice: Women, Prisons and Social Control*
1986	Congress passes first Anti-Drug Abuse Act that increases prison sentences for the sale and possession of drugs, eliminates probation or parole for certain drug offenders, increases fines, and provides for the forfeiture of assets
1987	*McCleskey v. Kemp,* Supreme Court rules that racial disparities not recognized as a constitutional violation of "equal protection of the law" unless intentional racial discrimination against the defendant can be shown
	Cuban detainees, from the Mariel boat lift, riot at the Atlanta and Oakdale, Louisiana, federal prisons
1988	*Thompson v. Oklahoma* establishes that executions of offenders ages 15 and younger at the time of their crimes is unconstitutional
	Congress passes the Civil Liberties Act and apologizes to Japanese American community for wartime detention in relocation centers
	Congress passes second Anti-Drug Abuse Act that introduces differential treatment for crack and powder cocaine and mandatory imprisonment for simple possession of more than 5 grams of crack cocaine
	California State Prison, Corcoran, opens; it is later dubbed "America's most violent prison"
1989	*Penry v. Lynaugh*, Supreme Court rules that executing persons with mental retardation is not a violation of the Eighth Amendment
	Number of black people incarcerated becomes greater than number of whites across the United States penal system for the first time
	Stanford v. Kentucky and *Wilkins v. Missouri,* Court rules that Eighth Amendment does not prohibit the death penalty for crimes committed at age 16 or 17
	John Braithwaite publishes *Crime, Shame and Reintegration*, which proposes a new approach to punishment based on restorative justice
1990	David Garland publishes *Punishment and Modern Society*
	Wilson v. Seiter establishes that prisoners must demonstrate that prison staff acted with "deliberate indifference" to prove "cruel and unusual" conditions
	The Solicitor General of Canada publishes *Creating Choices*, the first government report on women's prisons that is based on feminist or women-centered priniciples
1992	Washington State becomes the first jurisdiction to enact legislation known as "three strikes you're out"
1994	Congress passes the Violent Crime Control and Law Enforcement Act
	California brings in three-strikes legislation
	The Federal Bureau of Prisons opens its supermaximum secure facility, ADX Florence
	New Jersey passes Megan's Law requiring public notification of presence of former sex offenders in the community
1995	Pell grants are abolished for prisoners as a result of the Violent Crime Control and Law Enforcement Act
	Alabama, Arizona, Florida, Indiana, Iowa, Maryland, Oklahoma, and Wisconsin reinstate chain gangs
	Religious Freedom Restoration Act expands rights of prisoners to practice their religion in prison
1996	Congress passes the Prison Litigation Reform Act (PLRA) to limit prisoner litigation
	Congress passes the Illegal Immigration Reform Immigrant Responsibility Act that expands the capacity of the Immigration and Naturalization Service to detain foreigners
	California Supreme Court rules in *People v. Superior Court* that judges may dismiss allegations of prior felonies in second- and third-strike cases "in the interest of justice"

1997	Congress passes the National Capital Revitalization and Self-Government Improvement Act abolishing the D.C. system of corrections
	Critical Resistance established in Berkeley, California
1998	Allen Hornblum publishes *Acres of Skin: Human Experiments at Holmesburg Prison* that reveals extent of medical experiments on prisoners
1999	Number of people incarcerated in the U.S. is, for the first time, greater than 2 million
	Eleven of the Puerto Rican nationalists imprisoned since the 1980s are granted presidential pardons by President Bill Clinton
2000	Attica Brothers Legal Defense Fund wins a $12 million settlement for survivors of the Attica rebellion
	Illinois Governor George Ryan announces a moratorium on capital punishment in Illinois
2001	USA PATRIOT Act passed, in response to the September 11, 2001, terrorist attacks on the United States
	Enemy combatants are placed at Camp X-Ray at Guantanamo Bay, Cuba without trial or access to lawyers for an indefinite period of time
2002	*Ring v. Arizona,* Supreme Court rules that only a jury may pass a death sentence
	Atkins v. Virginia, Supreme Court rules that executing persons with mental retardation is unconstitutional
	Camp Delta, a permanent detention center for enemy combatants, opens at Guantánamo Bay, Cuba
2003	Congress passes Prisoner Rape Elimination Act designed to end prisoner rape
	Illinois Governor George Ryan commutes the death penalty of 160 inmates on death row
2004	First military tribunals held for inmates from Guantánamo Bay
	Abuse of prisoners at Abu Ghraib prison in Baghdad, Iraq, by U.S. military personnel becomes public
	Blakely v. Washington, Supreme Court rules that judges may not use their discretion to enhance sentences; activists believe this decision may affect the federal sentencing guidelines, particularly as they have been applied to those convicted of drug offenses

Introduction

The United States confines more people per capita than any other equivalent industrialized, democratic country. It is also one of the last remaining such nations to practice capital punishment, and one of only a handful of countries anywhere that executes juveniles. Sentences are longer in the United States than in most places, and the numbers of people of color behind bars is particularly disproportionate to their presence in society. In 1999, the United States crossed a threshold when, for the first time, the nation's penal institutions held more than 2 million people. In fact, prisons, jails, and detention centers have been filling since the 1980s at a rate faster than most can handle. As a result, overcrowding is rampant, even with growing numbers of privately run facilities being established and new state and federal institutions being opened each year.

This encyclopedia is a timely and necessary publication for anyone wishing to understand why confinement has become so commonplace in the United States. As many of the entries detail, prisons have become big business in the United States, spawning not just private prison companies but also a multitude of small businesses that service penal facilities (maintenance, laundry, food, clothing, etc.). In some communities, prisons provide one of the only sources of employment. In others, they have taken away almost all of the young men.

As increasing numbers of men, women, and children are being locked up—the prison, the jail, and the detention center are becoming part of many people's lives. The collateral effect of incarcerating more than 2 million is enormous. Many of us now know someone behind bars. More than that, however, prisons are part of our collective cultural imagination. We, as a society, seem to find it hard to imagine a different solution to criminal behavior. Yet, as the historical entries in these two volumes demonstrate, the prison has not been used so extensively for very long. Moreover, as other authors show, there are numerous alternative possible ways of dealing with those who break the law.

This encyclopedia draws together up-to-date statistics and academic research to sketch out the scope of prisons and punishment in the United States. Its goal is to provide information on all the different types of penal facilities currently being used while keeping a broad focus on the prison itself. Authors strive, where possible, to address issues of race and gender and to make clear how current and historical policies and practices have affected communities and individuals differently.

All of the entries are written in an accessible and engaging style that aims to be appealing for a wide readership. We hope that high school students, visitors to the public library, those who are confined, and criminal justice practitioners, and academics can all find matters of interest to them here. By including race and gender in each entry, the authors have sought to provide a critical assessment of their topic that reveals the differential impact of criminal justice policy.

Though the primary focus of the encyclopedia is on the United States, where possible authors have included comparative information about what is happening elsewhere around the world. There are also specific entries on a handful of other English-speaking penal systems, to provide a sense of comparison.

THEMES

With nearly 400 entries, the two volumes truly provide an encyclopedic analysis of prisons and correctional facilities. To help the reader make sense of

the wealth of information included in this collection, it is possible to characterize all of the topics into 12 distinct, yet overlapping, themes.

First, a number of entries are concerned with *prison architecture.* In them, authors map out the historical development of the physical design of penal institutions, showing how changing ideas and goals of punishment, along with the arrival of specific populations, and overcrowding, influence the way in which prisons are built. Likewise, how a correctional facility is designed shapes how prisoners are treated. To illustrate the effect of design, a number of specific prisons are described in some detail.

Theories of punishment constitute the second major theme in the encyclopedia. Specific entries describe goals of punishment, from deterrence to incapacitation. Accounts of particular methods of dealing with offenders, such as the capital punishment, explain how certain practices correspond to particular ideas about what punishment can achieve.

Entries on *prison populations* provide detailed accounts of specific groups of people within penal establishments. Particular attention is given to those groups that are particularly overrepresented such as African Americans and Latino/as. Women prisoners and the elderly are also dealt with separately, as are juvenile offenders.

A number of authors tackle *prison reform,* describing specific groups and organizations that are currently active, as well as individuals who have been crucial to attempts to ameliorate conditions within prison. Entries on abolition and activism point to alternative ideas about punishment that do not involve confinement.

Juvenile justice is another key theme. As with the entries on adult prisons, authors examine treatment of young offenders in historical and contemporary settings. Attention is paid to specific legal cases that particularly affected the treatment of juveniles and to key institutions where they were housed.

Staff are crucial to any penal institution. To that end, a number of entries examine the historical development of correctional officers as well as their present work conditions. Attention is paid to the issue of professionalism, as well as to staff training.

To convey how prisons attempt to address offending behavior, a number of authors focus on a range of *treatment programs.* Topics in this field include psychological services, drug treatment programs, Alcoholics Anonymous, work, education, and vocational courses. There are also a number of entries on related issues such as prison health care, mental health care, HIV/AIDS, and gynecology.

As the penal system in the United States has become increasingly overcrowded, many aspects of it have been handed over to private companies. As a result, *privatization* is another common strand of this encyclopedia. Entries provide information about the move to the private sector overall, as well as describing specific parts of prison life that are now run by corporations. Entries are also included on the two biggest private prison companies in the United States.

Ever since the first penitentiaries, prisoners have been put to *labor.* In a number of entries, authors describe the historical development and changing nature of prison work. They also detail how penal systems train inmates in employable skills to help reduce reoffending rates.

Where possible, each entry in this encyclopedia includes an examination of *race, gender, and class.* Some entries concentrate specifically on these issues, to describe racial dynamics, racism, or specific groups of inmates.

Prisons and other correctional facilities are shaped by the context of *sentencing policy and laws.* Authors describe significant legal cases that have changed penal policy, as well as explain the relevance of constitutional amendments to prison policy. Sentencing guidelines, sentencing laws, and the rationale for different types of sentences are also considered.

Finally, certain entries center on issues of *security and classification.* These include examinations of classification systems, along with description and analysis of prison discipline. The different levels of security are also explained individually, while examples of key types of institutions are outlined. Related topics include entries on specific types of punishment such as probation, parole, community corrections, electronic monitoring, and house arrest.

ORGANIZATION

The entries are organized alphabetically. Each one is cross-referenced to point the reader to related topics that they might find relevant. The essays also all include a list of further readings to help the reader in any additional research. The index provides a guide to the topics covered in specific entries as well as those listed under alternative names.

SIDEBARS AND ILLUSTRATIONS

The encyclopedia contains 25 sidebars and a number of illustrations, including graphs, tables, and photos. In the sidebars, prisoners share their firsthand accounts of life behind bars.

APPENDIX

The appendix lists institutions in the federal prison system. Included in this list are the address and location of each facility, along with brief descriptions of the programs and treatment each place offers. It gives an overview of one of the largest and most important prison systems in the United States to provide a greater sense of the opportunities available for those behind bars.

CHRONOLOGY

A detailed timeline is listed at the start of each volume. This chronology dates key legal cases, publications, and the founding of certain penal establishments in the United States.

CONCLUSION

While a collection of this size is not designed to be read cover to cover, it is hoped that readers will find the information in each entry absorbing enough to lead them onto another. To that end, readers should take note of the cross-references listed below each entry to direct them to other, related areas. As with all reference books, this collection is designed not just to inform but also to explain and analyze. Reflecting the work of many different individuals, at various stages in their careers and from a number of different places, this encyclopedia aims to provide the most comprehensive overview of issues related to prisons, punishment, and confinement in the United States today.

Acknowledgments

There are many people to thank for helping to pull together this collection of entries. First of all, I have been incredibly fortunate in my editorial team. Jeanne Flavin, Jim Thomas, Esther Heffernan, and Stephanie Bush-Baskette really went above and beyond the call of duty. Not only did they help put together the list of topics, but also they helped me edit some of the thornier pieces of prose that I received. Most important, they did all this with good humor, generosity of spirit, and speed. They particularly stepped into the breach when I experienced the joyful surprise of my daughter Ella arriving one month early and thereby disrupting the scheduled completion of this encyclopedia.

At Sage, I would like to thank Rolf Janke and Jerry Westby for asking me to edit these two volumes. Working with them is always a pleasure. Vonessa Vondera managed to keep the list of contributors and all other organizational matters in order, allowing me to stay focused on editing, while Kate Peterson and Pam Suwinsky have done a wonderful job correcting minor errors and smoothing out stylistic flaws during the copyediting process. Denise Santoyo ensured that all the final issues were resolved so that the encyclopedia could actually be published.

Although there have definitely been moments in its completion where I swore never to be involved in a project of this size again, it has been a fascinating experience that I am pleased to have undertaken. Not only has the encyclopedia enabled me to make contact with most of the interesting people in my field of prisons research, but also I have learned a lot from reading each entry. To that end, I would like to thank the more than 250 authors who are responsible for the entries that I have edited. Drawn from across the United States, as well as from the United Kingdom, Australia, New Zealand, and Canada, they have sought to define their allotted topics in ways that are accessible to a general readership while remaining rigorously academic. This dual task of an encyclopedia is not always easy, yet it is important. Each author also strove to include information about race and gender in order to avoid generalizing.

Others who have helped include Chelsea Adewunmi, who transcribed all of the prisoner entries and helped edit them, while also organizing all my computer files so I could be sure of which entries I still needed to chase up. I also appreciate the assistance of Michal Bosworth, Marianne Fisher-Giordano, Paul Lucko, and Shoshana Pollack, all of whom read through some entries and gave suggestions for changes. The various prisoners who have contributed the information for the sidebars also need to be acknowledged, particularly Seth Ferranti, who organized a number of men to write about their experiences.

Finally, I'd like to thank Anthony for helping out on the home front and for always being enthusiastic about this project. He kept reminding me of the utility that encyclopedias play in disseminating information from the confines of the academy to the general public. I'd like to dedicate this to Ella, who is wriggling on my knee, saying "ooh ooh ooh" as I type this one-handed. She has made the finishing-up stage of this encyclopedia much more amusing than it might otherwise have been, if a little slower than planned.

About the Editor

Mary Bosworth is Assistant Professor of Sociology at Wesleyan University in Connecticut. She has published extensively on a number of different aspects of imprisonment. Her first book, *Engendering Resistance: Agency and Power in Women's Prisons* (1999), analyzes contemporary women's imprisonment in England in light of feminist theory. In contrast, her second book, *The U.S. Federal Prison System* (2002), is designed as a resource for prisoners and their families as well as prisons researchers and practitioners. In it, Bosworth combines academic literature with government reports and firsthand prisoner accounts to explain and analyze key aspects of the federal prison system.

In addition to these two books, Bosworth has published numerous journal articles and book chapters on topics from the history of women's imprisonment in France to methodological issues in prisons research. She is currently coediting (with Jeanne Flavin) a collection of essays on race, gender, and punishment that will be published in 2005.

After finishing her PhD at the University of Cambridge in 1997, Bosworth started working in the United States in the Sociology and Anthropology Department at Fordham University in New York City. In 2002, she moved to the Sociology Department at Wesleyan University. She has been a visiting library fellow at the School of Criminal Justice at Rutgers University and a visiting scholar at the Maison Suger in Paris. In the summer of 2004, she was a visiting scholar at the Crime Research Centre at the University of Western Australia, and at the Institute d'études européennes at the Université de Montréal, where she conducted a comparative study of the detention of immigrants and foreigners in light of recent legislation. In fall 2004, she became a visiting scholar at the Oxford University Centre for Socio-legal Studies and at Wolfson College to continue this research. In December 2003, Mary Bosworth gave birth to her first child, Ella Michal Bosworth-Gerbino.

A

ABBOTT, JACK HENRY (1944–2002)

Jack Henry Abbot is remembered as a complex and controversial figure in the history of U.S. prisons. In 1978, Abbott, while in prison, initiated a lengthy correspondence with author Norman Mailer, who was at the time writing *The Executioner's Song* (1979), a fictionalized biography of executed murderer Gary Gilmore. Abbott and Gilmore served time together in the Utah state penitentiary. Mailer not only was eager to learn more about Gilmore but also took an interest in Abbott's own writings. He was, apparently, impressed by Abbott's ability to convey the stark reality of prison life and was instrumental in having Abbott's letters published in the prestigious *New York Review of Books.* Self-educated, Abbott delved into the revolutionary philosophies of Mao and Stalin and wrote critically about violence and racism in America and in its prisons.

In the Belly of the Beast

Abbott's collection of writings culminated in the publication of the autobiographical text *In the Belly of the Beast* (1981). The book, featuring an introduction by Mailer, was commercially successful and highly acclaimed by critics. In it Abbott chronicles his life as a state-raised convict. He spent the better part of his first 12 years being shuttled among foster homes before being sent to the Utah state reformatory. At age 18, he was released, but only six months later he was sent to the Utah penitentiary to serve time for writing bad checks. Three years later, he stabbed one inmate to death and injured another in a prison brawl, adding more time to his sentence. In 1971, at the age of 25, he escaped briefly and robbed a bank, an offense that added a 19-year federal sentence on top of state time. In the *New York Times Book Review,* critic Terrence Des Pres called Abbott's book "awesome, brilliant, perversely ingenuous; its impact is indelible, and as an articulation of penal nightmare it is completely compelling" (Worth, 2002, p. B2).

When Abbott was being considered for parole, Mailer wrote a supportive letter on his behalf: "Mr. Abbott has the makings of a powerful and important writer" (Worth, 2002, p. B1). Mailer pleaded for Abbott's release, guaranteeing him gainful employment; subsequently, Abbott was transferred to a New York halfway house in early in June 1981 where he worked as a researcher earning $150 a week. Abbott was quickly embraced as a curious celebrity, appearing on nationally televised news programs and attending dinners with New York's literary elite.

THE MURDER OF RICHARD ADAN

Just six weeks after his release, Abbott's fame turned tragic when, during a confrontation outside a restaurant, he stabbed a man to death. His victim, Richard Adan, was a 22-year-old aspiring actor working nights as a waiter. The murder brought intense criticism of Mailer, who was ridiculed for having romanticized Abbot for his literary talent while failing to recognize the ex-con's capacity for violence. Mailer said he "felt a large responsibility" for the death of Adan, insisting that he "never thought Abbott was close to killing and that's why I have to sit in judgment on myself. I just was not sensitive to the fact" (Worth, 2002, p. B1).

After the deadly incident, Abbott eluded police and fled New York City. Following a month-long manhunt, he was apprehended in Louisiana and extradited to New York where he was convicted of first-degree manslaughter and sentenced to 15 years to life. In 1990, Abbott was sued in civil court by Adan's widow, who was awarded $7.57 million in damages. The award included Abbott's future earnings as well as the $100,000 he had already earned from *In the Belly of the Beast* and $15,000 he had earned from the rights to a film about the murder and another book he had written titled *My Return* (1987). Abbott had already been barred from using any of the proceeds of *My Return* under New York State's so-called Son of Sam law that prevents offenders from profiting from their crimes.

CONCLUSION

In 2002, corrections officers at the Wende Correctional Facility (New York) found Abbott, age 58, hanging from a bed sheet, an apparent suicide. After learning of Abbott's death, Mailer lamented: "His life was tragic from beginning to end. I never knew a man who had a worse life. What made it doubly awful is that he brought a deadly tragedy down on one young man full of promise and left a bomb crater of lost possibilities for many, including most especially himself" (Worth, 2002, p. B1).

ABOLITION

The term *abolition* emerged during the 1830s to define a means of ending slavery. According to abolitionists slavery could be wiped out only by abandoning it and all the structures dependent on it altogether. In contrast, other antislavery activists at the time known as *gradualists* sought to end slavery by buying slaves and setting them free. Gradualism did little to reduce or eliminate the slave system since it did not target the root of the practice. Similar divisions exist within the field of criminal justice. Unlike other reformers who want to change, improve, or better the existing justice system, abolitionists wish to do away with it altogether. Reformers who are not abolitionists usually lobby for more humanitarian treatment of offenders, while seeking to reduce prison terms, or alter criminal law in some manner. Such a course calls for modifications— often substantial—without challenging the institutional or philosophical base on which the system is constructed. In contrast, abolitionists want to either eradicate whole elements of the current punishment system or bring an end to it entirely. They also advocate for a variety of alternatives.

Contemporary abolitionism dates from the countercultural political movements of the 1960s and 1970s. As a relatively new force on the penal landscape it is still evolving. Initially defined by its opposition to incarceration as a means of punishment and thus identified as *prison abolition,* in the mid-1980s the abolitionist position became one of

penal abolitionism. Penal abolitionists—activists, ex-prisoners, academics, religious actors, politicians, inmates and their families, laborers, students—are opposed to an adversarial criminal justice system that promotes and supports revenge, punitive imprisonment, retribution, and coercion. They are also equally concerned with victims and offenders since they believe that the current systems fail both parties as well as the community.

HISTORY OF THE MOVEMENT

Penal reformers began to criticize methods and practices of punishment almost as soon as the modern criminal justice system was established at the end of the 18th century. The rise of a resolute abolitionist ideology, however, is a far more recent phenomenon. Seeds for such a movement grew within the academy and at the grassroots level in the United States and Europe during the 1960s and 1970s when dramatic social and political upheaval led many to call the mainstream and its institutions, including the criminal justice system, into question.

Academics and students during this period began to examine what crime was, where it came from, and how society dealt with it. In the process, they created numerous approaches to criminology, defining themselves and associating their ideas with a variety of titles—radical, structural, feminist, peacemaking, neo-Marxist, left realist—all of which fell under the heading of *critical criminology*. Critical criminologists were (and remain) deeply concerned with issues of class, race, economic structures, inequity, power, social control, and gender. These scholars chronicled the harm, inefficacy, and problems of the criminal justice system calling into question its ideological, philosophical, and theoretical foundation. They also disputed the role of "professionals" in resolving such problems, calling instead for the inclusion of inmates, ex-convicts, and those most affected by penal policy. At the ninth World Conference of Criminology, held in Vienna, academics presented themselves as *abolitionists* for the first time.

As such ideas were being explored and expanded within the academy, abolitionist activism of another sort was taking shape on the ground. In the late 1960s, a prison reform movement was brewing in Scandinavia. The National Swedish Association for Penal Reform, known as KRUM, was founded in 1966. After just a few years this reform organization developed into the first unequivocally abolitionist body. Their assembly was composed of prisoners, ex-prisoners, lawyers, social workers, sociologists, inmate's families, and psychiatrists thus representing a novel cohort. As members worked on humanitarian and "treatment" issues inside correctional facilities, they began to believe that mere reform would not suffice. It would not be enough simply to alter or amend the system in certain ways since these would not change its fundamental principles and customs that were deeply troubling and profoundly entrenched. The modern-day penal model, as they saw it, was flawed and not receptive to reform. This experience served to clarify and radicalize their approach to social change. They began to generate new ideas, strategies, and sentiments about prison rather than attempt to modify specific penal policies. By 1971, the group defined its mission as one "to abolish imprisonment and other types of forced incarceration." As the Swedish group evolved, similar groups materialized: KROM in Norway, KRIM in Denmark, and KRIM in Finland. An abolitionist movement had been born.

RELIGION, ABOLITIONISM, AND NORTH AMERICA

Though a global movement, abolitionism in Canada and the United States exhibits many distinct characteristics. In this part of the world, religious groups and individuals driven by faith have been an integral part of abolitionist activity from the start. In fact, abolitionism is, in many ways, the latest chapter of an enduring tradition of activism going back more than 200 years. The Quakers, specifically, who are closely associated with the creation of the penitentiary at the end of the 18th century, were active in establishing the North American abolitionist movement during the last quarter of the 20th century.

For example, Fay Honey Knopp, a Vermont Quaker and prison minister, founded the Prison Research Education Project (PREAP) in 1976. During that same year, PREAP published *Instead of Prison: A Handbook for Abolitionists,* which was designed as a "how to" manual. The volume served to organize and galvanize penal activists around North America. By the 1980s, PREAP was renamed the Safer Society Program and Press and continued to work in a variety of ways toward an alternative punishment landscape. An abolitionist trend was emerging and traveling north.

The Canadian Quaker Committee on Jails and Justice, an active penal reform organization, officially declared support for the elimination of prisons in 1981. Within a year it grew beyond the continent to become ICOPA, International Circle of Prison Abolitionists. In the spring of 1983, the first of ICOPA's prison abolition conferences was held at the University of Toronto. This unprecedented gathering was the first of what have become annual events. The conference, which moves around the world, offers a means for the abolitionists to transcend their geographic borders and share ideas, cultivate strategies, and educate others. The meetings are financially supported by the International Foundation for a Prisonless Society. Since 1987, the "P" in ICOPA has stood for "penal" instead of "prison" reflecting the growing complexity and nuance of the abolitionist approach.

IF NOT PRISON—THEN WHAT?

Abolitionists reject the existing retributive paradigm and work to overthrow it. They seek to create and promote alternative responses to crime and punishment based on forgiveness by encouraging practices that reduce domination and harm, mandate citizen participation and establish a central role for the victim. They regard offenders as valued community members and believe that the processes of justice may help to solidify social cohesion, prevent crime, and reduce victimization. As the paragraphs below demonstrate, scholars and activists promote a number of different ways of trying to eradicate the current system.

Abolitionists such as Louk Hulsman (1991) and Heinz Steinert (1991) argue that criminal events are unexceptional and should be dealt with as we do a wide range of other community problems including floods, fire, and public health. In other words, we should view crime as a conflict that is a normal part of life and living together, rather than as a remarkable occurrence. Others, including Richard Quinney and Harold Pepinsky, speak of "making peace" on crime and violence. Their approach is primarily a theoretical one in which they hope to change the language and retributive thinking around crime and punishment. They support practices that work to foster peace between affected parties—victims, offenders, survivors, and family members—and within the community.

Theology is central to many in the penal abolition movement, including Ruth Morris, Howard Zehr, and Dan Van Ness, who argue for religious or faith-based responses to crime and justice. Using the Bible and religious tenets as their basis, these activists promote programs centered around mercy, pardon, restoration, amnesty, and healing. There are yet others, such as Sebastian Scheerer and Herman Bianchi, who favor the processes of civil courts over criminal ones. For them, disputes should be settled between the parties directly involved in the criminal event rather by a state-run "monopoly" that defines and resolves such occurrences.

Many abolitionists, including Stanley Cohen, Thomas Mathiesen, and Nils Christie, also address quite specifically the logistics of how to replace revenge-based punishments. Reflecting their criticisms of structured and rule-bound institutions such as prisons and courts, their strategies focus on the importance of decentralization. They assert that communities rather than the state must control the justice process. Responsibilities must therefore shift from professionals to citizens who take an active role in community affairs. Most important, society should stop relying on incarceration. Instead we must release the vast majority of those who are currently incarcerated while diverting new offenders from possible prison sentences into alternative programs. They also identify the need to cultivate new language to foster new ways of thinking

and doing justice. The term abolitionism itself, based as it is in the prison paradigm, is problematic and may need to be changed.

CONCLUSION: THE FUTURE OF ABOLITIONISM

Abolitionists work to liberate societies from a static repressive penal system that reflects and sustains prevailing unjust power relations. They seek to imagine what else can be both within and beyond the realm of criminal justice. Scholars argue that the dawn of the new millennium marks a crossroads for penology. Prisons are draining the fiscal coffers, do not appear to deter crime, hold disproportionate numbers of people of color and the poor, and have failed to deliver on virtually every promise. The rehabilitation-retribution cycle has come around so many times that each commands nothing more than cynicism and resignation.

Many abolitionists have embraced and champion an emerging innovative approach directed toward resolving and responding to criminal events known as *restorative justice*. Restorative justice is touted as the harbinger of a much needed paradigm shift and prison alternative. Yet many urge caution, arguing that the movement cannot use notions associated with or integral to retributive justice since these keep it wedded to the same formula of repression, guilt, victims, and punishment. For example, critics ask, is restorative justice aiming to "restore" the community, victim, and offender back to the racist unequal standing that prevailed prior to the criminal event? Or can it do something more radical and far reaching?

Penal abolitionism is a global movement whose supporters are unified not by a single ideology or theory but rather a shared goal. For abolitionism to have a future it must be flexible and welcome new ideas. It must remain dynamic, responding to and evolving with the world it aims to change. Criminal justice may indeed be ready for change but the future is difficult to predict. Thirty years ago, penologists foretold the end of the prison only to witness the largest expansion and incarceration boom ever seen. The prison seems particularly adept at sustaining itself. That which intends to replace or reduce its use has historically been absorbed into the penal repertoire serving to expand and deepen the culture of control rather than diminish it. The challenge thus remains for abolitionists to imagine new possibilities and find ways of putting them into practice.

ACCREDITATION

Accreditation is both a process within and a goal of corrections. The contemporary structures now in

place for institutions and agencies to be accredited indicate an increasing professionalism within the field of corrections. Just as universities must be accredited in order to award degrees and to be perceived as legitimate places of learning, penal facilities seek accreditation from the American Correctional Association (ACA) to indicate that they are offering their services at a particularly high level. Unlike other processes of accreditation, however, there is no negative effect of failing to be certified.

One of the premises of modern institutional corrections is that offenders are sent to prison as punishment rather than for punishment. Through the accreditation process, correctional professionals are able to assess and improve all aspects of confinement within an institution and the conditions for those persons working within its walls. Yet accreditation is not a panacea that will eradicate the beliefs or behaviors of those persons who seek to punish inmates, or otherwise abuse their authority, nor will it change years of legislative neglect. Accreditation addresses the totality of correctional confinement conditions and their affects on inmates and staff by accentuating the positives and identifying areas for improvement.

THE PROCESS OF ACCREDITATION

Correctional facilities, field services, and agencies may become certified as having met or exceeded a comprehensive set of standards established by the ACA through a series of self-audits, reviews, site visits, and formal hearings, which may take up to 18 months to complete. Once it has been awarded, accreditation lasts for three years. ACA endorsement may be given to pretrial detention and incarceration facilities for adults as well as to juvenile institutional services and community corrections services (probation, parole, and intermediate sanctions) for both adult and juvenile offenders. There are also accreditation standards for health care services within corrections.

Accreditation requires far more than applying a new coat of paint or adding a second dessert on Sundays. First, the agency conducts a self-evaluation of its policies, finances, physical plant, staffing, training and professional development, health care, inmate programs, and emergency services. This evaluation seeks to measure how well the agency is already complying with ACA standards (many of which are merely sound correctional practices) and which areas need improvements. The self-evaluation permits the agency to begin the process of improvement prior to a formal audit. During the 12 to 18 months that typically elapse between a self-evaluation and a formal audit, agencies work toward full compliance with ACA standards.

The formal audit is conducted by the Commission on Accreditation for Corrections, whose 25 members are drawn from juvenile and adult correctional associations, architects, health care associations, and interested persons outside of corrections. The commission sends three to five members to investigate the agency or institution under review. To be accredited, the institution must demonstrate 100% and 90% or better compliance with mandatory and nonmandatory standards, respectively. After its visit, the commission produces a final report in which the members either recommend ACA accreditation or describe the additional efforts that are required to meet the relevant standards.

Once an agency is accredited, it must submit annual reports listing compliance with existing standards and efforts to comply with new standards as they arise. It will be reinvestigated every three years. There are no direct penalties for an agency that fails to meet the requirements for accreditation by the ACA. Instead it is granted six to twelve months to meet those standards and provided with technical assistance to improve its level of compliance. It is then reevaluated by an accrediting team.

THE GOALS OF ACCREDITATION

Correctional agencies seek to provide more than just places of custody while responding to both internal and external influences. External pressures force correctional agencies to provide safe, humane custody within the fiscal and legislative boundaries imposed on them. Internal pressures are imposed by three constituent groups, each with its own needs: (1) inmates (medical, physical, psychological, rehabilitative), (2) correctional staff (preservice, inservice, and ongoing training; professional development; pay; morale),

and (3) administrative/managerial staff (policy, procedures, defense against lawsuits, reduced liability, fiscal resources). In addition to meeting the needs mentioned here, the accreditation process also aims to evaluate existing strengths and weaknesses of the correctional agency and to develop measurable and attainable goals for reducing or removing those weaknesses.

THE BENEFITS OF ACCREDITATION

The Arkansas Department of Correction (ADC) offers a case in point on how the accreditation process can assist an agency that desires to improve itself. The Arkansas prison system was one of the worst in the United States during the 1970s. Confinement conditions in the plantation style prisons were harsh and brutal. Inmates worked long hours in the fields and cattle barns to return at night to barracks where trustees ruled in the absence of correctional officers and many other free-world staff members. Classification and programs were limited in number and scope. From an administrative perspective, the prison system was in poor condition as few administrative and fiscal controls existed and those that did were often disregarded.

After being declared unconstitutional as a result of *Holt v. Sarver* (1970), ADC made enough substantial improvements to warrant release from federal monitoring in 1973 and was declared to be constitutional in 1982. Since that time, ADC has continued to improve itself to the point that it applied for the self-evaluation leading to its first accreditation in 1981. Today, all of ADC's 17 units and 4 work release centers are ACA accredited, and one senior manager serves as an accreditation commission member helping other correctional professionals learn from their experiences. Indeed, ADC's Boot Camp was named "Best of the Best" by the ACA during 1998.

CONCLUSION

Increasingly, in the United States, correctional personnel and the agencies that employ them can claim professional status. This is due, in part, to the accreditation process associated with the ACA. Today, correctional staff at all levels can point toward national minimum standards in education, training, and performance while agencies can identify minimum standards in administration and finances, operational policies and procedures, emergency procedures, programming, services, and physical plants as areas that an external, regulating organization has certified them as "professional." Compliance with these standards is ongoing among most agencies and reaccreditation occurs in a three-year cycle. Failure to meet or exceed those standards can result in decertification of this professional status. As noted previously, while there are no direct penalties for failing to be accredited or reaccredited, the loss of professional standing within corrections is often accompanied by intensified scrutiny by the courts when dealing with inmate litigation, increased liability, and decreases in staff morale. The costs of not being accredited far outweigh the costs to become accredited.

Legal Case

Holt v. Sarver, 309 F. Supp. (E.D. Ark., 1970).

ACTIVISM

Prison activism is a broad-based social movement that addresses injustices in the criminal justice system. Thousands of individuals and organizations are moved to action by the current U.S. prison crisis and are working to change or abolish the system. Their work takes different forms and has varying goals

that are not always in accordance with each other. There are large human rights organizations, such as Amnesty International and Human Rights Watch, that include prison issues in their broader work, as well as smaller local and national organizations, such as the Prison Moratorium Project and the Prison Activist Resource Center, devoted solely to reforming or abolishing the prison system. Organizations range from religious to political to youth based. Some focus on a single issue, such as freeing political prisoners, the lack of Pell grant availability for prisoners, or prisoner disenfranchisement, while others aim at changing the entire system.

Action takes a variety of forms. Some advocate groups work both in the courts, helping inmates with their individual legal battles, and in Congress, lobbying for the protection of prisoners' rights and policy changes. Others run workshops in prisons in areas such as poetry and visual arts. There are books-to-prisoner programs to supplement poorly stocked prison libraries. Postrelease organizations work to fill the void left by the state by offering education, job training, and placement opportunities to recently released prisoners. Many groups work on public education, exposing the myths about crime in the United States and the disproportionate impact of race, gender, and class in the criminal justice system.

HISTORY

Prisons originated out of a desire to reform the punishment of criminals. At the end of the 18th century, corporal and capital forms of punishment came to be seen as inhumane, and the "criminal" as one who could be reformed. However, while changes to the prison system throughout history are usually referred to as "reforms," the goals of early reformers were not necessarily aligned with the approach of prison activists today, many of whom seek to abolish the prison altogether. Rather, historical prison reformers such as the Pennsylvania Quakers were often just as concerned with improving the security or efficiency of prisons as they were with ameliorating conditions inside them.

Two figures in the first half of the 20th century stand out as prison activists. Clarence Darrow, the criminal defense lawyer who represented Eugene Debs before the Supreme Court, theorized on the criminalization of the poor. He argued that the only difference between those in prison and those not in prison was their financial situation. In 1902, during a speech to inmates at Cook County Jail in Chicago, Illinois, Darrow argued for the abolition of prisons. Taking particular contention with the death penalty, Darrow represented more than 200 defendants in capital cases, losing only one. Another figure from the early 1900s is Thomas Mott Osborne, former mayor of Auburn, New York. In 1913 he spent a week as an Auburn Prison inmate and published a book about his eye-opening experience. From that experience, Osborne worked to transform prisons into effective rehabilitative institutions, becoming a progressive warden at Sing Sing for a time. After working for the system, Osborne founded the Mutual Welfare League, which focused on postrelease opportunities for inmates.

The second half of the century saw a large growth in prison activism. For example, Caryl Chessman, executed by the State of California in 1960, left behind a legacy of prison activism. In his 12 years on death row in San Quentin, Chessman fought for, and won, a number of civil rights for prisoners, especially in the area of access to books and the right to write. It was these rights that radical prisoners in the 1970s like George Jackson (author of *Soledad Brother)* depended on to develop and express their views and galvanize the public and other prisoners.

In the 1970s, prison activism became more radical, as a movement to abolish prisons grew out of the Black Power and antiwar movements. Groups and individuals began to point to the racism within prison and the disproportionate application of incarceration on the poor. Especially in California, there were a number of politicized prisoners, some of whom were political prior to their incarceration and others who changed while in prison. George Jackson, who was incarcerated at the age of 18 for robbing a gas station and during the next 10 years became one of the leaders of the anti-prison movement, was a key figure in U.S. prison activism. His book, *Soledad Brother: The Prison Letters of George Jackson* (1970), shed light on the brutality

of the U.S. prison system and was internationally read. He and other prisoners challenged the popular discourse that portrayed prisoners as uneducated, immoral, violent predators.

Though in principle the activists of the 1970s were seeking to abolish or to change all prisons, in practice their focus was almost exclusively on men's institutions. These days, however, a number of organizations exist that concentrate solely on women's experiences. Groups like Critical Resistance and Women's Advocate Ministry as well as individuals like Angela Davis and Kathy Boudin have done a great deal to illuminate the conditions in women's prisons and to set out an agenda to reform or abolish women's facilities.

ABOLITION VERSUS REFORM

Within activist circles there is an ongoing debate between those who advocate for reform and others who advocate for abolition, also known as "decarceration." Both sides believe that the prison is in crisis. However, prison abolition groups work to reduce and eventually eliminate prisons by restructuring society so that punitive forms of social control are not necessary. In contrast, reform advocates strive to improve conditions within prisons. They also seek alternative forms of punishment, such as electronic monitoring or mandated treatment, and make prisons more effective rehabilitation centers, all the while maintaining the current framework of punishment as the dominant form of social control.

Reform groups wish to make prisons humane and rehabilitative as well as to reduce the numbers of incarcerated people. They try to ameliorate the prison system so that it focuses on rehabilitation and offers opportunities for inmates to obtain treatment, education, and skills. This task is difficult, however, as support for rehabilitation within the criminal has dwindled since the late 1970s. There is little money for educational and job training programs that help reduce recidivism rates. Reform groups see these programs, along with drug treatment programs, as important opportunities for inmates and solutions that will eventually reduce the number of people in prison. For example, after prisoners became ineligible for Pell grants in 1995, college-in-prison programs became regrettably rare despite their proven success at reducing recidivism rates and improving opportunities for inmates. The absence of such programs is one of the many points of action for reform groups.

In addition to improving services within prison walls, reform groups often seek to reduce the number of people incarcerated. To that end, they support alternative punishments, including mandated drug treatment, community service, house arrest, and other intermediate sanctions. Prison reform groups also try to improve current conditions within prisons by targeting such issues as prisoner rape, denial of civil rights, conditions in supermaximum facilities, and poor health care.

Abolitionists argue that restructuring services within prisons and the criminal justice system serves only to reentrench the inequalities that these institutions create. Rather than finding a replacement for prison, they work to develop solutions outside the criminal justice system, focusing on justice rather than punishment. Intermediate sanctions are not acceptable to abolitionists, because they operate within the current criminal justice system, putting the state in control of people's lives, and still rely on the looming threat of a prison sentence as the consequence of noncompliance. While alternatives such as electronic monitoring keep people out of prison, abolitionists argue that they continue to locate and punish poor people and people of color in disproportionate numbers. Instead of the "criminal" as a category, which is located in a particular place in our society, namely among the poor and people of color, abolitionists prefer to use the category "lawbreaker," which most people have been at some point in time.

An example of an abolition strategy can be found in the decriminalization of drug sale and use. Abolitionists argue that drug addiction should be understood as a medical problem, not a criminal one, and rather than reserving treatment for affluent drug abusers and punishing those who cannot afford treatment, quality, voluntary, appropriate treatment should be available to all who seek it. This redefinition of the drug crisis would reduce the prison population and free up resources to be used for health care and treatment.

DEATH PENALTY

Though from the inception of American colonies individuals and groups have sought to abolish the death penalty, their efforts became more organized in 1845, when the American Society for the Abolition of Capital Punishment was founded. Since then, work has occurred at both the state and national levels in faith-based, political, and legal organizations. These groups fight both for the abolition of the death penalty and for individuals facing execution. For example, Mumia Abu-Jamal spent years on death row until the work of many individuals and organizations lobbying on his behalf succeeded in a commutation of his death sentence. Some who sought to save Abu-Jamal's life became involved because they saw the death penalty as unethical, while others were drawn to his struggle because of his specific position as a political prisoner on death row.

Death penalty lawyers have become particularly important in anti-death penalty activism. They seek to reverse death sentences after defendants have been convicted and sentenced. While their activism takes place in the courtroom and deals intricately with the law, death penalty lawyers do more than merely point to the injustices of their defendant's initial trial; they tell their defendant's story. They move past the crime to reconstruct their clients as human beings in the eyes of the court.

The replacement of life imprisonment for Abu-Jamal's death sentence highlights an important debate within the death penalty abolition movement: What should replace a death sentence? Often, organizations or individuals argue for a sentence of life imprisonment as the appropriate alternative to the death penalty. However, some, such as Angela Davis, see the abolition of the death penalty and the abolition of prisons as interdependent.

PRISONER ACTIVISM

Anti-prison activism and prison reform work is not done only by groups external to the system. Prisoners play a key role in prison activism. Because of the total institution within which they are confined, resources available to prisoners for this kind of work are limited. Often there are restrictions on organizing within prisons, and inmates are written up or otherwise penalized for actions such as petition writing. However, despite tight constraints on them, many find ways to organize and exert agency in a collective manner. Various forms of prisoner activism include the organizing of political or identity groups, pursuing lawsuits that push for protection or expansion of prisoner rights, publishing writing that exposes injustices within the system to the public, strikes, and rioting.

Female prisoners are thought to be less political than their male counterparts. However, research shows that women face considerable additional barriers to organizing. First, more than 75% of female prisoners are mothers, most of whom were the primary caregivers to their children before incarceration. For these women, the consequences of resisting the status quo may be too high. The risk of adding extra time to their sentences or having their visiting and/or phone privileges suspended may not be worth it due to its effect on the lives of their children. Moreover, since the female prison population is much smaller, they do not receive the media attention or outside support that many men's causes receive. When they do organize, women tend to lobby for different issues than do men. In particular, they often seek remedies for medical care and parental rights. Because organizing efforts often rely on outside support in the forms of legal advice and media attention, such silence surrounding women's activism greatly weakens female prisoners' efforts.

CONCLUSION

Attempts at prison reform and abolition have existed since the prison was first established. Efforts have been made from within and outside the prison walls. Though calls for the end to incarceration have so far been unsuccessful, many groups and individuals have made significant changes to how prisons are run. Such people provide a crucial monitoring role to ensure that basic levels of

humanity and justice are maintained behind the bars of the nation's total institutions.

ACTUARIAL JUSTICE

Actuarial justice refers to a theoretical model current in the criminal justice system that employs concepts and methods similar to actuarial mathematics. Actuaries evaluate future risks such as unemployment, illness, and death. Their projections are the backbone of the insurance and financial security industries. In these fields, actuarial techniques are used to produce insurance percentage rates needed to establish premiums to cover expected losses and expenses. In the justice system, proponents of an actuarial approach attempt to evaluate risk and dangerousness of offenders and treatment programs. Actuarial justice also underpins crime prevention strategies and policing.

CHARACTERISTICS OF ACTUARIAL JUSTICE

There are at least four characteristics associated with actuarial justice:

Deviance is normal. Crime is now perceived as an inevitable social fact. We no longer try to eliminate it, for it is perceived as a direct consequence of living in society. Like traffic accidents, for example, crime is understood to be something that has a significant probability of happening. We try to prevent it and minimize its consequence, by judging the risk that various situations and individuals pose. In this view, crime has lost its moral component. It has been normalized as a by-product of modern societies.

Risk profiles rather than individuals. One of the fundamental characteristics of actuarial justice is its reliance on the concept of risk. The actuarial lens reconstructs individual and social phenomena as risk objects. Hence, the unit of analysis in the criminal justice system is not the biographical individual anymore but rather one's risk profile. Through actuarial techniques, individual identity is fragmented and remade into a combination of variables associated with different categories and level of risk.

Managing rather than transforming. Changing individuals was the key project of the disciplinary model. The goal was to transform criminals into law-abiding citizens through therapy or other correctional interventions aimed at altering their personalities. Within actuarial justice, transforming individuals is no longer the exclusive goal, in part because it is difficult and resource consuming. The objective shifts to managing the risks that offenders represent. To do so, offenders are identified, classified, and organized in terms of a risk profile. Management therefore comes to be at the heart of the system. Institutional paths are provided for different categories of offender according to the risk they pose. Diagnosis and treatment have more and more given way to managerialism.

The future rather than the past. Finally, actuarial justice has a prospective outlook. It is primarily interested in estimating and preventing the occurrence of forthcoming behaviors rather than with sanctioning them or understanding and addressing their past causes. The focus of actuarial justice is mainly on incapacitating and regulating future behaviors.

Actuarial justice is a set of tendencies in the criminal justice system that still needs to be documented in order to be defined more clearly. Even if actuarial justice is more easily delineated by opposition to the rehabilitative and retributive models, the preceding characterization should not lead one to think that these two models have been superseded by actuarial justice. Neither should these models be conceptualized as a sequence. As it will be shown below, they coexist within the criminal justice system (O'Malley, 1992). One step in the quest to comprehend actuarial justice is to identify its theoretical underpinnings as well as its intellectual, political, and social conditions of possibility.

EMERGENCE OF ACTUARIAL JUSTICE

The origin of actuarial justice, and actuarial practices more generally, traces back to our capacity to perceive and think about phenomena at a group or social level. Before the late 18th to early 19th centuries, averse events were mainly perceived as personal misfortunes. Along with the birth of statistics, the capacity to conceptualized events socially made it possible to observe patterns that affect people on a larger scale. Therefore, new realities came into view: birth and death rates, patterns of accidents, unemployment rates, and so on. It allowed for the emergence of a new form of power focused on the population as a set of characteristics or profiles. In the language of Michel Foucault, it is called government or bio-power. Actuarial practices are a manifestation of that particular form of power.

Despite these early foundations, the idea of actuarial justice became articulated as such only at the end of the 1980s. According to Malcolm Feeley and Jonathan Simon (1994), there are three main reasons why these ideas became popular at this time. First, this particular line of thought was already present in other fields of the law, namely, tort law. In effect, in tort law strict liability and no-fault gained ascendancy over the notion of individual responsibility. Causality and guilt are not an issue in tort law; the preoccupation is with managing of a pool of averse events. Second, the supplanting of the individual justice logic by the system-thinking and rational management logic contributed to the development of actuarial justice. In effect, we now think of justice in terms of a complex system in search of efficiency and not as the operation of a judge who impartially weigh an individual moral implication in a crime. Finally, the utilitarian idea of deterrence weakened the resistance against actuarial justice in the sense that it replace the traditional moral and individualistic view of crime and punishment by an economic conception of individual guided by the calculation of costs and pleasures.

On the political level, liberal and conservative stances both contributed to the rise of actuarial justice, through their emphasis on management. The first sought to regularize procedure through due process; the second encouraged the use of extended imprisonment and thereby increased the correctional population prompting the use of actuarial techniques for efficient management.

ACTUARIAL JUSTICE IN PRACTICE

Instances of actuarial justice in practice can be found in many parts of the criminal justice system. For example, these days it is common to refer to crime as a risk to be addressed by an insurance base model of control. Accordingly, tools such as target hardening, statistical profiling, opportunity minimization, and loss prevention are put in place. To minimize the occurrence of negative events, proponents of crime prevention and the police rely on risk classification. "Bad risks" are then prevented from entering into some form of social relation as happens in the selective incapacitation of high-risk offenders. In addition, crime prevention aims at modifying the context where aversive events might take place. Hence, the target of control shifts from the criminals to the potential victims and their environments. Finally, another sign that crime

prevention is increasingly influenced by actuarial justice is that when people are unable to avoid risk, strategies are implemented to systematically pass it along. Thus, for example, supermarkets often calculate the price of goods to include the foreseeable loss incurred by shoplifting.

Actuarial justice also permeates corrections to form what has been called the "new penology." This correctional model encompasses all the characteristics listed earlier: the normalization of deviance and the focus on risk, management, and the future. Under these ideas, the practices of parole have changed substantially. While originally, readmitting someone to prison while he or she was on parole demonstrated the failure of the correctional system because it showed that the person had not been successfully treated during the incarceration, in the actuarial justice model it has become a sign that the system efficiently controls risks. The criminal is neutralized before he or she commits further crime. Similarly, under an actuarial model, the criminal justice system has become increasingly reliant on long prison terms and three-strikes laws. Not only do these measures aim at punishing offenders for past behaviors, but they mostly seek to contain future crime.

The development of actuarial justice literature was, until recently, mostly based on research done with male offenders. It is then reasonable to ask if this model is relevant to the situation experienced by juveniles and women in the criminal justice system. Research shows that it is applicable to a certain point. Hence, Kimberly Kempf-Leonard and Elicka Peterson (2000) demonstrated that some parts of the juvenile justice system are permeated by the actuarial justice model. Such a shift seems to challenge the *parens patriae* orientation. It is largely the case at the prehearing detention stage, when the type of detention facility is chosen and when community-based services are used. In these instances, risk assessment and management as well as cost-effectiveness seem to prevail over the "best interest of the child." In the same vein, Kelly Hannah-Moffat (1999) demonstrated that the actuarial justice vocabulary and logic are increasingly present in women's imprisonment, alongside the disciplinary and retributive models.

CONCLUSION

Actuarial justice is a conceptual model of the criminal justice system that is preoccupied with managing future risks rather than transforming individual and eliminating deviance. Even if its origin can be traced to the late 18th century, the actuarial justice model developed in the 1980s under the impulse of the system thinking and the management logic as well as the utilitarian philosophy. Both the right- and left-wing politics participated in its development. The actuarial model is pervasive in every part of the criminal justice system from crime prevention to sentencing and corrections. In conclusion, while actuarial justice and the notion of risk suggest neutrality and objectivity, actuarial practices are marked by gender, culture, and subjectivity. Invested with an aura of science and rationality, actuarial practices hide the political processes behind the construction of crime, the identification of segments of the population as high-risk offenders, and the exclusion resulting from the "necessary" protection measures. Finally, actuarial justice isolates the criminal justice system from the social finalities that were once measures of its worth.

ADULT BASIC EDUCATION

Adult basic education (ABE) is an umbrella term that includes a number of prison courses. Most programs are designed to help inmates obtain literacy skills and/or a high school or general equivalency diploma (GED), though some institutions also offer classes in life skills, anger management, interpersonal relationship, and financial budgeting along with vocational and occupational skills programs. Research suggests that all of these courses help offenders gain legal employment and decrease their rate of rearrest, reconviction, and reincarceration. They also reduce their disciplinary problems while incarcerated.

PROGRAMS

As part of their ABE programs, most states require inmates to take literacy classes if they fall below a certain level of capability. In Arizona, for example, all inmates are meant to be tested on arrival with the Test for Adult Basic Education (TABE), and those who fall below an eighth-grade score in reading, language, or math on the TABE must attend Functional Literacy classes for 120 days. Since 1991, all inmates in the federal system are meant to have a GED in order to participate in any institutional jobs above entry-level positions. In New York State, they must read at least at a ninth-grade level.

In addition to basic literacy programs, states offer vocational and occupational training programs to teach inmates how to search and apply for jobs. Many jurisdictions also offer life skills programs as part of their basic education. Such courses are meant to assist inmates in mending family relationships and in dealing with issues such as anger management. Tennessee, for example offers a life skills program to mothers incarcerated at the Tennessee Prison for Women known as the Child Visitation Program. This course allows young children (between the ages of three month and six years) to spend an entire weekend with their mother on the prison grounds to encourage family bonds. Before women may participate in the program, they have to be discipline free and complete a parenting skills class. During the weekend visit, mothers are allowed to stay in a single cell with their child and to eat meals and interact with their child in a family atmosphere.

Life skills programs also strive to help inmates reintegrate into society when they are released. South Dakota, for example, runs a program called FORWARD for inmates within one year of their release date. In addition to addressing family issues, this course helps individuals set occupational goals and teaches them how to budget.

DISCIPLINE AND RECIDIVISM

Research has shown that participants in adult basic educational programs recidivate approximately 29% less than nonparticipants. Correctional administrators have also found that those inmates who participate in adult basic educational programs including life skills and vocational and occupational training have less disciplinary violations compared to inmates not enrolled in these programs. This is believed to be because participants are not idle and therefore are less likely to be involved in violent situations. Correctional administrators also believe that these programs foster a sense of accomplishment and hope for inmates who would normally not have a positive outlet. As a result, administrators are able to use these programs as rewards and incentives for good behavior among the inmates.

CONCLUSION

Adult basic education programs help inmates succeed after release in a number of ways. Not only do most courses offer instruction in reading, writing,

and basic arithmetic, they also often teach reasoning and analytic skills. Courses that stress life skills such as balancing a checkbook, setting a budget, and applying for a job are also common. Altogether, ABE courses, like most prison education, seek to help prisoners readjust to life outside the prison, and help them to avoid coming back.

ADX (ADMINISTRATIVE MAXIMUM): FLORENCE

Administrative Maximum (ADX), the highest security federal penitentiary, is located on a government reservation in Florence, Colorado. When Florence was built, it was the Bureau of Prisons' (BOP) first *correctional complex*. On the grounds adjacent to ADX are minimum-, medium-, and maximum-security prisons.

HISTORY

ADX is the third in a line of federal high-security penitentiaries that began with Alcatraz (1934–1963). From 1963 to 1978, BOP officials dispersed problem prisoners among several standard penitentiaries rather than concentrating "the worst of the worst" in one small special purpose prison.

The return to the concentration model began with the transfer of the system's most serious disciplinary problems to the federal penitentiary at Marion, Illinois, which opened in 1963. Ten years later, in 1973, a Control Unit within Marion was established in which inmates moved only in restraints and escorted by several officers. No congregate activities were allowed for these prisoners who were regarded as the most dangerous and disruptive in the federal system. The movement to a regime in which the entire prison was run in a Control Unit mode followed the killing of two officers in separate incidents in the Control Unit on the same day, October 22, 1983. In each case, three officers were escorting a prisoner who was able to remove his handcuffs, secure a knife, and attack the escort group; in addition to killing two officers, four others were seriously injured. Several days later, the body of the 25th Marion inmate to die at the hands of his fellow prisoners was found.

On October 28, BOP Director Norman A. Carlson ordered that "indefinite administrative segregation" regime, popularly called a "lockdown," be initiated in all units of the prison. Henceforth, prisoners were moved one at a time from their individual cells under the escort of three officers and only after they had been handcuffed and leg chains had been attached. All congregate activities including going to the dining hall for meals, to work, to the yard and recreation areas, and to education classes and religious services in the chapel were terminated. All basic services including food were provided to prisoners, who were confined to their cells for 23 hours, leaving one hour for solitary exercise.

What came to be officially labeled as the "high-security" program quickly produced complaints

from prisoners and several prisoners' rights groups on the grounds argued that these conditions of confinement violated the inmates' protection against "cruel and unusual (psychological) punishment." A legal challenge was mounted in the Federal District Court of Southern Illinois, which subsequently ruled against the prisoners. This ruling was affirmed by the 7th Circuit Court of Appeals and by the U.S. Supreme Court when it denied a writ of certiorari. These decisions provided the constitutional basis for what came to be known as the "Marion model."

Officials from many states visited the prison to make certain that the new "supermax" prisons they were planning took into account the policies and procedures that had been tested in the courts. Marion carried out its function as what the press called the "new Alcatraz," until its successor at Florence, Colorado, came on line in November 1994.

PHYSICAL DESIGN

ADX is the first federal penitentiary specifically designed to house only maximum-security prisoners. It has a rated capacity of 490 prisoners, all of whom are held in single cells in nine completely separate units. Three units *are* designated for general population prisoners. A Control Unit serves the need for long-term disciplinary segregation while a Special Housing Unit (SHU) is used for short-term disciplinary segregation and a High Risk Unit holds inmates who require protective custody. Two units house prisoners whose improved conduct allows them to be placed first in an Intermediate or Transitional Unit and then in a Pre-Transfer Unit. Increased privileges and opportunities for greater association with other prisoners are allowed in these two units; piecework is available for prisoners in the Pre-Transfer Unit. All inmate movement in ADX is under escort and is controlled by 1,400 electronic doors and 168 closed-circuit television cameras.

Because the regime at ADX was planned for prisoners who would be locked up 23 hours a day, cells are larger than those found in standard prisons. Cells measure 7 feet by 12 feet and contain a shower, sink, and toilet; a concrete slab provides the base for a mattress and another concrete abutment from a wall serves as a table for food trays and writing, next to a concrete stool attached to the floor. A 12-inch black-and-white television set in each cell provides programming from the major commercial networks and the institutional cable system. Each cell has a window 2 feet long and 5 inches wide that looks into a small exercise yard surrounded by concrete walls. Cells are entered first through a solid-steel door with a small window and then through a grill door with a food tray slot in the bars. Inmates in the general population, Control Unit, SHU, and High Risk Unit eat in their cells; men in the Intermediate Units eat together in a common area in each unit; and those in the Pre-Transfer Unit eat in a separate dining area outside their unit.

INMATE SERVICES

Religious services and courses on stress management, anger management, and drug abuse are offered on closed-circuit TV. When requested, chaplains representing a variety of religions and two psychologists are available to meet with inmates through the barred door of the inmate's cell. Self-study courses in the areas of basic adult education and English as a second language are offered. To meet the constitutionally protected right for all prisoners to have access to basic legal materials, requests from unit law libraries are brought to the inmate's cell. Inmates in the Pre-Transfer Unit can work in the institution's clothing industry.

Depending on security considerations, indoor and outdoor exercise areas are available to individuals, pairs, or small groups. The Control Unit and the SHU have individual, enclosed exercise areas. Chain link screens covers all outdoor exercise areas. No universal gyms, free weights, or any other athletic equipment are provided. The amount of time allowed for recreation varies from 7½ hours a week in the Control Unit to 28½ hours a week in the Intermediate, Transition, and Pre-Transfer Units.

Visits by family, lawyers, or approved visitors are conducted in a concrete booth through a glass partition with conversations carried on through a telephone monitored by staff, except for attorney-client visits. Inmates are allowed five social visits a month, each

lasting a maximum of seven hours; due to its remote location and the severing of family ties through long years of imprisonment, few inmates have visits as often as ADX rules allow. Control Unit and SHU prisoners are allowed one 15-minute telephone call each month. High Risk and general population prisoners begin with two calls monthly. Inmates in the Transition and Pre-Transfer Units are allowed up to four calls in the same time period.

Food, snacks, stamps, athletic shoes, and other items can be selected from a commissary list; using their own funds, inmates can purchase these items up to maximum of $175 a month. Men in disciplinary segregation are denied this privilege whereas inmates in the Pre-Transfer Unit are able to go directly to the commissary.

WHO GETS TO ADX AND WHY

ADX houses an older population compared to other federal penitentiaries—the average age is 40. It takes time to accumulate a record of misconduct serious enough for a prisoner to work his way up to Florence through the disciplinary segregation units of other prisons. The racial/ethnic composition of the population in the year 2000 was 41.5% Caucasian, 14.5% Hispanic, 40% African American, 2% Native American, and 1.5% Asian/Pacific Islanders. Approximately 10% are not U.S. citizens. The offenses for which prisoners are currently serving sentences that average 40 years in length are bank robbery (33%), murder (23.4%), drug offenses (13.6%), firearms/explosives (8.9%), and kidnapping (5.6%). Other offense categories include crimes related to terrorism, violations of the RICO (Racketeer Influenced and Corrupt Organizations Act) statute (racketeering), Continuing Criminal Enterprise, and Threatening Government Officials.

Approximately 95% of the prisoners are transferred to ADX as a result of misconduct in other prisons: assaulting other inmates (16.3%), murdering other inmates (15.9%), escape (8.8%), attempted murder of another prisoner (7.7%), assaulting staff with weapons (4.7%), and rioting (2.9%). Other justifications for transfer include gang leadership, taking staff hostage, murder and attempted murder of staff, and drug distribution. Among the 5% of the inmates directly committed from courts are the high-profile offenders who have always brought attention to these exceptional federal prisons. Al Capone and Machine Gun Kelly were held at Alcatraz. John Gotti and assorted spies were housed at Marion. ADX housed the Oklahoma City bomber, Timothy McVeigh, until his transfer for execution and now holds Theodore Kaczynski (the Unabomber), Robert Hansen (ex-FBI agent who sold secrets to Russia), Ramzi Yousef (convicted in the 1993 World Trade Center bombing), and members of Al-Qaeda.

THE STEP-DOWN PROGRAM

The great majority of prisoners move through ADX via its Step-Down program. After being found guilty of misconduct in disciplinary hearings in other institutions, prisoners sent to the Control Unit receive a specific number of months to serve at ADX. A serious offense, for example, assaulting a staff member, will result in a term of 48 months before the inmate can enter the Step-Down program. Most prisoners begin their time at ADX in general population units, where after establishing a record of clear conduct for at least 12 months, they can move to the Intermediate Unit for a minimum of 7 months. They may then proceed to the Transitional Unit for another 5 months of nonproblematic behavior and finally to the Pre-Transfer Unit where, after another year with no misconduct reports, they are eligible for transfer to a standard penitentiary. Thus, it takes a minimum of 36 months for an ADX prisoner to work his way through the various steps. While there are exceptions, most prisoners including those who begin their terms in the Control Unit move through ADX in five years or less.

The Step-Down program puts the responsibility for moving through the prison on the prisoner, rather than asking staff to predict the future conduct of men who are being held under a high level of restraint and who do not experience the normal association between prisoners and between prisoners and staff. This policy ensures that prisoners move through ADX to other prisons in order to free up space for new "management problems." Exceptions to

movement into the Step-Down program are cases in which "intelligence" has revealed that while they have engaged in no obvious misconduct, prisoners have been giving orders to others to engage in various illegal activities. Included in this group are leaders of prison gangs, drug cartels, and organized criminal enterprises. Other exceptions to the Step-Down program are prisoners who have killed staff, spies, traitors, terrorists, and celebrity prisoners.

THE SUPERMAX CONTROVERSY

Alcatraz and Marion always housed less than 1% of the federal prison population; ADX holds less, 1/2 of 1%, but the drama associated with these prisons and the offenders sent to them has continued to provide the substance of controversy for prisoners' rights groups, for corrections' professionals, and for the electronic and print media. As soon as it opened, ADX became known as the "Alcatraz of the Rockies" because its operations emphasize highly controlled movement and limited privileges and program opportunities compared to other federal prisons. Although the question of whether the conditions of confinement at Marion and ADX are appropriate and necessary or whether they constitute "cruel and unusual punishment" has been litigated in the federal courts, the debate over how much punishment is too much continues at ADX. Ward and Werlich (2003) have reported basic data for Alcatraz and Marion prisoners including most of those who moved on to ADX. The data include measures of the incidence of mental health problems, the inmates' conduct records in other prisons, and the inmates' criminal records after they were released from their sentences. No systematic research on the effects of long-term confinement under conditions of super maximum custody has been reported for any state prison.

CONCLUSION

The mission of ADX is to "safely house the Federal Bureau of Prisons' most violent, disruptive and escape-prone inmates in an environment which provides the inmate an opportunity to demonstrate improved behavior and the ability and motivation to eventually reintegrate into an open population." From the date of its opening at the end of November 1994 to the end of 2002, no inmate has been murdered, no escapes have been attempted, and no staff have been seriously assaulted at ADX. An additional justification for concentrating, in the words of one Alcatraz warden, "all the rotten apples in one barrel" is that the removal of highly disruptive inmates allows other prisons to operate more open and diverse institutional regimes. However, because ADX and other supermax prison apply the maximum punitive measures sanctioned by the federal courts, they require oversight by agency administrators, legislators, researchers, and the press.

AFRICAN AMERICAN PRISONERS

African Americans are incarcerated in the nation's jails and prisons in disproportionate numbers. At present, black inmates account for more than half of those in U.S. penal facilities even though they make up only 13% of the nation's total free population. The causes and effects of the rate at which the black community is confined constitute some of the most urgent problems facing U.S. society today.

RATES OF IMPRISONMENT

According to the most recent figures, there are approximately 912 male state and federal prison inmates per 100,000 U.S. residents, and 61 female

inmates per 100,000. If these figures are then broken down by race, there are 3,437 African American men per 100,000 and 191 African American women per 100,000 locked up as compared to 450 white male and 35 white female inmates for every 100,000 residents. These figures mean that African American men are being incarcerated at a rate approximately eight times that of white men, and black women are confined at approximately five times that of white women. Though more men than women are in prison, African American women have been incarcerated at a greater rate than African American men during the previous two decades.

Further differentiations based on race and ethnicity can be made when age is also considered. For example, across the country an estimated 10% of all African American men ages 25 to 29 are in prison. In some jurisdictions, this figure is as high as 50%. Overall, an African American male has a 29% chance of spending time in prison at some point in his life, as compared to a white male, who has a 4% chance, and a Latino male, who has a 16% chance.

HISTORY

Prior to the abolition of slavery in the United States, African Americans were rarely incarcerated in penitentiaries. Instead, punishment was administered to them on the slave plantations where they were imprisoned and controlled by their owners. When slavery was abolished, Jim Crow laws and the convict leasing system led to a rapid growth in the number of African Americans behind bars. Particularly in southern states where the majority of the black population was located, many African Americans were forcibly returned to work for former slave-owners as plantation owners leased offenders to pick cotton and perform other tasks.

As early as the 1890s, the convict lease system came under scrutiny because of accounts of brutal treatment of the inmate workers. Yet it was not until the 1930s that all states finally abolished this system—and made their governments the sole overseers of convict labor. Indeed, even in those states that officially did away with leasing, other structures grew to replace it that continued many of its racist traditions. For example, in many states, chain gangs—where convicts labor outdoors while chained to each other—partially replaced the leasing system. African Americans were once again overrepresented among the members of the chain gangs. This method of punishment existed in many states until the 1960s. It was reinstated first in Alabama in 1995, quickly followed by Florida and Arizona. Despite public outcry from and litigation by groups such as the American Civil Liberties Union, this practice now exists in many other states as well.

In the 1970s, racial disparities among U.S. prisoners began to increase. Though prison admissions for all convicted felons grew rapidly in this decade, the number of African American persons being sentenced to prison grew fastest of all. Indeed, since the beginning of national-level data collection on prison populations in 1926, the incarceration rate of African Americans has seen an overall steady increase, while during this same period the incarceration rate of white prisoners declined.

CAUSES AND EFFECTS OF THE OVERREPRESENTATION OF AFRICAN AMERICAN PRISONERS

Criminologists have identified several causes of the overrepresentation of African Americans in the U.S. prison system, including: the rate at which blacks commit crime, criminal justice policies such as policing and sentencing, socioeconomic factors, and racial bias. Weitzer and Tuch (2002), for example, found that race was a key factor in police decisions to stop and interrogate suspects. Others have found that, compared to any other group, young, black men are more likely to be denied bail and sentenced to the harshest prison terms.

One of the most common explanations for the dramatic increase in the imprisonment of African Americans is found in the so-called war on drugs. Many observers believe that the combination of law enforcement focus on combating drug sales and use and the relatively insignificant number of treatment resources available to individuals with lower incomes has led to the rise in the African American prison population. Likewise, current drug laws that

punish crack cocaine use much more harshly than powder cocaine have been shown to be particularly detrimental to minority communities, where crack cocaine is more readily available. Not only has the increase in drug-related prison sentences been greater among blacks than whites, but so too has been the rate of incarceration for drug offenses for African Americans.

There are numerous collateral consequences of incarcerating high numbers of African Americans. Some of the most troubling effects include the economic, emotional, and social impact on the children of prisoners; the lack of support for the partners of inmates; the inability of ex-felons to secure gainful employment; and in some states, their loss of the right to vote. Though children are adversely affected by the incarceration of their parents, no matter what their race or ethnicity, when large sections of the community are being confined at the rate that is occurring across black communities in the United States, the impact on black children is even greater. Entire generations of young people are currently growing up without the presence of male role models or fathers.

WOMEN

Between 1986 and 1991, there was an 828% increase in the number of black women incarcerated for drug offenses in state prisons. This was the greatest increase of any demographic group in the United States. In most state and federal prisons, the percentage of black women in the incarcerated female population now equals or exceeds the percentage of black males in the incarcerated male population. Drug offenses constitute the primary offense for which black women are incarcerated, even though most women's role in the illicit drug markets is fairly minor and is most often related to their involvement with a male and is a result of their drug dependency.

Although most inmates are the parents of at least two children under the age of 18 years at the time of their imprisonment, women are, more often than men, the primary caretaker of their children prior to incarceration. Due to the overrepresentation of black women in the female prison population, the increase and large number of imprisoned black women exacerbates the impact on black children of having a parent who is incarcerated.

Research suggests that the presence of black women in the prison systems must be investigated separately from that of black males. Although they experience similar situations due to race, the intersection of race and gender provides for very different experiences in the criminal justice system.

COPING

All prisoners, including African American prisoners, seek out various support systems to cope with their incarceration. Many African American male prisoners choose religion, including converting to Islam, particularly, the Nation of Islam, during their incarceration as a way to deal with incarceration. In some prison systems with large African American populations, such as New York State, Islam is the most common religion behind bars.

Another form of coping in prison is through the formation of comparable alliances in which people group together for security. Research demonstrates that such alliances are typically formulated along racial lines and that this custom is more prevalent among male prisoners than female prisoners. Such alliances may take the form of prison gangs, which are typically divided by race. Two of the most common gangs in which young black men participate are the Bloods and the Crips. Gangs are far less common in women's prisons. Prisoners also form non-gang-related groups, such as religious organizations or sports teams.

CONCLUSION

Despite the decrease in crime in recent years, it is anticipated that if the current sentencing policies remain in effect, particularly for drug-related offenses, the number of African Americans sent to prison will continue to increase and the racial disparities within the prison population will continue to increase. Fortunately, this state of affairs is beginning to gain more attention from academicians, policymakers, and the general public. With

this new interest, it is anticipated that measures, such as youth delinquency prevention efforts, can and will be implemented to alleviate the overrepresentation of African Americans in U.S. prisons and, accordingly, assuage the negative outcomes brought about by this epidemic.

ALCATRAZ

The United States Penitentiary (USP) Alcatraz was one of the most famous and controversial prisons in American history. Located on Alcatraz Island in San Francisco Bay, California, it was operated from 1934 to 1963 by the Federal Bureau of Prisons. Before that, the U.S. Army had maintained a military prison on the site for nearly 70 years. USP Alcatraz housed some of the country's most notorious criminals, including Al Capone and Machine Gun Kelly. Reputed to be the most secure prison in the United States at the time, it was popularly known as "The Rock" and "America's Devil's Island."

HISTORY

The Bay Area's original inhabitants, the Ohlone tribe of Native Americans, may have visited the rocky, 12-acre island to fish and gather food in the centuries before the arrival of Europeans, but apparently they established no permanent settlements there. Nor did the Spanish occupy the island after explorer Juan Manuel de Ayala sailed through the Golden Gate in 1775 and named it after the many *alcatraces*, or pelicans, that he saw nesting there.

In the 1850s, however, the U.S. Army established a fort on Alcatraz, to defend one of the most important seaports in the newly admitted state of California. Over the next half-century, the site gradually evolved into an important disciplinary barracks for military prisoners.

By the 1860s, the Army had begun using a portion of the fortress to incarcerate soldiers convicted in courts-martial, as well as a few civilians suspected of sympathizing with the Confederacy during the Civil War. In the 1870s and 1880s, the Army added more cell space on the island, and during the Spanish-American War (1898–1900) the population of military prisoners approached 450. The transition from military post to military prison culminated in 1907, when Alcatraz ceased entirely to operate as a fort. That year, the Army redesignated the site as the Pacific Branch of the U.S. Military Prison, and over the next two years it demolished the citadel that had anchored the fort's defenses, erecting in its place a large, permanent cellhouse. The Army finally closed the prison in 1933 because it was too expensive to operate, the salt air was causing the buildings to deteriorate, and the Army deemed the facility's highly public location to be an embarrassment.

ALCATRAZ BECOMES A FEDERAL PRISON

About the same time that the Army was preparing to withdraw from Alcatraz, the United States was in

the throes of one of the most wrenching crime waves in its history. The imposition of Prohibition in 1920, and the onset of the Depression less than 10 years later, gave rise to an unprecedented explosion of organized criminal activities, gangland wars, bank robberies, and kidnappings that terrorized the nation. As soon as the Army left Alcatraz, the U.S. Department of Justice moved in to transform the facility into a high-profile super-prison to hold the toughest underworld figures and make a bold statement about the federal government's war on crime.

The responsibility for managing the new USP Alcatraz fell to the Federal Bureau of Prisons (BOP). The Justice Department had established the BOP only a few years earlier, in 1929, to provide more consistent, centralized, and professional control over the handful of far-flung federal prisons that then existed. It would serve as the prison for the prison system—for those very few inmates who had proven too disruptive, violent, or escape prone to be managed even at such maximum-security penitentiaries as USP Atlanta or USP Leavenworth. Alcatraz would accept few direct commitments of inmates from the courts. Instead, nearly all its inmates would be designated to Alcatraz only after having committed serious infractions at lower-security institutions.

CONDITIONS INSIDE

After several months of retrofitting the prison with improved bars, locking systems, metal detection devices, and other security enhancements, the BOP began transferring inmates to Alcatraz in August 1934. Once there, they were housed one man to a cell, both to protect them from each other and to prevent them from working together to undermine institution security. There was a high staff-to-inmate ratio, and the movement of inmates in the cellhouse, dining area, workshops, and recreation yard was highly restricted and constantly monitored. By the late 1930s, there was a special cellblock, called the Treatment Unit, where inmates could be held in isolation as punishment for serious infractions. Alcatraz initially attempted to impose

Photo 1 *Alcatraz*

a "silent system," whereby inmates were seldom permitted to speak with each other, and to severely limit the number of visits or correspondents that inmates could have, except with their attorneys—although both of those policies were loosened within the first few years of operation. Also, all prisoners were to receive the same treatment—with no special privileges or status for celebrity inmates, as sometimes had occurred at other prisons.

Yet Alcatraz was scarcely the dungeon of popular imagination. Sanitation standards were unusually high, there was a full-service hospital staffed by officers from the U.S. Public Health Service, and even the inmates conceded that the food was both plentiful and good—if only because the BOP did not wish to antagonize a potentially explosive inmate population with unappetizing fare. Alcatraz even maintained an "inmate mail box," a precursor of modern inmate grievance systems, which enabled prisoners to air complaints through uncensored, unmonitored letters to judges, members of Congress, the attorney general, or other officials outside the BOP. Inmates could both occupy their time and earn money by working in a laundry that washed clothes for military bases up and down the West Coast, reconditioning furniture for use in federal offices, making uniforms for prisoners in various BOP facilities, manufacturing cargo nets and

anti-submarine nets for use by the Navy during World War II, or carrying out janitorial assignments throughout the prison.

Although Alcatraz did not offer the sorts of classroom-based educational and vocational training opportunities available at other BOP facilities, the prison did arrange for a correspondence school program for the inmates, through the University of California. Inmates also had access to a 15,000-volume library, musical instruments, art and writing supplies, a commissary, athletic equipment, an outdoor recreation yard, and a small auditorium where they could attend religious services and regular showings of motion pictures. By the 1940s, inmates could listen, via earphones, to radio broadcasts piped directly into their cells—although their selections were limited to stations and programs approved by the warden.

The BOP kept the inmate population at Alcatraz as low as possible—only about 1% or 2% of its total inmate population—to ensure the intensive control necessary to manage its most intractable prisoners. Alcatraz never held more than 302 inmates at any one time, even though it had the capacity to house many more. More typically, the Alcatraz population hovered at around 250, and often slipped below 200. Throughout its entire history, USP Alcatraz incarcerated a total of 1,557 inmates.

ESCAPES AND DISORDER

A further indicator of the prison's stability was that there were only 14 escape attempts, altogether involving fewer than 40 inmates. All but three of the would-be escapees drowned in San Francisco Bay, were shot to death, or were recaptured. The only inmates unaccounted for were Frank Morris and brothers John and Frank Anglin, who used drills they had fashioned in the prison's machine shop to break into the utility corridor behind their cells, escaped via the roof of the cellhouse on June 11, 1962, and attempted to paddle their way to freedom aboard small life rafts they had constructed using rubber raincoats that they had glued together and inflated—leaving behind papier-mâché heads sticking above the blankets in their cots to cover their disappearance. Although sailors on a merchant ship thought they spotted a body floating in the bay the next morning, and despite surveillance of their families for the Justice Department for many years, there were no confirmed sightings of the men after their escape—either dead or alive.

One of the escape attempts metastasized into the lone serious disturbance in the prison's history: the so-called Alcatraz Blastout of May 2–4, 1946. Exploiting a flaw they had noticed in institution security procedures during a time of day when most inmates were at their work assignments and the cellhouse was virtually empty, six inmates who had remained in the cellhouse for various reasons were able to take nine officers hostage, confine them in cells, and grab their keys and billy sticks. They then broke into a gallery above the cellhouse, where they obtained firearms. Having thus taken control of the cellhouse, the inmates hoped to use the keys to break out or, failing that, to incite a full-fledged riot. Even with they keys, however, they were unable to get out. The other 200 inmates on the island, meanwhile, refused to join the uprising and instead were moved by staff into the recreation yard where they waited peacefully until the incident was over. A 42-hour siege ensued, which finally ended when U.S. Marines dropped grenades into the cellhouse. Two BOP officers were killed (one by friendly fire), and three of the six inmates were killed. The other three inmates were recaptured, and two of them eventually were executed for their participation in the disturbance.

CONCLUSION

The BOP had never been comfortable with USP Alcatraz, and as early as 1939 had begun to nudge the Justice Department and Congress into replacing the facility. The prison's dramatic location in picturesque San Francisco Bay, complete with tour boats circling the island to give gawkers a better view, was always a public relations headache for the BOP. Day-to-day operational expenses were enormous, as all supplies (including fresh water) had to be barged to the island, and the transferring

of inmates (as well as staff and their families) to Alcatraz often involved costly coast-to-coast transportation. By the 1950s, deterioration of the physical plant was proceeding at such an alarming rate that erecting entirely new structures would have been more cost effective than attempting renovations. Also, at this time, the public demand for tough prisons was evolving into a greater emphasis on the sort of rehabilitative and normative approaches long advocated by senior prison administrators.

In the late 1950s, Congress finally appropriated funds to begin work on a new BOP penitentiary in Marion, Illinois, that would replace USP Alcatraz as the highest-security prison in the federal system. USP Marion would be built specifically to house high-risk inmates and would feature the most up-to-date prison designs and building materials—rather than being a repurposed, retrofitted structure like USP Alcatraz. Also unlike Alcatraz, Marion would be located in a rural portion of the Midwest—far from tourists and other casual onlookers, but with easier access to more parts of the country.

USP Marion, however, did operate according to the same philosophy as Alcatraz: that a large prison system needed to maintain a highly restrictive facility where it could concentrate its most dangerous inmates so that they could not disrupt programs and operations, or threaten staff and inmates, at less restrictive facilities. In 1962, while USP Marion was still under construction, the BOP started transferring inmates to other U.S. penitentiaries. It transferred the last 21 inmates in March 1963, and closed USP Alcatraz. The site remained vacant until American Indian activists, accompanied by family members and other supporters, occupied the island from 1969 to 1971 as part of a political protest. In 1973, the National Park Service acquired Alcatraz and turned it into a prison museum and wildlife sanctuary that quickly—and ironically—became a popular tourist destination.

ALCOHOL TREATMENT PROGRAMS

Most state prisons and all federal prisons offer some type of substance abuse education or treatment programs to help inmates overcome their addiction to alcohol and other drugs. It is thought that these programs may also help to reduce recidivism. With 36.41% of all men and 27.86% of all women in prison reporting alcohol use leading up to or during their offense, it seems that there may be a connection between drinking and crime. Nonetheless it is unclear whether prison-based alcohol treatment programs are effective, since less than 25% of both state and federal prison inmates take part in them.

TYPES OF ALCOHOL TREATMENT

There are several different types of alcohol treatment available in correctional settings. While some individual and family counseling may be offered, the vast majority of treatment occurs in group settings because it is more cost effective. In addition,

some alcohol treatment programs combine various treatment modalities, but most are based on disease, educational, or social learning/cognitive behavioral models. These models are discussed in turn below.

Disease Model

Proponents of the disease model believe that alcoholics have a disorder rendering them incapable of controlling their drinking. Unlike nonalcoholics, they cannot drink in moderation. Treatment from this perspective is designed to teach alcohol abusers to recognize their disease and its consequences. Abstinence is considered the only appropriate strategy.

Self-help and "12 step" programs are based on the disease model. Participants in these types of programs generally attend group sessions a few times a week. Treatment length may range from a few weeks to a year, and individuals are persuaded to avoid environments conducive to drinking and encouraged to use their support systems when faced with difficult situations. Support from other recovered alcoholics is an important element to this category of therapy.

Evaluations of the disease model are generally mixed. While some research supports this treatment modality, the majority of research and meta-analyses suggest it is not very effective. For example, one of the most common treatments based on the disease model is Alcoholics Anonymous (AA). Many prisons contain AA programs, and some courts offer "good time" credit to inmates for successfully completing an AA program. Still, data indicate there is a low rate of program completion and that offenders who are coerced into entering AA programs to gain good time or other rewards often have worse outcomes than those who received no treatment. However, results are more promising for offenders who join AA groups because they are earnestly looking for treatment.

Educational Model

Alcohol treatment programs based on educational models have their foundation in the idea that people drink to excess because they are unaware of the damaging effects of alcohol. Educational programs seek to inform offenders about harmful health and behavioral consequences of alcohol use with the goal of preventing relapse upon release. These types of alcohol programs are found in all federal prisons and many state prisons. They are usually conducted in group meetings, and treatment length varies.

Overall, studies show that education-based substance abuse programs are less effective with higher-risk offenders, because their focus is on informing participants of the destructive effects of alcohol rather than teaching them how to change behaviors and thought patterns. However, like those based on the disease model, evaluations of educational treatment programs have produced mixed results. Results range from no effect to some evidence of success. One educational program demonstrating evidence of some effect is the In-Focus day treatment program, which was implemented at an Oregon women's prison. While this program contains a strong substance abuse education component, it also contains other elements such as basic life skills training and relapse prevention.

Social Learning/Cognitive Behavioral Models

Some of the most promising approaches to alcohol treatment are based on social learning and cognitive behavioral models. Treatment from these perspectives is based on the notion that behaviors and the thoughts associated with them are learned not only directly but also vicariously by watching and imitating others.

Goals of social learning and cognitive behavioral treatment include teaching offenders more prosocial skills, behaviors, and cognitions. The new behaviors and ideas are then reinforced, often through the use of contingency contracts or token economies, in which participants earn rewards and praise for demonstrating the desired action. Successful programs generally adhere to the principles of effective reinforcement in which it is thought that rewards should be consistent, immediate, and contingent on the desired behavior.

Most cognitive behavioral programs also use role-playing and practicing. These exercises allow participants to become more comfortable with new behaviors so they will be more likely to employ them in their natural environments. Evaluations of properly implemented social learning/cognitive behavioral programs—those based on the principles of effective correctional intervention—consistently reveal high levels of success as compared to other types of treatment. The majority of these types of prison-based programs are set in therapeutic communities.

THERAPEUTIC COMMUNITIES

Therapeutic communities (TCs) are another way of dealing with alcohol (and substance) abuse. TCs seek to change the viewpoints and even personality of offenders by group therapy and occupational improvements. The primary agent of change is the community of offenders. A therapeutic community may utilize any number of the above treatment modalities. One of the most common is a combination of the self-help and cognitive-behavioral approaches (e.g., relapse prevention).

Most prison therapeutic communities have separate quarters, housing inmates in treatment away from the general population. This kind of physical barrier results in treatment participants interacting only among themselves. The environment in most communities is more like an inmate's life on the outside than the typical prison cell or dorm, and inmates usually have input into the operation of the program. Participants typically remain in therapeutic communities for 9 to 12 months, during which time they are constantly in treatment. There are several group meetings per week, and inmates are trained to confront and help each other at any time of the day or night.

Prison therapeutic communities have produced promising results for offenders when compared to milieu therapy, individual counseling, or no treatment at all. As with any type of program, results depend on the elements of each particular case study. Programs that incorporate some cognitive behavioral/social learning techniques appear to be most successful and cost effective. For example, the Amity Program, a therapeutic community in California, employed cognitive behavioral techniques and 12-step techniques. Evaluations of this program showed some effectiveness in reducing the number of rearrests and reincarcerations for participants.

CONCLUSION

Alcohol is a factor in the commission of many crimes, so it is important to offer effective treatment to offenders. There are a variety of possible approaches to dealing with alcohol abuse, each of which is derived from specific psychological and educational models. Regardless of the particular model of treatment administered in the program, the most successful programs share some common characteristics. For example, the most effective programs almost always include some cognitive behavioral and/or social learning techniques. Treatment should also be long term and targeted for high-risk and high-need offenders. Finally, alcohol treatment programs should include an aftercare component for the greatest chance of success.

ALCOHOLICS ANONYMOUS

Alcoholics Anonymous (AA) was begun in 1935 in Akron, Ohio, by two men—a stockbroker (Bill W.) and a surgeon (Dr. Bob S.). By 1950, there were 100,000 recovering alcoholics in the AA organization worldwide. Today, the group has millions of members, and AA meetings are held in the community and in correctional facilities across the United States. Essentially, AA is a self-help and support group that views alcoholism as an incurable disease. Because it is thought that there is no cure for the condition, lifetime abstinence is the only alternative to progression of the disease.

AA MEETINGS AND IDEOLOGY

AA meetings are designed to enable those who wish to become and stay sober to convene with the purpose of discussing their drinking problems and telling their stories. AA meetings in the community are generally open to both men and women, while AA programs in correctional facilities are, for obvious reasons, limited to the single-sex members of the facility population. Most institutional AA meetings are composed of only males or females.

AA meetings may be open or closed. Open meetings are open to alcoholics, their families, and those interested in solving a drinking problem or assisting someone who has a drinking problem. In contrast, closed meetings are reserved for alcoholics to discuss problems related to their drinking and actions taken to maintain sobriety. Such closed meetings are commonly found in correctional facilities.

In addition to general discussions of problems and sobriety maintenance, participants also discuss the 12 steps of AA, which offer a way to live a sober life. Many AA meetings in correctional facilities discuss the 12 steps and how the steps can help them overcome their disease. A perusal of the 12 steps reveals the strong religious aspect of the program. For example, members must first admit that they are powerless over their addiction and in order to overcome the addiction, they must believe that a higher power will assist them in removing character flaws including the addiction. Furthermore, the members must maintain the relationship with the higher power through prayer and meditation and asking for forgiveness. The 12 steps are as follows:

1. Admitting they are powerless over the addiction.
2. Believing in a higher power.
3. Making a decision to turn life over to the higher power.
4. Making a moral inventory of ourselves.
5. Admitting our wrongs.
6. Being ready to have the higher power remove character flaws.
7. Asking the higher power to remove the flaws.
8. Make a list of people we have wronged.
9. Make amends to people we have wronged without causing additional suffering.
10. Continue taking personal inventory and admitting any wrongdoings.
11. Through prayer and meditation improve our relationship with the higher power.
12. Convey these messages to other alcoholics and practice these principles in our lives.

AA AND OTHER TREATMENT PHILOSOPHIES

While AA does not view itself as a psychological model of therapy, there are some therapeutic goals embedded within its traditions. For example, members must deal with denial, find healthy role models through AA sponsorships, and develop coping techniques. In addition, AA meetings challenge members' "stinkin' thinkin'" or antisocial thoughts.

Thus, while the AA organization seeks to remain nonprofessional, there are some remnants of other treatment modalities (e.g., behavioral and cognitive approaches) found within some AA programs.

AA IN PRISONS

The Federal Bureau of Prisons and many state departments of corrections offer AA groups in their penal institutions as a supplement to other programs in cognitive and behavioral interventions for alcohol abuse. Typically, AA sessions are either self-directed by a "model" inmate (i.e., one who has been through treatment and AA and has been sober for a number of years) or offered by an outside provider.

As with outside AA groups, prison inmates must find a sponsor to assist them through the 12-step programs and to act as a role model. Usually, the sponsor is a recovering alcoholic and has been sober for a number of years. He or she may be in or outside the prison. If a member of the outside community, this person can be especially important when the inmate is released.

CONCLUSION: THE EFFECTIVENESS OF AA

While many correctional facilities continue to adhere to the 12-step model of AA, research on its effectiveness has not been promising. A recent meta-analysis of 355 published studies and 48 dissertations on AA found that those who participated in AA were significantly less likely to be abstinent than those who did not participate in treatment. Furthermore, the study found that individuals who were coerced into AA, as many offenders are, have worse outcomes than if they had not received treatment. More promising results were found for those who joined AA voluntarily. Accordingly, forcing offenders into AA as a condition of their sentence, or to earn "good time" credit, may be doing more harm than good. Other types of alcohol treatment programs, such as those based on cognitive behavioral models, have proven to be more successful with offenders.

ALDERSON, FEDERAL PRISON CAMP

The Federal Industrial Reformatory and Industrial Farm for Women at Alderson was opened in 1927 in 200 acres in the hills of West Virginia under the administration of warden Mary Belle Harris and a dedicated staff of women. Set in an open rural area, it had 14 "home-like" cottage-style buildings, each of which housed 30 women and a live-in warder. There was also a prison nursery. According to a detailed classification scheme, inmates were employed in an "industrial" farm and power sewing room and offered educational and treatment programs developed by and for women. They were also allowed to participate in inmate-led clubs. During its first years, Alderson became not only the showpiece women's reformatory, visited by Eleanor Roosevelt and other dignitaries, but also an example of broader progressive prison reform. It was viewed by many as providing a national and international model for women's reformatories. It is presently used by the Federal Bureau of Prisons (BOP) as a minimum-security camp for women.

BACKGROUND

Prior to the establishment of Alderson, the federal government contracted with other jurisdictions to house women convicted of federal crimes. Despite earlier efforts to provide prison space at the federal level for women, contracting remained the policy until a series of legislative acts significantly increased the number of women in federal courts. For example, the Selective Service Act of 1917, criminalizing prostitution near U.S. Army camps, brought new prisoners and federal funds for women's institutions. Likewise, the Harrison Drug Act and the Prohibition Amendment led to unexpected numbers of women being sentenced to federal prison.

During this period, a number of influential women were imprisoned for prohibited suffrage protests or, in the case of Kate Richards O'Hare, for violating the Espionage Act of 1917. Their subsequent public appeals for reform of women's prisons strengthened the efforts to open a model women's reformatory at the federal level. Following the election of a Republican administration, aware of the role that the suffrage movement had played in their victory, Mabel Walker Willebrandt was appointed the first woman assistant attorney general. With responsibility for federal prisons, Willebrandt moved to provide not only a central administration for the male federal prisons, but, joined by a coalition of women's organizations, prison reform groups, and a network of influential women who administered state boards of corrections and reformatories, she successfully brought legislation for the construction of Alderson through Congress on June 5, 1924. With the gift of land at Alderson, provided in the hope that a model prison run "entirely by women" would bring thousands of visitors to West Virginia (including "experts from abroad"), the $2.4 million prison construction began with the aid of male prison labor.

MARY BELLE HARRIS

Mary Belle Harris, named in 1925 as superintendent, was responsible for the construction and development of the reformatory and remained its articulate defender for 16 years until her retirement in 1941. Harris, a graduate of the University of Chicago with a doctorate in Sanskrit and philology, had been recruited after a career of teaching by Katharine Davis, a fellow graduate, to be superintendent of the women at the New York Workhouse, and subsequently superintendent of New Jersey's state reformatory for women. With the passage of Selective Service Act, Harris became the assistant director of the Section on Reformatories and Houses of Detention, responsible for the women and girls convicted and detained as prostitutes.

DEVELOPMENT

Almost from the beginning, Harris found herself in conflict with Sanford Bates and James Bennett, the male directors of the BOP, who saw women as an "insignificant" but continuing problem in a male-dominated correctional system. The relative autonomy of Alderson and its influential supporters threatened their efforts to develop uniform BOP policy and control. Harris, in her reports, not only defended Alderson's programs but also complained, for example, when the BOP adopted her classification methods but attributed them to others. She argued for the reformative value of Alderson's progressive programs against the assertion that Alderson's programs were not adequate for "gun molls," "madams," and "confirmed drug users," who required the steel cells and armed guards of male maximum-security facilities. Harris's approach was continued until 1949 by her replacement Helen Hironimus, her former secretary, who included pictures of babies in her reports to remind the central office of the "other" inmates at Alderson, maintained Alderson's tradition as a reformatory by and for women.

However, by the 1950s, administered by women wardens without Harris's vision, Alderson was described by an inmate as "just another penitentiary." Efforts were limited to maintain a progressive "women's world" at Alderson against the pressures for uniform BOP policies that reflected dominant male perceptions of correctional needs and concerns. Other dimensions of the movements for women and civil rights also affected the institution. The 1950s

struggle for equal pay for equal work and a 40-hour workweek resulted in the elimination of the live-in warders positions and the development of the staffing and housing patterns of male institutions. Civil rights decisions put an end to racial segregation in Alderson's cottages. In response to overcrowding, the cottage kitchens and dining rooms were replaced by a central facility. With equal employment opportunities, positions in other BOP facilities opened for women, but in turn a man was appointed warden of the BOP's "women's institution" in 1976.

Over time, the public view of Alderson shifted from that of a "grand experiment" to an institution that housed notorious women. Infamous prisoners included the widow of Machine Gun Kelly, Axis Sally, and Tokyo Rose, all of whom were sentenced for treason after World War II, as well as the accused communist Elizabeth Gurley Flynn. Alderson came into view again with the media coverage of the escape of Lynette "Squeaky" Fromme, the failed assassin of U.S. President Gerald Ford, from Alderson's open grounds.

CONCLUSION

With the present classification of Alderson as one among a number of minimum-security camps governed by uniform policies and practices, women have become increasingly treated "like men." Harris's assertion that Alderson's policies and programs, while developed by and for women, were models for wider progressive penal reform came to little. Alderson's subsequent history reflects the changing political realities that have shaped correctional policies and practices as well as the perceptions, presence, and position of women within those realities.

AMERICAN CIVIL LIBERTIES UNION

The American Civil Liberties Union (ACLU) is a nonprofit, nonpartisan organization founded in 1920 by Roger Baldwin, Crystal Eastman, and Albert DeSilver. It was created to protect the liberties granted by the U.S. Constitution's Bill of Rights, plus the 13th, 14th, 15th, and 19th Amendments. These civil rights amendments generally protect and provide for freedom of speech, association, and assembly; freedom of the press; and freedom of religion. The Bill of Rights also established the right to equal protection under law that includes equal treatment regardless of race, sex, religion, or national origin and the right to due process characterized by fair treatment by the government whenever loss of liberty or property is at stake. Finally, the right to privacy includes freedom from unwanted government intrusion into private and personal affairs.

HISTORY

The formation of the ACLU coincided with a range of social issues that arose from U.S. involvement in World War I. One of the most pressing issues was over conscription. It soon became clear that a draft was inevitable, raising the problem of how to deal with conscientious objectors. Different organizations attempted to aid the nonexempted conscientious objectors, many of whom received harsh treatment in prison and had their mail censored by the postmaster general. Further legal scrutiny came as the Espionage Act limited or outlawed such constitutionally protected issues as freedom of the press and association.

After World War I, the ACLU shifted its effort and concern from conscientious objectors to protecting labor. Specifically, leftist movements including the communist party, the socialist party, the unions, and also mainstream labor movements were now seen as a threatening move toward the entrenched political mainstream. Roger Baldwin, who had been involved in protecting the rights of conscientious objectors and had even served jail time himself for refusing to submit to the draft, decided that organizations that once focused on the war now must focus on labor. It was at this point in 1920 that Roger Baldwin with Albert DeSilver formed the ACLU.

Fear of growing numbers of Communists and other people with political associations considered radical combined with a series of mail bombs drove Attorney General A. Mitchell Palmer to provide legislation that would justify government actions known as "Palmer raids." Palmer raids were conducted on groups or individuals with radical political association where property or persons were detained without ever being charged or having seen a judge or jury. At first, the public appeared to support Palmer raids, but after the newly formed ACLU published accounts of them and accused the government of violating the Fourth, Fifth, Sixth, and Eighth Amendments of the Bill of Rights, public support diminished. Although the ACLU initially formed to protect labor, it became readily apparent that the ACLU would soon work to protect the rights of people whose constitutionally protected freedoms were being violated.

CRIMINAL JUSTICE

The ACLU tackles many general issues under the umbrella of criminal justice including but not limited to juvenile justice, the death penalty, indigent defense, racial bias, police practices, search and seizure, sentencing, prisons, prisoner rights, and the war on drugs. The wing that deals specifically with prisons is known as the National Prison Project.

From their first protests against the Palmer raids of the 1920s, the ACLU has ranged widely in its legal activities constantly dealing with topical subjects. In 1925, in what is known as the *Scopes* case, for example, the ACLU secured a lawyer to defend a Tennessee biology teacher charged with violating a ban prohibiting the teaching of evolution. In the 1930s, the ACLU had two major cases including the *Ulysses* case and also the case against "Boss" Hague. The *Ulysses* case forced an anticensorship ban that resulted in the ban of James Joyce's novel *Ulysses* to be lifted while the "Boss" Hague case found that a ban on union organizers' meeting in Jersey City was unconstitutional. During World War II, the ACLU stood against the internment of Japanese Americans, and during the Cold War it battled against loyalty oaths. The ACLU was active in the civil rights movement as early as 1954 when it joined the fight for school desegregation that ultimately resulted in the *Brown v. Board of Education* decision, which declared segregated schools to be a violation of the 14th Amendment. In 1973, the ACLU supported the decriminalization of abortion in *Roe v. Wade*, and in 1997 in *ACLU v. Reno* it managed to have the Communications Decency Act struck down after it was found to violate free speech. Currently, the ACLU is actively involved in challenges against the Prison Litigation Reform Act, the USA PATRIOT Act, and the incarceration of suspected Al-Qaeda operatives at U.S. Naval Base Guantánamo Bay.

While these are some of the most well-known cases, the ACLU constantly addresses ongoing issues such as AIDS, capital punishment, lesbian and gay rights, immigrants' rights, prisoners' rights, reproductive freedom, voting rights, women's rights, and workplace rights. It also defends controversial groups including American Nazis, the

Ku Klux Klan, and the Nation of Islam in order to prove that the freedoms of the U.S. Constitution apply to all U.S. citizens.

CONCLUSION

The ACLU is the nation's largest public interest law firm. It is run by a national board of directors, who set policy for a 50-state network of staffed, autonomous affiliate offices. The national office in New York coordinates the efforts of more than 60 ACLU staff attorneys and 2,000 volunteer attorneys who handle approximately 6,000 cases a year. Any individual or group can contact the ACLU if the person or group feels civil liberties have been violated. With the exception of the Department of Justice, the ACLU appears before the Supreme Court more than any other organization.

AMERICAN CORRECTIONAL ASSOCIATION

The American Correctional Association (ACA) is the official organization devoted to overseeing the development and implementation of improved correctional methods and operational standards. It has more than 20,000 members globally. To achieve its goals, the ACA works with practitioners, academics, and the state. Each year, it holds two annual conferences. It also publishes a directory of facilities, regular reviews of "best practice" in the United States, and two journals: *Corrections Today* and *Corrections Compendium.* In addition, the ACA hosts on-site training sessions and offers insights and input on policy decisions and recommendations to the state. Most important, the ACA is the only institutional accreditation body in the field of U.S. correctional operations.

HISTORY

In 1870, the predecessor to the ACA, the American Prison Association, was established by what was then called the National Prison Association and elected future U.S. President Rutherford B. Hayes as its first president. Highlighting a broadening conception of punishment, in 1954 the Congress of Correction adopted the current title emphasizing a new preoccupation with improving inmates and returning an altered, more adjusted citizen back to communities. This shift reflected a growing liberalization toward punishment that encouraged academics, policymakers, and (to a lesser extent) practitioners to view the potential benefits of incarceration for both society and inmates. Indeed, this thought began to balance more punitive sorts of punishment and displaced dominant trends that merely sought to warehouse and punish law violators.

At the founding meeting in 1870 in Cincinnati, Ohio, and through collaboration between national and international correctional experts, the American Prison Association created the Declaration of Principles. These principles, according to the ACA, clearly "state the beliefs and values underlying the practice of their profession." The central focus for correctional services was identified as the *moral regeneration* of the criminal. In the original statement, these early correctional leaders recognized the importance of returning well-adapted—or, as it was hoped, resocialized—offenders to society possessing the *individual will* to refrain from criminal opportunities and redirect their energies toward more industrious endeavors. From its origins, members of the organization saw the potential for reducing

recidivism (i.e., reoffending) by strengthening attachments between inmates and several social institutions such as the family, education, religion, and community.

ACCREDITATION AND THE DECLARATION OF PRINCIPLES

While the originators of the ACA made significant developments to the delivery of punishment, current members are continually working to improve correctional policy and service. With such improvements in mind, the ACA renewed and revised the Declaration of Principles (revisions completed in 1930, 1960, 1970, 1982, and 2002) to lead rational practices, clarify philosophical goals, and encourage multijurisdictional cooperation (i.e., local, state, national, and international).

In the Declaration of Principles, the ACA includes seven foundational concepts to direct "sound corrections policy and effective public protection." The seven principles are humanity, justice, protection, opportunity, knowledge, competence, and accountability, and taken cumulatively they serve as professional beacons steering practitioners to better understand and execute their purpose and mission. The ACA, in an effort to ensure compliance to these principles, offers an accreditation program (by the Standards and Accreditation Department) to evaluate and upgrade correctional administration, programs, and services. For a correctional facility to be accredited by the ACA, it must submit to a four-prong process, centered on a comprehensive on-site, official ACA audit. More than 1,500 facilities have successfully passed through this process since 1978.

The accreditation program offers correctional facilities several benefits. Through accreditation, facilities receive improved training and development, receive assessment of program strengths and weaknesses, receive protection from lawsuits, increase staff morale and professionalism, and establish standardized measurable criteria for evaluation and improvement. Correctional facilities must be a recognized government agency or private entity conforming to appropriate regulations. All agencies seeking accreditation must meet a series of institutional requirements. The agencies are facilities confining pretrial or presentenced adults or juveniles, sentenced adults or juveniles, or supervision of adults or juveniles sentenced to community corrections and have a single administrative official accountable for all agency operations. ACA principles and the accreditation program, therefore, work to ensure that correctional facilities emphasize due process, fairness, public safety, and humane conditions.

CONCLUSION

The ACA develops, evaluates, and adjusts correctional policy in the United States and abroad. It is working hard to instill a professional attitude combined with an ever-vigilant eye toward ensuring the moral/ethical foundation for current punishment strategies. Though not all correctional facilities have been accredited by the ACA, most strive to meet its goals. As a result, the ACA creates a standard that penal administrators try to meet.

ANGOLA PENITENTIARY

The Louisiana State Penitentiary (LSP) at Angola houses approximately 5,000 men and is arguably the South's most infamous prison. Commonly called Angola, this prison was one of the South's most cruel and brutal prison farms in the 19th and early 20th centuries. More recently, it has become the oldest maximum-security prison ever accredited by the American Correctional Association.

Angola is a prototype of the Southern plantation model of imprisonment. It was first used as a prison

in 1880 when the prisoner lessee S. L. James purchased the land from Isaac Franklin's widow and transferred prisoners there from the old walled penitentiary in Baton Rouge. Franklin had been one of the largest slave traders in the South. Angola was only one of seven plantations in the estate at the time of the purchase; the estate consisted of 10,015 acres. Although it is commonly thought that the Louisiana State Penitentiary was named Angola because the original slaves who worked the property came from Angola, Africa, there is no documentation to support this belief. Still an operating farm today, Angola occupies 18,000 acres and is the largest maximum-security prison in the United States. Requiring no walls, it is surrounded on three sides by the Mississippi River and on the fourth by the rugged Tunica hills. It has been home to a former university president, famous prisoner musicians, and an award-winning prison journalist.

HISTORY

After the Civil War, Louisiana turned to a lease arrangement for many of its convicts, most of whom were black former slaves. By the end of 1866, 75% of all Louisiana prisoners were black, and as of July 1, 2002, the proportion remained at this level. Mark T. Carleton (1971) observes that from the early lease system, through state control until the 1970s federal court intervention, race and profit were the defining factors of Louisiana's philosophy of punishment. S. L. James reputedly became one of the richest men in Louisiana from the lease profits. The state resumed control of the institution with an eye toward those same profits.

Under the lease system, which expired in 1901, convicts worked on private property—both Major James's and that of other plantation owners who subcontracted their labor—for the profit of the lessee, Major James. They worked the land, farming and cutting timber, performed as household servants, and repaired and built levees in the never-ending struggle to contain the Mississippi. They were contracted to railroad companies to rebuild the lines destroyed during the Civil War. Consequently—and contrary to public belief—the majority of prisoners were not housed at Angola but were located throughout the state.

Although today it is an institution only for men, women were the first prisoners transferred to Angola after S. L. James purchased the property in 1880. Women worked in the fields during the James lease and did domestic work in the employees' households. They remained part of the prison until 1961.

STATE CONTROL

When the convict lease expired in 1901, the state resumed control of the prisoners and immediately built new housing, consisting of wooden cabins. The women's quarters were built in the center, at least one mile from other structures in compliance with the Board of Control regulations providing for the separation of males and females. At the time of transfer, there were 1,142 prisoners. Well into the 1920s and 1930s, not more than 25% to 30% of all state prisoners were housed at Angola. Throughout those years, men and some women were working at levee camps, road camps, and other plantations around the state.

The resumption of state control was probably not obvious to inmates since their daily work life changed little and most officials and employees of the James era were retained. The state also pursued the profit motive using primarily black convicts for farming, timber operations, and working on the various levee camps and road camps that the state eventually contracted. As well, the state maintained three other plantations some distance from Angola. White male convicts and all female convicts were sent to Angola except those few of the former who were sent to the camps for clerical or "mental" work. Women continued to do field work under state control, hoeing sugar cane and sorting tobacco. The tobacco barn was located next to the women's quarters, thereby expediting those tasks. There was no effort to rehabilitate inmates due to the underlying assumption that it was neither necessary nor possible to so transform black men and women.

A succession of wardens and general managers struggled to make Angola a profitable enterprise by getting the most out of its inmate labor force. Henry

Fuqua, general manager, fired most of the professional guards and instituted convict trustees in their place in 1917. As salaries for officers and guards constituted almost 50% of the 1913 budget, Fuqua's action was certainly cost efficient. In comparison, supervision costs for the 2002–2003 budget are projected at 63.9% for a typical adult institution.

Due in part to decisions like Fuqua's, Angola gained a national reputation as the worst large prison in America. Newspapers described floggings administered to prisoners to make them work harder and more efficiently. Women were not excluded from such punishments and sometimes received as many lashings as any of the men. A 1951 incident in which 37 white inmates slashed their Achilles tendons focused national attention on Angola's problems and brought about a brief period of reform under the direction of Governor Robert Kennon. The main prison complex (still in use today) was constructed replacing the wooden out-camp buildings, many dating to the turn of the 20th century. A new reception center was built, along with quarters for women inmates, and professional penologists brought modern ideas to penitentiary operations. Convict trusty guards were greatly reduced for a few years, and the basics of rehabilitation were initiated. The women were finally moved to St. Gabriel in 1961.

A severe budget cut in 1962 ended most of these reforms and took Angola back to the conditions of earlier times. By the early 1970s, Angola once again became known as the bloodiest prison in America. This time, reform came through federal court intervention. Judge Gordon West's court order of June 10, 1975, mandated sweeping changes in all aspects of Angola's operations—population, security, classification, discipline, medical care, housing, physical plant, and mental health.

Under federal court supervision for almost 25 years and with the necessary legislative support, Angola was finally turned into a relatively safe, secure, and productive maximum-security prison. In 1975, at the time of the court order, Angola was one of two state prisons in Louisiana. It is now part of a system of state institutions, including medium-security prisons and parish jails holding shorter-term inmates.

CONTEMPORARY ANGOLA

Angola is the only maximum-security prison in Louisiana. Home to 90 men on death row, Angola is also Louisiana's official execution site. In 2001, approximately 3,300 of Angola's population were serving life without parole, and another 1,400 were "virtual" lifers with sentences longer than they can live to serve. Due to the length of their sentences, the majority of men presently housed at Angola will likely die there. To care for the old and dying, Angola has developed a Hospice Program that is purportedly a model for other prisons. In it, prisoner volunteers perform hospice functions for their dying convict friends.

Since most Angola prisoners never leave, the prison provides a variety of vocational, religious, recreational, and self-help programs. Newly arrived prisoners are required to do 90 days of agricultural work in the fields and many of them do so for decades. Other employment includes maintaining day-to-day operations of the institution, work at the (license) tag shop, silk screen shop, print shop, metal fabrication shop, and the mattress, broom, and mop factory.

Education programs include basic literacy, general equivalency diploma (GED) preparation, vocational education (culinary, auto mechanics, body and fender repair, carpentry, and graphic arts), and the New Orleans Baptist Theological Seminary (NOBTS), Angola Campus, that offers associate and bachelor degrees. NOBTS is the only college program offered to prisoners in Louisiana (other than correspondence) and as of 2002, NOBTS has awarded degrees in Christian ministry to more than 100 convicts since 1995. The graduates are then sent out to other state prisons to minister to their fellow convicts.

The prison sponsors approximately 30 self-help organizations including Toastmasters, Jaycees, Vets Incarcerated, and the Lifers' Organization in addition to a variety of faith-based and religious programs. Boxing, volleyball, softball, football, and basketball are just some of the intramural athletic activities. Angola also has the sole surviving prison rodeo in the United States, the only licensed prison

radio station in the nation, and the only prison museum in the southern United States operated within an active prison.

CONCLUSION

The Louisiana correctional system has improved greatly since the intervention of the federal courts in 1975. Ironically, as Angola has become a much safer prison than it ever was, Louisiana's incarceration rate has skyrocketed to the highest in the nation and the Western world. Almost coterminously with the federal court's intervention, Louisiana eliminated the possibility of parole for lifers. The war on drugs and the state's partnership with federal authorities require Louisiana to make violent offenders serve 85% of their time. The unanticipated impact on Angola is that it is becoming the most expensive state-run old-age home in the United States. Inmates seldom leave Angola. Most of the men presently confined at Angola will face the convict's worst nightmare: They will die there.

ARGOT

Argot is a 19th-century French word originally derived to classify meaning or jargon among criminals. Beggar and thieve guilds used this type of language to communicate within their particular subgroups. More generally, argot is a vocabulary and group of idioms, with semantic meanings used by a specialized group of people, within a social system. These are organized, professional groups, particularly members of the criminal subculture who operate outside the boundaries of the law. This language is not considered part of the standard cultural vocabulary. It is determined by social factors and used with the specific intention to render communications unintelligible to those outside the group.

PRISON ARGOT

Prison argot is a complex and ever changing vocabulary that is used by inmates or former inmates to communicate both inside and outside the prison walls. Examples of this language can be demonstrated in terms such as *crushing* or *crushing out*, which were coined for escapees in the years 1904 and 1925, respectively. Another phrase,"back-gate parole," from 1929, refers to an inmate who died in prison.

Argot is a shared meaning among the prisoners sanctioning their relative status and rights similar to that of a guild. Secrecy can be maintained from the prison staff and other inmates outside the group. Not all of these terms remain secret as demonstrated above, in fact, many would be recognizable to people with no real connection to the correctional system. However, there are multitude of phrases, terms, and symbols unknown to those outside prison. Even those who are within the system, such

as guards and other inmates, may be unaware of the complex language system being used.

IDENTITY AND LANGUAGE

Prison argot varies both regionally and ethnically within prison populations. Due to the ethnic variations in the United States, prison populations house differing percentages of inmates from varying regional and ethnic backgrounds. This leads not only to East Coast, Midwest, and West Coast variations in prison argot but also to differences in language between ethnic groups. Furthermore, subgroups or gangs within those prison populations can have more specific vocabularies and symbols. It is an assimilatory process for the prisoners combining argot terms with their language (most generally English, Spanish, Native American, and black English) creating a comprehensible language that is both lexically and grammatically particular.

Prison argot performs important tasks for the inmates by establishing identity and allegiance to other inmates allowing them to communicate privately, even while under surveillance. It creates clear and observable social types that have defined roles. For example, in one Santa Fe, New Mexico, prison, there are approximately 88 terms describing prisoners both inside and outside the prison walls. In the eyes of the inmate, it is very important to know exactly who another person is. Eighteen of these terms were specific in relationship to race—Anglo, Chicano, and so on.

When a prisoner arrives at the correctional facility all possessions are stripped away. The argot term that is associated with him or her is important in establishing an identity and allegiances. An inmate can discern another in a variety of ways, through tattoos, hand symbols, gang symbols, and argot terms. The distinct language of argot brings cohesiveness into prison life through specific word patterns and placements. While there is cohesiveness for the individual in particular groups, argot also contributes to the segregation and exclusion of other inmates.

Beyond establishing identity and allegiance, prison argot aids prisoners to operate their "business" privately without interference from prison staff or other inmates. Those partaking in ventures that are illegal or that break prison rules may use prison argot in an attempt to keep secret their affairs. Subgroups, cliques, or gangs in the prison population, such as the Bloods or Crips, can maintain this secrecy even further by keeping their codes private and by using *cants*. Cants are vocabulary normally associated with gangs and are similar to and employed along with argot, but the language is temporary, changes abruptly and is modified as needed. This ensures the safety and secrecy of the vocabulary of the language by having the capability to change significantly important words. If the interpretation of a word becomes known by one outside the group, the group can either change the meaning of the word altogether or establish a new word as a replacement. Argot vocabulary changes may also arise out of heightened security within the prison walls.

CONCLUSION

Prison argot can result in and is attributed to poor communication among prisoners and staff. It has been the cause many dilemmas inside the correctional facility including, but not limited to, racial problems, murders, employee unrest, major security violations, riots, and inmate assaults. Prisons have currently seen an increase in argot languages, as more subcultures bring their symbols and dialects into correctional facilities and the prison population expands, these distinct argot languages will continue to increase along with the possibility of increased problems such as the ones mentioned above.

ART PROGRAMS

Art programs have long been a component of correctional recreation and a significant part of prison culture. Programs include self-directed hobby shop projects, formal arts and/or crafts programs, art therapy, and education-oriented art classes. Benefits of art programs include reduced idleness and disciplinary infractions as well as the opportunity for self-expression. They are beneficial to correctional management and offender adaptation, rehabilitation, and reintegration.

HISTORY AND CURRENT PRACTICE

The history of prison art is largely undocumented, but it is likely that prisoners have produced art since the earliest forms of confinement. The first recreation and art programs in the United States were offered at the Elmira Reformatory in 1876. In the late 19th through mid-20th centuries, art programs existed in U.S. prisons but were atypical. Following World War II, the American Correctional and National Correctional Recreation Associations acknowledged the significance of prison recreation. With the rise of correctional rehabilitation in the 1960s and 1970s, art programs flourished as a component of the leisure education model, which viewed recreation as therapeutic/rehabilitative. Programs were supported by the National Endowment for the Arts Artist in Residence Program and Project CULTURE (Creative Use of Leisure Time Under Restrictive Environments), administered through the American Correctional Association and funded by the Law Enforcement Assistance Administration (LEAA).

Today, art programs are offered in county, state, and federal correctional facilities in the United States and around the world, though the "get tough" approach in the 1980s and 1990s, rising incarceration rates, and diminished resources have reduced the number of programs in U.S. prisons. Most art programs are sustained through outside grants, artist-in-residence programs, and volunteers.

TYPES OF PROGRAMS

Correctional art programs offer a broad range of activities including fine arts, crafts, ceramics, jewelry making, wood carving, horse hair weaving, mural painting, poetry, creative writing, drama, music, dance, and in some prisons, public art, video production, and photography. Some programs offer opportunities for prisoners to exhibit and/or publish their work. Correctional art programs can be categorized into four general (non-mutually exclusive) types: (1) self-directed hobby shop projects; (2) formal creative arts and/or crafts programs; (3) art therapy; (4) education-oriented art classes tied to correctional education departments. Many prisons have a hobby shop in which prisoners may (usually for a monthly or quarterly fee) engage in individual and/or supervised projects in conjunction with or independent of formal art programs.

PROGRAM BENEFITS

Prison art programs, in conjunction with other factors and opportunities, are associated with reduced recidivism and disciplinary infractions, increased self-esteem, development of life skills, and reduction of idleness. Studies suggest that art programs provide a means through which prisoners can constructively serve their time, develop positive leisure activities and habits, and learn skills beneficial to institutional adaptation, rehabilitation and reintegration process. Art programs serve a correctional management function in that prisoners who are involved in art activities are less idle and less likely to be involved in institutional misconduct.

CONTROVERSY AND CHALLENGES

Several issues have hindered the proliferation of art programs in prison. First, the "principle of least eligibility"—the idea that prisoners should not be offered the opportunity to engage in leisure activities—has ensured that art programs are the first to be cut during budget crises. Second, many art supplies, materials, and tools are considered contraband and/or are threats to institutional security and management. It is a challenge for prisoners and art instructors to reconcile creativity and institutional constraints, and for correctional managers to balance the costs (control of contraband) and benefits (reduction of idleness) of art programs with respect to security and management.

Institutional constraints, the prison subculture, and the human desire to produce art have created a unique genre of "outsider" art involving the use of unorthodox materials. These materials may include soap, cigarette ashes, shampoo, bible pages, melted chess pieces, toilet paper, cigarette packages, matches, wood scraps, hair, and potato chip bags. Art may also be used as a commodity, for example, trading drawings, cards, poems, decorative envelopes for cigarettes, services, and other items. While seen as innovative by the art community, the use of certain materials and the practice of trading artifacts challenges correctional security and management.

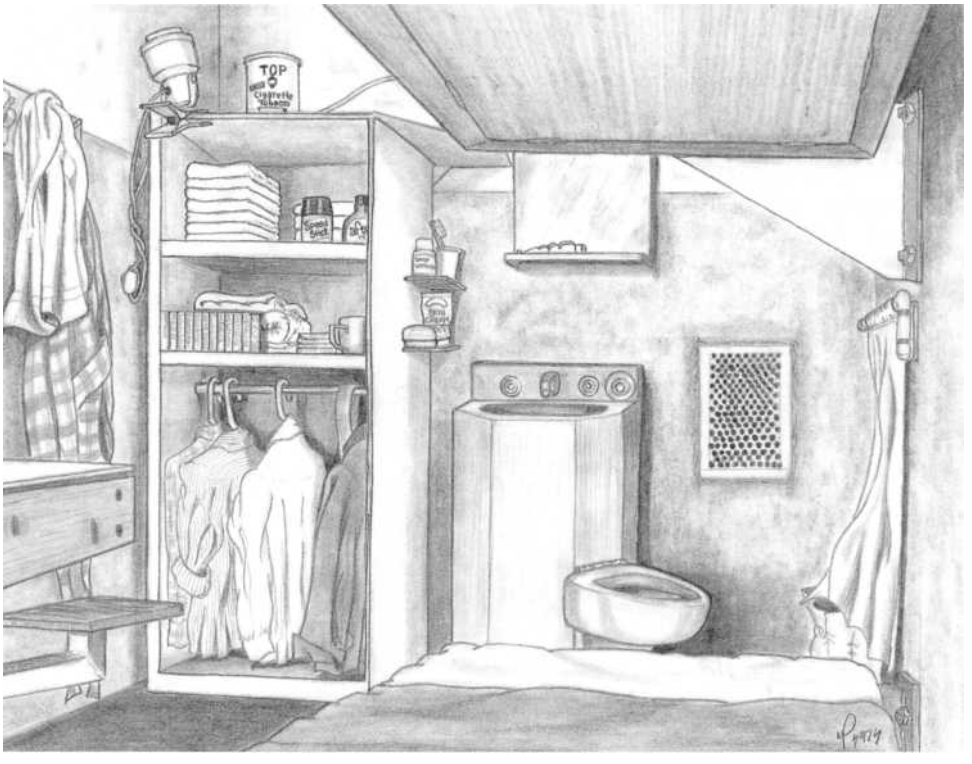

Figure 1 *"My World": 6 ×9 of Concrete and Steel*

SOURCE: Illustration by Martin Potter (1997).

Many art programs provide outlets for prisoners to sell and/or exhibit their work. This practice has also generated controversy, specifically in the case of high-profile serial killers such as John Wayne Gacy, Arthur Shawcross, and Richard Ramirez, who have sold and exhibited their work. As a result, some art exhibits in museums and galleries have banned or cancelled art shows featuring the work of violent offenders, some programs no longer allow violent offenders to show/sell their work, and in cases where prisoners are allowed to sell their work a portion or all of the proceeds are donated to crime victim advocacy agencies.

CONCLUSION

With or without formal art classes, prisoners will find ways to produce art. Programs provide prisoners with a constructive outlet and life skills, which, in turn, enable them to adapt better to the prison environment, to do time constructively, to deal with emotions, and to reintegrate upon release. Correctional art programs supplement work, education, and other available recreational activities to provide a range of options for prisoners. Most departments of corrections in the United States and around the world recognize that such options are beneficial to prison staff and offenders because they provide a constructive outlet for prisoners and are an important part of programming and institutional management.

ARYAN BROTHERHOOD

The Aryan Brotherhood is a violent, male white supremacist prison gang that is affiliated with the national hate-based organization Aryan Nations. The gang is said to follow the principles of "Identity" or "Christian Identity." Proponents of Christian Identity believe that Armageddon is either upon us or fast approaching when whites and nonwhites must fight to the death in an ultimate "race war."

Aryan Brotherhood members are involved in extortion and drug operations, predominantly selling methamphetamines in prison. Aryan Brotherhood violence and criminal activity, however, does not just occur behind prison walls. Members of this gang were involved in the murder of James Byrd in Jasper, Texas, the killing of Saselzley Richardson in Elkhart, Indiana, and the dog mauling death of Diane Whipple in San Francisco, California. In prison, as well as posing a risk to others, primarily nonwhite inmates, members of Aryan Brotherhood are also known to be violent toward staff members.

OVERVIEW OF HISTORY AND BELIEFS

The Aryan Brotherhood is believed to have begun in San Quentin Prison, California, during the 1960s. Since then, membership has spread nationally with known groups in Texas, Florida, Montana, New Mexico, and various other states. The most notorious of them all is the Aryan Brotherhood of Texas, or ABT. Aryan Brotherhood members follow a system of rules and regulations, which are set out by the leadership, or "commissions." Groups known as "councils" oversee daily gang operations.

All members of the Aryan Brotherhood are Caucasian and are either serving or have completed some sort of prison sentence. Many sport neo-Nazi symbols as tattoos including the swastika, Nazi lightning bolts, "AB" (for Aryan Brotherhood), and the number "88" (for "Heil Hitler–since "H" is the eighth letter of the alphabet). Some men also may be tattooed with shamrock clover leafs, and various Celtic symbols to symbolize their Anglo-Saxon roots.

Members of the Aryan Brotherhood believe that whites are superior to all others. They base their ideas in Christian Identity, which they claim is an alternative "religion" based on five main propositions: (1) White people are the Israelites of the Old Testament; (2) those of Jewish descent are the direct offspring of a mating of Eve and Satan; (3) Adam and Eve were the first *white* people; (4) all nonwhites are an entirely different species than whites; and (5) the war between whites and nonwhites, Armageddon, is in the foreseeable future.

HOW DOES THE ORGANIZATION WORK?

It is difficult to join the Aryan Brotherhood. Those who wish to take part in the gang are placed on probation for approximately one year. They must also take a "blood in, blood out" oath that usually requires them to commit a violent act such as an aggravated assault or murder in order to be initiated into the gang. Once an individual has joined, he is a member for life. Blood must spill in order to be admitted and released from membership.

There are numerous "outreach" programs funded by other white supremacy groups, which provide smuggled literature to Aryan Brotherhood inmates. These publications include *The Way,* published by the Aryan Nations; *Taking Aim,* published by the Militia of Montana; and *Jubilee,* an Identity-affiliated publication. White supremacy and Christian Identity reading material is widely traded throughout prisons, and members are encouraged to recruit and convert as many white inmates as possible. There are even internal publications penned by inmates for other inmates preaching white supremacy, such as *Thule* and *Prisoner of War.*

THE FBI FILES AND PROSECUTIONS

The FBI investigated the Aryan Brotherhood gang in the California penal system from 1982 to 1989 (FBI File No. 183–7396, 1982). The FBI files were

closed in 1989 when the U.S. Attorney in Los Angeles declined prosecution, in large part due to the difficulty of finding reliable witnesses. Prosecution of Aryan Brotherhood members would be hard to obtain with testimony from inmates who were subject to threats (and acts) of violence by gang members against "snitches." Moreover, it is difficult to find former members to speak out against the Aryan Brotherhood since the group subscribes to a "Blood in, Blood Out" code in which blood must be spilled to join or leave.

Yet in October 2002, a Los Angeles federal grand jury issued an extensive indictment against 40 Aryan Brotherhood members and associates, alleging violations of RICO (Racketeer Influenced and Corrupt Organizations Act), violent crimes, murders, drug trafficking, extortion, and gambling. Search warrants were executed in California, New York, Illinois, Colorado, Connecticut, Florida, Georgia, Louisiana, Massachusetts, Pennsylvania, Nebraska, and Washington in connection with Aryan Brotherhood activities. Thirty of the 40 individuals indicted were in prison, with the remainder conspiring with them from the outside, again, on a nationwide basis.

CONCLUSION: THE FUTURE OF THE ARYAN BROTHERHOOD

Prisons, by nature, are filled with strife and conflict among individuals with violent tendencies. As a result, there are many perceived benefits for inmates to affiliate for social contact, exploitation, and personal protection. As long as these needs are met through gang affiliation, prison gangs such as the Aryan Brotherhood likely will continue to flourish in American prisons.

ARYAN NATIONS

Founded in the mid-1970s, Aryan Nations, until recently, occupied a settlement in Hayden Lakes, Idaho, where its leader, Richard Girnt Butler, propagated his theological hate ideas. In the 1960s, Butler built a church on his 20-acre compound, equipped with a church-school and paramilitary training ground. He named it the "Church of Jesus Christ Christians," and it attracted a small congregation. These days, Aryan Nations is estimated to have about 1,000 supporters nationwide. Former Silicon Valley entrepreneurs Carl Story and Vincent Bertollini have been its primary financiers.

IDEOLOGY OF HATE

Butler's theology is typical of Identity preachers. He openly adulates Hitler, aligning Aryan Nations with other white supremacists and neo-Nazi groups. According to Butler, Jews are not the true descendants of the Biblical Israelites; rather, that distinction belongs to persons of Northern European ancestry. Known as the British theory, the Christian Identity movement purports that Aryans, not Jews, are God's chosen people. The vilification of Jews

and blacks constitutes further characteristics of the theology of hate.

The Aryan Nations is also antigovernment. It promotes the use of violence as the means to make America a promised land reserved for the Aryan people. Paramilitary violence can be equally used to establish Christ's kingdom in the national racist state of America. It proposes to eliminate what has been labeled ZOG—Zionist Occupation of Government. In addition, it believes that the United Nations will take over the American government and establish a world government under the supervision of the world body.

The Turner Diaries

During the 1980s, under the leadership of Butler, supporters of Aryan Nations merged with members of the neo-Nazi National Alliance and some Ku Klux Klan splinter groups to establish the Silent brotherhood, known generally as the Order. The Order, a right-wing white supremacy group, may have taken its name from the *Turner Diaries.* In the futuristic novel, the hero's supporters were largely responsible for planning and executing an attack aimed at crippling the American government, in hopes of creating a sovereign Aryan homeland to be established in the Pacific Northwest. In December of 1984, the Order's plans were halted due to the death of its leader, Robert J. "Bob" Mathews, who died during a confrontation with federal agents on Whidbey Island, Washington.

The murderous violence associated with groups such as Mathews's the Order is not typical of Aryan Nations. For example, Butler has taken pains to disassociate himself and Aryan Nations from militant activity. However, all right-wing groups have similar ideologies and are philosophically bound by religious beliefs. The basic principle of the Identity movement and those within the extreme right include the doctrine of the intrinsic superiority of the white race

PRISON ACTIVITIES

White supremacy groups have been at the forefront of the rise in race-based violence in U.S. prisons. Among the most notorious is a group known as the Aryan Brotherhood. Surfacing at California's San Quentin Penitentiary during the 1960s, this group has strong ties to Aryan Nations. Today they are present in prisons throughout America. In addition to perpetrating racial violence, they purportedly are also involved in extortion and drug trafficking.

Members of the Aryan Brotherhood are usually extremely violent. Examples of such individuals include John Stojetz, who was convicted in 1997 for the murder of a 17-year-old African American inmate. Likewise, Donald Riley, who was convicted in 1994 for the killing of an African American marine, was also a veteran of the Desert Storm war in Iraq. Finally, there is reportedly strong evidence suggesting that six of the eight inmates who have been murdered by other inmates at Pelican Bay State Prison in California since 1996 were part of a dispute that developed within the Aryan Brotherhood.

CONCLUSION

In 2000, Butler and his organization lost a major legal battle, which not only bankrupted Aryan Nations but also forced its leadership to sell the group's compound and name. In September 2001, the group named Harold Ray Redfeairn to succeed the aging Butler. It also announced that the organization would relocate its headquarters to Ulysses, Pennsylvania, where its director of information, August Kreis, lived.

The Anti-Defamation League (ADL), an organization that monitors hate groups and their activities, has warned that the new brand of Aryan Nations constitutes a significant threat because of its public call to violence. Since Butler's demise, nascent groups are struggling for power and to prove their right to the leadership inheritance. They have intensified their anti-Semitic, homophobic, and racist rhetoric that have been the bedrock of their philosophy. One such group, Church of Jesus Christ Christian/ Aryan Nations in Ulysses, Pennsylvania, has openly favored the use of violence to achieve the Aryan Nations ideology. Led by August Kreis, the Pennsylvania faction scheduled a July 26–28, 2002, Aryan Nations Congress, which included speakers such as James Wickstrom, Gary Blackwell, Barry Harris, and Hal Turner.

The new trend in Aryan Nations movement violence is rooted in the Christian Identity movement of Phineas Priests. According to the ADL, the Phineas Priesthood is not a formal organization, but rather it is used by individual extremists to describe themselves in order to neutralize their prior criminal activities. Richard Kelly Hoskins, a believer in the anti-Semitic culture, borrowed the idea from the biblical Phineas, who murdered an Israelite and Midiante who had consummated together. This theology of hate is interpreted by Hoskins and others to mean that they have been divinely given the mission to kill Jews and non-white people.

ASHURST-SUMNERS ACT 1935

The Ashurst-Sumners Act of 1935 barred the sale of prison goods in interstate commerce, preventing states from selling goods produced from inmate labor to customers in other states. It sought to stop inmate-manufactured goods from flooding the market and undermining free labor. It also required that any products prisoners made would be marked accordingly for outside places that permitted their importation. Though the laws regulating inmate labor have changed since the act was implemented, many of the issues it raised remain relevant today.

HISTORY

From 1929, a series of federal laws was introduced that restricted prison labor. Before that time, states were entitled to regulate their own inmate workforce. For example, many states in the early 19th century contracted inmates to local farmers and industries in exchange for money and goods under a system known as convict leasing. These women and men worked for no pay. Though initially such programs were popular with the public, they were eventually abandoned due to numerous criticisms. In particular, outside laborers who felt unable to compete with the cheap inmate labor force began to organize to end the leasing system. By 1891, a number of states to regulate the utilization of prison labor for revenue. Likewise, by 1894, prison contract labor as well as the practice of leasing inmates to private industries had largely been regulated.

In 1929, the federal government responded to pressure to end prisoner labor by introducing the Hawes Cooper Act. This act introduced some restrictions on the sale of inmate goods. However, it stopped far short of a total ban, permitting instead each state to determine whether or not it wanted to ban the sale of goods made by prison labor. It was not until 1935, with the passage of the Ashurst-Sumners Act, that Congress managed to regulate inmate-manufactured goods in some detail.

THE ACT

The Ashurst-Sumners Act was divided into two sections: (1) the illegal shipment of inmate-manufactured goods and (2) goods to be marketed. In the first section, the act specified:

> It shall be unlawful for any person knowingly to transport or cause to be transported . . . merchandise manufactured, produced, or mined wholly or in part by convicts or prisoners, or in any penal or reformatory institution, from one State . . . into any State . . . where said goods, wares, and merchandise are intended by any person interested therein to be received,

> possessed, sold, or any manner used, either in the original package or otherwise in violation of any law of said such State. . . . Nothing herein shall apply to commodities manufactured in the Federal penal and correctional institutions for use by the Federal government. (18 U.S.C. 396c [1935])

By prohibiting the selling or transfer of inmate-made goods for profit or trade, this part of the act made it difficult for states to employ their inmates at work other than that required for institutional maintenance.

The second section of the act set up strict guidelines for how those institutions that continued to manufacture goods by inmates could dispose of their products to foreign buyers:

> All packages containing any goods, wares, and merchandise manufactured, produced, or mined wholly or in part by convicts . . . when shipped or transported in the interstate of foreign commerce shall be plainly and clearly marked, so that the name and address of the shipper, the name and address of the consignee, and nature of the contents, and the name and location of the penal or reformatory institution where produced wholly or in part may be readily ascertained on an inspection of the outside of such packages. (18 U.S.C. 396c [1935])

Despite the restrictions set in place by the Ashurst-Sumners Act, many labor organizations and business leaders felt it did not go far enough. In response to their concerns, Congress amended the Ashurst-Sumners Act in 1940, renaming it the Sumners-Ashurst Act. This act made it a federal crime to transport convict-made goods in interstate commerce for private use, regardless of laws in the states. It continued to allow, however, for inmate manufactured goods either to be bought by the state where they were made or to be purchased by other state agencies for state use.

CONCLUSION

Since 1979, Congress has granted exemptions to the restrictions on interstate commerce of inmate-manufactured goods through the Justice System Improvement Act of 1979 for "Prison Industry Enhancement" pilot projects. Earlier, it made an exception during World War II by enacting an emergency clause to the Ashurst-Sumners Act that allowed the manufacture and transfer of inmate goods to the military and those abroad.

These days, the shape of prison labor is in flux. Many states now require that inmates work. Though inmates mainly produce items for state purchase, some work for private companies, producing a range of goods from underwear to furniture. Outside labor organizations still fear the negative impact such programs could have on them, while others still debate the various merits of employing inmates at all. Much, in other words, has changed, while also remaining the same.

ASIAN AMERICAN PRISONERS

Asian Americans are one of the smallest minority groups in U.S. prisons. Statistical analyses show they are often included in the "other" category with Native Americans and Alaska Natives. Regardless, Asian Americans must be studied because of their increasing involvement in crimes, and their growing numbers behind bars.

WHO ARE ASIAN AMERICANS?

Asian Americans in the United States include Asian Indians (which embraces the countries of

Bangladesh, Bhutan, India, Nepal, Pakistan, Sri Lanka, and Tibet), Cambodians, Chinese, Filipinos, Indonesians, Japanese, Koreans, Pacific Islanders (combined from the Polynesian Islands, such as Guam, Hawaii, Samoa, Tahiti, and Tonga), Thai, and Vietnamese. Even though there are enormous differences between these groups in their histories, cultures, and beliefs, the criminal justice system combined these populations to be treated as one ethnic group. Overall, Asian Americans account for 4% of the population in the United States.

HISTORY

Since the 1800s, Asians have emigrated to the United States from their separate countries in large clusters. All groups suffered various forms of discrimination. In 1882, for example, the U.S. government denied Chinese immigrants access to the United States through the Chinese Exclusion Act, only abolishing the Act in 1943 when the two nations became allies in World War II. Further laws were established to prohibit Asians from marrying individuals from another ethnicity, restricting the amount of land they could own, and assessing additional state and local taxes against them. Finally, the U.S. government responded to the bombing of Pearl Harbor by forcing Japanese Americans to leave their homes and businesses for internment camps for the duration of World War II.

CRIME

Asian Americans involved in illegal activities are often part of organized crime and gangs. The illegal activities of these groups include gambling, prostitution, extortion, money laundering, counterfeiting, and robberies. Crimes in Asian American communities are believed to be underreported for a variety of reasons. Recent immigrants may be reluctant to report crimes based on their own experiences in their homeland because of corruption in their homeland's criminal justice system, while victims may fear retribution for reporting the crime. The police in many cities, particularly those with large Asian populations such as New York City and San Francisco, have instituted a range of outreach programs to try to combat these problems. Most agencies, however, are hampered by language problems, inadequate community relations, and limited resources.

PRISON STATISTICS

There have always been very few Asian American prisoners in the United States. For example, in 1880, of the 12,681 foreign-born prisoners only 526 were Chinese. In the past 20 years, Asian Americans continuously have had the least number of inmates in both federal and state prisons in the United States of all the minority groups. The *Sourcebook of Criminal Justice Statistics* in 1980 reported that of the more than 300,000 prisoners in the United States, only 699 prisoners were Asian Americans. In 1985, this number had more than doubled to reach 1,575. By 1990, there were 464 Asian Americans in the federal prisons and 2,016 in the state prisons out of a total of more than 700,000 prisoners in the United States. While in 1995 of the more than 1 million prisoners in the federal and state prisons in the United States, Asian Americans accounted for around 6,000 prisoners. Finally, the 2000 *Sourcebook of Criminal Justice Statistics* reported that more than 8,000 prisoners in the federal and state prisons were Asian Americans, yet the total number of prisoners in the United States reached more than 2 million.

CONCLUSION

It is important to remember that the groups that are combined as Asian Americans are not homogeneous in their histories, cultures, or beliefs; rather, these populations have their own autonomy. Still, more research needs to focus on Asian Americans because of their mounting involvement in criminal activities, thereby increasing the number of Asian Americans in U.S. prisons. For example, from 1980 to 2000, the number of Asian American prisoners jumped from almost 700 prisoners to more than 8,000 prisoners in both the federal and state prisons in the United States.

ATTICA BROTHERS LEGAL DEFENSE FUND

The Attica Brothers Legal Defense Fund was formed by a group of political activists and attorneys who banded together to help the prisoners charged with criminal offenses in the wake of the infamous Attica Prison riot. The riot, which began on Thursday, September 9, 1971, ended four days later when the state of New York opened fire for six minutes, killing 29 prisoners and 10 employee hostages, six of whom were officers, and wounding 140 others. The shooting occurred when 1,200 inmates gathered in the D-yard of Attica State Prison, holding 38 prison officials hostage.

EVENTS LEADING UP TO AND DURING THE RIOT

In July 1971, just two months before the riot, inmates at Attica had sent a manifesto, which demanded humane treatment, to the governor and the Corrections Commissioner of New York. The commissioner responded that month by visiting the prison and sending a prerecorded speech that promised reform. However, many speculate that this response was too late and that the mounting tensions had already made the prison disturbance inevitable. Although it is unclear whether the riot had been prearranged, many prisoners had been organizing and planning nonviolent protests such as a prisonwide sit-down strike.

After the riot, 250 prisoners were held in solitary confinement and 1,200 were beaten and/or denied medical treatment for their participation in the uprising, though all deaths were a result of the state's shooting. According to Richard X. Clark (1973), a former inmate and a leader in the Attica revolt, none of the hostages were badly injured during the riot itself.

THE COURTS' RESPONSE TO THE ATTICA RIOT

In December 1972, the state of New York handed out the largest series of inmate indictments seen to date, totaling 42 in all. Sixty-two inmates were charged with 1,489 felony counts in connection with the riots, including kidnapping, assault, sodomy, and murder. In striking contrast, the original grand jury did not indict any correctional officers, state troopers, or state officials for the way in which the riot was handled. The New York State Special Commission, nine citizens appointed by Chief Judge Stanley Fuld of the New York Court of Appeals and the presiding justices of the four Appellate Division Departments, was asked to investigate the underlying causes and consequences of the Attica riot. The commission, which was funded through the state government, did verify that prison officials were physically and emotionally retributive toward the inmates immediately following the riot, yet there were no immediate charges filed for these reprisals.

THE FOUNDATION AND WORK OF THE DEFENSE FUND

The purpose of the Attica Brothers Legal Defense Fund was to support and defend the inmates who

were thereafter indicted by the state of New York. Appalled by this seemingly inconsistent behavior, and in support of the inmates' call for prison reform, more than 75 lawyers from across the nation rallied to defend the inmates who came to be known as the "Attica Brothers." The collaboration of these attorneys, first called the Attica Defense Committee and later renamed the Attica Brothers Legal Defense Fund, was formed by October 1, 1971. Some of the fund's lawyers were appointed by the state and received payment through the state, while others worked *pro bono.* Expenses were eventually covered by civilian contributions that were solicited through direct mail.

In all, the indictments resulted in eight trials, seven acquittals, and only one conviction. The Attica Brothers Legal Defense Fund estimates that the prosecution spent at least $4 million by 1974 alone. In all, the state spent $189 million investigating and prosecuting the Attica incident. Ten of the inmates charged with felonies pleaded guilty, but eventually most of the original 1,489 charges were dropped. On December 31, 1976, New York Governor Hugh Carey granted pardons and clemency to all 62 of the inmates who had been charged with a crime. While this was a victory for the Brothers of Attica, the Defense Fund felt that it was not enough and claimed that the prosecution should have put some focus on the criminal acts of state officials as well. Consequently, a whistle-blowing attorney managed to document the inequitable behavior of the prosecution and, as a result, a second grand jury indicted Gregory Wildredge, a state trooper. Governor Carey also pardoned Wildredge in 1976 before he went to trial.

After the Defense Fund's success, five of the fund's lawyers—Elizabeth Fink, Joseph Heath, Dennis Cunningham, Michael Deutsch, and Daniel Meyers—continued to work on a federal civil rights action that would eventually reward the Attica Brothers with a settlement of $12 million, the largest inmate settlement that the United States has ever seen. This settlement was won in 2000, more than 30 years after the riot. Many of the inmates named in the suit did not live to receive their portion of the settlement.

CONCLUSION

The lawyers who were the Attica Brothers Legal Defense Fund distributed financial advice to the Brothers before disbanding in 2000, shortly after the awards from the settlement were distributed. They left behind a significant legacy. The landmark decision in the case against the Attica prisoners changed the way that the state of New York deals with hostage situations as well as affecting how calls for prison reform were heard across the country.

ATTICA CORRECTIONAL FACILITY

Attica Correctional Facility, a maximum-security state prison for male inmates, is located in rural upstate New York, not far from the city of Buffalo. Opened in 1931, Attica is best known for the September 1971 riot that resulted in the death of three prisoners and one correctional officer, and more important for the forcible retaking of the prison in which state law enforcement officers caused the deaths of 10 employee hostages—6 of whom were correctional officers—and 29 inmates.

The Attica riot was a crucial event in U.S. penal history for three reasons. First, the reform efforts by prisoners, many of which were later implemented by correctional officials nationwide, led to significant changes in ideas about prison management and prisoner rights. Second, the massive use of force by the state in retaking the prison was an exceptional show of strength and brutality that revealed the

Photo 2 *Attica*

stark power relations underlying corrections in the United States. Finally, a large and complex body of litigation arose in response to the riot and the state's retaking of the facility. These civil suits wound their way through the courts for more than 30 years due to the perseverance of prisoners, hostages, and their families in using the courts as a means of redress. In short, the 1971 events and their aftermath raise important questions about use of force by agents of the state and about the legitimacy of the criminal justice system and the legal process.

THE 1971 RIOT

At 8:50 A.M. on Thursday, September 9, 1971, a group of Attica prisoners broke through a security gate and gained control of part of the prison. In the process, they assaulted and fatally injured a correctional officer. They took 43 officers and prison staff hostage and established residence in a large, enclosed yard. At the time of the riot, the prison held 2,243 mostly black and Latino inmates, 1,281 of whom were in the yard during the four-day uprising.

Throughout the four-day occupation of the yard, inmates sought to have their grievances heard by prison administrators and state officials. They drew up a list of politicians, journalists, and religious leaders thought to be sympathetic to their concerns, and they asked that persons on the list be brought to Attica to act as observers. Corrections Commissioner Russell G. Oswald repeatedly entered the prisoner-held yard to hear their demands and inform them of his willingness to grant as many as possible. Representatives of the 33-member observers group also entered the yard to discuss the inmates' concerns.

After several days of negotiations with state officials, the concerns of the prisoners culminated in "15 Practical Proposals" that included such issues as

> minimum wage for prisoner labor,
>
> freedom of religious and political activity,
>
> an end to censorship of mail,
>
> increased rehabilitation programs,
>
> a healthier diet,
>
> better medical care,
>
> a formal procedure for hearing inmate grievances,
>
> better recreational facilities and equipment, and
>
> an end to solitary confinement punishment.

Even as negotiations were proceeding, state law enforcement officials prepared for a possible forcible retaking of the facility. The observers committee, sensing a breakdown in the negotiations, and becoming concerned about the large number of heavily armed state police officers massing outside the prison, publicly appealed to Governor Nelson Rockefeller to come to Attica. Several influential observers who knew the governor on a professional basis spoke to him by telephone at his Hudson Valley estate, beseeching him to come to the prison to forestall a potentially large loss of life. The governor refused.

RETAKING THE PRISON BY FORCE

At 7:40 on the morning of September 13, 1971, Commissioner Oswald issued an ultimatum to the prisoners in D-yard. He gave the prisoners one hour

to release all of the hostages and convey their willingness to assist in restoring order to the prison, noting that he had personally listened to their demands and agreed to many of them. At 9:00 A.M., prisoners brought eight hostages to the catwalk surrounding the yard, with knives held to their throats. Word was received at 9:30 A.M. that the prisoners in the yard had rejected the commissioner's ultimatum.

Sixteen minutes later, at 9:46, tear gas was dropped on the yard from a helicopter. New York State Police officers—along with correctional officers, deputy sheriffs, and state park police—began firing from the catwalks overlooking the inmates and hostages. Riot-equipped state police officers armed with shotguns entered the yard and began shooting even though their visibility was restricted by clouds of tear gas and by the gas masks worn over their faces. The melee lasted for approximately six minutes. In this time, 450 shots were fired, striking 128 persons. When the shooting stopped, 10 hostages and 29 inmates were dead or dying. Scores more were injured, many seriously.

Prisoners were made to strip naked and lie on the ground. Some were beaten, tortured, or shot. The naked inmates were forced to run a gauntlet of officers, who beat them with clubs as they passed through the rows.

In the aftermath of the retaking, state officials initially reported that the rioting prisoners had caused all the deaths and injuries. However, medical officials soon contradicted this view, by claiming that deaths and injuries occurring during the retaking had resulted from gunshot wounds fired by state troopers and other law enforcement officers. In addition, few provisions for medical care had been made, which greatly delayed any treatment of the injured.

CRIMINAL AND CIVIL LITIGATION

A large body of criminal and civil litigation resulted from the Attica riot and the subsequent retaking of the facility by the state: criminal prosecutions of prisoners involved in the riot and of officers involved in the retaking, an early round of civil suits by inmates, civil damage suits by hostages and their families, inmate wrongful death and injury suits, and a federal class action civil rights suit brought by inmates.

It first appeared that many inmates and law enforcement officers had committed criminal offenses during the riot and retaking. Prisoners faced charges of assault, kidnapping, and murder for abduction of the hostages, the death of the correctional officer who received fatal injuries early in the uprising, and the killing of three prisoners during the four-day siege. Many of the police and correctional officers who had participated in the retaking were charged with assault and murder for their part in the shootings and for beating and torturing of inmates. State police were also accused of allegedly obstructing investigation of the shooting by destroying and withholding evidence.

Sixty-two prisoners were subsequently indicted, of whom eight were convicted. One was convicted of murder and sentenced to 20 years to life for the fatal assault on the correctional officer in the first moments of the riot. One correctional officer was indicted but the charges were dismissed.

In December 1976, New York Governor Hugh Carey announced his decision to "close the book" on Attica by terminating all criminal prosecutions. The governor stated that the prosecutions had been one-sided and that the state had failed in conducting the criminal investigations. He noted that the retaking of the prison had been improperly planned and carried out and that the state had failed to properly collect evidence and investigate all crimes allegedly committed by inmates and law enforcement agents. "The state itself should not sanction the maintenance of legal proceedings out of harmony with the principles of equal justice," he wrote. The governor pardoned the seven indicted inmates and commuted the sentence of the prisoner who had been convicted of murder. In addition, he announced that there would be no further prosecution of state police or other officers for their part in the forcible retaking of the facility.

With the criminal cases out of the way, attention was directed once again to the civil litigation. Prisoners had filed several civil suits soon after the 1971 events. In the most important of these, *Inmates of Attica Correctional Facility v. Rockefeller,* the U.S. Court of Appeals for the Second Circuit ruled that

the actions of police during and after the retaking constituted cruel and unusual punishment in violation of the Eight Amendment to the Constitution of the United States. In a round of other civil suits resolved in later years, the courts awarded $1.5 million to nine inmates or their estates. Resolution of some of these cases was not achieved until nearly 20 years after the event.

Twenty-eight former employee hostages and their families also filed civil damage suits against the state in the New York State court of claims. In 1981, the state court of appeals dismissed all but one of the hostage suits because the hostages or their families had accepted workers' compensation checks soon after the 1971 events. In the remaining case, the widow of prison clerk Herbert Jones was awarded $1.62 million in 1981.

Finally, in what was to become one of the longest-lasting civil suits in American legal history, inmates filed a class action suit in U.S. district court in 1974 (an earlier class action suit filed in 1971 had been dismissed). The suit alleged that prison officials, police, and Governor Rockefeller had violated the civil rights of prisoners during the retaking of the prison by using excessive force and inflicting unnecessary suffering and death. The class action suit was not resolved until 25 years later when a U.S. federal judge ruled in January 2000 that New York State must pay 502 prisoners or their estates $8 million for death or injuries incurred during the 1971 retaking of the prison.

Even after the resolution of the inmate class action suit, other concerns remained. In 2001, Governor George Pataki announced the creation of a bipartisan task force to study complaints by former Attica employees or families of employees who had been killed or injured during the riot and retaking. As of 2003, the task force had not issued a report.

CONCLUSION: THE LEGACY OF ATTICA

The 1971 events at Attica Correctional Facility are commonly referred to as the "Attica riot." However, the primary reason that Attica is remembered today is the many deaths and serious injuries that resulted from the massive use of force by state law enforcement officers in retaking the prison from the inmates. Prisoners had rioted many times before in American history, but never had there been such a concentrated barrage of firepower used by officials to quell an uprising, and never before had there been such a large loss of the lives of prisoners and prison employees. Subsequent judicial rulings have affirmed that the force used by the state in retaking the prison was excessive and that acts of brutality and racism occurred. In addition, the torturous process of criminal and civil litigation arising from the Attica events casts doubt on the legitimacy of the legal process.

AUBURN CORRECTIONAL FACILITY

Auburn Penitentiary, which gave its name to the "Auburn system" of imprisonment that influenced penal regimes throughout America and the world, opened in Auburn, New York, in 1819. Today, it is one of the 71 state prisons in New York. Until the 1970s, it was called Auburn Prison but is currently known as the Auburn Correctional Facility.

HISTORY

William Brittin was hired to oversee the building of the facility, and, upon its opening, became the warden. Its architecture resembled that of the first New York state prison, Greenwich Village's Newgate, with large rooms housing 8–12 inmates instead of singular cells. By 1817, the main building and the south wing were complete and ready to accept prisoners. These early prisoners were put to work finishing the construction of the remaining sections of the building.

Eventually, Captain Elam Lynds, a veteran from the War of 1812, was hired as principle keeper at Auburn. While Lynds was well liked by prison authorities, prisoners objected to his strict military-style rule. Discontent grew to such an extent that, in 1818, the inmates rioted and the military had to be called in to quell the rebellion. This riot led to new state legislation, enacted in 1819, that, ironically, authorized much harsher treatment of prisoners, including flogging. In addition, the legislation called for the construction of a north wing at Auburn to be composed of small cells to be used for solitary confinement. The government then appointed three men to run Auburn: William Brittin, the agent and keeper of Auburn; John Cray, the overseer of discipline and police; and Elam Lynds, the head of finances. While all three men agreed that the prison should be self-supporting, their philosophies of punishment varied greatly, which led to conflicts among them. By 1821, Brittin became ill and left Auburn. Conflicts led Cray to resign, thus leaving Lynds as the sole agent and keeper of the prison.

Around this time, New York State was developing a new plan for the organization of prisons based on a philosophy of solitary confinement and silence, using the Pennsylvania prison model. The legislature decided that prisoners would be separated into three classes with the most troubling offenders placed in solitary confinement. By the end of December 1821, some of the solitary cells in the north wing of Auburn were complete and 80 prisoners were moved in. The cells were 3 feet wide and 7 feet long. Prisoners were kept in complete isolation and were not permitted to work or speak. Their only distraction was a Bible. Within one year's time, 5 of these men had died and over 40 were declared mentally ill.

THE RISE OF THE SILENT CONGREGATE SYSTEM

After the year's experiment with solitary confinement, there was a general consensus that this type of imprisonment did not work. New programs were created by New York State that allowed prisoners to work together during the day and to be confined in isolation at night. The system was based on the belief that through isolation, quiet reflection, and hard work, prisoners could reform. Silence was required so that prisoners could not exchange criminal ideas.

The new system, implemented under Lynds, was very regimented. The prison was run on a strict schedule and the rules of silence were stringently enforced. Six days a week, prisoners marched in lockstep (a march which involved a shuffling slide step with one hand on the shoulder of the next man, with all heads turned toward the keeper in order to maintain silence) from their cells to a common dining room, where a small meal was eaten, and then to the prison workroom. After a full day of silent work, prisoners returned to their cells for a solitary dinner. On Sundays, prisoners left their cell only to attend church services. Otherwise, they were left to reflect in solitary confinement and were allowed to speak only to the prison chaplain. Rule breakers were subject to severe punishments; Lynds was partial to flogging and he and his staff all carried leather whips. Inmates were not allowed any contact with the outside world. Efforts to make the prisoners as indistinguishable as possible included dressing them all in the same black-and-white striped uniform, and identifying them only by their numbers.

Because of the congregate style of the workroom, supervision became a challenge. Corridors were constructed around the workrooms. The walls separating the workroom and the corridors had small holes and slits in them so that the guards could stand in the corridors and see the activity in the room without being seen. These corridors also served another purpose as they permitted outsiders

to come to the prison and, for a small fee, wander through the corridors to view the prisoners, thus creating an extra source of revenue for the prison.

Elam Lynds's system of silent congregate labor became a model for other prisons, gaining popularity for two reasons. Not only was silent congregate labor consistent with the philosophy of silence of the Pennsylvania prison system, but the congregate workshops made the labor economical. Manufacturers began contracting for labor with Auburn and other prisons like it. This arrangement benefited both industry and the prison; that is, industry got cheaper labor and the prison acquired work for prisoners to do. Auburn became self-sufficient, and sometimes even able to produce a profit. Only in later years, as local laborers and unions protested the use of cheap prison labor, did the labor component become less successful. By 1890, Auburn switched from the contract system to the state use system, whereby the inmates produced supplies for use within the prison and other state facilities.

PRISON REFORM

In 1913, Thomas Mott Osborn was appointed to lead a commission on prison reform in New York State. Osborn determined that to understand the workings of a prison, it was necessary to live there. He voluntarily committed himself to Auburn prison for a week, living under the same conditions as the prisoners. At this time, silence and strict discipline were still used as the main components of prison life. The week left Osborn with many new ideas about running a prison. He concluded that the current prison system only damaged the inmates. Believing that inmates should have as much freedom as possible within the prison, Osborn advocated for a system of self-government. He also felt prison society should be as close to regular society as possible to teach inmates how to live in a civil society. Osborn was very critical of Auburn and the silent congregate labor system. Instead of instilling a sense of responsibility and initiative, he was convinced that Auburn's system created tensions and encouraged bad behavior. He recommended closing Auburn and implementing a new system of indeterminate sentencing.

Auburn was not shut down but instead became the location for an experiment in a new type of prison. Osborn worked with the warden and other staff, helping the prisoners to create a Mutual Welfare Inmate League, a type of self-government within the prison. As a result, prisoners participated in group activities such as concerts and sports. Prisoner grievance committees were established to deal with internal problems. The experiment at Auburn led to the establishment of similar programs at other prisons, which, for the most part, resulted in failure. Furthermore, once Osborn was no longer at Auburn the self-government system collapsed under criticism that the prison lacked adequate control over inmates. The Mutual Welfare Inmate League at Auburn was disbanded in 1929 after a prison uprising.

WOMEN

In the first years of Auburn, while the state concentrated on how to deal with male offenders, women were housed in the attic where the windows had been sealed, leaving the area with little light and air. For the most part, the women were left to their own devices and did not have to conform to the silent system. They were employed to do tasks such as spinning and knitting. By 1832, female offenders were moved to the remodeled south wing of Auburn. Women continued to be housed in very poor conditions until they were transferred out of Auburn to a new female unit at Sing Sing.

THE MODERN ERA

One hundred years after it first opened, the facility at Auburn remained largely the same as when it was first constructed. Auburn was marked by substantial overcrowding and idleness, the latter due to a decline in the amount of work available for prisoners. Poor living conditions led to riots breaking out at Auburn in 1921 and in 1929. Riots once again broke out in 1970 after the prisoners' request to conduct a Black Solidarity Day, a result of the civil rights movement, was denied. A number of the inmates who were involved in this riot were sent to Attica Prison and later were involved in the devastating riot that occurred there.

During the 1920s, Auburn started producing license plates for the New York Department of Motor Vehicles, a practice that continues today. Today, this workshop generates about $9,000,000 a year, which helps offset the cost of running the prison. In addition, over the years, Auburn has developed other academic and vocational instruction, such as industrial training through Corcraft Industries. The correctional facility also has counselors to help inmates deal with drug and alcohol problems.

CONCLUSION

Auburn Penitentiary shaped policy and practice in prisons in the United States and throughout the world. Best remembered for the congregate system, Auburn was also noteworthy for opening the State Lunatic Asylum for Insane Convicts in 1859 that was specifically designed to house mentally ill convicts. In addition to being the first prison to have an insane asylum for convicts, Auburn is also credited with being the first prison in the world to have an electric chair. The first execution took place on August 6, 1890. More than 50 men and women were executed at Auburn, with the last execution taking place in 1963.

Today, none of the original 1800s structures of the Auburn Penitentiary remain, even though a prison continues to operate on the same site. At present a maximum-security prison, Auburn houses about 1,800 men. In addition to holding long-term prisoners, Auburn has recently become a transfer facility for inmates moving between facilities. Auburn is a central feature of the surrounding community; since the 1820s it has provided one of the main sources of employment in the town. While many changes in the way prisons are run have occurred, the influence of Auburn still can be seen in the administration of modern prisons.

AUBURN SYSTEM

The Auburn system refers to a 19th-century model of penal discipline in which penitentiary inmates worked together in silence. This strategy of prison management competed with, and ultimately replaced, the earlier Pennsylvania system in which prisoners were kept in solitary confinement for the duration of their sentence.

During the day in the Auburn system, inmates were employed in prison industries where they worked collectively. At night, they were kept in separate cells. This approach is often referred to as the congregate or silent system. It was based on the belief that hard labor and silence would help offenders reform. In penitentiaries run using this strategy, prisoners caught trying to communicate were punished harshly by the prison keepers.

HISTORY

Overcrowding at the Newgate Prison in New York led the legislature in 1816 to approve the building of a new state prison in Auburn. Originally, Auburn was designed as other prisons with congregate sleeping. However, concerns over a lack of discipline at Newgate led to the legislature authorizing a new punishment for the most violent inmates. As in the Pennsylvania system, these men would be locked up in solitary cells where they could not communicate with one another. Unlike the

Pennsylvania system, where inmates worked at handiwork in their cells, individuals in solitary confinement at Auburn were not permitted to do anything at all. Within two years, however, prison officials became concerned about the high rates of insanity and suicide they were witnessing. The situation became so bad that the prisoners held in solitary were pardoned and released by the governor. Twelve of these men soon committed new crimes and were convicted and returned to the prison. Solitary confinement, it seemed, did not work. As a result, prison administrators began to reconsider how the institution should be run.

In 1831, a new warden of Auburn, Elam Lynds, and his deputy, John Cray, instituted an alternative system of management called the congregate system. The congregate or Auburn silent system of prison management was seen as a rival to the Pennsylvania or separate system even though it incorporated some of its strategies. Like the Pennsylvania system, for example, no communication between inmates was allowed at Auburn. However, while prisoners in the Pennsylvania system were kept completely separate from one another, in the Auburn system, men worked and ate together. They were simply not permitted to speak to one another or to communicate in other ways. Administrators of both systems believed that silence would not only prevent inmates from influencing one another, but it would also help reform them. It was believed that silence and hard work would make them think about the crimes they had committed and help them repent and turn to God.

To maintain the silence, harsh discipline was used in the Auburn system. Any infraction was punished immediately by flogging. Individuals who denied that they spoke would be flogged for lying. Still, guards had to be ever vigilant to keep prisoners from talking. At night, the guards would remove their shoes and tip toe up and down the cellblocks listening for whispering among the inmates. In addition, John Cray, Warden Lynds's deputy, designed the "lockstep" as a way to allow the guards to better prevent talking and thus maintain discipline. The lockstep was a formation for marching inmates through the prison. Each inmate had to walk with a shuffling side step lined up one behind the other with his hand on the shoulder of the man in front of him and turned toward the guards with his eyes cast down. The lockstep march allowed the guard to enforce silence because he could see the face of each inmate. Inmates were monitored nearly constantly or so they may have thought. Officials even watched prisoners from a 2,000-foot passageway through peepholes behind the workshops at Auburn to be sure they worked hard and refrained from talking or other communication.

The men worked in silence from sunup until sundown every day except Sunday. On Sunday, still silent, they were required to attend chapel followed by dinner and returned to their cells. In their cells, they were to remain silent with only a Bible to distract them unless they were lucky enough to receive a visit from the chaplain.

WOMEN

While the male inmates were held to the strict silent system at Auburn, penal administrators did not enforce it as stringently with the women prisoners. It was commonly believed that it would be much more difficult to keep women from speaking to one another. Furthermore, women, it was thought, were naturally more sociable and keeping them silent might damage their nervous systems. As a result, though women were required to work at tasks such as knitting and spooling wool, silence was not strictly imposed.

Even though the women at Auburn were not prohibited from speaking, observers have noted that the conditions of their confinement were much worse than those for men. Women were kept in an unventilated attic above the kitchen. In response to widespread criticism, a matron was finally hired in 1832 to oversee the female inmates, and four large apartments were constructed in the south wing of the prison for women. Female offenders lived here until a new wing for them was opened at Sing Sing in 1838.

RIVALRY WITH THE PENNSYLVANIA SYSTEM

Reverend Louis Dwight, the secretary of the Boston Prison Discipline Society, and others supported

the Auburn silent system against its rival the Pennsylvania separate system. Although physically harsher, the Auburn system proved to be much more successful and longstanding than the Pennsylvania system. The reasons for the success were primarily economic. In both systems, inmates were required to be industrious in silence, working six days a week for up to 10 hours a day. However, under the Auburn system, the silent inmates were forced to work together in what were essentially prison-run factories that helped support the costs of the prison. Inmates housed under the silent system made everything from boots, harnesses, carpenters' tools, buckets, and brooms to clocks, wagons, buttons, carpets, and rifles. The prison managers would take bids on the convict labor to companies, which would supply raw material for the inmates to use to make goods that the companies would sell. By paying the inmates little or nothing for their work, the prison managers could cover the cost of the prisons and had the potential to make the prison a profitable enterprise.

CONCLUSION

The profitability of the Auburn system contributed to its implementation in many prisons throughout the world during the 1800s. The silent system was adopted by Coldbath Fields Prison in England during the 19th century. Other prisons were built as congregate prisons including Sing Sing in New York, which opened in 1825, and Kingston Penitentiary in Ontario, which opened in 1835.

While silent congregate labor was adopted by many prisons including Eastern Penitentiary, which had practiced the separate system, the Auburn system eventually died out as well. In 1894, the New York legislature ended contract labor system for inmate work in New York. By the early 1900s, inmates were permitted to speak, and the striped inmate uniforms and lockstep were gone. Still, today though, we see remnants of this system in current ideas about inmate labor and the specialized uniforms required in some prisons.

AUSTRALIA

Australia is a member of the Commonwealth. Between 1788 and 1829, Britain annexed the whole continent. In 1901 the various colonies united in a federation but retained important links with Britain. The British monarch remains Australia's head of state, a largely ceremonial position. The Australian Federation has six states and two territories, all of them self-governing. The six federating states have a different status constitutionally, from the territories, since they originally derived their power from acts of the British Parliament. These six states, when agreeing to form a nation, delegated certain powers to a central federal Australian parliament: for example, they delegated their external affairs powers but retained their criminal justice powers. There are eight separate criminal justice systems, eight different police forces (the Australian Capital Territory, however, is policed by the Australian Federal Police), and eight separate correctional systems.

STRUCTURE

Correctional systems are the responsibility of state and territory governments, not the federal government.

There are no federal prisons in Australia as there are in the United States. Instead, the small number of federal prisoners who exist are housed in state prisons.

There are many regional and administrative differences and variations between each of the eight correctional systems in Australia. However, in general, each state or territory government has either a government department or a separate government-funded agency that undertakes the administration of corrections, both custodial and community, for that state or territory.

In 2001, the year for which the most recent figures are available, national expenditure on corrective services was $1.46 billion Australian dollars (AUD). Of this total, $1.3 billion (87%) was spent on prisons and correctional centers. Costs per prisoners are different for each jurisdiction, but in 2001 they ranged from $195.90 (AUD) to $108.40 (AUD) per prisoner, per day.

That same year, there were 119 operational adult correctional facilities in Australia that together held an average of 21,138 people per day. A further 1,178 people were serving periodic detention orders, which usually consists of weekend detention only. This practice allows certain prisoners to live at home and maintain work commitments during the week.

Australian prisons hold those awaiting trial or sentence (on remand), as well as those who have been sentenced to a period of incarceration, frequently within separate parts of the same facility. After arrest, offenders can usually only be held for a certain period of time by police until they must be brought before a court. If a court decides to deny them bail and remand them to custody, they will then be moved to a prison. There is no equivalent to the American jails in the one-tiered Australian correctional system.

JUVENILE JUSTICE

In all Australian states and territories, juvenile justice is the responsibility of a separate government department, which usually also administers any custodial facilities for young offenders. In most cases, the juvenile justice systems service offenders aged between 10, which is the age of criminal responsibility in Australia, and 17 years. Eighteen years is the age of legal adulthood in Australia, when persons can vote, consume alcohol, and drive a car. In some jurisdictions, offenders aged 18 years are also held in juvenile detention facilities if they were sentenced prior to turning this age. In some jurisdictions, juveniles may be transferred to adult prisons upon reaching 18 years and in others offenders aged 17 years may be placed in adult prisons if serving a long sentence. There were 604 juvenile offenders detained in custody on June 30, 2001. Juvenile justice in Australia has a range of diversionary measures and policies, including imprisonment as a last resort, which ensures that only around 1% of juveniles in contact with the criminal justice system are actually imprisoned.

HISTORY

Australia was inhabited for thousands of years by the indigenous peoples, Australian Aboriginals, who lived a nomadic and tribal existence with strong connections to the land. They had a complicated system of tribal law and wide and varied communities and languages. Australia was then settled by Europeans, primarily the British, in the 18th century.

From the mid-17th century, British prisoners were transported to America. When the American War of Independence caused the cessation of transportation, British prisoners were housed in disused ships due to the crowding within British prisons. As these "hulks" also became too crowded, it was agreed to commence transportation to the new colony of New South Wales.

British transportation of prisoners to Australia occurred from 1787 to 1868, and included men, women, and children. Though some free settlers came with the first fleet as soldiers, ministers, and so on, most only began to arrive in increasing numbers from 1793. As an incentive to emigrate, these settlers were entitled to apply for a convict on arrival, although this appears not to have occurred until sometime in the early 1800s. Despite the harsh

conditions in the new colony, once convicts had served their sentence many elected to remain in Australia as settlers, either because they could not afford the cost of the travel back to Britain or because of better opportunities in the new land.

Australian correctional systems developed from a transplanted system of British criminal justice. Despite having autonomy for their own system since federation in 1901, prisons and their administration in Australia have continued to mirror the development of corrections in the United Kingdom; however, increasingly, Australian policy is also influenced by practices in the United States.

DEVELOPMENT OF CORRECTIONS, 1970s–1990s

Since the 1970s, Australia, like many countries in the world, has experienced significant growth in the use of imprisonment. At the same time, there has been a continuing controversy over the effectiveness of imprisonment as a method of dealing with crime.

During the 1970s, prisoners' rights and public information of what was occurring behind the walls of the prisons became important issues. There were a number of governmental inquiries during this time as well as a substantial number of prisoner riots throughout all of the nation's correctional systems. A number of prisoners and ex-prisoners also made their grievances known through litigation.

In the mid-1970s, prisoners in many Australian states fought successfully to retain their status as citizens while incarcerated, to be permitted to marry, to hold bank accounts, to vote in elections, and to sue and be sued. Administrative law provisions were also strengthened during these years through the appointment of Parliamentary Commissioners (ombudsmen), who could examine the actions of correctional officials either on their own account or following complaints from prisoners. The first of these ombudsmen were appointed in Western Australia in 1972. These commissioners created a powerful check and balance on the exercise of power within correctional institutions. Recently, Western Australia has appointed a prison inspector (based on the United Kingdom model) with additional powers designed to increase oversight of correctional administration, practice, and process. Queensland, too, has recently instituted an external body, the Crime and Misconduct Commission, to oversee staff conduct.

In the 1970s and 1980s, women correctional officers began to be employed in prisons for men and social workers and welfare officers were introduced to all penal institutions. During this time, although there was an abandonment of the aim of rehabilitation, correctional centers began to emphasize accountability and humane containment in prisons. These ideals were challenged, however, with the advent of the HIV/AIDS epidemic and a significant rise in deaths in custody in the mid- and late 1980s. As a result of the noticeable increase of deaths in custody, the Australian governments agreed to the formation of the Royal Commission Into Aboriginal Deaths in Custody (RCIADIC), which had significant implications in the development of the various correctional systems.

Finally, the 1990s saw the reemergence of punitiveness in punishment, resulting in rising incarceration rates. Privatization of corrections has been the most visible response to increasing imprisonment rates. Five of the eight jurisdictions currently operate private prisons in Australia. Currently, approximately 17% of Australia's correctional centers are privately operated.

PRISON DEMOGRAPHICS

Every year on June 30, each state and territory in Australia undertakes a national prisoner census. Each state supplies the centralized Australian Bureau of Statistics (ABS) with a range of information on prisoner demographics, including characteristics related to most serious offense and length of sentence. The ABS then outlines the number of prisoners in custody on that night, by state and correctional center as well as daily averages for each month in the preceding year (e.g., July 1, 2001, to June 30, 2002). These figures provide an excellent snapshot of changes in the Australian correctional system over time.

Gender

Currently, the majority of prisoners, 93% (20,960), in Australia are male. The imprisonment rate for men is currently 285 per 100,000 adult male population and for female prisoners is 20 per 100,000 adult female population. While males continue to dominate the prison population globally, the proportion of prisoners who are female has increased in Australia in the past 10 years from 5% in 1991 to 7% in 2001.

There are now separate prisons for women in all states. However, given the small number of women incarcerated in each Australian jurisdiction, there are generally only one or two options in terms of where they can be housed. As a result, in most cases, women's prisons are built to accommodate all security levels within the one center. Also, due to the large geographic areas of some states, some prisons house both males and females, albeit in segregated areas.

Women are generally incarcerated for shorter periods of time than men. In most Australian jurisdictions, women have the right to have their children remain in custody with them from birth until a designated age—generally this is somewhere from three years to five years old. The correctional centers often have designated living units for these women with larger cells to accommodate a cot.

Type of Prisoner

Eighty-one percent (18,123) of all Australian prisoners are serving a sentence, and 19% (4,335) are remanded in custody either awaiting or involved in a trial or awaiting sentencing. Thirty-five percent of sentenced prisoners are serving a fixed-term sentence. Fifty-three percent are serving a maximum-minimum sentence, that is, those prisoners are eligible for release after serving a minimum term (set by the court) in custody and who must be released once the maximum term (also set by the court) has been served.

Most Australian prisoners are sentenced under the laws of the state or territory where the offense was committed. Only about 5% of all Australian prisoners are federal prisoners held under Commonwealth laws. Most of these are imprisoned for offenses relating to drugs, particularly trafficking and importation offenses.

Indigenous Imprisonment

Indigenous people are overrepresented in the nation's prison systems and are a significant factor in rising incarceration rates. They are estimated to be 2.4% of Australia's total population but make up 20% of the country's prison population. There are currently 4,445 indigenous prisoners in Australia. They are approximately 15 times more likely to be imprisoned than nonindigenous people. They have an imprisonment rate of 1,829 prisoners per 100,000 adult indigenous population compared to an imprisonment rate of 150 per 100,000 for nonindigenous persons. After substantive and ongoing research in this area, it is now more widely recognized that the overrepresentation of Aboriginal people in the Australian criminal justice system is the result of underlying structural issues, including racism, poverty, and destruction of their culture.

Imprisonment Rates

The prisoner population in Australia increased by 50% between 1991 and 2001. The adult imprisonment rate increased from a national average of 117 to 150 per 100,000. Within Australia, in the six states and two territories, imprisonment rates vary substantially, with some jurisdictions below the national average and others well above.

Offense Composition

Nearly half (48%) of all currently sentenced prisoners are convicted of offenses involving violence or the threat of violence, including murder (7%), other homicide (3%), assault (11%), sex offenses (10%), other offenses against the person (1%), and robbery (13%). Sentenced prisoners convicted of a property offense as their most serious offense currently represent 26% of all sentenced prisoners, including 12% for break and enter. A further 9% are serving sentences for drug offenses as their most

serious offense and 4% of sentenced prisoners were convicted and incarcerated for driving offenses.

GENERAL PRISON CONDITIONS

Each jurisdiction has its own correctional legislation and policies relating to the administration of punishment. However, there is also a national body, the National Correction Minister's Council, with a representative from each of the states and territories as well as New Zealand, that meets annually to discuss issues of concern, exchange ideas, and review existing national guidelines. This national body allows for some degree of standardization across the country particularly in relation to the maintenance of national guidelines and various international obligations.

Australia is a signatory to some of the United Nations conventions relating to punishment and has developed its own Minimum Standard Guidelines. These guidelines are based on the United Nations Standard Minimum Rules for the Treatment of Prisoners and related recommendations as well as the Council of Europe Standard Minimum Rules. They do not have the status of legislation, and the level of implementation is debatable. Court action has been attempted by inmates relying on the Standard Minimum Rules regarding time out of cell, exercise, standard of food, and overcrowding, but all cases have been unsuccessful as the courts have ruled that the Minimum Standard Guidelines are guidelines only and are not legally enforceable.

Housing

There are two types of custody in Australia, open and secure. Open custody is generally where prisoners are accommodated in very low security facilities. Most of the low/open security facilities are called "prison farms" and are generally located in geographically remote areas. They are usually not surrounded by fences, other than normal stock fencing, or locked in cells/units. Prisoners in these institutions are free to come and go within most areas of the facilities and are placed there on a trust basis because they are not considered a risk to themselves, other prisoners, staff, or the wider community. Secure custody refers to more traditional prisons and correctional centers that are surrounded by walls, fences, and electronic security, within which movement is strongly curtailed by staff. In these, prisoners must usually be escorted from one part of the prison to another or prisoner movement is electronically controlled by opening and closing various gates and doors and the provision of airlocks.

In general, most prisoners in Australia occupy a one- or two-person cell. In most jurisdictions, shower/toilet facilities are located within each cell. There remain some dormitory-style accommodations with shared shower facilities in various correctional centers in some of the more remote centers. Most inmates are expected to complete their own washing, cooking, and cleaning within their living areas and cells. Living arrangements vary from individual small huts on many of the prison farms to secure units, which range from 4 to 50 cells. Each unit generally has a kitchen and communal living and exercise areas. Some have individual laundry facilities as well. Most prisons also have staff administration areas, sporting facilities, and separate facilities for education, prison industries, and religious services. They also offer correctional programs such as anger management, sex offender treatment programs, and the like and individual therapy such as counseling. Many of the proffered programs are now being adapted for various discrete groups such as indigenous persons and those of non-English-speaking background.

Clothing

Prisoners are supplied with clothing by the prison for the duration of their term, including footwear. Usually, they are supplied with shorts, T-shirts, underwear (although some women's prisons allow women to purchase their own underwear), tracksuits for winter, and one pair of canvas sneaker type shoe. Usually, these are in one designated color, for example, in one state all male prisoners wear brown, in another green. If prisoners damage the clothing, they are generally responsible for replacing it at their own cost.

Food

In most jurisdictions, the type of food is related to the level of security in which prisoners are housed. However, it is now common that each living unit has its own kitchen and ingredients are supplied for prisoners to make their own meals. Often a prisoner will be assigned the role of unit cook and expected to prepare and cook for the others in that unit. In higher-security units or older centers without individual-unit kitchens, meals may be delivered precooked usually by the central prison kitchen, staffed by prisoners.

Prison Industries

The majority of correctional centers now have designated prison factories. Industries that exist in secure custody include bakeries, laundries, woodworking, metal working, and tailor shops. Industries in open custody include nurseries, dairies, and farming. These prison factories often generate income for the prison. The money either becomes part of that center's individual budget (offsetting other expenditure) or is returned to the central department that oversees that state's correctional facilities and is reallocated as part of the larger overall correctional funding for that state. There is, however, strict legislation in most states/territories that monitors the types of industries prisons are able to undertake and how they can be run. Prison factories must not compete with other industries in the general community.

Money in Prison

The wages prisoners earn as a result of employment within the prison industries vary, depending on the jurisdiction and the type of work in which they are involved. Inmates can also study full time in some jurisdictions and are given a small wage as a full-time student. If they do not choose to work or if the prisons are unable to provide employment for all who request it, prisoners receive a small amount of unemployment funding. Prisoners have an account at the prison and, in most jurisdictions, family members are allowed to deposit up to a certain amount of money each month. Prisoners are expected to buy some food, beverages, cigarettes, and personal hygiene items with this money and there is a limit on what can be spent each week. In some centers, prisoners can buy a TV or radio for their cells from this money.

Staff

There are no nationally collated numbers of staff who work in corrections currently available in Australia. Each state and territory is responsible for the recruitment, selection, and training of its staff. Recently, nationally endorsed competency standards have been developed for correctional employees throughout Australia but how each state incorporates these competency standards into its own training is quite individualized.

Apart from the normal staff associated with a prison, there are also external personnel who provide assistance. These include teachers, who may come to the prison for a set number of weeks to offer a particular course; prisoner support organizations, for example, indigenous elders/mentors; and official visitors such as ombudsman or the prison inspector, who arrive to discuss concerns or grievances with prisoners.

NATIONAL ISSUES OF CONCERN

While there is much variance in Australian corrections there are also matters that cross over all jurisdictions due to their importance or commonality. Issues of national concern in recent history include deaths in custody, mandatory sentencing, and privatization. These issues have resulted in practical changes across Australian correctional systems, although the implications and associated implementation are often different for each jurisdiction.

Deaths in Custody

Australia remains the only Western country to have established at the highest level (national) an inquiry into deaths in custody. Known as the Royal Commission Into Aboriginal Deaths in Custody (RCIADIC), this inquiry was established following a rapid increase in Aboriginal deaths in custody in the mid-1980s. Despite the focus on indigenous

deaths, the inquiry has had wide-ranging implication for the handling of all deaths in custody. A key recommendation of the RCIADIC was that all deaths in custody should be monitored and that data should be routinely collected about them. Indeed, there have been remarkable advances made in the recording and reporting of deaths in custody as well as changes to organizational processes and architectural design that seem to have reduced the number of deaths. For example, the total custodial deaths in Australia in 1987 were 93 compared to a total of 56 people dying in prison custody in 2001. However, there has been little research that has analyzed the wider *national* social, structural, and organizational issues concerning the prevention of further deaths in custody rather than at a jurisdictional level. In particular, many deficiencies remain in police, correctional, and coronial practices.

Mandatory Sentencing

Mandatory sentencing first occurred within Australia in the late 1990s following international trends, particularly from the United States. It was introduced within the Northern Territory and Western Australia in relation to property offenses, especially break and enter offenses; however, there remained extensive debate throughout Australia about the introduction of such laws. The legislation within the Northern Territory was repealed after a change of government in early 2000, and the Western Australian legislation was also recently amended due to perceptions that such legislation continued to exacerbate the overrepresentation of indigenous Australians within Australian criminal justice systems.

Privatization

The decade of the 1990s saw the reemergence in Australia of organizations providing correctional programs for governments in Australia. While the private provision of correctional programs, especially medical services and some specialist rehabilitation programs, had been occurring for some time, it was in 1990 that Australia's first privately operated prison (Borallon) commenced operation.

Since then approximately 10% of Australia's prisoners have been incarcerated in privately managed prisons. The private operators are responsible for the full range of prisons from high- to medium- and low-security facilities. Three major companies are involved: Corrections Corporation of Australia (CCA), Australasian Correctional Management (ACM), and Group 4 Securitas (Group 4). The first two companies are consortia with strong U.S. connections, and Group 4 Securitas is European. All three have access to advice and information about the private operation of prisons from their overseas operations. There are no wholly owned Australian companies operating private Australian prisons.

Until very recently, the detailed contracts between state governments and the private providers have not been accessible to the public because of commercial-in-confidence provisions that make it impossible to know precisely how much the state pays private corporations to run its penal facilities. This has made discussion about the relative cost advantages of the private operators compared with government operations extremely difficult. Administrative integration of a multioperator system is an ongoing challenge and has produced problems of controlling the appropriate flow of information about prisoners through the correctional system.

There have, however, also been some advantages. The introduction of newer and different models of prisoner management, modeled on the overseas experiences, has meant that many older prisons within Australia have been closed and that many of the public correctional systems have adopted similar models of prisoner management. In particular, unit management and the wider provision and utilization of prison industries have occurred within publicly owned prisons since privatization.

CONCLUSION

Australian corrections remain a somewhat fragmented system. Australian correctional systems have only recently come together to share information on what works and what does not. Recent innovations, including large-scale capital works and increased demands for accountability in state

criminal justice systems, have substantially changed penal practice to the point where, while continuing to mirror overseas development, Australian corrections is now developing its own unique processes and structures.

B

BATES, SANFORD (1884–1972)

Sanford Bates was one of the preeminent penologists in the United States. He was particularly known for his support of rehabilitation and many related reforms and innovations. He had more than 50 years administering local, state, and federal prison and parole systems, including a stint as director of the Federal Bureau of Prisons from 1930 to 1937.

BACKGROUND

Sanford Bates, born July 17, 1884, practiced law from 1906 to 1918 in Boston and served two 2-year terms in the Massachusetts legislature. He entered penology reluctantly. First, the Republican administration in Boston persuaded Bates to act as street commissioner. A few months later, the city needed a commissioner of penal institutions and appointed Bates, over his objections. By the time he retired as commissioner of the New Jersey Department of Institutions and Agencies in 1954 at the age of 70, Bates had served successively as penitentiary commissioner of his native Massachusetts (appointed by then-Governor Calvin Coolidge), and parole commissioner of New York State and superintendent of Federal Prisons. He was director of the Federal Bureau of Prisons from 1930 to 1937, and then went on to serve as executive director of the Boys Clubs of America, Inc. until 1940.

His performance earned him a reputation both nationally and internationally. For example, he was elected president of the American Prison Association as well as the International Penal and Penitentiary Commission. He headed a five-year survey of sentencing, probation, and parole in connection with the American Bar Foundation's study of criminal justice. President Harry Truman appointed Bates to the U.N. Commission on Crime Prevention. Bates died on September 8, 1972, at the age of 88.

CONTRIBUTIONS

Bates's 50 years of service left a mark on the study and practice of penology. While commissioner of penal institutions in Boston, he introduced a prison school and partial self-government for inmates. During his decade as commissioner of the Massachusetts State Department of Correction, Bates revised the parole system, introduced printing and foundry work to the available prison industries, established merit pay for prison employees and a state wage for prisoners, founded model institutions for male and female "defective delinquents," and created the first crime prevention bureau connected with a prison department. He also offered inmates university

extension courses and arranged for county prisoners to be examined by state psychiatrists.

During his seven-year tenure of director of the Federal Bureau of Prisons, 15 institutions were added to the system, including not only Alcatraz (a famous maximum-security prison) but also libraries, medical departments, bureaus of social work, and training programs for guards. In both New York and New Jersey, Bates established model parole systems. In New Jersey, he transferred many prisoners from maximum-security prisons to work farms and experimented with using inmate labor on public outdoor projects.

One of Bates's most significant contributions was ridding the penal system of politics. At the time he became director of the federal prison system, federal prisons were, as one scholar observed, "virtual hostages of the patronage process." Wardens were lightly supervised by the Department of Justice while dedicated to maintaining good ties to their sponsors in Congress to whom they owed their jobs. By contrast, Bates sought to base hiring and promotion on merit, not patronage. While he recognized the importance of maintaining good ties with Congress, he noted in a March 26, 1929, letter to Attorney General William D. Mitchell that "I should confidently expect the backing of my superiors in withstanding that happily infrequent kind of pressure which comes sometimes from the unreasonable demands on persons whose chief aim in life is political." His position was particularly noteworthy given that he himself had been a politician in a state known for its patronage.

In his book *Prisons and Beyond*, articles, and letters, Bates articulated a guiding philosophy for the management of prison inmates. Although seeing inmates as individuals and advocating a humane system of incarceration and parole seem unremarkable today, at the time this view was unusual. Bates's philosophy reflected not only his commitment to reformation but also his belief that the Bureau of Prisons should be a role model for other states to emulate. His accomplishments prompted the Chairman Wickersham of the president's law enforcement commission to voice regret that the commission's last report had not differentiated between federal and state institutions when it denounced the present prison system as antiquated, inefficient, and failing either to reform offenders or to protect society. Wickersham acknowledged that the revolutionary changes Bates had introduced in the system of penal management, control, custody, and training of offenders were inadequately recognized.

CONCLUSION

Sanford Bates shaped ideas about and practices of punishment in the United States during and after his lifetime. As director of the Federal Bureau of Prisons, he left his mark on a national system of prisons that itself guided many state systems. A lifelong civil servant, he demonstrates the impact one individual can have on broader policies and procedures. To that end, he is one of a number of prison reformers and workers who have shaped the current U.S. penal system

BECCARIA, CESARE
(1738–1794)

Cesare Bonesana Marchese Beccaria, was a key figure in the history of criminology and in the field of punishment. Typically, he is identified as the founder of the classical school of criminology, and as one of the first modern proponents of deterrence. In 1764, he anonymously published his ideas in a treatise titled *Dei Delitti e delle Pene* (*On*

Crimes and Punishments). This text subsequently influenced the development of systems of punishment in most contemporaneous European nation states, and in the United States as well. It was translated into French in 1766 and a later edition, with an introduction by Voltaire, found its place in the salons and courts of Europe within movements of reform identified with the rising bourgeoisie and "enlightened" aristocrats. Praised for its clarity, eloquence, and humanity, *On Crimes and Punishments* was translated into English in 1767. Beccaria's views were hailed by Jeremy Bentham as the foundation of his work and were cited as an influence on the thought of William Blackstone. In the newly forming United States, John Adams, Benjamin Franklin, James Wilson, Thomas Jefferson, and others recorded the use of Beccaria's insights in their efforts to shape both the federal constitution and new state judicial and criminal legislation and penal sanctions.

Along with many of his contemporaries, Beccaria believed that members of a society were bound by a social contract that legitimated laws for the security of their persons and property. He also argued that human behavior was driven by a utilitarian approach in which people sought to avoid pain and seek pleasure and happiness. His own summary of his views, as a "general axiom," was that "in order that punishment should not be an act of violence perpetrated by one or many against a private citizen, it must be essential that it be public, speedy, necessary, the minimum possible in the given circumstances, proportionate to the crime, and determined by the law" (Beccaria, 1995, p. 113). His eloquent arguments against the use of torture and for the abolition of capital punishment were widely quoted in his day and retain their relevance today.

Somewhat ironically, more recent neoclassical criminology has been identified with a "get tough on crime" stance that only partially reflects Beccaria's initial plea for penal reform. Thus, contemporary scholars stress the role of rational choice in criminal behavior, the use of determinant rather than discretionary sentencing, and the deterrent rather than rehabilitative function of corrections.

BACKGROUND

Beccaria was born into an aristocratic Milanese family of moderate wealth. After graduating from the University of Pavia with a doctorate in law in 1758, he joined a literary academy frequented by other young men from the Milanese elite. Subsequently, he followed his mentor and friend Pietro Verri into a new "Academy of Fists," whose members' heated debates on scientific, literary, social, and economic issues and reforms, stimulated Beccaria's interest in and writing on monetary reform. He later responded to Verri's suggestion that he turn his talents and eloquence to a study of the existing criminal law. With the supportive assistance of the members and following extensive editing by Verri, since initially Beccaria knew little about the criminal system, the manuscript developed from a pile of notes. Fear of the reaction of the authorities to his critique led to his decision to publish it anonymously at first. After the fame of his work spread there were demands for his presence, but after a short visit to Paris in 1766, where he was hailed as a benefactor of humanity, he returned to Milan where he remained, despite an invitation by Catherine the Great to implement his recommendations in Russia. Active first as a professor of economics, and later in a series of governmental positions in Lombardy, he continued to write on subjects in political economy and remained active until his death in 1794.

It was not until 1791, when Beccaria was appointment by Emperor Leopold II to a commission for the formulation of a new criminal code for Lombardy that he was involved directly in an effort to bring his recommendations into law. The members subsequently split over the question of the abolition of capital punishment, and after long debates and in the face of political instability after the French Revolution the commission's work was never implemented. Beccaria did not live to see his work bear fruit in his own land. However, in the new United States his work had greater impact.

PENAL REFORM

In an early edition of *On Crimes and Punishment,* an allegorical engraving shows Justice turning from

an executioner brandishing a shorn head to a pile of chains, a shovel, and a mallet resting at her feet. In his widely read and debated chapter on the death penalty when public executions or their threat were widely used as the punishment for crime, Beccaria (1995) argued that when "a man who sees ahead of him many years, or even the remainder of his life, passed in slavery and suffering before the eyes of his fellow citizens . . . the slave of those laws by which he was protected, [the example] will make a stronger impression on him than would a spectacle which hardens more than it reforms him" (pp. 70–71).

Even before the formation of the United States, John Adams, in his successful defense of the British soldiers tried after the Boston Massacre in 1770, quoted Beccaria: "If I can but be the instrument of preserving one life, his blessing and tears of transport shall be sufficient consolation to me for the contempt of all mankind" (Maestro, 1973, p. 137). Likewise, Beccaria's influence was apparent in the efforts to restrict the use of the death penalty in the new state codes and the apparent agreement, in a country where the institution of slavery was widespread and accepted, that penal slavery was an appropriate substitute for death.

In Pennsylvania, influenced by Beccaria's thought, Benjamin Franklin, Benjamin Rush, and others in 1786 revised the criminal code limiting the death penalty to murder, rape, arson, and treason and substituted in its place "hard labor, publically and disgracefully imposed." This practice, however, that placed chained prisoners with shaven heads cleaning and repairing the streets of Philadelphia evoked disturbances that led the authorities by 1790 not only to move the punishment from public view but also to substitute private solitary labor. With the construction of cells for solitary confinement, the Walnut Street Jail became hailed as the birthplace of the American penitentiary—a reversal of Beccaria's basic argumentation.

In Virginia, Thomas Jefferson with others began the revision of the criminal law in 1778 citing Beccaria's opposition to the death penalty and recommending the substitution of hard labor on public works. Their legislative efforts lost. When the bill limiting the death penalty to crimes of treason and murder successfully passed in 1796, following the experience in Philadelphia, the alternative punishment of "slavery and suffering" rather than death, led in Virginia to the construction and use of the prison rather than public works.

CONCLUSION

Beccaria's influence was not only felt during the classical period when many of his insights, summarized in his "general axiom," including the rule of law, judicial codes, and public trials, were embodied in legislative and judicial reforms following both the American and French Revolutions but also in continuing efforts in abolish capital punishment. In the United States, his arguments that public slavery at hard labor was a greater deterrent to crime than public executions became, in the twist of political events and control, the impetus for the development of the solitary cells of the penitentiary while retaining the goal of hard labor. Finally, in the more recent rational choice revival of neoclassical criminology the works and insights of Beccaria have again found their advocates.

BEDFORD HILLS CORRECTIONAL FACILITY

In the world of corrections, Bedford Hills Correctional Facility, a maximum-security prison in

the state of New York, is well known for its historical past and the innovative correctional program it currently offers its inmates. However, Bedford Hills is relatively unknown to the general public, principally because its inmates are women.

HISTORY

In New York's earliest correctional history, women were housed at men's prisons or in local jails. Between 1838 and 1877, a building at Sing Sing Prison served as the state's women's facility. When overcrowding became an issue in the men's section of Sing Sing, women were moved to county jails in Brooklyn, Buffalo, and Rochester. The condition of women inmates did not improve in these places as local jails were hardly a suitable place for state-sentenced inmates facing years of confinement.

As reformatories were being established with the promise to salvage young men's lives through education and parole, legislators were pressed to give women the same consideration. Eleven years after the world-renowned Elmira Reformatory opened, the Hudson House of Refuge for Women opened in 1887. With the success of the Hudson House, in 1892, the New York State Legislature passed a bill authorizing a woman's reformatory in Westchester County, to be built at Bedford Station on the Harlem Railroad line.

Seven years later, the New York State Reformatory for Women at Bedford opened, with the first inmates arriving on May 11, 1901. The reformatory was to house women, aged 16 to 30, who had been convicted of minor offenses. Bedford was controlled by a Board of Managers, appointed by the governor. Dr. Katharine Bement Davis was named Bedford's first superintendent. Davis's innovations at Bedford won her national and international acclaim as a champion of women's suffrage.

The first inmates at Bedford Hills worked half a day cooking; making clothing, baskets, and hats; and working in the laundry building. The women milked cows, raised chickens and pigs, farmed in vegetables, planted trees, shoveled coal, painted cottages, and put up fences. They built an artificial pond and harvested the ice during winter. They also learned to make concrete, building thousands of square feet of walkways, stairways, and floors.

The other half of the day was spent in traditional education classes, as well as courses in carpentry, stenography, typing, chair caning, painting, mechanical drawing, cobbling, and bookbinding. Gymnastics classes, inmate productions of Gilbert and Sullivan musicals, and summer recreation were also a part of Davis's fresh-air treatment of the inmates.

In 1927, Bedford, as part of a reorganization of New York's state government, was placed under the newly created Department of Correction. In 1933, women from the state prison in Auburn were moved to a group of buildings adjacent to the reformatory. The entire complex was renamed the Westfield State Farm. Although the reformatory and prison were within one-quarter mile of each other, they operated as two distinct institutions separated by a road and fence.

In 1970, Westfield State Farm was reorganized as women were removed from the prison section and replaced with male inmates. The reformatory became a general confinement facility for women. This new complex constituted a single institution called the Bedford Hills Correctional Facility. The men and women inmates were separated with the exception of coed activities such as creative writing classes and dances.

In 1973, the male prison was administratively separated from Bedford Hills and was renamed Taconic. As the state female inmate population rose to unprecedented numbers, Taconic was converted to a medium-security prison for women, which remains today distinct from the Bedford Hills maximum-security facility.

BEDFORD HILLS TODAY

Today's Bedford Hills is dramatically different to its reformatory predecessor. Currently, Bedford Hills is the only maximum-security women's facility operating in the state of New York. In addition, it is the receiving and classification center for all women sentenced to prison.

Living conditions are different also. When reformatories were being built for women, the

architecture was soft, keeping with the image that women were passive and congenitally domestic. The original unfenced facility consisted of cottages, each with its own kitchen and flower garden. The women were placed in cottages according to age, marital status, and behavior.

Today at Bedford Hills, within the confines of massive security fencing, prisoners live in a variety of styles and ages of buildings. Some live in three-story brick buildings built in the 1960s, while others live in modern dormitories. Fiske Cottage, built in 1933 and a remaining link to the past, serves as an "honor house" with individual rooms to which the inmates hold the keys.

New mothers at Bedford Hills live with their babies in the Nursery, the oldest prison nursery in the United States, for up to 18 months. In addition, this is currently the only women's facility to offer its inmates a Family Reunion Program, consisting of overnight, private visits with spouses, children, and other family members of the inmates. The Children's Center is an innovative program designed to make children feel comfortable while visiting their mothers. Both the Nursery and the Children's Center are staffed by inmate child care workers. Other programs include education and advocacy in custody and foster care situations and education workshops to improve parenting skills.

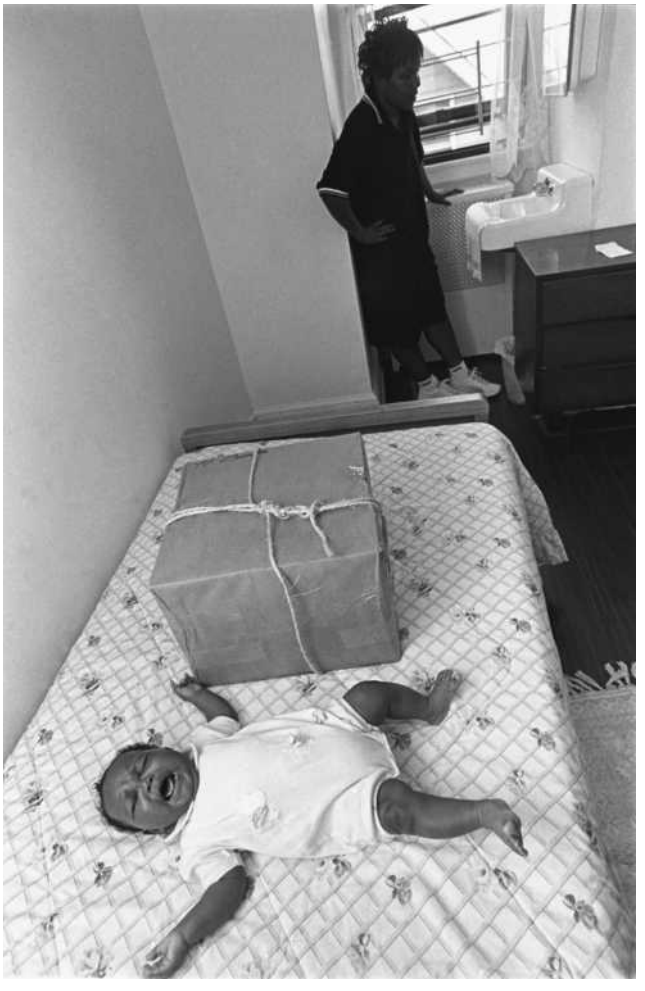

Photo 1 *Bedford Hills*

THE CHILDREN'S CENTER

The Children's Center offers a wide variety of services to women sentenced at Bedford Hills. The main goal of the center is to assist the women in strengthening and preserving their families, in particular their relationships with their children. The center is funded by the Department of Correctional Services and programs are administered by Catholic Charities, in the diocese of Brooklyn. Prisoners primarily conduct the programs, with responsibilities being to plan activities and arrange for workshops, as well as teaching and initiating the programs.

There are various centers within the broader scope of the Children's Center. These include the Children's Center, Parenting Center, Nursery, Infant Day Care Center, Prenatal Center, and Child Advocacy Office. Each of them will be discussed below.

The Children's Center consists of a well-equipped playroom, with games, age-appropriate toys, building blocks, easels for painting, and a children's library. During holidays, the center is seasonally decorated with matching craft activities. This is currently the only prison in the United States where children and their mothers may visit unescorted.

Within the Parenting Center are 20 different programs and services provided to the inmates. Programs include child development associate courses, where inmates earn credentials as child development associates to work in an accredited nursery school; mental hygiene programs; parenting courses; and bilingual parenting training.

Services include holiday activities, a mother's group, nursery aids, a transportation clinic, and a toy library.

Women who are pregnant upon arriving at Bedford Hills will deliver their children in a hospital located outside the prison and will then return to live with their children in the Nursery, located in the facility medical building. Keeping mother and child together has always been acknowledged and respected at Bedford Hills, understanding that the child's best interest is paramount. In addition, it is believed that inmates who maintain strong bonds with their families during their incarceration period have a greater chance of rehabilitation with a lower chance of recidivism. Parenting, educational, vocational, and substance abuse treatment programs in combination with bonding with their children help the women at Bedford Hills to establish a strong foundation for a lifestyle change.

In February 1990, the Infant Day Care Center opened at Bedford Hills. The purpose of this program is to care for children of inmates who are attending school or engaged in work assignments. This center is staffed by prisoners who have been trained through the child development associate courses. Outside volunteers, known as the "Grandmothers' Group," spend time in the center assisting staff and mothers.

The Prenatal Center was established as recognition of this most critical time in a woman's pregnancy. This center provides pregnant inmates with the opportunity to receive parenting classes and substance abuse classes, as well as sewing, crocheting, and other handwork/craft classes.

Finally, the Child Advocacy Office was established to address all child-related problems. Mothers meet individually with trained child advocates and contacts are made with family members, schools, and various social agencies. In addition, cases involving out-of-state transportation and other unusual problems are directed to this office.

CONCLUSION

Bedford Hills Correctional Facility has come a long way since its humble beginnings as a reformatory for New York's female misdemeanants. Today, as the state's only maximum-security prison for women, it functions as a caring community whose residents aid and support each other. Bedford Hills and its innovative programs, particularly the Children's Center with its various programs for mothers and children, have received numerous awards in recent years. Representatives from across the country, as well as China, England, France, and Scotland, have paid official visits to view firsthand the facility and programs.

BENNETT, JAMES V. (1894–1978)

James V. Bennett was the second director of the Federal Bureau of Prisons (BOP), serving longer than any other (1937 to 1964). Bennett played a role in establishing the centralized bureaucracy for overseeing the operation of federal prisons, the BOP, while working for the U.S. Bureau of Efficiency. In 1928, he produced a report, *The Federal Penal and Correctional Problem,* that described the deteriorating

conditions caused by severe overcrowding at the three existing penitentiaries of the time—Leavenworth (Kansas), Atlanta (Georgia), and McNeil Island (California). He identified three acts taken after 1920—the Prohibition Act, the Harrison Narcotic Act, and the Automobile Theft (Dyer) Act—as contributing to the rising number of federal inmates. Instead of proposing to expand the three existing federal prisons, Bennett reasoned that additional federal prisons should be built to reduce transportation costs and to preserve prison sizes that could be managed easily by one warden.

Prior to joining the Bureau of Efficiency and later the BOP, Bennett had graduated from Brown University (1918) and served as a cadet aviator in the Army Air Corps during World War I. Bennett received his law degree in 1926 from George Washington University. He was hired by the first director of the BOP, Sanford Bates, in 1929, shortly after the formal establishment of the BOP.

Bennett argued in 1935 that one of the key issues facing prison management was inmate idleness. One of his key contributions prior to assuming the directorship of the BOP was serving as the initial commissioner of prison industries, which since 1978 has been known by the trade name UNICOR. Under his leadership, legislation was written and enacted by Congress that established Federal Prison Industries, Inc. as a separate corporate entity in 1934. As a corporate entity, prison industries had its own board of directors and working capital that was separate from the federal appropriations process. President Franklin D. Roosevelt and Sanford Bates established the policy that prison industries should be broadly diversified and provide little competition to any one industry in the private sector, and Bennett followed this policy as commissioner of prison industries and later as director of the BOP.

As director of the BOP, Bennett enacted a progressive philosophy regarding the treatment of staff and inmates, especially early in his career. Some of the accomplishments of Bennett may have been initiated during the Bates administration. For example, during the first month of Bennett's administration, all BOP personnel became part of the civil service. This replaced the political patronage system that had existed previously.

Bennett also established the BOP tradition of associating major job promotions with transfers in the 1940s. To combat local empire building and provincialism, as well as potential resistance to central office policy and directives, transfers were tied to accepting a position at a different prison. Some staff initially resisted. These days, however, it is commonly thought that the promotion-tenure link transformed the BOP from a collection of idiosyncratic prisons to a coordinated system under the control of central office.

Bennett and Bates opposed controlling inmates with the simple use of brute force. Sometime during the 1930s, either before or after Bennett assumed the directorship, the BOP disallowed the previous practice of allowing guards to carry billy clubs at penitentiaries. Bennett established the first halfway house used by a correctional agency in the United States to ease the adjustment of inmates back into society. Bennett also created the first "open prison" at Seagoville, Texas. This prison did not have a perimeter wall, fence, guard towers, or the other custody devices most typically associated with prisons. As Bennett noted in a paper delivered to the Institute of Illinois Academy of Criminology in 1955, "The emphasis throughout is on self-reliance, self-respect, and trustworthiness" (Roberts, 1980, p. 33).

Bennett took a leave of absence in 1945 to organize civilian German prisons for the American military at the end of European hostilities in World War II. He received numerous awards for his federal career, including the president's Award for Distinguished Federal Civilian Service, which was presented by President Dwight D. Eisenhower.

Bennett's last official day at the BOP was on his 70th birthday. Critics argue that Bennett became less effective in the latter stages of his career, and then-Attorney General Robert Kennedy had denied his request to extend his stay. Nonetheless, looking over his entire career at the BOP, Paul Keve (1991, p. 214) argued that he was a leader of integrity with sound management practices.

BENTHAM, JEREMY (1748–1832)

Jeremy Bentham, credited for conceptualizing the "roundhouse" panopticon prison, was a philosopher and essayist whose contributions to criminal justice theory over 60 years extended far beyond his prison designs. A prodigious, even obsessive, author, Bentham wrote on numerous topics spanning criminology, moral philosophy, law, and politics. Born of wealthy parents in London, he studied to be a lawyer like his father and grandfather. However, he eventually discarded this plan and instead began to write social and political critiques. His wealthy background and a later substantial inheritance allowed him to pursue his interests in relative comfort.

Bentham wrote during a time of social upheaval, both in Britain and on the continent. The French and U.S. revolutions, expanding British imperialism, and the problems of crime in England in addition to what Bentham viewed as a breakdown in the moral fabric of society and law, stimulated much of his work. Considered both a philosophical and political radical, many of his reformist ideas were not accepted until the early 19th century.

BENTHAM'S PHILOSOPHY

Bentham is often considered to be one of the founders of Utilitarianism even though he did not originate the core ideas. Utilitarians argue that ethical behavior is determined by the consequences of an act. As a result, according to Bentham, both human actions and government policies should be guided by a "utility principle" in which actions should be intended either to produce good or to reduce harm. Such a view was not based simply on numbers or "majority rules." Rather, the goal or end of an act should be weighed with a calculus that, on balance, will result in the greatest social good or the least social harm, even if it causes individual discomfort. Ethical rules are derived from the principle of the greatest universal utility, summarized by John Stuart Mill (1957) after studying Bentham:

> Pleasure and freedom from pain are the only things desirable as ends; and that all desirable things (which are as numerous in the utilitarian as in any other scheme) are desirable either for pleasure inherent in themselves or as means to the promotion of pleasure and the prevention of pain. (pp. 10–11)

Although recognizing and emphasizing the role of individual choice, Bentham did not believe that people should make choices simply on the basis of their own personal self-interest or pleasure. Rather, a society's "greatest felicity" occurred in conditions that required a shared moral climate, and individuals were obligated to make those choices guided by a common social good. To use a contemporary example, some observers have argued that, for utilitarians, if racism makes the majority of a society "happy," then it can be morally justified. However, this violates the fundamental premise of Utilitarianism, which is that principles of justice are a primary utility, and choices that violate this utility are unjust or immoral.

BENTHAM'S CONTRIBUTIONS TO CRIMINAL JUSTICE

Introductory criminology texts usually divide criminology of the later 18th and early 19th centuries into classical and neoclassical views, placing Bentham in the latter. Although somewhat arbitrary, the distinction is useful for two reasons. First, it helps us understand how writers in the first part of

the 19th century shifted from earlier 18th-century views of criminal law as primarily for punishment. Second, it illustrates how criminal law and correctional policies respond to social changes as they evolved.

The distinction between the two schools reflects an emphasis in application rather than any fundamental differences in philosophy. Both classical and neoclassical theorists attempted to examine crime in a way that would allow for a "rational" formulation of policy. The classical school is often associated with Cesare Beccaria (1819), who believed that "the degree of punishment, and the consequences of crime, ought to be so contrived as to have the greatest possible effect on others, with the least possible pain to the delinquent" (p. 75).

The intent of this "just measure of pain" was to deter the offender from future offenses as well as to prevent others from similar acts by indicating that punishment was swift and certain and "cost" more than gains from the crime itself. Both schools focused on crime as a violation of law, moving away from the view of crime as "sins against nature," which dominated criminal law well into the 18th century (and still guides some 21st-century thinking). Both held that the best way to reduce crime was to punish offenders, both for retribution and deterrence. Both opposed excessive punishment and, for the most part, capital punishment, corporal punishment, transportation and prison ships, and torture. Both also argued that the punishment must fit the crime and that punishments should be calibrated according to the nature of social harm of the offense.

The primary difference lies in Bentham's and his followers' reform-oriented views of how punishments should be applied. For Bentham and those influenced by his work, existing criminal law and corresponding punishments were unjust, because they did not account for individual differences. Unlike the classical school, which reacted to crime after it occurred by punishing offenders and thus reducing crime through deterrence, Bentham believed that society could proactively address crime before it occurred by emphasizing moral choices and creating a just system of laws. He advocated indirect means of preventing crimes, such as education, religious sanctions, discouraging "encouragement to crime," and promoting an enlightened, benevolent society (Bentham, 1843).

Like, Beccaria (1819), Bentham believed in the deterrent power of punishment. He felt that the severity of punishment should be increased as the deterrent value decreased. But Bentham also advocated alternatives to conventional punishment, arguing that not all offenses require incarceration or harsh responses. He suggested that "private punishment," or "forfeitures" and other restrictions could be a strong deterrent. Also, unlike classical theorists, who argued that all offenders should be treated alike, regardless of circumstance, Bentham suggested taking the context of a crime and the nature of the offender into account when inflicting punishment.

THE PANOPTICON

One of the key ways in which Bentham sought to deal with crime was through transforming prison policies. Over the decades, he specified a number of principles to guide sentencing and prison administration. Among these included holding wardens responsible for prisoner injuries by fining them for prisoner deaths, increasing sentencing latitude of judges, a presaging of bail and home confinement, and the recognition that some punishments, such as transportation, fell heaviest on the poor and lower classes.

In addition to such policy suggestions, Bentham is perhaps best known to criminology students for his design of the panopticon prison, a round, multitiered open structure with a guard tower in the center. He developed his ideas for this model following a trip to Russia with his brother in 1785 in a venture to help Empress Catherine the Great modernize the Russian government, including the penal system. In a series of letters and articles over the years (Bentham, 1970), Bentham conceptualized a single round building with a floor-to-ceiling guard tower in the center surrounded by tiers of cells. Each cell would have a window for fresh air and light and be easily and safely accessible to staff. Most significantly, this new technology would allow a single

guard to have visual access of every cell and prisoner. Keeping prisoners under surveillance, he believed, would make prison control safer, more effective, more humane, and efficient by increasing discipline while reducing staff resources required to maintain it. Prisoners in the panopticon would work rather than sitting idle, and, in the process, would not only learn the benefits of discipline but also make a profit for the prison itself.

Catherine ultimately rejected the idea, and no panopticons were ever built in England. Indeed, only a handful of true panopticons were ever constructed anywhere, although for many decades prison architecture was influenced by the radial design. In the United States, the Western Penitentiary in Pennsylvania was constructed in 1826 guided by Bentham's model. In 1925, Stateville Penitentiary opened with four panopticon units. A fifth was planned, but was replaced with a "long house," reportedly because of the cost of building the roundhouses. Three of Stateville's four panopticon units were torn down in the 1980s. The fourth was upgraded and remains functional, largely for historical reasons. It is reputedly the only remaining operational panopticon in the world.

CONCLUSION: THE LEGACY

Due to a number of problems with the panopticon design, particularly in the expense of building and maintaining it, Bentham's model never became the mainstream institution that he had hoped. This does not mean, however, that his ideas faded from either criminological imagination or from the realm of policy. Rather, the panopticon continues today to influence thinking and practice in a number of ways. In practical terms, constant surveillance, usually through technology, is crucial to most penal institutions. Likewise, labor remains a key part of many institutions. More conceptually, the panopticon was famously used by French philosopher Michel Foucault as an example of how power operates in modern society.

Bentham's other insights into prison construction and management provided the basis for reform well into the 19th century. His ideas of alternative punishments and reform laid out the philosophical framework for later development of probation and parole, advocating community responsibility for offenders. Although he is rarely read today by criminologists, his legacy remains. His view that social justice and just law are intertwined, and that both are necessary for humane and effective prisons, make him worth studying.

BISEXUAL PRISONERS

Bisexuality is defined as sexual attraction, potential attraction, or sexual behavior toward members of both sexes. Bisexuality, though, like homosexuality, remains an elusive term. Is a married man who engages in periodic homosexual activity gay? Does one incident of same-sex activity render a person gay? Defining bisexuality among prison inmates is especially challenging. Is sexual orientation defined by acts committed prior to incarceration or by acts committed during incarceration? If someone

engages in same-sex sex during incarceration, but returns to heterosexuality upon release, is that person gay or bisexual?

ATTITUDES TOWARD BISEXUALS IN PRISON

Much like the outside society, attitudes toward bisexuals in prison are typically unfavorable. One recent study has shown that male inmates tend to be more homophobic than women and that black inmates are more tolerant toward homosexuality than whites. Some facilities may segregate the more effeminate male homosexuals from the general population for their own protection or to discourage sexual behavior. This is because homosexual inmates have been found to be at greater risk of sexual victimization than heterosexual inmates. Due to actual or perceived potential victimization, some homosexual and bisexual prisoners may request protective custody to avoid harassment or assault from other inmates.

METHODOLOGICAL PROBLEMS

Numerous methodological challenges arise when studying sexuality among prisoners. Using a narrow, essentialist definition of bisexuality may not capture the full scope of sexual identity. Likewise, focusing on sexual behavior alone may not reveal desires that are unrequited. Gauging sexual behavior among inmates requires self-report or observational data. Yet observational data may be problematic since observations alone cannot reveal the sexual orientation of the participant, but only their behavior. In addition, it may be difficult to distinguish between consensual or coerced sex. Researchers have found that when interviewed, correctional officers claim they cannot always differentiate between consensual and nonconsensual sex because extortion techniques employed by inmates may not be immediately apparent. For example, an inmate may "willingly" engage in sexual activity as a means of survival or protection from other inmates, with such behavior appearing to the correctional officer as a consensual act.

Self-report measures also have some problems. Due to the stigmatizing nature of homosexuality and bisexuality, many people will underreport their sexual orientation or desire. Inmates may be reluctant to admit engaging in sexual activity for various reasons such as embarrassment or fear of being taken advantage of by other inmates. In attempting to gauge sexual orientation, more comprehensive studies have addressed sexual behavior prior to incarceration as well as behavior engaged in while incarcerated.

BISEXUALITY AMONG MALE INMATES

Due to the difficulty in defining homosexuality and bisexuality, the estimated number of homosexual and/or bisexual prisoners varies. Estimates of the number of male bisexual prisoners range from 11% to 15% while the proportion of male homosexual prisoners is thought to fall somewhere between 6% and 10%. Perhaps most confoundingly of all, the overall percentage of male inmates in medium-security facilities reported to engage in consensual homosexual activity in prison ranges from 2% to 65%. While in one study, only 2% reported engaging in same-sex behavior themselves, the vast majority of inmates indicated that it is their perception that consensual sex occurs every day.

BISEXUALITY AMONG FEMALE INMATES

As with men, there are no accurate estimates of bisexual female inmates. Early studies claimed that women establish "pseudo-family" or friendship relationships that center on emotional attachment and may involve sexual activity. In contrast to men's sexual behavior in prison, which is often characterized by domination and aggression, women were thought to reproduce the gender roles of the outside society. Those involved in a pseudo-family may take on either the "masculine" or "feminine" role within the relationship. The relationships are viewed as intimate, with each partner providing companionship and emotional support.

More recent studies indicate that women prisoners involved in sexual relationships do not adhere to any particular gender roles. In fact, like many male prisoners, the impetus for sexual involvement is often the economic exchange for food or other commissary

items. The study concludes that mistrust leads to reluctance to become involved with other inmates.

CONCLUSION

Few studies explicitly address bisexuality in prison. Notwithstanding the methodological concerns involved in identifying bisexual prisoners, continuing research is necessary to develop practical policy recommendations that address the dangers and consequences of coercive sexual behavior as well as health concerns rising from unprotected sex among inmates. Understanding prisoners' sexuality will also help explain the prison experience more clearly.

BLACK PANTHER PARTY

The Black Panther Party (BPP) was formed in October 1966, in Oakland, California, by Huey P. Newton and Bobby Seale. At the time, it was the most prominent revolutionary black power organization. At its peak, the BPP maintained between 10,000 and 30,000 members across more than 30 chapters in North America.

The BPP stressed black cultural pride and promoted educational programs and other community activities. Its political and economic ideology rested on Marxist revolutionary tenets that called for black power, armed resistance, the release of all blacks from jails, and payment of compensation to African Americans for centuries of exploitation.

Early BPP members sought to protect blacks against the police's unnecessary punitive use of force. Members patrolled urban ghetto areas with firearms and law books to prevent police brutality and petit-apartheid practices such as police harassment, illegal arrests, stop and frisks, selective enforcement of the law, racial profiling, and so on. Conflicts between the BPP and the police in the late 1960s and early 1970s led to armed confrontations in California, New York, and Chicago and the arrest and imprisonment of Huey Newton, who was accused of murdering a police officer. The Federal Bureau of Investigation (FBI) engaged in a massive campaign against the BPP, which promoted internal quarrels within the organization and finally led to its demise. While the national influence of the BPP began to wane after 1971, its organizational life span continued until 1982.

THE BPP AND IMPRISONMENT

Between 1967 and 1970, the FBI used state and local police departments, illegal wiretaps, and agent provocateurs to penetrate and destabilize the BPP. In 1967, one of the key BPP leaders, Huey Newton, was jailed on charges of killing an Oakland policeman. In New Haven, Connecticut, the FBI rounded up 14 Panthers including Bobby Seale and Erika

Huggins and charged them with conspiracy and murder, kidnapping, and conspiracy. Other members of the BPP jailed between 1971 and 1982 include Mumia Abu-Jamal, Sundiata Acoli, Herman Bell, Marshall Eddie Conway, Mark Cook, Bashir Hameed, Robert Seth Hayes, Teddy Jah Heath, Mundo We Langa, Abdul Majid, Russell Shoats, Jalil Abdul Muntagin, Baba Odinga, Ed Poindexter, and Albert Nuh Washington.

Angela Davis, a black radical activist and scholar and member of the BPP, was also incarcerated in connection with an armed takeover of a California courtroom in 1970. In 1970, Geronimo ji Jaga Pratt, a decorated war hero received a sentence of 25 years to life in prison on charges of murdering a white couple. He served 27 years before his sentence was overturned. The police had withheld information that the victim had actually accused another man of the offense and Pratt was innocent.

Ironically, incarcerating such people often provided them the opportunity to read widely and sharpen their ideologies. It also enabled the party to recruit new members from among the other prisoners. There was, in other words, a relationship between activists inside and beyond the prison walls, which sentences of confinement could not disrupt.

THE ROLE OF WOMEN IN THE BPP

Black women in the United States have a long history of participation in community-based political and civil rights movements. The BPP was no exception, and women played significant roles and held leadership positions in it until 1981 when the BPP's last Oakland-based community program shut down. According to a 1969 survey, about two-thirds of the general membership of the BPP were women. As early as 1970, the BPP formally called for equality and liberation of women.

Some of the women party members included Kathleen Neal Cleaver, Matilaba, Connie Mathews, Assata Shakur, Zayd Shakur, Shelley Bursey, and Erika Huggins. Each played significant roles in national leadership positions. For instance, Shelley Bursey worked with the newspaper; Kathleen Cleaver, a communications director, ran for state political office on the auspices of the BPP, and Matilaba published drawings in the newspapers. Others like Connie Mathews became the international coordinator, Assata Shakur was exiled in Cuba, while Erika Huggins served jail time.

In the black communities, women were actively responsible for running freedom schools established by the BPP. They also ran the organization's free health clinic, antidrug campaigns, and community-run Breakfast for Children Program. The last of these community programs closed in Oakland in 1981.

THE DEMISE OF THE BPP

Most scholars of American social movements have attributed the decline of the BPP and other social movements of the 1960s to multiple factors that include internal disputes, state political repression, ideological errors, an inexperienced and youthful membership, strategic mistakes, and the cult of authoritarianism. Some argue that the BPP eventually collapsed in part because of oligarchization in which there was an unequal organizational relationship and misuse of power and control by a numerical minority. Tensions between the leadership over the proper direction for black liberation, the role of the armed struggle and electoral politics, the issue of alliances with white radicals, and competing visions of political ideology all served to divide members from one another. The party was also split over organizational strategy and how best to associate with other black organizations. Some scholars estimate that, by the middle of 1971, BPP membership had declined to merely 1,000.

In addition to internal quarrels, the BPP was further eroded by the combined repression of the local, state, and national governments. In 1968, FBI Director J. Edgar Hoover described the BPP as the greatest internal threat to American security. During the COINTELPRO era, the FBI sought to shut the BPP down and more than 300 of its members were jailed or forced into exile. David Hilliard reports the significance of the FBI in his 1993 autobiography: "They employ every kind of deviousness to put us at one another's throat, make us appear like gangsters and thugs, niggers killing niggers" (Hilliard & Cole, 1993, p. 221). The FBI's COINTELPRO was instrumental in using various tactics of "repressive

acts of barbarism" such as harassment, arrest and detention, surveillance, snick-jacketing, forged letters, paid informants, and undercover police agents to suppress the members of the BPP that eventually led to the assassination of party leaders (see Jones, 1998, p. 371).

CONCLUSION: THE LEGACY OF THE BPP

As a leading black leftist revolutionary organization in the liberation struggle in America, the BPP captured the imagination of many young people in the United States and in other oppressed revolutionary groups abroad. The legacy of the BPP can be seen in four major areas: the saliency of armed resistance, a tradition of community service, a commitment to the self-determination of all people, and a model of political action for repressed people.

The BPP demonstrated a willingness to have alliances with other leftist organizations and maintained a desire to incorporate women into the organization's hierarchy. Even in its embryonic stage, the BPP advocated for the rights of women and homosexuals. In short, the BPP represented an early model of multiculturalism in American history. Its impact transcended American borders as its tactics, ideology, and politics became a frame of reference for others and were embraced by oppressed movements in both domestic and international arenas.

Despite its ultimate demise, due to internal disputes and government repression, the BPP contributed politically, socially, and economically to the American political landscape. Party members led the movement to squash police brutality, which resulted in the emergence of civilian police review boards. The Black Panthers' ideas, such as free breakfast programs, may have contributed to the policy of free meals to poor children in American schools today.

BLOODS

The "Bloods" gang was founded by Sylvester Scott and Vincent Owens in Piru Street, Compton, Los Angeles, in the 1960s in response to another group known as the "Crips." As a criminal organization, the Bloods are known to be involved in murder, theft, robberies, extortion, and drug sales. Originally consisting mostly of African Americans and some Latinos, the group evolved to include a full range of ethnicities including white, Asian, and Caribbean persons.

Individuals who wish to join the Bloods must "Blood in" by either spilling their own blood or that of someone else. This must be done by some violent act including battle between the recruit and another gang member or by an act against a non–gang member. As in any organization, a recruit must demonstrate loyalty and obedience to the group starting with this first act.

INTERNAL ORGANIZATION AND COMMUNICATION STRATEGIES

The Bloods are part of separate cliques or "sets" depending on where they are located and their

primary goals. In this way, they compare to the college fraternity system, which has a national charter and many different chapters across the country.

Organizational communication within a complex group such as the Bloods is paramount. Traditionally, street gangs communicate through graffiti as well as through other signals and markings. These markings can include specific tattoos, hand gestures, and language. The most common tattoo is two burned dots over a single burned dot to resemble a dog's paw in blood. Blood members may also call one another "dog." The hand gestures can vary by "set" or when members are under legal supervision to deny affiliation and divert attention and trouble for the gang by law enforcement.

As with other gangs, the Bloods also identify themselves through a particular color: red. Gang colors can be displayed through hats, bandanas, and most commonly, a beaded necklace displaying a pattern with the appropriate colors. The word *Blood* has even been turned into and acronym the reads: Blood Love Overcomes Our Depressions.

BLOODS IN PRISON

Having started as a street gang, the Bloods are now an important prison organization, where they provide group safety and identity for their members as well as an outlet for aggression and criminal activity. As with other prison gangs, Bloods engage in various forms of violence, including physical assaults on corrections officers and sexual assault. They also seek to intimidate rival gang inmates in order to establish a sense of fear and territory. Much of their activity in prison centers on assuming and maintaining control of certain businesses particularly drugs and other forms of contraband.

The prison provides a fertile recruitment site for the street gangs. Indeed, although prisons attempt to control gangs they often facilitate their growth. Traditional methods of control drive gang recruitment underground rendering staff unable to protect inmates from threats and intimidation to join a particular gang. Drug trade inside prison expands the gang's reputation and wealth, thus strengthening its position and power both on the street and behind the walls. Bloods have long used the drug industry to fund their activities on the streets, and easily adapt it to the prison situation.

Due to the current war on drugs, increasing numbers of Bloods are entering prison. When incarcerated, these men often form "super gangs" such as the United Blood Nation (UBN) that started in Riker's Island Detention facility. This set includes independent Bloods from California, as well as members of New York sets including Nine Trey Gangsta Bloods (NTG), Miller Gangsta Bloods (MGB), Valentine Bloods (VB), Mad Dog Bloods (MDB), One Eight Trey Bloods (183), Mad Stone Bloods (MSB), Gangsta Killer Bloods (GKB), and Blood Stone Villains (BSV). The super gangs are controlled by a strict code of conduct. Bloods require that all members come to the aid of a fellow Blood above all other actions. They have a hierarchy for control that resembles the institutional hierarchy. There is a leader in the prison as well as in cellhouses. People known as enforcers keep members in line at the tier level.

CONCLUSION

Initially formed in Los Angeles to combat their rivals the Crips, Bloods have migrated to major cities throughout the United States including Chicago, New York, Philadelphia, Miami, and cities in Texas. Blood activity in Texas and Florida—especially Miami—rose very quickly because these states border Mexico, Central America, and South America, which are major distribution centers for drugs in the United States. Bloods are also concentrated in parts of New York City and certain parts of New Jersey. Because New Jersey and New York have so many different ports and many ways for the importation of narcotics through various drug cartels or organizations, the Bloods are able to grow and move the drugs on the street. Jersey City, Newark, and Camden are a few of the major Blood territories that resulted from the rise of the UBN

Once thought to be a criminal organization primarily aimed at counterbalancing their rivals, the Crips, the Bloods have expanded to the major urban areas

across the country. Their strength and power are increasing and present a formidable challenge to prison authorities. Latest estimates are that 25% of state correctional facilities have members of the Bloods organization, and that number grows annually.

BOOT CAMP

Boot camps were first established in the United States in 1983 as an alternative to traditional forms of incarceration. Most are residential facilities for juvenile delinquents or adult criminals with military-style structure, rules, and discipline. Boot camp programs are expected to reduce prison crowding and related costs. They are also intended to reduce recidivism and antisocial behavior. Finally, it is commonly believed that they can deter individuals from future offending while also helping to rehabilitate them through the imposition of discipline.

THE CURRENT SITUATION

There are currently more than 75 juvenile boot camps and military-structured programs in 39 states (Rogers, 2002). Modeled after boot camps for adult offenders, the first juvenile boot camps emphasized military discipline and physical conditioning. Offenders often enter the programs in groups and are commonly referred to as platoons or squads. While in the program, they are required to wear military style uniforms and engage in strenuous physical fitness activities, educational programs, treatment programs, and military drills (Mackenzie, Gover, Armstrong, & Mitchell, 2001). Offenders sentenced to boot camps are generally young, first-time, nonviolent felons. Most states, for example, restrict participation to offenders between the ages of 17 and 25, although a few have maximum age limits of between 25 and 30 years of age.

In general, boot camps are selective about the type of offenders admitted into the program. Juveniles undergo psychological, medical, and physical evaluations to determine eligibility. In their study, Mackenzie et al. (2001) found that the majority of the juveniles are young men around 16 years of age. On average these young offenders had been only 13 years when they were first arrested. Most had previously been committed to institutions.

DO BOOT CAMPS WORK?

Criminologists and criminal justice practitioners have evaluated the success of boot camps along a number of parameters. They have examined whether or not they reduce recidivism, prison overcrowding, or cost. They have also looked at the impact of military training on offenders, whether boot camps have helped inmates to adjust, and whether these institutions have had any success addressing the drug problem. So far there is no compelling evidence that boot camp participants recidivate less than the groups with which evaluators have compared them. Likewise, their effect on prison overcrowding is weak at best.

Overcrowding

According to Doris L. Mackenzie and Claire C. Souryal (1991), for boot camps to reduce prison crowding successfully, there must be a sufficient number of eligible offenders entering and completing the programs; and these individuals must be drawn from a population of prison-bound offenders, not from those who would otherwise be sentenced to probation. It is difficult for most programs to meet the first qualification, because they are simply too small to affect crowding. Meeting the second qualification greatly depends on who decides which offenders are placed in boot camp programs.

In some states (Georgia, South Carolina, Texas, and Arizona), as in Florida, judges sentence offenders directly to boot camp. If these offenders are denied entry or are dismissed, they are sent back to the court for resentencing. This type of decision-making structure suggests that a higher proportion of boot camp entrants are selected from those who would otherwise receive probation. Consequently, their incarceration in boot camp will have no effect on prison overcrowding rates at all.

Reduction of Cost

Do boot camp programs reduce costs? It is difficult to interpret the cost data from different states or to make meaningful comparisons across states because of differences in methods of accounting. However, in most states it seems that boot camps cost as much or more per day than traditional incarceration. In Oklahoma, for example, the staff-inmate ratio in boot camps was about four times greater than that for the general prison population, indicating that boot camps would be much more expensive than prison.

In Mississippi and Georgia, the boot camp programs are about as costly as a similarly sized unit in the prisons they adjoin. Cost figures vary from state to state and illuminate the higher costs of operating boot camps over the traditional methods (i.e., probation). For example, in the state of Texas the cost per youth in 1998 for probation supervision was $8.90 a day as compared to $88.62 for residential placement and $85.90 for a youth assigned to a detention facility (Criminal Justice Policy Council, 1999). According to Jerry Tyler, Ray Darville, and Kathie Stalnaker (2001), juvenile boot camps usually are more costly than most other traditional options, and with rare exceptions recidivism rates are extremely disappointing. Unfortunately, the limited data available do not show the effectiveness one might expect from the money and resources channeled into these programs.

Military Training

Boot camp programs are modeled after military basic training and aim to instill self-discipline, respect for authority, and fear of the criminal justice system in the offender. Offenders are required to wear military uniforms, march to and from activities, and respond rapidly to the commands of the drill instructors. Daily activities range from strenuous physical fitness to challenge programs (e.g., ropes courses). The military-style discipline of youths in boot camp programs has been controversial. The military has a very different mission than the correctional system. The ultimate goal of the military is to train young men to kill the enemy. Why would a method that has been developed to prepare people to go into war, and as a tool to manage legal violence, be considered useful for deterring or rehabilitating offenders? The militarism of boot camps, the use of hard labor, and efforts to frighten offenders away from crime may be counterproductive to appropriate behavior. Although boot camps do not provide training in the use of weapons or physical assault, they promote an aggressive model of leadership and a conflict-dominated style of interaction that could exacerbate tendencies toward aggression.

Inmate Adjustment

There have been mixed results about the impact of boot camps on juvenile offenders. Donald J. Hengesh (1991) argued that boot camps should be seen as a foundation for change, not an instant cure. They are designed to provide young offenders a sound foundation on which to build new lives. Hengesh pointed out that most offenders entering boot camps lack basic life skills, are in poor physical condition, have dropped out of high school, and have had considerable exposure to the criminal justice system. They lack self-esteem and have established track records of being quitters or losers whenever they are faced with obstacles or problems. Boot camps, according to Hengesh, are designed to equip these youthful offenders with the foundation to offset these problems, because boot camps teach responsibility through continuous strict conformity to program rules and by holding offenders accountable for their behavior.

In their study, Michael Peters, David Thomas, and Christopher Zamberlan (1997) found that youths in boot camps showed impressive improvements in academic skills and significant numbers of youths found a job while in aftercare. Boot camps

provide opportunities for personal development, learning technical and living skills, and drug treatment (Anderson, Laronistine, & Burns, 1999). According to Mackenzie et al. (2001), there were no reported differences between juveniles' anxiety and depression in two types of facilities (i.e., boot camps and traditional facilities) during their first month of confinement. Offenders in boot camps perceived their environment to be more positive, less hostile, and less conducive to freedom than juveniles in traditional facilities. Scales measuring changes over time found that juveniles in boot camps became less antisocial and less depressed than those in traditional arrangements.

Drugs

While it is clear that many offenders sentenced to boot camps need drug treatment and education, it is not clear whether these programs are the most effective way to provide it.

In Illinois, drug education and treatment are mandatory. During orientation, the offender's drug and alcohol history is evaluated, and based on the evaluation, the offender is placed at the proper level of treatment. The duration of treatment varies from 2 to 10 weeks, depending on the individuals. New York operates a six-month program, and all inmates, regardless of substance abuse background, attend alcohol and substance abuse treatment classes for approximately 200 hours. Texas offers a two-phase program that is part mandatory and part voluntary. The focus is on drug education and individual counseling, which lasts for approximately five weeks. Florida and South Carolina's programs focus exclusively on drug education, and participation is mandatory. In South Carolina, drug education classes meet for four hours each weekend during the first month. In Florida, inmates participate in a substance abuse workshop that meets for 15 days.

The efficacy of these programs has yet to be established.

CONCLUSION

Boot camp programs have been embraced by politicians who are looking for a quick fix for crime and the public who are demanding protection from violent young offenders. However, as a crime preventive strategy, there is little evidence that they work to reduce crime. Indeed, some evidence suggests that boot camps could accelerate rather than reduce crime.

Except in the case of violent offenders, there is evidence that many Americans support a broadened use of noninstitutional sanctions that would reduce system contact and costs. The most effective treatment programs are made available outside of the formal institutions of the juvenile justice system. These tend to be skill-oriented nonpunitive programs.

BRIDEWELL PRISON AND WORKHOUSE

Bridewell was the first correctional institution in England and was a precursor of the modern prison. Built initially as a royal residence in 1523, Bridewell Palace was given to the city of London to serve as the foundation for as system of Houses of Correction known as "Bridewells." These institutions, eventually numbering 200 in Britain, housed vagrants, homeless children, petty offenders, "disorderly women," prisoners of war, soldiers, and colonists sent to Virginia. Bridewells were relatively self-contained and distinct from county jails that functioned to hold those awaiting trial or punishment.

Photo 2 *The Bridewell concept carried over to the United States. Here Chicago's Bridewell, also known as Cook County Jail, shows men being forced to work in the prison's quarry.*

SOURCE: *Chicago Daily News.*

CHALLENGES OF A GROWING SURPLUS POPULATION

Sixteenth-century England was a period of enormous change. The unraveling of feudalism and the emergence of capitalism saw rising food prices, a change in official religions, dissolution of the monasteries, and the disbandment of private armies. These events released agricultural laborers, unemployed soldiers, and redundant monastic servants to seek work in the growing towns and cities. Those who could not find work roamed from town to town as homeless vagabonds; others were forced, by sickness or misfortune, into an impoverished life of debauchery, begging, and theft. In London alone, with a population of 75,000 in 1550, 12,000 desperately poor immigrants from around the country arrived, threatening to envelop the metropolis in vice and crime: "Citizens found themselves besieged in their streets by the leper with his bell, the cripple with his deformities and the rouge with his fraudulent scheme" (O'Donoghue, 1923, p. 137). Concern for the poor soon became mixed with fear of these "savages," "beasts," and "incorrigibles." "Respectable" citizens—and especially the new merchant classes—wanted "to protect themselves from the unscrupulous activities of this vast army of wandering parasites" (Salgado, 1972, p. 10), and demanded that something be done to make the city streets safe for the conduct of business.

THE DISRESPECTABLE UNDESERVING POOR

Based on ideas in Lutheran writing and models in Flemish Europe, in 1552, the ill-fated Protestant Bishop of London Nicholas Ridley requested that Bridewell Palace be donated to the city for the purpose of housing and transforming the problem of the streets. At Ridley's urging, a committee of city

aldermen and commoners distinguished between the *respectable deserving poor* and the *disrespectable undeserving poor.* The *respectable poor* included those suffering from sickness and contagious diseases, wounded soldiers, curable cripples, the blind, fatherless and pauper children, and the aged poor. These people were the responsibility of the more fortunate and would be segregated by their class and condition, given immediate assistance, including shelter, treatment, adequate maintenance, and in the case of the children, education and training, in a variety of houses and hospitals around the city. Such "respectable" citizens were seen as having fallen upon hard times through no moral fault of their own, by reason of failure in business, ill health, or other misfortunes.

In contrast, the *disrespectable poor,* including vagabonds, tramps, rogues, and a variety of dissolute, "loose" and immoral women, harlots, unfaithful wives, and prostitutes, were thought to be worthless. Most vilified was the "robust beggar," whose career was seen as a choice for a soft and easy life. Such people were to be punished with imprisonment and whipping, before being trained to honest work in a prison, which should also be a house of work, with opportunities for the amendment of character. The "stubborn and foul" would make nails and to do blacksmith's work; the weaker, the sick, and the crippled might make beds and bedding. The premises would also be used to train poor and resistant children into various trades. According to Ridley, Bridewell was intended "to deal with the poverty and idleness of the streets, not by statute, but by labor. The rogue and the idle vagrant would be sent to the treadmill to grind corn, but the respectable poor—whether young, not very strong, or even crippled—would be taught profitable trades, or useful occupations" (O'Donoghue, 1923, pp. 150–151). Training children for work was thought to be an early form of crime prevention.

THE BRIDEWELL SYSTEM

Bridewell was self-contained, managed by city of London aldermen and commoners who appointed its judges and court personnel, including clerks, treasurers, governors (warders), beadles, and sheriff, and set its system of punishment. By regulation, beadles (early police) were directed to patrol the streets of the city, clearing them of beggars, vagrants, and idlers, whether men, women, or children, who were conveyed to Bridewell, to be dealt with by its court. Beadles were empowered to search all suspicious houses, alehouses, skittle-alleys, cock-pits, dancing saloons, gambling dens, and the like. The appointed officers were authorized to convey to Bridewell the keepers of such places as well as the "ruffians and masterless men" arrested therein.

Typically, a presiding judge would hear the case against those "raked in" from the streets whose crimes would include begging with no visible means of subsistence and pilfering from stores. In any year, Bridewell handled some 1,300 persons (an average of 26 a week), who were usually sentenced to no more than a month of confinement. Destitute beggars and vagrants were often sentenced to four days and "a good washing," before being returned to their parishes. Individuals were usually "punished and set to work." "Punishment of course meant the lash—laid on with spirit by an unsentimental brute of a hempman—and it was carried out in a small room, hung with black . . . in the presence of some governors. . . . After receiving their deserts in public, they were sent down stairs to beat hemp or gather up old rags and wastepaper of the government monopolist, or to scour out the city ditches" (O'Donoghue, 1929, pp. 10–13) or set to grind corn on a treadmill.

Punishment at Bridewell had multiple dimensions. The standard whipping (also called flogging) with willows or holly rods of up to 100 stripes or lashes was administered to men, women, and children on their backs as part of an initial punishment. Later this punishment was extended to those who did not work enthusiastically and to anyone who broke various internal rules. After being whipped, people were often displayed in a public pillory where they were pelted with dirt, stones, and dead dogs and cats. Bridewell also had a pair of stocks, and a block, on which the "women of the streets" would have to beat out certain amounts of hemp a day with heavy mallets.

In addition to corporal punishment individuals could be confined in a variety of places within Bridewell, including a dungeon, known as "the

hole," and the "Little Ease," which was a cell so small and low that a prisoner had to spend hours there in a squatting position. There were also torture chambers where people were tied by their hands fully stretched above their heads with manacles (so that their toes just touched the cell floor). Another torture (also called the manacles) was known as the "Scavenger's Daughter." This comprised a hoop of iron that compressed the human body into a small ball at the turn of a screw. Finally, there was the "gibbet," which, although rarely used and only for serious offenses, involved suspending a victim in an iron cage where he or she, if already dead, was left to rot, or if alive, to die of starvation and exposure.

Those who stayed in the Bridewell slept on straw beds in filthy, vermin-infested, dark and foul-smelling conditions and were fed meager portions of putrid food. This was after many had been separated from any money or property they may have had, which went toward the livelihood of the governors. Bridewell did not segregate its inmates by age, or by guilt or innocence, although women had their own quarters under the charge of a matron, and political and religious prisoners were separated from the rest, as were injured soldiers. All were allowed visitors from family and associates, and although direct communication with the outside world was prevented, carriers and costermongers served this function.

CONCLUSION: BRIDEWELL'S CONTRIBUTION TO PENAL REFORM

Bridewell is usually seen to be the precursor of the modern prison. Although its system of Houses of Correction did not immediately replace the preexisting forms of corporal and capital punishment, over time they were supplemented by attempts at education and training, particularly for the young. In workhouses, the object was reform of the prisoner, who was to be passed through its workshops and discharged as soon as work could be found in domestic service, workshops, or at sea. Indeed, Bridewell functioned as a kind of labor exchange for youths. Many of the boys and girls were educated in music and many boys had masters on the premises from whom they learned an apprenticeship in such trades as glove making, felt making, beaver hat making, and silk weaving, for up to 7 to 10 years. The work was long and the sustenance meager but the apprentices, as many as 100 at a time, were protected by the governors from harsh treatment by their masters. They were usually kept clean and dressed in new clothes for special occasions. In some cases, they left with financial support from well-wishers to make decent livelihoods employing their own apprentices.

William Penn's "Great Law" of Pennsylvania in 1682 fused the hard labor of the workhouse (Bridewell) with the confinement of detention jail (Newgate) to form the modern prison system. Chicago's Cook County Jail, which employed inmates at quarrying and hard labor, was known as "the Bridewell." The idea that offenders could be reformed through work and training continues to be part of modern penal theory. Likewise the notion that there are deserving and undeserving poor is often cited as an explanation for penal practices. Though clearly there are many differences between the early workhouses in Britain and contemporary prisons, connections can be made, suggesting that any historical account of punishment should include these foundational institutions.

BROCKWAY, ZEBULON REED (1827–1920)

Penologist and prison reformer Zebulon Reed Brockway ushered in a new age of social control in America, one ostensibly based on enlightened and rational scientific principles. He is perhaps best known for his criticism of determinate sentencing and his advocacy of its replacement: the *indeterminate sentence*.

In contrast to the determinate sentence, the principle of indeterminacy permits prisoners to complete their rehabilitation in the community if experts judge them sufficiently reformed. Brockway believed the determinate sentence was an "active cause of crime" because prisoners who were not yet rehabilitated could be released. Indeed, there was no incentive to reform. He felt the indeterminate sentence was a better alternative because it gave correctional authorities several concrete tools with which to reach the rehabilitative ideal. He thought it replaced the "law of force" with the "law of love," instilling in prisoners "confidence," "courage," and "moral excellence," which Brockway identified as "the very essence of virtue." Because the prisoner had to earn the right of release by obeying the rules of the institution, he believed indeterminate sentences made self-interest work to the advantage of prison authorities by enhancing discipline. They also permitted the examination of inmates by panels of experts, thus allowing prison authorities to time the release of reformed persons into society and to monitor them in the community.

Born in Lyme, Connecticut, in 1827, Brockway spent his life in the service of repressive social control institutions. He began his career as a guard at the Connecticut State Prison at Wethersheld in 1848. By 1861, after positions in numerous prisons, he had scaled the ladder of the correctional hierarchy to the powerful position of superintendent of the House of Corrections in Detroit. It was at this post that he first tried his hand at reform, participating in the construction of an indeterminate sentencing law that was aimed at first-time offenders. Although Michigan courts struck down the legislation, Detroit foreshadowed things to come.

During the 1870s, Brockway worked closely with several reformers, including Enoch Wines, who drafted the Declaration of Principles delivered at the National Congress of Penitentiary and Reformatory Discipline in Cincinnati in 1870. Brockway's major contribution at the congress was his paper "The Ideal of a True Prison for a State," wherein he argued that penitentiaries properly have two functions: (1) the protection of society by the prevention of crime, and (2) the reformation of criminals. He argued against relying on force and fear as tools of control. Well-run institutions, for him, did not need to intimidate or coerce inmates. Rather than punishment to achieve compliance, he advocated systems of rewards. The role of corrections was to provide education and training and to teach inmates self-respect and self-control. Brockway advocated separate facilities for women, which he argued should be under the management of women. He advocated a medical model whereby penitentiaries were to be transformed into reformatories focused on classification, rehabilitation, and prevention; in other words, society would treat the criminal, not the crime.

ELMIRA

Brockway moved from Detroit to New York in 1876 to head up a new state reformatory at Elmira, where he served as superintendent until 1900. At Elmira, Brockway was given wide latitude to pursue his ideas. He experimented with halfway housing arrangements, educational programs in trade and industry, and rigid military style training. Among his most important innovations was an incentives scheme based on the marks system. Used by correctional facilities in Ireland and pioneered by Captain Alexander Maconochie of the Norfolk Island penal colony in Australia, the marks system required inmates to begin their sentences with a number of strikes against them. If they consistently followed prison rules, strikes would be removed. Once all strikes were removed, they were free to leave. Brockway adopted a scheme using privileges for proper conduct in the 1880s, producing the first working parole system in the United States. His success at implementing the principle of indeterminacy

led to the adoption of similar programs throughout the country.

CONCLUSION

Elmira Reformatory and the "Father of American Corrections" could not boast of a spotless record. Brockway's methods came under scrutiny in the 1890s when prisoners began to report physical and psychological abuse. On Governor Roswell Flower's orders, the State Board of Charities conducted an extensive investigation and found evidence of inhumane treatment, including shackling, starvation, inadequate medical attention, beatings with paddles and leather straps, and psychological tortures, such as solitary confinement. A second investigation, requested by Brockway, was inconclusive, and on this basis the governor dismissed the case against Brockway. In 1899, newly elected Governor Theodore Roosevelt appointed a new management team that usurped Brockway's power. Brockway left Elmira the next year. He was 73 years old. He continued to lead an active life, publishing an autobiography in 1912 and serving as mayor of Elmira. He died in 1920.

BUREAU OF JUSTICE STATISTICS

The Bureau of Justice Statistics (BJS) is a division within the U.S. Department of Justice, whose primary task is to compile, analyze, publish, and disseminate data on crime and justice. It was founded in 1979, and since then has gathered statistical information about criminal offenders, victims of crime, and the criminal justice procedures and processes used by state and federal governments. Legislators and criminal justice practitioners use the information accumulated by the BJS to create new programs and policies aimed at combating crime and to ensure that the U.S. justice system is efficient and fair. According to the Bureau of Justice Statistics Strategic Plan FY 2003–2004 (BJS, 2002, p. 1), the "BJS's paramount goal is to improve the quality of our national intelligence on crime and justice and to enhance the quality of the debate concerning societal policies."

THE PRIMARY TASKS OF THE BJS

The BJS publishes annual information on criminal victimizations, offenders under correctional supervision, and federal statistics on criminal offenders and case processing. One of the annual publications is the *National Crime Victimization Survey* (NCVS). The NCVS data, which are collected by the Bureau of the Census from approximately 150,000 victims of crime, describe the effects and consequences of victimization. Information within the NCVS reveals how victims and offenders meet and the specifics of the crime, such as weapons, costs of the crime, and place and time of the offense.

In addition to the annual NCVS, the BJS releases intermittent publications on administrative and management issues in policing and corrections, practices and policies among prosecutors, and criminal and civil court processes in state courts. It also produces various work on felony convictions, characteristics of correctional populations, budgeting and expenditures in criminal justice, employment information, and other research on criminal justice topics.

HOW TO ACCESS BJS INFORMATION

Information disseminated by the BJS is available to criminal justice policymakers and scholars in a number of ways. First, BJS findings can be requested through the National Criminal Justice Reference Service (NCJRS). The NCJRS provides copies of reports to interested parties and maintains a mailing list. The NCJRS will provide referrals to other sources of criminal statistics for anyone interested in these data.

Second, research information from the BJS can also be downloaded from the Internet through the National Archive of Criminal Justice Data (NACJD). The NACJD provides secondary data for quantitative research in order to facilitate studies in the field of criminal justice. The NACJD will also provide technical assistance to individuals interested in performing quantitative research.

Third, the Federal Justice Statistics Resource Center (FJSRC) maintains data collected from federal policing, judiciary, and correctional agencies on criminal suspects and defendants processed in the federal system. Researchers can download criminal justice data sets and search for statistics on federal offenses and offenders on the FJSRC Web site, which operates in conjunction with the BJS.

Fourth, the BJS sponsors the National Clearinghouse for Criminal Justice Information Systems (CJIS). The CJIS acts as a clearinghouse for information on criminal justice resources and grant opportunities. It provides information on criminal justice software programs, information technology, best practices, case studies, and federal and state criminal justice system activities. Finally, the Infobase of State Activities and Research (ISAR) provides information about research and publication activities in individual states. The BJS provides publications on state-related criminal justice programs to the ISAR.

REPORTING PROBLEMS FACED BY THE BJS

Although the BJS attempts to provide accurate statistical information in a timely manner, statistical research of any sort raises a number of problems. The NCVS, for example, is often criticized because of the methodology used in the survey. The NCVS is mailed to victims of crimes or, in some cases, administered over the phone. The rates of response may vary from year to year and may be influenced by a number of factors such as race, gender, type of victimization, education, socioeconomic class, whether or not the victimization was reported to the police, and so forth. In other words, an educated individual who understands the purpose of the NCVS or is familiar with the survey from coursework in a college or university may be more likely to return or participate in the survey because he or she realizes the information is confidential and is not likely to lead to individual identification. However, someone who was victimized in an extremely personal and/or traumatic manner, such as rape, and who is not familiar with the purpose of the NCVS may not return or participate in the survey for fear of personal identification or because of embarrassment, anger, worry, or other emotional or personal reasons. The lower the response rate, the less able the researcher is to generalize the results to an entire population.

The NCVS also raises questions about respondent trustworthiness. Because the survey asks for information that is extremely personal and of a traumatic event, individuals may not fully disclose the extent of type of their victimization, the factors that led up to or instigated their experience, or the disposition of the case. A victim's choice whether to fully disclose may be intentional or unintentional. A person may intentionally choose not disclose the information because of factors such as fear, anger, or humiliation about the victimization or the circumstances

surrounding the victimization. He or she may unintentionally not release the information because the victim cannot remember or does not know the answers to the information requested in the survey. The respondent may also intentionally or unintentionally provide answers to the survey that may be misleading. This may be the case in situations in which the individual manipulates the answers to meet their perception of socially accepted behaviors, to look good in the eyes of the researcher, or to disguise his or her own role in the offense or victimization.

Other statistical information used in BJS publications comes from a variety of state and federal resources (prosecutor's offices, corrections departments, prisons, etc.). These data may also be susceptible to error because of the recording procedures used by the various agencies. The agencies may also maintain the statistics for their own purposes and not necessarily the reasons provided by the BJS. Finally, the figures provided by agencies may be manipulated by administrators to secure more funding, to draw attention to particular programs or needs, or to look good to other agencies.

Fortunately, the BJS has worked continuously to maintain internal and external quality standards for validity and reliability in its statistical reports. One quality standard used by the BJS is an examination of data needs with regard to legislative mandates. Reviews are consistently held to determine whether additional reports should be added to the publications list or if reporting procedures should be modified to meet legislative priorities. The BJS also requires agencies to conform to particular reporting procedures and data collection requirements. In addition, the BJS annually compares statistics gathered from state and federal agencies and in the NCVS with those published in the Uniform Crime Reports available yearly from the Federal Bureau of Investigation (FBI).

CONCLUSION

The BJS works closely with the American Statistical Association (ASA) and other agencies to verify and critique the statistics programs used by the BJS. Other agencies provide experienced researchers to analyze the data collected while focus groups of experts discuss new policy initiatives, advice from public interest groups on how to make statistical information more accessible to the public and academic researchers, and information on the suitability of BJS statistics in legislative decisions. Because of all of these strategies, the BJS is able to provide valid and reliable statistical information to criminal justice policymakers, state and federal criminal justice systems, and the public on criminal offending, victimization, case processing, and the feasibility and success of programs, legislation, and initiatives in criminal justice.

C

CAMPUS STYLE

The idea in architecture that form should follow the function or purpose of the building is apparent in prison design. Massive impersonal cellblocks reflect eras when themes of punishment and control dominated. In contrast, the development of campus-like facilities, usually in rural areas, with small living units and other services in buildings distributed within open spaces reflected a belief that treatment and reintegration should be key correctional goals. Earlier juvenile and women's institutions in some states and at the federal level were built in campus style with cottages, including kitchens, dining rooms, and in some facilities, nurseries, designed to provide a homelike and domestic environment. The design assumed that both juveniles and women could be best reformed through education and work and by the example set by staff members in a humane setting.

During the 1960s, when ideas about treatment, unit management, and reintegration dominated corrections, both states and the federal correctional systems began to build campus-like minimum- and medium-security facilities with scattered housing units for adult male prisoners. These units, staffed with unit managers and treatment personnel, usually provided rooms for 30 or 40 inmates. They were built with wood, light, and color for a more normalized environment. Dining halls, school buildings, and recreational facilities, work, administrative and health areas were often arranged in a more centralized open plaza area, with secure fencing surrounding the entire layout.

HISTORY

Although campus-style prisons proliferated in the United States in the 1960s and 1970s, penal institutions with similar forms had been built earlier, including the New Jersey Reformatory at Annandale completed in 1929 and the Missouri Intermediate Reformatory at Jefferson City completed in 1932. The Illinois women's prison at Dwight opened in 1930, and in 1958 the Michigan Training Unit at Ionia was opened. At the federal level, the Federal Industrial Reformatory and Industrial Farm for Women was opened in 1927 on more than 500 acres of land in Alderson, West Virginia, with 14 cottages, each with a kitchen and dining room and rooms for approximately 30 women, a school building, industries building, laundry, and a working farm in what was described as a "beautiful, open, campus-like setting" (Keve, 1991, p. 83).

An instructive example of the changes that occur in philosophy and architecture in the transition from an adult female to an adult male institution occurred at the federal facility at Seagoville, Texas. It opened

in 1940 in farmland, with a capacity for 400 women on a cottage plan similar to that of Alderson and a fence described as built to keep cows in and people out. In 1942, with the advent of World War II, it became a detention center for Japanese, German, and Italian families. In turn, in 1945 Seagoville became the "showcase" federal minimum-security open facility for men with the campus-like setting providing a "climate" for changing attitudes, while the domestic kitchens and dining rooms were removed from the cottages.

CHANGING PENAL IDEAS AND DESIGN

During the 1960s, as they had earlier for juveniles and women, ideas about the goals of prison turned toward rehabilitation and reintegration, and prison architecture, in turn, changed. Critics began to argue that traditional penal institutions, often huge fortress-like buildings designed to be menacing, did little to prepare individuals to move into successful lives outside of these institutions. In contrast, campus-style prisons were believed to provide a more normalized setting that would assist people in returning to the community. Inmates could be housed in smaller groups within units that could provide a range of specialized programs and living conditions, while unit management could increase both contact and knowledge by staff of individual treatment needs. Distributing other daily activities elsewhere on the campus, rather than providing all the amenities in a single building, was viewed as a more realistic experience of community living. In these institutions, prisoners frequently left their cells to visit the dining halls, or to go to work, recreation, and school buildings. Health services and visiting and chapel areas were also housed in separate buildings.

Campus-style prisons were purposefully designed to provide a different look and feel to traditional penal institutions. Rather than bars of steel, clanging doors, and the rattle of keys, they tended to use wooden doors, laminate surfaces, carpeting, and brightly colored paint. All of these changes in style were thought to make these institutions appear more like the world outside of prison.

CAMPUS-STYLE INSTITUTIONS

In *The New Red Barn,* William Nagel (1973) discussed several new campus-style prisons he and his group visited during their examination of prisons in the United States for the American Foundation's Institute of Corrections in the early 1970s. They visited juvenile institutions in Georgia, Wisconsin, Washington, and Texas as well as the Robert F. Kennedy Youth Center in Morgantown, West Virginia. This federal facility for youthful offenders opened in 1969 in a rolling campus provided with modern teaching equipment, a well-designed chapel, an impressive gymnasium and swimming pool, and extensive classification and treatment programming in its living units. Nagel also described a campus-style facility opened in 1972 for adults at Vienna, Illinois, that later included the local community college within its grounds. He thought the housing units, built around an open area that included churches, shops, schools, and a library, looked like garden apartments. He noted that many of these facilities including those located in Fox Lake, Wisconsin; Ionia, Michigan; and Vienna, Illinois; had very bright and attractive dining areas.

As was their goal, campus-style prisons present a more humane design that can make the prison experience a little easier. They are also more flexible for programming, classification, and unit management. Their building style can serve a variety of functions more cost effectively, while prisoners and staff members have the opportunity to be outside, enjoy fresh air, and experience the changing seasons. A visit to a campus prison may lead some to believe that security is less than in other prison designs, but while some are open facilities, others are very secure. In many states, campus-style prisons have double fences, which deter and prevent escapes by offenders, lessening the fears of neighboring residents, while others are active in providing community services.

CONCLUSION

While some campus-style prisons were built in the early 20th century, they proliferated in the 1960s

and 1970s in the United States. Penal philosophy focusing on the reintegration of prisoners into society after they served time in prison led to construction of many campus-style prisons by the end of the 1970s. Changing public attitudes, movements to "get tough on criminals," and extensive overcrowding has led in most prison systems to changing styles of prison architecture, exemplified in the growth of the supermax prison. Campus-style prisons remain, however, as the humane symbols of their era.

CANADA

Canada has two separate penal systems at the federal and provincial/territorial levels. The federal system imprisons individuals who commit the most serious offenses and are sentenced to two years or more, as outlined in Section 731(1) of the Criminal Code of Canada. All federally sentenced persons fall under the jurisdiction of the Correctional Service of Canada (CSC). In contrast, provincial and territorial correctional facilities incarcerate people who receive a sentence of less than two years. They also hold accused persons on remand awaiting trial, those who fail to pay a fine, federally sentenced individuals appealing their conviction and/or sentence and individuals who apply to serve their provincial time in a federal institution under the Exchange of Services Agreement.

Although there are considerable differences between the federal and provincial/territorial systems, there are also some striking operational similarities between them. For example, CSC's total operational expenditure in 2000–2001 was $1.3 billion, while at the provincial/territorial level it was $1.2 billion. Of these totals, $879.3 million or 80% of the total federal operating expenditure was directed toward custodial services, and in comparison $948 million or 69% of the total provincial/territorial operating funds were allocated to custodial services. These figures translate into an average daily inmate cost of $189.21 at the federal level and $137.44 at the provincial/territorial level. Furthermore, in 2000–2001 the two systems employed a similar number of full-time equivalent staff: 12,572 federal staff and 13,084 provincial/territorial staff.

On average, Canada's rate of incarceration is much lower than in the United States, but substantially higher than in many Western European countries. Each year, the federal system processes a much smaller number of persons than the provincial/territorial systems. For example, 7,723 individuals were admitted to federal custody in 2000–2001 as compared to 227, 279 who were sent to provincial/territorial institutions. Nonetheless, the average number of persons incarcerated at any given time was much more comparable between the two systems, with 12,732 individuals in 68 federal prisons and 18,815 in 143 provincial/territorial institutions. Nationally, in 2000–2001 there was a federal incarceration rate of 54 persons per 100,000 Canadian adults, and a provincial/territorial rate of 80 per 100,000 adults. In the provinces and territories, the rate varied extensively from 684 per 100,000 adults in the Northwest Territories, to 150 in Saskatchewan, and 47 in Nova Scotia. Due to the variations within the provincial/territorial systems, this entry will focus mainly on the federal institutions and the policies of the CSC.

HISTORY

Four models of punishment characterize the history of corrections in Canada: deterrence, rehabilitation, incapacitation, and rehabilitation. Each model has directed the policies and practices in different time periods, and at times have overlapped. In general, CSC's approach to the incarceration of men and women has been one and the same; however, the history of women's imprisonment varies somewhat from that of men's, as it has been influenced by dominant conceptions of femininity, the sexual division of labor, and popular theories of female crime. There has also been a similar, although less pronounced, specific history to the incarceration of Aboriginal peoples.

Deterrence

From the 1600s through to the 1820s, Canadian offenders were dealt with according to ideas of deterrence. As a result, severe physical punishment, such as flogging and mutilation, were common. The deterrence model continued to dictate the response to crime through the 1820s and 1830s; however, this period also introduced what was believed to be milder strategies of punishment, including incarceration and hard manual labor.

As in other countries, 19th-century penal reformers sought to find more humane methods of dealing with offenders than corporal punishment. As part of this movement, the first Canadian penitentiary was built in 1835 in Kingston, Ontario, and the federal Department of Justice (DOJ) was established in 1868. The Kingston penitentiary sought to deter criminals through the threat of incarceration and train those within it in socially acceptable behavior that would prevent them from engaging in future crime. By 1868, the DOJ took over responsibility for Kingston as well as the two penitentiaries in St. John, New Brunswick, and Halifax, Nova Scotia. The creation of the DOJ changed ideas about criminals and their conduct since its officials believed in the necessity of humane treatment and reform. It was still some time, however, before the prison completely replaced earlier strategies of corporal punishment. Likewise, it was not until the 1930s that offender rehabilitation was seriously considered. Around the same time, in 1938, Canada's federal correctional system and the CSC were established.

Rehabilitation

The period from post–World War II to the early 1960s is typically identified as the rehabilitation era in Canada. Two reports helped shape this time and one facilitated its demise. First, the 1937 report of the Royal Commission on the Penal System of Canada, chaired by Mr. Justice Archambault, concluded that the primary goal of the correctional system should be the reformation of the offender in conjunction with community protection. A second report submitted in 1956 by the Justice Department Committee, and chaired by Mr. Justice Fauteux, reaffirmed rehabilitation as the primary objective of corrections, arguing that the offender was damaged during developmental years and could be treated within the prison system.

By the mid-1960s, growing skepticism surfaced about the effectiveness of rehabilitation programs in Canadian penitentiaries. In response, *The Report of the Canadian Committee on Corrections,* also known as the *Ouimet Report* was released in 1969. As with previous studies, the committee strongly supported rehabilitation, except this time in the community rather than correctional facilities. Shortly afterward, an article by Robert Martinson in the United States (1974), titled "What Works—Questions and Answers About Prison Reform," was selectively adopted into Canadian penal ideology to support the demise of prison rehabilitation programs. In place of rehabilitation, deterrence resurfaced as the correctional aim of the Canadian penitentiary system.

By the late 1970s, offender rehabilitation was nearly obsolete from Canada's prison system. In 1977, a federal government task force officially rejected the medical model approach to offender rehabilitation and replaced it with the program opportunity model, which stated that offenders were ultimately responsible for their behavior. The opportunity model placed the responsibility of rehabilitation on the prisoner with no compulsory intervention from treatment officials.

Incapacitation

Largely in response to the perceived failure of prisoner rehabilitation, throughout the 1970s and into the 1980s Canadian corrections sought mainly to incapacitate offenders while emphasizing punishment and deterrence. This was a short-lived approach, however, and was soon replaced with the idea of selective incapacitation of high-risk, dangerous offenders that partially grew out of a study conducted by the RAND Corporation in the United States.

The aim of the RAND study was to help administrators differentiate between low-risk and high-risk offenders. Follow-up research created a seven-point item scale to distinguish between those offenders who posed the greatest danger and should be incapacitated and others who could be released after shorter sentences. This scale was then used by officials to designate offenders as high, medium, and low risk. Ultimately, such ideas of selective incapacitation led to the construction of classification tools to identify offender risks and needs, both within the prison and the community.

Reintegration

The idea of offender reintegration built on the concept of selective incapacitation of high-risk offenders and rehabilitation in the community. Through the 1980s, the federal system maintained its commitment to various forms of community-based sanctions. Some suggest that the rising cost of incarceration greatly influenced this focus on less expensive community reintegration options.

In the late 1980s and early 1990s, due in part to this new focus on community reintegration, the public and penal administrators became increasingly concerned about community safety. In response, the CSC began to model its offender assessment and treatment techniques on its own risk/need research. Institutional and community risk/need assessment scales were implemented in the early 1990s, and since that time CSC has risen as an international leader in the field. Its classification tools collect information on factors to determine criminal risk and identify offender needs, which in turn underlie its management of prisons and prisoner populations and well as offenders reintegrating into the community.

CURRENT POLICY

Since the late 1990s, the guiding ideology of CSC has incorporated the four models of punishment that characterize the history of Canadian corrections. CSC currently stresses offender reintegration, with primacy afforded to community protection (thus selective incapacitation), and maintenance of incarceration for punishment/deterrence with deceased attention on institutional offender rehabilitation. This is relayed in CSC's mission statement, first produced in 1997. It reads:

> The Correctional Service of Canada, as part of the criminal justice system and respecting the rule of law, contributes to the protection of society by actively encouraging and assisting offenders to become law-abiding citizens, while exercising, reasonable, safe, secure and humane control.

CSC's current attention toward reintegration, and thus decreased incarceration, is supported at-large within the community. However, how CSC's ideology transfers into policy and practice is called into question on many fronts when the offender population and its characteristics are considered.

POPULATION CHARACTERISTICS

These days, the typical federal prisoner in Canada is poor, male, single, undereducated, and a substance abuser. He also has an unstable employment history and is disproportionately likely to be from a racial minority group. In terms of the female population, over 50% are mothers, the majority of them are the primary family caregiver, and an overwhelming percentage have a background of sexual abuse and violence. In 2000–2001, women made up 5% of federal (and 9% of provincial/territorial) admissions, while Aboriginal peoples comprised 17% of federal (and 19% of provincial/territorial) admissions. Given that indigenous people make up only roughly 3% of Canada's total population, their

numbers in the penal facilities of either system are clearly elevated.

Men and women differ in the age at which they are federally incarcerated. In 2000–2001, 47% of male and 56% of female prisoners were between 20 and 34 years of age. At a higher percentage but with similar proportional difference between the sexes, 58% of Aboriginal males and 66% of Aboriginal females were between the ages of 20 to 34. There is diversity as well in the percentage of men and women serving their first federal sentence. Sixty-two percent of males and 82% of females were serving their first penitentiary sentence, and a comparably lower 57% of Aboriginal males and 72% of Aboriginal females were. Finally, men and women also differ in terms of how long they are incarcerated. The average length of sentence for 31% of males was between 3 and 6 years, whereas it was under 3 years for 36% of females. Likewise for Aboriginal males, the most common sentence was 3 to 6 years (33%) and for 35% of Aboriginal females it was under 3 years.

CSC periodically assesses its prisoner population to determine individuals' risk to the public and to the security of the institution, staff, inmates, and themselves. On April 29, 2001, the majority of males were classified as medium security (59%), followed by minimum (21%) and maximum (14%). This varied significantly for women, of whom the majority were classified as minimum (44%), followed closely by medium (40%) and then maximum (9%). Most male and female Aboriginal offenders were classified as medium (62%), followed by minimum (17%) and maximum (16%).

In 2000–2001, the most common offense of all federally sentenced persons was a Schedule I, which includes the most serious crimes with the exception of murder. Fifty-nine percent of men and 44% of women, and 67% of Aboriginal males and 56% of Aboriginal females, were imprisoned for a Schedule I offense. The second most common offense differed between the sexes. Sixteen percent of men in general and 21% of Aboriginal men specifically were imprisoned for a sex offense, while 24% of women and 22% of Aboriginal women were incarcerated for a drug offense.

Examining the prisoner population from the operational standpoint of CSC, the average annual cost of incarcerating an individual in 2000–2001 at the federal level was $88,427. Broken down by sex, this figure corresponds to an amount of $66,381 for men and $110,473 for women. Women are more expensive to imprison largely because of their fewer numbers and the legal requirement to provide program and service equity with males. In comparison, the average annual cost of supervising an individual in the community (e.g., parole) in 2000–2001 was $16,800.

In 2000–2001, there were also 81 escapes from federal facilities, while at the provincial level there were 1,110. Although this appears to be a dramatic difference, as a percentage of all custodial admissions it translates into a rate of 1% at the federal level and 0.5% at the provincial/territorial level. Finally, that same year there were 43 deaths in federal facilities and 49 in provincial/territorial institutions. As a percentage of all custodial admissions, this translates into 0.6% of all federal admissions and in comparison only 0.02% of all provincial/territorial admissions. Of the provincial/territorial deaths, 28 were suicides and 2 were murders while federally there were 9 suicides and no murders.

WOMEN PRISONERS

For the most part, CSC's treatment of female prisoners has and continues to be subsumed under its treatment of male prisoners. This being said, there is also a history specific to female prisoners in Canada. As relayed, this history has been influenced by dominant conceptions of femininity, the sexual division of labor, and popular theories of female crime.

Historically, women were incarcerated in men's institutions in Canada. Women who were sentenced to prison were thought to be "unnatural," since it was generally viewed as unfeminine for women to be involved in crime. Thus, the few incarcerated women were granted little attention in terms of care and treatment within the men's institutions. For example, women were incarcerated in makeshift sections of the institutions and they did not have access to programming.

In 1934, the first separate facility for federal female prisoners was opened, the Prison for Women, across the road from the Kingston penitentiary. At the foundation of the prison's operation was acceptance

of a traditional role for women, emphasizing their domestic position in society. Women were taught, for example, to be better seamstresses and homemakers and to act like proper ladies. Efforts at reforming the female criminal into a traditional caregiver continued until the 1960s.

In the mid- to late 1960s, the public advent of feminism initiated the identification of women who committed crimes as offenders (i.e., Adler's 1975 liberated female criminal) and this assisted with the placement of females on the corrections agenda. This is similar to the U.S. experience, where serious acknowledgment of the unique experiences of women prisoners surfaced in the early 1960s. In Canada, even though CSC was claiming to acknowledge differences between males and females, it did little to account for this understanding in its policies and practices.

The 1970s and 1980s were witness to a significant shift in CSC's response to the female prisoner. No longer was attention focused on differences between females and males, but rather, it was placed on formal equality between the sexes. The problem with this was that the standard against which the female was compared was the male, which disregarded the specific and unique needs of the federal female prisoner in general, and within specific populations in particular (i.e., Aboriginal women). Some practices during this period also remained consistent with the traditional patriarchal view of women prisoners, such as institutional programming at the Prison for Women that supported normative standards of femininity (e.g., hairdressing courses, child care training).

In the early 1990s, apparent progress was made by CSC in its acknowledgment of the unique needs of federal female prisoners *and* their equitable treatment in comparison to males. Goff (1999) summarized:

> In essence this approach recognizes that female offenders and male offenders are different, hence they should have programs, services and facilities designed to meet each group's specific needs. A key component in this ideology is the women-centred approach to corrections, which argues that policies must be restructured to reflect the variety of realities experienced by women and men. (p. 169)

Examples of the translation of this approach into practice were the creation of the position of Deputy Commission for Women and the construction of five regional institutions and a healing lodge for federally sentenced women to replace the one centrally located prison in Kingston, Ontario. However, such actions were criticized for continuing to apply the male standard to the female prisoner. It was argued that the ideal of the woman-centered approach was not translated into practice.

An example of CSC's current application of the male standard to the female prisoner is its Offender Intake Assessment (OIA). The OIA is a form of risk/needs measurement that was introduced by the CSC in 1994 as a part of all federal prisoners' institutional intake. The OIA was not specifically constructed to measure female risk and needs, and so women's experiences are not at the core of the instrument. Many are therefore critical of the measurement tool, noting some research has concluded that the tool imposes harsher conditions of imprisonment on women (e.g., increased security classification), does not account for women's roles as mothers and caretakers, and negatively affects women's treatment options in prison and upon release. This criticism is not specific to Canada, as it is raised in U.S. corrections as well. In early 2000, CSC initiated work in the area of female-specific risk/needs assessment, but the findings are yet to be publicly released.

ABORIGINAL PRISONERS

Aboriginal peoples in Canada have suffered and continue to experience a number of forms of racial oppression. This is largely a consequence of capitalist development in Canada, which continues to be highly dependent on the perpetuation race, gender, and class divisions. As with African Americans in the United States, Aboriginal peoples are more likely to be incarcerated upon conviction, denied bail, and held in custody longer in comparison to non-Aboriginal peoples. Until recently, there has been limited attention allotted to race and the federal prisoner by the CSC. The incarceration of Aboriginal peoples, as relayed at the start of this

entry, shows they are disproportionately represented within the system, have greater chances of being incarcerated for a second time, and have higher institutional security classifications. This all points toward the need for specific attention to Aboriginal prisoners. Some advances have been made by CSC in recent years, and include the construction of the Healing Lodge for federally sentenced females (Okimaw Ohci), Aboriginal-specific health strategies in HIV/AIDS, endorsement of NativeSisterhood within the prison system, and the establishment of 24 halfway houses for Aboriginal males across Canada. Again, although CSC has acknowledged that Aboriginal prisoners have unique experiences and circumstances in comparison to non-Aboriginal prisoners, there remains a need for ensuing informed policy and practice.

Similar to the history of female prisoners in Canadian corrections, the acknowledgment of the uniqueness of Aboriginal in comparison to non-Aboriginal prisoners to date has come at an expense. In particular, Aboriginal offenders have often come to be thought of as a homogeneous group. For example, CSC's OIA does not account for diversity within the Aboriginal offender population (e.g., Inuit, Metis, First Nations). Furthermore, risk and need assessment tools individualize offender risk and need, decontextualizing these from the social and political structures, and so the tools are not able to account for the impact of colonial oppression, which cannot be individualized.

CONCLUSION

Canada's two systems of incarceration, federal and provincial/territorial, have numerous similarities as well as differences in their operations and prisoner populations. At the federal level, which is likewise characterized by similarities and differences, the history of corrections can be chronicled through four models of punishment: deterrence, rehabilitation, incapacitation, and reintegration. These models offer insight into CSC's approach to imprisonment during various time periods, which assists in understanding the CSC's historic and current policies and practices. CSC's current ideology, conveyed in its mission statement and evident in its operations, relays the need for increased attention specific to female and Aboriginal prisoners.

CAPITAL PUNISHMENT

Capital punishment refers to the use of the death penalty as punishment for certain crimes. In America, almost 20,000 persons have been legally put to death since colonial times, with most of the

executions occurring in the 19th and 20th centuries. In recent years, opposition to the death penalty has become more vocal in many states, leading some criminologists to predict its eventual demise.

HISTORY

The United States has had a system of capital punishment in place since colonial times. The first recorded legal execution in the American colonies occurred in 1608 in Virginia, when Captain George Kendall was executed for the crime of spying for Spain. Since then, the crimes eligible for a death sentence have changed. For example, prior to the American Revolution, the list of capital crimes included idolatry, witchcraft, blasphemy, murder, manslaughter, poisoning, bestiality, sodomy, adultery, manslaughter, bearing false witness in capital cases, conspiracy, and rebellion. Now, the application of the death penalty is overwhelmingly confined to murder. It is noteworthy, however, the colonial Americans used the death penalty less often than courts do today despite the greater number of eligible crimes.

During the 19th century, the number of executions increased significantly, with more people put to death between 1800 and 1865 than in the entire 17th and 18th centuries combined. Changes were also enacted that included the introduction of the concept of degrees of murder and the removal of executions from the public realm. In some states, discretionary death penalty laws replaced those that mandated the death penalty for anyone convicted of a capital crime. In addition, the jurisdiction of executions was changed from local to state control. Individual towns were no longer responsible for capital punishment. Instead, the state became the executioner. Finally, the number of offenses punishable by death was reduced and some states began abolishing the death penalty. The number of executions decreased immediately following the Civil War. However, in the last two decades of the 19th century, the number increased again to approximately 1,000 each decade.

Abolitionist efforts grew during this time period as well. Michigan eradicated the death penalty in 1846 for all crimes except treason. Five other states also enacted abolitionist legislation. By 1901, however, three of these states had reestablished capital punishment.

During the first two decades of the 20th century, the United States entered what is known as the Progressive period of social reform. More states abolished the death penalty or severely restricted its use. Six states (Kansas, Minnesota, Missouri, Oregon, South Dakota, and Washington) abolished the death penalty entirely, and three others limited its use to rare offenses such as treason (Arizona, North Dakota, and Tennessee). However, concern about communism and the threat of revolution led to the reinstatement of capital punishment in five states by 1920, and the number of executions across the country overall increased. The 1930s hold the record for the greatest number of executions in one decade in U.S. history, averaging 167 executions per year. The combination of organized crime during the Depression and the writings of criminologists who suggested that the death penalty was necessary to deter violence increased its popularity during this period. By 1950, only three states that had previously abolished capital punishment had not reenacted statutes allowing the death penalty.

During the 1950s, public support for capital punishment began diminishing again, although there were periods of strong support for it. International support for the death penalty was declining. Two cases were particularly noteworthy at this time for the debate surrounding capital punishment. First, the prosecution of Julius and Ethel Rosenberg garnered public support for capital punishment. The Rosenbergs were accused of engaging in espionage for the Soviet Union. Although there was public debate about their sentences as well as widespread international protest, the Rosenbergs were executed in 1953. A Gallup poll taken five months after their executions indicated strong support in the United States for capital punishment, with 70% of people supporting the death penalty. Less than one year later, however, another case occurred that led to strong opposition to the death penalty. Caryl Chessman, who had been sentenced to death in 1948, published the first of four books from death

row in California. In them he claimed innocence, and his case became the focus of worldwide opposition to capital punishment. Chessman's execution was stayed eight times before his death sentence was carried out in 1960. National and international efforts to intervene brought the case into the spotlight. Following his execution, opinion polls indicated decreasing support for capital punishment. Four states abolished the death penalty within five years (Iowa, Michigan, Oregon, and West Virginia).

By the mid-1960s, a number of constitutional challenges to capital punishment had been raised. In the case of *Trop v. Dulles* (1958), the U.S. Supreme Court set forth the argument of evolving standards of decency that became important in later constitutional challenges to the death penalty. Eventually, three cases led to a moratorium on executions. *Maxwell v. Bishop* (1970) raised the issue of racial discrimination in the application of capital punishment, and *Witherspoon v. Illinois* (1968) called into question the use of "death-qualified juries" (or the practice of removing potential jurors for cause if they were opposed to the death penalty). *United States v. Jackson* (1968) focused on the requirement that a jury recommend death for federal kidnapping cases. The last execution prior to the 1972 national moratorium on executions occurred in Colorado in 1967.

FURMAN V. GEORGIA AND ITS AFTERMATH

In 1972, the Supreme Court ruled on the case of *Furman v. Georgia,* instituting a complete moratorium on executions in the United States. The *Furman* case focused on the arbitrariness and capriciousness of capital punishment that resulted from unrestrained discretion of juries. While the Supreme Court did not rule that the *practice* of the death penalty was unconstitutional, it did find that existing statutes (involving the *process* of sentencing) were unconstitutional. Death penalty statutes in 40 states and the federal government were overturned, and 629 death sentences were vacated. The *Furman* decision not only instituted a moratorium on executions but also established the "death is different doctrine." This doctrine has led to the policy of treating capital cases as different from all other crimes, requiring what has been referred to as "super-due process" (Radin, 1980). Super-due process refers to the special procedures that are required in capital cases. It includes guided discretion, automatic appeal, and the suggestion that states review all capital cases to ensure that sentencing was proportional for similar crimes.

States immediately devised new capital punishment statutes. The new statutes either removed all discretion by mandating death sentences for all capital offenses or instituted standards of guided discretion. In *Woodson v. North Carolina* (1976), the Supreme Court rejected statutes that imposed mandatory death sentences. The Supreme Court then upheld the death sentence in *Gregg v. Georgia* (1976). The *Gregg* ruling provided for guided discretion, bifurcated trials, automatic appellate review of all death sentences, and proportionality review to detect sentencing disparities. The first execution following reinstatement of capital punishment was in Utah in January of 1977. Since then, nearly 900 persons have been legally executed in the United States.

THE SUPREME COURT AND CAPITAL PUNISHMENT

Since the *Gregg* decision, the Supreme Court has heard cases on a variety of issues related to capital punishment, including constitutionality, procedural issues, mitigating and aggravating circumstances, and who is eligible for execution. As the composition of the Court has changed, the decisions it has rendered have also changed. This is particularly evident in decisions related to the constitutionality of death penalty statutes and procedural issues. In *McCleskey v. Kemp* (1987), the Supreme Court revisited the issue of racial discrimination in application of the death penalty. Using social science research, *McCleskey* argued that a marked pattern of discrimination based on the race of the victim existed in capital cases. The Supreme Court found, however, that statistical analysis indicating a pattern of racial discrimination in death sentencing did not

make the death penalty statute unconstitutional. Instead, the Court stated, discrimination must be proven in individual cases. In *Pulley v. Harris* (1984), the Supreme Court ruled that states were not required to provide proportionality review of death sentences to determine fairness of sentencing. In a series of cases, the Supreme Court upheld the removal of potential jurors for cause if they were opposed to the death penalty. The Supreme Court ruled in *Herrera v. Collins* (1993) that federal courts did not have to hear claims of actual innocence based on newly discovered evidence.

There have also been a number of constitutional challenges to aggravating circumstances included in state death penalty statutes. Aggravating factors must be present to seek the death penalty, but the states differ as to what is considered an aggravating factor. Aggravating factors fall into three broad categories: those that focus on the characteristics of the offender (e.g., prior conviction for a violent crime), those that focus on the characteristics of the crime (e.g., occurring during the commission of a felony); and those that focus on the characteristics of the victims (e.g., law enforcement or multiple victims). The courts have also allowed the defense to present limited information about mitigating factors, circumstances that may be considered to reduce culpability. The Supreme Court has upheld the use of vaguely defined aggravators, allowed the use of victim impact statements, and required that mitigating factors be considered only if supported by evidence.

The Supreme Court has rendered a number of decisions regarding eligibility for a death sentence. In *Thompson v. Oklahoma* (1988), the Court ruled that an individual age 16 at the time of the offense can be sentenced to death. In *Ford v. Wainwright* (1986), the Supreme Court addressed the issue of prisoners who go insane while on death row, ruling that to be eligible for execution the offender must be able to understand the punishment and the reason for its application. The Supreme Court's rulings on degree of participation in the offense have been less clear, however. In 1982, the Court ruled in *Enmund v. Florida* that an offender who neither killed nor intended to kill could not be sentenced to death. However, in 1987 the Court refined its position in *Tison v. Arizona,* stating that the lack of killing or intent to kill were irrelevant if the offender was a major participant in the crime and showed a "reckless indifference" to life.

Finally, the Supreme Court applied the "evolving standard of decency" interpretation to execution of the mentally retarded in *Penry v. Lynaugh* (1989). Penry, who was sentenced to death in Texas, had the mental capacity of a seven-year-old child. He appealed his sentence arguing that the Eighth Amendment ban of cruel and unusual punishment prohibited execution of the mentally retarded. His appeal was denied. The Court's opinion stated that because no evidence of a national consensus against execution of the mentally retarded existed, there was no basis to suggest the Eighth Amendment was violated. The Supreme Court pointed out that only two states prohibited execution of the mentally retarded at that time, and national opinion polls provided little evidence of consensus on this matter. In 2002, the Supreme Court again agreed to hear the *Penry* case, signaling their desire to revisit the issue of mental retardation and capital punishment. Although Penry's sentence was commuted for another reason prior to the arguments, the Supreme Court revisited the issue in *Atkins v. Virginia.* In the *Atkins* case, the court reversed its earlier decision based on the "evolving standard of decency" issue. By the time that the *Atkins* case was argued, 18 states had enacted legislation banning the execution of mentally retarded individuals, six within the year the case was argued. Furthermore, national opinion polls provided evidence of a growing consensus that mentally retarded individuals should not face execution. Thus, in June 2002 the Supreme Court handed down its decision to ban execution of mentally retarded individuals.

In June 2002, another ruling of the Supreme Court had far-reaching implications. In *Ring v. Arizona,* the Court determined that a judge may not decide critical sentencing issues and impose the death sentence as this violates the right to trial by jury. Arizona and eight other states had statutes that allowed judges, not juries, to determine sentencing in capital cases. As many as 800 death sentences may be affected by this ruling.

CAPITAL PUNISHMENT IN THE UNITED STATES TODAY

As of late 2002, 38 states, the federal government, and the U.S. military have death penalty statutes in place. The District of Columbia and 12 states (Alaska, Hawaii, Iowa, Maine, Massachusetts, Michigan, Minnesota, North Dakota, Rhode Island, Vermont, West Virginia, and Wisconsin) do not authorize the death penalty. More than 3,500 individuals in the United States are currently under a sentence of death. The vast majority of these are men, with 52 women awaiting execution in late 2002. More than 860 persons have been executed since 1976, including 10 women.

The use of the death penalty is not applied equally across all jurisdictions allowing it, however. In terms of per capita execution rates, Delaware has the highest per capita execution rate, followed by Oklahoma, Texas, and Virginia. Almost half of all executions have occurred in just two states (Texas and Virginia); Texas accounted for 37% of all executions between 1992 and 2002. More than 80% of executions post-*Furman* have occurred in the South. Other states and the U.S. military have death penalty statutes but have not executed anyone since the reinstatement of capital punishment.

THE FEDERAL DEATH PENALTY

The federal death penalty law also was struck down in 1972 by the *Furman* decision. In 1988, Congress enacted the Drug Kingpin Statute allowing execution for murder committed in the course of a drug conspiracy. The federal death penalty was further expanded in 1994 to include more than 60 offenses. Offenses not related to homicide include treason; espionage; large-scale drug trafficking; authorizing or attempting to kill an officer, juror, or witness in a Continuing Criminal Enterprise case; and using the mail system to deliver injurious articles with the intent to kill.

The federal government has executed two individuals since reinstatement of the federal death penalty. The first federal execution since 1963 was the 2001 execution of Timothy McVeigh, convicted of the 1995 Murrah Building bombing in Oklahoma City. Later in 2001, Juan Raul Garza was also executed. Garza was the first person executed under the federal drug kingpin law that allows execution for murders related to drug trafficking. As of late 2002, there were 26 men awaiting execution on Terre Haute Penitentiary Death Row.

In 1996, Congress focused on speeding up the appellate process in capital cases with the Antiterrorism and Effective Death Penalty Act. This law restricts the federal appeals process by dismissing subsequent petitions when a claim has been rejected and through rejection of new claims unless rendered valid by a Supreme Court decision or based on compelling new evidence not previously available.

The federal death penalty has been strongly criticized. In 2000, the Justice Department released a report citing serious racial and geographic disparities in the application of the federal death penalty. Over 40% of the cases where the death penalty was sought originated in five jurisdictions. Furthermore, the report indicated that racial minorities were the accused in nearly 80% of federal cases in which the death penalty was requested. Other research has suggested that whites are more likely to avoid a federal death sentence by entering guilty pleas. In 2002, two district court judges ruled that the federal death penalty was unconstitutional. U.S. District Judge William Sessions of Vermont ruled that the federal death penalty is unconstitutional because of the evidence allowed in the guilt phase of the trial (*United States v. Fell*), while U.S. District Judge Jed Rakoff (New York) cited the probability that innocent individuals have been executed in declaring the 1994 federal death penalty law unconstitutional.

METHODS OF EXECUTION

Methods of execution have changed over time and vary slightly from state to state. By the end of 2002, all states except Nebraska allow lethal injection as a method of execution. Ten states, including Nebraska, authorized electrocution. Five states still authorized the use of the gas chamber, three states authorized hanging, and three authorized the use of firing squads.

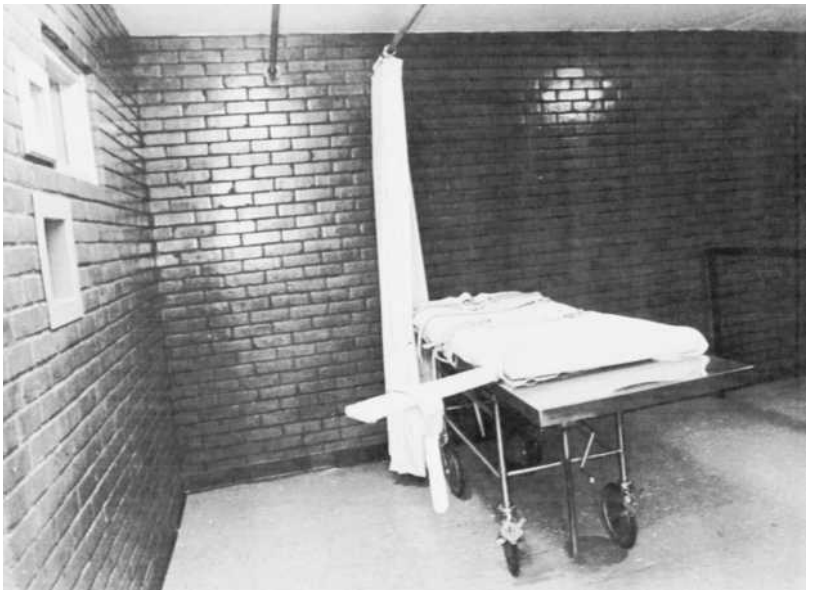

Photo 1 *Capital Punishment*

Lethal injection was first authorized in Oklahoma in 1977, although the first execution by lethal injection did not occur until 1982 in Texas. Since 1977, the majority of executions have relied on this method. In lethal injection, three drugs are administered intravenously to the condemned person. First, sodium thiopental, an anesthetic, renders the individual unconscious. Pancuronium bromide is then administered. This drug induces muscle paralysis and stops breathing. Finally, potassium chloride is administered to stop the heart. Although developed as a more humane mode of execution, lethal injection has resulted in several botched executions. In several cases, technicians have had difficulty locating usable veins. The injection equipment has malfunctioned in other cases, either coming loose or becoming blocked. In several cases, the prisoners had severe reactions to the chemicals, resulting in convulsions.

Until the latter part of the 20th century, electrocution was regularly used for executions. The electric chair, first used in 1890, sends a large jolt of electricity into the body for approximately 30 seconds. Then, medical personnel determine whether the prisoner's heart is still beating. If it is, another jolt is administered. This process continues until the person is pronounced dead. A number of electrocutions have required repeated jolts, and there are numerous documented cases of the condemned individual burning. In a Louisiana execution in 1947, an electrocution malfunctioned and was halted. The Supreme Court ruled that a second execution attempt did not constitute cruel and unusual punishment, and the prisoner was subsequently electrocuted successfully (*Louisiana ex rel. Francis v. Resweber*).

The gas chamber was developed in the 1920s as a more "humane" method of execution. The condemned individual is restrained in a chair in a sealed chamber, under which there is a container of sulfuric acid. A signal is then given, and sodium cyanide crystals are released into the chamber. The prisoner inhales the hydrogen cyanide gas that is released, resulting in asphyxiation. This method has been criticized as overly cruel, since the condemned individuals often struggle and appear to suffer. Today, it is allowed only in Arizona, California, Maryland, and Missouri. All four states, however, authorize lethal injection as well. It is also authorized in Wyoming if other methods are declared unconstitutional.

Two other methods of execution remain legal but are rarely used. Three states still authorize hanging as of 2002, but this method has been used only three times since reinstatement of capital punishment with the *Gregg* decision in 1976. In addition, two states authorize the use of firing squads. The use of a firing squad is also allowed in Oklahoma if other methods are declared unconstitutional. However, only two executions by firing squads have occurred since 1976. The firing squad execution of Gary Gilmore in January 1977 in Utah was the first post-*Furman* execution in the United States.

CONCLUSION: CONTEMPORARY DEBATES ON CAPITAL PUNISHMENT

Discussion of the death penalty has centered on several topics including the costs of maintaining it and whether or not capital punishment is a deterrent

to homicide. The research on costs suggests that capital punishment is far more expensive than life without parole, due in part to the expenses related to trials as well as with the cost of the appeals process. The "death is different" doctrine requires more intensive investigation by both prosecutors and defense attorneys, although prosecutors generally have more funding available. Research on the deterrence aspect is mixed, but most studies indicate that the death penalty is not a general deterrent.

Beginning with the work of Cesare Beccaria, many criminologists have argued that instead of being a deterrent the death penalty actually has a brutalizing effect, increasing violence through example. Ernest Van den Haag, one of the few supporters of a deterrence argument, has suggested that since the death penalty is the most severe punishment it should have the greatest deterrent effect. However, research does not support his contention. States that have abolished capital punishment have not seen a rise in murders, and comparisons of contiguous states with and without capital punishment do not indicate any deterrent effect. International opinion about the American system of capital punishment has also been an area of interest. The United States and Japan are the only industrialized nations that still maintain a system of capital punishment. This, in conjunction with execution of juveniles and foreign nationals, has led to extensive international criticism, particularly from Western Europe.

Two other issues related to capital punishment have marshaled considerable interest: racial and economic inequities in the system and wrongful convictions. The *Furman* ruling was based on inequitable application of capital punishment, and reinstatement was designed to reduce the arbitrariness and discrimination inherent in the system. The continued pattern of minority death sentences, at both state and federal levels, has generated serious concern. Regional patterns of executions have been identified as a serious problem with more than 80% of post-*Furman* executions occurring in the South, while only 44% of all homicides occurred in that region. A 1990 U.S. General Accounting Office study concluded that race of the defendant was a factor in the decision to prosecute a case as a capital case.

Furthermore, since 1973 more than 100 persons have been released from death rows across the United States, 12 as a result of DNA analysis. In Illinois, the release of 13 men from death row led to Governor George Ryan declaring a moratorium on executions in January 2001. Two years later, in January 2003, he then commuted the sentences of all of those on death row to life in prison. As of this writing, the long-term impact of this unusual decision is unclear. Opponents of the death penalty hope for a gradual erosion of this practice in the United States. Only time will tell.

CELEBRITIES IN PRISON

With few exceptions, celebrities in the United States do not go to prison. Their wealth, power, and influence afford them many privileges, including the leniency of the criminal justice system. It is, therefore, worth examining the rare cases in which celebrities are incarcerated, to see why they received such unusual treatment.

Celebrity by definition is a social construct that is usually shaped in large part by the media. People become celebrities because some aspect of their lives is thought to be newsworthy. Such figures typically include individuals who enjoy success in professional athletics, entertainment, politics, and business. Fame can also be a result of notoriety, as some of the subsequent sections will address. It should be noted that few women achieve celebrity status in prisons like men both because of the relative rarity of women in positions of power and influence in our patriarchal society, and because crime is largely a male activity. People of color are also unequally represented in the subsequent sections; sometimes they are overrepresented, and other times they are underrepresented. This is due to the systemic racism of our society generally, and in the criminal justice system specifically.

CELEBRITY CONVICTS

This category includes incarcerated actors, politicians, musicians, and athletes. In most instances, these individuals are imprisoned only after numerous run-ins with the law. Their fame usually affords them a certain amount of leniency from the courts, until they have offended numerous times. Notable examples include boxer Mike Tyson, who was imprisoned on a rape charge; televangelists Jim and Tammy Faye Bakker, who were incarcerated for fraud and conspiracy; and actor Robert Downey, Jr., and musician Bobby Brown, who both spent time behind bars for drugs. In addition, night club owner Steve Rubell was incarcerated for tax evasion, Louisiana Governor Edwin Edwards and Ohio Congressman James Traficant, Jr., were sentenced to prison for racketeering, and former NFL player and music entrepreneur Suge Knight was locked up for assault and a probation violation. Most recently, businesswoman Martha Stewart recieved a 5-month sentence for lying to investigators about her sale of InClone Systems stock in late 2001.

EX-CON CELEBRITIES

Ex-con celebrities are usually individuals who were incarcerated before they became famous and have subsequently reached celebrity status in some area of endeavor (usually) unrelated to their crimes and incarceration. Often, their demographic characteristics and the circumstances of their crimes closely approximate those typical of the incarcerated population. This category includes comedian Tim Allen, who was sentenced to prison for drugs; boxer Ralph "Sonny" Liston, who was found guilty of larceny and robbery; and activist and community leader Malcolm X and musician Merle Haggard, both of whom did time for burglary. Author Piri Thomas was incarcerated for attempted murder, while boxing promoter Don King served a sentence for manslaughter, actor Mark Walhberg spent time in prison for an assault charge, and author and security consultant Frank Abagnale was convicted of forgery and fraud.

CONVICT CELEBRITIES

Convict celebrities include individuals who, while quite ordinary in many respects, found themselves elevated to the status of celebrity because of media coverage of their crimes. In this category, we find individuals who lived most of their lives prior to the crime for which they were incarcerated in relative obscurity. They are, in other words, famous exclusively because of the media coverage of their crime. Their newsworthiness can be attributed to a number of factors, most commonly the seriousness of their crime or the victimization of a public figure. Their notoriety may also derive from several factors such as their relatively privileged social standing, location, rarity, and prurience. In many respects, the experiences of these individuals are the darkest embodiment of artist Andy Warhol's "15 minutes of fame." This category is the most diverse and populous, and includes an assortment of serial killers such as Charles Manson, high-priced sex trade workers such as Sydney Barrows and Heidi Fleiss, bombers such as Ted Kaczynski (the Unabomber), criminal bankers such as Charles Keating and Michael Milken, and assassins or would-be assassins such as Mark David Chapman and John Hinckley, Jr. It also covers celebrity stalkers such as Robert Hoskins and statutory rapists such as the teacher Mary Kay Letourneau.

In many instances, celebrity convicts are housed in modern, well-equipped, and (relatively) comfortable medium- or minimum-security institutions (colloquially, and somewhat inaccurately, referred to as "country club prisons"). In instances when their sentences take them to institutions more typical of the vast number of state and federal prisons in the United States, they are rarely housed with the general population, and are often extended "privileges" that the average inmate is denied, such as unrestricted commissary, additional exercise time, specially prepared meals, unencumbered use of audiovisual equipment, and deferential treatment by guards and administrators and are often not even required to wear standard prison-issue uniforms. Furthermore, subsequent to their release celebrity convicts rarely have difficulty obtaining a living-wage job, finding a place to live, accessing vital social services, or reestablishing contact with family and friends. Rather, they return to their opulent surroundings and lavish lifestyles, largely unfettered by the stigma commensurate with ex-con. Conversely, the release of the average inmate marks his or her return to the same state of relative economic deprivation, racism, patriarchy, and alienation that were correlates of her or his incarceration.

IN-HOUSE CELEBRITIES

Unlike the convict celebrities, the crimes of in-house celebrities, while sometimes heinous, are only tangentially connected to their fame. Rather, they enjoy some measure of celebrity status because of what they have done while incarcerated. These individuals typically come to the attention of journalists, writers, or scholars (primarily criminologists) and have their lives and/or time in prison chronicled in print. Among them we can count "Stanley" and Sidney Blotznam, Chic Conwell, Harry King, and Gary Gilmore. While considerably less common among this category for a number of reasons, not the least being restrictive prison practices, we must also count inmates who have authored their own books or otherwise produced scholarly or artistic offerings while incarcerated. Among them are Jack Henry Abbott, author of *In the Belly of the Beast: Letters From Prison* (1981); the Lifers Group (10 inmates from the Rahway State Prison), who recorded a self-titled rap CD in 1991; and Sanyika Shakur, author of *Monster: The Autobiography of an L.A. Gang Member* (1993).

POLITICAL CONVICT CELEBRITIES

Political convict celebrities include people who, while ostensibly incarcerated for street crimes, are generally thought to have been persecuted by the criminal justice system because of their political dissidence. This group of people includes historical as well as contemporary figures. For example, feminist, social reformer, and anarchist Emma Goldman was incarcerated in both New York and Missouri and was eventually deported from the United States in 1919. Other notables include labor

activists and anarchists Nicola Sacco and Bartolomeo Vanzetti, who were incarcerated and eventually executed in 1927 for allegedly robbing and mortally wounding a paymaster and guard in Massachusetts, and communist leader Gus Hall, who was imprisoned for allegedly conspiring to teach and advocate the violent overthrow of the government. Native American activist Leonard Peltier, who was convicted of killing two FBI agents during a shoot-out, and freelance journalist and community activist Mumia Abu-Jamal, who was found guilty of killing a Philadelphia police officer, are further examples. We can add to this category Eugene V. Debs, who was sentenced to 10 years for an antiwar speech and ran for president as a Socialist Party candidate, from his cell in USP Atlanta. Finally, we should not forget the more than 100 members of the Industrial Workers of the World persecuted for their protests of World War I and sentenced to USP Leavenworth.

CONVICT CRIMINOLOGY CELEBRITIES

A final category of celebrities in prison should include a number of criminologists whose scholarship and activism has been informed not only by rigorous academic training and study but as well by their own experiences with incarceration. While not all convict criminologists are former inmates, several have self-identified as such, including Richard G. Hogan, John Irwin, Richard S. Jones, Alan Mobley, Daniel S. Murphy, Greg Newbold, Stephen C. Richards, Charles M. Terry, and Edward Tromanhauser. The rigorous scholarship and commitment to social justice of these academics have provided unique insight on penal policies and practices.

CONCLUSION

People in prison and jail are deprived of liberty, access to many goods and services, consensual heterosexual relationships, autonomy, security, and numerous other things that noninmate populations take for granted. In some instances, such as in the case of celebrity convicts, fame may function as a bulwark against some of the pains of imprisonment. In other cases, as with political convict prisoners, individuals may achieve notoriety precisely because of the harsh treatment they have received in prison. In any case, considering incarceration through the lens of celebrity allows us to differentiate between types of inmates and treatment people receive. It also reveals the significant impact of media attention on our understanding of incarceration.

CELL SEARCH

Prison officials may search prisoners' cells at any time because the U.S. Supreme Court has ruled that prisoners are not protected by the Fourth Amendment of the U.S. Constitution. Indeed, though a number of federal circuit courts in the late 1970s were willing to recognize that prison inmates had a *limited* right to be free from *unreasonable* search and seizure, by the mid-1980s the U.S.

Supreme Court had determined otherwise. Thus, the Court stated that "a prisoner has no reasonable expectation of privacy in his prison cell entitling him to the protection of the Fourth Amendment against unreasonable searches" (*Hudson v. Palmer,* 1984).

PRIVACY AND CONFINEMENT

The Fourth Amendment of the U.S. Constitution states that "the right of the people to be secure in their persons, houses, papers, and effects, against unreasonable search and seizure, shall not be violated." To arrive at the conclusion that prisoners do not have this protection, the Supreme Court applied the *Katz* privacy test to establish the reasonableness of a prisoner's Fourth Amendment claim. Under this test, a person can invoke the Fourth Amendment prohibition against unreasonable search and seizure only if he or she demonstrates an actual expectation of privacy and only if society is prepared to recognize this expectation as reasonable (*Katz v. United States,* 1967). After applying this two-pronged standard, the Court held that "society is not prepared to recognize as legitimate *any* subjective expectation of privacy that a prisoner might have in his prison cell" (*Hudson v. Palmer,* 1984).

By using privacy as the standard to determine the reasonableness of a Fourth Amendment claim, the Court noted that the Fourth Amendment right to privacy is "fundamentally inconsistent" with incarceration. As a result, the interest of a prisoner's privacy within the prison cell must yield to the accepted belief that "the loss freedom of choice and privacy are inherent incidents of confinement" (*Bell v. Wolfish,* 1979).

SECURITY AND CONFINEMENT

An expectation of privacy within a prison cell must be one that society is prepared to recognize as legitimate before prisoners can effectively invoke Fourth Amendment concerns. In prison, the Supreme Court decided that the right to privacy is always curtailed by the institution's responsibility for security. To this end, the Court clearly held in *Hudson v. Palmer* (1984) that prison administrators are obligated to provide an environment for inmates and prison employees that is both secure and sanitary. While society *might* value the ability of prison inmates to enjoy some degree of Fourth Amendment protection, that is, privacy, this possibility is outweighed, and effectively cancelled out, by the more prominent social demand that prisons represent a secure and sanitary environment. The Court saw no way to reconcile the "privacy rights" of inmates with the more pertinent social concern of prison security and sanitation. "It would be impossible to accomplish the prison objectives of preventing the introduction of drugs, weapons, and other contraband into the premises if inmates retained a right of privacy in their cells" (*Hudson v. Palmer* 1984).

CELL SEARCHES

Because prisoners are not protected by the Fourth Amendment, prison cell searches may occur at random times in a frequent and unannounced basis. They need not adhere to the dictates of an established plan or method of search. Furthermore, random shakedown searches may be done regardless of whether the prisoner is present to observe the search of his or her cell.

The Court's willingness to allow prison cell searches to occur randomly, frequently, unannounced, without any established guidelines, and in the absence of the prisoner signifies an almost never recognized deference to governmental agents (prison administrators) to decide for themselves the rights of another (prisoner). As the Court concluded in *Bell v. Wolfish* (1979), "Prison administrators [are to be] accorded wide ranging deference in the adoption and execution of polices and practices that in their judgment are needed to preserve internal order and discipline and to maintain institutional security."

In effect, the Supreme Court has mandated that prison administrators and not courts should determine the extent to which cell searches are consistent with a balancing of prisoner concerns and the security of penal institutions. Thus, under *normal* circumstances no judicial body should supersede the decisions made by prison administrator regarding cell searches when matters of institutional security are at stake.

Shakedown cell searches while potentially detecting illegal contraband can also harass and destroy the property of prison inmates. On this issue, the Supreme Court is a little more critical, holding that the "intentional harassment of even the most hardened criminal cannot be tolerated by a civilized society" (*Bell v. Wolfish*, 1979). The Court further stated "that prisoners do not have a reasonable expectation of privacy does not mean that he is without remedy for calculated harassment unrelated to prison needs, nor does it mean that prison attendants can ride roughshod over inmates' property rights with impunity" (*Hudson v. Palmer*, 1984).

Figure 2 *View of a Prison Cell*

Notwithstanding the Court's strongly wording warnings against the harassment of prisoners and the needless destruction of inmates' personal property, the Court has retained that "despite the importance of avoiding the destruction or loss of prisoner property, such loss or destruction does not violate the United States Constitution. Even if an officer intentionally destroys a prisoner's personal property during the challenged shakedown search, the destruction does not violate the due process clause where an adequate post-depravation remedy exists under state law" (*Bell v. Wolfish*, 1979). Given that the state in which the prisoner is located has a legal remedy to address claims of harassment and property destruction the U.S. Constitution offers prisoners *no* protection from such violations.

CONCLUSION

While prisoners have seen their rights increase in a number of important areas—medical assistance, legal assistance, religious rights, due process rights, free speech rights, and the ability to use the mail system—the same cannot be said of Fourth Amendment protections. Prison administrators need not consider a prisoner's Fourth Amendment concerns as they carry out cell searches in whatever manner and fashion they deem necessary. The Supreme Court's decision that prisoners are not constitutionally entitled to privacy protections in the confines of their cell cannot mystically remove privacy concerns from the prisoner. The impasse created between a socially recognized "reasonable expectation of privacy" and the privacy expected by prisoners is likely to escalate, as the absolute treatment of the issue by the Court is bound to create future tension.

CHAIN GANGS

In the middle of the 19th century, the practice of chaining prisoners together while they worked became customary in England and Australia. The iron chains weighing from six to seven pounds were riveted together by blacksmiths, inspected daily to prevent tampering, and remained attached to prisoners for the length of their sentences, between six months and two years. From its inception, the rationale of chaining convicts transcended the utilitarian notion of security. Instead, chain gangs are spectacles of punishment; being chained—especially in public—is degrading and dehumanizing.

HISTORY

In the United States, following the Civil War, Reconstruction required manual labor to rebuild the South's economy and infrastructure. While convicts in the North worked in prison factory shops, their Southern counterparts—who were disproportionately black—labored outside prison walls on the plantations and in public works projects. During this time, chain gangs were widespread in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Texas, and Virginia where sentences ranged from a few weeks to 10 years. They were used extensively throughout the convict leasing system in the South where private businesses compensated the state for use of its prisoners. Prisoners wearing striped uniforms were chained together in crews of five to seven and transported to work sites in caged wagons holding up to 18 men. At night, all of the chains were attached to a steel rod running the length of the sleeping area.

During Reconstruction, chain gangs demonstrated the unbroken line between slavery and the use of convict slave labor. The appeal of chain gangs was not limited to free labor, it also satisfied the racist sentiment that blacks should be shackled to the land. Testimonies of brutality and oppression often surfaced from the Southern prison camps. It was even rumored that unlucky hitchhikers were arrested and railroaded to chain gangs, thus serving as a valuable source of free labor. Sadistic armed guards often took delight in shooting at the feet of prisoners. Deploying the lash, "whipping bosses"—akin to the slave driver on antebellum plantations—routinely disciplined prisoners on chain gangs. According to a corrections officials of that era: "A Negro is punished to 'teach him respect for a white man,' or for 'inciting insurrection,' or because he 'tried to run away,' or because 'he is just a bad nigger'" (Barnes & Teeters, 1946, p. 631). Especially under intense heat, sick, malnutritioned, and injured convicts accused of malingering were typically whipped until they returned to work; even worse many prisoners were beaten to death and clandestinely buried in quicklime.

PUNISHMENT

The most brutal punishments imaginable were inflicted on members of the chain gangs who were assigned to road camps of the South. Floggings were routinely administered to promote discipline. In addition, many were placed in the sweatbox that was just large enough for a man to stand erect when the door was closed. The only ventilation in the box was provided by a breathing slot, that was one inch high and four inches long, a little below the height of the average man. Often the boxes were placed in direct sun. Men were confined in them from a few hours to a few days. Swelling of the legs in extreme cases necessitated the victims being hospitalized for a week or more. It was not unusual for a convict to die of suffocation. Larger sweatboxes were designed to punish several prisoners collectively. In 1941, a grim report chronicled the appalling treatment of Georgia's prisoners forced into the sweat box in which "a Negro convict had died of suffocation in a sweat-box 7½ feet square, where he, together

with 21 other prisoners, was incarcerated for 11 hours. There was only a six-inch opening in the roof of the box for the purposes of ventilation" (Barnes & Teeters, 1946).

REFORM

Eventually, the brutality of chain gangs was criticized publicly. In the 1930s, the story of Robert E. Burns shocked the common conscience. His book, *I Am a Fugitive From a Georgia Chain Gang,* which was made into a movie, brought critical attention to the inhumane chain gangs in the South. While a fugitive in New Jersey, Burns—aided by the courtroom tenacity of lawyer Clarence Darrow—successfully fought extradition to Georgia. His trial precipitated and amplified public outrage concerning chain gangs, prompting state officials across the South to discontinue the practice. Economic developments also contributed to the demise of chain gangs. Following World War II, American servicemen returning from war needed jobs in civil service, construction, and highway maintenance, prompting government officials to scale down their use of convicts.

THE REEMERGENCE OF CHAIN GANGS

In the 1990s, the prohibition on chain gangs eventually gave way to resurging "tough on crime" campaigns proclaiming the need for greater forms of retribution and deterrence. As public anxiety over crime escalated, political leaders advocated the return to earlier penal practices, such as requiring prisoners to wear prison striped uniforms and stripping them of amenities (e.g., television, weightlifting, and cigarettes) as well as reintroducing chain gangs. The year 1995 became a watershed when state and county corrections departments in Alabama, Arizona, Florida, Indiana, Iowa, Maryland, Oklahoma, and Wisconsin reinstated chain gangs.

In Alabama, prisoners were shackled at the ankle in three-pound leg irons and bound together by eight-foot lengths of chain, forced to work the fields with shovels and swing blades for 12 hours a day. Other chain gangs spent their days breaking rocks into pea-sized pellets, a demeaning chore imbued with pure punishment since the state has no use for crushed rock. Ron Jones, prison commissioner of Alabama, referred to the public spectacle in offering a rationale for recent chain gangs: "Deterrence . . . the sight of chains would leave a lasting impression on young people" (Bragg, 1995, p. 16). Commissioner Jones even proposed that women inmates also be shackled to chain gangs; however, the measure was rejected by the governor. Jones further boasted that guards armed with shotguns loaded with double-aught buckshot supervise the chain gang, obligated by law to shoot if a prisoner attempts to escape. "People say it's not humane, but I don't get much flak in Alabama," said the commissioner (Bragg, 1995, p. 16).

RACE

As is so often the case with corrections, blacks are overrepresented in chain gangs. Alabama Congressman Alvin Holmes opposed chain gangs for this reason, arguing: "The only reason they're doing it is because an overwhelming majority of the prisoners are Black. If the majority were White, they wouldn't have the chain gang" (Jackson, 1995, p. 12). Representative John Hilliard also joined the campaign to halt the use of chain gangs: "I think it's a reminder of the way it used to be, putting the African-American male in chains" (Jackson, 1995, p. 12). Serving two years for receiving stolen property, one inmate who spends his days on the chain gang breaking rocks complained, "They're treating us like . . . slaves" (Jackson, 1995, p. 16).

In Queen Anne's County (Maryland), the antebellum notion of chain gangs has taken a futuristic twist. Corrections officials have proposed the use of "chainless" chain gangs by attaching stun belts to prisoners assigned outdoor work detail, leaving convicts writhing in the dirt if they attempt to escape or engage in violence. Supporters of that practice claim that the belts reduce the costs of supervision. They also argue that "there is no long-term physical damage to a prisoner who is stunned" (Kilborn, 1997, p. 11). Amnesty International, however, has challenged the practice, arguing that stun belts are cruel, inhuman, and degrading and can be used to torture prisoners.

CRITICS

Civil libertarians and human rights advocates took exception to chain gangs, charging that the practice violates the Eighth Amendment's prohibition on cruel and unusual punishment. According to Alvin J. Bronstein, executive director of the National Prison Project of the American Civil Liberties Union, "People lose touch with humanity when you put them in chains. You are telling him he is an animal" (Bragg, 1995, p. 16). Amnesty International also weighed into the controversy, arguing that chain gangs violate international treaties on human rights; specifically, the use of leg irons is outlawed under the United Nations Standard Minimum Rules for the Treatment of Prisoners. Similarly, it is reasoned that chain gangs also violate the principle of acceptable penal content whereby sanctions are acceptable only if lawbreakers can endure them and still maintain their human dignity. In 1995, the Southern Poverty Law Center filed suit in federal district court, arguing that chain gangs are barbaric and inhumane.

In reinstating chain gangs, corrections officials insist that they have the support of citizens. Still, many people question the logic, utility, and overall fairness of chain gangs. "If these guys are so dangerous, they shouldn't be out on those crews. And if they're not dangerous, why put them in chains?" asked Mary Chambers, a Maryland resident. Chambers added: "You have people in there for drunk driving. Maybe they have a problem. But do you put them in chains?" (Kilborn, 1997, p. A-18).

The controversy over chaining extends beyond chain gangs to include inhumane restraining practices employed not as security measures but also for disciplinary purposes. In Alabama, for example, inmates filed a class action suit challenging the use of the hitching post at the Fountain Correctional Center where those who refuse to (or are late for) work were handcuffed to a triangular rail about four and a half feet off the ground. Prisoners were hitched as long as five hours at a stretch, exposed to the blazing sun, and often go for as long as seven hours without water, food, and access to a toilet. The practice has been monitored by the American Civil Liberties Union Prison Project, which asserts that there are alternative, humane ways to discipline balky inmates (i.e., isolation cells and/or loss of privileges). Furthermore, there are reports of racism insofar as the hitching post appeared to be reserved for black inmates. In 1997, a federal magistrate ruled that the Alabama corrections officials should not be allowed to hitch inmates to posts, commenting: "Short of death by electrocution, the hitching post may be the most painful and tortuous punishment administered by the Alabama prison system" (Nossiter, 1997, p. A14). State corrections officials have appealed the magistrate's opinion. But the Southern Poverty Law Center, which represents the inmates, promises to continue its legal battle against the hitching posts, calling the practice a form

of torture. In her ruling, Magistrate Vanzetta Penn McPherson fittingly likened the hitching post to the pillory of colonial times.

CONCLUSION

Given that the history of the modern chain gang is traced to slavery, it is important to recognize the limitations of the nostalgia inherent in much of the emerging penal harm movement. Supporters of the "get tough" movement claim that prisons are not harsh enough to fulfill the retributionist goal of imposing punishment, instilling discipline, and deterring lawbreakers from future offenses. Moreover, they insinuate that corrections coddles inmates and—by way of circular reasoning—imply that high rates of recidivism are the result of inadequately punitive institutional conditions. While adhering to traditional notions of retribution, the get-tough movement is inspired by nostalgic visions of criminal justice.

Get-tough proposals commonly include "three strikes" legislation and correctional boot camps as well as a return to hard labor and chain gangs. Sentiments of nostalgia signaled a backlash to the modern, and liberal, penal institution where inmates are afforded certain constitutional protections, participate in institutional programs, and are permitted to keep personal belongings while incarcerated (e.g., cigarettes, civilian clothes, coffee, snack food, televisions). Sounding the alarm of perceived lawlessness and growing social disorder, the nostalgic version of corrections punctuates the supposed need to regain control of inmates and prisons, as well as a return to a simpler and racist society. Referring to the reemergence of chain gangs, Congressman Holmes remembers that as a child in Alabama he never saw a white man on a chain gang: "The only people you ever saw were Black. The whole purpose of having the chain gang is racist to the core. There are certain Whites in key positions who want things back the way they used to be" (Jackson, 1995, p. 14). Critics of chain gangs insist that by turning back the clock to revive nostalgic forms of punishment, corrections officials reinforce racist stereotypes of lawbreakers.

CHAPLAINS

Chaplains have been part of the U.S. prison system since its beginnings. From the first penitentiary set up by Quakers in the Walnut Street Jail in Philadelphia, the clergy have been able to enter penal institutions to provide religious training, counseling, and support. Since this time, the role of the prison chaplain has diversified and become much more complex.

Eighteenth- and 19th-century proponents of the Pennsylvania system sought to reform offenders through a combination of solitary confinement and Bible reading. Inmates in this system were housed in separate cells; their only human contact was the occasional visit of a clergyperson or prison guard. At that juncture, prison chaplains were the earliest paid noncustodial staff; they provided education and counseling in addition to religious programs. One of the first chaplains, named William Rogers, began teaching the Bible at the Walnut Street Jail in 1787, where he was also responsible for Sabbath schools as well as providing reading and writing instruction.

Though the tasks of a prison minister have changed since these early beginnings, the contemporary job retains some of the influences of its origins. Chaplains are meant to provide succor to their inmate flock, while also performing the role of security officer. They are, in short, aiming to rehabilitate within a punitive environment. It is this paradox that shapes much of the job.

WHO IS THE PRISON CHAPLAIN?

Prison chaplains are ordained clergypersons who minister within an institutional setting. They may be employed full time or part time, and some even volunteer to provide an array of religious services and programs to meet the inmates' spiritual needs. To some extent, the prison ministry differs little from that provided to local church congregations, except that it takes place in a correctional environment. However, at a closer look, there are some crucial differences. First, the prison chaplain must work with offenders of all faith traditions present in the institution. Second, of course, the prison environment places the prison chaplain into a potentially dangerous and volatile situation. Moreover, recent "get tough on crime" policies, such as sentencing guidelines, mandatory minimums, truth in sentencing, and the war on drugs, have increased levels of frustration, stress, and disciplinary problems in prisons because of overcrowding. In this overheated environment, prison chaplains may be more preoccupied with their personal safety and security than are their counterparts who provide religious ministry to local community church congregations.

Although state and federal correctional department personnel hiring policies may differ, there are several universal qualifications for a prison chaplain position. Most agencies require that a minister has graduated from an accredited four-year college or university or from a school of theology or divinity. In addition, a prison minister is expected to be a representative of his or her faith community, to have obtained ecclesiastical endorsement by his or her denominational body, and to have performed a minimum of two units of Clinical Pastoral Education (CPE) and pastoral counseling training and experience.

CHAPLAIN FUNCTIONS

Prison chaplains have many diverse responsibilities. Primarily, of course, they are responsible for managing religious activities within the correctional facility. They must ensure, therefore, that all offenders are afforded the opportunities to practice the faith of their choice. In general, they do this by

coordinating religious programming, providing prison ministry and crisis intervention, and by ensuring the implementation and delivery of religious programs and services.

As religious program coordinators, prison chaplains are the primary advisors on and implementers of religious program policy. As such, they clarify issues involving various faith practices, religious articles, religious diets, and other religious standards while ensuring that these services are provided to the fullest extent possible within the usually restrictive correctional environment. In addition, prison chaplains are expected to develop and maintain up-to-date religious activity schedules and ensure that information about various opportunities for religious activities is available to all inmates. Finally, they must develop plans, policies, procedures, and budget recommendations to deliver pastoral care in the prison setting.

As part of their ministry, all chaplains are required to teach the central and inclusive doctrines common to major faith groups without degrading the tradition of others. They also provide regular religious worship services, pastoral counseling, and spiritual guidance, as well as individual and group counseling. In addition, they are expected to lead, host, and coordinate Bible studies, worship services, and general spiritual development and growth seminars. Finally, prison chaplains assist offenders in obtaining literature and other materials necessary to practice their faiths.

Prison chaplains play an important role in helping offenders adjust to prison and deal with the prison environment. In this role, they provide crisis intervention in emergency situations, offering counseling to offenders in times of need, such as during divorce or the illness of an immediate family member. They also frequently counsel those who have difficulty coping with the day-to-day issues that result from the pains of imprisonment. In addition, the prison chaplain provides inmates with notification of the death of a loved one, as well as maintains contact, support, and pastoral visitation when offenders are hospitalized in other medical correctional facilities.

Prison chaplains must coordinate and supervise all inmate religious programs and services. This means that the minister must ensure that an array of religious programming, from traditional Protestant and Catholic services to a variety of services for other world religions, such as Islam, Judaism, Native American, Quaker, Wicca, Buddhism, Hinduism, and Sikh, is available. Programs range from worship services, pastoral counseling, spiritual guidance, Bible study, prayer groups, and Christian Fellowship to temple, Native American sweat lodges, Wiccan services, Spanish Bible study, and Siddha meditation practice. The prison chaplain also maintains a chapel library, which includes books, magazines, audiocassettes, and videos to accommodate the religious rights and diverse needs of all offenders.

Religion and Diversity in Prison

Religion in prison is one of the best experiences that a believer in Jesus Christ can have. Because there are so many different races and ethnicities of people in the same place, inmates get to experience how people of different cultures worship. Similarly, the chaplains have the chance to experience ethnic groups on a level that I believe would never happen in another setting. Through exposure to other cultures, you learn to live with people with different faiths and understand certain behaviors that you may not agree with but are justifiable according to another's religion. However, even though you learn how to deal with people on a new level through this experience, a level you may have never learned on the outside, it would be better to learn it on the outside where you are free, rather than on the inside where you really don't have a choice.

Jesse McKinley Carter, Jr.
FCI Fairton, Fairton, New Jersey

THE MULTIPLE REALITIES OF PRISON CHAPLAINCY

Prison chaplains encounter multiple realities working in the correctional environment. Not only do they have to work with people of different faiths and provide counseling to all, they also must

perform a number of administrative and security-based tasks. Like all prison employees, the prison chaplain is first and foremost a correctional officer. He or she is also a community liaison officer, administrative assistant, and human resource specialist. Accordingly, prison chaplains do not spend all or even most of their time providing religious instruction or advice. The prison chaplain is expected to be visible in all areas of the institution, make regular rounds through the correctional facility, assist with inmate management, serve on the adjustment committee, be on call for emergencies, and be ready to assist correctional officers as needed.

There is a considerable amount of paperwork attached to the everyday management of religious services. Like all prison employees, prison chaplains have many administrative tasks. They must maintain records, prepare reports on pastoral care, develop lists of activities to distribute to offenders, document pastoral counseling and services provided in the offender record, and compile various ad hoc reports as requested by prison administrators. They also help inmates with requests for visits, clothes, and commissary money. As well, prison chaplain are usually expected to be a source of information to prison staff, participate in staff retreats and meetings, and attend educational and professional training seminars.

Prison chaplains are responsible for community development, coordinating resources from the community to meet the spiritual needs of offenders in the correctional facility. As such, they speak to religious, civic, and other community groups to promote the prison ministry and to enlist financial and volunteer support. Prison chaplains work closely with representatives of the various faith communities to encourage community participation in correctional facility religious programs and to ensure that volunteer activities are conducted in a diverse yet secure manner. They also recruit, coordinate, supervise, and provide formal and informal training for all volunteers.

CONTRACT CHAPLAINS

Both compassion and the U.S. Constitution compel departments of corrections to provide basic religious services, including opportunities for spiritual growth, to the prison population. In spite of this, in a law-and-order era with overcrowded prisons, many states have decided that they can survive with fewer chaplains in tight fiscal times. Faced with mounting costs and tighter budgets, state legislators and correctional administrators across America have reduced the number of prison chaplains and, in some cases, eliminated all of the positions as a cost-saving strategy. In many instances, funds have been allocated to provide full-time chaplain positions on a contractual basis, which do not carry benefit packages or job security.

At first glance, contracting out chaplain services might appear to be a sound management and fiscal decision; however, there are numerous compelling reasons that existing prison chaplain positions should be retained and those eliminated reinstated. First, religious volunteers, who primarily promote their own faith tradition, may overlook some religious groups. Because offenders retain the right to worship freely in their own faith, a failure to provide these services can lead to increased tensions, grievances, and possible lawsuits from offenders who feel they have no outlet for religious worship. Prison chaplains understand the complexity of the constitutional issues involved, and therefore work to provide worship opportunities for all inmates.

Second, fewer prison chaplains may also mean fewer volunteers, since a primary role of the prison chaplain is the recruitment of volunteers from local church congregations. Third, volunteers as well as staff may be at greater risk of harm, as the prison chaplain is responsible for ensuring that volunteers follow appropriate security policies and procedures. Finally, without prison chaplains, the stresses of everyday life in prisons increase, since under normal circumstances chaplains provide counseling to inmates to help them adjust to prison and deal with the inherent tensions of the prison environment as well as handle grief when crisis situations arise. The elimination of these services risks amplifying the stress levels of both inmates and staff, as well as increasing the likelihood of conflict, disciplinary problems, and/or violence.

CONCLUSION

Prison chaplains provide offenders of all faith groups with reasonable and equitable opportunities to pursue religious beliefs and practices consistent with the security and orderly running of the prison facility. As such, they conduct and facilitate religious services; provide pastoral care, religious programming, and spiritual guidance; and provide an impartial religious leadership to meet the diverse needs of the different faith groups in the prison environment. Prison ministry continues to be an integral part of correctional programming, as demonstrated by the routine weekly religious programs such as worship services, pastoral counseling, Bible study, Sunday services, and visitation ministry provided by prison officials.

CHESNEY-LIND, MEDA (1947–)

Meda Chesney-Lind, professor of women's studies at the University of Hawaii at Manoa, was a pioneer in juvenile justice and feminist criminology in the early 1970s, a time when, as she says, feminist research was considered a "career killer" (Chesney-Lind, 2000, p. 3). She has written scores of journal articles and book chapters and has authored or edited four books addressing female offending and incarceration. Her contributions to the discipline have been recognized by awards from several professional associations including the American Society of Criminology and the Academy of Criminal Justice Sciences. She is a vocal advocate for girls and women, particularly those involved in the criminal justice system. Her scholarship on the sexist treatment of girls in the juvenile justice system and, more recently, soaring rates of women's imprisonment, has focused national attention on these issues.

SCHOLARLY WORK AND THEMATIC IDEAS

Chesney-Lind revolutionized the field of juvenile justice by drawing attention to the unequal ways in which young women and young men were treated. In articles published in criminology and women's studies journals, she pointed out that young women were more likely than boys to be arrested and incarcerated for status offenses. Status offenses, which include such activities as running away from home, truancy, incorrigibility, curfew violations, and being sexually active, are considered offenses only because the perpetrator is a minor; they would not be considered offenses if the actor

was an adult. Chesney-Lind argued that status offenses were a means by which parents and the state were able to police and enforce a particular ideal of femininity for young women. As a result of the growing awareness of the problem of disparate treatment of male and female delinquents, many states have attempted to address the double standard.

Girls, Delinquency, and Juvenile Justice (coauthored with Randall Shelden, 1992, 1998) and *The Female Offender: Girls, Women, and Crime* (1999) expose the problems associated with applying male-oriented criminological theories to girls and women. Historical data and numerous contemporary studies show that mainstream theories and approaches based on adults (especially adult males) do not explain female delinquency. Instead, factors such as histories of troubled family backgrounds (marked by poverty, divorce, parental death, abandonment, alcoholism, and frequent abuse) may contribute to their delinquency. These backgrounds may prompt young women to run away from home where they may engage in prostitution, petty property crimes, and drug use. As a result, statutes originally developed to "protect" girls have criminalized their survival strategies.

Chesney-Lind recommends that counseling for delinquent and at-risk young women should address these multiple problems and should include educational and occupational support. Furthermore, programming should address the needs of young women who do not live with their families and provide them with access to caring adults and communities. Chesney-Lind's research also examines racial issues and injustices; girls' involvement in gangs and violence, and sentencing. More recently, Chesney-Lind has coedited a book with Marc Mauer, *Invisible Punishment: The Collateral of Consequences of Mass Imprisonment,* that explores some of our most infamous criminal justice policies (e.g., "three strikes and you're out," "a war on drugs," "get tough on crime" attitudes that included mandatory sentencing, and prison privatization) and details the detrimental impacts and social consequences these (and other) policies have had on our families and communities.

CONCLUSION

Meda Chesney-Lind is arguably the preeminent scholar of female delinquency. Her research has focused national attention on the growing number of women and girls entering the correctional system and has aided in the call for seeking alternative solutions to women's incarceration. Her continued research and active voice in policy issues will endure to facilitate arguments against gender-blind and racialized policies and practice on crime-related issues. Meda Chesney-Lind's contributions have pointed out noteworthy contradictions and gaps in the literature on girls and women in the criminal justice system. Her scholarly work sets the scene for additional research and policy making and has contributed to recognition of the contributions of feminist criminology.

CHILD SAVERS

The child savers were a group of reformers in 19th-century Chicago who created the first juvenile court in the United States and developed the model for a separate juvenile justice system that is widely in use around the world today. The child savers hoped to care for and reform delinquent, neglected, and dependent children, helping them to lead lives of conformity and thereby preventing future crimes.

ORIGINS

Anthony Platt literally wrote the book on child savers. In *The Child Savers* (Platt, 1977), he describes the child saving movement as being driven by middle- and upper-class women who had the means, the time, and the political connections to work on philanthropic endeavors. These women were primarily the white, Anglo-Saxon Protestant wives and daughters of prominent men in Chicago; as such, they were highly educated and had the leisure time, the resources, and the support to pursue interests outside of their own households.

Working to create new institutions for wayward children seemed to be a natural expansion of the traditional female role as the child savers expanded their duties in the domestic sphere out into the community. Because raising children was largely viewed as women's work, there was little resistance to the child savers as they embraced the role of providing care for and correcting children in need of supervision.

IMPACT ON CHILDREN AND JUVENILE JUSTICE

The child savers created the first juvenile court in Chicago in 1899. It explicitly recognized children and adolescents as more malleable than adults, more open to rehabilitation, and less culpable for their crimes. The juvenile court was based on the idea of *parens patriae,* where the state—through wise and benevolent judges—would serve as a surrogate parent to children in need of help and supervision. Judges had wide discretion to determine and to act in the "best interest of the child." The process was meant to be less adversarial than criminal courts, so it was assumed that children did not need due process protections. Children had virtually no rights as their fate was in the hands of the judge.

As it was created, the juvenile court focused on both prevention and control. A primary goal was to control and rehabilitate juvenile delinquents, protecting the community from further crimes. In addition, the juvenile court served a social work function, supervising and caring for dependent and neglected children in the hopes of preventing them from turning to crime to meet their basic needs. Children deemed in need of supervision were frequently sent to reformatories outside of the city where they could learn working-class skills and middle-class, conforming values.

THE LEGACY OF THE CHILD SAVERS

The child savers undoubtedly had good intentions. They created an innovative juvenile justice system that almost immediately became a model for similar systems in every state and many countries. They managed to separate juveniles from adults in court and in correctional facilities and to change the way the public thought about poor children and adolescent offenders. Critics, however, argue that the child saving movement may have done more to benefit middle- and upper-class women than it did for children. The child savers carved out new roles and careers in social work for women, creating new legitimate opportunities for women to work in the public sphere.

At the same time, the child saving movement placed more restrictions on children's behavior, furthering government control over children's activities that previously would have been overlooked or dealt with more informally in the community. With additional power and responsibility to enforce these new rules and correct such youthful misbehavior, the juvenile justice system particularly focused on poor, immigrant children as those in need of reformation. In many ways, girls were more closely

monitored than boys, as the child savers took an active interest in patrolling and reforming the moral and sexual behavior of girls.

The social distance between the child savers and the children they targeted was significant, and scholars, including Anthony Platt and Thomas Bernard, have suggested that the child saving movement reinforced the sense of moral and intellectual superiority of the reformers over their charges. In addition, critics argue that the child saving movement was largely a symbolic movement that ultimately served to reinforce social institutions, controlling the poor and helping them to adapt to lives in an unjust system.

CONCLUSION

Many people continue to support the basic ideas of the child savers. Yet 100 years after its creation, the juvenile court is under attack as juveniles are again being tried as adults for serious offenses and judges' discretion has been replaced in many states by determinate sentencing. The best interest of the child has been replaced with the goal of holding young offenders accountable for their actions and meting out like punishments for like crimes.

The child savers had an enormous impact on how we think about and how we treat delinquent, neglected, and dependent children. Their legacy, both the good and bad, will continue to shape our vision of juvenile offenders long into the future as we struggle to find the balance between prevention, rehabilitation, punishment, and protection of the community.

CHILDREN

Children may be involved in the U.S. prison system in two ways: directly by their confinement in juvenile institutions and adult prisons or indirectly by the incarceration of their parents. On any given day in the United States, approximately 107,000 juveniles are incarcerated in juvenile institutions and adult facilities. Children in another estimated 336,300 households in the United States had at least one parent in jail or prison in 1999.

INCARCERATED CHILDREN

Children are incarcerated in both juvenile institutions and in adult prisons. In 1998, the number of delinquency cases in juvenile court reached 1.8 million; increasing 44% from 1989. This expansion of the number of children brought before the juvenile court for delinquent offenses in turn spurred an increase in the number of juveniles being incarcerated. The number of children incarcerated in juvenile institutions peaked in 1990 when 570,000 such juveniles were housed in these facilities. The total number of juvenile offenders in custody across the United States has decreased since that time. According to the Census of Juveniles in Residential Placement, as of October 29, 1997, the number of juveniles being housed in correctional facilities had been reduced to approximately 105,790.

One of the most controversial aspects of incarcerating children involves housing them in adult facilities. Prior to the Juvenile Justice and Delinquency Prevention Act of 1974 (Public Law 93–415, 42 U.S.C. 5601) juveniles were often housed in the same facilities as adult offenders. This act did not, however, entirely eliminate the presence of juveniles under the age of 18 in the adult criminal system.

Currently, there are several ways in which juveniles can be housed in correctional institutions with adults. First, juveniles can be sent to adult court through a judicial waiver in which the judge decides to transfer a case from juvenile to adult court, usually as the result of a transfer hearing. Second, in some states juveniles are automatically waived to the adult court based on the crime they allegedly committed. Most of these statutorily excluded offenses involve murder or other person-related offenses. The age at which statutory exclusions may be applied to juveniles differs among states. For example, those charged with a capital crime in Florida are automatically tried in adult court while children aged 14 and older in North Carolina are also automatically tried in adult court if charged with a capital offense. In New Mexico, juveniles must be aged 15 and older and charged with murder, while in Mississippi they have to be aged 17 and older and charged with a felony. Finally, some jurisdictions allow the prosecutor discretion to decide in which court (adult or juvenile) to prosecute the individual.

As with so much of the criminal justice system, race seems to play a role in the number of juveniles transferred to adult court. Between 1988 and 1997, the number of black youths who were transferred to adult court increased by 35%. Yet the number of white youths transferred increased by only 14%. Furthermore, black youths were more frequently transferred for person-related offenses, while white youths were transferred for property offenses.

JUVENILES IN ADULT PRISONS

When juveniles are transferred to the adult system, they are often incarcerated in adult facilities, despite their age. Of the approximately 107,000 youths incarcerated daily in the United States, 14,500 are confined in adult facilities. Forty-four of the 50 states and the District of Columbia allow children 17 years of age and younger to be housed in adult correctional facilities. While a small portion of these juveniles were being held as juvenile offenders (21%), the majority (75%) were held as adult offenders. Seventy-nine percent of the incarcerated youth were 17 years old, while 18% were 16.

Juveniles housed in adult jails experience a rate of suicide that is 7.7 times higher than their counterparts in juvenile detention centers. Incarcerated juveniles in adult facilities are frequently the victims of rape or attempted rape. Ten percent of the juveniles in adult prisons versus 1% of the juveniles in juvenile facilities reported that another inmate in their facility tried to sexually victimize them. Juveniles in adult correctional facilities are also often the targets of staff assaults. One in 10 juveniles in adult prisons was reportedly the victim of staff assaults. Juveniles also face victimization from their fellow adult inmates, presumably because of their youthful age. Finally, young people housed in adult facilities reported being attacked with a weapon by a fellow inmate at a rate 50% higher than their counterparts in juvenile detention centers.

CHILDREN OF INCARCERATED PARENTS

The number of children with at least one parent incarcerated in prison has risen in response to the growing rate of incarceration in the United States. Between 1991 and 1999, the number of children with a parent in state or federal prison increased from 936,500 to 1,498,800. This number continues to grow by 5.7% each year. Of the 72 million children in the United States during 1999, approximately 2% had a parent incarcerated in a penal institution. Twenty-two percent of these children were under the age of five.

While the majority of incarcerated parents are fathers (97%), the number of mothers continues to expand. Since 1990, the number of women incarcerated has grown by 106%. In addition, minority children are affected more than white children by parental incarceration. African American children were nine times more likely to have a parent incarcerated; Latino children, three times more likely.

Placement

Before their confinement, approximately 64% of the parents lived with their children. Once their parent is incarcerated, the home environment of many of these children changed. After their incarceration, 85% of parents, most of whom were fathers, reported that

the child's other parent (the mother) now held the responsibility for raising the child. Not all children remained with one of their natural parents, however. Some were placed in the homes of other family members, most commonly, their grandparents. Fifty-three percent of children whose mothers were incarcerated and 14% whose fathers were incarcerated lived with their grandparents. Children are also often placed with extended family members. Given the emotional and financial burden of raising other people's children, many of these children find themselves being constantly shifted between family members.

Some children are placed in the foster care system, which may raise a number of problems. First, in families where there are multiple children, siblings are often separated from one another in placements, adding to the trauma of having lost a parent. Second, a majority of parents who are incarcerated will eventually be released, yet efforts to reunite them with their children are minimal in most jurisdictions. The impact of parental incarceration on permanency planning can be profound. For instance, social workers often have a difficult time contacting the parent and thus permanency planning strategies and hearings may take place without any input from the parents. Following the Adoption and Safe Families Act of 1997, incarcerated parents now have less time than ever to make their case for keeping their children.

Visits

Maintaining contact between incarcerated parents and their children is difficult and often ignored by correctional officials. While 60% of the mothers and 40% of the fathers in prison reported having weekly contact with their child, the primary means of such contact was via telephone or mail. Fifty-seven percent of state inmates and 44% of federal inmates reported never having had a personal visit with their child.

Financial constraints make all means of contact more difficult. Since the primary means of telephone access for most prisoners is expensive collect calls, many are simply unable to communicate with their children. In addition, many of the parents in the state (62%) and federal (84%) prisons are incarcerated at facilities more than 100 miles from their homes, making the financial and logistical issues insurmountable. Finally, correctional institutions often lack appropriate parent-child visiting facilities. The visiting process in many institutions is often very invasive and frightening for children. The physical contact between parents and children may also be limited, depending on the institution, while the physical environments of visitation areas are most uninviting given the institutional atmosphere.

EFFECTS OF A PARENT'S INCARCERATION ON CHILDREN

There are numerous effects of parental incarceration on children. Aside from the initial trauma of having a parent arrested (which many of them witness), children must also deal with the physical separation from their parent. The loss of physical parental contact, as well as the general disturbance of the family structure, serves to uproot the child's sense of family. Many also suffer serious economic hardships when their parent is incarcerated due to the reduction of family income. The emotional consequences of parental incarceration, however, may be even more severe. Children usually experience an emotional attachment to their parent, regardless of whether they were living with that parent prior to their incarceration. After incarceration, children often become angry, anxious, and depressed or even experience post-traumatic stress disorder as a result of parental incarceration. They may blame themselves for their parent's incarceration. These emotional issues often manifest themselves in behaviors that place them at risk for delinquency. For instance, many children turn to alcohol and drug abuse, teen pregnancy, and truancy in an effort to alleviate the effects of the incarceration. Finally, children with incarcerated parents are five times more likely to engage in criminal and/or delinquent activities than are their peers without incarcerated parents.

EFFORTS TO MAINTAIN PARENT-CHILD CONTACT

There have been some efforts by nonprofit agencies, state agencies, and correctional officials to foster the parent-child relationship. Many efforts have been programmatic in nature, such as Girl Scouts Beyond Bars, which has been implemented in four states, as

well as the creation, at the federal level, of the Resource Center for Children of Prisoners, jointly organized in 2001 by the Child Welfare League of America, the American Correctional Association, and the National Center on Crime and Delinquency. The most common efforts, however, are visiting programs designed to provide incarcerated parents more contact with their children. The efforts of correctional institutions are vastly different, but some of the more common visiting initiatives include interactive videoconferencing, an allotted number of overnight stays per month, week-long summer camps, and weekend camping trips.

CONCLUSION

The discussion of the relationship between children and prisons can be divided into two separate issues: the direct incarceration of children and the incarceration of their parents. While conceivably the most influential aspects of prisons on children results from their own incarceration in adult and juvenile correctional facilities, the effects of the incarceration of their parents has serious repercussions for many children in the United States today.

CHILDREN'S VISITS

There are currently approximately 1.9 million minor children with a parent in prison and millions more who have experienced the incarceration of a parent at some point in their lives. African American children are almost nine times more likely than white children to have a parent in prison, and Hispanic children are three times as likely. The majority of these children are under 10 years old.

Criminological literature suggests that visits improve the postrelease success of prisoners, reducing their recidivism as well as the chances of future incarceration of their children. Likewise, research shows that visits help maintain family ties and increase the likelihood that a family will reunify after release from prison. Child welfare experts assert that lack of contact between parent and child following separation can harm a child's development and perpetuate family patterns of destructive behavior.

SCALE AND SCOPE OF PARENTAL CONTACT

Although most children have some contact with their incarcerated parents by phone or mail, more

Family Visits

Being in the visiting room is like waiting in an airport or bus station. The scene is constructed of the same nondescript uncomfortable chairs and vending machines encompassed by a feeling of boredom. All the prisoners are in their khakis and boots. Their clothes look pressed and their boots are shining because they are trying to look good for their people. But all the prisoners look identical because everything in federal prison is supposed to be uniform.

You know you should be happy to get a visit in prison but the environment of the visiting room is so depressing. Usually a bunch of kids are running around and all the mommies look sad because their man and breadwinner is locked up. Families usually gather around their loved one but they can't touch them because prison regulations stipulate one hug and kiss upon arrival and one on departure. Plus, you have guards all around you checking you out to make sure you're not smuggling drugs into prison or anything. If you get too close to your girl the guards will come up and call you to the side to humiliate you and tell you "if they have to warn you about excessive touching again, your visit will be terminated."

So you sit there trying to be happy seeing your family and friends and eating vending machine food but there is so much surveillance and the visiting room is so loud with everybody yelling that it ends up being a big hassle. Your people drove God knows how many hours to see you, so you feel obligated to stay and to make conversation, but your family is falling asleep from the trip and the whole affair is really rather tiring and then the visit ends. You leave, and proceed to the necessary strip search routine as you hope that the cops won't hassle your family.

Seth Ferranti
FCI Fairton, Fairton, New Jersey

than half never visit them in prison. Children who do visit do not see their incarcerated parents regularly or frequently. Long distances to most correctional facilities, lack of transportation, and limited financial resources are the most common reasons why children do not visit their parents in prison. Prisons are often located in remote, rural areas, typically more than 100 miles from the urban areas where most of the prisoners' children reside. Public transportation rarely services these areas and many families do not own a car or have the resources to rent one.

Prisoners' relationships with their children's caregiver also influences whether children will come to see them while they are incarcerated. Approximately 90% of children with an imprisoned father live with their mother, while only about 20% of children whose mother is in prison live with their father. When a mother goes to prison, often the father is absent. Most children of incarcerated mothers live with a grandparent or other relative. Visiting rooms in men's prisons are typically crowded with mothers who bring children to visit their fathers. However, visiting rooms at women's facilities are noticeably sparse with only a few grandmothers, sisters, or other relatives who are able to bring children to visit their mothers.

There has been a seven-fold increase in the number of incarcerated mothers over the past two decades, while the percentage of children who visit their mothers has declined from 92% in 1978 to less than 50% in 1992. The number of children with a mother in prison nearly doubled from 1991 to 1999 and two-thirds of these mothers were their children's primary caregiver before incarceration.

Some caregivers are angry with the parent and may not believe he or she deserves to see the child. In some cases, children do not want to visit their incarcerated parent. In other cases, parents may be ashamed or embarrassed about their criminal activity, may not tell their children where they are, or do not want their children to see them in a prison. Prisoners and caregivers alike debate whether to have children visit because of the stressful entry process, unfriendly environment, and tearful goodbyes.

THE VISITING PROCESS

Prior to a visit, prospective visitors must file paperwork and review prison rules. Children under

18 years old must have their original birth certificate and be accompanied by an adult; sometimes the legal guardian is required. Clothing restrictions are common and when violated, may prevent the child from visiting. It is not uncommon for visitors to wait two or three hours before being admitted through the prison gates. Once inside, each visitor must pass a security checkpoint to prevent contraband such as drugs or weapons from entering the facility. Uniformed guards escort visitors through a metal detector and often search, frisk, and/or ask them to remove shoes or babies' diapers.

Some prisons have a playroom where children can be entertained with toys, games, and books; however, visiting most often takes place in an open area such as a cafeteria, with tables and surrounding stools bolted to the floor. Children are typically elated once they see their parents and siblings often vie for their attention. Naturally, children's reactions depend on how old they are, how long it has been since they have seen their parent, and their individual circumstances.

While rules vary across institutions and their levels of security classification, parents are generally allowed to give each child one hug and one kiss hello and goodbye. Parents can usually hold babies, but children are not allowed to sit on their lap. Guards closely oversee family interactions and reprimand prisoners or visitors who violate regulations. If a child or parent misbehaves, the visit may be terminated and future visits jeopardized. Prison officials see visits as a privilege that can be revoked in order to motivate good behavior among prisoners.

The length of visits varies by institution and can range from 20 minutes to two hours. Occasionally, children's visits that are part of a parenting education program run longer. Children, parents, and caregivers all report that saying goodbye is the hardest part. The child-unfriendly environment coupled with emotional goodbyes make some parents and caregivers decide against future visits.

Incarcerated parents with children in foster care make up approximately 10% of those in prison with children. These individuals must depend on child protective services (CPS) workers to arrange for their children to visit. Availability of funds and willingness of a CPS worker or foster parent to transport the child, as well as their attitudes toward children visiting parents in prison, all influence whether and how often visits take place. Even though CPS mandates visits as part of all reunification plans, research finds that most children in foster care are not taken to see their parents in prison.

IS VISITING BENEFICIAL OR HARMFUL TO CHILDREN?

There is an ongoing debate about whether prison is an unhealthy environment in which to bring children to be with a parent. Some fear it normalizes the harshness of prison and believe children should remain afraid of it. Others worry that older children might come to see serving time as a right of passage. Many wonder if having to say goodbye again and again only exacerbates the trauma of separation.

Denise Johnston, M.D., a national expert on children of incarcerated parents, maintains that visits are not harmful. She recognizes that sad goodbyes are a natural response and indicative of an affective bond. Furthermore, a visit immediately following parent-child separation reassures children that their parents are alive and safe. Visits ease fears children may hold about prisons and dispel frightening illusions instilled by media images. In the visiting room, children do not feel the stigma of having an incarcerated parent and can connect with other kids who share similar circumstances. Visits allow a child to return to his or her own life feeling more secure.

Most children of incarcerated parents get little or no emotional support to help them process their feelings. Children's ages, their situation before their parent's incarceration and relationship with their caregiver all influence their reactions to the separation. While research on this population is limited, studies consistently find that children of incarcerated parents often have problems in school with concentration, aggressiveness, withdrawal, or excessive crying. Some children too young to understand the criminal justice process blame themselves, inferring that they must have done something wrong to deserve abandonment. Visits mitigate the anxiety

of separation, improve mental health for both child and parent, and are a critical step toward family reunification.

CHILDREN VISITING PROGRAMS

There are various programs across the nation that support child-parent visitation in prisons. For example, the Bedford Hills Correctional Facility in New York has the nation's oldest, complete prison program where newborns can live with their mothers up to one year, and children visit on weekends and during the summertime. Girl Scouts Beyond Bars is a mother-child visitation program started in Maryland in 1992 that has expanded to several states across the country. Operation Prison Gap in New York and Families With a Future in California help transport children to visit their incarcerated parents. While there is relatively little information about these children, their numbers are growing and they are perhaps the most at-risk population of children in the nation.

CONCLUSION

There are significant collateral costs to incarcerating parents. At the current rate, two out of three prisoners will recidivate, each costing taxpayers more than $20,000 per year in prison. Children of incarcerated parents are 50% more likely than other children to become entangled in the criminal justice system, continuing intergenerational cycles of crime and incarceration. Visits are a low-cost intervention with proven advantages for family reunification and crime prevention.

CITIZENS UNITED FOR REHABILITATION OF ERRANTS

Citizens United for Rehabilitation of Errants (CURE) is one of the most active prison reform groups in the United States. The organization began in San Antonio, Texas, on January 2, 1972, when volunteers drove hundreds of miles in dilapidated buses to the state prisons. Riding on the buses were families who had not seen their loved ones in years. In the 1973 legislative session in Austin, one of the buses was used to bring families to help in passing legislation that banned prisoners from having disciplinary power over other inmates. Initially, the prison system had assisted CURE with the bus service, but they stopped cooperating when this bill became law. As a result, CURE decided to become a statewide advocacy organization and moved to Austin in 1974.

Besides prison reform, CURE began to focus on jail, parole, and probation problems. It helped ensure the appointment of the first black, woman, and Hispanic to the parole board as well as the creation of commissions on jail standards and probation. This last agency, the Texas Adult Probation Commission, became the vehicle for a substantial increase in community corrections.

All these victories were a prelude to *Ruiz v. Estelle,* the most comprehensive lawsuit ever filed and the longest ever argued on a prison system.

When the historic order came from Federal Judge William Wayne Justice, it would be at the end of CURE's first decade of existence and it would reform most of the Texas prison system.

1982–1991: IN TRANSITION

After testifying and helping to facilitate *Ruiz,* CURE moved from confrontation to cooperation in encouraging the state to comply with the court order and not to appeal it. In 1983, the Texas Legislature responded by shifting millions of dollars from proposed prison construction to community corrections. The governor was removed from the parole process that not only streamlined the procedure but also led to many more releases.

During the rest of the decade, other state chapters were also established. Forty states now have chapters, and the volunteer leaders are either families of prisoners or former prisoners. Training for these volunteers occur at conferences on leader development that are held every few years. In 1991, CURE established national issue chapters that focus on specific goals such as treatment for sex offenders, reforming the sentences for "lifers," and bringing together the federal prisoners and their loved ones. Like the state chapters, the leaders of the issue chapters are either former prisoners or families of prisoners.

In August 1985, CURE expanded to a national organization and opened an office in Washington, DC. At the federal level, CURE helped to (1) extend the WIC (Women, Infants and Children) Program to pregnant prisoners, (2) increase the Prison Industry Enhancement (PIE) Program to all states, and (3) create an Office of Correctional Education within the U.S. Department of Education.

1992–2003

In 1994, Congress passed the Violent Crime Control Act, which increased the number of crimes for which capital punishment could be applied, gave millions more dollars to states to build prisons, and discontinued Pell grants for prisoners.

CURE's only victories during this period were the creation of an Office of Correctional Job Training and Placement and Specter grants for prisoner education. Within CURE, this depressive picture seemed to be reflected too. From 1997 to 2000, six CURE leaders died. Two passed unexpectedly and one was executed by the state of Texas. However, eventually, the organization seemed to build from these ashes. Equitable Telephone Charges, CURE's highly successful national campaign to reduce the costs of inmate phone calls, was launched. This was followed by For Whom the Bells Toll, a project to have religious communities toll their bells on the day of an execution.

There were also four far-reaching reforms approved by Congress. First, all deaths in custody would have to be reported to the U.S. Department of Justice and annual statistics compiled on them. This legislation was similar to the bill CURE had passed in Texas in the 1983 reform session. Second, mental health courts were created. Similar to drug courts, this allows a judge to divert a mentally ill offender from jail into treatment. Third, the section of the U.S. Department of Justice that sues prisons and jails for unconstitutional conditions received its first staff increase in its 20-year history. Fourth, the U.S. Department of Veterans Affairs was mandated to assist incarcerated veterans with reentry.

Finally, almost 200 people participated in the First International Conference on Human Rights and Prison Reform that was held in October 2001 in New York City. Most of the 24 countries that were represented prepared and delivered report cards to their ambassadors to the United Nations. These cards reported on the status of human rights in the prisons in their countries.

CONCLUSION

At the time of writing, CURE is considering expanding internationally. Whether this happens or not, the organization has tried and many times succeeded in providing "a place at the table" for prisoners and their loved ones when prison policies are decided.

Governors, legislators, prison directors, and wardens have had to at least consider formal positions taken by this organized, totally independent, volunteer

group. Whether CURE is the name of this type of prisoner consumer organization or movement remains to be seen. But CURE leaders are convinced that an organization like CURE should be keeping an eye on every prison and jail in the world.

CIVIL COMMITMENT OF SEXUAL PREDATORS

In the 1990s, public outrage over habitual sexual offenders prompted some states to enact sexual predator statutes. These statutes empower states to confine and treat sexual offenders indefinitely once they have completed their criminal sentence. The legislative rationale for these statutes is that states must protect their citizenry from persons who have a history of sexual deviance pursuant to the states' *parens patriae* and police powers duties. The legislation provides for the civil commitment of dangerous offenders who may lack a mental disease or defect but who are highly likely to sexually reoffend upon their release from prison.

CIVIL COMMITMENT STATUTES

In 1990, Washington became the first state to enact a sexual predator statute. Missouri became the latest state to enact such a statute in 2002. Other states that provide for the involuntary civil commitment of sex offenders include Arizona, California, Colorado, Connecticut, Florida, Illinois, Iowa, Kansas, Massachusetts, Minnesota, Nebraska, New Jersey, New Mexico, North Dakota, Oregon, South Carolina, Tennessee, Texas, Utah, Virginia, and Wisconsin. The statutes in all states presume that sexual predators have a mental abnormality or disability and that they are persons who lack the ability to control their sexual deviancy.

These civil commitment statutes have similar procedural processes governing the postprison confinement of sexual predator offenders. A local prosecutor will be notified that a sexual offender is about to be released from prison. If a prosecutor decides to pursue civil commitment, he or she will begin an involuntary civil commitment hearing or trial to determine if the offender is too dangerous to be released. The commitment proceeding can be held before a judge or jury, and if the prosecutor proves beyond a reasonable doubt that the offender is a sexual predator then the offender will be committed to a secure facility. The commitment is indefinite, and the offender will be held until such time as it is shown that the offender is no longer a threat to the community.

CONSTITUTIONAL CHALLENGES

Constitutional challenges to sexual predator statutes have questioned whether the statutes satisfy due process. Substantive due process prohibits a state from limiting an individual's fundamental rights unless the state has a compelling state interest. In addition, the state statute has to be narrowly tailored to achieve that interest. In regard to sexual predator statutes, states argue that the state must protect the community from the substantial harm that a sexual predator can inflict on victims of rape and sexual assault. Opponents of sexual predator statutes argue that the statute's presumption is not based on a showing of a mental illness or defect, the traditional focus of civil commitment laws, but on a showing of a mental "abnormality," an overbroad characterization. In addition, opponents argue that an individual's procedural due process rights are violated when fact finders presume habitual offending propensities based on past conduct without adequate procedural protections to ensure that such commitments are not indefinite.

Civil commitment is traditionally based on the need to confine and treat persons who suffer from a mental illness and release persons when they are no longer a danger to themselves or others. Because civil confinement of sexual offenders does not depend on the ability of the state to provide treatment, opponents of sexual predator laws argue that the statutes do not comport with the expanded rights of the mentally ill that has occurred over the past 30 years.

Sexual predator statutes have also been challenged under the Constitution's double jeopardy and *ex post facto* provisions. Opponents of these laws argue that an individual should not continue to be "punished" upon completion of a prison sentence. Since the statutes were enacted after many sex offenders had committed their offenses, opponents also argue that the laws cannot be applied to these individuals.

ONE STATE'S EXAMPLE: KANSAS

The U.S. Supreme Court upheld the constitutionality of Kansas's Sexually Violent Predator Act in two cases. In *Kansas v. Hendricks,* 521 U.S. 346 (1997), a divided court found that because the statute is "civil" and not part of the criminal law system the statutes cannot violate the Constitution's double jeopardy and *ex post facto* clauses. In *Kansas v. Crane,* 534 U.S. 407 (2002), the U.S. Supreme Court clarified the definition of a sexual predator and held that involuntary civil commitment of a sexual offender is permissible if a sex offender is shown to lack control over his or her behavior. The Court stated that a finding of "total" lack of control is not required, but the state cannot commit a person without a showing that the individual suffers from a volitional impairment (e.g., pedophilia) and has serious problems with controlling his or her behavior.

CONCLUSION

Sexual predator statutes that provide for the civil commitment of sexual offenders who cannot control their sexual offending behavior are, in general, constitutional. These statutes must provide substantive and procedural processes that establish that an offender suffers from a mental abnormality and lacks control over the deviant sexual behavior beyond a reasonable doubt. States cannot automatically transfer sexual offenders to a secure facility involuntarily at the expiration of a prison sentence without due process. Nonetheless, because these statutes are civil in nature other constitutional concerns that might exist if the statutes were part of the criminal law do not apply.

CLASSIFICATION

Classification is fundamental to correctional practice. It is incumbent upon any correctional agency, institution, or community to identify (classify) who is (a) at risk of reoffending, (b) likely to incur problems adjusting to prison, and (c) in need of specific services. Determining whether an offender is able to participate in various types of treatment programs, examining such traits as ethnicity, age, gender, and intelligence, also falls under the rubric of correctional classification.

Offenders are not all alike but differ according to risk, treatment needs, intelligence, gender, ethnicity, financial needs, family considerations, personality, employment, employability, and other factors. Failure to assess for and plan for such differences may imperil the safety of prison facilities and communities. At the same time, ignoring assessments, which help to match offenders to appropriate treatments and

Type of System	*Purpose: Institutional Corrections*	*Purpose: Community Corrections*
Risk Assessments	Predict institutional misconducts	Predict new offenses
Needs Assessments	Identify offender needs for programming referrals	Identify offender needs for programming referrals
Risk/Needs Assessments	Seldom used in institutions	Predict new offenses with needs that are also risk factors
Responsivity Assessments	Assessments of IQ, maturity, personality, and other attributes likely to interfere with an offenders' ability to participate in certain programs.	Assessments of IQ, maturity, personality, and other attributes likely to interfere with an offenders' ability to participate in certain programs.

Figure 1 *An Overview of Correctional Classification Approaches*

services, increase the likelihood that offenders will commit new offenses upon release.

HISTORY AND DEVELOPMENT OF "OBJECTIVE" CLASSIFICATION

Prior to the 1960s, correctional classification typically involved a clinical process, where decision makers based their determinations on professional judgment of an offender's dangerousness, treatment amenability, treatment needs, or his or her likelihood of absconding or escaping. Critics faulted this process as inequitable, subjective, and discretionary. More recently, classification has begun to use actuarial or objective assessment and testing procedures. Research finds that properly constructed and validated tests are far more accurate than professional judgment.

The common features of objective correctional classification systems are as follows:

1. They are usually administered systematically to all offenders in a correctional institution or program, usually at the point of intake and at regular intervals thereafter.
2. They result in a "typology" of offenders in an agency, where each "type" on the typology categorizes offenders according to similar needs or risk levels.
3. Some level of staff training is required to administer the system.
4. The classification process is governed by agency policy, which set forth uniform and efficient procedures, applying the same criteria to all offenders in an expeditious way.

There are four types of classification systems currently in use: (a) risk assessment systems, (b) needs assessment systems, (c) risk/needs assessments, and (d) systems for testing amenability to treatment. The latter falls under the notion of offender *responsivity* in which agencies are seeking to identify those individual attributes or learning styles that could affect an offenders' ability to participate in certain interventions, including those he or she might need.

As shown in Figure 1, each one of these three broad categories of classification system serves a different purpose. As a result, "What do you want the classification system to do?" is a question that needs to be answered prior to selecting or constructing classification systems (Hardyman, Austin, & Peyton, 2004). Keeping these functions clear helps to prevent misuse of a classification system. Unfortunately, agencies often use systems for the wrong purpose. For example, institutional systems typically do not predict new offenses in the community.

RISK ASSESSMENT

Risk assessments are designed to predict new offenses or prison misconduct. As early as the 1970s, the U.S. Parole Commission was employing the Salient Factor Score (SFS) to classify parolees into high, medium, and low levels of risk of reoffending, while institutions were developing models

designed through the early National Institute of Corrections (NIC) Model Prisons to classify incarcerated offenders according to maximum, medium, and minimum custody.

The factors considered in the NIC institutional classification systems appear in Figure 2. A host of validation studies found such systems, including their later versions, to be predictive of institutional misconduct, particularly serious misconduct. Individual states have modified these systems somewhat, but the basic structure of the NIC model has stayed intact and is the most common system in institutional use.

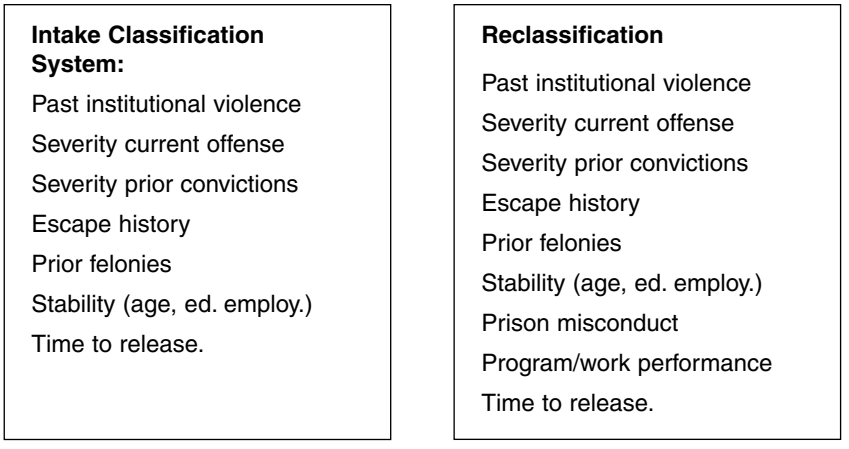

Figure 2 *Factors Considered on Institutional Custody Classification Systems*

This classification instrument is administered to all inmates upon admission and then readministered every six months to one year thereafter. Classification specialists score each item, add the scores, and consult guidelines to determine what custody level matches the score. It is noteworthy that the factors listed in Figure 2 are *static* factors—they do not change over time. Reclassification assessments attempt to correct for this. Items such as prison misconduct, time to serve, accomplishments in institutional treatment programs can reduce or increase one's custody assignment. Similarly, some systems change scores or weight on the static items for purposes of reclassification. With the item not count for as many points on the reclassification instrument as it does on the intake classification system, custody assignments can drop.

Institutional custody classification systems offer no recommendations for programming and correctional treatment. Similarly, they do not predict recidivism in the community. Therefore, it would not be entirely correct to assume that offenders classified at minimum custody are the best candidates for work release, early release, or furloughs. Instead, community risk assessment instruments are needed for this purpose.

At roughly the same time that the custody classification systems were appearing in institutions, the U.S. Parole Commission implemented the SFS. SFS items (shown in Figure 3) are entirely static, meaning that an offender scored as poor risk is unlikely to be reclassified as low risk at a later date. As with the NIC system, the SFS has little information to offer practitioners about treatment needs. Just the same, it has been revalidated and found to work with both men and women offenders.

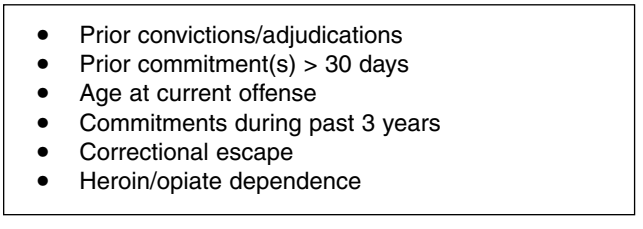

Figure 3 *The Salient Factor Score (Hoffman, 1994)*

Agencies using these two models find them useful in classifying offenders according to risk. They inform what is widely considered to be the most important function of corrections—community and institutional safety. Even without additional tools to inform treatment or responsivity considerations, these models, particularly the community risk models, have changed the face of correctional practice and made programs such as intensive probation, a host of intermediate sanctions, and alternatives to incarceration possible.

NEEDS ASSESSMENTS

Classifying offenders into separate institutional custody levels or community supervision levels on the basis of risk alone cannot determine what should be done for them in terms of treatment, facilitating adjustment to prison, or preventing problems while in prison. Needs assessment systems attempt to offer such treatment-relevant implications. In both community and institutional corrections, needs assessment instruments supplement risk assessment instruments. Most are not designed to inform custody or level of supervision.

Needs assessments serve a number of purposes including (a) systematic and objective identification of offender needs; (b) linking offenders to needed programs to promote behavioral change and prevent physical, psychological, or social deterioration (if incarcerated); (c) provide a tool for individualized case planning; and (d) allocate agency and programming resources. When used in institutional settings, needs assessments conform to what Levinson (1988) termed as "internal classification."

The needs that are most likely to be identified by these instruments include health, intellectual ability, mental health, education, employment, and drug and alcohol abuse. Like risk assessment models, needs assessments are designed to be administered at intake and at regular intervals throughout the correctional terms.

Usually, correctional case managers or counselors using this kind of classification system rate each need according to the extent to which, if any, the problem interferes with daily functioning. In response to the alcohol abuse item, for example, a case manager might be prompted to indicate where there is (a) no alcohol abuse; (b) occasional abuse, some disruption of functioning; or (c) frequent abuse, serious disruption, needs treatment. Understandably, some have faulted such items as requiring too much subjectivity and likely to lead to problems with the reliability of the instrument.

More acceptable approaches would more closely follow guidelines established by the American Correctional Association that emphasize the importance of providing objective criteria for each level of need, and informing determinations with the best available information (e.g., assessments, presentence investigations, medical reports, and psychological evaluations). More recently, agencies have begun to use established screens, especially for mental health, substance abuse, and education.

Needs assessments were never designed to be the final assessment of a serious problem such as substance abuse; instead, they are intended to triage offenders, identifying those who need more intensive assessments. For more detailed assessment, agencies tend to use established screens and assessments to supplant the less formal needs assessment instrument. Substance abuse, for example, may be assessed by instruments such as the Substance Abuse Subtle Screening Inventory (SASSI), Adult Substance Use Survey (ASUS), or Addiction Severity Index. Mental health screenings have used the Minnesota Multiphasic Personality Inventory-2 (MMPI-2), Symptom Checklist 90 (SCL90), or MCMI III to name just a few.

Another alternative that is discussed in unpublished agency documents (e.g., states of Texas and Colorado), rather than in the published media, involves the use of algorithms or scoring rules for combining an assessment with behavioral indicators of an offender need requiring treatment. The Colorado Department of Corrections, for example, developed scoring rules for combining results of the MCMI III with indicators pertaining to past hospitalization, medications, past treatment, and history of self-destructive behavior to indicate whether the offender is low, moderate, or high need for mental health services. Taking this a step further, the state of Texas links similar need categories to treatment/programming recommendations. The importance of guiding case managers to available services commensurate with assessment results should not be overlooked. Many assessments sit in files and do not get used.

RISK/NEEDS INSTRUMENTS

In a growing number of community correctional agencies, risk and needs assessments are being combined into a single instrument. Such classification models

constitute what Bonta (1996) referred to as the third, and most recent, generation of correctional classification strategies. The most commonly used system of this nature is the Level of Service Inventory-Revised (LSI-R), a system developed in Canada during the late 1980s and 1990s. States and federal jurisdictions have developed alternatives to the LSI, but published accounts of their validation are scarce.

The classification items comprising the LSI-R scores are shown in Figure 4. Most of these items are dynamic, pertaining to offender needs that can change over time, especially when agencies successfully target and program for those needs. The LSI-R does not target all of the offender's needs that an agency may wish to address, however. For example, housing, child care, and self-esteem are not listed. In fact, any dynamic need included on the LSI-R is also a risk factor, or to use a term coined by the assessment's authors, a *criminogenic need* (Andrews, Bonta, & Hoge, 1990). Therefore, the LSI and other instruments like it are composed of both static current and prior offense variables and by dynamic needs that are also risk factors.

- Criminal history
- Education/employment
- Financial
- Family/marital
- Accommodations
- Leisure/recreation
- Companions
- Alcohol/drug
- Emotional/personal
- Criminal sentiments

Figure 4 *Level of Service Inventory-Revised (Andrews & Bonta, 1995)*

Given its dynamic features, the LSI-R scores can change over time; this is an important feature of this mode of classification technology. Agencies can administer the assessment at later points in time to determine whether an offender's participation in needed treatment programs resulted in a reduction in his or her overall risk score. At the same time, the most recent scores are the most valid predictors of future offending.

Studies of the LSI-R suggest that, for men, reduced scores result in lower rates of recidivism and increased scores result in higher rates. However, recent analysis of the validity of this measure for women has been more equivocal. The success of classification systems, may, in other words, be determined in part by gender.

As their title implies, risk/needs instruments serve two functions: They classify offenders into high-, medium-, and low-risk categories, and they identify the needs that are contributing to an offender's risk profile. These features make such classification models extremely useful to agencies providing treatment services designed to change offender behavior. From meta-analysis contributed to by the same authors (Andrews, Bonta, & Hoge, 1990; Andrews, Zinger, Hoge, Bonta, Gendreau, & Cullen, 1990) emerge two of several principles of effective intervention (treatment) that are highly relevant to the use of dynamic risk assessment instruments—the risk principle and the need principle.

First, the *risk principle* maintains that intensive and extensive services are more effective among high-risk offenders; low-risk offenders usually respond better when they receive either no interventions or minimal intervention. Research bears this out. Second, the *need principle* maintains that in order to reduce offender recidivism, programs must address offender characteristics (or needs) that are related to future offending. As noted earlier, these needs are called criminogenic. They include substance abuse, antisocial attitudes, and antisocial peers, to name a few. To distinguish criminogenic from noncriminogenic needs, noncriminogenic needs are not associated with criminal behavior. A program can and should treat a noncriminogenic need such as physical health, but it must be understood that such treatment is not likely to lead to a reduction in the offender's future offending.

RESPONSIVITY

During the 1970s and 1980s, a number of correctional psychologists worked to evaluate and develop psychological assessments to facilitate the notion of differential treatment. Grounded, as all classification research is, in the notion that offenders are not all alike, the assessments developed by these scholars classified offenders according to personality or conceptual/cognitive maturity. These and later studies found differential adjustments to prison and differential responses to specific types of correctional interventions.

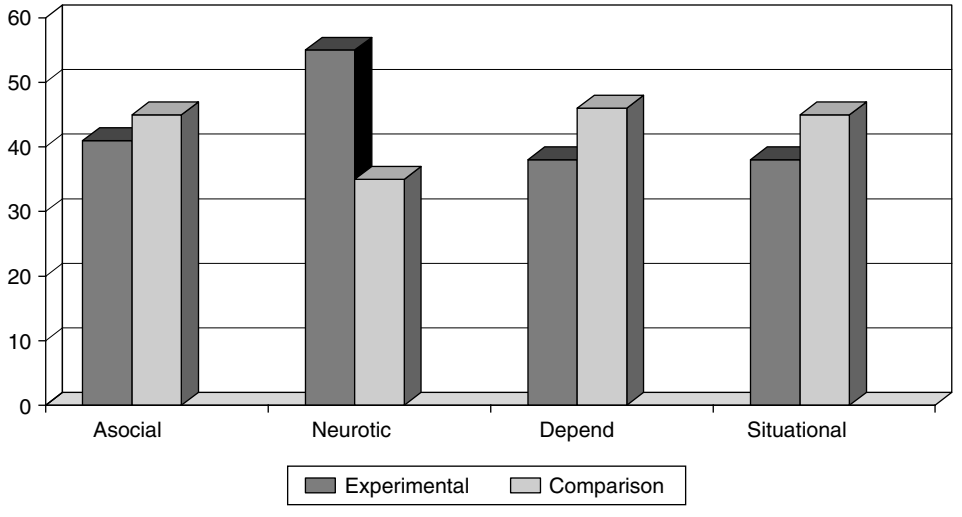

Figure 5 *Percentage Returning to Prison Following Cognitive Skills Programming by Specific Personality Types (Van Voorhis et al., 2002)*

One of the latest studies of psychologically informed differential treatment employed the Jesness Inventory (Jesness, 1996) to classify adult male parolees into the following four personality styles, which have roots in the earlier scholarship on differential treatment:

Asocial aggressive: Offenders with internalized antisocial values, beliefs, and attitudes. Crime is a lifestyle.

Neurotic: Highly anxious offenders, whose criminal behavior represents the acting-out of an internal crises. Crime for these offenders often has more of a personal meaning than an instrumental one. Dysfunctional, self-defeating coping responses play a role in getting these individuals into trouble.

Dependent: These offenders tend to be immature and easily led. They get into trouble through their own naïveté and in the course of being too easily led by other offenders.

Situational: These offenders have pro-social values, and less extensive criminal careers. They get into criminal behavior on a situational basis that they are unable to cope with or through substance abuse.

When these parolees were assigned to Ross and Fabiano's (1985) cognitive skills program (Reasoning and Rehabilitation), some types were clearly more successful than others. The treatment implications for findings such as these suggest that the cognitive skills program was most appropriate for asocial, immature, and situational offenders. Neurotic program participants, on the other hand, faired worse than members of the comparison group who did not participate in the program. They perhaps should be screened out of the program into a program more suitable to their needs. Such a practice would involve practitioners in doing exactly what the classification systems are designed to do—match offenders to programs they can benefit from. Alternatively, the program, itself, could be altered to better accommodate or work with neurotic personality attributes.

Today, differential treatment is encompassed in one of the principles of effective intervention, the *responsivity principle*. The responsivity principle maintains that programs should consider different learning styles, motivation levels, personality types, intellectual functioning, housing, child care and other considerations that are likely to become barriers to the success of some types of interventions. That is, even when an offender, even a high-risk offender, might need a specific type of program on the basis of having a related risk factor, he or she may still not be able to attend because of intellectual consideration, child care needs, or other responsivity-related characteristics. Assessing and screening them from inappropriate to more appropriate programming would increase their chances of success.

CONCLUSION: THE NEXT STEPS

At present, several concerns are receiving the attention of researches and practitioners alike. First, at both national and state levels, agencies have voiced concern for the validity of these systems among women offenders. In fact, a recent nationwide survey

of state directors of classification revealed that 36 states still had not validated their custody classification systems on women offenders. Efforts to do so in seven states quickly revealed that existing systems either were invalid for women or overclassified them, thereby placing them in higher custody levels than warranted on the basis of their ultimate prison adjustment. Use of invalid classification systems, of course, is considered to be professionally unethical.

Second, the development of new assessments for specific types of offenders, such as psychopaths and sex offenders, and for specific criminogenic needs is resulting in numerous additional assessments to inform case management and supervision of these individuals. These include, for example the (a) Hare Psychopathy Checklist-Revised; (b) Sex Offender Need Assessment Rating (SONAR), (c) Static 99, (d) Spousal Assault Risk Assessment Guide (SARA), and (e) Criminal Sentiments Scale.

A final issue does not involve the assessment systems but rather the practitioners who use them. Particularly relevant to dynamic risk assessments and needs assessment, the systems are often not used to make case management decisions. The implementation of such systems, in many agencies, appears to have stopped at the point of administering the assessment. The next step, using the assessment results to guide program referrals is either not understood by case managers or is not possible due to insufficient program resources. Clearly, the next level of research and development would be to develop case management systems to use these models to their full potential.

CLEMENCY

Clemency is a broad term for intervention that reduces the punishment for a crime. Also called *executive clemency*, because it normally results from the decision by the executive officer of a state (the governor) or the federal system (the president), it includes pardons, reprieves, and commutations. Clemency is considered essential to the criminal justice system, because in theory, if not always in practice, it serves as an executive check to balance perceived injustices in sentencing.

The power of the sovereign to forgive crimes dates at least from the time of Solon in seventh-century Athens. It was a mainstay of English common law and was used variously to show mercy as well as to provide incentive to privateers and other criminals to join battles on behalf of the crown. In the United States, Alexander Hamilton provided the rationale for the constitutional foundations in the *Federalist Papers*:

> [The president] is also to be authorized to grant "reprieves and pardons for offenses against the United States, *except in cases of impeachment*." Humanity and good policy conspire to dictate, that the benign prerogative of pardoning should be as little as possible fettered or embarrassed. The criminal code of every country partakes so much of necessary severity, that without an easy access to exceptions in favor of unfortunate guilt, justice would wear a countenance too sanguinary and cruel. (Hamilton, 1788/1961, p. 447)

TYPES OF CLEMENCY

Because state and federal statutes vary, definitions of the forms of clemency also vary. In general, *commutation* refers to reducing the punishment for an offense. One common example is the reduction of the sentences of abused women who murdered their abusive partners, or the reduction in sentence of relatively minor drug offenders who received sentences disproportionate to their crime under harsh mandatory sentencing statutes.

A *pardon* nullifies an original sentence and can occur while an offender is incarcerated, or while on parole or probation. A pardon can also be issued after a full sentence has been completed, or even granted posthumously, as occurred when New York Governor George Pataki pardoned comedian Lenny Bruce. There are several types of pardons. An *absolute*, or *full pardon*, ends the punishment of an offender and fully

restores the offender's civil rights. A *conditional pardon* requires an offender to meet a set of prespecified conditions that can include restitution, counseling, therapeutic programming, or other conditions. Like parole or probation, a conditional pardon can be revoked if the offender fails to comply with the specified conditions. A *partial pardon* absolves a limited range of the offenses. For example, the original conviction might be upheld, but the severity of the offense is mitigated by factors that lessen the severity of the original charges and that were not recognized during the original judicial proceedings.

Amnesty, also called a *general pardon,* is a blanket pardon of a class of offenders and can include persons who have not yet been convicted of a crime. Amnesty precludes future punishment for the offense. An example occurred when President Jimmy Carter, in one of his first acts of office in 1979, granted amnesty to young men who, during the Vietnam War era, failed to register for the draft or who sought refuge in another country to avoid military service. In the past decade, President Bill Clinton gave amnesty to qualified Central American aliens residing in the United States, and in 2004 President George W. Bush proposed a de facto limited amnesty program for unregistered immigrant workers.

Other than by a full pardon, clemency actions, unlike exoneration, usually do not clear the offender's record of the conviction, and the recipient generally still bears the legal stigma. However, governors or the president can *exonerate* an offender, which expunges the conviction and removes the blame for the offense. Exonerations most often occur following wrongful convictions and the presumed offender was found innocent (as opposed to "not guilty") of the offense.

Although a form of clemency, a *reprieve* generally does not reduce or alter a sentence, although this may eventually occur. Instead, it temporarily defers punishment. This most often occurs in capital cases usually for the purpose of allowing courts to reconsider the offender's appeal.

Clemency

For federal prisoners, only the president has the power to grant clemency. It is a power the recent presidents exercise rarely. Indeed, ever since Ronald Reagan's term in the early 1980s, acts of clemency have become less frequent, where only a handful of federal prisoners receive any form of relief through this extraordinary act of the executive branch of government.

There are a few different types of clemency, including amnesty, pardons, and commutations of sentence. Prisoners who want clemency usually try for a commutation of sentence. Ordinarily, a prisoner must exhaust all other possibilities for relief before submitting a petition for clemency. Federal prisoners can request the clemency petition from their case managers, or directly from the U.S. Pardon Attorney, whose office is responsible for reviewing all such petitions.

I submitted a petition for clemency in 1993. I had then completed over five years in prison, during which time I had earned an undergraduate degree, maintained a clean disciplinary record, and contributed to programs inside and outside of prison walls. I solicited and received letters of support from leading penologists around the United States. I have worked hard to earn freedom, and the hopes of receiving a commutation of sentence sustained me through thousands of lonely prison nights, in a dark, dank prison cell. Two years after I submitted my petition, however, I received a form letter from my case manager informing me that my petition had been denied. Now I am in my 17th year of this sentence, and I contemplate the possibility of filing a second petition. The political climate today, however, feels much colder than in 1993, and I am less than sanguine about President Bush granting me relief. Regardless of what an individual does to redeem himself, today's kinder, gentler America wants its pound of flesh.

Michael Santos
Federal Prison Camp, Florence, Illinois

GRANTING CLEMENCY

Although courts may grant reprieves or commute sentences, this requires that offenders go through the legal process to appeal their case. Executive clemency, by contrast, occurs at the individual discretion of the president or a governor.

For federal crimes, Article II, Section 2, Clause 1 of the U.S. Constitution gives the president the irreversible power to grant pardons or commutations for federal offenses, except in the case of impeachment. The president cannot grant clemency to those convicted of crimes in a state court. However, presidential clemency power does extend to convicted offenders in Washington, D.C., federal territories, and the U.S. military.

A governor of a state in which a state offense has been committed may also issue clemency, but this power varies dramatically by state. Governors in 35 states have sole authority to make clemency decisions, but in five states, boards make clemency decisions and in the rest the authority is shared between the governor and an advisory board (Michigan Battered Women's Clemency Project [MBWCP], n.d.).

Both state and federal procedures require that those wishing to appeal for clemency undergo a formal application process. At the federal level, The Office of the Pardon Attorney in the Department of Justice provides forms and guidelines for eligibility and processing. After review, these are submitted to the president. State clemency requests are also reviewed by a board or similar committee, and then submitted to the governor.

Pardons, the most common form of clemency, are traditionally granted at the end of an executive's term of office or during the holidays in December. Although accurate figures are not maintained, most estimates indicate that about 2,000 pardons are granted to state offenders annually, a figure that most observers see as fairly stable over the past decade. At the federal level in the past century, however, the number of pardons and other forms of clemency has varied dramatically among the presidents, ranging from less than 5% of clemency requests granted under the first President Bush to about one-third granted by President William Howard Taft.

Until the end of the Civil War in 1865, presidential pardons were granted sparingly. Only three presidents, James Monroe (419), Andrew Jackson (386), and Abraham Lincoln (343) granted more than 300, and the majority of President Lincoln's pardons were given to Union soldiers. This changed dramatically after the Civil War and peaked in the mid-20th century with a "pardon explosion" by Presidents Calvin Coolidge (1,545), Herbert Hoover (1,385), Franklin D. Roosevelt (3,687), and Harry S. Truman (2,044). Although President Bill Clinton's pardons during his eight-year tenure in office were controversial, the number of pardons he issued, 456, was roughly the same as those granted during the terms of Presidents Gerald Ford in a bit over two years (409) and Ronald Reagan in eight (406). President Clinton pardoned about half of those granted by President Richard Nixon (956), who served barely six years in office. However, despite the explosion in the federal prison population, the number of annual clemency applications between 1953 and 1999 edged toward 1,000 only twice, suggesting that relatively few convicted felons are granted, let alone apply for, clemency (Jurist Legal Intelligence, 2004a, 2004b).

THE CONTROVERSY OF PARDONS

Although those receiving clemency cut across class and race divisions, there is a perception that clemency tends to be given to high-status offenders who are wealthy or politically connected. This perception occurred early in the history of clemency in the United States, when wealthy patrons were accused of granting clemency for political or monetary reasons. President Lincoln was alleged to have used pardons of Union soldiers to improve morale of Northern troops, and President Warren G. Harding was suspected of participating in "pardons for cash" schemes.

More recently, President Clinton was accused of pardoning of Marc Rich, who had fled the country, in return for contributions from Rich's wife. Gerald Ford was accused of politicking when he granted a postimpeachment pardon to former President Nixon, and the first President Bush was alleged to have pardoned six Iran-Contra defendants to avoid embarrassing revelations about high-level political involvement in trading "arms for hostages."

In addition, the governors or other high officials of some states have been accused of or charged with pardons for cash. Although not uncommon in the 19th century, the practice apparently has since

declined. However, In the 1920s, Texas Governor Miriam A. Ferguson pardoned more than 2,000 offenders in her first term, with the price alleged as high as $5,000, and in 1923, Oklahoma Governor John Walton was removed from office for selling pardons. More recently, in 1979 Tennessee Governor Ray Blanton also was implicated in a pardon- selling scheme, although he was not indicted.

Governors have also been accused of using clemency for ideological or political motives. In 1986, outgoing Governor Toney Anaya commuted the sentences of New Mexico's five death row inmates, and Ohio changed its pardon statutes after departing Governor Richard F. Celeste pardoned 67 prisoners in 1991. Wisconsin Governor Tommy Thompson was accused of granting an unjustifiable pardon to the son of a close political colleague prior to leaving office in 2000. Perhaps the most controversial clemency action in recent decades was the blanket commutation of 167 death row inmates by Illinois Governor George Ryan in his final days in office, which the governor justified on the bases of the state's demonstrably flawed system of justice in capital cases.

CONCLUSION

Clemency has been widely criticized in recent years. Some citizen groups claim that it unfairly reduces prison sentences imposed on serious offenders and is unfair to victims. Other groups feel it should be granted more liberally, especially in cases where offenders killed an abusive partner, when an offender is old or terminally ill, or when other extenuating circumstances not recognized at trial mitigate the seriousness of the offense. The controversies arising from high-profile cases have eroded the public's confidence in the integrity of the system, and the continued concerns with crime and increased sentences increase the suspicion that clemency is "soft on crime." Yet clemency remains a final remedy for sentences that were originally unfair or for which punishment serves no further purpose. Despite the controversies, clemency gives hope to prisoners and helps reduce some of the injustices in the criminal justice system.

CLEMMER, DONALD

Donald Clemmer was one of the first to study and document the psychological effects prison life can have on inmates. He is best known for *The Prison Community* published in 1940 in which he coined the word *prisonization* to explain how individuals adapt to incarceration. In this text, he also explored the relationship of individual inmates to prison groups. Clemmer's study was the result of a career that spanned more than 30 years working in prisons, and it became the foundation for further research on the social and psychological effects of prison.

WORKING IN CORRECTIONS

Clemmer served as the first director of the District of Columbia's Department of Corrections in 1946 until his untimely death on September 18, 1965. Before obtaining this position, Clemmer also worked more than 15 years in Illinois prisons, the

federal penitentiary in Atlanta, and the Federal Bureau of Prisons.

During his time in the District of Columbia, Clemmer was always in search of new ways to rehabilitate inmates in the hope that they would not return to prison. Clemmer's philosophy was emphasized in the *Personnel Handbook* for the Department of Corrections in 1949, "That is, while custody and discipline may be regarded as of importance, so also is training of inmates wherever possible, as well as their proper feeding, clothing, and medical care" (Oakey, 1988, p. 173). Clemmer was also instrumental in increasing the number of psychologists and psychiatrists on the staff of the Department of Corrections and he served as a strong advocate for the treatment of addictions such as alcoholism. He was hailed as a humanitarian when he abolished the use of "the hole" or solitary confinement as a form of punishment. During Clemmer's reign, there were very few problems at his facilities, which many attribute to his humane treatment of the inmates and staff.

The Prison Community

The Prison Community was based on many years of research at the Illinois State Penitentiary. Its central idea, known as prisonization, is described by Clemmer as a process by which an individual will take on the traditions, moral attitudes, customs, and culture of the penitentiary population. According to Clemmer, prisonization occurs to all inmates, to varying degrees, immediately upon entering the prison doors and explains why individuals take on the language, dress, inferior position, and rules of prison life to survive. Whether individuals will completely assimilate to the prison culture occurs depends on many factors including their personality types, the length of the sentence to be served, their relationships with family and friends outside of prison life, and their desire to isolate themselves from prison groups.

According to Clemmer, inmates adapt to life in prison by relinquishing self-esteem and independence to the prison system. Prisoners are known by numbers rather than name, they give up their clothing for a prison uniform, and they assume a subordinate role to prison staff. Paradoxically, the essential qualities inmates surrender are necessary for their later successful reintegration into the community upon release. Consequently, the degree to which people assimilate to their life inside prison affects the chances the inmate has in being reintegrated into society upon release.

PRISONER GROUPS

In *The Prison Community,* Clemmer also addresses the relationship of inmates to primary and informal groups while incarcerated. Until this study, it was assumed that prisoners have strong alliances with various prison groups just like those in the free world. However, Clemmer claims that most inmates are either not intimately associated with a group or are only superficially affiliated with groups. A very small minority of inmates were found to associate with primary groups and those relationships were discovered not to develop in the same manner as primary groups outside of prison because they lack a fundamental unity. Clemmer explains that primary groups outside of prison develop based on the "warmth of person-to-person relationships" while inmate relationships are often based on the "convict code," which dictates not snitching on another inmate or participating in any acts that would assist the prison staff.

CONCLUSION

Clemmer's work contributed to penology by inspiring further research into ways of reducing the prisonization process and increasing the inmate's chances for reintegration into society. Other researchers have also used Clemmer's study as the basis for understanding prison culture as it relates to females inmates, prison gangs, prison race relations, and effective rehabilitation. Although its ideas are no longer accepted in their entirety, it remains a key text in prison studies.

CO-CORRECTIONAL FACILITIES

Co-correctional facilities house women and men in the same institution under the direction of one administration. Some allow a significant amount of interaction between the sexes, while others have no direct interaction between female and male inmates at all. These prisons are also sometimes referred to as coed institutions.

When the first prisons were established in the United States, the small number of women offenders were housed with the men. By late in the 19th century, however, all prisons had been desegregated by gender. Co-correctional prisons resurfaced as a correctional strategy 30 years ago to serve as an innovative method for better program delivery to prisoners. It was also hoped that they would be cost-effective since they could use vacant sleeping and living quarters in women's prisons.

HISTORY

The first prisons in the United States incarcerated women and men, and adults and children together. This mixed-gender, mixed-age setting was not always the most conducive environment for the prisoners, particularly for women and children since rape and other acts of intimidation and violence occurred regularly in them. As a result, reformers began to advocate for gender segregation during the 19th century. In 1873, the first women's prison opened in Indiana. Women-centered facilities such as Indiana Women's Prison provided job opportunities for professional women, who served in positions as matrons, administrators, and other prison staff. These female workers were expected to act as positive role models for the inmates.

Almost one century later in 1971, a co-correctional facility was opened in Forth Worth, Texas, for adults sentenced to the federal prison system. During the 1970s, five federal co-correctional facilities opened, and by 1977 fifteen state co-correctional prisons had been established. Through the 1980s and 1990s, many more co-correctional facilities were set up. According to the American Correctional Association's 2002 *Directory of Adult and Juvenile Correctional Departments, Institutions, Agencies, and Probation and Parole Authorities,* 54 adult and 38 juvenile state co-correctional facilities were in operation in the United States during 2001. Eighteen of these are part of the federal prison system.

The level of interaction between female and male inmates varies among co-correctional facilities. In many, there is virtually no direct contact between the sexes, while others have contact at all times except during sleeping hours.

CURRENT PRACTICE

In the modern era, co-correctional facilities do not have the same problems of the sexually integrated prisons over a century ago. Instead, prisoners enjoy an environment that is more comparable to that of society outside the prison than is evident in same-sex institutions. Being able to interact with members of the opposite gender on a daily basis is thought to reduce disruptive and predatory homosexual activity,

lessen violence between prisoners, and promote a better self-image of the inmates.

Co-correctional institutions generally try to facilitate cross-gender relationships, to assist with rehabilitation and effective reintegration into the community outside prison for offenders. Supporters of this approach to prison management claim that these facilities improve access to programs for all offenders, particularly women, who often receive less educational and vocational training than men.

As they did in the beginning, co-correctional facilities enable administrators to redistribute prisoners into systems with more space. Thus, some prison administrations deal with the increased numbers of women by using available space in men's prisons, while others transfer men into low-capacity women's prisons to relieve some of the overcrowding among the men's institutions. The Federal Bureau of Prisons also sometimes uses these facilities to house prisoners at risk of victimization in other institutions, including former police officers and judges, and "blatant" homosexual persons.

Last, the programs may enable women prisoners to be in more geographically desirable locations, closer to their places of origin. Because there are few women prisoners, many states have only one or two prisons exclusively for them. Co-correctional facilities provide women with greater opportunities to be near their children and other family members.

SOME PROBLEMS WITH CO-CORRECTIONAL FACILITIES

Even though supporters of coed prisons believe that women would be afforded more opportunities by being housed with male inmates, co-correctional programs have also been criticized for relegating the small numbers of women within them to a subordinate position. For example, the availability of recreational, vocational, medical, and educational programs for women in co-correctional facilities is often deficient because most correctional institutions are designed for men, not women. When women are introduced into a prison that had housed only men, adjustments have to be made to address their needs. Women cannot merely be added to a male prison environment without appropriate adjustments in the delivery of services. When co-correctional programming has been found to be in keeping with the needs of women offenders, male inmates who dictate the level of participation by women in these programs may hinder female inmates' involvement in the services offered by the prison administration. Similarly, some women find it traumatic to live in an environment with men because of their tendency to have histories of sexual and other abuse.

Another concern of opponents to the co-correctional model is the way in which coed facilities perpetuate traditional gender roles. This problem can be seen in the manner in which labor assignments are distributed. Evidence suggests that women tend to perform domestic work such as cleaning the living areas, while men are more likely to be assigned to landscaping duties outdoors. Similarly, female prison staff members have been shown to have fewer opportunities for advancement in co-correctional facilities as in women's prisons, due also to the male-dominated field of corrections.

As a result of a male inmate-dominated co-correctional prison environment, women inmates may be less likely to take on leadership roles. As it is, critics argue that women prisoners tend to concentrate on relationships and caretaking of others, as opposed to focusing on their personal improvement. By integrating men into the milieu, women will continue to employ this characteristic and cater to the male inmates' needs, putting their own needs second.

Women and men adjust to and serve their time in prison differently. Interaction among men in prison tends to be more aggressive and violent than that of women. Therefore, combining women and men in one institution may bring about coercion and exploitation that women would not have suffered in a single-sex institution. Women in integrated settings are more likely to be disciplined for prison code violations. Also, men tend to have more freedom to move around the facility than women.

Though some believed that homosexual activity would decrease when a prison is gender integrated,

there is little evidence to support this view. Prison administrators and staff have been criticized for the enforcement of homophobic and sexist policies and procedures in co-correctional facilities. Though homosexual behavior is forbidden, just as in same-sex facilities, some heterosexual behavior, such as hand holding, is often allowed in co-correctional prisons. Furthermore, when heterosexual sex is punished by corrections officials, women are more likely to be disciplined, even in cases where the male inmate has been identified.

In same-sex facilities, inmates sometimes demand that another person provide sexual services to other inmates who are willing to pay for it. Such prostitution also occurs in sex-integrated facilities with women serving as the sex workers, and men acting as "pimps." Not only does this interaction among the inmates promote the transmission of sexually transmitted diseases, it may result in pregnancies. Given the high numbers of women who have experienced sexual abuse prior to incarceration, such activity in prison may revictimize already damaged individuals.

CONCLUSION

The efforts of co-corrections supporters to make prison resemble the society outside the prison walls have positive and negative effects. The gender roles played out by prisoners tend to correspond with those traditionally established roles in U.S. society, where males portray patriarchal characteristics. Unfortunately, these interactions may also demonstrate the dysfunctional relationships experienced by the female and male prisoners prior to their incarceration, causing disruption in institutional functions. This distraction in programming may interfere with the successful integration of inmates back into general society, as opposed to the expected outcome of better use of resources, more programming for women, and improved rehabilitation methods.

COLLEGE COURSES IN PRISON

Research indicates that prison college programs are among the best tools for reducing recidivism. Individuals who take college courses while in prison improve their chances of attaining and keeping employment after release. They are less likely to commit additional crimes that would lead to their return to prison. The effectiveness of these programs led to their widespread adoption for several years. However, nearly all programs were discontinued during the 1990s and few college programs are currently available in prison settings. The history of these programs, and the debate about their merits, demonstrates the counterproductive effect that political influence can have on efforts to combat crime.

HISTORY

The University of Southern Illinois began the nation's first prison-based college program in 1953. Other programs followed, but since the development of these programs was dependent on limited funding, only 12 postsecondary correctional education programs existed by 1965. The funding situation

changed significantly that year as the U.S. Congress passed Title IV of the Higher Education Act. This act gave inmates and other low-income students the right to apply for federal financial aid in the form of federal Pell grants to be used for college courses.

Title IV provided the funding that was needed to ensure the financial stability of corrections education programs. As a result, by 1973, 182 college programs were operating in U.S. prisons. By 1982 (which was the last year an official count was made), 350 programs were active in 45 states and approximately 27,000 inmates received some form of postsecondary education. Although the numbers had increased significantly, this represented just 9% of the total prison population at the time.

Prisoners applied for Pell grants under the same criteria as those outside prison. Pell grants are noncompetitive, need-based federal funds that are available to all qualifying low-income individuals who plan to enroll in college degree programs. For qualifying individuals in correctional facilities, the average Pell grant award was less than $1,300 per year. The total percentage of the program's annual budget that was spent on inmate higher education was 1/10 of 1%. Although the cost was relatively low, the idea of providing Pell grants to prisoners remained controversial and many argued for the elimination of these grants.

The beginning of the end for college programs in prison was in 1991, as Republican Senator Jesse Helms of North Carolina introduced an amendment to eliminate federal funds for education to inmates. Several members of the U.S. House of Representatives introduced similar amendments. Like Helms, they claimed that federal money was being spent at the expense of "law-abiding" students who were enrolled in college outside of prison. Although these amendments failed, this argument would return the next year with the passage of the Higher Education Reauthorization Act, which determined that Pell grants for prisoners could be used only for tuition and fees. The 1992 bill also made those on death row, or serving life without parole, ineligible for Pell grants seeming to acknowledge the importance of education for those who would eventually be released from prison.

Despite evidence supporting the connection between higher education and lowered recidivism, the U.S. Congress included a provision in the Violent Crime Control and Law Enforcement Act of 1994 that eliminated Pell grants for prisoners. This law had a devastating effect on prison education programs. In 1990, there were 350 higher education programs for inmates. By 1997 only 8 programs remained. Ironically, at the same time as the federal government abolished Pell grants for prisoners, many states were undergoing a dollar-for-dollar tradeoff between corrections and education spending. New York State, for example, steadily increased its Department of Corrections budget by 76% to $761 million. During the same period, the state decreased funding to university systems by 28%, to $615 million. Much of the increase in corrections spending was the result of longer prison terms and the need for increased prison construction.

In the 1993–1994 school year, more than 25,000 students in correctional facilities were recipients of Pell grants. Although these grants were not the only source of revenue for these programs, they provided a predictable flow of money that enabled the continued functioning of classes. Since there were no replacement funds, programs were forced to abandon efforts to provide college courses in prison.

BENEFITS OF CORRECTIONS EDUCATION

In 2002, there were more than 1.4 million prisoners in federal and state facilities. That same year, more than 600,000 inmates were released, either unconditionally or under conditions of parole. Many of those released will be rearrested and will return to prison. Costs of this cycle of incarceration and reincarceration are very high. Many studies suggest that corrections education has the potential to greatly reduce these costs. For example, a 1987 Bureau of Prisons report found that the more education inmates received, the lower their rate of recidivism. Those who earned college degrees were the least likely to reenter prison. For inmates who had some high school, the rate of recidivism was 54.6%. For

college graduates, the rate dropped to 5.4%. Similarly, a Texas Department of Criminal Justice study found that while the state's overall rate of recidivism was 60%, for holders of college associate degrees it was 13.7%. The recidivism rate for those with bachelor's degrees was 5.6%. The rate for those with master's degrees was 0%.

Even small reductions in recidivism can save millions of dollars in costs associated with keeping the recidivist offender in prison for longer periods of time. Additional costs are apparent when we consider that the individual, had he or she not committed another crime, would be working, paying taxes, and making a positive contribution to the economy. When we add the reduction of costs, both financial and emotional, to victims of crime, the benefits are even greater. Finally, the justice system as a whole, including police and courts, can save a great deal of money when the crime rate is reduced.

The Changing Minds study (Fine et al., 2001), which was conducted at Bedford Hills Correctional Facility, New York's only maximum-security prison for women, was the first major study to examine the impact of college in prison since Pell grants were eliminated. As other research had shown before, Changing Minds demonstrated that college prison programs transform lives, reduce recidivism, create safer prisons and communities, and significantly reduce the need for tax dollars spent on prisons. Only 7.7% of the inmates who took college courses at Bedford Hills returned to prison after release, while 29.9% of the inmates who did not participate in the college program were reincarcerated. The authors calculated that this reduction in reincarceration would save approximately $900,000 per 100 student prisoners over a two-year period. If we project these savings to the 600,000 prison releases in a single year, the savings are enormous.

The success demonstrated in the Bedford Hills study has led to the creation of the Center for Redirection Through Education. This organization continues to work to develop college programs in prisons throughout New York State. Other states are also working to develop postsecondary education programs but they continue to face funding problems. In most cases, options are limited to single courses with no expectation of earning a full degree.

CHALLENGES

Students in prison education programs evidence a wide range of potential and have had varying educational experiences. Inmates who choose to enroll in college courses are not necessarily any different from the typical university student. As in any college-level course, the range of abilities can include very gifted students, students who face challenges, and students who have various motives for enrolling in college courses.

The educator's challenge is compounded by the uniqueness of prison culture and the need for security. Prisons adhere to strict routines and provide a controlled environment for education classes. These routines may not be ideal for teaching or learning. College programs may also adhere to schedules that conflict with the requirements of correctional institutions. Another issue is that inmates are often moved from one facility to another with little or no notice. This movement interrupts, or ends, the individual's educational programming. Along with structural issues related to security, social factors may further limit learning opportunities. For example, prison culture can vary from one facility to another, or even in different parts of a single facility. The support and expectations of fellow prisoners can be an important determinant of prison culture. Prison administrators may also have varying degrees of support for education—especially if they see education as a threat to the primary functions of security and control. If the culture of the facility is not supportive of the individual's educational goals, and willing to work toward integrating education into the dominant goal of creating a safe and secure facility, it may be difficult for individuals to reach their goals.

CONCLUSION

Most studies indicate that an individual who takes college classes while in prison is less likely to return to prison than someone who has not received

the same educational opportunities. There is some question as to why these courses lower recidivism. Many of the benefits of a college education are hard to measure. As such, it may be difficult to show a clear relationship between educational opportunity and recidivism. However, an intervening factor, the ability to find and hold a job, appears to relate to college courses in prison since college education increases the likelihood of postrelease employment, which, in turn, reduces the chance of recidivism.

The vast majority of incarcerated individuals will eventually be released. The growth in the incarcerated population over the past 20 years has created unprecedented release rates since there are just so many people in prison. Due to strict sentencing guidelines, these women and men have often served long terms and are released only when their terms have been completely served. Many are released unconditionally, without parole or other postrelease supervision. Each of these individuals will be expected to begin leading a productive, law-abiding life outside prison walls. Access to a quality education can increase their chance of success.

COMMISSARY

Prison commissaries help ease some of the deprivations of imprisonment, by allowing inmates with sufficient funds to buy products from a fairly broad range of items. They stock food and other goods. Items include shoes, radios, food, stamps, photocopy and phone credits, and, in some institutions, over-the-counter medication such as Tylenol, ibuprofen, and allergy medicine. Prison commissaries vary in their prices, variety, and accessibility, although some attempt is usually made to ensure

consistency between establishments in the same correctional system. In most prisons, individuals may visit the commissary only once a week, although in jails those awaiting trial may be able to make purchases more frequently. Housing units within a facility usually visit the store at different times to minimize contact and conflict between different inmates. Although, increasingly, commissaries are being privatized, profits from commissary purchases often go back into an inmate fund for such items as cable television, leisure time activity equipment, and other resources for the general population. Thus, the benefits of prison commissaries may be felt by more than just those individuals who buy products from them.

Commissary

The commissary is where prisoners can buy all types of stuff—sneakers, sweatsuits, radios, junk food, toiletries, stationery supplies, batteries, and anything else that is allowed in prison, which isn't much. Unlike shopping on the street, there is little selection. For example, in here there is one brand of peanut butter, and if you don't like that brand then too bad. In prison you don't have any choice and that's how the administration wants it. Different compounds have different things on the commissary but they are all pretty much the same.

At most federal institutions you have a limit on how much you can spend. It is usually $275.00 a month and is referred to as your spending limit. As soon as you spend it you can't spend any more until you revalidate on the first of the next month. You can also put money on your inmate ID card, which can be used for the laundry machines, photocopiers, vending machines, or to buy photo tickets that can be used on special days in recreation to get your picture taken. The commissary sells stamps but you are limited to buying only three books at a time (sixty stamps).

At most prisons there are also thriving underground economies for obtaining services and goods unavailable at the commissary. With certain goods like mackerels, cigarettes, or stamps, you can buy services such as laundry, ironing, or room cleaning, or buy drugs or foods smuggled out of the chow hall like green peppers or onions. You can also buy hooch, prison alcohol that others make from juice and sugar they buy at the commissary. Also, if you have to pay off a gambling debt you can tell the person to give you a list and you will buy it at the commissary.

Seth Ferranti
FCI Fairton, Fairton, New Jersey

HISTORY

In the first gaols and workhouses of the 17th and 18th centuries, inmates had to provide their own food, clothing, and equipment. Either friends or family members would bring them in such items, often providing meals on a daily basis, or else they would have to procure them by other means. The warden or gaoler often supplemented his income by running errands to buy items for those who were incarcerated, or by employing his wife to cook their meals.

Unlike these earlier institutions, penitentiaries began to provide all the food, clothing, and basic items of clothing and the like that inmates would need during their period of confinement. No additional items were allowed. It was not until the 20th century that penal institutions returned to the practice of allowing inmates to supplement their food and possessions. This time, however, rather than running errands in the community, they set up a store within the prison itself: the commissary.

HOW DO COMMISSARIES WORK?

To buy items at the commissary, an individual must have a commissary account. This account is usually established when an individual first arrives in prison. In most institutions, friends and family members may send in postal orders to deposit funds in an inmate's commissary account. Likewise, inmates may deposit any wages earned from prison labor in the account. Most systems no longer allow prisoners cash during their sentence. No matter how much money an individual has in his or her commissary account, prisons usually limit the amount of money someone may spend at the commissary

each month. Jails may be more flexible, since people who have not yet been convicted retain more privileges than those who have been.

In the federal prison system, individuals may spend between $150 to $300 at the commissary per month, depending on where they are held. The current most common amount that a prisoner may spend is $175. Certain items, like stamps, are not included in this sum. During the holidays in December, most institutions expand the sum inmates may spend. Unspent monies may not be carried over to the next month.

POSITIVE AND NEGATIVE ASPECTS OF COMMISSARIES

Commissaries play an important role in most penal establishments, by providing additional items that inmates may need or desire. Though everyone will be given the bare necessities, government-issue products such as shampoo, toothpaste, and toilet paper are not always to everyone's liking. Commissaries usually offer alternatives that may be the regular brands that prisoners used prior to incarceration.

Being able to choose items, however mundane, enables some prisoners to cope with the monotony and restrictions of prison life. Items in most commissaries, however, cost at least the same as they would outside, and, in some cases, more. This can be difficult for most people to afford, unless they have additional monies sent in, because prison wages are extremely low. In addition, commissaries may not stock ethnically specific items, such as hair products for African Americans, or foreign language magazines for non-English speakers. In some states, prisoners have filed suits, mostly unsuccessfully, to challenge both the prices and the items available in the prison store.

Like many other aspects of contemporary prisons, commissaries are increasingly being leased to private companies. These companies, such as Covenco, Inc. in Pennsylvania, which contract with state and federal departments of corrections, endeavor to make a profit. Thus, the range of items they make available, and the prices they ask for them, will often reflect their own desires, rather than those of the prisoners. These same companies also usually offer similar services outside of prison, operating vending machines in schools, or providing food to hotels and other businesses.

Finally, commissaries play a role in the maintenance of order and discipline in penal institutions, in a number of ways. First, some of the items for sale in prison stores such as canned fruit or fruit juice can be used by skilled prisoners to make hooch or prison alcohol. Any product, in fact, could be used for trade between inmates, and thus may become contraband. Although everyone is entitled to spend the same amount per month, not everyone will have access to the funds to do so. In this case, the commissary can lead to conflict and competition between individuals. Also, inmates commonly prey on others for their items, particularly newly arrived prisoners. Sometimes gang members must "donate" their commissary goods to a reserve pool for others who cannot afford to buy what they need. Finally, in recognition of the emphasis most individuals place on their ability to shop at the commissary, the right to buy items from a prison or jail commissary can be taken away as a disciplinary measure, for minor infractions.

CONCLUSION

Commissaries play an important and complex role in most penal institutions. Though items are often overpriced and may not always be precisely what individuals are looking for, being able to buy things, however small, is prized by most inmates as a means of retaining some autonomy in a restrictive environment. Many of the items for sale in the prison store help people maintain contact with the outside, such as cards and stamps. Other goods such as books, magazines or foodstuffs can be used to help provide a little variety in their everyday life behind bars.

COMMUNITY CORRECTIONS CENTERS

Community corrections centers include halfway houses, work release centers, and restitution centers. Individuals housed in these places usually work in the community and participate in court-ordered programs such as drug treatment or family counseling. Centers hold inmates either as an alternative to incarceration or at the end of their prison sentence for a period of readjustment to community life. Community residential corrections programs are the most underutilized component of the corrections continuum.

HISTORY

Halfway houses for released prisoners were first established during the 1800s in Boston and New York to aid former offenders in their readjustment to the community. While other cities and states gradually introduced similar establishments, it was not until 1975 that all states in addition to the federal government had approved legislation approving the use of halfway houses. The passage by Congress of the Prisoner Rehabilitation Act of 1965 made it possible for the U.S. Bureau of Prisons to delegate the care, custody, and control of inmates to a community treatment center or contract facility. Contract facilities are nonprofit, or private, facilities owned and operated by a nongovernment entity for the same purpose and operated much the same as a government-operated community residential center. Shortly after passage of the Prisoner Rehabilitation Act of 1965, many states followed suit and began to use community residential centers to help integrate probationers and inmates into the community as part of the service of their sentence or as a condition of probation.

THE PURPOSE OF A COMMUNITY CORRECTIONS CENTER

Community corrections facilities serve two roles: halfway in prison and halfway out. That is, for offenders who are on probation or appearing for sentencing for the first time, a halfway house offers an alternative to the judge who believes that the offender, at the time of sentencing, will not be well served by going straight to prison. However, in his or her opinion the offender needs a period of time to benefit from stronger controls, regular employment, counseling, and perhaps other programs such as drug treatment. The sentencing judge may then place the offender on probation with the condition that he or she may serve the first 90–120 days in a halfway house. While in the program offenders are required to find employment (if they are unemployed), participate in required programs such as drug treatment or education. In addition, they must follow rules and regulations that restrict their activities. They will also usually meet once or twice with the probation officer assigned to his or her case to discuss rules and concerns. Once offenders have completed their stay in the program without incident and are ready to leave, they are usually entitled to live at home under the supervision of a probation officer.

Halfway out of prison refers to the inmate's release from prison prior to the expiration of sentence in order to secure employment, have time to become reintegrated with his or her family, and experience a period of decompression after serving perhaps years in the regimented environment of prison. When an inmate is transferred to a work release facility or halfway house, he or she is usually placed on furlough for a period of time to travel by public transportation to the designated facility. Once there, she or he will undergo a period of classification and in-house assignments in order for the staff to properly classify the inmates and determine whether there are issues that indicate the inmate should be returned to custody. This usually does not

happen because the inmate must meet the criteria of (1) being within 90–120 days of release from custody, (2) no history of violence or organized crime or sexual offenses, and (3) good adjustment in prison. Thus, before inmates are accepted into a residential facility, they must be screened by the institutional staff and the halfway house staff. Providing a residential service for those who are halfway out of prison addresses the issue of prisonization and inmates' needs for a period of adjustment to the community before being allowed to go on parole. If someone has regular employment, has a place in his or her family, and/or a place to live, the parolee stands a much better chance to complete the demands of parole or succeed upon mandatory release.

Finally, a minority of residents of halfway houses are pretrial inmates. These include individuals suspected of crimes and awaiting trial who have been deemed not dangerous enough or not enough of a risk of flight to be held in prison, and too dangerous or too much of a risk of flight to be released into the community unsupervised pending trial. For these people, a community residential center provides the supervision necessary, while shielding the inmate from the potential harm resulting from spending time in jail.

STAFFING

All community corrections centers operate under the purview of a central office or board of directors. The government facility is part of the community programs division of the department of corrections, or if a local corrections center, part of the jail division of the sheriff's department. Nonprofit centers are also operated under the supervision of a board of directors whose members are selected by the parent agency. In the case of some centers, after the initial board is selected, members of the board will select replacements. As a consequence, the director of the facility will report to either a supervisor in the central office or the board itself.

Other than the director, there is some variation in staffing a community corrections center. At minimum, there should be one case manager for every 30 to 50 inmates, an employment placement officer, and an adequate staff to provide security and supervision. The supervision staff should have at minimum one supervisor for every 25 inmates on all three shifts, 365 days a year. In addition to security and supervision of inmates, officers may have to drive inmates to employment interviews, supervise organized recreation, and perform sundry tasks related to the orderly management of the facility, such as passing out laundry, counts, and supervising sanitation. Many community corrections centers also have on staff, or on contract, a licensed social worker or psychologist to develop and run counseling programs and to assist with classification and reclassification of inmates

PRIVATIZATION

The privatization of halfway houses is not new, but the practice was reinvigorated in the mid-1970s when Canon and Company opened a for-profit facility in Inglewood, California. The facility was operated just as a government-operated or nonprofit facility and was quite successful. However, it closed due to the lack of contract funding during the Reagan years.

Not long after Canon and Company opened, Eclectic Communications Corporation of Santa Barbara and Behavioral Systems of the Southwest opened halfway houses as private corporations. In the mid-1980s, Corrections Corporation of America opened for business as a private corporation in both institutional and community corrections. At present Corrections Corporation of America holds a 52% market share of privately held beds in the United States and a 43% share of global private corrections beds, including community corrections centers.

PROGRAMMING IN A COMMUNITY CORRECTIONS CENTER

The programs of community corrections centers vary from jurisdiction to jurisdiction and whether they are a government, nonprofit, or private facility. For example, a work release center operated by the state department of corrections may focus almost exclusively on employment and security. As a part

of case management, the inmate may be referred to a community drug treatment program for counseling. On the other hand, many programs are designed for offenders with a history of substance abuse and the entire program will revolve around counseling and related programs, including employment.

On the whole, community corrections centers offer a relatively wide range of program opportunities such as referring inmates to local community colleges for completion of a general equivalency diploma (GED) or for vocational training, in-house counseling sessions either by staff or contract social workers or psychologists, and other enrichment programs such as assistance from officers from the department of employment assistance. In addition, the orientation may include sessions on how to find a job, how to get along with a supervisor, how to use the local transportation system, and how to manage money.

It is important to stress that the community corrections center can be used as a means to increase control of the offender, that is, remove him or her from the freedom of community life to a program that can provide stricter controls short of imprisonment. They can also be used as a transition device between the strict regimentation of prison to the relative freedom of parole. Either way, the community benefits and in addition, the offender usually must pay a portion of his or her paycheck each week as reimbursement for room and board. Part of each paycheck is also used to make court-ordered payments such as restitution or child support payments.

EFFECTIVENESS OF COMMUNITY CORRECTIONS CENTERS

The effectiveness of community corrections centers is difficult to address. If one is asking if they are effective as a rehabilitation agent, the answer is, probably not. Perhaps we should think of community corrections centers as a tool for reintegration rather than a means of rehabilitation. Edward Latessa and Lawrence Travis (1991) looked at a matched sample of probationers and halfway house residents and found no difference in postrelease behavior. They conclude that halfway house placement may be better for some offenders but that such a placement might best be based on the offender's need rather than on a desire to increase the penalty. David Hartman, Paul Friday, and Kevin Minor (1994) looked at predictions of successful halfway house discharge and recidivism and concluded that program completion is more important than the completion of specific components and that successful program completion can be associated with lessened recidivism. Finally, Karol Lucker (1997) examined the role of privatization in community corrections and concluded that, despite defects of private offender treatment, the abolition of private halfway houses is neither warranted nor likely.

GENDER-SPECIFIC ISSUES

Many community corrections centers are single-sex facilities though some also house both men and women. There usually are no problems related to inappropriate behavior between men and women in coed facilities because most inmates are focused on job, family, and just getting out. Still, when problems occur they usually result in both inmates being remanded (back) to custody.

Merry Morash and Pamela Schram (2002) report that on average 31.4% of women inmates are released through prerelease centers and 10.7% are released from prison through a halfway house. In one of the few pieces of research about women in community corrections, David Dowell, Cecilia Klein, and Cheryl Krichmar (1983) reviewed a group of female residents of a halfway house in Long Beach, California, and compared them with a similar group of parolees who did not receive the benefit of halfway house services. They conclude that release through a halfway house reduced both the number and severity of offenses committed after the women were released from the facility. Thus, while gender-specific research is sketchy in regard to successful outcomes of confinement in community corrections centers, overall research indicates that they are at least cheaper than prison and do less harm than imprisonment.

Determining whether community corrections centers are more successful for men or women is difficult due to definitions of success and to the

absence of research. Nonetheless, many argue that since female offenders have special needs, community corrections centers should address those needs through programs that include substance abuse, parenting classes, counseling that addresses codependency, and even therapy for abuses suffered at a younger age. In addition, many community corrections centers are designed to control male offenders and the intent is to separate and observe behaviors.

CONCLUSION

Community corrections centers aim to provide offenders with opportunities to adjust to the demands of community life under the supervision of staff. While research into their effectiveness is inconclusive, for the most part they appear to do less harm to the individual than incarceration. In the spectrum of punishment options currently available in the United States, community corrections centers fall somewhere in the middle, alongside probation, fines, community service, and restitution. Since they are cheaper and more humane to operate than prisons, and because they allow the possibility for enhanced family contact, many argue that community corrections centers should be used more frequently, to house a greater variety of nonviolent offenders.

COMPASSIONATE RELEASE

Compassionate release of prisoners is appropriate when circumstances unforeseen at sentencing make continued incarceration unjust, and when no other adequate legal mechanisms exist to effect sentence reduction. Where recognized, compassionate release may be justified by a wide variety of postsentence developments. These can include extraordinary and compelling medical circumstances (such as imminent death, debilitating illness or injury, or mental illness), changes in the law that reduce the sentence but are not retroactive, unwarranted sentence disparity, extraordinary assistance to the government, compelling change in family circumstances, or sentencing error that was not discovered in time to be corrected using available legal procedures (American Bar Association [ABA], 2003, pp. 3, 4).

A system for early release for compassionate reasons can be administered by the courts, corrections systems, parole authorities, or a combination of agencies. It may involve sentence reductions, medical furloughs, early parole, or other administrative or judicial methods. However accomplished, compassionate release recognizes that in certain cases continued incarceration has ceased to serve legitimate penological ends. It expresses a moral judgment that whatever the reasons for imposing sentence, they are overborne by subsequent events that render continued incarceration unjust and inappropriate.

CURRENT PRACTICE

Compassionate release is comparatively rare today due to the widespread adoption of fixed or mandatory sentencing schemes and the abolition of parole by

many states and the federal government. For example, in the mid-1980s, Congress passed the Sentencing Reform Act abolishing parole and authorizing sentencing guidelines, and adopted a number of laws providing for mandatory minimum sentences. Similarly, in the states the advent of "truth-in-sentencing" laws eliminated some of the existing compassionate release mechanisms—for example, those accomplished through parole—or created conditions incompatible with earlier, more flexible approaches to sentencing reduction. Thus, indirectly and perhaps unintentionally, changes in sentencing law have effectively curtailed the practice of reducing sentences on compassionate grounds (ABA, 2003, p. 2).

States generally have provisions ranging from the explicit to the general that may be used for humanitarian requests. In a 1995 survey, it was found that about only half of the states provide compassionate release mechanisms for the terminally ill (ABA, 1995, p. 6). Others have general methods such as clemency, furlough, and parole that may be used to serve compassionate ends (Aldenberg, 1998, p. 557; ABA, 1995, p. 6; Russell, 1994, p. 836, n. 10; Volunteers of America, 2001, p. 5). The federal government's compassionate release statute, 18 U.S.C. § 3582(c)(1)(A), provides relatively broad authority to the Federal Bureau of Prisons to submit a motion to the sentencing judge for sentence reduction based on "extraordinary and compelling circumstances" (Price, 2001, p. 189).

In some cases, compassionate release is confounded by political concerns, adherence to the principle that respects the finality of sentences, or a lack of guidance about the appropriate grounds for relief (Price, 2001, p. 190, n. 6). Decision makers are constrained to be conservative in their application of compassionate release by a tough-on-crime atmosphere, or fear that those released may reoffend (Aldenberg, 1998, p. 553; Greifinger, 1999, p. 236). Many compassionate release programs are limited to cases where the prisoner is just about to die and require determinations that he or she is unlikely to reoffend or become a threat to public safety (Russell, 1994, pp. 826–827). This means that, where mechanisms exist, as a practical matter they are used sparingly.

In 1996, a study of state and federal release programs by the U.S. Department of Justice's Office of Justice Programs found only 20 jurisdictions had released prisoners pursuant to early-release authority (ABA, 2003, p. 4, n. 5; U.S. Department of Justice, 1996–1997, p. xiv). A survey of the use of sentence reductions in the federal system found that only 226 people had been released from federal prison between the years 1990 and 2000 (Price, 2001, p. 191). Not only is the federal statute rarely invoked, it is limited generally to those circumstances where the prisoner is near death, despite the apparently broad use of the power contemplated by Congress (Price, 2001, pp. 188, 189). In recent years, the Bureau of Prisons has somewhat expanded the scope to include prisoners suffering diseases that have resulted in "markedly diminished public safety risk and quality of life" (Price, 2001, p. 191).

CONCLUSION

For some in the criminal justice community, compassionate release defeats the aims of tough-on-crime sentencing. Expanding the use of compassionate release might create a back door through which offenders may avoid serving their sentences. Others support the reinstatement and expansion of compassionate release mechanisms, arguing that rule-bound sentencing systems do not adequately account for compelling postsentence developments. In light of its determination that most sentencing systems cannot routinely accommodate the variety of "truly exceptional" postsentence developments that may warrant reconsideration of incarceration, the ABA House of Delegates recommended in 2003 that jurisdictions evaluate existing procedures. The ABA urged jurisdictions to develop and implement mechanisms for sentence reductions in cases of extraordinary and compelling postsentence developments and develop criteria ensuring that the procedures that are developed can be easily used by prisoners and their advocates (ABA, 2003, p. 1).

CONJUGAL VISITS

Conjugal visits, sometimes referred to as family visits, are a privilege afforded to some married lower-security-risk inmates in a limited number of jurisdictions in only a handful of states. These programs allow spouses, and sometimes the couples' children, to visit for several hours at a time in complete privacy for the purpose of maintaining interpersonal relations. Heterosexual intercourse may occur during these conjugal visits.

HISTORY

American penal institutions first officially introduced conjugal visiting programs in 1918 in Mississippi. Evidence, however, suggests that this policy had been implemented unofficially long before it was legally permitted, to induce inmates to work harder in the fields. Thus, it seems that the origins of conjugal visitation were rooted solely in the management of inmates and the administrative needs of the institutions rather than in any desire to fortify family bonds. Initially, these conjugal visits were intended to be exclusively sexual in nature and did not require inmates to be married. In fact, records suggest that prostitutes occasionally met with those eligible to enjoy heterosexual relations within prison.

CURRENT PRACTICE

In the period immediately following the legalization of conjugal visiting, there were no correctional facilities appropriate for private sexual encounters between partners, so inmates would have to meet in their cells and hang a sheet to provide some visual privacy from others. Today, institutions offering conjugal visits provide various settings for privacy. Certain institutions use campgrounds on the premises of correctional institutions, where families may even stay together overnight. Others make available private rooms within prison walls themselves. The type of setting for family relations depends on several factors, including the level of security of the institution—even though they are limited almost exclusively to individuals held in lower-security institutions—the type of facility the prison or jail is using, and the resources available to the institution.

THE CASE FOR CONJUGAL VISITS

Conjugal visiting programs have been instituted in a limited number of correctional facilities to offset some of the negative psychological effects of being imprisoned. Their primary justification is that inmates who maintain relatively normal familial interactions are more likely to have lower recidivism rates and are easier to manage while serving their sentences.

In addition, conjugal visitation policies have sometimes been justified as a way to reduce the amount of homosexual activity that occurs between inmates who have no other sexual outlets. This reasoning is predicated on the presumption that

inmates have uncontrollable sexual desires that, if not channeled into heterosexual interactions, will result in consensual homosexual contact or homosexual rape. One problem with this justification has been that acts of rape have more to do with power and control of another inmate than with sexual pleasure or desire. Another challenge to this reasoning has been that not all inmates prefer heterosexual relationships, and many may intentionally seek out homosexual contact exclusively.

Conjugal visits have been praised by individuals and groups that seek to keep children of inmates closely bonded with their institutionalized parents. Extensive research exists on the negative psychological impacts of having a parent imprisoned. The findings of these studies have provided the impetus for many of the conjugal visitation programs predominantly in women's prisons that allow children to visit their mothers overnight or throughout weekends. Certain specialized programs, like the one initiated by the Girl Scouts of America, have established programs with some women's correctional institutions that allow mothers and their daughters or sons to work together on projects that can result in badges of merit or other forms of positive recognition. As an incentive for incarcerated women, conjugal visits with children are sometimes granted for the successful completion of parenting courses provided by correctional institutions. Some institutions even provide nurseries on the institution's premises where expectant mothers can prepare to give birth and then stay for up to 18 months after the birth of her child, with the expectation that she continue to fulfill expectations of conduct. Few problems have been documented as a result of these programs, although unfortunately these kinds of program incentives are chiefly offered only to female inmates.

CHALLENGES TO CONJUGAL VISITATION

There are several problems with conjugal visits that have been brought to light by their opponents. First, since so few inmates are eligible for them, the fairness of these programs has been challenged. These visits are available only to male or female inmates who are legally married, which by definition excludes the possibility of visitation by gay or lesbian partners or those who are involved in common law marriages. On these grounds, conjugal visits have been the target of constitutional challenges.

In addition, the kinds of facilities that would be appropriate for these visits are scarce, largely due to limited resources, often making them unavailable. Likewise, research has found deficits in security, abuses of power by correctional officers, and the abuse of inmates by jealous convicts, among other problems. Other problems are more ideological in nature, such as the logic of offering a program that offers enjoyment to inmates, or the sexual nature of many of these visits. Finally, conjugal visits may produce children who may not be financially supported or parented because the mother or father is incarcerated.

CONCLUSION

It is commonly believed that children who maintain healthy relationships with both parents will grow up to be more stable and more likely to be law-abiding individuals. It is also believed that inmates who are allowed to maintain an active position within their families will have a smoother transition to civilian life upon eventual release. As a result, some hypothesize that family conjugal visits may prove to be an effective long-term crime prevention method.

CONSTITUTIVE PENOLOGY

Constitutive penology is an extension of postmodernist constitutive criminological theory. Its proponents argue that societal responses to crime are interrelated with the wider society, particularly through "crime and punishment" talk. Discursive distinctions are constructed and continuously reinterpreted (iterated) through penal policy pronouncements, practical actions, discussions in the popular culture, and the proclamations, rules, and practices of institutional structures such as the criminal justice system, correctional institutions, and punishment and rehabilitation. These abstract distinctions obscure the numerous ways in which penological discourse and practices permeate the wider society. They also disguise the connections between the theory and practices of penology and the impacts, costs, and consequences that these have for our societal system. Constitutive penologists call for (1) the integration of prison and related penological practices with society, (2) a demystification of the penological society, and (3) the development of more holistic responses to criminal harm.

Constitutive penologists also argue that conventional penology provides the discursive reference for actions that create, develop, and sustain prison. Discursive structures are embodied with ideological material, which provides the backdrop for socially constructed meaning. Whether penology is taken in its broadest sense to mean the systematic study of penal systems, or the more narrowly focused investigation of the effectiveness of sentencing in preventing reoffending, or even the microscopic examination of penal institutions and their routine practices of violence and discrimination, all research sustains the continued existence of the penological society, dubbed the "incarceration nation." Thus, debates over being in or out of prison, over building more or less penal institutions, about overcrowding and overspending, about alternatives to and challenges, all continuously assume the taken-for-granted existence of the very structures that need to be questioned and explained. In short, they reinforce the prison as a necessary reality.

CRITIQUE OF CONVENTIONAL PHILOSOPHIES OF PUNISHMENT

Constitutive penologists see penal policy as part of a way of talking about dealing with offenders (discursive process) whereby aspects of existing practice are selected, emphasized, refined, and given linguistic form and formally discussed, while other aspects are ignored, subordinated, dispersed and relegated to the informal, are framed as aberrant, or seen as "noise." Conventional penologists generally distinguish between six general philosophical approaches that underpin their policies and inform sentencing practice: (1) incapacitation/social defense, (2) punishment/retribution/just deserts, (3) deterrence, (4) rehabilitation/treatment, (5) prevention, and (6) restitution/reparation. For a constitutive penologist, any one of these "philosophies" constructs a false separation between the penal system and society. For example, incapacitation does not separate offenders from society since being *in* prison is being *in* society; prison is physically, structurally, and symbolically integrated into the broader community. Rather than "walls of imprisonment," there is continuity between being "in" or "out." The incarcerated are not incapacitated, since they do additional and, in many cases, more serious forms of offensive behavior inside prison as a reaction to their confinement. Metaphors for the lawbreakers such as "slime," "dirt bag," "asshole," and "scumbag" often both objectify the humans who perpetrated the harms and provide the very "logical" penal response that encourages the development of a pool of suspects, shielding other more invisible and powerful "excessive investors" in harm production from potential incrimination while maintaining the need for social structures of control.

Constitutive penologists also point out that we pay the economical and social costs of massively expanded prison programs. Socially, the "new

penology" of incapacitation has accentuated the issue of race in American society, since one in three African American males aged 20–29 are in prison, on probation, or on parole. This permeates the minority perspective of those people of color *outside* prison who withdraw sentiment for, and commitment to, society's formal institutions, especially from government and law enforcement. It simultaneously corrupts the majority white population's views on minorities, thereby contaminating day-to-day interaction; through this, the institutions and structures of society reinforce the justification for implicit and institutionalized racism. Thus, argue constitutive penologists, incapacitation has a major impact on the nonwhite *and* white populations. Once moral sentiment is withdrawn, people feel morally justified in violating all kinds of rules based on the rationalization that "whites" and other dominant groups in general cannot be victims of specific crimes, since their racist violations of minorities make them the aggressors. Minorities are merely taking back what was seen as rightly taken from them, including dignity, self-determination, property, and even life itself.

Finally, incapacitation feeds the false security of social order and the "safer with them behind bars" mentality. The paradox is that for each constitutive brick of incapacitation we release another swirl of freedom for "accident makers" (Bhopal), "liberators" (Iran-Contra), "job creators" (GM's Jeffrey Smith), "risk takers" (Boesky, Milken), and "fabricators" (Enron). We feel safer in our homes and workplaces, yet it is often in these routine places that we are most victimized.

Constitutive penologists apply a similar analysis to the other penal policies. For example, they claim that advocates for punishment/retribution/just deserts foster the idea that there are circumstances where it is acceptable to harm others on the basis that harmful acts should be followed by other harmful acts, as though it was self-evident that this equation of proportion and reaction was justified. Likewise, deterrence communicates the idea that we should seek ways to avoid making our own acts appear like those that are punishable for fear that we too will be punished. Ideas of rehabilitation/treatment, argue constitutive penologists, suggest that both the harms committed and the victim who suffers are less important than manipulating aspects of the individual offender's personal or situational environment to prevent them from harming again. This conceptual separation of victims, offenders, and environments overlooks the interconnected and coproduced nature of social "reality," failing to see that we are locking the offender into the very social role that the policy intends to expunge.

Finally, constitutive penologists criticize the more radical philosophies of restitution/reparation. They acknowledge that this approach at least brings the victim back in to share their experience of being harmed with the individual/agency that allegedly caused the harm. They also point out that insofar as the community and control institutions have a facilitative role, then less harm is being done by this kind of mediated intervention. However, they argue that the hidden message of restorative justice is that getting together and talking about a problem can fix it, without recognizing that the very structural situations in which folk are enmeshed are not part of the transformational mix. Neglected is an understanding that the emerging "mediation-discourse" is itself the basis of reducing differences into least common denominators, which can mean "equitable" solutions, downplaying the uniqueness of the disputant's own constructions. In other words, bureaucratic discourse that promotes "mediation" and "resolutions" overlooks differences in discursive practices that privilege some over others and their associated underlying ideologies; rarely is the outcome of restorative justice that institutions of society see themselves as a contributing force.

AN ALTERNATIVE SEMIOTIC APPROACH

Constitutive penologists are concerned with how criminologists may, despite their best intentions, replicate the very system they try to understand and critique. Criminologists do this by constructing ideal typical classifications that disguise how policy makers, practitioners, targeted agents, and theorists de-emphasize some aspects of the reality of prison practice as aberrant, unofficial, informal, or untypical in order to make claims about its operational

identity. To avoid legitimating the prison while analyzing penal policy, constitutive penologists argue that it is necessary to use a semiotic approach that deconstructs the role that language use plays in the construction of the penal system and its attendant philosophies and institutions. Transformation of crime and societal responses to it, they argue, requires a reintegration of crime and societal responses with the whole of which each is a part, and they indicate that a change in the whole is necessary to bring about a change in any of its parts. This is a holistic exercise, in many ways analogous to the hologram where illumination of any part reproduces the whole; the "part" resides in the whole, but each part represents the whole.

An alternative direction would provide an opportunity for the development of a new "replacement discourse." Replacement discourse is not merely another package of ways to talk and make sense of the world, but a language of "transpraxis." It connects the way we speak with our social relations and institutions, so that we are continuously aware of the interrelatedness of our agency and the structures it reproduces through the constitutively productive work of our talking, perceiving, conceptualizing, and theorizing. "Transpraxis is a deliberate and affirmative attempt not to reverse hierarchies but, instead, to affirm those who victimize, marginalize and criminalize while renouncing their victimizing, marginalizing and criminalizing practices. Transpraxis is an effort to validate the act of resistance. The key to transpraxis is speech, words, grammar and how we talk about (and then act upon) emancipation" (Arrigo, 2001, p. 220). Constitutive penology asks us to rethink the discursive structures within which we situate our research on the penal question.

Constitutive penologists have suggested several directions and alternative notions for the development of social justice: social judo; replacement discourse; transpraxis; newsmaking criminology; narrative therapy; reconceptualizing crime as "harms of reduction" and "harms of repression"; recovering subjects; an understanding of the social formation more in terms of historically contingent and relatively stabilized configurations of coupled iterative loops (constitutive inter-relational [COREL] sets), which can be seen as the basis of contingent "structures" with effects; and forms of an empowered democracy in a political economy identified by Unger as "superliberalism."

Social judo responds to the state's continued investment in violence to counter harms (called criminal justice), which thereby escalates the overall prevalence of violence in society. It argues for creative responses whereby those investors in harm have their power turned against themselves. It is a policy of undermining excessive investors in harms. In its maximal beneficial form, conflict is an occasion to reexamine given societal relations, institutions, and structures and their tendencies toward harm. Reconceptualizing harm in terms of "harms of reduction," whereby a person is reduced from some standing, and "harms of repression," whereby a person is denied her or his ability to attain a position sought without it being at the expense of the other, provides a suggestion for an alternative way of perceiving harm. It takes us beyond the restrictions of the legalistic definition of crime.

The notion of COREL sets offers an alternative nonreductionist way of historically conceptualizing the interconnectedness of prison and prison policy with the social formation, and for shedding light in a political economy on the various forms of excessive investment to impose power on others in the form of harms of reduction or repression. Constitutive penology, then, would make as its first priority the development of a social formation, which minimizes harms of reduction and repression. They argue that it is in the very resolution of conflicts that we need creative initiatives that transform the process whereby the conflict reproduces harm that sets in place new conflict. They believe that this cycle of conflict production must end. Constitutive penologists have advocated a multifaceted approach to "criminal" justice policy. Their "radical accusatory" policy implicates the entire society for its contributions to harm; their "reformist remedial" policy is much in accord with Unger's superliberalism, which advocates an empowered democracy. A social justice approach would implicate the individual, community, and societal levels consistent with "transformative justice."

CONCLUSION

A genuinely alternative, replacement discourse would envelop not just the declarations of policy but the ways its practitioners and policy makers distinguish their reality from the totality and point toward ways these can be reintegrated. It would require a "bringing back in" of the underemphasized, informal, unofficial, marginalized practices (the unspoken) that are part of the totality of the prison business. Only with such a comprehension of the totality and the contribution of these excluded parts to the reality-making process, argue constitutive penologists, is it possible to provide an alternative understanding of the phenomena of crime and crime control in our society. Only from such an understanding of the total constitutive process is it possible to generate a replacement discourse that begins the deconstruction of penology, the correction of corrections, and the ultimate reconstruction of penal policy that is its own demise.

CONSULAR VISITS

Pursuant to the guidelines established by the Vienna Convention on Consular Relations (VCCR) in 1963, any criminal justice or correctional institution detaining a foreigner must notify him or her of the right to have his or her consulate notified about the confinement. The United States, which ratified the convention in 1969, considers the right to consular visitation within correctional institutions so fundamental that the U.S. State Department requires it for all international detainees (other than those suspected of terrorism), even if an inmate's country of origin has not signed the VCCR. Following the detainee's request to have the consulate informed of the arrest and confinement, the custodial criminal justice institution may permit a locally stationed consul to visit the detainee in the institution without hindering access or communication.

WHAT DOES A CONSUL DO?

The consul is an official representative of a particular government who lives in a foreign country to help the home nation's citizens within that country and to represent the home country's interests in various affairs. Generally, consuls should provide

advice to the detainee on a range of matters. For example, they should furnish a list of possible sources of legal representation from the confining nation and provide information about the local legal system. They may also offer humanitarian assistance in addition to any other practical assistance required by the detainee. The consul may arrange for financial assistance in the form of a loan and may notify the detainee's family about the detention. However, consuls may not provide a detainee any direct aid or legal advisement.

The assistance a consul may provide a foreign national is limited. The consul may not demand the release of the detainee, provide legal advice, pay for legal services, get bail, pay fines, offer financial support beyond a prisoner loan, conduct an investigation, or get the detainee legal or institutional treatment that exceeds that of other inmates or other nationals. The consul's role is simply to provide indirect assistance to the detainee and represent the foreign government's interests in criminal cases.

If the confinement is ongoing or long term, consular visits may continue. The frequency of these visits will depend on various factors such as the length of sentence, how far the prison is from the consul's office, and the seriousness of the situation. Most important, visits require the consul to obtain the necessary local government's approval and prison clearance prior to any official visit. Some institutions are more restrictive than others, particularly those of higher security. Most consular visits do not occur more than once a year following initial visits at the beginning stages of incarceration.

SPECIAL CIRCUMSTANCES: DUAL NATIONALITY

Some detained foreigners maintain dual national status. If a dual national is detained in a country of one of his citizenships, the assistance a consulate is able to provide will likely be further restricted by the detaining nation, in accordance with a strict interpretation of international law. It is possible, however, that the local authorities will allow the consul to provide some limited assistance. The decision to do this is made entirely by the country detaining the law violator, leaving the consul from the other country of citizenship very little control.

CONCLUSION

Article 36 of the VCCR specifies that notifying detainees about their consular rights should be provided "without delay" by local or national authorities. This requirement was intended to prevent any type of interrogation prior to a consular visit, if this is what the detainee would like. However, there is some evidence that this mandate has been interpreted rather broadly by responsible authorities within U.S. institutions, resulting in consular notification that often follows detention by varying amounts of time. Similarly, changes in policy since the terrorist attacks of September 11, 2001, have meant that foreigners suspected of terrorism may be held indefinitely without charge and without access to a lawyer or any other kind of a representative, including their consul.

The extent to which U.S. law enforcement agencies may have breached their consular notification obligations has been evidenced in a recent lawsuit. In *Sorensen v. City of New York,* a Danish national sought punitive and compensatory damages for the failure of the New York Police Department to inform her immediately upon arrest that she had the right to consular notification and visitation. This court case revealed that more than 50,000 foreign nationals had been arrested in New York City during a one-year period of time, but official records showed that only four of these individuals had been notified of their consular rights. Thus, even though the United States has fully supported the tenets of the VCCR, consular officials are sometimes unable to provide the crucial assistance to foreigners at the stages of the criminal justice process when it would be most beneficial.

CONTACT VISITS

Contact visits generally permit an inmate to visit with a friend or relative for a limited amount of time in the same room, rather than to communicate through a glass window. Most correctional facilities set strict visiting hours and policies and require that visitors be approved prior to their arrival, to give the institution reasonable time to conduct a background check of the visitor. Contact during these visits is usually closely monitored, allowing only minimal, if any, physical contact, such as handholding or a brief hug.

Contact visits are considered a privilege and can be revoked for any number of reasons. In higher-security institutions, or in the case of death row inmates, those in disciplinary detention, or those who are being kept in protective custody, contact visits are usually not allowed since it is thought that security concerns outweigh the benefits provided by allowing contact visits. Some states such as Michigan also severely restrict visits for inmates of any security level.

CONTACT VISITATION POLICIES

Correctional institutions that allow inmates contact visits have numerous and very specific rules and regulations that control the process. These rules, which include the number of individuals that may be on an inmate's visiting list and the frequency with which he or she may receive visits, generally vary according to the facility's security requirements, its traditions, and its availability of resources, including visiting space and personnel. Contact visits are most often afforded only to lower-security-risk inmates, although each institution may make exceptions depending on individual circumstances and the mandates of the jurisdiction.

Most correctional facilities require that eligible inmates provide lists at the outset of their incarceration of those whom they want to visit them. Usually, individuals may include parents, spouses, children, friends, attorneys, and religious leaders. However, prisoners are allowed to include only a small number of people on their visiting lists; they are usually forced to prioritize their contacts by those closest to them or those most likely to come. Most institutions conduct background checks on these individuals before they are allowed to visit to ensure that they present no security challenge and are not likely to pass contraband, such as drugs or weapons, to the inmates with whom they are in contact. Felons, parolees, and former inmates are generally not permitted to have contact visits with inmates.

BENEFITS OF CONTACT VISITS

The primary justification for allowing inmates contact visits is to decrease the potential negative psychological effects of being imprisoned. It has been suggested that contact with loved ones and others who are "on the outside" can decrease the effects of what Donald Clemmer (1939) has termed prisonization and what Gresham M. Sykes (1958) has called the pains of imprisonment. It is believed that if inmates are able to connect with those who are not institutionalized, they will be better able to adjust to their release. An inmate who has maintained contact with individuals outside of prison may have a group of people to help him or her start a new life upon release. The loved ones who came to visit may help him or her live a law-abiding life by providing financial assistance or by aiding in a job search.

Contact visits also allow children and incarcerated parents to maintain some relationship with each other. Children are often allowed to see their parents in jail or prison, and being allowed to touch or embrace them may be especially meaningful. Such physical contact could have implications for the child's sense of security and identity as well as the parent's success in transitioning to freedom once released back into society.

Some even suggest that the efficiency of correctional institutions may be enhanced by allowing contact visits since inmates look forward to them so much. They may act as an incentive for good behavior or participation in rehabilitation, educational, or life skills programs. Institutions that have contact visit policies seem to run more smoothly, because their inmates have a powerful motivation to comply with facility rules.

SOME PROBLEMS CAUSED BY CONTACT VISITS

Because visitors are the primary source of smuggled contraband, including drugs, weapons, and money to inmates, contact visits present special problems for correctional institutions. Although correctional officers and other staff attempt to ensure that visitors do not have materials that can be passed along to the inmates by conducting background checks and by searching their belongings, it is not possible to prevent all of this illegal activity. Even if visitors do not smuggle contraband to inmates, it is possible that they act as partners in crime by helping the inmate continue criminal activity from inside the correctional institution. In other situations, inmates might take advantage of sympathetic visitors by encouraging them to carry out some illegal action for the inmate. Some inmates may become depressed if they do not have anyone to come to see them. The isolation for these individuals is exacerbated by witnessing others getting out of work responsibilities or other obligations to meet with their friends and loved ones.

CONCLUSION

Contact visits are considered by many to be a successful method for jail and prison inmates to maintain bonds and associations with the world outside of the institution, making transitions upon release much smoother. These policies have also been touted as effective means for better controlling growing inmate populations. However, the very aspect that makes contact visits so valuable to inmates and correctional facilities also presents several problems, including the potential for contraband to flow from visitor to inmate and increased criminal activity within the institution. Even so, the benefits of contact visits appear to outweigh their risks, suggesting that better methods of screening and searching visitors is in order to ensure the highest security possible.

CONTRABAND

Contraband refers to any item in the possession of an inmate that was not directly issued by the institution or purchased through appropriate channels such as the commissary or a hobby-craft program. In most facilities, each prisoner has only a few square feet of space to store personal property. By limiting the type and quantity of personal property prisoners may keep in their possession, administrators try to reduce the possibility for contraband while also maintaining order in the institution.

WHY IS CONTRABAND A PROBLEM?

Above all, prison administrators want uniformity in the prison system. Prison should be classless, without

distinction or wealth or poverty. People must, therefore, wear the same clothing, eat from the same menu, and have comparable living quarters.

In their efforts to maintain order and sameness among the prisoner population, administrators issue a specific quantity of clothing to each inmate. If this clothing is altered in any way, such as a patch or the insertion of pockets, the clothing becomes defined as contraband. It may then be confiscated, and the inmate may face disciplinary action. For example, if an individual purchases a sweatshirt from the commissary with personal funds and then marks the sweatshirt with a name or symbol, the item becomes contraband.

Each prisoner is entitled to food, shelter, and clothing as provided by the institution. The prisoners may purchase specific items for personal use or consumption from the commissary, but only in limited quantities. They are not allowed to hoard items, to transfer ownership, or to relocate government-issued supplies from specifically authorized areas to nonauthorized ones. For example, although vegetables may be served and authorized in the food services department, kitchen foods immediately become contraband if they are transferred to the living quarters for consumption there.

WHY IS CONTRABAND IMPORTANT TO PRISONERS?

Just as administrators strive to create homogeneity within the confines of each institution, the prisoners struggle to preserve some aspect of their individuality. Their names have been replaced with numbers; they have been stripped of their freedom, their clothing, and their identities. As a result, acquiring something that is not government issue brings some flavor, some variety to the monotony of daily prison life.

Prisoners may also alter clothing or property for utilitarian reasons. For example, the prison commissary may sell athletic apparel without pockets. Prisoners are required, however, to carry their prison identification with them at all times. Some, therefore, sew pockets into their clothing to hold such items. The commissary may also sell battery-operated radios or reading lights. Prisoners may modify these items with electrical adapters so they can avoid the costly purchase of batteries.

Prisoners may purchase contraband food from those who hustle it out of the kitchen in order to eat on their own schedule rather than on those imposed by the prison authorities. They may use contraband fruit, sugar, and yeast as ingredients for a prison-made wine or hooch. Finally, they may modify structured elements of the prison such as a pipe or piece of steel into a weapon for use against others; they may collect rope as a tool for escape or for suicide.

WHERE DOES CONTRABAND COME FROM?

Contraband comes from inside and outside the prison walls. Prisoners may be limited to possession of five books, five magazines, $20 worth of stamps, or individual paperwork that does not measure more than three inches in height when stacked flat. Everything in excess of these standards is defined as contraband and subject to confiscation. Prisoners must, in other words, regularly send items home or discard property they have accumulated through the mail over time.

Other, more insidious forms of contraband may be smuggled into the institutions with the help of guards or visitors. Some guards may bring drugs, alcohol, weapons, or other prohibited items into the prison. Visitors may also try to pass such items during contact visits. This type of contraband is considered a serious breach of institutional security. Anybody found in possession of such items will be subject to criminal prosecution.

CONCLUSION

Obviously, not all contraband items present the same threat to the security and order of the institution. Prisoners caught with drugs or weapons may face further prosecution, while administrators have a variety of sanctions at their disposal with which to punish those who have been caught with items of a less threatening nature such as food. For these kinds of illicit items, prisoners may lose their commissary, visiting, or telephone privileges.

Despite the sanctions association with contraband, it remains a common part of prison life. Some guards use their discretion and overlook minor contraband violations, such as extra clothing or books. Others enforce prison rules strictly, confiscating all items and writing up prisoners for disciplinary infractions. Due to the large numbers of inmates compared to staff, it is impossible to catch all illicit items. As a result, contraband continues to play a significant role in most prisoners' experiences of incarceration.

CONTRACT FACILITIES

The practice of contracting with private agencies for correctional services grew substantially in the late 20th century, coinciding with a steady growth in the size of the correctional population. Contract facilities have become increasingly common in English-speaking countries, particularly in the United States, the United Kingdom, and Australia. Also referred to as partial privatization or outsourcing, the practice has faded in, out, and back into popularity over the course of history. Under a contract system, correctional services are funded by the government agency responsible for custody of inmates but delivered by a third party. The government maintains control over the type and quality of services provided but delegates the service delivery to a private entity. Contracts are typically arranged with nonprofit agencies, for-profit companies, or other government units.

While the contracting out of particular services such as medical care, food service, maintenance, education, and mental health services is widespread in corrections, the contracting out of entire correctional facilities is limited and has remained a controversial practice, particularly when for-profit companies are involved. Concerns that private companies may sacrifice conditions of confinement in order to make money and general ethical concerns about the delegation of punishment underlie an ongoing debate over contract facilities. In practice, the respective advantages and disadvantages of using contract facilities tend to vary considerably depending on the individual ability of contractors, the capacity of governments to oversee contracts, and the extent of provisions covered under the contracted agreement.

HISTORY

Government contracting with the private sector in the United States dates as far back as 1785 when the nascent federal government contracted with private stagecoach operators to deliver mail and passed subsequent legislation that required the bidding process to be publicly advertised. The U.S. experience with contracting for prisons and correctional facilities dates to the early 19th century. Borrowing from European workhouse models, the earliest American prisons (such as Philadelphia's Walnut Street Jail) contracted out the labor of convicts to private entrepreneurs. While the practice extended well into the 20th century, it became increasingly controversial due to abusive treatment of inmates, insider contracting arrangements, and concerns that prison labor was unfairly depressing wages and cutting into the private sector job market. By 1940, federal and state laws severely restricted the market for prison-made goods.

In the juvenile justice field, contract facilities have been providing services to juvenile delinquents since the early 20th century. Unlike the adult contract system, contracts for juvenile facilities have been primarily with religious, charitable, and other nonprofit agencies rather than for-profit businesses. As a result, the practice of placing juvenile delinquents in privately run facilities has proceeded with far less controversy than has been the case in the

adult corrections arena. In the 1970s, the movement to deinstitutionalize status offenders from the youth correctional system created a demand for more contracted services and spawned considerable research on the effectiveness of contract facilities. As adult correctional populations increased during this time, at least 18 states passed "community corrections acts" designed to transfer resources and funding from state departments of correction to local governments and to provide community residential services to offenders. Many jurisdictions turned to private contractors to operate these facilities.

During the 1980s, governments throughout the world came under increased pressure to cut costs and reduce the public workforce while still meeting their legally mandated responsibilities to provide various public services. Advocates for "reinventing government" sought to lower costs and improve the quality of services by making many traditional government programs, such as corrections, open to competitive bidding by the private sector. A new model of contracting for correctional facilities emerged that differed fundamentally from the earlier century's model. Under the old model, contract facilities received funding by selling the labor of inmates. Under the new system, private contractors are paid simply to keep prisoners under custody, or for providing other services (such as education and counseling) that are specifically spelled out in a contract.

THE GROWTH OF CONTRACT FACILITIES

The primary advantage of using contract facilities rests in the speed with which additional prison capacity can be obtained and the possibility of increasing bed space without public capital expenditure. Unprecedented growth in the number of prisoners in the United States led to considerable overcrowding in public facilities; by 1989, two-thirds of the states were operating under court orders or consent decrees due to conditions of confinement suits brought on by overcrowding. By 1990, nine state systems were operating at more than 150% of capacity, 15 states were operating at between 125% and 150% of capacity, and the federal prisoner population was at roughly 190% of its rated capacity.

Burgeoning prisoner population rates were accompanied by rapidly rising correctional costs. State and local government annual operating costs for correctional facilities ballooned eight-fold between 1978 and 2000, from $5 billion to nearly $40 billion. Total capital outlay for new prison construction in the states averaged nearly $2 billion each year during the 1990s. Many jurisdictions could not issue bonds, the primary method of funding large, capital projects such as prisons and jails, without going directly to the voters—a time-consuming process with an uncertain outcome. In some cases, states were at or approaching debt ceilings, and expenditure on new prisons precluded spending on other needed capital projects. The entire process of planning, designing, permitting, building, staffing, and opening a new government-owned facility can take several years. Private entities, on the other hand, invest private capital into new facilities and can cut a substantial amount of time off the development process. Moreover, by contracting with another government jurisdiction or private provider that has existing unused bed space, governments can forestall capital investment in new prisons and quickly relieve immediate problems of prison overcrowding.

The demand for increased capacity caused by prison overcrowding and the relative expediency of using contract facilities combined to fuel rapid growth in the private prison industry in the United States. Between 1988 and 1998, the number of contracted prison beds increased from 3,000 to 132,000. By 1998, there were 158 private correctional facilities contracting for the placement of about 5% of the total U.S. correctional population. But by the end of the 1990s, incarceration rate growth began to cool off, prison capacity began to more closely approximate need, and the rate of growth in contract facilities declined accordingly.

AVOIDING PROBLEMS WITH CONTRACT FACILITIES

Simply contracting with a nongovernment entity to provide correctional services does not guarantee that contract facilities can actually provide correctional

services at less cost or greater quality than government programs. The body of research comparing public and private facilities finds that cost savings in contract facilities are most likely to occur in jurisdictions where the wages and benefits of public employees exceed the national average and that, on the whole, contract facilities provide a quality of inmate care on parity with public facilities. However, research also shows that many problems in contract facilities are prompted by poorly written contracts or by inadequate contract monitoring by government agencies.

Prior to entering into the contract process, government agencies should consider whether they have the capacity to manage and monitor contracts with private entities adequately. While the use of contract facilities may streamline government operations, it does not relieve government from the ultimate responsibility for custody and care of inmates. At minimum, successful contracting requires that governments assign full-time staff to the tasks of contract management. Contract development should begin with a competitive bidding process that permits bids by nonprofit as well as for-profit organizations. Many government jurisdictions also allow government agencies, including divisions within the contracting jurisdiction, to compete head-to-head with nongovernment bidders. Commonly referred to as "market testing," this practice was pioneered in the United Kingdom and has had the collateral effect of prompting government-operated facilities to adopt cost-saving strategies in order to remain competitive with the private sector.

Contracts should be thorough and specific to ensure accountability, detailing all areas of operations, including: staffing patterns, care and treatment provided to inmates, and policies and procedures for dealing with serious incidents. Quantifiable performance standards should be established to set acceptable levels for all operations along with procedures for government access to the contractor's facility, records, and staff. The contract should also specify the payment structure and billing policies to be used. Most contract facilities operate under a per diem payment system, whereby the provider is paid only for actual bed days used. The length of the agreement should be kept as short as possible by requiring that the contract be rebid every three to five years.

The contract should also describe courses of action to be taken should the contractor fail to live up to any contract provisions, be found to be deficient in any operational areas, change its management structure, or go out of business. Such stipulations should include a corrective action process to deal with deficiencies, a dispute resolution process for handling disagreements between the government and the contractor, and a system of liquidated damages that details financial penalties, to be deducted from contract payments, when serious deficiencies occur or previously identified compliance problems are not corrected. Finally, the contract should specify grounds for termination of the agreement, including grounds for termination for cause and termination by mutual consent.

CONCLUSION

Contract facilities, it seems, are here to stay. Their standards must, however, be carefully monitored, by criminologists, government agencies, and private businesses alike. Ongoing research and documentation will ensure that conditions in these institutions does not fall below comparable ones in state-run facilities.

CONTRACT MINISTERS

Contract ministers are employed by all prison systems in the United States to offer pastoral care to inmates whose religious beliefs may not be adequately covered by the staff prison chaplain. Increasing numbers of these contract workers are being hired, as some jurisdictions have decided not to employ full-time chaplains. At their best, contract ministers can offer a broad range of religious options and care to the inmate community. They may also, however, operate at somewhat of a disadvantage, since they are not part of the full-time prison staff. In general, contractors are expected to respect the interfaith ethos of prison ministry and it is understood that proselytism in all forms is forbidden.

STAFF CHAPLAINS IN PRISON MINISTRY

All federal and most state prisons in the United States have at least one chaplain on staff who ministers to the diverse religious needs of the inmate community. With the passage of the Religious Freedom Restoration Act (RFRA) of 1993, which prohibits the state from taking any action that would substantially burden a prisoner's religious exercise, some state prisons that previously did not have a chaplaincy program have since employed a staff chaplain. The RFRA challenged the notion that a prisoner's right to religious observation could be refused because of perceived security threats and has now placed the burden of proof on the state or institution to prove any such threat.

A prison chaplain is responsible for providing all inmates with sufficient opportunities for religious worship, religious education, counseling, and crisis intervention. Besides providing these direct services, the prison chaplain is also in charge of administrative functions such as hiring contractors and coordinating prison volunteers as well as representing corrections to the larger community. Most prison chaplains are required to hold a master's in divinity degree, possess at least two years of pastoral care experience, and be endorsed by their own religious tradition. However, in some state prisons, lay people may also qualify for a chaplaincy position after completing a prison chaplaincy training program.

Prison chaplains' professional code of ethics obliges them to emphasize an impartial and interfaith approach to their prison ministries. For instance, they are meant to discourage the usage of their own denominational title (e.g., Rabbi, Father, Imam) within the prison setting, in favor of the more generic title of Chaplain. In addition, they must ensure that the diverse religious worship needs of all prisoners within the institution are being met. To meet these diverse needs, a prison chaplain may hire contractors (i.e., qualified clergy from a particular denomination) to perform religious worship services.

THE USE OF CONTRACTORS IN PRISON MINISTRY

There are a variety of possible scenarios in which a chaplain may be required to use outside contractors. In some situations, a contractor may be hired to conduct religious worship services that fall outside of the chaplain's own denomination. For example, a Protestant chaplain may hire a contract imam to perform worship services for the Islamic inmates if there is no Muslim chaplain on staff to meet this need. Outside contractors of the same faith background as the chaplain may also be recruited in the following instances: the prison chaplain is a lay person who is not allowed to perform certain, liturgical duties; there is an inordinately large number of inmates of that faith background who require multiple worship services a week; or the prison's physical layout is such that separate worship services are needed such as in a high-rise building.

A signification portion of most U.S. prison chaplaincy budgets are earmarked for the hiring of contractor services. However, due to budgetary considerations, contractors are recruited in most cases only when there is a critical mass of inmates requiring their services. For example, a prison chaplain could not divert resources to hiring a contract rabbi if there was only one Jewish inmate in the institution. Instead, the staff chaplain would have to meet the religious worship needs of the Jewish inmate by either coordinating a volunteer rabbi or the inmate's

own rabbi to come in and perform the necessary liturgical duties for the inmate.

A CASE STUDY OF A CONTRACT MINISTER

Paul Rodgers is president of the American Correctional Chaplains' Association and the full-time chaplain at Dodge Correctional Institution, a state prison in Waupan, Wisconsin. In his role as chaplain, Rodgers uses contractors to fill the unmet religious worship needs of various groups of inmates. The faith backgrounds and worship needs of incoming inmates are generally determined by having them fill out a Religious Preference Form when they enter the institution.

Although the majority of inmates at Dodge Correctional Institution come from mostly Protestant backgrounds (i.e., mainly Lutheran and Methodist), there is a sizable enough Catholic population that Rodgers contracts Catholic priests to meet the religious worship needs of the Catholic inmates on a weekly basis. Rodgers himself is Catholic, but as a layman chaplain cannot perform mass or serve the Eucharist.

There are only 25–40 Jews among the 20,000 men and women who are incarcerated in the state of Wisconsin. In addition, Muslims, Buddhists, Native Americans, and those belonging to other religious groups represent only a small fraction of the state's total prisoner population. To meet the needs of these religious minorities, the state of Wisconsin's corrections system hires individual contractors to travel throughout the state to a number of prisons to perform religious services for these underserved groups. Chaplain Rodgers, as well as other prison ministers, also use volunteer clergy from these various faith traditions to help serve the religious minorities within Wisconsin's state prison system.

CONCLUSION

Contractors as well as volunteers help to meet the worship needs of prisoners at many penal institutions. Even though staff prison chaplains are obliged to foster an interfaith, impartial environment and to provide counseling and crisis intervention to inmates of all faith traditions, contract ministers are often required to assist them, if the prison holds a particularly diverse population. By supplementing the work of prison chaplains, contractors and volunteers ensure that a prisoner's right to religious observation are upheld.

CONTROL UNIT

The National Institute of Corrections defines a *control unit* as

> a highly restrictive, high custody housing unit within a secure facility, or an entire secure facility, that isolates inmates from the general population and from each other due to grievous crimes, repetitive assaultive or violent institutional behavior, the threat of escape or actual escape from high-custody facility(s), or inciting or threatening to incite disturbances in a correctional institution. (Riveland, 1999, p. 6)

Control units are also referred to as administrative maximum penitentiaries, intensive housing units, intensive management units, maxi-maxi units, maximum control facilities, restrictive housing units, secured housing units, and special housing

units. These days they exist in almost all penal systems.

HISTORY

Since the inception of prisons, correctional administrators have always had to determine what to do with those inmates who did not conform to institutional rules. Both the Auburn and Pennsylvania models of the penitentiary that developed in the 19th century relied heavily on isolation to foster inmate reform and obedience. In these systems, women and men were held in isolation for long periods of time and forbidden to communicate with one another. They were also forced to labor. Unlike today, recalcitrant prisoners could also be whipped. Once corporal punishment was outlawed, correctional officials began more frequently to remove recalcitrant inmates from the general population often placing them in solitary confinement, more commonly referred to as "the hole" or "the box." Inmates in solitary confinement were unable to interact with others and placed on restricted diets for a period of time determined by the correctional administration. In two landmark cases, *Wolff v. McDonnell* (1974) and *Sandin v. Conner* (1995), the U.S. Supreme Court further delineated the due process rights afforded inmates before they could be placed in isolation for a set period of punishment in response to violation of an institutional rule.

The Federal Bureau of Prisons is often credited with the development of super-maximum secure facilities when it opened Alcatraz in San Francisco Bay to hold habitual felons. When Alcatraz closed in 1963, its inmates were spread throughout the bureau's remaining federal penitentiaries. In 1978, in response to the high level of violence in the federal prison system, U.S. Penitentiary in Marion, Illinois, opened a high-security control unit. As a result of continued violence at Marion, the entire prison was converted to lockdown, otherwise known as indefinite administrative segregation. In 1994, the Federal Bureau of Prisons opened the Administrative Maximum Penitentiary in Florence, Colorado, that now houses the federal prison system's most serious and chronic troublemakers.

State correctional systems soon followed the federal prison system's example and developed segregated housing areas or units within existing prisons, or built separate prisons for this purpose. A recent survey by the National Institute of Corrections reports that 30 states are operating one or more such facilities or units. Nationally, there are at least 57 control units/facilities, providing more than 13,500 beds. Similarly, Canada reported that between 1991 and 2001, its percentage of segregated prisoners more than doubled to represent 5.5% of federally sentenced prisoners. Such facilities are usually justified by a perceived need to manage an increasing number of violent and seriously disruptive inmates.

POPULATION CHARACTERISTICS

Who exactly is housed in control units is unclear. Although the U.S. Department of Justice provides statistics on the number of penal facilities by security level (maximum, medium, minimum), it does not provide separate information on those held in control units or super-maximum secure prisons. Indeed, given that most prisoners are confined in control units only for short periods of time, accurate information might be difficult to obtain.

Compounding the problem, there are few empirical studies of inmates housed in control units in the United States or Canada. Since most of the research that does exist focuses on a small number of control units in a handful of correctional institutions, the demographic information of the samples may not be representative of the larger control unit population. With these caveats in mind, studies indicate that in both Canada and the United States men housed in control units have an average age of 29. Over half are Caucasian and about one-quarter are black.

Not unexpectedly, information about women in control units in the United States and Canada is also very limited. Once again, from the limited body of literature that exists, it appears that segregation is practiced similarly in men's and women's prisons, with two exceptions. First, women may have greater freedoms within control units than men since they are usually allowed reading materials and

personal toiletries such as make-up. They are also usually permitted to congregate for meals. Somewhat paradoxically, however, women are more likely to be placed in control units for relatively minor infraction most of which appear merely to be conduct that violates their gender roles, such as swearing, tattooing, and "mouthing off." The demographic characteristics of women housed in segregation in Canada and the United States indicate an average age of 31. In Canada, women housed in segregation are 67% Aboriginal, 23% Caucasian, and 10% black.

PLACEMENT IN CONTROL UNITS

In both the United States and Canada, inmates are placed in control units at the discretion of correctional administrators for one of three purposes. Those who are charged with a serious rule violation may be moved to a control unit while the investigation of their crime and disciplinary hearing takes place. If they are found guilty of violating a serious rule (one that involved the threat or use of violence), they may be returned to the control unit to serve a specified number of days or months as imposed by the hearing officer. When control unit confinement is a sanction for prisoners found guilty of violating serious prison rules, it is called disciplinary segregation or punitive segregation. In some instances, when a rule violation also contravenes state laws, as is the case in assaults, homicides, and drug trafficking, prisoners may be convicted for these additional crimes.

Inmates suspected of playing a role in an incident or potential incident within the prison, and who have not yet been formally charged, may also be detained in a control unit until the investigation is complete. This type of isolation is referred to as administrative segregation or administrative detention.

Last, inmates may be placed in a control unit when prison officials believe they are dangers to themselves or will be victimized by others. Control units thus provide protective custody to vulnerable inmates, such as those who have been threatened or experienced physical or sexual assaults, those who are unable to function in the general population perhaps because of their mental or physical disabilities, and those who serve as informants for the administration. Inmates who are repeatedly involved in serious institutional rules (assaults, predatory behavior, inciting riots, or attempting escapes) could be segregated until the administration believed that they were no longer a threat to institutional security.

WHAT ARE CONTROL UNITS LIKE?

Control units are basically a miniature prison within the larger institution. They vary widely in the degree of restrictions placed on those living in them, but their primary purpose is always to control inmate behavior. Those held for protection are likely to have more privileges afforded to them than are those held for administrative or disciplinary purposes.

Regardless of the reason for their confinement, control unit inmates typically remain in their small cells for 22–23 hours a day. The cells are often equipped with solid steel doors that prevent any communication between prisoners. Remote-controlled electronic sliding doors and intercom systems further reduce the direct interaction and contact between inmates and correctional staff. No communal dining, exercise, or religious services are provided. If inmates are offered programs/services such as education or substance abuse treatment, these are typically brought to the inmates via counseling staff or through television or cable programming. Work opportunities are almost nonexistent. Human contact is often limited to medical staff, clergy, and counselors who visit the inmate. Noncontact visits with approved visitors are permitted for some inmates housed in control units.

THE CASE FOR AND AGAINST CONTROL UNITS

Current policies in most jurisdictions allow for inmates to be housed for administrative reasons and protection for indefinite periods of time. A few studies have examined the effects of short-term periods of isolation (60 days or less) and report that inmates adapt initially by increased pacing and sleeping, and then typically shift into reading,

physical exercise, or meditation to deal with the lack of stimulation. Individuals housed in control units evidence more internalized problems, interpersonal distress, and psychiatric symptoms than those in the general population. However, at least one study found no empirical evidence that these symptoms deteriorated after confinement in control units for periods less than 60 days. The effects of longer terms of solitary confinement have not been studied, although personal accounts suggest that it is stressful and may limit inmates' coping abilities.

The use of control units has been criticized by several organizations including Amnesty International, Human Rights Watch, the American Friends Service Committee, and the National Lawyers Guild, and some have formed campaigns to shut down all control units. These groups raise concerns about the negative psychological impact that such confinement may have on inmates. There is consensus that inmates with serious mental health problems should not be placed in control units. The high constructional and operational costs due to the enhanced security features and intensive staffing necessary to deliver services and programs to inmates individually are also a source of concern for some critics.

In contrast, correctional administrators usually tout three benefits of control units. First, they reduce the level of violence in other correctional institutions throughout a correctional system. The threat of transfer to control units serves as a deterrent to violence, and thus makes the inmate population more manageable. Second, control units house only the most violent prisoners who have demonstrated that they cannot be held at other prisons without jeopardizing the safety of other inmates and correctional staff. However, there is some evidence that in practice broader criteria for entry are employed. Last, the reduction of violence that results from use of control units allows the security at other prisons in that system to be relaxed. No empirical data have been collected to test these claims.

CONCLUSION

In recent years, control units have become commonplace in many penal systems. Given the controversies that still rage over their effectiveness and impact on psychological health, clearly more research needs to be done. Until it is clearer what this modern form of solitary confinement actually achieves, there is a fairly strong case that its use should be kept to an absolute minimum.

CONVICT CRIMINOLOGY

There are a significant number of former prisoners studying criminology and becoming professors. As a result of their experiences of arrest, trial, and

years of incarceration, they have profound insight that promises to update and inform what we know about crime and correction. Since 1997, ex-convict criminology and criminal justice professors have organized sessions at annual meetings of the American Society of Criminology, Academy of Criminal Justice Sciences, and American Correctional Association. These professors discuss academic response to and responsibility for deteriorating prison conditions.

THE NEW SCHOOL OF CONVICT CRIMINOLOGY

The conference presentations were used to build a working group of ex-convict and nonconvict critical criminologists to invent the "new school of convict criminology." This is a new criminology led by ex-convicts who are now academic faculty. These men and women, who have worn both prison uniforms and academic regalia, served years behind prisons walls, and now as academics are the primary architects of the movement. As ex-convicts currently employed at universities, the convict criminologists openly discuss their personal history and distrust of mainstream criminology.

Regardless of criminal history, all the group members share a desire to go beyond "managerial" and "armchair" criminology by conducting research that includes ethnography and the inside perspective. In contrast to normative academic practice, the "convict criminologists" hold no pretense for value-free criminology and are partisan and proactive in their discourse. This includes merging convict, ex-convict, and critical voices in their writing. As Rideau and Wikberg (1992) wrote, "That's the reality, and to hell with what the class-room bred, degree toting, grant-hustling 'experts' say from their well-funded, air-conditioned offices far removed from the grubby realities of the prisoners' lives" (p. 59).

CONVICT CRIMINOLOGISTS

The ex-convicts can be described, in terms of academic experience, as three distinct cohorts. The first are the more senior members, full and associate professors, some with distinguished research records. A second group of assistant professors is just beginning to contribute to the field. The third, only some of whom have been identified, are graduate student ex-convicts.

While all these individuals provide convict criminology with unique and original experiential resources, some of the most important contributors may yet prove to be scholars who have never served prison time. A number of these authors have worked inside prisons or have conducted extensive research on the subject. The inclusion of these "non-cons" in the new school's original cohort provides the means to extend the influence of the convict criminology while also supporting existing critical criminology perspectives.

Convict criminologists recognize that they are not the first to criticize the prison and correctional practices. They pay their respects to those who have raised critical questions about prisons and suggested realistic humane reforms. The problem they are most concerned with is that identified by Todd Clear in the foreword to Richard McCleary's *Dangerous Men* (1978/1992): "Why does it seem that all good efforts to build reform systems seems inevitably to disadvantage the offender?" The answer is that, despite the best intentions, reform systems were never intended to help convicts. Reformers rarely even bothered to ask the convicts what reforms they desired. The new school "con-sultants" correct this problem by entering prisons and directly asking the prisoners what they want and need.

ETHNOGRAPHIC METHODOLOGIES: INSIDER PERSPECTIVES

Convict criminologists specialize in "on site" ethnographic research where their prior experience with imprisonment informs their work. They interview in penitentiary cellblocks, in community penal facilities, or on street corners. Their method is to enter jails and prisons and converse with prisoners. This may include a combination of survey instruments, structured interviews, and informal observation and conversation. As former prisoners they know the

"walk" and "talk" of the prison, as well as how to gain the confidence of the men and women who live inside. Consequently, they have earned a reputation for collecting quality and controversial data.

Ex-convict academics have carried out a number of significant ethnographic studies. John Irwin, for example, who served a prison sentence in California, drew on his experience to write the *The Felon, Prisons in Turmoil, The Jail,* and *It's About Time* (with James Austin). Richard McCleary, who did both state and federal time, wrote his classic *Dangerous Men* based on his participant observation of parole officers. Charles M. Terry, a former California and Oregon state convict, wrote about how prisoners used humor to mitigate the managerial domination of penitentiary authorities. Greg Newbold, having served prison time in New Zealand, wrote *The Big Huey, Punishment and Politics,* and *Crime in New Zealand* to analyze crime and corrections in his country. Stephen C. Richards and Richard S. Jones, both former prisoners, used "inside experience" to inform their studies of prisoners returning home. Finally, Jeffrey Ian Ross and Stephen C. Richards coauthored *Behind Bars* and coedited *Convict Criminology.*

Prison Writing

Officially, the Federal Bureau of Prisons supports the writing of prisoners, but there are a number of ambiguous policy and program statements that allow the administration to come out of nowhere, start writing you shots, and put you in SHU. My experience is a perfect example of what happens to prison writers.

I started out getting published in underground magazines. My first published pieces were poems and essays on prison life. Then I started writing about prisoners with special talents like musicians, basketball players, and other types of phenomenal athletes. Back then my writing never created a stir with the administration. Sometimes I would even show my case manager or counselor the pieces I had published.

Then one time I wrote a piece that was published in *Don Diva* magazine, a thuglife publication based in New York City. The piece harshly criticized the war on drugs and I compared the future drug war trials to the Nuremburg Trials. As soon as the administration found out about this article I was shipped right out of the low security prison I had resided in for three years with no problems to a higher security prison where I was harassed and retaliated against for the next six months.

But I persevered and to this day I am still writing and getting published. I have heard other stories about writers in prison too. For example, Dannie Martin, a.k.a. Red Hog, who was thrown in and out of the hole for years, has finally got out and now has an agent and several books under his belt. I believe that prison writing is a good profession to try to start while in prison because when you get out you have viable options, plus it's better than working at McDonald's.

Seth Ferranti
FCI Fairton, Fairton, New Jersey

LANGUAGE AND POINT OF VIEW

The convict criminologists all share an aversion to the language used in most academic research writing on crime and corrections. Typically, researchers use words such as *offender* and *inmate*. In comparison, convict criminology prefers to use *convicts, prisoners*, or simply *men* or *women*. The distinction is important because it illustrates the different point of view of researchers and authors who have never been incarcerated with those that have. *Offender* and *inmate* are managerial words used by police, court officials, and criminal justice administrators to deny the humanity of defendants and prisoners. To the ear of a former prisoner, being referred to as an offender or inmate is analogous to a man being called a boy, or a women a girl. Clearly, the struggle feminists fought to redefine how women were addressed and discussed taught an important lesson to the convict criminologists: Words are important.

RESPECT FOR CONVICT AUTHORS STILL IN PRISON

A number of the convict criminologists continue friendships and working relationships with writers in prison, some of whom are well published in

criminology. This includes Victor Hassine, a prisoner in Pennsylvania who wrote *Life Without Parole;* Wilbert Rideau, a convict in Louisiana who wrote *Life Sentences* (with Ron Wikberg); and Jon Marc Talyor, serving time in Missouri and the author of numerous newspaper and journal articles. The ex-convict academics use correspondence, phone calls, and prison visits to communicate with these prisoners in order to stay current with prison conditions.

The convict authors write serious commentaries on prison life. Unfortunately, much of their research and writing, while critically informed, based on their experiences inside prisons, may be only partially grounded in the academic literature. After all, many of these authors lack or have difficulties obtaining the typical amenities that most scholars take for granted. For example, they may not have access to a computer for writing, to a university library, and or to colleagues educated in criminology. They struggle to write by hand, or with broken or worn out machines, and lack of supplies. They may be unable to procure typewriter ribbons, paper, envelopes, stamps, and so on. In addition, their phones calls are monitored and recorded, and all their mail is opened, searched, and read by prison authorities. In many cases, they suffer the retribution of prison authorities, including denial of parole, loss of "good time" credit, physical threats from staff or inmates, frequent cell searches, confiscation of manuscripts, trips to the hole, and disciplinary transfers to other prisons.

In comparison, convict criminologists have academic resources and credibility to conduct a wide range of research and writing. These resources allow them to use developments in theory, methodology, and public policy to hone their discourse. As academics they know the scholarly literature on prison, including theory, methodologies, and how issues have been debated over the years. This knowledge provides them with the opportunity to generalize from research findings and to understand better how prison conditions compare over time, from state to state, or country to country.

RECENT POLICY RECOMMENDATIONS

Convict criminologists have come up with several policy recommendations. First, the group advocates dramatic reductions in the national prison population through diversion to probation or other community programs. Today, many men and women are sentenced to prison for nonviolent crime. These people should be evaluated as candidates for early release, with the remainder of their sentence to be served under community supervision. The only good reason for locking up a person in a cage is if he and she is a danger to the community. A prisoner should have an opportunity to reduce his or her sentence by earning good-time credit for good behavior and program participation. Unfortunately, many state correctional systems, following the federal model, have moved toward determinate sentencing. This "truth in sentencing" has limited provisions for good-time reductions in sentences, and no parole.

One problem with reducing the prison population is predicting who might commit new crimes. Despite numerous attempts, we still have no reliable instruments to predict the potential risk of either first-time or subsequent criminal behavior by either free or incarcerated individuals. The problems are many, including "false positives," which predict a person to be a risk who is not. Conversely, "false negatives" are persons predicted not to be dangerous who turn out to be so. Even so, the fact that our science is less than successful at devising classification schemes and prediction scales is not an adequate rationale for failing to support reductions in prison admissions and population.

Second, convict criminologists support the closing of large-scale penitentiaries and reformatories, where prisoners are warehoused in massive cellblocks. Over many decades, the design and operation of these "big house" prisons has resulted in murder, assault, and sexual predation. A reduced prison population housed in smaller institutions would be accomplished by constructing or redesigning prison housing units with single cells or rooms. Smaller prisons, for example, with a maximum of 500 prisoners, with single cells or rooms, should become the correctional standard when we begin to seriously consider the legal requirement for safe and secure institutions. As a model, we should turn to European countries that have much lower rates of incarceration, shorter sentences, and smaller prisons.

Third, we need to listen carefully to prisoner complaints about long sentences, overcrowding, double celling, bad food, old uniforms, lack of heat in winter and air-conditioning in summer, inadequate vocational and education programs, and institutional violence. The list grows longer when we take a careful look at how these conditions contribute to prisoners being poorly prepared for returning home and the large number that return to prison.

Fourth, we have strong evidence that prison programs are underfunded, since administrators and legislators continue to emphasize custody at the expense of treatment. Prisoners should be provided with opportunities for better-paid institutional employment, advanced vocational training, higher education, and family skills programs. It is true that most institutions have "token" programs that serve a small number of prisoners. For example, a prison may have paid jobs for 20% of its prisoners, low-tech training, a general equivalency diploma (GED) program, and occasional classes in life skills or group therapy sessions. The problem is that these services are dramatically limited in scope and availability.

We need to ask convicts what services and programs they want and need to improve their ability to live law-abiding lives rather than assume and then implement what we believe is good for them. One recommendation is that prisoners be provided with paid employment, either inside or outside of the prison, where they will earn enough to pay for their own college tuition. At the very least, all prisons should have a program that supports prisoners to complete college-credit courses by correspondence.

At the present time, most U.S. prisons systems budget very little for prisoner programs. Instead they spend on staff salaries and security. This is because prison administrators are evaluated on preventing escapes and maintaining order in their institutions. So the prisons are operated like zoos where human beings live in cages, with few options to develop skills and a new future.

Fifth, convict criminology advocates voting rights for all prisoners and felons. The United States is one of the few advanced industrial countries that continues to deny prisoners and felons voting rights. We suggest that if convicts could vote, many of the recommendations we advocate would become policy because the politicians would be forced to campaign for convict votes. State and federal government will begin to address the deplorable conditions in our prisons only when prisoners and felons become voters. We do not see prisoners as any less interested than free persons in exercising the right to vote. To the contrary, if voting booths were installed in jails and prisons, we think the voter turnout would be higher than in most outside communities.

Sixth, we advocate that prisoners released from prison have enough "gate money" that would allow them to pay for three months' worth of rent and food. The ex-cons could earn some of this money working in prison industries, with the balance provided by the institution. All prisoners exiting correctional institutions should have clothing suitable for applying for employment, eyeglasses (if needed), and identification including a social security card, state ID or driver's license, and a copy of their institutional medical records. They should be given credit for time served on parole supervision. Finally, we need to address the use of drug and alcohol testing as the primary cause of parole violations.

Seventh, our most controversial policy recommendation is eliminating the snitch system in prison. The snitch system is used by "guards" in old-style institutions to supplement their surveillance of convicts. It is used to control prisoners by turning them against each other and is therefore responsible for ongoing institutional violence. If our recommendations for a smaller population, housed in single cells or rooms, with better food and clothing, voting rights, and well-funded institutional programming were implemented, the snitch system would be unnecessary. In a small prison, with these progressive reforms, prison staff would no longer be forced to behave as guards, instead having the opportunity to actively "do corrections" as correctional workers. The staff would be their own eyes and ears, because they would be actively involved in the care and treatment of prisoners.

Finally, we support the termination of the drug war. Military metaphors continue to confuse our

thinking and complicate our approach to crime and drug addiction. For example, the theory of judicial deterrence, discussed as a rationale for sentencing in nearly every criminal justice textbook, is derived from the Cold War idea of nuclear deterrence. This idea evolved into mutually assured destruction (MAD), which was the American rationale for building thousands of nuclear bombs to deter a possible Soviet nuclear attack. The use of deterrence and war has now bled over from the military strategic thinking to colonize criminal justice. The result is another cold war, this one against our own people. We advocate an end to the drug war, amnesty for drug offenders, and a reexamination of how our criminal justice priorities are set.

PROS AND CONS OF CONVICT CRIMINOLOGY

The first strength of convict criminology is that it is based on a bottom-up, inside-out perspective that gives voice to the millions of men and women convicts and felons. The second is that the group is composed of men and women who have served prison time in many different environments including the Federal Bureau of Prisons, various state systems, different countries, and at different levels of security. Altogether, the founding members of the group have served more than 50 years in prison. Finally, it should be remembered that it would have been much easier for the ex-convict professors to conceal their past and quietly enjoy their academic careers. Instead, they decided to "come out of the closet," develop their own field of study, and take up the fight against the liberal-conservative consensus that continues to ignore the harm done by mass incarceration in the United States.

There are two glaring weaknesses of this new field. First, most of the ex-convict professors are white males. This is the result of two facts: Very few minorities leave prison prepared to enter graduate school, and over 90% of prisoners are male. To some extent, this problem is being addressed through active recruitment of minorities and women into the group. For example, the group does include feminist non-con criminologists who conduct prison research.

Second, because the group is partisan and activist it is clearly biased in its approach to research and publication. On the other hand, the convict criminologists would argue that given the prejudice most people, academics included, have against criminals, convicts, and felons, the idea of value-free prison research is at best a polite fantasy. The only solution to this dilemma is for all researchers who contribute to the literature to discuss their biases openly, including former criminal justice personnel.

CONCLUSION

Convict criminology is a new way of thinking about crime and corrections. The alumni of the penitentiary now study in classrooms and serve as university faculty. The old textbooks in criminology, criminal justice, and corrections will have to be revised. A new field of study has been created, a paradigm shift occurred, and the prison is no longer so distant.

CONVICT LEASE SYSTEM

Convict leasing refers to a particular means of putting inmates to work that originally developed in the South following the end of the Civil War, but was eventually used all over the United States. In this system, persons convicted of criminal offenses were sent to sugar and cotton plantations, coal mines, turpentine farms, phosphate beds, brickyards, sawmills, and cotton mills. They were leased to businessmen, planters, and corporations in one of the harshest and most exploitative labor systems known in American history. Though this practice no longer strictly exists in the United States, remnants of it can be found in joint venture programs where prisoners work for the profit of private corporations.

HISTORY

Convicts have been used as a source of cheap and profitable labor for centuries. The ancient Greeks and Romans both put convicted criminals to work on state-operated public works. In the Middle Ages, convicts were routinely sold into slavery, especially galley slavery. By the late 15th and 16th centuries, workhouses were established to confine beggars and vagabonds, to put them to work grinding corn, making nails, spinning fabric, or other labors.

This same trend occurred in the American colonies. In 1699, Massachusetts "declared that rogues and vagabonds were to be punished and set to work in the house of correction" (Rothman, 1971, p. 26). Other colonies followed suit. Inmates of the first American prisons were forced to labor as part of their incarceration. The Walnut Street Jail, which began to accept prisoners in 1790, set its inmates to work under what we now call the piece-price system. With the rise of the penitentiary system in the early 1800s, convict labor was a central focus of reform.

THE AMERICAN CONTEXT

The early debate over the merits of the Pennsylvania and Auburn systems focused on the uses of convict labor and, ultimately, on profitability. The Pennsylvania system reflected a plan for solitary confinement of inmates. Each inmate worked alone in his cell without contact with other inmates. Work was mostly menial and unprofitable for the institution. The Auburn system combined separate confinement with silent, collective work. This system became the model for most prisons in the United States.

A few years after the first prison opened in Auburn, New York, in 1817, a local citizen was given a contract to operate a factory within the prison walls. Prisoners were also leased out to private bidders to be housed, fed, and worked for profit. This practice provided the beginnings of the lease system.

Eventually, three systems of convict labor emerged in the 19th century: the contract system, the state use system, and the convict lease system. The contract system dominated prisons in the northern part of the country. Under this system, the state feeds, clothes, houses, and guards the convict. To do this, the state maintains an institution and a force of guards and other employees. The contractor pays the state a stipulated amount per capita for the services of the convict and sells the final product on the open market. In the lease system, the state enters into a contract with a lessee who agrees to receive the convict; to feed, clothe, house, and guard him; to keep him at work; and to pay the state a specified amount for his labor. The state does not maintain an institution to house prisoners. In the state use system, the state conducts a business of manufacture or production but the sale of the goods produced is limited to state agencies. Today, the state use system is the most commonly used of the systems.

RELATIONSHIP BETWEEN SLAVERY AND CONVICT LEASING

The convict lease system was inexorably intertwined with the post–Civil War economic recovery of the South. Emancipation moved the Southern

economy from a slave society based on forced labor to a caste society based on more overt, coercive techniques. The antebellum South was a labor-intensive, agricultural society. The convict lease system helped restore the basis of agricultural profitability by alleviating the shortage of labor. The legal system provided a cheap labor force of experienced agricultural workers and helped to control the black population.

In Southern states, prisons were not used extensively prior to the Civil War. After the war, the South was faced with severe economic, political, and social problems. At the time, the North and the South both incurred vast increases in prison populations due to the large numbers of returning servicemen and the postwar recession. The situation was more acutely felt in the war-ravaged South as prisons, railroads, factories, and much of the land itself had been almost totally destroyed in many areas. The destruction of the economy coincided with the emancipation of black slaves, creating a further strain on economic and social institutions. The South's solution to this problem was to create a system of convict leasing, as well as to found a number of plantation-style penitentiaries. Both served to perpetuate race and class divisions while profiting the state.

The lease system worked in concert with the new criminal codes of the postwar South, which, in a series of laws known as the Black Codes, piled up heavy penalties for petty offenses against property while at the same time weakening the protection afforded blacks in court. Prior to the Civil War, blacks were not sent to prison in great numbers. When a slave did commit a crime, the matter was usually resolved locally. A range of corporal punishments (flogging, beating, etc.) was typically used for petty criminal acts, while more serious offenses were dealt with through shootings or lynchings. After the war, the implementation of vaguely worded laws (vagrancy, loitering, etc.) meant that just about any former slave could be arrested and sentenced to prison.

The "pig law" of Mississippi, passed in 1876, illustrates the nature and effect of the Black Codes well. This bill "declared the theft of any property valued at more than ten dollars, or of any kind of cattle or swine, regardless of value, to be grand larceny," which was punishable by up to five years in the state prison (quoted in Shelden, 1980, p. 6). After its adoption, the number of state convicts in Mississippi increased from 272 in 1874 to 1,072 by the end of 1877. The number in Georgia increased from 432 in 1874 to 1,441 in 1877 (Woodward, 1971, p. 213).

Such laws caused not only a dramatic increase in prison populations but also a shift in the racial make-up of who was incarcerated. McKelvey (1977) noted: "In the Deep South [African Americans] soon exceeded 90% of the total prison population, making the traditions and methods of the old slave system seem more logical patterns for southern penology than the costly methods of the north (p. 198). Shelden (1980, p. 5) noted that the black population at the main prison in Nashville, Tennessee, went from 33% in 1865 to 67% in 1867 and remained at 60% well in to the 20th century.

LEASING, CAPITALISM, AND VIOLENCE

The lease system rapidly became a large-scale business. Leases of 20 and 30 years were granted by legislatures to powerful politicians, Northern syndicates, mining corporations, and individual planters. The Tennessee Coal and Iron and Railroad Company (later to become a subsidiary of the U.S. Steel Corporation), dealt in convict "futures" in the same way brokers dealt in wheat and corn futures. Most problematically, as McKelvey (1977) noted, under the lease system, "there was no check, as in the North, where cells rapidly became crowded and compelled the construction of costly bastilles if convictions were too frequent" (p. 211).

In effect, under the leasing system, convicts became the slaves of the lessee as the latter had complete control over their food, clothing, discipline, and especially working conditions. Though the lessee was nominally responsible for the health and well-being of his convict-workers, abuses, brutality, and degradation became part of the system as lessees deprived convicts of necessary care and resorted to brutal punishments to extract more

work from them. A grand jury investigation of the penitentiary hospital in Mississippi reported that inmates were

> all bearing on their persons marks of the most inhuman and brutal treatment. Most of them have their backs cut in great wales, scars and blisters, some with the skin peeling off in pieces as the result of severe beatings . . . they were lying there dying, some of them on bare boards, so poor and emaciated that their bones almost came through their skin, many complaining for want of food. . . . We actually saw live vermin crawling over their faces, and the little bedding and clothing they have is in tatters and stiff with filth. (quoted in Woodward, 1971, p. 214)

As a result of such treatment, the mortality rate for convicts rose dramatically. In the South, for instance, the rate of mortality was 41.3 per thousand convicts, while the rate for Northern prisons was only 14.9 (McKelvey, 1977, p. 183). The average annual death rate among Negro convicts in Mississippi from 1880 to 1885 was almost 11%; for white convicts it was half that. The death rate among prisoners of Arkansas was reported in 1881 to be 25% annually (Woodward, 1971, p. 141). In Louisiana between 1870 and 1901, 3,000 black convicts died under the lease system (Carelton, 1971, p. 46).

THE END OF THE LEASE SYSTEM

The reformist literature portrayed the lease system as being worse than slavery. An unidentified Southern man succinctly summarized the situation in 1883: "Before the war, we owned the Negroes. If a man had a good negro, he could afford to take care of him. He might even get gold plugs in his teeth. But these convicts: we don't own 'em. One dies, get another " (quoted in Carleton, 1971, p. 46).

Nonetheless, the lease system disappeared largely because of economic objections of both labor and business, rather than because of humanitarian objections. Free labor complained that convict labor deprived free men of jobs and businesses complained of unfair competition. McKelvey (1968) noted: "But the lease system was doomed by its decreasing usefulness to the state, and it was not abandoned until profitable substitutes were perfected." These other systems included plantations, industrial prisons, and the chain gang, which still exists today (McKelvey, 1968, p. 185).

CONCLUSION

Today, private companies are once again increasingly using inmate labor. Though convict leasing is no longer practiced, some critics point to the similarities between it and current joint venture schemes. Other similarities can also be found in the racial constitution of the prison population, where African Americans remain disproportionately incarcerated. Though the abuses of the past are unlikely to be repeated, the problematic history of convict leasing is important to recall when evaluating the role of private businesses in prison work programs.

COOK COUNTY, ILLINOIS

Cook County, Illinois, founded the first juvenile court in the United States in 1899. Today, the juvenile court has become a model for dealing with various social and psychological problems besetting youths in the United States.

HISTORY: THE FIRST JUVENILE COURT

The first juvenile court was established in Illinois largely due to the collaborative efforts of the Chicago Women's Club, the Chicago Bar Association, and the Illinois State Conference of Charities. The club convinced the Chicago Bar Association to draft a juvenile court bill, which was subsequently passed by the Illinois House. The bill was the 1899 Illinois Juvenile Court Act, which suggested that the state should care for dependent and/or neglected children who had been abandoned or lacked proper parental care, support, or guardianship. The early juvenile court functioned as an administrative agency of the circuit or district courts, and it was mandated as such by legislative action. By 1945, almost all states had developed similar juvenile court systems.

The Illinois Juvenile Court Act contained a number of important features. For the first time it defined a delinquent as under the age of 16. It also mandated that children must be kept separate from adult institutions, while prohibiting altogether the detention of children under age 12 in jail or police custody. It established special, informal procedural rules in juvenile court by employing a social work approach rather than a law enforcement or prosecutorial one in which probation officers handled the intake phase. The act also introduced private hearings in limited courts of record, where notes might be taken by the judges to reflect judicial actions. It granted original jurisdiction and individualized justice (based on each child's needs) in all cases concerning people under the age of 16. In this manner, the law divested the adult courts of all jurisdiction over children and reflected the concept of *parens patriae* (the duty of the state to act as the children's parents) as a functional approach.

The juvenile court as conceived in Cook County emphasized rehabilitation instead of punishment. In contrast to earlier practices, it relied on probation officers in diagnosis and processing for adjudicatory hearings instead of criminal prosecutors. In effect, the courts hoped to redeem all salvageable children while leaving only those not amenable to correction to be waived to adult criminal court processing.

THE SITUATION TODAY

Today, Cook County, Illinois, is still at the forefront in juvenile corrections. The historical Chicago Area Project, instituted in the early 1930s and based on social disorganization theory and the ecological approach that was developed by researchers at the University of Chicago, is still a model. As a demonstration program, the project was designed to discover a procedure for the treatment of delinquents and the prevention of delinquency in those Chicago neighborhoods that sent disproportionately large numbers of boys to the Cook County Juvenile Court. The project currently operates out of the Division of the Illinois Department of Corrections, and through research, has contributed immensely to the field of American criminology and corrections.

The Chicago Area Project has empowered many neighborhoods through involving community volunteers, community organizations, local churches, and other institutions in the process of program development and implementation. In cooperation

with neighborhood residents, the project has affected social and environmental transformations by providing facilities, professional guidance, and child welfare programs.

Numerous other community-based youth-oriented diversion and delinquency prevention programs have based their activities on the Chicago Area Project. Just one example can be found in the Atlanta Operation Weed and Seed that started in the 1980s. Like the Chicago Area Project, it is a neighborhood empowerment program designed to work with community organizations and volunteers, local churches, and other institutions to revamp socially disorganized neighborhoods and empower them to become self-reliant. It was initiated in collaboration with Atlanta University, and grant funds came from both federal and state governments. It offered counseling, social services, and back-to-school or work curriculum as essential ingredients of the project.

Other correction-related juvenile programs in Cook County include the 4-H program and the Center for Conflict Resolution (CCR). A youth development program of the University of Illinois Cooperative Extension Service (CES), about 60,000 Cook County children and teenagers are enrolled annually in 4-H clubs. Through hands-on learning experiences in the arts and sciences and community service projects, and participation in official club meetings and activities, the clubs help these children grow and develop. CES also works with the Juvenile Detention Center to provide stress management, crisis coping, and leadership skills and self-esteem workshops for the detainees.

The CCR is one of the numerous distinguished programs in Cook County. Since 1992, it has been engaged with the Cook County State's Attorney's Office to provide mediation services for both the minors charged with crimes and the victims of those crimes. In cases involving criminal damages, criminal trespass, battery, assault, and simple theft, mediation is often used as an alternative to adjudication process. It is also employed in cases where victims seek restitution or want the juvenile to perform community service, or when the victim and the juvenile still have an ongoing relationship. On average, CCR mediates about 150 cases annually.

Finally, Cook County vigorously enforces the Safe School Zone Act passed by Illinois legislature in 1985. The act requires that 15- and 16-year-olds charged with delivery of a controlled substance within 1,000 feet of a school be tried in adult court. In 1987, the act was merged with the Juvenile Court Act, thereby making drug offenses higher-level crimes, especially when they are committed within the school safe zone. In 1989, the "Safe Zone Act" was extended to public housing developments in the state. It is, however, particularly in Cook County that this law is vigorously enforced.

CONCLUSION

Cook County, Illinois, made a lasting impact on juvenile corrections in the United States. Until 1898, children were arrested, charged, tried, and sentenced to adult prisons. Illinois was the first state to pass a bill that separated juveniles from adults, and Cook County was the first to direct the juvenile court toward meeting the goals of the juvenile bill. The pioneering roles of the Chicago Area Project and the 4-H program in delinquency prevention and control clearly place Cook County in the annals of juvenile justice and correctional history. Recently, however, many of the ideas of the first juvenile reformers have come under attack as more and more states choose to waive young offenders to adult courts, and even to incarcerate them in adult prisons. Whether the views and practices of Cook County will survive these changes remains unclear.

CORCORAN, CALIFORNIA STATE PRISON

One of the 33 state prisons in the California archipelago, California State Prison, Corcoran (CSP-C) houses approximately 6,000 minimum-, medium-high-, and maximum-security inmates. Corcoran provides a variety of educational and vocational programs, as well as an acute care hospital and a substance abuse program. But Corcoran, dubbed "America's most violent prison," has achieved media notoriety not for its innovations in corrections but for claims of serious human rights violations.

OVERVIEW OF THE FACILITY

Corcoran is located in California's Central Valley, approximately midway between Fresno and Bakersfield. Opened in February 1988, Corcoran Prison was built on 942 acres that was once Tulare Lake. It is designated as a Level I, Level III, Level IV, General Population, and Security Housing Unit/Protective Housing Unit institution.

Minimum-security Level I facilities are characterized by open dormitories without a secure perimeter. At Corcoran, five Level I dormitories house about 884 inmates. A substance abuse program was activated in January 2001, providing alcohol and drug treatment for 190 Level I inmates. Medium-high Level III facilities usually have individual cells, fenced perimeters, and armed coverage. At Corcoran, about 1,000 inmates occupy five Level III buildings. Maximum-security Level IV facilities are characterized by cells, fenced or walled perimeters, electronic security, and armed officers both inside and outside the installation. At Corcoran, about 2,000 inmates occupy 10 buildings in Level IV general population.

Another 2,000 Level IV inmates at Corcoran occupy two special housing unit (SHU) facilities. Corcoran was the first California prison with a separate facility built to house SHU inmates exclusively. Special units within the SHU facilities accommodate handicapped inmates, those with HIV, and prisoners requiring protective housing.

In addition to the Levels I, III, and IV facilities, Corcoran Prison maintains an acute care hospital (ACH) with 75 beds. The ACH is a maximum-security facility, providing acute medical, surgical, mental health crisis, and specialty outpatient services to inmates. Corcoran also employs about 600 inmates through prison industry authority (PIA) programs. Inmates work in Corcoran's manufacturing yards, institutional laundry, 400-acre agribusiness center, warehouse/freight distribution center, or industrial maintenance and repair facilities.

ALLEGATIONS OF HUMAN RIGHTS VIOLATIONS

Throughout the late 1990s, prison activists and journalists reported that serious human rights violations were occurring at Corcoran Prison on a regular and ongoing basis. Otherwise incredible claims of "gladiator fights" and state-sanctioned rape seemed plausible when several whistleblowers, all former Corcoran guards, substantiated the accounts. In 1998, state legislative hearings concluded that a pattern of brutality existed at Corcoran. An independent panel confirmed that 24 of the 31 serious or fatal shootings at Corcoran between 1988 and 1995 had involved unjustified use of deadly force. Investigations by the state attorney general and the Federal Bureau of Investigation (FBI) followed, and although all were acquitted, several guards were prosecuted in a series of high-profile trials.

ASSAULTS

According to reports, a group of rogue Corcoran guards (calling themselves the "Sharks") met a busload of new prisoners in 1995. The Sharks mistakenly believed that these prisoners had been involved in the assault of a correctional officer at another California correctional institution, Calipatria Prison. The officers dressed in dark jumpsuits and riot gear. They covered their badges with tape so they could not be identified. Then they pulled the shackled prisoners off the bus and subjected them to an anonymous hail of fists, steel-toed boots, and metal batons that continued for more than 30 minutes. Other examples of coordinated assaults have been reported. Corcoran prisoners recount similar events that took place as early as 1988.

RAPE

Corcoran guards were accused of orchestrating inmate rapes. According to former Corcoran guard Roscoe Pondexter, officials knowingly placed 118-pound Eddie Dillard into a cell with 220-pound Wayne Robertson, despite the fact that Robertson was listed in prison records as Dillard's enemy. They did so because Robertson, known as the "Booty Bandit," regularly raped prisoners as a favor for Corcoran guards. He was employed as a tool of punishment; in exchange, he was rewarded with extra privileges.

Dillard maintains that Robertson raped him repeatedly over a three-day period. A full rape examination was ordered, but inexplicably cancelled. Although Dillard's claims were corroborated by Pondexter's testimony, investigative reports, and Robertson's own boasting, the four Corcoran guards who were tried for intentionally placing Dillard into the cell with Robertson were acquitted in November 1999.

GLADIATOR FIGHTS

Corcoran guards were also accused of staging fights among rival gangs in the SHU yards, then shooting at them when fights broke out. Under the California Department of Corrections (CDC) "integrated yard policy," rival gang members were assigned to common exercise yards in order to destabilize ethnic gangs. But, whistleblowers alleged, the resulting "gladiator fights" were regulated by Corcoran guards for amusement and blood sport.

On April 2, 1994, Preston Tate was taken from his SHU cell to participate in a gladiator fight. Predictably, Tate and his cellmate were attacked by two rival inmates. After several seconds of flailing punches, guards fired 37 mm wooden baton rounds, then fired a single 9 mm round, blowing Tate's skull open.

Tate's shooting, combined with testimony from former Corcoran guards, prompted U.S. Attorneys to indict eight Corcoran guards on charges of violating the civil rights of prisoners in 1998. In June 2000, all eight guards were acquitted. The CDC did, however, pay $825,000 to Tate's parents in a civil settlement, the CDC's largest settlement for a shooting death.

CONCLUSION

Since opening in 1988, Corcoran Prison has retained a reputation for being a brutal and violent institution. Allegations of orchestrated assaults, coordinated rapes, and gladiator fights were made throughout the 1990s, sparking local and federal investigations and leading to the prosecution of several correctional officers. These officers were acquitted, but there is no question that Corcoran has been stained by a legacy of institutional violence. Although conditions have certainly improved at Corcoran, the advocacy group California Prison Focus maintains that Corcoran remains plagued by prisoner abuse, staff misconduct, medical neglect, and safety violations to this day.

CORPORAL PUNISHMENT

Corporal punishment refers to physical penalties that cause pain or disfigure the body. It is usually contrasted with practices such as imprisonment, probation, or parole, which control but are not meant specifically to harm the body. Of course, incarceration may cause discomfort and potentially subject inmates' bodies to violence such as rape, but it is not the same as whipping or flogging where the judicial sentence directly requires acute pain as the payment for an offense. While executions obviously harm the body by putting someone to death, legally they must not involve torture or unnecessary pain and suffering.

HISTORY AND EXAMPLES OF CORPORAL PUNISHMENT

Corporal punishments predate the birth of the prison. Indeed, early jails and prisons were designed merely to hold offenders until their corporal punishment could be carried out. A common strategy until around 1800 was to hold an offender in the stocks. Just as every community now has a jail, historically every village had stocks. For this punishment, offenders were placed in hinged heavy timbers with holes cut in them to hold arms and/or legs, so that they were "powerless to escape the jests and jeers of every idler in the community" (Earle, 1896/1995, p. 37). Stocks could be used to hold offenders prior to another penalty or as a form of punishment itself.

Another method commonly used at this time was the pillory. The pillory was similar to the stocks in design (and ubiquity) but held "the human head in its tight grasp, and thus holds it up to the public gaze" (Earle, 1896/1995, p. 44). Individuals held in this structure were further humiliated by the public who would throw at them "rotten eggs, filth, and dirt from the streets, which was followed by dead cats, rats" and "ordure from the slaughter-house" (Andrews, 1890/1991, pp. 85, 86). They might also have their ears nailed to either side of the head hole or cut off entirely ('cropped') for additional ridicule. Some communities put offenders in the pillory during public market days to increase their exposure.

Whipping posts were usually similar to the pillory in design, although they also could be little more than a post to which an individual was secured. Some communities tied an offender to a whipping cart and walked him or her through town "till his body became bloody" (Earle, 1896/1995, p. 70). This technique, which was popular until the 1800s, could be done with a variety of implements such as reeds, birch rods, and whips; famously the cat-o'-nine-tails was made of a rope that was unraveled and knotted at the ends to inflict maximum discomfort.

Finally, more permanent methods of corporal punishment existed such as branding, maiming, and amputation. Branding involved burning a sign into someone's flesh that forever labeled him or her a criminal. Often the sign would vary depending on the crime. Maiming could take many forms and was usually aimed symbolically at addressing the crime: A blasphemer would have his tongue cut out or fixed to the side of his cheek, thieves would have a hand cut off, and so on. In extreme cases, offenders' hearts could be cut out, or their limbs amputated.

GENDER AND CLASS

As with most forms of social control, corporal punishment was never applied equally across social classes or groups. Aristocrats, for example, were usually exempt from such practices, while certain techniques—such as the dunking stool and scold's bridle—were almost exclusively reserved for women for gendered crimes like gossiping or being argumentative. The dunking stool was used occasionally for men accused of slander or for quarrelsome married couples. It usually resembled a see saw onto which the offender could be placed in a

chair that was then plunged into cold water "in order to cool her immoderate heat" (Andrews, 1890/1991, p. 4). The bridle was "a sort of iron cage, often of great weight; when worn, covering the entire head; with a spiked plate or flat tongue of iron to be placed in the mouth over the tongue" so "if the offender spoke she was cruelly hurt" (Earle, 1896/1995, p. 96). This device locked in the back, and women would either be led around town or attached to a post. The bridles were sometimes ornamented to give the wearer's face a bestial appearance. The women staked out in the public square could expect "painful beatings, besmearing with feces and urine, and serious, sometimes fatal wounding–especially in the breasts and pubes" (Held, 1985, p. 150).

CORPORAL PUNISHMENT AND EXECUTIONS

Until the 19th century, abuse and torture were integrated into the death sentence to maximize a person's suffering. For example, an English sentence for treason in 1691 required the offenders to be

> hanged by the neck, to be cut down while ye are yet alive, to have your hearts and bowles taken out before your faces, and your members cut off and burnt. Your heads severed from your bodies, your bodies divided into quarters . . . and disposed of according to the king's will and pleasure; and the Lord have mercy upon your souls. (quoted in Johnson, 1998, p. 14)

Depending on the jurisdiction and the time, offenders were burned to death, broken on the wheel (breaking the major bones of their body with an iron rod while tied to a large circle symbolizing eternity), impaled, disemboweled, and beheaded. They could also be drawn and quartered by being tied to four horses that pulled in different directions. After executions, the corpse might be gibbeted and displayed hanging in chains. As medical schools sought after corpses to teach anatomy and improve surgical success, poor offenders were sentenced to be dissected, sometimes in a public hall. The previous practice of robbing graves for cadavers provoked hostility in villages, which occasionally burned down medical schools in retaliation for the digging up the recently deceased and the "deliberate mutilation or destruction of identity, perhaps for eternity" that dissection entailed (Richardson, 1987, p. 29). The strong reaction reveals how dissection and the potential evisceration of a person's body were seen as punishment even after death.

FOUCAULT AND THE BIRTH OF PRISON

The transition to prison from corporal punishments and the spectacle of execution is the subject of *Discipline and Punish* by French philosopher Michel Foucault (1979). This book famously starts with a gruesome description of the 1757 execution of Damiens, who had been convicted of regicide. Before he dies, Damiens's flesh was torn with red-hot pincers, he was partly burned and eviscerated, and then, unsuccessfully drawn and quartered. The executioner finally had to cut Damiens's body apart and then burn the pieces. The second type of punishment that Foucault describes is a "House of young offenders" 80 years later, based on a strict timetable or schedule. Using these two examples, Foucault (1979) argues that punishment underwent major changes between 1760 and 1840 "from being an art of unbearable sensations, punishment has become as economy of suspended rights" (p. 11). According to him, in less than 100 years, public spectacle disappeared, physical pain was downplayed, the prison replaced corporal punishment, and punishment became hidden and part of "abstract consciousness."

Foucault argues that spectacles of pain associated with corporal punishment were rooted in the sovereign's power to wage war against his enemies and were intended to terrorize citizens into obedience. Such displays, however, were inefficient systems of social control and with the rise of capitalism states sought to find better ways of appropriating bodies rather than killing them. The new goal, which Foucault views as creating "docile bodies," advanced through mechanisms of surveillance and control that were typified by the prison but existed in many other social institutions as well: "Prisons resemble factories, schools, barracks, hospitals, which all resemble prisons" (Foucault, 1979,

p. 228). The result is generalized surveillance and the formation of a disciplinary society based on a strict organization of space, timetables, performance standards, repetitive exercises, and drills. The end of corporal punishment is thus not seen as a humanitarian step but a transformation to more totalizing forms of power and domination. Foucault (1979) ominously states:

> Historians of ideas usually attribute the dream of a perfect society to the philosophers and jurists of the eighteenth century; but there was also a military dream of society; its fundamental reference was not to the state of nature, but to the meticulously subordinated cogs of a machine, not to the primal social contract, but to permanent coercions, not to fundamental rights, but to indefinitely progressive forms of training, not to general will, but to automatic docility. (p. 169)

CONTEMPORARY ARGUMENTS

Because many non-Western countries practice corporal punishment, Westerners somewhat ethnocentrically tend to see this penalty as primitive or barbaric. Even so, occasionally politicians in the United States, United Kingdom, or Australia attempt to reintroduce corporal punishment as part of a "tough on crime" agenda. Likewise, people commonly debate whether public school teachers should be allowed to spank or cane students for disciplinary reasons. The most important current advocate of corporal punishment is criminologist Graeme Newman. In his text *Just and Painful* (1995), he makes a case for corporal punishment that also serves as a critique of prison, which he sees as overused, violent, and expensive.

Newman's suggestion is to implement corporal punishment in the form of electric shocks to be used instead of prison for minor offenses; he sees the combination of shock and prison to constitute torture, which is not the case for a one-time infliction of pain. Shocks would be done in a public punishment hall, after which the offender would be released. For Newman, the pain of punishment can be matched to the severity of crime by controlling the number of shocks, the voltage, and duration of the jolts. Acute physical pain, Newman argues, is experienced more similarly by people than the chronic pain of a prison sentence, which will vary between institutions and even for individuals in the same prison. While men, women, whites, and minorities "respond to and interpret pain differently, there is every chance that they actually feel pain in about the same way" (Newman, 1995, p. 60). Newman further argues that minority overrepresentation in punishment is a "silent statistic," but if blacks were punished in public to the differential extent they are now, "it would be *too much.* It would force us to be accountable for the excesses of prison" (p. 62, emphasis in original).

While some see Newman's system as humiliating to the offender, he argues that many forms of punishment such as boot camps are built on degrading activities like cleaning toilets with toothbrushes. He argues that the obviously painful nature of corporal punishment would force society to take responsibility for it, in contrast to prison violence and rape, which usually we feel is not our concern. Corporal punishment in the form of electric shocks could also be administered more cheaply than prison, and would not require a primary wage earner or parent to be imprisoned. It would, therefore, cause less disruption to people's lives.

Newman (1995) notes that his book is "a polemic, intended to inflame and provoke" (p. 2). The point is thus less political advocacy of corporal punishment than an attempt to have people think more deeply about why and how society punishes offenders. He fears that many who say they support his position do so for the wrong reasons, while others reject it because of complacency with mass incarceration or cultural arrogance about "barbaric" Islamic countries that practice corporal punishment.

Newman, however, agrees with criticisms from human rights organization about practices in non-Western countries that combine corporal punishment with incarceration. For example, Amnesty International (2002a) notes, "Caning is used in Malaysia as a supplementary punishment for at least 40 crimes even though it contravenes international human rights standards." Newman would not support such sentences, because he believes the criminal should be incarcerated *or* experience corporal punishment; it is the combination of the two that he

sees as torture, which is a process and different from a one-time infliction of pain. Thus, he would also agree with Amnesty International in condemning Saudi Arabia for sentencing two defendants charged with drug crimes to "to 1,500 lashes each, in addition to 15 years' imprisonment. The floggings were scheduled to be carried out at a rate of 50 lashes every six months for the whole duration of the 15 years" (Amnesty International, 2002b).

CONCLUSION

Corporal punishment has been involved in some of the spectacular excesses of the criminal justice punishment, but it is a type of punishment of interest to people across schools of punishment. Retributivists are attracted by the increased ability to create "just deserts" by matching the crime with a wide range of corporal punishments. Utilitarians, going back to Jeremy Bentham's vision of a spanking machine (Farrell, 2003), see potential for more uniform and precise punishments than incarceration can offer.

In spite of widespread "tough on crime" rhetoric, the public has ambivalent feelings about the deliberate infliction of physical pain as the official sentence. In addition, sentencing women, especially white women, to corporal punishment would present another barrier. Women's demands for equal rights have sometimes resulted in a backlash in the form of harsher sentences, a phenomenon referred to as "equality with a vengeance." Yet executions of women are more troublesome to many than the execution of men. And the Alabama prison commission was fired by the governor in 1996 when he suggested women join the predominantly black men on the state's chain gangs (Gorman, 2001, p. 405).

Corporal punishment, like the chain gang, will continue to attract interest because there is something about the notion of "punishment for punishment's sake, that appeals to an electorate scared of crime [and] fed up with what it sees as coddling" (Gorman, 2001, p. 406). Both, however, are inconsistent with the trend described by Foucault as moving away from spectacle to the surveillance-based society.

CORRECTIONAL OFFICER PAY

Historically, prison guards were paid poorly for their work and were subjected to poor working conditions. Today, the pay and position of the correctional officer has improved dramatically in many jurisdictions. However, differences in pay still exist between states and by gender.

HISTORY OF OFFICER PAY

Historically, the position of prison guard has had low social status. Subject to poor working conditions

and low pay, it was a field that few aspired to and often entered only as a last resort. Usually, guards lived on the prison grounds and were thus continually interacting with prisoners. Such a relationship often compromised their capacity to be viewed as authority figures and limited their ability to enforce punitive and rehabilitative models.

Even so, attempts were made almost from the beginning to increase the social status of the prison guard. During the development of the penitentiary in New York, for example, guards were required to wear uniforms and to behave in a professional manner. Additional attempts to professionalize the role of the officer were made in the 19th and 20th centuries, as many states changed the job title from "prison guard" to "correctional officer."

CURRENT LEVELS OF PAY

In addition to changing the social status of the correctional officer, attempts were made throughout the 20th century to increase the compensation provided to officers for their work. Compensation for correctional officers is based on a number of factors, including type of facility, location, rate of starting salary, number of years of service, turnover rates, frequency of promotion opportunities, training opportunities, job performance, and educational level. In 2002, the median yearly income level for correctional officers was $32,670, with the lowest 10% earning less than $22,010 and the highest 10% earning more than $52,370 (Bureau of Labor Statistics, 2003b). A survey of 25 states in the central United States illustrates how salaries can vary dramatically from state to state. In 2001, the average salary for officers in North Dakota ranged from $21,000 for entry-level officers to $38,352 for experienced officers. In contrast, Wyoming correctional officers begin their careers at a higher salary of $23,844, but the maximum salary level after five years' experience is lower compared to North Dakota's, at $33,876 yearly (Correctional Officers Salaries, 2002).

In comparison to the salaries in the central United States, correctional officers in California receive significantly higher salaries. In 2004, a job announcement by the California Department of Corrections listed a yearly salary range of $34,284 to $58,620. In 2003, 391 officers earned more than $100,000 due to overtime pay (Gladstone, 2004). Salaries have increased dramatically for California officers since the 1980s, when the median yearly salary for a correctional officer was $14,400. The California Correctional Peace Officers Union has been largely responsible for the increases in the pay structure for California prison guards. Its lobbying efforts have also increased the benefits available to guards, which include medical coverage and a retirement plan that allows employees to retire at age 55 after 30 years of service and receive a stipend equal to 75% of their yearly pay. While the California Correctional Peace Officers Union has made a number of positive contributions for correctional officers in its jurisdiction, it has also been criticized for its lobbying efforts and contributions to political campaigns. These efforts have prioritized budget decisions toward officer pay over other services to prisoners within the correctional system (Pens, 1998).

GENDER

In addition to pay variations by state, research suggests that female officers are compensated at a lower rate than male officers. According to the U.S. Department of Labor, female correctional officers earned 78.6% of the wages of their male counterparts in 2002 (Bureau of Labor Statistics, 2003a). Women are also less likely to hold positions in management or administrative posts, even in female-occupied facilities. Like many other male-dominated occupations, women in corrections tend to occupy lower-ranking positions. Women are also more likely to be found working in state facilities, where wages are lower compared to federal facilities.

CONCLUSION

The compensation for working in prisons has evolved significantly throughout history. Prison guards in early prisons received limited monetary compensation and were required to live with the inmates within the prison walls. As an occupation

of lower status, in early correctional history the position of prison guard had few benefits. Today, the salaries and benefits for correctional officers vary widely from jurisdiction to jurisdiction. While the career can be financially lucrative in some facilities, such is not the case for all who work in this field. However, the expanding growth of the prison system in the United States, coupled with the political forces of prison guard unions, have led to increased opportunities for employment as well as improvements in pay and benefits.

CORRECTIONAL OFFICER UNIONS

The first correctional officer unions were established in the mid-20th century. In the early 21st century, more than 50% of prisons have officer unions working to improve the conditions of their members. In some states, such as California, correctional officer unions have become extremely powerful, able to lobby governments into pursuing certain correctional building programs and methods of punishment. Even so, most are prohibited by law from going on strike because of the chaos that a strike would cause behind prison walls.

As with other labor organizations, correctional officer unions seek to bargain for better working conditions, better pay and benefits, and guaranteed job security. They also work toward appropriate training techniques and encourage enhanced technology while seeking to improve communication between higher management and employees. Unions offer their members information about medical issues and taxes, and if there is a legal issue arising out of employment, they will cover legal fees and/or provide representation. Union members usually make contributions to a legal benefit plan to help pay for such services. Correctional officer unions argue that if management improved working conditions, increased pay, and provided the required training, the turnover rate for correctional officers would decline.

HISTORY OF UNIONS

In the past, correctional officers received assistance from labor unions that represented all workers. These labor unions and correctional unions include AFL-CIO, AFSCME, Central Impact 82, CSEA of New York, Massachusetts Correction Officers Union, Pennsylvania State Corrections Officers Association, and Public Employees Federation Union, to name only a few. These groups bargained for better pay and conditions for all laborers, but they were not always able to deal specifically with the issues facing those who worked in prison. Consequently, correctional officers realized that they needed their own representatives.

California

The California Correctional Peace Officers' Association (CCPOA) is one of the major and most

organized correctional unions in the United States. Founded in 1957 to bargain for better working conditions, training, and pay for employees in corrections, CCPOA strove to make the occupation more professional by providing appropriate training for the officers. It also began extensive background checks for all potential corrections employees and implemented policies and procedures that provide correctional facilities with the required safety equipment needed.

CCPOA has improved the working conditions of its members and has reduced the once-tremendous turnover rate for correctional officers. Statistics show that during the 1970s and 1980s, the state's turnover rate was 25%. Today it is down to 8%, in large part because of the effort that has been put into making the conditions better for correctional employees.

CCPOA has been particularly influential in politics, in large part because it has donated considerable sums to legislators' campaigns. As a result, it seems to wield considerable influence in crime and policy issues, leading some to claim that the CCPOA is the main reason for the success of the "three strikes" laws. In addition to addressing law-and-order issues, CCPOA has also lobbied for more mainstream union issues, such as the right to collective bargaining, home loan assistance for officers, benefits for officers and families of deceased officers, improved health plans, and income tax credits. Similarly, CCPOA has asked that peace officers may carry concealed weapons across state lines. In recent years, CCPOA succeeded in obtaining grant money to improve the juvenile justice system, thereby hiring more correctional officers, and in creating the National Corrections and Employees Week, which is celebrated the week beginning May 4.

PRIVATIZATION

The recent shift in some states and the federal system toward privatizing parts of their penal system has considerably weakened some prison officer unions. Private prison companies generally will not hire employees who are members of a union, nor allow employees to unionize later. Consequently, it is difficult for many private prison employees to lobby against their relatively low wages and poor benefits. While organizations such as CCPOA have so far managed to persuade legislators to restrict the number of private facilities in their state, other unions have not been as successful. The long-term effect of privatization on prison officer unions is unclear, yet it seems already to have created a dual system of pay and conditions, with private employees losing out relative to their public counterparts.

CONCLUSION

Unions aim to improve conditions of the correctional officers by improving their wages, conditions with management, and emotional stability within the workforce. Research suggests that states that have a separate union for correctional officers have a lower turnover of officers in their prison systems. Officer unions are powerful because they are very active in politics; even though most officer unions are not allowed to strike, they still have the power to make changes.

CORRECTIONAL OFFICERS

Correctional officers are responsible for the security of the penal institutions in which they work and the

safety of the inmates housed within their walls. Their duties include enforcing the rules and regulations of the facility, responding to inmate needs, diffusing inmate conflicts, and supervising daily movement and activities within the institution.

As of June 2000, state and federal prisons employed 430,033 individuals. Nearly two-thirds of these people were involved in direct contact with the inmate population and responsible for their safety and security. These figures represent a 24% increase from the number of correctional staff since 1995. The greatest increases in correctional employment are found in private institutions (364%), followed by federal (32%) and state (18%) facilities (Stephan & Karberg, 2003).

The increased need for correctional officers is a direct result of the growing numbers of correctional facilities that have been established throughout the United States in the past few decades. In many communities, the new jobs that have been created represent previously unavailable employment opportunity, security, and stability. However, a career in corrections is not without its problems. Work as an officer is dangerous, given the population that they are responsible for supervising. A stressful work environment, burnout, and high attrition rates place a heavy load on the occupation. These factors, coupled with the intense growth of the industry, have left many prisons understaffed, which in turn can place officers who are working at the prison at risk. As of June 2000, the number of inmates to correctional officer ratio in federal facilities was 9:1, with state facilities reporting a 4.5:1 ratio (Stephan & Karberg, 2003). The demands of the job can also present strain for the personal life of the officer, as people are often forced to relocate based on job availability.

HISTORY

While the primary duty of the correctional officer has always been to maintain the security of the prison setting, changes in correctional philosophy throughout history have impacted the role of the correctional officer within the prison. During the early 19th century, for example, the penitentiary was designed to isolate offenders from society and from each other. At the time, the responsibilities of the officer were limited to maintaining the keys of the facility. Guards at this time were all men, as the majority of prisoners were male. The job as a prison guard had little status, and officers generally lived in the prison under poor conditions receiving little pay for their work.

As the penitentiary system evolved, so did the role of the correctional officer. Officers began to wear uniforms and operate within a paramilitary structure. They often used corporal punishment against the inmates to demand compliance. Though the central nature of this practice was reduced in the late 19th century, physical sanctions remained as a component of treatment within the reformatory movement.

GENDER, RACE, AND ETHNICITY

During the early correctional period, women were not employed as prison guards. Instead, those few women who worked in penal facilities were employed in office work and domestic positions. Only a handful worked as matrons in the women's wing of a state penitentiary. It was not until Indiana led the way and established a women-only prison in 1873 that the field of corrections work opened for women guards, and even then, positions were available only in women's institutions. Like their male counterparts, these early female keepers were required to live within the prison walls and were poorly compensated for their work.

The introduction of the women's reformatory movement saw not only a shift in the philosophy of the prison but also a shift in the social class of the guards. Whereas the early female keepers tended to be drawn from the working classes, the mid-19th century saw an influx of middle- and upper-class white women into the correctional system. Their role was to "guide and discipline the fallen women and serve as examples of virtuous middle class femininity" (Britton, 2003, p. 58)

Other than those women employed by women's prisons, the workforce of the prison has historically been male. It took the 1972 Title VII amendment to the

Civil Rights Act to allow employment opportunities for women as correctional officers. This same legislation also signaled the end to all women's facilities, as men became entitled to apply to work with female prisoners.

Like many other parts of the labor force at the time, men's prisons were slow to incorporate women into their correctional staff. Administrators tried to get around equal opportunity's legislation by claiming that women were excluded on the basis of a bona fide occupational qualification. However, lower court decisions in *Gunther v. Iowa* (1980) and *Harden v. Dayton Human Rehabilitation Center* (1981) held that the bona fide occupational qualifications could not be used to deny prison employment opportunities to women.

In addition to being largely male, early correctional officers were exclusively white. Just as women were denied opportunities for employment in corrections, so too were African Americans, Latinos, Asian Americans, and Native Americans. Indeed, as with gender, much of the racial discrimination in correctional employment paralleled the racial discrimination in mainstream society. When opportunities of employment did arise, the job duties for guards of color were limited to guarding inmates of color.

Today, the ranks of correctional officers are diversifying. In 1999, women made up 23.5% of the correctional workforce while African Americans accounted for 24.9% of correctional officers, and Latinos constituted 8.7% of the population (Bureau of Labor Statistics, 2003). However, given that the majority of prisons are located in rural areas, the workforce remains predominantly white. This relationship results in issues of racial conflict within the prison, given that the majority of inmates are from inner-city environments, where racial diversity is much more prevalent.

WORKING CONDITIONS

The types of facilities in which correctional officers work and the inmates they supervise vary by jurisdiction. At the local level, correctional officers are responsible for the custody of offenders awaiting court proceedings, or who are involved in community-based correctional programming in the jail setting. The population of the jail is in constant change, with more than 11 million people processed through local jails each year (Bureau of Labor Statistics, 2003).

Correctional officers are also employed at the state and federal levels, where at year end 2002, they were responsible for 1,440,655 adult inmates, representing a 2.6% increase in the prison population from the previous year (Harrison & Beck, 2003). In contrast to the jail setting, the purpose of the state and federal prison facilities is general population confinement. Prisons are typically more stable places to work than jails, as inmates typically spend longer periods of time in them and work and live to a strict routine. Of course, inmates can also be housed in privately operated prisons. Private prisons housed 6.5% of the U.S. prison population, or 93,771 prisoners, at year end 2002 (Harrison & Beck, 2003). The duties of an officer in a private prison are similar to those supervising inmates in state and federal facilities.

In addition to jurisdictional variations, the prison setting varies by security setting, ranging from minimum- to low-security confinement, up to maximum-security and even super-maximum secure prisons. Such jurisdictional and security differences impact the correctional officer due to the differing operational practices of the facility and the procedures for dealing with the needs of inmates.

For example, while maximum or supermax facilities often involve little to no physical contact between the inmate and the officer, lower-security prisons usually require more direct supervision and interaction with the prison population. In the former, officers increasingly tend to supervise inmates through video camera surveillance systems. Communication with inmates occurs via an intercom system, rather than engaging in face-to-face encounters, which may put the officer at risk. Access to the cell may be controlled electronically, allowing an officer to remain in an enclosed booth. If an inmate is let out of his cell, he is handcuffed and shackled and usually escorted by at least two officers wearing shank-resistant body armor. In a recreation yard setting, control is typically maintained by an armed guard stationed in a surveillance tower.

In comparison, medium- and minimum-security facilities place the officer in the center of the inmate population. Guards are unarmed and outnumbered in these facilities. Unable to use physical force as a primary mechanism to maintain order, guards must rely on their interpersonal skills and develop relationships with the inmates to maintain control on a daily basis.

The physical layout of the prison, as well as policies on inmate movement, also help the officer maintain control of the facility. When larger-scale disturbances arise, the use of force has varied. Historically, tear gas was used to subdue prisoners during times of crisis. The use of violent force to retake the Attica prison in 1971 resulted in the loss of life for 29 inmates and 10 employees, six of whom were guards. Today, advances in technology have increased the variety of nonlethal agents that can be used to control noncompliant inmates.

Prisons are responsible for meeting the daily needs of the inmate population, including nutrition, shelter, clothing, and rehabilitative, psychological, and recreational programming, and correctional officers must ensure that all of these services are provided. The prison setting regulates every aspect of an inmate's life through the labor of its correctional officers, who are responsible for supervising their movement and activities throughout the prison. The work of a correctional officer is unlike that of any other occupation as "prison officers are involved with the totality of inmates' lives, supervising and surveilling their meals, showers, communications and a multitude of normally private aspects of personal and sexual behavior" (Britton, 2003, p. 3).

It is common to hear accounts of correctional officers feeling imprisoned, just like the inmates. For example, Ted Conover's (2000) ethnographic exploration into the work of a correctional officer at Sing Sing found that "prison work was about waiting. The inmates waited for their sentences to run out, and the officers waited for retirement . . . it was a life sentence in eight-hour shifts" (p. 21).

Research consistently demonstrates that correctional officers are subject to high levels of stress. They have similar rates of divorce, death, and suicide to police officers. The major sources of stress for correctional officers result from role ambiguity and role conflict. Role ambiguity refers to the uncertainty officers may experience regarding the duties, responsibilities, and expectations of their position. Related to role ambiguity is role conflict. Role conflict occurs when the reality of job conflicts with the strict "rule based" method under which officers receive their training. The use of discretion to make decisions often places correctional officers in a no-win situation, as they are stuck between appeasing administrators and inmates. Additional sources of stress include a perceived lack of authority, poor communication, lack of administrative support, inadequate equipment, lack of training, and inconsistencies in staff discipline. Left untreated, stress can result in absenteeism, physical illness, emotional issues, and drug and alcohol abuse.

In addition to stress related to their job, the physical health of correctional officers is sometimes placed at risk by the nature of their employment. Notwithstanding the threats of injury or death while on the job, correctional officers must deal with the possibility of additional risks to their physical health. Exposure to the inmate population and their health needs in turn leaves the correctional officer potentially exposed to various health concerns such as influenza, tuberculosis, hepatitis, and HIV and AIDS. As of 2001, 2.0% of state prisoners and 1.2% of federal prisoners were identified as HIV-positive. While only a small proportion of the prison population, the confirmed rate of AIDS among prisoners (.49%) is three times that of the general population (.14%). In addition, 1 in 12 deaths in prison is AIDS related (Marushack, 2004). While officers are aware of these risks and engage in practices to minimize their potential risk, research has shown that many correctional officers ignore other health risks caused through smoking, poor nutrition, lack of exercise, and a failure to attend to preventive medical care (Wright & Northrup, 2001).

TYPOLOGY OF CORRECTIONAL OFFICERS

Like every occupation, correctional officers have different personality styles that affect their working relationships. The ability of correctional officers to

perform their job successfully often depends on how they enforce the rules and regulations of the facility. Research by Britton (2003) found that "no effective officer does the job completely by the book. Many prison rules are explicitly contradictory and many others are unnecessarily petty. Enforcing all rules uniformly would undoubtedly lead to widespread discontent and perhaps even mass disorder" (p. 64). With the central role that correctional officers play in the organization of the prison and the impact they have on the life of the inmate, understanding the different approaches of correctional officers is useful in the management from an organizational and interpersonal level.

Research on correctional officers divides the occupation into two general philosophical categories: custodial officers and human services officers. Custodial officers see themselves as rule enforcers of the prison structure and follow a "by the book" philosophy (Owen, 1988). Human services officers take a more personal approach to their work, focusing on a counseling or rehabilitative philosophy (Johnson, 1996). Research by Owen (1988) distinguished an additional category: the "lazy-laid back officer" that referred to those who were simply going through the motions of the job with little investment in their role in the prison or their potential impact on inmates.

Expanding on previous research, Farkas (2000) developed a typology of correctional officers to understand the relationship between individual characteristics of the officer and the social setting of the prison. Drawing from data obtained in interviews, five types of correctional officers were generated: rule enforcer, hard liner, people worker, synthetic officer, and loner.

The rule enforcer is the most common type of correctional officer. Reflective of the by-the-book classification by Owen (1988), the rule enforcer is described as one who embraces the ideology, norms, and values of the prison structure. Militaristic in nature, the rule enforcer is concerned with maintaining control within the prison and is highly suspicious of the motives of inmates. The typology of the hard liner is a subsidiary of the rule enforcer. While the hard liner is similar to the rule enforcer, they distinguish themselves through their abuse of power.

The people worker style is similar to the human services worker characteristic illustrated in previous research. People workers are focused on maintaining a positive and communicative relationship with the inmates. Central to the people worker style is the officer's use of discretion. Due to their role in the prison, correctional officers are endowed with a high level of freedom in their rule enforcement. The people worker focuses on their interpersonal skills rather than punishment as a method for resolving conflicts. The synthetic officer is a combination of the rule enforcer and the people worker. While they follow a strict interpretation of the rules and regulations of the facility, they are also interested in understanding the individual needs of the inmates and circumstances of the situation. The synthetic officer is one "who treats inmates fairly and with respect but enforces all the rules and doesn't take all the crap inmates try to give you" (Farkas, 2000, p. 442). The loner is one who tries to fit in with the normative structure of the organization, yet feels alienated from the prison, coworkers, and inmates.

PATHWAYS, QUALIFICATIONS, TRAINING, AND COMPENSATION

The pathway to working as a correctional officer is different from most other occupations. According to Britton (2003), few children grow up with the aspirations of becoming a prison guard. Many correctional officers report that working in the prison was a profession that they drifted into, rather than as part of an occupational plan. For many, their interest in a career in corrections was fueled through their university coursework in criminal justice. For others, they came to prison work as a result of their military or other policing experience. Yet few come to the job knowing what to expect and draw conclusions from media representations of corrections. While many officers reported that while the media portrays the occupation of the correctional officer as one subjected to constant violence, the reality of life on the job was "a lot better than what's portrayed in the movies" (Britton, 2003, p. 92).

Qualifications for employment as a correctional officer vary with the type of institution. Most state

facilities require correctional officers to be at least 18 or 21 years old, have a high school diploma or equivalent, and have no felony convictions (Bureau of Labor Statistics, 2003). For example, a position as a correctional officer with the California Department of Corrections requires applicants to be at least 21 years of age, possess either a high school diploma or its equivalent, and have a history of law-abiding behavior. Applicants must also be in good physical and emotional health and be legally eligible to own and possess a firearm (California Department of Corrections, 2003). To work for the Federal Bureau of Prisons requires either four years of college study, a bachelor's degree, or three years of full-time experience completed in a policing or corrections-related field.

Training programs for correctional officers vary with the type and jurisdiction of the facility. Federal officers complete 200 hours of training, 80 of which are based at the institution in which they will be employed and 120 hours of specialized training. Federal correctional officers also receive opportunities for additional specialized training throughout their careers (Britton, 2003). State training systems vary by state and are often less rigorous. In Texas, correctional officer trainees undergo 120 hours of classroom training (Hallinan, 2001). Correctional officers are instructed in subjects related to their job duties, including CPR/first aid, use of force/defense tactics, chemical agents and firearms training, crisis intervention, report writing, institutional standards, inmate/staff communications, safety and security procedures, and other related topics.

Correctional officers also participate in on-the-job training, whereby they shadow another officer to become familiar with the daily routine of the prison. At the Sing Sing Penitentiary in New York, correctional officers spend four weeks training with another officer before they receive solo assignments. The on-the-job training becomes the most important experience in preparing officers to work as a correctional officer (Conover, 2000). An important, though informal, component of the on-the-job training involves learning about the day-to-day activities of the prison from the inmates themselves. Inmates, like guards, have an interest in keeping order within the prison walls and often know the routine better than the newly trained guard.

Like working conditions, the pay scale for correctional officers has improved over recent years. Overall median annual incomes for correctional officers in 2000 were $31,170, with the lowest 10% earning less than $20,010 and the highest 10% earning greater than $49,310. For correctional officers employed in federal facilities, the median income equaled $37,430, with state correctional officers' median incomes equaling $31,860 (Bureau of Labor Statistics, 2003). According to the Federal Bureau of Prisons, the starting salary for correctional officers at the GS-5 level in 2003 was $28,909, not accounting for regional differences (Bureau of Prisons, 2003). In addition, correctional officers employed in the state or federal system receive medical and retirement benefits.

CONCLUSION

Though low pay and poor working conditions characterized the history of the correctional officer, the occupation has greatly improved. Today, the occupation benefits from racial, class, and gender diversity. Nonetheless, the career is not without its problems as officers are exposed to high levels of on-the-job stress, as well as threats to their personal safety. In spite of these concerns, employment opportunities as a correctional officer will continue to increase as a result of the expanding prison industry.

CORRECTIONS CORPORATION OF AMERICA

Corrections Corporation of America (CCA) is a private corrections corporation that was formed in 1983 in Nashville, Tennessee, by Thomas Beasley, with financial support from the venture capital firm of Massey Burch, the financiers of Kentucky Fried Chicken. The company manages 60 correctional facilities in 21 states, housing 54,000 inmates, and employing more than 14,000 people.

CCA began the current era of prison privatization with the first county-level award from Hamilton County, Tennessee, in 1984. In 1985, the company made an unsuccessful attempt to manage the entire prison system of Tennessee. Today, CCA is the largest private provider of correctional services to government agencies. It boasts the sixth largest corrections system in the nation, trailing only Texas, California, the Federal Bureau of Prisons, New York, and Florida. CCA currently has contracts with the Federal Bureau of Prisons, the Immigration and Naturalization Service (INS; in 2003 this agency was renamed the U.S. Citizenship and Immigration Services, USCIS, and placed under the governance of the Department for Homeland Security), and the U.S. Marshals Service. It also has contracts with 21 state governments and the District of Columbia.

Facilities run by CCA house prisoners at all security levels (minimum, medium, and maximum), though the most of the CCA prisons house medium-security inmates. Both men and women are housed in CCA facilities. The Arizona Department of Corrections contracts with CCA to house all of its female prisoners.

ACCOUNTABILITY

Private prison companies such as CCA should not be thought of as prison systems themselves, but as agents of public prison systems. In all cases, governments are ultimately responsible for the care and well-being of prisoners. Through regulatory and accountability measures, governments seek to evaluate the programs that private prisons operate.

The chief organization offering accreditation to correctional facilities is the American Correctional

Association (ACA). The ACA assesses administrative and fiscal controls, staff training and development, safety and emergency procedures, sanitation, and rules and discipline. CCA seeks ACA accreditation for all of its facilities. Currently, about 85% of CCA facilities are ACA accredited.

In addition to seeking accreditation, CCA has built strong ties with the public sector corrections community and political officials. CCA has connected itself to the public sector corrections community by hiring several former high-ranking government officials, including J. Michael Quinlan, former director of the Federal Bureau of Prisons. Public-private connections between CCA and political officials have been noted by those monitoring campaign contributions. For example, during the 2000 election cycle, CCA made more than 600 campaign contributions worth roughly $500,000 to state-level candidates in 13 southern states.

PROBLEMS WITH CCA FACILITIES

Correctional facilities run by CCA have had their share of problems. Critics have accused CCA prisons of being understaffed with poorly trained guards, unsanitary, and unsafe. There have been multiple cases of these kinds of charges reported in the press. In addition, CCA came under heavy criticism after a report was filed in 2000 for the Wisconsin legislature that found unacceptable conditions such as insect and rodent infestations and evidence of guards smuggling drugs and weapons into CCA prisons that house inmates from Wisconsin.

CCA has also come under attack for its recent strategy of building prisons on spec, where correctional facilities are constructed before any government contract is in place, thereby avoiding contracting laws to which federal and state governments are subject. This practice, some argue, enables companies like CCA to exert undue influence on how, where, and when new prisons are built.

CONCLUSION

While there are compelling examples of both positive and negative impacts of CCA on the corrections landscape, one thing is certain: CCA continues to win contracts from national and state governments. As long as inmate populations continue to grow beyond the capacity of governments to house them, and there is increased public pressure to cut corrections budgets, it is likely that CCA and its competitors will gain an increasing share of the corrections market.

COTTAGE SYSTEM

During the first three decades of the 20th century, a dozen states built women's prisons using a cottage style architectural design. Instead of traditional cellblocks, female prisoners were housed in small units scattered across a rural "campus" setting. These cottages generally held 25 to 30 women in single or double rooms. To cut costs, some states (Maine, Kansas, and Ohio) developed dormitory style cottages housing 50 to 100 women.

Each cottage, designed to foster women's rehabilitation by promoting the "idea of family life," typically contained its own kitchen, dining room, and sitting room. In these idealized domestic settings, female prisoners received training in sewing, cooking, serving, and other domestic arts. Special cottages for pregnant, mentally defective, and/or inmates with venereal disease were common, as was racial segregation. Most reformatories classified

cottages by security level: minimum, medium, and maximum.

HISTORY

Cottages represented a radical departure from traditional prison design. During most of the 19th century, women were incarcerated alongside men in separate annexes, wings, or units either within or attached to their state's male penitentiaries. After the Civil War, women activists began to campaign for entirely separate women's prisons. These reformers were convinced that female offenders would be reformed only within a more domestic and homelike setting.

In 1873, Indiana established the nation's first completely independent, all female-staffed, women's prison. However, it followed a traditional cellblock design. New York's House of Refuge at Hudson (1887) and Western House of Refuge at Albion (1893) were the first women's institutions (albeit, for younger women) to incorporate cottage units alongside a typical "custodial" prison building.

Between 1900 and 1935, this new type of women's prison, officially labeled reformatories, was established in 17 states. The New Jersey State Reformatory for Women at Clinton, opened in 1913, was the first to rely exclusively on cottage housing. Subsequently, eight states mandated that their women's reformatories be built according to a cottage plan: Minnesota (1916), Ohio (1916), Connecticut (1917), Kansas (1917), Maine (1917), Arkansas (1920), Pennsylvania (1920), and North Carolina (1929).

During these early decades, African American women remained relegated to the more traditional women's prisons. In 1923, African American women represented two-thirds (65%) of female prisoners incarcerated in state penitentiaries, whereas they were only 12% of those sentenced to the new reformatories. Reformatory advocates fully subscribed to the dominant racist ideology that portrayed African American women as more "masculine," violent, aggressive, hardened, promiscuous, and immoral than white women. Consequently, African American women were regarded as unsuitable subjects for the reformatory's goal of transforming female offenders into proper ladies.

In addition to their cottage style architecture, women's reformatory prisons broke radically with traditional male prisons in their commitment policies, incarcerating both felons and misdemeanants. Unlike men, women could be sentenced to a reformatory for such misdemeanor offenses as disorderly conduct, public drunkenness, vagrancy, adultery, fornication, and petit larceny. In Illinois, for example, misdemeanor commitments represented 73% of all reformatory commitments in the 1930s, 38% in the 1950s, and 12% in the 1970s.

DISCIPLINE AND DAILY LIFE

To outside observers, the cottage style women's reformatory appeared far more benign than men's prisons: quaint cottages scattered across a campus style setting. However, the conditions of women's incarceration could be even more restrictive. Surveillance within the small cottages was often more intense and invasive than that experienced by men housed in far larger, more anonymous, cellblock units. Because women's reformatories initially lacked fences, walls, and guard towers, prisoners had to be strictly supervised. Ironically, they often enjoyed little freedom of movement across their bucolic campus settings.

Few studies exist of the evolution of the women's reformatory prison or its cottage ideal. The Illinois State Reformatory for Women at Dwight (1930–1972) provides a rare glimpse into cottage living. Reformers insisted that the cottage system was the heart of the reformatory's rehabilitative philosophy. They argued that cottage living facilitated individualized treatment, training in appropriate gender-role behaviors, and resocialization in-group living skills. Within this ideology, "home" was imbued with tremendous transformative power all its own.

Yet, in reality, cottage living provided only the most tenuous relationship to a real home. Cottage life rarely matched the tranquil domestic visions of the reformatory's founders. Prisoners were graded daily on their attitude, work, and "citizenship" (i.e.,

cooperation). They could be disciplined for such rule infractions as wearing inappropriate clothing, improper etiquette, unladylike language, and poor attitudes. These minor violations adversely affected women's chances of parole.

Staff, known as warders or matrons, also lived in the cottages. They were typically older, widowed, white women from small farming towns, who coveted the room and board that came with their modest salaries. Their only qualification was a high school degree. Deep divisions frequently emerged between cottage and professional staff of psychologists and sociologists. Psychiatric labels gave cottage warders little guidance in how to handle the numerous day-to-day problems they confronted. Responsible for managing and disciplining 20 to 30 adult women 24 hours a day, warders often resented the introduction of special diets or individualized treatment programs. Despite the existence of so-called minimum-security cottages, staff convenience dictated that daily routines were often the same in all cottages.

Disciplinary files reveal that cottage warders and their "girls" competed daily over who would "run the cottage." For example, in 1944 one warder in Illinois reported: "In one day here, I have found inmate Frances Grayson, second cook, runs the kitchen as she pleases. I heard her say she would butter up Warder Miller as she had Mrs. Orr and she would run the kitchen." This warder had no intention of allowing "her girls" to do as they pleased. She gave the woman a demerit for impudence. One week later she wrote another note explaining that at dinner she had seen one prisoner pass a handkerchief to another, who later used it to sneak a piece of cake upstairs. As the warder dryly remarked: "I noticed Crystal's bust being terribly large, but didn't say anything." Both inmates received two days in isolation as punishment for this minor infraction (Dodge, 2002, pp. 201–202).

CONTRAST WITH MEN'S PRISONS

Male prisoners were hardly ever disciplined for sneaking a few cookies, a piece of cake, or single sandwich. Although it was also against regulations for men to exchange any items of personal property, their cells were not inspected on a daily basis. When "shakedowns" did occur, correctional officers searched men's cells for weapons, drugs, and major contraband. In contrast, one former female prisoner recalled bitterly, "They weren't searching our rooms for knives or weapons, they were searching our bras and panties, searching our pockets for candy and gum, counting our barrettes and hair bands" (Dodge, 2002, p. 233).

The much greater staff-inmate ratio in men's institutions, as well as the architecture of men's prison with 500-man cellblocks, central cafeteria, and factory-size industrial work sites, mitigated against the possibility of such tight control. Yet architecture and scale cannot alone account for these differences. As in the free world, women were expected to tolerate and acquiesce to a level of social control that would be deemed unacceptable by men.

UNIQUELY REPRESSIVE CHARACTER

By the 1930s, most reformatories had come to resemble traditional women's prisons in the strictness of their disciplinary regimes, their lack of programs, and in their difficulty in attracting qualified personnel. The most distinct aspect of the reformatories, their cottage architectural design, soon gave way to far less expensive dormitories and more traditional cellblocks as the reformatories expanded and economics triumphed over ideology. Even when cottages remained in use, more economical centralized dining halls replaced individual-cottage kitchens. This shift to a more repressive system typically coincided with an increasing proportion of African American commitments. For example, in Illinois their percentage grew from 30% in the 1930s to 65% in the 1960s.

Instead of offering a wide array of individualized treatment services, security concerns dominated cottage life. Over the decades, rules and regulations grew increasingly restrictive. Even though the Illinois State Reformatory for Women was one of the best equipped and staffed of the nation's 17 reformatories in the 1930s, few inmates doubted that they were in anything other than a prison. The intimate cottage settings allowed for an unprecedented level of surveillance and control. From the

1930s to the 1960s, rules governed every aspect of women's lives, dictating how they must fold and wear their clothes, sit at the dining room table, and style their hair. Cottage staff vigilantly monitored every word and action, policing women's language, attitudes, dress, table manners, and associations. They carefully recorded all incidents that occurred on their shifts, from a prisoner's failure to eat her breakfast toast to open defiance, physical fights, "unladylike" language, possession of contraband goods, or suspected "unwholesome" friendships.

At the Illinois reformatory, as at many mid-20th-century women's prisons, lesbianism represented the greatest transgression of proper feminine behavior. Staff vigilantly monitored all inmate friendships, as the following notes from the 1950s indicate: "Warder questions the relationship of Lucille Edelberg and Pearl Fells. Warder feels that it is not what it should be to be referred to as wholesome." "Mrs. Lee advised me to watch Ola Mae Hahn, due to sex reasons; as yet I have seen nothing out of the way" (Dodge, 2002, p. 234). Even the most innocuous behaviors—walking or sitting regularly with another woman—were suspect. Exchanging or sharing contraband—whether candy, cosmetics, or clothing—was interpreted as a sign of a potential lesbian relationship. Any physical contact or show of affection was grounds for punishment. Gossip, rumors, and unsubstantiated allegations were routinely included in women's files.

In such a repressive setting, "domestic training"—trumpeted as the heart of women's rehabilitation—became merely a hollow simulation. Creativity and decision making are essential elements of real home making. However, in a prison environment, obedience, not decision making, was the "skill" that was taught. Menus, recipes, routines, timing, and procedures were all set by the institution. Any deviation or mistake could be cause for a demerit.

CONCLUSION

Despite its many advocates, the cottage model was never universally realized. Only 17 states established women's reformatories, mostly in the northeast and midwest. The movement barely touched the south or west. Many states continued to build custodial women's prisons that were either physically attached to, or a short distance from, their male penitentiaries. Fifteen states as late as 1976 still relegated women to a corner of the state prison for men. The 1970s also witnessed a return to the model of "coeducational" prisons. In 2002, one quarter (26%) of the 118 state penal institutions housing women were co-correctional facilities that incarcerated both men and women in separate housing units.

Thus, by the 1970s the ideal of a gender-specific women's reformatory had been cast aside. Modern women's prisons are once again under the authority of centralized departments of corrections. Male correctional officers and administrators, anathema to an earlier generation of female reformatory advocates, dominate women's corrections in most states. Architecturally, modern women's prisons are indistinguishable from men's: the homelike cottage ideal abandoned by the mid-20th century. Yet even at its height, the cottage system, conceived as a more humane model of incarceration for female offenders, resulted in a uniquely oppressive and repressive institution.

CREATIVE WRITING PROGRAMS

Creative writing programs in U.S. prisons began in the late 1960s and early 1970s in response to the burgeoning prisoners' rights movement. The 1971 Attica riot was particularly influential in prompting the formation of prison arts programs of which writing courses were usually a part. For their supporters, these programs are inherently constructive and potentially rehabilitative. While financial support for writing programs has waxed and waned, these programs continue to survive due the work of individual writers and activists.

HISTORY

The first significant effort to offer creative writing programs in American prisons was initiated by PEN (Poets Playwrights Essayists Editors and Novelists) in 1971. PEN was established in 1921 as a means of using professional writers to advocate for world peace, and its Freedom to Write committee has helped prisoners abroad since 1960. In 1971, PEN created the PEN Prison Writing Committee to advocate for and instigate creative writing programs in America. This group lobbied state and federal governments, as well as individual departments of corrections, to reduce censorship, provide access to typewriters, and improve prison libraries. PEN also persuaded other writers to read, teach, and mentor inmates. In 1973, PEN launched its first annual literary competition for prisoners and encouraged the formation of a number of journals devoted to prison writing.

The efforts by PEN precipitated individual authors to offer creative writing workshops in prisons across the country. Two such men whose work in prisons has been most influential are Joseph Bruchac and Richard Shelton. In the early 1970s, Bruchac, the author of more than 20 books of poetry and fiction, began teaching creative writing in a number of prisons, often at his own expense. Bruchac was awarded an NEA grant in 1975 that enabled him to expand his programs through the publication and distribution of the *Prison Project Newsletter,* a periodical that served as a forum for thousands of aspiring prison writers and workshop instructors throughout the nation.

Richard Shelton has also offered creative writing workshops in a number of Arizona state prisons since the early 1970s. The author of a series of poetry collections, including *The Tattooed Desert, Of All the Dirty Words,* and *You Can't Have Everything,* Shelton founded the Arizona State Prison Creative Writing Workshops (ASPCWW). Since 1974, ASPCWW has continuously run at least one and sometimes several creative writing classes in Arizona state prisons. The program has been supported since 1991 by a grant from the Lannan Foundation.

CALIFORNIA ARTS-IN-CORRECTIONS

In the late 1970s, California officials adopted the framework set forth by PEN and writers such as Bruchac and Shelton and became the first state to commit substantial funds for a system-wide arts program. This system shaped subsequent arts programs throughout the country.

The California Arts-in-Corrections program, initiated by Eloise Smith and Page Smith, still relied on the work of individual writers and activists, but it signaled a deeper commitment from the state to the arts and the benefits that arts-related instruction could bring. At the time of its founding, Eloise Smith stated that their goal was "to provide an opportunity where a man can gain the satisfaction of creation rather than destruction, earn the respect of his fellows, and gain recognition and appreciation from family and outsiders . . . provide the professional artist as a model of creative self-discipline, and show the making of art as work which demands quality, commitment, and patience" (Cleveland, 2000, p. 3). In 1981, Eloise Smith and Verne Stanford convinced the state to offer the program to all of the California state prisons as the Arts-in-Corrections program.

Despite studies that demonstrate that prison arts programs reduce recidivism, the California Arts-in-Corrections program in 2003 faced elimination due to a proposed $46 million cut to the state's prison education program. "This is a program that takes

people whose lives are often hopeless, and it gives them an avenue for personal change," said Jim Carlson, a former manager of the program. "It must be retained."

THE DECLINE OF CREATIVE WRITING PROGRAMS AND HOW UNIVERSITIES INTERVENED

Since the 1980s, growing conservatism across the United States has precipitated cuts in funding to a number of creative writing programs. For example, the National Endowment for the Arts dramatically cut funds to prison journals in 1982, and by 1984 every significant prison writing journal temporarily dissolved. In response, writers who believed in the value of teaching creative writing in prisons were forced to return to volunteering their services or to turn to academic institutions for support. Two groups that have effectively harnessed the financial support of universities are the Prison Creative Arts Project and SPACE.

The Prison Creative Arts Project, founded by Buzz Alexander at the University of Michigan in 1990, offers theater, writing, and visual art workshops in prisons and juvenile detention centers throughout Michigan. The project offers University of Michigan students the opportunity to teach in state prisons as part of a class. The group offers instruction, exhibitions, and advocacy.

Space in Prison for the Arts and Creative Expression (SPACE) was founded in 1992 by a group of women from Brown University interested in working in the Women's Division of the Rhode Island Adult Correctional Institution. The program offers theater, creative writing, and visual arts workshops to inmates. The group also produces a journal and trains others to respond to the issues of incarcerated women, particularly issues of disrupted families, histories of abuse, and challenges to feminine identities.

CONCLUSION

There is a mixed future for prison creative writing programs. Funding is still scarce, yet increasing numbers of anthologies by and about the lives of American prisoners are being published. These texts include *Disguised as a Poem: My Years Teaching Poetry at San Quentin* by Judith Tannenbaum, *Doing Time: 25 Years of Prison Writing* edited by Bell Gale Chevigny, *Prison Writing in 20th Century America* edited by H. Bruce Franklin, and *Couldn't Keep It to Myself: Testimonies From Our Imprisoned Sisters* edited by Wally Lamb. Books such as these make accessible the wealth of artistic production from U.S. prisoners and point to the ongoing importance of creative writing programs in prisons. They also offer testimony to the efforts of writers and activists from the past three decades whose belief in the power of writing helped influence the lives of inmates.

CRIME, SHAME, AND REINTEGRATION

In his book *Crime, Shame and Reintegration,* published in 1989, Australian criminologist John Braithwaite puts forth a theoretical model for dealing with crime at the individual and community levels. Braithwaite integrates many traditional

sociological theories of crime into a single view explaining why some societies have higher crime rates, why certain people are more likely to commit crime, and how communities can deal effectively with crime for the purposes of prevention.

According to Braithwaite, high rates of predatory crime in a society are indicative of the failure to shame those acts labeled as criminal. Braithwaite argues that the breakdown of community ties in modern urban communities has meant that perpetrators of crime are not made to feel ashamed of their actions, and thus continue victimizing others without remorse.

The concept of shame is the linchpin of this theory. Braithwaite suggests that if perpetrators were made to feel guilty about their actions, they would be deterred from committing further crime. He bases this assumption on the belief that those who are closely tied to family and community anticipate a negative reaction to the violation of community norms. Foreseeing the shame that they would feel, they are deterred from committing crime. However, according to this theory, shaming must be done in such a way as to be reintegrative, bringing the offender back into the community, rather than disintegrative, which would push the individual even farther out of the community. For Braithwaite, reintegrative shaming is the key to effective deterrence and crime prevention.

BACKGROUND TO THE THEORY

Braithwaite integrates the major tenets of five different theoretical traditions in 20th-century criminology into his theory of reintegrative shaming. He explains how labeling, subcultural, control, opportunity, and learning theories fit into his work. Crime, shame, and reintegration is not then an attempt to rewrite criminology, but to synthesize several seemingly disparate theories into a singular explanatory system.

Crime

Braithwaite begins with the notion, taken from control theory, that individuals are naturally drawn to commit criminal acts for personal gain and hedonistic pleasure. Proponents of control theory assume that it is more important to look at why certain people do not commit crime, rather than why some do. It is assumed that, without a particular set of restraints, the average person would commit criminal or immoral acts.

Criminological research has established that various personal and circumstantial characteristics are positively correlated to criminality. Being male, between the ages of 15 and 25 years, unmarried, unemployed or without steady employment, of lower socioeconomic status, living in a city, and having low educational attainment are all indicative of a statistically higher propensity for crime. The opposite is also true. Individuals who are female, younger than 15 or older than 25, married, of a higher socioeconomic status, living in a rural area, and having greater than secondary school education would be found to be at a significantly lower risk of committing a criminal act.

According to Braithwaite, the very characteristics that lead one person to have a higher propensity for criminality also lessen his or her relationship with family and community and leave a person less susceptible to the deterring power of shame. Those characteristics associated with a lower risk of criminality correlate to increased contact with family and community, which in turn increases a person's susceptibility to shame. For example, an individual who is married with children has responsibilities to his or her family that may constrain him or her from making risky or poor choices, whereas a single individual does not necessarily have such ties to family and responsibilities. Those who are more integrated into the community and involved in relationships with others are less likely to commit crime because they appreciate the shame and embarrassment that would result from violating community norms and values. Furthermore, those who are firmly integrated into a community feel personal responsibility for the safety and well-being of those around them. In contrast, those who are not integrated into a community or involved in meaningful relationships with others are more likely to commit crime because they do not feel a sense of responsibility

to those around them, and they are not constrained by feelings of shame.

Briathwaite uses these beliefs to argue that cohesive, communitarian societies, such as Japan, which are characterized by networks of interdependent relationships, are likely to have lower rates of crime than more individualistic, fragmented societies, such as the United States. In Japan, he claims, honor and responsibility to family and community are emphasized. The Japanese place their community and family above themselves. In contrast, people in the United States and other Western nations are socialized to value individuality and personal accomplishment and fulfillment over the needs of family and community. According to Braithwaite, it is this distinction of values that accounts for Japan's much lower rates of violent and predatory crime.

Shame

For Braithwaite, shame is the ultimate deterrent against the violation of societal norms, for those who have a stake in a particular community. As already stated, he differentiates between shaming that is stigmatizing and shaming that is followed by reintegration. Reintegrative shaming is characterized by a ceremony in which the criminal act committed is denounced and community members express their disapproval of it. The shaming ceremony is then followed by efforts to "reintegrate the offender back into the community of law-abiding or respectable citizens through words or gestures of forgiveness or ceremonies to decertify the offender as deviant" (Braithwaite, 1989, pp. 100–101). An example of reintegrative shaming in practice can be found in New Zealand family group conferencing, which is frequently used to deal with cases of juvenile delinquency. In this strategy, the victim and offender meet in the presence of family and concerned community members to work out an appropriate restitution and consequence for the crime. In Canada, a similar process of circle sentencing is sometimes used by Aboriginal communities.

Shame that is stigmatizing, or disintegrative, occurs when the act and the actor are denounced as unworthy of the community. There are no efforts to reintegrate the offender, and he or she is rejected by the community. Disintegrative shaming is exemplified in the traditional criminal justice system by the court and sentencing process. Here, the offender is stigmatized by his or her conviction and literally, as well as symbolically, sent away from the community to prison.

Shaming that is reintegrative is not "soft" or "easy" on the offender. Although it can be done in love and with caring, reintegrative shaming can also be degrading, cruel, and punishing. The difference between reintegrative and disintegrative shaming is not in the quality of the shaming, but in its aim and in the processes that follow. Disintegrative shaming emphasizes the evil of the actor, while reintegrative shaming acknowledges the act as an evil thing, done by a person who is *not* inherently evil. Reintegrative shaming is followed immediately by gestures of reconciliation and inclusion, before the deviant identity is established as a master status.

Reintegration

As a follow-up to his theory of crime and reintegration, Braithwaite wrote an article with Stephen Mugford in 1994 titled "Conditions of Successful Reintegration Ceremonies," which identified 14 characteristics that must be present for a reintegration ceremony to be successful. They noted that structurally successful reintegration ceremonies usually include two aspects: confrontation with the victim, which leads to effective shaming, and inclusion of the people who respect and care most about the offender. Reintegrative shaming is most effective when those who are closest to the offender and/or to the situation participate.

Braithwaite believes that offenders must be able to view their act outside of their own perspective to see the harm that it has caused. The victim's perspective is invaluable in breaking down the offender's justification of the act, to enable him or her to see it as a crime. The victim may have the most impact on an offender in a face-to-face encounter, but those who do not wish to meet the person who harmed them may also communicate

through letters, video conferencing, or a written statement. Shaming and reintegration are found to be most effective when those who support and care for the offender take part. This is because offenders are more likely to give regard to family and community members who have been involved in their lives than to people whom they do not know.

An individual's community may not be geographic, but instead composed of various individuals who have a common concern for the individual. For example, in New Zealand and Australia, Maori and Aboriginal people often bring relatives or friends of an offender from far away, so that those people can support the offender in his or her reintegration. Most important, those involved in the shaming and reintegration process must be able to impart to the offender the idea that they are denouncing the act that he or she committed, but restoring him or her to the community as a full member.

CRIME, SHAME, AND REINTEGRATION IN PRACTICE

Community measures and reintegrative shaming do not form an extensive part of the U.S. criminal justice system. They remain far more popular in New Zealand and Australia. However, in recent years, alternative measures that use the theoretical principles presented here have sprung up in the United States and Canada. Community conferencing, victim-offender mediation, and sentencing circles are examples of these new measures. Such measures are often referred to as *restorative justice*.

Community conferencing is one alternative to the traditional justice system in cases of juvenile offending. The victim and his or her supporters, the offender and his or her supporters, and other concerned community members gather in the presence of a community facilitator to discuss the incident and what should be done about it. The community conference is usually resolved when all parties agree on an acceptable restitution or punishment, at which point the reintegration can begin.

Victim-offender mediation is similar to a community conference, but it is usually not opened to concerned citizens. The victim and one or two supporters meet with the offender and one or two supporters in the presence of a trained mediator. The mediation is usually ended with the signing of a contract for restitution or community service. Victim-offender mediation may be used as a diversion from the traditional criminal justice system, or following the imposition of a custody sentence for a juvenile or adult offender.

Sentencing circles originated among Canadian Aboriginal peoples. The sentencing circle, available to juvenile and adult offenders, is similar to a community conference, in that it is opened to concerned community members, but it differs in that a judge presides over the circle and it is conducted in lieu of a formal trial. The sentencing circle differs from community conferencing and victim-offender mediation in that it may result in a custodial sentence, fine, or any option that would be available in a criminal sentencing hearing. A common thread among these alternative measures is that the offender has to first acknowledge his or her guilt in order to be eligible for these processes.

CONCLUSION

Braithwaite's theory has been criticized for its unquestioning assumption that Western societies are built on a consensus about what is right and what is wrong. His theory places little value on the beliefs and morals of subcultures while assuming that there is an overarching societal consensus on the laws of the land. Often, his theory obscures the fact that there are subcultures within the dominant culture that may or may not support the "dominant" consensus. For example, although violence against women is defined as criminal by the law and by many in society, prevailing patriarchal norms lead others to feel that there is nothing wrong with the abuse of a female partner or spouse. Similarly, those who grew up prior to the age of anti-drinking and driving sentiment often feel that it is perfectly acceptable and sociable to "take one for the road." They do not feel shame for their actions and are unlikely to respond well to a shaming ceremony. In such cases, reintegrative shaming may not work, since the crimes are not universally abhorred.

The use of prison, for Braithwaite, is inherently disintegrative and counterproductive, especially given the fact that most offenders return to the community. He thus supports the use of community alternatives to imprisonment or, at the very least, the use of proactive community reintegration following a term of incarceration.

CRIPS

The Crips are among the best-known gangs in the United States. Along with their rival group the Bloods, Crip sets exist in cities throughout the United States, and thus have attained status as a supergang. Due to their involvement in the drug trade, and as a result of increased policing of gang-related activity, many Crip members are currently imprisoned.

HISTORY AND DEVELOPMENT

The Crips began in Los Angeles in the late 1960s. Raymond Washington and Stanley "Tookie" Williams are generally cited as the initial organizers of the group. The first name taken by the Crips was the "Baby Avenues" for the street on which Washington lived. There is some dispute about the origins of the name "Crip" itself. Some suggest that the initial name was Cribs and it evolved into Crips. Others suggest that the initial name was "Crypts" taken from the Vincent Price movie, *Tales From the Crypt*. Other reports suggest that one of the members was a cripple and walked with a cane.

Whatever its origins, Crip gangs spread quickly throughout South Central Los Angeles into other parts of the city and Los Angeles County, composed primarily of young, male African American residents of these neighborhoods. These groups took the color blue as their primary symbol, and similar to the longer-standing Hispanic gangs in southern California, wore bandanas that identified their membership.

Members of the Crips fought against other youths in neighborhoods in and around where they lived. It did not take long for youths in other neighborhoods to form groups for protection; these groups soon took a name. The groups opposed to the Crips came to be known as the Bloods, and early gangs were known as Piru Bloods, for the street near which many of the youths lived. These gangs chose red as their color. Wearing this color symbolized both membership in the Bloods and opposition to the Crips.

The development of the Crips reveals the importance of oppositional groups in gang activity. As Malcolm Klein (1995) has observed, gangs cannot exist in a vacuum. Thus, because of the role that external rivals play in both increasing solidarity internally and spreading the growth of the group, the Crips could not exist long without a rival. The rivalry between the Bloods and Crips has been important in fueling the growth of both groups.

Equally important to that growth, however, has been the impressive movement of Crip and Blood gangs into popular culture. Even though black

gangs in the Los Angeles are fewer in number than their Hispanic counterparts, they receive the most attention. This notoriety is in part due to their involvement in violence, but can also be tied to their emergence in popular culture. This can be seen most directly in the depiction of Los Angeles Crips and Bloods in movies such as *Colors* and *Boyz in the Hood*, books such as *Do or Die*, and music videos. Through these vehicles, gang style and aspects of gang culture were spread to other American cities. There are even reports from several European cities, including Amsterdam and Munich, that youth groups that emulated Crip gang styles were emerging.

Crip gangs were very turf oriented and engaged in a considerable amount of violence. As they engaged in these activities, they were able to grow in number and size. When crack cocaine became available in the 1980s, Crip gang members became actively involved in the distribution of this drug. What is not clear, however, is the extent to which the Crip gang as an organizational entity was responsible for or behind the sales of the drug. There is solid evidence that Crip gang members were extensively involved in the sale of crack; however, the evidence that Crips controlled distribution of the drug is less solid.

ROLE IN OTHER CITIES

While Crip gangs trace their origins to Los Angeles, there are Crip sets in dozens of other American cities. The presence of such gangs in Cleveland, Indianapolis, Orlando, Atlanta, Charlotte, and St. Louis (among other cities) raises an interesting question about the Crips. Part of the reason that they have been identified as a supergang is that presence in other cities across the country. But how did this come to be? Maxson and Klein (1994) determined that most gang migration can be explained through traditional migratory patterns that involve family movement and employment patterns. Rather than gangs being "franchised" much like a fast food restaurant according to a plan and purpose, migration of Crip gangs appears to be due to the normal migratory patterns of Americans enhanced by the presence of cultural messages through music videos, movies, and cultural symbols.

Ron Huff studied gangs in Cleveland in the early 1990s (Huff, 1996). He found four groups of gangs active in Cleveland: Folks, Vice Lords, Crips, and other independent gangs. The two largest groups of Crip gangs he interviewed included the Rolling 20s and Shot Gun Crips, groups related at least by name to Crip gangs in Los Angeles. Individuals in these gangs displayed versatile crime patterns and considerable levels of organizational variation. The Crip gangs in Cleveland were composed largely of young black males, whose predominant activity was hanging out and engaging in drug sales. Member of these groups had high levels of arrest, indicating extensive involvement in crime.

Decker and Van Winkle's research in St. Louis (1996) uncovered a large number of Crip gangs, 16 in all. The remainder of the gangs were associated with Blood gangs. The largest of the Crip gangs included the East Coast Crips, Long Beach Crips, Rolling Sixties Crips, and Hoover Crips. There was little if any evidence that Crips from Los Angeles had come to St. Louis to "franchise" Crips, rather the power of cultural transmission was more likely to account for the presence of these Los Angeles gang names in St. Louis.

ROLE IN PRISONS

As an increasing numbers of Crip gang members were sent to prison for their involvement in crime, a proportion of gang activity shifted from the street to the prison. In prison, street gang rivalries often are played out in a similar manner as that on the street. Yet there are differences as well. In prison, for example, gangs usually involve older, more criminally involved members than do street gangs. Likewise, ethnicity or race can be more important than street gang membership for the purposes of forming affiliations. One of the other ways that prisons are important for street gangs is the manner in which individuals change prior to their return to the street. Most prison releasees are older and have a wider range of criminal networks and ties than street gang members.

Often information is passed from the street to the prison and from prison to the street. In this way, contact is maintained between street and prison gang members, reinforcing criminality and influence in both directions. Prison is also a location in which the transmission of gang culture and membership can be expanded. Individuals from different locations around a state can be exposed to Crip gang members and when they return to their communities, bring aspects of the gang with them to their friends and neighborhoods.

In attempting to understand the role that Crips play in prison, it is important to distinguish between the state and federal prison systems. In state prison systems, gang members can maintain ties among members and with their community much more effectively. Federal prisons are a much different story. Because of the wider regional and national draw of federal prisons, there is a greater mix of individuals. Consequently, the ability of a local gang to dominate prison life is diminished.

CONCLUSION

One of the original cofounders of the Crips, "Tookie" Williams, is currently awaiting execution in San Quentin's death row. Incarcerated since 1981, Williams has undergone a dramatic change of heart about his involvement in gangs. He is now a vocal opponent of gang violence and publishes books for children warning of the risks of becoming involved in drugs and criminal activities. Due to his activities since entering prison he has been nominated for the Nobel Peace Prize.

CRITICAL RESISTANCE

Critical Resistance is a grassroots organization that "fights to end the prison industrial complex by challenging the belief that policing, surveillance, imprisonment and other forms of control make our communities safer" (Critical Resistance, 2002c, p. 1). The national office of Critical Resistance is in Oakland, California, and there are local chapters in Springfield, Massachusetts; New Haven, Connecticut; Oakland, Sacramento, and Los Angeles, California; Washington, D.C.; New York City; and Sydney, Australia. Its work includes organizing local campaigns, movement building through large national and regional gatherings, and public education through film festivals, publications, and media work.

HISTORY

In 1997, a multiracial and intergenerational group of grassroots activists, scholars, students, and former prisoners met in Oakland, California, to generate a movement against mass incarceration and prison construction in the United States. Initially, the organizers decided to host an international conference that would bring together diverse constituencies affected by mass imprisonment, from prisoners and their families, to homeless advocates, sex worker organizations, antiracist, and LGBT (lesbian, gay, bisexual, and transgender) activists. This conference, titled "Critical Resistance: Beyond

the Prison Industrial Complex," was held at the University of California, Berkeley, in September 1998 and was attended by more than 3,500 participants. In conjunction with the conference, several thousand high school students staged a walkout to demand "Schools Not Jails." The Youthforce Coalition, dedicated to opposing criminalization and incarceration of youths of color and calling for funding for schools and youth programs, was an outcome of this event. Critical Resistance East, a Northeast Regional Conference held in New York in Spring 2001, and Critical Resistance South, held in New Orleans in April 2003, continued the work of building a national movement.

THEORIZING THE PRISON INDUSTRIAL COMPLEX

Both prison intellectuals and academic scholars have contributed to Critical Resistance's theoretical development. A key achievement of the group has been to popularize the concept of the "prison industrial complex." As Angela Y. Davis argues, the massive growth in imprisonment is linked not to efforts by the state to curb crime, but rather to broader political and economic trends. The rolling back of the welfare state, coupled with the downsizing and relocation of manufacturing, Davis argues, has generated a social crisis in industrialized nations. Aggressive policing and harsh prison sentences have replaced social investment, affirmative action, and welfare as the primary response to the social problems generated by desperate socioeconomic conditions. At the same time, the function of the prison has shifted from rehabilitation to incapacitation. A key goal of prisons in industrialized nations appears now to be the removal of large numbers of the poor, disenfranchised, and racially marginalized from the streets. In so doing, prisons reproduce and exacerbate the social problems from drug use to unemployment that plague communities of color and indigenous communities in particular.

The phrase "prison industrial complex" refers also to the profit element in mass incarceration. Critical Resistance has drawn attention to prison corporations such as Wackenhut and Corrections Corporation of America that build and operate private prisons. The private prison industry in the United States alone earns up to $2 billion a year, and subsidiaries in other locations, from South Africa to Britain, also provide immense profits. Whether public or private, prisons are also a source of earnings for a host of companies that supply necessities from food and telephone services to stun guns and razor wire or employ the cheap and disciplined prison labor force. This interdependence between the state and capital has ensured the centrality of prisons to the global economy.

ENVIRONMENTAL AND ECONOMIC IMPACT OF PRISON CONSTRUCTION

In Spring 2001, Critical Resistance filed a historic environmental lawsuit against the California Department of Corrections with the aim of preventing the construction of a new $596 million, 5,160-bed prison in California's Central Valley. In filing the lawsuit, Critical Resistance, in partnership with the California Prison Moratorium Project, brought together a coalition of groups that had previously not worked together, including environmentalists, farm workers unions, Latino and immigrant advocates, and antiprison activists. The lawsuit demonstrated the increasing importance of rural communities in the prison industrial complex. Many rural town councils have viewed prison construction as a solution to economic stagnation. However, Critical Resistance used research by Ruth Wilson Gilmore to show that prisons have not actually been as economically beneficial to such communities as previously thought. In addition, Critical Resistance highlighted the negative environmental impacts of prison siting, including the destruction of farmland, the drain on water supplies, and the threat to local endangered species.

Critical Resistance views legal action as part of a wider strategy to shift public opinion against prison expansion. The campaign has generated a national debate about the failure of the "prisons as public works" policy. In addition, the lawsuit has thus far delayed construction.

ABOLITION

Central to Critical Resistance's work is an abolitionist commitment. According to Critical Resistance, abolition is "a political vision that seeks to eliminate the need for prisons, policing, and surveillance by creating sustainable alternatives to punishment and imprisonment" (Critical Resistance, 2002b, p. 1). Rather than promoting alternatives to incarceration that operate within the remit of the criminal justice system, Critical Resistance calls for sustainable alternatives that generate safety and security, while refusing to rely on law enforcement. These measures include community-based economic development, educational programs, community forums, drug treatment, and medical care. In Delano, California, for example, Critical Resistance worked with a range of community and labor organizations to identify programs, including youth facilities, additional investment in schools, and job creation that could serve as an alternative form of economic development to prison construction.

CONCLUSION

As an abolitionist organization, Critical Resistance rejects reformist agendas that expand the remit of the prison industrial complex. Rather than seeking to improve conditions by allocating additional resources to corrections budgets, Critical Resistance calls for a reduction in corrections spending by releasing prisoners including nonviolent offenders, addicts in need of treatment, and elderly prisoners and reducing the number of prisoners returned to prison for minor parole violations. Critical Resistance argues against investing more money into the prison system, and instead calls for the diversion of funds from social control into social welfare and community development.

CUBAN DETAINEES

Today there are more than 1,000 Cuban nationals detained in federal prisons under special terms of confinement. Most of these men and women arrived in the United States in 1980 and are held as a result of special legislation and state powers that were enacted specifically to confine them. Most cannot be released since Cuba will not accept them back, and the United States will not grant them immigrant status.

WHO ARE THE CUBAN DETAINEES?

The Cubans came to the United States as part of the Freedom Flotilla that brought more than 120,000 refugees to the United States from the tiny port city of Mariel, Cuba, in 1980. Most of these people, soon to be called "Mariel Cubans" or "Marielitos" came to the United States because of economic problems in Cuba. A relatively small number of "anti-socials," political prisoners, and petty criminals were also forced to leave by the Cuban government. The overwhelming majority of Mariel Cubans were law-abiding citizens. They included farmers, mechanics, fishermen, truck drivers, seamstresses, accountants, construction workers, plumbers, carpenters, and professional athletes.

Ultimately, more than 90% of the refugees were processed by the U.S. Immigration and Naturalization Service (INS) and passed along to their families or

to private relief groups across America. During the INS processing, however, officials began to notice some Cuban men who were more hardened and rougher in appearance than others. Research also suggests that a disproportionate number of these men were minorities. Based solely on their appearance, the INS concluded that the Cuban government had taken advantage of the Freedom Flotilla by emptying its prisons of hard-core criminals. Though Castro denied the allegation, the media began characterizing the Marielitos as "murderers," "vagrants," "homosexuals," and "scum."

WHY WERE THEY INCARCERATED?

The INS identified 350 Cuban men who were considered to have criminal backgrounds in Cuba. This figure represented less than one half of 1% of the total number of Cubans who came to the United States via the port of Mariel in 1980. By comparison, in the same year approximately 6,000 out of every 100,000 U.S. residents committed a major-index crime, as reported in the *Uniform Crime Reports.* Criminality within the general U.S. population was, therefore, roughly 17 times greater than that among members of the Freedom Flotilla. Nevertheless, this small group of Cuban criminals inspired the belief that a number of émigrés were dangerous people who could not be trusted. They became the first cohort of Mariel Cubans incarcerated in U.S. prisons. Others cohorts would follow, including a small number of women among them, and their imprisonment would also be affected by the stigmatized image of the "dangerous Marielito."

In addition to the 350 criminals, some 7,600 Freedom Flotilla émigrés had questionable backgrounds and were classified by the INS as "excludable entrants." Such people were allowed to enter U.S. society under the strict conditions of INS parole under which their parole could be revoked without explanation. Over the next several years, the INS revoked hundreds of paroles and detained Cubans in federal prisons because they had no visible means of support or fixed addresses, because they did not have an appropriate sponsor, or because they required medical treatment. Other Cubans were sent to prison for violating curfew or travel restrictions, or for failing to participate in relocation programs. Still others were imprisoned for petty crimes. The INS revoked paroles for a range of infractions including driving without a license, shoplifting, or possession of small amounts of marijuana and cocaine. All of these men were given "indefinite sentences," meaning that they did not know when, if ever, they would be released from federal custody.

By 1987, the INS had criminalized enough male Mariel Cubans to fill two prisons: the Federal Detention Center at Oakdale, Louisiana, and the U.S. Penitentiary at Atlanta, Georgia. While it is generally assumed that maximum-security prisons exist to punish society's most dangerous criminals, this was not true for the Mariel Cubans. The maximum-security prison at Atlanta was used to warehouse the disadvantaged. A 1986 congressional report found that *absolutely none* of the nearly 1,900 Mariel Cubans locked up in Atlanta was serving a criminal sentence. That is, the detainees had already served their sentences for criminal transgressions, or they had committed no crimes at all.

HOW WERE THE DETAINEES TREATED?

The congressional report found that the Cubans at the Atlanta Penitentiary were incarcerated in the worst overcrowded situation in the federal prison system. Most were housed eight men to a cell for 23 hours a day. Suicide and psychological depression were rampant. In one year, nine Cubans committed suicide and there were 158 suicide attempts. There were more than 2,000 serious incidents of self-mutilation, 9 homicides, and 10 deaths from heart attacks and other natural causes. Ten percent of the Cubans were classified as mentally retarded, mentally disordered, or psychotic. The report concluded that the Cubans were forced to live in conditions that were "brutal and inhumane . . . without any practical hope of ever being released."

WHAT HAPPENED AS A RESULT?

In November 1987, the Cuban detainees responded to their conditions and legal uncertainties by mounting the longest and most destructive prison riot in American history. Using chains, blowtorches,

and homemade machetes, they seized Oakdale and Atlanta with military precision, taking more than 200 hostages, and burning the prisons to the ground. In all, the Cubans destroyed more than $6 million worth of federal resources. During the siege, the detainees held machetes to the throats of hostages and threatened to burn them alive with gasoline. After two weeks, officials negotiated an end to the riot by promising the Cubans a "full, fair and equitable review" to determine eligibility for release into mainstream American society.

CONCLUSION

Following the riots, the INS approved nearly two-thirds of the detainees for release. Because of the riots, the Cubans were guaranteed more rights than at any other time since their arrival on the Freedom Flotilla. Yet for all that happened, nothing much changed. The policy of indefinite detention still remains. (In 2003, the INS was renamed the U.S. Citizenship and Immigration Services, USCIS, and placed under the governance of the Department for Homeland Security.) Today, 1,700 Mariel Cubans are still being indefinitely detained in federal prisons where they are segregated from other prisoners and treated with special restrictions because they are thought to be extremely dangerous. Confined to their cells for 23 hours a day, they are given no access to education. Most cannot speak or read English. They have few skills that would help them assimilate into American society. In recent years, Cuban detainees have waged several small-scale disturbances. For many, depression, lethargy, and resort to suicide and self-mutilation have become a way of life.

D

DAVIS, ANGELA Y. (1944–)

Angela Yvonne Davis is an African American activist and scholar who was charged and arrested for an alleged role in the August 7, 1970, failed escape of three inmates at the Marin County courthouse in California. Davis was accused of supplying guns used in the inmate escape and conspiring to free Soledad Brother George Jackson. While evading arrest on these charges, she became the third woman in U.S. history to be placed on the FBI's Most Wanted List. Arrested in New York on October 13, 1970, she spent 16 months in jail prior to being granted bail after a California Supreme Court decision ruled on a death penalty case that changed her bail status. A jury found Davis not guilty of all charges on June 4, 1972. Since then, she has continued to work for prisoners' rights throughout the world.

BIOGRAPHY

Davis was born on January 26, 1944, in Birmingham, Alabama. While growing up, her family lived in a section of Birmingham known as "Dynamite Hill" because of the frequent bombings by racist whites attempting to prevent the neighborhood from being integrated. As a youngster, however, Davis spent summers in New York where her mother worked on her master's degree. Summers in New York were a striking contrast to life in Alabama. In New York, African American children could swim in public pools and eat in restaurants—activities restricted to whites only in Alabama.

During high school, Davis took part in an experimental program that allowed African American students from southern states to attend integrated northern high schools. Consequently, she spent two years at Elizabeth Irwin High School, a small private progressive school in New York City. Davis then went to Brandeis University where she graduated summa cum laude in 1965 with a major in French literature. After graduating from Brandeis, she spent two years studying philosophy on a scholarship in Frankfurt, Germany, before returning to the United States in 1967 to pursue her master's degree in philosophy at the University of California, San Diego (UCSD), where she worked with Herbert Marcuse, a Marxist philosopher who believed it was important not just to theorize but to act.

During her time at UCSD, Davis joined the Communist Party. She also became involved in the black power movements. Then, in 1969 after receiving her master's degree and while working on her doctorate, Davis signed a contract to work at the University of California, Los Angeles (UCLA). When asked by an administrator if she were communist,

Davis answered affirmatively. In a public battle, the California Board of Regents attempted to dismiss Davis despite her successful teaching, arguments about academic freedom, and a California Supreme Court ruling in her favor. The regents were eventually successful.

SOLEDAD BROTHERS

At the same time that she was struggling to keep her teaching position at UCLA, Davis learned about the Soledad Brothers, three African American inmates who were accused of killing a white prison guard. Davis became the cochairperson of their defense committee and began an intense correspondence with one of them, George Jackson.

On August 7, 1970, Jackson's younger brother Jonathan attended the trial of James McClain, an inmate charged with assaulting a guard. According to some present in the courtroom, Jonathan stood up, took four guns out of his coat, and announced he was taking over. After conferring with Ruchell Magee and William Christmas, two inmates also present as witnesses in the case, the three men took hostages and left the courtroom. They made it to a rented van where a shootout left McClain, Christmas, Jonathan Jackson, and the judge dead and others injured.

A warrant was issued for Davis's arrest on August 11, 1970. Though she was not at the trial, she was charged, along with the only inmate survivor, Ruchell Magee, of murder, a capital offense, as well as kidnapping and conspiracy. It was alleged that she had given guns to Jonathan. Davis went into hiding and managed to evade law enforcement until her arrest in October 1970 and was extradited to California. She remained imprisoned until February 23, 1972, when she was released on $102,500 bail due to a California Supreme Court decision abolishing capital punishment.

The trial against Davis began on February 28, 1972. After 104 prosecution witnesses, 12 defense witnesses, and 203 items of evidence, the trial ended on June 4, 1972. It was clear to her supporters that the evidence against her was nonexistent. Following three days of deliberation, the jury (11 whites and 1 Mexican American) agreed and found Davis not guilty of all charges.

CONCLUSION

Drawing on her own experiences as a political prisoner, an African American, and a woman, Davis is deeply involved in the movement for prison reform worldwide. Most recently, she was one of the leading organizers of a conference called "Critical Resistance: Beyond the Prison-Industrial Complex" held in 1998 at the University of California, Berkeley. Critical Resistance is now a national organization that "seeks to build an international movement to end the Prison Industrial complex by challenging the belief that caging and controlling people makes us safe" (Critical Resistance, 2003).

DAVIS, KATHARINE BEMENT (1860–1935)

Katharine Bement Davis was a nationally and internationally recognized pioneer in penology and prison reform. She was one of the first women to hold the top office in corrections in one of the largest cities in America and, in addition, she contributed ideas about the causes of crime and the effectiveness of treatment. Davis was a highly public figure, who spoke passionately about her work in the field and influenced policymakers and practitioners alike on the design and operation of prisons and reformatories.

Katharine Davis was born in Buffalo, New York, in 1860. Her parents were reformers. In the 10 years following her high school graduation she worked as a teacher before leaving that profession to pursue a degree at Vassar College. She then was granted a political economics fellowship and went on to obtain a doctorate at the University of Chicago. Returning to Vassar, she taught for several years before being appointed in 1901 to run the first female reformatory, Bedford Hills Correctional Facility, in Westfield, New York. She remained as superintendent of Bedford Hills for 13 years.

CORRECTIONAL INNOVATIONS

As female offenders were moved from men's prisons to their own institutions, Davis introduced the cottage system design for women's facilities. Unlike the warehouse-style prisons built for men, she viewed the cottage as more in keeping with the personality and temperament of women and as structurally more conducive to their good health. Davis even wrote an article titled "The Fresh Air Treatment for Moral Disease." She believed the cell-stacked architecture of prisons such as New York City's "Tombs" was "fundamentally wrong" because it shut out outside air and sunlight, which she considered "the greatest of all medicines for the mental, moral, and physical human sufferer" (Davis quoted in Marshall, 1914, p. SM6).

The women at Bedford were required to participate in schoolwork and to learn trades. They were also encouraged to work and engage in recreation outdoors, thus they were assigned farming chores. This environment was said to have a positive effect on all participants, even those who suffered from mental illnesses. As another innovation, a nursery was established within the reformatory where new mothers and their children could stay together for up to two years. This nursery program was later reactivated at Bedford as a highly acclaimed rehabilitation program in the 1980s.

Funding from grants and foundations enabled Davis to hire a prison psychologist. Performing routine psychiatric assessments for incarcerated women, Bedford Hills helped to lay the foundations of modern diagnostic prison procedures.

CRIMINOLOGICAL INNOVATIONS

Davis was a proponent of criminal theories that presented offenders as of subnormal intelligence and defective. An advocate of the medical model, she was concerned about the number of prostitutes, their lack of education and skills, and their high rates of disease. Fines for prostitution, she argued, usually placed the female offender further in debt to her male pimp and were therefore counterproductive.

In much of her criminology, Davis was highly influenced by the concerns of her day, particularly those about cultural adaptation to life in the melting pot of America. She pointed out the many Italian names on the rosters of incarcerated women and speculated that they emigrated with "their own primitive ideas of vengeance" (Davis quoted in Marshall, 1914, p. SM6). She lamented that some of the women murderers at Bedford were caught up in the conflicts of their culture when their own codes make them "victims of the racial custom of revenge" (Davis quoted in Marshall, 1914, p. SM6).

While others at this time were proponents of eugenics principles, Davis was more cautious. As a staunch advocate for the scientific study of crime, particularly the clinical assessment of the offender, Davis persuaded John D. Rockefeller, Jr., to donate $50,000 to establish the Laboratory of Social Hygiene directly across from the reformatory, one of the first institutes for studying female criminality.

Davis believed in the beneficial effect of cultural programs and introduced them into the prison.

Prisoners attended lectures, celebrated birthdays, and went on picnics. She hosted a tea reception for inmates in her quarters each New Year's Day. One of her most widely noted policies was the concept of an "honor cottage." Used as a means of encouraging good behavior, the honor cottage was reserved for inmates who had worked their way to the highest classification levels. Residents were allowed self-government and created their own rules. Gillin (1926) quoted one observer as saying, "The matron of the house has general oversight, but the girls in the honor cottage have as much freedom as a girl at a good boarding-school. The cottage is made as attractive as possible with ferns, pretty furniture, individual sleeping rooms, a pleasant sitting-room, and a sewing room where they make their own clothing" (p. 658).

Davis was also a supporter of early parole, preferring that inmates be released into country environments. She was of the opinion that the temptations of the city encouraged bad habits; thus, parole in the countryside gave the inmates a better chance to succeed. In addition, she actively sought parole and work and living arrangements that would most encourage adjustment into productive society.

Primarily because of her work at Bedford Hills, Davis became the first female corrections commissioner in New York City in 1914. She was responsible for the infamous Tombs prison, Raymond Street and Queens County jails in Brooklyn, the workhouse on Blackwell's Island, two other workhouses on Hart's and Rikers Islands, the New York City Reformatory for Male Misdemeanants, and the detention house for women. The Tombs was a source of concern because she felt the style of construction did not allow the building to be properly "flushed" and cleaned. It was woefully overcrowded and internal temperatures were difficult to regulate. She was also concerned about providing medical care and a separate facility for "inebriates."

CONCLUSION

Throughout her professional life, Davis researched successful programs around the country and in Europe. Disillusioned by the workhouse and penitentiary models, she encouraged judges to consider individual needs when sentencing and worked toward developing individualized treatment plans for offenders. She summarized her optimistic philosophy as follows: "The needs of society and the individual can be best served by a system of correction based upon the character and requirements of the person rather than on the nature of the criminal act" (Davis quoted in Marshall, 1914, p. SM6). True to her optimism, she believed that the best model for improving corrections would be an apolitical process with all sectors of public welfare and justice working together.

The legacy of Katharine Bement Davis is found in the many employees she instructed, the policymakers she influenced, and the correctional concepts she championed. Another well-known reformer, Mary Belle Harris, was a protégé whom Davis originally recruited to run the workhouse on Blackwell Island and to implement her progressive practices. As an indication of the extent to which her work and ideas were respected, Davis was appointed a cabinet member of New York City and chairwoman of the city's parole board.

DEATH ROW

Death row refers both to the physical space where those awaiting execution are held and the general

population who have been sentenced to death. Capital punishment is as old as written law. It was the ascribed punishment for 25 different crimes under Hammurabi's Code (c. 1700 B.C.). Since condemned individuals are typically confined between the moments of judgment and execution, some form of "death row" must be equally ancient. Through the centuries, however, death row has evolved from a rudimentary cell located near the place of public execution to a highly specialized, segregated unit within a modern penal facility.

THE EVOLUTION OF DEATH ROW

Historically, executions were public spectacles (and remain so in countries such as Saudi Arabia, Iran, and Nigeria). But throughout the 19th century, many Western countries began conducting executions in private, behind prison walls. In 1834, Pennsylvania removed its executions from the public gaze; Massachusetts, New Jersey, and New York followed in 1835. The last public hanging took place in England in 1868, in the United States in 1937, and the last public execution by guillotine took place in France in 1939. As these executions became private, the process was streamlined. In prisons built during the early 20th century, visiting facilities and the living quarters of the condemned were often placed very close to the execution chamber, sometimes merely paces away.

GLOBAL TRENDS

Amnesty International reports a gradual international trend toward the abolition of capital punishment. They state that as of August 2002, more than half the countries in the world have abolished capital punishment in law or in practice. Members of the European Union (EU), for example, enforce a mandatory ban on capital punishment. Citizens from abolitionist countries are not executed for their crimes unless they are committed under a retentionist jurisdiction. But offenders from countries retaining capital punishment may face execution. In 1998, 76% of all known executions occurred in just three countries: China, the Democratic Republic of Congo, and the United States of America.

Although 12 states and the District of Columbia have abolished the death penalty, the United States remains a solid retentionist nation. Thirty-eight different states authorize the death penalty, as does the U.S. military and the federal government. Since the death penalty was reinstated in 1976 by the U.S. Supreme Court, 842 people have been executed in America, including 3 in the national execution chamber at Terre Haute, Indiana.

THE RISE AND FALL (AND RISE) OF DEATH ROW IN THE UNITED STATES

The numbers of men and women on death row fluctuates in size over time. Their proportions are a function of the number of people condemned to die and the expediency with which executions are conducted. Of these two factors, however, the number of people condemned to die has the greatest effect on the population of death row. Obviously, the number awaiting execution shrinks dramatically when states abolish capital punishment.

American states began limiting or abolishing the death penalty as early as 1846. During the early 20th century, many U.S. states abolished or restricted capital punishment, but there was a resurgence in the practice from the 1920s to the 1940s. Throughout the 1950s and 1960s, however, public support for the death penalty waned. Capital punishment was legislatively abolished in England in 1965. It was briefly struck down in the United States, as well.

In 1972, in the watershed case of *Furman v. Georgia,* the U.S. Supreme Court held that the death penalty (as then applied) constituted cruel and unusual punishment under the Eighth Amendment of the U.S. Constitution. States halted their executions. Consequently, numbers on death row shrank from 334 (in 1972) to 134 (in 1973) as the sentences of condemned men nationwide were commuted. But just four years later, the American death penalty was resurrected. In 1976, in *Gregg v. Georgia,* the U.S. Supreme Court declared that, under new state legislation, executions could resume. At this point, death row began to grow once again. By 1977, when Gary Gilmore ushered in the modern era of American capital punishment with his execution before a Utah

firing squad, the numbers on death row had already ballooned to 423.

Since Gilmore's death, the size of death row has steadily escalated. At the end of 2002, there were 3,692 condemned individuals waiting to die in America. Yet the size and composition of death row may continue to change. Throughout the late 1990s, DNA evidence suggested that innocent people could be found on death row, triggering intense public debate about the propriety of capital punishment, leading to legislative reform and executive action.

THE DEMOGRAPHICS OF DEATH ROW

Death row prisoners tend to fall into certain demographic categories. They tend to be adult males, often come from impoverished backgrounds, and disproportionately belong to racial minorities. Many endure long periods of incarceration before their execution. In the following section, each of these issues shall be dealt with in turn.

Age

Most death row prisoners are adults. Since 1990, only seven countries are known to have executed juveniles (individuals under the age of 18 at the time of their crimes): the Democratic Republic of Congo, Iran, Pakistan, Yemen, Nigeria, Saudi Arabia, and the United States of America. Only the United States and Iran formally authorize the practice with U.S. barring execution of those who are less than 16 years old. The execution of juveniles in the U.S. is relatively uncommon. Although juveniles account for 15% of murder arrests, they account for only about 2% (81) of prisoners on death row and about 2.6% (21) of individuals executed since the death penalty was reinstated.

Class

Death row prisoners disproportionately come from impoverished backgrounds. Poverty may correlate positively with aggravating factors such as prior criminal history or predictions of future dangerousness, leading juries to impose death sentences. Affluence, on the other hand, may correlate positively with mitigating factors—close relationships with family and friends, well-articulated remorse, or status in the community—decreasing the likelihood of receiving a death sentence. Perhaps more important, wealthy capital defendants can afford sophisticated "dream team" legal representation, while disadvantaged defendants are often represented by overworked or inexperienced public defenders who may not even want the case. Even Supreme Court justices acknowledge that poverty influences the dispensation of capital punishment. In the *Furman* decision, Justice Douglas wrote, "One searches in vain for the execution of any member of affluent strata of this society."

Race

Race plays a significant role in the shaping of death row. Both the race of the defendant and the race of the victim may influence the imposition of a death sentence. Although whites constitute about 75% of the American population, they account for only 57% of those executed since the death penalty was reinstated and about 45% of those on death row. On the other hand, while blacks constitute only 12% of the American population, they constitute 43% of death row and account for 35% of those executed. Seventy-six percent (19) of the 25 prisoners on federal death row and 6 of the 7 prisoners on the U.S. military's death row are minorities. But research indicates that the race of the victim may play a more significant role on who is condemned to death than the race of the defendant. The murder of a white victim is more likely to result in a capital conviction than the murder of a nonwhite. More than 80% of capital cases in America involve a white victim, although only 50% of murder victims are white nationwide.

In *McCleskey v. Kemp* (1987), the U.S. Supreme Court considered research that demonstrated systemic racial discrimination in the imposition of capital punishment. After controlling for many nonracial variables, the research indicated that Georgia defendants charged with killing white victims were 4.3 times more likely to get the death penalty as defendants charged with killing blacks. While the Court did not challenge the legitimacy of

McCleskey's data, it rejected his claim that these findings amounted to an unconstitutional risk of prejudice in death penalty decision making. Warren McCleskey was executed in 1991.

Gender

Death row is composed primarily of males. Some countries, such as Russia, explicitly made women ineligible for capital punishment. Other countries did so in practice. Although women comprise about 51% of the U.S. population and account for about 20% of criminal homicides, they account for only about 10% of murder arrests, 2% of death sentences at trial, about 1.4% of prisoners on death row, and about 1.2% (10) of those who have been executed since capital punishment was reinstated. Legal scholars explain this screening-out effect by citing gender discrimination in the attitudes of judges and jurors and by claiming gender discrimination is inherent in existing death penalty statutes.

Time Spent on Death Row

Historically, little time elapsed between sentencing and execution. Under England's Murder Act of 1752, executions were carried out just two days after sentencing; after 1834, only three Sundays elapsed before the sentence was carried out. These days, however, because of the "super due process" safeguards required under *Gregg,* contemporary death row prisoners in America spend years (not days or weeks) awaiting execution. The average duration from sentence to execution is now more than 12 years, and some prisoners have spent more than 20 years on death row.

CONDITIONS OF CONFINEMENT

Typically operated as a prison within a prison, characterized by lockstep security and minimal freedoms, death row represents the hardest time a prisoner can do. "Death row is the most total of total institutions, the penitentiary most demanding of penitence, the prison most debilitating and disabling in its confinement. On death row the allegorical pound of flesh is just the beginning. Here the whole person is consumed. The spirit is captured and gradually worn down, then the body is disposed of" (Johnson, 1998, p. 71).

Time on death row often drags. Because a sentence of death is supposed to be both definitive and final, death row prisoners do not participate in rehabilitative activities such as education, therapy, or job skills training. Nobody wants to invest resources in developing an individual who will be executed in a month or a year or a decade. Plagued by tedium, some death row prisoners throw themselves into their appeals, honing their skills as jailhouse lawyers. Others write voluminous correspondence, immerse themselves in religious study or literature, or turn to handicrafts and art projects as a pastime. Many seek to lose themselves in television.

The physical environment of death row closely resembles that of super-maximum secure facilities. Because it is thought that death row prisoners "have nothing to lose," security is tight. Prisoners are usually confined to small single-occupancy cells for up to 23 hours a day and are monitored carefully. Movement is restricted: Meals are typically served to death row prisoners in their cells, and religious and legal services are often delivered to the cell (either by closed-circuit programming or book request). Prisoners are afforded opportunity to exercise for several hours per week, allowed to visit with family members and lawyers, and are usually permitted to have some personal possessions in their cells.

The elite correctional officers assigned to death row attempt to emphasize professionalism and compassion, and strive to maintain the dignity of the prisoner throughout the process. Actual execution procedures are rehearsed to precision, minimizing the likelihood of mishap or error. These staff also supervise inmates in their final days on deathwatch.

These maximum-security facilities are expensive. When coupled with the appellate processes required under *Gregg*'s super due process requirements, it is more expensive to execute a prisoner than to incarcerate him for a life sentence. A 50-year life sentence costs the government approximately $1 million. On the other hand, the average

execution costs somewhere between $2 and $3 million, and high-profile executions may cost more than $20 million.

There are also tremendous (psychological) costs for the prisoners on death row. The austere deprivation of super-maximum secure conditions was characterized by the *Madrid v. Gomez* court as pressing "the outer bounds of what humans can psychologically tolerate," and the oscillating hope and despair of death row can be torturous.

DEATH ROW SYNDROME AND VOLUNTEERS

In his essay "Reflections on the Guillotine," Albert Camus (1961) wrote:

> The devastating, degrading fear that is imposed on the condemned for months or years is a punishment more terrible than death. . . . Torture through hope alternates with pangs of animal despair. The lawyer and the chaplain, out of mere humanity, and the jailers, so that the condemned man will keep quiet, are unanimous in assuring him that he will be reprieved. He believes this with all his being and then he ceases to believe it. He hopes by day and despairs by night. As the weeks pass, hope and despair increase and become equally unbearable. (p. 200)

The anxiety of this sustained uncertainty may have legal as well as philosophical consequences. In *Soering v. United Kingdom,* the European Court of Human Rights held that extraditing a German national to the United States to face the death penalty would amount to a violation of the European Convention on Human Rights' prohibition against "torture or to inhuman or dehumanizing treatment or punishment." While the execution that Soering faced did not, itself, constitute a violation, a combination of the dehumanizing conditions of death row, the protracted delays between sentence and execution, and the stress of living under the ever-looming shadow of execution amounted to a violation of the European Convention. While the concept of a "death row syndrome" has met with little acceptance within the United States, it has achieved legitimacy in the international legal community.

Confronted with the prospect of enduring years, perhaps decades, of death row syndrome, some condemned prisoners exercise the little autonomy they retain, terminating their legal appeals, and "volunteer" for execution. Twelve percent of those executed since the death penalty was reinstated were volunteers, including Gary Gilmore (the first post-*Furman* execution by an American state) and Timothy McVeigh (the first federal execution after *Furman*).

COMMUTATION AND ABOLITION

Troubled by inequities and errors in capital sentencing, numerous organizations have called for a moratorium on the death penalty. Human rights groups such as Human Rights Watch and the American Civil Liberties Union along with religious organizations such as the American Jewish Congress and Catholic Charities USA lobby states to change their laws. They are further supported by a range of professional societies such as the American Bar Association and the American Society of Criminology and by dozens of city and county governments.

After 13 death row prisoners were exonerated in the post-*Furman* era, former Governor George Ryan of Illinois declared a moratorium on all executions in January 2000. An appointed commission evaluated Illinois's death penalty, recommending that it either be overhauled or abolished. Then, in January 2003, Ryan commuted the sentences of all 156 death row prisoners in Illinois to life in prison. Although extremely controversial in the United States, Ryan's action was mirrored elsewhere. In February 2003, President Kibaki of Kenya lifted the death sentence for 28 prisoners and commuted the sentences of 195 others to life imprisonment.

Other sociolegal changes are transforming the face of death row. Although about 70% of Americans favor the death penalty for a person convicted of murder, support decreases when life imprisonment without parole (LWOP) is introduced as an alternative. Given this choice, public support for the death penalty drops to the 45–50% range, and about 40–45% favor LWOP penalties. This divided public opinion is altering contemporary judicial practice. While the use of the electric chair

was upheld as constitutional by the Florida Supreme Court in 1997, it was condemned as an unconstitutionally cruel and unusual form of punishment by the Georgia Supreme Court in 2001. In 2002, in *Atkins v. Virginia,* the U.S. Supreme Court held that the execution of mentally retarded prisoners violated the Eighth Amendment's prohibition against cruel and unusual punishment. Since an estimated 12–20% of condemned prisoners are mentally retarded, the holding could exert a profound impact on the composition of death row.

DEAD MAN WALKING: FROM DEATH ROW TO EXECUTION

When a prisoner's scheduled execution date nears, he or she is usually transferred from death row to a holding cell near the execution chamber. The prisoner remains in this cell under "deathwatch" during the 24 to 72 hours before execution. He or she is kept under continuous supervision, denied physical contact with others, granted a final meal, and prepared for execution.

In some states, the condemned may select between the five methods of execution: lethal injection, electrocution, gassing, hanging, and firing squad. In practice, the lethal injection has become the de facto standard in U.S. executions, used in 76% of the executions conducted since *Furman* and all but one of the executions since January 2001. Lethal injection is available in 37 states and employed by the U.S. military and federal government. Electrocution, in contrast, is available in 10 states and is the only means of execution available in Nebraska. Lethal gas is an option in 5 states, while hanging and the firing squad are available only in 3 states. After the prisoner is pronounced dead, a postmortem examination is conducted and then the body is released, usually according to the prisoner's wishes.

CONCLUSION

Death row has evolved from primitive origins to a highly specialized component of the modern U.S. penal system. Despite an international trend toward abolition, after the *Furman* and *Gregg* decisions abolished and rehabilitated capital punishment, America's death row has grown steadily in size. Prisoners on death row tend to be poor adult males, and minorities are overrepresented. Death row conditions are severe. Delays between sentencing and execution yawn into decades, and alternating states of hope and despair lead some prisoners to suffer from "death row syndrome." Recent social events have led some organizations to call for a moratorium on capital punishment and have triggered changes within the executive and judicial branches of government.

DEATHWATCH

The term *deathwatch* is defined as the period of time, typically the last 24 to 48 hours, before a condemned inmate is executed. In many U.S. states, the deathwatch period is one of "virtually solitary confinement under unmitigated solitary confinement" (Johnson, 1998, p. 93). In other states, such as Arkansas, however, the condemned may have unlimited access to his or her attorney(s) and spiritual advisor along with limited access to his or her family members. What is constant across jurisdictions is the intense scrutiny and detailed records that are maintained during the deathwatch, as well as the inevitable death of the inmate.

A deathwatch commences once the condemned person is transferred from his or her cell on death row to the deathwatch cells. Large enough for a single individual, these cells are typically located adjacent either to death row or to the death chamber (in those facilities where the death chamber is located a separate building or in a separate facility as in a number of states). The deathwatch concludes once the inmate's death is certified and the body removed from the facility by the coroner or buried on the grounds of the prison.

PAST PRACTICES

When executions used to be conducted in public places, such as at England's Tyburn Fair, the need for the condemned to be alive for the open journey from the prison to the scaffold was paramount. The deathwatch of this period was minimal and sought only to ensure that the person did not take his or her own life. Consequently, some prison officials provided condemned inmates with laudanum (an early opium-based narcotic) or strong liquor to ensure compliance with prison rules and lower his or her resistance during the execution process.

Gradually, in response to a series of different factors, including public outrage when an execution was not carried out justly or efficiently, capital punishment was removed from the public arena. The transfer of executions behind prison walls changed the nature of the death penalty within the penal process. Penal practices no longer engendered significant public debate, and the mechanics of death became highly routinized and sterile.

CURRENT PRACTICES

One might wonder, since the condemned inmate is going to die anyway, what purpose is served by a deathwatch in a modern, state-sanctioned execution? The reasons for having the deathwatch are threefold: (1) to ensure the safety of the condemned and correctional personnel prior to the execution, (2) to ensure that the execution proceeds without difficulty, and (3) to avoid litigation against both the individuals involved and the state that sanctioned the execution.

Time spent on death row is more rigidly structured than in other areas of a prison. While some argue that the routine provides stability to a particularly stressful experience, no amount of predictability can mitigate the manner in which inmate reactions are polarized by violent outbursts on one end and despondency at the other end. The reactions of the condemned on death row are more unpredictable than usual since some people may believe they have nothing to lose since the state is planning to kill them. Actions that were ignored one day as trivial might be akin to a spark touching gasoline on the next day. Some inmates may despair, or withdraw into themselves, while others find new focus in religious prayer and meditation. Very few condemned men or women, at least in the last part of the 20th century, become "gallows-thieves" by attempting to cheat the executioner by taking his or her own life.

Condemned inmates facing the last one or two days of their lives know where the journey ends, but not what happens along the way. Their waking hours are occupied with visits from family members, attorneys, and spiritual advisers in preparation of the final moment. While they are preoccupied with these matters, a small number of correctional staff observe and record every event and utterance that occurs throughout the deathwatch; they are the deathwatch team.

This team engages the condemned in directed conversation during those moments not otherwise occupied. The purposes of such conversations are

twofold. First, they provide limited comfort to the individual while preparing him or her emotionally for the eventuality of death. Officers assigned to the deathwatch provide information concerning the next steps in the execution process. Thus, the condemned is aware of both the process of the execution and of any changes in the routine from that which he or she experienced while on death row. Second, such conversations are the ultimate form of dynamic security whereby staff members monitor the inmate's anxiety levels and try to ensure that he or she remains calm. The ultimate goals are to ensure that the execution is free of behavioral mishaps (resistance) on the part of the condemned and that no harm is caused to the inmate or any member of the deathwatch and execution teams prior to the carrying out of the death sentence. Regardless of the manner in which it is provided, the goals of providing such information are to help the individual accept the inevitable and to ensure that the execution proceeds without difficulty.

Today, the deathwatch team maintains constant vigilance and records every occurrence in the last hours of the condemned's life. This record keeping has the contradictory goals of ensuring and documenting that the prison system treats the condemned humanely prior to his or her execution while precluding any litigation that might interfere with subsequent executions. The remaining part is the manifestation of Foucault's *surveiller* ("to oversee" in French) that he identified in the practices and regimentation of the factory floor, the armed forces, and the prison. While he noted that these institutions offered the best expressions of such oversight, he would have agreed that the deathwatch provided the penultimate expression of the state's power and its ability to ensure that the individual is constantly subjected to and reminded of that power through the routinization and record keeping inherent in the deathwatch.

CONCLUSION—WALKING THE LAST STEPS TOGETHER

Yet, one might wonder, why would a correctional officer participate as a member of the deathwatch team? Nearly every jurisdiction that invokes capital punishment has its own execution routine, including who serves on the deathwatch and execution teams. In some states, the deathwatch and execution teams are one and the same, whereas other states may have separate teams for these two different functions. In Arkansas, for example, correctional officers serving on the combined deathwatch-execution team are all volunteers and have served together for nearly a decade at the Cummins Unit (where the death house is located). Two contributing factors to the longevity of this team include the effective leadership of the captain who leads this team and the mandatory critical incident stress debriefing that occurs the morning following every execution.

Following the last meal and the issuance of a clean set of prison clothes, the condemned may spend time with his or her spiritual adviser and/or attorneys, who are escorted out of the area shortly before the execution is to take place. In the final moments of the deathwatch, officers and members of the execution team escort the prisoner into the death chamber and secure him or her onto the gurney or chair. The deathwatch team (but not the execution team) departs from the death chamber once these tasks are completed. The duties of the deathwatch team members are not completed, however, until their observations are recorded and that deathwatch log submitted.

While moving executions behind prison walls removed them from the public eye, the deathwatch has remained a part of the modern execution process. The nation-state must not only ensure that justice is carried out, but it must also be seen to be carried out by both the condemned and the public. The deathwatch is merely one of the many sets of eyes that ensure that the process is complete.

DENTAL CARE

Prisoners are entitled to dental care while incarcerated because of the U.S. Constitution's Eighth Amendment that forbids the use of cruel and unusual punishment by the government. In the view of the U.S. Supreme Court, this civil liberty applies to prisoners incarcerated in federal, state, and local facilities. This means that the government may not demonstrate "deliberate indifference to [the] serious medical needs" of prisoners (*Wynn v. Southward,* 251 F.3d. 588, 593 [2001]). Such serious medical needs can include dental care.

In *Wynn,* for example, a prisoner alleged that when he was moved to an isolation unit, the attending prison official deliberately misplaced, among other things, his dentures. As a result, according to this prisoner, he suffered "bleeding, headaches, inability to chew his food, humiliation, shame, and 'disfigurement'" (*Wynn v. Southward,* 251 F.3d. 591 [2001]). The Seventh Circuit Court of Appeals subsequently ruled that Wynn should have the opportunity to demonstrate at trial that prison officials "knew of and deliberately disregarded [his] dental needs" (*Wynn v. Southward,* 251 F.3d. 593 [2001]). This same court also held, as per precedent, that "dental care is one of the most important medical needs of inmates" (*Ramos v. Lamm,* 639 F.2d 559, 576 [1980]).

The U.S. Supreme Court stated in *Estelle v. Gamble* (429 U.S. 97 [1976]) that "an inmate must rely on prison authorities to treat his medical needs." If prison officials demonstrate "deliberate indifference to serious medical needs," then an Eighth Amendment violation has been proven. It is also true, however, that "because society does not expect that prisoners will have unqualified access to health care, deliberate indifference to medical needs amounts to an Eighth Amendment violation only if those needs are 'serious'" (*Hudson v. McMillian*, 503 U.S. 1, 6 [1992]).

ADEQUACY OF DENTAL CARE FOR PRISONERS

Some scholars question the quality of dental care afforded prisoners. Demonstrably, for example, patients who are not incarcerated are better protected by legal principles surrounding the issue of medical malpractice. Outside prison walls, medical personnel are held to the standard of negligence. Within a prison facility, however, a prisoner is protected from medical malpractice only by the more relaxed standard of deliberate indifference. According to some, the nature of this standard does little to safeguard prisoner-patients, since "behavior that amounts to negligence can never equal the culpability required for a finding of deliberate indifference" (Vaughn & Carroll, 1998, p. 12). Similarly, the federal courts have made it clear that prisoners can invoke a constitutionally guaranteed right to medical care only if "serious medical needs" are at stake (Vaughn & Carroll, 1998, p. 12). Those who are not incarcerated, conversely, need not demonstrate such a need before seeking medical assistance (although a severe lack of economic resources can significantly constrain their access to medical care). In addition, medical care may not be as good quality in prison, since "prison medical personnel suffer from limitations in resources, staff, and facilities" (Vaughn & Carroll, 1998, p. 27).

Critics of the level of medical care available to those who are incarcerated worry that the courts have embraced what Michael Vaughn and Leo Carroll (1998) refer to as the "principle of less eligibility" (p. 3). This principle suggests that the "conditions of penal confinement must be harsher

than the living standards of the working classes and people on welfare" (p. 37). These same critics put forth an alternative and more egalitarian vision of medical care for prisoners in which they point out that physicians have a professional responsibility to provide the same level of medical care for all human beings, regardless of social status.

CONCLUSION

Federal, state, and local prisoners enjoy a constitutional right to adequate dental care. Prisoners who believe they have been improperly denied such medical care, however, must demonstrate not only that the medical implications of such a denial are serious but also that the prison official or officials in question denied care with deliberate indifference. Meeting these two legal standards can be quite difficult for prisoners.

Prisoners afflicted with medical disorders also face a host of additional hurdles to obtaining the level of medical care that many of those who are not incarcerated can expect. The Eighth Amendment to the U.S. Constitution, then, provides a floor below which the level of medical care provided to prisoners may not fall. Some believe that this floor is unduly low, while others suggest that prisoners should be least eligible for scarce social goods.

DEPRIVATION

The concept of deprivation, associated with the work of Donald Clemmer (1940) and Gresham Sykes (1958), explains prison culture and inmate conduct as primarily the result of the deprivations prisoners experience while incarcerated. In this view, prisoner culture is a fairly normal response to an abnormal environment. Their work was later challenged by others, beginning with John Irwin (1980), who contended that, instead, prison life was shaped by ideas, attitudes, and experiences inmates brought with them, or "imported," from their street culture. Today, most prison sociologists recognize that the two factors of deprivation and importation work together to shape people's prison experiences.

OVERVIEW

Proponents of the deprivation model argue that upon entering prison, individuals inevitably assimilate into a subculture, undergoing a process known as *prisonization*. Through these adaptation mechanisms, prison culture is formed in opposition to the prison administration and officers, whom inmates view as responsible for the prison rules that restrict their choices. According to Sykes (1958), there are five key deprivations that result from institutional regulations: the deprivation of liberty, goods and services, heterosexual relations, autonomy, and lack of personal security.

DEPRIVATIONS

The deprivation of liberty is the most fundamental aspect of confinement. It refers not only to the ways

Friendships and Coping in Prison

Contrary to some observers, friendship among prisoners exists, and a few friendships may even be forged in steel. However, most are based on some form of self-gratification, security consciousness, or peer pressure. It is only through time, trials, and tribulations that friendship develops among prisoners.

The most common and successful friendships are formed similar to those in a free society, where people of similar nature, skills, interests, or education bond. Depending on the nature of the institution (federal or state), or the security level (maximum, medium, minimum), friendships are also forged on the basis of race, geographical location, and social ties inside and outside of prison. Regardless of a prisoner's immediate emotional needs, most friendships are tempered and controlled by the authoritarian nature of prison control and by peer and clique pressures. These pressures tend to shape relationships on the basis of racial prejudice, sexual orientation, and even fear and security.

Friendship among prisoners thus becomes a pseudo-bond that must continually be tested and nurtured and allowed to breathe to prove its qualities. Among prisoners, the ties that reinforce bonding include shared gratifications, security, and protection, the need to belong, sex, fear, and sometimes even greed.

If nurtured, prison friends can lead to respect and equality while incarcerated. The ultimate test of friendship, however, is longevity, and whether the relationship endures beyond the prison walls.

Geoffery Truss
Dixon Correctional Center, Dixon, Illinois

in which prisoners have their freedoms curtailed but also to the conditions of their confinement. Prisoners are restricted to the boundaries of the institution, and their movement is further restricted within the institution by a system of passes and physical barriers. For significant portions of the day, they may also be locked in a cell or dormitory. Such loss of liberty has deep psychological impact on most people as they are cut off from their family and friends. Their links to the community and their support usually weaken over time serving as a constant reminder of this deprivation and deepening their level of distress.

While incarcerated, inmates are unable to control the quality, quantity, or nature of goods and services they receive. Although they usually receive adequate food, medical care, and housing, they have little choice in how basic services are delivered. As a result, most inmates become bored. They also are often frustrated or dissatisfied with the available choices of diet and commissary items. Low pay and lack of variety characterize a state of involuntary servitude, reducing the inmate self-esteem further and deepening the overall resentment against the administration. Freedom is further curtailed by the restrictions on personal possessions, access to family and other loved ones, and normal routines. The choice of with whom to cell, how to spend leisure time, when to eat, what to wear, and what property can be possessed add to the deprivation of free choice. In this "total institution" (Goffman, 1961) virtually all aspects of daily live are regulated.

The loss of heterosexual relationships is not restricted to the absence of physical intimacy in prisons but also to the restriction of all physical contact. In high-security facilities, for example, wives, lovers, and children are able to visit only behind a glass barrier. Even in lower-level institutions, physical contact is usually limited to handholding and an embrace upon arrival and departure during visits. The deprivation of normal physical contact with another human being, critically important to psychological well-being, adds a level of stress and dehumanization to the prison experience. There is little opportunity for a healthy outlet for a basic human need.

Deprivation of autonomy refers to the ability to make basic decisions about one's life or daily activities. Regardless of their crime or security level, prisoners are governed by rules and regulations over which they have no control. Guards constantly monitor and search them and in many cases regulate their communication with others on the outside by censoring mail, surveilling behaviors, and monitoring outgoing telephone conversations. There are

few issues over which a confined person retains any control.

The deprivation of personal security is, in many respects, the most troubling loss some people suffer. Prisons contain other individuals who may be violent or hostile. Even if there is no immediate threat, the very possibility of it is anxiety provoking. In some prisons, inmates are tested by others to see how far they will go to defend themselves and their meager possessions. Someone who fails to fend off attackers may be viewed by others as vulnerable and thus be revictimized. This often requires aggressive adaptation strategies that, while judged unacceptable on the streets, can become routinely necessary inside the walls.

PAINS OF IMPRISONMENT AND INMATE CULTURE

Proponents of the deprivation model view the pains of imprisonment as directly connected to people's response to their incarceration. For example, higher-security-level prisons are more likely to have more restrictions, and therefore high-security inmates have fewer choices and freedoms those in lower-security institutions. These restrictions often lead to seemingly antisocial behavior and resistance to prison rules and policy. Other factors, such as the percentage of inmates incarcerated for violent crimes, the proportion of minority offenders, the age of the institution, and the length and types of sentences that cause increased levels of deprivation, are also thought to lead to greater tension in penal facilities, and thus increase what some see as dysfunctional behavior. Finally, some studies have shown that the degree of overcrowding within an institution affects the level of misconduct and increases solidarity among the inmate population, because the lack of personal space exacerbates the painful conditions of confinement. This, in turn, creates adaptive behavior to find both physical and psychological comfort zones to reduce the impact created by these conditions.

The deprivations that prisoners face are not limited to the loss of physical liberty or to violence or overcrowding. The feelings of deprivation arise in other, more banal, ways. Loneliness, boredom, and discomfort are more emotionally profound, and the individual's self-image begins to diminish. The attack on a person's pride and dignity constantly diminishes his or her on view of self and leads to the inculcation of the values and goals of the inmate subculture. By engaging in seemingly abnormal and antisocial behaviors, the prisoner is able to obtain goods and services, a position within the prisoners' social hierarchy, some degree of autonomy and self-respect, and security. The inculcation of the norms and values of the inmate subculture, which conflict with prison rules and regulations, increases the likelihood that inmates will adhere to and support the inmate code of conduct.

According to the early deprivation theorists, inmate subculture upheld a particular inmate code that existed in opposition to all aspects of the prison administration: Inmates were not meant to interfere in other prisoners' business; they were meant to "stay cool," do their own time, not exploit others; and not to be weak. In this model, the inmate population was thought to be strongly loyal to the group norms and values.

WOMEN

Although most of the early studies of prison culture concentrated solely on men's prisons, a handful of authors have examined women's incarceration. Two works in particular examined whether women's prisons were shaped by the deprivations that female inmates faced. David Ward and Gene Kassebaum published *Women's Prison* in 1965, and Rose Giallombardo released *Society of Women* one year later. Unlike the comparable literature on men's prisons, which explained prison life as either a result of deprivation or a reflection of "bad guy" street culture, these authors developed a combination of both. Thus, while women were affected by their choices inside, the way they responded to them was generally shaped by ideas and expectations they brought with them from beyond the prison walls. More recent theorists (Bosworth, 1999; Jones & Schmid, 2000) have moved beyond this dichotomy. They suggest a more critical or phenomenological approach that examines prison adaptation and

culture as the result of a dialectical process of identity transformation. Changes to prisoners' sense of self, these authors contend, reflect, but are not dependent on, the street culture or prison deprivations.

CONCLUSION

Correctional institutions have changed drastically since the early studies of deprivation. Today, inmate populations consist of multiple subgroups, each of which subscribes to a variety of social norms and values that are often in competition with one another. The changes are a result of increases in racial and ethnic minority populations, religious and political stratification, and the growth of gangs. In addition, due to civil rights and inmate litigation institutions are held to higher standards of accountability.

As a result of the demographic shifts, sociologists no longer believe in a homogeneous inmate subculture. Instead, it is thought that the various groups have their own norms and values and each group is in competition with the others for power. Also, institutional management has changed. Inmates enjoy more freedom of movement, transfers to reduced-security institutions are common practice, and communication with friends and family for most people is encouraged and increasing. Many prisoners have more freedom to purchase items from outside the institution. Though prison remains a place of great restriction, these changes have all altered and, in some case, significantly reduced the "pains of imprisonment."

DETAINED YOUTH AND COMMITTED YOUTH

Detained youth and *committed youth* are legal terms used to describe the incarcerated status of a juvenile offender, under the age of 18 who has been charged with breaking the law. There are several ways in which youths may be detained or committed. The most common ways include (a) holding them while they await adjudication or placement or (b) committing them to state custody in residential programs and/or juvenile correctional institutions after a court disposition or adjudication. Today, there are more than 130,000 juveniles in residential placements across the United States. Most are sent to juvenile correctional facilities for nonviolent offenses.

An adjudicated delinquent is a young person who has been found guilty of a violation of federal or state law, or local ordinance. Under some federal and state statutes, youthful offender status is extended to young adults aged 18–25 in sentencing consideration. However, under some statutes juvenile offenders can be transferred to the adult court as early as age 16. With a growing punitive public sentiment and calls for accountability and public safety, many juvenile justice systems across the country have imposed harsher sanctions for youths. Likewise, many states have increased spending on juvenile justice programs designed to incarcerate youthful offenders. Despite this trend toward harsher sanctions for youths, several public opinion

polls reveal that respondents believe the main purpose of the juvenile court system should be to rehabilitate offenders and that juvenile crime can be reduced by prevention and rehabilitation rather than by enforcement or punishment.

THE DECISION PROCESS

When juveniles are arrested, state officials must decide what to do with them. All states have passed age limits and definitions for crimes that determine whether an accused individual will be treated as a juvenile or as an adult. Although the decision to divert youths from the court system ultimately lies with most state attorney offices, workers that handle initial intake assessments also have the discretion to make this recommendation. If the youths are handled judicially, it must then be decided whether they can be released to their parents or if they must be held in a state detention center facility until their court date. They should usually only be placed in detention if they pose a threat to public safety, have a prior criminal history, or because of the seriousness of their offense or other risk factors.

TYPES OF DETENTION

There are many different ways to hold juveniles. Home and secure detention are two common ways to keep youths under state custody. Individuals can be detained in preadjudicatory status (those awaiting court hearing), postdisposition (those awaiting commitment placement), as part of their punishment, or as an alternative to correctional institution (similar to jail status in adult system). Juveniles placed in secure detention have been found to be a risk to public safety, and must therefore be held in a physically secure location. Home detention, as a type of punishment, means that the person is closely supervised in the community, or electronically monitored, and is not allowed to leave the home other than for specified conditions.

TYPES OF COMMITMENT

Committed youths are persons under the age of 18 who have already gone through the court process and have either been found to be delinquent and sentenced to a juvenile facility or have been waived to adult court, sentenced as an adult, or placed in a state or federal prison or jail. Commitment facilities for youth can also house those who are status offenders, those who need to be confined to a mental health facility, or those who voluntarily admit themselves.

In the United States, both public and private facilities provide services to youth offenders. These include detention centers, shelters, assessment and diagnostic centers, boot camps, training schools, ranches, youth camps, halfway houses, and group homes. Public facilities are usually locked local detention facilities or locked state correctional institutions for youth. Private facilities are usually less prison-like, and youths are generally confined by staff security measures. Nationally, the largest portion of state juvenile justice spending is for residential placements.

When making a juvenile justice placement recommendation, the type and seriousness of offense as well as prior record are used to determine commitment level. Facilities range from low to maximum risk. If an individual is considered to be of age, or to have committed a serious crime, as defined by the state legislature, he or she can be waived to adult court and placed in an adult facility. In some states, legislative changes have allowed for the automatic transfer of youths into adult court because of specific offenses.

COMMITMENT PLACEMENT DECISIONS

The juvenile justice agency for most states determine where to confine youths, the types of special programs to enroll them in, and if needed, their specific rehabilitative goals. There are states, however, in which the court chooses the actual institution, security level, or specialized program for each youth. Once committed to an institution, there are different types of sentencing models that states use which define the length of stay for any juvenile in their custody. These include indeterminate only, indeterminate with a minimum, indeterminate up to a maximum, determinate and indeterminate, and determinate-only sentences.

For indeterminate arrangements, youths can be committed for an indefinite period of time (usually until staff determine they have successfully completed their individual case plan), or up to the age of majority. Sentences with minimum time periods specified or maximum time periods specified also fall under indeterminate arrangements. A combination of a fixed sentence with an indeterminate option or a determinate-only sentence that the court specifies length of commitment in advance are other examples of determinate arrangements.

SERVICES PROVIDED TO COMMITTED YOUTHS

In the least restrictive programs (e.g., low-risk residential), youths are generally sentenced for shorter lengths of stay and require fewer special services. As the level of commitment increases, sentences usually increase, youths have less access to the community, and greater security restrictions are placed on them. Staff ratios are smaller and the facilities may have more secure hardware and locked gates.

GENDER

In the United States, there has been a significant increase among female juvenile offenders as compared to males in the juvenile justice system in recent years. Today, females represent a greater proportion of juveniles who are detained as compared to those who are committed, although females also tend to admit themselves voluntarily into residential placements at a greater rate than males. Many females are detained for status offenses, violations that would not be illegal for an adult, such as running away. Despite the growing numbers of female offenders, there are fewer juvenile correctional facilities available to young women since not all commitment facilities can provide services to girls. As a result, judges who are looking to detain or commit females on the basis of graduated sanctions have fewer options of where to send them.

Graduated sanctions are levels of continuum of care for juveniles that aim to place youths in the least restrictive program available while still meeting both their individual needs and the safety of the community. In Florida, the majority of girls were found to be in more restrictive residential placements due to lack of alternatives. Young women also tend to be committed to more private facilities than public facilities. Finally, those who are committed to residential placements tend to be younger on average, compared to their male counterparts.

MINORITY YOUTHS

Minority youths have a greater likelihood of entering the juvenile justice system than white youths. In the United States, there are more black young people in residential placement than whites. This is referred to as disproportionate minority confinement. In fact, minority youths are disproportionately represented at every stage in the juvenile justice process, not just in confinement (commitment). On average, the number of African American youths referred to the juvenile justice system is twice that of their proportion in the general population. The custody rate of African American youths is about five times higher than for whites, while Latino and Native American youths are incarcerated at a rate about 2.5 times higher than whites. While minority youths represent approximately one third of the adolescent population in the country, they account for two thirds of the detained or committed youth population. This disproportion is most apparent among drug offense cases.

When charged with the same offense as a white youth, an African American youth is more likely to be detained preadjudication. African American youths and Latino youths are also held in custody longer than white youths for all offense categories. In addition, there is a greater proportion of minority youths committed to public facilities than private facilities. The pattern of disproportion exists across all offense categories, where the number of white youths referred is substantially greater than the number detained and where the proportion of African American youths detained is greater than the proportion referred. Youths of other races represent about the same proportion in their referral and detention.

CONCLUSION

California, Texas, and Florida, respectively, have the largest numbers of young women and men locked up within the United States. Juveniles in these states account for 25% of the total juvenile population, but over 30% of the juveniles in custody. Because the juvenile population in custody has grown, public facilities are faced with crowding, and many operate above capacity. These conditions and the decisions made in the processing of juvenile offenders have many implications for juvenile justice in the new millennium. For example, many voters in Florida disagree with the direction and priorities of their state's juvenile justice department and do not support shifting dollars from prevention and treatment to more correctional approaches, such as long-term lockups for juveniles. The public and political debate regarding ways to deal with juvenile offenders will continue. While the public may not be as punitive as the political debate would indicate, many youths remain in detained or committed status.

DETERMINATE SENTENCING

A determinate sentence operates when a judge assigns a convicted offender to a term of imprisonment for a specific time period, for example, three years. Thus, determinacy refers to knowledge at sentencing of the amount of time that the convicted person will actually serve. "Good time" credits (or remission) typically modify that presumption, but even so, offenders enter prison with much better knowledge of how much time they will actually serve than they would if they were given an indeterminate sentence. In the United States, determinate sentencing systems usually provide also for probation as an option. This means that the sentencing choice, which is typically negotiated in exchange for a guilty plea, amounts first to an in-out decision—to prison or to probation—followed by specification of amount of time (usually measured in years) or, in the case of probation, conditions of release.

HISTORY

Determinate sentencing reemerged in the 1970s in the United States in response to widespread dissatisfaction with the indeterminate sentencing that had prevailed for nearly a century. The origins of this policy shift may be traced to leftist (or progressive) critiques that emerged in the 1960s, before becoming a centerpiece of the growing right-wing (or conservative) agenda for crime control. Progressives decried the large disparities in the time being served by inmates, noting the fundamental injustices involved and highlighting the opportunities that unfettered sentencing discretion provided for racism and social class bias. They also identified an immense gap between the rhetoric of rehabilitation that justified indeterminate sentencing and the daily reality of prisons.

However, the critiques of indeterminate sentencing were easily co-opted by those pushing for a crackdown on street crime. Thus, conservative critics lobbied for determinate sentences to increase punishment at the same time as they shifted discretion from judges to prosecutors. Legislatures also began to set new, and higher, sentencing penalties.

Typically, such sentencing revisions initially targeted more serious, more violent crimes. Eventually, however, the effort would often sweep in some lesser offenses including property offenses and drug offenses. In short, the Left had set the stage but the Right put on another play.

IMPACT ON SENTENCING

Several states established determinate sentencing systems by legislative action in the 1970s. Others followed with various forms of sentencing guidelines that sought to systematize the administration of punishment. Some of the early changes improved the situation. Minnesota, for example, adopted presumptive sentencing guidelines, after which racial disparities declined and sentencing severity did not escalate. North Carolina showed similar trends. In most states, however, determinate sentencing vastly increased prison populations while de-emphasizing and degrading probation and related community sentencing options.

The federal system's approach to sentencing guidelines became especially influential, reinforcing the movement toward mandatory minimum sentences particularly in the "war on drugs." However, the federal guidelines, and the approach to determinacy that they fostered, have not occurred without debate. Numerous federal judges have publicly criticized the harsh sentences they are forced to hand down. Federal probation officers have also complained as their discretionary expertise has been greatly diminished.

In addition to developing sentencing guidelines, the federal government and many states such as Illinois and North Carolina began to pass other legislation that upheld determinate sentencing. Some of these policies included mandatory minimum incarceration sentences; repeat offender laws; increased punitiveness toward drug offenses; truth in sentencing laws; elimination or de-emphasis of parole; reductions in good time allowances; sentencing guidelines, or more generally, structured sentencing.

All of these policies, with the possible exception of sentencing guidelines and structured sentencing, led to harsher sentencing and a concomitant burgeoning of prison (and jail) populations. For some, such developments and their associated arguments have compromised the original progressive critiques of indeterminate sentencing out of which the determinate sentences grew. Thus, critics such as Kay Harris (1991), Ruth Morris (1995), and Dennis Sullivan and Larry Tifft (2001) query why we punish and how we could do otherwise. Whether informed by feminist, pacifist, Marxist, or anarchist thought, such critiques direct us to rethink the ethical foundations of the whole punitive enterprise. Whether this leads to calls for penal abolition, for increased voice and participation, or for building a needs-based economy, all point toward peacemaking. All suggest that the fixation with sentencing reform has been epiphenomenal, and has ignored the social structural sources of penal inequities. Sullivan and Tifft (2001) summarized such a view:

> By suggesting the need to consider applying restorative justice principles within larger structural frameworks, we are not simply recommending that we introduce restorative justice practices into our families, schools, and workplaces so that a set of non-retributive processes or procedures can be called forth when someone hurts another and we seek to bring about healing and reconciliation instead of punishing them. . . . Rather, we are talking more about the creation of social arrangements that are from the outset structurally healthy because they are set up to attend to everyone's needs. They are structured in such a way that they do not do violence to anyone or create loss or deficits for anyone by either limiting participation or distributing benefits according to one's position, merit, or desert. (p. 95)

SOCIAL CLASS, ETHNICITY, AND GENDER IMPLICATIONS

Implicitly at least, radical, feminist, and abolitionist critics view determinate sentences as a misguided, harmful, and dangerous penal enterprise. More recently, those who support restorative justice and reintegrative shaming alternatives to conventional criminal justice practices proffer another challenge to determinacy and its foundation in retributive and deterrent ideologies.

Even though the civil rights movement provided the broader social and political context from which determinate sentencing emerged, sentencing reform efforts in the United States tragically contributed to growing racial disparities in sentencing and corrections. Tonry and Hatlestad (1997) aptly characterized this situation as follows:

> The cruelest irony of the modern American sentencing reform movement is that diminution of racial discrimination in sentencing was a primary aim and exacerbation of racial disparities is a major result. The aim was to make it less likely that officials would exercise broad unreviewable discretion in ways harmful to minority defendants and offenders. The result has been the establishment of rigid rules and laws that narrow officials' discretion but that also punish minority offenders disproportionately harshly. Racial disparities in the justice system that are unprecedented in American history, and steadily growing worse, are the result. (p. 217)

At the same time, the mass incarceration project in the United States also greatly increased the numbers of women confined in prisons and jails. In large part, this resulted from application of increases in drug enforcement and penalties, together with changes in the economy that pushed more women toward low-level participation in the drug trade. Again, movement toward determinate sentencing in the 1970s paved the way for such inequities as well as the related phenomenon of prisons continuing the tradition of disproportionately confining those from economically impoverished backgrounds.

So if indeterminate and determinate sentencing both produced inequities and abuses, perhaps this historical record calls for responses to criminal harms that work outside the conventional sentencing frameworks. Restorative justice may serve this role as it poses a significant challenge to punishment and control arguments. More broadly, the criminology-as-peacemaking movement could fill such a role, as would any approach attuned to the problematic relationship between social and economic justice and criminal justice.

Any such efforts, however, will need to attend to powerful historical and contemporary features of the imprisonment project that tend to embed it culturally and structurally. Thus, any nation's stance on penality tends to justify extant structures of sentencing and punishment in ways so ingrained as to resist reform. Similarly, the larger political economic agenda that massive confinement's abeyance function serves obstructs progressive change. In addition, the emphasis of the "new penology" on risk assessment and management further bolsters imperviousness to transformation. Likewise, harsh sentencing and mass incarceration provide an insidious model for governing in an era of diminished progressive political efficacy.

INTERNATIONAL COMPARISONS

While the U.S. experience dominates the criminology literature, the story of determinate and structured sentencing and its relationship to prison populations becomes much richer with attention to the experience of other nations. Major sentencing reforms in the 1980s and 1990s took place in Australia, Canada, Sweden, and the United Kingdom with significant developments elsewhere as well. Such reforms sprang from some of the same sources witnessed in the United States: inconsistency in sentencing imposition and in sentencing implementation as well as concern about confinement itself.

While the United States receives criticism for its lack of attention to sentencing reforms elsewhere—with exceptions such as day reporting centers, community service, and day fines—other nations have shown less reticence in following its lead. Thus, Australia with regard to truth-in-sentencing legislation, Canada and Australia with regard to sentencing guidelines systems, and South Africa, New Zealand, Australia, England, and the Netherlands with regard to intensive probation supervision appear to owe such developments in part to American examples. This brief contrast suggests a possible pattern with regard to sentencing reform diffusion: the United States borrowing progressive reforms, albeit infrequently, while exporting regressive policies.

The overall tendency of sentencing reforms outside the United States has been in the direction of

providing greater structuring of decision making but generally with less of the legislative rigidity that characterizes some of the early U.S. experience. In addition, while such reforms often mimic the punitiveness of the America experience, they also provide notable attempts to reduce prison populations and to make more engaged use of authentic community-based options.

As in the United States, sentencing reforms in England have not always yielded the expected results. In contrast, Australia's experience appears more promising for avoiding mass incarceration effects.

Some promising developments in sentencing reform for U.S. consideration come from the experience of Sweden and Germany. Sweden has sought greater fairness and proportionality in sentencing by attention to principles rather than resorting to the more technocratic use of numerical sentencing grids favored in several U.S. jurisdictions. Germany has reduced prison populations by largely replacing short-term incarceration with the equivalent of probation (conditional dismissal).

CONCLUSION

Determinate sentencing has become something of a lightning rod for critiques of the punitive and repressive system of which it forms only a part. Thus, criticisms of it are often less an attack on the practice of letting an offender know for how long he or she will be incarcerated than they are a denunciation of mandatory minimum sentences; expanded drug enforcement, prosecution, and sentencing policies and practices; probation and parole revocation practices; and the growth of mass imprisonment over the past three decades.

Nonetheless, determinate sentencing does not have to be harshly punitive, and could even reduce prison populations. Instead, its impact depends on the scale of punishment. That is, how much pain, or deprivation of liberty, should the state impose? Should one err on the side of excess or on the side of insufficiency? How does one even determine what constitutes excess, insufficiency, or getting it just right?

Various classical schools of penal jurisprudence counsel imposing the minimum punishment necessary to the purpose. That purpose varies according to philosophy. For Cesare Beccaria and Jeremy Bentham and other early proponents of deterrence, the pain should prevent future reoffending. For contemporary scholars who believe in an idea of just deserts, the pain should satisfy some metaphysical standard of moral recompense. What these approaches share is profound respect for liberty, and distrust of centralized authority, especially the state. That explains the strong preference for imposing minimum penalties. It fit with the commitment to greater due process for the convicted and the imprisoned, fairer and less coercive treatment, and a recognition and acceptance of inmates' critiques of indeterminate sentencing and its tendency to shield, sanitize, and legitimize corrections regimes that promised treatment but delivered punishment or worse.

On all of these points, contemporary crime control proponents part company with such conventional Enlightenment thinking. Instead, in the 1970s they sought to marry the movement toward determinate sentencing with increased punishment. They won. Prison populations in the United States (as well as in many other advanced industrial nations) swelled during the last third of the 20th century due to changes in criminal justice policies, especially regarding sentencing. The critique of indeterminate sentencing and the march toward determinate sentencing, shared in part by the left and the right, became a significant source of mass incarceration instead of the basis for greater fairness that progressives sought.

Kent v. United States, 383 U.S. 541 (1966).

DETERRENCE THEORY

Proponents of deterrence believe that people choose to obey or violate the law after calculating the gains and consequences of their actions. Overall, however, it is difficult to prove the effectiveness of deterrence since only those offenders not deterred come to the notice of law enforcement. Thus, we may never know why others do not offend.

GENERAL AND SPECIFIC DETERRENCE

There are two basic types of deterrence—general and specific. General deterrence is designed to prevent crime in the general population. Thus, the state's punishment of offenders serves as an example for others in the general population who have not yet participated in criminal events. It is meant to make them aware of the horrors of official sanctions in order to put them off committing crimes. Examples include the application of the death penalty and the use of corporal punishment.

Since general deterrence is designed to deter those who witness the infliction of pains upon the convicted from committing crimes themselves, corporal punishment was traditionally, and in some places is still, carried out in public so that others can witness the pain. Although outlawed in the United States, public punishment is still used in other countries. For instance, in August 2001, Nigeria introduced *shari'a,* or Islamic law, that allows the application of corporal punishment. That same month, Iran sentenced 20 people to be caned for consuming alcohol. In November 2001, Saudi Arabia lashed 55 youths for harassing women. Likewise, Human Rights Watch reports that under Saddam Hussein's regime in Iraq, those who violated military orders or committed other crimes could be punished by amputation of arms, legs, and ears. Finally, in England and the United States, hangings were once carried out in public. The public and family members were allowed to attend so that they could see what happened to those who broke the law. Today, some advocates call for televised executions as a way of deterring murder.

Specific deterrence is designed—by the nature of the proscribed sanctions—to deter only the individual offender from committing that crime in the future. Proponents of specific deterrence also believe that punishing offenders severely will make them unwilling to reoffend in the future. A drunk driver, for example, would be deterred from drinking and driving because of the unpleasant experience he or she suffered from being arrested, or having his or her license taken away or his or her car impounded. The state must apply enough pain to offset the amount of pleasure derived from drinking.

EARLY CLASSICAL PHILOSOPHERS OF DETERRENCE THEORY

The deterrence theory of punishment can be traced to the early works of classical philosophers such as Thomas Hobbes (1588–1678), Cesare Beccaria (1738–1794), and Jeremy Bentham (1748–1832). Together, these theorists protested against the legal policies that had dominated European thought for more than a thousand years, and against the spiritualistic explanations of crime on which they were founded. In addition, these social contract thinkers provided the foundation for modern deterrence theory in criminology.

Thomas Hobbes

In *Leviathan,* published in 1651, Hobbes described men as neither good nor bad. Unlike religious philosopher Thomas Aquinas, who insisted that people naturally do good rather than evil, Hobbes assumed that men are creatures of their own volition who want certain things and who fight when their desires are in conflict. In the Hobbesian view, people generally pursue their self-interests, such as material gain, personal safety, and social reputation, and make enemies without caring if they harm others in the process. Since people are determined to achieve their self-interests, the result is often conflict and resistance without a fitting government to maintain safety.

Hobbes also pointed out that humans are rational enough to realize that the self-interested nature of people would lead to crime and inevitable conflict due to the alienation and exclusion of some members of society. To avoid this, people agree to give up their own egocentricity as long as everyone does the same thing approximately. This is what Hobbes termed the social contract. To avoid war, conflict, and crime, people enter into a social contract with the government so that it will protect them from human predicaments. The role of the state is to enforce the social contract. Hobbes indicated that if one agrees to the social contract, that individual authorizes the sovereign to use force to uphold the social contract. But crimes may still occur even if after governments perform their duties. In this case, Hobbes argued that the punishment for crime must be greater than the benefit that comes from committing the crime. Deterrence is the reason individuals are punished for violating the social contract, and it serves to maintain the agreement between the state and the people in the form of a workable social contract.

Cesare Beccaria

Building on the ideals of the social contract philosophers, in 1764, Cesare Bonesana, Marchese Beccaria, published his treatise, *Dei Delitti e delle Pene* (*On Crimes and Punishments*), in which he challenged the rights of the state to punish crimes. He followed Hobbes and other 18th-century Enlightenment writers that laws should be judged by their propensity to afford the "greatest happiness shared by the greatest number" (Beccaria, 1963, p. 8). Since people are rationally self-interested, they will not commit crimes if the costs of committing crimes prevail over the benefits of engaging in undesirable acts. If the sole purpose of punishment is to prevent crime in society, Beccaria (1963) argued, "punishments are unjust when their severity exceeds what is necessary to achieve deterrence" (p. 14). Excessive severity will not reduce crime, in other words, it will only increase crime. In Beccaria's view, swift and certain punishment are the best means of preventing and controlling crime; punishment for any other reason is capricious, superfluous, and repressive.

Beccaria and the classical theorists believed that humans are rational beings with free will to govern

their own decisions. Indeed, he emphasized that laws should be published so that people may know what they represent—their intent, as well as their purpose. Basing the legitimacy of criminal sanctions on the social contract, Beccaria (1963) called laws "the conditions under which men, naturally independent, united themselves in society" (p. 11). He was against torture and secret accusations, and demanded they be abolished. Furthermore, he rejected the use of capital punishment and suggested that it be replaced by imprisonment.

According to Beccaria, jails should be more humane and the law should not distinguish between the rich and the poor. Judges should determine guilt and the application of the law, rather than the spirit of the law. Legislators should pass laws that define crimes and they must provide specific punishments for each crime. To have a deterrent value, punishment must be proportionate to the crime committed. Finally, Beccaria argued that the seriousness of crimes should be based on the extent of harm done to society. As an advocate of the pleasure-pain principle or hedonistic calculus, Beccaria maintained that pleasure and pain are the motives of rational people and that to prevent crime, the pain of punishment must outweigh the pleasure received from committing crime.

Jeremy Bentham

Jeremy Bentham, a contemporary of Beccaria, was one of the most prominent 18th-century intellectuals on crime. In 1780, he published *An Introduction to the Principles of Morals and Legislation,* whereby he proclaimed his famous principle of utility. He argued that "nature has placed mankind under the governance of two sovereign masters, pain and pleasure" (Bentham, 1948, p. 125). Bentham believed that morality is that which promotes "the greatest happiness of the greatest number" (Moyer, 2001, p. 26) a phrase that was also common to Beccaria. The duty of the state in Bentham's view was "to promote the happiness of the society, by punishing and rewarding" (Bentham, 1948, p. 189).

Like Beccaria in Italy, Bentham was troubled by the arbitrary imposition of punishment and the barbarities found in the criminal codes of his time in England. Noting that all punishment is mischief, he maintained, also, that all penalties, per se, are evil unless punishment is used to avert greater evil, or to control the action of offenders. In short, the object of the law is to widen the happiness of the people by increasing the pleasure and lessening the pain of the community. Punishment, in excess of what is essential to deter people from violating the law, is unjustified.

SEVERITY, CERTAINTY, AND CELERITY OF PUNISHMENT

The theory of deterrence that has developed from the work of Hobbes, Beccaria, and Bentham relies on three individual components: severity, certainty, and celerity. The more severe a punishment, it is thought, the more likely that a rationally calculating human being will desist from criminal acts. To prevent crime, therefore, criminal law must emphasize penalties to encourage citizens to obey the law. Punishment that is too severe is unjust, and punishment that is not severe enough will not deter criminals from committing crimes.

Certainty of punishment simply means making sure that punishment takes place whenever a criminal act is committed. Classical theorists such as Beccaria believe that if individuals know that their undesirable acts will be punished, they will refrain from offending in the future. Moreover, their punishment must be swift in order to deter crime. The closer the application of punishment is to the commission of the offense, the greater the likelihood that offenders will realize that crime does not pay.

In short, deterrence theorists believe that if punishment is severe, certain, and swift, a rational person will measure the gains and losses before engaging in crime and will be deterred from violating the law if the loss is greater than the gain. Classical philosophers thought that certainty is more effective in preventing crimes than the severity of punishment. They rejected torture as a means of eliciting confessions, and the death penalty as an effective method for punishing murderers and perpetrators of other serious crimes. Capital punishment is beyond the just powers of the state.

MODERN DETERRENCE RESEARCH IN CRIMINOLOGY

The deterrence hypothesis remains a key intellectual foundation for Western criminal law and criminal justice systems. Today, the idea that sanctions deter criminals has influenced penal sanctions in death penalty cases and other areas of criminal sentencing. Adherents of the deterrence theory have consistently favored policies such as "three strikes" laws, establishment of more prisons, increased penalties, longer sentencing severity, certainty of conviction and sentencing, and the hiring of more police officers. Together, these policies would control and reduce the recidivism (a return to the life of crime) of offenders who have been convicted, and curtail the participation in crime by future offenders.

Yet, despite the merits of the deterrence argument, and until 1968 when criminologists started again to test the deterrence hypothesis, empirical measurement of the theory have been scant. Prior to the 1960s, studies focused only on the philosophical ideas of the deterrence doctrine, its humanitarian orientation, and its implications for punishment. One popular research endeavor that actually tested the deterrence theory in 1968 concluded that homicide might be deterred by both certainty and severity of punishment. In research conducted in 1969, criminologist Charles Tittle found support for the theory and concluded that that the certainty of imprisonment deters crime but that severity can only deter crime when certainty of punishment is reasonably guaranteed. Other studies in the 1970s have also challenged the validity of the earlier empirical findings, arguing instead that variations in police record keeping could account for the results on certainty.

When it comes to celerity of punishment, prior and current studies have generally avoided its inclusion in deterrence measurement. Most important, much of the empirical analysis of the deterrence value has been focused on whether capital punishment deters potential offenders from engaging in homicide acts. Collectively, the empirical results of the death penalty studies have concluded that the death penalty does not deter murder.

CONCLUSION

Because criminal justice policies are sometimes based on the foundations of the deterrence doctrine, debates on the deterrence effect of punishment continue to be waged in criminological research. Programs such as boot camps for teenage offenders and "scared straight" programs continue to rely on the deterrence theory. Across the nation, "get tough" policies are based as well on the actual and threatened incarceration of offenders. In their efforts to have more empirical support, criminologists today are working in the direction of expanding the deterrence concepts from certainty, severity, and celerity to include informal social processes of reward and moral beliefs.

Since some aspects of deterrence and rational choice theories are part of the routine activities theory, deterrence theory has been modified and expanded to include the rational choice perspectives. In summary, support for deterrence theory is much greater than it has been during the past two decades. However, research demonstrates that contemporary criminal justice policies place more emphasis on the severity of punishment than it places on certainty. Death penalty, longer imprisonments, three-strikes laws, mandatory sentencing, and a plethora of other "get tough" policies have not demonstrated greater deterrent effects of punishment than less severe penalties. Indeed, increases in the severity of punishment, rather than reduce crime, may actually increase it. On the other hand, increases in the certainty of apprehension of offenders' conviction and punishment have been found to have possible effects on crime reduction. The current trend toward the use of death penalty in the United States contradicts Beccaria's ideas on certainty and quick punishment.

DIIULIO, JOHN J., JR. (1959–)

For at least two decades, from the mid-1980s through the early years of the 21st century, political scientist John J. DiIulio, Jr., put forth a contentious body of academic research, proposals, and policy on prisons and offenders that agitated or assuaged both conservative and liberal critics of his work. At the beginning of the 21st century, DiIulio turned to writing about faith-based initiatives and became a national adviser on faith-based programming for President George W. Bush.

BIOGRAPHICAL DETAILS

DiIulio completed undergraduate work at the University of Pennsylvania and graduate work at Harvard University. His first major piece of scholarship, *Governing Prisons* (1987), was based partially on his dissertation work in political science at Harvard, where he studied the Massachusetts prison system. After graduation, DiIulio was hired at Princeton University, where he quickly developed a national reputation, initially advising liberal groups, such as the Edna McConnell Clark Foundation, which at the time provided significant funding for jail and prison crowding reduction efforts in various states. Subsequently, DiIulio drifted away from liberal groups, becoming more conservative in his politics and publications.

Currently, DiIulio is the Frederic Fox Leadership Professor at the University of Pennsylvania, a Senior Fellow at the Manhattan Institute, working with the Jeremiah Project, and a Senior Fellow at the Brookings Institute, where he cofounded the Center for Public Management. In addition, he is Senior Counsel with Public/Private Ventures, an employment and training research and practice agency located in Philadelphia.

Governing Prisons

DiIulio's major study, *Governing Prisons,* explored the administration and management of high-custody prisons in California, Michigan, and Texas. In this book, where he argued that little can be achieved within prison walls without order, DiIulio advocated studying prison "not as a mini-society but as a mini-government." As with other governments, he pointed out, prisons are subject to "a vigorous system of internal and external controls" including "judicial and legislative oversight, media scrutiny, occupational norms and standards, rigorous internal supervision and inspections, ongoing intradepartmental evaluations, and openness to outside researchers" (DiIulio, 1987, pp. 235–236) Thus, criminologists should pay particular attention to issues of management in order to understand the meaning and effect of punishment.

DiIulio followed *Governing Prisons* in the 1990s with two further books about corrections. In 1990, he

published *Courts, Corrections, and the Constitution*, an edited collection of articles written by researchers and practitioners who studied or managed jails or prisons in Georgia, New Jersey, New York, Ohio, Texas, and West Virginia, and one year later released *No Escape: The Future of American Corrections*. In both books he stressed the importance of managerial practices and external monitoring of penal institutions on how prisons work. Overall, DiIulio concluded that while there is nothing inherent in prisons, prison managers, or prisoners that make prisons work, prison can nonetheless be improved through better management practices. In short, he argued, "Good prison management and prison programs are possible" (DiIulio, 1991).

THE INFLUENCE OF POLITICS

In the mid-1990s, DiIulio formed an intellectual partnership with conservatives William Bennett and John Waters—former and current "drug czars" overseeing the Office of National Drug Control Policy—and moved away from just studying prisons. Together, these men argued that crime is caused by "moral poverty." They also claimed that the United States was witnessing the development of a new type of "super-predator" young offender, who could not be controlled without harsh, punitive intervention.

Moral poverty, they explained, is the effect of absent parents, when the young do not learn right from wrong; "It is the poverty of being without parents, guardians, relatives, friends, teachers, coaches, clergy, and others who *habilitate* children to feel joy at others' joy; pain at others' pain; satisfaction when you do right; remorse when you do wrong." Moreover, they added, "In the extreme, it is the poverty of growing up surrounded by deviant, delinquent, and criminal adults in a practically perfect criminogenic environment—that is, an environment that seems almost consciously designed to produce vicious, unrepentant predatory street criminals" (Bennett, DiIulio, & Waters, 1996, pp. 13–14). Super-predators, in other words, are the result of poor parenting and poor communities. Thus, the web of punishment and surveillance should be extended to include these people as well as the offenders themselves.

CONCLUSION: A CHANGE OF HEART?

For a while, DiIulio continued to argue that increasing numbers of juvenile offenders were turning into super-predators. He also posited that incarceration practices had more of an impact than commonly acknowledged, especially by liberal crime analysts. However, in the wake of a deepening religious commitment, DiIulio came to regret and revise his "super-predator" comments. He began embracing crime prevention efforts and churches, not prisons. In 2002, President George W. Bush appointed him director of the White House Office of Faith-Based and Community Initiatives, but he resigned less than a year later amid a controversy about comments he made in the press that were critical of Bush policies and practices. Since then, he has not produced any new work on punishment. However, given the growing role of religious organizations in prisons around the country, including the opening of an entirely faith-based penal institution in Texas, it seems that DiIulio foresaw a new shift in the means of governing prisons and offenders.

DISABLED PRISONERS

The overall number of disabled offenders housed in prisons or jails, and the types of disabilities they possess, is not known. We know more about the extent and nature of mental disabilities than we do about physical disabilities among the incarcerated population. Most recent estimates indicate that among state prisoners 16.2% are mentally ill, of which 6.4% to 8% evidence severe mental disorders such as schizophrenia, manic-depressive illness, and major depression; 4% to 10% are mentally retarded; and 10% are learning disabled.

POPULATION CHARACTERISTICS

As in the general community, proportionally more women in prison appear to have mental disabilities than men. Recent estimates indicate that 31.0% (n = 326,256) of state inmates and 23.4% (n = 20,734) of federal inmates had a physical impairment or mental condition, and 21% of federal and state prison inmates reported that the disability limited their ability to work. Rates of vision and speech impairments are higher among the prison population than the free population. Across type of disabilities, a greater percentage of male inmates than female inmates reported learning and speech impairments, whereas a greater percentage of female inmates than male inmates reported hearing, vision, and physical impairments and mental conditions.

In comparison, a recent survey of sentenced and remanded prisoners (pretrial detainees) in England and Wales found prevalence rates of psychoses of 7% for sentenced male offenders, 10% for remanded male offenders, and 14% for female prisoners. The reported disability rate among Canadian prisoners is 4.1%, with the largest percentage being physical disabled due to disease or illness.

AMERICANS WITH DISABILITIES ACT

The Americans with Disabilities Act (ADA), enacted in 1990 and effective in 1992, defines persons as disabled if they have a physical or mental impairment that substantially limits one or more major life activities such as walking, speaking, seeing, hearing, learning, caring for oneself, performing manual tasks, or working. Mental impairments include mental retardation, organic brain syndrome, mental illness, or learning disabilities. Physical impairments include blindness, deafness, and chronic medical conditions brought on by disease or aging. Examples of such medical conditions include seizure disorders, tuberculosis, AIDS, end-stage renal disease, cardiovascular conditions, and respiratory conditions. Inmates under 21 years of age with an educational disability have a right to special education under the Individual with Disabilities Education Act.

The ADA requires correctional agencies to screen offenders for the presence of disabilities and to establish services/programs to address their needs. However, two separate surveys conducted by the U.S. Department of Justice found that only 70% of state prisons screened inmates for mental health problems at intake, 82.3 % of state inmates reported they were asked about their health history upon admission to prison, and 85% reported they received a medical exam since prison admission.

ACCOMMODATING DISABLED OFFENDERS

Inmates with disabilities present major challenges to the correctional system. The U.S. Department of Justice requires that all public agencies, including prisons, assess their compliance with the ADA and create plans to eliminate barriers to access of services and programs for eligible inmates with disabilities. This often includes modifying rules, policies, or practices so that the disabled are not deemed ineligible based solely on their disability. Correctional facilities must provide physical access for its inmates, visitors, staff, and volunteers with disabilities. Services and activities may be relocated to an area that provides access for the disabled rather than having to engage in renovations or new construction. Many prison systems have separate housing units available for the disabled. For example, mentally ill inmates in the federal prison system and in over half of state correctional systems offer

separate housing units in one or more institutions. Eight states and the Correctional Service of Canada operate specialized facilities for the mentally ill.

Inmates and their families or visitors are entitled to effective means of communicating, and auxiliary aids such as assisted listening devices, telecommunications devices for the deaf, taped texts, and qualified readers may be necessary for this communication to occur. Because correctional facilities are responsible for medical care of their inmate population, inmates with disabilities are provided wheelchairs, prescription eyeglasses or hearing aids, readers for personal use or study, and assistance in eating, toileting, and dressing as needed.

CONCLUSION

Prisons and jails are stressful environments and were not designed with the disabled in mind. These two factors combine to make the adjustment of the disabled more difficult. Incarceration can often exacerbate preexisting disabilities, especially those related to mental health. In addition, inmates may develop disabilities while incarcerated through injuries or through aging. In the wake of recent federal recognition of the rights of the disabled, correctional systems will have to be more responsive to inmates who possess qualifying disabilities and costs of incarceration are likely to increase.

DISCIPLINARY SEGREGATION

Disciplinary segregation is a generic term used to identify various forms of separate or segregated confinement where prisoners are housed as a form of added punishment. Persons are usually held in this manner in response to disciplinary infractions that they have been judged to have committed. In addition to separation (and sometimes isolation), disciplinary segregation also commonly includes the imposition of additional restrictions on the movement of inmates within the institution, a decreased level of privileges and programming, and more severe levels of material deprivation.

TYPES OF SEGREGATION

As a generic term, disciplinary segregation subsumes more specific forms of punitive prison confinement. For example, some prisons practice a form of disciplinary segregation known as confinement to quarters (CTQ). Prisoners usually are placed on CTQ status as a result of having violated relatively minor prison rules. Generally, they are not permitted to leave their cells and cannot participate in the normal routines of the prison including work, education or vocational training, or recreation.

Disciplinary segregation also includes various forms of solitary or near-solitary confinement, where prisoners are placed—generally for specific terms of punishment—because they have been found guilty of violating more serious prison rules. Most prisons have separate housing units that are devoted to some form of solitary-like confinement. Terms of such disciplinary confinement typically vary as a function of the severity of the infraction and range from a few days to months and, in extreme cases, a year or more.

More recently, a number of prison systems in the United States have created an especially severe

form of disciplinary segregation—imprisonment in so-called supermax facilities. These are often free-standing housing units or entirely separate prisons devoted to this form of disciplinary segregation. In them, prisoners generally are subjected to extreme forms of solitary-like confinement, unprecedented levels of monitoring and surveillance (because of the technological sophistication that is brought to bear in many such units), and very severe restrictions on movement and property. Prisoners often are placed in supermax for long and potentially indefinite periods of confinement. They may be placed in this form of disciplinary segregation for a number of reasons. Either they have committed what are regarded as very serious disciplinary infractions, or they have been judged to pose a very serious threat to the security of the institution, and/or because they have been labeled by prison authorities as gang members or associates.

Finally, administrative segregation ("ad seg") is a form of disciplinary segregation that is used for a variety of reasons in many correctional systems. In some systems, prisoners are placed in ad seg because they are suspected of having violated prison rules and are awaiting a prison disciplinary hearing or other procedure used to adjudicate their case. In some instances, prisoners are placed in ad seg because they represent what is perceived to be a general threat to prison security. And, although it technically falls outside the scope of disciplinary segregation, prisoners may be held in ad seg for their own protection, as a form of protected custody or what, in some prison systems, is known as "safekeeping." Even though these prisoners are not being disciplined for any infractions that they committed, they may be held under conditions of segregated confinement that are similar or identical to those of prisoners who are being punished and may be experienced by the prisoners themselves as punitive in nature.

THE RATIONALE FOR SEGREGATION

The use of segregation, physical restriction, and material deprivation as punishment within a prison in some ways replicates the punitive logic of prison itself—the use of "spatial confinement" to punish wrongdoers. Much as a prison embodies the idea that the persons who have committed crime in the free world should be removed from it, so too does disciplinary segregation reflect a belief that prisoners who have violated prison rules or are otherwise perceived as a threat to the operation of the prison itself are to be "taken away" and separated from the normal day-to-day routines of the environment in which they once lived.

Also like incarceration, in most instances, this kind of disciplinary sanction entails more than just removal or separation. As noted above, there usually are additional restrictions on personal liberties and material conditions that prisoners otherwise would retain during their imprisonment. Thus, although segregation is at the core of the sanction, other aspects enhance its punitive quality. Indeed, the punitiveness of disciplinary segregation and its potentially adverse psychological effect derive in part from these additional restrictions on movement, activities, property, contact with the outside world, and social interaction with fellow prisoners.

One could argue that the underlying *logic* (as opposed to punitive effect) of the use of spatial confinement as punishment, of which disciplinary segregation is part, has been degraded over time. In earlier times, there was an apparent purpose to the isolation that was imposed by incarceration. Originally, all convicts were isolated in a supposed attempt to enhance the prison's capacity to induce their "penance." Later, prisoners ostensibly were segregated to prevent them from contaminating one another with the internalized (and presumably contagious) criminality from which they were thought to suffer. At around the same time, as prisons proliferated in the course of the 19th century, Jacksonian reformers in the United States claimed that prisoners needed to be separated and isolated to protect them from the destructive influences of the surrounding society.

However, as the use of imprisonment greatly expanded over the course of the 19th century and well into the next, the logic of these more extreme forms of spatial confinement was modified and diluted. The large numbers of prisoners who had to

be housed for increasingly long periods of time made isolated confinement impractical and, eventually, impossible to sustain on a widespread basis. Congregate labor, commingling, and eventually high levels of social density brought about by overcrowded prison conditions became the norm.

When the project of personality transformation through long-term isolation gave way to managerial control through short-term solitary confinement, prisoners were still segregated, to be sure, but for different reasons. In some instances, segregation supposedly gave prisoners some respite from the turmoil in which they had become involved (in the hopes that they could disengage)—an opportunity to "cool out." Then there was the notion that isolation provided a shock treatment of sorts—a stimulus for the prisoner to come to his or her senses, receive an "attitude adjustment," or otherwise to be persuaded by the painfulness of the segregation to mend his or her ways. The continuing threat of future placement in the harsh environment of segregation was conceived as a lesson learned, a future deterrent.

Of course, none of these goals was regularly or predictably achieved. Moreover, notwithstanding the sometimes noble-sounding justifications, they always seemed to mask a basic, underlying punitive purpose. Nowadays, however, there is no mixed motive or need to disguise the punitive intent of even the most extreme forms of disciplinary segregation. Indeed, to many critics, the most extreme uses of isolation as punishment appear to be designed to achieve only one real purpose—to hurt people. The hurting at times seems so gratuitous that a more draconian end, beyond the simple infliction of pain, suggests itself—the goal is one of breaking a prisoner's spirit so profoundly that the experience will psychologically disable him.

The most extreme forms of disciplinary segregation, especially the supermax type confinement, seem to be practiced with no real concern for how or whether the prisoner will ever be able to readjust to free society, or even to mainline prison life. Indeed, most of these regimes have been implemented without any thought being given to long-term psychological consequences. Even the most extreme and, therefore, most psychologically disabling disciplinary segregation units often operate without transitional programs or graduated steps in which prisoners are exposed to conditions and experiences that are designed to reacclimatize them to more normal social environments and regain the competencies required for meaningful social interaction. In these cases, which appear to be becoming more common, it seems that the purpose of disciplinary segregation has become one of permanent exclusion from free society.

CONDITIONS AND COMPOSITION OF DISCIPLINARY SEGREGATION

Because forms of disciplinary segregation vary so widely, it is difficult to generalize accurately and meaningfully about the exact conditions of confinement that prevail in segregation units. By definition, prisoners held within them experience greater levels of social isolation, more severe limitations on movement and activity, and degrees of more deprived living conditions. Beyond these general characteristics, however, the exact nature of conditions will depend on the particular prison and the particular level of segregated discipline that is being applied.

Thus, disciplinary segregation includes units such as the Estelle High Security Unit in Texas in which prisoners were subjected to an especially problematic mix of extremely deprived and restricted confinement combined with high levels of noise and chaos. Certain units or "pods" in the California security housing unit at Pelican Bay—the state's most notorious supermax—are so quiet that they give the impression that no one is housed there, while other units in the same facility are boisterously loud. Prisoners in disciplinary segregation units in Florida—known as "close management"—are punished for talking to one another or for being "on the door" while in their cells (where they could otherwise communicate with one another or at least see what was taking place outside their cells).

The cells inside the "administrative maximum" or ADX are really cells within cells; in addition to the solid doors, each one is equipped with an inside

set of bars, which, when closed, prevent prisoners from coming to the doors of their cell. In some overcrowded disciplinary segregation units (such as Pelican Bay's supermax), prisoners are double-celled (housed with another prisoner), even though they are confined to their cells for an average of 23 hours per day. And, in one unusual variation of disciplinary segregation, prisoners in the High Security Unit at the Lexington federal penitentiary were kept in a form of "small group" isolation, where they were housed in the same small units and only allowed to interact with each other under conditions of extreme surveillance and deprivation.

GENDER AND RACE

Disciplinary segregation is used in women's prisons as well as in those that house men. Although, in general, fewer women prisoners are perceived to be a threat to the safety and security of the institution, and women generally are thought to adapt to prison confinement in less violent or aggressive ways, some women have been held in disciplinary segregation for very long periods of time. For those who are held in segregation, the conditions of confinement are as severe, psychologically taxing, and potentially harmful as those in men's prisons.

For a variety of reasons, higher numbers of prisoners of color are housed in disciplinary segregation units. In the United States, in particular, African Americans tend to be sentenced to prison in disproportionate numbers and to be given longer prison sentences than whites. For these reasons and perhaps because, in at least some prisons, prison rules are applied differentially to African American prisoners, they tend to be heavily overrepresented in disciplinary segregation units in many prison systems.

DEBATE OVER THE NEED FOR AND EFFECTS OF DISCIPLINARY SEGREGATION

Disciplinary segregation is a long-standing correctional practice. Yet it has been controversial and subjected to criticism since its inception several centuries ago. Prison administrators who defend and employ the practice in varying degrees generally offer at least one common rationale for its continued use—that housing otherwise dangerous or disruptive prisoners in one place, away from others, makes prisons safer overall. Although commonly asserted, and endorsed essentially as "commonsense" by many prison administrators, this rationale still lacks any convincing empirical proof or objective documentation. In some instances where policies of disciplinary segregation have been pursued aggressively, prison infractions and overall violence rates appear to have decreased. However, alternative explanations for these reductions are many and varied. In other instances, disciplinary segregation appears to have contributed to increases in violence and disruption (with the same caveat—that many alternative explanations for the adverse outcomes cannot be eliminated). Moreover, because most forms of disciplinary segregation lack explicit educational or therapeutic components—ones by which prisoners might learn something about the origins of their offending behavior or obtain treatment for the alleged maladies that caused them to infract—they are pursued more as a short-term management strategy rather than a real program of long-term violence control.

On the other hand, critics of the practice argue that much prison violence and disruption stem from adverse or poorly managed prison conditions, not from the inherent and cross-situational violent propensity of prisoners. Removing prisoners who have engaged in violent or disruptive behavior, absent attention being given to correcting or improving criminogenic prison conditions, is not likely to have an appreciable impact on overall levels of prison violence. Moreover, depending on the nature and duration of the disciplinary segregation itself, extremely adverse psychological reactions (including, in some instances, reactions that may make prisoners more rather than less violent) are likely to occur. Opponents of the extensive use of intense forms of disciplinary segregation contend that the costs of the practice—in economic and especially psychological terms—greatly exceed its alleged benefits.

CONCLUSION

Although sometimes prisoners' behavior and state of mind "improve" during and after their confinement in disciplinary segregation, becoming more compliant and less problematic overall, these "spontaneous remissions" appear to be infrequent. Given the fact that no proven penological or consistent therapeutic rationale is systematically pursued through this kind of confinement, the lack of beneficial outcomes is not surprising. Instead, prisoners commonly show patterns of deepening resentment, oppositional resistance, and even various forms and degrees of psychological deterioration. What is surprising is that so few alternative approaches to disciplinary infractions have been designed or implemented in correctional systems. But this, too, may reflect the power of the prison form and the punitive imperative that it implies: Wrongdoing must be responded to with penal punishment, and such punishment—in modern times—entails a form of separation or isolation from others, no matter the long-term consequences.

DISCIPLINE SYSTEM

All correctional facilities have a discipline and punishment system to ensure an orderly and safe environment for staff and inmates. Accordingly, rules and regulations cover almost all aspects of an inmate's daily routine. These rules should be provided in written form to everyone as they arrive at the reception and evaluation center. Anyone who breaks any of the rules and regulations of the penal institution will be subject to a disciplinary hearing within the institution. If the infraction is criminal and serious enough, the person also may be charged with another offense and taken to court.

DEVELOPMENT OF FORMAL DISCIPLINARY SYSTEMS

The use of a dark and isolated cell as a method of punishing violations of prison rules dates back to the earliest prisons in the United States. To enforce the rule of silence in the congregate prison system, inmates were placed in "the hole." These cells were often bare, unlit, and poorly ventilated. Those confined to them were served a diet of bread and water. The duration of their confinement ranged from days to years. Inmates were often placed in solitary confinement arbitrarily and were subject to verbal humiliation, physical beatings, and torture.

At this time, disciplinary procedures were exercised without challenge since inmates were legally considered slaves of the state. Although the case was at no time a legal base point upon which the courts could rely on for doctrine, it seems that many were influenced by the *Ruffin v. Commonwealth* (1871)

decision that "the prisoner has, as a consequence of his crime, not only forfeited his liberty, but all his personal rights except which the law in its humanity accords to him." Indeed, most courts maintained their "hands-off" policy about conditions of confinement well into the 20th century. Thus, it was not until the 1960s that federal and state courts began regularly to consider inmate appeals about correctional practices regarding their treatment and violation of their constitutional rights.

The 1941 case of *Ex parte Hull* is generally considered to mark the beginning of the court's intervention in inmates' allegations of mistreatment. In this case, the U.S. Supreme Court declared that inmates have the unrestricted right to the federal court system. Later, in *Coffin v. Reichard* (1944) the court extended federal habeas corpus to include conditions of confinement, stating that inmates retain all the rights of ordinary citizens except those expressly or by necessary implication that are taken from the inmate by the law. This decision, marking the first time in which a federal appellate court ruled that inmates do not lose all their civil rights as a condition of confinement, modified the long-standing interpretation of *Ruffin v. Commonwealth.*

The ruling in *Monroe v. Pape* (1961) permitted access to the federal courts to litigate inmate rights without first exhausting state judicial remedies. Later, in *Cooper v. Pate* (1964), the court ruled that state inmates could sue prison staff for depriving them of their constitutional rights. Hence, both the *Monroe v. Pape* and *Cooper v. Pate* court decisions signaled the end of the hands-off doctrine, and consequently served as the catalyst for an explosion of inmate lawsuits against prison authorities. In response, the rampant physical brutality, rigid authoritarian discipline, and repulsive conditions that had previously characterized disciplinary segregation were dramatically reduced.

DUE PROCESS: ITS SOURCE AND PURPOSE

Inmate disciplinary procedures are governed by the 14th Amendment to the U.S. Constitution. This amendment provides that a state shall not make or enforce any law that abridges the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law. Most disciplinary actions were exercised without challenge until the Supreme Court ruled in *Wolff v. McDonnell* (1974) that states are required to provide inmates with due process procedures before depriving them of a constitutionally protected liberty interest. The Supreme Court ruled that prison disciplinary procedures must follow certain minimum due process procedures when an inmate faces serious action that could result in the withdrawal of good time or placement in disciplinary segregation. Even so, prison officials are not bound by the same procedures found in criminal court because of the special conditions of incarceration. For example, inmates do not have the right to cross-examine witnesses or present evidence that may be hazardous to institutional safety or correctional goals.

In *Wolff,* the Supreme Court outlined the following due process procedures for states to follow when an inmate is accused of a disciplinary infraction. The inmate (1) must receive advance written notice (at least 24 hours) in order to prepare a defense against the charges; (2) is permitted to seek counsel from another inmate or a staff member when the circumstances of the case are complex or if the prisoner is illiterate; (3) has the right to present documentary evidence and to call witnesses on his or her behalf, as long as the security of the institution is not jeopardized; and (4) has a right to a hearing before an impartial body and has a right to receive a written statement of fact findings concerning the outcome of the hearing.

Following *Wolff,* the Supreme Court has relaxed many of the due process standards in disciplinary proceedings. For instance, it ruled in *Baxter v. Palmigiano* (1976) that in less serious cases where inmates might lose privileges, due process requirements are not required, even when a short-term segregation is possible. The Court also determined that the inmate has no right to counsel in these cases. Similarly, in *Sandin v. Conner* (1995), the Supreme Court ruled that disciplinary actions that are taken to achieve the goal of a safe and secure prison and do not add to the sentence being served or change the conditions of the sentence being served do not

create a liberty interest. Therefore, due process is not required. Finally, *Wolff* requirements are not required for disciplinary hearings that result in a 30-day segregation sanction. On the other hand, if the results from the disciplinary hearing change an inmate's release date, the due process protections defined by *Wolff* still apply.

DISCIPLINARY POLICY

The disciplinary policy of any correctional facility is a written document outlining the specific behaviors that are prohibited to inmates. This document should explain the process for considering guilt and determining punishments as well as listing the range of sanctions that usually result from disciplinary infractions. A copy of the disciplinary policy is usually provided to all new inmates on arrival at the reception and evaluation center. The policy should notify them of the rules and regulations they are responsible for adhering to and the possible sanctions associated with being found guilty of a disciplinary infraction.

DISCIPLINARY PROCEDURES

While all state and federal systems must adhere to the Supreme Court rulings listed above, they will vary slightly in terms of their responses to minor and major infractions. Even so, it is possible to generalize about the disciplinary procedures in most institutions.

When an inmate commits a disciplinary infraction, the correctional staff has several options to deal with the rules violation. Usually, the staff member who suspects that a disciplinary infraction has occurred must document it in an incident report, which is then submitted to the shift commander. The incident report specifies the prohibited act allegedly committed by the inmate and includes all the details surrounding the incident witnessed by the employee writing the report. The shift commander has the authority to dispose informally of a minor disciplinary infraction; however, a written record of the informal resolution is maintained. If an informal resolution of a minor disciplinary infraction is not appropriate or successful, the incident report is forwarded to the chief of security for investigation. Major disciplinary infractions, which cannot be disposed of informally, are reviewed by the shift commander and then forwarded to chief of security for investigation. Investigations for both minor and major disciplinary infractions normally commence within 24 hours of the reported violation.

If an inmate is found not guilty of a disciplinary infraction, the incident and disciplinary report, the disciplinary committee's decision, and all references to the disciplinary infractions should be removed from his or her institutional record unless the disciplinary report also includes an action for which the inmate was found guilty. If a prisoner is found guilty, a copy of the disciplinary report, notice of hearing, request for representation/witnesses form, waivers, the disciplinary committee's decision, and appeal forms are kept in his or her institutional record and central office record. The inmate is also provided with a written statement of the guilty findings, the evidence relied upon, the sanction(s) imposed, and a notice of the right to appeal.

DISCIPLINARY SEGREGATION

Individuals found guilty of some infraction against prison rules are usually placed on disciplinary segregation away from the rest of the population. Inmates on disciplinary segregation are typically housed in single cells or rooms and receive the basic necessities and services such as food, clothing, showers, medical care, and visitation by the prison chaplain. They are also allowed limited exercise, reading materials, and mail. They are not, however, usually eligible for most program privileges, other than religious guidance and necessary medical services.

Disciplinary segregation operational procedures are designed to ensure that an inmate's interactions with correctional staff occur infrequently. Inmates who are placed in disciplinary segregation typically spend 23 hours a day in their cells and are deprived of human contact and touch. Their meals are provided through slots. When they leave the cell, they are restrained and escorted by a minimum of two correctional officers. They also are denied contact

visits. While the evidence is not conclusive, medical experts and psychologists suggest that inmates confined in these conditions often suffer some type of mental breakdown. These experts argue that the side effects of total isolation range from delusions, schizophrenia, paranoia, panic attacks, and hallucinations to delirium-like conditions of hearing voices and even whispers. Experts also contend that total isolation leads to depression, cognitive impairments, anxiety, unbearable levels of spontaneous fits of rage and frustration, and difficulty in concentration with memory, which may result in disorientation, mind wanderings, self-torture, mutilation, and/or suicide. Finally, the experts suggest that apathy and lethargy set in, since inmates are tired all the time as a result of being completely idle.

GENDER DIFFERENCES IN DISCIPLINE

Despite lower levels of violence in women's prisons, it seems that staff members often perceive female prisoners as being harder to manage than their male counterparts. Male inmates are often considered to be more cooperative and respectful than female inmates, who are usually portrayed as manipulative and emotional. As a result, staff members are often quick to formally discipline women for certain actions that they might tolerate if they were committed by a man.

Indeed, despite lower levels of violence and serious infractions in women's prisons, empirical evidence indicates that the discipline for female inmates is generally harsher compared to that of male inmates. For example, Dorothy McClellan found in 1994 that in Texas, female offenders were far more likely to be cited for minor rule infractions than their male counterparts. The study findings also revealed that in these cases, the female inmates were punished more severely than males who committed similar offenses. For example, infractions such as cursing were thoroughly enforced in the women's prison, but were usually ignored in the men's prison. Likewise, in contrast to males, female inmates tended to be cited more often for offenses such as disobedience, disrespect, and vulgar language.

CONCLUSION

Prison disciplinary procedures are employed to regulate inmates' behavior while incarcerated in state or federal prison systems. Upon arrival at the reception and evaluation center, in addition to medical screening, psychological testing, and classification, inmates are provided with copies of written rules and regulations that govern their behavior as well as outline rules violations plus the prescribed penalties for violating established rules. As such, when imposing a disciplinary action on an inmate, correctional administrators adhere to the standards outlined in the *Wolff v. McDonnell* case to ensure that the minimal due process standards are met in disciplinary proceedings.

Inmates who are found guilty of major rules infractions typically are separated from the general population and placed in disciplinary segregation for a specified period of time. While not all inmates manifest negative psychological effects from total isolation in disciplinary segregation to the same degree, empirical evidence suggests that a significant number of inmates do suffer some type of mental breakdown. This problem has led many to recommend that trends toward increased use of forms of extremely harsh confinement be reversed. In addition, prisoners should be screened for special vulnerability to isolation and carefully monitored. Finally, while the informal and formal disciplinary procedures are the same for male and female offenders, research indicates that in some prisons the discipline female offenders receive is harsher than that of male offenders.

DISTRICT OF COLUMBIA CORRECTIONS SYSTEM

Washington, D.C., has a unique governance structure, unlike any other city, since it is not part of any state. Article I, Section 8 of the Constitution gives the national Congress exclusive power to make legislation for this federal city. In the 1990s, the city's prison system deteriorated into disarray and the city as a whole faced severe budget crises. Although previously Congress had handed some control over internal matters to the city government, including running a prison system, it was convinced to act. As a result, Congress passed the National Capital Revitalization and Self-Government Improvement Act of 1997. This act enabled Congress to take control of the prison system, while leaving responsibility for the jail system with the city.

THE DISTRICT OF COLUMBIA DEPARTMENT OF CORRECTIONS

The District of Columbia Department of Corrections (DCDC) was founded in 1946. It is an independent agency within the District of Columbia government, with a director appointed by the mayor. It supervises confinement for the city's pretrial detainees and the misdemeanants. DCDC is also responsible for running the city-owned halfway house.

THE DISTRICT OF COLUMBIA JAIL SYSTEM

Two facilities, controlled by separate administrations, currently serve as jails for the District of Columbia: the Central Detention Facility and the Central Treatment Facility. They are located next to each other, and in fact are physically connected by a bridge. Transfer from one jail to the other is often referred to by both inmates and staff members as "going across the bridge."

The Central Detention Facility is commonly called the DC Jail. It is run directly by the DCDC. Opened in 1976, it was built to house up to 2,200 inmates. Until 2002, the jail population was limited by a court order to a population of 1,674. Since that court order was lifted, it now houses an average population of more than 2,000 people.

The Central Treatment Facility (called CTF) was originally built to serve as an intensive medical and drug treatment facility for the District of Columbia's prison system. It opened in 1992. In 1997, the city signed a 20-year contact with Corrections Corporation of America to administer the day-to-day functions of the CTF. It is built to house a maximum of 898 inmates and houses an average of 800 people per day.

COMPOSITION OF THE DC DEPARTMENT OF CORRECTIONS POPULATION

According to publicly released DCDC statistics, almost 85% of the District's inmates are African American men. African American women make up the next largest group, comprising 8.5% of the

population. Hispanic men are 2.8% of the population and Hispanic women, 0.2%. The rest of the inmate population in DC is made of people who are Asian, white, or other racial groups. Broken down by gender, men constitute 91% of the DC corrections population and women are the other 9%.

PRISONS FOR INMATES FROM THE DISTRICT OF COLUMBIA

Historically, the District's 3,000-acre prison complex was located in Lorton, Virginia. In 1997, Congress passed the National Capital Revitalization and Self-Government Improvement Act to correct the serious financial difficulties facing the city. Congress wanted to address unfunded liabilities in the city's pension programs and other budgetary problems and refine the city's court system.

Years of neglect by the city government had turned the Lorton prison complex into an irreparable financial drain on the city's budget. The Revitalization Act mandated that the District close the Lorton prison complex and move its sentenced felons to control of the Federal Bureau of Prisons. In November 2001, the last of the Lorton prisoners was transported out. Now, after a felony sentencing hearing, a DC offender is designated to the Federal Bureau of Prisons and is taken from either of the two local jail facilities to a federal prison.

As a result, people who have been convicted of a felony violation of Washington's municipal code may be sent to prisons as far away as California. The Federal Bureau of Prisons has promised to try to keep 80% of DC inmates within 250 miles of the District and 90% within 500 miles. As this statement is simply one of intent to try, it is not legally enforceable on any level. It should be noted that the nearest federal medical center for women is in Fort Worth, Texas, so ill female inmates must be housed far away from the city and their families.

PAROLE FOR DISTRICT OF COLUMBIA PRISONERS

The parole process for prisoners from Washington, D.C., has also been federalized. Prior to the passage of the National Capital Revitalization and Self-Government Improvement Act of 1997, the local District of Columbia Board of Parole made decisions about parole for District inmates. With the passage of that act, Congress shifted authority to the U.S. Parole Commission. This policy change was finalized on August 5, 2000. Now, all decisions regarding whether to grant or revoke the parole of a DC inmate are made by the presidentially appointed commission in accordance with the federally established guidelines. This policy change is confusing for those inmates who believe that their parole should be determined according to the old DC guidelines.

In the past, decisions about parole were made on an individual basis by a parole board that was familiar with the city, its culture, and the programs available. Now decisions are made by presidential appointees from around the country. In turn, their decisions are based on relatively inflexible federal guidelines. While there are special guidelines for DC prisoners, these are based on the guidelines originally set up for federal prisoners, who, in general, commit a different class of crimes than those committed by prisoners prosecuted by the city. In addition, the U.S. Parole Commission is not bound by recommendations entered by the DC Board of Parole. Thus, prisoners may have been told that they would be paroled after serving a short amount of time, but after the transition, all decisions are revisited based on the stringent federal guidelines. These days, parole is legally considered a privilege, not a right. Thus, inmates do not have a right to parole at a certain date. At the time of this printing, legal challenges to the imposition of the new guidelines have not been successful.

When offenders are released on parole, unless there are special circumstances, they are released to live in the District under supervision. The Court Services and Offender Supervision Agency supervises the more than 2,615 people who are on pretrial releases, probation, or parole in DC. This agency was created by the Revitalization Act and took over from the previous city-run agency. It is the job of the Court Services and Offender Supervision Agency to ensure that people comply with the terms of their parole, for example, by

maintaining a job or remaining drug free. If there is a problem with an offender complying with the terms of parole, the agency can recommend that his or her parole be revoked.

PROBLEMS WITH THE DISTRICT OF COLUMBIA SYSTEM

Many lawsuits have been filed against Washington, D.C., for the unconstitutional conditions in all of its facilities. Two of the most important that are still relevant now that the Lorton Complex closed are *Campbell v. McGruder, et al.* and *Women Prisoners of the District of Columbia Department of Corrections, et al. v. District of Columbia, et al.*

Campbell v. McGruder, et al. was filed in 1971. It was later consolidated with another lawsuit, *Inmates of D.C. Jail v. Jackson, et al.,* which was filed in 1975. Both of these cases are class action lawsuits that were filed on behalf of pretrial detainees and sentenced inmates. Both cases charged widespread constitutional violations in the conditions of the DC Jail in areas such as medical care, environmental conditions, and mental health services. The city proved unable or unwilling to remedy persistent problems, so in 1995 the Court appointed a receiver to run the medical department. The receiver ran the medical services until 2000, when the District was once again allowed by the court to run its own medical services. Now it hires a subcontractor to provide services at the jail. Also, to counteract the effect of overcrowding, the Court implemented a population cap of 1,674 in 1985.

Due to the requirements of the Prison Litigation Reform Act, and the amelioration of some of the unconstitutional conditions that led the court to impose the cap, the population cap was lifted in 2002. Now, the DCDC is free to house as many people as it wants at the jail, regardless of how crowded it becomes. It remains to be seen whether DCDC can meet the requirements imposed by the Constitution with the number of people held in the jail.

The Women Prisoners lawsuit was filed in 1993. It alleged multiple violations of federal law, including discrimination based on gender, lack of appropriate medical care, and sexual harassment of female inmates. While the trial court ruled in many respects for the inmates, the District of Columbia was able to narrow the scope of the judgment somewhat in the appellate process. In the end, the lawsuit forced DCDC to create a policy and programs to limit sexual harassment, institute better obstetrical and gynecological care, and establish programming equity for the women as compared to the men.

Other problems continue. In the city jail system, inmates continue to complain of inadequate medical care, unhealthy environmental conditions, sexual harassment, sexual assault, and a mismanaged central records office. As men and women are placed around the country in the Federal Bureau of Prisons, there are concerns that arise about issues such as access to family, the cultural competence of staff in far-away prisons, and parity of programs.

CONCLUSION

The Washington, D.C., prison system remains in the control of the U.S. Congress, while the jail system is still under local control. Prisoner rights advocates continue to monitor the DC Department of Corrections for both ongoing and new problems. As the transition to federal control of prisoners is completed, advocates also continue to scrutinize and attempt to alleviate problems, especially those caused by the great distance between the prisons and the DC community. As the corrections system for the city remains split between local and federal control, there will continue to be an effort to ameliorate the confusion caused in both inmates and the general public.

DIX, DOROTHEA LYNDE (1802–1887)

Dorothea Lynde Dix was a social reformer and advocate for better treatment of the mentally ill. During the 19th century, mentally ill individuals generally were confined in the same facilities as convicted criminals. Between 1841 and 1856, Dix inspected jails, prisons, workhouses, and other institutions housing the mentally ill in the United States and in 13 European countries, collecting evidence of mistreatment of criminals and the mentally ill. She actively worked for the creation of mental hospitals designed to treat the mentally ill and to separate them from convicted offenders, changing the nature of the prison population. In addition, she brought about major improvements in how criminals in prisons and jails were housed and treated.

BIOGRAPHICAL DETAILS

Dorothea Dix was born in Hampden, Maine, on April 4, 1802. Her parents, Joseph and Mary Dix, were inattentive and abusive to Dorothea and her two younger brothers, Joseph and Charles. Her father was an alcoholic itinerant preacher, who rode circuit and was frequently absent from home. Her mother, who suffered from depression and was often bedridden, did not adequately care for the children. By the time she was 10, Dorothea was expected to care for her younger brothers and to stitch religious tracts, which her father sold.

Shortly before the War of 1812 began, the family moved to Vermont, and later to Worcester, Massachusetts. When she was 12, Dorothea and her brothers went to live with their wealthy paternal grandmother in Boston. Madame Dix attempted to educate Dorothea and turn her into a socialite. However, Dorothea had no interest in dancing or fine clothes and was eventually sent to live with her great-aunt, Sarah Duncan, in Worcester. While there, Dorothea opened a small "dame school" for girls between the ages of six and eight. She ran this school until 1819, when she returned to Boston and opened a school for older children in a building on her grandmother's estate. The school flourished and, after her father's death in 1821, allowed her to support her widowed mother. In addition to teaching,

she also wrote poetry, children's textbooks, and religious tracts for children.

Dix was not physically strong and suffered from tuberculosis during the 1830s. In 1836, she collapsed and was forced to close her school. Upon her doctors' recommendation, she left for a long holiday in Europe. While visiting friends in England, Dix met prison reformers such as Elizabeth Fry and Samuel Tuke, who were attempting to develop more humane treatments for the mentally ill.

BECOMING A SOCIAL REFORMER

Dix returned to Boston in 1838, after the deaths of her mother and grandmother. Her inheritance from her grandmother, combined with royalties from the sale of her books, gave her financial independence. In 1841, she was asked to teach a Sunday School class for women inmates in the East Cambridge Jail. She was appalled at the conditions in which the inmates lived. Criminals, children, and the mentally ill were crowded together in filthy, unheated cells without furniture or blankets. Many were naked, physically abused, and underfed. This experience greatly affected her and was the impetus for what would become her lifelong passion: a dedication to improving conditions for individuals suffering from mental and emotional disorders.

Dix campaigned for better treatment of inmates in the East Cambridge Jail and eventually obtained a court order requiring the jail to provide heat and proper clothing for the inmates. She then traveled to other parts of Massachusetts, finding similar conditions in jails, workhouses, and other facilities for the mentally ill. In 1843, with the help and support of Dr. Samuel Howe, Director of the Perkins School for the Blind, she presented her evidence to the Massachusetts Legislature and eventually persuaded the legislature to allocate funds to expand the State Mental Hospital in Worcester.

Dix then began investigating the conditions of institutions in other states. She proceeded the same way in each state, first visiting facilities and collecting information on conditions in which the mentally ill were housed, then preparing a "memorial" (a document presenting her evidence and outlining her concerns), and finally, persuading well-known local politicians to act as lobbyists by delivering her memorials and requesting funding for better accommodations for the mentally ill. In total, she played a key role in the founding of 32 mental hospitals, 15 schools for the "feeble-minded," and a school for the blind. Her efforts also inspired other reformers who also worked to establish or improve hospitals and other institutions for the mentally ill.

In the 1840s, Dix developed a proposal focusing on national long-term care and treatment of indigent mentally ill. She recommended that Congress set aside a land grant, with the income used to care for the mentally ill. Her proposal was supported by President Millard Fillmore, and she lobbied for her plan from 1848 to 1854. In 1854, her bill passed in the House and Senate, but President Franklin Pierce vetoed the bill.

In the late 1850s, Dix traveled to Europe, planning to rest and recover from her failed attempt at national provisions for the mentally ill. However, she soon began crusading for indigent mentally ill throughout Europe. Between 1854 and 1856, she visited 13 different countries and even met personally with Pope Pius IX, persuading him to order improvements in hospital conditions in Rome.

CONCLUSION

Dix returned to the United States in 1856 and continued her work as an advocate for the mentally ill. In 1861, when the Civil War began, Dix was appointed superintendent of U.S. Army Nurses. She recruited women volunteers and organized them into a nursing corps, established field hospitals and other facilities, and tirelessly worked to raise funds for medical supplies. After the war ended, Dix returned to her advocacy work, primarily focusing on Southern states where facilities for the mentally ill had been damaged or destroyed during the war. In 1881, Dix fell ill and retired, moving into an apartment in the New Jersey State Hospital, in Trenton, New Jersey, the first hospital planned by Dix and built through her efforts. She remained there for six years, until her death on July 17, 1887.

DOCTORS

The purpose of medicine is to diagnose, comfort, and cure; the purpose of prisons, although sometimes rehabilitative, is to punish through confinement. These often mutually incompatible purposes form the background for the interaction of correctional and health professionals and help explain why ethical dilemmas, even in well-managed correctional settings, are inevitable. Medicine is typically practiced in an office, clinic, or hospital where the goals of patient care define the administration and process of care. The role of prison doctors in the practice of medicine should be the same in corrections as it is in the outside world: to provide health care to the patient. Like their peers in the community, prison doctors are bound by certain ethical imperatives, particularly protection of the confidentiality of the patient-provider relationship and the process of informed consent. Correctional medicine, however, is practiced in a space where custody is predominant and health care is viewed, at best, as a necessary support for good administration, and, at worst, as a barely tolerated interference with the authority of the warden or correctional staff.

The provision of humane and effective health care for prisoners is guaranteed by the Eighth Amendment of the U.S. Constitution. Nonetheless, it presents formidable challenges. The extent to which these challenges are faced and met reflect wider societal views, the ethical integrity of prison medical services, and the degree of support prison doctors receive from their colleagues and professional associations.

DUTIES OF PHYSICIANS IN THE CORRECTIONAL SETTING

Correctional physicians have numerous duties. Their most basic task is to provide hands-on health care. This is usually done in the intake areas, during sick call, in infirmaries, and whenever emergency care is required. Physicians also act as consultants with outside providers, hospitals, emergency rooms, and specialists. Should an inmate die while in custody, it is the prison doctor who must ascertain why this happened. He or she must assess the conditions surrounding the death and determine whether the delivery of medical care contributed to its occurring.

Prison doctors are also crucial to the detoxification of inmates. The withdrawal process from drugs or alcohol generally happens in two phases: (1) the initial four to six hours and (2) a more prolonged phase in which an individual may require treatment through the administration of decreasing doses of either the same drug on which he or she was physiologically dependent or a drug that has been demonstrated to be effective in controlling symptoms. Doctors must determine which medications to use to help inmates in this part of the process while also monitoring their reaction to the first stage of withdrawal.

Many individual physicians approve of assisting in executions, even though all major medical societies and organizations (including the American Medical Association [AMA], the American College of Physicians, and the American College of Surgeons) have published their opposition to physician participation in capital punishment on ethical grounds. Twenty-eight states require or permit

doctors to be involved in executions. According to the AMA, physicians may certify death and administer a tranquilizer. They may not, however, pronounce death, place an IV for lethal injection, order the drugs to be used, or do anything else to facilitate the execution.

CHALLENGES FACED BY PRISON DOCTORS

A number of factors often create barriers to the provision of physician services in correctional institutions. For example, medical personnel and correctional staff may be incompetent or indifferent to prisoners' health. There is often a shortage of prison doctors, since it is difficult to find highly qualified practitioners willing to trade their income from private practice for prison service salaries. Consequently, prison health services tend to rely heavily on physicians' assistants (PAs) and nurses. The situation may be exacerbated by the location of a facility, low salaries, sexism, and poor working conditions. For example, isolated rural institutions may find it difficult to hire a medical professional. Other institutions may refuse to hire women. Those facilities that employ physicians do not always provide adequate supplies or equipment. Most problematically, the lack of trust inherent in penal facilities makes providing medical care difficult. As a result, inmates do not assume that the medical system is acting in their best interests.

The changing and aging prison population has meant that prison doctors are now dealing with medical problems that were less prevalent 20 years ago, such as those associated with caring for the elderly. They are also required to provide adequate obstetric/gynecological care for the growing number of women prisoners, while treating and preventing the spread of tuberculosis, hepatitis, and HIV/AIDS.

PRIVATIZATION OF HEALTH CARE

As with so much else in the U.S. criminal justice system, prison health care in many facilities has been privatized. When this happens, physicians work as contract employees, rather than for the state. The Physicians' Network Association is one such private company that provides health care to adult and juvenile facilities throughout the United States. Established in 1990, this organization provides physician, nursing, and mental health services to correctional facilities, nursing homes, assisted living centers, and medical clinics.

CONCLUSION

Despite the many challenges facing prison doctors, in many ways, correctional health care is one of the last bastions where a physician can actually practice medicine the way it was taught in medical school. He or she is free from the problems of private practice such as billing, rationing care based on ability to pay rather than need, defensive medicine, cost of operating a practice, and so on. There is no need to worry about whether there will be enough patients to make ends meet. A physician who wants to provide good health care can do so in the prison setting. He or she can continue in the role of caregiver and patient advocate.

DONALDSON, STEPHEN (1946–1996)

Stephen Donaldson, the first American jailhouse rape survivor to discuss his experience publicly, spent many years of his life working to expose the problem of sexual assault in U.S. correctional institutions. He also served as the president of the group Stop Prisoner Rape from 1988 to his death in 1996.

Donaldson, who was born Robert A. Martin, Jr., in Norfolk, Virginia, lived a life of many firsts. He adopted the name Stephen Donaldson as a pseudonym for his involvement in the gay liberation movement, started the world's first gay student organizations at Columbia University in 1966, and was the first sailor publicly to fight against a discharge from the U.S. Navy for "homosexual behavior."

In 1973, Donaldson was arrested during a Quaker antiwar pray-in at the White House. He refused to pay the $10 bail, which he believed discriminated against the poor, and instead chose to go to jail.

Donaldson was initially placed in a cellblock with other nonthreatening prisoners, including G. Gordon Liddy, who had broken into Democratic Party headquarters in the Watergate complex that year. In his autobiography, Liddy relates what he heard happened to Donaldson when District of Columbia Jail Captain Clinton Cox transferred him to an all-black cellblock. The young, small, and white prisoner was beaten and gang-raped approximately 60 times over the next two days.

Donaldson required rectal surgery to recover from his injuries. Furious at having been set up by Cox, he called a news conference on August 24, 1973, the day of his release from the hospital. He also testified about his experience before the Washington, D.C., City Council. The Washington *Star-News*, writing of Donaldson's experience, called him "a man of uncommon understanding."

Protesting his experience in the Washington, D.C., jail was the beginning of a life of work to end sexual abuse in prison. In 1984, he was named Eastern regional director for People Organized to Stop Rape of Imprisoned Persons, the group that eventually became Stop Prisoner Rape (SPR). He was named president of SPR in 1988.

Donaldson was an indefatigable researcher and prolific writer on the subject of prisoner rape. His articles and editorials appeared in the *New York Times*, *Los Angeles Times*, *Boston Globe*, *Penthouse*, and many other publications. He was the first person to collect statistical data on the incidence of prisoner rape. He joined a team of researchers, headed by Dr. Cindy Struckman-Johnson of the University of South Dakota, that concluded that from 9% to 22% of male prisoners are raped in confinement each year.

Donaldson appeared at many rallies to improve prison conditions, as well as on radio and TV. He was the focus of a 40-minute live TV interview on *Good Morning San Francisco* in 1985, after which the U.S. Parole Commission ordered him not to speak about jails and prisons in the media. He also appeared on *Geraldo* and *60 Minutes* to discuss prisoner rape.

Buddhism was a serious interest for Donaldson, and he taught courses on the subject at Columbia University. He spent a year in India becoming an Advaitist Hindu monk and took the name "Lingananda," as part of his studies.

Seemingly suffering from posttraumatic stress disorder as a result of the 1973 incident, Donaldson was frequently in and out of trouble with the law. He was jailed numerous times, and he was often raped in custody. While incarcerated in the early 1980s, he contracted AIDS from a prisoner who sexually enslaved him. Such victims are called "punks" in prison lingo, and Donaldson—in the Buddhist tradition of embracing what is painful or unpleasant—took the additional name of "Donny the Punk." Under this name, he became well-known in the punk rock music culture in the United States and Europe.

Not long before he died, he wrote a brief for and testified before the U.S. Supreme Court in *Farmer v.*

Brennan, the case that became the legal precedent for handling of both inmate-on-inmate rape and custodial sexual misconduct. In defense of the sometimes explicit content on SPR's Web site, Donaldson also testified as a plaintiff in the case *ACLU v. Reno*, which challenged the Communications Decency Act.

Donaldson died July 18, 1996, in New York City at the age of 49. His death was caused by an "indeterminate virulent infection complicated by an AIDS-defining condition." Several of his essays are featured on SPR's Web site, www.spr.org.

DOTHARD v. RAWLINSON

In *Dothard v. Rawlinson* (1977), the U.S. Supreme Court addressed how Title VII of the Civil Rights Act of 1964, which forbids sex discrimination in the workplace, applied to a state prison's employment policies regarding prison correctional officers. At the time, Alabama had a statute that specified that prison guards must be at least five feet, two inches tall and weigh at least 120 pounds. The plaintiff in *Dothard,* a female applicant for a prison correctional officer position within an Alabama maximum-security facility, alleged that this policy, although seemingly neutral with regard to gender, had a discriminatory impact in practice. Namely, women were far less likely than men to meet the state's minimum physical standards. The weight and height requirements in question disqualified about 40% of female applicants, and only 1% of male applicants. The Court held that once a plaintiff demonstrates that an employment policy has a disparate impact on the basis of sex, the burden of proof then shifts to the employer, who must show that there is a manifest relationship between the specified qualifications and the employment in question. The plaintiff would then have the opportunity to demonstrate that "other selection devices without a similar discriminatory effect would also serve the employer's legitimate interest in efficient and trustworthy workmanship."

In *Dothard v. Rawlinson,* the Court ruled that the plaintiff did indeed establish a prima facie case of sex discrimination and that the state did not demonstrate the validity of using height and weight standards to measure an applicant's ability to serve as a correctional officer. As a result, the minimum height and weight requirements were held to be in violation of Title VII of the Civil Rights Act of 1964. The Supreme Court thus paved the way to open up employment as correctional officers to female applicants.

GENDER AS A BONA FIDE OCCUPATIONAL QUALIFICATION

During the early stages of Dothard's legal attack on Alabama's height and weight requirements, the state adopted a regulation specifying that women could not work as prison guards in maximum-security facilities where they would be in "continual close physical proximity to inmates of the institution." This regulation had the effect of screening women out of about 75% of prison guard positions. Dothard subsequently amended her claim to include the state's open use of gender as an occupational qualification. The question for the Court was whether the explicit use of gender qualifications is "reasonably necessary to the normal operation of that particular business or enterprise." Gender in this case was deemed to be a bona fide occupational qualification that would constitute a legitimate

exception to Title VII's general prohibition against sex discrimination in the workplace.

The Supreme Court's ruling that gender was a legitimate factor disabling women from certain tasks on the grounds that the "environment in Alabama's penitentiaries is a peculiarly inhospitable one for human beings of whatever sex" rescued the state from a Title VII violation. The Court pointed out that no attempt was made to segregate male sex offenders from the prison's general inmate population, and hence female guards in such institutions would likely prove unable to function effectively. In short, given Alabama's notoriously brutal prisons, the state could legitimately prohibit women from serving as prison guards in maximum-security prisons in "contact" positions.

The Court in *Dothard* did emphasize that "Alabama's penitentiaries are evidently not typical . . . [and] women guards could be used effectively and beneficially" in many maximum-security prisons. As such, one can understand the impact of *Dothard* as potentially quite narrow, since the Court took pains in this case to interpret the claim of Alabama against the backdrop of what they themselves characterized as a prison system shot through with "rampant violence" and a "jungle atmosphere."

DISSENT IN *DOTHARD*

In his dissent, Justice Thurgood Marshall refused to accept that Alabama's particularly inhospitable maximum-security prisons were in any sense operating "normally." Marshall concluded that "two wrongs do not make a right," and Alabama, if indeed its prisons were in violation of the Eighth Amendment's prohibition against cruel and unusual punishment, should be required to remedy this constitutional deficiency "with all possible speed." Marshall also suggested that the conditions of Alabama's maximum-security facilities posed just as much risk to male guards as to female guards. Marshall then lamented that the Court majority in *Dothard* required from the state no empirical evidence of breakdowns in the "normal" operation of their prisons because of female prison guards. He concluded that mere speculation about what *might* happen should not be able to satisfy the stringent requirements of a bona fide occupational qualification defense.

DISCRIMINATION AGAINST MALE PRISON GUARDS

In those relatively few cases involving male prison guards and female prisoners, the courts have been more sympathetic to the privacy rights of women inmates. An interesting companion case to *Dothard* can be found in *Torres v. Wisconsin* (1988). In this case, the superintendent of a women's maximum-security facility (Taycheeda Correctional Institution) decided to prohibit men from serving in correctional officer positions that involved a great deal of contact with prisoners. The superintendent argued that the rehabilitation of many female prisoners would be substantially furthered by limiting the access of male correctional officers. Two men filed suit after they were reassigned to positions involving less contact with prisoners, albeit they suffered no loss of pay because of the reassignment. The Seventh Circuit Court of Appeals held that the state successfully carried their burden of demonstrating a legitimate employment issue based on gender.

The court in this case was convinced that the state's goal of rehabilitating female prisoners at Taycheeda Correctional Institution, where about 60% of the inmates had been sexually abused by males in the past, was materially furthered by the superintendent's policy on gender. As in *Dothard,* the court concluded that while there was no available "objective evidence" on the harmful effects of having male prison guards in close contact with female prisoners with a history of sexual abuse, the "totality of the circumstances" presented in the record demonstrated to their satisfaction the legitimacy of the policy in question.

CONCLUSION

The ability of prison facilities to use gender as a job requirement has been narrowed greatly since the *Dothard* ruling. The courts have tended to favor the employment rights of female prison guards over the privacy claims of male prisoners. Conversely, the federal courts have been more willing to limit

the employment opportunities for male guards when they are dealing with female prisoners. The overall employment impact on male prison guards has been negligible, however, in part because the vast majority of prisoners in the United States are men.

The general trend has been for the federal courts to find that "very few prisons [were] as 'constitutionally intolerable' as Alabama's maximum-security prison" (Jurado, 1998, p. 27). Many states have no gender requirements for who may serve as a prison guard in maximum-security facilities, ostensibly because no such requirements are warranted on the basis of physical strength, security, or correctional officers' influence on prison conditions. Evidence suggests that correctional officers very rarely use physical force to carry out their job duties but rather rely on interpersonal skills such as negotiation, accommodation, and manipulation to carry out their core job functions. Available evidence also suggests that women correctional officers are not more likely than male officers to be assaulted by inmates. Finally, whether correctional officers are men or women does not seem to have an appreciable impact on prison conditions.

Legal Cases

Dothard v. Rawlinson, 433 U.S. 321 (1977).
Torres v. Wisconsin, 859 F.2d. 1523 (1988).

DRAFT RESISTORS

A draft resistor or conscientious objector is an individual who, with sincere conviction that is motivated by conscience, cannot take part in either all forms or in particular aspects of war. There have been many examples and ways of resisting armed service throughout the history of the United States. During Vietnam, for example, many young men refused to appear for military obligations and often engaged in a public declaration of resistance by burning their draft card. Others, more silently and anonymously, merely crossed the border. Both then and now, members of the armed forces claimed conscientious objector status.

The U.S. government recognizes two types of conscientious objectors: (1) those who, by reason of religious, ethical, or moral belief, are conscientiously opposed to participation in war in any form and (2) noncombatant conscientious objectors, who are opposed to killing in war in any form but who do not object to performing noncombatant duties (e.g., medic) in the armed forces. In addition, there are four other types of resistors who are not officially recognized: (1) tax protesters, whose conscience does not allow them to pay the military portion of their taxes because of ethical, moral and religious beliefs; (2) selective objectors, whose conscience forbids them to participate in an "unjust" war (e.g., Vietnam); (3) nuclear pacifists, who refuse to participate in a nuclear war, or what they believe would likely become a nuclear war; and (4) noncooperators with the draft, whose conscience does not allow them to cooperate with draft law requirements.

Many resistors, such as Quakers, who are pacifist by doctrine, refuse to serve for religious reasons.

Others do not fight because of a deep sense of their responsibility toward humanity as a whole and from a belief that the government doe not have the moral authority to wage war. Some draft resistors are unwilling to serve in the military in any role, while others may agree to work in noncombat roles. In World War I, for example, numerous resistors drove ambulances, often under fire.

HISTORY

If the citizen soldier can be traced back to the early origins of America, so can the draft resistor. The first known recorded instance of pacifist resistance to military service took place in Maryland in 1658, where one Richard Keene was fined for refusing to be trained as a soldier. Usually, religion underpinned individual resistance to military action. Indeed, James Madison, in his original proposal for a bill of rights, also felt that no person should be compelled to render military service because of religious scruples. It is not clear why his idea was never adopted, but the evidence suggests that the framers of the Constitution favored leaving military exemptions to the jurisdiction of the states.

Conscientious objection first achieved legal status during the Civil War. At this time, President Abraham Lincoln established a system of alternative civilian service, and the revision of the 1864 draft law provided that draftees who objected on religious grounds be considered noncombatants.

From 1948 to 1973, the United States drafted men to fill vacancies in the armed forces. In 1973, the draft ended and the United States converted to an all-volunteer military. Today, a registration is in place, whereby with certain exceptions all 18-year-old men residing in the United States are required to register for the draft.

During the 20th century, conscientious objectors risked punishment and incarceration if they refused to serve in battle. For example, many of those who objected to fighting in World War I on either religious or moral grounds, as well as those who just spoke out against the war, were sent to prison. Most famously, socialist Eugene Debs was convicted of criticizing the conviction of draft resistors and draft opponents and was sentenced to 10 years in prison. Similarly, even though President Franklin D. Roosevelt restored the citizenship rights of more than 1,500 persons who served prison terms for draft violations (or for minor espionage acts) during the war, numerous men were incarcerated for refusing to serve in World War II. Of the 34.5 million men who registered for the draft in the second world war, more than 72,000 applied for conscientious objector status. Of these, 6,000 rejected the draft outright and served prison sentences. Once again, it was not until after the war that President Harry Truman pardoned some 1,500 of these individuals and another 9,000 who had been convicted of military desertion during wartime. During the Vietnam War, more than 209,000 men were formally charged with violating draft laws. Of the 25,000 indictments, 8,750 were convicted and fewer than 4,000 served prison time.

CONTEMPORARY VIEWS

In 1970, the Supreme Court removed the religious requirement and allowed conscientious objection based on a deeply held ethical philosophy with no reference to a deity. One year later, however, the Court refused to allow objection to a particular war that affected tens of thousands of opponents to the Vietnam War causing an exodus of draft evaders, primarily to Canada and Scandinavia.

President Gerald Ford in 1974 instituted a partial clemency program for draft resistors. The program covered the following categories: convicted drafted violators, convicted military deserters and AWOLs (absent without leave), draft violators who had never been tried, and veterans with less than honorable discharges for absence offenses. Persons receiving clemency were required to complete up to 24 months of alternative service and sign an oath of allegiance to the United States. Only 27,000 of the 350,000 eligible individuals applied and 21,800 were given clemency, mostly those living in the United States, not exiles.

In 1977, President Jimmy Carter established two programs to assist war resistors. In January, he issued an unconditional amnesty for draft resistors and

later that year, set up a process to pardon military deserters. Together these programs provided amnesty for all draft evaders whether they had pursued legal remedies or not. Unfortunately, there are no accurate figures available for the real number of resistors who benefited from it. In addition, Congress did not adequately fund the program and the period of time under which people could apply was very limited.

CONCLUSION

Claiming conscientious objector status is by no means a thing of the past. There were 117 conscientious objectors during the 1991 Persian Gulf War. More recently, in the war in Iraq several hundred U.S. soldiers initially applied for this status. Likewise, the United States is not alone dealing with this issue. In Israel, for example, many soldiers in the IDF (Israeli Defense Force) have recently been subject to court-martial for their refusal to fight against the Palestinians, seeing it as an army of occupation. There is no such alternative civilian service in Israel, so most serve jail or prison sentences for their acts of conscience. Wherever a state elects to wage war, it seems that there will be those who refuse to serve. The question then becomes how does society respond to their resistance?

DRAMA PROGRAMS

Theater behind bars has consistently survived in harsh prison environments as well as in more lenient milieus. Prisoners and practitioners report that drama programs involving workshops, classes, or productions enable them to transcend their prison routines and move toward greater empathy. They also help them gain access to literature and to a world outside their confinement while feeling part of a community. Drama helps many to create personal space in an impersonal place; work toward personal, social, or institutional change; and prepare for release and reintegration. However, as prisons seek to make conditions increasingly restrictive for inmates, artists have more difficulty in finding supporters inside, and prisoners have less opportunity for creative outlets.

HISTORY

Prison is a ready-made place for theater because people need to be able to express themselves. Theater has always been a way for ordinary people to feel extraordinary, and for many to transcend their circumstances, physical problems, or emotional lives. In an unfeeling or repressive environment, it is a way to be connected to one's inner self and it is also a way to step into the shoes of a person whose behavior may be radically different from one's own. Entertainment from the outside is one way prisoners gain access to drama but more significant are those programs initiated by inmates or provided by artists and/or teachers from the outside.

While it is difficult to pinpoint a first program or play behind bars in this country, a photo from the State Penitentiary in Canon City, Colorado, held in the archives of the *History of the American West, 1860–1920* in the Denver public library, shows male prisoners enjoying a stage show at the turn of the 20th century. The 1970s and 1980s saw an increase in the relationship between theater and criminal justice. Programs in European countries far surpassed those in American prisons as companies from England, France, Italy, Spain, Ireland, and Germany, for example, sought to create innovative

ways to reach prisoners. Theater troupes such as England's Clean Break started because inmates wanted to communicate their experiences with others. Theatre for Prison and Probation began in Manchester, England, as the need grew to teach practitioners to work in prisons. John Bergmann founded Geese Theatre in 1980 in Iowa and expanded his work to include training and performing with prisoners in seven countries. Shakespeare too got a turn as Murray Cox brought *Hamlet* to a secure psychiatric hospital in the United Kingdom, male inmates in a Kentucky maximum-security prison performed *Titus Andronicus,* and women at Framingham Women's Prison in Massachusetts put on *The Merchant of Venice* and *Rapshrew,* an adaptation of *The Taming of the Shrew.*

By the 1990s, as more violence hit America's cities, the country turned toward a "tough on crime" policy and theater programs folded as prison officials feared the wrath of politicians and the scorn of the public for allowing inmates to participate in nonpunitive activities. When the Omnibus Crime Bill, in 1995, took away Pell grants from incarcerated adults—the federal funds that were supporting students behind bars—many college credit programs disappeared. At the same time, many other arts programs were cut across this country.

TYPES OF PROGRAMMING

Drama programs that encourage productions inside tend to fall into two categories. Many artists work with inmates' own stories and help prisoners create plays from them. These kinds of works are original and may involve music and poetry as well. Rhodessa Jones from San Francisco has been creating original pieces for more than 10 years with incarcerated women, incorporating music and dance into her theatrical productions as well. In South African prisons, puppets often play a large role in productions as a way to tell stories, and in Brazil, a dialogue was initiated after a play about the oppressive prison system was performed for an audience that included politicians. Other practitioners work with scripts and develop plays that expand inmates' knowledge of literature, producing the plays exactly as the author wrote them, or recreating classic texts by allowing prisoners to add some of their own words to the original text.

Theater practitioners also use drama techniques for ends other than performance such as anger management, dealing with drugs, bullying behind bars, stress management, and teaching cooperation versus competition. Buzz Alexander in Michigan created a course to educate theater students at a university to be volunteers behind bars. Charles Dutton, known to TV audiences as the star of the 1990s sit-com *Roc,* first educated himself in solitary confinement by reading plays. When he returned to the general population, he started a prison theater group for inmates to deal with their pent-up energy, and when he was released from prison pursued an acting career at Yale Drama School. Most practitioners who go into prison to do drama work also talk about the fact that they, as teachers, are consistently taught by the inmates, thereby reconnecting with the age-old transformational power of theater.

PROBLEMS IN RUNNING A PRISON DRAMA PROGRAM

The major problems that drama practitioners face come from the nature of incarceration itself. Inmates may enroll in a class or sign up for a production and then get disciplined for weeks and be pulled out or transferred to a different prison. Visits, doctor appointments, and conflicting activities cause inmate-students to miss rehearsals or classes. Literacy can be a problem and often students of many skill levels are enrolled in the same class. However, by reading plays and by using improvisation, groups overcome the discrepancies in abilities.

Most difficult are issues around production. Props and costumes need approval and prison rules must be carefully followed, sometimes meaning extra hours for thorough searches. Any disruption in the prison may mean activities are cancelled. Security always takes precedence over expression and may cause performance cancellations. Tensions between inmates may also surface in the intensity of dramatic performance and because correctional officers

sometimes sit in on rehearsals. Issues that must always be addressed are working with the authoritative prison administration, safety, conflicts within the group, the liaison with guards, and time issues.

CONCLUSION

Anecdotal evidence from participants indicates that drama programs in prison are important to the inmates and that the "tough on crime" attitude should not discredit such programs. Black, white, and Latino women were equally involved in classes taught in the Massachusetts Women's Prison and reported that their experiences in class and on stage helped them learn more about other ways of living than those they had learned on the street. In England, evaluations show that prisoners' attitudes changed after their involvement with drama. Many became more self-confident and reported higher levels of self-esteem. Officers reported a good sense of group coherence that promoted a more respectful environment. European Theatre and Prison Conventions have been held in Milan, Manchester, and Berlin, aimed at organizing artists and promoting theater in prison as a viable vehicle for growth and change. What is certain is that these kinds of energies are not going away and may in fact thrive in even the most repressive environments and most secure institutions. While the future of drama programs may be at risk, the outcomes have been so positive to insist that theater behind bars is definitely an underutilized tool in U.S. prisons.

DRUG OFFENDERS

Drug offenders have been the fastest growing segment of the U.S. prison population since the mid-1980s. As a result of the "war on drugs," which focused local enforcement on street dealing and increased sentences for drug crimes, drug offenders now make up a significant proportion of inmates in most state prisons and in the federal corrections systems. The growth in numbers of people serving sentences for drug offenses has disproportionately penalized ethnic minorities, especially young back men. The decision to treat drugs as a law-and-order issue rather than one of public health has also created significant obstacles to effective treatment provisions for drug users.

DRUGS AND CRIME

Crime is one of the attendant problems of drug abuse. According to one estimate, a male drug user may commit 80 to 100 serious property offenses per year to pay for his drugs. A number of ethnographic and longitudinal studies of drug-using criminals also show that high levels of drug (ab)use are associated with high levels of crime, while lower levels of drug use are associated with fewer offenses. However, the connection between drugs and crime is not always straightforward. Not all drug users are predatory offenders; many have no convictions except for illegal possession and remain otherwise "crime-free" for all their drug-taking careers. Moreover, there is evidence to suggest that some types of drugs are less associated with crime than others; offending might have more to do with the lifestyle and personal circumstances of the drug user than anything else. For example, ecstasy use is not generally associated with crime because of the sociodemographic features of users most of whom are occasional drug users with adequate economic resources. They are less likely to have a criminal

history or a subsequent criminal career. On the other hand, heroin users are more likely to be working class, unemployed, homeless and poly-addicts. Drugs and crime are strongly associated with this group, but this may be because their sociodemographic background put them at a higher risk of criminality in the first place.

DRUG CONTROL

The current characterization of drug control in the United States as a war on drugs was initiated by the Nixon administration in the early 1970s. Since then, the United States has launched successive "wars" on drugs even at a time when general population surveys showed declining levels of drug use. In each war, law enforcement and punishment have been by and large favored over prevention, treatment, and education strategies.

In practice, the war on drugs has been translated into "get tough" drug laws and harsh mandatory minimum prison sentences. In an increasing climate of zero tolerance, police crackdowns and intensive community policing strategies have also been extended to minor drug users and buyers. Controversial police enforcement activities have included undercover drug buys, increased use of stop-and-search powers especially in drug hot spots, and police arrests for various misdemeanors such as loitering and disorderly conduct.

CONSEQUENCES

The toughened-up approach to drug control has brought a large number of drug offenders into the courts, jails, and prisons. From 1980 to 1998, the total number of criminal arrests nationwide increased by 40% while the number of drug arrests rose by 168%. Of the 38,288 suspects referred to U.S. attorneys for prosecution during 1999, about one-third were involved with marijuana; 28%, cocaine powder; 15%, crack cocaine; 15%, methamphetamine; 7%, opiates; and 3%, other drugs. The majority of these suspects (around 97%) were investigated for drug trafficking (including manufacture, distribution, or possession with intent to distribute illicit drugs), 2% for simple possession, and less than 1% for other drug offenses. According to data collected by the U.S. Department of Justice, the number of drug offenders entering into the prison system has also increased dramatically in the past two decades. Between 1980 and 2000, the number of women and men incarcerated in federal prisons and new commitments to state prisons for drug offenses increased more than tenfold. The average time served in prison by a convicted drug offender rose by over 100% during the same period.

Many minor drug offenders have been caught up in the drug control system. A significant proportion of the prison inmates are low-level drug offenders with no current or prior violence or previous prison time. Almost half of the drug defendants convicted in federal courts during 1999 had no prior convictions; 92% of first-time drug offenders were sentenced to prison. Even statutes that are meant to target the violent and more serious offenders often result in punishing relatively minor drug offenders. For example, as of 1995 more people had been sentenced under California's three-strikes law for simple marijuana possession than for murder, rape, and kidnapping combined.

RACE AND GENDER

There have been other effects of the drug-related prison population explosion. At every level of the criminal justice system empirical analyses suggest that the war on drugs has resulted in worsening racial disproportionality in juvenile institutions, in jails, and in state and federal prisons. Between 1985 and 1995, the number of black state prison inmates sentenced for drug offenses rose by more than 700%. In some states, the racial disparity has been dramatic. In Pennsylvania, for example, drug commitments of black males increased by a staggering 1613% in the 1980s; white males by 477%. In 1990, 11% of Pennsylvanians were black but 58% of state prisoners were black. A similar pattern has been found in Minnesota, North Carolina, and Virginia. It is now clear that blacks and Hispanics are serving most of the mandatory prison terms under the existing drug laws. In 2000, sentenced

for drug offenses were 43,300 (out of a total of 178,500) Hispanic state prison inmates and 145,300 (out of 562,000) black state prison inmates.

The impact of the prison population explosion on young black men and minority communities has been well documented. Black women are also overrepresented among those sentenced to prison for drug offenses. For example, in 1994, around 8 out of 10 women sentenced for crack cocaine offenses and 1 in 2 women sentenced for drug offenses overall were black.

EFFECTIVENESS

Conclusions about the effectiveness of drug sentencing are hard to draw. It is difficult to measure the deterrent effect of criminal sanctions on drug selling. Indeed, some critics argue that as long as demand for drugs and the likelihood of marginal gains from drug selling remain high, offenders in socially and economically marginal neighborhoods may continue to perceive strong economic benefits from participation in the drug economy. The incapacitative effect is also limited in high-volume drug offenses since a top drug dealer or major trafficker in prison may simply be replaced by someone else in the organized crime enterprise.

In Britain, the use of imprisonment for drug offenders has remained relatively steady over the past decade—about 10% of the total of drug offenders by the end of the 1990s. Research indicates that drug taking among prison populations prior to incarceration is high, with use in the 12 months before entering prison ranging from 40% to about 70%. Findings from self-report studies show that many continue to use a variety of drugs while in prison. However, many are reluctant to seek help, as they fear they will be targeted during their sentence (e.g., for additional searches).

In the United States, there are similar estimates that as many as 50% to 60% of state prison inmates have a drug problem sufficiently severe to warrant treatment. The provision of drug treatment programs in prison varies, and claims for the effectiveness of treatment for drug and alcohol problems differ dramatically. There is a significant gap between the need and the availability of drug treatment in prison, and any programs that do exist are often determined by the interests and qualifications of the staff and the amount of time allocated to this rather than other requirements. The goal conflict between treatment and custody that has existed since the inception of prisons remains highly pertinent especially at a time when other training and education activities are seen as extravagances that make life too easy for inmates.

CONCLUSION: AN ALTERNATIVE APPROACH

So is there an alternative approach to the treatment and punishment of drug-using offenders? In 1989, the first American drug court to adopt the so-called Miami drug court model was established to provide court-based treatment programs to treat the offenders' drug addiction. Since then, there has been a burgeoning of dedicated drug courts throughout the United States as well as in Canada, Australia, and the Republic of Ireland. Drug courts are not homogeneous. Some place offenders on a diversionary program prior to adjudication stage, others implement postadjudication treatment courses, and still others deal only with low-level offenders. Many proponents argue that drug court has revitalized rehabilitation within the criminal justice system. They claim that treatment experience begins in the courtroom and continues throughout, making it a comprehensive therapeutic experience for the drug-using offenders. At the same time, sanctions are imposed for continued drug use, and responses increase in severity for failure to abstain. Evaluations of drug courts are promising, although as less tractable offenders enter the programs, rates of compliance may decline and recidivism may rise. Other critics have argued that the drug court produces personalized justice and, with it, a set of attendant dangers since it may produce vastly divergent sentences for similar offenses.

There is no doubt that penal sanctions for drug offenses have been influenced by populist concerns about the evil of drugs and inherent contradictions in the goals of punishment. In this context, the rhetoric of a "war" on drugs is particularly unhelpful because it legitimizes the potential excesses of

a law-and-order approach to the problem of drugs while at the same time obscures its social costs and differential impact on particular social groups.

DRUG TREATMENT PROGRAMS

Drug treatment programs are designed to provide offenders with the skills to end drug use and maintain a drug-free lifestyle. Currently, less than half of all U.S. correctional facilities have specific substance abuse programming. Despite rates of substance abuse estimated at a minimum of 75%, treatment capacity is limited to approximately 10% to 15% of the overall population. Due to restricted funding and resources, most programs address substance abuse in general rather than exclusively focusing on the use of illicit drugs. Interest in the development of treatment specific to narcotics is, however, increasing due to high rates of drug offenders, recidivism, and prison overcrowding. The types of treatment available range from traditional institutional 12-step programs such as Narcotics Anonymous to intensive "treatment communities" where the offender is separated from the general prison population. Preliminary program evaluations indicate that some forms of substance abuse treatment are associated with decreased parole breaches, recidivism rates, and addiction relapse.

DEVELOPMENT

Correctional drug treatment programs in the United States originated in the 1930s with "narcotics farms" in Lexington, Kentucky, and Fort Worth, Texas. Treatment in these institutions was based on therapeutic withdrawal using gradually declining doses of methadone. Diversionary programs such as these, which placed offenders in civil substance abuse institutions rather than in correctional facilities, continued to be the primary means of dealing with drug-using offenders until the 1960s. In the 1960s and 1970s, the idea of treating offenders through psychological counseling and programming gained popularity. Treatment options incorporating programs such as detoxification, 12-step programs, counseling, and residential treatment developed and spread. In the late 1970s, however, meta-analyses of existing programs showing limited effects on recidivism led to the adoption of a "nothing works" approach to penal rehabilitation.

Diminished faith in the treatment of offenders resulted in a swift decline in correctional drug treatment programs that lasted until the mid-1980s.

RECENT FUNDING INITIATIVES

The declaration of a "cocaine epidemic" and the "war on drugs" in 1986 led to unprecedented numbers of drug offenders in U.S. prisons. In response, the Anti-Drug Abuse Act of 1986 called for the development of new resources for correctional drug treatment. Initiatives such as projects REFORM and RECOVERY were implemented to provide the research and training needed for the development of nationwide treatment programs. These initiatives originated in the Bureau of Justice Assistance, but were soon passed to the Department of Health and Human Services's newly developed Center for Substance Abuse Treatment. Currently, program funding is provided by a variety of sources, including the Bureau of Justice, Department of Health, research organizations such as the National Institute on Drug Abuse, correctional psychological services, and individual states and correctional facilities.

PROGRAM ADMISSION

Offenders are referred to treatment programs through institutional admissions screening, staff, judge, or case manager recommendation, parole requirements, or, more rarely, through volunteering. Offenders are often initially identified for suitability based on reported substance abuse history, drug-related offenses, or standardized psychological tests such as the Addiction Severity Index. Many institutions also require individual interviews with psychology staff or social workers to confirm motivation and personal suitability for treatment. As a general rule, more intensive programs have more stringent admission criteria. Additional requirements vary by treatment program, but often include documented history of drug use, drug-related recidivism, and a clean institutional disciplinary file. Most programs do not admit inmates who have a history of violent or sexual offenses, mental illness, or in-custody disturbances. Sentence length also determines program participation as some treatment modalities require up to one year to complete or are offered only to inmates approaching parole or release dates.

PROGRAM MODALITIES

Treatment programs vary according to the offender population, resources, and attitude toward rehabilitation of individual prisons and/or their governing states. Larger institutions usually offer a greater range of treatment options. Where more than one option is available, inmates are generally matched during the screening process according to personal needs and suitability criteria. Inmates can be transferred to other prisons in order to access suitable programs, but restrictions such as security level, available beds, jurisdiction, and inter-facility cooperation make the practice comparatively rare.

Diversion

Due to prison overcrowding, programming diverting offenders with nonviolent drug-related offenses or drug abuse problems is an extremely popular option. These programs include community-based incarceration such as halfway houses with mandatory participation in community substance abuse programs, boot camps, intensive probation, and electronic monitoring. Most use urinalysis, the collection of urine samples for drug testing on random or fixed intervals, to monitor offender compliance. A term of incarceration is often imposed if the offender breaches the diversion arrangements, for example, by failing a urinalysis test or by committing a new crime.

The TASC (Treatment Alternatives for Safer Communities) program is a popular example of a diversion offered to drug-using offenders. There are more than 180 TASC projects operating across the United States. TASC provides intensive case management, treatment, and support to drug offenders who do not pose a serious threat to the community. Clients in the TASC program remain in treatment for an average of six to seven weeks longer than average criminal justice clients and are provided with referrals to community resources following

program completion. By taking a comprehensive, individual-needs approach, the program aims to provide offenders with the skills and contacts to develop a drug- and crime-free lifestyle.

Treatment Communities

Treatment communities are the most intense treatment option available, although specific practices vary from program to program. Inmates must have a well-documented history of drug abuse issues; self-report is inadequate and the screening process thorough. Treatment communities are characterized by residential settings that separate inmates from the general population. Cornerstone, operating in Oregon, opened as the first correctional treatment community in 1975. The Stay'n Out program in New York, established in 1977, is the most commonly modeled program, having demonstrated reduced rearrest rates among both male and female participants in a 1984 National Institute on Drug Abuse evaluation. Both programs follow a similar approach, with the key difference being the use of primarily ex-addict, ex-offender staff in the Stay'n Out model.

Program length in treatment communities varies from a few months to over a year, with optimal effects shown at participation durations of 9 to 12 months. Treatment communities are designed to offer comprehensive programming to address substance abuse as a lifestyle issue. It is understood, in other words, as a symptom of wider personal problems rather than as a sole cause of offending. Communities operate based on mutual self-help and responsibility. Inmates depend on one another for support and share the responsibility of day-to-day program operation.

Programs such as Cornerstone and Stay'n Out are broken down into phases of increasing responsibility and therapeutic intensity. The introductory phase familiarizes prisoners with daily operations, intermediate phases teach them to deal with substance abuse issues by recognizing relapse triggers and developing life skills, and final phases place prisoners in leadership positions assisting newer participants. Many programs also incorporate a community transition phase in which prisoners are released to community aftercare, monitored, and often encouraged to continue assisting with the program as role models. Programming offered within the community usually includes a combination of individual psychotherapy, group therapy, cognitive-behavioral therapy, life skills training, relapse prevention skills, education, and occupational training.

In the federal system, the Federal Bureau of Prisons offers a number of incentives to prisoners participating in residential drug treatment programs. These incentives include financial compensation to make up for lost work time and sentence reductions of up to one year for inmates who successfully complete residential programs.

Group Counseling

Several treatments fall under the heading of group counseling within correctional institutions. Programs incorporating expression through means such as dramatic role-playing and art are gradually accompanying traditional practices such as cognitive-behavioral therapy in which the offender learns to identify and modify problematic thinking and behavioral patterns. Most group therapy programs use a confrontational approach. Inmates discuss the emotional, cognitive, and behavioral issues associated with their drug use and respond to challenges and suggestions offered by their peers.

Counseling sessions occur at various levels of frequency and intensity. Program frequency varies according to institutional resources and practices. The participants largely determine intensity, as group members must decide how much they are willing to reveal and interact with the others. Members of the prison psychology department often staff groups, although some institutions use private contractors or incorporate community volunteers.

Individual Counseling

Individual psychological counseling is available to all members of the inmate population. However, high counselor workloads limit the duration and frequency of treatment sessions; other modalities would ideally complement personal development.

Treatment specifics depend on the training of the psychologist, but are most typically based in psychoanalysis, reality therapy, cognitive therapy, or behavioral therapy.

Methadone Maintenance

Methadone programs are rare due to the security and policy issues related to providing incarcerated offenders with a narcotic substance. However, the danger of HIV transmission through intravenous drug use among incarcerated heroin addicts garnered support for the establishment of the "Key" program at the Rikers Island facility in New York. The first of its kind in 1987, the Key provides methadone to heroin addicts during their incarceration and arranges referrals to community programs on release. Inmates do not have to be on a methadone program prior to incarceration in order to qualify.

Twelve Step

Twelve-step programs are available in most facilities with substance abuse programs. Narcotics Anonymous and Cocaine Anonymous are based on the Alcoholics Anonymous format but adapted to focus on illicit drug addictions. Twelve-step programs are often staffed by volunteers and ex-addicts from the community; therefore, they can operate at virtually no cost to the institution. They provide a forum of mutual support for offenders as they work through steps from admitting the problem to attempting to make amends for harm done. Some groups provide sponsors in the community to provide additional support, particularly upon community reentry.

Drug Education

Drug education programs have been mandatory in all federal prisons since 1990. Program participation is compulsory for any inmates with drug-related offenses. The education sessions are low intensity and relatively brief, designed only to inform participants of the potential consequences of drug use and motivate them to pursue further treatment. Treatment is intended to be a minimum of 40 hours in duration, usually taking place twice a week for approximately 10 weeks. Education sessions address issues such as reasons for drug use, theories of addiction, types of drugs, effects of drug use on the individual, and effects on the family. These sessions consist of activities such as lectures, movies, group discussions, and written assignments.

Detoxification

Detoxification programs provide therapy for inmates undergoing withdrawal on admission to the institution. Participants may be provided with gradually declining doses of methadone or receive counseling through the prison psychology department or community volunteers. Detoxification programs may also be offered to those ceasing a drug habit maintained within the correctional institution.

TREATMENT PROGRAMS FOR WOMEN

Female offenders are more likely than male offenders to have substance abuse problems. Yet, because women constitute a small minority of the correctional population, the treatment programs that are available to them are most often ones that have originally been designed for men. The problem with such programs is that female substance abusers tend to have very different needs that traditional male programs do not address. First, female drug use is more often correlated with criminality. Therefore, the percentage of women incarcerated for drug-related offenses is higher and it is increasing more quickly than that of male offenders. Second, drug use by female offenders is more likely to be instigated or encouraged by a romantic partner and associated with issues of abuse, psychological problems, and escape. Third, female drug offenders are less likely to have marketable employment skills and are at a higher risk for health problems such as HIV, malnutrition, and sexually transmitted diseases. Finally, due to histories of abuse and dependency, many women may be unable to cope with the adversarial nature of group therapies designed for men.

Programs that address the specific needs of female substance abusers are being developed. The OPTIONS (Opportunities for Prevention and Treatment Interventions for Offenders Needing Support) program in Philadelphia, for example, focuses on issues such as diet, body image, abuse, parenting, empowerment, and self-image that are of greater concern to women. OPTIONS, a treatment community, also operates in a cyclical pattern, eliminating the pressure and competition of the hierarchical system in male programs. Other programs offer innovative modalities such as acupuncture and recreation therapy in place of adversarial group therapies.

Programs such as WINGS (Women Incarcerated Getting Straight) in Alabama and Stepping Out in San Diego, California, also provide treatment specific to pregnant or postpartum women. These programs are usually less intense and focus on health and parenting as well as substance abuse issues. Although many programs for female offenders attempt to integrate postrelease community resources, transitional efforts are often hampered by low education and employment skills and few placement options, particularly for women with children.

CURRENT PROBLEMS FACING DRUG TREATMENT PROGRAMS

The primary barrier to the development and implementation of correctional drug treatment programs is funding. Although successful programs are cost-effective through reductions in justice and health costs, programs face competition for limited funds from other correctional programming. They must deal with political resistance from the zero-tolerance mentality surrounding both drugs and incarceration. In addition, prison overcrowding severely limits the space available for treatment. Programs such as treatment communities rely on separating the offender from influences such as drugs, rivalry, and peer pressure in the general population. With no room to isolate prisoners in treatment, programs must face these additional barriers to rehabilitation.

Programs also face problems of subject selectivity. Not all screening processes are able to weed out volunteers who are looking to improve their record or kill time rather than address real problems. Substance abuse treatment programs are also seen as prime marketing grounds for inmate drug dealers. Most intensive programs target high-risk populations—offenders with long histories of drug abuse and recidivism. Measures of success based on absolute levels of relapse rather than control group comparisons may therefore be interpreted as indications of program failure.

To achieve cost effectiveness, treatment programs cater to the greatest common denominator. Unfortunately, this practice does not address the needs of minorities such as women and people of varying racial and ethnic backgrounds. Despite the overrepresentation of Native and Hispanic offenders with substance abuse issues, for example, only a few programs offer instruction or interaction in languages other than English.

CONCLUSION

Although the developmental trend in correctional drug treatment is fairly recent, the Federal Bureau of Prisons, individual researchers, and the National Institute of Drug Abuse have been involved in program evaluation since the late 1980s. Program success is most commonly measured by reduced rates of recidivism, parole revocation, and drug use relapse. Current data indicate that the most successful programs are of high intensity, such as treatment communities, and incorporate a supervised community transition phase. Duration of treatment is also correlated with success, with an ideal program length of 9 to 12 months. Treatment modalities such as 12-step programs, drug education programs, individual counseling, and group counseling that are infrequent, low intensity, and take place within the general population are generally of negligible efficacy unless part of a more comprehensive overall treatment program that includes some form of postrelease continuity.

Preliminary evaluations indicate that comprehensive drug treatment programs reduce recidivism as well as drug use. Reduced rates of reincarceration can in turn reduce prison overcrowding and justice system expenses. Successful treatment programs are therefore necessary in a nation where the “war

on drugs" ensures that both drug offenders and prison overcrowding remain key social concerns.

E

EASTERN STATE PENITENTIARY

The Eastern State Penitentiary opened in 1829. Sometimes called the Cherry Hill Penitentiary, it was erected in what was once a cherry orchard. Cherry Hill was designed from the beginning to enable those in solitary confinement to work. Care was taken so that its architectural design would follow the premises of the Pennsylvania system. Its first seven cellblocks were built to radiate from a central rotunda where guards could keep surveillance on prisoners who were housed in their own cells, each with central heat, running water, a toilet, and a skylight. Next to each cell was an outdoor exercise yard surrounded by a wall. Samuel Wood, a Quaker and member of the Philadelphia Society for Alleviating the Miseries of Public Prisons, served as Cherry Hill's first warden. Several of the wardens who followed Wood were also members of the Philadelphia Society.

Cherry Hill became famous as the chief exponent of the separate system. It attracted penal reformers from all over the world who came to see how successfully rehabilitation could be accomplished by means of total and complete separation and to view its modern construction. Ultimately, however, this system was replaced by the silent or congregate system initiated in New York State at Auburn Prison. Nonetheless, elements of the separate system can still be seen in contemporary practices of solitary confinement.

SOLITARY CONFINEMENT

When an inmate arrived at Eastern State Penitentiary, he was placed in a cell and left alone to contemplate his fate without work or reading materials. After a few days, if he had not already requested it, the prisoner was asked if he wanted work to do in his cell. If he had a trade that could be continued inside his cell, he was permitted to pursue it. If he did not, he was allowed to choose one and received instruction from an overseer. Prisoners wore masks or hoods on the few occasions when they were permitted out of their cells to prevent them from communicating with each other. Prisoners did, however, receive visitors.

The Board of Inspectors visited regularly as required by the terms of their appointment. The Philadelphia prison society had an extensive visiting program to encourage contact with the prisoners at Cherry Hill. The society's records indicate that its members made thousands of visits each year. Not only did they provide support and counsel to the inmates, they also accumulated information about prison operations and conditions. They made notes about each visit and the morale and emotional status of the offender. Records indicate that inmates

were allowed visits with family members a few times a year.

Advocates of the separate system maintained that physical punishment was unnecessary to control an institution. Because prisoners were isolated from each other, there were few opportunities to get into trouble. If someone was recalcitrant, he was not permitted to work or keep reading materials in his cell. He could also be placed on a restricted diet.

CRITICISMS OF THE REGIME

In 1834, serious allegations surfaced that Warden Samuel Wood had used cruel forms of physical punishment against several prisoners. An investigation by the state legislature in 1835 discovered that Wood had isolated prisoners in a dark, unheated cell with no bedding and only bread and water for exceptionally long periods of time. It was also suggested that he used the shower bath to discipline prisoners by pouring water, at various temperatures, on an inmate from different heights. Another punishment was the tranquilizing chair. Prisoners were strapped to a large chair so tightly they could not move any part of their body. Finally, there was evidence Wood had used the straight jacket and the iron gag. A minority report expressed concern about the severity of punishment; however, the investigators' majority report found that such punishments were not inappropriate, and Wood was not admonished. Over the years, the prison's Board of Inspectors sanctioned the use of limited forms of corporal punishment at Cherry Hill.

THE CHALLENGE OF THE AUBURN MODEL

Unlike the separate system of solitary confinement, the Auburn system required prisoners to work together in large groups during the daytime. Only at night were they isolated in their own cells. To deal with the large numbers of prisoners gathered together, a strict code of complete silence was enforced. Officials instituted extensive surveillance techniques backed by certain and swift punishment once they discovered an infraction. Prisoners marched to and from their cells to the industrial shops or the mess hall in silent lockstep formation. When a prisoner disobeyed the rules, he was subject to immediate corporal punishment, usually a flogging or caning.

With the initiation of the Auburn system began a fierce debate about the meaning of punishment. Adherents to the Pennsylvania system spoke and wrote prolifically about its virtues, as did its detractors who supported the silent system. Both sought to remove offenders from society and prevent them from contaminating each other. They shared the theory that offenders were a "different class" of people (Hirsch, 1992, p. 36). Their similarities, however, ended here. The separate system kept inmates physically segregated 24 hours a day. In contrast, the Auburn system made inmates separate only at nighttime and enforced a rigid code of silence during the day.

Embedded in the two regimens were different beliefs about human nature and the ability of people to change. In the Pennsylvania system, isolation was tempered by the Quaker philosophy. Although there are reports that some wardens at Cherry Hill relied on corporal punishment, there is ample evidence that efforts were made to avoid incorporating it into the regular regime of the penitentiary. The men who devised the Pennsylvania system believed in the capacity of the individual to reform and that corporal punishment threatened rehabilitation. Those who devised the silent system were less inclined to believe that offenders could reform and thus spent little time aiding prisoners' efforts to change.

In 1833, French statesman and author Alexis de Tocqueville and his traveling companion Gustave de Beaumont chronicled the debate that was waging between the Pennsylvania and New York systems in their book *On the Penitentiary System in the United States.* For Beaumont and Tocqueville, the New York system, with its reduced expectations, was more likely to instill good habits and an industrious nature. Prisoners learned useful trades in a congregate setting that was more like what they would eventually

experience upon release. Similarly, after visiting Cherry Hill in 1842 author and social reformer Charles Dickens denounced the Pennsylvania system for its psychological torture. Acknowledging the good intentions of those who supported separation, Dickens wrote that they simply did not know what they were doing. Finally, critics pointed out, prisons built for the separate system were more expensive, and the inmates could not produce the quantity and variety of products that could be produced in the large, congregate shops that resembled assembly-line factories.

CONCLUSION

By the 1850s, the Philadelphia Prison Society had failed to convince the nation that the separate system was best. Cherry Hill was the only penitentiary in the United States that operated under the separate system, and even there the system had been diluted. Overcrowding made it impossible to assign every inmate to a single cell. By 1866, Cherry Hill officials no longer titled their system the separate or silent system, instead designating it the individual treatment system. A congregate workshop was built in 1905. In 1913, the separate system was officially abandoned. Pennsylvania closed the Eastern State Penitentiary in 1971.

Recently, this historic institution has been reborn as a museum. The Pennsylvania Prison Society opened the penitentiary for guided tours in 1994. In 2001, the Eastern State Penitentiary Historic Site, Inc., a nonprofit corporation, took over operation of the facility and extensive preservation efforts. In its new guise as an historic site, Eastern State Penitentiary powerfully demonstrates the early ideas of confinement in the United States.

EDUCATION

A range of educational opportunities is available in prisons, jails, juvenile justice facilities, and various community-based settings. Classes are often tailored to the needs of students and seek to provide learning experiences that will help them during their sentence and after release. For example, those entering correctional facilities may require classes in literacy, communication, and other subjects that will ease their transition into a corrections setting. In contrast, those who are nearing release will benefit from learning experiences that prepare them for the transition into a society that is very different from that found in prison, and, depending on their length of sentence, possibly unlike what they left behind. Other courses or learning may be selected based on age, gender, prior education and skills, and other factors.

Education

A U.S. Supreme Court Justice once stated that criminals are sent to prison as punishment, not to be punished. However, many citizens are against educational programs in prisons. Deprivation of education in prisons is a means of punishing prisoners.

These same citizens expect prisoners to be rehabilitated upon their release. Rehabilitation starts with education. Education unlocks many doors in a person's mind, giving a person legitimate skills and opportunities upon release.

Education also changes the way people think. It gives people hope and confidence in a future free of crime and incarceration. To eradicate education in prisons is to abandon prisoners in their quest for successful reintegration into society after they've paid their debt.

Education also plays a key role in prisoners' pursuits for redemption, be it spiritual or secular. How can I redeem myself or prove worthy of freedom if I am not invested with the proper tools to accomplish these objectives? I fail society because my incarceration has failed to prepare me adequately for my return to society. How can you expect me to build a better life and become a better citizen if I'm not given the appropriate blueprints? To deprive a prisoner of education while incarcerated is to render that person useless. We live in a society that emphasizes the importance of education in terms of success.

Finally, who do you want for a neighbor: An educated ex-con focused on positive productivity, or an uneducated ex-con focused on the only avenue you have left open: Crime?

John Rowell
Dixon Correctional Center, Dixon, Illinois

HISTORY

The earliest U.S. prisons generally sought to educate prisoners through religious instruction. Pennsylvania's Walnut Street Jail tried to reform and teach inmates by encouraging hard work and religious contemplation. Both activities were conducted in solitude. Over time, however, education outgrew solitary Bible reading, culminating in the introduction of a school in 1798, together with a library of 110 books.

The competing Auburn system that provided the model for most penitentiaries in the federal and state systems was far less supportive of prison classes, because of a concern that they might distract inmates from the more important tasks of prison labor. Nonetheless, by 1870 the National Prison Association, which was the forerunner of the American Correctional Association, set out in its Declaration of Principles that "education is a vital force in the reformation of fallen men and women" (Conrad, 1981, p. 1). Since then prison classes have been an entrenched part of the prison experience.

Inmates in the first prisons were taught the basics of reading and writing by prison staff and, if possible, an employable skill that might keep them away from criminal activity upon release. Later, education departments began to have responsibility for law and leisure libraries as well as vocational training and postsecondary schooling options. In most prisons, they also organize sports and recreational activities.

PURPOSE

The U.S. Department of Education defines correctional education as "that part of the total correctional process that focuses on changing the behavior of offenders through planned learning experiences and learning environments. It seeks to develop or enhance knowledge, skills, attitudes, and values of incarcerated youth and adults." Similarly, the U.S. Department of Justice "recognize[s] the importance of education as both an opportunity for inmates to improve their knowledge and skills and as a correctional management tool that encourages inmates to use their time in a constructive manner" (cited in Tolbert, 2002, p. 15). These definitions illustrate the overlapping goals of correctional education: to improve individual skills while helping to manage correctional settings.

Prison-based education programs may provide incentives to inmates in an environment in which rewards are relatively limited. Formal classes and other less structured educational settings offer socialization opportunities with similarly motivated students and educators, who serve as positive role models. Education keeps students busy and provides intellectual stimulation in a place that can be difficult to manage. Programs also provide a "light at the end of the tunnel"—a stabilizing force for the individual who otherwise views his or her situation as somewhat hopeless.

Corrections education often focuses on improving individual skills needed to function productively within correctional facilities. These courses include literacy, special education, English as a second language (ESL), and learning disabilities. Other classes are designed to help inmates with life skills necessary in, and out, of correctional facilities. These include classes in parenting, empathy skills, communication and dispute processing, and cultural awareness. Finally, some classes are designed to instruct prisoners in vocational skills that may lead to employment opportunities upon release. These courses include library science, tutoring, barbering or hairstyling, auto and small engine repair, cooking, laundry and tailoring, carpentry, and building maintenance.

COLLEGE COURSES AND BASIC EDUCATION

Many states have mandatory education laws that require correctional education courses for any inmate who scores below a certain level on a standardized test. At least 26 states have laws that mandate education for a certain amount of time or until a set level of achievement is reached. The level that inmates must reach varies enormously, however. The Federal Bureau of Prisons, for example, requires inmates who do not have a high school diploma or a general equivalency diploma (GED) to participate in literacy programs for a minimum of 240 hours or until they obtain their GED. In New York State, by comparison, prisoners must indicate merely that they can read at a ninth-grade level. Enrollment in correctional education is also usually required if the inmate is under a certain age, as specified by that state's compulsory education law. Thus, in Connecticut, all young women under the age of 18 who are held in the state's only women's facility in Niantic spend the majority of their day in school.

Since the mid-1990s, prison classes other than basic literacy has been under attack both from within and outside the prison. Tertiary education has been particularly vulnerable. Although college classes in prison date to the 1920s, academic or postsecondary courses were rarely offered until 1965, when Congress passed Title IV of the Higher Education Act, a major part of which was the Basic Education Opportunity Grants. Later renamed the Pell grant in honor of Senator Claiborne Pell, the bill's sponsor, this act enabled prisoners and other low-income people to afford college education for the first time.

These days, however, prisoners are no longer guaranteed the right to earn a college degree. Since Pell grants for prisoners were abolished by the Violent Crime Control Act of 1994, few college programs remain in operation throughout the country. In 1990, there were 350 higher education programs for inmates. In 1997, only eight programs remained. Since there was no source for replacement funds, these programs were forced to abandon efforts to provide college courses in prison. Most of what is left of a once successful system of prison higher education is college by correspondence for those who can afford to pay for it themselves. Prisoners are limited even here, by restrictions on audio- and videocassettes and on the number of books they are allowed to have in their cells at any one time. They are also not given access to the Internet. Compounding matters, many universities have established residency requirements for course completion. Fears of alumni disapproval, faculty absences, and an association of the university degree with offenders are all used as excuses by many institutions from stepping into the breach created by the repeal of the Pell grants.

BENEFITS OF EDUCATION WITHIN AND BEYOND THE PRISON

There are numerous benefits of an education both within and beyond the prison. At the most basic level, enrollment in education classes may raise an inmate's income during his or her sentence. In the federal system, for example, prisoners must have a GED or equivalent in order to work in most prison jobs. Without this qualification, they remain at the lowest pay level in the institution. Those for whom English is not their native language must take ESL classes to be able to read and understand simple instructions in their prison jobs. Many prisons also provide a range of other nonfinancial incentives for inmates who participate in education classes. Opportunities to earn privileges within the facility, increased number of visits, and the accumulation or loss of "good time" credit that can lead to earlier parole are all used to motivate students while simultaneously encouraging certain types of behavior within the facility.

In addition to helping prisoners cope with their sentence, education also appears to have a significant impact on people's tendency to reoffend. For example, the Three State Recidivism Study (Steurer, Smith, & Tracy, 2001) examined the impact of prison education while controlling for the effects of socioeconomic factors, criminal behavior, family life, educational experiences, and work history. This study found that inmates who participated in education programs while incarcerated showed lower rates of recidivism after three years. Measures of recidivism, rearrest, reconviction, and reincarceration were significantly lower in each of the three states. Employment data demonstrated that during each of the three years after release wages reported to the state labor departments were higher for the education participants than nonparticipants.

Likewise, a 1987 Bureau of Prisons report found that the more education an inmate received, the lower the rate of recidivism. Inmates who earned college degrees were the least likely to reenter prison. For inmates who had some high school, the rate of recidivism was 54.6%. For college graduates, the rate dropped to 5.4%. Similarly, a Texas Department of Criminal Justice study found that while the state's overall rate of recidivism was 60%, for holders of college associate degrees it was 13.7%. The recidivism rate for those with bachelor's degrees was 5.6%. The rate for those with master's degrees was 0%. Finally, the Changing Minds study (Fine et al., 1991) found that only 7.7% of the inmates who took college courses at Bedford Hills returned to prison after release, while 29.9% of the inmates who did not participate in the college program were reincarcerated.

Even small reductions in recidivism can save millions of dollars in costs associated with keeping the recidivist offender in prison for longer periods of time. The Bedford Hills study, for example, calculates that the reduction in reincarceration would save approximately $900,000 per 100 student prisoners over a two-year period. If we project these savings to the 600,000 individuals who are released from prison in a single year, the savings are enormous. Additional costs are apparent when we consider that the individual, had he or she not committed another crime, would be working, paying taxes, and making a positive contribution to the economy. When we add the reduction of costs, both financial and emotional, to victims of crime, the benefits are even greater. Finally, the justice system as a whole, including police and courts, saves a great deal of money when the crime rate is reduced.

CHALLENGES

Prison educators face many challenges that are shared by teachers in other settings. Inmates who choose to enroll in corrections-based courses are not necessarily any different from the typical student. As in any class, the range of students can include very gifted students, students who face challenges, and students who have various motives for enrolling in the course.

The correctional educator's challenge is compounded by the unique nature of prison culture and the need for security. Prisons adhere to strict routines that may not be ideal in an educational setting. In addition, inmates are often moved from one facility to another. This movement interrupts, or ends, the individual's educational programming.

These structural issues are accompanied by social factors that can further limit learning opportunities. For example, other prisoners may not support the individual's educational efforts. Although the student may be very motivated to earn an education, he or she remains in an environment in which conflicting demands may limit the opportunity to act on that motivation. In addition, prison administrators may also have varying degrees of support for education—especially if they see education as a threat to the primary functions of security and control.

Since correctional education programs offer courses in a variety of areas, institutions often rely on a range of funding sources. Some sources will provide general funds while others will provide funding for specific programs. As discussed above, Congress placed significant restrictions on corrections-based college courses with the passage of the Violent Crime Control and Law Enforcement Act of 1994. This act eliminated Pell grants for prisoners, with devastating effects. As a result of the elimination of Pell grants for prisoners, nearly every prison-based college program was eliminated. Since this funding often provided the foundation for other educational programs, the elimination of these programs had a ripple effect in correctional facilities. The funding problems were exacerbated with the passing of the Adult Education and Family Literacy Act (AEFLA), which became law in 1998. Funding continues to fall short of need, and the AEFLA has not improved this situation. The AEFLA continues to provide funding but altered the formula for state funding. Prior to 1998, states were required to spend at least 10% of AEFLA funds on educational programming in correctional institutions. The law now requires that they spend no more than 10%. Similar limitations were placed on funding as the Perkins Vocational and Technical Act was amended in 1998 to require that no more that 1% of federal funding for vocational and technical education programs be spent in state institutions, including correctional institutions.

Legislation over the past 20 years, a time in which the prison population has grown at unprecedented levels, has resulted in significant cuts in corrections education funding. This has resulted in the elimination of many programs. Ironically, the "get tough on crime" mentality resulted in the elimination of many programs that were effective in reducing crime. In the 1990s we began to see a dollar-for-dollar tradeoff between corrections and education spending. New York, for example, steadily increased its Department of Corrections budget by 76% to $761 million while decreasing funding to university systems by 28%, to $615 million. Research by the RAND Corporation demonstrates that crime prevention is more cost effective than building prisons and that of all crime prevention methods, education is the most cost effective. However, states were committing an increasing percentage of their budgets to fund longer prison terms and increased prison construction.

CONCLUSION

At the end of 2002, there were 1,440,655 people in federal and state prisons. The vast majority of these individuals will be released and will be expected to become productive, law-abiding members of society. Nearly 600,000 inmates are released each year, either unconditionally or under conditions of parole. Unfortunately, many of those released will be rearrested and will return to prison. Costs of this cycle of incarceration and reincarceration are very high. Corrections education has the potential to greatly reduce these costs as studies consistently indicate that an individual who benefits from education while in prison is less likely to return to prison than someone who has not.

There is some question as to why corrections-based education leads to lower recidivism. Many of the benefits of education are difficult to measure. As such, it may be difficult to show a clear relationship between educational opportunity and recidivism. However, an intervening factor, the ability to find and hold a job, appears to clearly demonstrate the benefits of corrections-based education. Individuals who take courses while in prison improve their chances of attaining and keeping employment after release. As a result, they are less likely to commit additional crimes that would lead to their return to prison. Individuals who benefited from college courses in prison also found better jobs and held

these jobs for longer periods of time. It is clear that these factors work together to reduce recidivism—those with more education find stable employment, which makes them less likely to commit crime.

The imprisonment binge over the past 20 years has created a situation where we are beginning to see prison releases at unprecedented levels. Due to strict sentencing guidelines, these prisoners have often served long terms and are released only when their terms have been completely served. As a result, many are released unconditionally, without parole or other postrelease supervision. Each of these individuals will be expected to begin leading a productive, law-abiding life outside prison walls. It is clear that access to a quality education increases the individual's chance of success.

Correctional educators continue to work with their students while facing constant scrutiny and pessimism from the public and from some legislators who question the value of their work and the merits of providing educational opportunities for those who have committed serious crimes. Due to various controversies surrounding corrections education, most prisoners do not participate in prison education programs. The rate of participation has dropped over the past decade during a time in which crime control efforts became increasing punitive. Given the unprecedented prison population, and the equally unprecedented rate of release, corrections education has the potential to save millions of dollars while improving the lives and opportunities of individuals who have served their time and have successfully paid their debt to society.

EIGHTH AMENDMENT

The Eighth Amendment to the U.S. Constitution forbids "cruel and unusual punishments." The federal courts have sought to address how this is to be

applied in the context of prisons. At what point do prison conditions become so egregious and inhospitable that the government has, in essence, inflicted cruel and unusual punishment upon prisoners?

HISTORY

The U.S. Supreme Court first became involved in the field of prisoners' rights in 1964, under the leadership of Chief Justice Earl Warren. By the early 1970s, federal district courts, which had been empowered by the Warren Court to play a key role in evaluating the constitutionality of prison conditions, began to apply the Eighth Amendment to state and federal prisons. As a result, by 1986 "in thirty-seven states correctional administrations or individual prisons were operating under federal court orders" (Rosenberg, 1991, p. 306). Despite the potential for change, however, most agree that the interventions by the federal courts led to minimal improvements in the conditions of life in prison. In any case, since the latter part of the 1980s, the role of these courts has been much reduced by the Supreme Court under the leadership of Chief Justice William Rehnquist.

APPLYING THE EIGHTH AMENDMENT TO PRISONS

Federal courts have developed several standards that are to be used in evaluating a prisoner's claim of an Eighth Amendment violation. First, the punishment in question must be both cruel *and* unusual before the Eighth Amendment can be used to limit the power of the government. Second, prison inmates do retain fundamental Bill of Rights protections, so long as those rights are compatible with the legitimate objectives of incarceration. Third, in the case of *Wilson v. Seiter* the Supreme Court has decided that the threshold question for deciding if the Eighth Amendment has been violated is if prison guards have, as part of their official conduct, engaged in the "serious deprivation of a human need" vis-à-vis prisoners. Furthermore, a prisoner seeking vindication under the Eighth Amendment must demonstrate that the prison official in question had a "culpable state of mind" when depriving a prisoner of a human need such as food, warmth, or exercise. This means that the prison official(s) must have acted with "deliberate indifference" in depriving a prisoner of a human need—that is, he or she must know that the prisoner will face a serious risk of substantial harm and then fail to act on that knowledge. Such a claim can encompass the state's failure to protect an inmate from other prisoners, as in the case of rape or prison violence. Similarly, the government has a constitutional obligation to provide adequate medical and mental health services to needy prisoners. Prison overcrowding can also create a legal cause of action, if prison conditions subject inmates to a "substantial risk of serious harm." Finally, the government has violated the Eighth Amendment if prison officials inflict "unnecessary and wanton . . . pain." This standard of conduct, however, is qualified by a recognition that harsh punishment may be appropriate as part of the core functions of a correctional facility.

ROLE OF CONGRESS AND THE COURTS IN RECENT YEARS

Congress responded to what it saw as the illegitimate role of federal judges in determining prison policy with the Prison Litigation Reform Act of 1996 (PLRA). This piece of legislation significantly limited the ability of prisoners to bring Eighth Amendment litigation against state and federal facilities by requiring that prisoners exhaust all possible administrative remedies prior to bringing any grievances based on federal law about prison conditions to the courts. Prisoner petition appeals subsequently fell by 5% in 1997, although they rose by 8% in 1998—due, in significant part, to the rapidly growing prison population in the United States. In *Porter v. Nussle,* 534 U.S. 516 (2002), the U.S. Supreme Court ruled unanimously that the term *prison conditions* applies both to general conditions within a prison and to individual instances involving a claim of excessive force employed by a particular correctional officer. Nussle, an inmate, had argued that a single instance of excessive force applied by a guard against an inmate fell outside the PLRA's coverage of "prison conditions," and thus could be brought before a

federal court via an Eighth Amendment claim without recourse to administrative remedies within the prison system itself.

The District Court for the Middle District of Alabama, in December of 2002, held that a women's prison designed to house 364 inmates violated the Eighth Amendment by allowing the prison population to reach 1,017. In the view of the court in this case, this extreme form of overcrowding subjected the inmates to a "substantial risk of serious harm." The prison administrators were then ordered to remedy this constitutional defect as quickly as possible, using their own discretion in the fashioning of a solution. The U.S. Supreme Court, however, in *Wilson v. Seiter,* held that placing two inmates in cells designed for a single person does not necessarily violate the Eighth Amendment. Rather, prisoners living under such conditions must demonstrate the "deprivation of a . . . human need [and] a culpable state of mind on the part of prison officials."

While the Supreme Court of late has been decidedly hostile to the rights of prisoners, it has not uniformly struck down all Eighth Amendment claims. In a recent case, *Hope v. Pelzer,* for example, the Court held that an Alabama prison's use of a "hitching post" to place handcuffed prisoners in the hot sun for several hours did indeed constitute the "gratuitous infliction of wanton and unnecessary pain," and thus violated the Eighth Amendment.

A limitation on the Eighth Amendment's application to incarceration facilities is the issue of what constitutes a "punishment." Conditions in jail prior to a trial, therefore, and sexual predators who are confined by the government after serving their term of detention in order to receive treatment, are not covered by the ban on cruel and unusual punishments. In such cases, however, the Fifth Amendment's due process clause would apply, and the courts have developed standards for this claim that are similar to those they have developed for the Eighth Amendment.

CONCLUSION

All of the above limitations on the ability of prisoners to invoke the Eighth Amendment on their own behalf may help to explain the limited impact that litigation has had on prison conditions in the United States. While many scholars agree that Eighth Amendment litigation has helped to ameliorate the very worst conditions in U.S. correctional facilities, several also suggest that many serious problems such as prison overcrowding and sadistic behavior by prison guards remain.

ELDERLY PRISONERS

The most common definition of an *elderly inmate* is someone aged 50 and older. The point at which someone becomes elderly has been set at 50 because research has identified a 10-year differential between the overall health of inmates and that of the general population. Most have attributed this to people's lifestyles prior to incarceration during which many used drugs and alcohol to excess, had

poor eating habits, and were poor. Even so, there has been difficulty and dissent among scholars, both in corrections and in general, in reaching agreement on who classifies as an "elderly prisoner." The definition of aging is affected by many factors including physical, emotional, social, and economic changes in communities. Similarly, the processes of aging are dependent not only on time but along on the interaction of various factors such as gender, age of parents, susceptibility to disease, environment, diet, and lifestyle.

CURRENT SITUATION

There are approximately 103,132 inmates aged 50 and older in U.S. correctional facilities. Most elderly inmates are male and tend to be held in minimum-security facilities. Changes in sentencing, which have criminalized more practices and lead to longer periods of confinement for many crimes, in conjunction with a move away from early-release practices such as parole, are all contributing to a rapid growth in older inmate populations. In essence, inmates are staying longer and growing older in prisons rather than being older when entering prison.

ELDERLY PRISONER DEMOGRAPHICS

There are three main groups of elderly prisoners. First, there are the first-time inmates imprisoned at an older age. These people are highly likely to be imprisoned for a violent offense and have the most complex needs of the three groups due to their lack of familiarity with the conditions of incarceration. In the second group are repeat offenders who return to prison at a later age. They often have substance abuse problems and associated poor health. In the final group are people who have grown old in prison due to the long sentences they are serving. While prisoners in this group are likely to be well adjusted to the system, they are also very likely to be institutionalized so that their release is very difficult for them to manage. Such people may be at high risk of self-harm and suicide when they return to the community, or they may reoffend in order to be returned to a penal institution where they will feel more comfortable.

OFFENSE CATEGORY

Most inmates over 50 years of age are imprisoned for violent offenses. Whereas age may be a mitigating factor in sentencing for most other offenses, it will have the least effect for violent offenders. Thus, older persons who commit a violent crime are more likely to be imprisoned than older people committing property or nonviolent crimes.

HOUSING

Most correctional centers are designed to accommodate young and active inmates. Elderly residents report finding the prison environment cold and damp and the stairs and distances difficult to cope with. Since they may be unable to climb stairs, they usually require ramps or wheelchair accessibility to be built. Correctional institutions designed during the 1980s often feature buildings scattered over wide areas. Inmates in these institutions are required to walk long distances to obtain meals, medical services, and other essentials. This may be difficult for elderly inmates.

Research has also found that older inmates express a greater need for privacy and for access to preventive health care and legal assistance, all of which have implications for the design or modification of correctional centers. Currently, prisons are generally designed to provide basic health care and do not have the facilities for the higher health monitoring required for older people. Overcrowding has also meant that inmates often lack of individual space and have only minimal access to services. These factors may be particularly difficult for elderly inmates to manage.

IMPLICATIONS FOR MANAGEMENT

The specific needs of elderly inmates, in particular their need for a high level of care, dramatically increase the cost of incarceration. Growing old is accompanied by an inevitable physical decline. The

majority of people over 60 years of age in the community have at least one chronic health condition, use more prescription drugs, have more adverse reactions to medication, and spend twice as much time in medical facilities. The health care costs of the elderly in prison are second only to HIV/AIDS patients.

Elderly inmates in U.S. correctional facilities commonly receive more specialized medical care including chronic care clinics and preventive care. They also usually have an increased frequency of physical examinations. More than half of the correctional departments in the United States report that special nutrition/dietary care and housing and the use of inmate aides to provide nonmedical assistance are available to the elderly in their particular jurisdictions. On the other hand, very few of these agencies have special units for elderly female prisoners. Elderly women will have very different health care and other needs not only in relation to other elderly male prisoners but also to other female inmates in general. Difficulties they face include menopause, osteoporosis, and frequent difficulties with arthritis, cardiac conditions, and memory loss.

It may also be complicated to find ways of keeping older inmates occupied during their term of incarceration. There are few suitable programs and it is often difficult to find specialized and suitably trained staff. Careful staff recruitment and selection for sensitivity to the unique requirements of elderly inmates should be a considered by administrators. Suitable programs may include reading and discussion groups, modified exercise and fitness programs, and modified treatment and rehabilitation programs. Often the reasons for offending are quite different for older people and difficult to address through current rehabilitation programs.

Certain legislation must be considered when developing and implementing policies, processes, and programs for older inmates. Antidiscrimination law, such as the Americans with Disabilities Act, addresses age and can affect issues such as opportunity to work, transport, and access to health care and buildings. It must be carefully considered by correctional administrators.

CONCLUSION

Research shows that while elderly inmates may appear better adjusted to prison life and less disruptive than younger inmates, many have more extensive psychological and emotional difficulties. Older inmates frequently express fear of being victimized by younger prisoners and suffer from greater social isolation within the correctional environment. Such differences from the mainstream prison populations mean that elderly inmates require more physical and personal resources than other types of inmates in correctional centers.

ELECTRONIC MONITORING

Electronic monitoring emerged in the United States in the early 1980s, at a time when prison overcrowding and costs necessitated the development of alternative strategies for supervising offenders. Electronic monitoring involves the use of telemetric technology to monitor the presence or absence of an offender in a specified monitored location. The surveillance technology is often coupled with community sanctions such as probation or home confinement, also known as house arrest, to ensure compliance with specified conditions such as curfew. The objectives of electronic monitoring, like other alternative correctional measures, are to protect society through offender supervision, decrease the use of incarceration among less serious offenders, punish offenders, and support rehabilitation.

PROGRAMS AND TECHNOLOGIES

Electronic monitoring programs are run by state departments of corrections, local courts and law enforcement agencies, and private contractors, depending on the jurisdiction in which the program is run. There is a great deal of variation in the administration of this penal strategy. For example, programs may target specific populations, and offense types, and vary in their hours of operation. Some charge the offender a fee, while others do not.

Electronic monitoring exists at all stages of the criminal justice system from pretrial to postrelease supervision. Thus, surveillance may be used as (1) an alternative to pretrial detention, (2) a sanction meted out at time of sentencing, (3) an alternative to custody that is offered postsentencing, (4) a tool to ensure compliance with a work release program, or (5) a condition of probation or parole.

There are two main types of monitoring technology currently in use: *continuous signaling* and *programmed contact*. Continuous signaling involves the use of three devices: a transmitter that is worn by the offender on the ankle or wrist, a receiver-dialer attached to a telephone in the monitored location, and a central computer that receives the transmitted information. The transmitter sends signals to the receiver-dialer, which contacts the central computer at the monitoring center whenever there is a change in the offender's status (entering or leaving the monitored location). The offender's approved schedule is stored within the central computer, allowing for a comparison between the signaled change in status and the offender's schedule to ensure compliance and detect violations.

Programmed contact technology involves the use of equipment that initiates periodic telephone calls to the location under surveillance (usually the offender's home) to verify the offender's presence. Verification may occur by having the offender insert a worn device, or wristlet, into a verifier box that is attached to the phone. This is known as an "electronic handshake." Verification may also be established using voice verification technology, video verification, or by having the offender call an 800 number and typing in a random code provided by a device worn by the monitored person to establish ID.

For individuals who do not have a telephone, a drive-by unit may be used for monitoring purposes. A transmitter worn by the offender will send out signals that an officer can receive by tuning a receiving device into the frequency of the monitor. The person will not be aware of when checks are being conducted.

Hybrid electronic monitoring equipment, combining continuous signaling and programmed contact technology, is now also being used. When continuous signaling equipment notes a deviation from the offender's approved schedule, he or she will be contacted by telephone to allow for verification of his or her location.

Electronic monitoring programs may also use alcohol-testing systems to ensure compliance with a condition to abstain from alcohol use. There are four types of alcohol testing systems currently available. The simpler tests provide only an indication that the offender has consumed alcohol, while more sophisticated testing systems measure a person's actual blood alcohol level.

ELIGIBILITY FOR ELECTRONIC MONITORING: WHO IS BEING MONITORED?

Due to the variance in the administration of electronic monitoring programs across the United

States, no one set of eligibility criteria exists. Rather, individual programs define and operate under their own regulations.

Electronic monitoring is currently in use with both adult and juvenile offenders. While both male and female offenders are eligible, the majority of those being monitored are male. Most offenders under this type of surveillance have committed nonviolent offenses. However, there are some monitoring programs that specifically target high-risk offenders who are considered to be at risk for recidivism. These programs increase the level of supervision for selected recently released offenders, allowing correctional officials to watch their reintegration into the community.

To be considered for most electronic monitoring programs, an offender must have a structured living arrangement and either be currently employed or actively seeking work. While some programs accept only those who do not have a history of serious substance abuse, other programs are specifically designed for offenders who have been convicted of driving while under the influence (DUI) or drug law violations.

PREVALENCE OF USE AND EFFECTIVENESS

Currently, electronic monitoring programs are operated in some form in most, if not all, U.S. states. Because such programs are operated at various levels of government and by nongovernment agencies, and their duration is relatively short, it is difficult to obtain accurate information regarding the number of individuals being monitored at any given time. While electronic monitoring programs have grown rapidly, the percentage of offenders being supervised in this way compared to the total number of offenders under some form of supervision is extremely small. Recent estimates suggest that approximately 28,000 to 30,000 people are currently being electronically monitored across the United States, equaling only 0.6% of the total offender population.

Determining the effectiveness of electronic monitoring is complicated by a dearth of experimental studies that evaluate them. Existing evaluations use various indicators of success, including rates of completion and recidivism, and the number of violations accumulated while participating in a program. Success rates for electronic monitoring vary dramatically, ranging from 30% to 100%. These rates are affected by a program's rules and regulations and its approach to dealing with violations, as some programs are very strict and will terminate an offender's participation upon first violation whereas others will assess the violation and provide offenders with warnings. Most revocations from electronic monitoring programs are the result of technical violations, not the commission of a new offense. At present, it is unclear whether electronic monitoring is more effective in terms of successful completion and rates of recidivism than other community sanctions.

SOME STRENGTHS AND WEAKNESSES OF ELECTRONIC MONITORING

Arguably, one of the greatest strengths of electronic monitoring is that it provides an intermediate sanction between the extremes of probation, which offers minimal or limited supervision, and incarceration, which entails total supervision. Surveillance of this nature enables individuals to maintain family and community ties and employment during the sanctioning period. The maintenance of these supports may decrease their likelihood of reoffending, particularly important for juvenile offenders. Offenders placed on electronic monitoring are also able to avoid the stigma of imprisonment.

Electronic monitoring is also a means for avoiding what has been termed "offender contamination," that is, exposing first-time or nonserious offenders to the more experienced offenders found in prisons. Despite the less restrictive nature of surveillance as compared to incarceration, it has been reported as having a stabilizing affect on the lives of monitored offenders, as they become accustomed to a routine of attending work and spending time in the home. Offenders under electronic surveillance may be made to pay restitution to their victim as a condition of their program. Electronic monitoring

programs have also had some success in effectively treating certain types of offenders such as those convicted of DUI, drug, and other nonviolent offenses. Finally, the costs associated with this strategy are far less than the costs of incarceration.

Despite numerous strengths, electronic monitoring also has a number of weaknesses. The technology associated with it has had to be continually upgraded to deal with numerous technical problems such as the incompatibility of phone lines, radio frequency interference, and transmission blockage due to environmental conditions. Although many companies have added tamper detection equipment to their techniques, offenders continue to remove or disable monitoring devices and avoid detection.

The implementation of electronic monitoring programs may, in some instances, widen the net of criminal justice control by punishing individuals who would have otherwise been diverted from the justice system. When used with serious or high-risk offenders, it has been criticized for failing to adequately protect the public, as those who are under surveillance are free to be in the community unescorted.

Although electronic monitoring was initially implemented in response to increasing prison overcrowding, it has had only a minimal impact on decreasing prison populations. It has also been criticized for turning the home into a prison. In doing so, electronic monitoring may have a negative impact on other inhabitants of the household, whose lives are disrupted by numerous phone checks, unannounced home visits from correctional workers, and having a member of their family restricted to the home. Relapse after program completion is also a concern, as offenders must adjust to the process of going from the intensive supervision of electronic surveillance to minimal or no supervision.

THE USE OF ELECTRONIC MONITORING INTERNATIONALLY

Electronic monitoring is in use or has been considered for use in a number of countries around the world including Canada, Singapore, Australia, Sweden, and the United Kingdom. In Canada, it has not been implemented by the federal government, but rather programs are run at the provincial level in four provinces: British Columbia, Saskatchewan, Newfoundland, and Ontario. Surveillance programs of this nature developed slowly in Canada and are subject to a great deal of variation in program administration. In Canada, electronic monitoring is used to enhance compliance with house arrest and may be initiated by the courts or by corrections depending on jurisdiction.

Like in Canada, electronic monitoring in the United Kingdom has developed slowly. While the strategy was introduced by the Criminal Justice Act of 1991, this sanctioning option was not used until 1994. In the United Kingdom, electronic monitoring has two main uses: (1) part of an order of probation lasting less than six months and (2) a home detention curfew whereby an offender will spend the last two months of a custodial sentence in the home under electronic surveillance. Electronic monitoring is a national program in the United Kingdom and is supervised by the Home Office.

CONCLUSION: THE FUTURE OF ELECTRONIC MONITORING

Electronic monitoring technology continues to be developed to enhance the supervision capabilities of correctional officials. Equipment has now been created that links the individual to the global positioning system (GPS). The coupling of electronic surveillance with GPS removes the restrictions of monitoring the offender in only one or a small number of locations and enables the continuous tracking of offenders. Future advances in monitoring technology involve the creation of tracking devices that may be implanted into the body of the monitored individual. This device would be able to signal the location of the offender at all times and monitor such activities as drug use or alcohol consumption associated with offending.

ELMIRA REFORMATORY

"Elmira" conjures up both the best and the worst of prison history in the United States. Though it is most commonly known for the reformatory that bore its name, Elmira, New York, was originally a prison opened to contain Confederate prisoners of war during the Civil War. It became known as a "death camp" because of the squalid conditions and high death rate in its few years of operation. Approximately one-quarter of the 12,000 Southern prisoners died there between summer 1864 and the war's conclusion in 1865. Today, only a large stone plaque in the current residential area marks the prison once known as "Helmira."

The opening of New York State's Elmira Reformatory at a different site in 1876 marked an important shift in the history of U.S. penology. Built as the first rehabilitation-oriented institution in the country, the ideals of the early-19th-century's penitentiary model, which were embodied in the Pennsylvania and Auburn systems, were supplanted by the new ideals of the reformatory movement. Fixed sentences intended to fit the crime were replaced by the new indeterminate sentence designed to fit the criminal. Mass discipline and physical punishment would give way to individual classification, with privileges as rewards. Instead of releasing the criminal unconditionally after his debt to society was paid, the reformatory's "new parole procedure would assure he did not begin running up a new tab" (Elmira, 1998).

CONSTRUCTION AND DESIGN

In 1869, the New York State Legislature authorized the purchase of 280 acres of land in Elmira. The original plans for the reformatory made provisions for 500 prisoners. Cellblocks would be arranged so that prisoners could be divided by classification, but not completely isolated. Construction soon began, with the majority of physical labor done by inmates from other state prisons. Elmira received its first prisoners in July 1876. Thirty inmates transferred from the Auburn Prison to help finish construction, with others following as the construction progressed. By 1879, the $1.5 million project was nearly completed, and the appearance of the institution reflected its purpose. Zebulon Brockway (1969), superintendent of Elmira from 1876 until 1900, commented:

> The very outward appearance of the reformatory so little like the ordinary prison and so much like a college or a hospital helps to change the common sentiment about offenders from the vindictiveness of punishment to the amenities of rational educational correction. (p. 163)

This thinking spawned a new vocabulary at Elmira. The institution itself was referred to as "the college on the hill" or "a reformatory hospital." Inmates were deemed "students" or "patients" (Blomberg & Lucken, 2000, p. 71).

INDETERMINATE SENTENCES AND INSTITUTIONAL PROGRAMS

Elmira's reformatory program was, originally, intended for first-time felons between the ages of 16 and 30 and was developed by Brockway. It combined the indeterminate sentence, a mark system of classification, and parole. The first indeterminate sentencing law, which also was drafted by Brockway, was enacted in New York in 1877 and applied only to the Elmira Reformatory. This law retained the maximum penalties in the state statutes while typically setting the minimum sentence at one year. The amount of time served between the minimum and maximum was up to the supervisor and,

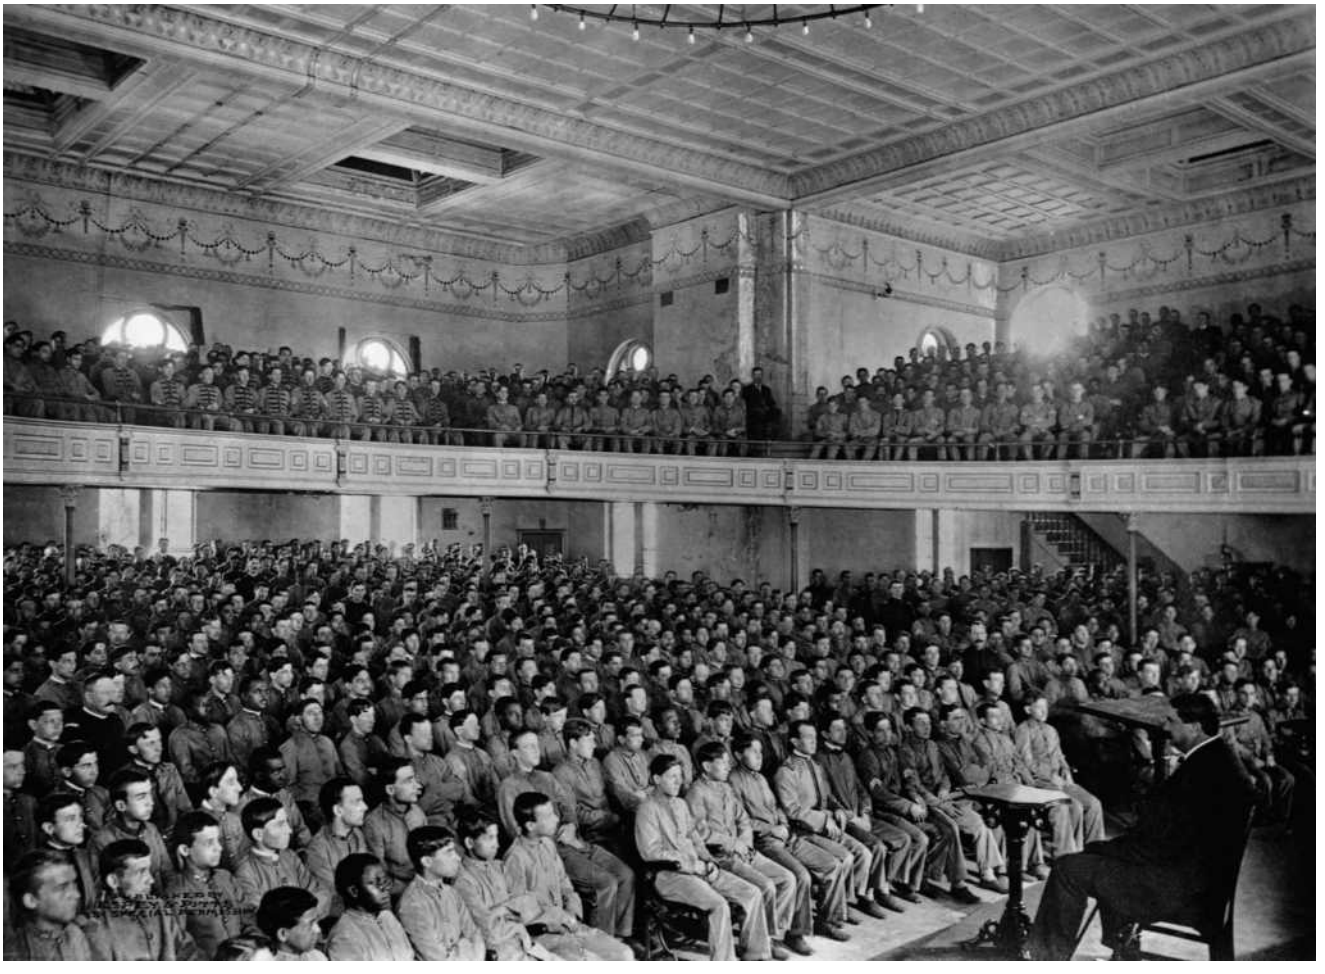

Photo 1 *Elmira*

ultimately, the prisoner himself (Witmer, 1925). According to Brockway (1910),

> The indeterminate sentence was important for reformation in that . . . the indeterminateness of the sentence breeds discontent, broods purposefulness, and prompts to new exertion. Captivity, always irksome, is now increasingly so because the duty and responsibility of shortening it and of modifying any undesirable present condition of it devolves upon the prisoner himself, and, again, by the active exactions of the standard and criterion to which he must attain. (p. 470)

To shorten his sentence, the prisoner was forced to adhere to the reformatory program. Not only did this entail good behavior, but he also was required to earn good marks in work and school. Elmira's educational program consisted of inmates, college professors, public school teachers, and lawyers teaching a wide range of general subjects, as well as sports, religion, and military drill. In addition, a trade school served to provide inmates with the entry-level skills needed for work in such fields as tailor cutting, plumbing, telegraphy, and printing.

THE MARK SYSTEM

Progress through Brockway's reformation program was traced through a mark system of classification, similar to the merit and demerit system used in military academies. Upon entering the reformatory, an individual was placed in the second of three grades for an observation period of six months. If he failed to comply with the program, he would be demoted

to the third grade where he would stay until he proved himself worthy of returning to the second grade. Demotion to the third grade meant increased punishment and the loss of privileges. The inmate would be placed in a red uniform and forced to march in lockstep. In addition, he would be denied writing, mail, and visitation privileges. On the other hand, six months of good behavior in the second grade would earn an inmate promotion to the first grade and the privileges that went along with it.

The first grade entitled the inmate to a comfortable blue uniform, a spring mattress, better food, and extended library and bedtime hours. An additional six months of good behavior in the first grade, coupled with other criteria, such as the inmate's offense of conviction, number of marks earned or lost, attitude, history and future plans, would determine the inmate's eligibility for parole. Parole, which was typically set at a minimum of six months, served as a test to determine how much of the reformation program had been absorbed. Once on parole, the prisoner worked at prearranged employment in the field in which he had been trained, with required "monthly reports certified by the employer and [parole] supervisor." Upon completion of this trial period of freedom, and barring any setbacks on behalf of the prisoner, he would become a free man (Brockway, 1969, p. 324).

CONCLUSION

By the time Brockway retired in 1900, the population of Elmira had grown to roughly 1,500 inmates. Even though the end of his career was marred by investigations into physical and psychological abuse at the institution, many of his original programs had remained in place, most notably the classification system. Brockway would interview each new inmate to discover any potential problems or needs, and then place him in programs that could best reform that inmate. These ideas were expanded in 1917 by Dr. Frank Christian, one of Brockway's successors. The culmination of Brockway's and Christian's work was the building of a reception center at Elmira in 1945, which officially became a part of the main facility in 1970, resulting in the reformatory being renamed the Elmira Correctional and Reception Center.

Even though Elmira is no longer a reformatory, many of the programs that began with Brockway can be seen in the modern institution. The reception center still has an active educational and industrial programs, as do many other prisons across the nation. In addition, although indeterminate sentences and parole have been criticized, they, along with classifications of prisoners and the use of privileges as rewards, still serve key functions in corrections today.

ENEMY COMBATANTS

In 2001, the Bush administration coined the term *unlawful combatant* (later renamed *enemy combatant*) to describe certain individuals either captured

during the war in Afghanistan or suspected of having links to the terrorist organization Al-Qaeda. Currently, any individual who the administration deems a threat or danger to the United States, including "citizens who associating themselves with the enemy and with its aid, guidance, and direction, or enter into this country bent on hostile acts are enemy belligerents" (U.S. District Court, Lower Manhattan, *U.S. v. Padilla* [2002]), may be defined as an enemy combatant. In other words, U.S. citizens may also be designated as enemy combatants.

As of March 2003, two Americans have been categorized in this way: Jose Padilla and Yassar Esam Hamdi. Padilla was named an enemy combatant in June 2002 after he was "captured" not on a battlefield, but at Chicago's O'Hare Airport. The government says he was planning to detonate a radiological bomb in America. Padilla was transferred to a Navy brig in South Carolina where he has been questioned by military interrogators and denied contact with outsiders, including his attorney. He has not been charged with a crime. Hamdi is an American-born Saudi who was captured in Afghanistan. He is being detained at a Navy brig in Virginia. Provisions for future enemy combatants include a special wing at Goose Creek (SC Navy Brig) to accommodate up to 20 U.S. citizens. Attorney General John Ashcroft is said to have announced additional plans to construct detention camps for U.S. citizens deemed as enemy combatants.

Categorization as an enemy combatant denies a captive access to the rights of the Geneva Convention to which prisoners of war are entitled. Enemy combatants are not permitted contact with lawyers, family, or friends. They may also be denied counsel, detained indefinitely, and held incommunicado, without due process and without review of their designation as enemy combatants by the U.S. Court of Appeals.

ORIGINS OF THE TERM

The term *enemy combatant* derives from two sources: international law and the 1942 U.S. Supreme Court *Ex parte Quirin* (317 U.S. 1) decision that pertained to eight suspected Nazi saboteurs, one of whom was a U.S. citizen. International law recognizes combatants and noncombatants in Article 3 of the Geneva Convention Rules of War (Hague 4, Chapter 1, Article 3, October 18, 1907). The terminology articulates who qualifies for prisoner of war status in order to establish who is then duly protected with rights. Article 3 states: "The armed forces of the belligerent parties may consist of combatants and non-combatants. In the case of capture by the enemy, both have a right to be treated as prisoners of war." International law standards for noncombatant status are reserved for persons accompanying the armed forces without being members, such as civilian members of military aircraft crews, war correspondents, supply contractors, members of labor units or of services responsible for the welfare of the armed forces (Article 4:4, Hague Convention 3, 1949). *Combatant* is defined by the following standards: "(a) That of being commanded by a person responsible for his subordinates; (b) that of having a fixed distinctive sign recognizable at a distance; (c) that of carrying arms openly; (d) that of conducting their operations in accordance with the laws and customs of war" (Article 4:2, Hague Convention 3, 1949).

In the 1942 *Quirin* case, the Supreme Court defined enemy combatant' with the same terminology as spies were then viewed under international law. That is to say, unlawful combatants were judged to be the same as spies, who engage in secretive passage through military lines, without uniform (a criteria under international law for prisoner of war [POW]) in a time of war for the purpose of waging war by destruction of life or property. This renders such individuals belligerents who are not entitled to the status of POW or offenders against the law of war and therefore subject to trial. Such individuals are subject to trial and punishment by military tribunals. Since *Quirin,* no new case has elaborated or superseded this definition.

IMPLICATIONS FOR THE FUTURE

At the time of writing, the implications of U.S. citizens being detained under military rule and denied constitutional rights continues to the subject of vigorous debate. On September 5, 2002, Senators Carl

Levin and Russ Feingold wrote to Attorney General John Ashcroft and Defense Secretary Donald Rumsfeld seeking clarification of the new category of enemy combatant in eight areas. Specifically, they requested the operative definition along with a document providing a clear and distinct definition (and its sources), the process by which individuals may be given this label, and the criteria used in its determination. They also wanted to know about the rights of U.S. citizens named as enemy combatants, the time line for detention, any documented changes to existing U.S. military regulations implementing the Geneva Convention of 1949, and an un-redacted copy of the president's orders designating Padillo and Hamdi as enemy combatants.

Around this same period, the American Bar Association (ABA) took two unprecedented actions condemning the practice of the Bush administration. In a resolution on August 13, 2002, the ABA denounced the secret detention of people by the Immigration and Naturalization Service (INS). On August 9, 2002, the ABA released a preliminary report addressing the government's ability to detain U.S. citizens as enemy combatants. The ABA cited Section 4001(a) of the 1971 U.S. Criminal Code that states: "No citizen shall be imprisoned or otherwise detained by the US except pursuant to an Act of Congress."

CONCLUSION

Individuals detained and labeled as enemy combatants without the process afforded by the U.S. Constitution or international law have almost no legal rights or safeguards. While supporters of this change of policy point to the need for safeguarding homeland security since the terrorist attacks on the Pentagon and the World Trade Center in New York City on September 11, 2001, critics argue that the current rule of law could become a malleable tool during times of peace and war.

ENGLAND AND WALES

Imprisonment is the harshest penalty available to the courts of England and Wales, since the death penalty was abolished for murder in 1969. Currently, around 110,000 offenders are each year committed to the 137 institutions that make up the prison system, providing employment for more than 43,000 staff to keep them there. All of this stands in stark contrast to the situation just over 50 years ago, when, in 1946, there were about 40 prisons, approximately 15,000 prisoners, and around 2,000 staff (Morgan, 2002, p. 1117). The reasons for this striking increase are complex, yet there is considerable consensus that the prison system in England and Wales has been in a state of ever-deepening crisis since the early 1970s.

Even though conclusions drawn from international comparisons should always be treated with caution, it is clear that England and Wales consistently use imprisonment to a greater extent than practically every other country in Western Europe.

In 2002, for instance, 139 persons were incarcerated per 100,000 population in England and Wales, compared to 96 in Germany, 95 in Italy, 93 in the Netherlands, and 68 in Sweden (Walmsley, 2003, p. 5). Such crude comparisons also indicate that England and Wales lie behind the global leaders in imprisonment—Russia, the United States, China, and South Africa—as well as most of the countries in Eastern Europe. Of course, these international differences can only be properly explained through separate and detailed analyses of the political changes, cultural sensibilities, economic landscapes, and social histories that each of these societies has experienced. Such a task is beyond the scope of this entry; instead the more modest ambition is to chart the historical origins of imprisonment and provide an overview of contemporary problems that sustain the prison crisis.

THE ORIGINS OF IMPRISONMENT

Any attempt to identify the exact moment when the prison was born in England and Wales is an exercise doomed to failure. For as Christopher Harding and his colleagues (Harding, Hines, Ireland, & Rawlings, 1985) point out, some form "of detention becomes necessary as soon as disputes over wrongs come to be settled in any but the most immediate and brutal fashion" (p. 3). According to the historian Ralph Pugh (1968, p. 1) the holding of defendants prior to trial was probably the earliest use of imprisonment, a practice that dates from the ninth century in England. At this time, the accused were held awaiting "gaol delivery" (the arrival of traveling courts) usually in makeshift structures such as castle dungeons, hall cellars, town gates, and stables.

Imprisonment in medieval England came to serve three main uses: *custodial* (detaining those waiting trial or sentence), *coercive* (forcing fine defaulters and debtors into making good their misfortune), and *punitive* (as punishment in its own right). The main role of early prisons was to detain rather than punish, with the coercive function used almost exclusively for recovering civil debt. The punitive potential of imprisonment was not thought to be useful until the late 18th century. Until this point, the customary forms of punishment were primarily corporal or capital including banishment, execution, mutilation, branding, whipping, and forms of public shaming.

As the feudal system began to break down and mercantile capitalism emerged, significant numbers of people migrated from rural areas to the burgeoning towns and cities. This new population was widely viewed as troublesome, and thought to spread crime, poverty, and unemployment. In response, a range of secular institutions that are usually understood to be the precursors of modern imprisonment emerged across Europe in the 16th and 17th centuries. The *hôpital général* in France, the *spinhuis* and *rasphuis* in Amsterdam, and Bridewells and workhouses in Britain were all used to confine the growing numbers of poor, homeless, and dispossessed citizens. Britain and France also transported offenders to their colonies.

It was not until the 18th century that the prison was really established as the best response to crime, as opposed to the former public spectacles of suffering such as capital punishment or flogging. There are competing explanations as to why the prison came to be the dominant response to crime at this time, from capitalism to technological advancements and legal changes. The role of religious reformers such as John Howard and Elizabeth Fry was also crucial. Such figures were opposed to the indiscriminate mixing of men and women in the Bridewells, workhouses, and local gaols. They were also concerned about the lack of segregation between the tried and the untried, the open sale of alcohol, gambling, and the generally filthy conditions, where diseases like typhus were rife.

Guided by religious piety and Enlightenment reason the reformers advocated the benefits of classification, isolation, and sanitation. Howard's widely publicized description of the abuses and distress encountered in these institutions and his comprehensive proposals for change, combined with the American War of Independence of 1776, which left the government with nowhere to send those sentenced to transportation, ultimately led to the 1779 Penitentiary Act. This act promoted a new vision of imprisonment that would unite the punitive and

reformative through hard labor and religious instruction in a system where prisoners were classified into groups, and profits from their labor were used to pay staff. Nearly 100 years later, in 1877, the penal system was finally fully brought under centralized state control.

THE MODERN PRISON SYSTEM

The prison system has changed considerably since the 19th century. While the big Victorian prisons hold the majority of prisoners, there is now a range of more recently constructed institutions as well. In many respects, prisons in England and Wales fall into one of two categories. First, there are local prisons and remand centers whose primary task is to receive and deliver prisoners to the courts, and to allocate those serving sufficiently long enough sentences to the second category of institutions. These are Young Offender Institutions and adult training prisons, which are further subdivided into closed and open institutions for men and women. This subdivision reflects a prisoner security classification and the level of security that institutions provide. All prisoners are classified A, B, C, or D according to a scheme devised in 1966 by Lord Mountbatten following a series of notorious prison escapes.

Category A prisoners are those "whose escape would be highly dangerous to the public or police or to the security of the state" and while Mountbatten thought that such prisoners would probably be no more than 120, a recent estimate puts the current figure at some 700 (Morgan, 2002, p. 1143). At the opposite end of the spectrum, Category D prisoners are those "who could be trusted under open conditions." Category B and C prisoners are those in between, who are held in closed conditions providing more or less security. Trial and remand prisoners, with the exceptions of those provisionally categorized as A, are all assumed to be Category B.

Where to house sentenced Category A prisoners has been the subject of long-running controversy. Mountbatten called for the concentration of all such individuals into one single-purpose maximum-security fortress that would not only ensure that high-risk prisoners were kept in secure surroundings but that security could be relaxed in other regimes. This proposal was quickly rejected on the basis that housing all high-risk prisoners together would mean that maintaining order and providing a constructive regime would be near impossible in a prison composed of "no-hopers." Instead a policy of "dispersal" was adopted, in which maximum-security prisoners are spread around among a few high-security prisons known as dispersal prisons. There are currently five of these institutions plus a further five that have high-security arrangements.

Even though the dispersal policy might have solved the problem of perimeter security since high-security prisons are very difficult to escape from, it has intensified the problems of internal control. For within the prison system the presence of a small number of maximum-security prisoners affects the vast majority of other prisoners who are subjected to much more restrictive and oppressive regimes so that high-security conditions are met.

The system of classification maintains a sharp differentiation between dispersal, training, and local prisons, to the extent that the latter have come to bear the brunt of the chronic overcrowding, squalid conditions, and understaffing, while the dispersal and training prisons have to a large extent been protected. The rationale behind this policy is the assumption that for prisoners serving short sentences there is too little time to achieve results, so that these prisoners all too often bear the brunt of the substantial problems faced in the penal system and where the sense of crisis is most palpable. It is important to recognize that the crisis is composed of the following sets of interrelated issues: an expanding prison population that contributes to overcrowding and decrepit conditions, which does much to undermine the authority and legitimacy of the system while constituting a number of troubling social consequences that are now outlined.

CONTEMPORARY CRISES

The Expanding Prison Population

Since the 1950s, the growth in the prison population has consistently kept apace of available space in penal institutions. This is in marked contrast to the

era between the two World Wars, when prisons were routinely half full. For instance, in 1928 there were only just over 11,000 prisoners in a system that could offer 20,000 cells. By 1938 the number of prisoners remained around the 11,000 mark, but many prisons had been closed on the grounds that they were no longer required (Stern, 1993, p. 24). In contrast, during the postwar era there was a fivefold increase in recorded crime from 280,000 in 1938 to 1,334,000 in 1965. During this period, the courts' proportionate use of imprisonment actually decreased as the fine replaced probation as the main form of sentence, yet the prison population tripled—from 11,100 in 1938 to 32,500 in 1968 (Bottoms, 1987, p. 181).

Even though the prison population rose modestly during the 1980s, and reached a peak at around 50,000 in 1988–1989, it then declined in the early 1990s to around 45,000. Between 1993 and 1998, it increased rapidly by some 47% to reach 65,300 and then declined slightly only to increase from January 2001 to reach a new peak of 71,220 in June 2002 (Home Office, 2002). Nevertheless, it is important to recognize that there has been a "twin-track" approach operating across criminal justice policy since at least the mid-1970s, where successive governments have pursued both "soft" and "tough" sentencing options simultaneously. In mid-1980, for instance, 22% of prisoners were serving sentences of more than four years; by mid-2000 this figure stood at 46% of adult male prisoners (Home Office, 2001, p. 76). These changes are partly explained by the introduction of parole in 1967 and subsequent developments in its use, but the important point to note is that long-term prisoners dominate life both numerically and culturally in most training prisons and consequently preoccupy prison administrators, with important consequences for the remaining prisoners.

Overcrowding and Conditions

The prison system in England and Wales is seriously overcrowded. The effects of the sheer numbers contribute to a sense of crisis in many ways. Most obviously, the overcrowding has a deleterious impact on conditions. Prisoners who begin their carceral career, and most do, in a local prison will typically find themselves in the midst of the worse conditions that the penal system can inflict, where overcrowding has been a daily feature of life within many of these institutions for more than three decades. The dilapidated physical conditions in which prisoners are contained combined with poor sanitation, scarcely edible food, decaying cramped cells, clothing shortages, and brief, inadequate family visits compound this wretchedness. Moreover, since there is neither the space, facilities, nor resources to provide training, work, and educational opportunities when there are too many prisoners to cope with, most people remain idle. Such abject conditions have been condemned by the European Committee for the Prevention of Torture, which concluded in 1991 that the overcrowding, unsanitary facilities, and impoverished regimes found at three Victorian local prisons amounted to inhumane and degrading treatment.

Authority and Legitimacy

Criminologists in Britain routinely portray a crisis of authority and legitimacy in the prison system. Here they refer not only to the long and bitter industrial relations between prison staff and management but also to major changes in the philosophy and organizational form of prison administration. In the postwar era, there has been a shift in the source of authority in prisons from a highly personalized form of charismatic power to systems based on bureaucratic rules and procedures. Further organizational changes have meant that the Prison Service, formerly a Department of State within the Home Office, became a semiautonomous executive agency in 1993 and privatization (the contracting out of public services to the private sector) is now an important and controversial feature of the penal landscape. For its critics, the turn to managerialist issues in the 1980s and 1990s has only served to undermine a sense of mission to the service, save for meeting narrow management objectives and performance indicators.

SOCIAL CONSEQUENCES

Gendered Prisons

As in other judicial systems, English prisons predominantly hold young adult men and most

commentators agree that the organization and culture of the prison system reflect this dominance to the extent that there are very different regimes for male and female prisoners. For instance, women prisoners have tended to be thought of as mad or sad rather than bad, and their regimes have reinforced traditional stereotypes of motherhood and domesticity. There are only a dozen or so women's institutions in the English prison system, making it both extremely difficult for women in prison to sustain relationships with friends and family while compounding their overall marginalization in research and policy areas.

Nonetheless, the drastic increases in the female prison population over the past decade and a series of scandals have pushed the issue of women's imprisonment to the forefront of policy debates. For instance, between 1990 and 1998 the female prison population doubled, and reached 3,350 in 2000, the highest level since 1901 (Home Office, 2001). The sense of crisis in women's prisons extends far beyond numbers. For example, since the mid-1990s the media have widely reported on the shocking practices of manacling mothers in labor and degrading methods of drug testing. In addition, Holloway Prison, the largest prison for women, was deemed too filthy to inspect by the Chief Prisons Inspector; and in 2002 more women killed themselves in prison than ever before. Nevertheless, there are some signs that the government is sufficiently concerned about the increase in women prisoners to have published the *Strategy for Women Offenders* with a view to reducing the number of women in prison (NACRO, 2001/02, pp. 27–28).

Ethnicity, Nationality, and Racism

As in the United States, prisoners in England and Wales are disproportionately young, poor, ethnic minorities. They also possess few occupational skills or academic qualifications and are likely to be suffering from psychiatric distress. Recent figures indicate that 19% of male prisoners and 25% of female prisoners are members of ethnic minorities; two thirds of them are Afro-Caribbean (Morgan, 2002, p. 1133). There are a number of reasons for this overrepresentation. One key factor is nationality, and it has been noted that 9% of the prison population comprises foreign nationals (a growing trend observed across Europe). Another factor is the relative youthfulness of ethnic minorities compared to the white population, which means that overrepresentation is all the more likely to occur (Morgan, 2002, p. 1134).

Elaine Genders and Elaine Player (1989) have provided substantial evidence of racial discrimination within prisons. For example, they found that the best jobs were regularly allocated to white prisoners, as prison officers believed that Afro-Caribbean prisoners were arrogant, lazy, and antiauthority. More recently, the official inquiry into the racist murder of Zahid Mubarek in March 2000 by his fellow cellmate, in Feltham Young Offender Institution, found pervasive institutional racism, leading the Prison Service to invite the Commission for Racial Equality to carry out a formal inquiry into racism in prisons. The first part of the report identified 20 "systematic failures" by the Prison Service to prevent the murder, while the second part commented more widely on racial discrimination in prisons (Commission for Racial Equality, 2003a, 2003b).

CONCLUSION

Clearly, the problems that face the penal system in England and Wales are deep, multifaceted, and controversial. In November 2002, the government released figures predicting that the number of prisoners would increase by 40% over the next decade, taking the population to more than 100,000 for the first time. The escalating prison population means that the system will expand far beyond Western European norms, with English and Welsh prisons continuing to be damaging places as the severe problems that have been documented here will intensify. Under these circumstances, it is unlikely that an overstretched prison system will help offenders lead law-abiding lives, while the question of why some countries persist with imprisonment to a greater extent than others remains more pressing than ever.

ENGLISH AS A SECOND LANGUAGE

English as a second language (ESL) is the term used to describe English-language instruction for nonnative English speakers. Another term used to describe the nonproficient English speaker is limited English proficiency (LEP). All prisoners in the United States should be able to demonstrate proficiency in English. If not, they must enroll in ESL or LEP instruction. In addition to providing language skills needed in the institution, corrections-based ESL and LEP instruction seeks to assist the learner with the basic language skills necessary to perform adequately in general education classes.

Of the total prison population, 8% are non–U.S. citizens. The number of inmates with limited English speaking ability is much higher. According to the Federal Bureau of Prisons, 31.7% of inmates held in federal facilities are classified as Hispanic, 1.6% as Native American, and 1.8% as Asian. These numbers vary greatly by state. For example, 53% of New Mexico inmates are Hispanic. New York has the second highest percentage of Hispanic inmates with over 32%. Five other states have Hispanic prison populations of over 25%. Although Spanish is the most common non-English language in prison, the ethnic background of inmates is changing in ways that reflect recent trends in immigration. As a result, we can expect an even wider range of languages in state and federal prisons. Due of a growing number of illegal immigrants, in some cases entire facilities are being

filled with non-English speakers. In this case, the language needs are so complex that ESL instruction is being supplemented, or replaced, with electronic translation technologies.

ASSESSING AND TEACHING

A survey of national of adult literacy in 1992 found that on a scale of 1 (low) to 5 (high), over half of nonnative speakers consistently scored below Level 3. Level 2 was the average level for Hispanics born in the United States, while Level 1 was the average for immigrants from Hispanic countries. Level 3 was the average for Asian-Pacific Islander born in the United States, compared to Level 2 for immigrants from Asia and the Pacific Islands (National Center for Education Statistics, 1992).

Several standardized and commercial tests are used to determine the proficiency level of a potential ESL student. Among these are Test of Adult Basic Education (TABE), Adult Basic Learning Exam (ABLE), Basic English Skills Test (BEST), CASAS ESL Appraisal, and the Henderson-Moriarty ESL Placement (HELP). Some of these tests measure the proficiency of the learner in his or her native language to provide a comparison with the learner's aptitude in English. Other tests measure oral abilities such as listening and speaking (the first two levels of English acquisition), while others measure writing and reading as well (the upper levels of English acquisition). The results of most tests need to be interpreted to properly classify the learner by level. Training on interpretation is required for best results, yet, due to expenses, such training is often not provided to the instructor. As a result, in many cases the learner is not properly classified before enrolling in ESL classes.

Several curricula are available to the nonnative speaker. Some of these, provided by general education material providers, include student workbooks, learning tapes, and instructor manuals. Two other curricula commonly used and available for correctional facilities are "Crossroads Café" and "I Can Read." These programs include videos that the student can use without support from an instructor or tutor. The videos show the learner the written target word, pronounce the word, and connect the word to phrases or objects.

CHALLENGES

Regardless of the curricula chosen, language mastery depends in part on the ability of the learner to interact with others to practice new vocabulary and speech patterns. This is not an easy task for the incarcerated student. Procedural policies of many facilities do not provide for adequate interaction, slowing down the acquisition process. Funding issues in correctional facilities create another problem. Corrections education programs typically have limited educational funds for materials. Administrators are forced to prioritize their expenditures. As a result, materials purchased for use in correctional education programs are concentrated on English-proficient students. This leaves the LEP inmate without adequate resources to improve his or her language skills.

On average, it takes five to seven years for a nonnative speaker of English to become accomplished at most communication tasks. The minimum requirement for a person literate in his or her native language is 750 to 1,000 hours of skills development to satisfy basic needs and to have limited social interaction in English. Due to the nature of correctional facilities, many inmates are transferred or released before that time period has elapsed. As a result, it may be difficult for prisoners to complete their ESL education in a correctional facility. However, even if basic language skills are not fully developed, one of the goals of the ESL educator is to help the individual acquire language skills necessary for survival in the prison society. This can be accomplished in a relatively short period of time.

CURRENT PROGRAMS AND ISSUES IN ESL TRAINING

Many different ESL programs are used in correctional facilities. Several states provide ESL training as part of their adult basic education programming. Since correctional education literacy programs vary from facility to facility, it is difficult to discover what services are provided to inmates. Each state,

and in some cases each facility, feels different pressures to develop and administer ESL and LEP programs. Varying levels of integration with other correctional education programs can also lead to problems with information sharing that could lead to increased standardization of delivery.

Since funding for ESL programs does not typically fall into state-mandated education budgets, ESL-specific programs must compete with state funds allocated to general education within the corrections departments. As a result, many facilities rely on outside volunteers or contractors to provide ESL instruction. Community volunteers and school agencies, such as community colleges, offer the majority of ESL programs to the general population. In addition, Laubach International and Literacy Volunteers of America has historically offered special training for low-language-proficiency learners and currently offer materials and guidelines for instruction in corrections-based ESL services.

Most ESL students are grouped with English-proficient students in general classrooms. Many of these students drop out of correctional education for the same reasons they do so in general public facilities' education. Common reasons include problems related to grasping the vocabulary, understanding the subculture expressed through language, and learning the conversational patterns used in normal speaking. Since speech patterns vary among ethnic groups, and these vary from standard English speech patterns, students are likely to make several mistakes speaking English as a second language. In addition to the inherent difficulty of learning a new language, pedagogical approaches by educators may diminish their effectiveness as teachers to non-English speakers. Many of these problems can be addressed through the development of ESL-specific programs or by encouraging educators to work to participate in opportunities for ESL training.

CONCLUSION

Data indicate that corrections education is an effective tool in the effort to reduce recidivism. Less evidence is available regarding a link between ESL programs and crime reduction. We know that correctional institutions function better when prisoners are encouraged to live together and follow the rules. As with other forms of corrections education, ESL and LEP programs provide opportunities for prisoners to learn to "do their time" in a productive way.

Many benefits of ESL instruction are difficult to assess. For example, it is hard to measure large-scale improvement in the ability to effectively function within correctional facilities. Corrections education is consistently shown to be very effective in efforts to reduce recidivism and improve employability after prison. Although the relationship of ESL instruction and crime control has not been clearly demonstrated, there is no reason to believe that ESL instruction does not have the same potential. In many cases, the incarcerated individual will not be able to fully participate in corrections education without first learning to speak English. As such, the benefits of education are denied to those with limited English skills.

The corrections industry, like the justice system as a whole, relies on established procedures, policies, and laws. The incarcerated individual and the institutions in which individuals are incarcerated each benefits from efforts to ensure that policies and procedures are effectively communicated. These policies and practices are often intended to protect the rights of those who interact with the system. Those who do not speak the dominant language of this system are at a distinct disadvantage. Although general impacts are difficult to assess, ESL instruction has the potential to reduce this disadvantage and minimize the loss of rights that may occur when an individual is unable to actively participate in processes that have serious implications.

ESCAPES

Each year a small number of men and women escape from their prison or jail. However, the popular perception of the violent and dramatic prison escape as portrayed in television and film is not generally true. Most escapes involve low-security inmates, or walk aways, who receive scant media attention and remain a low priority for understaffed police departments.

ESCAPE RATES

Prison escapes have decreased dramatically since 1994 when a total of 7,598 inmates (all security levels) escaped. In 2001, the total number of escapes (all security levels) was 5,487. When these figures are broken down into security levels, the number of higher-security escapes has decreased by 78% from 1994 to 2001, while the number of low-security or walk-aways has only decreased about 6%. In 1994, of the total number of escapes, 30% were classified as medium to high security, while in 2001, only 9% were classified as such. Such decrease is even more notable in light of the simultaneously growth in the prison population. During this period, the total number of inmates has increased 86% from approximately 1 million to 1.9 million.

WALK AWAYS

Those who seek to escape their prison sentence usually do it merely by walking away. That is to say, they either do not return to prison or simply disappear from work release, transitional supervision centers, halfway houses, furloughs, medical appointments, and so on. From 1994 through 2001, the number of walk aways fell slightly from 5,311 to 4,995. In the same period, the percentage of these escapees who were returned fell from 49% in 1994 to 46% in 2001. Less attention is paid to these kinds of escapes since the people involved usually are thought to pose little threat to the community.

HIGH-SECURITY ESCAPES

The total number of higher-security escapes from federal and state facilities decreased from 2,287 in 1994 to only 492 in 2001. Most high-security escapees are eventually caught and returned to the institution with additional time added to their original sentence. The rate at which escapees are caught and returned to confinement improved from 87% in 1994 to 91% in 2001.

The drop in number of high-profile and high-security escapes and the improved rate at which such individuals are found are attributed to a number of factors including an increased focus on correctional officer selection and education, more rigorous classification schemes, and better perimeter security. Various technological developments have also reduced prisoners' ability to run away from prison such as the installation of motion detectors, metal detectors, and nonlethal stun fencing. In some institutions, visits are now placed under video surveillance to reduce the possibility of contraband or weapons being smuggled into the prison that could be used in an escape attempt.

There have also been many changes and innovations in prison construction over the past decade

that have made high-security institutions much harder to escape from. Increases in perimeter fence lighting and the use of razor ribbon around the perimeter of the facility, for example, both act as physical barriers to those wishing to flee. Furthermore, the introduction of the supermax prison, such as Pelican Bay in California, has also affected the escape rate. Inmates in these kinds of institution are isolated from others and have little contact even with staff. They remain in lockdown at all times, in small cells that have only the tiniest of windows with unbreakable glass. Such institutions are nearly impossible to get out of other than by officially sanctioned means of release.

RISK ASSESSMENT AND ESCAPE BEHAVIOR

Reflecting the relative infrequency with which it occurs, there is not much current research being done about escape. To understand those factors that make escapes happen, therefore, we must, for the most part, turn to earlier studies. From this considerable body of work, it seems that there are three separate factors that determine whether inmates will try to escape: (1) static, (2) situational, and (3) psychological.

Static factors include such things as demographic characteristics such as age, race, and gender and well as the criminal's career and time behind bars. Thus, for example, Holt (1974) and Morgan (1967) found that escapees tend to be less than 30 years of age, and Morgan also established that many of the escapees had been incarcerated less than one year prior to their escape attempt.

Not only are certain types of offenses associated with an increased likelihood of escape, but the number of times someone has been incarcerated appears to be relevant. According to Holt (1974), therefore, inmates with property convictions were more likely to escape than those convicted of a crime against a person. These people were also more likely to have had prior escape attempts. More recently, the National Institute of Justice in 1987 stated that the prior escape record of the inmate was indicative of future behavior and could be effectively applied during the security classification process. Similarly, a 1997 study done by the Correctional Service of Canada indicated that the female inmates with more violent criminal convictions were more likely to attempt escape.

Situational factors associated with escape attempts include substance abuse, family issues, parole problems, and institutional problems. Hilbrand (1969) indicated that the more unstable a person's home life and familial situation, the more likely it is that he or she would try to escape. Family issues in particular are common causes of walk-aways, as inmates sometimes feel as though they need to resolve some family conflict and so cannot return to their place of confinement.

An additional situational factor, the threat of institutional violence and assault, also seems to be a factor in people's decision to escape (Loving, Stockwell, & Dobbins, 1959). Not surprisingly, those who feel at risk while incarcerated often try to flee. Other factors that are associated with an increased likelihood of escape include the number of times a person has been involved in incidents of misconduct and related disciplinary actions (Hilbrand, 1969) and whether they participate in institutional programming (Duncan & Ellis, 1973). Such research suggests that subjective factors, such as how content or invested in an institution someone is, will affect the decision to try to leave. Finally, researchers have even examined seasonal factors (Hilbrand, 1969). Not surprisingly, people are more likely to try to leave in the warmer months.

Although a number of scholars have attempted to identify those psychological factors that lead people to escape, there has been no conclusive evidence indicating that any specific characteristics indicate a higher probability of escape (Loving et al., 1959; Shaffer, Bluoin, & Pettigrew, 1985). Some radical psychologists and criminologists see escape attempts as a healthy form of resistance. For these authors, prisoners do not actually have to leave the prison confines to escape. Many other more everyday mechanisms can be used to create some distance between inmates and their surroundings. These strategies run the gamut from legitimate forms of self-expression such as writing and artwork to

illicit means of muting the senses like drug use. Firsthand accounts by inmates, as well as critical studies of inmate culture, portray such techniques as attempts to resist the power of the prison and its staff.

CONCLUSION

It is not easy to predict which prisoners will seek to escape and which will not. The complex interconnections between institutional, static, and situational factors as well as a person's history of escape attempts and psychological makeup make any such predictions unreliable. All that can be safely said is that despite various developments in technology, security, classification, and prison management, some inmates will always try to flee from their confinement. Incarceration is very rarely a desirable state and so people will try to escape.

ESTELLE v. GAMBLE

The U.S. Supreme Court case *Estelle, Corrections Director et al. v. Gamble,* 429 U.S. 97 (1976) underpins inmate rights to medical treatment in all correctional facilities. This case, generally referred to as *Estelle v. Gamble,* established for the first time that prison and jail inmates have a constitutional right to medical treatment under the Eighth Amendment. Its decision was made applicable to states by the 14th Amendment.

THE CASE

J. W. Gamble, an inmate at the Texas Department of Corrections, was injured while performing job-related duties after a bale of cotton fell on top of him while he was loading a truck on November 9, 1973. Gamble continued to work the rest of the day despite complaining of pain and tenderness in his back. He was diagnosed with lower back strain and prescribed pain medication along with "cell-pass, cell-feed" status for two days, which was later extended into a few weeks. Three weeks later, Gamble complained once again of severe lower back pain, which he claimed was as bad as when the incident first occurred. At this point, he refused to return to work. In response, he was sent to "administrative segregation" on December 3 and taken before the disciplinary committee. Once the disciplinary committee heard of Gamble's intense lower back pain and complaints of high blood pressure, the committee directed him to a doctor, who prescribed him medication. Gamble remained in administrative segregation for the entire month of December.

In January 1974, Gamble was reprimanded for not returning to his assigned job-related duties on the prison farm. Once again, he refused to work because of his back pain. Once again he was remanded to administrative segregation and brought before the disciplinary committee. This time, when he complained of pain and high blood pressure,

however, the medical staff testified that he was in "first rate" health and able to return to work. The disciplinary committee then refused Gamble's request for additional medical examination and sentenced him to solitary confinement until he agreed to return to work on the farm. At this point, Gamble filed the said petition.

The complaint first went before the U.S. District Court for the Southern District of Texas where it was dismissed "for failure to state a claim upon which relief could be granted." Later, the U.S. Court of Appeals for the Fifth Circuit reversed and remanded the compliant back to the District Court with explicit instructions to reinstate it. The complaint was then heard by the U.S. Supreme Court on certiorari.

THE ISSUE

Gamble filed civil suit against the warden of his Texas correctional facility and the assisting doctor to that prison under 42 USCS 1983. He argued that his constitutional rights against "cruel and unusual punishment" under the Eighth Amendment had been violated because the prison staff had refused to provide proper medical care when he injured himself while fulfilling work-related duties.

THE HOLDING

Gamble won his case. The Court found that the medical care provided to Gamble was insufficient and that prison staff acted with "deliberate indifference" to his medical problems. The Court held that deliberate indifference to an inmate's acute medical requirements violated the Eighth Amendment's prohibition on cruel and unusual punishment, and was, therefore, actionable as a civil right's grievance under Section 1983. Justice Thurgood Marshall delivered the majority opinion of the Supreme Court.

Justice John Paul Stevens dissented by arguing that the "pro se complaint against the prison's chief medical officer should not have been ordered dismissed." He further argued that "in any event, by its references to "deliberate indifference" and the "intentional" denial of adequate medical care, "the [Court] improperly attached significance to the subjective motivation of [Gamble] as a criterion for determining whether cruel and unusual punishment had been inflicted, whereas such determination should instead turn on the character of the punishment rather than the motivation of the individual who inflicted it" (429 at 104–105). According to him, the "intent" of the defendant is not necessary as long as the resulting condition results from the lack of proper medical treatment to the inmate. Justice Stevens argued that this ruling would give correctional facilities greater latitude in proving their provision of medical treatment, while placing greater burden on the petitioner, or recipient of the mediocre treatment. He concluded by adding that certiorari should have never been granted in this case and that the decision by the Court of Appeals should have been affirmed.

CONCLUSION

Estelle v. Gamble was the first case in which the Supreme Court considered prisoners' rights to medical treatment with respect to the Eighth Amendment clause banning the use of cruel and unusual punishment. In this case, the Court termed a new standard, which is known as the "deliberate indifference" burden. In employing the deliberate indifference burden, the Court paved the way for inmates to seek resolve for medical malpractice via tort law.

In 1996, Congress passed the Prison Litigation Reform Act (PLRA) to discourage inmates from filing "frivolous" lawsuits and to limit the power of federal courts in conditions litigation. The act also restricted inmates' use of attorneys in tort-related cases. This made it difficult for those seeking awards under the deliberate indifference standard set forth in *Estelle v. Gamble.* As a result, inmates are now faced with great obstacles in filing claims of neglect and substandard conditions. This affects a range of prisoner complaints, including how pregnant women are received in correctional facilities. If an inmate mother loses her child due to the inadequate services by staff, her chances of seeking civil justice are now limited. While the *Estelle* decision was a historical one in assessing inadequate health care, its standard set forth by the Court was

quite narrow in establishing deliberate indifference and was furthered restricted with the PLRA.

F

FAITH-BASED INITIATIVES

Faith-based initiatives refer to a widespread effort among governmental and religious nonprofit agencies to incorporate religious activism into various social welfare programs, including the correctional system. Most programs currently in place in the United States are centered around the Christian or Muslim faiths. Faith-based initiatives encompass everything from programs designed to help religious organizations obtain federal funding for outreach activities to the actual implementation of prison ministries.

The faith-based movement has recently been reenergized in the United States by President George W. Bush's strong commitment to it. Following his inauguration, President Bush announced the establishment of the White House Office of Faith-Based and Community Initiatives (OFBCI). During subsequent months, the Bush administration created legislative proposals focusing on the delivery of federally funded social services through faith-based organizations, becoming commonly known as the "faith-based initiative." The principle behind this initiative is that faith-based charities should have an equal opportunity to compete for federal funds to provide public services.

Included among the proposed legislation was HR 7, the Community Solutions Act of 2001. The bill sought to provide tax incentives for charitable contributions by individuals and businesses and expand the "charitable choice" provision of the 1996 welfare reform legislation. The charitable choice provisions prohibit public officials from discriminating against religious social service providers seeking to compete for government positions. By expanding the charitable choice provision, President Bush created a specific and highly controversial way in which government and religious institutions may collaborate to provide social services. As a result, the issue has stirred tremendous debate over the separation between church and state.

RELIGION IN PRISON

Research has indicated that religious activity (e.g., attendance at religious services) in prison reduces adult criminality. Previous studies have also shown that inmates most active in Bible study activities who attend 10 or more studies in a year were significantly less likely to be rearrested during a one-year follow-up period compared to inmates less involved or entirely uninvolved in Bible study activities. Such findings are often used to support

faith-based initiatives, even though other research exists that is somewhat more equivocal about the long-term effects of religion on reoffending rates.

Faith-based programs fall under two general headings: those that are federally funded by the government and others that are privately funded institutional programs. Federally funded programs are prohibited from promoting inherently religious activities such as prayer, Bible study, and proselytizing. Programs using federal funds are directed to further the crime reduction objectives established by the U.S. Congress. Privately funded programs are not restricted to the separation of church and state as are federally funded program.

Most faith-based initiatives are offender oriented, attempting to create a prison environment that fosters respect for both a higher power and for others while teaching the moral principles of a specific religion. The goal of these programs is to reduce reoffending through the power of religion. These outreach programs typically include components of Bible study, mentoring, educational classes, and transitional programming for ex-offenders.

Prison Fellowship Ministries, founded by Charles Colson (a former Watergate convicted felon), is an international volunteer Christian ministry that opened the world's first faith-based prison near Houston, Texas, in 1997. This faith-based initiative, the InnerChange Freedom Initiative, has subsequently opened three additional faith-based prisons in Iowa, Kansas, and Minnesota. Among the initiative, the state pays for the cells, guards, and uniforms, while Prison Fellowship finances the religious programs and activities through private funds.

In 2003, the University of Pennsylvania's Center for Research on Religion and Urban Civil Society evaluated the InnerChange Freedom Initiative and reported that graduates from the program have had significantly lower recidivism rates than a matched control group. The news was received with much excitement and celebration by Colson and President Bush. The program was deemed a success.

However, critics of the study are quick to raise concerns regarding the manner in which results were reported. InnerChange began with 177 volunteer prisoners but only 75 of them "graduated." Rather than report on both the successful prisoners ($n = 75$) and those who were kicked or dropped out ($n = 102$), the report highlighted only the successful graduates, something researchers call a "selection bias."

Overall, the 177 participants actually did somewhat worse than the matched control group. They were slightly more likely to be rearrested and noticeably more likely to be reincarcerated (i.e., 24% vs. 20%). Although the University of Pennsylvania study is not guilty of concealing information, it does seem to highlight the graduate-only results before reporting on all the facts.

John J. DiIulio, Jr., a serious advocate of faith-based initiatives who was the first director of the OFBCI and founder of the University of Pennsylvania research center, acknowledges that the study results were not exactly what he had hoped to find. However, he points out that one study is never enough to provide conclusive evidence either way. More research on InnerChange and other similar faith-based initiatives is necessary before answers can become unequivocal.

FUTURE DIRECTIONS

Faith-based initiatives face several future challenges. First, there is the legal issue of employment rules. Being exempt from Title VII of the Civil Rights Act of 1964 allows faith-based organizations to discriminate based on religious orientation. Faith-based initiatives are also restricted when it comes to proselytizing. President Bush's Executive Order states that government funds cannot be used for "inherently religious activity." The U.S. Supreme Court has yet to define the financial parameters for inherently religious activity. These and other legal challenges are sure to come into play as more religious organizations seek federal funding.

The criminal justice field has additional considerations for the future of faith-based initiatives. First, faith-based organizations are encouraged to provide assistance to victims in addition to offenders. Second, the relationship between religious figures and criminal justice administrators should be developed. Religious figures can provide

training about the important role criminal justice officials can play in assisting both victims and offenders.

CONCLUSION

Faith-based initiatives are a growing trend in both general social welfare programs and the correctional system. They often use federal funding to assist both victims of crime and offenders in an institutional setting. They tend to incorporate Bible study, educational classes, and mentoring to reduce recidivism among offenders.

The interest in faith-based initiatives continues to grow, particularly because it was one of President Bush's top priorities in the White House. And although the September 11, 2001, terrorist attacks on the United States forced the president to alter his political agenda, with faith-based initiatives taking a back seat to fighting worldwide terrorism, there is still a political movement attempting to pass legislation allowing religious nonprofit agencies to incorporate spiritual beliefs into various social programs using public funds.

Criticism surrounding the issue is likely to continue by many who feel the agenda violates the doctrine of separation between church and state. Additional research investigating the ability of these programs to reduce recidivism is necessary to fully inform the debate over their utility.

FAMILIES AGAINST MANDATORY MINIMUMS

Families Against Mandatory Minimums (FAMM) is a national nonprofit organization that challenges the inflexible and excessive penalties required by mandatory sentencing laws. It is the only advocacy group devoted entirely to sentencing reform.

MANDATORY SENTENCES

Congress enacted mandatory sentencing laws in 1986 because lawmakers believed that rigid, severe drug laws would catch drug kingpins and deter others from entering the drug trade. The laws established drug weight and type as the only factors that judges can consider in determining drug sentences and prescribed fixed and predetermined sentences for these crimes. In 1988, Congress created new mandatory sentences for drug conspiracy (under which drug weight had only to be alleged) and the presence of a firearm during a felony offense, as well as a five-year mandatory sentence for mere possession of five grams of crack cocaine. Most states also enacted mandatory minimum sentences for drug offenses in the 1980s.

As a result of these mandatory laws, judges can no longer consider the severity of the offense, an offender's role in the crime, or the offender's potential for rehabilitation when determining the sentence. This rigidity has led to thousands of low-level offenders and addicts now serving sentences designed for kingpins. In addition, the laws disproportionately affect minorities. African Americans account for 12% to 13% of America's general population, yet they comprise 30% of those receiving federal mandatory drug sentences. Hispanics constitute 12% of the general population but receive 43% of mandatory drug sentences. Mandatory sentences also affect an increasing number of women. In 1997, nearly 72% of federal female prisoners were serving drug sentences. Taking a message for a boyfriend involved in a drug deal or driving him to the bank can lead to conspiracy charges and the woman can be charged for the entire amount of drugs sold.

THE ESTABLISHMENT OF FAMM

Julie Stewart founded FAMM in 1991 when her brother was arrested for growing marijuana and sentenced to five years in prison under mandatory sentencing laws established by Congress in 1986. From this small beginning, FAMM has grown to an organization of more than 28,000 members, including individuals, organizations, prisoners, and their families. Its national office is located in Washington, D.C., while state coordinators maintain chapters in many states. FAMM lobbies for the repeal of mandatory drug sentences and the return to limited judicial discretion, as established in the U.S. sentencing guidelines, which govern all other federal criminal cases. Under sentencing guidelines, judges base decisions on all the facts of the case and select from a range of sentences based on those facts.

CURRENT PROJECTS OF FAMM

FAMM concentrates its efforts in five areas. The Legislative Outreach Project lobbies Congress and the U.S. Sentencing Commission to reform severe federal mandatory sentences and federal sentencing guidelines. State projects advocate sentencing reform in states with particularly harsh sentencing laws and work to prevent adoption of additional mandatory sentences.

The FAMM Litigation project was organized in 1995 to provide litigation assistance of pro bono counsel for cases that involve important or evolving sentencing issues before the U.S. Supreme Court, the lower federal courts, and the state courts. To bring public attention to harsh and disproportionate mandatory sentences on low-level, nonviolent offenders, the litigation project also accepts a handful of cases involving grave injustice, regardless of the legal issue presented. The project is guided by in-house counsel and an advisory board of prominent criminal defense attorneys and law professors, and it is aided by prestigious law firms with pro bono programs.

The FAMM Community Action Network trains and coordinates a national network of members to educate policy makers about sentencing reform. Through postcards, letters, phone calls, and visits to federal and state lawmakers, members actively influence sentencing policy. The FAMM Communication Project works with all forms of media to educate the public about the excessively punitive nature of mandatory sentencing policies. FAMM's extensive case files of people serving mandatory drug sentences help provide individual examples of injustice.

FAMM's efforts have brought about major improvements to federal and state sentencing systems and generated hundreds of articles in major newspapers and magazines and features on national and local television each year. These help alert citizens about the problems of mandatory minimum sentencing. Up-to-date information can be found on the FAMM Web site, www.famm.org, which provides updated information on mandatory sentencing, puts a face on sentencing laws with its extensive file of prisoners serving lengthy mandatory sentences, and provides a vehicle for citizen action.

CONCLUSION

Each year, one out of four federal drug offenders are sentenced under the more flexible sentencing guidelines rather than mandatory minimum laws, thanks to FAMM's efforts to establish a "safety valve" for first-time, nonviolent offenders who meet specific criteria. FAMM's work to establish more realistic weight measurements of marijuana and LSD offenses produced fairer sentences for nearly 1,000 prisoners and continues to affect hundreds of new cases annually. FAMM's participation in nearly 20 Supreme Court cases and numerous federal appeal cases has led to fairer sentences for hundreds of defendants. FAMM helped file clemency petitions for 21 members who were low-level, nonviolent drug offenders serving lengthy mandatory sentences. In 2000, President Bill Clinton commuted the sentences for 17 of them. FAMM also led a successful effort to amend Michigan's notorious "650 Lifer Law," which required life in prison without parole for anyone convicted of delivery or conspiring to deliver 650 grams of cocaine or heroin—even first-time offenders. In 2002, FAMM completed the job of reforming Michigan's draconian sentences by spearheading

a campaign that resulted in a bipartisan majority of Michigan's legislature voting to eliminate most of the mandatory minimums for drug offenses. The reforms allow judges to impose sentences based on a range of factors, replace lifetime probation for the lowest-level offenders with a five-year probationary period, and permit earlier parole for some prisoners.

FATHERS IN PRISON

Historically, much more attention has been paid to incarcerated mothers than to fathers. This is partly caused by concern about pregnant women in prison and also because of widespread beliefs that the mother-child bond is stronger than that between the father and child. In recent years, however, cultural norms have increasingly emphasized the importance of fatherhood. This, combined with concerns about the welfare of the children of male inmates, has led researchers to collect some of the first large-scale data regarding the fatherhood status of prisoners. Nonprofit groups and prison staff have also increased their efforts to provide services to incarcerated fathers.

The most comprehensive national information concerning fathers in prison comes from surveys conducted by the Bureau of Justice Statistics. Unless otherwise noted, all statistics cited here are taken from its report.

STATISTICS ABOUT FATHERS IN PRISON

About 55% of male inmates in state facilities have children under the age of 18—a percentage that has not changed appreciably over the past 10 years. Out of the incarcerated fathers, approximately 30% have more than one child. Comparable statistics for federal inmates are 63% and 40%, respectively. As a result, at least 1,372,700 minor children in the United States have a father in prison. During the past decade, a rise in the incarceration rate has resulted in an increase in the number of incarcerated fathers with minor children. Because data are not kept on the number of inmate fathers with children age 18 and over, we do not know the total number of incarcerated men with adult children.

Fathers in state facilities are serving an average sentence of 94 months, and those in federal prisons an average of 124 months. The most common offenses committed by those in state prisons are violent in nature, while, in the federal system, they are more likely to have to have been convicted of drug trafficking. In terms of race/ethnicity, approximately half of the fathers in state custody are African American, a quarter are white, and some 19% are Hispanic. At the federal level, 44% are black, 30% are Hispanic, and 22% are white.

While we do not have reliable data on the number of fathers in juvenile detention nationwide, estimates suggest that between 20% and 25% of them have children. This percentage is notable given that nationwide only about 5% of men under the age of 20 are fathers. These men are disproportionately represented in juvenile prison because incarceration and young fathering are concentrated in the same impoverished communities. In addition, regardless of their backgrounds, fathers appear more likely than those without children to engage in delinquent behaviors and to go to prison. National data are not kept on the number of juvenile fathers in county and local custody.

Fathering

In prison you get to think about a lot of things, and one of the most important is how to be a father to children who feel that you have abandoned them. Fathering from prison is one of the most difficult things I believe a man can do in his entire life. How do you explain anything to a child who believes that you don't or didn't ever care for them? They have the right to feel this way because after all, you left them. Your children don't care about what happened to put you here. They think about the fact that you're not there when they need to be held, when they need to feel the love that only a father could give.

I believe that children need both of their parents in order to feel secure in this short life we live in. Children growing up without fathers are missing something important that is a necessity in their lives. Raising your children is something you can never do over again. I've learned to be truthful with my five children. They all have different personalities but that doesn't stop all of them from hurting because I'm not there. I write them every month and try to do what I can to help them. I teach them what they need to know to become productive members of society.

Some fathers never get the chance to see their children because they are imprisoned far away from home. This makes it difficult for children to come to visit. Phoning is also not always an option since it is expensive and, in any case, a phone call from prison only lasts 15 minutes. All of these barriers make it difficult maintain family ties.

Jesse McKinley Carter, Jr.
FCI Fairton, Fairton, New Jersey

FATHER-CHILD CONTACT

Fathers in prison are generally allowed three kinds of contact with their children: mail, phone, and visits. About 40% of inmates report that they have at least one type of contact with their children each week. Most commonly they do this through the mail, with 27% of fathers reporting at least weekly contact. Phone calls are similar, with 25% of father inmates reporting that they talk to their children on a weekly basis. However, it must be noted that a full 43% report no phone contact and 32% do not write letters. One of the reasons for limited phone contact may be the cost. Most states have made arrangements with phone companies to include a surcharge on calls made from prison, raising the rates for already expensive collect calls. Children's caretakers are often on a limited budget and may not be able to afford such calls. Recent lawsuits have improved this situation, but the telephone remains an expensive means of communication. Prison rules that limit the amount of time each inmate is allowed for calls may also affect phone contact rates in some states.

In terms of visits, rules and policies vary by state and by institution. About 21% of incarcerated fathers nationally see their children at least once a month. State inmates are less likely than federal inmates to see children, with about 57% of them reporting that they never see their children. The equivalent percentage at the federal level is 44%. Visiting policy in jails tends to be more stringent than in prisons, with some forbidding visits altogether and others allowing only noncontact ones. At the juvenile level, these policies vary widely. While some institutions allow children to visit, others do not allow them to come into the facility except under special circumstances.

PROGRAMS FOR FATHERS IN PRISON

The recent interest in incarcerated fathers has prompted the creation of programs to provide support services for men and their children. Most states provide parenting classes in at least one of their adult facilities and several states also provide them at the juvenile level. These parent education courses focus on a wide range of topics including self-identity/self-esteem, parenting skills, child development, co-parenting, and legal issues regarding incarcerated fatherhood. In addition to parenting classes, some prisons offer other types of support services. For example, fathers in some prisons are provided with tape recorders to record stories and messages for their children. In others, special areas are set aside for father-child visits.

In addition to these initiatives in prison, there are a range of nonprofit groups that provide services, including parenting classes, to incarcerated fathers and their families. For example, the Osbourne Association in New York provides counseling and parenting classes to incarcerated men. It also staffs children's visiting areas in three prisons and provides information and referrals to the families of prisoners. Men who participate in the program are eligible to receive employment counseling and other social services upon their release. Other nonprofit groups focus on providing transportation for children to visit their fathers. As described below, these services are particularly important because many men are placed in prisons located far from their children.

EFFECTS OF FATHERS IN PRISON

We know less about the effect of incarcerating fathers on their children than we do about the effect of locking up mothers. The research that has been done suggests that the children exhibit symptoms such as nightmares, depression, and poor achievement. Reports from mothers point to negative behavioral changes in children after the father goes to prison. Imprisonment usually strains the relationship between a father and his children, and between a father and the mother of these children. Men miss years of their children's lives, and often become estranged from them. Children grow and change rapidly, and it is extremely difficult to maintain a close relationship from a distance. Imprisoned men also miss years of their wives' and girlfriends' lives, and they can provide them with only limited emotional support. As a result, there are high rates of divorce between inmates and the mothers of their children. Divorce, and the subsequent introduction of new men into the mothers' lives, may put further stress on the children.

Some research suggests that children with imprisoned fathers are more likely to engage in criminal behavior and do poorly in school, but such findings should be interpreted carefully. It is not clear if these outcomes are a direct result of the fathers' imprisonment or whether other factors are involved. For example, it is possible that the increased poverty that results from the loss of an incarcerated father's income could negatively affect the children. It is also possible that problems originating prior to the father's confinement are responsible.

CHALLENGES FACED BY INCARCERATED FATHERS

The structure of the prison system makes it difficult for fathers interested in maintaining a relationship with their children. Men are often placed in facilities far from where their children live. The Bureau of Justice Statistics reports, for example, that 60% of parents in state prisons are placed 100 miles or more from their children. Because the prison system disproportionately draws from poor communities, children's caretakers frequently cannot afford the costs of transporting children to see their fathers. Other disincentives to visiting come from the men themselves. Many are unwilling to expose their children to the prison environment, and some feel shame at being incarcerated.

Other challenges preventing incarcerated men from participating in their children's lives involve the children's caretakers. Caretakers act as gatekeepers, controlling the amount of contact incarcerated men have with their children. Problems or tensions between a man and the child's caretaker may limit his access. Relationship difficulties are sometimes a direct result of men's incarceration—caretakers may be angry about the loss of the man's income and his absence from their lives. Other times, however, problems exist well before the man's confinement. For example, only about 40% of the fathers in state custody and 55% of those in federal custody lived with their children before their incarceration. This suggests that relationships with mothers were already strained. Such tensions may be, at least in part, a result of drug use and other criminal behaviors the men engaged in before their arrest.

As noted above, a significant percentage of men in prison do maintain some type of contact with their children. Visiting is the most direct type of

contact and also presents some of the greatest challenges. Most men do not see the children on a regular basis and may be unsure how to act around them. Increasing this awkwardness, children may also be uncomfortable, angry, or tense. While some prisons provide toys or activities, most do not. This means that children, including toddlers, must sit still for long periods of time with nothing to do. Prison security measures mean that children watch as their fathers are counted or ask permission to go the bathroom. This can be embarrassing for both fathers and children. As a result of these factors, visiting hours sometimes turn out to be a disappointment for all involved.

IMPORTANCE OF FATHER-CHILD RELATIONSHIPS

Research suggests that enabling fathers to stay in contact with their children is beneficial. Not only does such contact allow men and their children to develop more realistic expectations of each other, it also helps children to work through feelings of grief and abandonment due to their father's absence.

Most men are eventually released from prison and will try to resume some sort of contact with their children. Denying fathers contact with their children while they are in prison makes the transition to home very difficult, both for them and for their children. Furthermore, there is evidence to suggest that parents who maintain close contact with their children during their incarceration are less prone to recidivism.

REENTRY OF FATHERS INTO THE COMMUNITY

Returning fathers face many challenges when they attempt to reintegrate themselves into their children's lives. They may have been replaced by a new boyfriend or husband. Some children, unused to their father's presence, refuse to accept his authority. Fathers who return expecting to reassume their role as head-of-household may experience resistance from both children and the children's caretakers. For example, many mothers become more independent during a man's incarceration and may resist his attempt to resume a decision-making role in the family.

In our culture, one of the primary roles fathers are expected to fill is provider of financial support. This is a particularly difficult role for newly released men because their prison records disqualify them from some jobs and discourage employers from hiring them for others. For men who want to provide support for their children, the inability to find a job can be deeply disappointing. In addition, some states continue a man's child support obligations while he is incarcerated. This means a father may leave prison with a large child support debt.

CONCLUSION

Each year, an increasing number of fathers spend time in our nation's correctional facilities. A failure to address the impact of prison on these men's children, families, and communities may have serious social consequences. The incarceration of a father can lead to an estrangement from his children, financial and psychological problems for those children and for their caretakers, and a lack of male role models in this man's community. While the issues of fatherhood and incarceration are attracting more attention and research, there is still a great deal to be learned. Increasing our knowledge of imprisonment's impact can help us to formulate appropriate policy responses to this pressing social problem.

FEDERAL PRISON SYSTEM

The federal prison system holds offenders who have been convicted of federal crimes. It is currently one of the biggest prison systems in the country, with more than 175,000 inmates. Most of these women and men are housed in a nationwide system of some 104 establishments. Others are held in community corrections centers, in state and local prisons, or under house arrest.

HISTORY

The U.S. Congress formally established the Federal Bureau of Prisons in 1930. By then, a fairly considerable federal corrections system already existed. Courts had been created in 1789, and seven prisons had been gradually established from the last decade of the 19th century. Individuals found guilty of federal offenses could be fined, given corporal punishment, or held in state, local, or federal facilities. The federal correctional system, although predominantly a 20th-century creation, has its roots, in other words, in the 18th and 19th centuries.

The so-called Three Prison Act, which was passed in 1891, began the process of creating the federal prison system by identifying three sites around the country for its first penitentiaries. Development, however, was slow, and six years passed before ground breaking began on the first of the penitentiaries, USP Leavenworth. All told, it took inmates 25 years to complete Leavenworth Penitentiary.

Leavenworth was followed by Atlanta in 1902 and then, in 1909, by McNeil Island in Washington State, which had originally been founded as a territorial jail in 1875. These three institutions made up the entire system for many years until new laws, such as the Volstead Act in 1918, which introduced Prohibition, caused the federal population to grow exponentially.

The first women's prison in the federal system, FPC Alderson, opened in 1928 almost 40 years after the Three Prison Act. Prior to this time, women convicted of federal offenses were held in state and local penal facilities. Unlike the earlier penitentiaries that had grouped men in single large buildings, Alderson housed women in low-level, freestanding houses set within a rural setting.

Alcatraz, commonly viewed as a precursor to today's supermaximum secure facilities, opened in 1934. Designed to be an impenetrable and inescapable facility, Alcatraz was the destination for the most notorious criminals of the time. Al Capone, George "Machine Gun" Kelly, and Robert Stroud, the so-called Birdman of Alcatraz, all spent time there. When Alcatraz finally closed in 1963, its prisoners were transferred to the modern facility at Marion, Illinois.

Originally, Marion was a Level 5 prison, the highest security rating of the time. A series of violent and lethal attacks by inmates on staff and other prisoners throughout the 1970s and early 1980s culminated in the killing of two staff members on the same day in October 1983. After this event, the prison was re-rated at the previously unheard of security level of 6 and placed on continual lockdown. In 1994, ADX Florence replaced Marion as the destination "of last resort" for those inmates who were labeled dangerous and troublesome in the federal system.

The supermaximum secure prison at ADX Florence has the highest security level in the federal prison system. It holds "inmates who have been officially designated as exhibiting violent or serious and disruptive behavior while incarcerated" (National Institute of Corrections [NIC], 1997, p. 1). Prisoners are housed in solitary confinement and are rarely allowed out of their cells. Very few inmates are sent directly to ADX Florence from the courts. They are

Arriving in Prison

My public defender said, "Take nothing, have what you need sent after you settle." I called the BOP to confirm this, and they said they provide everything, including postage. The three-hour drive was filled with fear and anxiety. Once I arrived, I said goodbye to my friends, we hugged, and I turned and walked away. I couldn't look back, I tried not to cry. This couldn't be real; it had to be a bad dream.

It took three hours to process me, and it was all so surreal. I had to wait for R&D, wait for medical, wait for a female officer. Another prisoner, my mentor, came and took me where I would spend the next 53 months of my life. Leaving R&D, I saw gray concrete buildings and a dirt yard, and this stark and barren landscape mirrored how I felt inside. My mentor was talking, but I was in a fog.

At first sight, the housing unit looked like Costco with brick cubicles. The women inside were kind and generous with words and supplies. Even though I weighed 265 pounds I was assigned to a top bunk. During that first night, I laid in my bunk and quietly cried.

Seven months have passed, and the fog has lifted. Some things are better than I envisioned, others are not. Medical treatment is inadequate and the administration and most staff seem to thrive on dehumanizing and exerting their power and authority. The BOP didn't provide everything, they barely covered the necessities. Family and friends can only send money. We live in constant turmoil. However, most of the women in here make it tolerable. Although this place has changed me, I have faith that eventually my life will go on.

Letha Kennedy
Federal Prison Camp–Victorville, Adelanto, California

usually transferred there from other high-security state or federal facilities during their sentence. Wardens wishing to commit prisoners to ADX Florence must make a special request to the North Central Regional Director and provide evidence that the individual "can be controlled only by separation, restricted movement, and limited direct access to staff and other inmates" (NIC, 1997, p. 1). According to the Federal Bureau of Prisons (2000b), "Inmates with severe or chronic behavior patterns that cannot be addressed in any other Bureau institution should be referred to ADX Florence general population, and those who are somewhat less problematic should be referred to USP Marion" (p. 12). If the inmate is designated a "failure" within Marion he may be sent on to ADX Florence.

Within 10 years of the creation of the Bureau of Prisons, the federal prison population and the number of facilities had almost doubled. The inmate population then remained more or less stable until the 1980s. During the second part of the 1980s, various laws, such as the Sentencing Reform Act, were passed that ended parole, established determinate sentencing, and created mandatory minimum sentences. As a result of these legal changes, the inmate population grew dramatically, more than doubling between 1980 and 1989, from more than 24,000 to almost 58,000. In response, 20 new prisons opened between 1987 and 1992 alone. The system continued expanding during the 1990s, with the population reaching 175,000 in early 2004 (www.bop.gov).

FEDERAL PRISONS TODAY

According to the most recent weekly population figures, the Federal Bureau of Prisons currently houses just over 175,000 inmates. Approximately 150,000 of these inmates are confined in bureau-operated correctional institutions or detention centers; the rest are held in state, local, and private institutions. Despite a continuing reliance on state and other facilities, the federal prison system remains heavily overcrowded, incarcerating 33% more people at year end of 2002 than it was built to contain (Harrison & Beck, 2003, p. 1).

Overall, the majority (56.5%) of prisoners in federal institutions are white, 40.3% are black, 1.6% are Asian, and 1.6% are Native American. About one-third (32.1%) are known to be of Hispanic ethnic origin. Almost 30% of all prisoners are foreign nationals, with more than 16% from Mexico alone. Since the 1980s, all are adults or juveniles who have

been charged as adults. There are no juvenile facilities in the federal system. Women now make up 6.8% of the total population, which is greater than their proportion in state prisons. This figure reflects an increase of 182% in the number of female inmates since 1988. In comparison, the number of male inmates grew by 158% during the same period (Federal Bureau of Prisons, 1998; www.bop.gov).

More so than in most state systems, a disproportionate number of individuals in the federal prison population are serving time for drug offenses. Currently, they constitute 54.7% of the total population. Other crimes include immigration (10.5%), robbery (6.5%), and burglary (4.5%). The most frequent sentence being served by federal inmates is 5 to 10 years (29.5%), with the next common period being 10 to 15 years (17.4%). Very few (2.0%) serve less than 1 year, and not many serve life either (3.2%). At the time of writing, 26 people are on death row. As these figures suggest, the majority of federal inmates are assigned low (38.8%) or medium (25.0%) security levels, and the rest are labeled as minimum (19.4%) or high (10.7%) security; 6.1% of inmates have not been assigned a security level (www.bop.gov).

STAFF

Around 35,000 people work in the Federal Bureau of Prisons. The vast majority of them (71.8%) are men. Likewise, most prison employees are white (64.4%). African Americans make up 21.0% of the total number of staff, while only 11.0% of officers are Hispanic, 2.0% are Asian, and 1.5% are Native American.

The federal system was one of the first to establish a training program for correctional officers in 1930. Even so, a formal, centralized system was not fully implemented until 1982, when the Bureau of Prisons established a residential program at Glynco, Georgia, where, to this day, all staff members receive the same basic training (Keve, 1991, p. 237). All prison workers, from the medical personnel to those running the prison factory, must be coached as correctional officers. They must know how to use firearms and restraining techniques. The only exceptions to this rule are the staff in private facilities, who are trained separately. They should, however, have equivalent skills to those in the public prisons.

Despite the bureau's early move to attempt to professionalize its employees, the pay and education levels of many staff members remain low. Just over one-third of all staff (34.6%) have only a high school diploma, while fewer than one in five of them (19.2%) have a bachelor's degree (Federal Bureau of Prisons, 2000c, p. 55). Salaries for correctional officers are similar to other areas of law enforcement. According to the Web site of the Bureau of Labor Statistics, for example, federal correctional officer salaries started at $27,000 in 2001. The previous year, the median salary was around $35,000. Like the police, correctional officers may retire after 20 years service for full benefits.

TYPES OF FACILITIES

The Bureau of Prisons operates many different kinds of facilities from penitentiaries to prison camps. Other than the sole supermaximum secure facility at ADX Florence, the highest-security prisons in the federal system are the U.S. penitentiaries (USPs). They have walls, or reinforced fences, and close staff supervision. Prisoners are held in both single-occupant and cell housing. These facilities, which include USP Marion, Leavenworth, and Lewisburg, among others, are designed to hold high-security male offenders. There is no penitentiary for women.

Federal correctional institutions (FCIs) are the most common type of penal institution. These facilities are usually low security with double-fenced perimeters, although there are some medium-security establishments as well. In correctional institutions, prisoners are typically housed in cubicles in dormitory style units with a medium staff-inmate ratio.

Federal prison camps (FPCs) and the three intensive confinement centers (ICCs) in Lewisburg, Lompoc, and Bryan have the lowest security rating of all the federal institutions other than the community corrections centers (CCCs), which are also known as "halfway houses." Because they are

classified as minimum security, most of them have no fences, and there is a low staff-inmate ratio. Individuals may be either sent to the camps directly from the court or transferred from other higher-security facilities. They are usually housed in open dormitories. Security is much more relaxed at these institutions than anywhere else. However, they generally offer fewer opportunities for education and recreation because they are primarily work-oriented institutions. This is particularly the case for those prison camps located next to higher-security facilities in the federal correctional centers (FCCs), which the bureau has built since the 1980s. In these institutions, camps are merely part of a series of other institutions, including correctional institutions and penitentiaries.

Administrative prisons make up the final and most varied category of federal institutions. These are designed to hold inmates of all security classifications with special needs or characteristics. They include the federal transfer center (FTC) at Oklahoma City, federal medical centers (FMCs), federal detention centers (FDCs), metropolitan detention centers (MDCs), metropolitan correctional centers (MCCs), the medical center for federal prisoners (MCFP) at Springfield, and the supermaximum secure section of USP Florence, which is known as ADX Florence.

The federal transfer center at Oklahoma City is the first stop for most prisoners as they enter the federal system for the first time. Because this institution holds some high-security prisoners, its conditions are much more restricted than some may expect. Though most inmates spend only a few days at this institution, some are assigned longer periods of time in the work cadre to provide necessary labor. Most visits here, however, will be brief, ranging from a few weeks to a few months.

FMCs are essentially prison hospitals. There are seven of them across the national system, six catering to men only and one (FMC Carswell) to women. Though all prisons offer medical care, if the individual has a chronic or serious illness he or she will usually be placed in an FMC. In addition to holding ill female prisoners, FMC Carswell has a special administrative unit for women deemed to be particularly high-security risks.

FDCs and MDCs hold people awaiting trial, as well as those who have been convicted but who are awaiting sentence. They will also house a small work cadre, like the transfer center, to provide labor for the main institution. They are, in effect, jails and thus have a rapid turnover of population, as most prisoners are held there awaiting transfer. Many detention centers have been contracted out to private companies.

There are three MCCs in the United States, in San Diego, New York City, and Chicago. These high-rise buildings opened within a year of each other, from December 1974 to August 1975, and represented the first shift within the Bureau of Prisons to "new generation" prison building. MCCs cater to a large and varied population. They hold both female and male sentenced offenders and those awaiting trial or sentencing. Inmates serving short-term sentences provide the necessary work details in each facility.

Finally, offenders may be sent to a community-based facility if they have been sentenced to six months or less. Very minor offenders may be held under house arrest. CCCs are essentially halfway houses and are contracted by the Bureau of Prisons to private companies. Only those people who are deemed no risk at all to the community may be sent there without prior time spent in a higher-security institution.

Individuals incarcerated by the Federal Bureau of Prisons will be assigned to a prison's mainline population in any one of the foregoing types of institutions. A certain number will, however, be segregated from the general population in special sections of these institutions such as control units, administrative segregation, disciplinary segregation, or death row. A rare few men (around 0.5%) will spend time in one of the system's highest-security facilities, the Control Unit of USP Marion or ADX Florence.

Each institution is imbued with a different ethos, depending on its security level and population type. Some, such as FMCs, provide specialized treatment for inmates with HIV/AIDS or other physical and mental health issues. Many women's facilities offer specific opportunities to enhance family ties. More than half of all the institutions now have residential substance abuse treatment programs as mandated

by the Violent Crime Control and Law Enforcement Act of 1994.

WOMEN IN PRISON

Women make up approximately 7% of the federal prison population. Of the total number of women incarcerated in the system, 58% are white, 39% are black, 2% are Asian, and 1% are Native American. Hispanics account for nearly one out of three female prisoners in federal custody (Federal Bureau of Prisons, 1998, p. 4; Greenfeld & Snell, 1999, p. 7).

More than two-thirds of women (68%) are imprisoned for drug offenses. The next most common category of crime, accounting for only 11% of those incarcerated, is extortion and fraud. Overall, women tend to commit less serious and less violent offenses than men and, in general, have lower security classifications. The majority of them are held either in minimum-security prison camps or in pretrial facilities. There is no medium-security facility for women in the federal system and only one high-security institution (Federal Bureau of Prisons, 1998, pp. 4–5). There are now 20 different prisons that hold female offenders, including prison camps, correctional institutions, FMC Carswell, and various MCCs.

Most women in prison (80%) are primary caretakers of children. More than half (59%) of women in federal prisons have children under the age of 18. Half of those women had lived with their children before entering prison (Greenfeld & Snell, 1999, p. 8). Many female inmates have experienced domestic or other forms of violence, in most cases including sexual assault. Nearly three-quarters (73%) of women in federal prison have completed high school, and 30% to 40% of those high school graduates have attended some college or more. Despite these relatively high rates of education, however, like male prisoners, most women were unemployed before their incarceration (Greenfeld & Snell, 1999, p. 7).

Women in prison abide by the same rules as men except in the areas of health and beauty treatments, pat searches, and transportation. Women generally are allowed more items under health and beauty than are men, and, in light of concerns about sexual harassment, their pat searches are more strictly regulated. Male guards are not permitted to take part in, or be present during, a search of a female prisoner. Women who are transported while pregnant should be held with fewer physical restraints than other prisoners, although a number of reports from human rights organizations suggest that this policy is not always closely followed.

DRUG TREATMENT PROGRAMS

More than half of the total population is doing time for drug offenses, and others are there for drug-related crimes. It is estimated that 80% of state and federal inmates either committed drug offenses, were under the influence of drugs or alcohol at the time of their crime, committed their crime to support their drug use, or had histories of substance use**.** Under the new sentencing laws, many of these individuals are serving long terms of imprisonment, often for their first offense.

According to a 1999 report to Congress, the Federal Bureau of Prisons "addresses inmate drug abuse by attempting to identify, confront, and alter the attitudes, values, and thinking patterns that lead to criminal and drug-using behavior" (Federal Bureau of Prisons, 1999, p. 1). The Bureau of Prisons differentiates between prisoners who are incarcerated for manufacturing or selling drugs and those who are incarcerated for crimes that were a direct result of their drug use and recognizes that each group requires different counseling and treatment. As a result, the federal system offers three different forms of drug programs through Psychology Services, each of which attempts "to identify, confront and alter the attitudes, values and thinking patterns that led to criminal behavior and drug or alcohol abuse" (Pelissier et al., 2000, p. 5). Currently, drug treatment options include a 500-hour residential drug treatment program, a 40-hour drug education program, and a more loosely organized set of counseling and self-help classes known collectively under the title of "nonresidential" drug treatment.

The residential drug abuse program (RDAP) is the most intensive of the bureau's drug treatment options. First, the inmate participates in a unit based program that generally has a capacity for around

100 people. During this time, he or she spends half of each day learning about drug use and the other half of it in ordinary activities such as work and education with the general population. Prisoners are screened and assessed at the beginning of the RDAP to work out their treatment orientation. To complete the program, they take a variety of classes, including "Criminal Lifestyle Confrontation," "Cognitive Skills Building," "Relapse Prevention," "Interpersonal Skill Building," and "Wellness," before being returned to the general prison population. Afterwards, they must also participate in 12 months of treatment, meeting with "drug abuse program staff at least once a month for a group activity consisting of relapse prevention planning and a review of treatment techniques learned during the intensive phase of the residential drug abuse program" (Pelissier et al., 2000, p. 4). The residential program even reaches beyond prison. Once an inmate is been transferred to a CCC, he or she will meet with privately contracted counselors to reaffirm the lessons of the drug treatment program. These sessions may also include other family members.

RDAPs are the most celebrated and, apparently, successful part of the bureau's current drug policy. According to a recent evaluation, these programs, which last from 9 to 12 months, reduce men's reoffending after three years in the community by 16% and women's by 18%. Thirty-six months after their release, men who have successfully completed an RDAP course also are 15% less likely to use drugs on release, and women are 18% less likely to do so.

Because of these findings, the Bureau of Prisons has introduced a series of incentives to encourage prisoners to participate in RDAPs. Some examples of the opportunities available include a small monetary award for successful completion of program; consideration for placement in a six-month halfway house; and what are referred to as "tangible benefits," such as shirts, caps, and pens with program logos. The most influential incentive, however, was brought in by the Violent Crime and Law Enforcement Act of 1994, which allows up to a one-year reduction in sentence from an inmate's statutory release date. This incentive has obvious attractions, and many prisoners are in favor of it. Others, however, are more critical of this reward. They point out that sentence reductions lead to inconsistent sentencing, in which participants do less time for the same crimes. Specifically, critics suggest that this policy may unintentionally reward inmates with drug problems (Pelissier et al., 2000, p. 6).

The 40-hour drug education program is somewhat less intensive than the residential program. It incorporates lectures, movies, written assignments, and group discussion. Participants usually meet twice a week for approximately 10 weeks, covering the reasons for their drug use and abuse, theories of addiction, physical and psychological addiction, defenses, effects of drug abuse on the family, and different types of drugs and their effect on an individual.

Nonresidential drug treatment can include meetings with Alcoholics Anonymous and Narcotics Anonymous as well as individual and group counseling offered by the Psychology Services. Finally, as part of their more general approach to curbing substance abuse, all federal prisons conduct regular random drug tests of all prisoners. Those with outside assignments are tested most frequently. The bureau's policy appears to have worked. The 2000 *Judicial Resource Guide* (Federal Bureau of Prisons, 2000a) states that "the number of positive test results for the random tests continues to be very low for the last few years—1.3% FY95; 0.9% FY96; 1.0% FY97; and 0.9% FY98" (p. 31).

EDUCATION AND VOCATIONAL TRAINING PROGRAMS

The main thrust of education in the federal system has always been literacy skills and vocational training. Inmates in the first federal prisons were taught the basics of reading and writing by prison staff and, if possible, an employable skill that might keep them away from criminal activity upon release. The first mandatory literacy program in the Bureau of Prisons was established in 1982. All inmates were required to enroll unless they could demonstrate a

sixth-grade level of reading and writing. In 1986, the standard was increased to an eighth-grade level, and in 1991 the current requirements of a high school equivalency (general equivalency diploma, GED) were established.

These days, the bureau's commitment to basic literacy has been taken a further step: All promotions in institution jobs above entry level require a GED. Although seemingly a commendable idea, tying education to prison labor so closely places those with little educational experience or those from a foreign or non-English-speaking background in a vulnerable position, rendering them ineligible for many prison jobs.

In addition to creating an employable workforce in prison, reduced reoffending rates have always been another important justification for prison education classes. For that reason, vocational courses and apprenticeships are two of the main strategies that education departments pursue to help prisoners prepare for successful release. Like most aspects of imprisonment, the quality and availability of these courses vary enormously. Some facilities offer a variety of choices from carpentry to cooking. Others, particularly high-security institutions, are much more restricted. In any case, certificates or diplomas will not specify that they were earned in a correctional facility.

WORK

Unlike other correctional systems, work of some sort is mandatory in federal prisons. Upon arrival, prisoners are offered jobs in various aspects of site maintenance, usually in food services. Following a certain amount of time (usually 90 days), they may shift to another area of prison labor, such as grounds maintenance, the prison farm, or work as an orderly. They may also apply for employment in the federal prison industries known as UNICOR. If they do not wish to work, they must enroll in some education or training program. The vast majority work at jobs that contribute to the maintenance of the prison such as grounds, and cooking. Around 25% are employed by the higher-paying prison industries.

CONCLUSION

Since the 1980s, the prison population in the United States has increased dramatically. The U.S. federal prison system currently holds more prisoners than ever before and far more than it can comfortably house. The majority of these women and men are serving time for drug offenses. Disproportionate numbers of them belong to minority communities, and few have significant levels of education or much legitimate work experience. Sentences have become longer, and consequently the average age of the inmate community is growing. All of these factors mean that there are a number of challenges facing the administrators of the federal system. How they respond to them will determine whether federal prisons will break down into disturbances as they have in the past, or whether they will remain relatively peaceful as they are at present.

FELON DISENFRANCHISEMENT

Felon disenfranchisement refers to the practice of banning individuals with a felony conviction from voting. These laws are determined at the state level. States have the option of banning a felon from voting while in prison, while on parole, probation, or permanently barring them from voting.

The United States is one of few nations across the world that bans people from voting while they are imprisoned. Countries such as Spain, Greece, Ireland, Switzerland, France, Israel, Japan, and the Czech Republic all allow incarcerated felons to vote. Furthermore, other countries such as Germany and South Africa require prison officials to encourage inmates to exercise the vote. In Puerto Rico, the right to vote is one of the few rights citizens retain during incarceration.

HISTORY

Disenfranchisement provisions have existed since the founding of the United States. Throughout earlier periods in American history, the right to vote was seen as a privilege that only some people deserved. It was not extended to groups such as women, Catholics, the illiterate, and the poor. Supporters of limited suffrage argued that class and social standing should be important determinants of political status. Others asserted that individuals who broke the social contract did not deserve to enjoy the full rights of citizenship, for example, voting. Therefore, legislators viewed criminal disenfranchisement laws as a means of both protecting the ballot box and promoting the community's interests.

Between 1776 and 1821, 11 states adopted provisions that denied the vote to convicted felons: Virginia (1776), Kentucky (1799), Ohio (1802), New Jersey (1807), Louisiana (1812), Indiana (1816), Mississippi (1817), Connecticut (1818), Alabama (1819), Missouri (1820), and New York (1821). The original justifications for these statutes were based on the dual concepts of deterrence and retribution. However, the end of the 19th century marked an important era for the expansion and strict enforcement of criminal disenfranchisement laws. After several constitutional amendments increased blacks' access to the political process, Southern white opposition soared. In response, most states tailored their statutes during the post-Reconstruction era to enhance their impact on African Americans. These news plans penalized blacks without any explicit reference to blacks as a racial group. As a result of this subtlety, states were protected from legal challenges. In particular, they were able to uphold the 15th Amendment's ban on

overtly racial policies while still promoting their interests.

Mississippi's plan set the standard for states interested in altering their disenfranchisement provisions. The state's 1869 constitution required disenfranchisement of citizens convicted of *any* crime. However, its 1890 constitution imposed disenfranchisement for a very narrow list of crimes such as bigamy, theft, and burglary. In particular, the disenfranchising crimes were based on those crimes that blacks were believed to commit more frequently, and excluded crimes that whites were believed to commit more frequently.

Realizing the effectiveness of Mississippi's plan, from 1891 to 1910 eleven other states—Louisiana (1898), Virginia (1902), Alabama (1901), North Carolina (1900), Georgia (1908), South Carolina (1895), Tennessee (1891), Florida (1889), Texas (1902), Arkansas (1893), and Oklahoma—adopted similar criminal disenfranchisement policies. The impact of these new statutes, in conjunction with the long-standing tools of poll taxes, literacy tests, violence, and intimidation, significantly reduced the eligible black electorate. For example, in 1897 Louisiana had more than 130,000 African Americans registered to vote, representing nearly 44% of the electorate. After the adoption of disenfranchisement provisions at the 1898 constitutional convention, the number of African Americans registered to vote plummeted to 5,320. In 1904, that number fell to 1,342.

Although the number of whites registered to vote during this time also decreased, the change was not nearly as dramatic. For example, 125,437 whites were registered to vote in Louisiana in 1897. In 1904, the number of white citizens who were registered was 91,716. Overall, the black electorate in Louisiana was reduced by nearly 96%, while the white electorate was reduced by 23%.

As the dual process of migration and urbanization pulled African Americans out of the South and into northern centers, the adoption of criminal disenfranchisement statutes spread across the country. Randall Kennedy documented the disproportionate number of African American men who were arrested in northern cities on what many believed to be false charges. These charges often included things such as burglary, assault, and inciting or participating in riots. Taken together, the evolution of felon disenfranchisement laws slowly eroded the legal enfranchisement that blacks had acquired.

CURRENT PRACTICE

These days, convicted felons constitute the largest single group of American citizens who are permanently prohibited from voting in elections. Currently, 48 states and the District of Columbia ban inmates from voting. In 32 states, individuals on parole or probation cannot vote. In 13 states, a felony conviction can lead to a lifetime loss of voting rights. As a result of these laws, there are more than 4 million American citizens who have permanently lost the right to vote.

Whether a convicted felon can vote depends on the state he or she resides in, not the state he or she was convicted in. Therefore, a felon convicted in the state of New Hampshire would be able to vote in elections while residing in New Hampshire. However, if that individual moved to the state of Virginia, he or she would lose that right.

Individuals with a felony conviction are not banned from holding public office. Therefore, many citizens would be able to hold elected office but would not be eligible to cast a vote in that election. For example, Lyndon LaRouche was able to run for president in 1992 and Jim Traficant was able to run for U.S. Congress in 2001.

RACE AND FELON DISENFRANCHISEMENT

Although the civil rights movement and the prison reform movement were important for making the American polity more inclusive, most states continue to be governed by disenfranchisement laws that were created during an era saturated with racial hostility. Indeed, African Americans and Latino/as account for nearly half of those (ex-) felons permanently banned from voting, with African Americans in particular, representing more than 36% of permanently banned citizens. The rate of black

disenfranchisement is nearly seven times the national average, and if current rates of incarceration persist, 3 in 10 of the next generation of black men in this country can expect to lose the right to vote at some point in their lifetime.

As it was historically, the disproportionate impact of these laws is particularly pronounced in a number of southern states. According to a U.S. Census report, the 10 states with the largest black populations combine to account for 58% of the total U.S. black population but account for less than 49% of the total U.S. population. All but one of these states has a lifetime ban on felon voting. In Alabama and Florida, one-third of black men are permanently barred from voting. In Mississippi, Virginia, Texas, and Iowa, one in four black men are permanently disenfranchised.

For most states with lifetime bans on felon voting, ex-felons can usually go through some type of review process to have their rights restored. This process varies significantly across the states. For example, in Alabama an ex-offender must submit a DNA sample to the state's department of forensic science. In Mississippi, an ex-offender must either secure an executive order from the governor or convince a state legislator to introduce a bill on his or her behalf. Therefore, although these options exist in theory they seldom result in the restoration of voting rights. This failure can be attributed to a number of factors including (1) limited knowledge of the process necessary to regain the right to vote; (2) an emphasis on more immediate needs, for example, finding housing, jobs; and (3) the lack of political and financial resources necessary to successfully navigate the restoration process.

CONCLUSION: THE IMPACT OF FELON DISENFRANCHISEMENT

The effect of criminal disenfranchisement laws was seen in the controversial presidential election of 2000. In Florida alone—where the result of the election was determined—there were more than 300,000 ex-felons who were barred from voting. In fact, 31% of all voting-age black men in Florida were disenfranchised. Given that the majority of the black population traditionally votes Democrat, had these men been able to vote, the result of the election could have been very different.

Thus far, the most successful tool for challenging the felony disenfranchisement laws has been litigation. A number of cases including *Hunter v. Underwood* and *Richardson v. Ramirez* have all successfully challenged the constitutionality of felon disenfranchisement restrictions. Although the laws still exist, these cases have narrowed their scope while also challenging legislators to adopt more uniform standards.

Many attribute the racial and gendered disparities in disenfranchisement rates to the national war on drugs movement ushered in during the 1980s. Thus, repealing the drug laws may reduce the number of people of color who are banned from voting. Given that the prison population continues to soar, unless changes are made in some arena, the United States can expect to see more and more people denied the right to vote in the near future.

FINE

A fine is a monetary sum ordered by the court to be paid to the state by a convicted offender for the purpose of retribution and deterrence. While the use of fines is a common form of criminal sanction in

both the United States and many European countries, the use of fines and their relative successes varies greatly by jurisdiction.

HISTORY

The practice of imposing fines for malfeasance dates back to the Dark Ages (500–1000 A.D.). Both German and Anglo-Saxon societies practiced a system of *wergild,* which required offenders to compensate victims for their damages. One of the earliest records of such practices can be found in the sixth-century legal code of Salic Franks (a tribe in what is now known as France). Under this system, a punishment of 24,000 denars (currency) was assigned for the killing of a woman of childbearing years and the sum of 8,000 denars for a woman past childbearing years.

After the Norman conquest of England in 1066 A.D., the system of wergild was transformed so that the sum paid by the offender (the *bot*) was divided between the king (*wer*) and the victim (*wite*). The amount of compensation was somewhat graded, in that greater compensation was provided for more serious offenses. The practice of wergild is the historical precursor to the modern criminal fine in the United States.

CURRENT PRACTICE IN THE UNITED STATES AND EUROPE

In the United States, fines are generally assigned as the sole sentence for only the most minor offenses, such as traffic violations and infractions. More commonly, fines are used in conjunction with another form of intermediate sanctions, such as community service and probation in misdemeanor cases, or in conjunction with incarceration in more serious cases. For example, a misdemeanor conviction might result in a sentence that includes a fine, community service, and probation, while a felony conviction might result in a sentence that includes a fine as well as a term of confinement in jail or prison. Currently, fines are assigned in 86% of lower court and 42% of superior court sentences. Although research indicates that less than half of all fines are in fact paid in the United States, more than $1 billion in fines are collected annually.

Currently, the use of fines in the United States is somewhat more limited than in European nations, in part due to the difficulty of enforcing this sanction and in collecting fines from offenders. In addition, there is some concern that the use of flat fines commonly practiced in the United States is unfair to the poor, for whom a predetermined fine may be unduly harsh, and too lenient for the very rich, for whom a predetermined fine may be a minor inconvenience.

Many European nations have solved the equity dilemma through the use of day fines, which have been commonly used since the early 20th century. In Europe, more than 80% of convicted offenders receive a sentence of a fine with no other sanctions. However, the mechanism for calculating day fines varies by country. In Germany, for example, a day fine is calculated by assigning a unit value for the offense. This unit value takes into consideration both the seriousness of the offense and the culpability of the offender. This value is then multiplied by the net daily income of the offender. In the German example, the day fine is roughly the cost for a number of day(s) of freedom. One of the benefits of the use of day fines is that it applies an equivalent multiple (based on the offense) to the income of a given offender; as such, it represents equivalent financial hardship to each offender. It also saves valuable prison resources for more serious offenders. Since this process was introduced, the use of day fines has grown while the use of short-term incarceration has diminished.

A number of states have experimented with day fines in the United States, with mixed results. Some studies have demonstrated that 70% of fines are collected under the day fine model, a substantial increase from the overall national collection rate of only 50%. In other studies, day fines seem to increase collection from the poorest offenders but have resulted in lower total collections overall, which, in practice, may deter some jurisdictions from applying this model. Other studies indicate that the use of day fines seems to have no impact on recidivism, so there appears little incentive to move toward the day fine in the United States.

CONCLUSION

The use of fines in the United States appears to be limited to use as the sole sanction in only the most minor cases or in conjunction with additional sanctions in the majority of cases. While initial evaluations of day fines in the United States demonstrate somewhat mixed results, the use of day fines have had promising results in Europe, namely, greater equity for offenders with varying incomes, a decline in short-term incarceration, and increased revenues.

FIRST AMENDMENT

> *Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.*
>
> —U.S. Constitution, Amendment 1 (ratified 1791).

The First Amendment guarantees a certain level of freedom of speech, religion, association, and access to government throughout the United States. Although it technically applies only to the federal government, it is made applicable to all the state governments (and any subunits of the states) through the due process clause of the 14th Amendment. Like all constitutional rights, however, First Amendment rights are not absolute. For example, freedom of speech does not give anyone the right to yell "Fire!" in a crowded theater, unless there is indeed a blaze. People in prison are subject to additional limitations since the mere fact they are incarcerated means that their rights of association are restricted.

Many states have language in their state constitutions that is similar to the First Amendment. Those states may interpret their own constitutional language to be more protective than the federal standard. Thus, the federal First Amendment sets a floor, not a ceiling, for the rights it mentions. Finally, prison administrations are always free to be more protective of the rights mentioned than either the federal Constitution or the state constitutions.

GENERAL TEST APPLIED BY THE COURTS

The general rule for prison limitations on First Amendment rights is found in the case of *Turner v. Safley* (1987). A rule is acceptable under the U.S. Constitution as long as it bears a "rational relation to a legitimate penological interest." This standard is usually an easy one for a prison system to meet. Safety and the orderly running of a prison are two common examples of widely accepted legitimate penological interests and provide a basis for many of the regulations inside a prison system.

Once a legitimate penological interest for a rule is established, the prison system only has to show that the promulgated regulation is rationally related to that interest. "Rationally related" means that the rule or regulation does not have to be the least restrictive means of dealing with the prison's interest; the rule or regulation does not need to be the most respectful of the First Amendment interest that it possibly could be. Rather, it simply has to be one

way of dealing with the legitimate penological interest the prison system has asserted.

Many concerns that prisoners have are related to the freedoms guaranteed by the First Amendment, from religious freedom to freedom of expression. Some issues are litigated regularly in the courts. Although always analyzed within the general *Turner* framework, these areas have their own specific tests. General rules have been developed by the courts. Some of the more common questions that prisoners and prison administrators face will be described below.

RELIGION

The First Amendment prohibits the government both from establishing a mandatory religion and from prohibiting the practice of any particular creed. Generally, these two rights are referred to as the right to freedom of religion. However, as for people outside of prison, inmates do not have absolute freedom to practice their religious beliefs.

In 1972, the U.S. Supreme Court held that a prisoner must be given a reasonable opportunity to practice his or her religion (see *Cruz v. Beto,* 1972). Since then, *Turner* has been decided, so the test the courts must apply is now more detailed. However, an examination of the earlier case is instructive. In the 1972 case, a Buddhist prisoner was prohibited from using the chapel for his religious observance. The Court held that he must be allowed to use the chapel but emphasized that the prison did not have to provide the same services for a minority of one that it provided the larger religious groups.

Post-*Turner* religious freedom cases have borne out that the *Turner* test does in fact provide great latitude for prison officials. *O'Lone v. Estate of Shabazz* (1987) was one such case. In *O'Lone,* Muslim inmates sued because they were being denied the opportunity to participate in Jumu'ah prayers, a requirement of their religion. The prison at which they were housed required work outside of the facility during the day and would not transport them back during the workday. Thus, Muslim prisoners could not go to Jumu'ah prayers, which are held on Friday afternoons. The Supreme Court ruled that the failure of the prison to allow Muslims to participate in Jumu'ah prayers was acceptable under the First Amendment. The Court reasoned that the work requirement was rationally related to relieving overcrowding and tension and the refusal to transport Muslim prisoners back was rationally related to efficient prison operations.

Within the general framework of religious freedom, religious names and religious food become very important to prisoners who have limited ability to control almost any other area of their life. These areas also cause concern for prison administrators, as name changes and special diets tax their resources. Because these two issues arise so frequently, cause such conflict, and have such importance to prisoners, they are discussed below.

Name Changes

Some people who are in prison change their names to reflect their religious beliefs. Again, courts have applied the test laid out in *Turner* to reach the following set of rules regarding name changes. People in prison have a First Amendment interest in using their religious name in conjunction with the name under which they were committed to the prison. However, people in prison cannot force the prison administration to reorder its filing system. If a state allows people to change their names legally, the prison can require that an inmate pass through that process before it recognizes his or her new name. For more explanation of these types of cases, see *Malik v. Brown* (1995) and *Hakim v. Hicks* (2000).

Religious Meals

Access to religious meals is also analyzed under the *Turner* scheme. A prisoner's request must be based on a belief that is sincerely held and religious in nature (see *DeHart v. Horn,* 2000). While the courts are not permitted to determine if the prisoner is interpreting his or her faith correctly, they can determine if the prisoner actually has a religious belief that compels a special meal. Efficient administration and prevention of jealousy among other prisoners are considered legitimate penological needs. Generally, it is very difficult for prisoners to compel a prison to give them special religious meals by

citing the First Amendment; see *DeHart v. Horn,* (2000) (finding that a Buddhist inmate had other means of expressing his Buddhism and holding he was not entitled to vegetarian meals), *Levitan v. Ashcroft* (2002) (remanding for further fact finding and *Turner* analysis the question of whether Catholic inmates could have access to wine for communion), and *Sutton v. Rasheed* (2003) (holding that Nation of Islam texts are religious books and inmates were entitled to have them in the Special Housing Unit).

In short, as these examples demonstrate, religious freedom cases are very hard to win if the only grounds relied on are First Amendment guarantees. As long as prison can point to a penological need and show that the infringement on religious freedom is rationally related to that need, the institution's view will be upheld.

ACCESS TO THE COURTS

The First Amendment also protects the right to petition the government for redress of grievances. In simple terms, all people have the right to complain to government, subject to minimal limitations. Inside the prison context, access to the court's claims is also analyzed under the *Turner* test: whether the limitation is rationally related to a legitimate penological interest.

As a starting point, prisoners retain the right to submit cases to court challenging their sentences or conditions of confinement (see *Lewis v. Casey,* 1996). As the specific examples show below, however, they do not have unlimited rights to access all the possible ways there are to complain to the government.

Grievance Systems

All prisons and jails have a system of filing internal grievances. Usually, this process has several steps and levels of appeal. Filing a grievance inside the prison system is protected under the First Amendment for two reasons. First, a prison grievance is in and of itself an attempt to seek redress from the government, in this case the prison system. It is also protected by the First Amendment because it is a prerequisite for filing a federal court case under the Prison Litigation Reform Act (see *Shabazz v. Cole,* 1999, and *Graham v. Henderson,* 1995). Thus, prison rules or customs that block prisoners from filing grievances violate the First Amendment. Again, however, any rule will be analyzed under the *Turner* test to see whether a rule or custom bears a rational relationship to a legitimate penological interest.

Law Libraries

Prisoners also do not have an unlimited right to a law library. Rather, they have the right to information that will help them litigate cases related to their confinement (see *Thaddeus-x v. Blatter,* 1999). To prevail in a lawsuit, a prisoner will have to show not only that he or she was denied access to legal material but also that he or she has been harmed by the denial (see *Lewis v. Casey,* 1996). Thus, a prisoner has to show that he or she would have won the case or been granted the relief otherwise denied if only he or she had access to the law library. Again, this is a high burden. It is again important to note that laws or regulations may require more access to the law library. However, those requirements are not mandated by the First Amendment.

RIGHT TO ASSOCIATION WITH THE OUTSIDE WORLD

The right to associate is protected by the First Amendment. This is derived from the literal right of the people to assemble, which is contained directly in the First Amendment. For those in prison, however, these rights are subject to the *Turner* analysis. This means the prison system can limit a prisoner's contact with the outside world as long as the limits are rationally related to a legitimate penological interest.

In the recently decided case of *Bazzetta v. Overton* (2003), the Supreme Court ruled that a prison system may place severe limitations of visits, even noncontact visits. Essentially, the Court found that orderly running of visitation, preventing the passing of contraband, and protecting children were legitimate penological goals and that these severe regulations did in fact bear a rational relation to those goals. It remains to be seen how this decision will be interpreted by lower courts.

Mail

Letters and publications are a common way for prisoners to communicate with the outside world. While prisoners can receive and send out mail, their right to do so is subject to limitations. Arbitrary censorship of outgoing mail will violate the First Amendment (see *Procunier v. Martinez,* 1974). However, prison authorities can review outgoing letters to make sure that the letters do not contain threats, criminal plans, escape plans, and other threats to the orderly and safe running of the prison.

Arbitrary censorship of incoming mail will also violate the First Amendment, although prison officials can be stricter about incoming mail (see *Thornburgh v. Abbot,* 1989). The reasoning behind this distinction is that only a limited number of categories of outgoing information will affect the orderly running of a prison, but the list of categories of incoming information that could cause a disruption is much longer and harder to quantify.

Press

Prisoners have the right to communicate with the press, but this right is not absolute. Representatives of the press are treated under the First Amendment like any other visitors (see *Pell v. Procunier*, 1974). Prisoners are not entitled to special meetings with or communication with members of the press. Again, the reader is cautioned there are laws and regulations that protect communications with the press more stringently than does the First Amendment.

CONCLUSION

The First Amendment covers many issues that arise in the prison context. While it does prevent prison officials from arbitrarily limiting the freedoms it guarantees, many restrictions remain on freedom of religion, association, and access to the courts. As long as a prison rule or regulation is rationally related to a legitimate penological interest, the rule or regulation is constitutionally sound.

FLOGGING

While flogging has long been outlawed as a method of punishment in the criminal justice system of the

United States, it is still used in other countries and has gained increasing support among several American penologists in recent years. Historically used instead of capital punishment or imprisonment, it has not proven effective as a deterrent to further aberrant behavior. Still, some contend that it helps maintain social order.

HISTORY

The practice of flogging or whipping for those convicted of wrongdoing has a long history. The Law of Moses, as outlined in the Old Testament Book of Deuteronomy (Chapter 25, verses 2 & 3) reads, "If the wicked man be worthy to be beaten, that the judge shall cause him to lie down, and to be beaten before him . . . forty stripes he may give him, and shall not exceed . . . ." Likewise, in England in the 1500s, the Whipping Act ordered delinquents to be tied to the end of a cart, naked, and beaten with whips through a market town till the body be bloodied.

In colonial America, flogging and other corporal punishments occurred both within the prison as well as in public view. The pillory, stocks, dunking stool, and public whipping post were commonly used. Whipping was not always reserved for those who committed a crime. Mothers of illegitimate children (and the fathers if known) were sometimes publicly flogged, as were blasphemers and drunkards. Upon arrival in America, members of certain religious groups, most notably Quakers, were often tied to a cart and whipped before being forced back on the ship that brought them. The systematic punishment of slaves by flogging and branding is well documented.

Benjamin Rush was one of the first vocal opponents to the public flogging of prisoners. A prominent Philadelphia physician and signer of the Declaration of Independence, Rush founded the Philadelphia Society for Alleviating the Miseries of Public Prisons. In an important pamphlet at the time, Dr. Rush wrote that the reformation of the criminal offenders can never be achieved through public punishment: "Experience proves, that public punishments have increased propensities to crimes. A man, who has lost his self-respect at a whipping post, has nothing valuable to lose in society. Pain has begotten insensibility to the whip; and shame to infamy" (Teeters, 1937, p. 25).

Later, as the American penitentiary evolved, corporal punishment remained a mainstay of prison discipline and inmate control. In some institutions, the cat-o'-nine-tails with wire-tipped leather straps was used, sometimes with a saltwater sponge bath to increase the pain. In San Quentin, inmates were strapped to a ladder, naked, without any protection for their neck and kidneys, and whipped with the "cat." In the late 1800s, the cat-o'-nine-tails was replaced in most prisons by other types of flogging devices, such as the baton and the hose. Sharp-edged paddles were used in the Ohio State Penitentiary.

By the 1940s, flogging as corporal punishment had essentially been abolished in Americans prisons, but it was not until 1968 that the federal courts officially condemned the practice. It has been argued that the framers of the Bill of Rights did not expressly forbid corporal punishment as a violation of the "cruel and unusual punishment" prohibition of the Eighth Amendment. But in 1968 in *Jackson v. Bishop* (404 F. 2d, 571; 579–80), the Eighth Circuit Court of Appeals held that whipping prisoners in the Arkansas prisons with a strap "offends the contemporary concepts of decency" and did not contribute to rehabilitation but instead frustrates the rehabilitative process while creating other correctional problems. "It generates hate toward the keepers who punish and toward the system, which permits it. It is degrading to the punisher and to the punished alike." Although this ruling was limited to the issue of whipping inmates as a disciplinary measure, it has been interpreted by many legal scholars to forbid it entirely. In 1972, Delaware became the last state to abolish public whipping as a criminal punishment.

CONTEMPORARY PRACTICES

Flogging as punishment is still used extensively in many other countries. In Iran, for example, public whipping for relatively minor offenses (e.g., drinking alcohol, disturbing public order) have increased in recent years. In Saudi Arabia, flogging is a punishment handed down by courts on an almost

daily basis. Amnesty International reports that in Nigeria, public whippings have been meted out for offenses that have included smoking marijuana, gambling, and carrying women on the back of motorcycle taxis.

Contemporary supporters of corporal punishment argue that lashing an offender is an effective deterrent because of the acute and immediate pain involved. Corporal punishment is seen as a viable response to prisoners who violate prison rules. Since they are already incarcerated and their date of release may seem distant (or nonexistent), some suggest that there is little else with which to maintain order. It is swift and visible to other inmates, as well as a proportionate punishment for certain crimes.

Criminologist Graeme Newman (1995) argued that "corporal punishment should be introduced to fill the gap between the severe punishment of prison and the non-punishment of probation. For the majority of property crimes, the preferred corporal punishment is that of electric shock because it can be scientifically controlled and calibrated, and is less violent in its application when compared with other corporal punishments such as whipping" (p. 54). He suggests that for violent crimes, in which the victim was subjected to pain and suffering, and for which there is no public wish to incarcerate, harsh punishment should be considered, such as whipping; humiliation of the offender is seen as justifiably deserved.

CONCLUSION

Opponents of flogging contend that punishing with pain is barbaric. There are always alternative punishments that can be used in prison, such as solitary confinement and the removal of privileges. Mistreatment of prisoners may encourage abuse from prison supervisors who seek to maintain order through a climate of fear. Finally, it does not deter; when the United States allowed flogging and similar punishments in the past, crime still increased.

FLYNN, ELIZABETH GURLEY (1890–1964)

Elizabeth Gurley Flynn, the daughter of working-class socialists, was born August 7, 1890, in Concord, New Hampshire. A founding member of the American Civil Liberties Union (ACLU) and a prominent Communist Party member, she was incarcerated under the McCarthy era in the federal prison for women at Alderson. Her account of her imprisonment that she published in the book *The Alderson Story: My Life as a Political Prisoner* sheds light on an important period of U.S. penal history.

BIOGRAPHICAL DETAILS

Flynn joined the Industrial Workers of the World (IWW) in 1906 and at the age of 16, and gave her first speech at the Harlem Socialist Club, *What Socialism Will Do for Women.* Subsequent to this speech and due to her political activism, Flynn was expelled from high school. One year later, in 1907, Flynn became a full-time organizer for the IWW. In this capacity, she traveled and took part in the IWW's "free speech" campaigns in several cities as far west as Missoula, Montana, and Spokane, Washington.

Photo 1 *Elizabeth Gurley Flynn*

Back east, Flynn helped organize campaigns for a wide variety of industrial workers in several different cities: garment workers in Pennsylvania; the textile strike of 1912 in Lawrence, Massachusetts; the strike of 1913 that involved silk weavers in Paterson, New Jersey; restaurant workers in New York; and finally, the iron miners' strike of 1916 in Mesabi, Minnesota. During these years of traveling and organizing campaigns, speaking out, and raising relief and legal defense funds on behalf of industrial workers, Flynn was arrested 10 times but never convicted of any criminal activity.

In 1918, Flynn helped establish the Workers' Liberty Defense Union and served as secretary until 1922. In 1920, she was a founding member of the ACLU and in 1927 to 1930 she chaired the International Labor Defense. Flynn was particularly concerned with women's rights and was a supporter of birth control and women's suffrage. During this time, Flynn also focused her attention on legal defense issues of labor and was a political activist for aliens who were threatened with deportation for their political views and affiliations.

COMMUNISM

In 1936, Flynn joined the Communist Party and made her first speech in 1937 as a Communist in Madison Square Garden. She wrote a feminist biweekly column for the *Daily Worker* and was also active in the women's commission as chair for the next 10 years. In 1940, due to her Communist Party membership, Flynn was removed from the national committee of the ACLU. Two years later, she ran for Congress at large in New York City, and although she lost she nonetheless received 50,000 votes.

In July 1948, 12 leaders of the Communist Party were arrested and falsely accused of advocating the overthrow of the U.S. government by force and violence. Flynn initiated a campaign for their release, but found herself arrested in June 1951 in a second wave of arrests under the infamous anti-Communist witch-hunt. On January 24, 1952, after a nine-month trial, Flynn was found guilty and was incarcerated in the Federal Reformatory at Alderson in West Virginia. Flynn described her experiences in Alderson in *The Alderson Story: My Life as a Political Prisoner.*

ALDERSON

Flynn was escorted by train from New York City to the Federal Women's Reformatory located in West Virginia. She was incarcerated from January 1955 to May 1957 and during these 28 months, she documented her many experiences as a political prisoner. In her writings, Flynn describes the injustices and suffering that she and others endured during confinement.

Upon her arrival, Flynn was labeled prisoner number 11710 and subsequently was fingerprinted for the third time since her original arrest date and sent into quarantine for the next three days. Flynn's living quarters, a small lock-in room, consisted of a toilet, wash bowl, narrow bed, radiator, and small cast-iron chest.

Along with the other women prisoners, Flynn worked at prison labor until 5 P.M. each day. Most of her sentence, Flynn was employed at sewing and mending article of clothing and linens. Others were made to do manual labor jobs that involved a lot of heavy lifting and moving, no matter how young or old and frail. Some were assigned clerical jobs, but most were assigned to duties in the craft store.

Flynn was placed in a maximum-security quarter because they considered her crime of being a Communist as maximum threat. It was thought that if they could keep close supervision on her that she would be restrained from carrying out acts of communicating communism to others. Because of the nature of her crime, Flynn had no expectation of making parole. She was also not entitled to industrial or meritorious good time off, even if she earned it.

In addition to her depiction of anti-Communist sentiment, Flynn's memoir is notable for its depiction of the racial and ethnic prejudice in the daily operations of Alderson. She describes, for example, the segregation of the Negro women and Spanish-speaking women. Flynn was also attuned to the class and gender expectations that were apparent in Alderson's population and regime. As she writes, despite a rather diverse population, "No rich women were to be found in Alderson" (Flynn, 1963, p. 37). Likewise, regardless of age, all inmates were referred to as "girls" and were at times treated as adolescents by the working prison staff.

Flynn was not able to communicate with many people outside of the prison walls and even her visits were restricted. Initially, the FBI reviewed Flynn's list that consisted of personal friends that she wished to correspond with and rejected it. Her visits were limited to once a month and all her visitors had to be a family member or an authorized correspondent. Flynn's sister, Kathie, went to see her on a monthly basis and kept her apprised of the political events taking place on the outside world and filled her in on the latest convictions and releases of others who were found guilty under the Smith Act. Kathie would end their session with new gossip of family and friends, and events from the neighborhood.

Upon her release on May 25, 1957, her sister Kathie, Marian Bachrach, and John Abt and his sister greeted Flynn at the gates. She was to report to a parole officer on the upcoming Monday and would remain on conditional release until July 6, 1957. Flynn promised her comrades whom she met during her stay in Alderson that upon her release, she would write about their experiences in Alderson to speak out about the injustices of censorship, discrimination, segregation, lack of proper medical care and equipment, and neglect to personal health care needs that she and others experienced. Flynn documented and wrote about her experience in an attempt to educate and rally public support for prison reform.

CONCLUSION

In 1961, Flynn became the national chair of the Communist Party and held this post until her death. In January 1962, the State Department revoked her passport along with four other well-known Communists. At the time, Flynn who had just returned from the Communist Party of the Soviet Union's 22nd Congress.

As usual, Flynn did not take her treatment passively. Instead, she protested that the State Department was a violation of the United Nations Declaration of Human Rights adopted in 1948. In 1964, when this case reached the court, the justices agreed with Flynn and ruled Section 6 of the McCarran Act unconstitutional. Flynn returned to the Soviet Union in August 1964 to represent the Communist Party at an international Party Congress. During this visit, she was hospitalized for a stomach disorder and died on September 5, 1964. She was given a state funeral in Red Square. Her body lay in the Hall of Columns of the Soviet Trade Unions for eight hours while mourners filed past. Flynn's final wishes were carried out when her remains were flown to the United Sates for burial in Chicago's Waldheim Cemetery. She was laid to rest near the graves of Eugene Dennis, Big Bill Haywood, and the Haymarket Martyrs.

FOOD

The U.S. Supreme Court has consistently ruled that prisoners have the right to an adequate and varied diet, including the right to tailor meals to religious prescriptions and medical needs. However, the provision of food in prison often remains a sore point for inmates. Problems include food and preparation quality, portion sizes, and the temperature at which it is served.

HISTORY

Traditionally, food was used in prisons as a means of reward and punishment. In the 19th century, for example, incoming prisoners were often served bread and water until they had earned the right for such luxuries as meat or cheese. In the Eastern State Penitentiary in Philadelphia, breakfast was sparse and monotonous, consisting of coffee, cocoa, or green tea, and a mix of bread and Indian mush. The primary meal at midday consisted of substantial portions of boiled pork or beef, soup, potatoes or rice, sauerkraut, and tea. Indian mush and tea constituted the evening meal.

Under the medical model of rehabilitation that emerged in the early 20th century, prison food became linked to scientific notions of nutrition. Prison diets were examined for the calorific content rather than used primarily as a means of control. Healthy prisoners, it was believed, would be productive workers and, ultimately, reformed citizens. Even so, some institutions, such as Alcatraz, deliberately offered a daily total of at least 5,000 calories, combined with minimal exercise, to make prisoners more lethargic and less likely to engage in violent behavior.

In recent decades, the science of nutrition has remained crucial to the provision of food in most prisons. Usually, diets are carefully planned and standardized. Some facilities post the weekly menu, including nutritional analyses of each meal listing caloric, fat, cholesterol, and sodium content of each prepared item. In addition, all federal prisons are meant to have a salad bar and offer a "heart healthy" version of the main meal. Fried and baked chicken, for example, or french fries and baked potatoes may be served at the same meal.

State prison systems, however, vary dramatically, in part because contracting food services out to the private sector is becoming increasingly common. As a result, many do not match the federal standards. However, because of both formal and informal pressures, such as prison reform efforts, prisoner litigation challenges conditions, and the nationwide influence of the American Correctional Association in providing minimal standards before individual prisons receive accreditation, prison food has improved dramatically.

SPECIAL MEALS

In most systems, prisoners with medical conditions, such as diabetes, HIV/AIDS, pregnancy, or heart problems, may request special meals. They may also be allowed special snacks, if examined and authorized by a dietician. Similarly, vegans, who eat no animal products, are increasingly becoming recognized as a legitimate group with special dietary needs.

Religious prisoners form another group who require and are usually entitled to special meals. While some prisons provide different meals for each faith group, others, such as the Federal Bureau of Prisons, offer one uniform option known as "common fare" that tries to satisfy the dietary requirements of all religions. In this system, the meat is kosher, pork and its derivatives are never used, and vegetarian options are meant always to be available. To avoid contamination with nonkosher or Halal food, common fare meals are

usually served with disposable plates and cutlery. Certain other religious-based food requirements are usually honored throughout the year. Muslims may eat breakfast before dawn and eat dinner after sunset during Ramadan. All Jewish prisoners who submit a request in writing to the chaplain are entitled to kosher food for Passover. Christians will be offered a meatless meal on the mainline menu during Ash Wednesday and on all Fridays of Lent.

Photo 2 *Kithen area of Alcatraz with daily menu posted, 1956*

FOOD AS PUNISHMENT

Other than restricting access to the commissary, food may not, by law, officially be used as punishment. There is no longer any such thing as a diet of bread and water. Inmates even when in disciplinary segregation are entitled to nutritionally adequate meal. Ordinarily, these are from the menu of the day for the institution. However, some supermaximum secure facilities serve what is known as a "food-loaf" or "meal-loaf" to recalcitrant inmates, especially those who continually throw feces or urine on staff. This product is made up of the ingredients of a regular meal, for example, hot dogs, potatoes, and beans, that have been mashed together, baked like a meat loaf, and served. Although nutritionally adequate, and thus not equivalent to a diet of bread and water, in serving, taste, and aesthetics it functions a form of punishment, even if defined as a "dietary adjustment."

COMMISSARY

Prison commissaries stock food and other goods for prisoners to buy. Items include shoes, radios, food, stamps, photocopy and phone credits, and, in some institutions, over-the-counter medication such as Tylenol, ibuprofen, and allergy medicine. Prison commissaries vary in pricing policies, variety, and accessibility. Prices are usually at least market rate, making prisoners dependent on funds from outside. Their prison salaries, often starting at $15 a month, are often insufficient to purchase other than the most basic hygiene items.

THE CULTURAL SIGNIFICANCE OF FOOD

In prison, food creates or ameliorates conflict, establishes social boundaries of power and status, and provides a significant element in prisoner culture. Prison meals establish a routine for prisoners and staff. Inmates are not required to go to meals, and some manage to avoid them all together by living off commissary items and "gifts" from others. For most, however, meals provide a valued opportunity to interact with others.

The scarcity of desirable food in prison creates an illicit market for alternatives. As with other

Prison Food

Prison food sucks. Or at least it does in all the medium joints I've been in. This is because the dudes working in the kitchen don't care about the quality of the food. On most compounds the chow hall is considered the worst place to work, so naturally, they don't want to work in the kitchen. They're not trying to cook good food, but are trying to "hustle" by stealing food like green peppers and onions that they can sell back on the block for a dollar each. The dudes who work on the mainline are just slopping the food on your plate and you better hope you get enough so you won't go hungry later.

The meals consist of a lot of rice, pasta, sandwiches, and garbage meats. They try to mix up the menu selections but the only things they don't ruin are the hamburgers and french fries, and half the time the fries are cold. And forget about getting good fruits. The fruits they serve in here look like the slop they give to pigs on farms. You can't even get a decent apple or pear let alone any exotic fruits. Even if you are on common fare, which is a special religious diet, you are only getting cantaloupe and pears.

A lot of dudes in here live off the chow hall food and I don't see how they do it. If I have commissary food in my locker I don't ever go to the chow hall. I cannot remember the last time I had a nice juicy steak, which I'll never be getting in prison. But if you complain about the food the kitchen administrators will just tell you that you should of thought of that before you came to prison.

Seth Ferranti
FCI Fairton, Fairton, New Jersey

scarce resources, competition generates an underground acquisition and distribution system. Some food can be obtained from the prison commissary or kitchen by theft and cooked in the privacy of one's cell.

Those who can acquire quantities of high-quality food use it as status-enhancing currency by sharing it with friends or impressing outsiders. Those particularly adept at obtaining quality merchandise develop a reputation as a valued peer. Pilfered food can be returned to the cellblock and distributed or sold, sometimes in collusion with staff. For well-connected inmates, a cell can be turned into a mini-cafeteria where food is sold.

SOME PROBLEMS WITH PRISON FOOD

Concerns about food are often related to how and when meals are distributed. The serving line at meals is a constant reminder of the diners' vulnerability and their powerlessness over the daily routine. Sanitary prescriptions in kitchens and dining rooms may or may not be rigidly enforced, and on hot days in poorly ventilated sweltering areas, the servers' perspiration, mingled with steam from the trays, may drip into the food. The prevalent rumors that some inmates "sabotage" food with saliva, feces, or other matter perpetuates the image of uncleanliness. Although there are few documented cases of foreign substances such as feces or saliva added to the food during preparation, the rumors contribute to lack of confidence in prison sanitation, especially for prisoners isolated in segregation units to whom food is delivered. While usually delivered in a covered cart from the central kitchen, food served in this way may be vulnerable to hygiene problems. It also frequently arrives cold.

Another problem with meals in prison is the hour at which they are served and the amount of time available to eat. Most meals occur in prison far earlier than is normal in the free community. Prisoners must, therefore, become accustomed to an entirely new eating schedule that may commence as early as 6 A.M. and end by 4 P.M. Generally, no more than 14 hours may elapse between the evening and breakfast meals. Thus, religious inmates fasting during Ramadan or Passover must sign a waiver form, articulating that they have chosen to go hungry for more than the allowed time period. In total institutions, mealtime is short, usually about a half an hour from entry to exit. If the lines into the dining room or through the "chow line" are slow, the time for eating is reduced proportionately. Inmates are taken to the dining hall from their cellblocks or assignments in lines, with one line entering when the previous group exits. Although variations occur

within and across prison systems, dining generally follows a highly structured regimen.

Finally, prison food can be repetitive despite variation in menus. This occurs in part because of poor preparation resulting in meals in which soggy vegetables and overcooked meat, for example, are indistinguishable from one meal to the next. Some institutions attempt to overcome the problems associated with the provision of food by making cooking facilities available to inmates. Women and low-security prisoners may have access to hotplates, microwaves, and other appliances necessary to cook and serve food. Sometimes, sympathetic staff may allow inmates to prepare food in their cells using illicit "stingers" or other heating devices, or ignore contraband food that prisoners have managed to obtain. The bulk of the population, however, is dependent on what the institution kitchens produce for everything other than what they may buy at the prison commissary.

CONCLUSION

The ubiquity of food, its importance both as one of life's small luxuries and a survival need, its relative ease of accessibility compared to other illicit resources, and its seemingly benign nature—"who has ever been stabbed with a sandwich?"—disguise both its practical and symbolic dual character as a conveyor and ameliorator of punishment. The ability to control when and what one eats is a basic aspect of adulthood. It is, therefore, often a flash point for conflict. The restriction of something as mundane as food adds a significant layer of punishment to the prison experience. The consequences derive not simply from deprivation of a discrete resource, but from the disruption of normal eating rituals such as mealtimes. In addition to being a valuable amenity, food functions as a commodity of exchange for other resources. The deprivation of fundamental amenities constantly reinforces loss of individual control.

Prisons are, to a large extent, restricted in the freedom they can give to inmates in preparing their own food because of security fears. Food service staff must account for knives and other potentially threatening implements before ending duty. They must also lock away any products such as yeast, cloves, or other spices that could potentially be used in the production of homemade alcohol (hooch). The variety of ways by which inmates attempt to reassert control may be perceived as maladaptive by administrators and outsiders, but they may also be viewed as creative strategies to increase normalcy in an abnormal environment.

FOREIGN NATIONALS

It is difficult to determine the exact number of foreign nationals incarcerated in U.S. prisons and jails, since it is not always easy to differentiate legal and illegal immigrants from U.S. citizens. Also, many state records are not accurate enough to provide precise statistics. Even so, certain trends can be identified. First, citizens of Mexico, El Salvador, Honduras, Guatemala, the Dominican Republic, Canada, Cuba, Brazil, Colombia, Jamaica, Ecuador, Haiti, and the Republic of China represent the largest sources of foreign inmates in U.S. prisons. Second, most foreign nationals are imprisoned for drug offenses and immigration act violations.

Finally, since the 1980s, the number of incarcerated noncitizens has been steadily growing. In particular, the number of Arabs in U.S. penal facilities has dramatically increased since the September 11, 2001, terrorist attacks on the United States.

OVERVIEW OF LEGISLATION

Since the mid-1980s, a number of laws have been passed that have caused the numbers of foreign nationals in U.S. prisons to grow. The 1984 Sentencing Reform Act, the 1986 Anti-Drug Abuse Act, the 1991 U.S. federal sentencing guidelines, the 1996 Illegal Immigration Reform and Immigrant Responsibility Act, and the Antiterrorism and Effective Death Penalty Act of 1996 all increased the alien inmate population substantially. These laws and their revised versions have both expanded the definition of various crimes and lengthened the sentences with particular regards to non-U.S. citizens.

The 1984 Sentencing Reform Act requires defendants to serve out 85% of their sentences. This affects foreign nationals' prison sentence length disproportionately because the crimes they commit typically carry longer sentences. About 75% of foreign nationals are convicted of drug offenses, which under federal sentencing guidelines carry harsher statutory minimum terms of imprisonment than other offenses. Given the time-served requirements, noncitizens serve an average of 50 months in U.S. prisons.

Departures from the federal sentencing guidelines influence noncitizens' length of imprisonment mainly by decreasing offenders' sentence length. Annually, approximately 27% of foreign nationals receive departures that are either increases or decreases, from the established federal sentencing guidelines. Approximately 16% received a lesser sentence by offering substantial assistance to the government in prosecuting or investigating other individuals. Another 10% had their sentences reduced through plea-bargaining. On the other hand, another 1% received an upward departure, that is, longer sentences, due mainly to the large quantity of drugs involved or extensive criminal history.

The foreign inmate prison population has been growing at an annual rate of about 15% for the past 20 years. According to the Bureau of Justice Statistics, the overall prison population increased an average of only 10% during the same time period. Given the number of foreign nationals living in the United States, the differences in incarceration rates between U.S. citizens and noncitizens seem problematic. In 2000, the Bureau of Justice Statistics estimated that foreign nationals in federal prisons would continue to increase at a rate of 4% annually through 2005, because of the new deportation procedures incorporated in the 1996 Illegal Immigration Reform and Immigrant Responsibility Act. The 1996 Illegal Immigration Reform and Immigrant Responsibility Act dictated increased law enforcement and also immediate deportation of illegal aliens by the U.S. Immigration and Naturalization Service (INS) after they have served their time. This has resulted in a threefold increase in immigration offenders housed in the federal system. (In 2003, the INS was merged into the Department of Homeland Security and renamed the U.S. Citizenship and Immigration Services, USCIS.)

NATURE OF VIOLATIONS

The majority of foreign nationals in U.S. prisons are sentenced for immigration and drug violations. Most are charged with unlawfully entering or reentering the country, alien smuggling, and misuse of visas. With the passing of the 1986 Anti-Drug Abuse Act, foreign nationals prosecuted for drug crimes increased substantially from 1,799 in 1985 to 7,803 in 2000. The act established mandatory minimum sentences of 5 or 10 years depending on the offense and the amount of controlled substances. Between 1984 and 1994, foreign nationals serving sentences for a drug offense increased by 20%.

Noncitizens convicted of federal drug offenses usually play a minor role compared to U.S. citizens. The majority was sentenced for having less than one kilogram of heroin and for having less than five kilograms of cocaine powder and other types of contraband. They are also less likely to have a known criminal record. Even so, the U.S. government usually prosecutes them more vigorously than

U.S. citizens. Hispanics and people from the Caribbean islands and from Canada are more likely to be serving time for drug offenses versus other racial/ethnic groups.

Between 1985 and 2000, foreign nationals prosecuted in federal courts increased from 4,539 to 23,477. In 1985, foreign nationals made up 14% of federal inmates. Ten years later, they accounted for 21,421, and by the year 2000 that number grew to 37,243. In 1996, foreign nationals who were serving time in federal prisons for immigration offenses totaled 4,411. By 2000, that number had more than tripled to 13,676. At year-end in 2001, there were 19,137 immigration violators detained. Of this number 10,784 had been convicted of criminal offenses and 1,589 had criminal cases pending. Men were more likely than women to be charged with an immigration offense, while Hispanics were the most common offenders, accounting for 87% of all violations. Whites accounted for 4% of all immigration violations followed by blacks, who made up 3% of the total numbers.

TREND IN FEDERAL AND STATE PRISONS

Though most foreign nationals in the federal prison system are there for immigration and drug offenses, they are usually incarcerated in the state prison system for violent crimes and drug offenses. Foreign-born inmates both legal and illegal accounted for 31,300 of the states' prison population in 1991; by 1995 the Bureau of Prisons estimated that approximately 71,294 foreign inmates occupied states prisons (Wunder, 1995). This estimate could be egregiously low as this figure is a very rough estimate. The states' departments of corrections rely on inmates to furnish citizenship information that they at times cannot verify.

About 1 in 23 inmates in state prisons is estimated to be foreign born, originating from approximately 49 countries. Mexican nationals account for the majority, 47%. Other countries that are heavily represented in the state prison system are Cuba, Dominican Republic, Colombia, Jamaica, El Salvador, Guatemala, Trinidad and Tobago, United Kingdom, and Vietnam. Nearly all foreign-born inmates are males, with 50% between the ages of 25 and 34 years old.

FOREIGN NATIONALS IN EUROPEAN PRISONS

The United States is not the only country that incarcerates disproportionate numbers of foreigners. Foreign nationals and second-generation immigrants are grossly overrepresented among the imprisoned population in countries such as England, France, Italy, Spain, the Netherlands, and Greece. In 1993, for example, 11% of all prisoners in English prisons originated from "West Indian, Guyanese and African ancestry." People of West Indian, Guyanese, and African ancestry between the ages of 18 and 39 make up about 2% of the English population, but they represent 11% of all prisoners in English prisons. The majority are imprisoned for drug offenses and burglaries.

Drug offenses and illegal immigration offenses account for the majority of foreign nationals' stay in European prisons. Three-quarters of foreigners in European prisons are serving some type of prison sentence for unlawful residence and unlawful entry. In Germany, Gypsies from Romania have incarceration rates 20 times those of German citizens. Moroccans' and Turks' incarceration rates are 8 times and 4 times, respectively, the rates of German natives. In the Netherlands, the prison population consists of almost 50% foreign nationals, while foreign nationals make up 29% of France's prison population. According to 1997 figures, German prisons have the most foreign prisoners (25,000), followed by France (14,200), Italy (10,900), Spain (7,700), England (4,800), Netherlands (3,700), Belgium (3,200), Greece (2,200), Austria (1,900), Portugal (1,600), Sweden (1,100), and Denmark (450).

CONCLUSION

A majority of foreign nationals in U.S. state and federal prisons are serving time for immigration and drug offenses. This trend is also evident in

European prisons. Although the exact number of noncitizens in U.S prisons is unknown, it is believed that this number continues to increase at an annual rate of about 15%. According to the Bureau of Justice Statistics, this number will decline to about 4% by 2005. The Bureau of Justice Statistics estimates that nationals from more than 75 countries were convicted in U.S. courts. Mexican nationals and nationals from South America and the Caribbean accounted for the majority of foreign-born inmates serving time in U.S. prisons.

FOSTER CARE

Foster care is a complex and difficult system for children of incarcerated parents. As arrest and incarceration usually occur in a swift and confusing manner, parents often have little or no opportunity to plan for the care of their children. Consequently, unless family members are able and willing to care for their kin, these children become part of the foster care system.

Prison policy often makes it difficult for parents to obtain information regarding the placement of their children and the name of their caseworker. Limited contact between child welfare workers and parents challenge the ability of the caseworker to assess the feasibility of parental reunification. Caseworkers find themselves in a double bind. The Adoption and Safe Families Act (1997) requires that state child welfare systems move a child toward permanency within the shortest possible time frame. The law also requires that the child welfare workers meet the requirements of reasonable efforts in providing services that will strengthen families and allow children to return home. Yet, when correctional facilities dictate the amount and type of contact between parents and workers and do not provide needed services, the best casework efforts are thwarted. In the midst of this quandary is the child caught in the foster care system.

STATISTICS

Mandatory sentencing policies and "get tough" legislation has put greater numbers of mothers and fathers behind bars serving longer sentences with no regard for their children. Close to 1.5 million children in the United States have at least one parent serving time in a state or federal prison, while nearly 600,000 more have parents who are being held in county jails

Statistics show that approximately two-thirds of all women incarcerated in state prisons have minor children. Over 70% of those with young children lived with them prior to incarceration. At the same time, about 56% of men in state correctional facilities have minor children and approximately half lived with them prior to incarceration. About 50% of children with incarcerated mothers are cared for by grandparents with low incomes. A further 25% live with their father, and about 12% live with another relative. The remaining 13% reside in foster care. Close to 90% of children of incarcerated men live with their mother. Children of incarcerated

parents often move back and forth between foster care and kinship care.

ADJUSTMENT TO FOSTER CARE

While incarcerated parents have to adjust to prison policy and a prison routine, children living in foster care also have to make significant adjustments to their new environment. Foster children bear the burden of adapting to a new set of parents, siblings, and extended family members. Roles and responsibilities connected to age, gender, and birth order are likely to change in their new family setting. Children need to master a new set of rules that revolve around bedtime, meal times, watching television, and doing homework. They often have to adjust to unfamiliar foods and food odors. Foster parents may speak a language they are not familiar with.

For some children, their new neighborhood may look very different from their old neighborhood. Children from urban settings might find themselves in a rural community and children from a rural community may find themselves in a city environment. Such changes of setting may require adjustments to noise, traffic, and outdoor vs. indoor recreation. At school, the children must face a new set of teachers and peers while enduring the stigma often attached to being in the foster care system. The religious practices of their foster family may seem unusual and participation at church services may lead to feelings of guilt. Similarly, some children may be required to change their hairstyle, style of dress, and even their style of communication. These imposed changes may raise identity issues for children that may be further compounded by multiple moves that demand multiple transitions.

UNINTENDED VICTIMIZATION

Children are the unintended victims of parental incarceration. They are traumatized first by the events that precede incarceration and then by the effects of separation, loss, and out-of-home placement. Prior to arrests, many children lead lives characterized by poverty, family violence, and addiction. If they are left with caretakers overwhelmed with economic and emotional responsibilities, they will once again be vulnerable to abuse and neglect. The resulting emotional and behavioral difficulties that these children experience put them at high risk for learning difficulties, substance abuse, delinquent behavior, and teen pregnancy.

PARENTAL ROLES

Incarceration changes established parental roles and weakens the parent-child bond. When parents enter prison they can no longer nurture or care for their children. The daily role that they play in their children's lives drastically decreases. Incarceration removes them from the parental decision-making process, limits their ability for financial support and supervision, and restricts their access to information regarding their children's daily activities and well-being.

Although children of incarcerated mothers and fathers suffer the same general effects of separation and loss, they experience them in different ways. Mother and fathers play different gendered roles in the lives of their children. The nurturing relationship usually delegated to mothers is critical to healthy child development. Absence of this nurturing relationship puts both children and mothers at risk. Those who shared a close and nurturing relationship with an incarcerated mother suffer the long-term consequences of the disruption of a healthy emotional bond that is sometimes replaced with custodial instability.

Although children of incarcerated parents live with mothers at much higher rates, there remain a significant number of children who live with their fathers prior to incarceration. Contrary to popular myths, many incarcerated men have strong emotional ties to their children and are important in their lives. Although their role is different from that of mothers, nonetheless, their role is also critical. Fathers often discipline their children, set guidelines for their daily behavior, and provide structure in their daily lives. They play an important role in their children's development, and children suffer negative consequences from paternal separation.

PARENTAL CONTACT

Prisoners have little or no control over their daily schedules and have limited resources. As a result, their ability to maintain family relationships becomes dependent on prison rules. Visits, phone contacts, and writing letters allow parents to maintain their parental role, if even in a limited manner. Feeling connected to their children prepares them to resume their social roles after release. In recognition of the importance of the family bond, some correctional facilities offer programs that promote the maintenance of healthy parent-child relationships. For example, the MATCH (Mothers and Their Children) program, first established in California in 1978, calls for the strengthening of the mother-child bond through improved visiting conditions, by providing inmates with training in parenting and early childhood education, by improving prenatal care, and by providing referrals to outside social service agencies. PATCH (Pappas and Their Children) is modeled after the California MATCH program.

VISITS

Visits provide a key means for maintaining contact with children. However, prison visits are not always easy. Visiting procedures are often unclear, and corrections officials are not always receptive to time-consuming family visits. Likewise, prisons are not "family friendly." Limitations placed on the frequency of visits as well as geographic proximity to the prison reduces both the number and quality of contacts and adversely affect the parent-child bond.

Children in foster care must rely on their caretakers for transportation to visits, some of whom may be unable or unwilling to travel great distances to facilitate visits. They may fear that the prison atmosphere will upset the child or believe that the parent is a poor influence. When visits do occur, they generally take place in an environment that is not conducive to privacy and communication. Visiting areas may be uncomfortable and noisy and are generally policed. When parent-child visits are beneficial to a child, visitation can ameliorate the stress of separation and increase the likelihood of reunification after incarceration.

PHONE CALLS AND LETTER WRITING

When prison programs allow, incarcerated parents can continue to nurture their children from afar. Frequent letters, phone calls, and birthday cards give children a sense of continued involvement in their parent's lives. Giving advice over the phone and writing letters allow parents to maintain their role if even in a limited manner.

However, communication between family members is often hampered by collect-call telephone policies. Foster parents and kin on the other side of a call from prison often pay three times the amount as a collect call from a public pay phone or call not placed from prison. Letters and packages that are sent from prison are often stamped with a warning. The public stamp as well as the operator announcing a call from a correctional facility stigmatizes the child on the receiving end of the communication.

CONCLUSION

Incarceration threatens the parent-child bond and further fragments already troubled families. It is almost impossible for children in foster or kinship care to feel connected to their parents and for parents to feel adequate. Prison puts families in a situation where they can no longer identify, assess, and respond to each other's needs. Incarceration punishes children as well as their parents by an imposed separation and often jeopardizes their emotional and physical well-being.

Families disrupted by incarceration are a community problem that needs to be resolved by the collaboration of many systems. While some crimes preclude the efficacy of continued contact, we cannot assume that because parents are incarcerated that the parent-child bond must be severed and that parents can no longer play a positive role in their children's lives.

FOUCAULT, MICHEL (1926–1984)

French philosopher Michel Foucault was one of the most influential social theorists of the last quarter of the 20th century. In his works, Foucault used the style and techniques of the historian, the sociologist, and the anthropologist to reveal how power operated in the wider society and in what he describes as "the system of penality." For Foucault, an imposed order affected every level of society, defining the character of general social institutions and organizations such as government, hospitals, asylums, and prisons. Power relations further permeate the individual self, the body, and the mind through which that self was expressed.

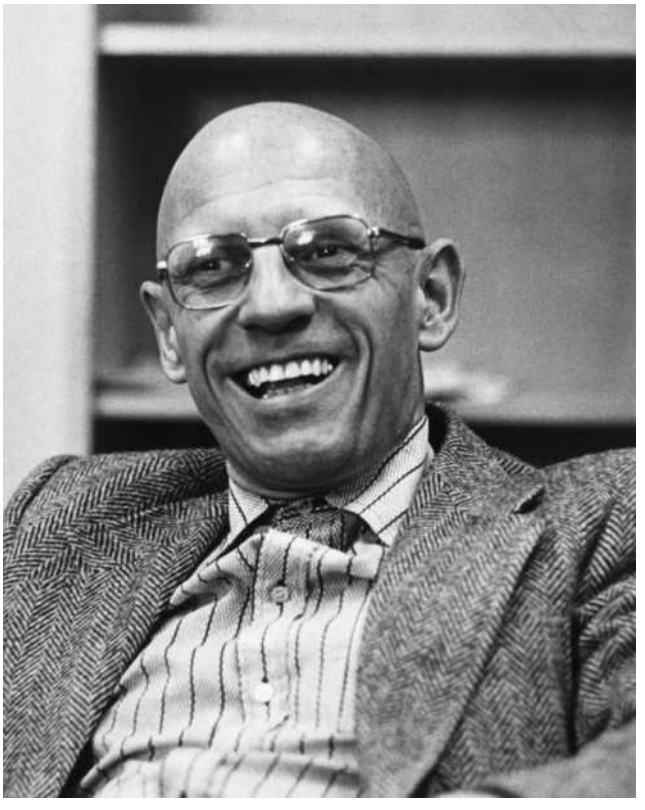

Photo 3 *Michel Foucault*

BIOGRAPHICAL INFORMATION

Born in Poitiers on October 15, 1926, Foucault moved to Paris to study at the prestigious lycée Henri-IV. In 1946, he was admitted to the Ecole Normale Supérièure where he studied philosophy with Maurice Merlau-Ponty. In 1948, Foucault received his degree in philosophy. He followed this in 1950 with a degree in psychology, and in 1952 was awarded a diploma in psychopathology.

Foucault published his first book, *Madness and Civilization,* in 1960. From this point until his death from an AIDS-related illness in 1984, he maintained an active publishing record, on a dizzying array of subjects. While all of his work has influenced the study of prisons in some form or another, his book *Discipline and Punish,* which analyzes the historical development of the prison, is most often cited. In addition to his academic work, Foucault influenced prison policy through his involvement with the Prison Information Group (GIP) that

sought to give inmates a voice in shaping penal practices in France.

FOUCAULT'S MAIN THEORETICAL IDEAS

Foucault sought the explanation of modern life in its historical origins. He believed that the social world of the past was an ordered place and that traces of that order could still be found. Searching for those traces in accounts from that epoch or period was an undertaking much like the work of archaeologists searching for relics and artifacts of ancient societies and cultures. Each specimen had a story to tell, and several of those stories could be combined to give an account of how the pharaohs of Egypt or the Aztecs of South America lived. Similarly, texts, records, accounts, and inventories could tell the story of a social organization such as a prison or correctional system in the same way that an artifact could offer up explanations of how food was prepared, how clothes were made, how animals were hunted and caught, or how battles were fought and won.

Foucault was not so much interested in extinct and ancient civilizations as in how archaeological features of recently passed social institutions and organizations could help explain how modern society came to be like it is. The social archaeology of the 15th or 16th centuries could offer sources and evidence of the origins of modern institutions such as the hospital, the school, or the prison. Knowledge was the key source to be sifted for archaeological discoveries.

In much the same way that an Egyptologist would dig in and around pyramids or burial sites looking for artifacts or cultural symbols such as paintings or ancient scriptures, the *discourse* (i.e., how knowledge was created, discovered, secreted and stored, displayed, replicated, and communicated) was the "site" where Foucault proposed to dig. How knowledge was ordered reflected how power was exercised in the society. Its consequences for individuals and for the society at large would describe for the archaeologist the world in which people had lived, which, in turn, described the origins of so much of modern living. Out of this discourse emerged the knowledge and ways of knowing that characterize later epochs. We see how the power of religion has given way to the power of science, and how the power of confession has given way to therapy. Interpreting acts of nature as acts of God has given way to scientific experimentation and discovery. Eventually, the sciences of the natural world extended to sciences of the social world such as psychology, sociology, criminology, and penology.

In a series of texts, Foucault examined how ideas about health, madness, discipline and punishment, and sexuality ensured the effective management and control of citizens. According to him, the simple process of recording births and associating that knowledge with the social status, literacy, residence, religion, and beliefs of the mother or both parents led inevitably to more efficient policing of society. Equally, anatomy and the search within organisms for the causes of diseases, which accompanied the growth and spread of clinics and hospitals before and after the French Revolution, delivered knowledge about the body and its functioning that was used to interpret individuals' bodies and their skills and capacities. This knowledge in Foucault's eyes was an essential prerequisite and accompaniment of early capitalism. The supply of fit and healthy workers to the factory system became the driving force for scientific, medical, and clinical advances throughout the 19th century.

If, for Foucault, discourse guides the institutions and organizations in knowing how to look and what to look for, the *Gaze* does the looking. Looking in this sense describes direct visibility of citizens and their actions as well as other forms of recording and accounting. Once again, Foucault asserts, the Gaze is historically contingent, as the amount of detail about individuals' lives recorded and stored has been continuously expanding since the end of the 18th century. These days, an almost unlimited amount of information is gathered from medical records of the state of our internal organs; records of our mental, social, and financial circumstances; and even daily instances of actions like going to work or making a telephone call.

Where to look is determined by another of Foucault's key concepts, *interiorization*. In a

different context, this might be understood as the reductionism of science, the constant seeking for causes and explanations by breaking down, looking within the object or process that science is seeking to understand. Contemporary examples include genetic engineering and the Human Genome Project that look within DNA chains to explain actions, behaviors, thoughts, moods, and many other social aspects of human life. Closed-caption television (CCTV), home video security, and satellite observations of smaller and smaller features of everyday life anywhere on earth are another example of how far the Gaze has extended. The Gaze also describes the origin of increasingly pervasive media such as paper-based bureaucracies; computer databases holding and exchanging vast amounts of personal information; and what he called technologies of the self such as social work, psychoanalysis, counseling, and family therapy where the Gaze could look inside relations between family members and at an individual's thoughts and feelings and record or report on them. Foucault argues that this progressive extension inward helps to manage societies as a whole and the communication, action, and thoughts of their citizens.

Discipline and Punish

Foucault applied many of his ideas to the prison in his book *Discipline and Punish: The Birth of the Prison*. Originally published in French in 1975, it was translated into English two years later. Since then it has remained extremely influential in the sociology of punishment and related fields.

The book begins with a graphic description of the 1757 execution of Damiens, who was hung, drawn, and quartered for killing a king before his remains were burned to ashes. Foucault's reason for starting his text with the details of this dismemberment was to show the lengths that the state went to eradicate not only the crime but also the body and soul of the criminal. To punish any crime it was thought necessary to mutilate or destroy the body of the criminal. For lesser criminals, such as thieves, the hand with which they offended was removed. Others were branded in a prominent place with a symbol or letter indicating their crime or sin for all to see. The "marked" man or woman could not go unnoticed and would be barred from contact with others, and moved on. Later, the punishment for lesser crimes was to remove the "body" entirely by banishment, exile, or transportation to the colonies or some other far-away place. For Foucault, the legal and penal process had an overriding purpose, to display, celebrate, and demonstrate the power of the sovereign in a ceremony where marks of vengeance were applied to the body of the condemned man.

In the next phase, the system of "penality" both engenders and is caused by the emergence of discipline. The exercise of power was to be achieved through the exercise of discipline, producing citizens who were obedient to absolute laws. Justice needed not only to be done, as in public executions, but must be seen to be done in elaborate judicial systems. Here was born the declaratory function of justice and punishment. The people must know the law and know that the law must be obeyed. Legal tests focused less on the "body that carried out the crime, and more on the "mind" and its intentions. The emphasis was not on removal or exclusion from the "body" politic but on the correction of the subject. The power of the state had to be seen to act directly on each individual subject. Foucault refers to a new "technology of power" and "political anatomy of the body." Biology, anatomy, and later, psychology and psychiatry, would see the body to be adjudged, convicted, punished, and disciplined in a different way.

In this way, according to Foucault, the prison was born. Punishment in the form of loss of liberty, or incarceration, leads to the carceral society. In this society, a public display or ceremony expunging the body-criminal from the body-politic was replaced by the definite knowledge that the criminal had been arrested, convicted, and sentenced and that the sentence would be carried out. There was no longer a need for the public witnessing of the punishment or of a ceremonial demonstration of the king's power. The punishment could be enacted behind closed doors, and for a measured and witnessable period of time corresponding with the length of the sentence of imprisonment. The reassurance that the punishment was being carried out and that the needs for

retribution, reform, and rehabilitation were being met rested in the architecture of the prison itself.

According to Foucault, prison design was influenced by Jeremy Bentham's model institution, the panopticon. In the panopticon, each object body/convicted offender was assigned a single cell. Cells were arranged in a semicircle on a number of levels. At the focal point of each semicircle was a guard observation post. The guards could see into every corner of each cell. Inmates were aware that they were in full view and being watched at all times. At the same time, the guard observation post was lit from behind the guards so that inmates could barely see the guards from their cells. A supervisory officer could be positioned behind the guards so that one supervisor could observe several guards, each observing several inmates.

This prison design reflected industrial societies' emerging needs for means of dealing with urban crime rates and other social problems. During the second half of the 19th century, this example of prison design became popular across the world. Bentham's panopticon formed the basis for Foucault's notion of the Gaze, the means by which modern societies observe not only their prison inmates but also their citizens in general.

CONCLUSION

Modern prisons retain many of the features and serve most of the functions that Foucault describes. Nonetheless, as society has moved on, so too has the system of discipline and punishment. Foucault depicted in later works, for example, the development of *technologies of the self,* where, to cope with increasingly broad and less absolute definition of crimes and deviance, the power of the state would become more diffuse and more intrusive in its effort to control. New forms of control evolve to see inside the family through child care and social work agencies, to see inside the minds and relations between parents and their children by the extension of compulsory education, to observe relations between parents and adults through attempts to regulate sexuality, abusive relationships, and forms of disempowerment. Foucault described and predicted how the Gaze and its associated discourse was and would continue to be a core feature of modern society.

FOURTEENTH AMENDMENT

Section One of the 14th Amendment (1868) to the U.S. Constitution guarantees all citizens equal

protection under the law and states that no citizen can be denied due process of the law. In other words, all citizens will be treated equally under state laws regardless of such factors as race, gender, and religious beliefs and the state has provided to the individual whatever legal process is due under the facts and circumstances of the case. Historically, the due process and equal protection clauses of the 14th Amendment did not relate to prisoners, since they were intended instead to protect the rights of former slaves after the Civil War. In 1871, for example, the Virginia Supreme Court in *Ruffin v. Commonwealth* stated that prisoners had forfeited their liberty as a consequence of their convictions and were, thus, "slaves of the state." The Virginia ruling and others like it prevented prisoners from filing lawsuits for violations of their constitutional rights. U.S. courts interfered little in prison and jail administration and practices until the 1960s.

DUE PROCESS CLAUSE

The due process clause in the 14th Amendment says no state should "deprive any person of life, liberty, or property, without due process of law." Court decisions have made clear that correctional personnel must provide due process provisions and procedural safeguards during inmate disciplinary procedures, but the procedures, as long as they are fair, do not have to mirror due process rights of a defendant on trail. Two significant U.S. Supreme Court cases on this subject are *Wolff v. McDonnell* (1974) and *Sandin v. Conner* (1995).

In *Wolff v. McDonnell,* the Supreme Court established minimum due process requirements for prison disciplinary hearings when the possible outcomes include the loss of "good time" credit or other privileges. According to the court, the inmate must be sent written notification of his or her alleged violation and be given a minimum of 24 hours to prepare for the hearing. The prisoner may call witnesses and submit documents as long as such actions do not cause a security risk. They may also ask for assistance in helping with the case. Inmates, however, do not have the right to a lawyer, nor may they cross-examine adverse witnesses during disciplinary hearings.

A series of subsequent Supreme Court cases have limited prisoner due process rights. In *Meachum v. Fano* (1976), the Supreme Court held that prisoners do not have any constitutionally protected rights to be assigned or transferred to a particular prison, even if the prison conditions are less desirable. In *Montanye v. Haymes* (1976), hearings are not required when transferring a prisoner to another correctional facility. More recently, in *Sandin v. Conner* (1995), the Supreme Court ruled that the 14th Amendment's due process clause does not apply to prisoners unless they are subject to "atypical and significant hardship" beyond what is ordinary in prison life. In the same case, the court ruled that disciplinary segregation of up to 30 days does not in itself constitute a significant hardship and, thus, does not require the due process procedures outlined in *Wolff v. McDonnell.*

An exception to the limitation of due process rights is the Supreme Court ruling of *Vitek v. Jones* (1980). Larry Jones was a prisoner who was involuntarily transferred to a mental institution without a hearing. The Supreme Court ruled that Jones was entitled to due process provisions and procedural safeguards, because of the increased risk of being stigmatized that he would experience in a mental facility and because he may be subjected to forced behavioral modification treatments. It should be noted, however, that the courts rarely limit the discretion of prison administrations in their classification schemes.

EQUAL PROTECTION CLAUSE

The 14th Amendment's equal protection clause prohibits racial, gender, and religious discrimination in correctional facilities. This has not always been the case. Traditionally, racial minorities were often segregated in facilities where conditions and programming did not meet the standards of their white male counterparts because prison administrators claimed that interracial violence would escalate without such segregation. Women, likewise, were often housed in poor conditions.

It was not until the 1960s that court decisions determined that the 14th Amendment's equal protection clause used in the 1950s to limit racial discrimination

in the school system could be applicable to correctional facilities. Though the courts have ruled that all prisoners do not have to be treated exactly alike in all circumstances, they have also deemed unconstitutional discrimination and classification schemes that are capricious and arbitrary.

In the case of *Lee v. Washington* (1968), the U.S. Supreme Court upheld a lower court ruling that found Alabama's state statutes mandating complete racial segregation within correctional facilities unconstitutional. The Supreme Court found that segregation violated the 14th Amendment, but, at the same time, also claimed that segregation was constitutional in certain circumstances, specifically the maintenance of security, discipline, and good order. More recent lower court decisions have stated that a generalized fear that racial desegregation will cause violence is not a valid reason to segregate facilities. All other possibilities such as proper supervision of inmates and decreasing the inmate population need to be tried first before segregating inmates.

Courts have also determined that unequal treatment of male and female prisoners is unconstitutional under the equal protection clause. In the first equal protection class action lawsuit filed on behalf of women prisoners in the United States, a federal district court found in *Glover v. Johnson* (1979) that Michigan provided substantially inferior educational and vocational opportunities for women prisoners compared to male prisoners. At that time, job training and college courses were offered in Michigan's male correctional facilities, while home economics classes were the only programs provided for Michigan's female inmates. The court stated that a small female prison population could not be used as an excuse to limit the educational, counseling, job training, and legal education programs for women inmates.

CONCLUSION

In sum, the constitutional rights of prisoners are still limited compared to the rights of U.S. citizens in free society. Nevertheless, since the 1960s, the courts have used the due process and equal protection clauses of the 14th Amendment to ensure that prisoners have access to the courts to address violations of their constitutional rights.

FOURTH AMENDMENT

The Fourth Amendment is designed to guard against unreasonable federal government searches and seizures of persons, papers, houses, and effects perpetrated against "the people" of the United States. The amendment was established because the colonists despised the general warrants used by the British to curb the illegal smuggling of molasses, which was a primary ingredient in the making of rum. These days, it is frequently invoked in relation to police search and seizure of narcotics or other restricted substances in the war on drugs.

The Fourth Amendment contains two clauses. The first ensures that no unreasonable searches and seizures will be constitutionally tolerated. The second clause, commonly referred to as the "warrant

clause," sets forth requirements that police must follow in order to obtain a warrant from a detached and neutral magistrate. The U.S. Supreme Court has interpreted these clauses independently. Thus, a warrant need not necessarily accompany a search or seizure (*Carroll v. United States*, 1925; *Terry v. Ohio*, 1968; *New York v. Burger*, 1987). A search or seizure must, however, be conducted in a reasonable manner, determined by balancing individual rights with those of the police who investigate crime (*Whren v. United States*, 1996). The use of balancing allows the Court to use a great deal of flexibility when addressing various Fourth Amendment claims.

"REASONABLE" SEARCHES

In 1967 (*Katz v. United States*), the Court devised a two-pronged test designed to establish a criteria of reasonableness in Fourth Amendment claims. As former Supreme Court Justice John Marshall Harlan described the *Katz* standard, "My understanding of the rule that has emerged from prior decisions is that there is a two-fold requirement, first that a person have exhibited an actual (subjective) expectation of privacy and second, that the expectation is one that society is prepared to recognize as 'reasonable.'" Thus, the reasonableness of a search, or its constitutionality, is largely a matter of "socially accepted" privacy concerns; anything a person does not try to keep private is not protected by the Fourth Amendment.

The vague nature of privacy has led to a range of legal interpretations of what constitutes a "reasonable" search. For instance, federal agents trespassing on a land-owner's "open field" may confiscate evidence later to be used at trial in a reasonable manner so long as they stay a good distance from his or her personal (family) quarters (*United States v. Dunn*, 1987). On the other hand, a person placing a call on a public phone may not have his conversation reasonably seized, without a warrant, by means of listening devices (*Katz v. United States*, 1967). While these determinations of reasonableness might seem odd if we consider property as a standard of reasonableness—the standard the Court used prior to 1967—they are consistent with the two-pronged privacy standard made explicit in *Katz.*

EXCLUSIONARY RULE

Although the Fourth Amendment clearly prohibits unreasonable search and seizure it does not provide a specific remedy to alleviate any such constitutional violation. What should happen to evidence that was found through a violation of Fourth Amendment rights? In particular, what should be done when the police break the law in order to catch lawbreakers? In 1914, the Supreme Court answered this question by ruling that "in a federal prosecution the Fourth Amendment barred the use of evidence secured through an illegal search and seizure" (*Weeks v. United States*, 1914). Thus, after 1914 a federal prosecutor could not use evidence deemed by a magistrate to have been collected via a violation of the Fourth Amendment. This standard of suppressing illegally gained evidence at a criminal trial would come to be known as the *exclusionary rule.* This rule was only expanded to include state prosecutions in 1961 (*Mapp v. Ohio*, 1961).

The rationale used by the Court to justify the exclusionary rule and its expansion to include state prosecutions is based on the principle of police deterrence. Presumably the hypothetical "rational" police officer desires to put criminals in prison. Evidence is the primary means to put criminals in prison. Therefore, it logically follows that if police believe their (unconstitutional) actions will result in the inadmissibility of evidence, they will determine that there is no benefit to be derived from engaging in violations of the Fourth Amendment. Of course, such a rationale is primarily dependent on a legal system to apply the exclusionary rule when needed.

STANDING TO ASSERT THE FOURTH AMENDMENT

During the past 20 years, the ability to protest a violation of the Fourth Amendment has become exceedingly difficult. The criminal defendant does not have an automatic right to challenge illegally obtained evidence. Instead, he or she must prove that there is a

reason the exclusionary rule should be applied toward criminal evidence. This is commonly referred to as standing to assert the Fourth Amendment.

Since 1980, a criminal defendant must demonstrate a "legitimate expectation of privacy" in the area searched, as a prerequisite of standing to challenge the legality of the search or seizure in question (*Rawlings v Kentucky*, 1980; *United States v. Salvucci*, 1980). By establishing that a criminal defendant must demonstrate a "legitimate expectation of privacy" in the area searched the Court has greatly restricted the circumstances in which the exclusionary rule may even be requested. For instance, passengers in a vehicle may not expect privacy (*Rakas v. Illinois*, 1978), nor may those visiting a house solely for commercial reasons (*Minnesota v. Carter*, 1998); likewise passengers in a taxicab do not have a "legitimate expectation of privacy" (*Rios v. United States*, 1960).

CONCLUSION

As an informed citizen contemplates his or her constitutional right to be free from *unreasonable* search and seizure at the hands of police who are constantly under pressure to search for the evidence of possessory offenses, a few things should be remembered. First, evidence that is effectively contested in a motion to suppress evidence is often, due to the *exclusionary rule,* deemed inadmissible at trial. Second, to appear before a judge at a suppression motion, standing to assert the Fourth Amendment must be established. Third, the ability to gain standing to assert the Fourth Amendment necessarily means that a criminal defendant demonstrate that a "legitimate expectation of privacy" existed in the area were the police searched for and seized the criminal evidence in question.

Violations of law by the police can almost always be challenged in civil court. However, a monetary reward is slight consolation if illegally gained evidence enters into a criminal trial resulting in the defendant's loss of liberty. For those who desire stronger police authority and less crime, this may be a positive restriction of Fourth Amendment rights. Nonetheless, the words of former Supreme Court Justice Louis Brandeis offer a compelling second opinion:

> Decency, security and liberty alike demand that governmental officials shall be subject to the same rules of conduct that are commands to the citizens. In a government of laws, existence of the government will be imperiled if it fails to observe the law scrupulously. Our government is the potent, the omnipresent teacher. For good or for ill, it teaches the whole people by its example. Crime is contagious. If the government becomes a lawbreaker, it breeds contempt for the law; it invites every man to become a law unto himself; it invites anarchy. (dissenting opinion *Olmstead v. United States*, 1928)

FRAMINGHAM, MCI (MASSACHUSETTS CORRECTIONAL INSTITUTION)

Massachusetts Correctional Institution– Framingham (MCI–Framingham), located 22 miles west of Boston in Framingham, Massachusetts, is the oldest women's prison in the United States. All women

sentenced to serve state time are processed at Framingham before being assigned to wherever they will serve out their sentence. The state's other facility for female inmates is South Middlesex Correctional Center, a minimum-security prison also located in the town of Framingham. The vast majority of female inmates (87%) are housed at Framingham.

Framingham has two units, each with a different level of security. A medium-security facility houses county and state inmates who have been sentenced to serve time in a state Department of Correction (DOC) facility. The maximum-security unit, known as the Awaiting Trial Unit (ATU), is used to hold women facing federal charges. In June 2002, the medium-security unit held approximately 500 women, while the ATU held just over 135 women.

INMATE CHARACTERISTICS

The state's female inmate population differs from the male population in several ways. As of January 1, 2002, the state DOC had 9,610 inmates under its jurisdiction. Six percent of these people were women (535) and 94% (9,075) were men. While approximately 78% of females in the state system are white and 21% are black, the male population is characterized as 66% white and 32% black. The age difference between the populations is reflected not only in the average age of the inmates, 35.7 years for the females and 36.8 years for the males, but also in the range of ages. Males ranged from 16 to 86 years, while females ranged from 18 to 71. Women, generally considered to engage in less violent crime than men, were convicted of more drug crimes (35%) than person offenses (32%). In contrast, nearly half of all male inmates (49%) were incarcerated for person offenses, followed by 20% for drug offenses and 19% for sex offenses.

CONDITIONS

For many years, all of Massachusetts' prisons operated above capacity. In response, the state mandated the DOC commissioner in 1985 to issue a quarterly report on the status of overcrowding in all state and county facilities. From these data, it can be seen that Framingham continues to suffer from serious crowding issues. For example, the ATU has operated at approximately 200% above capacity for more than two decades. The medium-security facility has remained steady at just over 125% capacity according to the state's data for the same time period.

Inmates live in two types of housing at Framingham: cells and dormitories; both are forced to accommodate more inmates than they were designed to hold. Overcrowded dorms are not only noisier and more stressful for inmates, they also place a greater demand on the security staff members whose responsibility is to watch all the inmates in the room. The size of Framingham's inmate population also requires that some women live double-celled, where two women live in a cell space originally built for one.

HEALTH CARE

Health care at Framingham has long been criticized. While a series of hearings and studies in the 1980s called for radical changes, criticism of its inmate care continued to grow. Recently, the University of Massachusetts Medical School was awarded the contract to provide both mental and physical health care services. It is hoped that this local teaching institution will have increased accountability and provide improved services.

The women at Framingham mirror the national profile of female inmates who have more medical problems than male inmates. About 15 inmates at Framingham are pregnant at any one time and approximately 20% of the inmates are HIV-positive, creating a great medical need. Pregnant women, like patients with HIV/AIDS, require regular, ongoing medical services including monitoring and testing. Therefore, poor health care is particularly damaging to these populations.

There has been a recent move to improve mental health services at Framingham, where at least six women have committed suicide since 1995. Compared to male inmates, female inmates have greater mental health care needs. Over 20% of the women at Framingham are actively receiving mental health care.

PROGRAMS

MCI-Framingham offers numerous educational, vocational, and therapeutic programs. Inmates can receive their general equivalency diploma (GED) while incarcerated and participate in college-level classes in a partnership with Boston University. The prison also offers a number of vocational trade programs, including computer technology and building trades. Women in the manicuring program receive the state-mandated 100 hours of instruction and are then eligible to take the state licensing exam. The state's correctional industry, MassCor, employs 18 women at its flag shop at Framingham. The facility has rehabilitative programs including Alcoholics Anonymous, Alanon, and Narcotics Anonymous; HIV/AIDS and sexual and domestic abuse survivor support groups have also been organized by the inmates. In the Choices youth outreach program for girls who are at risk for future offending, inmates share their criminal histories with the girls, hoping to have an impact on them with frank discussions of their own violent experiences.

In addition to helping children unknown to them, inmates can also participate in a number of parenting programs offered to help improve their relationships with their own children. Framingham sponsors a number of innovative therapeutic programs, including Catch the Hope. The project was started in 1991 to provide medical attention and social services to pregnant and postpartum inmates. In addition to substance abuse counseling and preparation for birth and infant custody planning, the program pairs inmates with professional birth attendants who guide them through their labor and delivery. The program also works with postrelease programs that will accept women with their children.

THE "FRAMINGHAM EIGHT"

In 1992, a group of women known as the "Framingham Eight" collectively petitioned the governor and the Massachusetts Advisory Board of Pardons for clemency. Each had been convicted of manslaughter or murder for killing her domestic partner. They argued that they had killed their batterers in self-defense (one woman was battered by her female partner). Boston College Law School Clemency Project organized the Framingham Eight Commutation Project, and the women received an outpouring of public support. Their case brought attention to the plight of battered women and is well known for its successful use of battered women's syndrome as a criminal defense (each of the eight women was eventually released by Governor William Weld). They also inspired a short film, *Defending Our Lives*, that won an Academy Award for Best Short Film—Documentary in 1993.

Just a few years later, another group of Framingham women successfully fought against injustice. In 1998, a group of inmates incarcerated at Framingham won a lawsuit against the DOC for brutality after an early-morning raid in September 1995 where masked correction officers dressed all in black forced more than 110 women from their beds and publicly strip-searched 16 of them in what the DOC called a training exercise. The DOC, while not admitting that it violated any laws, settled the suit by agreeing to discontinue the use of the training techniques and pay the women $80,000 in damages.

CONCLUSION

Framingham, like the larger DOC of which it is a part, has struggled during its history. In addition to the unique challenges female inmates present to prison officials, problems with overcrowding, inmate treatment, and health care services have marked the facility. Informed policy and program decisions are necessary to positively affect this population. Therefore, researchers must focus their efforts on the issues facing women in prison, such as the women living at Framingham.

FREEDOM OF INFORMATION ACT 1966

The Freedom of Information Act (FOIA) was originally enacted in 1966. It established for the first time a statutory right of access by any person to federal agency records unless the information sought was specifically exempted. The act requires certain materials to be made available under the agency's own initiative by publication in the *Federal Register* or in public reading rooms. Disclosure, not secrecy, is the dominant objective of the act.

After President Lyndon B. Johnson threatened a veto, the exemptions were broadened. The act, which went into effect in 1967, is codified as Title 5 U.S.C. § 552 and has been amended five times. At first, agencies interpreted the exemptions broadly and employed a variety of means to discourage FOIA use, including high fees, long delays, and claims that they could not find the requested materials. More recently, however, courts have interpreted most exemptions narrowly and fashioned procedural remedies against agency intransigence.

ADMINISTRATIVE PROCESS

The act specifies certain administrative procedures for processing requests. The initial request may be made to agency headquarters or a regional office and must "reasonably describe" the information sought. A statement of need is not necessary under FOIA, but may prove relevant in convincing an agency official to release the sought after information. Search and copy fees may apply, although it is also possible to have these fees waived. Generally, there is a 20-working-day statutory time limit for the agency response, but some agencies (particularly the FBI and CIA) may take years to reply. Such delay may usually be construed as a denial, although administrative remedies may be available if this occurs.

Once the relevant federal agency has determined whether the FOIA request will be honored, the agency must provide the individual or group that has lodged the request with a statement of what will or will not be released. The agency must also issue a statement of any reasons it may have for withholding the request and instruct the person about his or her right to appeal the determination. Finally, if necessary, the agency will also explain why it is not in the public interest to waive a fee.

FEES AND FEE WAIVERS

A requestor may incur three types of fees: (1) the cost of the search, (2) the cost of review, and (3) duplication costs. Agencies are required to provide for free the first two hours of search time and the first 100 pages of copying to noncommercial requestors. Multiple requests will not bypass fees.

The act states that if disclosure of the information is in the public interest, so as to contribute significantly to the public understanding of how government works, it may qualify for a fee waiver. However, the burden is on the requestor to prove (a) genuine public interest, (b) value of the records to the public, (c) that the information is not already in the public domain, (d) "expertise" in one's ability and intention to disseminate information, and (e) no personal interest in disclosure. A court can review agency fee action *de novo* (anew).

ADMINISTRATIVE APPEALS

Generally, exhaustion of administrative remedies is required prior to requesting judicial relief (i.e., obey each agency rule relating to data request). The burden of producing evidence of a proper agency appeal is on the requestor**.** The following items can be appealed: (a) denial of a request in full or in part, (b) adequacy of the agency's search, (c) failure to

respond within the time limits, (d) excessive fees, or (e) denial of a request for waiver of or a fee reduction. An appeal usually results in the release of additional documents that were initially withheld.

WHAT IS AN AGENCY?

An agency includes most entities that receive federal funds and operate under federal control. The courts and Congress as well as units in the executive office of the president are excluded, although not necessarily other offices in the executive branch of the federal government. Each entity is examined anew. A subunit of an agency may be sufficiently independent so as to be treated as an agency as may an advisory group (e.g., the Federal Bureau of Prisons is a subagency of the Department of Justice).

WHAT IS AN AGENCY RECORD?

There is a two-pronged test to determine whether a record is an agency record: (1) The agency must either create or obtain the material, and (2) the agency must be in control of the material at the time the FOIA request is made. The government bears the burden of proving that a record remains under the control of an exempt entity. Business records and personal entries created (but mixed) solely for an individual's conveniences that may be disposed of at that person's discretion are not agency records under the FOIA. There is no distinction between records kept manually or in computer storage systems. The requestor need not seek access from the agency that originated the document.

EXEMPTIONS

There are nine exemptions that allow an agency to withhold access to information. The FOIA, in other words, does not apply to the following:

Exemption 1: National Security Information

Matters that are specifically authorized under criteria established by an executive order to be kept secret in the interest of national defense or foreign policy and properly classified as such (e.g., CIA documents).

Exemption 2: Internal Agency Rules

Matters that are related solely to the internal personnel rules and practices of an agency, including agency matters in which the public could not reasonably be expected to have an interest.

Exemption 3: Information Exempted by Other Statutes

Matters specifically exempted by other statutes that leave no discretion on the issue. The statute must require or authorize withholding that incorporates a congressional mandate of confidentiality.

Exemption 4: Business Information

Privileged or confidential trade secrets or commercial or financial information obtained from a person. Information generated by the government does not fall under Exemption 4. One who has submitted information to the government may sue to prevent disclosure of that information. This type suit is known as "reverse FOIA litigation."

Exemption 5: Inter- and Intra-agency Memoranda

Inter-agency or intra-agency memorandums or letters, which would not be available by law to a party other than an agency in litigation with the agency. These claims are generally waived if the documents have been disclosed to third parties or non-federal agencies. This exemption was intended to incorporate the government's common law privilege from discovery in litigation such (a) "executive" privilege, which protects advice, recommendations, and opinions that are part of the deliberative, consultative, decision-making processes of government; (b) "attorney work product" privilege, which protects documents prepared by an attorney that reveal the theory of the lawyer's case or his or her litigation strategy; (c) the "attorney-client" privilege, which protects confidential communications; and (d) a qualified privilege based on Rule 26(c)(7) FRCP for confidential commercial information generated by the government in the awarding of a contract.

Exemption 6: Personal Privacy

Matters that are personal, medical, or similar files, the disclosure of which would constitute a clearly unwarranted invasion of privacy. This policy involves a balancing of interests between the protection of an individual's private affairs with the public's right to government information and the preservation of the basic purpose of the FOIA to open up agency action to the light of public scrutiny. "Similar files" is construed broadly. The identity of the requestor is irrelevant. A prior promise of confidentiality is not determinative. Prior public disclosure can defeat the exemption. The majority view is that this exemption shields lists of names and addresses (e.g., union memberships).

Exemption 7: Law Enforcement Records

Information compiled for law enforcement purposes if their production (a) could reasonably be expected to interfere with enforcement proceedings; (b) would deprive a person of a fair trial or impartial adjudication; (c) could reasonably be expected to constitute an unwarranted invasion of privacy; (d) could reasonably be expected to disclose the identity of a confidential source; (e) would disclose techniques, procedures, or guidelines for law enforcement investigations or prosecutions if disclosure could reasonably be expected to risk circumvention of the law; and (f) could reasonably be expected to endanger the life or physical safety of *any* individual. The threshold test is whether the records are compiled for law enforcement purposes—whether civil or criminal, judicial or administrative. The records are not exempt unless the agency can show potential harm from document release under one or more of the six protected law enforcement interests above (e.g., the release of an informant's name).

Exemption 8: Records of Financial Institutions

Matters related to records for the use of an agency responsible for regulation or supervision of financial institutions. This broadly interpreted exemption is designed to protect the integrity and security of financial institutions and safeguard the relationship between banks and their supervising agencies.

Exemption 9: Oil Well Data

Finally, matters related to geological and geophysical data (e.g., maps of wells). This exemption, the least invoked and litigated of all the exemptions, has been called the "Texas touch." It is often criticized as being redundant to Exemption 4 because it includes confidential business information.

SEGREGABILITY

Section 552(b) of the FOIA provides that any portion of a record that can be reasonably segregated from exempt portions shall be provided to the requestor. Claims by an agency otherwise must be made with the same degree of detail as required for claims of exemption. District courts have broad discretion to determine whether *in camera* inspection (secret judicial scrutiny) is necessary when the agency claims inability to segregate. When the requestor cites this issue in an administrative appeal, it often leads to additional release of information.

LITIGATION STRATEGY

The FOIA may be an attractive alternative or adjunct to civil or criminal discovery because a person need not be a party to a lawsuit nor make a showing of need or relevancy nor bear the government's litigation costs if unsuccessful. Theoretically, the FOIA is a faster way to obtain copies of agency records.

FOIA requestors must exhaust administrative remedies before filing suit to obtain agency records. Even if the FOIA time limits for disclosure have been violated, this does not guarantee a court-established strict deadline. Suits may be filed in federal district court (a) in the plaintiff's home district, (b) where the records are located, or (c) in the District of Columbia (most familiar with FOIA litigation). The statute of limitations is set by Title 28 U.S.C. § 2401(a) at six years. A federal agency must always be named as a party defendant in an FOIA lawsuit. The complaint should be brief and request expedition of the lawsuit (§ 552(a)(4)(D)).

CONCLUSION

The FOIA is meant to provide some kind of check and balance on government actions. Similar acts have been adopted in several countries. The complex laws surrounding such acts often make it difficult for regular citizens to use them successfully.

FRY, ELIZABETH (1780–1845)

Elizabeth Fry was a prison reformer who advocated for the humane treatment and rehabilitation of inmates. She incorporated religion, education, and vocational practices into her ideology of reform. She was a strict Quaker who incorporated her religious beliefs into her educational work to inmates. Fry primarily advocated on behalf of women offenders.

BIOGRAPHICAL DETAILS

Elizabeth Gurney Fry was born at Earlham in Norwich, England, on May 21, 1780. She was the third daughter of John Gurney and Catherine Bell, and 1 of 11 children. Her mother died when she was 12 years of age, at which point, in her mother's place, her eldest sister became responsible for tending to the children.

Elizabeth Gurney married Joseph Fry in August 1800. Joseph too, was a devout Quaker, and he hailed from a wealthy family. The newlywed couple settled in London, where Fry found her calling of assisting female prisoners. Fry was acknowledged in 1811 as a Quaker minister. Following her first visit to Newgate Prison in 1813, she dedicated herself to prison reform. Elizabeth Fry died on October 12, 1845, at the age of 65 years. She was the mother to 11 children and left an indelible imprint on prison reform practices.

NEWGATE PRISON

At the time of Fry's first visit to Newgate Prison, all female prisoners were confined in what was later labeled as the "untried side" of the jail. The women's division was made up of two cells and two wards, in a zone of about 190 yards. More than 300 women were crowded into this area, mixing those on trial with those who had been convicted of both mild and the most violent crimes. Children were also confined in this area alongside their mothers.

In April 1817, Fry organized a committee, the Ladies Association for the Reformation of the Female Prisoners in Newgate, which was extended in 1821 into the British Ladies' Society for Promoting the Reformation of Female Prisoners. The committee consisted of nine Quaker women and one clergyman's wife. These 10 women served the female prison population at Newgate, by providing clothing, religious and educational instruction, and employment training and opportunities. They sought to instill the habits of sobriety and order in the women with the hope of rendering them docile and peaceful in prison and beyond.

THE IDEOLOGY OF REFORM

In 1818, under the reign of King George III, and one year after the establishment of her school within Newgate Prison, Elizabeth Fry was called to give evidence before the Committee of the House of Commons on the Prisons of the Metropolis. She was the first woman, other than a queen, to be called into the councils of government in an official manner to advise on matters of public concern. It was during this meeting that Fry set forth her main ideology of penal reform.

Fry suggested that there should be women warders taking care of women inmates. According to her, a single-sex environment would be more conducive to their reformation, as the warders would be positive role models for the women offenders. Second, Fry suggested that there be an entirely separate prison for female inmates. Rather than using a section within the male institution, she thought that women should be held separately in order to address their special needs more thoroughly. She also sought to have the prisoners paid at a fair rate by the government and to be allowed to spend a portion of their earnings upon reception. Fry believed that if the inmates were able to support themselves through legal means upon release, they would be less likely to engage in criminal activity.

Fry wanted inmates to be classified and separated. She argued that first-time and petty offenders should be separated from more chronic and violent inmates. First-time offenders would not have the opportunity to learn the criminogenic lifestyles of the more experienced inmates and would thus be more susceptible to penal reformation strategies. Fry also advocated for the segregation of prostitutes, since she saw them as a special population who were in need of specific moral and religious reformation. She argued that female inmates should be allowed to eat their meals and engage in recreation time as a group, but should remain segregated at night for their mental and physical well-being.

Unlike her prison reform predecessor John Howard, Fry advocated for the elimination of solitary confinement. She realized that prison officials would be unwilling to relinquish this practice completely and therefore made an exception stating that if this practice must continue, it be used only for very short periods of time and in the most horrific of cases. Fry believed that strict Quaker religion should be enforced in prison to help rebuild and restructure the morals of the inmates and to guide their behavior upon release. She also implemented educational and vocational training to better the social position of the women and to help ensure them a viable means of living upon release. Women were taught to cook, sew, clean, read and write, and properly care for their children. Finally, following her Quaker beliefs, Fry argued for the prohibition of alcohol within the prison since she believed alcohol consumption was related to criminal activity. As a result of Fry's tactics, Newgate Prison experienced a drop in the recidivism rate from 30%–40% to 4%.

WORK OUTSIDE OF NEWGATE

In addition to assisting prison inmates, Fry also helped those who were aboard convict ships. When the women were transferred from Newgate to the convict ships, they often engaged in riotous and destructive behavior. The women were moved in open wagons, which was both humiliating and tended to make them aggressive. Fry advocated that the women be moved in closed hackney coaches, and she volunteered to escort them. The convict ships lay in the harbor for five to six weeks, wherein Fry and the Ladies Association incorporated the caring practices they were bringing to Newgate. Eventually, moving women from their prison to the convict ships was made illegal.

CONCLUSION

Elizabeth Fry's system of governing female inmates was premised on the assumption that women were capable of redemption. This approach was in stark contrast to the strongly held belief at the time that women offenders were more evil than their male counterparts and thus "irreclaimable" (van Drenth & de Haan, 1999, p. 72). Fry influenced penal systems in Canada, the United States, Australia, France, Denmark, and Wales. She was a forerunner in prison reform practices. Her legacy is remembered in such organizations as the Canadian Association of Elizabeth Fry Societies (CAEFS), which assists and advocates on the behalf of women in conflict with the law. Echoes of Fry's interest in women prisoners may also be found in the extensive body of work that concentrates solely on women's experiences of imprisonment around the world.

FURLOUGH

The word *furlough* has Old English origins and, when used as a verb, basically means to grant a leave. The expanded contemporary use of the word furlough usually refers to a scheduled temporary and nonduty and nonpay status. This period of work may be voluntary. Furloughs in the civilian world may at times be mandatory and of a financial emergency nature such as the widespread furlough of flight attendants who were not needed due to significantly fewer scheduled flights after the September 11, 2001, terrorist attacks.

In a correctional setting, furlough also refers to a temporary and time-limited leave of absence. Typically, an inmate on a furlough will be entitled to an overnight or longer release from prison. Furloughs are used most often to address social and rehabilitative needs of the inmate. They may be granted so that an inmate may be present during a crisis, such as a funeral, in the immediate family (mother, father, stepparents, foster parents, sibling, spouse, and children). Prisoners may also be allowed to leave the confines of their prison temporarily to participate in the development of release plans, to reestablish family and community ties, and to participate in select educational, social, religious, and therapeutic activities that might facilitate their transition to the community.

Anytime that an inmate leaves or enters a facility, there are procedural and security concerns. To address these concerns, each institution typically has established guidelines outlining who might be eligible for furlough and procedures before leaving and upon the inmate's return. They also dictate what costs are expected to be paid by the inmate typically before the furlough is granted. Each of these issues shall be dealt with in turn below.

ELIGIBILITY

In the United States, furloughs are not very common and inmates are carefully screened for risk to the community before permission for a furlough is given. In many other countries, furloughs are more readily and routinely offered. In the United States, usually only minimum-security inmates who are in the last year of their sentence, meet the institution's eligibility criteria, and are approved by the warden are eligible for a leave of absence.

Since research has shown that inmates who maintain ties with their families generally have lower rates of recidivism, activities that may facilitate release transition and strengthen family ties may be deemed appropriate for the granting of a furlough. Some work skill programs may also be considered appropriate for the granting of a furlough. In addition, prisoners may be granted furloughs to participate in classes or treatment that are not available at their institution, such as a residential drug and alcohol rehabilitation program, or to obtain medical services not available at the prison.

Furloughs are considered a privilege. They are, therefore, not routinely given to an entire category of inmates but are instead awarded only to those individuals with a record of behavior making them worthy of the privilege. Women and prisoners in remote areas may be at a disadvantage if vocational or other services are not provided in the communities near the prison since travel time and the difficulty of making arrangements may be too great for the limited time allocated to furloughs. In any case, the warden or disciplinary committee of the institution may decide to revoke or withhold furlough privileges of any inmate.

PROCEDURES

Security procedures mandate that facts pertaining to the reason for a furlough such as the alleged death or terminal illness of a family member must be verified, for instance, by contacting the funeral home or doctor, and then documented on the appropriate institutional forms by designated institutional staff. Inmates will be informed of the conditions of their furlough. Conditions of furlough vary by institution but typically include keeping a copy of the furlough agreement on their person at all times, remaining within the appropriate county limits, avoiding alcohol and illegal drugs, not associating with suspected criminals, and obeying all laws and regulations.

Before anyone leaves a correctional facility to begin his or her furlough, all relevant victims/witnesses should be notified of the starting and ending dates of the furlough as well as specific location. The chief law enforcement officer (sheriff and/or chief of police) of the furlough destination should also be notified before the prisoner leaves. Usually, inmates must also make contact with the appropriate law enforcement official upon their arrival in the community and must later produce a document verifying this contact when they return to the institution.

Of course, there are risks involved in allowing prisoners to be out on furlough. The purpose of the leave of absence may not be accomplished if, for example, employment is not secured. Also, there is the possibility that someone on leave may commit another crime. Occasionally, those out on furlough may simply "walk away" and escape. While some factors such as type of crime for which the inmate was arrested and previous escape history can be used in attempting to predict risk, no prediction formula is completely foolproof.

If the conditions of the furlough agreement are not met or are violated, a range of consequences may result. Failure to accomplish the purpose of the furlough such as by missing a scheduled interview or a minor violation of rules, for example, returning from furlough 10 minutes late, may result in disciplinary action. An individual who commits a felony while on furlough will not be entitled to any further leaves during the remainder of his or her sentence. Anyone who has not contacted the institution with an appropriate explanation and who is more than three hours late in returning shall typically have an escape warrant issued.

Inmates usually have to pay for any nonemergency costs associated with a furlough such as transportation, lodging, and meals. Costs for conducting a urinalysis upon the inmate's return to the institution will also typically be withdrawn from the inmate's personal funds prior to his or her release. Such funds may make it difficult for indigent prisoners to take advantage of the furlough system.

CONCLUSION

Furlough programs are widely but selectively used by most correctional institutions. Such programs are thought to improve inmate morale while furthering the goals of rehabilitation and lessening recidivism. However, not all administrators support them, since furlough programs are labor intensive because all prisoners must be screened before being allowed off the premises. Furthermore, furlough programs are by nature controversial, and thus, potentially risky for prisons, because the public typically does not approve of prisoners being released into the community before their sentence is complete. Even though the low levels at which inmates commit serious crimes while on furlough suggest that such fears are ungrounded, concerns remain high enough that few inmates will be given the opportunity to participate in a furlough while they are confined.

FURMAN v. GEORGIA

Furman v. Georgia was the U.S. Supreme Court case that briefly suspended capital punishment in the United States, for four years, from 1972 to 1976. Although the death penalty was eventually reinstated, *Furman v. Georgia* changed the legal and political landscape surrounding capital punishment.

HISTORY

Prior to the 1960s, courts uniformly supported the constitutionality of the death penalty. However, during the civil rights movement, a number of cases brought by death row inmates successfully challenged many of the legal and social assumptions that underpinned capital punishment. One of the first shifts toward challenging the death penalty actually occurred in the unrelated case of *Trop v. Dulles* (1958) where it was successfully argued that the framers of the Eighth Amendment inserted an "evolving standard of decency that marked the progress of a maturing society."

This decision was applied 10 years later in the case of *United States v. Jackson* (1968) where the court held that the sole discretion given to juries to determine the death penalty was unconstitutional because it forced defendants to waive right to jury trial in order to escape the death penalty. It further appeared in *Witherspoon v. Illinois* (1968) where it was ruled unconstitutional to exclude a juror who had reservations about the death penalty but who could still reach a reasonable decision on a capital case.

In 1971, the cases of *Crampton v. Ohio* and *McGautha v. California* challenged the death penalty on the basis of the due process rights of the Fourteenth Amendment but the Supreme Court disagreed with their claims and gave the jury full discretion in the determination of the death penalty on the basis that it was "humanly impossible" to guide the sentencing discretion of the jury. The next year, *Furman v. Georgia* reopened this challenge by arguing that jury decisions were evidently arbitrary and capricious and therefore "cruel and unusual" contrary to the provisions of the Eighth Amendment. This time, the court agreed by 5–4 majority, thereby voiding the death penalty statutes in 39 states and those of the federal government, commuting 629 pending death sentences across the country and imposing a moratorium on further death sentences until there were adequate safeguards against arbitrary and capricious jury sentencing decisions. Four years later, new death penalty statutes were once again ruled constitutional by the U.S. Supreme Court following the challenge of *Gregg v. Georgia* in 1976.

BACKGROUND TO *FURMAN v. GEORGIA*

In many ways, Furman was a lucky man. This is not just because he saved his own life and those of 629 other death row inmates by appealing against the death penalty and winning but also because he was not the only one whose case was decided on the same day. Instead, he was the first of three appellants to file appeals with the U.S. Supreme Court in 1969 (as his case number indicates, No. 69–5003). As a result, it could have been the name of Jackson as in *Jackson v. Georgia* (No. 69–5030) or that of Branch as in *Branch v. Texas* (No. 69–5031) that would be remembered widely today. In fact, the other two cases should actually be more well known than Furman's because their rulings have endured longer. The cases of Branch and Jackson finally ended the use of death penalty for rape, for which African American men were overwhelmingly executed in America prior to 1972. Their victories were solidified in 1976 when the U.S. Supreme Court clearly prohibited states from punishing rape with death in the case of *Coker v. Georgia.*

These three African American men made history by challenging and defeating a form of punishment that the Supreme Court agreed was cruel and unusual and therefore unconstitutional. Furman and Jackson appealed their cases before the supreme court of Georgia, while Branch appealed before the court of criminal appeals of Texas. All three cases were decided on June 29, 1972.

Furman

Furman was 26 years old with a sixth-grade education. He was found guilty of murder when he entered a house and shot the owner dead through

a closed door. He claimed that the gun went off unintentionally when he tripped and fell and that he had no intention of killing anyone. His counsel entered an insanity plea on his behalf, and he was committed to Georgia Central State Hospital for psychiatric observation. The hospital staff unanimously reported that he suffered from mental deficiency with psychotic episodes associated with convulsive disorder. They recommended further psychiatric hospitalization and treatment. But later, the superintendent reported that Furman was not psychotic at the time, that he knew right from wrong, and that he was capable of cooperating with his court-appointed counsel.

Jackson

Jackson was 21 years old when he was convicted of raping a white woman. He was serving a three-year sentence at that time for auto theft and had escaped from a work gang in the area. He entered the house when the woman's husband left for work and threatened her with a pair of scissors that he held to her neck. In addition to raping her, he demanded money. A court-appointed psychiatrist testified that Jackson was not an imbecile or schizophrenic and that he was competent to stand trial because he was only suffering from environmental influences.

Branch

Branch had earlier been convicted of felony theft with borderline mental deficiency and below average IQ of Texas prison inmates. He was convicted of entering the house of a 65-year-old white widow while she slept and raping her, with his hand on her throat. After raping her, like Jackson, he demanded money. Branch then left and warned her not to tell anyone what happened or he would return and kill her.

THE SUPREME COURT

The Supreme Court was asked by the three men to answer the following question: "Does the imposition and carrying out of the death penalty in (these cases) constitute cruel and unusual punishment in violation of the Eighth and Fourteenth Amendments?" Five of the Supreme Court justices answered the question affirmatively (concurring), while four justices answered the question negatively (dissenting). Justices William Douglas, William Brennan, Potter Stewart, Byron White, and Thurgood Marshall filed separate opinions in support of the judgments, while Chief Justice Warren Burger and Justices Harry Blackmun, Lewis Powell, and William Rehnquist filed separate dissenting opinions. By this narrow 5–4 majority decision, the Supreme Court could have effectively abolished the death penalty in America forever. However, the question before the Court was limited to issues "in (these cases)." That was the loophole that later enabled their decision to be overturned.

CONCLUSION

On June 26, 1997, the Southern Center for Human Rights marked the 25th anniversary of *Furman v. Georgia* by issuing a report that concluded that the promise of reform that emanated from the 1972 judgment did not materialize because the death penalty remains discriminatory, arbitrary, and cruel especially with reference to race, poverty, innocence, mental retardation, mental illness, and children on death row. This report echoed the argument of *McCleskey v. Kemp* (1987) when the Supreme Court was asked to rule the death penalty unconstitutional on the basis of racial discrimination. The petition of McCleskey was rejected by a narrow margin of 5–4 majority, the same margin with which *Furman v. Georgia* was granted.

Only Justice Marshall and Justice Brennan found in the case of *Furman* that the death penalty was unconstitutional. The other three justices who found in favor of *Furman* held that it was only the existing death penalty statues that were unconstitutional. This majority opinion meant that states quickly started rewriting their death penalty cases to get rid of arbitrariness. Only five months after the landmark decision, 34 states proclaimed new death penalty statutes that supposedly conformed to the higher standard set by the Supreme Court in the case of *Furman.*

These new acts were challenged in 1976 by three more cases, *Gregg v. Georgia*, *Jurek v. Texas*, and

Proffitt v. Florida, that were collectively known as *Gregg v. Georgia.* This time, the Supreme Court decided by 5–4 majority that the new death penalty statutes were constitutional, thereby ending the suspension of the death penalty and paving the way for the imposition of new death penalties in America, although the 629 sentences commuted as a result of the *Furman* decision could not be reimposed.

G

GANGS

As the number of gangs and gang members in the United States continued to escalate during the past two decades of the 20th century and the response by the criminal justice system became harsher, many gang members found themselves in the nation's prison system. A 1999 study of prison administrators in 47 states estimated that about one-fourth (24.7%) of all male prisoners and 7.5% of female prisoners were gang members. In comparison only 9.4% of men and 3.5% women were identified as such in 1991. This percentage change means that there were approximately 47,220 male gang members in the nation's prisons in 1999, up from 43,765 in 1993. Some states have even a greater proportion of gangs in their prison population. In Illinois, for example, about 60% are believed to belong to gangs.

According to the 1999 survey of prison administrators, the most frequently cited gangs overall around the country were the Crips (various factions), Black Gangster Disciples, Bloods/Piru factions, Vice Lords, Aryan Brotherhood, and Latin Kings. Most of these gangs have strong rivalries within the prison system, based almost solely on race. While incarceration may be a short-term solution to the problem of gang violence in the community, in the long run it has resulted in increased gang cohesion and membership recruitment. Many gang members report that prison strengthens their involvement in the group, which is exactly the opposite of the intended effect of incarcerating them, while others join a gang for the first time when they are imprisoned.

HISTORY

Prison gangs first emerged in the west in the state of Washington in 1950 and in California in 1957. Twelve years later, in 1969, they began to appear in Illinois. During the 1970s, states adjacent to California and bordering Mexico, as well as two states to the north of Illinois, had similar organizations develop inside their prison systems. In the 1980s, development continued in Missouri and Kentucky.

Early prison gangs spread either by transfers or rearrests of gang members in another jurisdiction. In these cases, the inmate in a new prison setting sometimes tried to reproduce the organization that gave him or her an identity prior to incarceration. In other cases, charismatic leaders imitated what they had heard about other gangs.

RELATIONSHIP BETWEEN STREET GANGS AND PRISON GANGS

Two major types of gangs exist within the prison system: street gangs imported into the prison and

groups that originate within the penal institution itself. There are many indigenous gangs in penal facilities. As a result, we need to be cautious about the common view that prison gangs are "mere extensions" of street organizations, for that is clearly not always the case.

Most indigenous prison gangs developed, at least in part, as a means of belonging and for protection during a term of confinement. Racketeering, black markets for illegal goods and services such as drugs, and racism have also been factors in the development of these organizations. Protection seems to be a key factor. When an individual enters a prison, he or she may be challenged to a fight. If this happens, typically the new prisoner will either join a gang or pay for protection or become a "servant" to other prisoners. It tends to happen more frequently in certain men's prisons than others and is more common in all men's prisons than in women's facilities. In Texas, gangs often recruit like fraternities and often specifically target prisoners who are serving short sentences. This way they can help the group when they leave. They adhere to a very strict code of silence and are committed to the gang for life, reflected in the common expression "blood in, blood out."

In contrast to the recruitment pressures experienced by the unaffiliated convict, the gang member from the street has little trouble in adjusting to the new environment. Besides physical security, the gang in the prison, as on the street, serves important material and psychological functions for its members. It functions both as a communication network and as a convenient distribution network for contraband goods. It also provides a source of identification and a feeling of belonging. Other members comprise one's family and are often referred to "my homes" or just "homes" (short for "homeboy"). Members live, and die, for the gang. The organizations, with their insignias, colors, salutes, titles, and legendary histories, often provide the only meaningful reference group for their members.

Many gang members in prison were leaders in the organization outside. They may still be looked to for guidance, and in many cases, they "call the shots" as far as gang businesses are concerned. For example, Larry Hoover of the Gangster Disciples reportedly ran his gang for years behind bars in the Illinois prison system (Curry & Decker, 1998, p. 134). It is for this reason that most penal facilities try to determine gang affiliation as people begin their sentence. Being a known gang member, or what is referred to by administrators as a "security control threat," usually draws with it restricted work, recreation, and housing. Most facilities also try to separate members of rival groups.

STRUCTURE AND ORGANIZATION

Most of the criminal organizations within any given urban area have their direct counterparts within the state prison system. In Stateville, Illinois, for example, the inmate system is organized in ways almost identical with the gangs on the streets of Chicago. Likewise, in a nationwide survey, Camp and Camp (1985) found that of 33 state prison officials who indicated they had gangs, a total of 21 said that these gangs had their counterparts in the cities of these states.

Prison gangs, not unlike many on the streets, adhere to a code of secrecy and emphasize power and prestige, both of which are measured in terms of the ability to control other inmates and specific activities within the institution. Money and drugs in particular represent tangible symbols of a gang's ability to control and dominate others, and of its ability to provide essential protection, goods, and services for its members. The gang's capacity to bring status and prestige for the members reinforces group commitment and solidarity.

One of the distinguishing characteristics of the prison gang, unlike most groups on the streets, is the virtual absence of any noncriminal, nondeviant activities. Members in prison usually become completely immersed in being a career prison gangster, leaving little time and less inclination for other than asocial behavior.

Prison gangs have several additional characteristics. They often have a well-defined hierarchical structure. They recruit based on "homeboy" preprison experiences. For many, the prison system is

only one of several institutions, along with welfare and the police, that their members may have experienced. Thus, there may be a sort of "anticipatory socialization" to prison. Indeed, ethnographer J. W. Moore (1978) notes that the prison system "is an omnipresent reality in barrio life, and contact with it is continuous and drastic, affecting nearly everybody in the barrio. . . . Prison adaptations are seen by convicts themselves as variants of adaptations to street life" (pp. 40, 98).

THE IMPORTANCE OF RACE

Since most urban gangs are made up of racial minorities, it should not be surprising that race is important among the gangs in prison. Such divisions often lead to inmate-on-inmate violence. Thus, in a 1999 survey of prison administrators, 87% said that gang disturbances were related to racial conflicts.

Virtually every study has found that the several different gangs that exist within the prison system are each made up of specific racial or ethnic groups. For example, one recent study found that in Florida there were six major gangs.

1. The Neta, which consists of Puerto Rican and Hispanic prisoners, was originally established in 1970 in the Rio Pedras Prison, Puerto Rico.
2. The Aryan Brotherhood (AB), for whites only, originated in San Quentin Prison (California) in 1967. Most of the members are white supremacists, with some displaying neo-Nazi characteristics and ideology.
3. The Black Guerrilla Family (BGF) was founded in San Quentin by George Jackson (former Black Panther Party member and author of *Soledad Brothers*) in 1966.
4. The Mexican Mafia consists of Mexican Americans and was formed in the late 1950s at a youth correctional center called Duel Vocational Center. They originally were an extension of a Los Angeles street gang.
5. La Nuestra Familia, a mostly Mexican American gang, originated in Soledad Prison in California in the mid-1960s.
6. The Texas Syndicate (TS), a Mexican American prison gang, was founded in Folsom Prison (California) in the early 1970s in direct response to other gangs, especially the Aryan Brotherhood and Mexican Mafia, who would prey on Texas prisoner (they have developed associations with two other smaller gangs, known as the Texas Mafia and the Dirty White Boys).

Many of the gang conflicts stem from these kinds of racial divisions.

In addition to racial conflict and intolerance, some of the conflicts between prison gangs arise from the many kinds of criminal activities in which they are involved. Most commonly, prison gangs offer the primary source of drugs in prison. They may also control sex, food, clothing, loan sharking, gambling, extortion, and protection.

THE RESPONSE TO PRISON GANGS

Gangs are the one of the most notorious aspects of life behind prison walls, at least within men's prisons. The unaffiliated convict enters the prison fearing that his or her life may be in danger from gangs. Even if he is not immediately concerned with survival, he will face the prospect of being "shaken down" for commissary items and/or sex. The guards can be of little help in protecting him, since in many institutions administrators tend to "look the other way" as rival gangs tend to maintain a certain level of social control and order. In one way or another, the convict must find a strategy for dealing with the gang situation.

Nonetheless, it is important to acknowledge that the gang problem varies from one type of institution to another. The 1999 prison gang survey found that as security levels increase, the gang problem also increases. Prison administrators report a greater number of gang disturbances in maximum-security prisons. Specifically, while about 10% of minimum-security prisons reported a gang disturbance in 1999, over half (59%) of the medium-security prisons had such disturbances, while almost two-thirds (64.7%) of the maximum-security prisons had gang disturbances (Knox, 1999).

Prison administrators have used a number of different techniques to control the gang problem within the prison system. According to the 1999 survey, among the most common recommendations include improving race relations, passing tougher legislation (no specifics given), eliminating weight lifting, monitoring telephones, monitoring mail, providing tuition support for staff to attend more training conferences, and using a full-time ombudsman for prisoners. As for the most common responses to the gang problem, these administrators used the following most often: transfers (used by 80%), the use of informers (54%), segregation (60%), isolating leaders (46%), and monitoring mail and telephone calls (61% and 51%, respectively). It appears that the prison gang problem has become worse over the years. The 1999 survey revealed that the vast majority of prison administrators believe the problem has worsened over the years. Specifically, while in 1992, of prison administrators surveyed, 27% believed the problem has increased, in 1999 almost two-thirds (63%) believed this. Most expected the problem of gang violence to increase in the next five years (Knox, 1999).

CONCLUSION

As inner-city social conditions worsen due to loss of jobs, low wages, poor schools, crumbling city infrastructures, and broken families, the attractiveness of gangs will continue to grow. The "get tough" policies toward gangs that began in the 1980s has had at least one negative result: Many of the gang members sent to prison have recently been released and placed right back into the very conditions that led to their gang affiliation in the first place. In Los Angeles, for example, a rise in gang-related homicides in South Central Los Angeles (255 in 2001, up from 161 in 1998) has been at least partly attributed to the release of these gang members, plus continued deterioration of their neighborhoods. As long as sentencing policies follow traditional conservative thinking, prison officials will continue to be confronted by gangs, as will the communities where these gang members grew up.

GARLAND, DAVID (1955–)

David Garland is one of the foremost scholars of punishment in the United States. His oeuvre can be divided into two broad projects. First, he has successfully carved out a domain of study that can broadly be termed the sociology of punishment. Second, he has explored the history of criminology. Both fields of study have been enormously influential.

In his work on criminology, Garland (2002) set out "to trace its historical conditions of emergence,

identify the intellectual resources and traditions upon which it drew, and give some account of the process of its formation and development" (p. 14). His work has an obviously historical bent, yet he does not search for inherent causes or unique events**.** Rather, Garland's approach is historical only so far as he recognizes the contingency of modern phenomena and problematizes their taken-for-granted existence. The point, he says, "is not to think historically about the past but rather to use that history to rethink the present" (Garland, 2001, p. 2) Thus, instead of starting from a preconception that criminology's development would inevitably mirror the course set out by the natural sciences, Garland traces the conditions that made its emergence and expansion possible without attributing cause and effect to these events.

SOCIOLOGY OF PUNISHMENT

Despite Garland's absorbing and significant contributions to the history of criminology, he is best known for his pioneering efforts on the sociology of punishment. In 1999, he became the founding editor of the journal *Punishment and Society,* which brings together interdisciplinary scholarship on this subject. His own work in this area has influenced a generation of scholars and has expanded the scope of understanding, inquiry, and theoretical interpretation of punishment. According to Garland (1990), the sociology of punishment, "broadly conceived, [is] that body of thought which explores the relations between punishment and society, its purpose being to understand punishment as a social phenomenon and thus trace its role in social life" (p. 14).

Garland (1991) encourages scholars to see punishment as a complex institution and evaluate it by "recognizing the range of its penal and social functions and the nature of its social support" (p. 160). His understanding of an expanded sociology of punishment is most clearly revealed in his 1990 book, *Punishment and Modern Society*, which has become a core text for graduate and senior-level undergraduate students. In this work, Garland offers a broad sociological description of punishment in contemporary society using the interpretive tools of Karl Marx, Émile Durkheim, Michel Foucault, and Norbert Elias along with several other social theorists. The result is an intricate investigation of punishment in late modern society that attends to the complexity of its development through what Garland calls a multidimensional interpretive approach. This book attempted to "extend and synthesize the range of interpretive material that currently forms the sociology of punishment, and to build up a more complete picture of how punishment might be understood in modern society" (Garland, 1990, p. 16).

Garland does not view "punishment" as a singular entity. Rather, he conceives of it as composed of a complex set of institutions, discourses, societal forces, and interrelated processes. Moreover, he suggests that punishment does not have a single purpose or serve a particular end. It is precisely because of its "stored up" historical meaning and diverse rationales that a multidimensional approach to understanding punishment's meaning, function, and rationale is paramount. To comprehend penality's nature and character at any given time requires one to "explore its many dynamics and forces and build up a complex picture of the circuits of meaning and action within which it . . . functions" (Garland, 1990, p. 17). Underlying this multifarious approach lies a commitment to discerning "punishment" in a way that exposes its complexity.

In his latest book, *The Culture of Control,* Garland extends his examination of penality to the burgeoning neoliberal crime control complex. He once again employs a multidimensional history of the present that examines the complexity of modern forms of punishment. In this work, Garland (2001) attempts to understand how the contemporary responses to crime and deviance took their present form, "with all their novel and contradictory aspects" (p. 2). Furthermore, his task was to "unravel the tangle of transformative forces that has, for decades now, been reconstituting those responses in surprising and unexpected ways and to understand the practices and policies that has emerged out of these developments" (p. 2). What distinguishes the contemporary forms of penality

from those that existed for most of the 20th century? Included among the "contradictory" and "novel" policies and practices that concern Garland in this work are the declining importance of rehabilitation as a sentencing option, a return to punitive sanctions, shifts in the emotional tone of crime policy, the return of the victim, an overriding concern to protect the public, crime as an issue in elections, transformations in criminological thought, privatization, and a perpetual sense of crisis leading to rapid legislative, organizational, and policy reform.

Perhaps the most surprising feature of contemporary penality, Garland points out, is the return and reinvention of the prison. Although prisons now seem firmly entrenched in the criminal justice landscape, this situation is of recent origin. Post–World War II penologists and commissions of inquiry saw prisons as counterintuitive institutions that were ultimately criminogenic. During the 1960s and early 1970s, considerable resources were "expended on the task of creating alternatives to incarceration and encouraging sentencers to use them" (Garland, 2001, p. 14). Unfortunately, the emergence of punitive politics, neoconservative rhetoric, and mass media preoccupation with crime largely reversed this trend such that Western nations are now locking up offenders at a record rate.

Clearly, the contemporary crime control landscape is an amalgam of policy and practice that has defied the most astute expert prediction. In *The Culture of Control,* Garland stops short of forecasting future developments, but instead offers a manner of coming to terms with the ever-changing criminal justice landscape. To understand the emergence and entrenchment of contemporary practice, Garland (2001) suggests that we look beyond rising crime rates and systemwide loss of faith in the welfare sanction, although these forces did play a limited role. Instead, he argues:

> It was created by a series of adaptive responses to the cultural and criminological conditions of late modernity—conditions which included new problems of crime and insecurity, and new attitudes towards the welfare. But these responses did not occur outside of the political process or in a political and cultural vacuum. On the contrary. They were deeply marked by the cultural formation . . . ; by the reactionary politics that have dominated Britain and America during the last twenty years; and by the new social relations that have grown up around the changing structures of work, welfare and market exchange in these two late modern societies. (p. 193)

It is this type of intricate genealogical analysis that sets Garland's analysis of current crime control policy apart.

CRITICISM

Despite the many important contributions he has made to the study of punishment and criminology, Garland is not without his critics. In the face of gross overrepresentations of the politically powerless and minorities of all kinds in carceral institutions in countries such as the United States, Canada, Australia, and New Zealand, Garland seems relatively unconcerned with this element of late-modern penality. Given his concern to push the limits in studies of punishment, this neglect is troubling. Garland's concern to untangle the forces that underlie contemporary crime control policy leads him to focus on practices and structures of penality at the expense of those subjected to them.

Although we cannot expect Garland to investigate and include every possible force and element into his analysis of punishment, nevertheless the systemic targeting of the powerless by state-sponsored forms of social control constitutes a fundamental part of the contemporary penal scene. The underlying rationale for this condition is connected to the systemic marginalization and subordination experienced by the politically, socially, racially, and economically excluded. It is also tied to the systematic targeting of the working classes and ethnic minorities by the policing arm of the state. Inherent biases built into state criminalization and management practices have continually reproduced—despite claims to the contrary—systemic inequality and resulted in these groups being overrepresented at all levels of the justice system (Hogeveen, in press). For example, in Canada Aboriginal youths make up roughly 5% of the adolescent population,

yet conservative estimates suggest they constitute 75% of the young offender prison population. Unfortunately, drawing on Garland's work does not allow us to adequately address the fundamental conditions that create and sustain this relationship.

Feminist and gender scholars are also concerned that Garland does not consider punishment a gendered and gendering institution. In recent years, feminists in particular have demonstrated that gender profoundly conditions parental and institutional responses to female criminality. Scholars such as Adrian Howe (1994), Pat Carlen (1990), and Barbara Hudson (1996) have addressed Garland's oversight by calling for a woman-centered penality, which not only "takes into account the maleness of supposedly gender neutral concepts, and requires attention to the lives of female offenders, but is also cognizant of the gendered power relationships in the societies which women and men are committing crimes and enduring penalties" (Hudson, 1996, p. 148). This women-centered scholarship has unravelled how penological reform so regularly reproduces the gender, class, and race inequalities governments set out to rectify.

CONCLUSION

Garland's analysis of historical patterns, emerging social relations, economic conditions, and political culture continuously produces fresh insight into contemporary penality. Though his scholarship ignores how crime control practices contribute to systemic discrimination particularly in terms of race and gender, David Garland has made incalculable contributions to the study of punishment.

GAULT, GERALD (GERRY) (1949–)

Gerald Gault was arrested when he was 15 years old on charges of making obscene phone calls to a neighbor. His trial and subsequent appeal led to fundamental changes in the juvenile justice system. Specifically, it ushered in due process rights for juveniles involved in delinquency proceedings.

As a direct result of this case, young people are now entitled to legal counsel, to confront and cross-examine witnesses, to confront their accuser, to refuse to incriminate themselves, and to be given timely notice of charges. While many of these due process rights are closely akin to those afforded to adults, they are not identical.

FACTS OF THE CASE

On June 8, 1964, Gerry Gault and a friend were arrested by the sheriff for making obscene phone calls. At the time of his arrest, Gault was already on probation for involvement in the theft of a wallet. As was common practice at the time, the sheriff took him to the Children's Detention Home without informing his parents. When his mother finally discovered where Gault had been taken and arrived at the home, the probation officer informed her that a hearing would occur the following day in the judge's chamber.

At the hearing, Gault and his parents were not served with a copy of the formal petition that had been filed by the probation officer. In addition, the victim was not present at the hearing, nor was she interviewed by anyone other than the probation officer. No one at the hearing was sworn in and no official records or transcripts of the proceedings were made. The hearing concluded with the judge deciding to "think about" the case. Gault was sent back to the Children's Detention Home. Within a few days, Gault was released from the home to his mother, and another hearing was scheduled to occur in a week. At the second hearing, the judge committed Gault to the State Industrial School for a period of six years, until his 21st birthday, even though there was some dispute as to whether he had merely dialed the number or actually made the obscene comments.

Because there was no right to appeal for juveniles in Arizona, Gault's attorney filed a writ of *habeas corpus* with the Superior Court of the State of Arizona on his behalf. The writ was subsequently denied. Although the Arizona Supreme Court upheld that juveniles were entitled to due process rights during delinquency proceedings, they failed to require that Gault should be released from his commitment because the procedures used during his delinquency proceedings were, in their opinion, consistent with due process. Their denial of the writ forced Gault's attorney to seek relief from the U.S. Supreme Court. On May 15, 1967, the U.S. Supreme Court disagreed with the Arizona Supreme Court's findings, reversed the case, and ordered that Gerald Gault be released from the State Industrial School. At the time of the U.S. Supreme Court's decision, Gault was already 18 years old. He had spent the last three years in the State Industrial School on a charge that would have resulted in a $50 fine and a maximum of 30 days in jail if committed by an adult.

SIGNIFICANCE OF THE CASE

In re Gault (1967) set forth specific requirements for due process rights afforded juveniles in delinquency proceedings. The specific rights recognized by the U.S. Supreme Court included timely notice of the charges, right to counsel, protection against self-incrimination, and right to confront and cross-examine witnesses.

The first right to which juveniles are now entitled is written notice of the charges against them. Such notice must be adequate and timely and contain information regarding the alleged misconduct. Furthermore, the Court specified that notice must be given to the juvenile as well as to his or her parents or care givers. The second due process right granted to juveniles in this case is the right to counsel. Such counsel shall be provided in all delinquency proceedings, regardless of financial ability. Juveniles as well as their parents must also be informed of their right to counsel, as well as the implications for the waiver of counsel.

The third due process right is the fundamental right against self-incrimination. Juveniles must knowingly give away their Fifth Amendment rights. If their rights are not knowingly given away, then their statements may not be used against them. The Court further said that "admissions and confessions by juveniles require special caution" when evaluating voluntariness. The fourth right that the Court

granted juveniles was the right to confront and cross-examine witnesses. A juvenile is entitled to all of the above-described procedural rights during the adjudicatory phase.

CONCLUSION

Although *In re Gault* led to the recognition of a substantial number of due process rights for juveniles, the Court failed to provide all of the rights enjoyed by adults facing criminal sanctions. Specifically, the Court chose not to address the juvenile code of Arizona, which did not provide for appellate review in delinquency matters. Even today, the right of a juvenile to appeal is dependent upon the state statutes. The Court also refused to address the issue of a juvenile's right to a transcript of the adjudication hearing. Juvenile court judges still enjoy an enormous amount of discretionary power.

GENERAL EDUCATIONAL DEVELOPMENT (GED) EXAM AND GENERAL EQUIVALENCY DIPLOMA

The General Educational Development (GED) exam assesses skills and general knowledge that are acquired through a four-year high school education. The exam changes periodically, most recently in January 2002, in an effort to keep up with knowledge and skills needed in our society. The exam covers math, science, social studies, reading, and writing. All of the test items are multiple choice except for a section in the writing exam that requires GED candidates to write an essay. The complete exam takes just under eight hours to complete and is typically broken down into several sections that can be taken over time.

In addition to the GED exam, the acronym "GED" is also used to signify the diploma (general equivalency diploma). Research that assesses the value of the GED examines employment and the likelihood of continuing with formal education after earning the GED. Scholars have also examined whether the GED is equivalent to a high school diploma. Past research indicates that employees with a GED are not the labor market equivalents of regular high school graduates. Those who leave school with very low skills benefit from obtaining a GED. However, this advantage is lessened for those who have obtained other employment-related skills. The message gained from much of the research is that it is best to remain in school. While the GED has value, it should not be seen as a replacement for four years of high school.

THE GED AND CORRECTIONS

Though there has been little research examining the impact of obtaining a GED in corrections settings, the majority of those studies that do exist suggest that earning a GED while in prison reduces the likelihood of returning to prison. However, some researchers have criticized the methodology used in studies that focus on recidivism since it

may be argued that those who choose, or are chosen, for corrections education programs benefit most from the experience since they have already indicated a willingness to "stay out of trouble." Arguably, these are the people who will benefit most from any efforts to increase their chances of success. It may be difficult to blame corrections education programs that focus on those most likely to benefit from the program.

Another problem regarding an effort to demonstrate the value of a prison GED, in comparison to a high school diploma or GED earned in a traditional setting, is related to the complexity of factors that surround an individual in the labor market. It is possible that the impact of earning a GED in prison is not great enough to overcome the negative effect incarceration can have on employment opportunities. Employers may be reluctant to hire someone who has served time in prison. In fact, a felony conviction can disqualify an individual for employment in some professions. Given the barriers placed before individuals who seek employment after prison, it may be difficult to demonstrate the impact of a single educational experience.

Although the employment-related impacts of the GED earned in corrections settings are difficult to assess, research has consistently demonstrated that corrections education can significantly reduce recidivism. A 1987 Bureau of Prisons report found that the more education an inmate received, the lower the rate of recidivism. Inmates who earned college degrees were the least likely to reenter prison. For inmates who had some high school, the rate of recidivism was 54.6%. For college graduates the rate dropped to 5.4%. Similarly, a Texas Department of Criminal Justice study found that while the state's overall rate of recidivism was 60%, for holders of college associate degrees it was 13.7%. The recidivism rate for those with bachelor's degrees was 5.6%. The rate for those with master's degrees was 0%. The Changing Minds study (Fine et al., 2001), which focused on the benefits of college courses in a women's prison, calculated that reductions in reincarceration would save approximately $900,000 per 100 student prisoners over a two-year period. If we project these savings to the 600,000 prison releases in a single year, the savings are enormous.

In addition to gains related to recidivism, prison-based education programs provide benefits related to the functioning of prisons. These programs provide incentives to inmates in a setting in which rewards are relatively limited. These classes also provide socialization opportunities with similarly motivated students and educators who serve as positive role models. Educational endeavors also keep students busy and provide intellectual stimulation in an environment that can be difficult to manage when prisoners break rules in search of an activity that breaks the monotony of prison life. Many prisons provide incentives for inmates who participate in corrections education. Opportunities to earn privileges within the facility, increased visitation, and the accumulation or loss of "good time" credit that can lead to earlier parole are used to motivate the student while providing incentives for appropriate behavior within the facility.

Prison educators face many challenges. Inmates who choose to enroll in corrections-based courses are not necessarily any different from students who enroll in GED courses in other settings. The range of abilities can include very gifted students, students who face challenges, and students who have various motives for enrolling in the course. However, the educational setting is very different. Challenges faced by corrections educators are compounded by the uniqueness of prison culture and the need for security. Prisons adhere to strict routines that may not be ideal in an educational setting. In addition, inmates are often moved from one facility to another. This movement interrupts, or ends, the individual's educational programming. These structural issues are accompanied by social factors that can further limit learning opportunities. The student may be very motivated to earn an education but is in an environment in which conflicting demands may limit the opportunity to act on that motivation. For example, other prisoners may not support the individual's educational efforts.

Prison administrators may also have varying degrees of support for education—especially if they see it as a threat to the primary functions of security

and control. GED courses may be seen as a burden to prison administrators who believe their primary goal is confinement. However, in many cases administrators are required to provide educational opportunities. At least 26 states have mandatory corrections education laws that mandate education for a certain amount of time or until a set level of achievement is reached. Enrollment in correctional education is also required in many states if the inmate is under a certain age, as specified by that state's compulsory education law. The Federal Bureau of Prisons has also implemented a policy that requires inmates who do not have a high school diploma or a GED to participate in literacy programs for a minimum of 240 hours, or until they obtain their GED.

States typically provide corrections education funding based, in part, on success as measured by the rate of GED completion. In addition to state funding, the federal government provides support to state corrections education through the Adult Education and Family Literacy Act (AEFLA), which became law in 1998. However, funding often fails to keep pace with needs. Legislation over the past 20 years, a time in which the prison population has grown at unprecedented levels, has resulted in significant cuts in corrections education funding. This has resulted in the elimination of many programs. Ironically, the "get tough on crime" mentality resulted in the elimination of many programs that were effective in reducing crime.

CONCLUSION

Studies consistently indicate that an individual who benefits from education while in prison is less likely to return to prison than someone who has not had the benefits of education while in prison. There is some question as to why corrections-based education leads to lower recidivism. This is a complex process, and difficult to measure, but it appears that the ability to find and hold a job consistently functions to reduce the chance that an individual will commit crime. Individuals who increase their education also increase their opportunities. Individuals who take classes while in prison improve their chances of attaining and keeping employment after release. As a result, they are less likely to commit additional crimes that would lead to their return to prison.

The benefits of earning a GED while in prison are difficult to demonstrate. Individuals may find it difficult to obtain employment after serving time in prison. Potential employers may benefit from education regarding the realities of employing someone who has completed his or her punishment and is attempting to return to a productive life outside prison walls. It may also be time to question the belief that tougher prisons, with limited efforts to educate or otherwise rehabilitate offenders, reduce crime. The get-tough-on-crime mentality has resulted in the elimination of many corrections education programs. Individuals in prison are typically burdened with many educational deficiencies. In many cases, the lack of skills limited options, resulting in criminal acts. Upon release from prison, with limited education and job experience that is well below the level gained by those outside prison, it is no surprise that many individuals will head back down the path that originally led them to prison.

GIALLOMBARDO, ROSE (1925–1993)

Rose Giallombardo is best known for her research on the inmate culture of a women's prison. Her 1966 book, *Society of Women: A Study of a Women's Prison,* helped raise questions about the degree to which studies based on field work in men's institutions were applicable to women. Giallombardo argued that women respond to the pains of imprisonment by re-creating traditional family roles among the inmate population. These informal systems sustain women's emotional need for social relationships and are shaped by their perception of female role expectations. Giallombardo's study ensured that gender issues could not be overlooked in prison research. Her findings continue to be cited in subsequent works that examine similarities and differences between male and female prisons and prisoners.

BIOGRAPHICAL DETAILS

Giallombardo completed her doctoral work at Northwestern University in 1965. Her dissertation, based on one year's ethnographic study at the Federal Reformatory for Women at Alderson, was published in 1966 as *Society of Women: A Study of a Women's Prison.* The study has become one of the standard sources for descriptions of women inmate's culture. Her later work, *The Social World of Imprisoned Girls: A Comparative Study of Institutions for Juvenile Delinquents,* published in 1974, summarized her earlier research findings and examined the presence of similar cultural elements within differing juvenile institutional settings. In 1966, Giallombardo edited a widely used reader, *Juvenile Delinquency: A Book of Readings,* revised through 1982, as well as editing *Contemporary Social Issues* in 1975. She held faculty appointments at New York University from 1964 to 1966, and at the University of Chicago from 1967 to 1972. During this period, she was a senior study director at the National Opinion Research Center and a research associate at the Center for Social Organization Studies.

RESEARCH BACKGROUND

Giallombardo placed her research in the context of earlier publications on inmate culture, beginning with Donald Clemmer's 1940 classic ethnographic study, *The Prison Community,* and Gresham M. Sykes's *Society of Captives: A Study of a Maximum Security Prison,* published in 1958. These authors argued that inmate culture develops in an effort to lessen the pains of imprisonment within systems of near total control. The deprivations of prison are viewed as the source of a culture resistant to staff and supportive of an "inmate code" that values loyalty, within a violent environment marked by struggles for power and goods. The tension between inmate solidarity and exploitive alienation gives rise to argot roles—"rats," "merchants and gorillas,"

"wolves, punks, and fags" and "real men," for example; as well as inmate norms—"do your own time," "don't trust anybody" and "don't snitch"—that reflect this reality. Giallombardo sought to investigate whether similar norms and roles existed in women's prisons.

Society of Women

Giallombardo argued that women's responses to prison reflected their sexual roles and institutional expectations in the larger society. Her work was influenced by a dominant cultural perception that men's status was decided by their occupational positions in the market place, while women's prestige and status derived from their roles as wives and mothers within the home. This view led Giallombardo (1974) to conclude that homosexual "marriage" relationships and the extensive "family groups" and other kinship ties she found at Alderson integrated the women into a social system that represented "an attempt to create a substitute universe within the prison" (p. 2). She asserted that the homosexual relationship, pivotal in the women's lives, was relatively unstable and competitive, while overlapping kinship structures provided stable networks of mutual support for the women.

The presence of both "marriage" and "family" relationships within the prison becomes a critical source for prestige and status for women beyond their ascribed status of inmate, while the absence of these relationships among male prisoners Giallombardo attributes to the inability within ascribed male roles for men to develop the affectionate "legitimate feminine roles" played out in informal supportive kinship networks. (Giallombardo, 1966, p. 186). Giallombardo concluded from her evidence that "the adult male and female inmate cultures *are* a response to the deprivations of prison life, but the *nature* of that response in both prison communities is influenced by the differential participation of males and females in the external culture" (Giallombardo, 1974, p. 3).

One year before Giallombardo's book was published, criminologists David Ward and Gene Kassebaum released a study based on their research at the women's prison in Frontera, California. At first glance, *Women's Prison: Sex and Social Structure* seems somewhat similar to *Society of Women*. However, Ward and Kassebaum provide only a limited analysis of how women cope with imprisonment, focusing almost exclusively on homosexual relationships, which they believe are a result of women's constant search for emotional support. Though they note in passing other responses to incarceration, they conclude that a women's prison is "a society dominated by homosexual ideology and behavior" (Ward & Kassebaum, 1965, p. 93).

Following both Ward and Kassebaum's and Giallombardo's publication of their research, Esther Heffernan's District of Columbia research, *Making It in Prison: The Square, the Cool and the Life,* published in 1972, found more complex and multiple subsystems of adaptation among the women. They included play-family structures, homosexual relationships, and economic and power networks. Heffernan also identified a range of argot roles and patterns of cooperation and resistance that reflected differing reactions to imprisonment based on the woman's previous identification with the norms and goals of conventional life, those of the "criminal underworld," or those for whom prison was "a way of life." These diverse and interrelated systems of adaptation were similar to those identified by John Irwin and Donald Cressey, in their 1962 article, "Thieves, Convicts and the Inmate Culture." Heffernan (1972) concluded that "members of the systems of the square, the cool and the life participate in an inmate system, but their orientation and relationships differ" (p. 164).

CONCLUSION: THE LASTING IMPACT OF GIALLOMBARDO'S RESEARCH

Rose Giallombardo's seminal research in *Society of Women: A Study of a Women's Prison* remains a major cited source, both nationally and internationally, in reading lists on inmate culture. Though most would now reject her rigid ideas of sex roles, this work has influenced all subsequent studies in the field of women's prisons. Cited in scholarly

debate over the degree to which imported values or internal reactions to the deprivations of imprisonment play a major role in the development of inmate culture, it was also used to analyze the comparative differences between male and female adaptations to imprisonment as well as to discuss the presence or absence, and the purpose and functioning of, "families" in prison.

More recently, and after a relative absence of comparative ethnographic studies of female prisons along with significant changes both in the position of women in society and in the numbers of imprisoned women and the administration of their facilities, new studies have recently appeared that ask new questions about women's imprisonment. Such works include Barbara Owen's 1998 study, *"In the Mix": Struggle and Survival in a Women's Prison,* and Mary Bosworth's 1999 publication of her British research, *Engendering Resistance: Agency and Power in Women's Prisons.* Both works raise questions stimulated by Giallombardo's earlier work, and modify her conclusions. Finally, the continuing influence of Giallombardo's analysis of gender and kinship structures is further apparent in a 2003 article by Craig Forsyth and Rhonda Evans, "Reconsidering the Pseudo-Family/Gang Gender Distinction in Prison Research."

GILMORE, GARY (1940–1977)

Gary Gilmore was the first person in the United States to be executed after the U.S. Supreme Court's moratorium on capital punishment was established by *Furman v. Georgia* (1972) and then lifted in a series of cases highlighted by *Gregg v. Georgia* (1976). Partly as a result of this, and because of the publication of Norman Mailer's (1979) book *The Executioner's Song,* Gilmore attained status as a minor celebrity in the public eye.

THE CRIMES AND EXECUTION OF GARY GILMORE

Gilmore was in and out of correctional institutions for much of his life. He was released from a term of imprisonment in April 1976, and in July 1976 he committed two homicides on two consecutive days. The first victim was a gas station attendant in Orem, Utah, and the second was a hotel clerk in Provo, Utah. He shot both victims in the head after robbing them. Gilmore was subsequently arrested and charged. In October 1976, his case went to trial.

Gilmore's case differed from contemporary death penalty cases in two ways. First, the trial was very brief—the jury selection, guilt phase, and sentencing phase were concluded within three days. Second, Gilmore elected not to pursue appeals. He requested death by firing squad and did not mount legal challenges to his sentence. By modern standards, his execution by firing squad on January 17, 1977—only five months after sentencing—was exceptionally quick. Gilmore's execution made him

the first person to be put to death following the lifting of the Supreme Court's moratorium on capital punishment.

A 1984 study by Robert Jolly and Edward Sagarin notes that the first executions following the *Furman* decision, including Gilmore's, were marked by characteristics that made them suitable for capital punishment, thus lending legitimacy to the reestablishment of the death penalty. For instance, Gilmore's murders appeared to be particularly wanton since the victims were shot execution style during the course of a robbery. In addition, Gilmore's guilt was clearly established, and Gilmore himself essentially asked—some observers might say challenged—the state to execute him.

Gilmore was incarcerated in Utah's death row from the time of his sentence until his execution. During his stay in prison, he attempted suicide by drug overdose, but was unsuccessful. He also entered into a hunger strike to protest unsolicited appeals that were made on his behalf. Gilmore made it clear that he wanted his sentence to be carried out, enhancing public interest in his case.

On the night of January 16, 1977, the United States got ready for the first execution in the past 10 years; Utah prepared for its first state execution in 16 years; and Gary Gilmore spent his last night at Utah State Prison. Reports suggest that, the night before his execution, Gilmore received guests, gave a boxing demonstration, made phone calls, consumed alcohol smuggled into the prison, danced, and gave a final interview.

The execution was set for the morning of January 17, 1977. Earlier that morning, a stay of execution was averted, and the U.S. Supreme Court refused to delay his case further. The execution was conducted by firing squad in a makeshift chamber in the Utah State Prison, and the official time of death was noted as 8:07 A.M. Following his death, the unusual nature of the Gilmore case continued, as some of his organs were removed for transplant; currently, executed inmates are generally considered ineligible as organ donors, in part because of the damages caused by the methods of execution. After autopsy, Gilmore was cremated.

GILMORE'S CELEBRITY STATUS

Executions are often surrounded by publicity and media coverage. In the months leading up to and following Gilmore's execution, his case received considerable national publicity. Gilmore himself became a minor celebrity as the public developed a fascination with both his crimes and the man himself. This public interest was largely fueled by the fact that he would be the first post-*Furman* execution, and also because he wanted to be executed.

The public interest in Gilmore's cases was evidenced by the coverage in the mass media. For instance, *Playboy* conducted a fairly lengthy interview with Gilmore that was published shortly after his execution. Two books have since been published regarding Gilmore's life, crimes, trial, and execution. The first to appear, in 1979, was a lengthy treatment by Normal Mailer, titled *The Executioner's Song.* The second was written by Gilmore's brother, Mikal Gilmore. Published in 1994, it was titled *Shot in the Heart.* Both books were subsequently developed into films. In addition, prior to his execution, Gilmore entered into negotiations to sell his story and some of his letters.

CONCLUSION

Few death row inmates have attained the notoriety of Gary Gilmore. By virtue of being the first person executed in the post-*Furman* era, and due to his insistence that the sentence be carried out, Gilmore's case attracted considerable attention. As such, he holds a place in the history of American corrections and capital punishment.

GOOD TIME CREDIT

Good time credits, also sometimes referred to as gain time, or time off for good behavior, allow for the early release of inmates from incarceration. Credits are deducted from a person's original sentence to reduce time served, providing the reward of early release from incarceration. The use of good time credits serves three purposes: population control, discipline, and rehabilitation. The number of credits awarded to prisoners varies from state to state. Credits are reduced or taken away if inmates are found guilty of disciplinary infractions or violations of prison rules. One criticism of good time credits is that they have evolved into a standard practice and are automatically awarded to inmates as a lump sum at the beginning of the prison term, thereby reducing their rehabilitative incentive. The use of good time credits was originally a key part of the rehabilitation process. Today, however, following an increased turn to punitiveness, good time credit is under attack.

HISTORY

The development of good time credits can be traced to the early 19th century, when the first good time law in the United States was enacted in Auburn, New York, in 1817. Other countries provided similar opportunities for inmates to reduce sentence length. For example, the marks system developed by Alexander Maconochie in Norfolk Island, Australia, rewarded good conduct during incarceration through a reduction in sentence length. The Irish reward system developed by Sir Walter Crofton provided a graduated structure of early release in which inmates progressed through a series of stages to earn release from incarceration, known as a ticket of leave. Both strategies were precursors in the development of modern-day parole. The Canadian remission system was also similar to the concept of good time credits. By 1876, 29 states in the United States had enacted good time laws.

PURPOSE

Good time was developed to serve three distinct purposes: discipline, population control, and rehabilitation. Thus, good time laws in the United States were designed primarily to facilitate prison management and to resolve problems with overcrowding.

Prison administrators used good time credits as a management tool to control the behavior of prison inmates. Credits provided powerful motivation for good behavior and an effective means of control, since those who refused to follow the rules or who acted out faced the possibility of the loss of good time credits. Misconduct was punished through a loss of accrued credits, which lengthened the term of incarceration.

Good time credits reduced prison crowding by establishing a safety valve through which administrators could regulate the flow of inmates out of the prison system. They also provided a back-door solution to the problem of prison overcrowding by allowing the early release of inmates from incarceration. Additional credits were occasionally provided during period of extreme overcrowding to accelerate the release process. For example, Michigan responded to a period of prison overcrowding in 1981 and 1982 by rolling back minimum sentence lengths by 90 days to increase the number of inmates released on parole. The early release of inmates from incarceration also made space available for incoming offenders.

Good time was once considered to be an integral part of the rehabilitative process because it allowed punishment to be tailored to the needs of each offender. It provided an incentive to participate in a wide variety of prison programs, including educational and vocational classes. Similarly, good work habits and pro-social skills were rewarded with the hope that they would carry over into the community upon release from incarceration.

ADMINISTRATION

Four forms of good time credits exist: statutory or administrative, earned, meritorious, and emergency credits. Statutory good time is awarded automatically

to prison inmates in a lump sum at the beginning of the term of incarceration. The credits are revoked only for a serious violation of prison rules or policy. A system of earned credits provides rewards for positive behavior such as program participation, similar to the original concept of good time credits. Meritorious credits are awarded to inmates who demonstrate exemplary behavior, such as those who donate blood. Emergency credits are used as a response to prolonged periods of overcrowding, during which credits are granted to eligible inmates nearing release from incarceration.

The administration of good time credits is often controversial because it allows prison staff extensive discretionary powers. Decisions to award credits or penalize inmates for misconduct are highly subjective because they are not based on a standardized written policy. Also, there is some variation in how many credits prisoners can earn. Thus, usually inmates earn credits at different rates based on their classification status. For example, prisoners in a lower-level-security housing unit typically earn more credits than those in a high-security housing unit.

RELATIONSHIP TO PAROLE

Parole refers to the discretionary early release of an inmate following a period of incarceration. It was developed to relieve prison crowding while providing supervision of offenders. Indeterminate sentences established minimum and maximum periods of incarceration thereby allowing correctional officials to tailor punishment to the needs of individual offenders. In an indeterminate sentencing system, release from incarceration follows successful completion of treatment. Parole developed in conjunction with indeterminate sentencing to assist in the goal of offender rehabilitation. The offender is eligible for parole release after serving a minimum term minus good time credits.

Dissatisfaction with the concept of rehabilitation produced a shift in emphasis from indeterminate to determinate sentencing. Determinate sentencing was intended to reduce discretion in sentence length by providing a fixed period of incarceration. Under a system of determinate sentencing, inmates were required to serve the entire sentence length prior to release from incarceration. Good time served as the predominant form of release in a determinate sentencing system.

PRESENT STATUS

The Violent Crime Control and Law Enforcement Act of 1994 provided federal funding incentives to encourage individual states to pass Truth in Sentencing (TIS) legislation. Truth in Sentencing increased prison sentences for offenders convicted of violent crimes and reduced discrepancies between original sentence and time served. It required certain inmates to serve an 85% minimum of the original sentence length prior to parole eligibility. It therefore restricted the ability of incarcerated offenders to earn good time credits through participation in prison programs and good behavior. By 1999, 27 states and the District of Columbia met the 85% requirement to qualify for funding through federal TIS grants. Little is known about how recent policies designed to "get tough on crime" such as truth in sentencing will influence rates of misconduct in prison populations and participation in prison programs.

CONCLUSION

Good time credits provide prison administrators with the ability to influence the size of the prison population by reducing time served. For this reason, they continue as one solution to the problem of prison overcrowding despite controversy over the extent of prison officials' discretion in their use and despite the passage of legislation intended to increase time served.

GOTTI, JOHN (1940–2002)

John Joseph Gotti was born on October 27, 1940 to John J. Sr. and Fannie Gotti, the fifth of 11 children. By age 12, he was already involved with people thought to be involved with organized crime known as "wiseguys." Gotti formally left school at age 16 to join the Fulton-Rockaway Boys, where he quickly rose to a leadership position. While a member of the Fulton-Rockaway Boys, Gotti was arrested five times between 1957 and 1961. Each time the charges were dismissed or reduced to a probationary sentence.

Gotti was one of the first individuals prosecuted under the Racketeer Influenced and Corrupt Organizations (RICO) statute for a variety of crimes centering on a criminal organization (in this case La Cosa Nostra). To secure his conviction, the prosecution relied on protected witnesses. Ultimately, Gotti was sentenced to one of America's most notorious maximum-security federal prisons, where he eventually died.

EARLY INCARCERATION

Gotti's first incarceration came in 1963, when he and Salvatore Ruggiero were arrested in an automobile that had been reported stolen. He spent 20 days in jail for this offense. Throughout the rest of the early 1960s, Gotti took part in small-scale criminal behavior such as larceny, unlawful entry, and possession of bookmaking records. Then in 1966 he spent several months in jail for attempted theft.

Once released from jail in 1966, John Gotti became an associate of an organized crime group headed by Carmine and Daniel Fatico. The group operated out of the Bergin Hunt and Fish Club in Ozone Park, Queens, New York. The Fatico group was a part of the Gambino organized crime family. At this point, Gotti began to hijack trucks coming from the John F. Kennedy International Airport until he was arrested by the FBI on November 27, 1967, with Gene and Angelo Ruggiero. He was then convicted of several hijackings and was sentenced to four years at Lewisburg Federal Penitentiary in Pennsylvania. He was released in January 1972.

When Carmine, the Fatico group leader was indicted, Gotti was appointed as acting capo (captain, or leader) of the group. He assumed control of the Fatico group in May 1972. Soon after his rise to power in the Fatico group, the Gambino family underboss (the secondary leadership position) Aniello Dellacroce was also imprisoned, and Gotti began to interact directly with Carlo Gambino, the family boss.

THE GAMBINO CRIME FAMILY

Gotti's relationship with Carlo Gambino was strengthened when he helped arrange the killing of Jimmy McBratney in 1973. McBratney allegedly was involved with the kidnapping and murder of Carlo Gambino's nephew Manny. While the details of the kidnapping are still debated, Gotti's was eventually indicted for McBratney's murder. Gotti pleaded guilty to attempted murder and was sentenced to four years' imprisonment. He spent less than two years at Green Haven Correctional Facility, 80 miles north of Queens, and was released on July 28, 1977. Shortly afterward, he was made a full member of the organized crime group.

While Gotti was imprisoned, the leadership of his "family" changed. Carlo Gambino died, and his nephew, Paul Castellano, was appointed as boss. However, underboss Aniello Dellacroce was next in line for the position. Two factions arose in the organization; Gotti sided with Dellacroce, while Paul Castellano maintained control over the organization.

Through the late 1970s and into the 1980s, Gotti built his "crew" (a fairly stable group that takes part in crimes together) into a strong organization. At the same time, the FBI was accumulating substantial resources in its battle against organized crime. Confidential informants, covert listening devices, and regular surveillance became more frequent.

In 1985, Gotti's crew began to plan the demise of their boss, Paul Castellano. A perceived slight occurred when Aniello Dellacroce died and Castellano refused to attend the funeral. Later Castellano stated he was going to split up Gotti's crew. Instead, Castellano was executed on December 16, 1985, in front of Spark's Steak House in downtown Manhattan, placing John Gotti at the helm of the Gambino family.

Initially known as the "Dapper Don" for his attire, Gotti soon acquired the new nickname of "Teflon Don" when he was acquitted two times. Finally, in 1992, with the help of Sammy "The Bull" Gravano as a government witness, Gotti was convicted on RICO charges.

THE RACKETEER INFLUENCED AND CORRUPT ORGANIZATIONS (RICO) STATUTE

Prosecuting individuals who are involved with a criminal organization (La Cosa Nostra, outlaw motorcycle groups, etc.) is difficult due to the secrecy surrounding such organizations. Historically, the resulting convictions have been for singular crimes such as hijacking one truck, the murder of one person, or the extortion of one business. RICO, however, enables prosecutors a legal means to connect these various crimes to show that each criminal event is tied to the maintenance and growth of a criminal organization. For example, the hijacking of a truck was done to obtain goods to sell at a profit for the group, the murder may have been committed to silence a witness to the hijacking thereby protecting the criminal group, and extortion may have been used to force a storeowner to sell the stolen goods. In all, the three crimes were performed due to association with a corrupt organization. Recently, RICO has been used to prosecute white-collar criminals as well as the traditional organized crime groups.

CONCLUSION

Gotti was sentenced to life in federal prison. He spent most of his term at the maximum-security facility in Marion, Illinois. Due to the confinement strategy of the administrators at the Marion Facility, Gotti's time in prison was largely uneventful. There were several reports of Gotti being assaulted by other inmates and receiving minor wounds. In the late 1990s, he was diagnosed with throat cancer. During that time, he was scheduled to be sent to the new state-of-the-art maximum-security facility in Florence, Colorado. On September 13, 2000, he was moved to the federal prison hospital in Springfield, Missouri, for treatment. John Gotti died on June 10, 2002, at the age of 61 from complications of head and throat cancer.

GOVERNANCE

Governance refers to the methods by which correctional facilities are administered. It usually includes the means by which a social and organizational hierarchy is created, how roles in that organization are formalized, and the manner in which order is maintained within the institutional social system. How prisons are run determines individuals' experiences of incarceration.

BACKGROUND

Two alternative models of prison governance gained prominence in the latter half of the 20th century both of which continue to influence how prisons are run today. The first of these approaches is known as the *control model* and is characterized by a rigid and routinized model of administration that is hierarchical in nature and emphasizes obedience, work, and education. The roots of the control model can be traced to the first penitentiaries in the Pennsylvania system. These institutions controlled prisoners and sought to reform them through regimes of silence and labor. John DiIulio is the contemporary scholar whose work is most often associated with this model of prison governance.

In contrast, the *participatory model,* advocated by scholars such as Hans Toch and John Irwin, stresses a system of inmate democracy. For its supporters, prisons are run best when they use prisoner input to shape their policy and programs. In this system, prisoners may be permitted a voice in the day-to-day operations through representatives on administrative committees. There is also usually a formalized protocol through which prisoner grievances can be heard. According to its supporters, this strategy helps maintain prison order, because all members are invested in it. It also prepares inmates more effectively for their eventual discharge by permitting them to engage in decision making that trains them for the challenges they will face upon release from prison.

CONTROL MODEL

Supporters of the control model believe that deviance occurs because of a lack of discipline and responsibility. As a result, only a social environment of absolute control can teach inmates acceptable patterns of behavior.

The control model is bureaucratic in the classic Weberian sense of the term. According to Max Weber, for a rational bureaucracy to work, there must be prescribed roles that each individual plays, and transactions between different members of the organization must be regulated. This will create stability, thereby reducing conflict between different members of the prison organization (namely, administration and staff) as well as staff and inmates. A clearly defined set of rules and principles that govern everyone's role, and the means by which they can interact reduces the uncertainty that often leads to conflict in prison. Any deviation from the control model, through inmate participation, for example, threatens the balance created by a bureaucratic model and could potentially lead to the emergence of violence, "con bosses," and gang conflict.

Prisons run according to the control model function like paramilitary organizations, with respect and obedience enforced relentlessly through a rigid system of discipline. The assumption is that obedience, work, and education, administered in a supervisory environment of zero tolerance, is the only way to bring about reform in the behavior of the inmates. To make this system work, everyone in the prison must know that the guards are in control.

The Beto Control Model in Texas

The control model of prison governance is best exemplified by the Texas prison system of the 1960s, implemented by Dr. George Beto beginning in 1962 and recounted by John DiIulio in his work *Governing Prisons.* Beto's ideas of prisoner governance were designed in reaction to the barbaric conditions that then existed in many Texas penal institutions. He modeled his administration after that of Joseph Ragen in Illinois's Stateville Prison; an authoritarian regime in which top-down control was employed with the ultimate goal of safety and order. Labor from sunup to sundown was combined with corporal punishment to create a prison system in which many individuals did not survive the length of their term either due to sickness or punishment. Although there are many who have criticized Beto's control model, during his 10-year reign there were only 17 homicides in the prison. This figure contrasts strikingly to the particularly brutal period that preceded Beto in which labor, violence, and disease meant that a sentence to a Texas prison would often amount to capital punishment.

Under Beto's system, officers relied on what were known as "building tenders," which were a modern manifestation of the old "con boss," or inmates who acted as proxies for the guards. These men were

empowered to enforce rules both formally and informally. Usually, they enforced most of the petty rule violations themselves and only involved the officers for larger violations. They also acted as a conduit of information to the administration so that they would be able to maintain a system of tight supervision. They were permitted a great degree of discretion, deciding what to report and enforce, on whom to inform, and which officers with whom they were willing to develop a relationship. Most of the guards were from rural areas, and the racial conflict that emerged between the white guards and the black inmates made for a particularly incendiary situation. Moreover, the inmates often enforced rules along racial lines, and minority inmates bore the brunt of an arbitrary and vicious execution of discipline. In Beto's control system, order and compliance was maintained by strict adherence to the authority of the correctional officers, but the ultimate enforcers were the building tenders.

As the prison population continued to grow, Texas was forced to rely more and more on building tenders and reward them with greater freedom and privileges. In the now landmark case *of Ruiz v. Estelle* (1980), the U.S. District Court in Texas intervened and specified a number of areas of prison administration that must be changed to bring the correctional system inline within constitutional guidelines. These included a mandated reduction in the ratio of officers to inmates, steps to be taken to address overcrowding, increased access of inmates to legal representation, the introduction of a more effective classification system, and an end to the use of building tenders. This effectively brought about the demise of the Texas control model.

PARTICIPATORY MODEL

The participatory model is based on a system of classification in which inmates' behavior governs the amount of autonomy they are given. The goal of this model is to match individuals with a level of supervision that is appropriate to their classification. Those who have proven records of behavior can earn more autonomy over their actions, while others who are unwilling to abide by prison rules will face increased restrictions. As such, most models of inmate participation are limited to minimum- and medium-security institutions. Rigid rule enforcement is to be avoided, unless demanded by the situation. This approach is rooted in the work of Cesare Beccaria and Jeremy Bentham, who suggested that punishment must be devised to inflict the least amount of discomfort to the offender while still ensuring that the requisite amount of punishment is delivered.

Proponents of the idea of prisoner participation believe that symbolism of rank should be suppressed so as not to create a perception of subordination by the inmates. In other words, there should not be a system of dress that can be used to identify rank or status within the prison. Inmates should also be free to socialize with one another and form groups to interact with others of a like mind. At its heart, the responsibility model believes that inmates should be subjected to the bare minimum of supervision needed to maintain order in prison.

The responsibility, or participatory, model differs from the control model at the very core of the purpose of prison. Prisoners have rights, and the role of the prison administrator is not to punish, but to supervise and "serve" the inmate. The prison environment is where the inmate lives 24 hours a day; therefore, prisoners should be permitted to play an active role in shaping how it is governed. The participatory model maintains that inmate compliance may be achieved much more efficiently by running a system in which they have input and do not feel powerless to control their own destiny. Subjecting prisoners to constant supervision teaches them only to second guess themselves at every point and does not permit them to adopt an approach that will help them adapt to the outside world after their release. Inmate participation in prison is an effective way to introduce and teach democracy and rights of citizenship to individuals, many of whom have had little interaction with these concepts in the past.

Michigan, California, and Arkansas

The most famous example of a participatory model is the Michigan responsibility model that

was founded by Director of Corrections Perry M. Johnson. This model allows inmates to maintain a certain degree of responsibility over their own environment and encourages interaction between staff and inmates to be governed by informal principles rather than by hard-and-fast rules. A classification system was used to ensure that each inmate was placed in an environment that was as minimally restrictive as possible while still maintaining safety, the belief being that an overreliance on security and force would prohibit inmates from learning to practice autonomy over their lives through effective decision making. The central theme in Michigan was that prison should be used as a tool of rehabilitation, and this can be accomplished most effectively by giving inmates the most freedom possible to self-govern, thereby instilling within them responsibility that will remain once they return to society.

The California consensual model is another participatory model of prison governance that emphasizes inmate responsibility and autonomy, although without any focused strategy such as in Michigan. In the California system, prisoner input shapes policy decisions and staff are intended to play a supervisory role, rather than a controlling role as in Texas. DiIulio notes that although California's system of governance lacks an identifiable approach in the same fashion as Texas or Michigan, the central theme is that administration of the prison relies upon the "consent of the governed." Much like Michigan, the California approach chooses to handle prisoners in a more informal manner, ultimately seeking to maintain order within the prison by keeping the peace between major prison gangs that hold significant influence within the prison social system.

In addition to the Michigan and California experiences, Thomas Murton, warden of Cummins Prison in Arkansas, achieved significant success in reforming a racist and violent prison system through inmate democratization. By permitting inmates to participate in the classification process of fellow prisoners, the violence rate within the prison decreased dramatically. After instituting this system, Murton was able to take steps to reintegrate the prison racially as well as implement a number of progressive programs that had been neglected in the past due to the violent nature of the facility. In a short while, Murton transformed an unstable Arkansas facility defined by administrative control through racism, violence, and torture into a participatory institution that had few instances of violence, all the while allowing significant inmate involvement.

Eventually however, democratic approaches such as those implemented at Arkansas run into difficulties, because prison staff tend to feel that they allow inmates "to run the prison." The model was designed to create a system of supervised self-governance by the inmates, but correctional officers perceived it as the administration favoring the rights of the prisoners over the need for them to do their job (i.e., keep the peace). Prisoners also felt that this model gave them power within the administration; therefore, they could be selective in how obedient they were to the demands of correctional officers. In the same way that the building tender system led to the emergence of a brutal hierarchy, the responsibility model also resulted in a hierarchy in which certain privileged inmates were able to exert a great deal of influence over their social environment.

COMPARISON

At the heart of these two models is a tension that strikes at the core of incarceration: What is the purpose of holding people in prison? Is it incapacitation and punishment (control model) or rehabilitation (participatory model)? In the control model, the emphasis is on discipline as a means to keep order within the institution. Supporters of this approach claim that rehabilitation and reform are impossible goals unless the social system within which these inmates exist is kept in order and a hierarchy is enforced. In the wake of federal court intervention in a number of states, in which authoritarian models of control were outlawed or curtailed, many systems witnessed social disruption and violence. This has been referred to by many as the "paradox of reform"; court intervention was supposed to produce a safer atmosphere for prisoners, but the lack of a strategy to replace the control model left a power void that was often filled by

prisoner gangs. Moreover, many correctional officers felt demoralized by the reforms and were unable to keep order within the prisons. Proponents of the control model point to this violence as evidence that the control model was the only successful approach, while critics maintain that it was the lack of an effective replacement strategy that caused this unrest in the 1970s and 1980s.

In contrast, those who advocate the participatory model suggest that a system of total control may keep order but neglects to provide for the rehabilitation of the prisoner. By refusing to consider the opinions and visions of inmates, institutions eventually release women and men who are ill-prepared to reenter a society that requires people to be autonomous and participatory in defining the direction of their lives. By rendering inmates decidedly impotent, they also neglect to create a stake for them in the direction of the prison, and instead may cause animosity that makes order more difficult to attain. Proponents of the participatory model point to the disruption in the wake of court reform as an example of the inequality and poor administrative techniques of the control model. They assert that if the only way to keep order is with constant supervision and threats of punishment, then we have failed in our duty to rehabilitate and those people being released are ill-prepared to reenter society.

CONCLUSION

The best way to govern prisons is a point of contention among prison administrators and criminologists. To what extent should inmates participate in any decision-making processes in penal facilities? How much discretion should officers have when doing their job? While answers to these questions remain unclear, what is obvious is that how prisons are run shapes people's experiences of incarceration. More problematic, governance may also influence what happens to inmates after release. As of December 2003, more than 2.1 million Americans are being held in U.S. prisons and jails, and research suggests that over half of them will recidivate within three years of their release from prison. Such figures indicate that no matter which models of governance are currently being used, they are failing to provide an environment in which successful long-term change can be sought and achieved.

GROUP HOMES

Group homes are nonsecure residential facilities used to house juvenile and adult offenders convicted of a criminal offense, as well as those younger individuals who are facing adjudication in a juvenile court or conviction in an adult court. Group homes are considered to be nonrestrictive, intermediate-level alternatives to secure confinement. Although their programs may vary, their underlying philosophies are similar. The primary purpose of these homes is to provide residents with rehabilitative services such as education, counseling, job training, and social skills while maintaining a level of interaction with the community.

Facilities designed to provide nonsecure community-based confinement for adult offenders are usually referred to as halfway houses. Group

homes are typically community-based treatment facilities designed for juvenile offenders. These facilities have become an increasingly common alternative to secure confinement in the juvenile corrections system. In fact, during 1998 alone, of the 634,000 juveniles adjudicated delinquent, 26% were ordered to an out-of-home placement, which includes detention centers, residential facilities, group homes, and foster homes. An estimated 3,000 of those juveniles were placed at a group or foster home (Champion, 2001; Puzzachera, 2002). Group homes may be private or public institutions. Because they rely heavily on the interaction of their residents with the community, group homes are usually community based whatever their administrative orientation.

NONSECURE CONFINEMENT

Group homes provide nonsecure alternatives to incarceration. There is limited direct supervision within the houses, and residents are free to move around them as well as to participate in a variety of activities in the community. Although the residents enjoy a significant amount of liberty, group homes are not without structure. There are numerous rules governing the conduct of the residents that must be obeyed. Typically, such rules entail respect for staff and other residents, a curfew, and active participation in a variety of rehabilitative programs, such as school, work, and counseling. Residents are also frequently required to submit to random urine tests for detection of alcohol and drug use, while staff members constantly monitor their general behavior.

Judges usually place juveniles in group homes for a designated period of time. During their time at the facilities, these juveniles remain under the dispositional control of the judge and program staff are routinely required to report the progress of the juveniles to the judge. The length of time that the juvenile must remain in the home can be extended if he or she is shown not to progress.

It should be noted that group homes are only one form of nonsecure confinement options available for juvenile offenders. Several other nonsecure facilities, such as foster homes, camps, ranches, halfway houses, farms, boarding schools, wilderness programs, and independent living programs, also exist.

KEY COMPONENTS OF GROUP HOMES

The central component of many group homes is their attempt to replicate a noninstitutional, home-based atmosphere. Generally, group homes are characterized by a family-based setting. They use counselors who serve as model parents for the residents on a daily basis. In an effort to maintain the family atmosphere, juveniles are usually housed in groups ranging in size from 10 to 15.

Most group homes are designed to rehabilitate juvenile offenders. Residents are thus provided services such as counseling, education, and vocational training, as well as problem solving and social skills training. Juveniles are expected to participate in some type of educational program. They are usually required to pursue a traditional diploma, general equivalency diploma (GED), or some type of vocational training. Unlike secure confinement alternatives, residents of group homes receive their education at schools or programs within the community. They may be enrolled in individual or specific therapy, such as substance abuse treatment or anger management, and they are usually required to participate in group counseling with their peers and program staff. Most group counseling activities are designed to elicit positive peer influence on behaviors, as well as to teach problem-solving skills. Finally, juveniles are usually required to participate in some form of community activity either in the form of interaction with other residents within the group home itself or in more structured events within the community, such as recreational or creative programs.

PROBLEMS

Group homes are not without problems. First, many have staff who are not properly trained to provide quality care. In many instances, community volunteers are used to aid in the delivery of services to the residents. Second, group homes are not currently subjected to a unified, governing set of rules and regulations, such as those that govern

secure confinement facilities. In many jurisdictions, these facilities operate without oversight by government agencies. Finally, not all juveniles are amenable to treatment in the group home setting. Therefore, it is important that juveniles undergo appropriate screening processes before being placed in a group home setting.

The reasoning behind placing juveniles in group homes has also been the subject of some scrutiny. Young women are more typically incarcerated in these homes for status offenses than are males. African American males have also been found to be more disproportionately incarcerated in these institutions than their white counterparts for minor offenses.

CONCLUSION

Group homes are nonsecure confinement options generally used for juvenile offenders. They provide a less restrictive alternative to confinement for treatment purposes. Group home are used frequently as an out-of-home placement for children, particularly young women and African American young men.

GROUP THERAPY

Group therapy is one of a number of methods used in prison settings to help inmates deal with their mental health problems and addictions. In group therapy, there is the leader and more than one client/member. The size of a group may be larger, to include one or two therapists (co-therapists) and many members. Research suggests that the most efficient size for group therapy is 6 to 10 members and the leader(s), though larger groups do form for various reasons.

DEFINITION

Various types of group therapy exist, including group guidance, growth group, group counseling, and group psychotherapy. Though these terms are sometimes used interchangeably, each method differs in structure and focus and in the qualifications and credentials vary of the group leader. Thus, in group counseling, the leader may be a layperson, a paraprofessional, or a credentialed professional who has been certified or licensed by a state or national program.

Programs based on group guidance typically have a large number of participants. In such groups, the leader functions more as an instructor or facilitator than as someone giving direct, specialized care. These groups usually offer educational and skill development as in the drug education programs available in all U.S. federal prisons. Growth groups, on the other hand, are intended to provide a setting for the participants to become more functional individuals, once again with the leader functioning as instructor, guide, or facilitator.

Group counseling and group psychotherapy are more clinical in orientation. These strategies are often used in therapeutic communities. Group counseling focuses on normal persons with common problems, whereas psychotherapy focuses on dysfunctional persons with disorders. As with individual counseling and psychotherapy, group counseling and psychotherapy can be viewed on a continuum. In practice, they may be blended and move from one orientation to the other as the group members' needs arise.

JUSTICE APPLICATIONS

Several types of group counseling and therapy are employed in the adult and juvenile justice system. Depending on the charges and contributing factors, an adjudged or adjudicated individual may be required to attend various types or multiples of groups. Three of the more popular types of groups that are commonly incorporated into sentencing and plea bargains are 12-step programs, that is, Alcoholics Anonymous, Cocaine Anonymous, or Narcotics Anonymous substance and drug abuse, anger management, and sex offender counseling or therapy programs. With the exception of the 12-step type programs run by laypeople, the other forms of groups are clinical in orientation and thus led by credentialed professionals.

These groups provide cost-effective and efficient service distribution since they usually employ only one leader for many participants. They strive to address the dysfunctions of individuals, while providing opportunities to explore different types of relating with other persons and to learn more effective social skills. Also, they offer opportunities for participants to discuss their perceptions of life situations and experiences and to receive feedback on how others interpret and cope with them. Finally, groups such as these enable their members to experiment with alternative behaviors.

CHALLENGES OF REHABILITATION

The challenges of rehabilitation in correctional confinement are complex because the population of the incarcerated present the therapeutic professionals multiple and diverse pathologies with many qualifying for dual or multiple diagnoses. These pathologies extend beyond the antisocial issues that led to incarceration in the first place. Research indicates that a large proportion of inmates present suffer from significant mental health issues including past abuse victimizations, substance abuses, and learning difficulties, not to mention adjustment issues associated with their confinement. In addition, there are the developmental issues of juvenile offenders, the different socialization of genders, and the belief systems of multiple cultures of the inmates. Perhaps most problematic, though group therapy usually attempts to provide a supportive environment for voluntary members, in correctional institutions groups are used to reform and socialize its members, who may be mandated to attend by the courts or by prison personnel. Finally, the therapeutic professionals are confronted with the additional difficulties of providing services in an environment that may either not understand or be unsupportive of the process of therapy itself.

EFFECTIVENESS OF GROUP THERAPY

The effectiveness of group therapy for adjudged or adjudicated individuals appears to vary. As with other forms of clinical treatments, various studies of "what works" have considered this category of treatment with mixed results. Cognitive-behavioral approaches, which attempt to modify the cognitive processing and the development of psychosocial skills of the individual, have often been shown to be the most successful. This strategy can be readily applied through therapeutic groups.

Some of the differences in the results of the various studies of effectiveness lie in the lack of controls of the consistency of services provided by various methods. Identifying and matching participants with appropriate treatments and the failure of the participants to commit to the effort by either dropping out or a lack of committed effort may decrease the success of treatment. Finally, as with all therapeutic relationships there are concerns with trust and confidentiality, in group therapy this is not only with the leader but also over the other members of the group. These are especially so for the incarcerated, even more than in individual therapy, because of the inmate code that exists in all prisons. This includes how prisoners are required to interact with staff and with other prisoners.

CONCLUSION

Even with strong social support for a more "get tough" approach to punishment, there remains a consistent belief by society that offenders should be rehabilitated before they are released back to the community. Group therapy is just one example of a strategy used in contemporary U.S. penal facilities

to help reduce reoffending rates. Though it cannot totally eliminate recidivism, studies suggest such counseling may reduce it. Offering therapy in a group setting helps individuals to realize that their issues and problems are not unique and that they are, therefore, not alone. Though counseling of this nature may not be appropriate for everyone, when it is done well, following a rigorous needs assessment, it provides a cost-effective and practical means of addressing common problems and behaviors in the inmate community.

GYNECOLOGY

Virtually every U.S. jurisdiction provides gynecological and obstetrical services to its female inmates. Under normal circumstances, the practitioner providing these services would be a gynecologist who had completed specialized residency training in the study and treatment of the diseases of the female reproductive system, including the breasts. Generally, this training also includes obstetrics (the care of the pregnant woman) and integrates the medical and surgical care of women's health throughout their life span. The study of obstetrics and gynecology includes the physiologic, social, cultural, environmental, and genetic factors that influence disease in women. Individual obstetrician-gynecologists may choose a wide scope of practice, to include the care of pregnant women and surgical procedures on the reproductive organs, or a more focused practice that limits care to ambulatory (office-based) services. In some cases, other medical practitioners, including nurse practitioners, nurse midwives, physician assistants, and physicians from other specialties such as family medicine or internal medicine, may provide gynecologic or obstetrical services. In prison, the credentials of the health practitioners providing these services to women are uncertain.

Three national organizations accredit correctional health care facilities: the National Commission on Correctional Health Care (NCCHC), the American Correctional Association (ACA), and the Joint Commission on Accreditation of Healthcare Organizations (JCAHO). Accreditation by NCCHC, ACA, or JCAHO is not mandatory in order for an institution to provide medical services to inmates. As one part of the accreditation process conducted by these national organizations, periodic site visits and reviews of inmate health care records are conducted to determine the quality of care provided. However, at these site visits, the use of gynecologic health care parameters, such as the percentage of inmates who have had Pap smears performed, are not routinely used in the review process. As a result, women's health issues are often marginalized in policy decisions.

WOMEN IN PRISON AND THEIR HEALTH PROBLEMS

Over the past 20 years, there has been a greater than fivefold increase in the number of women incarcerated in the United States, with the preponderance in state facilities. A number of health profession organizations and human rights groups have been calling attention to the inadequate health

care provided in our prisons and jails. The ratio of incarcerated, HIV-infected women to men is 3:1, in large part a result of their intravenous drug use, sexual abuse, prostitution, and sexual encounters with men of high-risk behavior profiles. For many of the same reasons the female inmate population is high risk for HIV infection, they are also high risk for other sexually transmitted diseases and gynecologic complications, such as cervical cancer.

LAWSUITS

One way in which women have successfully lobbied for an improvement in the quality of obstetric and gynecologic health care within the correctional setting has been through the use of class action lawsuits. At the forefront of this effort is attorney Ellen Berry, who has worked on behalf of women prisoners for 24 years in the California state and federal prisons and several large California county jails. In 1985, Berry filed *Harris v. McCarthy,* on behalf of pregnant women prisoners at the California Institution for Women in response to a range of serious allegations concerning pregnancy care, including a very high rate of miscarriage and fetal demise, birth complications, and untreated medical emergencies. At that time, there was no obstetrician-gynecologist to serve the 1,500 inmates. The settlement agreement in this case required the hiring of an obstetrician-gynecologist and the creation of a Pregnancy Related Health Care Team of an obstetrician-gynecologist, nurse practitioner, registered nurse, and social worker to evaluate and handle each pregnancy case based on the then current American College of Obstetricians and Gynecologists (ACOG) standards. Subsequent cases, including *Jones v. Dyer* (1986) on behalf of pregnant women in the Alameda County Jail and *Yeager v. Smith* (1987) on behalf of pregnant and postpartum women at the Kern County Jail, were successfully settled, again relying on ACOG guidelines of care.

CONCLUSION

Although class action lawsuits may be instrumental in addressing some deficiencies in the obstetric and gynecologic health care of inmates, more sweeping reform is needed. ACOG guidelines for women's health care that have been adapted to the unique setting of correctional institutions are needed. The use of female-specific health care parameters in the accreditation review process of correctional facilities would improve the standards of care. The accreditation process must also begin assessing the female inmate's access to care and quality of gender-specific, gynecologic care.

H

HABEAS CORPUS

Habeas corpus is a Latin term that means literally "you have the body." It refers to a judge-issued writ requiring the government to bring a prisoner to court for the court to consider whether the detainee's imprisonment is legal. It is also known as the Great Writ of Liberty because it is designed to prevent unlawful imprisonment.

Habeas corpus concerns due process—whether an inmate's constitutional or statutory rights have been violated. It is most commonly used when a state prisoner appeals his or her conviction to a federal court on the grounds that his or her constitutional rights were violated. Typically, only those who are incarcerated may file habeas corpus petitions. However, a person may file a petition if a court has threatened to jail him or her for contempt of court. In family law, a parent denied custody of his or her child by a trial court may also file a habeas corpus petition. Finally, many inmates on death row file habeas requests, although recently, their capacity to do so has been restricted.

HISTORY

Habeas corpus is mentioned as early as the 14th-century in England, and was formally articulated in the Habeas Corpus Act of 1679. It was considered important enough to be mentioned in the U.S. Constitution and the failure to issue it was one of the American colonists' grievances leading up to the American Revolution: "The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it" (Article 1, Section 9). It is one of the few individual rights guaranteed by the original Constitution.

During the Warren Court years (1953–1969), the U.S. Supreme Court expanded the use of the federal role and that of habeas corpus. It did so on the grounds that the Constitution called for the uniform protection of essential liberties, including the rights of criminal defendants. This trend reached its zenith in *Fay v. Noia* (1963) where the Court found that liberal access to federal review constituted a fundamental right. Since the 1970s, however, the Court has chipped away at that position, beginning under the stewardship of Justice Warren Burger (1969–1986). Arguing that federal review produced administrative inefficiencies and resource expenditures, the Burger Court in *Wainwright v. Sykes* (1977) introduced a cost-benefit analysis where the benefits to the individual should be weighed against the costs to the states for multiple appeals to the federal level. Many other changes to habeas corpus have occurred since Justices Sandra Day O'Connor, Antonin Scalia, and Anthony Kennedy joined the Court in the 1980s. The

Rehnquist Court's conservative majority has sharply limited the use of the writ, especially by death row inmates.

HABEAS CORPUS IN TIMES OF POLITICAL TURMOIL

Well before the present era, people's rights to habeas corpus were routinely restricted during times of political turmoil. President Abraham Lincoln suspended habeas corpus during the Civil War in parts of the Midwest to clamp down on members of the Union who supported the Confederate cause, the so-called Copperheads. Congress supported Lincoln's decision, but Supreme Court Justice Roger Taney objected. Lincoln ignored Justice Taney. In *Ex parte Milligan* (1866), the Supreme Court ruled that Lincoln's suspension of habeas corpus was unconstitutional since civilian courts were still functioning and habeas corpus could be suspended only if these courts had been forced to close. Notably, this decision came after the Civil War was already over.

Historically, the Supreme Court has deferred to the executive and legislative branches during times of turmoil, and only after the crisis has faded has it acknowledged the constitutional violations that occurred. During World War I, for example, the Supreme Court upheld the incarceration of those who vocally opposed the war. It was only after the war that the court ruled that people could not be jailed for speaking out against war. Likewise, during World War II, in *Korematsu v. the United States* (1944), the Supreme Court upheld the internment of Japanese Americans. This case was revisited in 1984 by a federal district court that vacated Korematsu's conviction. The court decided this case on the basis of evidence showing that the government had misled the courts on the necessity to intern Japanese Americans. In particular, an attorney, Peter Densho, discovered a memo from a U.S. Department of Justice lawyer named Edward Ennis, written to the U.S. solicitor general Charles Fahey, who was preparing to argue the Korematsu case before the Supreme Court in 1944. In it Ennis said, "We are in possession of information that shows that the War Department's report on the [necessity for the] internment is a lie. And we have an ethical obligation not to tell a lie to the Supreme Court, and we must decide whether to correct that record" (584 F. Supp. 1406 N.D. Cal). In spite of this document, Solicitor General Fahey did not correct the record in his appearance before the Supreme Court. Even though Korematsu's criminal conviction was nullified in 1984, the Supreme Court's 1944 decision in *Korematsu v. the United States* persists as a legal and historical precedent.

During the Cold War (1947–1991), the court generally refrained from intervening in cases where habeas corpus rights were abridged. On the few occasions when the Court did intervene, it sustained government actions. Only after the McCarthy era was waning did the court state that the right of free association made further prosecution for Communist Party membership infeasible.

Most recently, the passage of the USA PATRIOT Act (2001) has allowed for the indefinite detention of persons certified by law enforcement as national security threats. In other words, probable cause, guaranteed by the Fourth Amendment, does not need to be demonstrated to the courts. This feature, along with other provisions of the act, has sparked considerable debate and opposition since habeas corpus has effectively been nullified under such circumstances. Since the September 11, 2001, terrorist attacks on the United States, more than 100 prisoners captured in Afghanistan have been held at the U.S. military base in Guantánamo Bay, Cuba, classified as "illegal combatants" rather than as prisoners of war. By such classification, the U.S. government has avoided granting habeas corpus rights to these prisoners, effectively holding them incommunicado. This action has sparked international protest.

HABEAS CORPUS APPEALS BY DEATH ROW INMATES

Much of the concern about habeas corpus rights revolves today around death row appeals, with conservatives decrying delays in executions and civil libertarians alarmed at the drastically diminished role for habeas corpus appeals in recent years.

Justice Sandra Day O'Connor, writing for the majority, argued in *Coleman v. Thompson* (1991) that the key costs of multiple habeas corpus appeals were a loss of respect for the states. This effectively moved the debate away from balancing state interests (*Wainwright v. Sykes*) to actually *deferring* to the states, and away from a cost-benefit analysis to asserting a more abstract cost of comity. From one perspective, differences over federalism—what the proper relationship between the federal and state governments should be, with the "new federalists" arguing for a larger state role and diminished federal role—underlie the shifting Court's positions historically over habeas corpus rights.

In *McCleskey v. Zant* (1991), the Court limited death row inmate appeals to one round of federal habeas corpus review. Warren McCleskey was a Georgia death row inmate who has since been executed. He brought his second habeas corpus appeal on the grounds that he had discovered that the government had illegally planted an informant in an adjoining cell to obtain incriminating statements from him. The government had for years denied that this inmate was a plant. The Supreme Court denied McCleskey's appeal on the grounds that a "reasonable and diligent investigation" by McCleskey, in spite of the government's repeated denials, would *somehow* have allowed him to find out that the inmate had been a plant and that he could then have raised this issue at the state level.

In *Herrera v. Collins* (1993), Lionel Torres Herrera, another death row inmate, filed a habeas corpus petition on the grounds that new evidence had come to light demonstrating that he was innocent. The Supreme Court majority declined to remand the case for further proceedings on the grounds that there were no due process errors in his conviction. The Court thus found, in effect, that actual innocence is *not* a basis for a federal habeas claim. Justice Harry Blackmun, in his dissent, stated: "Nothing could be contrary to contemporary standards of decency . . . or more shocking to the conscience . . . than to execute a person who is actually innocent."

Finally, in *Schlup v. Delo* (1995), the Supreme Court held that a claim of actual innocence "would have to fail unless the federal habeas court is itself convinced that . . . new facts unquestionably establish Schlup's innocence." In other words, preponderance of evidence (let alone reasonable doubt) would not be enough. The Rehnquist Court has argued that its rulings will not produce unacceptable results because (1) if an inmate cannot demonstrate a constitutional violation at state trial, he has received a "full and fair trial" (Rehnquist's words); (2) lower state and federal courts will vet injustices in posttrial reviews; and (3) executive clemency is available to those who demonstrate their innocence. Critics point out that proving a constitutional violation and being accorded a full and fair trial are not equivalent, that state and federal courts will not necessarily spot or act on injustices, that most governors are reluctant to commute death sentences in the current political climate, and that some innocent defendants have not been granted executive clemency.

CONCLUSION

Despite its historical and legal importance to the U.S. judicial system, these days fewer and fewer habeas corpus requests are resulting in any effect. In 1995, for example, the Bureau of Justice Statistics conducted an empirical study of habeas reviews that found that only 1% of habeas corpus appeals were granted on the merits, and another 1% remanded to the state courts for follow-through. The study's authors concluded that their data indicated that state courts are performing well in protecting prisoners' federal constitutional rights. That conclusion has merit *if* it is safe to assume that federal review is adequately responding to inmate's constitutional rights. In light of recent changes under the PATRIOT Act, where it seems that some people's due rights are no longer fully protected, it is unclear whether we can always be so sanguine about the courts' responses.

HARD LABOR

Hard labor is a punishment of ancient origin and widespread adoption. In the United States, the Pennsylvania General Assembly established the first hard labor sentence in the fall of 1786 by directing "motley crews" of prisoners to clean and repair public streets. Imprisonment at hard labor then became a common sentence in the 19th century, in the United States and in many European countries. Today, several penal systems enforce hard labor, officially and unofficially. China, for example, maintains a vast system of hard labor camps under its "reform through labor" system. The central feature of Japan's prison system is compulsory hard labor production for private sector industry subcontracting. While Russia no longer has the old gulag, it still maintains the tradition of penal labor camps. At the Russian Strict Regime Colonies, labor is compulsory and hard, although those who meet production quotas are paid.

HISTORY

Hard labor has played an important role in criminal sentencing history as an alternative to corporal punishment and as a substitute for the death penalty—although, in extreme cases, it was just a sentence of slow death. In America, William Penn's Great Law of 1682 eliminated the death penalty for all cases except premeditated murder, and designated imprisonment with hard labor instead as a means of reforming offenders. This was a high point in the history of hard labor, and even in Pennsylvania the ideals of reformative work did not last long. In practice, over the course of its history, "hard labor" fell along a continuum of severity, with dignified and paid work at the soft end and, at the other pole, work that was futile and degrading, or even a form of torture and gradual death.

Hard labor first appeared as ancient slavery, the prototypical form created by the Romans as a life sentence to slaving in heavy irons at stone quarries and copper, silver, and salt mines. Likewise, penal slavery in gold mines and at monument construction was a sentence for criminals and war captives during the first century B.C. in Egypt, while the Spanish used penal slaves in their copper mines and stone quarries during the 17th and 18th centuries.

After an epoch of penance and fines during feudalism, labor exploitation reappeared in the early 16th century as an adjunct to emerging trade practices. Galley slavery was a common criminal penalty in 16th-century France, and during the 17th and 18th centuries in Spain and the papal states. Spanish American labor systems exploited penal labor in private industry in the 17th century and mandated slave labor in presidios during the next century. By the mid-18th century in Great Britain and on the Continent, hard labor imprisonment was widely used as a substitute for flogging.

Productive work was abandoned in England in the early 19th century, as soon as labor shortages turned into surpluses. Thereafter, hard labor took unproductive and torturous forms such as busting rock, cranking sand, and stepping the "everlasting staircases"—punishments intended to inflict a "just measure of pain" in minutely measured doses.

The labor of prisoners could be used profitably elsewhere, however. Transportation to America and Australia became a major strategy to relieve prison overcrowding at home while developing the labor-starved colonies. A cogent reinterpretation of Australian convict rule by Stephen Nicholas (1989) demonstrates how ordinary British and Irish men and women convicts were part of a global system of forced labor migration into a highly efficient and productive capitalist labor system. And, although their labor was truly hard, Australian convicts experienced incentives and rewards just like free workers. In a twist on the "less eligibility principle," which states that prison conditions must never be more desirable than the living conditions of the lowest paid free worker, prisoners put in fewer hours of hard labor than did free British worker counterparts.

HARD LABOR IN THE UNITED STATES

In one of the most nuanced examinations of hard labor in American penology, Christopher Adamson (1983, 1984) developed a socioeconomic interpretation of hard labor in America, connecting industrial and financial considerations with crime control objectives, especially the reinforcement of legal norms, reformation of the criminal through hard work, and deterrence. While these legal objectives were important in shaping penology, business cycles and the vicissitudes of labor supply helped determine the variable meanings of hard labor and solitary confinement through the first half century of the penitentiary experiment.

Effective deterrence must address the relative living conditions (as determined by the labor market) of free persons, Georg Rusche and Otto Kirchheimer (2003, p. 6) hypothesized. Thus, Adamson's research shows that during cycles of prosperity, prisoners were viewed as resources and hard labor regimes of productive activity prevailed in the United States. On the other hand, during recessions and depressions, prisoners were viewed as threats and placed in solitary confinement without labor or made to perform futile labor on treadwheels, as abject examples to would-be thieves. Thus, after 1800 shortages of skilled labor and European restrictions on emigration led to the widespread adoption of productive and profit-oriented prison manufacturing systems, such as shoemaking, ironworking, carpentry, and weaving. In the aftermath of the War of 1812, America experience a deep business recession, with high levels of unemployment and growing imports of cheap manufactured goods. According to Adamson, hard labor lost is financial value and it ability to meet criminal justice objectives. Prison sentences increased dramatically after 1815 to absorb the growing surplus population, and the severity of penalties increased. With the return to prosperity in the period 1825 to 1840, hard labor was redefined as productive economic activity and the Auburn system of congregate manufacturing reached its apogee.

In addition to the variable meanings of "hard" and whether "labor" was productive or unproductive, prison industry alternated between periods of private control with production for the open market and public administration for state consumption. The most extensive and vicious system of forced penal labor for private profit occurred in the post-bellum U.S. South, where labor-starved states of the former Confederacy adopted the convict lease system to extract private profit in a system of penal slavery on cotton plantations, railroads, rice fields, turpentine farms, and coal mines. The 13th Amendment to the U.S. Constitution, which abolished slavery, exempted involuntary servitude of "duly convicted" criminals. The Southern ruling class would probably have preferred free workers, but the freedmen vigorously resisted wage slavery. Forced to labor from dawn to dusk, held in rolling circus cages when not working, provided with grossly inadequate medical care, the average life expectancy of convicts on the lease was five to seven years.

COMPARATIVE EXAMPLES AND CONTEMPORARY PRACTICES

Other notorious forced-labor regimes of the modern era include the Soviet gulags of the Stalin period and South Africa's penal system, akin to the convict

lease, that forced blacks into agriculture and mining from the 1880s until the end of the apartheid regime in 1994. Forced labor for reformative and economic purposes has existed in Chinese history since the 17th century. Mao Tse-tung's Communist revolutionary "reform through labor," or *laogai,* and *laojiao,* or "reeducation through labor," systems have sent millions to agricultural labor camps to be "reeducated." Since the late 19th century, Japan has operated a system of prison industrial subcontracting that constitutes hard labor in the extremely exacting regimentation required by its prisoner-workers. Hard labor in U.S. states and Western countries today is rare, with Texas and Mexico as prominent exceptions. In the northern states, Mexico has begun supplementing its laissez-faire petty entrepreneurial prisoner economy with *maquiladora* sweatshop factories. Texas maintains vast state plantations where convicts harvest cotton by hand without monetary compensation. In most of the former Soviet bloc countries, hard labor regimes have been replaced with a corrosive and debilitating idleness, with Poland as a prime example. China, however, still imprisons more than a million on farms and in factories that are said to manufacture for export.

CONCLUSION

Hard labor has existed as a form of punishment for centuries. In some places and eras, it has been used in conjunction with a sentence of imprisonment, while elsewhere and at other times, it has been a punishment in its own right. These days hard labor in Western industrialized states is rare, possibly because of the competition it would pose to other workers. Even so, methods such as the chain gang, which has been introduced in numerous U.S. states, as well as the plantations in Texas and elsewhere in the South, indicate that hard labor remains part of penal policy in America. The question remains, however, is it an effective means of punishment or control? Or does it simply provide a source of income for the state?

HARRIS, MARY BELLE (1874–1957)

Mary Belle Harris was renowned for her work as the head of several women's prisons in the first part of the 20th century. Throughout her career, she maintained that women's institutions must assist inmates to become self-sufficient through work training and education in a supportive, nonpunitive environment. As with other penal reformers of the period. Harris believed that most women's crimes were caused by their dependence on men—economically and psychologically—and thus only in institutions run by women for women, could offenders achieve the skills and strengths necessary for independence. Harris's work and ideas culminated in the development, design, and management of the first federal women's prison at Alderson, West Virginia, from 1925 to 1941.

BEGINNINGS: EDUCATION AND TEACHING IN THE CLASSICS

Mary Belle Harris, born August 19, 1874, was the oldest child of three, and the only daughter, of John Howard and Mary Elizabeth (Mace) Harris. Her mother died in 1880, and her father married Lucy Bailey, a cousin of Mary Mace, who became her beloved stepmother. John Howard Harris was a Baptist minister and president of Bucknell University (1889–1919), where Mary Belle Harris earned a music degree (1893), an A.B. (1894), and an M.A. in Latin and classics (1896). Thereafter, she went to the University of Chicago, receiving a Ph.D. in Sanskrit and Indo-European philology (1900). It was at Chicago that she became friends with Katharine Bement Davis, a woman who was to have a pivotal role in Harris's later career in corrections.

Between 1900 and 1914, Harris taught Latin (one appointment was at the Bryn Mawr School in Baltimore, Maryland, led by Edith Hamilton), studied numismatics at Johns Hopkins University, and traveled to Europe as a teacher-chaperone, working at the American Classical School in Rome. During this time, she also studied numismatics at the Kaiser Friedrich Museum in Berlin. She returned to the United States in 1914.

PRISON REFORM AND ADMINISTRATION

Harris arrived in New York City when Katharine Bement Davis was commissioner of corrections. Davis offered Harris the newly created position of superintendent of women and deputy warden of the Workhouse at Blackwell Island, which she accepted. Thus, on July 1, 1914, at age 40, Mary Belle Harris began the work for which she had not trained, yet would bring her national renown.

In 1914, the workhouse held around 700 women convicted of prostitution, alcoholism, and drugs, who were serving sentences from three days to six months. Harris instituted changes that enabled the women to leave their cells, get some exercise, and do activities that relieved the boredom and petty infractions. Harris opened a library and allowed women to play cards and knit. She fenced off part of the yard so they could exercise. She also renovated the dining room and opened a lounge for staff. Harris's approach at Blackwell Island was to be her trademark: common sense changes that fit women's needs, even when it meant altering the accepted ways or challenging the bureaucracy.

After leaving the workhouse in 1917, Harris became superintendent at the State Reformatory for Women in Clinton, New Jersey, for two years. Over the same period, while on leave from Clinton, she was assistant director of the Section on Reformatories and Detention Houses for the (U.S.) War Department's Commission on Training Camp Activities under Martha P. Falconer. From 1919 to 1924, she was the superintendent of the State Home for Girls (juveniles) in Trenton, New Jersey, In March 1925, Mary Belle Harris embarked on her final and most public leadership role in women's corrections: heading the new federal prison for women in Alderson, West Virginia.

ALDERSON: "A SOCIETY OF WOMEN WORKING TOGETHER UNDER THE GUIDANCE OF OTHER WOMEN"

The Federal Industrial Institution for Women was established by the U.S. Congress in June 1924, and the site of Alderson, West Virginia, was selected in January 1925. Upon the recommendation of Assistant Attorney General Mabel Walker Willebrandt, Harris was appointed superintendent before the construction began. Supported by Willebrandt, Harris played a unique role in working with architects and engineers to ensure that the design and construction conformed to her view, and that of other reformers, of the best environment for rehabilitating women offenders.

The first 15 prisoners—"the early settlers"—arrived at Alderson on April 30, 1927, even though the institution was officially opened on November 24, 1928. The institution earned accolades throughout the United States, and occasionally beyond, largely as a result of Harris's design ideas and regime. As one member of Congress asked during appropriation hearings: "Alderson: That is a

Ladies' Seminary?"[1] Harris instituted physical fitness (baseball games), farming, an inmate self-governing system, and educational and vocational training. She also held county fairs, nature hikes, individualized classification—without any serious disciplinary problems and with few escapes. In keeping with the values of the times, all of these activities were racially segregated.

Despite her successes, Harris's independence to do as she wished in the institution became increasingly challenged once the Federal Bureau of Prisons was established in May 1930. For the next 11 years, until her retirement in 1941, Mary Belle Harris used the Alderson Advisory Board, women's networks, relationships with important personages such as Eleanor Roosevelt, and the press to battle for the ideas she and others had fought for in distinguishing the treatment of women from that of men. Harris and Sanford Bates, the first bureau director, argued about staff selection, a variety of inmate management issues, management of the institution including the physical plant, and most intensively the battle over the role of prison industries and education. In the latter situation, the bureau wanted to increase the output and limit Alderson's ability to limit the amount of time women spent at the sewing machines so these inmates could go to class.

CONCLUSION

After reluctantly retiring from Alderson at the age of 66 in March 1941, Harris returned to Pennsylvania and served on the state's parole board until it was abolished in 1943. She moved to Lewisburg, home of Bucknell University and the First Baptist Church, serving as a trustee of each. In 1953, she traveled throughout Europe and Northern Africa returning to Lewisburg in July 1954. Mary Belle Harris died on February 22, 1957, at the age of 82.

NOTE

1. Rep. Kop asked this of the superintendent of prisons, Captain O'Connor, during the l929 appropriations hearings.

HAWES-COOPER ACT 1929

The Hawes-Cooper Act (H.R. 7729) was passed on January 19, 1929, and mandated that prison-made goods and merchandise transported from one state to another were to be subject to the existing laws of the importing state. The act took effect five years after passage and was repealed in 1978.

HISTORY

Work by inmates in the earliest American penitentiaries was initially justified by the idea that hard labor was reformative in nature. Whether by individual labor in a solitary cell (as in Philadelphia's Eastern State Penitentiary) or through congregate labor in enforced silence (as in the Auburn system), work was thought to be integral to the reformation of the criminal. Gradually, as a result of increased public and government attention to the costs of prison operations, many institutions began to examine ways whereby a prison could also achieve some degree of self-sufficiency.

During this time, many states begin to use prison labor in various ways. The "contract system," where

inmates worked within the prison manufacturing goods and merchandise for private concerns, was a popular way of making prisoners work. Under this system, the manufacturer supplied the raw materials and prison officials supervised the inmates. Because the private manufacturer purchased the goods at an agreed on price, this was also called the "piece-price system." Also common, particularly in the South was the "lease system," which began in Kentucky in 1825. In this system, prisoners were rented to contractors to work often outside the prison itself. They were generally poorly paid (if at all) and worked in unsafe and often squalid conditions.

Over time, it became increasingly clear that much of the free market labor could not compete with the lower cost of (and lower-priced) products manufactured in or outside of prison by forced inmate labor. By the late 1800s, prison reformers, who opposed the exploitation of inmates who were forced to work, and labor unions, fearing unfair competition, increased their opposition to prison labor and prison-made goods. In response, several states enacted new laws between the 1880s and 1920s to restrict or outright prohibit the sale of goods and merchandise made by inmates within their states. In 1887, for example, the New York Legislature, with the Yates Law, abolished all prison labor contracts and manufacturing, limiting prison industries to handicrafts that could only be sold within the state. New Jersey, Ohio, and Illinois eliminated these contracts as well and beginning in 1893, Pennsylvania passed a number of restrictive laws and by 1897, prison industry ceased to exist at all in that state.

With the increased use of the automobile by the average American and the necessity for more public access, road construction and maintenance provided other opportunities for inmate labor. Known as chain gangs in the South, prisoners were employed to build bridges, clear land, and repair buildings as well. By 1923, only Rhode Island prohibited inmates (primarily from the county jails) from working on public highways. The use of chain gangs diminished when soldiers returned from World War II and these jobs reverted to the public sector.

Prison labor became particularly controversial during the Depression, as prison populations increased dramatically and organized labor reasserted its influence in the American workplace, arguing that prison labor and prison-made goods held an unfair competitive advantage. While prison officials and others opposed any new restrictions on prisoner labor, nevertheless many states adopted legislation that severely curtailed the ability of prisons to effectively employ the huge labor pool of incarcerated offenders. Congress followed suit and, in 1929, passed the Hawes-Cooper Act, the first of what would be several federal laws regulating or restricting the production and sale of prison-made goods.

THE ACT

The act reads (in part): ". . . That all goods, wares, and merchandise manufactured, produced, or mined, wholly or in part, by convicts or prisoners, except convicts or prisoners on parole or probation, or in any penal and/or reformatory institutions, except commodities manufactured in Federal penal and correctional institutions for use by the Federal Government, transported to any State or Territory of the United States and remaining therein for use, consumption, sale or storage, shall . . . be subject to the operation and effect of the laws of such State or Territory . . . and shall not be exempt otherwise by reason of being introduced in the original package or otherwise."

There were several other laws in this area passed by Congress placing restrictions on interstate commerce that made it increasingly more difficult to employ inmates in productive labor. For example, the Ashurst-Sumners Act, passed in 1935, made the shipping of prison-made goods to a state that prohibited the receipt, possession, sale, or use of such goods a violation of federal law. Although this strengthened the restrictions outlined in Hawes-Cooper, opponents were not satisfied because the prior act still relied on the states to ban such commerce. Five years later in 1940, the Sumners-Ashurst Act made it a federal crime to transport prison-made goods in interstate commerce for private use, regardless of whether the states involved had laws restricting it. Ultimately, 30 states also passed legislation restricting the sale of prison-made goods.

In addition to the restrictions placed on the shipment of goods made by state inmates, Congress addressed federal purchases and contracts with the Walsh-Healy Act in 1936. This basically banned prison labor on federal procurement contracts where the amount of the contract exceeds $10,000. During World War II, however, these prohibitions of inmate labor were temporarily suspended as prison industries produced much needed war materials. Some prisons became somewhat self-supporting and some even made profits, but after the war the restrictions were again imposed. This continued until the 1970s, when a general disillusionment regarding the purpose and effectiveness of prisons emerged and prison industry was once again identified as a mechanism to address these concerns.

THE ACT IS REPEALED

The Hawes-Cooper Act was repealed in 1978, and in 1979 Congress further relaxed restrictions on prison labor with the passage of the Justice System Improvement Act (or Percy Amendment). This permitted waivers of the Sumners-Ashurst and Walsh-Healy restrictions provided that (1) prisoners are paid the prevailing wage (sometimes union scale), (2) local labor unions are consulted and their approval given, (3) local nonprisoner labor is not affected, (4) participating prisoners must do so voluntarily, and (5) goods produced are in an industry where there is no local unemployment. The Justice System Improvement Act also created the Private Sector/Prison Industry Enhancement Certification Program (known as the PIE program), which began the process of allowing private companies to employ prison labor in many areas. The Comprehensive Crime Control Act of 1984 contained provisions that also encouraged the expansion of prison industries, and by 1985 the federal government and about half of the states had some private sector ventures.

By the end of 1994, the PIE program had 74 companies (e.g., J.C. Penney, Honda, Eddie Bauer) employing more than 1,600 inmates manufacturing a variety of goods, from bird feeders to circuit boards. Others were employed in service industries (e.g., Best Western Hotels and TWA) including data processing, airline reservations, and telemarketing. Of the $46 million in gross wages paid since 1979, inmate laborers have retained 56%, with the remainder going to room and board (19%), taxes (12%), victim restitution (6.6%), and family support (6.4%).

CONCLUSION: CURRENT INMATE LABOR

There are currently four basic program models of inmate-involved labor in use:

1. *Employer model.* Private company owns and operates a business that uses inmate labor to produce goods or services; business has control of hiring, firing, and supervision of the inmate labor force (e.g., telemarketing firms that train and employ inmates to do telephone surveys).
2. *Investor model.* The private sector capitalizes or funds a business to be operated by the state correctional agency; aside from the financing, the business will play no other role.
3. *Customer model.* Outside company purchases a significant percentage of the output of a state-owned and -operated business, which is located within the prison.
4. *Manager model*. Private sector manages a business owned by the correctional agency; the company does not supply any material or funding, nor does it purchase any of the products. This is a personnel-supplying system, which provides managers, supervisors, and technicians.

Critics of these and similar programs are quick to point out that this results in a prisoner being paid much less than the "prevailing wage" as mandated by the program. There is also the problem that many of these industries develop skills that are not transferable to the private sector upon the inmate's release. A number of supporters and prison reformers, however, are convinced that such programs are invaluable in teaching prisoners marketable skills, even though many prison industries involve labor-intensive, low-skill work, and that there is some rehabilitative success. An often-cited 1991 study of the U.S. Bureau of Prisons found that only 6.6% of federal inmates employed in prison industries reoffended or violated

parole compared with 20% for nonemployed prisoners. Whatever the perspective, it remains the case that more prisoners are idle than employed in prison industry, and the question of prison labor continues to divide the free and incarcerated worlds alike.

HAWK SAWYER, KATHLEEN

Kathleen Hawk Sawyer was appointed director of the Federal Bureau of Prisons by Attorney General William Barr (1991–1993) on December 4, 1992. The attorney general of the United States, as head of the Department of Justice, is the chief law enforcement officer of the federal government and represents the United States in legal matters generally. The office of the attorney general has responsibility for the Bureau of Prisons. The attorney general recommends a director of the Bureau of Prisons to the U.S. president, and upon approval by the president, Congress confirms the choice.

A career public administrator in the Department of Justice for the Federal Bureau of Prisons, Kathleen Hawk Sawyer was the bureau's sixth director since 1930. She has a doctorate of education in counseling and rehabilitation from West Virginia University. Preceding her career with the Bureau of Prisons, Hawk Sawyer was employed at the Sargus Juvenile Facility in St. Clairsville, Ohio, where she established a psychological counseling program for pre- and postadjudicated youths and their families.

FEDERAL BUREAU OF PRISONS TENURE

Hawk Sawyer began her career with the Federal Bureau of Prisons in 1976 when she became a psychologist at the Federal Correctional Institution (FCI) in Morgantown, West Virginia, which housed approximately 400 male juvenile offenders. In 1983, she was designated chief of psychology services. During that year, she also served as a senior instructor for the Bureau of Prison's Staff Training Academy in Glynco, Georgia, as a training instructor in vocational and occupational training programs.

In 1985, Hawk Sawyer became associate warden for programs at the FCI-Fort Worth, Texas. This facility was a co-correctional institution that housed 1,000 inmates. In 1986, the bureau appointed Hawk Sawyer as chief of staff training for three training centers: Glynco, Georgia; Aurora, Colorado; and Fort Worth, Texas. In 1987, she became warden at the FCI-Butner, North Carolina, which housed 800 male offenders.

Hawk Sawyer became the assistant director for the Program Review Division at the Central Office, Washington, D.C., in May 1989, which led to her appointment as director in 1992. In 1997, President Bill Clinton awarded her with the Distinguished Executive Award, the highest award offered to professionals in the Senior Executive Service.

CAREER GOALS

As director, Hawk Sawyer sought to reduce the recidivism rate by offering more work and education opportunities to federal prisoners. In her decisions, she was influenced by the Post Release Employment Project, a long-term evaluation of the impact of prison industrial work that found former prisoners who had worked in prison industries were 35% less likely to recidivate one year after release than comparison group members who had not. The report also found that prisoners who had worked in prison industries were more likely to be employed during the first year after release and earned higher wages during the first year of release than others

who had not had the same opportunities. In response to the study, Hawk Sawyer increased the number of inmates working for UNICOR (Federal Prison Industries) from approximately 16,000 inmates at the end of 1992 to 22,000 inmates mid-2003. She also focused on modernizing the educational opportunities offered to inmates by offering secondary education at every institution.

Hawk Sawyer also brought in a number of residential substance abuse treatment programs while director. Reflecting in part her background in psychology, these programs, which were available at 47 facilities in 2001, use a cognitive restructuring approach. They also incorporate a pro-social values program that focuses on inmates' emotional and behavioral responses to difficult situations and emphasizes life skills for respect of self and others. All federal prisons offer drug education programs.

CONCLUSION

During her distinguished career and as the first female director of the Bureau of Prisons, Kathleen Hawk Sawyer initiated major changes in the field of corrections, particularly in the fields of work, education, and treatment. She retired from the Bureau of Prisons as director in April 2003 and was replaced by Harley Lappin, the mid-Atlantic regional director for the bureau.

HEALTH CARE

Methods for diagnosing and treating illness are the same, whether the patient lives behind bars or in free society. No convincing legal or ethical argument can be made, on the basis of arrest, conviction, or sentence, to justify denying prisoners a level of health care that is equivalent to the community standard.

Though the principles and criteria governing medical practice for incarcerated persons are identical to community standards, the correctional context introduces important differences. Concern for safety and security is preeminent. Consequently, there may be compromises in privacy and confidentiality. Health care service delivery in correctional facilities is less efficient, given the need to secure all sharp items and medications from possible misuse. Movement and transport are necessarily controlled and restricted, resulting in downtime for health professionals between patients. Patients also have less freedom to choose among providers, though they remain autonomous and free to accept or reject treatment.

Caring for sick prisoners is challenging. Penal institutions were never designed for the purpose of providing health care. Their environment, regimentation, physical plant, and lifestyle are anything but therapeutic. Nevertheless, prisoners do become ill—sometimes quite seriously.

COURT-ORDERED REFORMS

Prior to the mid-1970s, prisons were virtually closed to public scrutiny, and convicts were accorded few rights. Most health care services were provided by other inmates—usually without formal training and with only rudimentary medications and equipment. Professional health care providers were few. Many of these had licensing, competence, or sobriety problems and could not find gainful employment elsewhere. As a result, abuses abounded. Sometimes medical care was denied as a form of punishment or because of the whim of an officer.

Few gave credence to prisoners' complaints. Judges ruled it was not the business of courts to meddle in the internal affairs of prisons and left these matters to the discretion of correctional managers. This state of affairs continued until the 1960s and 1970s, when white, middle-class, affluent, educated, and socially well-connected people were incarcerated for civil disobedience or other activities in civil rights and antiwar demonstrations. These activists generally had greater credibility than the typical inmate, whose only contact with a lawyer may have been with a public defender. Amid voters' rights rallies and Vietnam War protests, legal defense societies were quickly mounted to provide competent defense and advocacy.

Soon class action suits were filed, grouping similarly situated inmates together as plaintiffs seeking redress. Most were filed in federal courts and sought relief under 42 U.S.C. § 1983 of the Civil Rights Act from conditions of cruel and unusual punishment prohibited by the Eighth Amendment. In 1976, the U.S. Supreme Court in *Ruiz v. Estelle* ruled that "deliberate indifference to serious medical needs of prisoners constitutes the 'unnecessary and wanton infliction of pain' proscribed by the Eighth Amendment."

Following *Ruiz v. Estelle,* an avalanche of litigation ensued. Some suits were successful. Many resulted in court-ordered consent agreements and required defendants to implement sweeping changes under the watchful eye of court-appointed monitors. Besides medical and mental health care, reforms addressed overcrowding, brutality, nutrition, and access to courts. The most fundamental health arena changes required access to professional medical evaluation and prohibited interference with ordered medical treatment.

These improvements were costly, and some court-ordered reforms may have been excessive. In 1996, the Prisoner Litigation Reform Act swung the pendulum the other way, rendering access to courts much more difficult for inmate plaintiffs. These days, therefore, it is difficult for inmates to address health care problems through the court process. Instead, they must try to deal with any complaints they have at the institution where they are confined.

MEDICAL STANDARDS AND ACCREDITATION

Following public outcry over prison conditions, the American Medical Association formulated jail and prison health care standards in the late 1970s. These were subsequently adopted by the National Commission on Correctional Health Care. The American Correctional Association's facility-wide standards for various types of correctional institutions also addressed health care issues. Promulgation of standards was accompanied by development of accreditation mechanisms to assess voluntary compliance.

Correctional health care professionals credit the dual influence of court involvement and the standards and accreditation process for improving access to quality medical care for the incarcerated. Prison and jail clinics are generally staffed with an adequate number of competent health professionals; inmates no longer provide health care; treatment is documented in accordance with contemporary standards; many sites have viable quality improvement programs. The quality of health care typically available to prisoners today approximates that required by the standards and follows contemporary community practice. Glaring abuses and deficiencies are largely past.

The National Commission on Correctional Health Care endeavors to upgrade the quality of jail and prison clinical staff by encouraging them to become Certified Correctional Health Professionals and to join the Academy of Correctional Health Professionals. The American Correctional Health Services Association also sponsors programs to facilitate networking among correctional health care providers and raise their knowledge and professional awareness. Prisons and jails once were the refuge of questionably competent medical providers. Today, no stigma is attached to work as a prison doctor or nurse. Good—even outstanding—professionals are being recruited to this work.

RISING COSTS OF CARE

Partly because they are sicker, partly because they have little opportunity for self-care, and partly

Health Care

I have been incarcerated for close to five years now and have been in four different institutions. I was in a serious motorcycle accident when I was sixteen. I broke my left leg in three places, shattered my left ankle, suffered many internal injuries, and injured my back, which caused complete paralysis from the knee down on my left leg. I have had several operations because of these injuries. Since I have been in the federal prison system I have had to beg and plead with the medical staff to get even basic needs met.

I started my time at Carswell's Federal Medical Center in Ft. Worth, TX. I had three surgeries there, two on my back and one on my left leg and ankle. My back surgery was successful. The surgery, which was a fusion of my left leg and ankle, was a whole different story. The orthopedic surgeon that performed the surgeries set my cast crooked after the surgery.

Later, when I was transferred to FCI Dublin, still in my cast, the cast was removed. I was horrified because my foot was permanently crooked, turning inward. It looked deformed and remains that way today. I was devastated, as I still am. Before surgery I wore a leg brace (from the knee down), but my foot was straight. If I wore pants you could not even tell that anything was wrong with me. Now even with pants on it is quite evident that my leg is crippled. I am very self-conscious about it, but at this point there is nothing that can be done. I will try to get it corrected when I get out. I asked medical in Dublin if they could fix it. The head of medical there, told me that I would have to go back to Carswell for a procedure like that because they could not provide the aftercare necessary. Plus they did not want the liability. Needless to say, I decided not to go back to Carswell.

I do have to give credit, where credit is due. The physical therapy department in Carswell was real good, and I had a very caring and competent physical therapist. They also made sure I got my medications, my leg brace, and special shoes.

After FCI Dublin I went to Phoenix Prison Camp, and now I am currently at the Victorville Prison Camp in California. For the most part, with all the prisons I have been in it has been the same old story. There is no order and they are incompetent, with Phoenix and Victorville being the worst. I have been going to doctors for years before my incarceration, and I have never seen nothing like this. You rarely ever if at all, see a doctor. It is usually a physician's assistant or a nurse who cares for our medical needs; anything from a headache to terminal cancer, and it is usually the same treatment—Ibuprofen. I never once saw a doctor the whole time I was in Phoenix, which was over one year. I did write them up for negligence to their regional director, and I did win.

I have been in Victorville for three weeks now and have not yet seen a doctor. It is a task just to get your prescriptions filled here. When I asked the physician's assistant what the problem was, she told me that they were just overwhelmed with work because there are so many inmates. And that, I believe, is exactly it. They are all short staffed and don't have the time to spend on our individual medical needs. I am sure our medical care would improve considerably if there was enough medical staff for the inmate population. But until that happens, we will go without.

The Bureau of Prisons's sole function is not to simply warehouse inmates, but while in their custody, we have the right to receive health care in a manner that recognizes our basic human rights. Our eighth amendment right states that we are not to be subjected to cruel and unusual punishment. To be left sick or in pain is cruel and unusual punishment.

Tara Frechea
Federal Prison Camp Victorville, Adelanto, California

because confinement and idleness promote excessive focus on their bodies, prisoners tend to require more, rather than less, health care. The causes of their illnesses often predate their incarceration and include unhealthy lifestyles, trauma and injury, malnutrition, heavy use of drugs and alcohol, and generally poor access to the health care delivery system.

Following the huge increase in the number of incarcerated in the United States, the cost burden of health care services in corrections has reached staggering proportions. Medical costs are 9% to 12% of the total cost of corrections. In addition to the sheer number of inmates who need medical treatment, several other factors contribute to this high cost: (1) the growing number of elderly prisoners, (2) technological and qualitative improvements (e.g., new, costly medications and procedures), (3) focus of attention by courts and media, (4) communicable diseases such as AIDS and hepatitis C that are difficult and costly to treat, and (5) ravages of substance abuse. Each of these factors requires

increased staffing, pharmaceuticals, hospitalization, and liability insurance.

To cope with and attempt to reduce these costs, some correctional jurisdictions turn to privatization to divest themselves of the direct burden of managing and supervising health care programs and of the responsibility for controlling costs. This strategy has had mixed results. For smaller facilities, where acquisition of in-house expertise is often difficult, private companies bring the benefit of patterned approaches to policies and methods. Some large state systems also have gone this route, though they might do as well and at lower cost by employing competent managers and providers. On this point there are differing opinions.

KEY PROGRAMS

Correctional health care provides a number of key programs throughout a person's sentence. The most important of these are described below.

Intake Screening

Correctional facilities perform a brief health screening of each inmate immediately upon arrival to determine whether an emergent or serious health problem exists, whether there is significant risk of suicide or of alcohol withdrawal, and if medications are required. These needs should be attended to within the first few hours of arrival. Within the first 7 to 14 days, inmates undergo physical health assessment and mental evaluation to provide baseline information for their medical records.

Suicide Prevention

Health care providers and correctional staff should be trained in suicide prevention. Research indicates that individuals are most likely to try to take their own lives in the first hours of detention. Self-harm and suicide attempts can take place, however, at any time. Those determined to be at elevated risk for suicide require close supervision and, when clinically indicated, may have their property or clothing restricted. In rare instances, and despite literature criticizing this practice, brief use of restraints may occur. However, it often suffices to keep patients under observation in a setting where social interaction with others can occur, such as a day room, rather than secluding them in a cell. Isolation tends to exacerbate the loneliness, sadness, and depression already being felt.

Medication

Ensuring that outpatients receive their medications in the doses and at the times prescribed is one of the most important tasks of prison health care personnel. This is also often one of the most difficult jobs to do. Rules vary as to whether inmates are allowed to keep medications in their own possession. Prisons tend to be more lenient on this practice than jails because the inmates are better known to staff. National standards insist that medications be dispensed and administered in full compliance with state and federal pharmacy regulations.

Sick Call

"Sick call" refers to the scheduled opportunity for prisoners to see a health provider face to face. Patients generally initiate nonemergency requests by writing a note for review by a nurse, who subsequently schedules an appointment with an appropriate provider (nurse, physician, dentist, psychologist). All sick call encounters are documented in the medical record.

Segregation Rounds

The health and well-being of persons housed in segregated settings, apart from the general inmate population, pose special concerns. Standards require thrice weekly to daily visits from health care staff to ensure that health problems do not go undetected.

Emergency Response

Every correctional facility has a response plan or strategy for emergencies. If health care staff, typically nurses, are on site when a medical emergency occurs, they are summoned to the scene. However, officers are trained in First Aid and cardiopulmonary

resuscitation to serve as first responders until the nurse arrives. Serious illness or injury usually results in a call to the local ambulance and paramedic service, and the patient is taken to a hospital emergency room, accompanied by a correctional officer.

Many correctional facilities now include an automated external defibrillator in their emergency response kits and ensure that nursing staff and officers are trained in its use. This precaution enables fast response to cardiac victims among inmates, staff, or visitors.

Chronic Disease Management

When the number of patients with chronic illness is sufficiently large, it becomes efficient to schedule weekly or monthly chronic disease clinics apart from the times acute and new patients are seen. The appropriate provider calls chronic patients to the clinic for routine testing and follow-up according to the treatment plan. Especially in systems with multiple providers, use of approved chronic disease guidelines can help ensure consistency in treatment and avoid substandard care.

Contagious Disease Control

Close living quarters present elevated risk for spread of contagious illness. Consequently, correctional authorities must take systematic precautions to minimize transmission of infectious disease. AIDS, hepatitis B, hepatitis C, and tuberculosis are major concerns. These diseases abound among prisoners because of previous lifestyles, including needle sharing and substance abuse.

Mental Health Services

Since the 1970s, state mental hospitals have systematically deinstitutionalized (discharged) their patients to receive care in the community. Many of these women and men have been reinstitutionalized into prisons and jails. Such people generally cope poorly under the conditions that prevail in general prison populations. Many require a special intermediate-level mental health unit where antitherapeutic stimuli are minimized.

Dental Care

Prisoners are entitled to basic dental care. Such treatment usually provides them with fillings and routine endodontic and periodontal services. Gold crowns and extraordinary prosthetic or restorative measures are usually not allowed.

Detoxification and Withdrawal

Jails, especially, must identify new arrivals at risk of serious consequences of overdose or withdrawal from alcohol or drugs. Each new inmate is questioned about recent use of intoxicants and whether difficulty was previously experienced when discontinuing these substances. Mild to moderate symptoms can often be managed in the correctional facility, but severe symptoms of withdrawal nearly always require prompt admission to a hospital.

Off-Site Care

While smaller facilities refer all complex and specialty care to off-site providers, large correctional systems find it cost effective to schedule certain specialty clinics on site. Some even provide minor surgeries, dialysis, and inpatient care within the walls. When a prisoner requires medical care beyond the level available in the facility, services are arranged with a community provider or medical specialist. If necessary, the prisoner is admitted to a local hospital. Unless the hospital has a secure unit staffed by a cadre of officers, a correctional officer is assigned to remain by each prisoner's bedside to prevent escape or harm to other persons.

Pregnancy

Many pregnant prisoners are at high risk due to drug abuse, lack of prenatal care, AIDS, recent trauma, and other factors. They require close and specialized monitoring and care. Accommodations may be needed in diet, living conditions, and work assignments. Every effort is made to ensure delivery in a community hospital. Very few correctional facilities in the United States permit incarcerated mothers to be accompanied by their infant and

small children, though this practice is more common in other countries.

The Elderly and Disabled

To meet the special needs of the growing number of elderly and disabled inmates, some larger correctional systems are establishing dedicated housing units. These are barrier free, readily accommodate wheelchairs, and afford a more leisurely and less regimented and stressful routine. Like community homes for the aged, they make life more tolerable. Some chronic illness conditions can also be cared for in these units.

End-of-Life Care

Prison systems find it increasingly necessary to cope with dying inmates. Until recently, all but the most sudden and unexpected inmate deaths occurred in community hospitals. Wardens and jail administrators went to extreme lengths to ensure that nobody died in the institution. Instead of peaceful and reassuring surroundings, patients were unnecessarily subjected, during their final days and hours, to frightening sounds, commotion, and unfamiliar faces.

Dying prisoners experience the same kinds of disability, pain, anxiety, fear, confusion, incapacity, and needs as do free citizens who face old age and death. They, too, want closure, need to say farewell, desire to forgive and to be forgiven, appreciate kind words, crave companionship, require assistance, and fear dying alone. Separation from family and friends only exacerbates these problems. A few prisons have established special policies and programs to cover the final phase of life, relaxing visitation rules and other restrictions and utilizing the services of specially trained inmate volunteers to sit at the bedside, assist with activities of daily living, and provide companionship during the last days. Demonstrable benefits of this practice include redemptive and rehabilitative effects for the inmate caregivers themselves. Prisoners in these programs are allowed to die peacefully in a familiar environment and are appropriately permitted to refuse unwanted life-prolonging rescue methods.

Transitional Case Management

Transitional case management approaches have been successfully employed to assist terminally or seriously ill and disabled inmates to cope in the community after release from jail. Using case managers to prepare living and support arrangements prior to release and to afford follow-up guidance and assistance afterward, these programs can reduce recidivism and promote humane living conditions and should be implemented in collaboration with other agencies.

HOW MUCH CARE?

Medical care of inmates is subject to limits, just as it is in the community. Those whose care is paid by public funds or insurance policies cannot demand every expensive procedure, regardless of need. Cost must always be balanced with need so that there are sufficient resources for all.

Inmate status and nature or gravity of the crime—such as gender, race, color, creed, or ethnicity—have no bearing on such decisions. Even expensive procedures such as organ transplants ought not be denied solely because of inmate status. Age and expected years of life remaining, general health condition (including comorbidity), likelihood of successful response to treatment, and patient's wishes are relevant.

A jail or prison ought not deny or withhold a necessary treatment or diagnostic procedure because of lack of funds. Previous failure to access health services while in the community does not justify denial of care. Jails or prisons may defer treatment of short-term inmates until released from custody, provided a determination is made that this will not pose undue risk to the patient.

CONCLUSION

A healthy tension should exist between correctional authorities and the responsible health authority. If open and constructive discussion is repressed or discouraged, the differences in approach, policy, and mission can result in imprudent decisions.

There is no real contradiction between the principles and practice of good correctional programs and good health care programs. Each party needs to be familiar with the content and rationale of the other's policies. Health care professionals should never fail to be their patients' advocates.

Legal Case

Ruiz v. Estelle, 503 F. Supp. 1265 (1980).

HIGH-RISE PRISONS

Various architectural styles have been employed in prison design, from the first radial cells of the Pennsylvania model to the recent innovations of new-generation prisons. Classic models such as the Auburn style and the telephone pole design provided the blueprint for most facilities built in the late 19th and early 20th centuries. These facilities, which include Sing Sing and San Quentin, were designed to hold large numbers of men in single cells at night, and in congregate labor during the day. Although popular for most of the 20th century, they presented numerous obstacles for program implementation and delivery, as well as safety.

In response, prison administrators began looking for alternative styles of design to aid in the establishment of smaller facilities, or, at the least, for methods that could facilitate the establishment of smaller, distinct units within larger institutions. Recent design models also tend to rely on enhanced technology. High-rise prisons, also commonly referred to as skyscraper prisons, are just one solution to the problems posed by the early architectural designs described above.

HISTORY AND DESIGN CHARACTERISTICS

Experimentation with high-rise prison facilities began in the 1970s, when the U.S. federal government began to construct metropolitan detention centers for the purpose of detaining persons accused of federal crimes. Soon thereafter, many state and local jurisdictions began to employ the high-rise design in the construction of prisons and jails. Since this time, the majority of facilities built according to the high-rise plan tend to be located in urban areas, presenting accused persons and those charged with their care the unique advantage of proximity to court services and other municipal buildings housing criminal justice–related divisions and departments. The facades of many high-rise institutions are architecturally designed to blend in with the urban landscape in which they are built.

Most high-rise facilities detain offenders prior to trial and sentencing. Many hold women and men, as well as some juvenile offenders. To keep these populations separate, housing units are usually contained within one floor allowing for the housing of multiple security levels in one site (i.e., different security levels on different floors). Likewise, the functional units such as medical, education, or recreation are located on different floors, eliminating contact among subpopulations.

PROFILES OF HIGH-RISE FACILITIES

Several high-rise prisons that can be found in metropolitan settings in the United States are profiled below. Many details of these facilities conform to the theoretical plan originally developed for the building and use of these facilities. Nevertheless, each facility presents its own unique contribution to the inmates and neighborhood that it serves. A discussion of the pros and cons of high-rise institutions follows the profiles of these facilities.

Federal Detention Center–SeaTac

The Federal Detention Center–SeaTac is a 10-story, 502-cell facility. The physical plant is composed of a six-story cell tower, as well as a four-story base that houses administrative offices, health services, laundry facilities, a commissary, and food services. It also accommodates vehicle entry via a sallyport. Security is the main mission of the Federal Detention Center–SeaTac, and this function is represented in the placement of the physical plant, since the facility is removed from the intersection that provides access to the facility's parking and buildings. This remote physical placement of the facility minimizes visual contact between the inmates and the public.

Federal Detention Center–Philadelphia

Located in a historic district in the center of the city, the Federal Detention Center–Philadelphia's exterior is designed to be compatible with the buildings that surround it, visually incorporating the facility into the established fabric of the neighborhood. The physical plant is composed of 11 stories. Interestingly, several stories are below ground level, which facilitates secure transport of detainees via an underground passage to the Justice Byrne Federal Courthouse, which is located across the street from the detention facility. The base of the facility is composed of four stories and houses administrative offices, inmate services, U.S. Marshal offices, and access to the secure passage from the courthouse. The central control room is also located in the facility base, allowing for optimal surveillance of pedestrian, U.S. Marshal, and service personnel entry. In addition, the control room provides surveillance of vehicular entry via sallyports.

Federal Detention Center–Honolulu

The Federal Detention Center–Honolulu, which is the most recent federal institution to be built according to the high-rise plan, is located near the Honolulu International Airport. It is bound by airport facilities on the east and south, and residential housing from Hickam Air Force Base on the north. Thus, it is located on the fringe of industrial and residential areas of the city of Honolulu. The detention center is composed of 12 stories, with a 10-story main tower and a two-story administrative base. The administrative base houses the central control center, which provides surveillance for the main entrance, the waiting area, the service sallyport, and the main service corridor. The 10-story cell tower is L-shaped, with unit management offices centrally located between the two wings on each floor. The cell tower is composed of 496 general inmate housing cells and 62 special inmate housing cells, for a total of 558 cells and a rated capacity of 670 inmates. A one-story warehouse and receiving building is located adjacent to the main building. This component of the facility provides for storage of general supplies and food products, and also houses the central mechanical plant. The administrative base/cell tower and warehouse/receiving building are separated by sallyports used by service and U.S. Marshal personnel, and closed-circuit television monitoring controls access to the sallyports.

THE CASE FOR AND AGAINST HIGH-RISE PRISONS

High-rise prison facilities may be a viable means to increase penal capacity when space is limited. This is especially relevant when facilities are planned in urban areas. In turn, the building and opening of facilities along the lines of the high-rise model can help to relieve overcrowding at established, traditional facilities.

Nonetheless, many questions regarding the benefits of high-rise facilities remain. For example, although there is less geographic space to monitor, high-rise prisons may not be desirable in terms of optimal management and control. First, these facilities often require more staff as transport from housing units to service levels requires more detailed surveillance and potential problems that staff have not encountered at traditional facilities. Second, the surveillance of inmate activity within the facility is sometimes difficult in times of emergencies and disturbances. For these reasons, most guidelines for facility plans include a capacity of no more than 500 inmates, and a physical height of no more than five stories (inclusive of service floors and housing units).

When considering the interior details of a high-rise facility, the institution's purpose should be clearly assessed so that architectural accommodations can be made. For example, if the high-rise facility will house youthful offenders, one or several floors in the tower should be devoted to the building of classrooms. In turn, if the high-rise facility will house adult offenders, workshops should be included in facility plans.

Finally, individuals housed in high-rise prisons are rarely allowed outdoors. At most, inmates will be allowed to visit recreation areas on the roof. Such spaces have no greenery, or horizon to view. The long-term effects of such a sterile environment have yet to be assessed.

CONCLUSION

Over the past 30 years, the high-rise design has served to change the landscape of detention and corrections in the United States. These institutions have aided in the delivery of correctional services and programming for specific populations (i.e., maximum-security offenders, females, and juveniles) that are often housed together in these facilities. The facilities profiled above depict many facets of the high-rise prison as conceptualized in the mid-1970s. Nevertheless, the theoretical concepts related to the design of the high-rise prison have not been intricately developed or assessed since the mid-1970s, and the pros and cons of high-rise facilities must be considered before researchers begin empirical assessments related to the details of these unique facilities. Only until the questions surrounding the optimal use of such institutions is assessed can correctional researchers and planners begin to embrace the potential that the high-rise prison may have for detention and corrections in the United States.

HIP HOP

Hip hop was created by youths of African American and Caribbean (including Latin-Caribbean) descent in the early 1970s. At the time, the counter-disco movement was developing, and gangs in the Bronx, New York, were becoming the subjects of books and films that depicted black and Latino youths as savage predators incapable of rehabilitation. Contradicting this stylized and oversimplified presentation of the Bronx as a site of decay was an artform that would emerge into international significance through expressions that include rapping/MCing, deejaying/ mixing, break-dancing, and graffiti. This artistic and cultural movement produced a generation of people—"hip hop America"—who would embrace not only its distinct language, music, and fashion but also its politics, vices, and other social realities.

Hip hop culture became popular during the same time that African Americans were responding to the aftermath of the politically charged civil rights movement of the 1960s. While hip hop was developing in basements of the Bronx, many African Americans were returning from the turbulent war in Vietnam, where 10% of American soldiers used heroin, and 5% were hard-core addicts. Many of these men brought their addiction back to their communities, generating a new kind of criminal—one who would supplement the existing criminal activity that included numbers running, prostitution, fencing, and robbery, and one who would later give way to the onslaught of crack cocaine in the 1990s. Ironically, the infusion of drugs and the accompanying drug economy employed many young black and Latino men and women who would otherwise not participate in the labor market. Thus, Sanyika Shakur (1993, p. 70) reports that in 1993 the gangs in Los Angeles recruited more people than the four branches of the U.S. Armed Forces, and crack dealers employed more than IBM, Clorox, and Xerox combined.

HIP HOP AND THE PRISON INDUSTRIAL COMPLEX

In large part a result of harsh new sentencing laws against drugs, prison populations have grown exponentially in the United States since the 1980s. Hip hop culture, particularly in its music, has lent a "bullhorn" to the prison experience that has become part of the life of so many young women and men of color. Many hip hop artists began to tell prison stories in their music, write prison poetry, wear prison "fashion," and adopt a mentality that embraced incarceration as a right of passage rather than as an experience that should avoided at all costs. When "gangster"/"reality" hip hop (typified by harsh, misogynist lyrics and tales of violence and victimization) began to gain momentum as the dominant expression of anger and resentment among disenfranchised urban youths in the late 1980s, their forms of expression, as well as that of the communities they spoke for, evoked punitive responses from the criminal justice system.

For example, in 2001, California passed Proposition 21, officially titled the Gang Violence and Juvenile Crime Prevention Act, which supported more juveniles being tried in adult court, required that certain youths be confined in local detention and in state correctional facilities, restricted the types of probation available to youths, increased existing penalties by requiring longer periods of confinement, and broadened existing three-strikes categories. On the ballot, Proposition 21 used crime data from the early 1990s and omitted the more recent crime statistics published at the time by the California Department of Justice in 1999, which showed significant declines in juvenile crime and delinquency. In addition to Proposition 21's use of outdated and misleading statistics, its implementation disproportionately affected the number of youth of color subjected to being processed in an adult court, with potentially more severe court sanctions than their white counterparts.

In essence, Proposition 21 built on the false belief that the youths were not able to be rehabilitated and that by relegating them to a slavery of another kind—lengthy incarceration, increased violence and abuse, unemployment, and perpetual disenfranchisement—California would be solving the "problem" of juvenile crime. This legislation was interpreted by many as being a particular assault on hip hop America by including language that allowed for broad interpretations of what constituted "dressing gang-like" (which often includes the prison-inspired sagging pants) as reason enough to be considered worthy of suspicion. Many viewed Proposition 21 as a clear association of California's black, Latino, and Asian youths, and by extension, hip hop culture and fashion, with prison culture and marked culpability.

The massive incarceration and subsequent return of youths from urban areas generated an acculturation of prison culture—wearing the "uniform," the rigid structure that fosters no critical thinking, as well as the divisive, punitive climate—that spread like a disease through much of hip hop America, creating an overexposure to and desensitization to the prison culture. This has led to many adults reenacting prison culture by engaging in abusive relationships and

other antisocial behavior, as well as many youths adopting prison mannerisms as a survival mechanism both within and beyond penal institutions.

Perhaps the most significant impact of hip hop's acculturation of prison culture is the acceptance of violence and incarceration as a normal part of the black and Latino youth experience. Most black youths, and the people living in their communities, are law-abiding citizens. Research has confirmed that only 6% of youths are actually chronic, violent juvenile offenders. Still, most stories that end up in commercial hip hop music or on screen are stories of "stick-up kids," "gangsters," and heists, which leads to an internalization, among those who absorb the culture, that these occurrences are normal.

The prevalence of violence and incarceration in rap music is a reflection of the economic, political, and social stratification in many urban communities. However, violence, as expressed through hip hop art, is grossly exaggerated relative to the degree of violence that really takes place within black and Latino communities. It is true that for black males, ages 15–24, homicide and legal intervention are the number one cause of death. However, it is not true that most communities of color are crime-ridden neighborhoods infested with violent youths. It is true that black people experience a disproportionate rate of incarcerated from their communities due to a number of factors that include high unemployment, poor housing, and easy access to guns, liquor, and drugs, and the absence of other resources that make them less vulnerable to these vices.

CONCLUSION

African American youth culture since the 1980s has shared a paradoxical and multilayered relationship with the criminal justice system. The roots of this problematic relationship between people of African descent and the American correctional system lie in the usage of slavery as a penal code from the 1600s through the late 1800s, subsequent Jim Crow laws of the antebellum South, and anti-immigration laws that left many people of color searching for alternative means of qualifying their existence. The generational psychological and emotional effects of enduring "justice"—punishments that included the whip, the stocks, the pillory, the brand mutilation, lynchings, and jail—has left a mark of distrust and suspicion that is difficult to dissipate within communities of color. The legacy of this brand of justice is reinforced by the societal inequities that continue to be a breeding ground for conditions that lead to racial profiling, disparate sentencing, lengthy incarceration, and the aftermath of this incarceration.

Many criminal justice policies and practices that lead to lengthy incarceration feed on the myth that dark-skinned youths, particularly those who are part of hip hop America, are criminal. Hip hop is not criminal. But hip hop America has been criminalized—unjustifiably perceived as suspect, considered unable to be rehabilitated, and labeled an overall menace to American society. For much of hip hop America, correctional facilities have become the literal and figurative spaces where, as sociologist Stephen Nathan Haymes (1995) once stated, they "develop self-definitions or identities that are linked to a consciousness of solidarity" (p. 35). This adaptation of prison culture as "normal" has placed a scarlet letter on the art and mindset of many youths who see their collective community's prison experience as a necessary part of their lives, which is dangerous and demeaning to their psychological, emotional, and physical development.

HISPANIC/LATINO(A) PRISONERS

The terms *Latino/a* and *Hispanic* typically refer to people of Spanish origin. Latinos and Latinas are the fastest-growing minority group in the United States, growing seven times faster than the general population. Between 1980 and 1990, the Hispanic population had increased by half, while the white (non-Hispanic) population increased only 6%.

Such increases in the general population have also occurred behind bars. Between 1985 and 2002, the rate of Latino inmates in state and federal facilities increased from 10% to 18%. As for specific offenses, from 1995 to 2001, the number of Latino offenders incarcerated for property and drug offenses declined, but the rate for those incarcerated for violent crime increased by 81.5%. In 2001, the greatest portion of the 205,300 Latinos incarcerated in state prisons were sentenced for violent crime (50%), followed by drug offenses (23%), and property crime (16%). As for those under the sentence of death, approximately 12% are Latinos, most of them of Mexican origin.

The majority of Latino and Latina inmates are incarcerated in those states that contain a significant number of Latinos and Latinas: Arizona, California, Colorado, Florida, Illinois, Nevada, New Mexico, New York, and Texas. For example, based on the Bureau of Justice Statistics 1998 report, over 50% of New Mexico's inmate population is Latino/a, mostly Mexican. On the other side of the county, approximately one-third of all New York state prisoners are of Latino/a heritage, mostly Puerto Rican. SArizona, California, Colorado, Connecticut, and Texas and the federal prison system each has Latino/a inmate populations of more than 25%.

PRISON CONDITIONS IN THE PAST AND PRESENT

Spanish-speaking prisoners have long been subjected to differential treatment while inside prison walls. Many Hispanic prisoners are pressured to refrain from speaking their native language and also are denied the opportunity to learn the English language when such classes exist. Some have complained that their letters are not mailed out or allowed to be received unless written in English. Similarly, others allege that medical treatment is not given to Latino prisoners either because of the language barrier, discrimination by correctional officers, or use sometimes as punishment for certain behavior.

The 1971 Attica Prison rebellion represented a first crucial step in addressing some of the inequities Latino prisoners faced. On September 9, 1971, over half of the 2,243 prisoners at Attica Correctional Facility rebelled, holding 39 security and civilian personnel hostage. The rebellion ended four days later on September 13, claiming the lives of 29 prisoners and 10 employees, six of whom were guards, and wounding many others. Of the demands made by the prisoners, three in particular were geared specifically toward Latinos. These demands included adequate medical treatment for every inmate and if needed, Spanish-speaking doctors or an interpreter to accompany the inmate to the doctor. Also, Latinos requested a complete Spanish library and the institution of a program that would increase the number of Latino and African American correctional officers. The lack of Spanish interpreters, lawyers, books, and general services were and continue to be a large part of the Latino discontent. The Attica Prison rebellion also paved the way for Latinos(as) to form informal networks within prisons to continue the fight for equality and fairness.

One year after Attica, David Ruiz filed his pioneering *Ruiz v. Estelle* lawsuit, which revealed the unconstitutional conditions in Texas prisons. Though Ruiz claimed in a later 1989 court case that officers responded to his original suit by denying him medical care, interfering with his mail, and wrongly classifying him as a gang member, his action in 1972 dramatically changed prison conditions around the country for all inmates.

These days, many prisons have hired correctional officers who speak both Spanish and English. Some systems offer language training for existing staff. Some systems are exploring the possibility of developing language translation technology, which will automatically translate words and phrases in one language to computer-generated speech and/or

text in another language. Such technology may be useful during booking, informing individuals of their rights, screening, and emergency treatment and in large spaces to communicate with inmates during critical incidents.

PRISONER GROUPS

Both Latino and Latina prisoners tend to depend on each other for a sense of belonging and emotional support, and, more important, for physical protection from other inmates. For these reasons, since offenders typically come from the same geographic areas, Latino/a inmates often form informal groups composed of people they knew prior to being incarcerated. Informal networks sometimes provide supplies to their members such as clothing, cigarettes, and food. Furthermore, in some facilities in states such as California, New Mexico, and Texas, informal groups have become organized (and politically driven) in an attempt to challenge the correctional system to improve prison conditions.

The desegregation of some prisons during the 1960s led to the development of racial and ethnic gangs for socialization, protection, political motives, and deviant behavior (e.g., drugs). Some Latino prisoners, for example, joined gangs such as the Mexican Mafia, La Nuestra Familia, or Surenos. In an effort to weaken the power of racial and ethnic gangs, some states have actually separated specific racial and ethnic groups into certain cellblocks as a security measure. However, given the political economy of drugs and crime, gangs continue to present a serious problem to the correctional system.

WOMEN

In 2002, Latinos comprised 18% of all state and federal prisoners. Their incarceration rate of 1,176 per 100,000 residents was 2.6 times higher than the rate for Caucasian men. By contrast, in large part, due to increases in violent crime, lethality, and drug cases, Latinas are now the fastest-growing population of all prisoners. In 2002, Latinas comprised approximately 1% of all state and federal prisoners, and 6% of all Latino/a prisoners. Latinas are imprisoned at a rate of 80/100,000, which is significantly higher than the incarceration rate for Caucasian women (35/100,000). Also, incarceration rates are highest for Latinas between the ages of 30 and 34 (216/100,000). While incarcerated, Latinas not only confront some of the same issues faced by Latinos, but they also have to endure stereotypical and gender-specific pressures from the prison system and society in general.

CONCLUSION

Based on the existing literature, the Latino and Latina experience in correctional institutions across the United States not only differs from other racial groups such as African Americans and Caucasians, but there is significant variation within the Latino/a population. Even though certain improvements have been made, institutional gaps still remain. First of all, certain groups such as the Puerto Rican Nationalists, the Cuban Marielitos, Mexicans on death row, and South and Central Americans in Immigration and Naturalization Service facilities have received some of the most punitive sanctions in the history of the American criminal justice system. Second, Spanish interpreters, lawyers, and medical, technical, and educational services continue to be a significant concern for Latino/a prisoners. Considering the current situation of ethnic inmates (e.g., language barriers and illness), and the living conditions of some facilities (e.g., overcrowding; limited education, technical, and medical resources), the quality of prison life for Latinos and Latinas needs to be radically improved.

HISTORY OF CORRECTIONAL OFFICERS

The vocation of prison officer has changed from that of *guard,* who is concerned only with matters of security, to the *corrections officer,* who must deal with human relations, institutional procedures, and legal requirements. This transformation has come about via three historical eras: politics, professionalism, and civil rights.

THE ERA OF POLITICS

The formative years of the prison occurred during the age of Andrew Jackson (1820s), whose presidential administration was marked by the spoils system. The basic idea—of rewarding political loyalty with public office—became federal practice, and state officials responsible for prisons adopted it with great enthusiasm. The political era for prison officers began in the early 1800s and continued until well into the 20th century.

In this system, the warden was a political appointee who, in turn, selected all his subordinates—assistant warden, turnkey, yardmaster, and guard. The law gave the warden complete control over the selection and retention of prison officers. Generally, prison officers were required only to be "men of good moral character and temperate habits"; Wyoming provided that guards "be quick to grasp a situation" and Utah specified they were to be "capable of handling men" (Knepper, 1990, p. 233). The superintendent of Arizona's prison at Yuma preferred unmarried men who could live adjacent to the prison and always be on hand in case of emergencies, a hiring "policy" likely in place elsewhere.

The only qualifications required to be a prison officer at San Quentin or Folsom in California were "the physical and mental and moral ability to perform the duties of the offices to which they are appointed and to the satisfaction of the wardens" (Knepper, 1990, pp. 232–233). Vague and minimal language concerning job qualifications ensured that wardens made their selections with few constraints and invariably chose personal and political favorites.

The political system provided one or more well-paid positions in prison governance, along with greater numbers of positions for prison officers that paid reasonably well. In Arizona, guards received $75 a month in 1876. By 1900, they earned $80 a month during their first year and $100 a month after that. At $100 a month, guards' wages compared to skilled positions in mine operations, such as blacksmiths, machinists, engineers, and electricians, and on the railroads, including brakemen and boilermakers. Common laborers in mines and on railroads received $50–$60 a month, while farmhands were compensated as little as $30 per month.

The relatively high salaries for prison work, plus the benefits of sleeping quarters and meals came, however, with long hours and challenging work rules. Arizona's codified rules of conduct for guards in 1895 made them subject to 40 rules—7 more rules than applied to prisoners. It was the guards' responsibility to keep prisoners to the work assigned to them, require personal cleanliness, and restrict movement to designated places. The rules required guards to wear side arms, walk a beat every 15 minutes, and maintain a state of "watchfulness and wakefulness at all times." The warden's expectations extended to the guards' private life as well: The rules prohibited them from "consorting with loud and vicious company," frequenting saloons, and gambling while away from the prison (Knepper, 1990, p. 235).

THE ERA OF PROFESSIONALISM

Professionalism came to prison administration during the Progressive era (1900–1917), decades marked by wide-scale social engineering for egalitarian ends. Progressivism led to growth in the role of government and to cadres of government professionals specializing in everything from civil engineering and landscape architecture to policing and firefighting. Social workers, psychiatrists, and other experts joined prison staffs, and prison officers responded by professionalizing their ranks. The process they initiated around 1900 and continued throughout the 20th century. In corrections, *professionalism* refers to the idea that prison officers do more than "guard prisoners." The profession of prison officer requires specialized knowledge and skills acquired through education, training, and apprenticeship.

By the 1930s, most states included prison officers on civil service lists so that party politics no longer resulted in wholesale turnover of staff. However, the vocation of prison officer faced severe challenges due to a long workday, little training, and what had become a fairly low level of pay.

At the majority of prisons, officers continued to work 10 hours a day or more. Prison officers received little or no formal training but were expected to deal with inmates by intuition and on-the-job experience. When the Wickersham Commission (1928–1931) turned its attention to penal institutions, it found the situation for prison officers to be problematic. Named after its chair, George W. Wickersham, the commission was appointed by President Herbert Hoover to investigate the administration of justice following problems of corruption that had occurred during prohibition. The commission determined that low pay for prison officers made the positions attractive only to those without options or ambition. At somewhere between $1,000 and $1,500 a year, annual pay for prison officers had slipped below the level of "the most incompetent mechanic" (Rothman, 1980, p. 147). Consequently, staff turned over rapidly. Individuals worked for a year or two, then left.

During the 1950s, prison administrators increasingly began to voice the need for staff training and introduced specialized courses for prison officers. State commissions with responsibility for prisons began requiring that prison officers complete training comparable to that of state law enforcement officers. Oklahoma's commissioner of Charities and Corrections, for instance, recommended that all guards at the state's penitentiary complete a training school comparable to the highway patrol and that no guards at the state reformatory should have less than a high school education. This development led in turn to creation of centralized training academies within states and to a national training academy. James V. Bennett of the U.S. Bureau of Prisons became known for his insistence on prison staff selection and training during his more than two decades as director. Early efforts within the federal prison system to train line staff, beginning in 1969, were followed by a national institute for training corrections personnel. The National Institute of Corrections was established five years later.

It was also during the 1950s that prisons began to be called "state correctional institutions," wardens were renamed "superintendents," and guards became "corrections/correctional officers." These name changes were meant to inform the wider public that prisons, and those working in them, did not exist simply to "lock people away" but carried out a significant and meaningful role in society: enabling lawbreakers to fulfill their responsibilities under the social contract. The American Prison Association changed its name to the American Correctional Association (ACA) at its 1954 Congress of

Correction in Philadelphia, Pennsylvania. Founded by prison reformers in 1870, the ACA became throughout the second half of the 20th century a leading proponent of professionalism among corrections workers.

THE ERA OF CIVIL RIGHTS

The civil rights era (1954–1968) concentrated unprecedented energy against racial segregation and discrimination. Marches, protests, boycotts, "freedom rides," "sit-ins," and other forms of nonviolent protest helped bring about federal legislation to extend the benefits of citizenship to more people. Beginning with Black Muslims, prisoners won a series of rights through litigation and defeated the "hands-off" doctrine in which the courts had refused to examine prison administration. When prisoners came to be seen as citizens with rights under the law, it became apparent that prison officers had important legal rights related to their employment and working conditions. During the era of civil rights, women and African Americans claimed the right to pursue corrections as an occupation. Opportunities in corrections employment became available to women and African Americans as never before.

Gender

The first prisons had been designed by men, for men, and no women worked as guards in them, but by 1850, states began providing matrons for growing numbers of women prisoners. Matrons were responsible for the "female ward," typically small numbers of women prisoners confined in the absence of a facility for women. Women were hired to minimize the threat of exploitation, and consistent with the "matron theory" of prisoner reformation, to serve as good examples for female lawbreakers. More often than not, women became matrons as part of a "package deal": The warden or superintendent lived on site and the warden's wife assumed clerical and other administrative responsibilities.

The women's reformatory movement, beginning in 1870, led to the establishment of separate institutions for women lawbreakers. Copying the model of juvenile institutions, these women's prisons were built in rural areas on the cottage plan; inmates lived in small units under the supervision of matriarchal matrons. The title of "matron" survived until the middle of the 20th century, when it was changed to "cottage officer" and "cottage warden."

Women began working in men's prisons following enactment of the 1972 amendments to the Civil Rights Act of 1964. The amendments to Title VII strengthened the antidiscrimination provisions of the act and extended the nondiscrimination provision to public as well as private employers. By the late 1980s, women supervised male inmates in every state prison as well as the Federal Bureau of Prisons. The notion that men and women may be involved in similar work had come to prevail, although correctional staff experienced tensions as women took up their role in the control of inmates. By 1987, there were more than 519 women in correctional officer positions within the Bureau of Prisons, and women began to claim increasing numbers of upper-level management positions. Margaret Hambrick, appointed in 1981 to head the Federal Correctional Institution at Butner, North Carolina, was the first woman superintendent of a federal prison for men.

Title VII also ended many of the restrictions on men working in women's facilities. By the 1990s, the majority of staff positions in women's prisons came to be held by men. In 1996, women inmates in Michigan filed a class-action lawsuit charging that corrections officials had violated the civil rights of women prisoners by allowing men to use staff positions for sexual misconduct against the women under their supervision. The state reached a settlement in which corrections officials agreed to avoid assignment of male corrections officers to women's housing units. While restrictions on male staff supervising women prisoners remain subject to litigation, courts have found that male officers' employment concerns must give way to protect women prisoners' safety and privacy.

Race/Ethnicity

The 1972 amendments, and federal court intervention, opened the doors of prison employment to racial/ethnic minorities as well. In the southern states,

African American correctional officers worked in segregated facilities; part of all-black staff in facilities with all-black populations. These conditions limited leadership positions to a few. In North Carolina, for example, Lewyn M. Hayes became the first black superintendent of a corrections institution. He took charge of the Raleigh Youth Center for Negroes in 1952. The right to work in integrated facilities, and aspire to leadership positions throughout state corrections, did not come until the 1970s. There were no black employees supervising white inmates at Mississippi's Parchman Penitentiary, which had become by 1972, the starkest example of the system of racial segregation practiced in the South. Under pressure of federal court intervention, the superintendent in 1973 attempted to redress racial imbalance among staff with the appointment of an African American assistant warden and promotion of Eddie Holloway, who became Mississippi's first black warden.

Women and African Americans organized their own professional associations to identify areas of concern, make the most of opportunities, and offer support for colleagues. In 1975, at the ACA's annual congress, a Women's Caucus met to address the concerns of women in corrections. As a result, the ACA president in 1978 appointed a task force as a standing subcommittee of the Affirmative Action Committee. The National Association of Blacks in Criminal Justice (NABCJ) organized in 1974 following a meeting at the University of Alabama, at which Bennett Cooper, director of Ohio's Department of Rehabilitation and Correction, called for creation of a permanent national organization to focus on the goal of achieving equal justice for African Americans and other minorities.

CONCLUSION

Significant changes have occurred in the vocation of the prison officer during the 19th and 20th centuries. During the era of politics, all prison staff served "at the warden's pleasure." The era of professionalism institutionalized training requirements. Finally, during the era of civil rights, women and African Americans claimed the right to work in institutional roles that had been denied them. Despite all the changes, however, prison officers are still grappling with many of the same issues as they ever have. Relatively low salaries combined with low educational levels and repetitive tasks contribute to the job's enduring stigma.

HISTORY OF THE JUVENILE JUSTICE SYSTEM

See JUVENILE REFORMATORIES

HISTORY OF PRISONS

The presence of prisons is well documented in the annals of ancient history, mentioned in Greek philosophy, biblical sources, and the laws of Rome. The dominant forms of punishment in early times were execution, exile, fines, and the confiscation of property, and for debt, confinement until payment and debt bondage. The use of imprisonment as the major form of punishment, however, has a more recent history.

The difficulty of tracing the emergence of imprisonment itself as a form of punishment lies in the fact

that the prison—past and present—has had multiple functions. Prisons have served as places of custody for those to be tried, for those sentenced and awaiting their punishment, as sites for corporal punishment and execution, holding places for debtors, and (infrequently) in earlier times, as places for long-term or lifetime incarceration. For example, Rome's first-century B.C. Mamertine Prison, whose history can be traced back to the third-century B.C., was an underground chamber close to the seat of the courts, used both as a site of confinement and as a place of execution, as well as perhaps for punitive imprisonment. It is from these early beginnings and multiple functions that the contemporary use of imprisonment as punishment for crime can be traced.

EARLY EUROPE

In early medieval Europe, local prisons scattered across centers of population and seats of jurisdiction retained their multiple functions, while execution, exile, mutilation, enslavement, and fines remained the dominant forms of punishment. However, by the 13th and 14th centuries, canon law and ecclesiastical courts had developed with jurisdiction over lay persons as well as clergy. At the same time, monastic cells became a locus for penitential expiation within an institutionalized disciplinary system in a manner that foreshadowed the function of the prison as a site for moral correction.

In England, by the 12th century, the Tower of London, the Fleet, and other royal prisons held a range of occupants for both coercive and custodial purposes. People could be sentenced under common law or be placed there by the will of the sovereign for a range of activities, including incursion of debt. At the same time, towns and local nobles responsible for keeping the peace were required to provide local jails for those awaiting trial and sentencing. Jailors charged fees and sold food and clothing to the prisoners. Inmates had to pay any debts incurred during their confinement before they could be released. Conditions in these early jails ranged from relative comfort for those with means to a foul and death-threatening existence for those without.

The numbers of imprisonable offenses increased in England from the 13th century onward. By the 16th century, there were 180 such acts, including vagrancy, illegal bearing of arms, and morals offenses, which carried sentences of penal bondage. People sentenced for these crimes could be placed in "bridewells" or "houses of corrections" that sought to instill habits of discipline, hard labor, and religious observance in a domestic household model. London's Bridewell, the first of many in England, opened in 1556 for the confinement of women and men "idle, criminal and destitute."

For serious crimes, however, execution remained the primary punishment. The sheer number of

capital offenses, the severity of that punishment, and an increasing reluctance in the courts to enforce the penalty, led to the royal decree of 1615 that transportation to the colonies could be substituted for the penalty of death, with the stated purpose of combining "justice tempered with mercie" but reflecting economic interests as well. With the Transportation Act of 1718, penal bondage became the primary punishment for a range of offenses, predominantly those against property. Between 1718 and 1776, between 30,000 and 50,000 convicts, men and women, with sentences of bondage for 7 or 14 years or for life, were transported to America. By the 17th and early 18th centuries, the foundations were laid for the penal reforms that led to the development of the modern prison system.

THE RISE OF PENAL REFORM

Two currents were at work in England in the late 18th and early 19th centuries. One was a practical need to respond to the perceived rising crime and increasing disorder of a revolutionary time, to the loss of the American colonies for transportation, and to the increasing overcrowding and deteriorating conditions in local jails and houses of correction. The second was the changing views of the nature of punishment, inspired in part by Cesare Beccaria's essay *On Crimes and Punishments,* published in 1764. Beccaria's influence can be seen in the writings of men like Joshua Hanway and John Dornford, both of whom called for the care of both the body and the soul of the convicted, through solitary confinement, hard labor, and the ministrations of the chaplain.

Perhaps the most influential reformer of the time was John Howard, whose 1777 report on *The State of the Prisons in England and Wales* was widely read in England, Europe, and America. As the new sheriff of Bedfordshire, he was shocked with the conditions in the jails that were now his responsibility. Motivated by what he saw in his own county, he began to inspect all of England's prisons, decrying not only their filth, overcrowding, illness, lack of order and rules, but also the presence within them of acquitted persons unable to pay their jailor's fees. During his survey of the nation's prisons, he also visited the prison hulks at Woolrich, which were ships that had been pressed into convict service in 1776 as a "temporary expedient" after transportation to America ceased. Despite Howard's criticisms, the "temporary" use of the hulks as places of confinement supplying convict labor for the docks lasted until 1857.

Largely in response to Howard's exposé of prison conditions, England passed the 1779 Penitentiary Act. This act called for the construction of penitentiaries in each of the home counties, based on the principles of solitary confinement, religious instruction, and hard labor.

Millbank Prison, Britain's first vaunted national "penitentiary house," arose on the swampy banks of the Thames. In it, 1,200 convicts were to be housed in cells in six massive pentagons surrounding a central chapel rotunda. Though it was initially hailed as a humane and scientific experiment in the Christian redemptive value of hard labor in separate confinement, Millbank ultimately proved to be a failure. Inadequate pay rendered staff unreliable and hard to recruit, while small cells, built in a confusing maze made for unhealthy inmates, particularly when combined with a medically determined near-starvation diet, made inmates difficult to control. Begun in 1812 at the cost of nearly half a million pounds, and opened in 1816, Millbank had closed by 1844. Despite such initial setbacks in the design and running of penitentiaries, the movement for penal reform continued in England, and extended to the Continent as well as to the United States.

COLONIAL AND REPUBLICAN AMERICA

Like their counterparts in Britain, during the 17th and 18th centuries American colonists punished a wide range of conduct in a variety of ways, including fines, whippings, public shaming, banishment, and public execution. Influenced by Calvinism, the colonists believed that humankind was plagued by original sin that could not be corrected or rehabilitated. However, in some of the smaller, more intimate communities, offenders were viewed merely as wayward neighbors who could, through the use of the pillory and stocks, be cured through reintegrative shaming. If someone reoffended or committed a serious offense, they would be punished

harshly. Sanctions included public whipping and banishment and public executions.

Though for all of the colonies, as in England, public executions retained their central role, there was some variation in what conducts were proscribed and how they were punished. Thus for example, under Penn's "Great Law," Pennsylvania mandated hard labor in houses of correction for most offenses, while at the same time in New York about 20% of all offenses, including picking pockets, burglary, robbery, and horse stealing, were punishable by death.

The American Revolution and the repudiation of British rule brought about a reconsideration of the legacy of British justice. Deeply influenced by Enlightenment thinkers, and particularly by Beccaria's argument against the use of the death penalty, key reformers like Benjamin Rush in Pennsylvania and Thomas Eddy in New York advocated the deterrent use of incarceration. By 1820, almost all the new states had limited the use of the death penalty to first-degree murder or other serious crimes. In turn, following Pennsylvania's experiment in the Walnut Street Jail, most of the states, almost as their first public act, built state prisons with incarceration at hard labor as their primary punishment for crime.

As with the first penitentiaries in Europe, these early U.S. prisons were harsh and brutal places. Some, such as Newgate Prison in Connecticut, built in the 1770s, used an underground rock cavern that paralleled conditions in the ancient Roman Mamertine Prison. Repeating the troubles of the earlier houses of correction, inmates in the early state prisons were often inadequately supervised in overcrowded conditions. These prisons frequently spread disease and death but did little to deter crime in the new republic.

THE PENNSYLVANIA SYSTEM

Reflecting the same concerns that had influenced individuals like John Howard in England, reform groups lobbied for solitary confinement. One such influential group was the Philadelphia Society for Alleviating the Miseries of Public Prisons (1787). Following Howard's principles, the Philadelphia Society persuaded the Pennsylvania Legislature to authorize the construction of penal facilities that were based on a particular model of governance known as the Pennsylvania system. This system, as summarized by a contemporary, Robert Vaux, was based on five principles: (1) prisoners should not be treated with malice, their suffering should work to change their ways; (2) further corruption, or infection, within the prison can be prevented through solitary confinement; (3) solitary confinement can achieve penitence and repentance of the offender; (4) solitary confinement was a true punishment since people are social beings; and (5) solitary confinement was cost effective because it would not take long under isolation for inmates to become rehabilitated and fewer guards would be needed for their supervision.

The "separate system" was first implemented in Philadelphia in 1790, when part of the Walnut Street Jail was reconstructed into a penitentiary. Thirty-six solitary confinement cells were built for serious offenders. The policies of solitary confinement and mandatory labor implemented within the jail were designed to instill discipline and self-control. However, it soon became clear that this separate system was terribly expensive. The labor engaged in by the inmates did not cover the costs of the upkeep of the jail. Furthermore, overcrowding did not allow the administration to isolate inmates. Too many inmates spent time in idle waste so as to make the system virtually ineffective. In the end, the administration returned to hard convict labor and physical punishment in order to maintain control.

Despite the failures at the Walnut Street Jail, the state of Pennsylvania continued to experiment with the separate system, opening the Western Penitentiary in Pittsburgh in 1821 and in 1829 the Eastern Penitentiary in Philadelphia. Like the Walnut Street Jail, these prisons held inmates in isolation to work, read the Bible, reflect on their sins, and follow a code of silence. Cells were slightly larger than the typical cell of the day, and only a small amount of light shone within. Like the earlier Walnut Street Jail, by the 1860s overcrowding in the Eastern Penitentiary did not allow for solitary confinement. Once again, prison administrators returned to the old habits of leasing out convict labor and physically punishing rule breakers in order to maintain control. By 1833, the Western Penitentiary closed its doors.

THE AUBURN SYSTEM

While Pennsylvanian prison reformers advocated that prisoners should be held in solitary confinement for the duration of their sentence, New York prison reformers believed that inmates should labor together in order to minimize operating costs. The Auburn system, or the "congregate system," as it was called, held its inmates in solitary confinement only at night to allow them to contemplate on their sins but required that they labor in group workshops, engaging in factory-like labor. All activities followed strict schedules. Inmates were held to a code of silence from the moment they entered the prison to the moment they exited. In order to control movement, inmates were required to move in unison and in lockstep. During meals inmates sat backs straight, face to back. They were not allowed even eye contact with another inmate at any time. Each inmate wore a striped uniform. As informed upon their entrance to the prison, inmates for all intents and purposes were considered dead to the outside world.

However, as with the other prison reforms, overcrowding, budget concerns, and politics took over the administration of the Auburn Penitentiary. Soon inmate were housed two to three to a cell, segregation by offense or sex became impossible, and discipline was achieved through floggings, as in the past. While the congregate system was cheaper than the separate system, it still proved to be too expensive.

THE SOUTH

Though U.S. prison history is usually characterized as a battle between the Auburn and Pennsylvanian systems, it is important to realize that both of these models initially only influenced penal policy in the northern states. Life was very different in the South. Under slavery there were very few penitentiaries, and those that existed held only a handful of white offenders. South Carolina, for example, did not have a penitentiary until the late 1860s.

Following the Civil War and the abolition of slavery, southern prisons virtually doubled their inmate population as former slaves convicted under the notorious Black Acts were placed in prison or on chain gangs for any number of minor offenses. States also developed complex convict leasing schemes, where offenders were imprisoned in "portable prisons on wheels" as they labored for the state or for private entrepreneurs building roads, picking cotton, mining, or performing numerous other tasks to rebuild the shattered infrastructures of the South.

THE CINCINNATI DECLARATION OF PRINCIPLES

In 1870, the National Prison Association (now called the American Correctional Association) met in Cincinnati in order to address the harsh conditions of prisons throughout the country. The result of this meeting was the Declaration of Principles that set out a series of standards by which prisons should be governed. Most notably, the organization called for rehabilitation to become the primary purpose of the prison. The National Prison Association also declared that rehabilitation of the inmate should be achieved within the prison walls. Furthermore, time lapsed should no longer be the standard by which rehabilitation was determined. In essence, the Declaration of Principles called for the abolition of fixed sentences to be replaced by indeterminate sentences. In this way, the inmate had to prove he or she was rehabilitated before being released back into society.

THE ELMIRA REFORMATORY

The Elmira Reformatory, built in 1876, was the first prison to implement the Declaration of Principles set forth by the National Prison Association. Under the administration of Zebulon Brockway, the Elmira Reformatory sought to identify and treat the root causes of the individual's criminality. Believing in hard work as well as education, Brockway implemented a rigid program of work during the day and academic, vocational, and moral training during the evening. This program rested on a "mark" system of classification, based on earlier practices at Norfolk Island in Australia and in Ireland.

According to the mark system, an inmate could be placed in any one of three grades depending on his work and academic activities and behavior

within the reformatory. Inmates entered the Elmira Reformatory at grade two. If they earned nine marks a month for six months, they could move up to grade one, which was the grade required for release. However, if the inmate did not cooperate in his rehabilitation or violated rules, he was demoted to grade three. The inmate had to cooperate for three months before he could be considered for a higher grade. This classification system placed rehabilitation in the hands of the inmate.

PROGRESSIVE REFORMS: REHABILITATION AND THE MEDICAL MODEL

During the Progressive Era (1900–1930), prison reformers introduced many practices that remain today, including probation, parole, indeterminate sentences, the presentence report, treatment programs, and classification systems designed to identify the rehabilitative progressive of the inmate. The code of silence was eliminated, as were the lockstep and the separate system.

Progressive reformers believed in the medical model. They proposed that criminality was caused by individual social, biological, and psychological deficiencies. Hence the diseased inmate could be diagnosed and treated. The medical model ushered in a deepening reliance on indeterminate sentences; inmates were not released until the prison staff, often a social worker or psychologist, determined that they were cured. After World War II, new forms of treatment were introduced, such as group therapy, behavior modification, and counseling.

By the 1970s, the rehabilitation and medical models were losing favor. Rising crime, large-scale prison riots, and the publication of an influential article in 1974 by Robert Martinson that claimed that "nothing works" all contributed to a shift in penal policy. Liberal reformers began to call for the abolition of indeterminate sentencing and the reenactment of determinate sentencing in order to reduce the inconsistencies that had come to plague the penal system. Conservation reformers also lobbied to a return to determinate sentencing, arguing that the system was too lenient. Conservative reformers won the debate, ushering in a "get tough" on crime philosophy that resulted in habitual offender laws (i.e., three-strikes laws and sex offender laws), mandatory minimums, the reinstitution of the chain gang, and cuts in educational programs.

WOMEN'S PRISONS

Though much of prison reform in America, England, and Europe focused on the imprisonment of the male inmate, female inmates did get some attention. In the early 19th century, for example, fellow nonconformist Elizabeth Fry took over the mantle of John Howard. Unlike Howard, however, she mainly focused on the treatment of women. Fry in 1813 visited and publicized the disorderly conditions for women imprisoned at Newgate Prison in London. Confident of the role of faith, she taught and preached to the women and spoke and wrote widely, including her influential *Observations on the Siting, Superintendence and Government of Female Prisoners*, published in 1827. She stressed the need for the separation of women and children from male inmates, female prisons administered and staffed by women, and a focus on the needs of women for education and discipline. Quaker belief in the value of voluntary public action not only to curb abuse but to propose new reforms was instrumental in founding the Society for the Improvement of Prison Discipline in 1816, as well as stimulating women's prison associations.

In the United States, influenced by the work of Elizabeth Fry, the Women's Prison Association formed in New York in 1844 to improve the treatment of women and to separate them from men. The separation of female inmates was thought necessary because women were more delicate than men, had special needs including familial responsibilities, and were often victims of male inmates and guards. Though some, like Elizabeth Farnham, head matron of the women's wing at Sing Sing (1844–1848), attempted to improve conditions for female inmates fairly early in U.S. penal history, it was not until 1873 that the first female-run prison was opened in Indiana. In 1927, the federal government opened its first women's prison in Alderson, West Virginia.

CONCLUSION

These days, imprisonment has become an increasingly common method of punishment for all sorts of offenders in the United States. Though it has only been used as a punishment in its own right for little more than 200 years, the prison seems to be unassailable. Looking at the history of the development of this institution reminds us not only that it is of relatively recent origin, but also that many practices have been tried before and failed. Thus, as the nation turns to ever greater reliance on solitary confinement in supermaximum-secure prisons like Pelican Bay State Prison in California and ADX Florence in Colorado, we might do well to remember the failures of the Pennsylvania system and its concurrent expense.

HISTORY OF RELIGION IN PRISON

"Sin No More," the motto of the New York Prison Association, founded in 1844 and still active as the Correctional Association of New York, evocatively illustrates the religious origins and concepts that laid the foundation of the modern prison. An individual could redeem his or her sin through punishment. Although secular society institutionalized the criminal justice system, religion and religious discourse, whether sincere or formalist, has remained a key part of the correctional realm.

PENITENTIARY

The belief that it was possible to absolve sin through penance was the guiding principle of the early religious prisons and the origin of the term *penitentiary.* Jean Mabillon, a 17th-century French Benedictine monk, was the first to make use of the term penitentiary to designate the monastic prison in which the inmate was to spend his sentence for self-reform through spiritual contemplation and work in silence. Many of the early penitentiary practices, such as flogging and solitary confinement, were used in these religious prisons.

Quakers were the first to advocate prison reform in the United States based on religious principles. In 1787, the Philadelphia Quakers founded the Philadelphia Society for Alleviating the Miseries of Public Prisons. Philadelphia's Walnut Street Jail opened in 1790 where religious services were an integral part of the program for prisoners. Although a number of states built prisons on this model, by the early 19th century atrocious conditions, including overcrowding and congregate living arrangements, prompted reformers to look to new methods and models of confinement. The modern penitentiary was born with the Eastern State Penitentiary in Philadelphia (1829) and the Auburn Prison in New York (1819). Both prisons originally made use of solitary confinement for prisoners and were directed by rigid moralists and religious disciplinarians. Throughout the 19th century, most wardens of these prisons manifested at least outwardly a

deep spiritual commitment. Moral instruction was primarily, if not solely, religious, and the prison directors waged a continuous war on sin and social evils.

Through the second quarter of the 19th century, the major champion of the Auburn system of congregate labor and solitary confinement was the puritan New Englander Louis Dwight. Dwight founded the Boston Prison Discipline Society in 1826. The membership of the society was composed largely of Congregational and Baptist ministers. Dwight believed firmly in stern discipline and the inculcation of religious ideas in convicts. Most prisons in the United States until the post–Civil War period followed this model, a model infused with a stern Calvinist idea of the wages of sin.

After the Civil War, American prisons were subjected to the methodology of the social sciences and the professionals who became practitioners in social engineering. But in no way was religion and especially religious rhetoric banished from the corridors of the prison. In fact, Enoch Wines, one of the leading lights of post–Civil War prison reform, who helped compile the ground-breaking *Report on the Prisons and Reformatories of the United States and Canada* (1867), was a Protestant minister. Wines was one of the driving forces behind the National Prison Congress, held in Cincinnati in 1870. The congress, as summed up by Wines, strongly believed in the prison's role in the reformation of character. To accomplish this end, the congress recommended more productive labor, education, and religion in the prisons. The stated principles of the congress propounded reform through religion, education, and industrious work habits. The congress advocated social science methods, but methods still firmly based in religious belief.

THE RISE OF EVANGELISM AND THE SOCIAL SCIENCES

While it is clear that religion was a driving, defining force in prisons through the penitentiary's formative period in the 19th century, faith also found a central place in the prisoner's life during the Progressive period of the prison (1890–1950). It was not the stern Calvinism of olden days, but the Christian evangelical, social uplifting fervor of the social gospel movement. The character of prison reform during this period mirrored that of free-world society. The majority of Progressive reformers were middle-class Protestants who advocated applying Christian precepts to social problems. Moral fervor infused the Progressive prison reform movement with this Protestant spirit. But if the spirit was evangelistic the means were firmly rooted in a misdirected social science methodology that claimed to predict and reform criminal behavior.

As more and more social science professionals and methodologists took the reins of the vast American correctional edifice, official religious rhetoric became more formalist and even less efficacious than in the heyday of Calvinist influence. Though each prison usually had a chaplain, religion itself became more of an individual endeavor among the convicts. Self-reformation became the key for religious change. The increasing secularism that accompanied social science brought an end to institutionalized religion as a tool of reform. In addition, liberal theology advocated a more personal mode of devotion. Religion became just one more individual strategy of survival for the inmate.

THE INFLUENCE OF NON-CHRISTIAN RELIGIONS

Throughout most of the history of the American penitentiary, Christian principles molded the prison. However, as the racial demography of the prison changed during the 20th century so too did its religious makeup. With the great migration of southern blacks to the north and west in the first half of the 20th century, many northern prisons found themselves holding a black majority of prisoners. The militantly nationalistic Black Muslim movement converted many of these convicts. Giving converts discipline, protection, and a sense of purpose, the sect grew rapidly. Perhaps the most famous of these convicts was Malcolm X, who, as Malcolm Little, became a convert to Islam in a Massachusetts penitentiary in the 1950s.

Initially, prison official did not allow Muslims to observe many of the precepts of their religion,

including special diets and places and times to hold religious services. In response, a number of convicts asserted their rights and went to the courts, demanding, among other things, copies of the Koran, special meals, and to hold religious services. The U.S. Supreme Court, in 1964, in *Cooper v. Pate* reversed a lower court's dismissal of Black Muslim complaints, recognizing the Black Muslims as a legitimate religious group. This landmark case allowed prisoners for the first time to sue state officials in a federal court. The question of religion in prison thus opened the doors for countless prisoner lawsuits for the remainder of the century.

CONCLUSION

The history of religion in prison illustrates the condemned's quest for self-improvement and salvation. Institutionalized religion is a reflection of a society intent on the moral reformation of character. Religion gave the prisoner a framework in the quest for moral balance. Religion, however, could also be used as a retributive tool. Punishment as penance perhaps best sums up this history.

In the late 20th and early 21st centuries, prisons and prison reform have lost their bearings. The idea of rehabilitation and reformation, which was based on religious principles, fell out of favor in the 1970s and resulted in harsher, truth-in-sentencing laws, the abolishment of parole, and "no frills" prisons. Even so, at the end of the 20th century militant religion has made a comeback in prison in an attempt to resurrect the idea and practice of the ethical transformation of character. A number of moral and penal philosophers have taken up again the concept of religious repentance as an integral ingredient of punishment. Most controversially, a number of Christian prisons have sprung up in various states under the aegis of the Prison Fellowship Ministries, begun in 1976 by Charles Colson, the ex-convict former aide to President Richard Nixon. By many accounts, "graduates" of these prisons fare much better on release, have lower recidivism rates, and lead more productive lives than other ex-convicts. The reasons for these results are still unclear, as are the constitutional questions, but there is no doubt that religious activity has found a central place once again in the life of the prison.

HISTORY OF WOMEN'S PRISONS

Women throughout history have been imprisoned with men in refuges, workhouses and houses of correction, jails, debtor's prisons, chain gangs, penitentiaries, reformatories, and correctional institutions. Even so, their presence, and not infrequently that of their babies as well, was (and is) often overlooked in official documents and historical accounts. When it has been noted, often their imprisonment has been a source of concern and controversy. Above all, the numbers of incarcerated women and the conditions of their imprisonment have reflected not only wider socioeconomic realities and changing definitions of crime and forms of punishment but also the perceived nature and position of women at the time.

While there is a long history of women's imprisonment in Europe, Great Britain, and the American colonies, only in the 19th century did women begin to be incarcerated for long periods of time in facilities built for that purpose. Earlier, women and their children could be found in local almshouses and workhouses provided for the care and correction of

the poor and the vagrant; in crowded jails awaiting trial and sentencing; or, after sentencing, facing the penalty of death or its alternative, transportation and service in bondage. During the 18th and 19th centuries, Great Britain shipped thousands, women as well as men, initially to the American colonies and, after the American Revolution, to Australia.

HOUSES OF CORRECTION, LOCAL JAILS, AND TRANSPORTATION

During the 16th and 17th centuries, numerous "houses of correction" were established to house women and men found wandering, begging, or engaged in petty thievery or prostitution, for corrective discipline and productive work. London's Bridewell, the first of many in England, opened in 1556 for the confinement of "idle, criminal and destitute women and men." In 1602, the work of all the inmates in the Bridewell was leased to "three gentlemen," who then proceeded to sell the "labor" of the women as prostitutes. The first house of correction constructed specifically for women was Amsterdam's *Spinhuis*. Opened in 1645, it was hailed for its order, cleanliness, and productivity. The women's spinning and sewing was overseen by a warder and his wife in a paternalistic setting whose motto rejected vengeance but affirmed "a compulsion for good," and concluded: "My hand is stern, but my heart is kind."

In Great Britain, men and women were housed together in overcrowded and diseased local jails for many years. In 1813, Elizabeth Fry began visiting the women in London's Newgate Prison with other Quaker women. Most efforts to segregate prisoners by sex are usually traced to this time, and the subsequent public outcry caused by the reformers' reactions to what they saw. Reporting that nearly 300 women—"blaspheming, fighting, dram-drinking, half-naked"—with "their multitudes of children" were crowded into two wards and two cells while they awaited trial or after sentencing, faced death or transportation, Fry and her associates demanded changes in penal policy (Smith, 1962, p. 102). Ten years later in 1823, Parliamentary legislation required the separation of women, the appointment of a matron for their supervision, and no admission of men into their quarters unless accompanied by a woman officer.

While the 18th century's widening death penalty statutes, primarily for the protection of property, brought an increasing number of condemned women into the jails, the substitution in Great Britain of transportation for its actual use sent women, usually for theft, into the convict ships. Before the American Revolution, more than 30,000 men and women were sent to the colonies. From 1787 to the cessation of transportation in 1852, almost 25,000 women were shipped to Australia. Under the assignment system they were available for service as domestics or laborers, but the government reported in 1812 that they were "given to such of the inhabitants as demanded them, and were in general received rather as prostitutes than as servants" (Dobash, Dobash, & Gutteridge, 1986, p. 33). In response, a "Factory" prison was opened in Parramatta in 1821 to provide shelter and work for women who had not obtained jobs in service. While the original Factory and two others opened later served as a "marriage market" for interested settlers, women also viewed them as a place of protection rather than punishment. The final cessation of transportation forced the government of Great Britain to consider the alternative of long-term imprisonment as a replacement for the transportation that had regularly relieved their jails of women.

PENITENTIARIES OR REFUGES

In the legislatures of the new United States, as earlier in Great Britain's Parliament, there was awareness that capital punishment did not successfully produce a "terror" sufficient to deter an increasing number of property crimes. Influenced by a range of factors, including the writings of Cesare Beccaria, who argued that loss of freedom and public slavery were more effective a punishment than death, the new states built their penitentiaries. During the first part of the 19th century, disputes raged between those who supported complete solitary confinement and others who believed that the congregate silent system was best. Ultimately, the silent system won

out, since it enabled prison administrators to put prisoners to work in factory-like conditions, rather than leaving them alone in their cells all day furnished only with a Bible.

Another factor influencing where female offenders were placed can be found in legal scholar William Blackstone's assertion that under English common law a woman's legal existence as a person was suspended in marriage. In particular, under the "protection and influence" of her husband, who may restrain her "of her liberty" for misbehavior, a wife may be excused "in some felonies and other inferior crimes," though not for murder or treason (Blackstone, Sharswood's 1859 ed., Vol. I, pp. 442–444). Courts of the day, in America and Britain, were thus advised to recognize that a wife's criminal actions might occur under the influence of her husband or her need to provide for herself and her children absent her husband's "protection." Within the context of common law, the state as *parens patriae* could assume responsibility to "care and protect" as well as to "restrain" both children and "dependent" women. The state or "benevolent societies" assumed that paternal responsibility and control through the provision of refuges, almshouses, and houses of correction.

However, adult women who as *femme-sole* were legally persons were morally responsible for their actions when charged in a criminal court. Many urban and rural poor women, including freed slaves, had no "civil union" and the men and children in their lives were without legal "existence." As a consequence, they appeared in the courts as fit subjects for penitentiary discipline, as did those women convicted of murder or treason.

In 1833, in the Introduction to Gustave de Beaumont and Alexis de Tocqueville's famous report *On the Penitentiary System in the United States,* Francis Lieber argued that women needed the discipline of the penitentiary even more than men, since a woman in the courts as a *femme-sole* was not only "like a man" but according to "all criminalists" even more dangerous after "renouncing honesty and virtue" (Beaumont & Tocqueville, 1833, p. xiii). Confident that isolation from family, evil companions, and fellow convicts and the use of terror, silence, and work was of value, an inspector at Sing Sing reported that "no doubt is entertained, but the same discipline which now controls and subdues the male convict may be made equally serviceable with the female" (Beaumont & Tocqueville, 1833, p. xii). In the 1820s, the members of the Boston Prison Discipline Society praised the matron of the women's department of the Baltimore Penitentiary for developing a "system of industry, instruction and religious duty" for her 60 female convicts that saved them from sickness, made them "profitable for the State," and taught them "useful arts" for employment after release (Lewis, 1965, pp. 161, 162).

The reality, however, was revealed in the reports of the congregate penitentiaries where the unwanted women were placed in upper floors, inner rooms, or areas of the penitentiaries where, in competition with the larger numbers of male prisoners, they were deprived of exercise yards, windows, or fresh air. Indeed, just as its value for women was being hailed, the chaplain at the "model" Auburn Penitentiary protested that while the men's conditions were tolerable, for the 20 or 30 women, isolated and left to themselves in a securely locked attic room, it was "worse than death." Similarly, back in England, the governor of the newly constructed Millbank Prison in London reported that women held in solitary confinement in this model penitentiary "became liable to fits" that could be controlled only by the threat to shave and blister their heads. The assumption that women required less food, and thus could be given a reduced diet, had led to an outbreak of scurvy, illness, and death.

WOMEN'S VOICES ON REFORM

At Sing Sing, confident of the value of penitentiary discipline for women, a separate building named Mt. Pleasant, which included a nursery, was built in 1822. Its stormy history reflected the growing tension within prison reform movements between the male members, administrators, and legislators, who were increasingly supportive of solitary confinement, silent systems, and hard labor, and the middle-class women "visitors," who were not.

Predominantly Quaker and Evangelical, these women instead thought that kindness rather than terror was the key to submission and, reflective of women's nature, homelike communal settings rather than solitude were the locus of reformation.

Elizabeth Fry's *Observations on the Siting, Superintendence and Government of Female Prisoners,* published in 1827, became the influential guide for an increasing number of middle- and upper-class women who created their own reformist organizations. The Association of Women Visitors and the British Ladies Society for Promoting the Reformation of Female Prisoners in England and parallel societies in Philadelphia and New York sought control over imprisoned women, while attempting to follow Fry's advice to be "at once wise as serpents and harmless as doves" when facing male administrators and legislators. Fry's vision required a site separated from contact with male inmates or officers, managed by full-time "pious and benevolent" female staff with the assistance of lady visitors who would, through "kind superintendence" and "tender" treatment, develop their system of control and supervision. Her recommendations included classification with progressive motivational stages of privileges, provision for religious instruction, basic education, and continuous useful labor to create both orderly habits and training for later employment as domestics or seamstresses.

After a series of disturbances in Sing Sing's Mt. Pleasant Women's Prison, in 1844 the newly appointed matron, Elizabeth Farnham, influenced by Fry, was determined to transform the discipline that unsuccessfully "subdued" the female convict into one reflecting a "women's world," including the provision of flowers, curtains, a piano, women visitors, and a reading circle. After two years, Farnham was fired for her lack of "discipline."

However, critical changes were beginning to occur that would bring the opportunity for the views of Fry and others on the reformatory management of women prisoners to affect public policy both in Great Britain and the United States. While the penitentiary developed in the United States as the alternative to the "terror" of death, with the refusal of Australia to accept Great Britain's convicts, England's use of transportation for women ended in 1852. The resultant Penal Servitude Act of 1853 provided that all the rules and regulations for men would also apply to women.

PENAL DISCIPLINE

The heads of both England's and Ireland's prisons attempted to develop integrated systems of penal discipline for their male and female convicts, but Crofton's Irish system, more centralized, coordinated, and well publicized, became the model most influential in the United States. The system incorporated the concept of the "ticket of leave" or parole developed in Australia to release well-behaved convicts into the community before the end of their sentence, and elements of a "mark" system of incentives, not dissimilar to Fry's earlier recommendations, that were associated with the short-lived efforts of Alexander Maconochie to shift from a punitive to a reformative regime in the Australian Norfolk Island penal colony. Crofton's system, viewed positively in the 1850s by members of American prison reform societies, claimed to combine both punishment and reformation within the 3- to 15-year penal servitude sentences through the use of three stages. First, inmates had to endure a punishment period of solitary confinement (shortened for women) to ensure reflective submission and incentive for subsequent reformative discipline. Then they entered a second period of congregate work and successive levels of classification and earned privileges. Finally, they participated in an "intermediate" period of "individualized" supervised work in community settings, prior to early release under the surveillance of the constabulary.

For women, a wing of Dublin's Mountjoy Prison under the supervision of a matron and women officers provided the first two stages. Initially placed in cells for four months of solitary confinement, the women later moved through the levels of classification and increasing privileges in the second stage when they were allowed to participate in a congregate sewing room, schooling and religious instruction, a nursery, and provision for regular "lady

visitors." The successful completion of the second stage led to release to two refuges, one for Catholics managed by the Sisters of Mercy and one for Protestants, for work and placement in the community. The Irish system's well-publicized "success stories" tended to obscure the overt and covert resistance of women convicts to their well-disciplined "reformation."

However, viewed and praised by Rhoda Coffin and other influential American reformers, the Irish "reformatory system" became a model for prison management in the United States in the famous 1870 National Prison Association's "Declaration of Principles." The principles reflected the increasingly active role of "benevolent women" in social reform and embodied Fry's earlier vision that there should be separate facilities under "the agency of women." Reformer Coffin and others successfully won legislation in 1869 for the first separate prison for women in the United States, in the wake of sexual scandals at the Indiana Prison and the willingness of the warden to relieve himself of the burden of women. The Indiana Reformatory Prison for Women and Girls opened in Indianapolis in 1873 with women from the state prison and the juveniles housed in separate wings in what was described as a "homelike atmosphere." By 1877, the goal of full administration of the institution by women was achieved when Coffin was appointed head of the board and, in the words of the superintendent, the state "assigned to women the privilege of caring for, elevating and reforming her own sex" (Rafter, 1985, pp. 30–31).

Initially, efforts by women reformers in other states to place women with felony convictions in separate facilities were resisted by legislators and wardens of congregate penitentiaries and prisons who argued that the women inmates' domestic work—sewing, washing, and cooking—were management essentials. Their position was strengthened by the continuing reality that smaller numbers of imprisoned adult women made the provision of a separate system a serious economic burden, starving attempted facilities of needed resources, or in some cases, bringing under one roof all the women supervised by the state.

THE RISE AND DECLINE OF WOMEN'S REFORMATORIES

A critical element of the Irish system of reformative discipline brought to the United States was the administrative use of the incentive of parole to lessen sentence length. Parole was first introduced legislatively in Michigan in 1869 for women, but not men. The Michigan "three years law" for prostitution provided an indeterminate sentence of up to three years in place of a much shorter jail sentence, justified by the need for a longer period to "reform" prostitutes. Based on their good behavior women were released on parole to a newly formed House of Shelter, where they were prepared in a domestic setting to live a "true good womanly life." This gender-specific legislation for "fallen women" legitimized longer sentences for offenses that would not bring men to prison and assumed that women would benefit from differential sentencing and treatment. The result essentially set up a dual system with women with felony convictions remaining in the corners of state prisons while women whose lives did not conform to the dominant beliefs regarding their sexual and domestic responsibilities were brought under the supervision of the state. The House of Shelter combined what historian Nicole Rafter describes as the later model program for women's reformatories, one of a "relaxed prison discipline" combined with that of a "protective home" within a "family-setting," as the appropriate domestic model for the reformation of "fallen women."

The first "women's reformatory" opened in Massachusetts in 1877. After considerable political activity, unsuccessful starts, and persistent resistance, Hannah Chickering, Ellen Cheney Johnson, and others proudly celebrated the construction of the Reformatory Prison for Women at Sherborn (later called Framingham) for women who were "convicted of being vagrants, common drunkards, lewd and wanton and lascivious behavior, common nightwalkers, and other idle and disorderly females" (Lekkerkerker, 1931, pp. 92–94). With large work and school rooms, a chapel and nursery, individual rooms and dormitories and yards for recreation and farming, its founders assured the legislature that by

a "direct appeal" to the "self-interest" of these "idle and disorderly females," through the disciplinary use of classification, progressive privileges, shared wages, and conditional release, "voluntary industry, frugality and self reliance may be encouraged and promoted." Echoes can be heard of 16th- and 17-century "houses of correction."

New York followed suit through the politically astute efforts of Josephine Shaw Lowell and Abigail Hopper Gibbons, the first a commissioner of the State Board of Charities and the latter the active head of the Women's Prison Association. The significantly named House of Refuge opened at Hudson in 1887, followed in 1893 by the Western House of Refuge in Albion, New York. With Albion's cottages, including a nursery cottage, the model architecture for a women's reformatory emerged. Cottages promoted "the ideal of family life" with kitchens, dining rooms, and living rooms where, as a report notes, "the family assemble in the evening for diversion" (Rafter, 1985, p. 35). In the rationale for these new institutions, Lowell included not only an affirmation of the Irish system's goal of reformation but also the eugenic need to limit the "unrestrained liberty allowed to vagrant and degraded women" (Rafter, 1985, p. 44).

At the turn of the 20th century, with the emergence within the Progressive movement of professionally educated women, there were new efforts, predominantly in the Northeast and Midwest, to develop reformatories for fallen women. Opened in 1901, New York's Bedford Hills was headed by Katharine Bement Davis. With a doctorate from the University of Chicago, she stressed the scientific study of the backgrounds, characteristics, and methods of treatment for women. The placement of the Rockefeller-funded Laboratory of Social Hygiene at Bedford Hills and the formulation of model legislation for women's reformatories by the National Social Hygiene Association reflected the increasing Progressive concern with the social effects of prostitution. With the outbreak of World War I, fear of venereal disease among the troops led to the first gender-specific federal legislation prohibiting prostitution near army bases and providing federal support for the incarceration of women. Historian Estelle Freedman estimates that the legislation played a role in the development of at least 20 state women's institutions.

The subsequent passage of federal legislation criminalizing alcohol and narcotic use as well as providing suffrage for women, the appointment of Mabel Walker Willebrandt as assistant attorney general, and the presence of women's organizations active in prison reform brought mounting pressure for the construction of a model federal women's reformatory. The federal government, up to that point, contracted with states to house federal women prisoners. With the exposé by Kate Richard O'Hare, as a federal prisoner convicted under the Espionage Act, of conditions for women in the Missouri State Prison and the reluctance of states to house increasing numbers of women with federal convictions, the groundwork was laid for the significantly named Federal Industrial Reformatory and Industrial Farm for Women at Alderson, West Virginia. Opened in 1927 and staffed by women, the reformatory had, segregated by race, 14 cottages that included a nursery cottage and one named for Elizabeth Fry, as well as a working farm and garment factory, educational programs, forms of self-government, and extensive classification. Eugenia Lekkerkerker, in her classic study *Reformatories for Women in the United States* (1931), described Alderson as "undoubtedly the largest and best equipped reformatory that exists" (p. 127). Alderson was developed, organized, and defended by Mary Belle Harris, a fellow graduate with Davis of the University of Chicago, through 16 conflicted years with the male-administered central office of the Federal Bureau of Prisons (Lekkerkerker, 1931, p. 127).

By the 1930s, the women's reformatory movement had come to an end. States financially unable during the Depression to maintain a dual system brought the women housed in the corner of the state prison to the grounds of the "refuges" or "homes" for women imprisoned primarily for their sexual behavior. At the same time, the administration of both state and federal prison systems became increasingly centralized. While many states accepted the necessity of a separate prison for women, the prisons no longer functioned to serve women, but

supported and adopted the custodial values of the male-dominated prison system.

PATRIARCHY, SLAVERY, AND THE NEW SOUTH

While the Northern states developed reformatories for men and women, during the same period in the postbellum South, the passage of the Thirteenth Amendment in 1865 reaffirmed the belief that slavery or involuntary servitude as "punishment for crime" was a "terror-producing" alternative to death. For black women and men freed from domestic slavery, the rapidly developed Black Codes and vagrancy laws legitimated a state slavery that, through the use of convict leasing, provided the labor of both women and men to build the mines and railroads of the New South. In time, Southern states developed their own plantations, exemplified by Mississippi's Parchman Penitentiary, opened in 1900, where the women, most of whom were black, were segregated but vulnerable to sexual assault by male guards and trusties. They canned food, did laundry, sewed clothing, and in time of harvest, worked the cotton fields, reproducing women's roles under domestic slavery. At the same time, white women, with the exception of those *femme-sole* deemed dangerous "like men," were likely to be acquitted or if convicted, in a form of *parens patriae,* pardoned by the governor.

CONCLUSION: EQUAL RIGHTS AND INTEGRATION

In the 1960s, women reformers, often working within the civil rights movement, directly and indirectly shaped women's prisons. Legislation supporting equal employment opportunities had a double effect. Women whose employment options had previously been limited to the world of women's prisons were now able to move into men's prisons and central administration, while men were entitled to guard and administer women's prisons. As racial segregation based on the principle of "separate but equal" was questioned and challenged in the schools, women in the 1970s challenged gendered disparities in sentencing and the absence of or unequal programs and services for women.

Facing the cost of maintaining separate-but-equal programming for smaller numbers of women, one response at the state and federal level was the "coed" integration of facilities. Driven more by space needs than by programmatic concerns, however, the stated purposes included sharing educational, occupational, and medical resources, as well as "normalizing" relationships. In the face of resistance from staff, divergent disciplinary traditions and controversy on how "normalized" or "sexually exploitive" the relationships became, the reality of increasing numbers of women entering the system at the end of the 1970s curtailed the "experimentation" of co-corrections.

Ironically, the assumed "equality before the law" of sentencing guidelines, mandatory sentences, "three strikes" legislation, and the rejection of indeterminate sentences and parole disproportionately affected women. Like the earlier "war on prostitution," the "war on drugs" that began in the 1980s and still continues brought increasing numbers of women into prison. But rather than the earlier development of differential sentencing and treatment, the response has been increasing uniformity of treatment duplicating, for women, men's facilities and deterrent discipline. "Correctional institutions" may now be separated by gender or be "cogendered," but both are administered and staffed by women and men under the same disciplinary rules. Nevertheless, legacies of the past still remain in buildings, programs, and policies.

HIV/AIDS

At the end of 2000, around 2.2% of all state inmates (24,000 people) and 0.8% of all federal inmates (1,000 people) were infected with HIV. Among state and federal inmates, 0.6% and 0.2%, respectively, had AIDS. According to the Bureau of Justice Statistics (BJS), the rate of confirmed AIDS cases among the nation's prison population in 2000 was about four times the rate in the general population of the United States. Thirteen in every 10,000 persons in the United States general population had confirmed AIDS compared to 52 in every 10,000 prison inmates.

HIV INFECTION AND AIDS

The human immunodeficiency virus (HIV) does not kill a person directly. Instead, it destroys the immune system and makes people infected with HIV vulnerable to infections that are rarely seen in people with normal immune systems. After a person becomes infected with HIV, it may take years for symptoms to develop. During this latency period, many people are unaware they are infected but can still transmit the virus to others. Acquired immunodeficiency syndrome (AIDS) is diagnosed by a physician using certain clinical criteria (e.g., blood test results, AIDS indicator illnesses).

HOW HIV IS AND IS NOT TRANSMITTED

HIV can be spread by oral, vaginal, and anal sex with an infected person. The risk of HIV transmission through oral sex is much smaller than that associated with vaginal and anal sex. HIV is also transmitted by sharing needles or syringes with someone who is infected. Babies born to women infected with HIV may become infected before or during birth, or after birth through breast-feeding. Health care workers may be infected with HIV after being stuck with needles containing HIV-infected blood, or after infected blood gets into a worker's open cut or a mucous membrane (e.g., the eyes or inside of the nose). There has been one case of HIV transmission from acupuncture.

Most HIV-positive inmates became infected prior to their incarceration. HIV transmission through sharing injection equipment and unprotected sex does occur within correctional facilities, although not very frequently. A 1997/1998 article published in *The Canadian HIV/AIDS Policy & Law Newsletter,* for example, described a 1993 study of an HIV outbreak in a Scottish prison, which revealed that 13 inmates who engaged in extensive syringe sharing had become infected in prison. A study of an Australian prison found that at least four injection drug-using inmates had become infected in prison.

Correctional officers and inmates are often afraid of HIV being transmitted through a bite or a sneeze. Neither a small amount of blood being exposed to intact skin nor exposure to sweat, tears, saliva, or airborne droplets has ever been shown to result in HIV transmission. Biting or needlestick injuries pose a low threat of HIV transmission. According to the Centers for Disease Control and Prevention (CDC), 99.7% of needlestick/cut exposures do *not* lead to infection. Biting presents even less of a risk of HIV transmission than does a needlestick. Typically, a biter is more likely to come into contact with the victim's blood than vice versa. The medical literature has reported cases in which HIV appeared to have been transmitted by a bite but all of these cases involved severe trauma with extensive tissue tearing and damage, and the presence of blood. The CDC knows of cases where the hepatitis B virus has been transmitted through tattooing or body piercing, but no instances of HIV transmission through these practices. In the United States, blood is routinely screened for HIV antibodies. Consequently, HIV is very rarely transmitted through transfusions of infected blood or blood clotting factors. HIV is not spread by insects nor through casual contact such as sharing food utensils, towels and bedding, telephones, or toilet seats.

HIV AND AIDS IN PRISONS AND JAILS

The number of HIV infections and AIDS cases dropped from 1999 to 2000; however, this trend was not present in all states. The decrease in the number of confirmed AIDS cases was the first since data collection began in 1991. During 2000, 18 states reported a decrease in the number of HIV-infected inmates while 29 states reported an increase. Nearly one in four inmates known to be infected with HIV are incarcerated in New York; at least 6,000 inmates are infected with HIV in New York. New York also has the highest percent of the custody population that is infected with HIV (8.5%) followed by Maryland (with 4.3% or 998 inmates infected), Florida (with 3.7% or 2,640 inmates infected), and Texas (1.9% or 2,492 inmates infected).

The quality and effectiveness in HIV/AIDS care has improved with the introduction of protease inhibitors and highly active antiretroviral therapy (HAART). As a result, AIDS-related death rates in state prisons have been dropping, from 100/100,000 inmates in 1995 to 14/100,000 in 2000. AIDS-related illnesses are now the third leading cause of death in state prisons (after natural causes and suicides), having been the second leading cause of death since 1991. Death rates vary widely from state to state, however. For example, in 2000, the District of Columbia, Florida, New Jersey, Connecticut, New Hampshire, Pennsylvania, South Carolina, and Alabama all had AIDS-related death rates at least twice the national prison average of 14 deaths/100,000 inmates.

At mid-year 1999, 1.7% of jail inmates (8,615 inmates) were reported to be infected with HIV. Jails in the South and the Northeast account for 80% of all jail inmates known to be infected with HIV. The south held the largest number of inmates infected with HIV, followed by those in the northeast (3,822 and 3,105, respectively). Forty-three of the 50 largest jail jurisdictions held nearly 4,000 inmates who were known to be HIV-positive. Of these, almost one-third were held in New York City jails.

HIV/AIDS raises a number of issues for correctional administration, including those related to testing, housing, education, medical care, confidentiality, and the greater rates of HIV infection among women. Each of these issues is discussed briefly below.

HIV Antibody Testing

HIV infection is diagnosed by an ELISA test that is confirmed by a Western Blot test. Both of these tests detect HIV antibodies rather than HIV itself. It may take as long as several months for antibodies to develop to detectable levels. During this time, an infected person may still pass the virus on to others. All correctional systems provide HIV antibody testing on some basis. In 2000, the most common circumstances under which jurisdictions test inmates are: upon inmate request (46 jurisdictions), upon clinical indication of need (46), upon involvement in an incident (41), or upon intake (41).

Fifteen states test inmates in specific "high risk groups," and a handful of states test inmates upon their release, test all inmates currently in custody, or test inmates selected at random.

Housing

In 1985, 16% of state and federal facilities segregated prisoners with HIV and 75% segregated inmates with AIDS, on the grounds that it would reduce rates of HIV transmission. No reliable studies support this assertion. By 2003, Alabama was the only state to isolate inmates infected with HIV from all other prisoners in both its housing and its prison programs. Most states integrate inmates with HIV infection with the rest of the prison population and permit them to access some, if not all, prison programming. Some states house prisoners throughout the system until their medical condition warrants their transfer to a clinic that provides specialized care. Others—including programs in California, Texas, Florida, and South Carolina—group prisoners known to be infected with HIV into a single facility in an effort to provide state-of-the-art medical care. Some experts are concerned that a quarantine model may give prisoners in the general population a false sense of security and lead to greater transmission within the facility. Also, even in states with special HIV units, the demand for beds may exceed the supply, resulting in a lack of uniformity of care and expertise.

Education and Prevention

Incarceration provides an important opportunity to educate inmates about HIV, sexually transmitted diseases (STDs), and other communicable diseases. A 1997 National Institute of Justice/Centers for Disease Control and Prevention (NIJ/CDC) study found that HIV/STD education and prevention programs were becoming more common in correctional facilities. Few systems, however, had implemented comprehensive and intensive HIV prevention programs in all of their facilities. For example, while over 85% of prison and jail systems provided basic HIV information and explained the meaning of HIV test results, less than half offered education on more controversial topics such as how to negotiate safer sex or engage in safer injection practices. The NIJ/CDC study found that only 10% of state and federal prison systems and 5% of jail systems offered comprehensive programs in correctional facilities that included instructor- and peer-led programs, pre- and posttest counseling, and multisession prevention counseling.

Correctional administrators in the United States have resisted measures such as condom distribution that might reduce the spread of HIV and other STDs in the facility, citing concerns that condoms might be used as weapons (by filling them with sand or using them to strangle someone) or to conceal contraband. Another concern is that condom distribution implies that sexual activity is permitted when, in fact, it is prohibited behavior. In 2001, only 4% of U.S. jails and 10% of U.S. prison systems permitted condom distribution. Most other industrialized countries (including Canada and most European prison systems) make condoms available to inmates and report few problems.

Medical Care

The introduction of protease inhibitors and HAART in 1996 revolutionized the treatment of HIV/AIDS. These new HIV therapies have reduced morbidity and mortality in the general population, and they are widely available in correctional systems. Still, the treatment of HIV in a correctional setting presents many practical challenges as well as legal and ethical questions.

Barriers to Medical Care

Barriers to medical treatment of inmates remain such as high medication costs; inmate reluctance to seek testing and treatment out of fear, denial, and/or mistrust; and uneven medical competence and treatment standards. Features of correctional facilities such as strict schedules, definitions of "contraband," inmates' extremely limited ability to self-treat even minor medical ailments without reporting to sick call, and the need to constantly balance security concerns over the medical needs of inmates pose several challenges to the delivery of medical services to

inmates. Many inmates who are not adequately warned about the complicated drug regimens and the potential side effects may discontinue the treatment. Prison regulations and routines may interfere with inmates' attempts to comply with instructions regarding when and how to take the medication. If an antiretroviral regimen is pursued but fails, it may lead to resistance to other drugs of the same class thus limiting future treatment options and adding to the economic burden HIV imposes on society. Inmates with HIV infection often seek access to therapeutic clinical trials in hopes of obtaining good-quality care from knowledgeable university staff. Because of past abuses, federal regulations discourage—but do not prohibit—research conducted on inmates. Inmates seeking access to clinical trials may be accommodated by research protocols that recognize the importance of voluntary and uncoerced consent for research taking place in a prison setting. To determine the best treatment for the HIV-positive inmate, a clinician must take into account what will work best biologically, what will be most tolerable to the inmate-patient, and what will gain his or her maximum adherence to the treatment plan.

Legal and Ethical Considerations

The U.S. Supreme Court ruled in *Estelle v. Gamble* that inmates have a right to be free of "deliberate indifference to their serious health care needs" under the provisions of the Constitution's Eighth Amendment. According to the National Commission on Correctional Health Care (NCCHC), "deliberate indifference" often takes the form of denied or unreasonably delayed access to a physician for diagnosis and treatment, failure to administer treatment prescribed by a physician, and the denial of a professional medical judgment.

NCCHC identified some specific legal and ethical considerations associated with the provision of medical care. Maintaining rights to privacy has also been proven to be very difficult in a correctional setting where HIV infection is still feared and stigmatized; where medical information may be deduced from an inmate's movement, a cell search, or a pattern of scheduled visits; and where differing opinions may exist regarding who has a "need to know" someone's HIV status. Correctional staff and inmates have been implicated in breaches of confidentiality in many institutions. These breaches suggest a need to hold prison administrators more accountable for their confidentiality policies. Additional issues relate to the nature of the provider-patient relationship in a prison—the inmate cannot seek treatment elsewhere and the provider cannot refuse to treat the patient-inmate—and the right of a mentally competent adult to refuse treatment.

Women With HIV Infection

Factors such as drug use, race, poverty, having a partner who uses drugs, and having a history of sex work or physical or sexual victimization that place women at increased risk for incarceration also put women at increased risk for HIV infection. HIV infection rates are higher among women prison inmates than men inmates; 3.6% of all female inmates in state facilities were HIV infected compared to 2.2% of men. At the end of 2000, around 20,000 male inmates and 2,200 female inmates in state prisons were known to be HIV-positive. In six states and the District of Columbia, more than 5% of all female inmates were known to be HIV-positive. In two jurisdictions, more than 15% of all female inmates were known to be infected: the District of Columbia (41%) and New York (18.2%). As in the United States as a whole, women of color are overrepresented among those incarcerated who are infected with HIV.

Men and women HIV-positive inmates face similar problems such as the violation of their privacy rights, discrimination and stigma, unsanitary housing conditions, and difficulty accessing quality medical care. In addition, the HIV Education Prison Project reports that women inmates face the additional challenges of receiving HIV care from a doctor who not only has expertise but also recognizes the women-specific issues, such as gynecologic complications of HIV infections, management of the HIV-positive pregnant woman, and monitoring for toxicities of antiretroviral therapy. For example,

women who are infected with HIV have high rates of STDs and cervical neoplasia; thus physical examinations should include pelvic exams (with Pap smear and STD screening), and laboratory evaluations should include screening for other bloodborne infections (e.g., hepatitis B and hepatitis C, tuberculosis), and other tests. Around one-quarter to one-third of all untreated pregnant women infected with HIV will pass the infection to the fetus during pregnancy or birth. If a woman can safely take AZT or Retrovir during pregnancy, labor, and delivery and she has a cesarean delivery, infection rates can be reduced to 1%.

Discharge Planning

In 1996, inmates comprised 35% of the U.S. population infected with tuberculosis and 17% of those infected with HIV. Releasing sick inmates—including those infected with HIV—with proper treatment and arrangements for follow-up care not only improves their health status but also reduces the potential threat they pose to public health. Inmates with HIV benefit most from a "continuum of care" encompassing early detection, effective medical and psychosocial support, prevention and risk-reduction counseling, hospice care and substance abuse treatment when appropriate, prerelease planning, and linkage to community-based services. Ideally, discharge planning for inmates with HIV disease and other health problems helps to ensure prisoners will be able to obtain their medications and adhere to their regimens. A 1997 NIJ/CDC study of discharge planning services found that inmates in most correctional systems are given referrals for services. Far fewer systems actually make appointments for inmates and provide additional support and assistance to ensure that inmates make contact and receive the services they need. For example, although 82% of state and federal systems made referrals for HIV medications, fewer than one in three made an appointment. Continuity of care is particularly difficult in jail settings since the time of discharge is often unanticipated and many jail inmates enter and exit the system frequently.

CONCLUSION

HIV/AIDS poses a complex set of legal, ethical, and practical challenges for prisons and jails, particularly in the areas of housing, medical care, education, and discharge planning. While many medical advances have been made in the treatment of HIV infection, efforts are still needed to ensure that inmates' privacy rights are protected and that the correctional system's response to HIV is based on the best epidemiological information available rather than prejudice and fear.

HOME ARREST

Home arrest is a form of intermediate sanction that is used as an alternative to incarceration. This practice is known by many different names, including house arrest, home confinement, home detention, home incarceration, or home curfew. It comes in many forms and is used throughout the country for a diverse range of offenders. Typically, the decision to place someone on home arrest sentence is based on risk prediction involving factors such as the offender's past criminal record, the nature and circumstances of the current offense, history of good conduct, community and family witnesses, personal and family history, and drug or alcohol abuse history.

Home arrest allows the criminal justice system to reduce costs and some harmful effects of incarceration while allowing the offender access to rehabilitative opportunities in the community. Offenders under home arrest often serve their sentence (or some part of it) in the community, while remaining in their residence during certain defined hours of the day and night. As a result, they are often able to maintain employment. Where possible they are also required to pay some of the costs of monitoring house arrest, in addition to any restitution they may owe to victims.

Home arrest is administered at the frontend of the criminal justice system as a form of sentencing, but it can also be used at the backend of the criminal justice system as part of parole. It may be used for nonviolent offenders in lieu of prison or for violent offenders and/or repeat offenders as a form of intensive supervision after prison. In some instances, home arrest is used prior to conviction in the criminal justice system for pretrial release of offenders who cannot afford bail or for offenders who pose increased risk of flight or danger to the community.

HISTORICAL USE

Although some may think that home arrest an invention of the late 20th century, it was used as early as the 16th century when church authorities placed Galileo under house arrest for his heretical assertion that the earth revolved around the sun. In very early applications, an armed guard was placed outside the residence to enforce home arrest.

The first widespread use of home arrest in the U.S. criminal justice system occurred almost simultaneously in 1983 in two states, Florida and New Mexico. At the time, New Mexico's criminal justice system predominantly administered home arrest sentences to driving under the influence (DUI) and white-collar offenders, while Florida mainly sentenced DUI offender. Research from Florida indicated that 80% of offenders on home arrest were employed and half participated in restitution and community service programs. After Florida's success, the federal government started using home arrest in 1986 in concert with its early release and parole programs. The federal government in fact has made the most use of home arrest sentencing options.

CURRENT HOME ARREST PRACTICES

Home arrest is used in the United States in the pretrial phase of the criminal justice system, postconviction as a noncustodial sentencing alternative to incarceration, and postincarceration as an additional sanction after release from time served in a jail or prison facility. Offenders on home arrest are frequently required to stay within a few hundred feet of their residence. Some are mandated to remain at home 24 hours a day, while others are assigned curfew with authorization to leave during certain hours. Curfews are determined on a case-by-case basis by criminal justice officials according to the goals of supervision. Offenders typically are allowed to leave for work, medical appointments, appointments for rehabilitative programming, and other preapproved appointments. Compliance with curfews is verified by regular and random visits to the offender's residence and place of employment typically by a probation or parole officer.

Due to advances in cost and technology, electronic monitoring devices have become commonplace in home arrest sentencing to ensure compliance with curfew hours. Private companies, in contract with government or nonprofit agencies,

generally make and operate electronic monitoring systems. Offenders are required to wear a monitoring device on their person, such as a bracelet on their ankle or wrist; these devices are often noticeable, but advances have been made so that some appear to be an ordinary watch or pager. Some advances have been made to detect tampering and to ensure compliance such as voice recognition devices and visual verification through video cameras connected to computers, which allow offenders and criminal justice officials to meet without traveling to the offenders' residence.

Modern technology advances have increased reliability of monitoring devices where initially telecommunication and radio signals were used; now some devices have the ability to track the exact location of the offender by using global positioning satellite (GPS). This is used particularly as an enhancement for dangerous offenders, such as sex offenders who are restricted from going near victims, schools, day care centers, and parks. There has even been discussion of surgical implantations of monitoring devices, although due to the intrusive nature of these devices it is unclear that this would be constitutionally permissible.

There are two types of electronic monitoring systems—passive monitors and active monitors. Passive monitors respond only to inquiries; for example, the offender responds to an automated call and then places the monitoring device near the monitoring receiver to verify his or her location. Active monitors send continuance signals to the monitoring device worn by the offender to a monitoring receiver. The monitoring company notifies criminal justice officials if there is any break in the signal or any curfew violations. Typically, probation or parole officers will review the logs of violations at a later date. Violations may be due to unauthorized absences from the residence or place of employment, failure to return to residence, late arrivals, early departures, equipment malfunctions, loss of electrical power or telephone service, or device tampering. Penalties or sanctions for violations vary and commonly rely on criminal justice officials' discretion; however, they can range from increased monitoring to incarceration.

BENEFITS OF HOME ARREST POLICIES

Home arrest policies were originally designed to reduce costs of incarceration and to alleviate overcrowding in jails and prisons. The average cost of incarceration in jail or prison ranges from $10,000 to $25,000 per person per year, while the average cost to administer home arrest ranges from $2,000 to $7,000. Even when electronic monitoring is added to home arrest the average cost ranges from $3,000 to $10,000. The savings appear to be plain and simple. In addition, offenders are often required to pay a portion or the entire cost of monitoring devices.

Home arrest may be particularly advantageous for offenders with special needs. People with physical or developmental disabilities, communicable diseases, terminal illnesses, or mental illness, along with pregnant women and elderly offenders, may benefit from this strategy because they are able to use family and other community resources.

Proponents attest that home arrest is more humane than jails and prisons and minimizes the trauma and stigma of incarceration with hardened criminals. This is particularly true for juvenile offenders. By design, home arrest policies for juveniles comply with federal legislation that requires juveniles to remain outside of sight and sound of incarcerated adult offenders. Home arrest also helps juveniles because it allows juveniles to stay in their current school and education programs, while the home arrest curfews keep juveniles out of trouble and reduce influence of delinquent peers.

Home arrest provides more rehabilitation opportunities, such as job/skill training, drug/alcohol treatment, mental health counseling, self-improvement programs, and general equivalency diploma (GED)/education programs. These types of programs are in more abundance in the community than in jails or prisons and provide a better opportunity to rehabilitate offenders, increasing their likelihood of not returning to a life of crime. Proponents go so far as to claim that even after a period of incarceration home arrest provides an easier transition or reintegration back to community because it provides more structure than regular probation or parole.

PROBLEMS WITH HOME ARREST POLICIES

The critiques of home arrest fall into four general categories. First, critics argue that home arrest results in increased punishment. Second, they contend that home arrest is actually more costly. Third, they suggest that home arrest is actually ineffective in terms of surveillance and public safety, while finally, some argue that home arrest violates offenders' civil rights.

Combining arguments one and two, critics point out that home arrest policies are often used for low-level offenders who otherwise would merely have been sentenced to probation. Due to the restrictions that are part of home arrest, such as curfew and victim restitution, it may be, in fact, more punitive than traditional sentencing particularly since those offenders who receive home arrest frequently need surveillance and rehabilitation opportunities the least. According to this argument, home arrest policies actually increase or "widen the net" of the criminal justice system because offenders on home arrest are monitored more intensively. Violations of conditions are more likely to be detected, which results in more jail or prison terms.

Others point out that for pretrial detainees or for those who violate conditions on home arrest, the time served on home arrest does not count toward time served once they receive their sentencing. In other words, pretrial offenders still have to serve their entire sentence with no credit for the home arrest program time. Last, in terms of cost, home arrest can be expensive to start because equipment must be purchased, monitoring companies must be paid, and probation or parole officers still have to be paid.

For some, home arrest is not effective in terms of surveillance or public safety. Some critics believe that home arrest does not ensure incapacitation of criminal activity, and it does not effectively punish offenders. In general, the purpose of home arrest is incapacitation with some rehabilitation programming, but critics contend that if life goes on as normal without severe consequences this punishment may not deter criminals from violating the law. Others point out the lack of reliability in monitoring systems due to false alarms, battery failures, interruptions in service, and general lack of adequate technology. Offenders are able to commit crime while at home or in the community without violating any curfew and without the detection of a probation or parole officer. Offenders may keep associating with other criminal offenders and allow them to mastermind, control, or direct others to violate laws. Offenders may be able to continue drug sales, drug and alcohol abuse, conspiracy, and fencing of stolen property in their home. Also, because offenders are locked in the house with their family, home arrest may actually increase certain crimes such as assaults on family members including domestic violence and child abuse.

Despite the fact that staying at home may be somewhat of a luxury, offenders may come to hate their monitoring devices and surveillance officers. There is some concern, in other words, that home arrest may increase the likelihood of criminal activity due to "cabin fever," in which the desire to tamper with the monitoring device may become overwhelming. The effectiveness of home arrest may be reduced as some offenders become "stir crazy" and try to leave the residence. For this reason, many argue that home arrest should not last more than three to six months after which time the general effectiveness tends to wear off. Others contend that home arrest sets unrealistic goals and expectations of success because home arrest requires some level of self-discipline, but most criminals are impulsive by nature.

As mentioned above, concern exists about civil liberty issues in home arrest policies. By extending prison and punishment into the offender's own residence, criminal justice officials are said to be turning the offender's community into one big detention facility. Therefore, home arrest is unduly oppressive and grossly disproportionate to the criminal violations. Home arrest and electronic monitoring are likened to an Orwellian invasion with "big brother" watching over them in the privacy of their own homes. Opponents assert that home arrest is an abuse of monitoring that is so intrusive that it violates Fourth Amendment civil rights—especially those of family members in the same house who did not break any laws. In response, law enforcement

points out that home arrest is voluntary and because they have violated laws and victimized others, offenders have diminished civil rights especially in terms of Fourth Amendment waivers.

RACE AND GENDER

The racial and class bias of home arrest policies was evident early in its administration process. In the beginning, house arrest sentences primarily involved mostly male, mostly white, and mostly middle-class offenders because criminal justice officials eliminated offenders with long criminal histories, violent criminal histories, no employment, and no ability to pay for monitoring devices or restitution to victims. In addition, offenders on home arrest often need to provide references from the community to testify as to their good character. As a result of other factors in society and in the criminal justice system, young urban, minority males often have long or violent criminal histories, often lack employment, lack good character witnesses, and lack ability to pay for monitoring or restitution, and many do not have a telephone, which is a requirement for some of the monitoring devices. Because of the policy decision to use house arrest mainly for DUI, white-collar, and other low-level offenders, poor and minority offenders are often excluded. Along with minorities, a larger percentage of unmarried females also lack employment and ability to pay for monitoring and restitution compared to middle-class males. One can imagine the amplified bias young, unmarried, poor, urban, minority females face.

Some criminal justice jurisdictions attempt to address the inherent bias by using a sliding scale for offender income, although this cannot help those who have no employment at all. Some jurisdictions also provide telephones to offenders who do not have them. Community service may be substituted in place of monetary restitution to victims.

CONCLUSION

Although there have been no large-scale studies of the effects of home arrest, some research suggests that those who are confined to their houses for first offenses generally reoffend at lower rates than those who receive other forms of punishment. Some say this success is mostly due to the fact that those offenders had employment, and because home arrest is often given to those offenders who posed little risk anyway.

Home arrest has been used internationally throughout Europe, Canada, and Australia, and it has been used in all 50 U.S. states and the federal system including Guam, Puerto Rico, and the Virgin Islands. It became particularly popular in the United States during the 1980s as a sentencing alternative to combat prison and jail overcrowding, although its popularity waned somewhat in the "get tough on crime" era of the 1990s. At the time of writing, home arrest is on the ascendancy once more because of budget crunches, jail and prison overcrowding, and a national trend of philosophy changes in community corrections from rehabilitation to surveillance. The general public tends to approve of home arrest policies because of the inherent accountability, victim compensation, and offender payment for costs of supervision while maintaining relative community safety.

HOMOSEXUAL PRISONERS

Current demographic estimates figure that approximately 3% to 9% of the general U.S. population are gay. Similar numbers are thought to live in the nation's penal system. As a result, at any given moment, there are believed to be anywhere from 60,000 to 180,000 gays being detained in U.S. prisons and jails. Though no longer subject to the harsh sodomy laws of the past, these men remain targets of discrimination, hate crimes, and sexual assault, inside and outside prison walls.

INCARCERATING HOMOSEXUALS

Until recently, sexual acts considered to be particularly associated with homosexuality have been against the law in many states. In Oklahoma, for example, persons found guilty of engaging in sodomy faced a maximum prison sentence of 20 years. This law and others like it tended to discriminate against gays as heterosexuals engaging in the same activity were rarely punished. This disparity continued until the landmark case *Lawrence and Garner v. Texas* (2003), in which the U.S. Supreme Court ruled 6–3 that sodomy laws were unconstitutional.

GENDER ROLES

Within single-sex environments such as prisons, normative gender role systems become complicated. For instance, because women are not housed with male prisoners, traditional divisions of gender do not exist there. Instead, interaction between inmates serves to establish a unique cultural hierarchy based on gender roles rather than gender itself. Researchers have attempted to understand the existing gender role system in prisons and to ascribe meaning to three specific observed roles. The roles of "men," "queens," and "punks" serve to stratify inmates into a power structure that is partly based on perceived gender roles from outside the institutional setting.

Men, Queens, and Punks

The majority of male prisoners are classified as "men," meaning that they uphold most traditional norms of masculinity. Regardless of their behavior, most other inmates and guards do not consider them to be homosexual. Most "men" exhibit heterosexual behavioral patterns before and after incarceration and it is only within the confines of the penal system that they may act out what outwardly appear to be homosexual acts. Conversely, "queens," also known as "bitches" or "ladies," are homosexuals whose behavioral patterns inside prison are similar to their actions on the outside. Within the prison subculture, they are essentially considered to be females and are strictly receptive in terms of penetrative sex.

"Queens" are generally submissive to the "men," and are usually not allowed to hold positions of obvious social power. In many correctional facilities, queens are systematically separated from the rest of the population to protect them from violent attacks and to reduce the occurrence of sexual activity and assault. This partitioning sometimes leads to discrimination against queens, and they are often denied inmate privileges, such as library and yard exercise rights. Effeminate gay men who enter the prison system are often pressured to assume a role because overt homosexuality is believed to be socially unacceptable. However, men are able to exist as openly gay without having to subscribe to these specific gendered identities. A small percentage of homosexuals pass as "men" by assimilating into this dominant subculture.

"Punks" are typically young, nonviolent, middle-class offenders. Because of these factors, they often find themselves as minorities in position of conflict within the social hierarchy. The relationships between queens and punks are often very tense, as punks usually far outnumber queens. More important, since the most coveted position is in partnership with a "man" who will protect his allies from the

dangers of prison life, queens resent being passed up for punks. However, punks are also at higher risk of being raped by "men" and therefore occupy a marginalized role of their own.

SITUATIONAL HOMOSEXUALITY

Often mistakenly equated with homosexuality, situational homosexuality happens when heterosexual inmates participate willingly in homosexual relationships. Though it can simply be a response to loneliness and/or desire, situational homosexuality is often formulated around a hierarchy of power based on the sexual status of individual prisoners and the particular role they play within that hierarchy. This system is sometimes the source of sexual violence within prisons, when rape and assault are used as tools to maintain positions of authority among the prison population. Unfortunately, there is scant writing on situational homosexual activity before the 20th century, limiting attempts to trace its historical development. However, some evidence documents situational homosexuality, both consensual and coercive, in 19th-century prison systems.

Though difficult to gauge, researchers have been attempting to understand the prevalence of sexual activity within the penal system. One prominent recent study suggests that at least 80% of inmates perceive themselves to be heterosexual, whereas 8% report being homosexual. Of these, just under 19% are believed to have had a steady male partner. With regards to specific sexual acts during incarceration, 24% reported having touched or allowing their penis to be touched; while 23% had participated in oral sex. Twenty percent admitted to having had anal sex, and 8% had kissed or had been kissed by a fellow inmate.

THEORIES ABOUT SITUATIONAL HOMOSEXUALITY

A range of different explanations exist for why men who otherwise self-identify as heterosexual take part in homosexual activities remains unclear. For example, former inmate and prisoner rights activist Steven Donaldson has suggested that when a "man" sexually penetrates another inmate it is generally not viewed as a homosexual act. Instead, it serves to reinforce the "man's" masculine identity and power within the social hierarchy. Thus, within the confines of the prison, penetrating a "queen" or a "punk" is still considered to be heterosexual and to a certain extent, normal.

In contrast, proponents of the deprivation theory argue that prison homosexuality is specifically caused by the "pains of imprisonment." Based on the work of Gresham Sykes, these authors identify five specific pains prisoners face: the deprivation of liberty; deprivation of goods and services; deprivation of autonomy; deprivation of security; deprivation of physiological and emotional gratification associated with heterosexual relationships. Loss of these outside world comforts are then thought to cause inmates to seek gratification through alternative sources, usually through sexual relationships. Thus, prisoners can justify their transition to homosexual behavior because they are bored, needy, or lonely. Critics of this theory argue that sexual relationships established within the system often result in further victimization and exploitation. They also argue that it is difficult to measure deprivation because the individual inmates' perceptions of personal deprivation may not coincide with individual researchers' conceptualizations.

In contrast, followers of the importation theory believe that the behavior, both sexual and otherwise, of inmates is brought to the prison system from the outside. According to this theory, previous homosexual experience external to the prison setting is significant in predicting homosexual behavior while in prison. Thus, proponents of this theory suggest that inmates are sexually expressing themselves as they really are. Critics of this theory argue that most inmates' previous homosexual experience took place in jails, other reformatories, or incarceration programs. Thus, there is something unique about same-sex settings that seem to foster situational homosexuality.

HIV/AIDS

Individuals who participate in high-risk drug use, tattooing with dirty needles, unprotected sex, and sex work are at risk of contacting HIV/AIDS.

Specifically, those who engage in anal intercourse are at highest risk of contracting the deadly disease. Even though sexual activity is generally prohibited among inmates, it is undoubtedly a part of prison life. Prison officials are often tolerant of sexual relationships among inmates, and view them as an issue of minimal importance. Whether consensual or not, unprotected sexual relations put inmates at high risk for contracting HIV/AIDS. Despite the fact that sexual activity is acknowledged as a fact within prisons, in a majority of settings, condoms are considered to be contraband.

Not surprisingly, then, the current rate of confirmed HIV/AIDS cases is five times higher in state and federal prisons than among the general U.S. population, with African Americans and Hispanics being disproportionately affected. Because prisons have the nation's highest concentration of individuals with HIV/AIDS and are the population at highest risk for contracting it, heath experts refer to the circumstances as of epidemic proportions. Despite this, current research suggests that HIV transmission among prisoners is low and that most HIV-positive prisoners contracted the disease prior to incarceration. Regardless of these findings, any individual who engages in sexual activity, whether consensual or not, is at high risk for contracting the fatal illness while in prison.

VIOLENCE AGAINST GAY MEN

Violence against gay men is prevalent inside and outside of the prison setting. The torture and murder of Matthew Shepard in 1998 made national headlines and created widespread awareness of hate crimes against gays. Meanwhile, the prison setting has not been immune to such brutal attacks. In one well-known case, *Gregory v. Shelby* (2000), a known homosexual inmate was sexually assaulted and then murdered by a fellow prisoner.

SEXUAL ASSAULT

Sexual aggressors act out assaults for power rather than for sexual gratification. In men's prisons, inmate rape is generally committed by a "man" or group of "men" as an act of assertion of authority against one who wishes to preserve his heterosexual or homosexual autonomy. It is believed that sexual assault in male prisons reinforces the stereotypes associated with traditional societal gender roles. Thus, the largest influence of sexual assault is attributed to the "men," who are believed to be the ringleaders of social politics within the confines of prison.

Based on what is currently known about sexual assault in male prisons, race, class, and age appear to be significant factors for victimization. Middle- and upper-class prisoners are often more susceptible to sexual attacks because they are usually nonviolent and inexperienced in the prison's subculture. In addition, younger male inmates tend to be assaulted most often, as well as whites. In women's prisons, inmates tend to be assaulted by male prison guards, as opposed to other female inmates. Regardless of gender, victims are often discouraged from seeking help out of fear or shame. Even when sexual crimes are reported, disciplinary action is more likely to be imparted on known homosexuals than on known sexual aggressors.

Human rights groups have raised awareness of this sexual violence for both male and female prisoners, calling for significant policy changes. Proposals for reform include a tighter classification system based on the level of security needed to protect individual inmates, the legalization of consensual homosexual activity while still punishing rape, and the allowance of conjugal visits. Some institutions have abolished cell sharing, some house all "queens" and "punks" apart from the "men," and others punish any and all sexual activity. Others are developing educational campaigns to train guards to better handle situations of reported sexual assault. Perhaps most important, in 2003, the federal Prison Rape Elimination Act (HR 1707) was enacted calling national attention to the seriousness of sexual assault in prisons.

CONCLUSION

Just as a portion of the general population are homosexual, so also is a segment of the prison population.

While traditional homosexuality and situational homosexuality are often confused, same-sex intercourse can and does occur among both homosexuals and heterosexuals. However, gender roles and prison norms decidedly influence how each act is perceived by participants and by other inmates. For this, among other reasons, sexual assault within the penal setting is believed to be commonly used as a tool for reinforcing the hierarchical social order. Even consensual sexual relations can prove threatening as HIV/AIDS has become a more significant threat to inmates than to members of the outside population. Academics, activists, law enforcement agents, families, and inmates are all working toward creating sustainable solutions for these specific problems, and toward reaching out to homosexual inmates.

Lawrence and Garner v. Texas, 539 US 558 (2003).

HOMOSEXUAL RELATIONSHIPS

In American prisons, heterosexual sexual activity is restricted. While regulations vary across states, some inmates may have access (either legally or through contraband) to pornographic materials. In a small number of jurisdictions, others may participate in conjugal visits. Finally, still others satisfy their heterosexual sex drives by engaging in sexual activity with prison staff, both consensually and nonconsensually. However, many inmates who seek sexual experiences are limited to homosexual encounters. These occur in both male and female correctional institutions, although there are gender differences in how these homosexual relationships develop. This entry will specifically examine homosexuality in male prisons; other entries in this volume address sexuality in female prisons.

Research on sex in prison has been limited. Studies in male correctional institutions have focused mainly on coerced sex, while much recent research has stressed the prevalence of sex in prison and the problems associated with the human immunodeficiency virus (HIV). However, much remains unknown about sexuality in prison, including how often voluntary sexual activity between two or more inmates occurs and how many prisoners actually engage in homosexual relationships.

It is important to conceptualize two types of homosexual activity. The first is dispositional homosexuality, best described as individuals who self-identify as gay or lesbian. Self-identified gays and lesbians are rare in prison. Those who are incarcerated are often at risk. In male prisons especially, homosexuals hold a low status in the prison culture and sometimes require protection. The second type of homosexual activity is situational. This occurs when the individual self-identifies as straight, but turns to homosexual activity due to a lack of heterosexual opportunities. Situational homosexuality comprises the majority of prison sex.

Research regarding bisexual or transgender inmates is scarce, but no doubt a study of them would further develop the topic of prison sexuality. A recent study of jail inmates in protective custody found that there were some differences between bisexual

and gay inmates. Gay and bisexual prisoners reported feeling disrespect from their peers and from officers. However, gay inmates were less likely than bisexuals to change their behaviors while in jail, and were more likely to be harassed.

HOMOSEXUAL RELATIONSHIPS IN MALE PRISONS

Very little research has focused on consensual sex in male prisons, much less on relationships that form behind prison walls. However, there is a limited body of literature about the practice of exchanging sex for protection in what can amount to long-term relationships between male inmates. Anecdotal evidence, for instance, in Pete Earley's (1992) treatment of Leavenworth Penitentiary, *The Hot House,* is the most descriptive of this type of relationship. Essentially, a new, generally weak inmate (or "punk," in prison argot) makes the choice to partner with a stronger, more established man. The punk provides sexual favors, completes errands, and does other tasks as assigned by his partner. In return, he receives protection, so that it is understood that a conflict with the punk is tantamount to a conflict with his partner.

Whether or not these arrangements are consensual is debatable. On the one hand, some inmates choose to enter into these relationships. However, others may be pressured, by threat, intimidation, or actual force. Some individuals may feel as though becoming a punk is necessary for their own protection, so they do so voluntarily but without a true desire to be partnered with another man.

Entering into a relationship as a punk has long-term implications for an individual. Even if the initial relationship is short in duration, that inmate will carry the punk label and its implications of weakness with him throughout his prison stay. If the relationship ends, the prisoner may find it necessary to enter into a new relationship, or he may be physically coerced into doing so. If a relationship lasts, it is possible that the two inmates will transcend the simple exchange of sex for protection. Some men have reported caring relationships that have developed between the punk and his protector. However, others may perceive the relationship as an undesirable necessity. It appears that the transaction of sex for protection is a key characteristic of these relationships, with other forms of emotional intimacy being secondary.

ATTITUDES REGARDING HOMOSEXUALITY IN PRISON

There is a small body of research concerning attitudes toward homosexual activity in prisons. This section will briefly address the attitudes that inmates, correctional officers, and gay activists organizations hold toward prison homosexuality.

A study of inmates examined what characteristics were related to feelings of homophobia. Being female, African American, or having previous homosexual sexual experiences were associated with lower levels of reported homophobia. These findings are consistent with research regarding attitudes toward homosexuality outside prison walls, lending support to importation theory—the idea that inmates bring their existing attitudes into prison.

Research on correctional officers has found that most believe that prison sexuality is motivated by situational homosexuality (as described above). Officers were less likely to discover incidents of rape than they were to happen upon incidents of consensual sexuality. However, an overwhelming majority of officers acknowledged that they found it difficult to determine whether acts were consensual or coercive by nature. As reported above, the line between consensual and coerced sexuality in prison is a blurry one. While a majority of officers felt that both consensual and coerced sexual acts should be prevented, they rated preventing consensual sexual activity as less important.

Finally, while there has not been specific research regarding the role of gay advocacy organizations in issues of prison sexuality, it is possible to note some trends. It appears as though groups on the outside of prison are willing to become involved through advocacy and public awareness with issues of prison homosexuality in a very limited way. Namely, such groups appear to become involved

only when there are reports of abuse or failure to protect inmates. However, these circumstances appear to be rare—there does not appear to be much in the way of a permanent linkage between gay inmates and gay interest groups on the outside.

CONCLUSION

Homosexual relationships occur in all correctional institutions. However, there is limited research on consensual sex in prisons. Future scholars must work to clarify the nature of sexual activity, and attitudes toward it, within prisons.

HOOCH

Hooch, a term used to describe a fermented drink traditionally made by Native Americans of the Northwest, refers to any illicit alcohol manufactured by prisoners. As in the civilian world, alcohol or hooch is one of the common ways people deal with the boredom of their prison lives. Normally, hooch is made through a fermentation process of some combination of yeast, fruit, or sugar, but it can be made in many other ways, all of which are relatively easy, inexpensive, and can take from a few hours to a week. Fermented hooch requires only the basic ingredients of a fruit or starch base, a means of fermentation, a container, and a secure location to store the products away from staff or other inmates.

HOW IS IT MADE?

Although hooch can be made from any grain or fruit, the easiest and most common way of making it is with fruit juice, which can be obtained from sympathetic staff, kitchen personnel, or the commissary. Either by using yeast as a starter or by the more difficult way of attempting a natural fermentation, the concoction is distilled for a few days and then immediately consumed because of the short shelf life. This process requires practice and patience to perfect the timing and proportions of ingredients. Once some has been made to satisfaction, the starter can be saved for future batches. The fruity syrup in canned cherries or berries provides one of the best sources of making hooch. The heavy sugar content and fruit residue in the hands of a skilled practitioner provide a flavorful wine-like beverage with high alcohol content. Staff who have tested hooch made from this syrup during shakedowns claim that it contains as much as 10% alcohol, far higher than the more common 2% to 5% in hooch made from fruit juice or sugar-enhanced Tang.

A second way of obtaining alcohol is by filtering commissary or kitchen items, such as mouthwash or artificial food flavorings, through bread. The filtering helps remove impurities and concentrate the alcohol. Prisoners with access to refrigeration may also take mouthwash or similar products, freeze

them several times, and pour off the alcohol, which does not freeze. If done successfully, this produces a high-content alcoholic liquid that can either be consumed directly or mixed. Although this method can produce some exemplary high-quality alcohol, it requires access to a freezer that is relatively secure from staff scrutiny for at least a few days to allow freezing. It is also expensive because of the costs of obtaining commissary items. However, because of the high alcohol content, it can be more easily stored, and its manufacture does not produce the fermentation odor that can alert staff.

Hooch can be made in any container, including individual-sized milk cartons or the preferred plastic gallon containers. Although open containers such as large cans be used, those with lids are far better in order to prevent impurities or insects from contaminating the product, and to reduce odor. Inexperienced hooch makers often ignore the need to make the product in sanitized, or at least clean, containers. Neglecting this detail risks disrupting proper fermentation and decreases the potability.

CONCEALMENT

Outsiders often wonder how prisoners can make alcohol in a controlled and tightly monitored correctional environment. Although there is considerable risk of discovery, which can lead to severe disciplinary sanctions such as segregation, loss of "good time" credits, and increased long-term surveillance by staff, the rewards of making hooch generally outweigh the costs of discovery, especially for long-term prisoners.

Most commonly, prisoners produce hooch in their cells, despite the risk of discovery either due to the occasional fermentation odor or during a shakedown. There are, however, some limitations to this method. In institutions that restrict prisoners' property only to that which can be contained in designated property boxes, there is little opportunity for hiding contraband in the cell. The confined area of a cell also limits the quantity that can be produced at one time. As a result, some hooch manufacturers hide the alcohol in concealed areas within the prison that staff and other inmates are unlikely to find. This strategy often requires collusion with sympathetic staff or with trusted peers who will help secure the area and not sample the beverage before completion. Workshop areas, secluded vegetation, or rarely used storage facilities are ideal.

HOOCH AND PRISON CULTURE

Hooch serves secondary functions beyond consumption. If made in quantity, it can be a valuable commodity in the prison economy, sold or traded for other scarce resources. Skilled producers also receive a measure of respect from other prisoners, which is also a valuable asset. On occasion, staff can use it as a control mechanism by gaining compliance or compromise from producers in return for allowing discrete production. When this occurs, there are generally tacit rules that, if violated by prisoners, lead to shakedowns, discipline, and temporary halt of production.

It is not necessarily the actual production or consumption of hooch that creates problems, but the derivative consequences created by competition over scarce and highly valuable resources. Although not as valuable as drugs, yeast is also a marketable commodity, and it can be easily smuggled in or obtained in-house and bartered. Some inmates who may not themselves make hooch are able to traffic in yeast smuggled in from the outside. Producers can take part of their fermentation and give it to others who are less skilled. But this also creates the risk of competition for "markets." This, in turn, may lead to turf conflicts or other disputes, because as a valuable commodity, hooch distribution—as it was outside prison during Prohibition in the 1920s—becomes profitable for those who control it.

CONCLUSION

Contrary to some observers who claim that prison hooch is invariably foul tasting, skilled prisoners can produce a potent and pleasant-tasting libation that ranges in taste from homemade beer to an after-dinner aperitif. Regardless of taste, prison hooch is a mainstay of the prison culture both for prisoners and—on occasion—staff.

HOSPICE

> Death is not the worst possible outcome of medical care. Death is not even the worst possible outcome of incarceration. Dying alone, in pain, without social, familial, and spiritual supports is the terrifying end that many prisoners and, indeed, most people fear. Unfortunately, it is too often the reality they experience.
>
> *—Nancy Neveloff Dubler and Budd Heyman (1998, p. 355)*

WHAT IS HOSPICE?

Hospice is a form of end-of-life care that emphasizes palliative care services. *End-of-life care* refers to supportive services for individuals with advanced and potentially fatal illnesses. These services may include curative, life-prolonging, and palliative treatments. *Palliative care* includes comfort services designed to provide relief from symptoms without necessarily addressing or resolving underlying health problems. The intent is to provide relief from symptoms associated with serious, chronic, or terminal illness to improve quality of life, not to either extend or hasten the dying process. Hospice programs differ from other end-of-life care and palliative programs by specific patient enrollment requirements; they are limited to terminally ill patients with limited life expectancy. In addition, to be recognized as a hospice program, formal licensure or accreditation according to state regulations is required.

Hospice provides palliative or comfort care only to patients who have been diagnosed with terminal illness. Eligibility for inclusion in a hospice program varies by state and institution, but generally requires that the patient not only have a terminal diagnosis, for example, cancer or AIDS, but also a prognosis or life expectancy of less than six or 12 months to live. Determining a specific prognosis is very difficult and has proved to be a problem in hospice enrollment. Physicians are often reluctant to suggest that a patient has such a limited life span. Rather than requiring a definitive prognosis, enrollment in hospice may be based on a reasonable belief that a patient is likely to die within the next six months or year.

In addition to these eligibility requirements, patients may be required to have a "do not resuscitate" (DNR) order. This is a statement that allows health care professionals to forgo cardiopulmonary resuscitation (CPR) in the event that the patient's heart stops or other advance directives that limit life-sustaining treatment, for example, the use of ventilators, feeding tubes, or antibiotics. To be enrolled in a hospice program, patients must consent to the treatment approach and specific requirements. For those who are unable to consent themselves, for example, unconscious, comatose, or mentally incapacitated patients, a surrogate decision maker, usually a close family member, may consent on the patient's behalf.

Hospice is considered a concept or philosophy of care rather than a place. The concept dates back to medieval times and symbolizes care designed to comfort travelers and the sick. While hospice care may be provided in a particular place such as a unit in a hospital or a free-standing facility, it is more often provided in a patient's home or care setting (e.g., nursing home or assisted living facility), wherever it is most appropriate for the patient. The concept is one of comprehensive, interdisciplinary care for patients approaching the end of their lives. The emphasis is on palliative or comfort care rather than curative treatment, and usually includes emotional, spiritual, and practical support as well as physical treatment. Some curative treatments, such as hip replacement surgery or radiation therapy for cancer, may be offered to increase the patient's comfort. The goal is to offer personalized services

to support patients comfortably through the dying process.

The services are designed to create a caring environment in which the biological and other aspects of care are integrated to enhance meaningful existence in the final phase of life for both the patient and his or her family. Palliation addresses distressing physical symptoms such as pain, shortness of breath, and fatigue; social, psychological, emotional, or spiritual issues such as grief, fear, and loneliness; and other needs identified by patients and their families. Services extend to grief counseling after the patient's death.

An interdisciplinary care team, usually directed by a physician, addresses the needs of the patient and family. These teams may consist of various arrays of physicians, nurses, health professional assistants, therapists, social workers, case managers, clergy, dietary professionals, pharmacists, psychologists, and administrators. Trained volunteers provide companionship and other nonmedical care and when possible, the family is involved. Hospices often coordinate with other services within the community, including inpatient medical services, ancillary medical services, and social service programs such as counseling. All services are readily available to patients based on identified needs. The total package of services is covered by Medicare for patients who qualify for Medicare (note, this does not include inmates) and meet the hospice eligibility requirements. The requirement for a limited prognosis stems from Medicare and other third-party payer coverage restrictions.

HISTORY OF THE CARE OF DYING INMATES

Health care practices within prisons generally became a matter for public concern and litigation in the 1970s, after a series of prison uprisings and public advocacy forced the issue. A landmark federal court decision, in *Newman v. State of Alabama,* addressed living conditions in the entire prison system. With regard to the adequacy of prison medical services, the court recognized conditions it deemed constitutionally impermissible, including the use of unlicensed caregivers and instances of neglect and abuse. Other federal courts attempted to articulate a constitutional standard of care until the U.S. Supreme Court in the 1976 case of *Estelle v. Gamble* offered the basic constitutional standard of adequate health care:

> Deliberate indifference to the serious medical needs of prisoners constitutes the unnecessary and wanton infliction of pain . . . proscribed by the Eighth Amendment [in its protection against cruel and unusual punishment]. This is true whether the indifference is manifested by prison doctors in their response to the prisoner's needs or by prison guards in intentionally denying or delaying access to medical care or intentionally interfering with treatment once proscribed.

The provision of health care services, or lack thereof, is not to be used as part of an inmate's punishment. Since *Estelle v. Gamble,* other cases have provided substantive content to the requirement for adequate health care in prisons and jails, extending services available in the community to inmates. For example, the courts have ruled on the meaning of deliberate indifference, requirements for the provision of psychiatric care, inmate hospitalization, special medications or diets, emergency medical service training, contagious disease screening, and appropriate health care professionals. These rulings have been translated into standards for correctional health services, although such standards are limited to issues pertaining to specific legal cases and do not offer comprehensive guidelines.

The American Correctional Association (ACA) policy supports hospice services and mandates that health services provided within prisons be consistent with community health care standards. Historically, end-of-life care had not been a regular concern of correctional facilities. However, the development of hospice and palliative care programs in prisons was prompted by institutional changes, recognition of the needs of dying inmates, specific requests from prisoners, and the infrequency of compassionate release. Corrections officials began to recognize and respond to the need for

special services to care for the dying among its aging prison population in the mid-1980s.

The early development of prison hospice may be traced to the work of a paraplegic, wheelchair-bound prisoner at the U.S. Medical Center for Federal Prisoners in Springfield, Missouri, in 1987. This inmate, Fleet Maull, was living on a hospital ward and recognized the increasing number of dying inmates, especially those with AIDS, and their special needs. He noted that they often died alone without support from family or friends either outside or within the prison. He began to visit a few dying inmate-patients and felt that the close relationships they developed with him in their final weeks and months made a significant difference in their lives. Based on this experience, he developed a formal proposal for an inmate-staffed hospice volunteer program. Maull went on to found the National Prison Hospice Association.

Institutional changes provided impetus for the continued development of prison hospice. These changes included an influx of seriously ill inmates, especially those with HIV/AIDS; the use of determinant sentences; "three strikes" laws; and limited compassionate release programs. The combination of increased numbers of seriously ill inmates and longer sentences ensure more deaths in prisons. Compassionate release or medical furlough programs, while available in the majority of states and the Federal Bureau of Prisons, are rarely used, also ensuring that inmates will die while incarcerated. Compassionate release refers to the release of seriously ill or dying inmates through procedures including the commutation of sentences through the department of corrections, executive clemency, or commutation; reduction of sentence through the courts; administrative leave or furlough; and parole. The judges, administrators, governors, and parole boards must weigh the needs of the ill and dying inmate against society's need for protection, retribution, and deterrence. The expense of providing the medical services an inmate needs may also affect the consideration. Despite the humanitarian goals of compassionate release programs and the limited threat to society from a terminally ill inmate, mandatory sentencing requirements may make compassionate release impossible.

The first national survey on hospice and palliative care was conducted by the National Institute of Corrections in 1998. According to that study, the U.S. Bureau of Prisons and 11 states were operating prison hospice programs at one or more of their penal institutions. In addition, four more states, one municipal prison system, and the Correctional Service of Canada were developing formal hospice programs; nine states offered palliative care outside of a hospice program; and 11 states were considering the development of hospice programs. Further study since 1998 indicated that the numbers of palliative care and hospice programs continues to grow.

INMATE PALLIATIVE CARE AND HOSPICE PROGRAMS

Prison palliative care or hospice services mirror those available in community programs. Common program goals include the provision of appropriate and holistic care for dying inmates consistent with hospice philosophy, enhancement of the care available at the institution, and the assurance of "death with dignity." Palliative or hospice care services are provided to patients maintained within the general prison population, within prison hospital facilities, in special hospice beds, within independent licensed hospices, or in community hospitals (with prison supervision). Inmates are often transferred from one institution to another to gain access to these services.

Inmate eligibility for these services generally are they same as for community hospice; the inmate-patient must be terminally ill and have a prognosis of six months or less to live though some allow for a longer prognosis or require only physician referral or recommendation. Inmates, like other patients, are asked to consent to receive palliative services and may be required to sign DNR orders to participate in palliative care services. Palliative care or hospice services are available to all prisoners, male and female, where programs exist throughout the country.

Licensure or accreditation for hospice may be obtained from state agencies or national

organizations. Prison hospices may be licensed by the same agencies as community hospice. To be licensed or accredited, an outside agency assesses a program for compliance with particular standards. Correctional health care is accredited according to standards from organizations such as the Joint Commission on Accreditation of Healthcare Organizations, the National Commission on Correctional Healthcare, and the ACA. These organizations are developing standards for prison hospice licensure. Until these are implemented, assessment is done according to community hospice standards.

Little is known about the cost of palliative care and hospice programs in total, per service, or per inmate, but existing programs report that their costs are covered by the general prison health care services budget. The average length of stay or use of palliative care services appears to be longer for inmates than for patients who are not incarcerated. The requirement for a limited prognosis may be relaxed in the prison setting as inmate health care is not affected by Medicare and other third-party payer restrictions.

The available services vary among existing programs but contain some consistent elements. Special visitation arrangements for friends, family, and fellow inmates are a key aspect of existing programs. Other elements include advance care planning; pain and symptom management (with adequate formularies); companionship from family, volunteers, or pastoral care services; bereavement services; and funerals or memorial services.

Interdisciplinary care teams are similar to those in community hospice programs, but in prisons also include security officials. Community hospices are involved with many of the programs in some capacity, such as program development, technical assistance, working with families, or discharge planning.

Programs may also use community volunteers, inmate family members, and prisoner volunteers. The inmate volunteers provide supportive services and companionship, but usually cannot be employed by the program and cannot provide medical services. Inmate volunteers can provide companionship; conversation; assistance with eating, hygiene, telephone calls, letter writing, and movement; reading and activities; and spiritual support. The use of inmates remains difficult and controversial. Problems include concerns about protecting inmate-patient confidentiality, the potential for healthy inmates to victimize the weak, inmates violating or financially exploiting visiting family, unregulated inmate movement around an institution, and concerns about diversion or narcotics and other drugs used to treat the dying inmates. However, with careful screening, training, and supervision, institutions with inmate volunteer programs report success.

Through training, the inmates learn about the value of the program, the importance of confidentiality, and the consequences of any abuses. Including security personnel in the interdisciplinary team assists in the prevention of problems. Rather than creating problems, the inmate volunteers often become model prisoners, develop skills that will be useful when they are released from prison, experience increased compassion for others, work to protect the integrity of the program, feel comforted about the possibility of their own deaths in prison, and report appreciation for participation in the program. Prison personnel also report satisfaction with prison hospice programs and the use of inmate volunteers.

PRISON HOSPICE PROGRAM EVALUATION: BEST PRACTICES

The GRACE (Guiding Responsive Action in Corrections at End-of-Life) Project began in 1998 with the support of a grant from the Robert Wood Johnson Foundation. This collaborative of a number of correctional, research, and philanthropic organizations collected information on the state of end-of-life care organizations, aided in facilitating palliative care program development, and developed a set of best practices. Best practice program components include the use of

- interdisciplinary teams, including physician, nurse, chaplain, and social worker, at a minimum;
- increased visitation for families, including inmate family;

involvement of inmate volunteers;

comprehensive plan of care;

training in pain and symptom management;

advance care planning;

bereavement services; and

environmental adaptation for comfort.

SOME PROBLEMS WITH PRISON HOSPICE

Several characteristics of America's prisons combine to pose enormous challenges to achieving quality palliative or hospice care. Problems generally include balancing care and correction, notifying inmates about the availability of services, managing the program, and security concerns. Public opinion may not be supportive of programs to comfort inmates when prisons are designed to punish. Inmates are often in facilities far from home and may need to be transferred to access palliative services, making family involvement difficult. Prisons operate according to scale and promote conformity so that individual preferences and needs are difficult to address. Overcrowding interferes with the provision of services. Treatment plans are also be frustrated by inmate classification. Concerns about drug abuse and diversion constrain efforts to provide state-of-the-art pain management and symptom control. Pressure to avoid liability and litigation may result in the use aggressive treatment despite an inmate-patient's preference for palliative care. Communication and service delivery are complicated by the need to involve correctional personnel who must emphasize security and institutional efficiency.

In addition, a number of management problems are unique to older inmates, defined as those inmates at least 50 years of age. The geriatric population in prisons counts individuals younger than those in the outside population. Poor socioeconomic status, lack of access to medical care, lifestyle choices, and prison life combine to prematurely age inmates before and during incarceration. Management problems specific to this population include vulnerability to predatory abuse, difficulty mixing with younger inmates, need for accommodation for individual disabilities, requirements for special programming, and disproportionate consumption of health care services. Accessibility, safety, modified confinement conditions, classification procedures, and security are among the greatest challenges for those caring for elderly inmates and prison administrators.

End-of-life care programs in jails face many of the same difficulties as in prisons, but difficulties are exacerbated by short-term stays, rapid turnover, limited staff time and other resources, inadequate formularies, volunteers shortages, and security concerns. Yet some jail facilities are developing end-of–life care programs and transitional services. They are partnering with local hospices and working with prisons and community service providers.

CONCLUSION

Prison palliative care and hospice programs are growing throughout the United States in recognition of the needs of the increasing number of dying inmates. The programs reflect community-based hospice programs but are tailored to the unique needs of inmates, the physical setting of the prison, and security concerns. Overall, palliative care and hospice programs have overcome a number of difficulties and help many prisoners, correctional personnel, and institutions. Reported benefits for inmate-patients include increased comfort, appreciation, control, companionship, and family involvement. Inmate workers or volunteers also describe personal growth and appreciation for their participation in the programs. Benefits for institutional staff include help with workload, positive feelings toward the institution and inmate-patients, increased awareness of hospice and personal mortality, and improved care delivery. As standards for prison hospice develop, a number of health care and prison organizations continue to increase the quality of health care prisoners receive as they approach the end of life.

HOWARD, JOHN (1726–1790)

The origins of contemporary prison reform in the United States can be traced to an 18th-century English sheriff, John Howard. Howard, who was both a nonconformist and a social reformer, perhaps single-handedly changed the administration of English gaols and many of the habits of their inmates, rescuing prisoners from the conditions of neglect and filth in which they had long been held. Though Howard died more than 200 years ago, his legacy lives on. In the 21st century, his ideas are carried on through the work of several influential prison reform organizations in North America that currently bear his name, including the John Howard Association of Alberta, Canada, and the John Howard Association in Chicago, Illinois.

BIOGRAPHICAL DETAILS

At first glance, Howard seems an unlikely champion of prison reform. Born in 1726 in Enfield, England, to a comfortable middle-class family, Howard's childhood was disrupted by his poor health and by the death of his mother when he was 5 and of his father when he was 16. His subsequent years were spent in travel. On a trip to Portugal in 1756, his ship was captured by French privateers. Howard shared the sufferings of his fellow countrymen while on the ship, receiving little food or water while the ship sailed to a dungeon located in Brest, Belgium. Howard spent six days in the dungeon where treatment of prisoners was not much different than on the ship. He was further imprisoned at Morlaix, France, but was soon exchanged for a French officer. When he returned to England, he reported his experience to the Commissioner of Sick and Wounded Seamen of the British Royal Navy and was successful in receiving action to alleviate the conditions of the other English seamen.

After release, Howard married Henrietta Leeds, became a vegetarian, and turned to managing his landed estate. He also provided partial funding for a school for children that resided on his estate.

INSPECTOR OF PRISONS

In 1773, Howard was appointed sheriff of Bedford. One of his duties, neglected by his predecessors, was to inspect prisons. He soon found that in the three regional prisons for which he was responsible, prisoners were ill-treated. He also found that large numbers of men were confined simply because of their inability to pay various fees. For example, prisoners were required to pay their jailer, who received no other salary and, as a result, had little incentive to use any funds to improve conditions or to provide basic amenities. A previous unsuccessful attempt had been made to introduce legislation changing

how jailers were paid. However, it was not until Howard made his case to the English Parliament that two Gaol Acts were passed in 1774. The first set all prisoners free who were held for nonpayment of jailer fees and authorized jailer salaries. The second bill addressed health in prisons by encouraging improvement of sanitary conditions.

At his own expense, Howard began touring the prisons of Europe for the purpose of promoting reform. He focused especially on prison architecture, noting that water, circulation, and light were generally inadequate. Combined with lack of fuel, inadequate clothing, poor hygiene, and lack of food, prisons were badly in need of reform. Howard especially drew attention to many prisons having inadequate water. Drawing from his observations in British and European prisons, in 1777 he published a pamphlet, *The State of Prisons in England and Wales,* which radically changed penal policy in England and abroad.

Shortly after publishing his second and final book, *Lazarettos,* in 1789, John Howard set off once more to inspect prisons in eastern Europe. After tending to a prisoner with typhus, he became ill and died in the Crimea on January 20, 1790.

REFORM

John Howard put forward a series of general and specific reforms in his writings and public lectures. In particular, he was concerned with reducing the filth that characterized most penal facilities of the time. He argued that prisons should improve sanitation, by removing human waste, keeping cells and other living areas clean, and providing prisoners with clean water, soap, and bathing opportunities. The proper circulation of fresh air, he asserted, would reduce outbreaks of contagious diseases that characterized early-modern penal establishments. Likewise, Howard advocated separation of sick prisoners and for providing health care facilities for them.

In addition to his concerns about the cleanliness of facilities and the health of their inmates, he urged classification of prisoners so that the more violent offenders, youths, and other special populations not be housed together. As with other penal reformers, he strongly believed that prisoners should be kept occupied, rather than lying idle, and so he recommended various forms of penal labor. Finally, Howard advocated education to inform the public of the state of prisons.

CONCLUSION

Howard's works changed prisons in North America in several ways. First, his writings were widely read by reformers in Europe and North America. Second, the English reform acts based on his work provided model legislation for other countries including the United States. Reformers such as Jeremy Bentham drew from Howard's writings in redesigning prison architecture, and integrated Howard's emphasis on sanitation, air circulation, and natural light in their design. In the United States, Quakers drew heavily from Howard's writings in advocating humane prisons, in designing the Eastern State Penitentiary in Philadelphia. Finally, Howard's emphasis on making the public aware of prison conditions continues to be a primary goal of prison reform groups in the 21st century.

HUNTSVILLE PENITENTIARY

Since 1849, Huntsville has served as the headquarters of the Texas state prison system, which is currently the largest in the United States. An imposing red-brick fortress known as "the Walls," Huntsville gained national prominence not only for hosting the spectacular Texas Prison Rodeo but for its grim history of conflict, including perennial scandals, endemic abuse, and prisoner uprisings. Today, the Walls is home to America's busiest death chamber.

FOUNDATION

Although Texans considered building a prison under Mexican rule, construction did not begin until after U.S. annexation in 1848. Its model was the industrial penitentiary at Auburn, New York, dedicated to regimented labor rather than solitary penitence. Through most of the 19th century, Huntsville's rule books required prisoners to march in drills, eat in silence, and put in long hours at the textile factory and other workshops. During the Civil War, Huntsville became a vital source of cloth for the Confederacy, so much so that officials imported runaway slaves to staff the mill.

CONVICT LEASING

The end of slavery transformed Huntsville. Before the Civil War, the prison confined only whites, as Texas law stipulated that free blacks and slaves were to be punished only by whipping, hard labor, or hanging. After emancipation, however, a rapid influx of African American prisoners—many of them convicted of petty offenses such as "stealing a cap"—soon crowded the Walls. Pressed for cash and reluctant to build another penitentiary, lawmakers responded in 1867 by hiring out prisoners to the highest bidder. Thus, like other southern states, Texas adopted the convict lease system—the most ignominious punishment regime in American history.

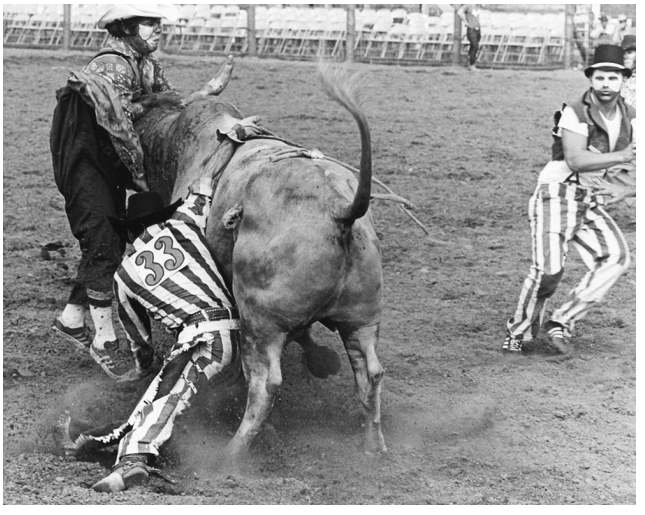

Photo 2 *Huntsville rodeo clowns*

As Texas's flagship institution, Huntsville provided a safer, generally less brutal punishment environment than other sites. While the state shipped out most black and Mexican convicts to isolated mining, railroad, and agricultural camps, Huntsville remained largely white and devoted to skilled industry. Moreover, enlightened administrators such as Thomas Jewett Goree, superintendent from 1877 to 1891, as well as a succession of physicians and chaplains, kept a close eye on its operations, ensuring that modest education and recreation programs developed.

Nevertheless, convict leasing generated its share of turmoil at Huntsville. In the 1870s, investigators discovered that juveniles as young as seven were languishing in its filthy cells and that lessees were engaging in "lascivious conduct" with black women prisoners. A group of federal soldiers held briefly at the Walls complained of spirit-breaking toil and a crude genital torture device called "the horse." Partly because Huntsville housed a number of well-educated prisoners, these wretched conditions engendered a literary protest movement around the turn of the 20th century. One convict writer complained that he was held in an "abject manner as a slave," while another described his time at the Walls as "fourteen years in Hell."

REFORM AND RETRENCHMENT

Huntsville underwent another dramatic transformation in 1910, when legislators abolished leasing after

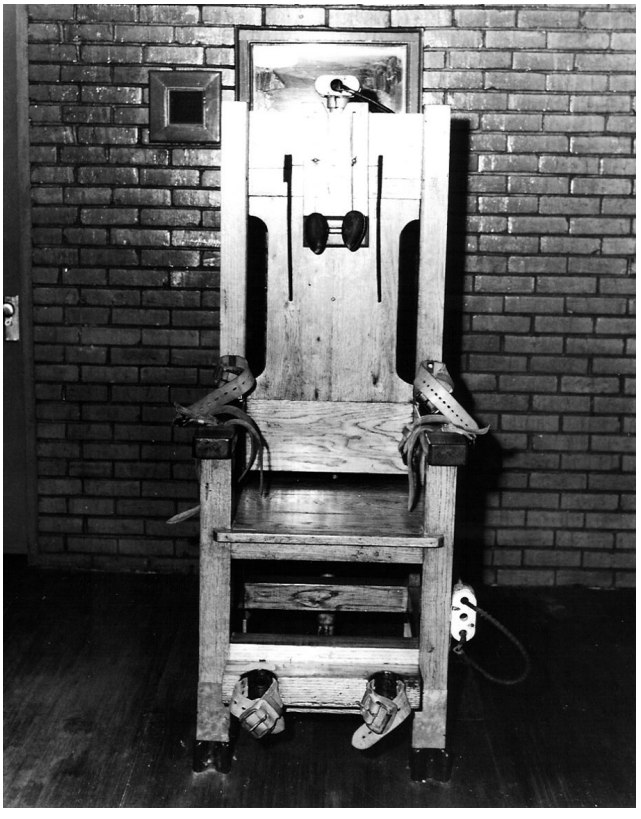

Photo 3 *Huntsville electric chair*

a protracted campaign by labor leaders, muckraking journalists, and progressive clergymen. A new team of administrators dedicated to "order" and "humane treatment" reasserted state control and enacted far-reaching changes: new shower and laundry facilities, a new reformatory for women, convict wages, and the abolition of whipping. Within three years, however, budget cuts, combined with uncooperative guards and mutinous convicts, precipitated a fierce backlash and swept away many of these reforms.

This grim cycle of reform and retrenchment would forecast much of Huntsville's 20th-century history. In 1927, former suffragists and other Progressives seized leadership of the prison system and tried to implement the tenets of scientific penology, turning the Walls into the testing ground for a new classification scheme, medical program, and work regime. Borrowing from Thomas Mott Osborn's experiments with prison democracy at Sing Sing, authorities also allowed Huntsville prisoners to organize a Prison Welfare League, which attracted thousands of members, as well as an award-winning prisoner newspaper, *The Echo,* which remains in publication today. As during the 1910s, however, parsimonious politicians and obstructionist guards, combined with a surge in prisoner escapes, ensured that most of these efforts were short lived.

More lasting changes were enacted after World War II under the leadership of Oscar Bryon Ellis (prison chief from 1948 to 1961), who came to power after an epidemic of prisoner self-mutilations. With a more generous budget than his predecessors, Ellis renovated Huntsville, modernized prison industries, and systematized education efforts. By enforcing rigid discipline and staff loyalty, Ellis and his protégés also made Texas's prison system into a national model of economy and order. Many believed the price of order was too high, however. In the 1960s, prisoners at Huntsville and nearby units began filing lawsuits, and in 1980 a federal judge declared Texas prisons unconstitutional. Thus began another reform effort that itself unraveled at the close of the 20th century.

HUNTSVILLE'S NOTORIETY

Through all of this administrative upheaval, Huntsville gained notoriety as a site of fierce conflict and public spectacle. Chronic conflagrations and periodic uprisings—including a death row breakout by members of the Bonnie and Clyde gang in 1934 and a bloody hostage crisis in 1974—kept the Walls in the news. More enduringly, the Texas Prison Rodeo, founded at Huntsville in 1931, evolved into one of Texas's major tourist attractions. Until 1986, tens of thousands of visitors streamed into Huntsville's stadium each fall to watch convicts get banged up in "the world's fastest and wildest" rodeo and to be entertained by celebrities, ranging from Tom Mix to Loretta Lynn. Between 1938 and 1946, a national radio show, "Thirty Minutes Behind the Walls," added to Huntsville's fame, while numerous Hollywood film productions, from *The Getaway* (1972) to *The Life of David Cole* (2003), have chosen Huntsville as their setting.

CAPITAL PUNISHMENT

Huntsville is also famous for its association with the death penalty. Executions began there on

February 8, 1924, when five young African American men were killed in the state's new electric chair. Texas executions had previously been handled at the county level. Huntsville's warden resigned, complaining that "reforming men and killing them can't be the same job," but his protest did little to slow the work of "Old Sparky," which dispatched 361 convicts between 1924 and 1964. The Walls's busiest execution era, however, began in 1982, when the state pioneered the technology of lethal injection. Since then, more persons have been executed at Huntsville than in any other state: 297 as of October 2002.

CONCLUSION

Although the exponential growth of Texas's prisons since the late 1960s has decreased its importance (in 2001, the Walls was but one of 105 Texas prisons and it housed just 1,544 of 144,981 inmates), Huntsville remains the centerpiece of the state's penal system. Top administrators live and work nearby. Because Huntsville operates a discharge center, many prisoners spend their last night in custody at the Walls. An assemblage of weather-worn brick fortifications and modern surveillance cameras, the prison stands as a monument to Texas's tortured past of enslavement, convict leasing, and arrested reform, even as it plays a key role in the state's colossal, bureaucratized punishment regime of our own time.

IMMIGRANTS/ UNDOCUMENTED ALIENS

Many migrants attempt to enter foreign countries illegally every year. In a separate but often interconnected system, most countries have processes to enable refugees to remain in their country through claims of political asylum. Known as "asylum seekers," these refugees petition the government for protection from their native countries' oppressive political system and, if granted, they are allowed to stay.

The majority of countries hosting undocumented immigration have generally dealt with the problem through detention and/or deportation. Illegal immigrants are processed in the correction and prison system either when they are detected entering the country without authorization or when they are arrested for committing some other crime. Depending on jurisdiction, apprehended immigrants are either detained to serve out an imposed criminal sentence, returned to their native country, or a combination of both.

Although most developed countries face similar problems of unauthorized immigration, the nature of occurrence and particular methods of dealing with undocumented aliens vary. This entry focuses specifically on the U.S. experience. As is common, the terms *undocumented aliens*, *undocumented immigrants/migrants*, *unauthorized aliens*, *unauthorized immigrants/migrants*, *illegal aliens*, *illegal immigrants/migrants* are used interchangeably.

HISTORICAL TREATMENT OF ALIENS IN THE UNITED STATES

Over the course of the 20th century, the United States increasingly supervised and penalized illegal aliens, depending in part on their racial or ethnic background. At the beginning of the 21st century, laws surrounding immigration and asylum have become very restricted indeed.

Prior to the late 1800s, the United States maintained an open immigration policy. Most free people could come and claim a piece of land for settlement thereby taking citizenship. By the early 1900s, America began to codify immigration laws through the establishment of quota acts. Cycles of economic depressions in 1870, 1907, and later in 1921 fueled concerns of immigrants displacing Americans in the labor force. In response, the

federal government began to restrict the number of immigrants allowed in the United States by setting limits on the number of legal entries. Fears of mass migration of the Chinese to the United States adding to labor shortages prompted the passage of the Chinese Exclusion act of 1882. This act prohibited Chinese from becoming U.S. citizens and prevented further Chinese immigration for a 10-year period. The terms of the act were extended three times before it was repealed in 1943 as a result of the U.S. and Chinese alliance during World War II.

In 1917, the first immigration act governing all migration to the United States was passed. This act required all foreigners to pass a literacy test and prohibited nonwhite immigration from most of Asia. In 1924, Congress passed and later amended the National Origins Act placing a ceiling on the number of allowable immigrants at 150,000 per year. It also established a quota for each nationality equal to 2% of that group already living in the United States according to the 1890 census. As the vast majority of the U.S. population was composed of people from Western and Northern Europe, considerable restriction was placed on entries from nations of Eastern and Southern Europe, Asia, Africa, and Latin America.

There are other instances where U.S. immigration policy has discriminated against people based on their ethnicity. In 1924, some 112,000 Japanese Americans were removed by force from their homes and placed in concentration camps. Likewise, illegal Mexican migrants were targeted during enforcement campaigns that removed them from the United States and returned them to Mexico. The first campaign was conducted from 1929 to 1934 and was called a "repatriation campaign." The second, referred to as "Operation Wetback" lasted from 1954 to 1958.

Over the next several decades, a series of immigration policy reforms were introduced that altered the landscape of legal immigration in response to the ebb and flow of geopolitical interests, economic conditions, and prevailing political ideology. Prior to the 1960s, immigration policy consistently specified particular groups and races of people for exclusion. In 1965, the United States adopted a new approach that eliminated racial and ethnic exclusions for the first time in history, yet maintained a ceiling of total allowable entries. Referred to as the "preference system," the new act awarded immigration status based on relatives of the entrant who lived in the United States.

By the mid-1980s, concern over the number of illegal immigrants had grown once again. In response to pressures to control the size of the illegal alien population in the United States, the 1986 Immigration Reform and Control Act (IRCA) initiated three primary provisions: (1) It created sanctions for employers who knowingly hired undocumented aliens, (2) it increased enforcement along the U.S. borders, and (3) it legalized some of the then current illegal aliens residing in the United States. Just four years later, the 1990 Immigration Reform Act for the first time stipulated that all immigrants were subject to numerical restrictions, restricted criteria for entry, and liberalized conditions for exclusion. In 1996, the U.S. Congress passed the Illegal Immigration Reform and Immigrant Responsibility Act and the Antiterrorism and Effective Death Penalty Act. These two acts expanded the powers of the Immigration and Naturalization Service (INS) by allowing for the detention and deportation of any illegal and legal immigrant who has been charged with or convicted of a drug offense or who otherwise possesses a criminal record. In addition, they established measures to control U.S. borders and augmented enforcement of laws prohibiting businesses from employing illegal aliens.

EFFECTS OF THE SEPTEMBER 11 ATTACKS

The September 11, 2001, terrorist attacks in New York City and Washington, D.C., perpetrated by 19 hijackers, all of whom were Arab, initiated yet another chapter in immigration management and discriminatory policy. Soon after the terrorist attacks,

Congress formulated and passed the 2001 USA PATRIOT Act, which set out a wide range of provisions to strengthen the government's ability to prevent future acts of terrorism. Among its provisions it allowed for mandatory detention of asylum seekers from 33 Arab nations identified as sources of terrorists carried out in Operation Liberty Shield. Such individuals will be detained while their asylum requests are processed without opportunity for judicial review.

Consistently, the opportunity for legitimate entry into the United States has narrowed and the enforcement of those in violation strengthened. Such regulations have increased the number of aliens into the correctional system. Largely determined by prevailing domestic and international concerns, throughout the course of history immigration policy has selected people of different nationalities and ethnicities for differential treatment or exclusion.

THE NATURE OF UNDOCUMENTED ALIENS IN U.S. CORRECTIONS

The exact number of illegal aliens entering the United States every year is unknown. Estimates of the number of unauthorized immigrants living in the United States range from 7 million to more than 9 million (Reyes, Johnson, & Swearingen, 2002). While the exact number is elusive, during 1999 the INS and its patrol division, the U.S. Border Patrol, apprehended more than 1.7 million aliens who entered the country without inspection or had overstayed the term of their visa. Of those apprehensions, 90% were made along the U.S.-Mexico border.

Most apprehended aliens are deported to their country of origin voluntarily, while others are detained temporarily until their fate can be determined. Some, particularly those claiming political asylum, are processed then released into the United States pending immigration proceedings if they do not threaten national security or pose a risk of absconding.

Migrants managed by the U.S. correctional system are held in a variety of types of facility. Most detainees are held in federal and state prisons and local jails along with other criminal offenders. A smaller proportion are housed in INS-operated facilities specifically constructed for those charged with immigration-related offenses. Still others are held in privately managed facilities under exclusive contract with the INS.

CURRENT TRENDS

Over the past several decades, the United States has seen a marked increase in the enforcement, arrest, and incarceration of immigration-related offenses. At the end of year 2001, the INS held 19,137 detainees. Since 1985, the number of detainees has more than doubled and the number serving a sentence of imprisonment has increased almost nine times, from 1,593 to 13,676 (Scalia & Litras, 2002). Moreover, those convicted of an immigration offense are serving longer sentences. The average time served for an immigration offense has risen from 4 months in 1985 to 21 months in the year 2000.

In 2000, there were a total of 16,495 individuals referred to U.S. attorneys for immigration offenses. Of those, 75% were charged with unlawful entry or reentry, 20% were charged with smuggling or harboring unauthorized aliens, and the remaining 5% were charged with misuse of visas or other immigration infractions. Identified in Table 1, of those charged with an immigration offense in the federal system, 57% come from Mexico. The second largest group of noncitizens charged with an immigration offense came from Asia and Oceania with 4%. Another 3% and 2% came from Central America and the Caribbean, respectively. Those charged with an immigration offense also tend to be male and young. For the year 2000, the Bureau of Justice Statistics reported that 9 out of 10 charged with an immigration violation were male and more than half were under the age of 30.

PROBLEMS SURROUNDING UNDOCUMENTED ALIENS IN CORRECTIONS

The treatment of undocumented aliens is controversial, and there are several criticisms that can be leveled at the application of U.S. immigration policy. Some argue that the U.S. government unjustly discriminates, treating immigrants of various ethnicities differently. For instance, Haitians who are apprehended attempting unauthorized entry are systematically deported while immigrants from Cuba are allowed to remain in the United States if they make it to American shores. Others have claimed that the practice of indefinitely detaining convicted immigrants who are not accepted for deportation by their native country is a violation of civil rights. On June 28, 2001, the U.S. Supreme Court found this to be unconstitutional (*Zadvydas v. Davis,* 2001).

Still others have raised concerns over the physical and mental abuse of detainees held in local jails and other facilities. With limited space in INS-operated detention facilities, contained immigrants are often placed in jail and prison facilities where INS oversight has been limited. Lawsuits and accusations questioning the treatment of immigrants in these facilities has prompted the INS to implement rules that require visiting rights and access to proper food, medical care, recreation, and libraries for all detained foreign nationals. Critics are skeptical that these rules will be meaningfully enforced. Finally, there have also been concerns that federal agents engage in racial profiling when apprehending immigrants. In the wake of the September 11 terrorist attacks, such claims were made about the apprehension and detention of those of Middle Eastern descent. There have also been ongoing allegations of racial profiling of Mexicans along the southwestern border region.

CONCLUSION

Several developed countries face problems of managing both legal and illegal immigration traffic. Almost consistently, U.S. immigration policy has moved toward the position of restricting immigration flows through heightened enforcement. The consequence of this enforcement has been increasingly high levels of foreign nationals detained in the correctional and prison system. In spite of this increase in incarceration, there is little evidence that the flow of undocumented immigration has been curtailed. With the initiation of the Department of Homeland Security, into which the INS was merged in 2003, a new focus through the lens of national security is expected to reshape the nature of immigration enforcement. Until there is a shift away from the mass incarceration of immigration offenders, problems with their detainment are likely to continue.

Legal Case

Zadvydas v. Davis, 533 U.S. 678 (2001).

IMPORTATION

To outsiders, the surface appearances of prisoner culture often may seem inexplicable and perverse. Two dominant models attempt to explain this culture. The first, variously called the importation or "negative selection" model, sees the culture as the reflection of a fairly preestablished set of norms, values, and behaviors imported into the prison from the streets.

The second, the deprivation or "functional" model, sees the culture as a reaction to what Gresham Sykes (1958) called the "pains of imprisonment." Critical evaluations of the deprivation model led some researchers, such as John Irwin and Donald Cressey (1962), to challenge the utility of the deprivation model in explaining the prison environment, and focused instead on the nature of prisoners themselves. The importation model shifts the focus away from responses to the deprivations of punishment as the source of inmate culture to the characteristics of prisoners themselves, which they bring with them into the prison.

Unlike deprivation theorists, who saw prisoner culture as arising from prisoners' attempts to create a normal existence by adapting to abnormal conditions, importation theorists attempt to explain prisoner culture as the mirror of attitudes and behaviors learned on the street and used as cultural building blocks in the prison. Focusing primarily on ultramasculine male maximum-security institutions, proponents believe that violence, aggression, and other predatory behaviors that characterize prisoner culture, especially in maximum-security prisons, generally are not unique to, developed in, or caused by the prison environment. Instead, the culture is learned on the street and expressed in the prison environment.

WHAT IS IMPORTED?

In its simplest form, people who prey on others on the streets also prey on others in the prison. Prison culture reflects an off-balance dance between prey and predators and between predators and the staff who would control them. Inmates use a number of survival mechanisms, such as alliances between predators, and accommodations made between staff, prey, and other predators to establish a workable, if not harmonious, existence. These strategies result from several broad factors beyond the walls that shape prisoner culture. First, prisoners, by definition, have failed to comply with the rules of civil society. Therefore, they continue their resistance to rules and authority in prison. Second, prisoners are seen as possessing an excess of socially undesired characteristics, such as manipulation, willingness to use force to attain goals, low commitment to honesty or truth, and little respect for the well-being of others. Third, prisoners reflect the structure of the streets from which they come. The increase in street gang activity since the 1960s thus becomes the structure for much of prisoners' social organization, and the gangs compete for power and other resources inside the walls. Finally, prisoners also

attempt to continue their street lifestyle in prisons. This results in an underground economy in which contraband such as drugs and alcohol are valued commodities, homemade weapons (shanks) become routine weapons for protection or assault, and inmate groups compete for control of resources.

The ultimate consequence of all these factors is a culture that facilitates the continued social values inside the walls for which the prisoners were originally incarcerated. Conning is valued, violence is condoned or even necessary, success in rule violations is valued, and disciplinary problems are high. Prisoners not only are not rehabilitated, but their original behaviors and values are enforced in the culture.

STRENGTHS

The importation model provides a number of useful insights into the sources of prisoner culture. If importation theorists are correct, then prisoner culture would be expected to shift in line with the characteristics of prisoners. These changes may reflect alterations in a demographic group, such as inner-city racial or ethnic minorities, or shifts in the broader society, such as awareness of civil rights.

There is considerable support for this view. Through the 1960s, for example, inmates were predominantly white, reflecting the racial composition of society. The demographics of prison populations created a dominant set of norms and values that were shared by most prisoners in the primarily white inmate population. As African Americans and Hispanics gradually outnumbered whites, the culture built on the experiences of inner-city males, whose norms and values were significantly different from those of white America. Blacks and Hispanics began to define themselves in terms of their racial and ethnic identities and less in terms of their prisoner status. Challenges to racial segregation and differential treatment were strengthened by court intervention into prison administration. As prisoners received more rights, the divisions within the inmate populations become more recognizable. Religious freedoms, influenced especially in the practice of Islam, increased for blacks and Native Americans, providing them with new spiritual outlets.

The growth of street gangs also reshaped the prisoner culture. In addition to the importation of gang behaviors and goals, it also affected how prisoners did time. The old inmate code, "do your own time," shifted to "do our time" as gangs required and enforced compliance with its norms. As with their street counterparts, the norms of the gangs become the most important element in the lives of the members in imposing both obligations and providing rewards. Competition for members, control, and goods and services have become predominant factors in prison socialization. Violence was no longer driven by repudiation of the prison structure but an expression against rival gangs for control, reputation, and furtherance of their illegal enterprises or as internal discipline to control members.

External factors influenced the composition of the prison population and culture changed in other ways, providing evidence for the importation model. The war on drugs brought an increasing number of young, poor, and undereducated inner-city offenders into prison. Many of them had been convicted of violent offenses. Studies show that inmates convicted of violent offenses are more likely to engage in violence in prison.

The sentencing structure has also changed the composition of the prison population further highlighting the differences within the inmate culture. Society's "get tough on crime" policies create special groups of offenders with different values and norms imported into prisons. One example is the increasing number of younger inmates, who are more likely than older inmates to participate in disruptive behavior. Older inmates are more inclined to respect authority, if not always rules, and are less likely to be involved in expressive violence. Furthermore, with more prisoners serving time, prison construction has dramatically expanded. With more prisons, it becomes easier to classify offenders and distribute them into need-oriented and security-flexible specialized institutions, thus creating a more homogeneous population.

The importation model suggests that, if we are to make prisoner culture more stable and less

dysfunctional, we should begin with rehabilitative programs that reduce the proclivity toward violence and predation and provide meaningful alternatives rewarded by changes in behavior. Prisons should be reorganized in ways that reduce the opportunities for and utility of predatory behavior. Importation theorists also suggest that many of the characteristics of prisoner culture are outside of direct administrative control, which creates an inevitable conflict between and among prisoners and staff. This, in turn, means that in addition to internal controls and reforms, the prisoner culture must also be addressed through wider social reforms that reduce the value of predatory behavior.

Finally, proponents of the model redirect the attention of researchers from inside the walls to the complex interplay of societal, legal, and other factors that facilitate what happens inside the walls. Prison culture cannot be perceived as something that emerges *sui generis*, as deprivation theorists emphasize, but are a complex interplay of factors on both sides.

LIMITATIONS

Despite its utility for offering insights into some of the sources of prisoner culture, the importation model remains somewhat limited. It is certainly not a profound observation that prisoner culture—any culture—reflects the characteristics of those who inhabit it. A commune of pacifists would be less likely to resemble prisoner culture than a commune of professional football players. Populations drawn from the same demographic backgrounds, whose members possess similar attributes and characteristics, are likely to translate their traditions into behaviors that lead to shared expectations, behaviors, and obligations. These shared ideas, in turn, lead to fairly invariant structures of collective meaning that we call culture.

Another serious problem is the gender bias. Despite several classic studies of the culture in women's prisons (e.g., Bosworth, 1999; Giallombardo, 1966; Heffernan, 1972; Owen, 1998; Ward & Kassebaum, 1965), studies of prisoner culture are overwhelmingly male oriented. The earliest studies of women's prisons characterized the culture as recreating fictive families as women attempted to adapt, somewhat passively, to their conditions. These studies generally stressed the importance of close family ties and the importance of familial interactions that women imported into the prisons. Giallombardo emphasized homosexual relations, suggesting that there was a single-mindedness to women's socialization within the prison environment. Recent research, however, has found that there is no more homosexual activity among females in pseudofamilies than among other women in the prison population. These findings support the view that women who import strong family values into the prison are likely to form similar bonds within the correctional facility. Recognition of this has led some female facilities to develop programs to foster the need for child care and other family activities. This, in turn, suggests that by changing the nature of the prisons, we can also modify the influence of street culture in the prisons, demonstrating some utility in integrating the importation and deprivation models.

The importation model is further weakened by its inability to account for variations in different types of prisons. For example, it has been unsuccessful in explaining prisoner culture in medium- or minimum-security prisons, where the culture becomes increasingly "normal." As Galliher (1972) observed, while there is cultural consistency within types of prisons based on security level, there are dramatic cultural variations across security types. This suggests that not only are "bad guys" not all alike, but it reinforces the judgment that there is something about the nature of the institution that shapes the culture and the repertoire of prisoners' accommodation responses to it.

The model also overemphasizes homogeneity among prisoners. Just as in the outside culture, prisoner culture is not composed of a monolithic set of norms and values. It reflects diverse groups that may not share the same values. Prisoner subgroups vary dramatically in their responses to the culture, with racially based gangs, faith-based groups, and smaller cliques adapting in their own ways to the environment.

Although a less serious limitation, importation proponents do not examine the consistency in prisoner cultures across time. In could be argued that the basics of prisoner culture have not varied dramatically in maximum-security prisons over the decades, only the manner in which they are expressed. Violence, hustling, the tensions between staff and prisoners, and attempts to make time easier are relatively constant.

Finally, importation theorists tend to focus on the socially destructive aspects of prisoner culture, such as predatory behavior, resistance to authority, violence, and antisocial attitudes. But these characteristics are most common in maximum-security institutions, where gang behavior, resistance to tight control, and violent prisoners with long sentences prevail. This distorts outsiders' perceptions of prisons by creating an image of abnormally maladjusted and recalcitrant predators, which further stigmatizes them. Even in the most violent of prisons, prisoners show acts of humanity, caring, and kindness, and most prisoners just want to do their time and return to their communities.

CONCLUSION: FUTURE OF THE IMPORTATION MODEL

Despite John DiIulio's (1987) observation that prisoner research suffers from overemphasis on the "society of captives," few studies have addressed prisoner culture as a process, and there seems to be a declining interest in prisoner culture in recent years. Two recent cutting-edge critical studies (Bosworth, 1999; Jones & Schmid, 2000) have de-emphasized prisoner culture itself and focused instead on the relationship between prisoner identity formation and maintenance and culture. Neither study rejects the importation or deprivation models. Instead, both provide a third approach that addresses how prisoners resist and accommodate to prison life, drawing from their available social and cultural capital, to define and create a "self-as-prisoner" in a phenomenological experiential process.

The importation model will likely continue to be a viable approach in studying the "society of captives." However, it must first overcome its limitations and recognize the dialectical process between what prisoners import and how what is imported, in turn, provides resources for adapting to the deprivations. Unless this occurs, the model may still provide some utility, but will become increasingly irrelevant to our understanding of how prisons "make good guys bad and bad guys worse."

INCAPACITATION THEORY

Proponents of the incapacitation theory of punishment advocate that offenders should be prevented from committing further crimes either by their (temporary or permanent) removal from society or by some other method that restricts their physical ability to reoffend in some other way. Incarceration is the most common method of incapacitating offenders; however, other, more severe, forms such as capital punishment are also used. The overall aim of incapacitation is to prevent the most dangerous or prolific offenders from reoffending in the community.

EXPLANATION

Incapacitation is a reductivist (or "forward looking") justification for punishment. Reductivism is underpinned by the theory of moral reasoning known as utilitarianism, which maintains that an act is defensible and reasonable if its overall consequences are beneficial to the greatest number of people. Thus, the pain or suffering imposed on an offender through punishment is justified if it reduces or prevents the further harm that would have been caused to the rest of society by the future crimes of that offender. The concern here is with the victim, or potential victim. The rights of the offender merit little consideration.

Incapacitation has long been a significant strategy of punishment. For example, in Britain during the 18th and 19th centuries, convicted offenders were often transported to Australia and the Americas. In the 21st century, the physical removal of offenders from society remains the primary method of incapacitation in most contemporary penal systems. This usually takes the form of imprisonment, although other methods of incapacitation are in operation.

The most severe and permanent form of incapacitation is capital punishment. Capital punishment is often justified through the concept of deterrence, but whether the death sentence actually deters potential offenders is highly contested. What is indisputable is that once put to death an individual is incapable of committing further offenses. Capital punishment is therefore undeniably "effective" in terms of its incapacitative function.

Other types of severe or permanent incapacitative punishments include dismemberment, which is practiced in various forms. For example, the physical or chemical castration of sex offenders has been used in some Western countries, notably North America. Less severe forms of incapacitation are often concerned with *restricting* rather than completely *disabling* offenders from reoffending. These include sentences such as disqualification from driving or curfews. In the United Kingdom, attendance center orders are used for individuals under the age of 21. Their aim is to restrict the leisure time of offenders by requiring them to attend a center in order to engage in some form of activity for a specified number of hours.

However, as mentioned above, the primary method of incapacitation is imprisonment. As with capital punishment, incapacitation in the form of imprisonment is considered to be a strategy that "works" because, for the duration of their prison sentence, offenders are restricted from committing crimes within the community.

So, according to this theory, punishment is not concerned with the nature of the offender, as is the case with rehabilitation, or with the nature of the offense, as is the case with retribution. Rather, punishment is justified by the risk individuals are believed to pose to society in the future. As a result, individuals can be punished for "hypothetical" crimes. In other words, they can be incarcerated, not for crimes they have actually committed but for crimes it is *anticipated* or *assumed* they will commit.

DEVELOPMENT AND DETAILS

Since the 1970s, and the demise of rehabilitation as a primary aim of punishment, incapacitation has become a significant goal of penal systems in both the United States and the United Kingdom. Two strategies have influenced penal policy and practice on both sides of the Atlantic: the "three strikes and you're out" policy and the practice of "selective incapacitation."

The three-strikes policy is partly informed by the theory of deterrence but is primarily underpinned by the concept of incapacitation. It has been influential in the United States since the early 1990s and aims to remove the most prolific or habitual offenders from society. Such offenders are given long sentences of up to life imprisonment for a third offense, regardless of the nature or gravity of that crime, if one or both of their previous offenses was a "serious" felony. In practice, this means that offenders can be given sentences that are disproportionately harsh for the offense committed. One of the most oft-cited examples of the severity of the three-strikes principle is the case of Jerry Williams, who, in 1995, was sentenced to life imprisonment without parole for stealing a piece of pizza.

The three-strikes principle has also had an impact on penal and criminal justice policy in the United Kingdom. The Crime Sentences Act (1997) proposed the use of harsh sentences, lengthier than the seriousness of the crime would normally warrant, for "serious" or prolific offenders. In addition, discretionary life sentences were introduced in the Powers of Criminal Courts (Sentencing) Act of 2000.

The second strategy, selective incapacitation, is concerned with identifying "risk" and predicting "dangerousness." This strategy emphasizes the proactive nature of incapacitative sentences. The aim is to incarcerate selectively those individuals who would pose a serious risk to the public if left within, or released back to, the community. Identifying risk is inherently problematic, and there have been many criticisms leveled at the subjectiveness of the methods and criteria used to predict future dangerousness. Indeed, as Norwegian sociologist Thomas Mathiesen has commented, many of the so-called aggravating factors often used to predict future behavior—such as previous periods of imprisonment, drug use, and unemployment—might actually be considered, by some, to be mitigating factors.

CRITIQUE

The use of incapacitation as a justification for punishment can be inherently problematic in both theory and practice. First, incapacitative sentences such as the three-strikes principle effectively repunish individuals for previous crimes. Alternatively, sentences based on selective incapacitation punish individuals for crimes not yet committed. There is an inherent risk with selective incapacitation that some of the individuals who are identified as "dangerous," and thus incarcerated, would not have gone on to offend. However, even if the methods of prediction were accurate, there are naturally moral and ethical questions about incarcerating individuals for what they *may* do rather than what they have actually done.

Incapacitative sentences also maintain and legitimize structural divisions within society. U.S. sociologist Christian Parenti comments that the excessive use of incarceration in the United States is indicative of a growing class-based, racial intolerance. The three-strikes principle, as with imprisonment in general, is disproportionately applied to minorities and the poor. While African Americans make up only 7% of the Californian population, for example, they constitute 31% of the state prison population and 44% of its "three-striker" population.

At the same time, a penal strategy based around the concept of incapacitation places no emphasis on the crimes of the powerful. So white-collar, corporate, and environmental crimes, which are more costly and, some would argue, more harmful to society, are overlooked. The emphasis instead is placed on street crime, which is disproportionately committed by the young and the poor.

Finally, incapacitative sentences, which are frequently dispensed to young people, take no account of the fact that most individuals "grow out" of their criminal activity. Many "criminal careers" do not last beyond the late teen years. Thus, long sentences without the possibility of parole make no allowance for the transitory nature of much law breaking.

INCREASE IN PRISON POPULATION

It would be no exaggeration to say that during the past two decades the U.S. prison system has been a growth industry. There are now more than 2 million people behind bars in America, with an incarceration rate above 700 per 100,000 (if we include jails), triple what it was 20 years ago. The United States is way ahead of other industrial democracies, whose incarceration rates tend to cluster in a range from around 55 to 120 per 100,000 population. Some countries have incarceration rates well below that range, such as Japan's rate of 37. Canada has a rate of only 115. The average incarceration rate for *all countries of the world* is around 80 per 100,000. Thus, America's incarceration rate is almost nine times greater than the average country.

Table 1 shows changes in the U.S. prison system during the past 75 years. Note that the most significant increases have occurred since the mid-1980s, when the war on drugs began to have its effects on jail and prison populations. Indeed, a recent estimate is that convictions for drugs accounted for almost *one half* of the increase in state prison inmates during the 1980s and early 1990s. Between 1988 and 1994, the number of prisoners who had been convicted of drug offenses went up by 155.5%. By comparison, only modest increases were seen for violent and property offenders. Between 1980 and 1992, court commitments to state prisons on drug charges alone increased by more than 1,000%.

The increase for women offenders has been even more striking. From 1925 to 1975, there was virtually no change in their rate of incarceration. Then, between 1975 and 2000, their incarceration rate increased by more than 600%, twice the rate of increase for males. Once again, this increase can be explained by drug policies, since the proportion of women sent to prison for drug offenses jumped from around 10% in the early 1980s to more than one third in the 1990s. In the federal system, the growth rate is even more dramatic. Whereas in 1984 a total of 28% of female offenders were drug offenders, by 1995 their percentage had more than doubled to 66%.

Table 1 The Growing Prison Population, 1925–1999 (rates per 100,000 in state and federal prison)

Year	*Total*	*Rate*	*Male Rate*	*Female Rate*
1925	91,669	79	149	6
1935	144,180	113	217	8
1945	133,649	98	193	9
1955	185,780	112	217	8
1965	210,895	108	213	8
1975	240,593	111	220	8
1985	480,568	202	397	17
1995	1,085,363	411	796	48
2000	1,321,137	478	915	59

SOURCE: Maguire and Pastore (2001, Table 6.27).

That the drug war has contributed to rising prison populations is further supported with data from U.S. district courts (federal system) showing that whereas in 1982 about 20% of all convictions were for drugs, by 1994 this percentage had increased to about 36. During this same period, the proportion of those convicted on drug charges who were sentenced to prison increased from 74% in 1982 to 84% in 1994, and their actual sentences increased from an average of 55 months in 1982 to 80 months in 1994. The average sentences for murder during this time actually *decreased* from 162 months to 117 months, while for all violent offenses the average sentence declined from 133 months to 88 months. At present, all of these changes have meant that on any given day, almost 60% of all federal

prisoners are serving time for drug offenses; of these, 40% are African American.

As a result of the growing population behind bars, the actual *number of prisons* has increased, along with, in some cases, the *capacity within* the prison. These days, some "megaprisons" can hold from 5,000 to 10,000 inmates (Austin & Irwin, 2002, pp. 125–131). In 1990, there were a total of 1,287 prisons (80 federal and 1,207 state prisons); by 1995 there were a total of 1,500 prisons (125 federal and 1,375 state prisons), representing an increase of about 17%. The federal system experienced the largest increase, going up by 56%.

Of course, all such changes have not occurred evenly across the country. Some states have experienced a far greater expansion in imprisonment than others. In Texas, for example, the number of prisoners increased by more than 100,000 during the 1990s. Likewise, prison construction varied widely by state and region, with the largest increases occurring in the South, adding 95 prisons for an increase of 18%. Texas once again leads the way, adding 49 new prisons for an increase of 114%. Oklahoma added 17 new prisons for an increase of 74% (Mays & Winfree, 1998, p. 171). Texas currently leads the nation with 102 prisons, an increase of 155% from 1991 (Rush, 1997, p. 157). As of December 31, 2000, Texas had 163,190 prisoners, with 1 out of every 20 state residents behind bars, up from 1 out of every 25 in 1996. During the decade of the 1990s, almost one of every five new prisoners added in the United States was in Texas (18%). The Texas prison population tripled during this decade.

RACE

The modern prison system (along with local jails) has been described by many as a ghetto or poorhouse reserved primarily for the unskilled, the uneducated, and the powerless. African Americans, particularly males, are especially vulnerable. For example, in mid-year 2003, according to the Bureau of Justice Statistics, 12% of all black males in their 20s were in prison or jail. Moreover, if current trends continue, roughly one third of all black males born in 2003 will spend time behind bars. In some cities in the United States, including the nation's capital, such figures have already been attained. Hispanics are also heavily overrepresented.

Many sentencing structures have a built-in class and racial bias. Drug laws, especially those for crack cocaine, illustrate this point most clearly. The penalty for possession and/or sale of crack cocaine is far greater than similar quantities for the powdered variety of cocaine. Recent scholarship has concluded that the evidence strongly suggests that such punishment has intentionally targeted African Americans, since this group is far more likely to use crack, while most users of the powdered cocaine are white and middle class.

Officially, this drug war was launched during the Nixon administration (according to Dan Baum [1997], Nixon's policy advisers specifically suggested that focusing on drugs would be a "legal" way to target blacks and hippies, whom they despised). The "war" was significantly escalated during the Reagan years when he promised that the police would attack the drug problem "with more ferocity than ever before." What Reagan did *not* say, however, was that the enforcement of the new drug laws would focus almost exclusively on low-level dealers in minority neighborhoods. Indeed, the police found such dealers in these areas mainly because *that is precisely where they looked for them,* rather than, say, on college campuses (Mauer, 1999, p. 142).

The results were immediate: The arrest rates for African Americans on drug charges shot dramatically upward in the late 1980s and well into the 1990s. During one period of time at the heights of the drug war, the proportion of admissions to prisons that were racial minorities increased from 42% to 51% between 1981 and 1991, while the proportion that were sentenced because of drug law violations increased from 9% to 25%. One study found that, between 1985 and 1987, of all the drug-trafficking defendants in the country, 99% were African American.

In fact, while African Americans constitute only around 12% of the U.S. population and about 13% of all monthly drug users (and their rate of illegal drug use is roughly the same as for whites), they represent 35% of those arrested for drug possession

and 74% of those sentenced to prison on drug charges. The evidence of racial disproportionality in the drug war is overwhelming. For instance, drug arrest rates for minorities went from under 600 per 100,000 in 1980 to more than 1,500 in 1990, while for whites they essentially remained the same. Facts such as these have led such reputable scholars as Michael Tonry, William Chambliss, and Noam Chomsky to conclude that it was the *intent* of the Congress and the Senate to target minorities.

As far as prison sentences go, studies of individual states are telling. For instance, in North Carolina between 1980 and 1990, the rate of admissions to prison for nonwhites jumped from around 500 per 100,000 to almost 1,000, while in Pennsylvania, nonwhite males and females sentenced on drug offenses increase by 1613% and 1750%, respectively; in Virginia the percentage of commitments for drug offenses for minorities went from just under 40 in 1983 to about 65 in 1989, while for whites the percentage actually *decreased* from just over 60% in 1983 to about 30% in 1989 (Donziger, 1996, p. 115; Mauer, 1999; Tonry, 1995). Presently, the rate of incarceration for African Americans exceeds that for whites by a ratio of 8 to 1.

CONCLUSION

The growth of the U.S. prison system has been truly staggering in recent years and has far outpaced the growth of crime. One recent study found that, looking back over the 30-year period from 1971 to 2000, the overall crime rate remained roughly the same (4,124 per 100,000 in 2000 compared to 4,165 in 1971), while the rate of imprisonment increased almost fivefold. The billions of dollars in expenditures on the prison industry have had no effect on crime. Yet prisons continue to grow and continue to house more and more racial minorities.

INDETERMINATE SENTENCING

Indeterminate sentences operate when judges assign convicted offenders to terms of imprisonment identified only as a range—such as from one to five years—rather than naming a specific time period. In this context, indeterminacy refers to the unknown ultimate amount of the penalty (length of time) at sentencing. That is, one *cannot determine* at the time of sentencing the length of time that the convicted person shall actually serve. In fact, since indeterminate sentencing allows for a series of discretionary choices by prison officials leading to an eventual decision by a parole board, an individual may not be sure how long he or she has left in prison until near the end of the time actually served. Despite various movements toward determinacy beginning in the 1970s, indeterminate sentencing still prevails in the United States.

Debates over the case for and against indeterminacy or determinacy in sentencing raise complex questions about the purposes of criminal sentencing and corrections, what such regimes of control and surveillance achieve, and their political implications and consequences. Supporters of indeterminate sentencing typically believe that imprisonment can rehabilitate offenders, despite all of the known problems with penal facilities today.

HISTORY

Indeterminate sentencing dominated ideas about and practices of criminal sentencing and corrections in the United States from the late 19th to the late 20th centuries. It emerged in its modern form at the National Prison Association meeting in Cincinnati, Ohio, in 1870 as part of a series of social inventions spawned by reformers during the Progressive era, which ran from the late 1800s through the early 1900s. Throughout this time, rehabilitation prevailed as the official, professional, and reformist aim for corrections. Probation and parole emerged and developed as related institutions closely tied to the rehabilitative ideal and indeterminate sentencing.

Like other innovations or social inventions of the Progressive era, the indeterminate sentence grew out of reformers' faith in science, rationality, government benevolence, and human progress. Thus, the indeterminate sentence ideally would proceed via information gathering, prediction, treatment, and ongoing assessment and eventually would culminate in release of the prisoner after professional review of the evidence found him or her "cured." Reformers clearly saw utility in the less humane side of the indeterminate sentence as well; if never judged cured of their criminality, prisoners could languish in prison for the rest of their natural life.

Instead of the careful and thoughtful individualized treatment program envisioned by reformers, correctional institutions determined the actual experiences of inmates. In state after state during the Progressive era, indeterminate sentencing served as an expedient way of processing the dispossessed who had run afoul of the law. In particular, judges, prosecutors, wardens, and parole boards quickly adapted indeterminate sentencing to their own ends. Judges could appear tough on crime by pointing to the high end of the indeterminate range imposed. Prosecutors and defense attorneys could induce guilty pleas by emphasizing the possibility of early release. Wardens and correctional guards also had a ready means of eliciting inmate compliance with the reward of early release and the punishment of extended confinement contingent on institutional record, including discipline as well as program participation. Finally, parole boards depended for their existence on the whole mythology of indeterminacy and correctional treatment under coercion.

RECENT DEVELOPMENTS

Recent decades have witnessed the emergence of various challenges to indeterminate sentencing. The movement away from it and toward determinate sentencing began in the 1970s and has received considerable legislative, judicial, policy, and scholarly attention since then. As crime grew in the 1970s, forces on both sides of the political spectrum began to lose confidence in the possibility of reforming offenders. Given that indeterminate sentences were justified in large part by a belief that prisoners could be rehabilitated, this change in sentiment inevitably led toward determinate sentencing

Nevertheless, indeterminacy still characterizes most of the sentencing policy and practice in the United States. This remains true in the adult (criminal) as well as juvenile (delinquent) arena where the majority of offenders are sentenced to a range of time in prison, rather than a fixed number of years. In large part, the continuing existence of indeterminate sentencing reflects the more general failure of the progressive social movements of the late 20th century to achieve more far-reaching structural societal transformations. Yet it also has more specific sources in the dynamics of criminal justice policy.

Why is that? Why does convenience dominate still even with the decline of the rehabilitative ideal? In part, it may reflect a kind of intellectual and cultural exhaustion with this issue. It likely indicates too the power of institutionalization. Indeterminate sentencing has become too much a feature of the correctional landscape to disappear completely without sufficient political resources and bureaucratic alternatives to make reform critiques more effective. Yet we must recognize the significant inroads that determinacy has made. Even though most states retain indeterminate sentencing rhetoric and associated institutional arrangements, almost all have incorporated various forms of determinacy such as mandatory minimum incarceration, repeat-offender laws, and sentencing guidelines. Thus, indeterminacy stays on more as a vestige rather than an ideological center.

SOCIAL CLASS, ETHNICITY, AND GENDER

Part of the impetus of the 19th-century penal reformers in the United States in crafting the interrelated institutions of indeterminate sentencing, probation, and parole was to reduce social class biases associated with the previous system. Thus, for example, frequent use by governors of the power to pardon produced a system in which those with means and connections presumably had greater access to freedom via this route. The new system, built around the indeterminate sentence, should then work more fairly, creating more access by less privileged prisoners to the release decisions made by professionals based on scientific reasoning rather than political influence.

Yet the new system often failed to produce such laudable outcomes. This becomes especially apparent when noting that indeterminate sentencing developed along with probation. Operating under the same rehabilitative philosophy, probation was designed to serve offenders in their own communities when criminal justice professionals felt that they need not be imprisoned. In practice, however, probation tended to function as a substitute for the suspended sentence. Yet probation, unlike the suspended sentence, gave judges the means to supervise and monitor offenders. This meant greater control, including the distinct possibility of revocation followed by incarceration. Since probation developed much more rapidly in urban than rural areas, this meant that convicted criminals in cities, disproportionately the disenfranchised (e.g., impoverished, immigrant, black, Catholic), tended to fall under the enhanced supervision of the state.

Similarly, multiple opportunities for discretionary decision making under indeterminate sentencing enhanced the prospects that ethnic, social class, and gender discrimination would occur. Indeed, when attacks on indeterminate sentencing and associated institutions arose in the 1960s and 1970s, they highlighted such concerns.

In general, indeterminate sentencing has reinforced the tendency of the criminal justice system to reinforce existing patterns of race, gender, and class domination and privilege. This sentencing strategy

exists within a broader context of social control and contributes to its regulatory and oppressive impacts. Sometimes this appears in patterns regarding social class and ethnicity, especially when recurrent low-visibility discretionary decisions allow bigotry room to affect individual fates. Likewise, indeterminacy often appears to institutionalize paternalistic treatment of women and girls, as female offenders who do not adhere to idealized gender norms frequently serve longer sentences than those who do.

CONCLUSION: INTERNATIONAL COMPARISONS

In criminal justice research literature and policy discourse, sentencing indeterminacy or determinacy remains largely a U.S. concern. Although its intellectual and cultural hegemony has characteristically influenced criminal justice discourse elsewhere, concerns about sentencing in Europe and in developing nations tend to center more on the broader themes of purposes, actual impact on persons, political consequences, and implications. In general, other nations have not embraced indeterminate sentencing to the same extent as in the United States.

INDIVIDUAL THERAPY

Individual therapy attempts to transform an offender into a law-abiding citizen through one-on-one sessions with a counselor or psychiatrist. Unlike group therapy, individual therapy provides the clinical environment for treatment that can be targeted to each client differently. It also provides an opportunity for people who have difficulty participating in a group to be treated. In practice, individual therapy is often part of a group therapy program such as drug abuse or sex offender treatment. Despite challenges to the goal of rehabilitation in the current "get tough on crime" era, most correctional facilities continue to offer some form of individual therapy, ranging from an initial assessment with a prison psychologist to more extensive ongoing counseling throughout a person's sentence.

BACKGROUND

Those working in the field of mental health draw on a series of different traditions and ideas, all of which rest on a belief that people can change so long as they want to. There are more than 200 different theoretical therapy models, which can be reduced to four distinct categories—psychodynamic, humanistic, behavioral, and cognitive. Some therapists draw only on one set of ideas, while others use elements from a number of categories, combining them as they deem appropriate and effective in assisting in change. For example, some subscribe to ideas of psychoanalysis that developed from

the work of Sigmund Freud. Others use methods of clinical psychology originating in the work of Lightner Witmer, who, in turn, was influenced by the experimental psychology of Wilhelm Wundt. Still others draw on the ideas of Frank Parsons, who first developed vocational guidance, in developing their individual counseling programs.

Educationally, practitioners of individual psychotherapy and individual counseling may hold a variety of degrees from a bachelor's degree to a doctorate (PhD, PsyD, or EdD). They may be psychiatrists, with medical degrees that entitle them to prescribe medications in treatment, or counselors who seek to help others manage their stress levels. Most states in the United States have licensing laws, which determine the minimal education and training for mental health counseling and the psychotherapeutic professions.

CURRENT PRACTICE

Authors of a report submitted to Congress that reviewed funded programs initiated in 1996 found that cognitive behaviorally oriented therapy, for both individuals and groups, appeared most effective (Sherman et al., 1998). This type of therapy attempts to change behavior by changing the ways individuals think. It addresses attitudes, beliefs, and thinking patterns, to shift people's moral reasoning and development as well as how they process information.

Anger management courses in prison are based on cognitive behaviorism. These courses, such as the Philadelphia Crime Prevention Program (PCPP), may be either individually focused or based on group work. The Philadelphia program tries both to change people's deviant behavior, to reduce their reoffending, and to alter their sense of self. Sex offender treatment programs are also generally based on cognitive behavioralism.

EFFECTIVENESS AND LIMITATIONS

The use and effectiveness of individual therapy in criminal rehabilitation have long been a source of heated debate because the element of personal choice that is so fundamental to therapy is severely compromised in prison. Inmates are often required to undergo psychological counseling as part of their sentence, and so do not choose of their own free will to embark on self-transformation. Others are offered a sentence reduction for participating in certain programs, which may be more important than the experience of therapy itself. Likewise, the therapeutic relationship between the individual inmate and the therapist is based on trust and confidentiality, which may be difficult to establish within an incarcerated population because the therapist is an employee of the justice system. Finally, not all institutions support individual therapy since it is both expensive and requires numerous staff. As a result, group therapy is more commonly offered.

SPECIAL NEEDS

As with the general population, those who are incarcerated are composed of clinical subgroups, each with common issues as well as special concerns that need individualized treatment. These subgroups are based on age, gender, and cultural backgrounds and types of crime. Unlike group therapy, individual therapy enables a practitioner to identify and then treat the particular issues that members of these subgroups demonstrate.

For example, female juvenile offenders are more often diagnosed with oppositional defiant disorder (American Psychiatric Association [APA], 1994), whereas male juveniles are more often diagnosed with conduct disorder (APA, 1994). Similarly juvenile offenders in general often require treatment for developmental issues due to their age. Both young offenders and adults often require counseling for learning disorders and sexual abuse. Female juveniles and adults report higher frequencies of sexual abuse victimization than males. Indeed, women may present a number of additional issues such as child custody, while some women arrive pregnant at the time of incarceration. Then there are the issues involving the status of child custody, both during incarceration and after release.

For all age classifications, there are the clinical issues of substance abuses and dependence by the individuals, and finally, there are the adjustments to being incarcerated, as well as various victimizations

that may occur in prison. As far as types of offenses, two have been of major social concerns: sex offenses and violent offenses. With sexual offenders, the issues include perpetrating of the present offenses and possible past victimizations of the individual. In regards to violent offenses, there are the antisocial issues and anger management.

CONCLUSION

There are numerous conditions and situations in prison where individual therapy is clinically indicated and, when used appropriately, may be effective. To ensure and to further this effectiveness, continued research, development, and standardizing of techniques for the variety of offenders encountered in the prison population are required. This will require specialized training for the clinical professionals in working with this challenging population. Also, education of the criminal justice and juvenile justice enforcement community may increase their awareness of the potential individual therapy offers in order to increase their support and cooperation of this component of rehabilitation.

INMATE CODE

Within the walls of prisons and underneath the formal rules of conduct mandated by each institution, inmates live by their own standards and rules. Isolated from the outside world, they create lives and meaning for themselves in conjunction with their peers in the institution. The inmate code dictates behavior and becomes the central point of reference for those immersed in the community of the prison.

The inmate code is an important element of the larger inmate subculture. It is, in a sense, a series of unwritten commandments, rules to live by, that are passed down from one generation to the next. The first and most important rule of the inmate code zis to "do your own time." To the extent possible, people should tolerate or ignore the behavior of others, keep their heads low, and not cause trouble. Inmates are expected to solve their own problems. They should never bring the guards into inmate business. The code suggests that if you have a problem, either fix it yourself or learn to live with it. Other important points from the inmate code include the following: keep your mouth shut and never be an informer or snitch; do not exploit other inmates; do not interfere in other people's business;

stay tough at all times and do not show weakness; and, whenever possible, remain loyal to your fellow prisoners.

Inmate Code

The "inmate code" is a set of norms that allegedly guides how inmates should act toward each other in prison. It is similar to the unwritten bylaws of many other institutions and groups. In particular, it is like the police "code blue," where officers cover for another, wrong or right (usually wrong), or the "blue flu," where police stand united in calling off work by calling in sick to protest working conditions. Students, for example, usually do not "rat out" other students they see cheating. Professors may ignore violations by their peers.

The most important aspect of the inmate code is the "code of loyalty," which is intended to protect the prisoner from administrative punishment, whether the prisoner is wrong or right. This occurs, for example, when one inmate will not inform prison authorities or other parties about another inmate's actions. This is commonly referred to as "no snitching; no ratting; no dry snitching" (or intentionally or unintentionally revealing discrediting information in a joking or gossiping manner), no squealing; no "stool pigeoning." The unity many prisoners derived from the inmate code came under attack in the late 1970s and early 1980s, when the federal government implemented an unwritten policy in which accomplices could testify against their partners for immunity, the "undercover snitch program," a reduced sentence, or witness protections. This unwritten policy was commonly called "whoever got down first." This policy effectively made it OK to snitch. Although one may still be rewarded for silence and not "ratting" on partners or other inmates, in general, "not ratting" is just another old school value. As a result, the inmate code has taken a 180-degree turn. Today, whistle blowing is a public value. To be a whistle blower is to be a crime stopper, a "good fellow." This has filtered into the norms and ethics of potential (or soon-to-be) inmates, which transforms the old inmate code of "don't rat" into one in which "stool pigeon" is acceptable.

Geoffrey Truss
Dixon Correctional Center, Dixon, Illinois

ORIGINS

There are two general schools of thought as to how and why inmate subculture develops. Some scholars have suggested that the subculture present in any institution is of indigenous origin and develops in response to the specific conditions of confinement and the problems of adjustment posed by the pains of imprisonment. Sociologist Gresham Sykes (1958) outlined five major pains of imprisonment: rejection by the free community, lack of goods and services available in the outside world (and often replacement with inferior products), deprivation of sexual intimacy, deprivation of autonomy or a nearly complete lack of independence, and the loss of physical security. Sykes and others have argued that the inmate subculture and the corresponding inmate code developed as an adaptation to these pains of imprisonment and to the particular problems and challenges of life as an inmate.

Alternatively, John Irwin and Donald Cressey (1962) argued that the inmate subculture is not unique to prisons at all. They claimed "it seems rather obvious that the 'prison code'—don't inform on or exploit another inmate, don't lose your head, be weak, or be a sucker, etc.—is also part of a criminal code, existing outside of prison" (p. 145). This position is referred to as the direct importation model, which suggests that the personal identities, values, and loyalties that inmates bring into the institution from the outside give shape to the subculture. In this view, the inmate code is a version of the criminal code that many inmates had adopted and lived by for most of their lives before entering prison. As such, they come into the institutions valuing toughness, respect, and the ability to "take it." They have faced adversity in their lives and they have learned to keep their eyes open and their mouths shut. They understand, above all else, the importance of doing their own time and letting others do theirs.

THE INMATE CODE TODAY: RACE, GENDER, AND SECURITY LEVEL

There is some debate today whether the inmate code still exists as it was described by Sykes, Irwin, Cressey, and others. James B. Jacobs, for example, argued that divisions among racial groups

in prison have played an important role in changing the inmate culture. According to Jacobs (1983), black and Latino/a inmates are generally better organized and more cohesive than whites; racially homogeneous prison gangs have thus been able to replace the original inmate code with codes of their own making, specific to their own needs and loyalties.

The inmate code also seems to be quite different in women's prisons. In general, the conditions and considerations of confinement are somewhat less threatening as women inmates tend to be less violent than males, posing less of a physical danger to staff members and fellow inmates. In her study of a large women's prison in California, Barbara Owen (1998) found that the inmate code among women is not nearly as important as it is among men. The desire, and need, for respect was one of the few values held by both the male and female inmate culture. Similar to their male counterparts, female inmates also felt the need to be ready to defend themselves, if necessary, but they generally tried to stay out of "the mix" and to avoid behavior that was likely to bring trouble and conflict with other prisoners or staff members. Owen also found that the current women prison culture seems to tolerate more "telling" or snitching than in the past—a key change from the traditional inmate code.

Finally, the inmate code may never be a facet of some of the newer supermaximum secure prisons where contact and communication between inmates are severely limited. With virtually no human contact in supermaximum secure prisons, a cohesive code amongst inmates is hardly necessary and is all but impossible to develop and maintain.

CONCLUSION

No discussion of life in prison is complete without consideration of the inmate code. While prisons exercise great power over the lives of those incarcerated within them, the hierarchy and leadership of inmates are frequently much more influential in their daily lives than the authority exerted by the correctional officers and the official rules of the institution. The inmate code dictates behavior and helps to shape the experience of individuals living behind bars.

INMATE VOLUNTEERS

In recent years, prison administrators have made increasing use of inmate volunteers to run a range of inmate programs. By using prisoners to staff these activities, prisons are able to continue offering courses and programs that they would otherwise be unable to provide due to budgetary problems and overcrowding.

INMATE VOLUNTEER PROGRAMS

Prison education departments frequently make use of inmate volunteers. Since the demise of Pell grants, prison education departments have had their budgets severely reduced. As a result, they often turn to prisoners with advanced skills to volunteer as tutors. Across the country, prisoners instruct fellow inmates in reading, writing, and math, as well

as in English as a second language. Some inmates hold advanced degrees and offer courses in business, history, creative writing, and so on.

Recreation departments also frequently rely on inmate volunteers to support many of the athletic programs. Prisoners volunteer to organize teams, to serve as referees and umpires, and to keep the detailed records of sporting activities required by the administration. Most facilities allow the volunteers to coordinate seasonal sporting events with several teams that compete against each other in softball, flag football, and basketball. Some institutions, such as San Quentin, even allow these inmate teams to contact and then play against similar teams from the community.

While many institutions have music rooms and even instruments, they may not be able to afford civilian instructors. Instead, they rely on individuals from the confined population to form bands to perform shows for the entire prison community. Inmate volunteers may also lead music theory classes and teach others to read music and play instruments.

Besides education and recreation programs, the psychology services department is another segment of the prison that extensively relies on inmate volunteers. One of the most important programs that runs under their supervision is the suicide watch program available in many institutions. When someone attempts to take his or her own life in the federal prison system, that person is taken out of the general population and placed on suicide watch. During this time, the individual is locked in an observation room where he or she can be monitored 24 hours a day. However, because there are not enough psychologists or correctional officers to be present all of the time, inmate volunteers take up the slack. The volunteers in the suicide watch program work in shifts, usually for four-hour intervals, sitting immediately outside the locked observation cell and recording the activities of the individual under the psychologist's care.

Psychologists also use inmate volunteers to participate in or even lead group counseling sessions designed to help new prisoners adjust to the complexities of confinement. Volunteers may also coordinate meetings for those prisoners who want to participate in the 12-step programs of Alcoholics Anonymous or Narcotics Anonymous. Chaplains too, invite inmates to contribute to spiritual programs in similar ways.

VOLUNTEER PROGRAMS ELSEWHERE

The United States is not alone in its use of inmate volunteers. In England and Wales and Northern Ireland, for example, a highly structured suicide prevention scheme exists in all prisons that depends entirely on inmate volunteers. Known as "listeners," inmates are first screened and then trained by members of the crisis help group, the Samaritans. Once accepted into the program, inmate volunteers then have greater freedom of movement around the facility, as they are meant to be available to listen to any other prisoner who needs help dealing with the strains of incarceration. British prisons also have traditionally used inmate volunteers to run programs within minimum-security prisons for mentally and physically disabled children. Some even volunteer to help with the aged in nearby homes for the elderly.

WHY PRISONERS VOLUNTEER

Just as administrators want to ensure that inmates are never idle, so too do most inmates eschew dead time. With so much time on their hands and nothing productive to do, many inmates find volunteering a solace. Volunteering programs not only fill their day but also give them something to think about and do.

CONCLUSION

As states face greater budgetary crises, they are reducing the funds made available to correctional institutions. However, the number of people being incarcerated is not slowing down. As a result, many prisons and jails are finding it difficult to offer programs in education, recreation, and religion. They also have problems providing adequate counseling services. Inmate volunteers, like community volunteers, help address some of the shortfall.

INS DETENTION FACILITIES

INS (Immigration and Naturalization Service) detention facilities hold non–U.S. citizens who have been convicted or accused of crime and are awaiting either trial or deportation. Since the 1990s, few federal agencies have grown more rapidly and become more controversial than the INS. With its new and expansive powers aimed at controlling illegal immigration, the INS has stepped up its commitment to detentions and deportations. Proponents of tough law-and-order tactics praise the INS for its campaign to rid the nation of criminal aliens; however, immigration advocates argue that the laws unfairly target immigrants who have had minor brushes with the law. Under the 1996 Illegal Immigration Reform and Immigrant Responsibility Act, numerous crimes were reclassified as aggravated felonies requiring detention and possibly deportation, including minor misdemeanors such as shoplifting and low-level drug violations (also see the 1996 Antiterrorism and Effective Death Penalty Act). Compounding the harshness of the revised statutes, enforcement was retroactive meaning that persons who had been convicted before 1996 also were subject to detention and deportation even though people previously convicted of those crimes rarely served jail terms and were placed on probation.

ORGANIZATIONAL STRUCTURE

The INS, which in 2003 was merged into the Immigration and Customs Enforcement (ICE), a bureau of the Department of Homeland Security, until recently operated within the U.S. Department of Justice. Its primary responsibility is enforcing the laws regulating the admission of foreign-born persons (i.e., aliens) to the United States and for administering various immigration benefits, including the naturalization of qualified applicants for U.S. citizenship. The INS also cooperates with the Department of State, the Department of Health and Human Services, and the United Nations in the admission and resettlement of refugees.

The operational and management functions of INS are administered through INS headquarters in Washington, D.C., that oversees approximately 29,000 employees through three regional offices and the headquarters-based Office of International Affairs. These offices are responsible for directing the activities of 33 districts and 21 Border Patrol sectors throughout the United States and three district offices and 39 area offices outside U.S. territory. INS field offices provide direct service to applicants for benefits under the Immigration and Nationality Act and implement INS policies to carry out statutory enforcement responsibilities in their respective geographic areas. Overseas offices, in addition, serve as important information channels between INS and U.S. Foreign Service officers and foreign government officials abroad. As its mission suggests, the INS is a unique agency because it has the duty both to enforce the law and to provide services to immigrants. The combination of these activities creates considerable strain for INS personnel as well as their clients.

Due in large part to problems caused by this dual mandate, the INS remained one of the most criticized agencies in the federal government. Specifically, it was often challenged over its controversial enforcement tactics and its difficulty to deliver services efficiently.

INCREASED FUNDING

At a time when Congress was cutting federal spending in the 1990s, it funneled increasingly greater funds and resources to the INS, making it the largest federal law enforcement agency. Between

1993 and 2001, the INS budget soared by more than 230% from $1.5 billion to $5.0 billion. During that period, spending for enforcement programs grew from $933 million to $3.1 billion, nearly five times as much as spending for citizenship and other immigrant services, which increased from $261 million to $679 million. The cost of shared support for the two missions increased from $525 million in 1993 to $1.1 billion in 2001. The INS also increased its full-time, permanent staff by 79% from 1993 (17,163) to 2001 (30,701). Most of that growth occurred in the enforcement programs, where the total number of employees, including officers, grew from 11,418 to 23,364. Border Patrol led the way with an increase of 7,962 employees or 159%. In addition, the agency designated funds to expand its detention sector.

INS DETENTION

Between 1995 and 2001, the INS more than doubled the number of detention bed spaces available, with the current capacity at about 20,000 beds; furthermore, the Detention and Deportation staff nearly doubled, growing to 3,475 full-time permanent staff. Although the INS allocated funds to improve services to immigrants, the lion's share of the budget was devoted to "strengthening its successful multi-year strategy to manage the border, deter illegal immigration, combat the smuggling of people, and remove criminal and other illegal aliens from the United States" (INS, 1999, p. 1). As of 2002, more than 20,000 undocumented immigrants (including asylum seekers) were detained by the INS.

With unprecedented power in dealing with immigrants, the INS has increased its reliance on detention and deportation, even though these policies are often fraught with contradictions and injustice. In particular, those violating revised immigration laws are unnecessarily detained for protracted periods of time. Many detainees are housed in harsh conditions of confinement exacerbated by overcrowding, inadequate health care, and in some instances assaults by staff or state detainees held on criminal charges. At the Krome Detention Center in Miami, for example, many female INS detainees have been subject to physical and sexual assault.

Locked behind bars and fearing possible deportation, INS detainees are both physically and emotionally isolated. Cultural and language barriers merely complicate the experience of being detained. When detainees from the far reaches of the globe, such as Pakistan, China, Ecuador, or Afghanistan, find themselves in local jails around the United States, communication between jail officers and detainees is often impossible. Most jails holding detainees are located in rural parts of the country where staff may rarely have encountered non-English-speaking people before the INS began paying them to hold its detainees. Language barriers make everything from receiving medical attention to understanding jail rules extremely difficult. Without proper translation, detainees cannot understand legal services lists, call attorneys, make requests, or file grievances, all of which contribute to their isolation. Because INS detainees struggle to maintain contact with family, friends, and lawyers, they often lack basic emotional and legal support necessary to endure the lengthy administrative process. Frequent transfers to other facilities also compound their confusion and frustration. There are numerous reports of individuals being lost in the vast detention system; as a result, some detainees miss their court hearings because administrators cannot locate them in time.

A critical look reveals unsettling contradictions in INS detention practices, most notably the reliance on unnecessary and costly confinement that generates income for facilities renting their cells. In doing so, the INS abdicates its custodial responsibilities to local jails and private corrections companies, which the agency and concerned groups have difficulty monitoring. Despite cries from human rights groups, the business of detaining undocumented immigrants and asylum seekers has produced a vast network of more than 900 private and county jails nationwide, all eager to cash in on lucrative INS contracts that usually pay twice the cost of housing inmates charged with criminal offenses. Local jail administrators and private corrections firms have taken comfort in the fact that Congress remains deeply

committed to its fight against illegal immigrants. The INS uses more than a third of its $900 million detention budget to rent cells, mostly in remote rural counties where the costs are low.
