# Community

Images and the visual practices that put them to work contribute significantly to the experience of those social and cultural groupings that structure human life. Clan, tribe, ancestors, congregation, family, ethnic group, race, and nation are only some of the many shared orders of social life. These forms of association configure the loyalties, obligations, and affiliations, as well as the aversions and oppositions, that shape individual and collective identity. The creation, display, gifting, veneration, ritual observation, and destruction of images all can help perform group solidarity and signal individual status within the group.

In the manner of open-ended advertisements, some images broadcast identity in a way that situates an individual or family within a larger public setting, such as a domicile in central Ethiopia (a), which displays murals painted by the Protestant owner of the home.

In this instance, the murals announce the particular nature of the homeowner's faith. Images are also used

to promote the interests of a particular clan and its social intentions. The Shintō figure of a goddess (b), which also represents a court figure, belonged to a shrine ensemble that was typically installed by a clan with the aim of elevating its standing and even as a way of serving its political ambitions. Royal and noble patronage of the visual arts accounts for much of the world's finest art, and much of this was created to broadcast status or curry

(a) *Tukul* (thatched hut) in Hossana, Ethiopia, with murals painted by the Protestant owner. [Photograph by David Morgan] (b) INSET. A tenth-century carved and painted wood statue of the Shintō goddess Nakatsu Hime Zo, wearing the robes of a court lady, from the Hachimangu Shrine in Nara, Japan. support of the priestly or monastic classes, the devout laity, or the gods themselves.

Images are often what members of a group physically share with each other as members. Some objects and images orchestrate people's relationship to one another. The Uramot Baining people of Melanesia initiate young men into higher grade levels of age by using masks, such as the animated tree fork shown here (c), which represents a natural configuration used in dwellings, and therefore is something whose power consists of its operation in two domains—nature and culture—which power the mask can deploy to disrupt the cultural order, dislodging a youth to move him to another social status. An ancestor figure (d) from Papua New Guinea represents an important predecessor who is accompanied by animals that are

the clan totems associated with the ancestor. This carving was displayed among a group of such ancestor figures in a cult house where the figures were consulted as oracles before a battle or hunt. The tattoos a man received while in prison in Mexico (e) indicate his identity as a Chicano, his machismo, and his long-suffering prison stays; they even mark the individual years spent in prison. Another sort of display common among gangs in Los Angeles is graffiti (f), which is used to mark territory belonging to gangs, display pride in the gang's symbols and presence, and, in the case of the illustration reproduced here, to commemorate members of the Eighteenth Street gang in Los Angeles. The image of Our Lady of Guadalupe and Christ above the cross clearly signal the religious nature of the commemoration, as well as the importance of Catholicism for Chicanos.

A Vodou initiation ceremony (**g**), is organized around a candlelit altar and chalk diagram, in which properly costumed participants take part in a structured liturgy. Whether Vodou or Christianity, Hinduism or Shintō, visually elaborate, theatrically complex ceremonies literally perform group identity, assigning particular roles to participants, even calling upon them to perform a repertory of actions or utterances. Such events may be restricted to small, semiprivate groups, such as the women's societies in African secret associations (**h**), in which the masks and costumes of society members cloak their identities as they assume the identities of spirits or ancestors. Or the events may be vast, highly orchestrated affairs, as in the annual

Gaṇeśa festival in Mumbai (i), where, during the culmination of the festival, thousands of participants accompany large sculpted figures of the elephant-headed “remover of obstacles,” made of unfired clay, to the sea, where the image is submerged and dissolved. The ritual destruction of the image brings the festival to a single, dramatic end in the public witness of an entire city’s inhabitants.

Memorials and monuments enact collective identity in powerful, though distinct, ways in modern urban settings. The Marine Corps War Memorial (j), though called a memorial, is much better described as a monument if by that term one intends a heroic celebration of a great deed

that is erected for the sake of public affirmation as constitutive of the nation's well-being. Monuments are intended to gather the group—in this case, the nation—around a figure or event that totemically represents the whole. Memorials, on the other hand, are constructed as commemorations of loss. The towering beams of light that marked the site of the World Trade Center Towers (**k**) destroyed on September 11, 2001, did not aggrandize anyone or glorify the city or nation, but acted as a colossal form of mourning and remembrance. As a city and nation, New Yorkers and Americans regarded the dramatic memorial as not only an elegiac and all too ephemeral reminder of what was taken from them, but also what might register that loss within the larger gesture of a luminous connection with the night sky over Manhat-

tan. Both memorials and monuments seek to materialize a larger self, whether national or even divine. Both declare in different ways and possibly to different ends that each person is incomplete in him or herself and only more fully alive and purposeful as part of a larger self.

Images are often charged with the task of encouraging the submission of individual interest to the interest of the community. Clearly, this is the message of the Maoist poster (I) in which Chairman Mao Zedong radiates light like a solar deity above a smiling crowd of China's many ethnic peoples, several of whom conspicuously display copies of Mao's Little Red Book. Self-effacing obedience was part of Chinese Confucian tradition. Obligation to ancestors, parents, and superiors is the focus of Confucianism, but, in contrast to Mao's dictatorship,

(I) A Chinese propaganda poster portrays Mao Zedong as the sun, with representatives of China's various ethnic groups holding Mao's Little Red Book. The text declares "Chairman Mao is the everlasting red sun in our hearts." [©Ric Ergenbright/Corbis]

(m) Remonstrance before the Emperor, handscroll, ink on silk, China, from Li Kung-lin, *The Classic of Filial Piety*, chapter 15, 1085 CE. The Metropolitan Museum of Art, Ex coll.: C. C. Wang Family, from the P. Y. and Kinmay W. Tang Family Collection, Gift of Oscar L. Tang Family, 1996 (1996.479a-c). Photograph by Malcolm Varon. [Photograph ©1991 The Metropolitan Museum of Art]

authority was not unchecked. In the Chinese illustrated scroll entitled *The Classic of Filial Piety* (m) a minister remonstrates with his sovereign, but while doing so he bows very low and avoids the sovereign's superior gaze. All spectators avert their eyes from the ruler out of respect for his authority, but also perhaps to absent themselves from his wrath or embarrassment as he is called delicately to task. Authority is a socially enacted reality, bestowed by all members of a society, even though not equally, nor with the same benefit, to everyone.

## GODDESS WORSHIP

*This entry consists of the following articles:*

- AN OVERVIEW
- GODDESS WORSHIP IN THE ANCIENT NEAR EAST
- GODDESS WORSHIP IN THE HELLENISTIC WORLD
- THE HINDU GODDESS
- THEORETICAL PERSPECTIVES

### GODDESS WORSHIP: AN OVERVIEW

The scope and antiquity of goddess worship are remarkable. Female sacred images are associated with some of the oldest archaeological evidence for religious expression and they still have efficacy in the contemporary world. Goddess images are depicted in a wide range of forms, from aniconic representations, such as abstract organs of reproduction, to fully elaborated icons decorated with the finery of monarchy. They are linked to all major aspects of life, including birth, initiation, marriage, reproduction, and death. They display the elaborate variegation of religious experiences in different cultural contexts. A historical survey reveals goddess worship to be a continuous phenomenon, despite periodic ebbs and tides during certain critical epochs.

**GODDESS WORSHIP IN UPPER PALEOLITHIC CULTURES.** Some of the earliest archaeological evidence for the human religious impulse consists of sculptured images and cave paintings of female figures excavated in hundreds of Upper Paleolithic sites throughout Europe and northern Asia, including France, Spain, Italy, Germany, Austria, the Ukraine, and Siberia. These images, carved in bone, stone, antler and mammoth tusks, outnumber those of male figures ten to one. They have been identified sometimes as part of an elaborate and pervasive worship of goddesses; they are commonly known as “Venuses,” after the Roman goddess of love and beauty. The interpretation of these artifacts remains controversial today.

Some Venuses have been discovered in Aurignacian deposits as old as thirty to forty thousand years. However, they appear more frequently about 25,000 years ago. Remarkably, these same goddess figurines have been unearthed from sites dated as late as the early Neolithic period. One of the earliest of these figurines, found in the Dordogne region of France, was estimated to be thirty-two thousand years old, roughly the age of the famous cave art of that period and situated one level above Neanderthal artifacts associated with what are believed to be ceremonial burials. This “pregnant” figure was carved from reindeer antler and is marked by a series of small notches that do not appear to be purely decorative. One cannot be sure how to interpret this figurine, though it might be part of an elaborate cult associated with later discoveries of the same type.

The Venuses have been widely interpreted as evidence of a single phenomenon, fertility symbolism. Some scholars have lumped these prehistoric figurines together with a later so-called Great Goddess complex and the emergence of agriculture. Most archaeologists, however, hesitate to treat all these female images as fertility symbols, because they are the product of a wide variety of peoples with different economic systems, cultural traditions, and languages. Perhaps the Venuses had a great variety of meanings, both within the different cultural contexts in which they were found and depending on the time period. Each of these images must be read in the context of its archaeological provenience. Thus, theories that the Venuses represent an ancient, widespread cult of “fertility magic” are oversimplifications. Current research suggests that the Venuses may be associated with a wide range of phenomena involving women, such as maturation, menstruation, copulation, pregnancy, birth, and lactation. They are not to be treated separately or isolated in any way from other artifacts of the same period that represent some type of “storied event.”

The Neolithic goddess figurines take different forms. Some are thin and geometric, representing snake and bird goddesses. These water and air deities were likely cosmic symbols of the regeneration of life. Other figurines are faceless, unclothed, and corpulent. Still others appear to be conspicuously pregnant, with exaggerated breasts and large buttocks. The most famous of these figurines, the Venus of Willendorf (Austria), is often taken to be typical of Upper Paleolithic mother-goddess figures. This image is four and three-eighths inches high, made of soft stone, faceless, fat, but not apparently pregnant; it appears to have been painted with red ocher. However, the diversity of female images is marked; not all are full iconic representations. There is a variety of images of female body parts such as sculptured breasts (from sites in Czechoslovakia) marked with curious notches that may have been either notational or decorative—some of these were worn as a string of beads, others as a single pendant. Abstracted images of vulvas have also been unearthed in France, Spain, and Italy. Some are forked images, others are shaped like disks, and all have clear, finely marked notch-

es, which may be connected in some way with the menstrual cycle.

Other permutations include the various female images painted on cave walls that have some association with animals and a variety of different symbols and markings of probable notational significance. A number of abstracted images of female buttocks have been found in various sites, sometimes with breasts and torsos. In one Italian grave site, for instance, a decorated bone pendant in the shape of female buttocks was found. The image is well worn, and it seems to have been used for some purpose during the life of its wearer and then placed among various other ceremonial burial objects, including two other crudely carved goddess images made especially for the burial.

There is a great range of evidence for goddess worship in the Upper Paleolithic era. The character of this worship is largely uncertain, and no single interpretation is adequate. The figurines may have been associated with pregnancy, birth, burial, fertility, initiation, hunting, and the menstrual cycle; they may even have had some erotic function. Although they represent a prominent element in the religious life of this period, it is erroneous to isolate these female figurines from other important and associated imagery, such as animals, male images, and undeciphered markings. Nor can one make the further leap of suggesting that this rich collection of sacred female images constitutes proof of an early stage of matriarchy; the symbolism of these images tells nothing clear about male or female roles in the social organization of Upper Paleolithic cultures.

**NEOLITHIC EARTH GODDESSES AND THE EMERGENCE OF AGRICULTURE.** The most noteworthy fact about Neolithic goddess worship is its strong continuity with earlier Upper Paleolithic configurations. Gradually Paleolithic goddess symbolism was transformed to fit into the complex of human needs generated by increasingly agricultural and urbanized forms of social organization. Most sources date the Neolithic era around ten thousand to four thousand years ago; it was marked by the appearance of ground stone tools and the domestication of plants and animals in Europe, North Africa, the Middle East, and throughout various parts of Asia. The female images found in Neolithic sites represent the continuity of traditions from earlier Mesolithic and Upper Paleolithic cultures. Chevrons, meanders, serpentine and spiral designs associated with Neolithic goddesses are all familiar motifs prefigured in Paleolithic female images. Also, it appears that the Neolithic goddesses who were linked to lunar mythology are derived from earlier roots. Many of the Neolithic goddess figurines are corpulent, like their Upper Paleolithic predecessors; they are connected also to the supply of wild animals, but by this time with the addition of domesticated animals such as the dog, bull, and male goat as well. Some of these Neolithic figurines are pregnant, seated on a throne, representing goddesses of vegetation. In general, they are composite images, sharing the traits of both preagricultural and agricultural societies. Also noteworthy is a comple-

mentarity between male and female images—one is not subordinate to the other.

The complex imagery of the Neolithic era was centered around females and animals, as illustrated by evidence from the famous Anatolian site of Çatal Hüyük, excavated by James Mellaart in 1961–1963. This Neolithic settlement located in southern Turkey is dated from the seventh to sixth millennium BCE. Its more than forty shrines, distributed through nine building levels, have yielded a wealth of information about Neolithic religion. The evidence displays a clear cultic continuity associated with a mother goddess and accompanying male deities. In some shrines at Çatal Hüyük the goddess is depicted as being supported by leopards or giving birth to a bull, which was a male deity. This association of goddesses with male deities is unusual at Neolithic sites; they usually appear without a male counterpart.

The statuettes at Çatal Hüyük suggest that goddesses were connected variously with pregnancy, birth, ritual marriage, and command over wild animals. Images of stylized female breasts similar to Upper Paleolithic figurines have also been found here. The principal deity of this Neolithic site is a goddess represented in three forms, as a young woman, a mother giving birth, and an old woman. There are also several images of twin goddesses, with one of the two portrayed in the process of giving birth.

In other Neolithic shrines, goddesses appear as bird and snake deities connected to rain and water. Further recent evidence of Neolithic goddess worship comes from a village site presently being excavated outside of Amman, Jordan. Here an international team of archaeologists has unearthed a series of plaster figurines three feet tall with startled expressions on their faces, along with fifty animal figurines, two adorned plaster skulls, and three Venuses. One of the statues is of a nude female standing and pushing up her breasts with her hand. This image may foreshadow the later cult of the goddess Astarte, who was widely worshiped in the area.

The question has to be raised as to whether these Neolithic goddesses were part of a single cult complex spread across Europe and the Middle East or whether they represent different traditions entirely. In some places they are associated with ancestor worship, death, and the afterlife; in others they are related to the emergence of agriculture and the fertility of crops. In still others, they represent developmental functions, as they had in the Upper Paleolithic era. Whatever the answer may be to this question, one thing is clear. Goddess worship is not, as some scholars have suggested, an innovation that appeared suddenly in the Neolithic period with the emergence of agriculture, which these scholars then see as a woman-controlled form of subsistence.

**GODDESS WORSHIP IN THE DEVELOPMENT OF CIVILIZATIONS.** Goddess worship has played a central role in the worldwide transition from small-scale social organization to the emergence of civilizations in India, the ancient Near East, Greece, Rome, China, and Japan. In these complex ag-

ricultural societies female deities have been variously linked to the fertility of crops, the sovereignty of kingship, the protection of urban ceremonial centers, and the waging of warfare against enemies.

**India.** No civilization in the world developed goddess worship so elaborately as did India. Terra-cotta figurines of mother goddesses have been found in the Indus Valley, dated at 2500 to 1500 BCE, along with abstract stone rings representing the yoni and lingam, prototypes for the later god Śiva and his female consort. Goddesses rarely functioned separately from male divinities in ancient India. Nor was goddess worship the central theme in the development of Indian civilization except during periodic episodes of florescence. Indeed, the goddess does not appear as a major focus in Indian literature until 600 BCE, in a legend recorded in the *Kena Upaniṣad*. Not until much later, probably the seventh century CE, did goddess worship emerge as a somewhat separate cult in Hinduism and eventually in Tibetan Buddhism. This Tantric expression of goddess worship was particularly strong in eastern India where it continues to flourish today, though somewhat less intensely than formerly.

At no point in the development of Indian civilization was goddess worship completely separate from devotion to male deities. The Hindu rajas wielded power through the manipulation of icons of major male deities such as Sūrya, Viṣṇu, or Śiva. While these gods had female consorts who were worshiped alongside them, goddesses usually played a secondary though by no means unimportant role as images of cultural identity. No doubt at the village level there has been a long, relatively unbroken continuity of goddess worship extending back to Neolithic times. Local village goddesses were besought (as they continue to be today) to increase human fertility, to cause or cure diseases, to bring about good fortune, to enhance the productivity of crops, or to destroy demons. Yet, at the more exalted level of courts and kings, these female deities played a less prominent role. Up until the early part of this century many rajas incorporated tribal peoples into their spheres of influence by worshipping local goddesses, but this royal patronage of goddess worship was usually accompanied by an even stronger devotion on the part of the raja to the sect of a male deity. Thus, it would be erroneous to conceive of Indian goddess worship as a distinct component in the development of Indian civilization. The widely known Hindu goddesses such as Sarasvatī, Lakṣmī, and Pārvatī rarely stand alone. Only Kālī and Caṇḍī, the more ferocious aspects of female divinity, become focal points for separate worship. Even in these cases the goddess rarely acts as a primary source for establishing the legitimacy of kingship.

**The ancient Near East.** In the ancient Near East the phenomenon of goddess worship displayed an even more elaborate and subtle set of nuances. Here are encountered several distinct civilizations, some having borrowed heavily from each other. A number of goddesses were prominent in ancient Egypt: Nut, goddess of the sky and consort of the

earth god, Geb; the goddess Neith, patroness of victorious weapons and the art of weaving; Isis, goddess of wisdom; and Hathor, another sky goddess who assumed various forms. Some of these goddesses were deeply entwined in the development and continuity of divine kingship. The name *Isis*, for instance, is related linguistically to the term for “chair” or “throne.” The throne or “holy seat” of the pharaoh was the “mother of the king.” The pharaohs thought themselves to be sons of Isis. Later Isis became linked to the god Osiris. The heroic story depicts Isis’s famous search for her murdered husband’s corpse, her discovery of it, and his resurrection. Eventually Isis became universalized as a benevolent goddess of the harvest. Her cult spread from Egypt to Greece and throughout the Roman Empire. By 300 BCE the cult of Isis had become a popular mystery religion, with secret initiation rites promising salvation and rebirth.

Another stream in the ancient Near Eastern tradition of goddess worship flows from the Mesopotamian civilization located on the Tigris and Euphrates Rivers. In that area the goddess Inanna was worshiped; she was the queen of heaven and earth and the goddess of love, and she was profoundly involved in the rise of Sumerian state-level social organization. Although she was one of many goddesses of ancient Sumer, Inanna outlasted and overshadowed them all. Also known as Ishtar and later worshiped by different Semitic peoples, Inanna had very ancient roots. She was part of an amalgamation of Sumerian and Akkadian religious and political beliefs, extending back to 3000 BCE or possibly further, and she is connected to the fertility of crops, the emergence of increasing sedentary patterns of social organization, and the development of the first urban centers.

In the late nineteenth century the world’s oldest texts on cuneiform clay tablets were unearthed after having been buried for at least four thousand years. Some of these texts tell the life story of Inanna from adolescence through womanhood and her eventual apotheosis. The texts are extremely rich; they reveal the sexual fears and desires of the goddess, an elaborate history of kinship among various deities in her family tree, her power as queen of Sumer, and her responsibilities for the redistribution of resources and fertility of the earth. Inanna’s cult was centered at the ancient temple city of Uruk. Here archaeologists have provided evidence for the earliest known urban civilization, dated 3900–3500 BCE and characterized by monumental temple architecture and the first writing. The oldest shrine of Uruk was dedicated to Inanna, as were numerous later temples. She was the supreme patroness of the city. Though related to other deities, she retained a certain degree of independence. Inanna’s shrine was the focus of considerable economic activity and the redistribution of resources characteristic of urban life.

Unlike the female divinities of India and Egypt, the goddess Inanna, who was most likely derived from Neolithic and possibly even earlier Paleolithic roots, played the principal role in the religious tradition of an urban society. She was considered to have equal status with the sky god, An, head

of the Sumerian pantheon. In this urban context, Inanna became a focal point for the full emergence of life in city-states, and she assumed the regal responsibility for victory in war and the redistribution of resources among urban peoples. Often these functions have been allotted to male deities in other traditions, as in the case of the Hindu gods Śiva and Jagannātha.

Inanna is identified with the Semitic goddess Ishtar and the West Semitic goddess Astarte. These deities, along with the Canaanite goddesses Asherah and Anat (a wrathful warlike deity), were worshiped by the early Hebrew people. It is certain that the early Israelites worshiped the Canaanite goddess Asherah; even Solomon praised the pillars representing this deity, and his son Rehoboam erected an image of her in the temple at Jerusalem. Probably the female deities of the early monarchic period did not disappear but were changed into different forms, despite repeated efforts to reestablish a strong monotheism in Judaism in the biblical period. Raphael Patai (1967) has argued that various disguises are assumed by the goddess in later Judaism: she appeared in the form of the cherubim (depicted as man and woman in an erotic embrace); in images of Yahveh’s wife Astarte; as the one and only God having two aspects, male and female; and in the form of the Shekhinah (the personified presence of God on earth). In this latter form, the Shekhinah argues with God in defense of man; she is sometimes manifested as Wisdom and at other times as the Holy Spirit. The feminine element played an important role in qabbalistic thought, especially in the thirteenth-century *Zohar*, which stressed the Shekhinah as female divine entity; she was also referred to there as Matronit (“divine matron”). The Shekhinah was seen as an intermediary between God and the scattered peoples of Israel and was widely accepted in Jewish communities in the fifteenth to eighteenth centuries, when Qabbalah had widely felt influence. According to Patai, the complex concept in Qabbalah that the Shekhinah and God are one, filtered down to the Jewish masses, led to the simplified belief in her as a goddess.

Although the early Israelites engaged in the worship of female deities, at some point goddess worship was removed from the religious tradition. Whether one places this purge of the goddess early in Judaism or posits a disguised form of goddess worship that was retained for centuries and then finally removed, the really important question is why the phenomenon was eliminated from the tradition at all. Some feminist scholars have argued that this purge of the feminine represents a repression of women. However, the phenomenon can be explained also by the purely theological argument that monotheism requires the loss of all “extraneous” deities, no matter what gender. This raises yet another question. Why has none of the monotheistic religions worshiped a feminine deity as its centerpiece? Could there be some truth to the often asserted position that monotheism represents a final ideological phase in the evolution of complex state-level civilizations? If this were true, how then does one explain In-

dian civilization, which is clearly a state-level form of social organization, but is neither monotheistic nor associated with an exclusively dominant male divinity? Perhaps the gender of deities has little, if anything, to do with the social structure in which they are manifested. Such questions require further research from different theoretical perspectives.

**Greece.** In Greece, the rebirth theme is found in the Eleusinian mystery cult associated with the earth goddess, Demeter. However, instead of the rebirth of a male deity, a female deity is reborn: Demeter's daughter, Persephone, is resurrected after her abduction by Hades, lord of the underworld. The pre-Olympian goddesses of Greece were usually connected to vegetation rituals. A prime example was Gaia, earth mother and chthonic mother of the gods. This deity was associated with the oracle at Delphi before the oracle became exclusively Apollo's. Her rituals included animal sacrifices, offerings of grain and fruit, and ecstatic possession trance. Many of the later Greek goddesses emerged from pre-Hellenic earth goddesses like Gaia. The famous twelve deities of Olympus included the goddesses Hera, Athena, Aphrodite, Hestia, Artemis, and Demeter. These Olympian goddesses were each given distinct roles to play in accordance with their earlier spheres of influence. The original chthonic aspects of these goddesses were diminished as they became subordinated in the Olympian hierarchy ruled by Zeus. No longer was each goddess an organic link to the generative forces of life and death. Instead, she became highly compartmentalized in her new role in the male-dominated Olympian pantheon. This compartmentalization demarcates a transformation in the role of goddess worship in the development of Greek civilization.

**Rome.** There was a strong identification of Greek deities with Roman deities. Most Greek goddesses had their Roman counterparts. In 204 BCE Roman aristocrats officially adopted the foreign cult of the Anatolian goddess Cybele, later to be known as the Magna Mater (Great Mother). On April 4 of that year the image of the goddess was carried into the city by Roman matrons, a temple was erected, and she was installed as a national Roman deity. Only self-castrated foreign priests were allowed to serve in the temples dedicated to Cybele, because Roman citizens were forbidden to be priests until the reign of Emperor Claudius (41–54 CE). Driven by Cybele, his angry mother, Attis died of self-castration and then returned to life in response to his mother's intense mourning. This death and rebirth theme was celebrated during a series of holidays at the beginning of spring; the rituals included a procession carrying a pine tree (representing the dead Attis) into the temple of the Magna Mater, violent ritual mourning, a celebration of the rebirth of Attis, and the bathing of Cybele's statue.

**China and Japan.** The Vajrayāna tradition of Tantric Buddhism in Tibet and Mongolia is widely associated with goddess worship. Male and female manifestations of the divine power are depicted as opposite but complementary aspects of each other. This dynamic tension of male and female

principles, derived from Tantric Hinduism, has resulted in a large number of goddesses who are intimately related to their male counterparts as consorts. Some goddesses, however, retain a certain degree of autonomy and represent independent deities. This is the case of the goddess Tara, a female *bodhisattva* who became a universal protectress. In Chinese Pure Land Buddhism, Guanyin, goddess of mercy, is also considered to be a *bodhisattva*. She is a principal teacher, a savior who can give her devotees assurance of enlightenment and carry believers to the western paradise of O-mi-t'o-fo's Pure Land. This goddess continues to be worshiped throughout China and in Japanese Buddhism.

The tradition of goddess worship is well established in Japan, not only in Buddhism, but also in Japanese Shintō, where many male and female nature deities are propitiated. In Shintō the world was created by a divine creator couple, the god Izanagi and the goddess Izanami. They gave birth to the sun goddess Amaterasu and her brother Susano-o no Mikoto, god of storms, along with other nature deities. Amaterasu eventually became the cult deity of the Japanese royal family, retaining both her Shintō function as sun goddess and a new role as Shining Buddha of Heaven. Until this century the emperor of Japan was considered to be the descendant on earth of Amaterasu. He was charged to keep peace in the world and to support her major pilgrimage shrine, located at Ise.

This survey of archaic goddess worship points to the diversity of the roles goddess worship has played in the development of civilizations. In some parts of the world goddesses were central in the emergence of urbanism and kingship. Elsewhere they were secondary consorts of male divinities or vestiges of mystery cults associated with earlier shamanistic religion. Sometimes they represented a continuity with Neolithic and Paleolithic traditions or were transposed and reconceived as the bearers of complex social organization—waging warfare, presiding over the collection of taxes and controlling the redistribution of resources. The emergence of virtually every major civilization was associated in some way with goddess worship. While there may not be a single "Great Goddess" worshiped universally, the ubiquity of the phenomenon remains unbroken from Paleolithic times.

**CONTEMPORARY PATTERNS OF GODDESS WORSHIP.** The worship of female sacred images is found in some form or other throughout the world, except in those societies dominated by Islam or certain branches of Protestantism. Even in cultures heavily influenced by iconoclastic secular movements vestiges of goddess worship remain. For instance, Joanna Hubbs (in Preston, 1982, pp. 123–144) traces images of a divine feminine in contemporary Russian folk art, film, and literature, noting strong national themes that continued to thrive in the Soviet era.

Goddess worship is represented widely in the Hindu, Buddhist, and Shintō countries of Asia. Catholic Europe is replete with pilgrimage shrines devoted to the Virgin Mary; some of these are associated with earlier pagan goddesses,

while others represent a postindustrial flourishing of Marianism during the nineteenth and early twentieth centuries. Even in North America, where Protestantism predominates, sacred female imagery is venerated in Catholic enclaves, like the large pilgrimage shrine devoted to Saint Anne de Beaupré in Quebec, Canada. In the United States a quarter of a million pilgrims a year visit the Shrine of the North American Martyrs (in Auriesville, New York), a composite pilgrimage site devoted to the Jesuit martyrs along with the American Indian Kateri Tekakwitha, “Lily of the Mohawks,” who is a candidate for canonization. Åke Hultkrantz (in Olson, 1983, p. 202) notes an extensive pattern of goddess worship among American Indians despite the widespread misconception that these religions are mostly oriented around male deities. Native American goddesses are often earth mothers linked to the cultivation of corn. Goddess worship played an important role in ancient Aztec, Maya, and Inca civilizations, traces of which continue to thrive in descendant Mesoamerican populations. The goddess Tonantsi remains today a vibrant focus of worship among the Nahuatl of Mexico (remnants of the great Toltec and Aztec civilizations). Here goddess worship expresses its typical syncretic pattern; images of Tonantsi are displayed on altars alongside Christian sacred images, like the statue of Joseph, who is considered by the Nahuatl to be a son of the goddess.

Throughout Latin America and the Caribbean a pattern of syncretism involving goddess worship is evident. Particularly widespread is the transformation of local Indian goddesses into Marian images. The best-known example of this syncretic expression is the famous Roman Catholic pilgrimage icon of the dark-skinned Virgin of Guadalupe, whose shrine was built on the site of a temple once dedicated to the Aztec goddess Tonantsi. Goddesses are prominent in some African tribal religions. Daniel F. McCall (in Preston, 1982, pp. 304–322) traces the diffusion of Neolithic goddesses from Southwest Asia to West Africa, where they became variously syncretized with local deities and were absorbed into Akan, Yoruba, and Igbo religious traditions.

**PATTERNS AND THEMES OF CONTEMPORARY GODDESS WORSHIP.** A comparative study of this vast array of types of goddess worship reveals certain common themes and distinct differences in the ways female deities are experienced. They are worshiped as nurturant or punishing mothers, protectors of community, images of national identity, sources for the resolution of human problems, symbols of virginity and purity, the origins of the fertility of crops and human beings, mediators between humans and male divinities, and sources for healing. None of these attributes is assigned to every goddess, although they frequently recapitulate one another and cluster together. The nurturing power, for instance, is associated often with the fertility of crops and conceived to be the source of community identity, but this pattern is not found everywhere. The following is a survey of common features identifiable with goddess worship throughout the world. While they are not universal characteristics of the phenomenon, these common features demonstrate how deeply rooted

goddess worship is within human experience. They each deserve special attention.

**Virginity.** In some parts of the world female deities are associated with virginity, purity, and perfect piety. This tradition is strongly represented in several religions. In Hinduism, Kannagi, goddess of chastity, symbolizes the sacredness of motherhood, which is linked to pure Tamil ethnic identity, language, justice, and politics. The Tamil concept of chastity connotes not asexuality but sacred power. Another example of the Hindu virginity theme is found in Nepal and India where Kumār *pūjā*, the worship of a premenstrual girl as the embodiment of a goddess, has been a tradition of some frequency until recent years. The combination of two seemingly contradictory themes—virginity and motherhood—was evident among ancient Near Eastern goddesses such as Inanna, Ishtar, and Anat. These goddesses were simultaneously chaste, promiscuous, nurturant, and warlike. While the Virgin Mary is never portrayed as being promiscuous, she sometimes embodies and exhibits a continuity with the attributes of these earlier goddesses; she is pious, intercedes, protects the community, bears children, is virginal, and enters from time into the world to do battle against the forces of evil. The apparent contradiction in the juxtaposition of virginity and motherhood dissolves if the doctrine of the Immaculate Conception is taken to “reinforce the dogma that the Virgin’s child is the son of God” (Leach, 1966, p. 42). The divine mother is not a mere projection of human motherhood; female divinities give birth, but, unlike human mothers, they are rarely considered to be polluted by the event because of their supernatural status.

**Motherhood.** Another dimension of goddess worship that enjoys widespread representation is the role of nurturant female divinities as god bearers and sources of both carnal and spiritual life. Deities of the ancient Greek and Roman world gave birth to gods, occasionally by having intercourse with humans. The earlier pagan role of god bearer finds continuity in Mary’s capacity as *theotokos*, mother of the incarnate divinity; here Mary becomes a human partner in the unfolding nature of God. Consequently she is the supreme intercessor with God on behalf of individuals who seek her assistance. The nurturing power of the divine feminine has very ancient manifestations, extending back to Neolithic goddesses, whose theriomorphic form was the cow. The nurturing goddess is often associated with mother’s milk, which gives life and has strong curative powers. A. J. Weeramunda (in Preston, 1982, pp. 251–262) describes the milk-overflowing ceremony in Sri Lanka, which is a ritual means for bringing health, both to individuals and the Sinhala community. Here the goddess, symbolized by milk, stands for matrilineal kinship, mother’s blood, bodily health, and integration of community. This ancient theme is recapitulated in Roman, Greek, and Coptic tales of miracles worked by the Virgin Mary that refer to the milk from her breasts and the power of her tears to cure diseases.

**Wifehood.** Goddesses are depicted frequently as wives and consorts. Sometimes as consort she is subservient to her

partner. However, the goddess may be raised to the powerful position of queen and protectress. In India, each year Jagannātha is said to argue with his jealous wife Lakṣmī after he has returned from a visit to other deities in the neighborhood. Here Lakṣmī is portrayed as a nagging wife. However, the role of consort to a male deity may be only secondary for a goddess. Inanna, the supreme goddess of ancient Sumer, was queen of heaven and earth foremost; her role as wife to Dumuzi, the shepherd king, was less important. Inanna's power was evident in the prolonged Sumerian New Year celebration that culminated in the sacred marriage rite of the goddess Inanna to the reigning monarch, a rite designed to ensure the fertility of soil and womb.

**Protection.** One of the most widespread and significant roles of female deities is the tripartite function of protectress, monarch, and emblematic symbol. This pattern contrasts with gentler, more nurturant motifs like fertility and healing. The Chinese Buddhist goddess Guanyin is a popular domestic deity who is considered also to be a *bodhisattva* and celestial bureaucrat. The Virgin of Gaudalupe provides a famous example of the emblematic, integrative, and protective role of the sacred female image. During the fight for Mexican independence, loyalists carried the banner of the Virgin of Remedios while their opponents marched into battle with the banner of the Virgin of Guadalupe; soldiers polarized between the two shot at the banner of the “enemy” virgin. In many parts of the world female sacred images assume highly specialized protective qualities; the Daoist goddess Mazu is protectress of fishermen and sailors who face the dangerous storm-ridden Taiwanese Straits; in Spain Our Lady of Macarena is protectress of bullfighters; the goddess Amaterasu was the supreme national guardian deity of Japan. The Black Madonna of Częstochowa continues to be considered queen of Poland, her image is worn on badges by members of the Solidarity movement, and she is highly revered as a focus of pilgrimage by millions of Polish Catholics, including Pope John Paul II.

**Earth goddess.** Some scholars have attempted to link the gender of deities with natural phenomena, typically associating female deities with the earth and male deities with the sun. Although this pattern is widespread, there are several noteworthy exceptions. For instance, the ancient Egyptian goddess Nut was conceived to be a sky deity whose partner, Geb, was an earth god. According to C. Jouco Bleeker (in Olson, 1983, p. 31) Egyptian goddesses were not believed to be intrinsically earth mothers. The Japanese Shintō goddess Amaterasu, who is identified with the sun rather than earth, is another example. Thus, the general rule that goddesses are earth mothers is clearly not without exception. There is considerable evidence from ancient times that goddesses were associated with various natural phenomena, particularly the sea, the earth, and the phases of the moon. The many *pithas* associated with goddesses in India are linked to the earth. Each of these pilgrimage sites devoted to goddesses is considered to be a fragment of Sati's body (the dead wife

of Śiva) that fell to earth when her corpse was divided up by the gods to prevent Śiva from going mad with grief. In Orissa, in eastern India, women behave as though they are menstruating during the three days when the earth mother menstruates; nor is it uncommon in India for men to avoid tilling the fields when the goddess is menstruating.

**Fertility.** This leads to another widespread characteristic of goddesses; namely, their power over the fertility of soil, the fecundity of women, and a plentiful food supply. The ancient Neolithic city of Çatal Hüyük offers evidence for goddesses of the hunt and the abundance of crops. Alexander Marshack (1972, p. 355) speculates that the Neolithic goddess, as mistress of animals, is prefigured in female images from the Upper Paleolithic era where goddesses are displayed holding animal horns that have been stained with red ochre. Goddesses remain associated with the abundance of food even today. The Inuit (Eskimo) goddess Sedna is an example; if angered by sins committed in the community she withholds the supply of sea animals. According to Hultkrantz, the American Indian conception of the mother goddess as mistress of animals was changed by the introduction of horticulture about 2000 BCE, when she began to be identified with the cultivation of maize, beans, squash, gourds, and other crops. In Europe corn-mother images have been placed in fields by peasants for hundreds of years. This concern with the fertility of the earth is repeated in the widespread association of goddess worship with human fertility. Barren women in Europe, India, Africa, and many other parts of the world turn to female divinities to ask for aid in pregnancy. Here goddesses become a source of life so that the human community may be sustained. The ability to bear a large number of children is often a sign of status in agricultural societies where abundant human labor enhances the wealth of a family unit. Thus, some form of goddess worship for the purpose of bearing children is often widespread in these societies.

**Healing.** If goddesses can give life they can also take it away. They are frequently supplicated for curing diseases. The Indian goddess Śitalā not only cures smallpox, she is considered to be its source and requires elaborate rituals to cool her anger, which causes the disease. Thus, Hindu people both fear and adore her. The healing of wounds, prayers for health, and the quest for wholeness are so universally associated with goddess worship that this aspect requires special scholarly attention.

Why are female deities more frequently invoked than male deities for purposes of healing? The obvious answer is that goddesses tend to be attributed more often with overall nurturant qualities. They are the primary and original sources of life, like human mothers, and they consequently represent a reprieve from the more painful realities of death, decay, and disease. Yet, as been already observed, goddesses are linked also to the darker experiences in the human condition. There must be an even more subtle reason for the ubiquity of the healing function attributed to female deities. In traditions where the female is subordinate to the male (and

this is quite widespread), the worship of female sacred imagery represents an embracing of the whole field of symbolic potentials and the bringing together of opposites. While male deities are approached during the course of everyday life for the favors required to sustain a worldly existence, female divinities become the focus for ongoing sustenance of the individual or local family.

It is no accident that female deities are strongly represented in home rituals, in roadside shrines, and at local pilgrimage sites in many parts of the world. Surinder M. Bhardwaj (1973) has demonstrated this point for Hinduism, noting how pilgrimage shrines devoted to goddesses are visited by pilgrims more on a subregional basis for the purpose of curing diseases and asking for small favors, while pilgrimage to the shrines of male deities is almost always at the regional or national level and for the purpose of *darshan* (Skt., *darsana*; “sight of the deity”) rather than a quest for cures. Not only is the mother more accessible and nurturant than the more distant father, she is the completion of a process by which the individual embraces the whole religious field, including both gods and goddesses who constitute not separate but complementary parts of a unified whole.

**Violence and anger.** The ambivalence associated with certain types of goddess worship is characteristic of another major theme in this survey. Because female divinities can take away life, they sometimes display a vengeful, angry, and terrifying aspect. Such goddesses are identified with dark occult powers, sacrifice, and death. Usually the darker aspects of goddesses are consonant with nurturing qualities. The Balinese Hindu goddess Rangda, the witch, is an exception to this rule. She is linked to the terrible and fearful powers of divine origin. Rangda, whose name means “widow,” is associated with her husband’s death. She is constantly doing battle with her archenemy Barong the dragon. Elaborate ritual battles between Rangda and Barong are acted out in the famous trance dances that have attracted so many tourists to Bali.

Rangda is associated with evil and death, unlike her Hindu counterpart, Kālī, who has a more nurturant side. Kālī grants boons to those who respect her, but she is easily angered and must not be crossed. Her major role is to battle demons, whose skulls she wears in a garland around her neck. Like Rangda, Kālī is linked to death by her association with widowhood and graveyards. In a brilliant essay on the goddess Kālī, C. Mackenzie Brown (in Olson, 1983, pp. 110–123) notes that her bloody intoxication with rage and violence is not an indication that she is evil. Kālī is “mother of us all”—she gives birth, dazzles with her splendor, and consumes in the game of life. Both beneficent and terrible qualities are combined in the image of Kālī. Just as Hindu disease goddesses become angry and cause epidemics because people have neglected to worship them, Kālī rises up from time to time, bringing about a reign of chaos in the realm of human order. Thus, she evokes enormous fear and ambivalence among devotees. Such violent expressions of

goddess worship are found in many of the world’s religions. Artemis and Medusa evoked similar responses among the ancient Greeks. Also, the Middle Eastern goddesses Ishtar and Isis were considered to have a terrible aspect associated with the cosmic dark forces. The Aztec goddess Ilimatēcutli was one of several deities associated with death.

The theme of ambivalence is further elaborated in the concept of *vagina dentata* (“vagina with teeth”) where the womb of the earth goddess appears to have a devouring mouth. For example, when the goddess is angry, she who is the source of life can take it away as slayer of life. The vessel of procreation becomes a tomb. Death by absorption into the *vagina dentata* is not always a punishment for wrongdoing. Sometimes the devouring womb represents the necessary death of the old order to establish a new social and religious organization. In these cases, entry into the *vagina dentata* is a rite of initiation leading through a dangerous passage along a path toward new birth. The violent act of being swallowed by an earth deity is a tradition found in many American Indian religions, among the Australian Aborigines, in Hinduism, and in various parts of Africa and Polynesia.

One of the most interesting rites associated with goddess worship is the widespread but not universal practice of blood sacrifice, which is found in some form or other in most religious traditions. While sacrifice is not confined to the veneration of female deities, it is represented widely in goddess worship traditions. The sacrifice of blood, whether of human or animal origin, has been linked to goddess worship from ancient times. Sacrifice is widely celebrated in that brand of goddess worship where female deities are portrayed as angry, vengeful, or punishing. Kālī and Durgā in the Hindu pantheon are deities of this kind. In contemporary India large numbers of goats, buffalo, chickens, and other animals are offered to these deities to satisfy their thirst for blood and to display community allegiance. Even human sacrifice is reported to have been practiced as an expression of goddess worship. It is not difficult to understand why blood sacrifices should be associated with goddesses. Through sacrifice human beings create bonds between themselves and deities. Because people turn to goddesses to fulfill their needs, it is logical for sacrificial offerings to be made as expressions of thanksgiving. Despite the fact that blood sacrifice has been outlawed in many parts of the world, this custom continues to thrive, often underground. Sometimes various types of sacrificial substitutions are made in place of blood offerings, like the sacrifice of cucumbers, pumpkins, or money.

The many patterns of goddess worship evident throughout the world extend deep into antiquity and continue to thrive in many of the world’s religions even today. Goddesses played a prominent role in prehistoric cultures, throughout the development of agriculture, and in the emergence of urban life associated with the great traditional civilizations. They continue to be a fertile source of religious experience within the contemporary world. Goddesses are multivalent

sacred images best understood within their separate historical and cultural contexts.

#### BIBLIOGRAPHY

- Bhardwaj, Surinder Mohan. *Hindu Places of Pilgrimage in India*. Berkeley, Calif., 1973. This excellent survey of pilgrimage cycles in North India conducted by a cultural geographer offers many insights into the contrast between pilgrimages to the shrines of male and female deities.
- Campbell, Joseph. *The Masks of God*, vol. 1, *Primitive Mythology*. New York, 1959. This work explores the early Upper Paleolithic and Neolithic roots of goddess worship. It represents a Jungian orientation suggesting a universal Great Goddess. Somewhat dated but useful as a secondary source if read critically.
- Campbell, Joseph. *The Masks of God*, vol. 2, *Oriental Mythology*. New York, 1962. This work refers frequently to goddess worship in Eastern religious traditions. Much generalization here, but still useful.
- Gimbutas, Marija. *The Goddesses and Gods of Old Europe, 7000–3500 B.C.: Myths, Legends, and Cult Images*. London, 1982. An extensive discussion of the art and symbolism of Old Europe for the Neolithic period.
- James, E. O. *The Cult of the Mother Goddess*. New York, 1959. A thorough discussion of goddess worship derived from archaeological and documentary evidence for the Middle East, the eastern Mediterranean, and India. An excellent source, although some of the interpretation is dated.
- Leach, Edmund. *Virgin Birth*. Cambridge, U.K., 1966. The Henry Myers Lecture.
- Marshack, Alexander. *The Roots of Civilization*. New York, 1972. An outstanding analysis of Upper Paleolithic data on goddess worship, suggesting that the phenomenon is part of a complex notational system rather than merely an indication of fertility symbolism. While Marshack's thesis may be controversial, the volume is a rich source of information and remains a major scholarly contribution.
- Mellaart, James. *Earliest Civilizations of the Near East*. London, 1965. A discussion of archaeological research on the Near East with particular emphasis on the emergence of Neolithic cultures. Mother goddesses are discussed throughout the volume, particularly at the famous site of Çatal Hüyük.
- Mellaart, James. *Çatal Hüyük: A Neolithic Town in Anatolia*. New York, 1967. This is the field report of an archaeologist who excavated a major Neolithic town in 1961–1963. The data presented here constitute an important contribution to our understanding of goddess worship in the Neolithic period. At the level of interpretation, the author tends to oversimplify, attributing much of the evidence for goddess worship to a fertility cult.
- Obeyesekere, Gananath. *The Cult of the Goddess Pattini*. Chicago, 1984. In this classic study of the goddess cult in Sri Lanka, the author has brought to bear a number of disciplines—anthropology, psychoanalysis, and ethnohistory—to reveal the complex, multifaceted manifestation of goddess worship in Sinhalese religion.
- Olson, Carl, ed. *The Book of the Goddess, Past and Present: An Introduction to Her Religion*. New York, 1983. This is one of the most recent volumes dedicated to the study of female deities. The contributions to this book represent a wide variety of studies of goddess worship written by historians of religion and feminists. The articles are uneven in quality; there is no overall synthesis or index.
- Patai, Raphael. *The Hebrew Goddess*. New York, 1967. This brilliant essay on goddess worship in Judaism written by an anthropologist represents a major contribution to comparative religions. Its bold thesis, challenging the purity of Jewish monotheism, remains both controversial and stimulating. An important source that deserves special attention.
- Preston, James J. "Goddess Temples in Orissa: An Anthropological Survey." In *Religion in Modern India*, edited by Giri Raj Gupta, pp. 229–247. New Delhi, 1983. An anthropological study of the network of goddess temples in Orissa, eastern India. Particularly valuable as an illustration of how goddess worship reflects religious, political, and social dimensions of human community.
- Preston, James J. *Cult of the Goddess: Social and Religious Change in a Hindu Temple*. New Delhi, 1980. A rare ethnographical work on a Hindu goddess temple located in eastern India. Particularly valuable as a resource for the role of goddesses in the process of cultural change.
- Preston, James J., ed. *Mother Worship: Theme and Variations*. Chapel Hill, N.C., 1982. This volume is the most comprehensive and up-to-date collection of data about goddess worship in the field of anthropology. Particularly useful as a source of primary data from firsthand fieldwork on the phenomenon with a comprehensive introduction and conclusion discussing contemporary issues in the study of female sacred images.
- Sangren, P. Steven. "Female Gender in Chinese Religious Symbols: Guan Yin, Ma Zu, and the 'Eternal Mother.'" *Signs: Journal of Women in Culture and Society* 9 (1983): 4–25. An excellent anthropological treatment of Chinese goddesses. Particularly valuable here is the author's discussion of how female deities differ from their earthly counterparts.
- Turner, Victor, and Edith Turner. *Image and Pilgrimage in Christian Culture*. New York, 1978. An excellent treatment of various Marian shrines within the context of pilgrimage. One of the few anthropological studies of Christianity.
- Wolkstein, Diane, and Samuel Noah Kramer. *Inanna: Queen of Heaven and Earth*. New York, 1983. This is the most up-to-date discussion of the ancient Sumerian goddess Inanna. The body of the volume comprises Sumerian texts together with excellent commentaries by several authors on various aspects of Sumerian culture history.

### GODDESS WORSHIP: GODDESS WORSHIP IN THE ANCIENT NEAR EAST

The diversity of female divinities within ancient Near Eastern societies makes it impossible to arrange them into neat categories, and any attempt to do so would inevitably involve a great deal of simplification. There are two main reasons for this: the complexity of the religious systems, and the long period over which they developed.

One could and should ask, with some legitimacy, why female deities are singled out for separate analysis. The answer to this lies, to a large degree, in the history of the discussions on goddesses. The topic has sometimes been covered with academic rigor, sometimes with highly charged ideological arguments. In the cultures investigated in this article, goddesses were inseparably integrated into a complex divine world. No single fundamental pattern universally repeats itself even in the cultures of the ancient Near East. The genders of the deities are culturally determined. For example, the sun was gendered male in Mesopotamia, while it was gendered female in the Levant and Anatolia. The “fickle” moon, universally assumed to be female, was gendered male throughout the ancient Near East. In Egypt the sky goddess belies the “Earth Goddess” stereotype. Thus, the goal of this article will be to identify the range of goddesses in particular societies and to comprehend their symbolic significance, rather than to delineate a rigid code that holds for all contexts. Unfortunately, the limited space allows only an introduction to the subject.

**THE NATURE OF THE EVIDENCE.** Reconstructions of ancient Near Eastern theologies are based on texts and artifacts, unevenly distributed in time and space. Data on goddesses can

be compiled from personal and place names, god lists and offering lists, seal inscriptions and votive dedications, mythological literary compositions and liturgical hymns, petitionary prayers and exorcistic incantations.

The literary and visual evidence are neither complementary nor comparable. Unfortunately, the texts have no pictures and the pictures rarely bear texts. In Mesopotamia, images of goddesses were clearly differentiated from mortal women by their divine horned headdresses. In other cultures, non-human features such as wings and animal attributes are indicators of divinity.

The most problematic artifactual material are figurines of nude women known from the Neolithic through all later periods and in all areas of the Near East, from Egypt to Iran. In prehistory, there are no written records to explain these mute figurines, but they are commonly assumed to be images of the goddess and/or images for fertility magic. Their exaggerated hips and breasts could also be understood as stylized conventions for rendering ideal feminine beauty. No evidence exists to identify the typical figurine with any major goddess. On the rare occasions that goddesses were depicted naked, they can be distinguished by context, stance, or attribute.

The meaning of figurines is not something enshrined in them but something that people confer on them, changing with time and context. Figurines can be considered both as “images of” human form and as “images for” important human concerns. Written records and anthropological evidence suggest numerous possible functions and meanings for these miniature human representations. Magical ritual texts specify how the figurines of a sick person are to be used during healing rituals. In Tanzania, adolescent boys are shown figurines of pregnant women during rites of initiation into adulthood. Had such images been found out of context, this type of figurine could easily have been identified as a “goddess” rather than as a symbolic device that plays a role in the formation of male identity.

There is an immense range of possible uses for figurines. They may have been cult figures, focal points of veneration in a private household shrine or public chapel. Conversely, figurines found in temples may well have been votive offerings given by worshippers to the deity, expressing their donors’ fervent piety, heartfelt thankfulness, or heartfelt entreaty. Figurines discovered in temple depositories may have been images created as part of a temple ritual.

Outside the temple, figurines were used in magic rituals to prevent or produce certain situations or states, such as ensuring fertility or good luck, warding off evil, curing illness, or causing harm to others. In these situations, the figurines might serve as talismans, amulets, fetishes, or therapeutic objects. These varied functions are known from many texts recording charms, incantations, and descriptive rituals.

On a more personal level, figurines might be markers of special times such as birthing or rebirthing, or periods of

transition or of other time-based processes such as female menstrual cycles. Figurines were employed as educational aids and teaching figures, used in initiation or puberty rites to illustrate sexual topics for adolescents of both sexes. Diminutive anthropomorphic images were also undoubtedly put to use as toys, in particular as dolls. They could also be adapted to illustrate songs, epics, or myths.

Figurines may have been placed in graves as part of burial rites to counteract the harmful effects of the ghost of the dead, as substitutes for the dead person's body in the next world, as images of a protective deity who guided the deceased to the underworld, or perhaps as favorite possessions to be enjoyed by the dead in the afterlife.

The functions listed above cover only part of the spectrum of possibilities, and a single figurine may have served more than one of these functions. Given the range of types, sizes, and potential uses of figurines, it is clear that no single explanation could ever account for them all.

**PREHISTORIC EVIDENCE OF FEMALE DIVINITIES (10,000–4000 BCE).** Female figurines with large stomachs and pendulous breasts from the European Upper Paleolithic and Neolithic periods (c. 40,000 to 5,000 years ago) are claimed to provide evidence of a homogeneous European prehistoric religion centered on the “Great Goddess,” whose image is reflected in these figurines. Many scholars have interpreted these figurines as depicting pregnant and/or breast-feeding women, and thus signifying fertility. This speculative interpretation was subsequently applied to the ancient Near East, where the first stone figures known were found in the Jordan Valley, on the shores of the Dead Sea, and around Mount Carmel (c. 10,000 BCE). In the ensuing period, crude female figurines of clay and stone appear at Mureybet, on the upper Euphrates (8000–7600 BCE). Anthropomorphic and zoomorphic examples occur in central Anatolia (8000–7000 BCE) and in the Valley of the Yarmuk River (late 7000–early 6000 BCE). Yarmukian anthropomorphic representations include those made of clay and of river pebbles, both detailed and schematic, some with cowry-like eyes and massive thighs but minimal breasts. On the Tigris in Mesopotamia, 6000 BCE graves (especially those of infants) have yielded female alabaster statuettes while ordinary settlement debris contained clay figurines, both human and animal. The alabaster statuettes are carved schematically with no accentuation of any female anatomical sexual parts. Disparate clay figurines are found at 6000 BCE sites in Mesopotamia and on somewhat earlier Zagros sites such as Jarmo. Farther east, from the Bakhtaran region in Iran, female figurines with tall necks, no facial features, and bulging breasts and thighs were uncovered in the excavations of Ganj Dareh and Tepe Sarab. Halaftian sites in northern Syria and northern Mesopotamia (5000 BCE) produced a variety of figurines, of which the most famous are the painted terra-cottas of seated women with pinched heads, long necks, arms encircling large breasts, and fat, bent legs lacking feet. The significance of these figurines is difficult to explain because their remarkable diversity and

varied places of discovery precludes any single explanation of their purpose. Some seem to be site-specific, reflecting local religious customs, such as the alabaster statuettes from Tell es-Sawwan.

One particular site (and its interpretation) has provided the basis for the belief in the worship of a universal monolithic “Mother Goddess”—the site of Early Neolithic Çatal Hüyük in south-central Anatolia, where certain female figurines are portrayed with large stomachs and pendulous breasts similar to the European prehistoric examples. In 1993, excavations began again at the site, now seen not as distinctive but within the context of a range of settlements from Early Neolithic Çayönü in southeastern Anatolia to Late Neolithic Hacilar in western central Anatolia.

**GODDESSES OF MESOPOTAMIA.** For over three millennia, the religious life of Mesopotamia was presided over by thousands of deities worshipped by a mixed population of Sumerians, Akkadians, Amorites, Kassites, and Arameans. A continual process of reinterpretation and syncretism, mutation and fossilization, fusion and fission generated a Mesopotamian religion that was a complex, multilayered accumulation.

It has often been remarked that female deities dominated early Mesopotamian religion. Major cities dedicated to goddesses were: Uruk and Zabalam, dedicated to Inanna (goddess of love, war, and sexuality), Eresh, dedicated to Nidaba (goddess of grain and writing), Shuruppak, dedicated to Sud (daughter of Nidaba, perhaps related to water and purification), Kesh and Nutur, dedicated to Ninhursaga (goddess of birthing), and Lagash, dedicated to Gatumdug (Mother of Lagash). However, other cities of equal rank had male tutelary deities.

In the second millennium, previously important cities in the lower stretches of southern Mesopotamia were abandoned for political, demographic, and perhaps ecological reasons. As the earlier cult centers began to lose their priority, the religious center of Nippur gained by their loss. In Nippur, Ninlil assumed the prerogatives of many of the other goddesses. This process was mythologized: Sud of Shuruppak was equated with Ninlil of Nippur through marriage with the god Enlil. When Sud became the bride of Enlil, she was renamed Ninlil. Once she was identified with Ninlil, she disappeared for all practical purposes from the Mesopotamian religious scene. Thus, the decline in the number of goddesses as city patrons between the third and second millennia has been explained as due to the decline of the cities of lower Mesopotamia. Similarly, the rise of northern cities brought their gods into prominence, such as Babylon and its god Marduk.

Other elements of nature, such as the earth, played a minor role in ancient Near East mythology. The primal female elemental at the beginning of time was water—the mingling of the waters was considered the source of life. The goddess of subterranean waters, Namma, was the engenderer of all—the heaven, the earth, and the gods.

The “mother goddesses” in Mesopotamia were birthing mother figures. The emblem of the “mother goddess” was the omega-shaped uterus rather than a child in her arms. The interchange of Ninhursaga (Lady of the Foothills), Nintur (Lady Birth-hut), Ninmah (Great Lady), and other “mother-goddess” figures becomes increasingly common as time passes.

The expected functions of “mother goddesses” regarding other aspects of human and animal life were in the hands of diverse goddesses and gods. The fish and water-fowl goddess Nanshe was better known for her association with divination, dreams, and oracles. She was also an administrator, responsible for checking weights and measures, protecting the weak, meting out justice, and punishing immoral acts. While Ninurta (the god of agriculture) was responsible for the fertility of the land, grain goddesses (of which Nidaba was the most prominent) were accountable for the growth of the grain. She was also in charge of the scribal arts, including accounting and surveying.

Goddesses occupied the same sex roles in the divine family as in the human family: mothers, wives, brides, sisters, and daughters. Pronounced complementarity existed between the divine genders, especially in a brother-sister relationship. The archetypical sister was Geshtinanna (Grapevine of Heaven), a paragon of sisterly devotion. She sheltered, mourned, and substituted for her brother Dumuzi in the netherworld. She played a prominent role as a singer of dirges and was associated with singing and music in general, and she became the recorder of the gods, particularly of the netherworld in the second and first millennia.

Goddesses were also responsible for clothing manufacture, beer brewing, the education of children, and doctoring the sick. Healing was always in the hands of the goddesses of medicine throughout the millennia, while pestilence and destruction were in the hands of the gods.

Inanna (in Sumerian, Ishtar in Akkadian) was the most revered and popular goddess of ancient Mesopotamia, and she has consequently served as a focus for persons seeking to revive “goddess” worship. Inanna first appears in the late fourth millennium as the patron deity of the city of Uruk, where she represented the numen of the central storehouse.

Even at this period, Inanna appears in various manifestations, each of which has a separate temple and cult. Two of her manifestations, “Morning” and “Evening,” describe the goddess as the planet Venus, in the morning and in the evening sky. In later texts, as Morning Star, Venus was female; as Evening Star, male. The two aspects corresponded to the double character of Inanna/Ishtar as goddess of love and war. She was viewed as a beautiful goddess of love who ruled the day and as a bearded goddess of war who ruled the night. Even in her male role, she never becomes fully male, but seems to be a female with male gender characteristics, thus providing a powerful symbol of the ambiguities of pure sexuality.

Despite her masculine gender roles, she was conceived as the epitome of femininity. She was the youthful goddess of love, and literary compositions relate the romance of Inanna and Dumuzi. Paradoxically, some compositions extol her as a timid virgin while others exalt her as a licentious harlot. In love poetry, she manifests her eroticism and celebrates sensuality.

In the late fourth millennium, there existed a pan-Mesopotamian league centered on Uruk and its deity Inanna. The importation of Inanna into every community, and her absorption of local female divinities of various character, resulted in one mega-female divinity. In addition to this process of syncretism, her character became more ambiguous as the result of further fusion and fission. Inanna and her Semitic counterpart Ishtar had partly merged by the mid-third millennium. Simultaneously with this fusion, different goddesses split off from this amalgam. At the end of the third millennium, the goddess Nanaya appeared in Uruk as the goddess of love. Inanna shared her aspect as Venus with Ninsianna, the “red lady of heaven,” who executed divine judgments.

The Canonical Temple List assigns the largest number of temples to various manifestations of Ishtar. These goddesses were understood as both one goddess and as many. They were hypostases of a single divine archetype, a situation similar to the proliferation of the various Zeus figures of classical antiquity or the local manifestations of the Virgin in Catholic belief.

The second millennium brought changes in the theological system. Gradual reduction of the roles played by female divinities, as well as domination by divine male spouses, curtailed their power of independent action. They therefore assumed an increasingly mediatory function between the human world and the masculinized divine world. Most of the goddesses popular in the third millennium continued to be worshipped but commonly under the names of their Akkadian counterparts.

With the rise of Babylon and its god Marduk to supreme dominion of the divine and human worlds, Sumerian and Akkadian divinities, both male and female, were relegated to lower positions in the hierarchy.

**GODDESSES OF IRAN.** Iran’s vast terrain is divided into areas of relatively isolated local cultures. The best known is Elam, in southwestern Iran. Yet, it is difficult to say anything certain about Elamite deities since little is known about Elamite mythology and the only sources of information are royal inscriptions.

The major goddesses were: Pinengir, Kiririsha, Narunde, and Manzat. In a treaty from the third millennium invoking the gods of Elam, the goddess Pinengir appears in first place as the highest deity of the Elamite pantheon. Despite assumptions concerning her being a mother goddess, nothing is known about her character until the Middle Elamite period (latter part of the second millennium) when

not only a temple but also an “inn” was dedicated to her. The latter suggests that Pinengir was responsible for love and sex life. During the second millennium on the coast of the Persian Gulf, another goddess, Kiririsha (Great Lady), occurs. Apparently, from Middle Elamite times, two separate deities existed, both designated “mistress of the sky,” “mother of the gods,” and “great consort.” Kiririsha seems also to have been responsible for combat and battle, judging by her votive offerings of battle axes.

Narunde, the sister of the seven good demons, is found only in the third millennium. She was a goddess of victory, who fought against the seven evil demons. Manzat (Rainbow) was the wife of Simut, god of Elam, and her function may have been to protect women as votive offerings of female figurines were found in her temple.

In the latter part of the second millennium, Medes and Persians migrated from the Asian steppes onto the Iranian plateau. Among the Iranian deities, one goddess alone is prominent: Ardivi Sura Anahita. She was the goddess of all the waters upon the earth and the source of the cosmic ocean. She was regarded as the source of life, purifying the seed of all males and the wombs of all females. Because of her connection with life, warriors in battle prayed to her for survival and victory.

**GODDESSES OF ANATOLIA.** In Anatolia, peoples of different languages and cultures coexisted producing a heterogeneous polytheistic system—an amalgam of Hattic, Hittite, Luwian, and Hurrian traditions with Syrian and Mesopotamian influences. It is difficult to determine the original character of the gods of the Hattic people, who preceded the Hittites on the central Anatolian plain, since knowledge of these gods has been transmitted through Hittite traditions. The Hittites were an Indo-European people who have left numerous texts dealing with religious practice and theology. Another Indo-European group, the Luwians, resided in southwestern Anatolia. The Hurrians were speakers of a Caucasoid language whose influence expanded throughout Syria and Anatolia in the mid-second millennium.

As the Hittite kingdom expanded, the cults of the various peoples of Anatolia, all of whom had their own religious traditions and local gods, were incorporated into the Hittite system. Interference between these theological systems resulted at times in gender change: the male Hattic/Hittite ruler of the underworld Lelwani became female under Hurrian influence and was identified with the Hurrian goddess of the underworld, Allani. The Hattic goddess Kait, the deity of vegetation, became the Hittite god Halki (Grain).

Important goddesses of the Hattic pantheon were the two sun-goddesses, the sun-goddess of the sky, Wurunshemu, the consort of storm-god, and the sun-goddess of the earth (or the netherworld). The name of the sun-goddess of the earth in both Hattic and Hittite is unknown while in late Hittite texts she was referred to by the Hurrian designation Allani. Next in importance was Inar (Hittite: Inara), a young

warlike goddess, the protective deity of the land. In addition to being a goddess of the wild animals, she was said to have power over fields and floods.

At the head of the Hittite pantheon were the storm-god and the sun-goddess of Arinna, identified with Hattic Wurunshemu. A mother goddess, Hannahanna (Grandmother), was a wise old woman, skilled in healing and childbirth, whose advice was regularly sought by other gods in the old Hittite vanishing god myths. Two important groups of goddesses were the Gulsh(esh) goddesses of fate and the mother goddesses. Kamrushepa, the Luwian goddess of healing, was responsible for the curing of earthly and heavenly diseases and illnesses.

Deities of Hurrian origin were mostly worshipped in Kizzuwatna (southern Anatolia) during the Hittite Empire period. In the sanctuary at Yazilikaya, a procession of the chief divinities of the Hurrianized Hittite pantheon was carved on its walls: one procession of gods on the western wall and another procession of goddesses on the eastern, with the principal deities meeting in the center. This monument provides an affirmation of the symmetry and equal importance of the gods and goddesses. Leading the goddesses was Hapat, the spouse of the storm-god Teshup, with their son, Sharruma, and daughter, Allanzu. From her images together with her son, she is thought to be a mother goddess and generally bears the title “the Lady, Queen of Heaven.” Shaushka, the bellicose and beautiful sister of the storm-god Teshup, appears twice, among both the gods and the goddesses. It is assumed that she had a bisexual nature, with both male and female characteristics and attributes.

**GODDESSES OF THE LEVANT.** Deities from a variety of backgrounds were venerated in the Levant: Syrian, West Semitic (Amorite, Canaanite), Hurrian, Akkadian, and Sumerian. In the second half of the second millennium, mythological and ritual compositions found at the site of Ugarit (modern Ras Shamra) on the Levantine coast provide a window into Canaanite theology. The principal Ugaritic goddesses were: Athirat (Ashratu, Asherah), Anat, and Athtart (Ashtart[e]).

The goddess Athirat appears for the first time as Ashrata in Amorite personal names in Mesopotamia during the first half of the second millennium BCE and sporadically in later Mesopotamian sources. In the latter half of the millennium, this goddess occurs in texts from Ugarit, Akhetaten (modern Amarna) in middle Egypt, and Taanach in northern Israel while in the first millennium her worship was limited to sites in southern Judah, Philistia, and northern Sinai, and to written references from the Bible. Nevertheless, she was invoked in one Phoenician magical plaque found in the Aramean city of Hadatu (modern Arslan Tash).

In Ugarit, this goddess appears as *’atrt* (or Athirat). In the mythological texts, she was the wife to the god El and mother to his seventy sons. She held the title “progenitress of the gods” and was associated with the fecund sea.

In the Bible, Asherah occurs most frequently as a cultic symbol of the divinity (wooden pole or tree), as in *Deuteron-*

omy 16:21, and occasionally as the goddess herself. She was often associated with Baal, as in *1 Kings* 18:19, when Elijah rails against four hundred and fifty prophets of Baal and four hundred prophets of Asherah.

Evidence of the importance of Asherah in the popular religion of the region of southern Judah is found in the controversial inscriptions on the pithoi vessels at Kuntillet Ajrud. One inscription reads: "I bless you by YHWH of Samaria and his asherah."

The two deities Anat ('nt) and Ashtart ('štrrt, Greek form: Astarte) share similar characteristics. Both were beautiful maidens and doughty warriors, and both were depicted as smiting goddesses, brandishing weapons above their heads and holding a shield and spear. After their first appearance in Syria, the worship of these two goddesses spread throughout Egypt and the Levant. Both goddesses were venerated in Egypt: at Deir el-Medineh, the craftsmen's village in Upper Egypt, the workers set up reliefs in their honor, while an Ashtart sanctuary was discovered at Pi-Ramesses, the northern capital in Lower Egypt. Both Anat and Ashtart survive in formal lists of Egyptian gods well into Roman times. In the first millennium BCE, Ashtart was the chief deity of the Phoenician city of Tyre (in modern Lebanon) and took precedence over Anat, although the latter continued to appear sporadically in dedications from as far afield as Lower Egypt. Both goddesses were invoked in the treaty made by the Assyrian king Esarhaddon with the king of Tyre.

Although these two goddesses were similar in character, they had different origins. The name Anat goes back to Hanat, the *theos eponymous* of the Amorite Hanean tribesmen in Syria, in the early second millennium. The cult of Anat was first attested in Egypt in the late Middle Kingdom (eighteenth century BCE). As the daughter of the sun-god Re and the wife of the war-god Seth, Anat acted as a mediator between the two. In late second-millennium Ugaritic myths, she was the sister of the storm god Baal, and again a mediator between him and the great god El. She was the mistress of animals, both protectress and huntress, as well as midwife at both animal and human births. She was pictured as a young maiden without children, swift as a bird and fierce as a lioness. Her proficiency in battle was legendary. The Baal myth tells of her bellicose attacks on men and divinities, as well as her help in placatory mediation for the building of Baal's palace. Anat searches for Baal in the realm of Mot (Death), and with the help of the sun-goddess Shapsu she finds and buries him and finally revives him by vanquishing Mot.

Ashtart epitomized the fury of battle and probably had astral associations with the planet Venus. In Emar (on the bend of the Euphrates River), one of her manifestations was Ashtart-of-Battle. In Egypt, she was addressed as "Lady of the Battle, goddess of the Asians." In the Phoenician cities of Tyre and Sidon during the first millennium, she was the leading goddess. In the Bible, Ashtart appears both in singular and plural forms: 'ashtoret and 'ashtorot. The Bible cites her worship as widespread among the original inhabitants of

Canaan and associates her with fertility and love rather than warfare.

From this review, it can be seen clearly that none of these major goddesses were "fertility" goddesses and that there were no "fertility" cults in ancient Canaan. The deities responsible for fertility were male. Baal was responsible for the fertility of the land and El for the fertility of human beings.

**GODDESSES OF EGYPT.** As in the other regions of the ancient Near East, the goddesses of Egypt can be described as local deities, although several local deities were worshipped throughout Egypt, from the beginning of the historical period onward.

According to the Heliopolitan cosmogony, the creator god Atum (He who makes/is complete), appears spontaneously in the waters of the god Nun. He engendered from himself the next generation of deities: the male Shu, the preserving force of dry air, and the female Tefnut, the corrosive force of moisture. Atum was said to have produced the pair by masturbation, by his personified feminine hand, or by a female complement, Iusaas ("She comes and grows great"). Shu and Tefnut bore the earth god Geb and the sky goddess Nut. Geb and Nut produced two more pairs of gods and goddesses: the gods Osiris and Seth and their respective wives and sisters Isis and Nephthys. One myth tells of the conflict between the two brothers Osiris and Seth. It describes how Seth, envious of his brother Osiris, drowned him and cut his body into pieces. However, Isis and Nephthys managed to collect the parts of Osiris' dismembered body. With her extraordinary magical powers, Isis then revived her husband-brother, was impregnated by him, and later gave birth to Horus.

The three goddesses Nut, Isis, and Nephthys were worshipped as the most important goddesses of Egypt. The sky-goddess Nut was the regenerative mother, the mother of the deceased king (and thus a mortuary goddess). She was also the mother of the solar deity Re who traveled by boat through the night sky within the body of the goddess. At dawn the god was reborn from between the thighs of the goddess in the East.

Isis was the primary symbol of the devoted mother and wife; she was referred to as "the Savior" and "Great of Magic," and she was entreated for protection, particularly on behalf of women and children. Representations of Isis suckling the infant Horus in her arms illustrate her role as the protective goddess-mother.

Although Nephthys (Mistress of the House) was the wife-sister of the god Seth, her loyalty to Osiris, her husband's opponent, earned her a similar position in the funerary cult to that of her sister Isis. Like Isis, she was regarded as the savior and protector of Osiris, and consequently of every dead person. Nephthys also played the role of wet nurse, despite not being able to give birth to children of her own.

Two other notable goddesses were Neith and Hathor. The history of Neith begins with the earliest history of Egypt, when she had a close, protective relationship with the king and queens. Her emblems, the double bow and crossed arrows, indicate her role as huntress. Once the most prominent goddess, her cult faded until the Late Period of ancient Egypt. In the Greco-Roman period she came to be portrayed as a primordial creator deity.

In the latter part of the Egyptian Old Kingdom, the goddess Hathor of Dendera came to the fore. Her complex nature is reflected in her numerous and diverse roles, her different forms, and her many cult centers. Hathor appeared as a woman, a cow, a falcon, “Lady of the Sycamore Tree,” a fiery *uraeus* (the cobra), and a savage lioness. Her name, which means “House of Horus,” identifies her as the mother of the king (who was identified with Horus), and is associated with her ancient role as the celestial cow and mother of the sun. Hathor was also the beautiful and sensual goddess of love, sexuality, joy, dance, and music.

Taweret (the Great One) was one of the most popular deities, associated with pregnancy and childbirth. She was usually represented as a composite being, with the body and head of a hippopotamus, the paws of a lion, and the tail of a crocodile, or a complete crocodile on her back. She was shown standing on her hind legs; her swollen abdomen and pendulous breasts indicate her association with pregnancy and nursing. The goddess Maat represents the perfect, stable order of existence which governs every aspect of the world from the laws of nature to the rules of human social life.

Clearly, there is no one gender role incorporated by these goddesses, each of whom exhibit an amazing amount of individuality.

In *Concepts of the Other in Near Eastern Religions*, edited by Ilai Alon, Ithamar Gruenwald, and Itamar Singer, pp. 81–102. Leiden, 1994. Discussion of Hittites' respectful attitude towards foreign gods and the absorption of various divinities from ethnically different regions into Hittite pantheon and worship.
- Van Gessel, Ben H. L. *Onomasticon of the Hittite Pantheon*. Leiden, Vols. I-II, 1998; Vol. III, 2001. The most recent comprehensive list of Hittite deities in cuneiform Hittite texts, but lacks information about the gender of the deities, their origin, and functions.
- Syria/Canaan/Israel**
- On the subject of the goddess Asherah there is a plethora of volumes regarding her role and character, especially in view of the biblical connotations. In the following, only the recent books in English published since 1990 are listed.
- Binger, Tilde. *Asherah: Goddesses in Ugarit, Israel, and the Old Testament*. Sheffield, U.K., 1997. A thesis from the Copenhagen school of Biblical criticism with a review of textual suggestions for the Khirbet el-Qom and Kuntillet Ajrud inscriptions.
- Cornelius, Izak. "Anat and Qudshu as the 'Mistress of Animals,' Aspects of the Iconography of the Canaanite Goddesses." *Studi Epigrafici e Linguistici* 10 (1993): 21–45. Excellent discussion of the iconography of the West Semitic goddesses.
- Day, Peggy L. "Anat: Ugarit's 'Mistress of Animals.'" *Journal of Near Eastern Studies* 51 (1992): 181–190. In this article,

Peggy Day argues against the common tendency to describe the Canaanite goddess Anat as a goddess of fertility. She re-examines the Ugaritic texts and demonstrates that Anat was rather a “mistress of animals,” both as huntress and a protectress.

Hadley, Judith M. *The Cult of Asherah in Ancient Israel and Judah*. New York, 2000. An important contribution to the debate about the exact nature of Asherah and her significance in pre-exilic Israel and Judah.

Kletter, Raz. “Asherah and the Judean Pillar Figurines Engendered?” In *Sex and Gender in the Ancient Near East*, edited by Simo Parpola and Robert M. Whiting, pp. 289–230. Helsinki, 2002. Discussion of the Judean Pillar figurines and their interpretation, see references in article for more information on this controversial material.

Walls, Neal Hugh Jr. *The Goddess Anat in Ugaritic Myth*. Atlanta, 1992. Similarly to Peggy Day, Walls denies that Anat is the consort of Baal or that the two deities had a sexual relationship.

Watson, Wilfred G. E. “The Goddesses of Ugarit: A Survey.” *Studi Epigrafici e Linguistici* 10 (1993): 47–59. An excellent survey of the principal goddesses of Ugarit, their names, epithets, and characters, with the exception of Attartu, for which he refers to a French publication.

Wiggins, Steve A. *A Reassessment of “Asherah”: A Study According to the Textual Sources of the First Two Millennia BCE*. Kvelaer/Neukirchen-Vluyn, Germany, 1993. An attempt to place Asherah in the wider ancient Near Eastern perspective, but does not treat the Mesopotamian sources in chronological order.

Wiggins, Steve A. “Of Asherahs and Trees: Some Methodological Questions.” *Journal of Ancient Near Eastern Religions* 1 (2001): 158–187. Explores the evidence for the dendritic associations of Asherah and their relation to Israel and other religions of the ancient Near East.

### Egypt

Hassan, Fekri A. “The Earliest Goddesses of Egypt.” In *Ancient Goddesses: Myths and Evidence*, edited by Lucy Goodison and Christine Morris, pp. 98–112. London, 1998. Essay focuses on bovine and maternal imagery relating to the royal ideology based on the author’s idiosyncratic hypothesis that Egyptian religion had its roots in cattle herding in the Sahara.

Hornung, Erik. *Conceptions of God in Ancient Egypt: The One and the Many*. Translated by John Baines. Ithaca, N.Y., 1982. Basic work on the Egyptian theological system.

Lesko, Barbara. *The Great Goddesses of Egypt*. Norman, Okla., 1999. Overview of the major goddesses of Egypt. Lesko cites the evidence for their earliest appearances, traces their cults through Egyptian history, and often uses the texts of prayers from ancient sources to illustrate the powers and attributes of each deity.

Troy, Lana. “Engendering Creation in Ancient Egypt: Still and Flowing Waters.” In *A Feminist Companion to Reading the Bible: Approaches, Methods, and Strategies*, edited by Athalya Brenner and Carole Fontaine, pp. 238–268. Sheffield, U.K., 1997. The author demonstrates how, for ancient Egyptians, creation on all levels was firmly linked to reproductive sexuality.

Van Dijk, Jacobus. “Myth and Mythmaking in Ancient Egypt.” In *Civilizations of the Ancient Near East*, edited by Jack M.

Sasson, vol. 3, pp. 1697–1709. New York, 1995. Description of creation myths and the Osiris myth. Discussion of the relative scarcity of written mythical stories and various theological schools.

JOAN GOODNICK WESTENHOLZ (2005)

## GODDESS WORSHIP: GODDESS WORSHIP IN THE HELLENISTIC WORLD

After Johann G. Droysen’s famous *Geschichte des Hellenismus* (1833–1843; 1877–1878), the term *Hellenism* was increasingly used to qualify a crucial period in the history of the ancient Mediterranean world. Droysen considered the exploits of Alexander the Great (356–323 BCE) as a crucial turning point in the politico-cultural history of the vast geographical area around the Mediterranean and saw the year of his death as the beginning of a new historical cycle. This cycle started with the progressive fragmentation of the supranational empire set up by the Alexander in the thirteen years of his dazzling career (336–323 BCE) and the creation of new kingdoms by his generals, the Diadochi, and ended with the Roman conquest of Egypt after the Battle of Actium (31 BCE). By reducing the ancient kingdom of the Pharaohs (subsequently inherited by the Ptolemies) into a Roman province (30 BCE), the new power of Rome, soon itself at the head of an empire, concluded its gradual conquest of the kingdoms of ancient Macedonian origin.

**THE HELLENISTIC PERIOD.** Hellenism covers a wide period: three centuries of intense political, military, social, economic, and religious events that influenced in various ways all the peoples of the Mediterranean. In the East, in particular, it affected the kingdoms that had been formed from the division of lands conquered by Alexander. However, this circumscribed definition is now considered inadequate, and the scope of Hellenism extends to cover the entire time span of the Roman Empire until its transformation into a Christian Empire at the end of the fourth century. At this time bloody sacrifices were prohibited by Theodosius (391 CE), with the aim of putting an end to the traditional cults of the Mediterranean world. The antipagan legislation of the Christian emperors took effect gradually and over a long period of time, and polytheistic religious traditions persisted, albeit to a lesser extent, in many regions of this vast geographical area for at least another two centuries. It was however the clear sign of a deep cultural and religious transformation that brought to a close the long and variegated historical period known as Hellenism. A distinction between early and late Hellenism can be identified, respectively, as the ancient Droysenian phase and that of Imperial Rome—each have particular aspects while also being part of an historical continuum.

**Hellenistic culture.** Unlike the Greek etymon *hellenismos*, which defines Greek as opposed to those different than Greeks (represented by the “barbarians”; i.e., all non-Greeks), after Droysen the term *Hellenism*—insofar as it refers to the last three centuries before the Christian era—was

used to express the complex cultural physiognomy of that age, with its repercussions in subsequent centuries. This was the result of Greek elements meeting and amalgamating to various extents with the traditions of those peoples—above all Asian, but also Western—who came into direct contact with them. The first and most evident consequence of the *gesta* of Alexander the Great, who had created an immense supranational empire and modeled the subsequent structure of Hellenistic kingdoms, was in fact the intense movement of people that, although mainly for military and commercial purposes, acted as a vehicle of wide-ranging cultural exchange and the source of profound changes also on a religious level.

Extremely significant differences existed on the social, economic, and institutional levels, between the nations of the eastern Mediterranean, where monarchic Hellenistic states lived alongside independently ruled Greek cities and their leagues. However, it is possible to talk of Hellenism as a sufficiently homogeneous cultural entity, based on a common language (the Greek of the *koine* set up on the basis of the Attic dialect) and characterized by common spiritual and intellectual traits. The religious component is an essential part of this culture, and here also there is significant homogeneity, albeit with local and national variety. This homogeneity is the result of various kinds of interference between the Greek religion and that of the peoples with which it came into contact. In other words, in religious terms the Hellenistic period was characterized by a phenomenon that, although foreshadowed and rooted in the archaic and Classical periods, now acquired such large proportions that it became a distinguishing feature of an entire phase in the history of Mediterranean civilization.

A distinction should also be made between the situation in the western Mediterranean and of the oriental regions, where Hellenism penetrated deeply into the local humus and from which in turn it sucked vital nutrients. Here, alongside peoples only marginally touched by Greek expansion in the early Hellenistic period, there were entire regions such as Magna Graecia and Sicily, with a Greek tradition dating back to the seventh and eighth centuries BCE, and Etruria, with centuries of contact with Greece and the East. For its part, during its gradual expansion through the peninsula, Rome was receptive to Hellenic influence already in the monarchic age, whereas the Classical period brought direct contact with the poleis of continental Greece. Moreover, with the eastward expansion of the Roman Republic, the Hellenistic period witnessed the large-scale Hellenization of the cultural and religious life of the Urbs, which would continue throughout the life of the Empire.

**Fundamental tendencies of Hellenism.** Although tending to be linked primarily to tradition, the dialectic connection between various components of a cultural system, beliefs, and cults nevertheless influence change in a community's socio-political and economic life. Two fundamental tendencies run through Hellenistic culture: (1) cosmopolitan

open-mindedness and the preeminence of the individual (i.e., the overcoming of the particularistic barriers of both the polis and the wider national aggregate) and (2) the initiative of the individual who, by making new life choices, may reject traditional patterns and participate independently in the many activities available in a supranational panorama. In this situation the individual often looks for new forms of aggregation, including from a religious point of view, and may join groups, communities, and associations that in foreign lands practice the cult of one or another deity (of the nation of provenience or of local deities) encountered by immigrants in their new home. In the case of the indigenous populations, certain divine figures are sometimes the object of particular veneration by groups of worshippers, independent of public or city traditions, and thus fuels dynamic forms of personal religion.

The phenomenon of religious contacts and influences is an almost structural factor in the history of Mediterranean peoples as far back as the observation of history allows. For the Greeks, it represented an important aspect of their colonial experience in the East and West, in which they took their own gods and came into contact with those of the local populations. However, it assumed particular relevance in the Hellenistic period and, subsequently, under the Roman Empire. The Greeks and almost all the peoples of the Near East and the West had in fact ethnic religious traditions whose origins and development were contemporaneous to the origins and developments of the communities in which they originated, where they were perceived as an essential component of cultural identity, together with language and the socio-economic and political framework. Because they are related to highly civilized peoples, the respective religious contexts may be defined as national rather than ethnic because they have (to varying extents) common constants and tendencies that, as in the case of the numerous Greek poleis, give homogeneity to the religious life of the individual ethnic group and go beyond local identities. The national religions of the ancient Mediterranean world were, then, the heritage of individual peoples, mutually acknowledged and cohabiting without intolerance or exclusivism.

An essential component of the picture is the structure of such religious traditions, which, with the exceptions already mentioned, may all in various ways be defined as polytheistic, implying the belief as reflected in ritual praxis in a series of superhuman entities with more or less clearly defined personalities. These divine figures possess particular attributes and prerogatives and are often connected with the various cosmic departments whose working they ensure and with human institutions over whose foundation they presided and of which they are now protectors. Greek polytheism may be defined as a dynastic-departmental religious structure, because the various deities (especially the main ones) are linked by bonds of parentage and endowed with power over the various spheres of cosmic and human life.

As contact intensified in the early Hellenistic period and, subsequently, in the Imperial Roman period, the struc-

tural similarities between the religious traditions of Mediterranean peoples made possible the phenomenon of religious cosmopolitanism that characterizes the period. In fact, certain cults (i.e., mythical–ritual complexes gravitating around single deities or divine “families”) spread progressive beyond their respective national boundaries, as is the case of the oriental cults that spread through Greece and the West. At the same time, Greek religion penetrated extensively into the East, in part superimposing itself on local systems and in part cohabiting with them, giving the religious life of the great Eastern cities—whether newly founded or of ancient origins—a more or less marked but in any case decisive Hellenic stamp. With the affirmation of the power of Rome, numerous figures of the Roman pantheon also began to be worshiped under various guises by the peoples of the Mediterranean and were found to be susceptible to forms of convergence or identification with local deities.

**METHODOLOGICAL ISSUES.** Before examining the Goddess worship in the Hellenistic World, two preliminary difficulties need to be discussed. The first regards the polytheistic structure of the religious contexts in question, in which each figure acts and functions with specific attributes and prerogatives yet also within a complex web of relationships involving the other superhuman entities—particularly those to which they are linked due to having similar or contrasting functions. This web implies a strongly anthropomorphic gender differentiation, which is translated into a distinction between gods and goddesses (i.e., in the creation of a male and female divine world). The question, as posed by Nicole Loraux (1990), then becomes “what is a goddess?”—an inquiry that can be related to the Greek pantheon as well as similar Mediterranean religious contexts.

When facing the problem of the significance of female divine figures within the religious systems of a Hellenistic milieu, the structural dialectic of the relations operating among all their components and, in particular, between the two gender dimensions must be taken into full consideration. The focus on the various female presences should not overshadow the individual basic reality of religious contexts in which the divine world is articulated according to the complementary functions and prerogatives of these two dimensions.

The second difficulty regards the very notion of Hellenism assumed as the parameter of reference for the theme under discussion. As mentioned previously, this term combines a time span that current historical research extends significantly beyond the limits of Droysen’s formula with an extremely wide-ranging spatial dimension, enveloping all the cultures of the Mediterranean area that in various ways came into contact with Greek culture. It follows that, in principle, the entire chronological and cultural framework in question must be examined to identify the personality and role at least of its main female figures, who embody the spiritual and religious needs that the worshipers—both men and women—in turn express through the prerogatives and the attributes with

which they create the goddesses’ images and organize their cult. Additionally, all the religious contexts converging in this vast geographical area maintained their ancestral structures and, despite the more or less profound changes caused by the politico-military and socio-economic events of the age, fundamentally conserved the beliefs and worship practices consolidated by tradition. Each of the divine figures of the numerous national pantheons had by now assumed universally recognizable stable and defined prerogatives and attributes, so a full description would require the examination of the deity’s entire history, right back to the most ancient sources.

Despite these reservations, we may try to identify the peculiarities of certain main female divine figures that occupied a dominant role in the collective religious imagination of early and late Hellenism. The distinguishing traits of this wide historical time span were individualism and cosmopolitanism—factors able to trigger processes of confluence and cultural homogenization. Also, on a religious level, it is legitimate to focus attention on those figures and their mythical–ritual systems that were involved in similar processes, grouping aspects and prerogatives of similar figures from other cultural contexts around an original national identity. These are not phenomena of syncretism (a widely abused term that is contested by religious historians) but authentically creative processes, whereby certain aspects of a deity’s defining functions and attributes were selected and developed so that the deity drew to itself other divine figures with similar functions but from different historico-cultural contexts.

**GREEK ORIGINAL TRAITS IN GODDESS WORSHIP.** In this process, as in other components of the Hellenistic cultural amalgam, a predominant and guiding role was played by the Greek religious tradition, in which there were a number of great goddesses with a long history (perpetuated by various sources of nourishment) and whose origins were often unclear (e.g., Mediterranean, Indo-European, Near Eastern), but which had by now assumed strong polyhedral identities. Figures included Hera, bride of the great Zeus, whose distinguishing feature is her link with marriage; Athena, the *parthenos* (never a child, always a virgin) who emerged intact and motherless from the head of Zeus as a warrior and patron of the arts, protectress of the polis, and civilizing deity; Artemis, the virgin huntress, mistress of the animals (*potnia therōn*), and protectress of the critical passages of human life from birth to male and female initiations; and, lastly, Aphrodite. She represented the very force of sexual desire and, according to Hesiodic tradition, was born before the other gods of Olympus from the marine foam fertilized by the member of Uranus and mutilated by his son Cronus to open the cosmic space necessary for the creation of gods and men. This figure undoubtedly had oriental connections in contiguity and probably in continuity with the Babylonian and Phoenician Astarte (perhaps via the Cypriot culture; Kypris is already a typical Homeric name given to her) and also brings together warlike aspects and a bisexual component.

In the Hellenistic period, Aphrodite once more takes forceful possession of those far-off roots, moreover never forgotten, to become associated and identified with numerous goddesses of Near Eastern pantheons. Already in the archaic and Classical periods, those roots were expressed, amongst other ways, in the typical love–death relationship with Adonis, whose typological analogies and historical connections with the Babylonian Tammuz are clear. Associated in Sappho's female *thiasos* with the ritual of mourning and in classical Athens with women dancing on roofs in a state of emotional turmoil, in the city of Alexandria during the days of Arsinoë II, wife of Ptolemy II, the cult of Adonis was, instead, the great city festival described in the famous Idyll XV of Theocritus, thus confirming a religious continuity that in the Hellenistic period widened to involve the cosmopolitan public of the newly founded cities.

The metropolis of Alexandria was, in fact, built on Egyptian soil by Alexander the Great as a tangible sign of *hellenismos* introduced into the heart of the ancient local civilization and, under Ptolemaic rule, was considered one of the most prestigious cultural and religious centers of the Mediterranean world. The traditional Greek cults were practiced there, and sources indicate that the prevalent cult was that of Demeter, who was the subject of numerous festivals also observed in Egyptian society and in Eleusis, a suburb of Alexandria, where she was evoked in her peculiar dimension as the figure-head goddess of the mystery cult. With no local “branch offices” to perform its role, Attic Eleusis would remain a religious center of extreme vitality throughout early and late Hellenism, attracting worshipers from all over the Mediterranean and, in particular, from Italy and Rome. Eleusis was also visited by many emperors from Augustus (31 BCE) to Gallienus (264/65 CE); Hadrian, an admirer of Greek culture, was a particularly devoted worshiper. They displayed a special respect for Demeter's gifts, which the famous Ciceroian formula listed as cereal cultivation and the mysteries with their eschatological guarantees.

On the acropolis of Pergamum (founded by Attalus I and capital of his kingdom) near the great altar of Zeus, stands the sanctuary of Demeter, together with those of Athena Polias and Hera Basileia. This sanctuary testifies to the substantial Greek influence on the new Asian kingdom, along the lines of the ancient Hellenic colonies in the Anatolian peninsula. This sanctuary, moreover, was also a particular center for the worship of Artemis, who in numerous sites of ancient origin or Hellenistic foundation displayed evident oriental traits (reflecting both the marked Mediterranean and Anatolian components of her ancient roots) and new confluences with figures of great local goddesses. Examples include the great sanctuary at Ephesus in which the unusual iconography of the cult statue of the goddess, enclosed within a sheath decorated with numerous animal protomes (heads or foreparts), plastically expresses her essential dimension as mistress of wild animals (*pothnia therōn*); those of Magnesia on the Meander, in which Artemis bears the name of

Leukophryene; of Sardis; of Perge in Pamphylia; of Bargylia, with the epithet Kindyas; and of Hypaipa, where she is identified with the Persian Anaitis. In fact, in the Hellenistic period, the Persian goddess was worshiped in various Anatolian centers, which to a varying extent preserved traces of ancient Persian domination. In the game of finding similarities between the traits and functions of divine figures that emerged from the contact between different religious contexts, she is usually identified with the Greek goddess. The name Persian Artemis (*persike*), in fact, is one of the most frequent names given to Anaitis—especially in Lydia, which emphasizes how various defining traits of the two figures are similar, such as their links with nature and the animal kingdom in particular.

**THE ORIENTAL AND EGYPTIAN CONTRIBUTION.** In the Hellenistic period, other major Eastern goddesses began to be worshiped beyond their national boundaries, thus increasing their number of worshipers. The contact with some of the main characters in the Greek, and then also Roman pantheon, led to partial changes in their personalities.

**Dea Syria.** A case in point is the Semitic goddess Atargatis, whose main center of worship was the city of Hierapolis-Bambyke in northern Syria. She had been known in Greece since the third to second century BCE by the name of Pure (*hagne*) Aphrodite or Goddess Syria and was on occasions called Aphrodite Goddess Syria or *Hagne* Aphrodite Atargatis, confirming that worshipers perceived certain analogies between the two goddesses. Moreover, Atargatis did not lose her own distinct identity, underlined by the national name and clearly expressed in her traditional association with the great Syrian Baal Hadad, lord of the tempest and of lightning, who was linked to the kingdom of the underworld and fertility.

In Delos, where the cult was introduced by Syrian merchants, the two gods were first venerated together as patrician gods by the Eastern community. When Athens took control of the island, the public of worshipers widened to envelop its entire cosmopolitan population, and the goddess progressively acquired supremacy over her male counterpart. From 118/117 BCE the holder of the priesthood seems to have been an Athenian, who proclaimed himself *hierews tēs agnēs Aphroditēs* (priest of the Pure Aphrodite). This title is an indication of the advanced process of Hellenization in which the goddess was by now involved. Lucian (second century CE) is attributed with the treatise “The Syrian Goddess,” which provides a description of the cult and religious traditions related to the great sanctuary of Hierapolis-Bambyke. The goddess, although linked to her male counterpart Hadad and to a lower ranking figure of unknown identity, seems to be the undisputed protagonist of the cult and of relative mythical traditions. Assuming the identification of Hadad with Zeus—considering that the numerous Semitic Baals and the major male deities of the numerous local pantheons tended to be assimilated with the king of the Greek gods or with the Roman Jupiter, by now perceived as his counterpart—Lucian also puts Atargatis on the same level as Hera.

However, confirming the polyhedral nature of this divine figure, Lucian declares that “on the whole, she is certainly Hera, but she also has something of Athena, Aphrodite, Selene, Rhea, Artemis, Nemesis and the Fates” (*De Dea Syria* 32).

There is an evident sense of a “game of identification” between various divine figures, clearly perceived by contemporary peoples, as a tool for classifying and evaluating their functions and prerogatives when comparing the numerous national pantheons. The presence of phallic symbols in the Heliopolitan sanctuary, together with many other elements of the ritual praxis, shows the goddess’s fundamental link with nature and fertility. The existence of a religious staff consisting of eunuch Galloi and of men and women who in the grip of obsession worshiped the goddess with singing, dancing, and the music of sacred instruments (*De Dea Syria* 43), indicates a cult with clear orgiastic traits, similar to that of the great Anatolian mother Cybele, with whom some ancient sources identify Atargatis. The marked astral and cosmic characterization of her personality (often identified with the constellation of Virgo), together with her peculiar traits as protectress of the polis and her identification with Fortuna and Tyche, portray a complex personality. This was the result of a long historical process that grew from the ancient local roots of a sovereign goddess of a city community to become—according to the canons of Hellenistic cosmopolitanism—the figure of the *omniparens* (universal genetrix; mother of all) and omnipotent cosmic deity celebrated by Apuleius (second century CE).

In terms of the diffusion and significance of her cult in the Mediterranean regions, Atargatis took her distance from her original male counterpart, who also—as Zeus or Jupiter Heliopolitanus and often bearing the name Optimus Maximus—enjoyed a certain popularity under the Empire. The divine consort of another Syrian god, the Baal of the city of Doliche in Commagene (northern Syria), however, assumed a subordinate position to her companion, while enjoying the latter’s great popularity in the imperial period (second–third century CE) only by reflection. This figure is identified with Iuppiter Optimus Maximus and bears the localized title of Dolichenus. He has warlike but also celestial and cosmic attributes and a bride whom epigraphic and iconographic sources identify with Juno, or often Regina Juno or Santa Juno.

This assimilation fits perfectly into the general framework in question and shows how the major female figures in the Greek and Roman pantheons, which were by now extremely similar, provided specific parameters of reference that allowed many divine figures with different national origins to be received into the great Hellenistic cultural amalgam. Moreover, filtered by Hellenic and Roman influence, these figures acquire a supranational, cosmopolitan dimension and are often characterized in cosmic terms, assuming functions and prerogatives of many other female deities while never totally obscuring their primitive identity. Al-

though her title identifies her with the bride of the highest Roman god, the iconographic type of the Juno of Doliche reveals its oriental origin in a number of characteristic elements. In parallel with her divine bridegroom, who is depicted standing on a bull’s back, the goddess appears upright on an animal (not always clearly identifiable as bovine or cervine) in a long robe with her head covered by a veil, or sometimes wearing a diadem (jeweled headdress) or a *calathos* (a cylindrical cap). The scepter and the mirror are her typical attributes.

**Cybele.** The Phrygian goddess of animals and mountains, Cybele was already known to the first Greek colonists on the coasts of Asia Minor and since the seventh to sixth century BCE was included in the Greek pantheon under the name of Great Mother (*Mēter Megalē*) on the basis of her identification with Rhea, mother of the Olympian gods. The iconographic scheme that originated in this period would remain basically unchanged until the last manifestations of her cult, which became one of the most widespread in the Mediterranean world after its official introduction in Rome in 204 BCE. In this solemn image of the goddess, she seated on her throne, often within a *naiskos* (shrine or small temple), with her veiled head surmounted by the polos, bearing the attributes of the sceptre, the *patera* (a libation bowl), and the *timpanum* (tambourine), and with a lion cub in her lap or accompanied by one or two lions in a heraldic position near the throne.

More or less Hellenized (also due to her relationship with Demeter) the Anatolian goddess does not lose the peculiar connotations of her personality and cult. Her individual characteristics are expressed in the names that refer to her Eastern origins (Berecynthian, Idaea, Cybele) and in the orgiastic forms of the rite, with a significant role given to women and its nocturnal connotations. In fact, the goddess has the prerogative of infusing obsession (*mania*) both in the religious dimension of divine possession and in the destructive manifestation of pathological madness, which however she may also cure in her role of healing goddess. Above all, the presence of a male counterpart, Attis, the subject of a bloodthirsty cult involving the self-castration of a number of worshipers forming the group of the Galloi, shows the oriental roots of the mythical–ritual system revolving around the Anatolian Great Mother.

The process of Hellenization of this system, which in the Classical period caused the figure of Attis and his bloody rites to be abolished, did not however achieve its radical transformation. In the early Hellenistic period in Greece, the young male counterpart of Cybele reemerged on a mythical and ritual level. His anthropomorphic representation displays the connotations of a superhuman figure linked to vegetation. He is the protagonist of a tragic event of death, redeemed by a promise of bodily incorruptibility and, above all, by the ritual evocation of the event itself. In this way, he becomes the subject of worship together with the Great Mother. The official introduction in Rome of the Metroac-

cult apparently supplants the Greek experience of it, because at the height of the military and political crisis caused by Hannibal's presence on Italic soil during the Second Punic War (218–210 BCE) the Senate turned to King Attalus of Pergamum as mediator at the sanctuary of Pessinunt, home of the Great Goddess. On arriving in the Urbs, the Black Stone, aniconic image of the goddess was housed in the temple of Victoria on Palatine Hill and then transferred to the sacred temple dedicated to her on the same hill, the center of the city's ancestral cults. The Hellenized dimension is present also in the figure of the Roman Magna Mater Idaea, adopted as national deity due to her links with the tradition of the city's Trojan origins as protectress of Aeneas, son of an Aphrodite perceived as homologous to the goddess Venus. In fact, the religious policy implemented by the public powers of Rome once again reflects the trends typical of the contemporary religious scene, whereby an oriental deity was introduced into the traditional religious structure and the aspects most suited to that structure were developed and its physiognomy remodeled to harmonize it with the other members of the pantheon.

At the same time, the new goddess does not lose her own identity, which in the case of Cybele would be affirmed strongly in the late Republic and early Empire when the Phrygian and mystic aspects of the cult reemerged. These aspects had been relegated to within the Palatine sanctuary, together with the figure of Attis and the eunuch Galloi, whereas the official space had been entirely occupied by the public festival organized by the aristocrats of the annual Megalesia games, which included the procession of the divine image and its immersion in the waters of the river Almo. The emperors Claudius (41–54) and Antoninus Pius (138–161) instituted the Phrygian festival cycle of March 15–17, in which the story of Attis was publicly evoked with manifestations of mourning and joy and marked also by the bloody practices of the Galloi. Once the Metroac ritual was adopted as the official cult of the state, thereby protected and promoted by the emperors, this Roman festive cycle spread to many parts of the Empire. By 160 CE the entire Empire knew of the Metroac sacrificial rite in its dual form of the taurobolium (sacrifice of a bull) and criobolium (sacrifice of a ram) and was performed by city communities and private individuals for the health of the emperor and his family as an expression of devotion and loyalty toward the highest public authority. In the drastic evolution of lifestyle and religious feeling in subsequent centuries, the cathartic connotations of the taurobolium were accentuated, and it shifted from being a public rite performed for the salvation of the social community in the person of its highest representative to become an individual, private rite. Its aim was thus the purification and salvation of the worshiper.

Both in the forms of the festival cycle of March and in those of the bloody rite of the taurobolium, the Great Goddess, protagonist of the cult, together with her male counterpart, Attis, would maintain her position of importance up

until the end of Hellenism. In the late fourth century CE she would unite in the taurobolium those representatives of the Roman aristocracy who had remained impervious to Christianization. From Vettius Agorius Praetextatus and his bride Fabia Aconia Paulina to many other members of the great Roman senatorial families, the tenacious loyalty to ancestral religious traditions would be given particular importance and attention through devotion to the Magna Mater Idaea, whose ancient Eastern personality is inextricably intertwined with the equally marked traits of her Hellenic and Roman manifestations.

**Isis.** The Egyptian goddess Isis is undoubtedly the figure that more than any other exemplifies the Hellenistic typology of a national deity assuming a cosmopolitan nature when coming into contact with similar personalities and under dominant Hellenic influence. Herodotos (c. 484–between 430 and 420 BCE) noted in his *Histories* that all Egyptians, independent of their innumerable local cults, venerated the couple of Isis and Osiris. For thousands of years they played a central role in Egyptian religion, due to their triple connection with pharaonic ideology, funerary practices and eschatology, and agrarian fertility.

In the light of the Greek interpretation, Osiris is identified with Dionysos because of his chthonic and agrarian aspects and especially the *pathē* (sufferings) embodied in his mythical story and cult, and Isis is identified with Demeter. This identification, however, only covers the aspect of her divine personality linked to fertility and maternity. Parallel to a progressive diffusion of her cult in Greece, Asia Minor, the islands of the Aegean and the West (first in Sicily and southern Italy and then throughout the peninsula and in the various regions of the Empire) in the Hellenistic period Isis's attributes and prerogatives underwent such extraordinary development that she became a *panthea* goddess. In his novel *Metamorphoses*, Apuleius (second century CE) defined her as "single Godhead (*numen unicum*) adored by the whole world in varied forms, in differing rites and with many diverse names" (*Metamorphoses* 11, 5). In the prayer that the protagonist of the novel addresses to the bright moon rising from the waters of the sea over the beach of Cenchreae (Corinth), he invokes the *Regina caeli* (Queen of Heaven) by listing the main figures of the Greek-Roman pantheon—all expressions of her multiform identity: Ceres honored at Eleusis, the *caelestis* (heavenly) Venus "worshipped in the island shrine of Paphos; or the sister of Phoebus . . . now adored in the celebrated temples of Ephesus; or whether as Proserpine . . ." (*Metamorphoses* 11, 5). He concluded: "By whatever name or ceremony or visage it is right to address thee, help me now in the depth of my trouble" (*Metamorphoses* 11, 5). In the reply of the epiphanic goddess, further details are added to the divine picture:

Thus the Phrygians, earliest of races, call me Pessinuntia, Mother of the Gods; thus the Athenians, sprung from their own soil, call me Cecropeian Minerva; and the sea-tossed Cyprians call me Paphian Venus, the ar-

cher Cretans Diana Dictynna, and the trilingual Sicilians Ortygian Proserpine; to the Eleusinians I am Ceres, the ancient goddesses, to others Iuno, to others Bellona and Hecate and Rhamnusia. But the Ethiopians . . . together with the Africans and the Egyptians who excel through having the original doctrine, honour me with my distinctive rites and give me my true name of Queen Isis. (*Metamorphoses* 11, 1–5)

Deeply Hellenized but at the same time rooted in the ancient Egyptian tradition, this image of Isis Myrionyma (with ten thousand names) is most vividly expressed in the hymns of praise (*aretologies*). In these, the goddess declares her powers (*dynameis*) and lists the benefits she has bestowed on humankind, configuring herself as a typical cultural heroine in line with the Hellenistic model of the *euretēs* (inventor of the fundamental human techniques and institutions) and *euergētēs* (benefactor). The Isiac *aretologies* are attested by epigraphs in many places of the Hellenized world and by literary documents and probably derive from a single prototype in which ancient Egyptian concepts were elaborated in the light of a new religious vision typical of the Hellenistic period. The model of Isis's *aretologies* is, in fact, attributable to the beginning of this period and was aimed at promoting diffusion of the cult of the goddess whose functional identity and iconography had by now become deeply Hellenized. After the goddess's genealogy and a list of her main cult centers, a list follows of her cosmogonic exploits (e.g., separation of the land from the sky, fixing the route followed by the stars, the sun and the moon) and of the benefits she bestowed on humanity (e.g., the abolition of cannibalism; the institution of public and family law; the invention of language, writing, and navigation; the institution of religious rites; and the definition of ethical laws). The listing of the numerous *aretai* presents a picture of Isis as a universal power, mistress of the cosmos in its natural and human dimension, and in some documents (e.g., *Hymn from Andros*, *Hymn from Kyme*, *Metamorphoses*) sovereign of astral destiny—the *Heimarmene* (fate) imposed on Hellenistic society as a dark and tyrannical force. This prerogative of the goddess is expressed in the frequent name of Tyche or Fortuna with which worshipers invoked her and in the iconographic attributes of the cornucopia and the rudder. Its liveliest representation is the story of Lucius narrated by Apeuleius in *Metamorphoses*. This trait explains the exceptional favor that Isis enjoyed in the entire Mediterranean world and represents the most typically Hellenistic aspect of her personality. In the variety of her attributes and her typology, the figure of Isis—although rooted in a national tradition—is a typical creation of Hellenism in the sense that she exemplifies its cosmopolitan aspects and at the same time satisfies individuals' needs for personal guarantees for the present and future. To this end, according to ancient Egyptian ideology, an essential role is played by the goddess in the mythical–ritual framework associating her with her spouse Osiris and her son Horus. In the organic explanation of the second century CE Greek writer Plutarch (before 50–after 120 CE), the Egyptian myth attributes Isis with the essential

task of searching for the dismembered body of her spouse. On recomposing it, she celebrated the funeral rites, through which she made the great Osiris immortal. At the same time, Plutarch defines the salvific function of the goddess toward humanity:

The sister and wife of Osiris . . . , nor did she allow the contests and struggles which she had undertaken, her wanderings and her many deeds of wisdom and bravery, to be engulfed in oblivion and silence, but into the most sacred rites she infused images, suggestions and representations of her experiences at that time, and so she consecrated at once a pattern of piety and an encouragement to men and women overtaken by similar misfortunes. (*De Iside et Osiride*, 27 as cited in Griffiths, 1970, pp. 26–27)

The divine story contemplates suffering and death but also provides a positive solution in the reanimation of Osiris, who regains life and sovereignty, albeit in the kingdom of the underworld. To the eyes of the Greeks, who are aware of the religious experiences typical of the Greek mystery cults, the story becomes an exemplary model for contemporary men and women. Translated into ritual terms (the *teletai*), it offers worshipers the hope of overcoming the difficulties and sufferings of human existence.

Plutarch's text thus draws a picture that is clearly illustrated in Book 11 of the *Metamorphoses*, namely, the presence in the Isiac cult of the initiatory and esoteric praxis of the mysteries, insofar as they are rites that place the worshiper in intimate contact with the deity through the ritual reevocation of a painful event that, however, has a positive outcome. The mystery component—absent from the ancient Egyptian religious context—is the result of the undeniable influence of the Greek, probably Eleusinian model, as in other cults of oriental deities. In particular, at the beginning of the Hellenistic period in some Greek centers, Cybele, another great goddess involved in the process of Hellenization characteristic of the age, assumed traits typical of mystery cults. These would persist with different forms and methods up until the imperial period, when they are discussed by Christian authors such as Clement of Alexandria (150–215) and Julius Firmicus Maternus (fourth century CE).

Insofar as they are subjects of a mystery cult resulting from the dense network of contacts with Greek religious influences and in particular with that of the Eleusinian Demeter to whom in various ways both are typologically related, the two goddesses, Isis and Cybele, express an important component of the great Hellenistic religious amalgam. They are, in fact, characterized by marked individualistic tensions, which on a religious level are reflected in the search for a more intimate and personal relationship with the deity, such as could be realized in initiatory and esoteric rites. At the same time, the Isiac cult is one of the most characteristic manifestations of the tendency to set up new community groups because it requires total devotion of the initiate. In exchange for the divine protection that broke the bonds of

the blind Fortuna and introduced him into the secrets of the cult, the Lucius of Apuleius must dedicate to Isis his whole existence in a total relationship of personal religion. Although not definable in terms of conversion because it persists within the framework of special devotion for a single deity without excluding the other members of a polytheistic pantheon, this relationship nevertheless expresses a religious experience of significant intensity and personal commitment, different from that offered by the traditional practices of public cults.

A last characteristic of the Hellenistic Isis—typical of numerous contemporary cults of female deities, yet in her case particularly significant—is the extension and role of the female presence that without being either exclusive or preponderant is proportionally large, both in terms of worshippers and priestly staff. As is known, in the ancient world a connection often appears between female deities and female priesthoods, without however there being any exclusion of male priesthoods nor of priestesses in the cults of gods. In any case, both in the public forms of the cult exercised in the great Hellenistic temples and in private forms of religious associations that are often of a local nature, the role of the female priesthood is highly significant in the worship of Demeter, Artemis, Athena, Cybele, the Goddess Syria Atargatis, and Isis. The fact that a special web of relationships relates each of these divine figures in various ways to the life of women in their fundamental roles of wife and mother is equally important. Among these, Isis stands out once more as the *Hymn from Kyme* proclaims: “I am she who is called God by women . . . I forced women to be loved by men” (as cited in Beard, North, and Price, 1998, vol. 2, pp. 297–298).

**GODDESS WORSHIP: THE HINDU GODDESS**

Academic interest in Hindu goddesses has burgeoned since the 1970s because of three coalescing factors: in the United States, funding for fieldwork in South Asia through postwar area studies programs; feminist scholarship, with its stress on women's experience and feminist perspectives; and the move from a reliance on texts and elite viewpoints to an emphasis

on local, oral, village contexts where goddesses tend to thrive. With increasing numbers of publications, however, the best way to characterize Hindu goddesses, either as individuals or as a category, has become contested and complex. Accordingly, this essay has three aims: to cover representative Hindu goddesses; to indicate the types of scholarly methodologies currently employed to study them; and to describe major hermeneutical controversies in their interpretation.

For heuristic purposes, this survey organizes goddesses via a pacific (*saumya*)/fierce (*raudra*) spectrum, or, as Wendy Doniger first labeled it, a juxtaposition between "breast" (gentle and nurturing) and "tooth" (ambiguous and potentially dangerous) goddesses (1980, pp. 90–91). In general, breast goddesses are boon bestowing and provide mediation and access to their more powerful consorts. One example is Śrī or Lakṣmī, associated from the Vedic period with royalty and from the epic period with auspiciousness, fertility, wealth, and usually Lord Viṣṇu. Iconographically, she is portrayed either alone, seated on a lotus and surrounded by symbols of fecundity (coins, water, elephants, and the color red) or with Viṣṇu in a position of humble subservience. Theological reflections on Lakṣmī reach their apex in the medieval writings of South Indian Śrī Vaiṣṇavas, for whom she is Viṣṇu's inseparable breast-jewel, and she argues with her lord over devotees, independently granting them grace (*prasāda*).

Other instances include Sarasvatī, the Vedic river goddess who by the epic period symbolized purity, learning, and the arts, and who, though putatively linked to Brahmā, helps devotees directly; Sītā, the wife of Rāma, the model of wifely perfection who, in Tulsidāsa's sixteenth-century Hindi version of the *Rāmāyaṇa*, the *Rāmcaritmānas*, acts as the devotee's intermediary to Rāma; and the various forms of Śiva's wife Satī, or Pārvatī, the one to draw her unpredictable husband from the sphere of *mokṣa* to that of *dharmā* through her beauty and sexuality. In the South Indian theological speculations of Śaiva Siddhānta, she is identified with Śiva's grace (*arul*), inherent in every human. In all cases, these mediator-goddesses are said to be *svakiya*, or married to their consorts, and even if they are soteriologically more significant than the male gods, the latter are more important ontologically.

"Tooth" goddesses are sometimes dangerous and must be viewed with caution. Famous examples are Durgā, or Ambikā/Caṇḍikā, the battle queen of the famed sixth-century Sanskrit "Devī-Māhātmya" section of the *Mārkaṇḍeya Purāṇa*, who slays demons on behalf of the gods and who offers her devotees either worldly enjoyment (*bhukti*) or liberation (*mukti*); and Kālī, the emaciated demon-chopper who emerges from Durgā's wrath to have an autonomous career as an awesome mother goddess, rescuing her votaries from distress. Other instances of ambivalent goddesses include those whose provenance is local calamity or disease, such as Śītālā and Māriyamman, goddesses of smallpox and skin maladies. Like "tooth" goddesses in general, they represent both the release from suffering and the cause

of that suffering; devotees of Śītalā in pox outbreaks claim that the mother's "mercy" (*dayā*) is manifest on the bodies of those she favors. Each of these powerful, independent goddesses, though potentially allied with a male, either as consort (Śīva is the husband of both Durgā and Kālī) or as companion (Jvārāsura, the Fever Demon, is Śītalā's helper), are not intermediaries to their male partners; one prays to them directly, hoping that their compassionate sides will "intercede," so to speak, with their more dangerous aspects.

Midway between "breast" and "tooth" goddesses are those who are neither subservient nor independently powerful, neither peaceful nor fierce, but who claim an equal status with their male companions. Pārvatī in her form as the female sexual organ (*yoni*), coupled with that of the male, Śīva *linga*, is a perfect example of such complementarity, as are Śīva and Pārvatī as two halves of the same being, Ardhanārīśvara, Śīva Half-woman. Rādhā, Kṛṣṇa's cowherd lover, is another illustration; although, like the "breast" goddesses mentioned above, she renders Kṛṣṇa accessible to Vaiṣṇava devotees, offering her grace and compassion to those who seek it (see Sūrdās's *Sūrsāgar* and the *Brahmavai-varta Purāṇa*). In other texts Kṛṣṇa exalts her over himself and even serves as a model of devotion to her rather than the reverse (see Jayadeva's *Gītāgovinda* and Rūpa Gosvāmin's *Vidagdhamādhava*).

In a theological move similar to that of Kṛṣṇa in the *Bhagavadgītā*, who asserts that all gods are really just forms of himself, Hindu goddess worshippers also claim that all manifestations of the divine feminine, whether benign or ambivalent, are simply faces or aspects of the one Great Goddess, Mahādevī. This profession is attested textually from at least the time of the "Devī-Māhātmya," where one finds epithets praising one goddess in terms of another, stories in which goddesses emerge from each other, and philosophical declarations about female energy (*śakti*), primordial nature (*prakṛti*), delusive power (*māyā*), and the absolute ground of being (*brahman*), each of which is said to characterize female deities. The concept of Mahādevī was an especially powerful tool for assimilating local, indigenous goddess cults into the normative, widespread Hindu pantheon, and the Purāṇas (fifth to eighteenth centuries) are textual repositories of lore concerning this process of consolidation. Recent anthropological studies underscore the same point: tribal and local deities in Orissa are slowly being identified with the pan-Indian Durgā; a local "girl" in Madurai has risen through identification with Śīva's consort Pārvatī to the status of his royal wife, now more beloved by devotees than her husband; and Vaḷḷi, Murukaṅ's Tamil wife, is a classic low-caste Cinderella whose origins have nearly been erased in her gradual upward mobility. The 108 Śākta "seats" (*pīṭhas*) of the Goddess, each a local shrine glorified by its incorporation into the legend about the fallen body parts of Śīva's wife Satī, are another illustration of regional deities being unified under the banner of a universal goddess.

One of the results of the proliferation of studies on Hindu goddesses has been both the expansion of knowledge

about individual goddesses and the theoretical nuancing of scholarly approaches to goddesses in general. Alongside translations or descriptive works, therefore, are field studies promoting feminist, neo-Dukheimian, Freudian, or post-colonial interpretive lenses. These treat a variety of individual goddesses, such as Āṅkālaparamēcuvārī, Bhadrakālī, Draupadī, Māriyamman, and Mīnākṣī, from South India, and Manasā, Nandādevī, Śītalā, and Vaiṣṇodevī, from the north. As a group, such works challenge two influential hermeneutical frameworks proposed when the study of Hindu goddesses was still nascent in the 1960s and 1970s. The first rests on a dichotomy between the local or "little" and the universal or "great" traditions and claims that local goddess cults lack geographic spread, textual articulation, Brahman priests, sophisticated theology, vegetarian ethos, and a domesticated deity. As new field research shows, such juxtapositions may be too stark. Āṅkālaparamēcuvārī is a village goddess prominent in Tamilnadu and Andhra Pradesh; her spread is wider than that of Mīnākṣī, who lives solely in one temple in Madurai, but the latter is a royal deity whose fame, and the wealth and Brahmanical prestige of her temple draw crowds from around the country. Bhadrakālī, a multiform of the north Indian Kālī, shares several important elements with her northern namesake, but her cult in Kerala has many unique features. The same is true of Manasā, the goddess of snakes, who is widely worshiped throughout India but in varying ritual and iconographic forms. Draupadī is reputed for her role in the *Mahābhārata*, but only in South India is there a cult centered on her. Nandādevī and Vaiṣṇodevī, both variants of Durgā, inspire complex local traditions in the central and western Himalayas, respectively. Finally, Śītalā and Māriyamman share a concern with skin diseases, but their iconography, personalities, and ritual prescriptions differ from region to region across India. Such scholarly studies imply twin processes at work: Sanskritization or Brahmanization, the identification of the local with the universally respected "higher" culture, and localization, whereby widely recognized goddesses adapt to bounded geographic contexts. Hence, the demarcation between "great" and "little" traditions is more porous than scholars once thought. A second influential opposition, according to which divine ferocity is associated with marital independence, has also been disputed; Kathleen Erndl, Lynn Foulston, and Stanley Kurtz all document sweet, married goddesses who accept blood sacrifice, possession, and fire walking, as well as independent goddesses who are benign and vegetarian.

Among other themes of interest to contemporary scholars of Hindu goddesses is the question of origins: from where do Hindu goddesses come? From the Indus Valley civilization, in the third millennium BCE or earlier? The Vedic period, after the mid-second millennium BCE? Autochthonous tribal culture? Although the issue is hotly debated, the scholarly consensus is that the Indus Valley peoples were probably goddess revering, as there are parallels between scenes depicted on some of their steatite seals and later Dravidian sacrificial goddess cults. Goddess worship is also important, as one

sees even today, in many tribal societies. In spite of the natural theological desire to read goddesses back into the Vedic tradition, there is little evidence for this in the Vedic texts themselves, although it is likely that because they are authored by the Brahman elite, they do not represent the totality of Vedic religiosity.

An additional topic that galvanizes scholarly and popular audiences, East and West, is the relationship of Hindu goddesses to Hindu women. Does the worship of female deities imply anything about expectations for women's behavior? The evidence is mixed: many goddesses appear to act as approved models for Hindu women. *Sītā*, *Sāvitrī*, and *Pārvatī* embody the ideal in wifely virtue; *Nandādevī*'s ritualized reluctance to leave her parents' home for *Śiva*'s abode mirrors the feelings of out-married Garhwali women; and the Orissan *Kālī*'s outstretched tongue is interpreted locally as a symbol of desired wifely shame on the part of the goddess when she realizes that she has stepped on her husband's prostrate body. In such cases the goddess's conduct acts to reinforce what many see as patriarchal values. Other goddesses, however, represent the opposite: no mother would want her daughter to have the fate of *Rādhā*, an adulteress played upon by the fickle *Kṛṣṇa*, or the character of the unruly *Kālī*, who dances naked, uncontrolled. Several scholars have investigated the specific effect that goddess worship has on women in particular locales. Most of them conclude that goddesses have not always been "good" for women: *Bhadrakālī*'s cult in Kerala is nearly exclusively male and represents male fears of women; almost no women in *Vindhyachal* at the shrine to *Vindhyavāsīnī* find any relationship between the *śakti* of the Goddess and ordinary women; and even the famed spiritual giant, *Ānandamayī Mā*, is perceived by her devotees as transcending gender entirely. However, such authors also concede that the potential for positive influence is present. As Kathleen Erndl notes, the goal for Hindu feminists on an ideological level is "to rescue *śakti* from its patriarchal prison," in which women, because of their power, need to be subdued (1993, p. 96). Western feminists and denizens of women's spirituality have long found Hindu goddesses inspirational sources of inner strength; until recently, however, Indian feminists have eschewed goddess symbolism as being a tool of patriarchal oppression.

Another site for the investigation of Hindu goddesses is the context of Hindu nationalism. With the rise of the *Vishwa Hindu Parishad* and the *Bharatiya Janata Party* in the late 1980s, one sees a concomitant resurgence of interest in the cult of *Bhārat Mātā*, or Mother India, and the weapon-bearing eight-armed *Aṣṭabhujā*, a deity self-consciously constructed by the women's wing of the *Rashtriya Swayamsevak Sangh* to provide women with an anti-Muslim rallying symbol. The politicized use of goddess imagery in the modern period goes back at least as far as the late nineteenth century, with *Bankimcandra Chatterjee*'s famed hymn, "Hail to the Motherland," or "Bande Mātaram!" (1882), in which the land of India is equated with the pillaged goddess in need

of her sons' heroic self-sacrifice. Most scholars, whether Indian or not, find the explicit equation of the nationalists' enemies with the goddess's victims to be extremely worrying.

Of course, goddesses are a malleable lot, and the nationalists are not the only ones to employ them for human ends. For example, *Santoṣī Mā*, Goddess of Contentment, found a mass following after the release of a Bollywood film celebrating her power in 1975, the *AIDS-Āmmā* was created by a health educator from *Andhra Pradesh* in 1999, and many ecologically minded activists are exploring goddess traditions for environmentally friendly stories, rituals, or associated philosophical concepts. Again, the data is conflicting; to take the case of the *Ganges River*, the same belief in the *Gangā* as goddess leads some Hindus to overlook pollution, since the Mother's purity is inviolable, whereas others attempt to cleanse her out of reverence.

A further topic is the intersection between *Śāktism* and *Tantra*, the antinomian ritual and philosophical system in which the normally forbidden is utilized as a means to the divine. From at least the tenth century, particularly in *Bengal* and *Kashmir*, *Tantric* speculation has involved goddesses: the ten *mahāvidyās* (great goddesses of transformation), the seven *mātrkāś* (mothers), and numerous *yoginīs* and *ḍākinīs* (female ghouls or adepts) in addition to *Kālī* and other deities. As *David Kinsley* opines, because of the ambiguous, death-dealing nature of many *Tantric* goddesses, they push the devotee to new insight: if one can embrace, worship, even love such deities, then one wins the *Tantric* boon of freedom from fear (1975, p. 144). Investigations of *Tantric* goddesses cults aim to decipher the relationships between the *Tantric* elevation of goddesses and ideas of women (most scholars conclude that, ideology notwithstanding, *Tantra* is primarily male oriented); to understand the nexus between the patronage of *Tantric* goddess cults and the power ambitions of their sponsors (since the time of the late *guptas* in the sixth to seventh centuries, kings, whether real or titular, have utilized *Tantric* symbolism to bolster their own claims to prestige); to study the interaction between Hindus and the British during the colonial period (for instance, in reaction to the first partition of *Bengal* in 1905, many nationalists used *Tantric* images of bloodthirsty goddesses to exhort rebellion against the white colonialists); and to chart the British-influenced Hindu critique of *Tantric* deities, due to which many have lost their rough, sexualized, meat-eating demeanors.

Evidence of the health and vitality of Hindu goddesses is indicated by the number who have made their homes outside India. Whether the new residence is the Caribbean, Europe, Britain, or North America, mainstream *devīs* such as *Lakṣmī*, *Sītā*, *Kālī*, *Durgā*, *Mīnākṣī*, and *Vaiṣṇodevī* have adapted in novel ways to their host environments. Most Hindu communities attempt to replicate as faithfully as possible the worship settings of "back home"—temples known for their claims to authenticity are the *Kālī* temple in *Toronto* and the *Mīnākṣī* temple in *Houston*—but even so, accommodations are made in terms of festival timings, temple

construction and zoning laws, and types of offerings. Devotees must also contend with the fact that non-Hindus in diaspora settings may have strange or even hostile attitudes toward their imported deities. How should a New York Hindu react to gift shop lunch boxes decorated with the face of Durgā, or to Western feminists' interpretations of Kālī as a symbol of women's rage against patriarchy? Such appropriations are balanced by what is perceived as more "genuine" attitudes towards Hindu theism, like the Western-organized and -financed Kālī Mandir in Laguna Beach, California, to which priests from Kolkata's Dakshineswar Kālī Temple are regularly brought for ritual accuracy. As scholars note and devotees experience, the Hindu Goddess, embodied in countless goddesses in Hindu contexts the world over, is complex, theologically flexible, and alive and well.

#### BIBLIOGRAPHY

A number of excellent volumes cover a range of Hindu goddesses: Vidya Dehejia, ed., *Devī: The Great Goddess: Female Divinity in South Asian Art* (Washington, D.C., 1999); John Stratton Hawley and Donna Marie Wulff, eds., *The Divine Consort: Rādhā and the Goddesses of India* (Berkeley, Calif., 1982) and *Devī: Goddesses of India* (Berkeley, Calif., 1996); David R. Kinsley, *Hindu Goddesses: Visions of the Divine Feminine in the Hindu Religious Tradition* (Berkeley, Calif., 1986); Axel Michaels, Corelia Vogelsanger, and Annette Wilke, eds., *Wild Goddesses in India and Nepal*, Studia Religiosa Helvetica, vol. 2 (Bern, 1996); and Wendy Doniger O'Flaherty, *Women, Androgynes, and Other Mythical Beasts* (Chicago, 1980). The philosophical aspect of the goddesses cult is explored by Tracy Pintchman in *The Rise of the Goddess in the Hindu Tradition* (Albany, N.Y., 1994) and Tracy Pintchman, ed., *Seeking Mahādevī: Constructing the Identities of the Hindu Great Goddess* (Albany, N.Y., 2001). For excellent studies and translations of seminal Śākta texts, see Thomas B. Coburn, *Devī-māhātmya: The Crystallization of the Goddess Tradition* (Delhi, 1984) and *Encountering the Goddess: A Translation of the Devī-māhātmya and a Study of its Interpretation* (Albany, N.Y., 1991); and Cheever Mackenzie Brown, *Devī Gītā: The Song of the Goddess: A Translation, Annotation, and Commentary* (Albany, N.Y., 1998), *God as Mother: A Feminine Theology in India: A Theological Study of the Brahmavaivarta Purāna* (Hartford, Vt., 1974), and *Triumph of the Goddess: The Canonical Models and Theological Visions of the Devī-Bhāgavata Purāna* (Albany, N.Y., 1990).

Apart from essays surveying individual goddesses contained in the edited volumes listed above, monographs on the following figures are highly recommended: on Ankālaparamēcuvari, Eveline Meyer, *Ankālaparamēcuvari: A Goddess of Tamilnadu, Her Myths and Cult* (Stuttgart, Germany, 1986); on Draupadī, Alf Hildebeitel, *The Cult of Draupadī*, 2 vols. (Chicago, 1988); on Kālī, Sarah Caldwell, *Oh Terrifying Mother: Sexuality, Violence, and Worship of the Goddess Kālī* (New Delhi, India, 1999), David R. Kinsley, *The Sword and*

*the Flute: Kālī and Kṛṣṇa, Dark Visions of the Terrible and the Sublime in Hindu Mythology* (Berkeley, Calif., 1975), Jeffrey J. Kripal, *Kālī's Child: The Mystical and the Erotic in the Life and Teachings of Ramakrishna*, 2d ed. (Chicago, 1998), Rachel Fell McDermott, *Mother of My Heart, Daughter of My Dreams: Kālī and Umā in the Devotional Poetry of Bengal* (New York, 2001), and Rachel Fell McDermott and Jeffrey J. Kripal, eds., *Encountering Kālī: In the Margins, At the Center, In the West* (Berkeley, Calif., 2003); on Māriyamman, chapters in Paul Younger, *Playing Host to Deity: Festival Religion in the South Indian Tradition* (New York, 2002); on Mīnākṣī, C. J. Fuller, *Servants of the Goddess: The Priests of a South Indian Temple* (Cambridge, U.K., 1984) and William P. Harman, *The Sacred Marriage of a Hindu Goddess* (Bloomington, Ind., 1989); on Nandādevī, William S. Sax, *Mountain Goddess: Gender and Politics in a Himalayan Pilgrimage* (New York, 1991); on Santoṣī Mā, Stanley R. Kurtz, *All the Mothers Are One: Hindu India and the Cultural Reshaping of Psychoanalysis* (New York, 1992); and on Vaiṣṇodevī, Kathleen Erndl, *Victory to the Mother: The Hindu Goddess of Northwest India in Myth, Ritual, and Symbol* (New York, 1993). Richard L. Brubaker's dissertation from 1978 is still a very good introduction to the category of village goddesses: *The Ambivalent Mistress: A Study of South Indian Village Goddesses and their Religious Meaning*. For a modern discussion, see Lynn Foulston, *At the Feet of the Goddess: The Divine Feminine in Local Hindu Religion* (Brighton, U.K., 2002).

Explorations of the relationship between goddess worship and the status of women may be found in Lisa Lassell Hallstrom, *Mother of Bliss: Anandamayī Mā (1896–1982)* (New York, 1999); and Alf Hildebeitel and Kathleen Erndl, eds., *Is the Goddess a Feminist? The Politics of South Asian Goddesses* (New York, 2000). Suzanne Ironbiter's *Devī* (Stamford, Conn., 1987) is a good example of a Western woman reading a Hindu goddess-text in a personalized fashion; Shobita Punja's *Daughters of the Ocean: Discovering the Goddess Within* (New Delhi, 1996) is a Hindu woman's counterpart. For women, goddesses, and nationalism, see Paola Bacchetta, "All Our Goddesses Are Armed: Religion, Resistance, and Revenge in the Life of a Militant Hindu Nationalist Woman," *Bulletin of Concerned Asian Scholars* 25, no. 4 (1993): 38–51; and Tanika Sarkar and Urvasi Butalia, ed., *Women and Right-wing Movements: Indian Experiences* (London, 1995). For Tantra in relation to Hindu goddesses, consult: Douglas Renfrew Brooks, *Auspicious Wisdom: The Texts and Traditions of Śrīvidyā Śākta Tantrism in South India* (Albany, N.Y., 1992) and *Secret of the Three Cities: An Introduction to Hindu Śākta Tantrism* (Chicago, 1990); David R. Kinsley, *Tantric Visions of the Divine Feminine: The Ten Mahāvīdyās* (Berkeley, Calif., 1997); Hugh B. Urban, *Tantra: Sex, Secrecy, Politics, and Power in the Study of Religion* (Berkeley, Calif., 2003); and David Gordon White, *Kiss of the Yoginī: "Tantric Sex" in its South Asian Contexts* (Chicago, 2003). Finally, discussions of goddess traditions providing (or not) inspiration for ecological consciousness may be found in Madhu Khanna, "The Ritual Capsule of Durga Puja: An Ecological Perspective," in *Hinduism and Ecology: The Intersection of Earth, Sky, and Water*, edited by Christopher Key Chapple and Mary Evelyn Tucker, pp. 469–498 (Cambridge, Mass., 2000); and Vijaya Rettakudi Nagarajan,

“The Earth as Goddess Bhū Devi: Toward a Theory of ‘Embedded Ecologies’ in Folk Hinduism” (pp. 269–296), and Kelly P. Alley, “Idioms of Degeneracy: Assessing Gangā’s Purity and Pollution” (pp. 197–330) in *Purifying the Earthly Body of God: Religion and Ecology in Hindu India*, edited by Lance E. Nelson (Albany, N.Y., 1998).

RACHEL FELL McDERMOTT (2005)

## GODDESS WORSHIP: THEORETICAL PERSPECTIVES

Theories about goddess worship have been advanced ever since the emergence of the social sciences disciplines in the nineteenth century. Religion specialists in the fields of anthropology, sociology, folklore, psychology, and comparative mythology have contributed numerous theories to explain the phenomenon of goddess worship. The topic has been revived in recent years, particularly by specialists in the area of women’s studies. The following survey of theoretical issues in the study of goddess worship reflects controversies that have raged over broader issues concerning the more general interpretation of religion.

**EARLY PERSPECTIVES ON GODDESS WORSHIP.** Nineteenth-century European social scientists and specialists in comparative religion were fascinated by what they conceived to be universal themes of human experience. Because they relied heavily on the accounts of missionaries, traders, and other travelers to different cultures rather than firsthand fieldwork, many of their speculative theories are discredited today. These writers were concerned with the origins of human institutions such as marriage, law, and religion. Contemporary scholars tend to be more cautious than these early writers about the origins of religion, believing that it is just as dangerous to speculate about the past as it is to develop theories about other cultures without firsthand field observation.

One of the most influential theories in the study of goddess worship was advanced by the nineteenth-century Swiss jurist and historian of Roman law J. J. Bachofen (1815–1887), who linked goddess worship with a more general theory of social development. He asserted that the first human societies were matriarchal and characterized by widespread promiscuity, which was reflected in the worship of female deities. While this theory has been discredited by contemporary anthropologists, early social theorists such as Lewis Henry Morgan, Karl Marx, and Friedrich Engels praised it. Sir James Frazer set himself the task of completing Bachofen’s assemblage of evidence for matriarchy among world cultures. Even Sigmund Freud thought that goddess worship was linked to an earlier stage of matriarchy. For Bachofen and his followers, “mother right” marked a fixed and predetermined stage in the evolution of human cultures. This stage in human evolution, according to Bachofen, can be confirmed by myths about goddess worship, which are living expressions “of the stages in a people’s development, and for the skillful observer, a faithful reflection of all the periods

in the life of that people” (Bachofen, p. 75). The matriarchal period of human history was one of sublime grandeur, when women inspired chivalry, chastity, and poetry in men. Although men had superior strength, women strove for peace, justice, and religious consecration—guiding the men’s “wild, lawless masculinity.” This early phase of cultural evolution was displaced, in Bachofen’s view, by a later period of conquest and patriarchy.

As early as 1851 proponents of the matriarchy theory were embroiled in a controversy set off by the famous jurist Sir Henry Maine, who insisted that the patriarchal family was the original social unit. This was the same year in which Bachofen was preparing his work *Das Mutterrecht*, asserting exactly the opposite thesis. Over thirty years later, anthropologist and folklorist J. F. McLennan (1886) reasserted the matriarchal theory, citing new anthropological evidence. Again in 1891 the matriarchy concept was discredited by Edward A. Westermarck, who was disturbed by Bachofen’s idea that myths and legends preserve the “collective memory” of a people. Westermarck’s argument attempted to reestablish Maine’s patriarchal theory of human origins.

The issue flamed into controversy once again in 1927 with the publication of Robert Briffault’s encyclopedic work *The Mothers*. Arguing against Maine and Westermarck, Briffault reasserted the existence of a primitive matriarchy that universally preceded patriarchy. However, unlike Bachofen, who defined matriarchy as a period of mother rule and inheritance through the female line, Briffault conceived matriarchy to be a period when women were socially rather than politically dominant. Briffault speculated that the “male instinct” created the original social herd and that the “female instinct” was responsible for the establishment of the family. Much of Briffault’s evidence was derived from the study of religion; he thought that the widespread existence of lunar deities among primitive peoples was proof of the early social dominance of women, because women were the first hierophants of lunar cults. Briffault’s evolutionary theory was not the last of its kind. As recently as the 1930s Wilhelm Schmidt advanced a theory for the origin of religion employing a multilinear rather than unilinear model of cultural evolution. Schmidt assumed the existence of three types of “primary cultures”—matrilineal, patrilineal, and patriarchal. According to Schmidt, women were involved in the earliest cultivation of plants. Consequently their social importance increased, giving rise to widespread goddess worship.

Few psychologists have contributed theories about goddess worship. Freud thought devotion to female deities represented an infantile desire to be reunited with the mother. According to Freud, goddess worship represents universal unconscious fantasies characteristic of a stage in early psychic development in which the mother seems to be all-powerful to the child. C. G. Jung placed the religious impulse in a more central position than did Freud. He postulated a set of innate universal archetypes operative in the human psyche, one of which was the feminine principle. Jung utilized

symbolism from primitive, archaic, and contemporary religions to shed light on the operation of these archetypes.

The Jungian perspective has been most fully developed in a classic work by Erich Neumann entitled *The Great Mother* (1955). This massive volume explores the phenomenon of goddess worship from a number of psychological perspectives. Unlike social theorists who traced the development of goddess worship in social time and space, Neumann analyzes the phenomenon purely in terms of inner psychic images. Although he repudiates Bachofen's sociological analysis of matriarchy, he praises him for having made lasting discoveries about the elementary character of the feminine. In Neumann's words, "early mankind and the matriarchal stage are not archaeological or historical entities, but psychological realities whose fateful power is still alive in the psychic depths of present-day man." Neumann posits a matriarchal stage sequentially preceding patriarchy at the psychic level. This stage in the evolution of the human psyche is represented by belief in the Great Goddess. A strange contradiction permeates Neumann's work; on one hand he discounts Bachofen's sociological argument for matriarchy, but at the same time he praises Briffault for having "discovered the fact (which is still insufficiently recognized) that early culture is in very high degree the product of the female group" (p. 281). At the methodological level, Neumann admits to removing documents and images of goddess worship from their cultural contexts. He rationalizes this methodology by asserting that psychohistory (a set of stages in the development of the human psyche) does not necessarily parallel historical events in a linear way. Despite such methodological curiosities, Neumann's work represents one of the most comprehensive treatments of goddess worship ever assembled by a Western scholar. Not only does he demonstrate the great variety of forms manifested in the phenomenon of goddess worship, he reveals the "transformative" nature of this religious impulse. He sketches out four manifestations of the Great Mother archetype: (1) the Good Mother (associated with childbearing, vegetation mysteries, and rebirth); (2) the Terrible Mother (linked to death, dismemberment, sickness, and extinction); (3) the Positive Transformative Goddess (related to wisdom, vision, ecstasy, and inspiration mysteries); and (4) the Negative Transformative Goddess (connected to rejection, deprivation, madness, and impotence). Any female deity can be classified as one of these four functions of the archetype; some goddesses can be placed in more than one of these categories.

There has been no major work on the topic by a single author since Neumann's classic treatment of goddess worship in the mid-1950s. There are several reasons for this. First, the works of Neumann and Briffault, who wrote in the twentieth century, reflect the nineteenth-century approach to comparative religions, which relished the fabrication of elaborate and ambitious theoretical frameworks for the study of complex phenomena. Also significant is the emergence of scientific anthropology, which, until recently, has stressed

the analysis of single, manageable cultural entities through direct fieldwork. Armchair speculation went out of style with the emergence of the Boasian school in anthropology during the early twentieth century. Few psychologists, excepting Freud and the Jungians, have studied religious topics. Contemporary psychologists have focused on discrete measurable phenomena, such as the religious content of dreams and the relationship of psychedelic drugs to altered states of consciousness. Within the mainstream of American psychological thought virtually nothing has been written on the subject of goddess worship.

Other than anthropologists and psychologists, some religion scholars have approached goddess worship from a phenomenological perspective. Joseph Campbell for instance, in his monumental four-volume work *The Masks of God* takes a Jungian approach to goddess worship. While he sometimes uses caution in connecting goddess worship with a matriarchal stage in cultural evolution, at other times he perpetuates the nineteenth-century hypotheses of primitive matriarchy. E. O. James (1959) vacillates between a purely historical description of different goddesses in their cultural contexts and generalizations that border on a universal psychic unity approach, much like Erich Neumann's.

**CONTEMPORARY ISSUES IN THE STUDY OF GODDESS WORSHIP.** After nearly thirty years without a major work on goddess worship, there has been a revival of interest in the topic from three quarters—anthropology, religious studies, and feminist scholarship. Several new books have been published on goddess worship in the early 1980s. The work *Mother Worship: Theme and Variations* (1982), edited by the author of this article, utilizes current data generated by anthropologists to address the topic. Another volume, *The Book of the Goddess: Past and Present* (1983), edited by Carl Olson, is a collection of articles by historians of religion and feminist scholars. Goddess worship is a central theme in the Autumn 1983 issue of *Signs: Journal of Women in Culture and Society*, which is devoted to the study of women and religion. This recent revival of interest in goddess worship is due to three main factors: (1) a new interest in the old matriarchy controversy, (2) an active discussion among feminists about goddess symbolism, and (3) the emergence of a new comparative religions.

**The matriarchy controversy.** The issue of primitive matriarchy, which once plagued the study of goddess worship, has not disappeared. Some modern writers continue to assume there was an early historical phase when females dominated males. They cling to the notion that goddess worship is a remnant of that earlier period. The controversy continues to stir lively debate among popular writers, though many scholars think the issue is a dead one.

Most contemporary historians of religion accept the anthropological view that a stage of matriarchy never existed. However, a few scholars of eminent stature like Joseph Campbell (in Bachofen, 1967, p. lv) continue to support Bachofen's idea of an age of "mother right" that preceded pa-

triarchy. They insist that this has been “confirmed irrefutably” by archaeological evidence. Although most feminist scholars today agree with the anthropological position, there remain a few articulate feminist authors who continue to perpetuate the idea of an original matriarchal stage. An example of this genre is Starhawk’s *The Spiral Dance: A Rebirth of the Ancient Religion of the Great Goddess* (1979), in which the author discusses a rediscovery of the ancient “matrifocal civilizations” and the “falsehoods of patriarchal history.” According to Sally R. Binford (1981, pp. 150–151) the belief in early matriarchies has taken a religious form for some feminists; mother-goddess worshipers in Los Angeles, for instance, have become organized into a church with a temple and priestesses. They believe that the archaeological data that refute their position reflect a conspiracy against women among professional archaeologists. Binford calls this movement a “New Feminist Fundamentalism.”

The only other scholars to take primitive matriarchy seriously in recent decades were Soviets, who espoused Friedrich Engels’s outdated nineteenth-century notions. Alexander Marshack (1972, pp. 338–339) cites Soviet archaeologists who interpreted Upper Paleolithic mother-goddess figurines as confirmation of the existence of early matriarchal hunting societies organized around totemic clans controlled by women. According to Marshack, this view is simplistic, a distorted interpretation of complex data. He insists that the goddess images from the Upper Paleolithic era are evidence for symbolic processes “extremely variable in meaning and use and that they played a number of specialized and generalized roles across the complex, integrated, time-factored culture. . . . These facts do not confirm a matriarchy.” Marshack adds one final but crucial note to his argument: the era was also marked by a separate, specialized masculine imagery and complex animal mythology, and the female figurines must be considered in this context. Thus, Upper Paleolithic society was neither matriarchal nor patriarchal, despite Marxist claims to the contrary.

There is no anthropologist today who would argue for a stage of matriarchy associated with goddess worship. It has been refuted on many occasions by anthropologists of all theoretical persuasions, including Marxists and feminists. In a brilliant argument against the matriarchy theory, Carolyn Fluehr-Lobban (1979, p. 343) notes three errors committed by scholars who insist on perpetuating this myth: They mistakenly assume that (1) the presence of female deities is evidence of matriarchy, (2) matrilineal societies are survivals of an era of matriarchy, and (3) matrilineality and matriarchy are related to each other. According to Binford (1981, pp. 152–153) all these ideas are false and misleading. In fact the myth of matriarchy is damaging to the cause of feminists. Women are not freed by perpetuating the myth. The idea that the type of complex social organization required for matriarchy could be found among prehistoric societies is so patently ridiculous as to be a source of embarrassment for serious scholars pursuing the study of religion.

Even scholars who reject the existence of a historical stage of matriarchy sometimes insist that the symbolism of goddess worship can provide information about the history of female social roles. Some feminists argue, for instance, that the absence of female sacred imagery in Judaism, Christianity, and Islam is due to the repression of women in Western societies. This attempt to draw a parallel between the gender of sacred images and women’s roles is misguided. Occasionally the two may parallel each other, but the social role of women may directly contradict or differ significantly from that suggested by a religion’s sacred imagery. A study of Hindu goddess worship does not allow us, for instance, to predict with any certainty the relationship of women to men in Indian society. This same point is made by the historian and women’s studies specialist Judith Ochsorn (in Olson, 1983, p. 18) in her 1982 study of the Middle Eastern goddess Ishtar. According to this scholar, the Near Eastern deities were heavily anthropomorphized. Sometimes they reflected the reality of social roles in the Middle East, but more often they represented a different concept of community—as exemplified by the frequent instances of incest among the deities, a totally foreign idea in the social reality of that period.

Today most scholars of comparative religions, including feminists, would agree that primitive matriarchy is a myth. This does not preclude continued research on male and female roles in prehistoric societies. Because fieldwork has not confirmed the existence of even a single matriarchal society, the matriarchy controversy is a quasi-religious issue that has no place in the serious study of goddess worship. Far more important is the contemporary scholarship of feminists who seek to deepen the understanding of the relationship of human nature to religion without invoking dubious nineteenth-century issues like primitive matriarchy. In much of this work women are searching for a new focus of identity in the modern world. Goddess worship has been intimately linked to this quest.

**The feminist revival of goddess worship.** One reason for the increasing popularity of goddess worship as a subject of inquiry is the expanding influence and scholarly development of women’s studies. According to Carol Christ (in Olson, 1983, p. 235) feminist writings about the gender of deities reflect two distinct types of argumentation: (1) religions that stress the maleness of the supreme being deify the masculine principle and see it as the only source of legitimate authority; (2) the attribution of male qualities to deities reflects distorted concepts derived from alienated male experience in Western societies. Feminists who use the first argument stress the need to eliminate masculine pronouns and gender-specific titles from Jewish and Christian scriptures and liturgy to restore authority to women. Feminists who assert the second argument oppose this simple solution because in their eyes the distorted male image of divinity in Western religions cannot be removed by merely changing gender-specific language. They argue that the symbolism will remain biased because of the dualistic, conquest-oriented, patriar-

chal, and hierarchical infrastructure that underlies these male-oriented religions.

Carol Christ (in Olson, 1983, pp. 238–248) presents a schematic view of feminist solutions to the problem of gender in the worship of deities. According to this scholar, there are four approaches advanced by feminist theologians to resolve the problem of male symbolism of God: (1) male symbols of God can be reinterpreted in nonoppressive ways; (2) language used to refer to God can be made androgynous; (3) female symbolism for the Supreme Being must be introduced in order to create an imagery that reflects dual gender; (4) male symbolism must be deemphasized to provide an opportunity for the Great Goddess, whose existence has been obscured by this symbolism, to reclaim her ascendancy. Western feminists are experimenting with many different ways to introduce female sacred imagery into Judaism and Christianity.

Those feminists who believe sexism to be an integral part of Western religions want no part in saving them from what they see as built-in sexist biases; instead, they advocate a reemergent goddess worship as a focus of religiosity appropriate to complex modern life. These feminists are actively developing extensive experimental liturgies for raising consciousness about goddess worship, both as it existed in antiquity and in religions outside of Western civilization. Thus, goddess worship and imagery are considered to be the focus of a new power for women rooted in the women's liberation movement and grounded in a new symbol system. *The Spiral Dance* by Starhawk is a recipe for the rebirth of an "ancient religion of the Great Goddess." It reflects the conviction among some feminists that goddess worship is a source of strength and creativity for women, and also provides an antidote to the regrettable patriarchal "conquest of nature" theme that characterizes Western thought.

The debate among feminists about these social and theological issues has been a healthy source of revitalization not only in terms of the reawakening of the study of goddess worship but also in terms of scholarly inquiry into assumptions about human nature that lie at the heart of Western religions. The growing literature in this field promises to shed new light on the role of goddess worship in the contemporary world. Consequently, one can expect a steadily increasing growth in the amount of research on the veneration of female deities, deriving particularly from the work of those contemporary feminists who are intentionally constructing new myths to transform traditional patterns of goddess worship into forms that give women a stronger sense of their own identity, power, and meaning in the modern world. Thus, the feminist movement is a major contributing factor in the revitalization of goddess worship as a topic of inquiry among popular writers and scholars in different disciplines.

**The new comparative religions.** A significant new direction is developing in the social sciences after the long siege of behaviorism in psychology and historical particularism in anthropology. The revolt against the errors of nineteenth-

century armchair theoreticians has come to an end. This is reflected in a new comparative religions, which focuses once again on the main themes of human religious experience. Instead of working from a dubious, in fact erroneous, data base, the new comparative religionists are treating these universal themes with the benefit of more than fifty years of extensive field work conducted in various cultures by cautious social scientists. Since the mid-1970s social scientists and religion specialists have been working together more closely. The result is the publication of numerous volumes devoted to the main themes of religion, such as sacrifice, death, rebirth, rites of passage, the evil eye, pilgrimage, and goddess worship. These new works are neither too speculative nor overly cautious about exploring panhuman dimensions of religious experience.

One of the most widely publicized and heavily attended sessions at the American Anthropological Association meetings in San Francisco during 1975 was entitled "Anthropological Inquiries into Mother Worship." This session resulted eventually in an edited volume on the topic (Preston, 1982).

The mid-1970s marked a watershed in the anthropological study of religion. Since that time some anthropologists have been about the business of synthesizing a vast amount of data accumulated over the years on various dimensions of religion. Much of this new information was isolated previously in the contexts of specific ethnographies devoted to the elaboration of particular cultural descriptions. The large numbers of people who attended the session on goddess worship in San Francisco were not attracted by any "star quality" scholars making their usual erudite presentations, but rather the time was ripe for introducing once again a topic that had remained more or less dormant for several decades. An extensive amount of data had been gathered on goddess worship in many different cultural contexts, and no one knew what to do with it. Scholars were seeking a new frame of reference. Historians of religion had been synthesizing the work of anthropologists for years. It was now time for anthropologists to return to their original task of making sense of a topic like goddess worship by placing it in a comparative framework.

The new approach to goddess worship, though cautious, strives to retain a delicate balance between cultural context and the broader panhuman issues that continue to be vital in the comparative study of religion. Despite the early years of ambitious speculation and the later period of overcautious skepticism, many questions about goddess worship remain unanswered. More knowledge about the relationship between male and female deities is needed. Why in some religions are female sacred images almost totally absent? What about the role of goddess worship in the development of complex forms of social organization? Why do female sacred images continue to thrive, even in Communist countries where religion is not officially sanctioned? How do the personal religious experiences of devotees who turn to goddesses differ from those who turn to male gods for answers

to their prayers? Why is goddess worship associated with such great antiquity? How does the worship of female deities fit into the postindustrial world? The new comparative religions, with its balanced perspective that incorporates questions of panhuman and culturally specific levels of analysis, has been another stimulus for the revitalization of major themes of religious significance shared by human beings the world over.

No single theory is adequate to explain the multifaceted phenomenon of goddess worship. What deeply felt impulse is there that continuously kindles the veneration of female sacred images for thousands of years among human populations? Are Victor Turner and Edith Turner (1978, p. 236) correct when they ask whether the resurgent interest in female sacred images during the modern era is an index of discontent with male iconoclasm, technology, progress, and bureaucratization? Elsewhere this author has written (Preston, 1982, pp. 340–341) that the loneliness of urban life, the contemporary emphasis on independence, the fast pace of technological society, and the radical severing of humankind's relationship with the earth have left people in postindustrial societies with a deep sense of disenchantment that is perceived to have the potential to be healed by a return to sacred qualities, which are often considered to be best expressed through a divine mother image. Even if one does not agree with the Jungian idea of a feminine archetype, all humans understand the mother-infant bond and recognize the related universal symbol of the womb as mother of life. The worship of female sacred images is deeply entwined with a panhuman experience of this primary bond. While not every incidence of goddess worship is an expression of the attempt by humans to return to the primary bond of origin, there can be no doubt this theme underlies the strong continuity of goddess worship expressed in so many different forms and in such great profusion throughout the world.

#### BIBLIOGRAPHY

- Bachofen, J. J. *Myth, Religion, and Mother Right*. Translated by Ralph Manheim. Princeton, 1967. A selection of writings translated from Bachofen's *Mutterrecht und Urreligion*. Here Bachofen elaborates on his controversial but dated theory asserting a predetermined universal stage of matriarchy associated with goddess worship.
- Binford, Sally R. "Myths and Matriarchies." *Anthropology* 81/82 1 (1981): 150–153. A brief but excellent critique of the current matriarchy controversy. The author is critical of the branch of feminists who cannot accept the fact that there is no evidence for matriarchy. An important source for illustrating the error of predicting sex roles through analysis of sacred images.
- Briffault, Robert. *The Mothers* (1927). Abridged by Gordon R. Taylor. New York, 1977. A classic last attempt to argue for the nineteenth-century idea linking goddess worship with matriarchy. This voluminous work is outdated. It no longer represents the thinking of contemporary social theorists on the topic.
- Campbell, Joseph. *The Masks of God*, vol. 1, *Primitive Mythology*. New York, 1959. This work explores the early Upper Paleolithic and Neolithic roots of goddess worship. It represents the Jungian orientation toward a universal Great Goddess. Somewhat dated but useful as a secondary source if read critically.
- Campbell, Joseph. *The Masks of God*, vol. 2, *Oriental Mythology*. New York, 1962. This work is encyclopedic in scope and refers frequently to goddess worship in Eastern religious traditions. Much Jungian generalization here, but still useful.
- Fluehr-Lobban, Carolyn. "A Marxist Reappraisal of the Matriarchate." *Current Anthropology* 20 (June 1979): 341–360. An excellent discussion of current anthropological thinking on the matriarchate with implications for goddess worship. Particularly important is the author's attack on the idea that goddess worship represents an epoch of mother-rule in human history.
- James, E. O. *The Cult of the Mother Goddess*. New York, 1959. A thorough discussion of goddess worship derived from archaeological and documentary evidence for the Middle East, the eastern Mediterranean, and India. An excellent source although some of the interpretation is dated.
- Marshack, Alexander. *The Roots of Civilization*. New York, 1972. An outstanding analysis of Upper Paleolithic data on goddess worship, suggesting the phenomenon is part of a complex notational system rather than merely fertility symbolism. While Marshack's thesis may be controversial, the volume is a rich source of information and remains a major scholarly contribution.
- Neumann, Erich. *The Great Mother: An Analysis of the Archetype*. 2d ed. Princeton, N.J., 1963. This is one of the most comprehensive discussions of goddess worship ever written. It represents the most thorough treatment of the subject from a Jungian psychological perspective. While some of the interpretation is overly speculative, it is still a valuable resource.
- Olson, Carl, ed. *The Book of the Goddess, Past and Present: An Introduction to Her Religion*. New York, 1983. This is one of the most recent volumes dedicated to the study of female deities. The contributions to this book represent a wide variety of studies of goddess worship written by historians of religion and feminists. The articles are uneven; some are excellent, others poor. The editor does not supply an overall synthesis or index.
- Preston, James J., ed. *Mother Worship: Theme and Variations*. Chapel Hill, N.C., 1982. This volume is the most comprehensive and up-to-date collection of data about goddess worship in the field of anthropology. Particularly useful as a source of primary data from firsthand fieldwork on the phenomenon with a comprehensive introduction and conclusion discussing contemporary issues in the study of female sacred images.
- Starhawk. *The Spiral Dance: A Rebirth of the Ancient Religion of the Great Goddess*. San Francisco, 1979. The author attempts to revitalize goddess worship as a focus of worship for feminists. Though erroneous assumptions are made here, the basic thrust of attempting to develop new forms of religious expression is important.
- Turner, Victor, and Edith Turner. *Image and Pilgrimage in Christian Culture*. New York, 1978. An excellent treatment of var-

ious Marian shrines within the context of pilgrimage. One of the few anthropological studies of Christianity.

Warner, Marina. *Alone of All Her Sex: The Myth and the Cult of the Virgin Mary*. New York, 1976. An excellent study of Marianism attacking the erroneous idea the female sacred images and women's roles are equivalent.

Wasson, R. Gordon, Carl A. P. Ruck, and Albert Hofmann. *The Road to Eleusis*. New York, 1978. A controversial and provocative discussion of the Greek mystery religion suggesting the possible use of psychotropic drugs.

**GODS AND GODDESSES.** In human religious experience, manifestations of sacred power (hierophanies) provide centers of meaning, order, worship, and ethics. Humans have always felt that real life is in close contact with sacred power, and that sacred power is often encountered in the form of divine beings. Ideas and experiences of these goddesses and gods thus are not so much intellectual reflections as existential concerns, revolving around the fundamental human questions of life in this world. The manner in which the divine beings are imagined and experienced, and the particular types, functions, and personalities of the divine beings, depend on the cultural context of the particular community of people.

Gods and goddesses fit most aptly into what have been called polytheistic cultures, where the divine reality has not been unified into monistic or monotheistic systems. Monistic views still allow for goddesses and gods as manifestations or emanations of one divine reality, whereas a monotheistic worldview absorbs their functions as attributes of the one God, or downgrades them to helpers, such as angels or saints. This article will focus on the major types of gods and goddesses in the cultures in which plurality of divine beings is taken for granted.

Scholarly discussion on gods and goddesses has raised a number of issues. One question has to do with the relation between gods and human society. Even though the goddesses and gods of a particular society necessarily reflect the values and traditions of that society, one cannot assume direct correspondences between the mythological divine world and humans. Just because a society emphasizes a mother goddess

does not mean that it was originally a matriarchy, for example. It seems that myths about the gods and goddesses cannot be taken as direct reflections of human historical experiences. At the same time, careful study of the changing visions of the divine beings may suggest some facets of the dynamics of social change within a particular community of people. For example, a change in dominance from one god or goddess to another may reflect the rising power of a particular group within the society with its mythological concerns. Or a change in a particular goddess or god's function could conceivably reflect new needs and concerns on the part of the people.

Another issue questions whether it is possible to identify the "original" function of certain goddesses and gods, in contrast to added or accumulated functions, or to distinguish between "primordial" gods, on the one hand, and lesser spirits or deified humans, on the other. While these distinctions can provide valuable insights, they can also be misleading. Although certain central functions may stand out, like those of creator, warrior, or fertility giver, often a particular goddess or god displays a number of functions, and it cannot be determined with certainty which should be considered the original or primordial. In fact, most divine beings are highly complex and are perceived to meet the needs of the people in a variety of ways.

In the last several years this discussion has been carried on particularly by feminist scholars who have focused a great deal of study on goddesses, with results that have enhanced our understanding of the importance, richness, and complexity of the individual goddesses. Earlier scholarship emphasized the importance and variety of male gods while stereotyping goddesses as secondary and limited to mothering and fertility functions. But feminist scholars have brought the study of goddesses to the fore and shown convincingly that they are no less important in power and sovereignty than male gods, and they are equally diverse in their functions.

One central issue is the question whether there was, in the prehistorical period, one unified Great Goddess (e.g., Mother Earth) that is somehow revealed or expressed in the various goddesses of the different peoples. J. J. Bachofen gave impetus to this theory in *Das Mutterrecht* (1861) by arguing that mothers ruled over families in the prehistoric era. Other scholars, such as Sir James Frazer in *The Golden Bough* (1911–1915), Erich Neumann in *The Great Mother: An Analysis of the Archetype* (1955), and E. O. James in *The Cult of the Mother Goddess* (1959), established the idea that the cult of the Mother Goddess was prevalent throughout the ancient world and that it reflects an essential human archetype. Archaeologists James Mellaart and Marija Gimbutas argued that evidence from archaeology supports the theory that the cult of the Great Goddess was reflected in the female figurines and other feminine symbols which dominated these societies. Gimbutas put forth the view that peoples of ancient Europe and the Near East were devoted to the worship of

the Mother Goddess in her various forms and lived in matriarchal, peaceful societies. They were disrupted and changed by the invasion of war-like Indo-Europeans, who brought their male gods and established patriarchal, violent societies.

Many feminist scholars, through extensive critical investigations of goddesses in past and present world religions, have questioned this theory of a unified Great Goddess behind all goddess figures, and of the societal changes that took place. These scholars, such as Lucy Goodison and Christine Morris in *Ancient Goddesses: The Myth and the Evidence*, argue that the theory that all goddesses represent mother or fertility power actually constricts and diminishes their role. Rather, they find goddesses representing the whole range of divine functions—creators, rulers, warriors, fertility-givers, promoters of sexuality, mistresses of animals, bringers of destruction and death, among others. And they show that male gods also include so-called feminine functions such as giving birth, nurturing, and bringing peace. The emphasis in this scholarship is not on uncovering a unified Goddess archetype, but on recognizing the complexity, diversity, and significance of goddess figures in the cultures of the world, past and present.

Yet discussion of the Great Goddess still plays a significant role in some contexts. Hindus, with their full array of goddesses, have long speculated about one Great Goddess (Mahādevī), manifested in various goddesses, including Pārvatī, Lakṣmī, Sītā, Durgā, and Kālī, while at the same time exulting in the individual aspects and activities of these goddesses. A significant appropriation of the idea of the Great Goddess has also taken place in the contemporary western movement variously called Goddess Spirituality, Goddess Religion, and Women's Spirituality. Growing out of feminism, Goddess Spirituality resonates to the perception of the Great Goddess, affirming women's bodies and lives and providing powerful images of the mysteries of life and death, regeneration, creativity, and the divine force in all of nature.

**HISTORY AND MORPHOLOGY OF DIVINE BEINGS.** To understand the full dimensions of gods and goddesses in the various cultures of the world, it is helpful to keep in mind both the cultural history and the morphology of human involvement with what they have considered sacred beings. Historically, all the different deity forms that have developed need to be understood and related to the cultural areas in which they are at home. People of each particular culture choose certain types of sacred modalities as strong and efficacious, and these modalities define the goddesses and gods as they are experienced and described within that culture. There is always an ongoing process of revaluation of the gods and goddesses, even in archaic cultures that seem to change very little over long periods of time. The modalities of the sacred are dynamic, one form diminishing in importance or becoming absorbed into another form, while new experiences give strength to other forms of the sacred. The way in which the people envision the gods and goddesses reflects something of

their social, political, economic, and cultural experience in a living process.

In considering the morphology of goddesses and gods across various cultures, the modalities by which the sacred is experienced are embedded in the structures of nature itself and in the structures of human life. Almost every significant reality in human experience has been seen in one culture or another as the arena of a sacred manifestation: sky, earth, sun, moon, mountains, water, hunting, planting, sexuality, washing, childbirth, eating, rulership, war, death, and so forth. Some common cross-cultural themes exist in the way peoples of the world have envisioned gods and goddesses. Since their power meets human existence precisely at the most vital and crucial areas of life, humans experience these divine manifestations in concrete, compelling forms. The goddesses and gods thus revealed are felt to have efficacious power, personality, and will. The fact that the divine beings have personality and will is rooted in the sense that human existence is not just aimless and haphazard but is related to the sacred pattern created or structured by the will of the gods and goddesses.

Each people's system of gods and goddesses depends on their traditional cultural context, for deities are always envisioned in ways appropriate to a culture. For example, divine beings in archaic hunting societies include ancestors, sky and astral gods, and representations of mother-type goddesses. But most characteristic of hunting cultures are sacred beings associated with animals: culture heroes in animal form and, above all, masters and mistresses of animals. These are powerful gods and goddesses who represent the sacred as experienced in the people's relationship to animals.

Planting cultures also know animal forms of gods, but here earth gods of fertility come to the fore. Earth goddesses and gods are creators and givers of life, appearing also in vegetarian goddess forms as, for example, Mother of Grain. Atmospheric gods—storm and sun—are important in that they fertilize the earth goddess and bring fecundity. Dying and rising deities often symbolize the cycle of vegetal fertility. Ancestors or culture heroes are important as the divine beings who originated cultivated plants.

Pastoral peoples are of many types and often include some planting activities in addition to keeping their herds. Sky and atmospheric gods tend to be supreme among these peoples. But they also revere divine powers associated with herds of animals, because sacred life-giving power comes to the people especially in relation to their herds.

Cultures that have developed beyond these archaic levels create very complex pantheons of goddesses and gods. For example, agricultural city-state societies like those of ancient Egypt, Mesopotamia, Greece, or Mexico typically have a hierarchical pantheon ruling over the city-state through a human ruler, the pantheon mirroring in some respects the various functions of the city-state. The complex civilizations established throughout Europe and Asia by Indo-European

peoples retained some elements of the early pastoralist gods but greatly expanded and developed these pantheons as they interacted with the religious traditions of the indigenous peoples in their various settlement areas.

In most cultures the plurality of divine powers is understood to operate as some sort of pantheon, a system of gods and goddesses functioning as a sacred community. Pantheons arise from the experience of the sacred in different arenas of nature and society. They change over time as some functions become more important and others less so, reflecting dynamic changes in social groups and culture. Often a pantheon has some kind of hierarchal structure based on the different functions of its goddesses and gods. There may be a sovereign or head of the pantheon, for example, a father of the gods (such as 'El for the ancient Canaanites) or a great goddess who ranks first before all in power and authority (such as Amaterasu in early Shintō). Sometimes the head of the pantheon is envisioned as old or remote, and the vital functions of maintaining life and order are performed by other powerful, immanent gods and goddesses. The pantheon functions as a particular culture's way of understanding the various experiences of the sacred in a symbolic system, providing orientation and unity to human existence in a world made up of a plurality of divine wills.

**TYPOLOGIES OF GODDESSES AND GODS.** In order to sketch the rich scope of divine beings in human history and culture, two somewhat different perspectives on gods and goddesses are explored here: a cosmic typology and a social typology. The cosmic typology outlines some of the epiphanies of sacred power through the structures of the cosmos and the organization of these divine forms. The social typology explores sacred beings in relation to functions in vital areas of human society and culture.

**Cosmic goddesses and gods.** Many religious traditions expressly recognize a cosmic typology of gods and goddesses. The Greeks divided their gods into the Olympians and the chthonic gods, and early Shintō myths spoke of *kami* of heaven and *kami* of earth. Deities of the Indo-European peoples typically are related to the three realms (Skt., *lokas*) of sky, atmosphere, and earth. In ancient Mesopotamian cultures, gods had cosmic functions, such as An of the heavens, Enlil of the storm, and Enki, lord of the earth and waters.

**Sky gods and goddesses.** Among cosmic gods, the sky deities generally take precedence. Even the most primal, archaic cultures know of a primordial supreme god who is manifested in the vault of the sky. The characteristics of this god are drawn from the experience of the sky: this is the high god with authority over all, all-seeing and thus all-knowing, present everywhere and sovereign in power. The sky god is also the ultimate creator and sustainer of everything, as well as the law-giver and moral overseer. At the same time this god is remote, a *deus otiosus*. Other goddesses and gods of the sky and atmosphere are often thought of as helpers of the supreme sky god. Tribes of southeastern Australia have a sky god called Baiame, or Daramulun, who is self-created, causes

rain, and sees and hears all. The Yoruba sky god is Ọlọrun, an almighty, immortal, all-knowing creator. An of ancient Mesopotamia is the supreme authority in the sky, presiding over the assembly of the gods. Varuṇa of Vedic India is visible everywhere, with the wind as his breath; he gives rain and thunder and is all-knowing, thousand-eyed, and is the universal king and the guardian of cosmic order. Ahura Mazdā, the Iranian supreme god, and Zeus, who became the high god of the Greeks, retain this celestial character of sovereignty, as do the related sky gods Jupiter of the Romans and Óðinn (Odin) of the Scandinavians. Among the ancient Chinese, Tian (Heaven) was considered the upholder of the universal moral order. Hathor, mistress of the sky in ancient Egypt, was closely identified with the king's sovereignty, and another sky goddess, Nut, extended that sovereignty to the journey into the afterlife. These sky gods and goddesses also take on many other specialized functions.

**Meteorological gods and goddesses.** Deities associated with meteorological and atmospheric phenomena often represent specialized functions or attributes of the supreme sky god. Important among these are, first of all, the storm and wind deities. Moving away from sovereignty and transcendence, they express fecundity, creative force, rain-providing power, epiphanies of force and violence and war, sources of energy for nature and for civil order. An, the Mesopotamian sky god, in this aspect is called the "fecund breed-bull"; he manifests his powers in the spring sky with thunder and fertilizes Ki (Earth) with rain. In this form, too, appear such great storm gods as Enlil of Mesopotamia, Indra of India, Min of ancient Egypt, Baal and Hadad of the Northwest Semites, Marduk of Babylon, and Þórr (Thor) of Scandinavia. While the supreme sky god is quite remote and transcendent, these storm gods become more immanent: Varuṇa the sky god becomes old and feeble, and Indra takes over; 'El is sometimes pictured as old and impotent, and Baal moves to central stage as the fecundator. The storm gods overflow with strength and vitality, burst open the clouds for rain, send fertility to the fields, and keep the cosmic forces going. Wind and storm are destructive as well as fecundating, and the ravages of such storm gods and goddesses as Þórr (Thor), Enlil of Mesopotamia, Anat of the Canaanites, Tlaloc of the Aztecs, Ngai of the Maasai, and Ẓango of the Yoruba are dreaded.

Sun divinities are meteorological sacred powers related to the sky, embodying and dispensing the power of life. The sun god brings light, enlightenment and wisdom and is often characterized by unchangeability, stability, and order. Shamash, sun god in ancient Mesopotamia, was considered god of oracles and diviners; Hammurabi called him the great judge of heaven and earth, source of laws and order. In ancient Egypt, the sun god, fighting against darkness and chaos, was thought daily to conquer darkness and create light anew. In many cultures the sun god or goddess plays the role of the supreme god; Re-Atum in ancient Egypt, Huitzilopochtli in Mexico, the sun god among various North

American Indians, and Amaterasu in Japan exemplify this. The sun god also has the power to destroy, especially in desert cultures; this god overpowers the living with heat and drought, devouring as well as generating life. The sun god has connections with the underworld, like Re of ancient Egypt who leads dead souls through the underworld, or Utu of Mesopotamia who acts as their judge during the nightly journey.

Goddesses and gods associated with the stars and planets frequently are experienced as the eyes and/or ears of the sky god, lending themselves to the all-seeing and all-knowing qualities of the supreme god. The Masai of Kenya believe the sky-rain god Ngai has universal vision through his nighttime “eyes”; a falling star is one of the eyes of Ngai coming closer to earth in order to see better. The sky god Varuṇa is “thousand-eyed,” and the Samoyed sky god Num employs the stars as his ears, through which he listens to the earth from the boundless regions of the sky. Inanna, Sumerian goddess of the morning and evening star (the planet Venus), was considered to be the source of the king’s power, one who brought the arts of civilization to the city and death and restoration to life. The polestar (north star), because it appears not to move, is seen in many cultures to represent divine power of stability; in India, for example, newlyweds worship Dhruva (the polestar) as a source of constancy in marriage. The complicated movements of the stars and planets led the ancient Babylonians to associate them with divine beings who control events in nature and human life, an idea also expressed by the ancient Greeks and others.

The moon waxes and wanes, disappears and reappears, and thus its divine epiphany epitomizes mysterious power, change and transformation, death and rebirth, fertility and regeneration. Frequently the moon manifests a fertility-giving goddess; this is true for Selene among the Greeks, Rabie among the Wemale of Ceram, and Pe among the Pygmies. There are also lunar elements associated with many of the great goddesses who have other functions. While the moon deity is often thought to be a goddess, in some cultures the moon is considered male, while the sun is a female divine being, as, for example, Tsukiyomi and Amaterasu in Shintō mythology. The moon deity rules especially over the rhythms of life associated with the waters, rain, vegetation, and the fertility of earth and all women. At the same time, the moon goddess or god sometimes becomes the mistress or master of the dead, receiving those who die and regenerating them. Gods of the moon, such as Thoth of ancient Egypt, Nanna of ancient Mesopotamia, and Aningaag of the Inuit (Eskimo), measure time and regulate natural phenomena.

*Earth gods and goddesses.* Earth deities form an important and complex category of the cosmic typology. Basic types include the various manifestations of the earth itself: waters, mountains, the great many hierophanies associated with animal forms and vegetal forms—all the divine aspects that seem “given” in the powerful epiphanies of sacred earth.

The earth is the primary source and nurturer of all life, and it is also the sacred power that receives all life back again. Many human cultures have perceived a particularly significant epiphany of the sacred associated with earth itself, sometimes named Mother Earth. Hesiod states in his *Theogony* that Gaia (Earth) first gave birth to Ouranos (Heaven), and the hierogamy between Gaia and Ouranos initiated the whole process of life. Humans perceive that the earth itself is endlessly creative but at the same time passive and indistinct, the repository of a wealth of sacred forces. Manifest in the very soil of the place where humans live, this earth type of goddess is expressed first of all in motherhood (that is, inexhaustible fruitfulness) from very ancient times in human experience. In the long saga of human life prior to the discovery of agriculture, various forms of mother goddesses played an important role in the way humans understood their existence; the multitude of female figurines found from Paleolithic cultures provides evidence of the importance of this power. And so it has continued through all human history. Children come from the earth mother; the sick are regenerated by being brought again into close contact with her; the dead are returned to her womb. For example, Ala, worshiped by the Igbo of Africa, is the source of fertility for the land and the family, the abode of the ancestors, and the guardian of laws; barren women pray to her for children, and men ask her for success in trade or increase in livestock. Throughout human history, goddesses with mothering and nurturing functions, together with fertility-giving functions, have been widespread, including both great goddesses widely worshiped and countless local goddesses.

It is striking that often these creative, mothering goddesses also have a dark side, seen as a source of violence and death. For Hindus, the great goddess Kālī epitomizes the ravages of time and death, as she is pictured with bloody fangs and devouring mouth, a necklace of human heads, and a skirt of human arms. She devours her children, and yet many Hindus worship her as loving mother. Equally gruesome are mother goddesses among the Aztecs, as, for example, Coatlicue, pictured with a skirt of writhing snakes, a blouse of human hands and hearts, heads of serpents for hands, claws for feet, with twin spurts of blood gushing from her decapitated body. Her central creative act was giving birth to the great war god Huitzilopochtli just as her four hundred children sought to kill her. Huitzilopochtli, born fully grown and armed, slaughtered the siblings, providing a central motif for the ritual human sacrifices at the Templo Mayor of Tenochtitlan. Such goddesses demonstrate the human experience that creativity, life, and growth are inevitably linked with violence, death, and decay.

Indistinct and unformed like the earth, yet similarly powerful, the *fons et origo* (font and origin) of all life is the sacred power manifest in water. Water symbolizes the primal reality from which all forms come and to which all forms return. Nun in ancient Egyptian mythology, for example, is the primordial ocean in which are the germs of all things.

Rich in seeds, the divine water is homologized to semen and fertilizes earth, animals, and women. Hapi, a male god of the Nile, is often depicted with breasts to show that he is a bringer of life. Enki, Sumerian god of waters, helps to organize and create the world and human life. Water also purifies and regenerates, and so the Iranian water divinity Aradvī Sūrā Anāhitā is thought to purify humans and multiply flocks. A great many local cults are associated with springs, streams, and lakes in various religions. For Hindus, Gaṅgā (the River Ganges) is a powerful goddess, nourishing the land and mediating between this world and the divine world. The beautiful Yoruba river goddess Oṣun bestows gifts of rulership and wealth on the rulers of the towns and cities through which her river passes. Many of the most powerful deities of the Ashanti are those associated with rivers and lakes; they can cure sicknesses and social ills, but they also have destructive powers. So water deities are ambivalent: water both generates life and destroys it. There is a sense that the goddesses and gods of the waters are capricious, randomly doing good or evil. Well known from Greek mythology is Poseidon, the untamed and faithless god of the ocean; from his palace at the bottom of the sea he swallows the world and renews it in rhythmic cycles. In Scandinavian mythology, Ran, the sea god Aegir's wife, draws people down with her net. Sedna, the sea goddess of the Inuit, is the mother of sea animals, but when humans violate taboos, she sends famine and destruction with icy dispassion. Water gods and goddesses can be symbolic of chaos, taking the form of dragons and snakes, both destroying the world and bringing rain and fertility; Apsu and Tiamat in Babylon, Prince Yamm in Canaan, and Vṛtra in India exemplify this duality.

Powerful epiphanies of earth deities are experienced through mountains, strong and distant pillars of heaven, stabilizing the earth and providing order and fertility. Most mountains in Japan, such as Mount Fuji, are felt to be the locale of *kami* presence; and Taishan in China is a divine mountain that attracts extensive worship. Śiva is called "lord of the mountains" in Hindu tradition, and his consort Pārvatī is "daughter of the mountains"; their favorite abode is on Mount Kailash in the Himalayas. The ancient Hebrews worshiped 'El Shaddai, apparently related to the mighty mountains, and the Israelite god Yahveh was first encountered as the god of Mount Sinai. Mountains are the source of life-giving springs and streams, and well as violent storms—and so many storm gods are linked with mountains, such as Baal-Hadad among the Canaanites. Pele, goddess of volcanic fire in Hawaii, demonstrates the destructive aspect of volcanic mountain epiphanies.

Reaching back to the dawn of human existence is the sense that the sacred is manifested in animal form. Epiphanies are associated with animals that are powerful and terrifying, those that exhibit wisdom or secret knowledge, those that are symbolically connected with the power of the earth, the moon, or the waters, and above all those that share sacred life-power with humans through their very flesh and blood.

Animal symbols of goddesses and gods include the cow in ancient Egypt, a manifestation of the sky goddess Nun; the fox Inari in Japan; the coyote in North America; the bear among the Ainu; the buffalo among North American Indians; serpents and dragons in a great variety of cultures; and others, including caribou, elephants, dolphins, whales, and eagles. Powerful deities in animal form are linked to rain and storm, in particular the bull (Baal, Indra, Rudra, etc.), the thunderbird, and the dragon. Imaging the divinities in animal form expresses a sense of close relation to the sacred life that sustains animals and humans alike.

With the agricultural revolution came also a revolution in cosmic epiphanies, giving rise to various forms of goddesses and gods of vegetation, as well as giving new emphasis to the fertilizing male earth gods. Plant life is an epiphany of sacred power. For example, in a bas-relief of Assur, the upper part of a god's body is represented as coming out of a tree; and a seal from the Indus Valley civilization depicts a divine being within a tree faced by a group of worshipers. Demeter was a goddess responsible for grain for the ancient Greeks, and among the Cherokee the goddess Corn Woman is the origin of the corn plant. Among the Polynesians the growth of plants such as banana trees and taros actually comes from the sacred concentration of power in the ancestral *dema* deities of the time of the beginnings. Characteristic of plant life is the rhythmic cycle of death and birth, season after season, and so the divinities of vegetation reflect this pattern of death and rebirth; this is true, for example, of Baal of the Canaanites and Tammuz of Mesopotamia. Gods of phallic energy, such as the ancient Egyptian Min and the Indian Śiva, express another aspect of the divine source of generative power.

**Gods and goddesses of the underworld.** Chthonic deities live in the dark recesses of the earth and are especially related to the underworld. In some cases, the gods of the underworld are raging, destructive monsters who bring down even the gods of life; such a figure is Mot in Canaanite mythology. The ruler of the place of the dead is grim and dreaded; this is true of Hades in ancient Greece, Ereshkigal in Mesopotamia, and Seth and Nephthys in Egypt. Sedna, sea goddess of the Inuit, and Taishan, a mountain god of the Chinese, are cosmic divinities who receive the dead into their abodes. These goddesses and gods of the world of the dead are ambiguous in the extreme: dreaded and avoided, they still have sacred powers that can assist people in this most critical passage of life. Often the deities of the underworld are related to the deities of life-giving power; Satene among the Wemale of West Ceram is an example. After all, it is the divine mother who gives and nourishes life who also finally receives back the dead. In illustration of this, figurines of pregnant goddesses have been found in prehistoric burial sites, providing images of life-giving power within the realm of death.

**Gods and goddesses of social functions.** Much research has been done on the social functions of goddesses and gods, especially on the triad of functions common to Indo-European divinities: (1) a sovereignty function with magical

and juridical aspects; (2) a function of physical power and bravery, especially in war; and (3) a function of fertility and prosperity. Georges Dumézil in particular has shown how this triad of functions penetrates all the societies that stem from proto-Indo-European culture, although each culture went on to develop their divinities further. While this important system of categorization is incorporated to some extent in the social typology used here, it should be noted that this scheme does not apply as readily to non-Indo-European cultures. For example, many deities of the ancient Near East and of Africa combine the sovereign and the warrior functions, and other ancient societies do not so clearly separate the food-producing class and its attendant deities from the warrior class and its gods. Most of the great gods and goddesses of non-Indo-European peoples cannot be neatly pigeonholed into this triad of functional classes; thus the following categories are amplified somewhat.

**Creators and guardians of society and order.** Supreme or sovereign deities often are considered to be creators and preservers of society and order. Often the supreme god creates human society and originates and upholds cosmic and moral law. This god holds people responsible on the basis of the moral design, judges them, and punishes them, either directly or through other deities who perform this function. In Vedic thought, the sky god Varuṇa is the cosmocrator and also the upholder of *ṛta*, the cosmic and moral law to which all things are subject. In theistic Hinduism, Vaiṣṇavas see Viṣṇu as the originator and preserver of society. Kṛṣṇa, *avatāra* of Viṣṇu, advises Arjuna to fulfill the duties of his warrior caste, for even Viṣṇu performs his *dharma* (duty) so that the worlds continue to function (*Bhagavadgītā* 3.3–24). Yahveh of the Hebrews both originates human society and gives forth the law that governs all peoples. Jupiter, the Roman high god, is the guardian of oaths, treaties, and moral duty. Shangdi, “Lord Above,” worshiped by the Shang rulers in ancient China, sends both weal and woe in governing the fortunes of the rulers. And Tian, “Heaven,” supreme deity for the Zhou rulers, provided a moral mandate for just rulers but withdrew it for those who were unjust. In Babylon, the assembly of the great gods, having created humans as servants of the gods, supervises human society and determines human destinies. Widespread among African peoples is the notion that the supreme god is the ultimate originator and authority governing human life, even as other gods fulfill the needs of everyday life. In Hindu tradition, the great goddess Śrī Lakṣmī, embodying Śrī (radiance, creative power), was thought to provide sovereignty and power to the kings in their rule.

Sometimes the supreme god or gods create the first gods, who then complete the creation. In Mesoamerican myths, the supreme dual creator god engendered several sons, including Tezcatlipoca and Quetzalcoatl, who then created the universe and the other gods. In other mythic scenerios, the original humans are first produced and then as divine culture heroes they complete the creation and over-

see its order. For example, the *dema* deities of the myths of the Marind-anim of New Guinea create the vital aspects of human culture and morality by their actions in the time of the beginnings. Ancestors often take the place of the high god as guardians of human morality, although the high god is recognized as the ultimate authority, the court of last resort. The high gods may have inspectors, like Eṣu of the Yoruba and Satan of the Israelites (*Job* 1–2), to help in upholding the divine order.

**Goddesses and gods of protection and war.** Gods who display physical power often function as gods of protection and war. This role is ascribed especially to cosmic storm goddesses and gods, such as Indra in the Vedas and Þórr (Thor) in Scandinavian mythology. Ancient Near Eastern cultures have combined sovereign storm gods to function as divine warriors and protectors; Marduk of the Babylonians and Yahveh of the Hebrews are two such gods. Mars of the Romans is a classical god of war, protecting the state against its enemies but also preserving fields and herds against damage and disaster. In Mesoamerica, the powerful warrior god Tezcatlipoca collaborated in creating the world and is present everywhere, but he also promotes conflicts and induces people to transgress. Huitzilopochtli, Aztec war god and sun god, was born in full warrior regalia and killed threatening deities so as to renew world order. For the Yoruba, Ogun is god of hunting, iron-making, and war; in great festivals he is worshiped by hunters, blacksmiths, and warrior chiefs, as well as the king. Mixcoatl, central Mexican warrior god, was also worshiped as god of the hunt. Many goddesses, such as Athena among the Greeks, Anat in Canaanite mythology, Sekhmet in ancient Egypt, and Durgā in Hindu tradition, are also presented as divine warriors and protectors.

Deified humans rise to become gods of war and protection, such as the famous Chinese general Guandi, who was deified as the warrior protector *par excellence*. The Christian apostle St. James is known as Santiago in Spain, where his body was miraculously brought after his death; he became the warrior saint for the Christian Spaniards, driving out the Muslims during the reconquest of Spain. Then Santiago was invoked as the warrior-protector during the conquest of Mesoamerica, helping to defeat the Indians who resisted becoming Christian. Gods can also appear in human form to destroy evil, as do the *avatāras* of Viṣṇu, whom this high god sends out from age to age to battle the rise of evil in the world.

Overall, a great variety of goddesses and gods function as divine protectors in every conceivable time of crisis: Castor and Pollux protect warriors for the Romans; in China the deified girl who became Tianshang Shengmu (Holy Mother in Heaven), known popularly as Mazu, is the protector of sailors; Min of ancient Egypt is the protector of travelers, as are the *kami* of the road in Japan and Saint Christopher in popular Christianity; and gods and goddesses all over the world protect women in childbirth and children as they grow up.

**Goddesses and gods of fertility and prosperity.** Deities promoting fertility and prosperity fit into an extremely broad and diverse category; in fact, the majority of gods and goddesses take on some of these functions, and the remaining categories listed below could be included in a general way in this basic category.

All the goddesses and gods associated with hunting and agriculture belong in this group. It is perhaps in securing and producing food that humans experience most deeply the interpenetration of divine cosmic powers and the divine forces of society and culture. In hunting cultures special importance is given to the hierophanies related to the animal herd most essential to the survival of the people, such as bears, reindeer, caribou, seals, and walruses. Sacred power manifests itself in mythological form as the master or mistress of animals; this god or goddess is an archetype of the herd, protector and master of animal life, who also provides boons to humans, giving to them of the sacred life of the animals. The Caribou Man of the Naskapi Indians (of Labrador), the Great Bull Buffalo of the Blackfeet Indians, and Sedna as the keeper of sea animals among the Inuit are examples of this type of divine being.

Planting peoples associate the sacred work of planting and harvesting with the deities who originate and continue the powers of vegetal fertility. In West Ceram, myths tell how the body of the goddess Hainuwele was cut up and planted in the earth, where it changed into root plants that the people have continued to cultivate. Widely known is the Mother of Grain, exemplified by Demeter in ancient Greece as goddess of the cultivated soil, and Corn Woman of Native American tribes.

A primary concern in the realm of fertility is human procreation, and most societies have deities of love, marriage, and procreation. In Greek mythology, Hera, wife of Zeus, is goddess of marriage, and Aphrodite and Eros are instigators of love. Ishtar of Mesopotamia and Hathor of ancient Egypt are goddesses of love and procreation. Freyja in Scandinavian mythology is at the same time divine lover/mistress and wife/mother. All across China, the bodhisattva Guanyin is invoked to help women in conceiving and child-bearing. The central Mexican goddess Xochiquetzal was widely popular as goddess of the arts, physical pleasure, and amorous love. Popular Mexican conceptions of the Virgin Mary, especially La Virgen de Guadalupe, identify her with indigenous fertility goddesses who occupied the land prior to the coming of the Europeans. Aborigines of Australia have myths about the Great Rainbow Snake who is responsible for human fertility.

An extension of this divine function of fertility is the granting of prosperity and wealth. In Scandinavia this function is performed by the deities known as the Vanir: Freyr, for example, grants peace and fertility, and his father, Njörðr (Njord), dispenses prosperity to those who go to sea. In the Hindu pantheon, Lakṣmī, the divine wife of Viṣṇu, is the goddess of wealth and happiness, granting sovereign power

to kings and prosperity to subjects. And Gaṇeśa, the popular elephant-headed god, is widely worshiped as the overcomer of obstacles and the bringer of good fortune. The human aspiration is summed up in the Chinese popular triad, the Gods of Posterity, Prosperity, and Longevity.

**Domestic and community gods and goddesses.** The center of concern for fertility and prosperity is the home, and many goddesses and gods dwell and function within it, guarding the door, presiding over the hearth, sustaining marital ties, and granting children—everything that makes for happy home life. Hestia is the goddess of the hearth for the Greeks, as Vesta is for the Romans. Among the ancient Aryans, Agni, the god of fire, also presides over the family cult of the hearth. Neith in ancient Egypt is skilled in the domestic arts, as is Athena among the Greeks. For the Ainu of northern Japan, the fire goddess, Iresu-Huchi, presides over the home, giving peace and prosperity, receiving and keeping children who have died. Traditional Japanese homes have images of Daikoku and Ebisu as protectors of the household, and the Chinese have Zao Jun, the god of the cooking stove, who watches over and brings prosperity to the family. For the Romans, the *penates* guard the storeroom, and the *lares* guard the family estate boundaries.

Beyond the home, local communities have gods of protection and prosperity. At the entrance to traditional Japanese villages stands a stone image of the bodhisattva Jizō, erected for the protection and welfare of the village. And the Chinese earth god Tudi Gong is worshiped in traditional villages; he is the god rooted in the locality who keeps track of village happenings and generally oversees the prosperity and welfare of the community. For cities, there are the Gods of Moats and Walls, to perform the necessary bureaucratic functions in the divine realm. In India, most traditional villages have a powerful local deity (*grāmadevatā*), usually a goddess, celebrated in rousing festivals, thought of both as village founder and protector and also occasional source of disease and disaster.

#### **Gods and goddesses of healing, sickness, and death.**

A major concern in human life has always been sickness and death; appropriately many goddesses and gods operate in this critical area. Some bring sickness and death, others cure sickness and protect the dead, and still others perform both functions. Well known is the Greek god Asklepios, who presides over healing and medicine. In China, Baosheng Dadi was a human doctor who after death became a god of medicine and healing. Traditional Japanese keep images of the Buddha Yakushi, king of medicines, in their homes for health. Some gods and goddesses specialize in bringing about sickness: the Pakoro Kamui brings smallpox to the Ainu; Irra is the dreaded plague of ancient Mesopotamia; and Namtar, the herald of Ereshkigal, Mesopotamian goddess of the underworld, has sixty diseases that he can spread among humans.

The ambiguity of divine power is often expressed in the existence of one deity who is both the bringer of health and prosperity and the agent of destruction and death. Hermes,

protector and guide of travelers, becomes the grim psychopomp who guides souls to Hades. In the Vedas, the god Rudra often brings sickness and destruction, although he is also revered as the healer. The Great Rainbow Snake of the Australians, Hina of the Hawaiians, and Kālī of Hinduism all promote fertility and birth but also cause destruction and death. Human hopes of merciful treatment in the passage of death are reflected in the existence of many goddesses and gods who guard, nourish, guide or otherwise help the deceased. Hathor of ancient Egypt nourishes the dead, and the *bodhisattva* Jizō in Japan is especially revered as the receiver and protector of infants who die. Yama of Hinduism, as the first mortal to die, guides the dead to the celestial world. Amida (Skt., Amitābha) is popularly worshiped in Japan as the merciful Buddha who, when a person dies, appears with his holy retinue to lead the soul to rebirth in the Pure Land paradise. Some cults link the worshiper to the story of the deity's death and resurrection. Prominent cults of this type are that of Osiris and Isis in Egypt, Tammuz in Mesopotamia, as well as several of the Hellenistic mystery religions.

#### Gods and goddesses of culture, arts, and technology.

Divinities related to cultural expressions are quite diverse, with roles corresponding to the needs and experience of a particular society. Among divine culture heroes are Prometheus, who stole fire from the gods for the benefit of humans; Blacksmith in Dogon tradition, who acquired seeds from heaven and brought them to earth for the first crops; Rāma, the carrier of culture, whose feats are recounted in the Hindu *Rāmāyaṇa*; Nyikang, the first king of the Shilluk of Africa; and Quetzalcoatl, the deified hero of the Aztec. Some culture heroes are thought of as the original humans who created the vital aspects of human existence in the mythic time of the beginnings. The *dema* of the Marind-anim and the ancestors in the Dreaming of Australian myths provide the prototypes for human cultural activities such as planting, sexuality, and festivals. The changing image of the trickster, such as Coyote among North American Indians, perhaps could fit here; though not necessarily worshiped as a god, the trickster typically wrests some cultural benefit for humans from the gods.

Gods and goddesses are patrons of the arts, representing the creative force and the secret knowledge of individual arts. Creativity comes from divine sources, and so worship of gods and goddesses provides inspiration and creative energy for poets, writers, sculptors, painters, weavers, dancers, musicians, and various other artists. Sarasvatī in Hinduism is the goddess of learning, art, and music, widely worshiped in school festivals. Thoth, the god of wisdom in ancient Egypt, is endowed with complete knowledge and is the inventor of all the arts and sciences: arithmetic, surveying, geometry, astronomy, soothsaying, magic, medicine, surgery, music, drawing, and—above all—hieroglyphic writing. In India, Śiva is the lord of the dance, inspiring festival dancers; Ogun inspires ecstatic dancing among the Yoruba as well as creative body art done with iron tools.

There are goddesses and gods for almost every conceivable occupation, craft, and technology. Njorðr (Njord) of

Scandinavia is patron of those who build ships and go to sea. In Greek mythology, Herakles and Hermes are associated especially with merchants, Athena is associated with women artisans, and Hephaistos, the god of fire, is the creative flame of the forge in metalwork. Amaterasu in Shintō tradition was linked to the art of weaving. Among the Yoruba it is believed that Ogun clears away obstacles and gives prosperity to all those who work with iron and steel—warriors, hunters, blacksmiths, goldsmiths, barbers, butchers, and (in modern times) mechanics and taxi drivers. Hermes is the patron not only of merchants but also of thieves and rogues; and Inari of Japan is the *kami* of rice growers as well as geisha and prostitutes.

#### Gods and goddesses of esoteric knowledge and magic.

The mysterious character of divine power finds expression in deities associated with secret mysteries and magical powers that are available only to those who have special knowledge or have been initiated into the worship of these goddesses and gods. The high god of the Indo-Europeans is, in one of his aspects, the source of esoteric knowledge and magic. Varuṇa of the Vedic period in India has the sun as his eye and controls *māyā* (“creative power,” but later also “illusion”). Óðinn of the Scandinavians is one-eyed, having left his other eye in the well of the giant Mímir in return for the gift of wisdom. A famous poem describes how Óðinn hung on a tree for nine days and nights in order to acquire the esoteric knowledge of magical runes. Deities of esoteric knowledge inspire poets, shamans, and prophets, and they give up secret knowledge to diviners. The Scandinavian goddess Freyja, for example, taught the gods magical knowledge, and this is tapped into by women called *völva*, who go into trances and act as soothsayers. Yogic exercises in Daoism attempt to tap into the power of the exterior and interior gods, and Tantric practices in Esoteric Buddhism involve invoking the cosmic Buddhas and *bodhisattvas* for esoteric knowledge and power.

#### BIBLIOGRAPHY

A classic discussion of the meaning and typology of gods and goddesses throughout all cultures is Mircea Eliade's *Patterns in Comparative Religion* (New York, 1958). Raffaele Pettazzoni provides a model cross-cultural study especially related to the omniscient quality of deities in *The All-Knowing God: Researches into Early Religion and Culture* (London, 1956). Although outdated, *The Mythology of All Races*, 13 vols., edited by Louis H. Gray (Boston, 1916–1932), contains a wealth of valuable information. Scholarly analyses of the major mythologies can be found in *Mythologies of the Ancient World*, edited by Samuel Noah Kramer (Garden City, N.Y., 1961).

Of the immense amount of scholarship focused on goddesses, Marija Gimbutas, in books such as *Gods and Goddesses of An-*

*cient Europe* (London, 1974) and *The Language of the Goddess* (San Francisco, 1989), has been most influential in promoting the theory of the Great Goddess worshiped in ancient cultures, manifest in countless forms and symbols throughout old Europe and Asia before being suppressed by male-dominated cultures and gods. This theme is continued in Jean Markale's, *The Great Goddess: Reverence of the Divine Feminine from the Paleolithic to the Present*, translated from the French by Jody Gladding (Rochester, Vt., 1999). A more nuanced view of mother-type goddesses is put forth in *Mother Worship: Themes and Variations*, edited by James J. Preston (Chapel Hill, N.C., 1982). Many scholarly studies have questioned the theory of a unified Mother Goddess as they carefully lay out the great variety of goddesses, as seen in works including *Ancient Goddesses: The Myths and the Evidence*, edited by Lucy Goodison and Christine Morris (Madison, Wis., 1998); *Goddesses Who Rule*, edited by Elisabeth Benard and Beverly Moon (New York, 2000); and Lotte Motz, *The Faces of the Goddess* (New York, 1997).

Richard Wilkinson's, *The Complete Gods and Goddesses of Ancient Egypt* (London, 2003), offers a comprehensive survey of the deities worshiped by the ancient Egyptians. Thorkild Jacobsen's *The Treasures of Darkness: A History of Mesopotamian Religion* (New Haven, Conn., 1976) is a masterful presentation and interpretation of ancient Sumerian and Babylonian divinities. John S. Mbiti's *Concepts of God in Africa* (New York, 1970) surveys ideas from all over Africa, emphasizing the importance of the high god. Focusing on the Yoruba, J. Omosade Awolalu discusses some of the main deities of their vast pantheon in *Yoruba Beliefs and Sacrificial Rites* (London, 1979). *Africa's Ogun: Old World and New*, edited by Sandra Barnes (2d ed., Bloomington, Ind., 1997), is a model investigation of one specific god, Ogun, laying out many facets of this god's cult in traditional times and describing vital transformations among contemporary Yoruba both in Africa and in the Americas. For a helpful survey of the deities of native North Americans, see Sam Gill, *Dictionary of Native American Mythology* (Santa Barbara, Calif., 1992), and David Adams Leeming, *The Mythology of Native North America* (Norman, Okla., 1998). Excellent information on deities of Mesoamerica is found in *Oxford Encyclopedia of Mesoamerican Cultures*, edited by David Carrasco (3 vols.; Norman, Okla., 1998). For convenient information on deities of South America, see John Bierhorst's, *The Mythology of South America* (New York, 2002).

Georges Dumézil's views on Indo-European deities are well represented in his *Gods of the Ancient Northmen*, edited by Einar Haugen (Berkeley, Calif., 1973), and his *Archaic Roman Religion*, 2 vols. (Chicago, 1970). Much interesting information on the Scandinavian deities is carefully presented in E. O. G. Turville-Petre's *Myth and Religion of the North: The Religion of Ancient Scandinavia* (New York, 1964). While not covering all Greek mythology, W. K. C. Guthrie's *The Greeks and Their Gods* (London, 1950) is still a helpful study of Greek goddesses and gods; and Mark Morford's, *Classical Mythology* (5th ed., White Plains, N.Y., 1995), covers the whole range of gods and goddesses. Robert Turcan's, *The Gods of Ancient Rome: Religion in Everyday Life from Archaic to Imperial Times* (New York, 2001), includes descriptions of the ancient Roman gods and goddesses. For India, Sukumari Bhatnagar's *The Indian Theogony* (Cambridge, U.K., 1970)

looks at the Indian gods and goddesses from the early Vedic period to the late Puranic tradition. A flurry of scholarly investigation has focused on the Hindu goddesses, including *Seeking Mahādevī: Constructing the Identities of the Hindu Great Goddess*, edited by Tracy Pintchman (Albany, N.Y., 2001); and *Devī: Goddesses of India*, edited by John Hawley and Donna Wulff (Berkeley, Calif., 1996). A model investigation of one Hindu goddess is Sarah Caldwell's *Oh Terrifying Mother: Sexuality, Violence, and Worship of the Goddess Kālī* (New York, 1999).

THEODORE M. LUDWIG (1987 AND 2005)

**GÖKALP, ZİYA** (1876–1924), Turkish sociologist influential in the modernization of religious thinking and in the development of Turkish nationalism. He was born Mehmed Ziya in the small town of Diyarbakır in southeastern Turkey. After a traditional Muslim primary education and a secular secondary education in Diyarbakır, he went to Constantinople to continue his studies in 1895. Five years later he was arrested and banished to his hometown for his involvement with the Young Turks, then a secret organization.

Following the successful Young Turk revolution of 1908, he went to Salonika as a delegate to the Society (later Party) of Union and Progress. There he contributed to a journal of philosophy (*Yeni felsefe mecmuası*) and a literary review (*Genç kalemler*) published by the Young Turks. It was at this point that he adopted the pen name Gökalp ("sky hero"), which he retained for the rest of his life.

With the outbreak of the Balkan War, he and his associates moved to the Ottoman capital, where their Turkish nationalist ideas were sharply opposed by the politicians and writers known as Islamists, as well as by the traditional Ottomanists. In Constantinople Gökalp became acquainted with a group of Turkish-speaking émigré writers from Kazan, the Crimea, and Azerbaijan whose ideas had been influenced by those of the Russian Narodniks. Prominent among these writers was Yusuf Akçura of Kazan, the author of a lengthy essay entitled *Three Ways of Policy* (*Üç tarz-i siyaset*), in which he speculated on three possible directions for the Ottoman Empire—a continuation of Ottomanism, a political unification of Muslims, or a national unification of the Turks (possibly including those of the Russian Empire).

This formulation of the Turkish problem had a strong influence upon Gökalp, whose writings after 1911 were concerned with the resolution of Akçura's trilemma within the framework of the modern nation, although the modifications he proposed were unacceptable not only to the Ottomanists and Islamists but even to the Turkists themselves. In his major work, *Türkleşmek, islamlaşmak, muasırlaşmak* (Turkism, Islam, and Secularization, 1918), he presented the concept of secularization, already initiated by the Tanzimat reforms, as a means of reconciling the "three ways." Throughout his life Gökalp dealt with the political, religious, cultural, and educational ramifications of what he believed

to be the reforms necessary to arrest the decline of Turkish national unity. Following the fall of the Ottoman Empire he welcomed the birth of the nationalist, republican, and secular regime in 1921, and in the remaining three years of his life he strove to adapt his earlier writings to it.

Central to Gökalp's thought were two distinct yet inter-related concepts, "civilization" and "culture." The first of these he associates with traditions created by and belonging to different ethnic groups and capable of being transmitted from one group to another, while "culture" represents the specific and unique set of mores of a particular nation. For Gökalp "culture" is the more basic of the two because without cultural roots, any attempt to develop a dynamic civilization will be unsuccessful.

In applying this distinction to the concrete issue of Turkey's transition from a multiracial, formally Muslim empire to a democratic, Western-oriented, and secular nation-state, whose cultural basis would be Turkish and only secularly Muslim, he was dealing not with the problems of Western society or civilization, but with a nonsecular, non-Western society that had come under the influence of Western civilization. He was concerned mainly with the place the Turkish people would assume in the modern world, since they were seen as alien to the Christian cultural background of Western civilization. He felt that the nations of the West, while remaining Christian in character, were destined to become secularized because of the dominant role assumed by science and rational thought. Non-Christian Turks, however, and others who were neither Christians nor Muslims, such as the Japanese, could be secularized only if and when they became "nations," for modern Western civilization had little to do with the language, religion, folkways, and mores of the people outside the world of Christianity.

After Gökalp's death, there was a decline of interest in his earlier writings, which preceded the readjustment of his thinking to the conditions of the nationalist, secular regime. His ideas, however, would exert considerable influence upon later Muslim thinkers, such as Muḥammad Iqbāl.

**GOLD AND SILVER** are among the most widespread symbols in the history of religions. Their exceptional physical qualities make them—like their celestial counterparts, the sun and the moon—unusually powerful symbols of spiritual realities. As a physical substance, gold is quite literally incorruptible: it is highly resistant to chemical reactions and is immune to the corrosion that affects baser metals. It is also intrinsically luminous, seeming to shine with a light of its own. Thus no speculative leap was required to make gold the universally acknowledged symbol of life and the spirit and of perfection and immortality. There is a certain obviousness to the symbolic value of gold that explains its universal appeal throughout history and in virtually every corner of the world.

Silver too is naturally suited to serve as a religious symbol. Its faultless whiteness has made it a symbol of purity and—in the appropriate historical contexts—of chastity. Purified in the refiner's fire, it becomes a symbol of purification and perfection. Associated with its silvery counterpart in the night sky, it is integrated into an entire complex of lunar symbolism that includes—not surprisingly—the great purifier, water.

**RELIGIOUS SIGNIFICANCE.** When John Ruskin spoke of gold's "imperishable splendour," he spoke metaphorically of a universally recognized quality that people of earlier times took quite literally. For many in the history of religions, gold has not merely symbolized the imperishable but embodied it. In ancient India the *Satapatha Brāhmaṇa* identified gold with immortality. The ancient Chinese identified it with Heaven. Beliefs such as these lie behind the extremely widespread use of gold in connection with a whole variety of funerary practices. Indeed, most of the surviving examples of the ancient goldsmith's art have been found in graves. One of the most impressive collections of artistic gold articles was discovered in the tomb of Tutankhamen (Egypt, fourteenth century BCE), including the stunning gold burial mask that formed a part of the king's coffin. Gold funeral masks are quite common globally: They have been found from Champa (modern Vietnam) to Peru. The mummies of the kings of ancient Peru were completely wrapped in gold foil. In addition to masks, many other accessories and ornaments found in graves are also made of gold or silver. In the case of gold the meaning is clear: The immortality of the deceased is ensured by providing the deceased with an immortal persona, the mask made of gold. Moreover, gold (like jade) was sometimes used to block up the natural openings of the corpse in the belief that this would prevent its decay. In some cases, notably in ancient China, such concern for immortality began while the person was still alive. Thus Chinese alchemy, as in some other alchemical traditions, it was believed that drinking an elixir made from gold would confer immortality.

As a symbol of spiritual realities, gold occurs frequently in the representations of key religious figures. The Buddha, the Enlightened One, is frequently portrayed in gold. One

of the most impressive examples is the huge image of the Buddha found in the Wat Traimit in Bangkok, Thailand, an image made entirely of gold. One also thinks of the dazzling gold ornaments that adorn the *bodhisattvas* in the paintings discovered at Dunhuang. Equally striking are the golden aureoles that surround the heads of saints in Christian iconography.

Religious rituals have also made use of gold and silver. All manner of ritual implements and vessels have been fashioned from these precious metals. The medieval Christian church made extensive use of gold in the construction of crosses, chalices, patens, ornamental covers for the Bible, and reliquaries. One also finds silvered cases created to house Buddhist sūtras, and a variety of Buddhist ceremonial objects in gold.

Yet the symbolism of gold and silver in the history of religions has not always been completely positive. Particularly in the Western Semitic religions (Judaism, Christianity, and Islam), gold and silver have occasionally taken on a negative value. One need only recall the story of the golden calf (*Ex.* 32) or the golden image set up by Nebuchadrezzar, which Shadrach, Meshach, and Abednego refused to worship (*Dn.* 3). In the Hebrew scriptures gold is often the symbol of idolatry or of purely human glory. There is a similar distrust of gold and silver in Islam. According to one *ḥadīth*, or saying of the prophet Muḥammad, “He who drinks from gold and silver vessels drinks the fire of Hell.” In the opinion of the thirteenth-century Persian cosmographer al-Qazwīnī, the use of gold and silver for ornament thwarts the divinely intended purpose of these metals, which should be used as coinage for trade.

**ASSOCIATION WITH SACRED TIME AND SPACE.** Gold and silver have also played an important part in the articulation of sacred time and space. Sacred time par excellence is often represented as a Golden Age, which is followed by an only slightly inferior Silver Age. The widespread schema of the four ages of the world finds its way into the *Book of Daniel* (2:31–45), in Nebuchadrezzar’s dream of a colossus with a head of gold and with breast and arms of silver.

To the extent that sacred space has been organized around a temple, the presence of gold and silver ornament has contributed powerfully to the creation of a properly numinous ambience. Here one thinks not only of the wealth of Solomon’s temple and of medieval Christian cathedrals, but also of the Temple of the Sun at Cuzco in ancient Peru, which was covered with enormous quantities of gold. In the Hindu tradition the world has passed through four periods of time; according to popular legend, all the accoutrements used by people were made from gold in the earliest period, which was regarded as the purest era.

**ASSOCIATION WITH ALCHEMY.** Nowhere, however, is the symbolic potential of gold and silver exploited more fully than in the various traditions of alchemy. According to alchemical doctrine, gold and silver develop in the earth under the influence of the sun and moon respectively. The ultimate

goal of this development is the production of gold, which is consequently viewed as the perfect metal, and as a symbol of spiritual perfection. The alchemist’s art is intended to hasten this natural process, both in external nature and within the alchemist’s soul. Silver here becomes the symbol of the soul’s purity and passivity before the activity of the spirit, symbolized by gold.

DAVID CARPENTER (1987)  
*Revised Bibliography*

**GOLDEN AGE.** In its narrowest sense, the term Golden Age refers to a mode of utopian existence, described in a variety of Greek, Roman, and later Western Christian texts, that is freed from the vicissitudes of everyday life and is characterized by peace and plenty, with nature spontaneously producing food and humans living in close relationship to the gods. Most usually, the Golden Age is located temporally in the far past or, more rarely, in the distant future. Spatially, it is located in vague or far-off regions of the earth; more rarely, it is a place accessible only after death, as described by Pindar (fifth century BCE) in his portrait of the Elysian Fields (*Olympian Ode* 2.68–76). In its broadest sense, the term has been extended by some scholars to include any mythical, paradisaical time of origins. As banalized in common discourse, *golden age* has been transformed into a quasi-historical label for any period of extraordinary wealth or human achievement.

**THE HESIODIC MYTH AND ITS DEVELOPMENT.** The most particular reference to the Golden Age, although it does not use the term, is the account of the successive races of people given by the Greek author Hesiod (eighth century BCE) in his didactic poem *Works and Days* (106–201). Whether di-

rectly or indirectly, Hesiod is the sole source for the myth in later Western literature and the arts. The account sits somewhat uneasily in its Hesiodic context, being introduced almost by way of a digression, and seems to be in tension with other anthropogonic motifs in the poem. Five races or kinds of people are described in temporal succession. Four are characterized by valuable metals: the golden race, the silver race, the bronze race, and, after an intervening race of heroes that is most likely not part of the original schema, the iron race. Although not fully developed, there appears to be a succession of moral and physical decay. With the exception of the intrusive race of heroes, each state appears to be inferior to its predecessor.

In its brief description of the golden race, the Hesiodic narrative combines six motifs: (1) the succession of races of people (in Hesiod's account, these are different species, separate creations of the gods, and are not to be seen as successive stages of mankind, the world, or history); (2) the correlation of the races with metals; (3) the identification of the golden race with the reign of an elder deity (in Hesiod, with the rule of Kronos); (4) the topos that, in the beginning, humans lived in close company with the gods; (5) a set of paradisaical features including a carefree existence of feasting, wealth, and peace in a state of perpetual youth, terminated by a peaceful death; and (6) the spontaneous yield of crops from the earth, so that humanity was fed without toil. Each of these motifs has worldwide distribution. At times, they have served as elements that have been integrated into broader systems of religious, historical, and anthropological thought (for example, systems of apocalypticism, messianism, utopianism, or primitivism) as well as literary genres such as the pastoral. However, the combination of motifs in Hesiod is without parallel.

In later Greek poetic versions, especially the influential *Phaenomena* (96–136) by Aratus (third century BCE), additional details were added to Hesiod's brief account. The Golden Age was characterized, above all, by justice. Its utopian mode of life included vegetarianism. What was of greater importance, the metals now identified stages in the history of a single race, and the implicit theme of degeneration was more consistently applied. In Greek philosophical literature—most extensively by Plato (*Statesman* 269–274)—this latter element was fully developed and related to notions of historical periodicity, recurrence, and world cycles. The later, expanded portrait of the Golden Age, with the additional motif of free sexuality, was carried over into Latin versions of the Hesiodic myth, above all in the first-century work of Ovid (esp. *Metamorphoses* 1.76–150). The Latin tradition is important in three respects. First, the persistent Greek terminology referring to the “golden race” (*chruseon genos*) was transformed into the more familiar phrase “the Golden Age” (*aurea saecula* or *aurea aetas*). Second, although some Roman texts maintain the four metals schema, the contrast was reduced to a duality: then and now, the Age of Kronos and the Age of Zeus, the Golden Age and the present times. Third, with the general loss of Greek literature in the Middle Ages,

it was the Latin tradition, especially the Ovidian version, that was most influential on later Western literature. Beyond its adaptations of the Hesiodic myth, Roman tradition contributed new spatial and temporal dimensions to the Western imagining of the Golden Age. Two innovations were of greatest significance; both may be associated with the towering figure of Vergil in the first century BCE. The development of the Alexandrian conventions of the pastoral, the literary topos of the idyllic place (*locus amoenus*), and the paradisaical imagery of the Golden Age came together in Vergil's portrait of Arcadia in his *Eclogues*. In such poetry, the Golden Age came closer to the experience of the contemporary human. Taken out of mythical time and reduced to the “good old days,” to bucolic scenes of the rustic, simple life, the pastoral became “an image of what they call the Golden Age” as Alexander Pope observed in his *Discourse on Pastoral Poetry*. At the same time, an eschatological element was introduced. Often tied to imperial ideology, the notion was advanced that the Golden Age was recoverable, now or in the immediate future. While this became a commonplace of imperial rhetoric (see Vergil, *Aeneid* 6.791–794)—no fewer than sixteen Roman emperors claimed that their reigns had reestablished the Golden Age—the best-known example remains the fourth of Vergil's *Eclogues*. This mysterious poem, composed in 41–40 BCE, ties the end of the Iron Age and the initiation of a new Golden Age to the birth of a wondrous child. In Vergil's work, the myth of the Golden Age is no longer an expression of pessimism with respect to the present; rather it has become a prediction of future hope and regeneration. Elements in the poetic tradition of the Golden Age lent themselves to christianization. In its Greek form, it could be harmonized with accounts of Eden and with notions of sin as accounting for humanity's fall from Paradise. The eschatological understanding of the Golden Age could be harmonized with predictions of the birth of the Messiah and the coming of Christ's kingdom. However, apart from contributing to theories of world periods, the myth of the Golden Age was not a major element in Christian literary imagination from the early sixth century (see Boethius, *Consolation of Philosophy* 2.5) until the Renaissance. While late medieval epic traditions (for example, Dante and the *Roman de la rose*) continued antique conventions of the Golden Age, a variety of new historical factors contributed to a reawakening of interest in the motif of the Golden Age. Alongside of the rediscovery of classical texts and works of art was the self-consciousness of a “renaissance,” of a new birth, a new age that was, at the same time, a recovery of lost, past glories. Thus, the motto of Lorenzo de' Medici, “the time returned” (*le tems revient*), the description by Vasari of the era of Lorenzo as “truly a golden age” (*Life of Botticelli*), the elaborate court and coronation pageants in which Saturn-Kronos and the four metallic ages were depicted by actors (Vasari, *Life of Pontormo*). Once again, the language of the Golden Age and imperial ideology were conjoined. The development of Renaissance urbanism led to a new, nostalgic interest in the pastoral, a form rediscovered by Jacopo Sannazaro and Tor-

quato Tasso and culminating in Edmund Spenser's dominant interest in the Golden Age. The reformers found in the concept of the Golden Age an expression of their interest in a return to simplicity (see, for example, Erasmus's *In Praise of Folly*). Above all, it was contact with other cultures through exploration that allowed a sense of the palpable presence of the Golden Age. Joined to the topos of the Noble Savage, the new peoples and territories, especially those of the "New World," are unceasingly described in the Renaissance chronicles as living in the Golden Age. While shorn of much of its mythic content, the concept plays a role in the subsequent, somewhat turgid history of rival theories of the progress and degeneration of mankind. In the seventeenth and eighteenth centuries, these various contexts were much elaborated, especially in the context of the mythic understanding of immigrant America. It was a place of new birth and rebirth, a place of freedom, its bounty vast and unimaginable. From the seventeenth-century Puritan imagination (in Cotton Mather's words, "the first Age was the Golden Age; to return unto that will make a man a Protestant, and I may add, a Puritan") to the nineteenth-century romanticization of the American West (historian H. H. Bancroft, for example, described life as "a long happy holiday . . . such as the old-time golden age under Cronus or Saturn"), the imagery was self-conscious and persistent. Finally, in the nineteenth and twentieth centuries, the topos of the return of the Golden Age was joined to the industrial myth of progress, expressed on the one hand in the notion of science as providing a world without care, and on the other in theories of primitive communism that animated many radical social and political utopian experiments and political movements. Both of these ideologies are a major motif in the writings of Dostoevskii (most explicitly in *Notes from the Underground* and *The Dream of the Ridiculous Man*), perhaps the most creative literary use of the Golden Age since Vergil.

**THE GOLDEN AGE IN CROSS-CULTURAL COMPARISON.** In considering the worldwide distribution of the myth of the Golden Age, much depends on decisions of definition and classification. Does one seek close parallels to the specific constellation of motifs found in the Hesiodic narrative, or does one note any instance of a sharp duality between a previous age of perfection and the present? Does one include such closely related topoi as postmortem realms that are the reverse of present conditions, or terrestrial paradises? Does one insist on the notion of past possession of the Golden Age? Does one focus on those mythologies that report its permanent loss, or on those that promise its return? Does one include mythologies in which characteristics resembling life in the Golden Age serve as narrative elements, expressing some contrast between a past and present state (as in the various mythologies of the origin of death), but do not function as the focal point of the myth? Does one include instances of isolated motifs (such as the widespread motif of self-harvesting plants or automatic implements) that occur in folkloristic contexts other than a Golden Age? Out of the number of possible comparisons, three systems of Golden

Age mythology stand out, both for their persistence and for their differing functions: the Golden Age in relation to myths of origins, to millenarian activities, and to royal ideologies.

**Myths of origins.** Most myth posits a sharp duality between "then" and "now," a duality often overcome in the narrative through modes of transformation whereby the one becomes the other. This split and its attendant transformation is most clearly expressed in myths of origin, especially those that take the form of a mythology of rupture between a previous state and the present order. Evaluations of this previous state vary: it may be better, or worse, or simply different than the present. Among early literary accounts, scholars of the ancient Near East have identified a genre of creation narrative that begins with the formula "When there was not" (the same negative formula recurs in medieval Christian descriptions of the other world). Some of these take on the form of a myth of a Golden Age. For example, "Enki's Spell," a part of the Sumerian epic *Enmerkar and the Lord of Aratta*, tells of a time when there were no dangerous animals to threaten humans, when there was nothing to fear, and when humankind spoke a common tongue, obeyed divine laws, and was ruled by the beneficent deity Enlil. This happy state was brought to an end through the jealousy of another deity (Enki). This same negative formula recurs in Scandinavian mythology to describe the original cosmos (*Völuspá* 3, 5). In this state, before the creation of man, the gods lived in peace, playing games and possessing much gold (*Völuspá* 8). This happy mode of existence will return. The golden feasting tables will once again be set out and the fields will bear crops without cultivation (*Völuspá* 61–2). This last motif is common to many Indo-European epic traditions; for example, *Mahābhārata* 3.11.234–235 tells how during the *kr̥tayuga* there was no work and the necessities of life were obtained by being merely thought of. The motif occurs as well in many mythologies of the invention of agriculture, especially in the Indonesian and North American Indian culture complexes. For example, in a variation on this theme, which includes as well the mythologem of rupture, a characteristic etiological tale from the Bororo (of Mato Grosso, Brazil) tells how, in olden times, a woman went to pick maize, which in those days was planted and cultivated by spirits. The woman accidentally hurt her hand and blamed the accident on Burekóibo, the chief of the spirits. In punishment, the spirits ceased their labors, and humans had to toil for food, clearing the forest, planting the seed, and cultivating the crops. There was as well a diminution in the size of the ears of corn since the days when the spirits were responsible for agriculture.

**Millenarianism.** The explicit connection of the Greco-Roman myth of the Golden Age and Christian chiliasm is at least as old as the third century (Lactantius, *Divine Institutes* 5.5, 7.24) and was fully developed in the complex, medieval Christian sibylline traditions. Similar combinations are equally prominent in archaic mythologies and recent na-

tivistic movements. While none of these are demonstrably free from possible Christian influence, they reflect, as well, indigenous tradition. Perhaps the clearest set of examples is from the South American Indians of Gran Chaco and Amazonia. There are mythologies of a lost Golden Age such as that found among the Temb . In earlier times, there was once a place where work was unknown. The fields planted and harvested themselves. When the inhabitants grew old, they did not die but were rejuvenated. The present-day Temb  no longer know the route to this "Happy Place." Such a mythical place can also be used to describe an original peaceful unity, subsequently shattered, which explains the difference between the white colonialist and the native. Thus, the Mataco picture a time and place long ago when there were no Christians, when the ancestors of what would later become the Christians and the Mataco lived together harmoniously in a single house. Everything was provided without labor, from tools to domesticated animals and clothing. The Christian ancestors took away the best of these things, leaving the Mataco only clay pots and dogs. In other versions of this motif of the origin of inequality, the native utopia is superseded by a European one, as among the Bororo. After living peacefully together, quarrels broke out over the possession of magically produced objects. The white people's ancestors were sent away in boats to avoid bloodshed and have never returned because they found a more beautiful and even more wondrous uninhabited land. A more complex expression of a recoverable Golden Age occurs among the various Tupi-Guaran  and Tupinamba groups who have set off on lengthy tribal wanderings from the interior to the Atlantic coast in order to reach a mythical "Land without Evil" or "Land of Immortality and Perpetual Rest." (The earliest record of such a journey is from a Spanish report in 1515; the most recent instance occurred in 1957.) This land, variously described by the different groups, has neither sickness or death; it is a vast garden-island, filled with game and fruits, on which the inhabitants will spend their time feasting and dancing. The same sort of Golden Age imagery recurs among Tupinamba nativistic resistance movements. The Santidades, as described by late sixteenth-century Jesuit missionaries, were common among groups displaced by force to work on the colonial plantations. Native religious leaders urged their followers to stop work and revive old rituals. If they did so, the fields would plant and harvest themselves, tools would work automatically, and old people would be rejuvenated and not know death. The fundamental imagery of these groups stems from shamanistic visions of an other-world. Many exhibit, as well, clear Christian borrowings. Such influence, however, was reciprocal. In 1539, a large group of Tupinamba crossed the South American landmass at its widest point in a nine-year journey ending in Peru. There their tales of the mythical "golden place" they were seeking so excited the Spaniards that an expedition was immediately launched to locate Eldorado (originally a golden man; later believed to be a city of gold).

**Kingship.** From the earliest Mesopotamian hymns of self-praise by Shulgi, ruler of the third dynasty of Ur (r. 2094–2047 BCE) to the encomia addressed to seventeenth-century European monarchs (such as Charles II, whom Abraham Cowley celebrates for having transformed an Age of Iron into an Age of Gold), royal ideology and the myth of the Golden Age have been intertwined. As noted above, historical kings from the emperors of Rome to the Medicis have claimed that their reigns reestablished the Golden Age. There is even greater elaboration of Golden Age motifs in the myths of primordial sacred kings. Kronos-Saturn in Greco-Roman tradition is one such example, already present in the Hesiodic account. Iranian mythology is more extended and explicit.

After the ninth century CE, in the late Pahlavi, New Persian, and Arabic writings as well as in the so-called secular epic tradition, the disparate Iranian royal genealogical and mythical traditions were organized into a systematic presentation that located the origins of kingship in the figure of H shang. Depicted in quite conventional terms as an ideal king and civilizing hero as well as the progenitor (with his sister Guzak) of the Iranian people, H shang established justice, peace, and law. He invented iron-working, the arts of mining and navigation, and the building of canals for irrigation. He was the first to hunt with dogs, make clothing out of skins, and to fashion wooden doors for houses. During his reign, according to the fifteenth-century universal history by M rkhw nd, the *Rawzat al-saf * (Garden of purity), the "world bloomed" and people "reposed in gardens of content." Behind this stereotypical portrait of an ideal realm, lies an older, most likely pre-Zoroastrian, myth of a full-blown Golden Age, that associated with the reign of the Indo-Iranian figure of Yima. In the earlier traditions of the Avesta, Yima is like the sun. In his reign of a thousand years, humans and beasts do not die (indeed, there is no difference in appearance between a man and his son); waters and plants do not dry up from the heat; there is neither excessive warmth, nor cold, nor any form of disease; and there is an inexhaustible supply of food (*Yasna* 9.4–5; *Yashts* 9.10, 10.50, 17.30, 19.32–33). During this Golden Age, Yima enlarged the world three times in order to make room for his citizens and bounty, but such a realm could not be extended indefinitely. Therefore, Ahura Mazd  warned Yima that a universal winter would come and that Yima was to carve out a subterranean kingdom with magical tools, into which he was to bring the most magnificent individuals among the men, animals, and plants in his realm as well as the most savory foods. This kingdom, *vara*, in many respects resembles Yama's realm of the dead in Indic tradition. There, in his underground golden kingdom, which will glow with its own self-generated light, Yima will rule and men will live "the most beautiful life" (*Vendidad* 2). In late traditions, Yima will emerge, at the end of the world's winter, to repopulate the earth (*M n g i Khrad* 27.27–31). Following the so-called Zoroastrian reform, this archaic myth was radically altered. The Golden Age of Yima's rule lasts only until he lies, when the glorious

kingship will leave him (*Yashts* 19.33–38). Indeed, in some traditions, Yima is only the builder of the subterranean realm; Zarathushtra's third son will be its ruler (*Vendidad* 2.42–43).

#### BIBLIOGRAPHY

Walter Veit's *Studien zur Geschichte des Topos de goldenen Zeit von der Antike bis zum 18. Jahrhundert* (Cologne, 1961) and H. J. Mähl's *Die Idee des goldenen Zeitalters im Werk des Novalis* (Heidelberg, 1965) are the most comprehensive histories of the theme of the Golden Age as found in Western literature. A balanced account of the Hesiodic tradition and a selective bibliography can be found in the edition of Hesiod's *Works and Days* by M. L. West (Oxford, 1978). Jean-Pierre Vernant's important *Myth and Thought among the Greeks* (London, 1983) complements West's book. The most significant monograph on the Golden Age in the Greco-Roman tradition, with judicious cross-cultural parallels, is Bobo Gatz's *Weltalter, goldene Zeit und sinnverwandte Vorstellungen* (Hildesheim, 1967). A rich selection of Greco-Roman texts in English translation is presented in Arthur O. Lovejoy and George Boas's *Primitivism and Related Ideas in Antiquity* (1935; reprint, New York, 1973). For the myth as found in Renaissance literature, see Harry Levin's topical study, *The Myth of the Golden Age in the Renaissance* (Bloomington, Ind., 1969). Ernst H. Gombrich's "Renaissance and the Golden Age," reprinted in his *Norm and Form: Studies in the Art of the Renaissance* (London, 1966), is invaluable on the connection of the myth to the ideology of the Medicis. The introduction to Gustavo Costa's *La leggenda dei secoli d'oro nella letteratura italiana* (Bari, 1972) sets the Renaissance revival of interest in the Golden Age within the broadest of cultural contexts. On the Golden Age and America, see Charles L. Sanford's *The Quest for Paradise: Europe and the American Moral Imagination* (Urbana, Ill., 1961).

On the central theme of automatic crops and/or tools in Western literature on the Golden Age, see Roy Walker's *The Golden Feast: A Perennial Theme in Poetry* (London, 1952); for its occurrence in Indonesian and Amerindian myths, consult the brief synopsis in Gudmund Hatt's "The Corn Mother in America and in Indonesia," *Anthropos* 46 (1951): 853–914. On the complex South American mythologies of the "Land without Evil," see Mircea Eliade's masterful summary, with essential bibliography, "Paradise and Utopia: Mythical Geography and Eschatology," reprinted in his *The Quest* (Chicago, 1969), pp. 88–111. For the mythologies of Hōshang and Yima, the most complete account, with a translation of all relevant texts, remains Arthur Christensen's *Les types du premier homme et du premier roi dans l'histoire légendaire des Iraniens*, 2 vols. (Stockholm, 1917–1934). For a comparative treatment within the broad context of Indo-European royal ideology, see Georges Dumézil's *The Destiny of a King*, translated by Alf Hiltebeitel (Chicago, 1973).

JONATHAN Z. SMITH (1987)

**GOLDEN RULE.** The expression *Golden Rule* has come into use in various modern European languages over the past

few centuries as a popular reference to the dictum, "Do unto others as you would have others do unto you," best known in Western culture from its formulation in the New Testament (*Matt.* 7:12, *Luke* 6:31). Identical or similar axioms of moral behavior are nearly universal, however, appearing in a wide variety of cultural contexts from oral folk wisdom to ancient scriptural and philosophical writings. The written canonical versions most frequently cited as examples of golden-rule thinking include those found in early Jewish sources, both in the Mishnaic and Talmudic corpus (*Pirke-Avot* 2:10, *Babylonian Talmud: Shabbat* 31a) and in the apocryphal and pseudepigraphic literature (e.g., *Ben Sira* 31:15, *Tobit* 4:15, *Jubilees* 36:8); additional passages in the New Testament (*Rom.* 13:8–10, *Gal.* 5:14, *Acts* 15:20 [Western recension, codex D]); Qur'anic and post-Qur'anic Islamic teachings (*sūrah* 83: "The Deceivers" [*At-Tatfif*, or *Al-Muṭaffifīn*]; Al-Nawawi, *Forty Hadith* 13; Ibn Al-'Arabi, "Instructions to a Postulant" [*Risāla . . . l'il murīd*]); classical Greek and Latin texts (e.g., Plato, *Republic* 443d; Aristotle, *Nicomachean Ethics* 9:8; Isocrates, "To Nicocles" 61b, "To Demonicus" 14, 17); sacred precepts imparted in the *Udyoga* and *Anuṣasana* sections of the Sanskrit epic *Mahābhārata* (5:39:57, 13:114:8); and comparable pronouncements in the Zoroastrian *Avesta* (*Dadestan-i denig* 94:5, *Shayest Na-shayest* 37:51), the Buddhist *Dhammapada* (10:129–130), the Jain *Āgamas: Sūtrakṛtāṅga* (1:10:13, 1:11:33) and other sūtras, and the Bahā'ī scriptures (*Kitāb-i Aqdas* 148). There are also striking parallels in the *Analec*tis (4:15, 5:12, 15:23) and other works of the Confucian canon (*Daxue* 10:2, *Zhongyong* 13:3, *Mencius* 7:A:4).

Occurrences in these and other traditions can be multiplied virtually without limit, inasmuch as statements preaching a basic consideration for the feelings of others—in ideal conception if not in common practice—are all but self-evident in human culture, reflecting both the fundamental imperatives of social organization and a deeply ingrained, though regularly ignored, instinct of empathy for fellow members of the species. However, many apparently parallel statements about elementary human decency are simply too vague or sweeping to support detailed comparison, while others may have been taken out of their original contexts and put forward as equivalent teachings by apologists keen on defending the validity of one non-Western ethical system or another. In order to properly assess the cultural and religious significance of various golden-rule formulations, therefore, it is vital to scrutinize them from the perspective of a number of specific variables and issues:

1. The place of this teaching within its given religious or philosophical context: does it simply describe a commendable mode of behavior, or is it enshrined as the central pillar of an entire moral edifice?
2. The defense of this principle in the face of abundant evidence of its nonobservance in human conduct: Is it taken a priori as an inviolable tenet of revealed dogma, or is it proposed as a piece of utilitarian advice for the

successful regulation of social life? Does it merely enjoin a correct attitude toward one's fellow humans, or does it require one to translate these feelings into the praxis of concrete acts?

3. The manner in which the precise rhetorical structure of a given formulation reflects the specific intellectual underpinnings of its cultural milieu: Is it presented as an incontestable point of doctrine, or is it put forward as a polemical position or a defensive response within a context of moral disputation? Is its verbal form, especially its framing in either positive or negative grammatical terms, simply an aspect of literary style, or does its linguistic mode of presentation correspond to deep-seated assumptions about the moral ground of the human condition and the possibility of humankind's spiritual perfection?
4. Claims of universal validity: is a certain culture-specific version held to be a statement of moral truth for all humans and all time, or is it understood to apply exclusively within a particular religious community or sociohistorical context?
5. Mutual influences and borrowing: does a given citation represent an independent enunciation of the principle, or can it be traced back to a chain of inherited sources or to ur-texts shared with other traditions?
6. Commentarial expansion: how do scriptural exegetes and textual scholiasts seek to elucidate the message of empathetic self-projection expressed in canonic teachings and to ground this in the logic of philosophical or theological discourse?

**THE GOLDEN RULE AS THE CORE OF MORALITY.** That which makes various Golden Rule formulations in different cultures not simply shining precepts of moral excellence but truly golden—in the sense of setting the highest standard of moral value—is the explicit claim that the exhortation to treat one's fellow humans by the same criteria of behavior one wishes to enjoy oneself constitutes the essential core of an entire system of belief. For example, Hillel the Elder (first century BCE–first century CE) folds all of Jewish law into one succinct reply—while his questioner “stands on one foot”—as, “What is hateful to you, do not do unto your fellow man” (*Babylonian Talmud, Shabbat* 31a). In this is heard the unmistakable echo linking it with the language of slightly later enunciations of the same message in several New Testament passages.

This may reflect no more than direct borrowing or the use of common oral and written sources drawn from the fount of Eastern Mediterranean wisdom literature. But what gives this parallel its primary significance is the manner in which both texts go on to cite these gnomic statements as encapsulations of religious truth: “the entire Torah” in Hillel's words and “the law and the prophets” in the Gospel refrain. Significantly, we observe very much the same impulse to elevate the Golden Rule to the status of an all-embracing

universal principle in a wide variety of other cultural contexts, including at least two passages among the vast pool of edifying verses in the *Mahābhārata* identifying this teaching as the “essence” or the “summation” of the *dharma* (duty or morality), Al-Nawawi's (1233–1277) blanket pronouncement that one who fails to observe this precept cannot be called a member of the Muslim community of the faithful, and the set of linked passages in the Confucian *Analec*s that use words virtually identical to those of Hillel (“what is not desirable to you yourself, do not do”) to define the “single thread [binding all of Confucius's thought] into a consistent whole.”

In all of these examples, it is noteworthy that what is claimed to be the “central thread” of the Golden Rule is reduced to a rather unexpected point of doctrine, in each case accentuated by conspicuous silence with respect to such essential tenets as the creation of the world and the acceptance God's commandments in Judaism, the unity and singularity of God in Islam, the ideals of virtuous rule and ritual order in Confucianism, or the metaphysical underpinnings of Hindu and Buddhist thought: spiritual liberation, enlightenment and *nirvāṇa*, the universal godhead. In many of these passages, therefore, one suspects that the citation of the Golden Rule as the ultimate ground of an entire body of moral teachings is pointedly intended to be provocative, its stark enunciation designed to shake listeners from complacent belief in their conventional articles of faith and to force them to contemplate the core principle of primary human empathy underlying all ethical thinking. As a result, it is not surprising that in each of these respective scriptural traditions, legions of commentators have come forward to meet this intellectual and spiritual challenge, exercising their best exegetical skills in an attempt to reconcile the sublimely simple message of the Golden Rule with finer points of doctrine.

**RHETORICAL FORMS AND CONTEXTS.** With respect to the rhetorical articulation of golden-rule statements, the most commonly debated issue revolves around the use of positive or negative terms of discourse in different occurrences. Much ink and breath has been expended to argue that these two alternative grammatical modes reflect profoundly variant perspectives on the human condition. According to a widely held view, the framing of the precept in positive terms (“Do unto others”) rather than negative ones represents at once a more idealistic and a more demanding view of man's capacity for altruistic behavior, setting standards of moral perfection that, if met, would amount to an *imitatio* of divine compassion. By this same reasoning, the negative formulation would seem to set the bar of moral expectation far lower, at the more “realistic” level of a covenant of nonintervention, requiring of people only that they refrain from aggressive and exploitative treatment of their fellows. In some discussions, however, these assumptions are reversed, and the point is made that, in a sense, basing one's behavior toward others on what one wishes to receive in return turns the selfless empathy of the Golden Rule into a form of self-interest, at best, or that it may even give license to impose one's own values

and preferences on other people. Conversely, it may be argued that the idea of mutual nonaggression, far from enjoining simple inaction or restraint, may be understood to sanction an even more open-ended commitment to the inviolability of individual rights.

Regardless of which of these views is upheld, when one surveys the full range of canonic golden-rule statements, one discovers that typically the selection of positive or negative verbal form is not set in stone as a choice between mutually exclusive approaches to the principle of reciprocity in human relations. This observation becomes immediately clear when we note the inseparable connection drawn between the Golden Rule and the command to “love thy neighbor” in both testaments of the Bible (linked in the Gospels by direct textual contiguity and in the rabbinic tradition by virtually automatic exegetical association)—a point underlined by the fact that the original source text for this shared teaching at the heart of both testamental traditions, in *Leviticus* 19:18, presents these words as the culmination of a series of negative ethical injunctions. Moreover, even the uplifting note of positive exhortation in the Gospel versions of this teaching, often held to embody the purest expression of Christian love, did not prevent the early church fathers from transposing the words recorded in *Mark* and *Luke* into negative formulations in certain other early Christian writings (e.g., *Acts* [Western recension, Codex D] 15:20, *Didache* 1:2, and the *Apologia* of Aristides 15). In the same spirit, we find in such post-biblical Jewish texts as *Mishna Avot* (*Pirke-Avot*) and *Ben Sira* a fairly free alternation between positive and negative wording. The same is true of the terms of the Golden Rule enunciated in the Confucian *Analects*. The near replication here of Hillel’s negative formulation may tend to lead certain Western observers to hasty conclusions regarding the practical, or this-worldly, character of traditional Chinese religious thinking—until one notices that this statement is conspicuously counterbalanced by a crucial passage in *Mencius* where a strikingly positive rhetorical exhortation is used to enjoin concerted efforts to live by the ideal of reciprocal empathy.

In weighing the significance of this point of textual analysis, therefore, it is crucial to distinguish between the purely linguistic choice of this or that mode of assertion and the deeper semantic grounding of positive and negative propositions regarding human perfectibility. Just as the negative language in certain Old Testament and Confucian versions in no way precludes a positive moral signification, so, too, the parallels cited in Hindu texts as the essence of the *dharma* can be construed in this term’s double sense of both a set of restrictive laws and rules of behavior and also a positive evocation of the entire structure of meaning in human existence. In all of these examples, the notion that the evil inclination, sinful nature, or aggressive impulses of humans require the coercive force of moral sanction to prevent mutual injury is in no way inconsistent with a concomitant faith in the spiritual power of primary human empathy. This is particularly clear in the later Confucian development the vision of

human interrelatedness set forth by Mencius (c. 371–c. 289 BCE), within which the all-embracing framework of prescriptive ritual observances is conceived as a modality for recovering and bringing to realization the inborn core of humanity’s essential moral nature.

A second rhetorical factor conditioning expressions of the wisdom of the Golden Rule in different cultures concerns the precise positioning of a given formulation within the broader context of intellectual discourse in which it figures. Thus, where the best-known Judeo-Christian and Hindu-Buddhist versions present this precept as the foundation of universal moral law, in a number of classical Greek and Latin sources statements of more or less equivalent import tend to be uttered within the framework of discussions on the ideal fulfillment of human character, especially in connection with the classical ethical conceptions of temperance, moderation and spiritual well-being. For example, expressions of the principle of reciprocity in the *Republic* and *Gorgias* (507b), by Plato (c. 428–348 or 347 BCE), and the *Rhetoric* (1166–1167) and *Nicomachean Ethics* of Aristotle (384–322 BCE), are oriented more toward the perfection of the individual self than toward the reciprocal relation between person and person. In major works of Stoic philosophy such as the *Meditations* of Marcus Aurelius (121–180 CE) (e.g., 5:20, 7:73, 9:4, 11:1), this ideal of altruistic self-transcendence is cited, in a manner reminiscent of Mencius, as the mark of an individual’s fullest attainment of harmony with Nature.

In many passages, the wisdom of the Golden Rule seems to carry a markedly utilitarian message with reference to the ordering of specific sets of human relationships. This occurs, for example, in the citation of this principle in the writings of Seneca (4 BCE–65 CE) (*Epistles* 47:11) with respect to the treatment of slaves, in the context of punishment in the Buddhist *Dhammapada* and honest measurement in the Qur’ān, and in the preaching of kingly virtues in the “Letter to Aristieias” (207) included within the corpus of the Jewish apocrypha. Indeed, discussions of the practical implications of such teachings for the maintenance of primary social order constitute a central focus of more recent golden-rule discourse, from the classic analysis of the essential structure of power in works such as *Leviathan* (chapter 15), by Thomas Hobbes (1588–1679), to the scathing critique of humanity’s hypocritical sacralization of its own self-interest in chapter 5 of *Civilization and Its Discontents*, by Sigmund Freud (1856–1939).

Within the Greek vision of the maximum fulfillment of human capacity, this issue is commonly linked to the concept of justice, in the sense of the interpersonal balancing of conflicting needs and wants. In this light, certain negative formulations of the Golden Rule may be understood as mirror images of the concept of retributive justice, prescribing a sort of proactive or reactive payment in kind for undesirable behavior. In its starkest form, this type of interpretation may even be reduced to the unforgiving terms of the *lex talionis*, “an eye for an eye,” in apparent opposition to the doc-

trine of compassionate forgiveness suggested by the textual contiguity of the Golden Rule to the sermon on the mount in its Gospel manifestations. But just as the literal application of the principle of retributive justice was replaced early on in Jewish law by the concept of mutual responsibility, “requiting love for love” (*gemilut-ḥasadim*), so, too, in a famous passage in the *Analects* (14:34), Confucius (551–479 BCE) is pictured as rejecting the idea of repaying injustice with justice (literally, “requiting injury with virtue”) on the grounds that this would constitute a breach of equity, preaching instead that one repay only virtuous behavior in kind and respond to injury with the “correctness” of justice.

**METAPHYSICAL AND THEOLOGICAL IMPLICATIONS.** In a number of important canonic enunciations of the Golden Rule, both in scriptural and in commentarial writings, thinkers go beyond the positing of its wisdom as the central pillar of their respective ethical systems espousing consideration and justice toward one’s neighbor (variously construed as one’s fellow Jew, fellow members of the Islamic community of the faithful, and the like, or in the broadest sense, all of one’s fellow human beings) and ascribe to this precept significance of a metaphysical or theological character. Thus, for example, an authoritative rabbinic commentary on the *Leviticus* injunction to “Love thy neighbor” (*Palestinian Talmud, Nedarim* 9:4) cites this single verse as comprising the entire “book of the creation of man” (*sefer tol’dot-ha’adam*).

In certain formulations (e.g., the Jain *Sūtrakṛtāṅga*) the scope of application of the principle of universal empathy is expanded to a cosmic level to take in all one’s fellow creatures, indeed all of creation, as coterminous with one’s own eternal Self. This same exegetical impulse also finds expression in the philosophical writings of a number of later Confucian thinkers, among them Wang Yangming (1472–1529), who see in the moral message of the Golden Rule enunciated in the *Analects* a metaphysical identification with the “single body” (*yiti*) of the entire universe. This understanding gives new meaning to Mencius’s attachment of his own positive formulation of the Golden Rule to the startling proposition that “the ten-thousand things are all within myself,” here not an expression of the vaunt of unbounded ego but a soaring affirmation of the innate moral core lodged within every human heart. This leap of faith from basic human interrelatedness to a spiritual identification with all creation may also help to explain the textual linkage in both Jewish and Christian scripture between the parallel commands to “love thy neighbor” and to “love thy God,” as well as Ibn al-‘Arabi’s mystical extrapolation from the wisdom of the Golden Rule to the submission of humans to the infinity of the divine will.

ANDREW H. PLAKS (2005)

**GOLDENWEISER, ALEXANDER A.** (1880–1940), was an American anthropologist and student of primitive religions. Born in Kiev, the son of a distinguished jurist and criminologist, Alexander Alexandrovich Goldenweiser was educated in his native Ukraine, and later, at the graduate level, in the United States. An important early influence was the intellectual companionship and guidance of his father, Alexander Solomonovich Goldenweiser, a social thinker influenced by Hegel and Spencer. Father and son shared a broad intellectual outlook and traveled together in Europe.

Goldenweiser immigrated as a young man to the United States and from 1900 to 1901 pursued graduate study in philosophy at Harvard. He later shifted his studies to Columbia, where he came into contact with Franz Boas and his students, and took his doctoral degree in 1910 under Boas’s supervision. Goldenweiser taught as an instructor at Columbia from 1910 to 1919, served as a lecturer in the Rand School of Social Sciences from 1915 to 1929, and was professor of thought and culture at the Portland Extension of the University of Oregon from 1930 until his death in 1940. He also taught at the New School for Social Research, the University of Wisconsin, and Reed College.

Although he carried out several months of anthropological fieldwork (on the social and political organization of the Northern Iroquois), Goldenweiser’s primary interests were

theoretical. He was known as the most philosophical of American anthropologists, and he remarked once that he would rather read bad theory than no theory at all. The formative influence on his mature work was clearly that of Boas and his students. Goldenweiser's most influential writings are sober and sharp-sighted critiques of the cultural evolutionism and diffusionism prevalent in the early twentieth century.

Goldenweiser's "Totemism: An Analytical Study" appeared in 1910, the same year as James Frazer's monumental *Totemism and Exogamy*, although, as Lévi-Strauss later noted, Goldenweiser's 110 pages were to have a more permanent theoretical influence than Frazer's four volumes. Frazer sought to establish the status of totemism as an evolutionary stage of religious development, a sort of universal primitive institution. Goldenweiser argued that what was called "totemism" was in fact merely the co-occurrence of three otherwise distinct traits—the differentiation of formally similar clans, the use of plant and animal symbols to distinguish them, and the recognition of a special relation between clan and totem.

Goldenweiser, often immersed in the themes and issues of his times, wrote widely on a number of topics relating to culture and history. It was, however, in such works as his analysis of totemism, or his essay (1913) on "The Principle of Limited Possibilities in the Development of Cultures" (in which he argues, against the diffusionists, that limited possibilities make cultural similarities inevitable) that his remarkable, critical intellect was able to transcend the limitations of its era.

#### BIBLIOGRAPHY

Goldenweiser's most significant contribution to the study of religion was his essay "Totemism: An Analytical Study," *Journal of American Folk-Lore* 23 (1910): 179–293. A shorter early essay sets forth the "minority position" on the subject of independent invention and diffusion: "The Principle of Limited Possibilities in the Development of Culture," *Journal of American Folk-Lore* 26 (1913): 259–270.

ROY WAGNER (1987)  
*Revised Bibliography*

**GOLDZIHNER, IGNÁCZ** (1850–1921), was a Hungarian Arabist and Islamicist. After elementary schooling and a Jewish religious education in his birthplace, Székesfehérvár, Goldziher moved to Budapest in 1865. By the time he completed the *Gymnasium* in 1868, he had already begun to study Islamic languages at the university under Arminius Vámbéry. From 1868 until 1870 he pursued his studies first in Berlin with Friedrich Dieterich and Emil Rödiger for Ara-

bic and Hebrew, and with Abraham Geiger and Moritz Steinschneider for the historical relations between Judaism and Islam, and then in Leipzig, where he received his final training as an Arabist under Heinrich Leberecht Fleischer, obtaining his doctorate in 1870. The work of the Austrian scholar Alfred von Kremer opened up for Goldziher the perspective of an intellectual history (*Geistesgeschichte*) of Islam. Appointed privatdocent at the University of Budapest in 1871, he undertook several journeys, including a year's stay in Egypt (1873–1874), where he attended lectures at al-Azhar mosque. Goldziher became secretary of the Liberal Jewish Community in Budapest in 1876 and had to confine his research largely to the evenings; yet during these years he prepared his major publications. He became professor of the philosophy of Judaism at the Jewish Seminary in 1900 and was appointed to the chair of Semitic philology at the University of Budapest in 1905; from there he exerted great influence as the "patriarch" of Islamic studies until his death in 1921.

Goldziher may be said to have laid the foundation of Islamic studies as a scholarly discipline based on the literary and historical study of texts, most of which were at the time available only as manuscripts. It required great erudition and immense knowledge acquired through the reading of the original sources, and a creative use of the categories of the history of religions, to reconstruct the architecture of the history of Islamic religion as he did.

Goldziher's first contribution was to reveal and then study Islam's sources (such as the Qur'an and the *hadīth* literature) as well as its religious disciplines: the techniques of Qur'an exegesis (*tafsīr*), jurisprudence (*fiqh*), and philosophical theology (*kalām*). He also successfully undertook the study of texts pertaining to the further development of religious ideas, including those of mystical and "sectarian" developments.

Second, by trying to understand the problems treated in the religious texts within the framework of Muslim thought itself, Goldziher was able to show the inherent logic of the history of ideas in Islam. He could situate texts and ideas not only in the "outward" history of Islamic institutions and in political history but also as part of the inner development of Islam as a religion.

Third, Goldziher carried out a critical quest for historical truth and strived to show the historical situation, character, and limitations of ideas and practices that were of a religious nature and that were consequently held to be of an eternal validity. As a historian, he revealed the historical character of the texts that, with their interpretations, form part of Islamic religion and culture. He also traced external historical influences that have played a role in the development of Islam.

Goldziher revealed Islam as a complete entity in itself—that is to say, a religious entity—and encouraged its study. His insights into Islamic scripture and tradition, law, and

theology were certainly enhanced by his familiarity with similar problems in the study of Judaism. The respect he enjoyed among Arabs is noteworthy; his contacts with Muslim scholars were many, and several of his publications have been translated into Arabic. The diary he maintained—an unusual habit in the world of scholarship—was published in 1978.

#### BIBLIOGRAPHY

The following publications of Goldziher's have become classics in Islamic studies. In *Die Zāhiriten: Ihr Lehrsystem und ihre Geschichte; Beitrag zur Geschichte der muhammedanischen Theologie* (Leipzig, 1884), which has been translated into English as *The Zāhiris: Their Doctrine and Their History; A Contribution to the History of Islamic Theology* (Leiden, 1971), Goldziher provides an in-depth treatment of the distinctive jurisprudence and theology of an early medieval Islamic school that later disappeared. Perhaps most important was the publication of his two-volume work *Muhammedanische Studien* (Halle, 1889–1890), which has been translated as *Muslim Studies*, 2 vols. (Chicago, 1966–1973). The second volume contains a historical study of the development of *ḥadīth*, or tradition literature (pp. 3–274), and traces the writing of particular groups of *ḥadīths* to various currents and trends of the first one and one-half centuries of Islam. Goldziher also published a survey of the history of Islam, *Vorlesungen über den Islam* (Heidelberg, 1910), which originally had been intended as the Haskell Lectures of 1908; it is available in English as *Introduction to Islamic Theology and Law* (Princeton, N.J., 1981). His last major publication, a study of the different schools of Qurʾān exegesis (*tafsīr*), was *Die Richtungen der islamischen Koranauslegung* (1920; reprint, Leiden, 1970). Among other works by Goldziher available in English is his *A Short History of Classical Arabic Literature* (Hildesheim, 1966). Goldziher's *Gesammelte Schriften*, edited by his pupil Joseph de Somogyi, have been published in six volumes (Hildesheim, 1967–1973). The first volume contains a biographical account by the editor.

A bibliography of Goldziher's publications, *Bibliographie des œuvres de Ignace Goldziher*, has been compiled by Bernard Heller (Paris, 1927). Supplements have been published in the two *Ignace Goldziher Memorial Volumes* (Budapest, 1948, and Jerusalem, 1958). Goldziher's diary, or *Tagebuch*, has also appeared, in an edition edited by Alexander Scheiber (Leiden, 1978).

**GOLEM** SEE LÖW, YEHUDAH BEN BETSAL'EL OF PRAGUE

**GOOD, THE.** A distinction has to be made between two sets of questions related to the concept of the good. There are ethical problems about how to elaborate reasonable criteria of goodness, where goodness is conceived as a characteristic of human actions and of things or properties that are directly or indirectly relevant to human life. And there are questions concerning the goodness of God or of existence as such, apart from God's benevolence and love for the human race. I shall concentrate upon the latter question.

In archaic and polytheistic religions, gods are not necessarily good either in the sense of caring about human well-being or in the sense of providing humanity with a model of moral conduct; some are, some are not, and many combine good and evil characteristics in both respects. Yet in the myths of origin, the evil of gods has been connected, as a rule, with destruction and disorder, and goodness with creation and harmony, whether or not any one of the gods was invariably and systematically good or evil. In Iranian dualist mythology good and evil were attributed respectively to one and another mutually hostile divine beings. In all monotheistic religions God is totally good in an absolute and unqualified sense, and his goodness consists not only in that he loves his creatures: It is his intrinsic, nonrelative property; God would be good even if he had not created the universe. So conceived, goodness acquires a metaphysical meaning that probably cannot be further analyzed, cannot be reduced to other concepts, and has an axiomatic character.

Philosophical reflection on this kind of goodness is Plato's legacy; he discovered the idea of the good, which is, of course, desirable and therefore good for humankind, as well as the source of all goodness; but the good is not good because desirable, but desirable because intrinsically good. This topic was taken up and elaborated by later Platonists, including, in particular, Plotinus; to him the One is good both in terms of human needs and happiness and good in itself, apart from this relationship. Other Platonists, however, denied that the characteristics of goodness could be meaningfully attributed to the first principle: Speusippus, Plato's successor in the academy, made the point, and so did the last pagan philosopher, Damascius, to whom the first principle, being utterly ineffable, could not possibly have any properties, whether relative or even absolute; having no name (even the word *principle* is not appropriate) and no relationship with other realities or even with itself, it cannot be called good in any sense.

Christian philosophy, which assimilated many Platonic categories, has always stressed all the meanings of divine goodness: God is good in himself, he is the creator of all goodness, he is benevolent, and he is the source of criteria whereby one's acts are called morally good or evil. Whatever

else is good is such derivatively and by participation in the goodness of God. And, apart from a few dualistic sects, all creation was, in Christian thinking, attributed to God; because no existence is conceivable apart from God, whatever exists is good by definition. Evil has no positive ontological characteristics and is to be defined as pure negativity, *privatio*, lack of being: evil comes from the ill-will of human or diabolic creatures endowed with freedom of choice and abusing this freedom; yet even the devil, insofar as he exists, is good, even though his will is incurably and totally corrupt. This doctrine has been elaborated in detail by Augustine. In Thomas Aquinas's idiom it is summed up in saying that being and goodness are coextensive (*esse et bonum convertuntur*). Some Christian philosophers and theologians discussed the question (broached already by Plato): Are the criteria of good and evil, given by God, arbitrary or intrinsically valid? In other words, is the good good because God has decreed it to be good (as some nominalists and Descartes believed), or has God said that it is good because it is good in itself (as Leibniz argued)? If the former, moral rules appear to humans as arbitrary and contingent as, say, the rules of traffic; God could have decreed other norms of conduct and said, for instance, that adultery is good and loving one's neighbor wrong—a conclusion that sounds outrageous to common sense; yet, if God orders what is intrinsically good, apart from his decrees, he appears to be bound by laws that do not depend on him, which makes his omnipotence doubtful. The question can be invalidated, however, by saying—in conformity with Thomist metaphysics—that God is what he decrees and that there are no rules of goodness different from his essence, therefore he neither obeys a foreign law nor issues arbitrary decrees of which the content is contingent upon his essence.

If God is good in himself, and not only benevolent to his creatures, it is essential, in Christian terms, that one should love him not only as a benefactor and savior but because he is who he is. The point was strongly stressed by many Christian mystics and other "theocentrically" oriented writers. They argued that God is not only the highest good but the only good proper, therefore humankind is for God, rather than he for humans; individuals should admire him utterly oblivious of all favors and graces received from him; indeed their love should be the same even if they knew that he condemned them to hell, and they should be happy to accept his will unconditionally, whatever it means to them; they ought only to want God to be God, whereas to love God in reciprocity for his benevolence is unworthy or perhaps sinful. The standard Christian teaching, while stressing the value of the disinterested love of God, never goes so far as to say that worshipping God in connection with his gifts and graces is a sin or to deny that one's salvation is an intrinsic good and not only an instrument whereby God's glory is augmented; indeed, the last two statements sound heretical. The theory of "pure love" was hotly debated in the Catholic church in the seventeenth century.

The idea of divine goodness as a nonrelative property does not seem to be a product of pure philosophical speculation. It is rooted in, and makes explicit, the old tenet of many religions: Creation as such is good, and therefore the creator is good as such.

The distinction between autotelic (or intrinsic) and instrumental goods has been almost universally admitted by philosophers since Plato and Aristotle, yet there has never been an agreement about how to draw the line between them and how to define what is good in itself; many philosophers have denied that a collection of properties can be found that would be common to all the things and experiences people have called good. In the conflict between utilitarians and Kantians, and between utilitarians and pragmatists, these problems are among the most often debated.

#### BIBLIOGRAPHY

A comprehensive listing of bibliographic references to the concept of the good would include works by most Western philosophers, including Plato, Aristotle, the Stoics, Augustine, Thomas Aquinas, Spinoza, Hobbes, Hume, and Kant. The following twentieth-century works can be recommended:

- Dewey, John. *Theory of Valuation*. Chicago, 1939.  
 Ewing, A. C. *The Definition of Good*. New York, 1947.  
 Hartmann, Nicolai. *Ethics*. 3 vols. Translated by Stanton Colt. London, 1932.  
 Moore, G. E. *Principia Ethica*. Cambridge, U.K., 1903.  
 Rice, P. B. *On the Knowledge of Good and Evil*. New York, 1955.  
 Ross, W. D. *The Right and the Good*. Oxford, 1930.  
 Stevenson, Charles. *Facts and Values*. New Haven, 1963.  
 Westermarck, Edvard A. *The Origin and Development of the Moral Ideas*. 2d ed. 2 vols. London, 1924.  
 Wright, Georg H. von. *The Varieties of Goodness*. London, 1963.

LESZEK KOLAKOWSKI (1987)  
*Revised Bibliography*

**GOODENOUGH, ERWIN R.** (1893–1965), was an American historian of religions. After studying for the Methodist ministry at Drew Theological Seminary and Garrett Biblical Institute, Goodenough spent three years in New

Testament and Jewish Studies at Harvard University, chiefly with George Foot Moore, before proceeding to Oxford University and earning a D. Phil. in 1923. Little influence of Oxford is discernible in his work, except perhaps in the sketch of Middle Platonism provided in his dissertation on Justin Martyr. In the published version (Jena, 1923) he mentions none of his teachers. The book does, however, foreshadow his later studies of Philo Judaeus, for in it Goodenough discovered the influence of Philo to be pervasive in early Christian theology.

Goodenough began teaching at Yale University in 1923 and remained there until his retirement, steadily producing articles and books to demonstrate that many sectors of Judaism had been receptive to Greco-Roman influence, not only in the realm of philosophical ideas but also in those of mystical intuition and artistic representation. His *By Light Light*, subtitled *The Mystic Gospel of Hellenistic Judaism* (1935), was not universally accepted by students either of the Hellenistic world or of Judaism, but like all his works it stimulated interest in his hero, Philo.

In 1953 began the publication of Goodenough's major work, *Jewish Symbols in the Greco-Roman Period*, which was posthumously completed in 1968 in thirteen volumes (including a volume of valuable indexes and maps). The genesis of this remarkable combination of fact and analysis was a visit Goodenough made to Rome during his time at Oxford. In Rome he saw catacomb frescoes and intuitively concluded that the depictions of Old Testament scenes must have had Jewish models. Excavations in the early 1930s at Dura-Europos (in which Yale participated) seemed to confirm his theory, for a third-century synagogue with bold and mysterious frescoes of biblical themes (now preserved at Damascus) was found.

Such paintings, prohibited by rabbinic teaching, required explanation, and Goodenough took two primary lines of approach. First, he went back to the Jewish catacombs at Rome and to many museums elsewhere, searching for the symbols present at Dura and working out their meanings for members of the Jewish communities. Then, influenced by psychoanalytic methods, he proceeded to explain their "basic" (usually Freudian) significance. Another principle he employed had to do with his division of the paintings into "left" and "right" on the basis of Pythagorean and gnostic notions, although the scenes themselves seem to be arranged "up" and "down."

The possibility or even likelihood that Goodenough was overinterpreting naturally occurred to him as well as to others, but he preferred to take this course rather than to retreat into agnosticism. As an "ex-Christian," as he called himself, he found mystical theories especially attractive. His tendency to say what he thought, and to point out what he did not believe, aroused the ire of the youthful William F. Buckley, Jr., whose *God and Man at Yale* (1951) included an attack on Goodenough's lack of orthodoxy in teaching college students.

During a year at Brandeis University (1962–1963) Goodenough moved to Cambridge, Massachusetts, where he contemplated writing a study of early Christianity based on his Hellenistic Jewish model. In a commemorative essay, Goodenough's friend and sometime student Samuel Sandmel raised questions about the possibility of such a work, in view of Goodenough's lack of knowledge of the history of scholarship, especially in the New Testament field, but he concluded that what Goodenough considered "prolegomena" to this proposed final work were probably more valuable than any book on Christian origins would have been.

Goodenough was active in learned societies, serving as editor of the *Journal of Biblical Literature* from 1934 to 1942 and as president of the Connecticut Academy of Arts and Sciences from 1947 to 1958. He took an active part in the American Council of Learned Societies from 1953 to 1965 and was a member of its Committee on the History of Religions. In this setting especially he was highly influential because of his learning, common sense, and personal charm.

#### BIBLIOGRAPHY

Goodenough's studies of Philo Judaeus also include *The Politics of Philo Judaeus* (1938; reprint, Hildesheim, 1967) and *Introduction to Philo Judaeus* (Oxford, 1940). Goodenough set forth some of his own religious ideas in *Toward a Mature Faith* (New York, 1955). Samuel Sandmel's essay in memory of Goodenough appears in a volume of other such essays, entitled *Religions in Antiquity*, edited by Jacob Neusner (Leiden, 1968). Other contributors of personal reminiscences to this volume include Morton Smith and Alan Mendelson.

ROBERT M. GRANT (1987)  
*Revised Bibliography*

**GORĀKHNĀTH**, also known by the Sanskrit form of his name, Gorakṣanātha, was a teacher of *haṭhayoga* who lived sometime between 900 and 1225 CE. A leading Hindi scholar, Hazariprasad Dwivedi, has observed that "since the time of Śaṅkarācārya there has not been anyone in India as influential or as great" as Gorakṣanātha. There is still no consensus about either his dates or the compositions that may be correctly attributed to him.

Scholars who favor an early date for Gorakhnāth base their claim mainly on indications of an early date for his guru, Matsyendranāth. They focus especially on a reference made by Abhinavagupta (tenth century?), in which he identifies a Matsyendranāth as his own guru. Some sources call

Gorakhnāth's guru Mīnanāth (both *mina* and *matsya* signify "fish"). Most scholars take Matsyendranāth and Mīnanāth to be the same person. Svatmarama's *Haṭhayoga-pradīpikā*, however, lists Gorakhnāth as the fifth or sixth in spiritual descent from Matsyendra and the direct disciple of Mīna. This lineage would lead one to conclude that Matsyendra and Mīna are different and that Gorakhnāth lived more than a hundred years after Matsyendra. A later date for Gorakhnāth is based on the genealogy of Jñāndev, the author of the Marathi classic *Jñāneśvarī*, which, according to some manuscripts, was written in the year 1290. Jñāndev claims to be the third in spiritual descent from Gorakhnāth. This would place Gorakhnāth in the early thirteenth century.

No reliable data on the life of Gorakhnāth exist. He is, however, the subject of many fascinating legends, legends that provide an archetypal portrait of a great yogīn and wonder-worker. The majority of these legends originated with the Hindu sect known as the Kānpḥaṭā Yogīs—also called *nāths* and *nāth siddhas*—who have been the principal proponents of the doctrine and practice of *haṭhayoga*.

It is said that Gorakhnāth's doctrine was first propounded by the god Śiva. Śiva imparted the doctrine to his wife, Pārvatī, while they were seated in a boat, or castle, floating on the milk ocean. Matsyendranāth changed himself into a fish in order to listen surreptitiously to Śiva's teachings. When the god became aware of this ruse, he uttered a curse foretelling that Matsyendranāth would forget what he had learned. Eventually, Matsyendranāth became ensnared by the charms of the women of the mythical land of Kadalī and forgot the doctrine. His disciple Gorakhnāth disguised himself as one of the dancing girls of Kadalī and broke his guru's enchantment through the words of his songs. Matsyendranāth and his disciple then returned to their former practice of austere yogic asceticism.

Gorakhnāth and Matsyendranāth are included among the eighty-four *siddhas*, who belong as much to Buddhist Sahajiyā tradition as to the Śaiva tradition of the Kānpḥaṭās. The Kānpḥaṭās also include them among the so-called nine *nāths*. Although the names of some of these *nāths* vary from list to list, two of them—Jālandharīpā or Hāḍisiddha, an Untouchable brother-disciple of Matsyendranāth, and Kānhupā, Jālandharīpā's chief disciple—form the principal subjects of a related cycle of legends that recount their relations with King Gopīcānd and his mother, Queen Mayanāmatī. Kānhupā may be identical with Kṛṣṇapāda, the author of several of the Tantric Buddhist songs called *caryāpadas*.

The texts attributed to Gorakhnāth are all expositions of the practices and mystic doctrines of *haṭhayoga*. Some are written in Sanskrit and others in Hindi or other languages of North India. Most important are the *Siddhasiddhānta-paddhati* and the *Gorakṣa-śataka* in Sanskrit and the *Śabadī* and *Gorakhbodh* in old Hindi.

The *Gorakṣa-śataka* (Hundred verses of Gorakṣa) is one of the basic texts of *haṭhayoga* and shares many verses with

other such texts such as the *Haṭhayoga-pradīpikā* and *Gheraṇḍa-saṃhitā*. The *Gorakṣa-śataka* describes the six (elsewhere eight) "limbs" of yoga—postures (*āsana*), breath control (*prāṇāyāma*), sense withdrawal (*pratyāhāra*), concentration (*dhāraṇā*), meditation (*dhyaṇa*), and illumination (*samādhi*)—and pays particular attention to certain yogic practices such as the *khecarī mudrā*, the muscle contractions called *bandhas*, and meditations on the seven mystical centers (*cakras*).

The *Siddhasiddhānta-paddhati* is a more extended and theoretical work that gives a somewhat different map of the supraphysical anatomy of the subtle body. It describes nine *cakras*, together with sixteen mental supports (*ādhāras*), three points of concentration (*lakṣyas*), and five firmaments (*vyomans*). These are all used as points of reference and aids to the attainment of supreme reality, here called the *anāman* ("nameless"). An elaborate cosmology postulates a series of correspondences between the microcosm of the individual body and the macrocosm of the physical universe. The goddess Śakti is called the support of the body. *Anāman* is closely related to, or identical with, the union of Śiva and Śakti. When the master yogīn produces this union within his subtle body, the supernatural powers (*siddhis*) appear spontaneously. After twelve years of practice the yogīn becomes the equal of Śiva himself.

SEE ALSO Cakras; Haṭhayoga.

#### BIBLIOGRAPHY

An excellent study of Gorakhnāth and the Kānpḥaṭā Yogīs is found in Shashibhusan Dasgupta's *Obscure Religious Cults*, 3d ed. (Calcutta, 1969). George W. Briggs's earlier work, *Gorakhnath and the Kanphaya Yogis* (1938; reprint, Delhi, 1973), is full of information but is somewhat disorganized. It contains a translation of a version of the *Gorakṣa-śataka*. Also valuable, with an excellent bibliography, is Mircea Eliade's *Yoga: Immortality and Freedom*, 2d ed. (Princeton, N.J., 1969). The *Siddhasiddhānta-paddhati* has yet to be translated into English, but it is summarized by Kalyani Mallik in her introduction to her collection of Sanskrit texts, *Siddha-siddhānta-paddhati and Other Works of the Nātha Yogīs* (Poona, 1954). The initial citation is from Hazariprasad Dwivedi's study in Hindi, *Nāth-sampradāy* (Varanasi, 1966), p. 106.

DAVID N. LORENZEN (1987)

**GÖRRES, JOSEPH VON** (1776–1848), was a German publicist and Romantic mythologist. Born in the Rhineland and educated in Catholic schools, Johann Joseph von Görres remains best known for his fervent nationalist activities as editor and pamphleteer: successively a republican, monarchist, and, as Catholic polemicist, an ultramontanist—this last position also marked his tenure as professor of history at Munich in the final third of his life, during which he wrote *Die christliche Mystik* (4 vols., 1836–1842). His nationalism is reflected in his mythic interests. While lecturing

at Heidelberg from 1806 to 1808, he was associated with Achim von Arnim and Clemens Brentano, who were then publishing their landmark German folklore collection *Des Knaben Wunderhorn* (1806–1808). Görres published his own collection *Die teutschen Volksbücher* (1807) and *Allteutsche Volks und Meisterlieder* (1817). In 1820, after having studied Persian from about 1808, he presented a translation entitled *Das Heldenbuch von Iran* (part of the *Shahnameh*). His major work on myth is *Mythengeschichte der asiatischen Welt* (1810).

This “history of the myths of the Asiatic world” seeks to demonstrate that a primal monotheism originated in India and spread from there through the world, though in confused or debased form. Görres carries his thesis into discussions of Indic, Persian, Chaldean, Egyptian, Greek, Chinese, and Germanic myth. Seen from this perspective, his book is a prime example of German Romantic descriptions of pagan myth as “plagiarized” versions of the one true monotheistic revelation—a doctrine borrowed from earlier Christian writers. But his book is not a history in any rigorous sense so much as a grand Romantic visionary system, rapturously elaborated. He openly relies on “higher” intuitive insight where scholarly evidence is lacking or recalcitrant. His thought (always difficult) is perhaps best understood as suggesting that the godhead is perpetually present. In the far-off mythic age, original humankind lived in the godhead, openly, spontaneously, and wholly. When this golden age dissolved, humans entered “history” and came to believe in an external “nature.” Still, the original truth survives in myth and can be at least partially recovered despite humanity’s dispersal and self-division into many peoples and languages. There are echoes of Schelling in Görres’s emphasis on nature and history as the self-revelation of the godhead. But he also seems at times to deny history or nature any real status whatever, and in this vein he may be close to certain views of William Blake.

## BIBLIOGRAPHY

Görres’s work is collected in *Gesammelte Schriften*, 6 vols., edited by Marie Görres (Munich, 1854–1860), with two additional volumes edited by Franz Binder (Munich, 1874). The most illuminating discussion of the Indic mythic background for Görres is A. Leslie Willson’s *A Mythical Image: The Ideal of India in German Romanticism* (Durham, N.C., 1964). Fritz Strich’s *Die Mythologie in der deutschen Literatur von Klopstock bis Wagner*, 2 vols. (Halle, 1910), is the standard work. Görres is discussed as mythologist, with translated selections, in *The Rise of Modern Mythology, 1680–1860*, compiled by me and Robert Richardson (Bloomington, Ind., 1972), pp. 380–386.

BURTON FELDMAN (1987)  
*Revised Bibliography*

**GOŚĀLA**, more fully Gośāla Maskariputra (sixth century BCE according to tradition, but, following Western research, rather fifth, or even fourth century BCE); one of the principal heterodox religious figures of early India. A contemporary of the Buddha and the Jina, Gośāla was the leader of the Ājīvika community and is said to have regarded himself as the twenty-fourth *tīrthānkara* of the current *avasarpinī* (“descending”) age. His name is given in various forms depending on the source of the reference: Makkhali Gośāla in Pali; Maskarin Gosāla (“the ascetic with the bamboo rod”) in Buddhist Sanskrit; Gosāla Maṅkhaliputta in the Jain Prakrits; and Maṅkali in Tamil.

Much of the information concerning Gośāla and the Ājīvikas derives from early Buddhist and Jain scriptures and the commentarial literature that developed around them. As a result, the picture of the Ājīvikas suffers from the inevitable distortions of sectarian prejudice. Some stray allusions to the Ājīvikas can also be found in Sanskrit literature. The Tamil epics, however, are comparatively well acquainted with the sect and the Ājīvikas are mentioned in South Indian epigraphs dating from the fifth to the fourteenth century CE.

A fairly reliable account of Gośāla’s life and his relationship with Māhavīra can be found in the fifteenth chapter of the fifth *aṅga* of the Jain canon. According to this account, Gośāla was born in the kingdom of Magadha (Bihar), probably the son of a *maṅkha* or professional mendicant. Impressed by the teachings and personality of Māhavīra, Gośāla insisted on being admitted as his disciple and for at least six years accompanied him on his peregrinations. At last, feeling himself to be spiritually more advanced than his master, he undertook the practice of austerities, acquired magic powers, and challenged Māhavīra. Surrounding himself with disciples, he is alleged to have established his headquarters in Śrāvastī (northwest of Magadha), forging close links with the potters’ community there.

In the twenty-fourth year of his asceticism Gośāla was visited by six other ascetics, possibly disciples. It is surmised that at that meeting the teachings of Gośāla were codified to form the core of Ājīvika scripture. It was on this occasion that he enumerated the six inevitable factors of life: gain and loss, joy and sorrow, and life and death, along with the two “paths,” song and dance. It is now believed that the original corpus of Ājīvika scripture was composed in an eastern Prakrit, perhaps akin to the Jain Prakrit Ardhamāgadhī. Quotations and adaptations of these scriptures appear to have been sporadically inserted in Buddhist and Jain accounts of the sect, but the Ājīvika scriptures themselves failed to survive.

Ājīvika doctrine apparently contained elaborate teachings on cosmology, reincarnation, and the elemental categories. It divided humanity into six groups, classified according to their psychic color (black, blue, red, green, golden/white, white/supremely white. Compare the *lesyas* in Jainism). However, the school is best remembered (and condemned in Buddhist and Jain sources) for its uncompromising determinism (*nīyati*). In a Jain text an Ājīvika deity declares that

there is in fact no real human effort, no deed, no strength, no courage, no action or prowess: all beings are instead “determined” (after Basham). This determinism thus denies free will, moral responsibility, or the maturation of *karman*. It was this tenet that elicited the strongest condemnation from the Buddha in his assessment of various “false views.”

#### BIBLIOGRAPHY

Although written many years ago, A. F. R. Hoernle’s “Ājīvikas,” in volume 1 of the *Encyclopaedia of Religion and Ethics*, edited by James Hastings (Edinburgh, 1908), can still be profitably consulted. A convenient short summary of the Buddhist accounts concerning the Ājīvikas can be found in George Peiris’s “Ājīvika” in volume 1 of the *Dictionary of Pali Proper Names*, edited by G. P. Malalasekera (1937; reprint, London, 1960). See also Jozef Deleu’s *Vijāhannatti (Bhagavāi): The Fifth Anga of the Jaina Canon* (Brugge, 1970), pp. 214–220. At present, the standard work on the subject is A. L. Basham’s *History and Doctrines of the Ājīvikas: A Vanished Indian Religion* (London, 1951). See also the review of this work by Walther Schubring: “Bücherbesprechungen: A. L. Basham; *History and Doctrines of the Ājīvikas*,” *Zeitschrift der Deutsche Morgenländischen Gesellschaft* 104 (1954): 256–263. The dates of Gośāla cannot be disjoined from those of the Jina and of the Buddha. The latter, especially, has been reassessed; see Heinz Bechert (ed.), *The Dating of the Historical Buddha / Die Datierung des historischen Buddha. Parts 1–3* (Symposien zur Buddhismusforschung, IV/1–3, Abhandlungen der Akademie der Wissenschaften in Göttingen. Philologisch-Historische Klasse, Dritte Folge, Nos. 189, 194, 222), Göttingen, 1991, 1992 and 1997.

COLETTE CAILLAT (1987 AND 2005)

**GOSPEL.** As a word in the English language, *gōspel* represents Middle English terminology derived from the Old English *godspel* (from *gōd*, “good,” and *spel*, “story”). “Gospel” is the common translation of the Late Latin *evangelium*, which is a virtual transliteration of the Greek *euaggelion*. In classical Greek, *euaggelion* designated everything connected with the *euaggelos*, the bearer of good news (from *eu*, “well,” and *aggelos*, “messenger, one who announces”). Initially *euaggelion* designated the reward given to the messenger who brought happy news (see Homer, *Odyssey* 14.152–153). In the plural the term *euaggelia* was used to designate the offerings to the gods made in thanksgiving upon the reception of good news (e.g., Xenophon, *Historia Graeca* 4.13.14). Later *euaggelion* came to be used for the content of the message, the good news itself, usually an announcement of a military victory.

*Euaggelion* occasionally entered into religious use, where its connotation was derived from oracular usage. Within this context, *euaggelion* signified a divine utterance, but the term was also used in the cult of the emperors. There it enjoyed a mythical quality. Anything having to do with the emperor

could be qualified as *euaggelion*, particularly imperial birth announcements and news of the emperor’s ascension to the throne, but even imperial decrees. A significant passage in this regard is a calendar inscription (9 BCE) from Priene in Asia Minor that comments upon the birth of the emperor Augustus. This passage is usually translated “For the whole world the birthday of the [emperor] god began the joyful news [*euaggeliōn*, a genitive plural] in his regard,” but the passage is mutilated, and the Greek *euaggeliōn* may just as well refer to “joyful sacrifices” instead of “joyful news.”

Hellenistic Jewish authors, such as Philo of Alexandria (d. 45–50 CE) and Josephus Flavius (37–c. 100 CE), used *euaggelion* with a secular connotation. The term was also employed by the translators of the Greek Bible (the Septuagint), who used *euaggelion* to render the Hebrew *bsr*. In the Hebrew scriptures *bsr* is used only in a secular sense. *Euaggelion* likewise has only a profane meaning in the Septuagint. There *euaggelion* is used of the reward given to a messenger in 2 Samuel 18:22 and of a joyous message in 2 Samuel 18:20 (likewise 2 Sm. 4:10, 18:25, 18:27; 2 Kgs. 7:9).

**THE SEPTUAGINT.** In the Septuagint (a Greek translation of the Hebrew scriptures), the verb *euaggelizein*, cognate with *euaggelion*, is commonly used in the profane sense with the meaning “to announce.” In “Second Isaiah” (*Is.* 40:9, 52:7, 60:6, 61:1), however, and in some texts dependent upon it (*Na.* 1:15; *Ps.* 68:11, 96:2), *euaggelizein* specifically connotes the announcement of the good news of salvation. The messenger of good news (*euaggelizomenos*) announces that the time of salvation is at hand, that Yahveh will reign as king, that a new age is about to dawn. Within this context the use of the verb acquires an eschatological connotation. The era of salvation is made present by the announcement of it. Neither “Second Isaiah” nor the dependent texts use the noun *euaggelion* in this eschatological, salvific sense.

The notion of the bearer of the good news of salvation persisted in both Hellenistic and Palestinian Judaism (see the Targum on *Isaiah* 40:9 as well as 1QM 18:14 from among the Dead Sea Scrolls). The mid-first-century *Psalms of Solomon* (11:1–2) uses *euaggelizein* in the eschatological sense, while in postbiblical Judaism *bsr* and its cognate verb refer not only to concrete historical news but also to prophetic messages of weal and woe, angelic messages, and divine announcements of consolation and blessing.

**NEW TESTAMENT.** Within the New Testament, *euaggelion* is used far more frequently by Paul than by any other author (forty-eight times in the indisputably Pauline writings). His writings are the first literary attestation to the Christian usage of the term. It is characteristic of Paul that he uses the term in an absolute sense and without any qualifying adjective. To some authors this suggests that Paul first gave a Christian connotation to the term *euaggelion*, while to others it implies that Paul had taken over an earlier Christian usage. In any event, there is little doubt that the term acquired its Christian significance in a Hellenistic environment. While some scholars maintain that the early Christian usage was derived

from emperor worship, the more common opinion locates the roots of the Christian use of *euaggelion* in “Second Isaiah.”

**Paul.** In the Pauline letters two passages confirm the thesis that Paul has taken over the absolute use of *euaggelion* from early Christian usage. The passages in question are *1 Corinthians* 15:1–4 and *Romans* 1:1–4. In his first letter to the Corinthians, Paul uses classic language to describe the handing on of traditional teaching and employs *euaggelion* to identify the content of that teaching. Paul explicates the content of the *euaggelion* by citing a creedal formula, probably derived from Palestinian Christian circles, that focuses on the death and resurrection of Jesus. In the opening verses of the letter to the Romans, the content of the gospel is the disclosure of Jesus as the Son of God and the Lord by his resurrection from the dead. Thus, for Paul, the basic content of the gospel is the resurrection by means of which Jesus is constituted as Lord. This is understood as the fulfillment of the scriptural promise. Paul sometimes (e.g., *1 Cor.* 9:12, *2 Cor.* 2:12) calls it the gospel of Christ (*euaggelion tou Christou*) because the good news of salvation has Christ as its central object.

In the writings of Paul, *euaggelion* also defines the oral proclamation of the missionary (e.g., *2 Cor.* 8:19, *Phil.* 4:15). In *1 Corinthians* 9:14, Paul uses the word in two senses, that is, as his message and as the act of proclamation. The act of proclamation involves more than recitation of a creedal formula or recital of the traditional kerygma on Jesus’ death and resurrection. Paul’s whole person is involved (see *1 Thes.* 1:5, 2:8). His proclamation is the work of an apostle “approved by God to be entrusted with the gospel” (*1 Thes.* 2:4). Paul writes succinctly of “my gospel” (*Rom.* 2:16) or “our gospel” (*2 Cor.* 4:3). Those who receive his message receive it “not as the word of men but as what it really is, the word of God, which is at work” (*1 Thes.* 1:13). For Paul, the gospel is the “gospel of God” (e.g., *1 Thes.* 1:9, *2 Cor.* 11:7) because it comes from God and is about God’s work. Coming from God, the gospel is powerful. Its proclamation brings about the eschatological era of salvation; it implies the ending of one world order and the beginning of a new one.

**Mark.** Both in understanding of the term *euaggelion* and in frequency of its usage (seven times), Mark is similar to Paul. This does not imply a direct dependence of Mark on Paul, because both of them reflect earlier Christian missionary usage. Mark, however, uses only *euaggelion*, the noun, and not the related verb. For Mark, *euaggelion* is a technical expression used to denote the kerygmatic announcement of salvation. Jesus is the subject of the gospel insofar as he proclaimed the coming of the kingdom of God (*Mk.* 1:15). When proclamation occurs, that which is proclaimed becomes a reality. Accordingly, the activity of Jesus became the object of the gospel. Mark editorializes on the tradition he has incorporated into his work in order to affirm that the gospel relates to that which has been done in and through Jesus. Mark emphasizes this notion by opening his

work with “The beginning of the gospel of Jesus Christ, the Son of God” (*Mk.* 1:1). This striking statement brings into focus a point of view even if it does not, strictly speaking, function as a title for the entire work.

**Matthew and Luke.** Neither Matthew nor Luke employs *euaggelion* so frequently as does Mark, and the Johannine literature does not use the term at all. Matthew uses the term four times but never without further qualification. He writes of “the gospel of the kingdom” (*Mt.* 4:23, 9:35), of “this gospel” (*Mt.* 26:13), and of “this gospel of the kingdom” (*Mt.* 24:14). In all four instances Matthew uses *euaggelion* in relation to a speech complex. For him Jesus is no longer the content of the gospel; instead, he is the communicator of the gospel. The speeches of Jesus are “gospels.” Matthew’s emphasis is on Jesus’ preaching and teaching as providing a paradigm for the Christian way of life.

Luke does not use *euaggelion* at all in the first part of his written work, but it appears twice in *Acts* (15:7, 20:24). Nonetheless, Luke employs the verb *euaggelizomai* (“I bring the good news”) frequently both in his gospel (ten times) and in *Acts* (fifteen times). By doing so, Luke emphasizes the act of preaching, which is then explained by the direct object that accompanies the verb. He sharply distinguishes the preaching of the apostles from Jesus’ own preaching. Willi Marxsen has suggested that Luke deliberately avoided using *euaggelion* in the first part of his work because instead of giving a record of the church’s proclamation he was writing a type of “life of Jesus.”

**THE WRITTEN GOSPEL.** The general Pauline usage of *euaggelion* to mean the proclamation of salvation as concretized in the death and resurrection of Jesus continued into the second century as the writings of Polycarp of Smyrna (*Letter to the Philippians* 9.2) and the *Didache* (12.3.1) attest. Aristides of Athens, the first of the Christian apologists, once mentions the “evangelical writing” (*euaggelikē graphē*), and Ignatius of Antioch intimates that the gospel was a written text when he wrote to the church of Smyrna that neither “the prophetic predictions nor the law of Moses nor the gospel” has convinced his opponents (*Letter to the Smyrneans* 5.1).

Even when *euaggelion* came to be applied to a written text, the word continued to be employed in the singular, and this use of the singular was still widespread in the third century. The usage bespeaks the conviction that the gospel was identical with the teaching of the Lord. This usage is reflected in the formulaic expression “the Lord says in the gospel” (e.g., *2 Clem.* 8:5), but it is also reflected in the titles of the Gospels. The earliest parchment codices of the New Testament, namely, the fourth-century Sinaiticus and Vaticanus codices, entitled the Gospels “according to Matthew,” “according to Mark,” and so on. This manner of providing each of the written gospels with a title suggests that *euaggelion* applied to the whole collection of the four canonical gospels. Nonetheless, three of the early New Testament papyri have made use of more complete titles: *Gospel according to Matthew* (P<sup>4</sup>) and *Gospel according to John* (P<sup>66</sup>, P<sup>75</sup>). Even this

is a strange turn of phrase if the sole intention is to designate authorship. These titles seem to suggest that the single gospel was narrated according to the vision of a specific evangelist. There was only one message of final, eschatological salvation, namely, salvation accomplished through the death and resurrection of Jesus, but the message could be conveyed in different ways.

In the middle of the second century, Justin Martyr (c. 100–163/5), writing in Rome, was the first Christian author to write of the Gospels in the plural (*euaggelia*). In his *First Apology* (c. 155) and his *Dialogue with the Jew Trypho* he refers to the “memoirs of the Apostles” on some fifteen occasions. The first time he mentions the memoirs, he adds by way of explanation “which are called gospels” (*hatina kaleitai euaggelia*; *Apol.* 1.66.3). In two other places, however, he retains the singular use of *euaggelion* (*Dial.* 10.2, 100.1). At the time of Clement of Alexandria (150?–215?) the *euaggelion* was understood to be a book on the system of Christian morality. Subsequently the term was also applied to the so-called apocryphal gospels, the oldest of which come from the second century.

The transference of *euaggelion* from the designation of an oral proclamation to a written text—a usage that most probably derives from the first verse of Mark—attests that these texts had the same content and purpose as the oral proclamation. Both the oral proclamation of the gospel and the written gospel speak of eschatological salvation accomplished in the life and death of Jesus of Nazareth. Far from being biographies of Jesus, the four canonical gospels attest to his preaching and to his activity in the light of his death and resurrection. The historical traditions they contain are subordinated to their religious and kerygmatic purpose. They were written to evoke and/or confirm faith in Jesus as Christ and Lord (see *Jn.* 20:31). The central content of the gospel is one, even if it is attested in documents written by different authors.

**LATER USAGE OF THE TERM.** At the time of the continental Reformation, Martin Luther (1483–1546) sharply distinguished between the law and the gospel. The law makes demands and provokes anxiety; the gospel bestows grace and brings consolation. From his study of *Romans* 1:16–17, where Paul writes of the gospel as “the power of God for salvation . . . for in it the righteousness of God is revealed through faith for faith,” Luther concluded that justification did not depend on outward obedience to the law. Although the content of the law is the unchangeable will of God, the law brings humans before the throne of judgment. The first use of the law deters people from sin by fear of punishment; a second use makes even believers conscious of their sin. In contrast, the gospel, appropriated through faith, reveals the saving love of God, assures believers of justifying grace, and offers a promise of the forgiveness of sins.

In modern times, preaching the gospel is characteristic of Christian missionary endeavors throughout the world. Gospel faith is popularly associated with evangelical preach-

ing and the view that Jesus is one’s personal savior. The reading of a passage from one of the four canonical gospels (*Matthew, Mark, Luke, John*) is a key feature of worship services of the more liturgically oriented Christian churches. Frequently the excerpt that is read is simply referred to as “the gospel.”

## BIBLIOGRAPHY

The most comprehensive study of the term *euaggelion* remains the article “Euaggelion” written by Gerhard Friedrich for the *Theological Dictionary of the New Testament*, edited by Gerhard Kittel, vol. 2 (Grand Rapids, Mich., 1964), pp. 721–736. The original German text was first published in 1935. Significant contributions to the knowledge of Paul’s understanding of the gospel are Peter Stuhlmacher’s *Das paulinischer Evangelium*, in the series “Forschungen zur Religion und Literatur des Alten und Neuen Testament,” vol. 95 (Göttingen, 1968), and Ernst Käsemann’s *Commentary on Romans* (Grand Rapids, Mich., 1980), pp. 6–10. An analytic study of Mark’s understanding of *euaggelion* is Willi Marxsen’s *Mark the Evangelist* (Nashville, 1969), pp. 117–150. In this study Marxsen also compares the use of the term by Matthew and Luke with that by Mark. In his *Studies in the Gospel of Mark* (London, 1985) Martin Hengel examines the Markan use (pp. 53–58) as well as the titles of the Gospels (pp. 64–84). Useful studies of the gospel as a Hellenistic literary genre are G. N. Stanton’s *Jesus of Nazareth in New Testament Preaching* (London, 1974), pp. 117–136, and Charles H. Talbert’s *What Is a Gospel? The Genre of the Canonical Gospels* (Philadelphia, 1977). A good introduction to Luther’s understanding of the difference between law and gospel has been given by Gerhard Ebeling in chapter 7 of his *Luther: An Introduction to His Thought* (Philadelphia, 1970).

RAYMOND F. COLLINS (1987)  
*Revised Bibliography*

**GOZAN ZEN.** The Japanese term *gozan* (also pronounced *gosan*; Chin., *wushan*; “five mountains”) refers to a system of monastic organization and its associated culture that flourished in Song-dynasty China and medieval Japan. Because many Buddhist monasteries in premodern China and Japan were located on mountains and conceived of as being secluded from the world, the word *mountain* came to connote a monastery. The “five mountains” were a designated group of Zen (Chin., Chan) monasteries. Gozan organization began to develop in China during the Song dynasty (960–1279) and was transmitted to Japan during the Kamakura period (1185–1333). These monasteries developed a

distinctive pattern of Zen monastic life, a common organizational hierarchy, and a characteristic cultural style. Thus the expression “five mountains” is also applied to the literature produced by monks from these monasteries (*gozan bungaku*), the wood-block books printed in these monasteries (*gozan-ban*), and the art and culture associated with them (*gozan bunka*). This article will outline the development of the Gozan administrative organization, define the Gozan style of Zen, and introduce Gozan literature and culture.

As with Zen itself, Gozan organization, learning, and culture had their origins in China, and throughout their history in Japan the Gozan monasteries remained major conduits for the dissemination not only of Zen but also of Chinese culture in the broadest sense. During the Song dynasty some fifty large Chan monasteries in the Hangzhou and lower Yangze regions of China were brought under the regulation of civilian officials and organized into a three-tier hierarchy headed by five great monasteries (*wushan*; Jpn., *gozan*). These were among the most prestigious Chan training centers in China. They were visited by such Japanese monks as Eisai, Dōgen, and Enni, who went to China in search of Zen beginning in the late twelfth century. From the mid-thirteenth century on, Chinese monks from these monasteries, fleeing the advancing Mongols and seeking a new mission field for Chan, made their way to Japan, where they were patronized by shoguns, provincial warrior chieftains, and members of the imperial court.

Before the close of the thirteenth century a similar three-tier hierarchy of Zen monasteries was beginning to take shape in Japan under the patronage and regulation of the Hōjō regents who dominated the Kamakura *bakufu*. The early Kamakura Gozan included Kenchōji, Engakuji, and Jufukuji. Jōchiji and Jōmyōji were added later. With the overthrow of the Kamakura *bakufu* in 1333, the Kemmu Restoration of 1333 to 1336, and the establishment of the Muromachi *bakufu* after 1336, political power shifted back to Kyoto. A Kyoto Gozan hierarchy was quickly designated by the emperor Go-Daigo and the early Ashikaga shoguns.

The Gozan network assumed its final configuration, although by no means its full scale, under the third shogun, Ashikaga Yoshimitsu. By an edict of 1386 the five Kyoto Gozan, ranked in order of seniority, were Tenryūji, Shōkokuji, Kenninji, Tōfukuji, and Manjuji. Their counterparts in Kamakura were Kenchōji, Engakuji, Jufukuji, Jōchiji, and Jōmyōji. The great Kyoto monastery of Nanzenji was set at the apex of the Kyoto and Kamakura Gozan as a superior temple. Lesser Zen monasteries in Kyoto, Kamakura, and throughout the provinces were ranked beneath the Gozan as either *jissatsu* (“ten temples”) or *shozan* (“many mountains”). Just as the Gozan category had been inflated from five to eleven monasteries, so too the *jissatsu* and *shozan* tiers grew rapidly in number. By the fifteenth century there were nearly fifty *jissatsu* and more than two hundred *shozan*.

This network was a fairly centralized system with uniform monastic regulations and organization and with close

links maintained between the Gozan in Kyoto and Kamakura and their satellites in the provinces. Monks could move fairly freely among the monasteries, and a novice who began his religious career in a provincial *shozan* might continue his training in a larger regional *jissatsu* and, perhaps, go on to hold high office in a central Gozan. The whole network was supervised by a Zen monk official, known as the *sōroku*, from a subtemple within Shōkokuji. The *sōroku* served as the mediator between the *bakufu* and the Gozan. Not all Zen monasteries were included within the Gozan. The Gozan system was dominated by those branches of the Rinza school, especially the lineage of Musō Soseki, who found favor with the *bakufu*. Very few Sōtō Zen monasteries were included, and the Rinza monasteries of Daitokuji and Myōshinji were excluded.

Zen monastic life within the Gozan was lived under the traditional Buddhist monastic precepts and characteristic Zen regulations known as *shingi* (“regulations for the pure community”). Gozan Zen practice in Japan was based on the codes in force in Chinese Chan monasteries and shaped by such Chinese émigré monks as Lanqi Daolung and Wuxu Zuyuan in the thirteenth century, and their successors Musō Soseki, Gidō Shūshin, and Zekkai Chūshin in the fourteenth century. The core of monastic life was communal meditation in the monks’ hall, private and public interviews with a Zen master involving the resolution of *kōan*, lectures on the sūtras and Zen texts in the Dharma Hall, and prayers and sūtra chanting in the Buddha Hall. In the late Kamakura and early Muromachi periods the standards of Gozan monastic life were fairly strictly observed. By the fifteenth century, however, a slackening of discipline was becoming evident as monks took the privilege of the great monasteries for granted, neglected the rigorous practice of Zen, and devoted themselves to more worldly interests or to cultural activities. The monk Ikkyū Sōjun was so disappointed that he quit the Gozan in disgust and joined the Daitokuji community. He castigated Gozan monks, calling them idle rice bags who were concerned only with eating well and living comfortably.

Many Chan masters of the Song dynasty had consorted with lay scholars and artists, whose cultural interests they shared. Chan monks became well known as calligraphers, painters in ink monochrome, poets, and students of Chinese philosophy. Some masters rejected these non-Buddhist avocations as distractions from the true quest for enlightenment through Chan. Other monks defended them as legitimate means of expressing, enhancing, or relaying the insights of the search for enlightenment. These cultural interests were too strong to contain and the acquisition of secular learning and cultural accomplishments became a part of life in the great Chinese monasteries. These tastes were quickly transmitted to the Japanese Gozan, where they served to draw the Zen monks and their warrior and court patrons more closely together. Calligraphy and the writing of Chinese poetry were the two most common avocations, but Gozan monks were also accomplished ink painters, designers of gardens and

buildings, arbiters of taste in art objects, interior decoration, and the advocates of drinking tea, as well as teachers of Confucian and Daoist thought.

Under the patronage of the *bakufu*, the court, and the provincial warrior nobility, the Gozan system flourished economically. Gozan monasteries acquired estate holdings throughout Japan. The Kyoto Gozan, in particular, were active participants in trade with China, in commerce, and in money lending. The bursars of some monasteries acquired reputations as astute managers of resources and lands. Politically, Gozan monks were active in defense of their monastic interests. They lent their managerial and diplomatic expertise to warriors, serving as advisers and go-betweens in domestic disputes and in the conduct of diplomacy and trade with China. By the fifteenth century, the Gozan was much more than a network of monasteries. It could be counted among the most influential and powerful religious, political, and economic institutions in medieval Japanese society.

The weakening of the Muromachi *bakufu* and the warfare of the late fifteenth and sixteenth centuries exposed the Gozan to depredation. Many monasteries were burned or lost their landholdings. Communities were scattered, morale was reduced to a low ebb, and spiritual concerns were neglected. Although some recovery took place under the patronage of Hideyoshi and the Tokugawa shoguns, the Gozan never recovered the influence it had had in the medieval period. Perhaps the last prominent Gozan monk was Ishin Suden of Nanzenji, who served both as *sōroku* of the Gozan and as an influential adviser to Tokugawa Ieyasu.

Many of the former Gozan monasteries survive today, some of them as Zen training centers. Among these are Nanzenji, Shōkokuji, and Tenryūji in Kyoto, and Engakuji in Kamakura. The Gozan system, however, as a monastic hierarchy and means of regulation and centralization faded out with the Meiji Restoration. Contemporary Zen monasteries are grouped by lineage around their major monasteries (*honzan*). Moreover, contemporary Rinzai Zen owes more to Hakuin Ekaku (1686–1769) and the Daitokuji and Myōshinji lineage than it does to the medieval Gozan.

*Revised Bibliography*

**GRACE.** The religious significance present in the Anglo-French word *grace* is both multifaceted and ambivalent. As a theological term, it may attempt to pinpoint the activity of God here and now, or it may disclose nothing less than the reality underlying all of religion and faith.

This almost transparent term points to the fundamental power and horizon of every revelation, to the ultimate religious question and statement in any religion, for grace stands primarily not for human virtue but for God's presence. Grace is a divine activity in human history and in human lives. The reality signified by *hesed* ("loving-kindness") in the Hebrew scriptures and by *charis* ("grace") in the Greek scriptures can be found in the Dao, in the power of the Hindu triad, and in the radical absence contemplated by Buddhism. Occasionally one can find in these other traditions the same theological discussions about the mediation by grace of the divine in human freedom and suffering.

Christian theologians have filled volumes with definitions and classifications of grace. Because God remains mystery, the ineffable presence of the deity eludes precise definition, and therefore the ultimate meaning of the word remains mysterious. In theology, as distinct from the expression of religion in art (where grace is shown rather than defined), the word *grace* frequently denotes either too much or too little.

Moving back through the Latin *gratia* to the Greek *charis*, with its overtones of graciousness and liberality, the word *grace* assumed a Christian theological importance with Paul. But even for Paul, whose creative interpretation of Christianity began the turbulent odyssey of this term, the word has several meanings. *Charis* can mean a power coming from the spirit of Jesus active in a Christian (the charism of healing or preaching; *1 Cor.* 12), but it can also mean the power of God to help one follow Christ despite the evils and difficulties of human life. And with Paul there is also a more objective meaning of grace. The foundation of all grace and of all graces (charisms) is the generous saving activity of God manifested toward humankind in the history and destiny of Jesus. God's grace is the gift of persevering, loving, purposeful generosity that becomes visible in a climactic way in the life, teaching, death, and resurrection of Jesus.

*Charis* means the favor of God, but that favor made active in the advent of Jesus Christ, particularly so in his words and deeds. God's loving generosity in Christ bestows not only forgiveness of sin but a new, death-surviving mode of existence. Jesus Christ is grace objectified, and in and after him the worlds of creation, time, and human personality have been radically (if invisibly) altered. Paul applied Jesus'

phrase “the kingdom of God” largely in a concrete manner to Jesus himself, particularly through the triumphant guarantee of newness assured by Jesus risen from the dead.

In a significant phrase, Paul proclaims that while sin inevitably leads to death, the *charisma* of God to humanity is “eternal life in Christ Jesus” (*Rom.* 6:23). The following chapters of that letter describe this *charisma*: new freedom, familial intimacy with God, the capability to follow the new “law” of love, the indwelling of the Holy Spirit in men and women, and God’s advocacy on behalf of needy individuals (*Rom.* 8). Personal entry into this life is begun by baptism conceived as rebirth in Christ’s death, burial, and resurrection. The event of Easter has both personal and cosmic results.

A final realization of *charis* for Paul comes from this very baptismal life. The new life of grace is not only a divine favor and an adoption but also a commissioning for action. *Charismata*, charisms, are powers of the Holy Spirit active in mature Christians, empowering them to act on behalf of the reign of God and the life of the church. Christians are not passive. Each Christian has through the baptismal spirit some active gift to aid the church either inwardly or in its mission of service and evangelization. Drawing on his metaphor of the body, Paul faces the difficult challenges of diversity and unity in the young churches and of leadership amid a variety of services. Nonetheless, Paul will not abandon this final realization of the new presence of God where grace continues through time to be present in human life and ministries of service (*Rom.* 12, *1 Cor.* 12).

#### **HISTORICAL DEVELOPMENTS IN THE THEOLOGY OF GRACE.**

Eastern Christian theology was heir to thought forms of human participation in the divine and subsequently emphasized less the evil and ruinous counterpart to grace than the almost mystical capacity of the human person to become, through grace, a participant in the life of the triune God. In the first two centuries of Christianity, the church was largely Greek-speaking. However, by the end of the second century, with the influence of Tertullian in the West and Clement of Alexandria in the East, Greek and Latin theology had begun to take distinct directions. In the more Hellenistic, Neoplatonist world of the Eastern Empire the seeds of the New Testament teaching about a new creation, a new man and woman, and a human being who is the temple of the spirit of God found fertile soil.

The school of Alexandria in the third century, the great bishop-theologians of the fourth century, and monasticism and mysticism in the fifth to eighth centuries solidified and concretized Eastern theology—a theology of trinitarian, divinizing grace renewed by Christ. In the East, Manichean dualism and the Augustinian theology of a God redeeming a segment of the fallen world were overshadowed by a view owing much to Neoplatonism, which envisioned a single world in which the divine plan and presence was intertwined with creation and the Trinity continues that plan and presence through the effects of redemption.

After the sporadic but often intense persecution in the second and third centuries, the role of baptism as a commission for an eschatological life related less to the fading idea of martyrdom than to the newer opportunity of communal eremitical monasticism. Some monastic figures stressed the ascetic side, others the contemplative. With schools and theologies influenced by orientations based in the thought of Origen and Dionysius the Areopagite, the monastic life became a school of contemplation fulfilling in a special way the Christian vocation. Far from being simply training for visions and miracles, monasticism viewed grace as the seed or enabler of a God-bestowed contemplative outlook that, as it intensified, fostered not visions but apophatic faith in touch with the darkness of the divine essence. Furthermore, in the Eastern Christian churches, the liturgy became the sacramental place where grace reaches the concrete; in the liturgy, the social and the historical meet contemplatively the timeless icon, hymn, and sacrament of worship.

In the West, Christianity came to emphasize salvation from sin. With Augustine grace took on characteristics of an intermediate power sent from God to heal the effects of evil in human beings. Augustine’s life and conversion led him to emphasize sharply the human person’s proneness to evil and corresponding need for some divine assistance so that men and women might turn to God in faith and hope and to their neighbors in mercy and love. With Augustine, grace appears in a triad along with freedom and evil. Human freedom can mean freedom to choose this or that, but more often it means the freedom to choose God as the personal ultimate in a life. Evil can mean the fallen human condition—characterized, for example, by prison camps—or it can mean the personal realization of evil in a sinful act.

Within Western Christianity the history of the controversies over grace illustrate the changing and perduring meanings of the word. In the first decades after Christ Paul asserted, against Jewish or Christian groups who based their hopes on external religious observances, the free and open salvation made widely accessible by God’s recent entry into human history. Augustine upheld against the ascetic Pelagius (whose view of the positive capacity of human nature made a strict following of the Christian way more plausible) the pervasive infection of the primal fall. Augustine considered human choice without grace to be enchained, bereft of the contact of a divine activity (namely, grace) by which one could please and live for God. In Augustine, conceptions of the fall, the human sinful condition, and original sin describe the opposite of salvation, of true goodness and life. The view of the nature of grace as an intermediary, as a quasi entity of divine promise and power, began to appear.

In the thirteenth century, Thomas Aquinas, who was at work on his synthesis of nature and society with Christian teaching, disagreed with his Augustinian colleagues over the need for grace. Thomas defended the natural potentialities of the human personality to do their work—to know the truth, to seek the good. He considered original sin to be a

serious wounding of the personality from within the emotions and the ground of the will but not an irrevocable termination of the image of God. He brought back into Western thinking the spirit of the Alexandrian school, a synthesis of nature and grace where every aspect of creation and grace has the potential to find its place in a harmonious whole.

Martin Luther, propelled by his rediscovery of Augustine and Paul, protested against the localization of divine power in things (e.g., indulgences and noncommunal liturgy) and denied that the forms and laws of the church had a monopoly over grace. Luther's theology of justification by faith permitted him to disengage grace from human control and to return its meaning to God alone. Despite the extrinsic nature of grace for Luther and its initial separation from virtue and service, it would not be correct to view Luther as unconcerned with progress in the Christian life, that is, with sanctification. For Luther, the Christian life is different from the life of sin: The Christian life is lived as the product not of law and effort but of an initial constituting and saving (justifying) grace. Calvin selected other emphases for his Reformed theology of grace, particularly God's sovereignty manifested in the divine transcendent plan for the elect.

The Reformation began a long period filled with controversies over the nature of grace. Essentially these were arguments over how human freedom in need of redemption was affected by truly divine grace. If grace is God's act or the exercise of God's power, how do the finite and the created participate in it? How can predestination and human freedom be reconciled?

The great topic of Baroque Roman Catholic theology lasting for almost two centuries after the middle of the sixteenth century was grace conceived as a finite, God-given force that converts, sanctifies, inspires, and saves. Corresponding to the culture of the times, with its new empirical science and Cartesian philosophy, grace had the characteristics of the subjective, the mechanical, and the theatrical. Italian and Middle European art and architecture of the period were frequently statements of a cosmic and mystical theology of grace: In a sacral world of light and golden divine symbols, great saints were depicted in their triumphant lives.

For Protestant communities as well as for Catholic religious orders the seventeenth and eighteenth centuries were times of meticulous theological analyses of grace. Strongly held views on God's action and human psychological response (both at the time of conversion and during the span of a Christian life), similar to those of the Jansenists, Jesuits, and Dominicans, brought into existence Arminians, Methodists, and Pietists who debated the triad of divine action, human freedom, and sin.

The spirituality of the Jesuits reflects the Baroque (and later nineteenth-century) Catholic devotional analysis of the interior life as activated by modes of "created grace," that is, God as the principle of human transformation rather than God as God ("uncreated grace"). In the seventeenth century,

the Jesuits, providing leadership to the Counter-Reformation, found themselves embroiled in controversies over freedom and grace on three fronts. The origin of the Jesuits' positive view of human efforts cooperating with grace lay with the great Reformation theologies. Within Roman Catholicism, the Dominicans judged the Jesuits' theory of human freedom to be exaggerated and their theology of divine foreknowledge to be inadequate, while the followers of Michel de Bay (Baius) and Jansen asserted that the Jesuits neglected the seriousness of original sin.

As the eighteenth century progressed, such theological controversies seemed dated and were swept aside by the rationalism and naturalism leading to the Enlightenment. If human nature was good, wounded by the past structures of society, it needed not a divine jostle but its own education to pursue the good. Grace is transformed, even replaced, by the human mind and will, a nature awaiting cultivation, and even by human history, where religion should be viewed as a facet of reason.

Nineteenth- and twentieth-century philosophy provides a different interpretation of the active presence of God in history and life. The movement from Schelling and Hegel to Marx saw no need to preserve any separation of grace from nature and sin. Consciousness, freedom, and development become aspects of one reality, the enactment of the life of the ultimate, and in that process of enactment there is no supernature above nature.

After World War I some theologians began to rethink Christianity precisely as a religion of grace, but from modern perspectives on the self and freedom. Grace was viewed as a horizon of consciousness and history, as the challenge made by the holy against the demonic in life. Grace is the presence rather than the mechanics of God. For Paul Tillich, all aspects of human life could be theonomous, that is, transparent to the divine, rather than authoritarian or superstitious. As symbols of God, nature, religion, and art inspire a new being in believers, one that struggles with the problems of meaning, life, and morality. For Tillich's Roman Catholic counterpart, Karl Rahner, grace was no less than God as horizon and presence. God's activity in human life and history is universal and actively draws the world to a future that is the plan and future of God. Human life, open to and vivified by grace, is realized, preached, and exemplified particularly in Christ. Pierre Teilhard de Chardin, the Jesuit paleontologist, was convinced that the ultimate force driving the threads of evolution—spiritual as well as biological—on earth was not instinct but grace. What the *Gospel of John* calls *agapē*, love, is in Christ the source and the goal of the cosmos. For Teilhard, religious history, like evolutionary history, is acted out over a long time. From the great religions of the world a central line emerges—that of Christ as the incarnation of God's gracious purpose. In the contemplation and discipleship of grace, a higher, developmental phylum introduces to the human race individuality-in-community and freedom-in-charity. Rather than the end of the world being

close, the human race, for Teilhard, is only a few steps out of the cave.

In the thought of these three popular twentieth-century theologians, Tillich, Rahner, and Teilhard, one sees the modern, post-Kantian, and post-Heideggerian shift to the historical subject. Grace is both a divine presence and a developmental horizon of all history; Christ and the church are grace manifest, but they are not its exclusive repositories. In short, grace is viewed no longer as the change of God's will (Luther) or as a supernatural divine power agitating within human minds and wills (Council of Trent, 1545–1563), but as the patient, luminous, inviting presence of a transcendent and mysterious God intimately active in the pain and glory of life.

**PROSPECTS IN THEOLOGY OF GRACE.** Reinterpretations of grace reestablished grace as nothing less than the underlying reality of all religious enterprises, as the very presence of God. In this way it is the foundation for various schools of spirituality—Origenist, Greek and Russian, Benedictine, Franciscan, Dominican, Anabaptist, Carmelite—but it also confronts and stimulates Christian ethics to put greater emphasis on issues of peace and justice in the world. Grace is perceived as the axis along which the kingdom of God confronts institutionalized evil.

The ecumenical movement, which began as the mutual acceptance of Christian churches—Protestant, Catholic, Anglican, and Orthodox—gradually discovered through scholarly investigations a remarkable lack of conflict between, for example, Luther's and Thomas Aquinas's interpretations of grace, and between Trent's and Karl Barth's. There are fewer doctrinal and theological differences than first assumed. Drawing on the tradition held by mainstream Christianity that God's active presence reaches an incarnation and a climax in Jesus Christ but is not monopolized by Christ, Christian theologians such as Karl Rahner and official Christian assemblies such as the Second Vatican Council have increasingly acknowledged the presence of grace in other world religions and in the struggles of individual lives in increasingly secular and agnostic contexts. For example, dialogue between Christianity and Buddhism is now not simply an exchange of similar words about ritual or theodicy but an exploration of different presentations and explorations of grace in speculative, monastic, and mystical traditions.

Realms as diverse as art, politics, and monasticism disclose different approaches to what Jesus called the kingdom of God and to what the history of Christian theology calls grace. In the realm of art is found the presentation in various media of the primal dialectic between sin and grace. Here grace emerges from the dramatic reiteration of an active unseen presence that reveals "the more" and its opposite, the violent exploitation of the holy, the beautiful, and the human. The structure of Gothic architecture, the oils of Fra Angelico and the engravings of Rembrandt, the formation of light by the Baroque, the planned abstractions of Kandinsky (which are there to make real "the realm of the spiritual")

are struggles with the horizons of the holy, of the spiritual, of grace. Such novelists as Fyodor Dostoevsky, Graham Greene, Georges Bernanos, François Mauriac, and Flannery O'Connor have often had evil and grace as their themes. In such works, grace challenges in the most surprising ways the conventions of religion and society, and evil is presented as the almost necessary counterpoint to grace. Life becomes a chiaroscuro of evil and grace.

The Christian theological term *grace*, then, can refer at the same time to the most abstract dimension of religious power or human transcendentality and to the blood and sweat of ordinary everyday life. The record of theological controversies over grace illustrates its prominence as a religious problem and its ultimate mystery. The core of that mystery is God as active in history and in every human life.

**GRAEBNER, FRITZ** (1877–1934), German ethnologist, was born on March 4, 1877, the son of a schoolteacher in Berlin. Graebner attended school in Berlin from 1887 to 1895 and studied history, German philology, and geography, and other subjects (especially ethnology) at the universities of Berlin and Marburg (1895–1901). In 1901 he received his doctorate in philosophy at Berlin with a dissertation on medieval history. By this time he was already employed at the Berlin Museum of Ethnology as an auxiliary scientific assistant.

In 1906 he transferred to the museum of ethnology in Cologne (called the Rautenstrauch-Joest Museum after those who endowed it), became a full assistant there in 1907, and the museum's director in 1925. In 1911 he qualified as a privatdocent at the University of Bonn. His work was interrupted by his capture in Australia at the outbreak of World War I; because he was German, he was kept prisoner there until 1919. In 1921 he was appointed professor extraordinarius at Bonn and in 1926 became an honorary professor at the University of Cologne. However, he was unable by this time to lecture any longer, because he was already suffering from a serious illness that soon made all scientific work impossible. He retired in 1928 and returned to his native city, Berlin, where he died on 13 July 1934.

Graebner's fields of specialization were the cultures of Oceania and Australia. He first became generally known in the field of ethnology through his 1904 lecture "Kulturkreise und Kulturschichten in Ozeanien," which was delivered at a meeting of the Berlin Society for Anthropology, Ethnology, and Prehistory and published in *Zeitschrift für Ethnologie* 37 (1905). (Bernhard Ankermann, a colleague of Graebner, delivered the lecture "Kulturkreise und Kulturschichten in Afrika" at the same meeting.) From then on, Graebner produced numerous detailed studies that dealt with, among other things, themes of social organization and spiritual culture (thus it is wrong to consider him merely a "museum ethnologist" who concentrated in a one-sided way on the material aspects of culture). In these studies he made broad comparisons that ranged throughout the world. Contesting the theories, prevalent at the time, of the more or less unilinear evolution of culture and the "elementary idea," Graebner

(in his first book, *Methode der Ethnologie*, 1911) took up ideas first espoused by Friedrich Ratzel and Leo Frobenius and developed the culture-historical method. This method seeks to bring cultural-historical processes to light even where written sources are lacking or insufficient. To this end, Graebner's method begins with particular facts and seeks to establish "culture circles" (*Kulturkreise*), then to infer from the geographical locations of these complexes their "culture strata" (*Kulturschichten*), that is, the relative ages of cultures and their reciprocal influences, and, finally, to uncover the origins of individual cultures.

Because a culture circle must comprise all the necessary categories of cultural life, including religious ideas, Graebner also took up certain problems of the history of religions. He rejected speculations that traced all religious manifestations back to a single primordial phenomenon (e.g., animism or belief in magic); he subjected the theories of E. B. Tylor and James G. Frazer to detailed criticism and sought, unlike them, to bring to light the religious phenomena typical of individual culture circles or, as the case might be, larger cultural groups. Thus he regarded patrilinear and matrilinear cultures not as phases of a single standardized development but as independent cultural forms that coexisted with each other; he established, for example, that animism, worship of the dead, and lunar myths played a greater part in matrilinear cultures, whereas belief in magic and sun myths were more important in patrilinear cultures. He discussed this system (which was in large measure taken over by Wilhelm Schmidt) in many essays on specific topics, in the relevant sections of his comprehensive presentation of ethnology ("Ethnologie," in *Die Kultur der Gegenwart*, edited by Paul Hinneberg, 1923) and in full detail in his final major work, *Das Weltbild der Primitiven* (1924). In this last book he represented the religious ideas of nonliterate peoples as the points of departure for the religions of the high cultures and for subsequent philosophical systems.

*Translated from German by Matthew J. O'Connell*  
*Revised Bibliography*

**GRAIL, THE.** Late in the twelfth century, a mystic theme appeared in Western literature that was fast taken up as the central feature of chivalric romances with a religious message and appeal. The key image of the theme is “the Grail,” or, frequently, “the Holy Grail,” which is still a metaphor for spiritual salvation and the goal of a quest by the elect. As a religious concept the Grail is of interest for having served, for about one century and in the context of contemporary civilization, as a symbol with, in social terms, a strongly aristocratic connotation. The two pivotal works of the Grail cycle, *Conte del Graal* (or *Perceval*) by Chrétien de Troyes and *Joseph d'Armathie* (or *Roman de l'estoire dou Graal*) by Robert de Borron, were dedicated, respectively, to Count Philip of Flanders and Count Gautier of Montfaucon, both feudal lords, both Crusaders who died in the Holy Land.

**THE FORERUNNER: CHRÉTIEN'S GRAIL PROCESSION.** It is widely accepted that the earliest appearance of the Grail theme is in Chrétien's *Conte del Graal*, written in the late eighties of the twelfth century but left unfinished, probably because of the author's death. The relevant narrative is concentrated in two brief scenes, the one set in the “Grail Castle,” the other in the “Hermitage.” An innocent young knight, unaware of the realities of life and aimlessly wandering, is directed by a mysterious fisher to a mysterious castle. In the hall he meets the same fisher, the “Fisher King” and lord of the castle, an invalid bound to his couch. The youth then sees a strange procession passing by, full of symbols: a squire with a white lance, from which a drop of blood falls on his hand; two squires bearing golden candelabra; a noble maiden carrying a *graal*, a receptacle set with precious gems and shedding a brilliant light; another maiden with a platter of silver. The young knight, who has not yet matured enough to fulfill his destiny and who overrates the chivalric virtue of silence, does not ask the question of charity expected of him, “Who is served with the *graal*?” He thus fails to meet the test that would have restored the ailing Fisher King and the wastelands surrounding him. When he awakens the next morning the spell has disappeared, the castle is empty, and he resumes his wanderings, now in search of the lost castle. After five years he is directed to a hermitage and begs help from a holy man, who consents to the repentant's desire for salvation. The Fisher King, he learns, is his uncle, whose father's life was sustained by a Host brought to him in the Grail.

**CHRISTIANIZATION OF CHRÉTIEN'S PROTOTYPE.** Soon after Chrétien, in whose Grail fragment Christian doctrine is handled in rather ambiguous terms (as pointed out by Leonardo

Olschki, 1966), the topos is again taken up and transformed into the central feature of a spiritual, and ever more Christian, body of literature. The following titles exemplify the genre.

Robert de Borron (late twelfth to early thirteenth century) is the author of *Joseph d'Armathie*, written in verse and, somewhat like a Christian legend, based on apocryphal gospels, the *Evangelium Nicodemi* and the *Vindicta Salvatoris* (Vengeance of the Lord). Joseph, thrown into prison, survives thanks to the *veissel* in which Christ, during the last supper, instituted the Eucharist and in which his blood was gathered during the passion. The symbolization has taken a sharp turn: The Host, which was the content of the Grail in Chrétien's story, is here replaced by Christ's holy blood, and the vessel itself has changed into the chalice of the sacrament. Borron, furthermore, links the evangelization of Britain with the transfer of the Grail to the West.

A prose version of *Joseph d'Armathie*, named *Didot-Perceval* (after the manuscript collection in which it is preserved) and attributed to the same Robert de Borron, is patterned after Chrétien yet has a distinct religious reinterpretation of the happenings: The Grail of the procession, for example, becomes the receptacle of the last supper, and Perceval, if he passes the test, will become the guardian of Christ's blood.

*Perlesvaus*, a prose text (written between 1191 and 1212), blends a chivalric romance with a Christian allegory, strongly in the Cistercian spirit. Here the Knights of the Grail have become knightly monks.

A group of five romances in prose, attributed to Walter Map and called the Vulgate Cycle (1215–1230), was the most popular of the Grail versions. Among them are the *Estoire del Saint Graal* and the *Queste del Graal*. In these stories the quest of illustrious knights for the Grail is told in terms of expiation and redemption, election and rejection. The Christianization is emphasized by changing the carrier of the Grail, according to sacramental usage, from a woman to a man. The knights' worldly virtues have been replaced by chastity and charity. The Grail, now the goal of the quest, symbolizes the blending of the two worlds of contemporary civilization, knighthood and religion.

**THE ELUSIVE GRAIL.** The corpus of the Grail romances raises questions that, in general, are unanswerable. The Grail itself has remained a riddle: Its shape varies from vase to cup to dish to stone; the use is that of a talisman or a reliquary; its symbolic meaning shifts with the context. By the middle of the twelfth century the term appears in the western French dialects, still marked by the indefinite article as a common noun (“a grail”). This is also the way Chrétien uses it. But already in his prologue, and from Borron on, it is commonly used as a proper name, “the Grail.” The derivation of the word itself is still hypothetical. There is a consensus on a base form *gradalis*, but the consensus stops at the root morpheme of *gradalis*: It has been variously identified as *gradus* (“degree,

step”), implying that food was placed in the vessel “step by step”; as *cratis* (“wickerwork”) or *creta* (“fuller’s earth”), both of which hint at the material used in making the receptacle; and as *cratus*, a shortened tenth-to-thirteenth-century Latin form of the Greco-Latin *crateral/craterus* (“crater”), secondarily expanded by the suffix *-alis* in analogy to other words for vessels, such as *baucalis* and *garalis*.

The long history of exegesis, striving to bare the issue of the myth, has been moving in two directions. The one is synchronic: It relates a work to the events and currents of its time and thereby aims to discover the meaning (*sens*) a story may have had for its contemporary public. The other direction is diachronic: It centers on the subject matter (*matière*), which it locates in a tradition and which it derives, as far as possible, from specific models. Knowledge of the model highlights the “message” of the work.

**THE SYNCHRONIC VIEW.** The impact of the contemporary world on the Grail corpus and, above all, on Chrétien’s *Conte del Graal* has been traced to religious diversity and policy, upper-class education and ethical perceptions, and to events of historical import. Various interpretations follow.

1. The objects carried in the ceremonious procession before the Fisher King, such as the Host in the Grail, the bleeding lance, and the candelabra, have been explained as echoes of the eucharistic procession practiced in the Byzantine Mass (Konrad Burdach, William A. Nitze).

2. The extensive Christianization manifest in the *Queste del Saint Graal* has been interpreted as a reflection of Cistercian mysticism, specifically that of Bernard of Clairvaux (Albert Pauphilet, Étienne Gilson).

3. The spiritual structure of the *Conte* is related to ideas current at Chartres, the Western center of the twelfth-century Renaissance. Chrétien realizes in his work what Bernard Silvester, the humanist, requested of a true author: “Being a philosopher, he has to write about the nature of human life.” And Chrétien has created in Perceval a character motivated by the two forces of theology and charity, from which the Fisher King and the wastelands expect their redemption (Leo Pollmann).

4. The legend implies a heretical attempt (Nitze speaks of its “heterodox tinge”) to fight the supremacy of Rome and to replace Rome’s propaganda of the doctrine by another authority (Giulio Bertoni).

5. The Grail myth is considered a militant allegory, inspired by the activity of Count Philip of Flanders, against the heresy of the Cathari and other dualistic sects; the father of the Fisher King is the Perfect Man of Catharism (Otto Rahn, Leonardo Olschki). To Olschki, the castle, representing the dualistic beliefs, is contrasted to the hermitage, which stands for Christian orthodoxy; and Perceval does not yield to the lure of the former but embraces the true faith of the latter.

6. Chrétien’s *Conte del Graal* is an *Erziehungsroman*, a novel of education, describing the military, chivalric, spiritu-

al, and religious formation of Perceval, the perfect knight and the perfect Christian (Martín de Riquer). Specifically, because Perceval displays traits of Prince Philip Augustus, the *Conte* seems to have been designed as a “mirror of princes,” sponsored by Philip of Flanders to further the education of his royal godson and pupil, the future king (Rita Lejeune).

7. Perceval symbolizes the two virtues of prowess and charity (defined as “love of God”), and charity finally prevails over prowess (David C. Fowler).

8. The decadence and fall of the kingdom of Jerusalem function as a starting point. An analogy can be drawn between the concept of the Crusades and the religious theme of the Grail: The quest for and conquest of a Christian ideal is transferred to the elect in a castle of mystery. The construct of defeat and renewal represents an underlying exhortation to persevere in the Crusades (Helen Adolf).

9. The quest for the Grail is the conversion of the Jewish Temple, intended to offset further bloodshed of the Jews by fanatic Crusaders. Chrétien was working against the hatred of the Jews (Urban T. Holmes, Jr., M. Amelia Klenke).

10. The Grail procession was inspired by representations in Christian art of the Crucifixion, with such figures as Longinus, the carrier of the lance, and a beautiful young woman who gathers the blood of Christ in a vase; she in turn becomes an allegory of the church who brings the Eucharist to the Old King (Riquer). Similarly, Klenke relates the objects of the procession to the cathedral art of contemporary France.

11. According to C. G. Jung’s depth psychology, the vessel is not a historical reality but an idea, or primal image, and as such is of universal significance, found in untold numbers of myths and legends.

**THE DIACHRONIC VIEW.** The supposed models of the Grail romances vary widely as to provenance and genre. They include specific paradigms such as the Indic Vedas, an Iranian national epic, the Alexander legend of late antiquity. But three great traditions of medieval culture are now recognized as the dominant influences: Christian legends, Celtic folklore, and ancient rituals.

**Christian legends.** The hypothesis of a Christian foundation of the Grail myth centers on the objects in the Grail procession. The apocryphal gospel *Vindicta Salvatoris* contributed a cardinal episode to Robert de Borron’s version: that of the elect, Joseph of Arimathea, kept alive by a vessel—an image deeply noted in Christian tradition. Once in existence (as Willy Staerk points out), the Grail blended with the varying perceptions of the last supper in early Christianity. Staerk recognizes five connotations of the Grail: vessel with Christ’s blood; receptacle of the last supper; calix of the first Eucharist; receptacle of the Host; calix in which the first Mass was celebrated. The image of the lance, too, was embedded in the Christian tradition: It is the lance with which Longinus, a pagan soldier and Christian martyr, opened the side of the crucified Christ (*Jn.* 19:34). Longinus turned into

the hero of a legend (Burdach). The third object, the silver plate (*tailleur d'arjant*), has been repeatedly identified as the paten on which the calix of the Last Supper was placed. Some analysts question the assumption of an underlying Christian model and see Chrétien's *Conte*, the first medieval form of the Grail story, as still "pré-Christianisé" (the term used by Pierre Gallais). They see in Robert de Borron's Christian version an *ex post facto* reconstruction of the myth's "early history," produced with the aid of pseudogospels.

**Celtic folklore.** Because the Arthurian world provides the milieu for the Grail romances, the repeated attempts to derive features of the myth from Celtic lore are certainly justified. Irish sagas and Welsh tales, it is assumed, were taken up by Breton storytellers, who adapted their themes to the French environment. The Grail objects are among such themes: The magic horn of the gods, the wish platter, and the horn of plenty anticipate the Grail, and the spear of Lugh, either dripping blood or held before a caldron of blood, returns in Chrétien's bleeding lance. Above all, one character vital to the narrative, the Fisher King, has his Celtic counterpart: The maimed king, his wound, and his wastelands reflect the pagan belief, transferred into Celtic lore, that the reproductive forces of nature were related to the sexual potency of the ruler (R. S. Loomis, William A. Nitze, Emma Jung and Marie Louise von Franz).

**Ancient rituals.** The Grail myth in its sundry versions can be read as a saga of nature worship (Jessie L. Weston). The mythic prototype discernible behind it is the ancient cult of Adonis, the deity linked to vegetation and fertility and symbolizing the fading and rebirth of nature. He was the lover of both Persephone, goddess of death, and Aphrodite, goddess of love, and thus always on his way from death to life, and from life to death. Proceeding from there, Weston interprets the episodes and characters of the Grail story in terms of a nature ritual: The maimed Fisher King, deprived of his reproductive powers, is to be restored to life by the fulfillment of the quest, and thus is an analogue of the wastelands; cup and lance are the sexual symbols of female and male, just as blood stands for life; the Grail, by providing the sacramental meal, represents the source of life.

Following a similar line of thought, Nitze senses behind Perceval's story, with the decisive role of his mother and the nonrole of his father, echoes of a matriarchal system; and he sees in the suffering of the Fisher King and his land, to be ended by the initiate's (at first unasked) question, the key to the Grail procession: the restoration of life and vegetation. This leitmotiv is prefigured (without, as Nitze emphasizes, an immediate connection) in ancient ceremonies such as the Eleusinian mysteries and the cults of Mithra and Isis.

**COUNT PHILIP'S BOOK.** In his prologue to the *Conte*, Chrétien states that Count Philip of Flanders transmitted to him a book containing a very good story, the *Tale of the Grail*, with the suggestion "to turn it into rime." This cryptic statement by the author about his source has provoked numerous hypotheses, not least concerning its reliability. Because Chrétien

is unlikely to have made a playful or insincere reference to the illustrious name of his patron, one must assume that the model for the *Conte* was a real one and that it was a story written in prose. Of the sources mentioned here, ancient rituals anticipated, in several respects, the *sen* of Chrétien's Grail narrative, and Celtic lore prefigured various details of the objects and characters. But none of these analogues, nor their aggregate, amount to what Chrétien's prologue praised as "the best story every told at a royal court." Yet such a story, the authors of this article suggest, did exist. The model was the *Isis Book*, the eleventh book—half fiction and half a personal memoir—of Apuleius's novel, the *Metamorphoses* (second century). In Chrétien's time the *Metamorphoses* existed in Florence in at least one manuscript but was not well known in France and had hardly been exploited for literary purposes. A comparison reveals both direct analogues between the works of Apuleius and Chrétien, and source material contained in the Apuleian text, which Chrétien may have associated with features of other traditions.

**Analogues.** The similarities cover subject matter, structure, textual homologies, and major and minor details. The *Isis Book* is, in the words of Arthur Darby Nock, "one of the great ancient documents of a conversion." Its theme, like that of the *Conte*, is the salvation and rebirth of a young man, Lucius, who is selfish and a sinner and yet a select, and who after his tribulations (narrated in the preceding ten books) is initiated into a mystery religion. The *Isis Book*, in the portions comparable to Chrétien's Grail story, describes the procession of Isis and the conversion of Lucius. The Isis procession, moving in ritual order, is dominated, just as Chrétien's procession is, by gold, light, beauty, and mystery. Lucius's conversion, like Perceval's, is staged as a dialogue between two characters, the initiate and the initiator. The phases of the ritual run parallel in both versions, with numerous textual concordances: selection; the initiate's readiness; his prayer for help; revelation; the hortatory sermon; the initiation.

Four topoi occurring in the *Conte*, three of them in the hermitage scene, are prefigured in a Hermetic dialogue which was traditionally ascribed to Apuleius and likewise narrates an initiation. From the ninth century on, an apocryphal treatise, the *Asclepius*, was included among the works of Apuleius. The *editio princeps* (1469) of the *Metamorphoses*, based on an unknown manuscript, contained the *Asclepius*. In short, it is not clear whether Count Philip's book contained the treatise together with the novel or not. The *Asclepius* was the Latin translation of a Greek dialogue that described the catechesis of Asklepios by the mystagogue Hermes Trismegistos. It was familiar to and often quoted by the prominent authors of the school of Chartres. The analogues to the *Conte* are a secluded sanctuary as the locus of the ritual, with four men present; the Hermetic term *malitia* for spiritual ignorance (*agnosia*), rendered as *mal* by Chrétien; a vegetarian meal ending the conversion; and the topos of the wastelands as an apocalyptic vision of Egypt, which in the *Conte* is tied to Perceval's (failed) test.

**Stimuli.** Chrétien's technique of syncretism seems to emerge from his use of the Isis procession, which provides motifs for the two central features of his Grail scene.

*The Fisher King.* The prelude of the Isis procession, the Anteludia, consists of a bizarre spectacle of persons and properties. Among the many unconnected items are (in this order) the following: a hunting spear; a hunter; a sword; a fowler; a fisherman with hooks; a sedan on which someone is carried; a golden cup; a feeble old man. These eight unrelated words (or phrases) return in Chrétien's word portrait of the Fisher King and his court: a *fisherman* fishing *with hooks* in a river (where Perceval meets him first) reappears as the lord of the castle, marked as such by having among his men a *hunter* and a *fowler*; maimed by a *spear*, he is confined to a *couch* on which he *is carried* around; he presents a *sword* to his guest and pours wine from a *cup of gold*, while he watches the procession that brings the life-sustaining wafer to the *feeble old man*, his father. By welding these incoherent bits into one figure and linking it to ancient fertility myths and Celtic lore, Chrétien created an impressive character of medieval literature.

*The Grail.* Two vessels carried in the main body of the Isis procession share the salient features of the Grail, above all, those of its external aspect: Both are golden; in addition, the *cymbium* ("bowl") sheds an intense light and the *urnula* ("small urn") is ornamented and mysterious. The inherent powers of the Grail, on the other hand, are prefigured in other sources. Celtic tradition may have contributed the idea of the horn of plenty. As to the ancient rituals, the *Corpus Hermeticum* seems to have provided with its fourth treatise, entitled *The Krater*, a model of the Grail that contributed its mystic functions. The Greek text states that "the vessel is divine," repeated nearly verbatim in Chrétien's "Tant sainte chose est li graaus" ("The Grail is so holy an object"). The content of the Hermetic vessel is *nous*, intellect, which makes one perfect; it is concretized as the wafer that the Grail contains. The Old King (the Fisher King's father), sustained in his retreat by such spiritual rather than material nourishment, evolves, in other words, into Perfect Man. The means by which the Hermetic materials were transmitted to Chrétien is not clear. The fourth treatise of the *Corpus Hermeticum* was known in Byzantium, to be sure, and Chrétien, quite knowledgeable about contemporary Byzantine affairs, as he demonstrated in his *Cligès*, could easily have heard about Hermetism and its mystical appeal. But Hermetic ideas were in vogue at the school of Chartres, and if the Old King is a replica of the Hermetic Perfect Man, as he is portrayed in the death scene of Hermes in the contemporary *Liber Alcidi*, the scene at the Grail Castle turns into an example of twelfth-century theosophy and "literary paganism."

**WOLFRAM'S KYOT.** With his Grail story Chrétien left a rich legacy to medieval letters; yet his followers divided the heritage. On the one hand, starting with Robert de Borron, the romances of the Grail cycle displayed an ever greater emphasis on the Christian aspect; on the other hand, there stands,

by itself, a masterpiece of literature, Wolfram von Eschenbach's *Parzival* (c. 1200–1212). Its narrative, to be sure, is modeled after Chrétien's *Perceval*. The differences of content, frequently at the frontier of religion, appear to be related to a difference of sources. But on the question of sources the two authors are not very helpful. Chrétien's puzzling remark about Count Philip's book has its counterpart in Wolfram: He mentions an enigmatic informant, Kyot, as having provided an Arabic model for the *Parzival* and, in addition, as having expressed his misgivings about Chrétien's choice of the (unspecified) source for *Perceval*. Questions of Kyot's provenance and even his mere existence have provoked varying hypotheses. On the basis of Wolfram's scattered remarks, of the Catharist beliefs ascribed to the Grail community, and of the striking role that the science of geomancy plays in *Parzival*, the authors of this article identify Kyot as Guillot (i.e., William) of Tudela, in Navarre, the author of the first part of the *Chanson de la Croisade albigeoise*. He was, as the author of this work, familiar with Catharism, was an adept of geomancy, had settled around 1199 in southern France, wrote in a Provençal French *Mischsprache*, and in all probability knew Arabic.

The source that Kyot transmitted to Wolfram and that Wolfram fused with Chrétien's story was, again in this analysis, the *Corpus Hermeticum* ascribed to Hermes Trismegistos. The treatises of this body of works communicate the mystical beliefs of a loosely structured brotherhood in second- and third-century Egypt, and they were written in Greek, known in Byzantium, and transmitted to the West through Arabic. The treatise that topically comes closest to Chrétien's Grail fantasy is the one on the soteriological vessel of Hermetism, the Krater. Wolfram re-created the Grail in Hermetic terms as an astral myth. In *The Krater* it is stated that "God filled a great krater with intellect and sent it down to earth"; similarly, in Wolfram's version, the Grail is an astral vessel whose powers derive from a wafer brought down by a dove. The radiant maiden who carries the vessel in Wolfram's Grail procession also represents a Hermetic concept: She is called Repanse de Schoye, which translates the Greek for "knowledge of joy," the second most important virtue (after knowledge of God) in the process of spiritual rebirth.

The great religious conversion scene at the hermitage in the *Conte* also seems to be re-created by Wolfram in accord with his Hermetic inspiration. In the treatises of the *Corpus Hermeticum*, Hermes Trismegistos appears as the dominant figure: He is a saint, an ascetic, a teacher, a sage; he is the symbol of learning and the founder of astrological science. Wolfram's mystagogue, Trevrizent, appears to be a portrait of Hermes Trismegistos. He is a holy man, has written about religious doctrine, and is a teacher of astrology. This typological derivation accords with the etymological root of this name. The epithet *trismegistos*, "the thrice-great," was rendered in Arabic as "the thrice-sage," which was translated into medieval Latin as *triplex scientia* ("threefold wisdom") and into Old French whose obvious (although not docu-

mented) equivalent *treble escient* was, finally, corrupted by Wolfram into *Trevrizent*.

The works whose resemblances to the Grail myth have been outlined here, the *Isis Book* for Chrétien and the *Corpus Hermeticum* for Wolfram, fall within the broad class of sources often subsumed under the label of "ancient rituals." Yet the web of homologues involving subject matter, structure, characters, text, key terms, and the ambience of mystery appears sufficiently dense to consider these works, on the borderline between religion and literature, as the specific models of the two Grail romances.

### BIBLIOGRAPHY

The extensive literature on the Grail is regularly reported in the annual *Bulletin bibliographique de la Société Internationale Arthurienne* (Paris, 1949–). An annotated list of contributions from the turn of the century to the late fifties can be found in Urban T. Holmes, Jr., and M. Amelia Klenke's *Chrétien de Troyes and the Grail* (Chapel Hill, N.C., 1959), pp. 168–194. For good overviews from varying standpoints, see Jessie L. Weston's "Grail, The Holy," in *The Encyclopaedia Britannica*, 11th ed. (New York, 1910); Martin de Riquer's "Gaal," in *Dictionnaire des lettres françaises*, vol. 4, *Le Moyen-Âge*, edited by Robert Bossuat and others (Paris, 1964); and Maur Cocheril's "Gaal," in *Dictionnaire de spiritualité*, vol. 6 (Paris, 1967). The constituent works of the Grail cycle are analyzed in R. S. Loomis's *Arthurian Literature in the Middle Ages* (Oxford, 1959).

The present survey draws, in particular, on the following works: William A. Nitzke, "The Fisher King in the Grail Romances," *Publications of the Modern Language Association of America* 24 (1909): 365–418; Jessie L. Weston, *The Quest of the Holy Grail* (1913; New York, 1964); Konrad Burdach, *Der Grail*, "Forschungen zur Kirchen- und Geistesgeschichte," vol. 14 (Stuttgart, 1938); Leo Pollmann, *Chrétien de Troyes und der Conte del Graal* (Tübingen, 1965); Leonardo Olschki, *The Grail Castle and Its Mysteries* (Berkeley, Calif., 1966); Emma Jung and Marie Louise von Franz, *The Grail Legend* (New York, 1970); and two of our own studies, *The Krater and the Grail: Hermetic Sources of the Parzival* (1965; Urbana, Ill., 1984) and "On the Sources of Chrétien's Grail Story," in *Festschrift Walther von Wartburg*, edited by Kiert Baldinger (Tübingen, 1968).

HENRY KAHANE (1987)  
RENÉE KAHANE (1987)  
*Revised Bibliography*

**GRAIL MOVEMENT.** The Grail movement was begun in the Netherlands in 1921 by a Dutch Jesuit priest, Jacques van Ginneken, and a group of students at the Catholic University of Nijmegen who were among the first Dutch Catholic women to earn university degrees. They were inspired by van Ginneken's vision that Western civilization was in crisis and in need of major changes, arguing that women had never had a fair chance to develop their capacities to the full, in either the church or society, and that women had great gifts with the potential to change the world and move it in a Godward direction. Van Ginneken envisioned a movement of young women, under female leadership, willing to give themselves totally to spreading the kingdom of God, not as nuns in the cloister but as laywomen in the midst of the modern world.

**INTERNATIONAL DEVELOPMENTS.** By 1936 the Grail movement had spread to Great Britain, Germany, and Australia, although the movement was suppressed in Germany by Adolf Hitler's government in 1939. In April 1940, on the eve of the German invasion, two Dutch Grail leaders sailed for the United States to establish the Grail in the Chicago archdiocese. Serious disagreements with diocesan authorities led them to relocate to Cincinnati, Ohio, where Archbishop John T. McNicholas welcomed the group of autonomous laywomen determined to define their own work. They purchased a farm in Loveland, Ohio, where they established a training center named Grailville and offered programs of alternative education, preparing women for leadership in the lay apostolate. Grailville quickly became the hub of a national movement, with eleven other centers spanning the country from coast to coast.

The Grail in the United States pioneered in many fields, promoting full, active participation of the laity in the liturgy, fostering vigorous contemporary expressions of a Christian spirit in the arts, and disseminating its ideal of a new Christendom through publications, exhibits, and art and book stores. In the 1950s the Grail trained teams of young American women and sent them to developing countries. Other Grail teams organized projects for racial and economic justice in the inner cities of Detroit, Brooklyn, and Cincinnati, and in rural Louisiana. In the 1960s the Grail was in the forefront of ecumenical dialogue and opened its membership to women of other Christian traditions. It also played a significant part in the modern catechetical movement, emphasizing personalist, psychological, and artistic approaches in the teaching of religion.

From 1940 to 1965 the Grail continued to expand internationally. Teams from the lay mission school at Ueber-

gen in Holland were sent to Brazil, Surinam, and Java in the 1940s. In the 1950s and 1960s teams from Holland and the United States went to South Africa, Basutoland, Uganda, Nigeria, and Japan.

**POST-VATICAN II.** The many liberation movements of the 1960s brought vast religious, social, and cultural changes. The Grail responded with a rethinking of both its structures and its key concepts. Structurally, as a result of an international process of consultation carried on from 1964 to 1967, the organization changed from a highly centralized and hierarchical pyramid, having at its apex a core group committed to celibacy, to a more collegial institution. The new structure enabled all members—married, single, or celibate—to share as peers in policy and decision making and to be eligible for any functional role. Grail work was reorganized into three task forces; working nationally and internationally, each focused on a broad goal that included living the faith, the empowerment of women, and liberation.

The early concerns with racial and economic justice that had led Grail members into the inner cities and overseas service were deepened by a feminist liberation theology that emphasized the interconnections between racism, sexism, classism, heterosexism, and environmental degradation. The goal of the struggle for justice was broadened to include justice for the earth and a global ecological vision of a sustainable society. The original psychology of complementarity that stressed the fostering of womanly qualities as the way to empowerment gave way, after a long process of study, to the development of a strong feminist consciousness among Grail members. The feminist approach included a thorough analysis of sexism in church and society, and an affirmation of women as moral and religious agents, fully capable of engaging in theology and of setting ethical norms. Moreover, the 1940s goal of striving to build a new Christendom in the midst of a secular world gave way to an acceptance of religious pluralism. In the words of the 1988 International General Assembly, “We are a faith community of women. We are learning that we are nourished by different wellsprings.” A 1999 Grail pamphlet adds, “We support one another in our search for God. We work towards transforming our world into a place of justice, peace, and love.”

The Grail has empowered thousands of women who have participated in its activities, enabling them to move beyond what was expected of women by church and society. Since 1969 the movement has contributed significantly through its conferences, programs, and publications to the development of feminist theology and spirituality in the United States and Europe, a contribution recognized by many theologians, Protestant as well as Catholic. Mary Jo Weaver, a professor of religious studies at Indiana University, commented:

Their commitment to women has resulted in some stunning and influential programs . . . [that] brought women together from all over the country to discover and articulate the need for a more inclusive theology

and liturgical language . . . broke new ground for women and supported an emerging feminist theology that begins, not with God, but with a theological reflection on women’s experience. . . . The Grail is small . . . as contrasted with NCCW (National Council of Catholic Women) but it is significantly more influential as a forum for Catholic feminist thought. (1993, pp. 126–127)

Nelle Morton, a professor of theology at Drew University, wrote: “These two conferences [Alverno 1971, Grailville 1972] became a watershed for women of religion to critique boldly the traditional male-oriented theology as partial (not including woman experience) and examine our own experiences for sources of theological reflection” (1985, p. 12). Elisabeth Schüssler Fiorenza, a professor of scripture at Harvard Divinity School, evaluated the 1972 Grailville Conference by saying: “This workshop proved to be one of the birthplaces of feminist theology, a movement that since has profoundly changed both theology and church” (1998, pp. 1–2).

By 1998 the Grail had become established in Australia, Brazil, Canada, Germany, Italy, Kenya, Mexico, Mozambique, the Netherlands, Nigeria, Papua New Guinea, Philippines, Portugal, South Africa, Sweden, Tanzania, Uganda, and the United States.

JANET KALVEN (2005)

**GRANET, MARCEL** (1884–1940), was an eminent French Sinologist associated with the Durkheimian sociological tradition. Granet wrote extensively on ancient Chinese

religious institutions in relation to the development of Chinese civilization. He was born at Luc-en-Diois and, after demonstrating his outstanding scholastic abilities at several *lycées*, enrolled at the elite *École Normale Supérieure* in Paris, where he studied European history and came under the sway of Émile Durkheim, who was offering lectures there. The crystallization of Granet's intellectual interests, along with his turn toward China, came about during his graduate work from 1908 to 1911 at the *Foundation Thiers*. His commitment to sociological theory deepened, and in looking for comparative material to extend his study of the code of honor in European feudalism, he took up the study of Chinese language and history under the direction of the renowned Sinologue Édouard Chavannes. From this point on, Granet's academic focus was fixed on China. As forecast by his initial interest in feudalism, he was continually concerned with the problem of the development and significance of ancient Chinese "feudal" institutions as interrelated with kinship, morality, and religion.

Granet's baptism as a Chinese scholar came when he studied the Chinese classical texts and commentaries in Beijing during the years 1911 to 1913, the traumatic period of the republican overthrow of the Qing dynasty. He was to return to China only once more, for a brief stay in 1918, at the end of his World War I military service. Returning to Paris, he married in 1919, took his doctorate in 1920, and resumed writing and teaching in his prewar position at the *École Pratique des Hautes Études*. At about this same time he accepted an additional teaching appointment at the Sorbonne, and in 1926 he was elected to a prestigious chair at the *École Nationale des Langues Orientales Vivantes* and was installed as the first director of the *Institute des Hautes Études Chinoises*. Throughout this period Granet gained fame for his brilliantly synthetic style as an author and teacher and was actively engaged in Parisian intellectual circles that included such notable colleagues as Marcel Mauss, Henri Maspero, Marc Bloch, Édouard Mestre, and Louis Gernet. After the fall of France in 1940, Granet took over the fifth section of the *École Pratique* from Marcel Mauss, who, because he was a Jew, was forced by the Nazis to relinquish his post. Granet's distinguished career was tragically ended shortly thereafter, when he died suddenly at the age of fifty-six.

Granet's importance stems both from his specific analysis of ancient Chinese religion and from the methodological implications these specialized investigations have for the overall interpretive study of religion. With regard to his approach to early Chinese tradition, especially as set forth in *Fêtes et chansons anciennes de la Chine* (1919; translated into English as *Festivals and Songs of Ancient China*, 1932) and *Danses et légendes de la Chine ancienne* (1926), Granet violated the traditional Sinological mold of strict philological and historical exegesis by considering the whole corpus of ancient Chinese documents, both the classics and nonorthodox texts, as fragmentary specimens of a comprehensive system of

thought. The point of textual analysis, therefore, is not just to distinguish between true historical facts and false mythological embellishments but to accept the fact that an entire ancient text, or set of texts, reveals a particular logic that is ideologically grounded in mythic and ritual themes. In fact, for Granet and his contemporary Henri Maspero, the actual historical facts are often only emblematic scraps manipulated in accordance with a mythic and ritual code that, in turn, categorically reflects back on the forms and transformations of ancient social life.

From this admittedly controversial perspective, Granet attempted to show that the ordinarily ignored aspects of primitive, peasant, or folk tradition are embedded even in orthodox classical works and that these archaic social and religious patterns are crucial for understanding the fundamental "collective representations" that regulate all subsequent Chinese thought. In *Fêtes et chansons*, for example, Granet uncovered in the classical Chinese *Book of Odes* an ancient spring and autumn festival cycle that, he implied, is the basic categorical imperative for the later Chinese cosmological system of complementary dualism. Although he typically eschewed the use of comparative ethnographic material, in *Danses et légendes* he extended his earlier analysis, much in the spirit of Marcel Mauss's "Essai sur le don" (1923–1924), by demonstrating how the mythic and ritual themes of totemism, initiatory masculine brotherhoods, and potlatch that are found in the whole ensemble of ancient texts help to expose a specific pattern of cultural development that leads from ancient peasant society through a clan system of alternating prestations (i.e., a comprehensive system of social reciprocity) to a developed patriarchal feudal system.

Aside from other important technical writings that also touch on the same key theoretical issues, the culminating expression of Granet's approach to China in particular and to methodology in general is *La pensée chinoise* (1934). The significance of this stylistically graceful and keenly insightful example of *haute vulgarisation* is that, besides presenting a brilliant portrait of the distinctive character of the Chinese mind, it implicitly goes beyond a simple application of a Durkheimian sociology of knowledge by suggesting that the categories of Chinese thought may be viewed as a total transformational system of linguistic representations not wholly determined by the historical flux of social forms. As with his last work on kinship, *Catégories matrimoniales et relations de proximité dans la Chine ancienne* (1939), which the anthropologist Claude Lévi-Strauss acknowledged as a precursor to his own methodology (*Les structures élémentaires de la parenté*, 1949), *La pensée* unconsciously points toward the modern development of structural hermeneutics, as is seen, for example, in Lévi-Strauss and, appropriately enough, in the work of Granet's students, the Indo-Europeanist Georges Dumézil and the paleohistorian André Leroi-Gourhan.

Granet has often been condemned by Sinologists as too much of a poetic generalist and by sociologists as too much of a narrow specialist. And it is true that his special genius

was to fall between the two camps by respecting both philological limits and interpretive breadth. Granet was an artisan of texts who sometimes “gambled” with his speculative conclusions, and there is no doubt that much of his work on Chinese religion and society must be discarded or at least drastically revised. At the same time, however, recent scholarship indicates that Granet’s pioneering methodological spirit and some of his specific findings still have considerable relevance for the study of traditional Chinese religion and the general sociology of religion.

### Works by Granet

In addition to the works already mentioned, the posthumous collection of Granet’s important articles and monographs on Chinese religion, society, and kinship entitled *Études sociologiques sur la Chine* (Paris, 1953) should be mentioned. See also Granet’s two other popular, and in some ways least successful, works: *La religion des Chinois* (Paris, 1922), translated as *The Religion of the Chinese People* (New York, 1975), and *La civilisation chinoise: La vie publique et la vie privée* (Paris, 1929), translated as *Chinese Civilization* (London, 1930).

### Works about Granet

There is no full-scale biographical or critical examination of Granet, but see the appreciative discussion and full bibliography by Maurice Freedman, “Marcel Granet, 1884–1940: Sociologist,” in his translation of *The Religion of the Chinese People* mentioned above. On some of the methodological implications of Granet’s works, see Derk Bodde’s “Myths of Ancient China,” in *Mythologies of the Ancient World*, edited by Samuel Noah Kramer (Chicago, 1961); C. Wright Mills’s “The Language and Ideas of Ancient China: Marcel Granet’s Contributions to the Sociology of Knowledge,” in *Power, Politics and People*, edited by Irving Louis Horowitz (New York, 1963); Maurice Halbwachs’s “Histoires dynastiques et légendes religieuses en Chine,” *Revue de l’histoire des religions* 94 (1926): 1–16; and Louis Gernet’s “Histoire des religions et psychologie: Confrontations d’aujourd’hui,” *Journal de psychologie* 47–51 (1954): 175–187.

## GREAT MOTHER SEE GODDESS WORSHIP

**GREEK ORTHODOX CHURCH** is a broad term used to describe several historical expressions of the life of

the Christian church. The terms *Greek Christianity* and *Greek church* are often used as synonyms for it, but with different nuances. This article seeks to clarify the term *Greek Orthodox church* by describing Greek Orthodox Christianity through its historical development to its twenty-first century expressions.

**THE EARLY CHURCH AND GREEK CHRISTIANITY.** In their broadest meaning, Greek church and Greek Christianity can refer to the earliest development of Christianity as it moved from its Jewish matrix into the Greek cultural world of the Roman Empire. In this sense it is contrasted to Jewish Christianity. Cultural life at the time was imbued with the Greek heritage: language, philosophy, religion, literature, and political values. In the early Christian tradition, Greek often meant pagan or Gentile, but it referred, as well, to Christians who came to the faith from a polytheistic background as distinguished from Jews who accepted the messiahship of Jesus. Much of the New Testament and the earliest Christian patristic documents were written in the Greek language. Thus, insofar as early Christianity was a religion of conversion, it reflected its immersion in Greek language and thought.

**GREEK CHRISTIANITY AND LATIN CHRISTIANITY.** Greek Christianity soon came to be distinguished from other cultural embodiments of the Christian experience, especially Latin Christianity. The early development of Latin Christianity has its roots in the Greek tradition as exemplified by Irenaeus of Lyons (c. 130–c. 200). The Greek approach to Christianity was strongly theological, seeking to come to as careful a comprehension as was possible of the mysteries of the Christian faith. It expressed itself, as well, in rich worship traditions and iconography, on the one hand, while cultivating monastic, ascetic, and mystical Christian traditions on the other. But by the late third century the special characteristics of the Latin cultural milieu began to influence the church in the West and formed a more practical, legally oriented Christian expression. Nevertheless, Greek and Latin Christianity at this period were not contrasting forms of the faith but were complementary to each other.

**BYZANTIUM’S GREEK CHRISTIANITY.** The Christian church in the Byzantine (East Roman) Empire (325–1453) retained and developed the ancient traditions of Greek Christianity. Organizationally, this fostered more of the early church’s sense of local autonomy, in which the council remained central to church life. The early Christian tradition, as expressed in the Greek fathers, Eastern monastic spirituality, early canonical practice, and liturgical life became normative for Byzantine Christianity. Distinct Christian traditions, however, differentiated from the Greek tradition, producing other ecclesial identities. These were the Oriental Orthodox churches, the Nestorian church, and the Roman Catholic Church.

The Oriental Orthodox churches (each with a national component and traditionally characterized as monophysite) and the Nestorians became ecclesially distinguished from Greek Christianity by the fifth century. Latin Christianity, following its own inner dynamic, and strongly influenced by

the rise of Frankish and Germanic political and economic power in western Europe, developed into a distinct ecclesiastical reality. This distinction was formalized with the Great Schism between the two great halves of Christendom that occurred over a period from the ninth to the early thirteenth century. The schism between Greek East and Latin West was made permanent by the sacking of Constantinople in 1204 during the Fourth Crusade. It then became a linguistic convention to refer to the church in the West as “the Roman Catholic Church” and the church in the East as “the Greek Orthodox church.”

**GREEK ORTHODOXY AND SLAVIC ORTHODOXY.** With the rise of Slavic Christianity, a new ethos affected the identity of the Greek Orthodox church. This development was a direct result of Greek Orthodox missionary policy in the ninth through the twelfth century, which fostered indigenous cultures, liturgical languages, and clergy in each mission church. Originally, the church hierarchy was composed of Greeks. But each of the various Slavic and other peoples eventually obtained their own hierarchies. All of these new churches, however, received the Christian faith in its Greek form (in contradistinction to the Latin/Roman form). But while there was a deep-rooted spiritual identity with the ancient Greek Orthodox tradition of Christianity, there came into being a new Slavic identity within these churches.

What intensified the mix of traditional Greek Orthodox Christianity and the Orthodox Christianity of local nonethnic Greeks was the *millet* system put in place by the Muslim conquerors of the Byzantine Empire (1453). As a means of governing the Orthodox Christian peoples, as well as all other ethnic-religious groups, the Muslims understood them to be one people, or nation (the *millet*). The patriarch of Constantinople was recognized as the head of the Orthodox Christian nation with civil as well as religious duties. Greek metropolitans and bishops were appointed over the various Orthodox peoples to exercise this new administration, which included responsibilities for collecting taxes, assuring the observance of the law, and the loyalty of the Orthodox Christian populations to the central government. The combination of spiritual and secular responsibilities created many difficulties and occasioned abuses, but it also provided many opportunities for service to Orthodox unity. Thus, the ecumenical patriarchate served as a focal point in the defense of the Orthodox faith from incursions of Roman Catholic and Protestant missionaries intent on proselytizing the Orthodox during the seventeenth and eighteenth centuries. Numerous councils were held for this purpose. With only a few exceptions, all of the documents arising out of this movement were written originally in Greek.

At the same time, the ecumenical patriarchate, both as a representative of the Turkish authorities and as an agency of Greek ethnic influence upon the indigenous cultures of these Orthodox peoples, began to be perceived in some ways as an alien force. When, in the first half of the nineteenth century, various national wars of independence were initi-

ed against the Muslim Ottoman Empire, they were often concurrently actions of independence from the Greek cultural influence of the patriarchate of Constantinople as well as from its political influence. This led to the formation of independent (autocephalous) national churches. A partial exception was the Church of Greece. Its separation from the ecumenical patriarchate was forced by political considerations only.

Generally, the new order of things required a church organization and consciousness that would demarcate the newly organized autocephalous churches from the ethnic Greek traditional character of the ecumenical patriarchate, while concurrently acknowledging fully its historical ecumenical character as *primus inter pares* (first among equals) of the Orthodox world. In this manner, the Orthodox churches of Russia (1448), Serbia (1879), Romania (1885), Bulgaria (1870), Czechoslovakia (1922), Finland (1923), Poland (1924), and Albania (1937) came into being. Thus, for example, today it is possible to differentiate Greek Orthodoxy from Slavic Orthodoxy and Romanian Orthodoxy as cultural realities within the canonically unified Eastern Orthodox church.

**GREEK ORTHODOX CHURCHES TODAY.** In the modern and ethnic sense, Greek Orthodoxy is understood to include those churches whose language, liturgy, and spirit keep Orthodoxy and the Greek ethnic cultural tradition united. These churches are the Church of Greece, the patriarchate of Constantinople (in part because it is also the international center of world Orthodoxy), the patriarchate of Alexandria, the patriarchate of Jerusalem, the Church of Cyprus, and the ethnic Greek diaspora jurisdictions throughout the world.

**The Church of Greece.** The most restricted meaning of Greek Orthodox church refers to the autocephalous Church of Greece. Prior to the Greek War of Independence, which began in 1821, Christianity in what is now known as Greece was, for most of its history, part of the ecumenical patriarchate of Constantinople. Even though the church was self-declared autocephalous in 1833, it understands itself to be in direct continuity with the founding of Christianity in Thessalonica, Philippi, Corinth, Athens, Nicopolis, and other Greek cities by the apostle Paul. Given the Orthodox tradition that ecclesial order often follows civil governmental patterns, over the centuries the church in Greece has come under various patterns of ecclesial jurisdiction. Following the early period, when metropolitan sees had been established in the major cities, Greece came under Constantinople, where it stayed—with a few interruptions—until the nineteenth century. Originally, the autocephalous Church of Greece included only the southern part of the modern nation of Greece, since only that area was liberated in 1830. Over the years, as the Greek nation expanded, the church also grew in territorial size and numbers. But this equation of the boundaries of the state and the jurisdiction of the Church of Greece is not absolute. Several areas of the nation of Greece are ecclesiastically under the control of the ecumeni-

cal patriarchate: the Dodecanese, Crete, and Mount Athos. The Orthodox church is the official church of Greece, while at the same time freedom of religion is guaranteed by the constitution. The vast majority of Greece's population of over ten million people are baptized Orthodox Christians. In addition to the archbishop of Athens, there are eighty-five bishops in seventy-seven dioceses and almost seventy-five hundred parishes.

**The patriarchate of Constantinople.** With the establishment of the modern secular Turkish state in 1921, under Kemal Atatürk, the position of the patriarchate of Constantinople has suffered severe weakening. Following the destruction of the Greek military forces in the Greco-Turkish war of 1922, an erosion of the Greek population of Asia Minor has continued unabated. It began with the exchange of populations between Greece and Turkey as mandated in 1923 by the Treaty of Lausanne. Only the Greek population located in western Thrace and Constantinople (Istanbul) was exempted from the removal to Greece. The treaty also guaranteed the independence, freedom, and permanence of the patriarchate in its location in Constantinople, but it soon became a pawn in the political conflicts of Greece and Turkey. The conflict of Turkish and Greek interests in Cyprus has been the occasion for the patriarchate to become a pressure point against Greek interests.

In 1955, after years of general harassment, government-inspired riots wrought havoc on the Greek community of Istanbul, in which not only private homes and shops but churches, cemeteries, schools, and other institutions were vandalized and destroyed. Economic and administrative pressures forced a large part of the Greek Orthodox population to leave the last remaining enclave of Greek Orthodoxy in Turkey. Only a couple thousand now remain, as the patriarchate clings to its legal rights to remain in its historic city.

The patriarchate's numerical strength resides in the numerous Greek Orthodox dioceses, or eparchies, within its jurisdiction in the diaspora. In addition to four eparchies in Turkey, the Patriarchate of Constantinople exercises jurisdiction over the Archdiocese of Crete, with eight metropolitan sees; the four metropolitan sees of the Dodecanese; the historic monasteries of Patmos and Mount Athos; the Greek Orthodox Archdiocese of North and South America, with ten dioceses; the Archdiocese of Australia, with five archdiocesan districts; the Archdiocese of Thyateira and Great Britain and the Exarchate for Western Europe, Ireland, and Malta, with eight bishops, in addition to the archbishop; the Metropolis of France and the Exarchate of Iberia, with three metropolitan regions; the Metropolis of Germany and the Exarchate of Central Europe, with three bishops and the archbishop; the Metropolis of Austria and the Exarchate for Italy and Hungary; the Metropolis of Belgium and the Exarchate for the Low Countries, with the archbishop and one bishop; the Metropolis of Sweden, Scandinavia, and the Northern Lands, with one bishop; the Metropolis of New Zealand and the Exarchate for India, Korea, Japan, the Phil-

ippines, Singapore, Indonesia, and Hong Kong, with the archbishop; the Metropolis of Switzerland and the Exarchate of Europe, with the metropolitan who also presides over the Orthodox Center at Chambes, Switzerland. The Ecumenical Patriarchate maintains a permanent representative at the World Council of Churches in Geneva. Although there are some exceptions, nearly all of the people making up the congregations of these ecclesiastical jurisdictions are of Greek background.

**The patriarchate of Alexandria.** Egypt was one of the first areas to come under the influence of Islam in the eighth century. The larger portion of the Christian population that survived belonged to the Coptic church. Nevertheless, the Greek Orthodox patriarchate of Alexandria continued to exist in Egypt throughout the centuries. Its major constituency consisted of a well-organized Greek community that was strongly entrenched in leadership positions in commerce, finance, and education. Numerous educational and cultural institutions were supported by the Greek community. In addition the patriarchate of Alexandria had canonical control over all of Orthodoxy on the African continent. By and large these jurisdictions were composed of Greeks in the various African nations and some missionary churches. The numerical strength of the Greek Orthodox patriarchate in Egypt was broken with the rise of Gamal Abdel Nasser in 1954. The Greek population of Egypt lost much of its economic and social status and began to emigrate. Nevertheless, in 2002 the patriarchate continued to serve about 350,000 Orthodox Christians whose members worship in the Greek, Arabic, and several native East African languages. There are thirteen metropolitan sees.

**The patriarchate of Jerusalem.** Though severely tried throughout the years of the Muslim conquests of the Holy Land, the patriarchate of Jerusalem was able to sustain itself until the Crusaders conquered the city of Jerusalem in 1099. The Greek Orthodox patriarch was expelled and replaced with a Latin patriarch. This situation lasted until 1177. In 1517 the area came under the control of the sultan in Constantinople while the church continued to struggle to maintain its rights to the holy places of Jerusalem. In the mid-nineteenth century, international agreements affirmed the rights of the Greek Orthodox patriarchate over the ancient churches of the Holy Sepulcher. Changing political circumstances in the area have required the negotiation of agreements regarding the status of the patriarchate with the British, Jordanians, and Israelis. At the beginning of the twenty-first century, the patriarchate counted 130,000 members with sixteen bishops and maintained under its jurisdiction the archdiocese of Sinai, in present-day Egypt.

**The Church of Cyprus.** The Church of Cyprus, consisting exclusively of Greek Cypriots, received its independence as an autocephalous church through the eighth canon of the Council of Ephesus (431), but its history goes back to New Testament times (*Acts* 11:19). Its bishops participated in the Council of Nicaea (325). Although the Orthodox

church suffered severe repression during the period of Latin domination (1191–1571), it retained its Greek Orthodox character. Under the Turks (1571–1878) the Orthodox hierarchy was fully acknowledged. The Orthodox church is very close to the people of Cyprus, especially since the 1974 Turkish invasion of the island nation when almost half of its members were made refugees in their own land. In 2002, the Church of Cyprus counted more than 442,000 members with six dioceses, seven bishops, and twelve hundred priests.

**The Greek Orthodox diaspora.** The Greek Orthodox Christians found throughout the world today in traditionally non-Orthodox lands are primarily under the jurisdiction of the Patriarchate of Constantinople. The various ecclesial jurisdictions are mentioned above. Those in English-speaking lands are the Greek Orthodox Archdiocese of North and South America, the Archdiocese of Australia, the Archdiocese of Thyateira and Great Britain, and the Metropolis of New Zealand. Of these, the American jurisdiction is the largest.

The Archdiocese of North and South America was established in 1922. Sixty years later it consisted of the archdiocese and ten dioceses with 488 parishes, 569 churches, 530 priests, and 670,000 duly recorded members, although it serves a much larger number of persons who identify themselves as Greek Orthodox Christians. It supported 24 parochial schools and 412 afternoon Greek schools. The church also has two institutions of higher learning, Hellenic College and Holy Cross Greek Orthodox School of Theology. It maintains an orphanage and several old-age homes. In 1984 it supported 518 catechetical schools for children and 186 adult religious education programs. By 2002 the archdiocese counted 540 parishes and 800 priests, and a membership estimated at 1.5 million. Nearly every parish has a “Philoptohos [Friends of the Poor] Society” and one or more youth groups. It publishes a bimonthly newspaper, *The Orthodox Observer*, and a scholarly theological journal, *The Greek Orthodox Theological Review*, through the Holy Cross School of Theology. This pattern of organization and functioning is the model for the other churches of the Greek Orthodox diaspora.

STANLEY SAMUEL HARAKAS (1987)

**GREEK RELIGION [FIRST EDITION].** [*This entry focuses on Greek religion during the Archaic and Classical periods, from the eighth to the fourth century BCE. Other religious systems of the ancient Mediterranean region are treated in Aegean Religions, which discusses the earlier cultures of Cycladic, Minoan, and Mycenaean peoples, and in Hellenistic Religions, which surveys the later history of religions in the Greek-speaking world.*]

The Greek religion of the Archaic and Classical periods (eighth–fourth century BCE) presented several characteristic traits that should be borne in mind. Like other polytheistic cults, Greek religion was a stranger to any form of revelation: it knew neither prophet nor messiah. It was deeply rooted in a tradition in which religion was intimately interwoven with all the other elements of Hellenic civilization, all that gave to the Greece of the city-states its distinctive character: from the language, the gestures, and the manner of living, feeling, and thinking to the system of values and the rules of communal life. This religious tradition was neither uniform nor strictly defined; its nature was not dogmatic in any way. It had no sacerdotal cast, no specialized clergy, no church, and no sacred book in which the truth was fixed once and for all. It had no creed that gave the faithful a coherent set of beliefs about the beyond.

**MYTHOLOGY AND RELIGION.** On what basis, then, did the deep-seated religious convictions of the Greeks lie, and how

were they expressed? As their beliefs were not based on doctrine, they did not entail for the devout any obligation to adhere, for fear of impiety, on all points and to the letter to a body of defined truths. It sufficed for a person performing rites to give credence to a vast repertory of stories learned in childhood. Each of these stories existed in many versions, allowing a wide margin of interpretation. It was within the context of this narrative tradition that beliefs about the gods developed and that a consensus emerged as to their nature, their role, and their requirements. Rejecting this core of common beliefs would have been, for a Greek, like giving up the Greek language or the Greek way of life. However, for all that, the Greeks were fully aware that other languages and other religions existed. They could, without falling into disbelief, remain objective enough about their own religious system to engage in a free and critical reflection on it, and they did not hesitate to do so.

But how did they preserve and transmit this mass of traditional “knowledge” about the social reality of the otherworld—the families of the gods, their genealogies, their adventures, their conflicts or agreements, their powers, their spheres and modes of action, their prerogatives, and the honors that were due them? Where language was concerned, essentially in two ways. First, through a purely oral tradition maintained in each household, especially by women: nurses’ tales or old grandmothers’ fables, as Plato called them, were absorbed by children from the cradle. These stories, or *muthoi*—which were all the more familiar for having been heard by children at the age when they were learning to speak—helped shape the mental framework in which the Greeks imagined the divine, situated it, and conceived it.

As adults, the Greeks learned about the world of the gods through the voices of the poets. Through the tales about the gods, the remoteness and strangeness of the otherworld took a familiar, intelligible form. Performed with a musical instrument, the poets’ songs were not heard in private, intimate surroundings, as were the tales told to children, but at banquets, official festivities, and important competitions and games. The rise of a written narrative tradition modified and preserved the very ancient tradition of oral poetry and came to occupy a central place in the social and spiritual life of Greece. The poets’ songs were not a luxury reserved for the learned elite, nor were they merely personal entertainment for an audience; they functioned as a real institution that kept alive the social memory, as an instrument for the preservation and communication of knowledge. As a verbal form that could be memorized easily, poetry expressed and fixed the fundamental traits that went beyond the particularities of each city and were the foundation of a common culture for all of Hellas—especially those traits reflected in religious representations of the gods proper, daemons, heroes, or the dead. Had it not been for all the works of the epic, lyrical, and dramatic poetry, we could speak of Greek cults in the plural instead of a unified Greek religion. In this respect, Homer and Hesiod played prominent roles: their narratives

about the divine beings acquired an almost canonical value and functioned as sources of reference for the authors who came after them as well as for the public that listened to or read them.

Certainly, the poets that succeeded Homer and Hesiod were not as influential. As long as the city-state remained alive, however, poetic activity continued to act as a mirror, reflecting the image of the inhabitants and allowing them to perceive their dependence on the sacred and to define themselves with reference to the immortal. Poetic activity gave the community of mortals its cohesiveness, its continuity, and its permanence.

Consequently, a problem arises for the historian of religions. If poetry was the vehicle through which the attributes of divine creatures, their roles, and their relationships with mortal creatures were expressed, and if it fell to each poet to present, with occasional modifications, the divine and heroic legends that, taken together, constituted an encyclopedia of knowledge about the otherworld, should these poetic tales and dramatized narrations be considered as religious documents or be given a purely literary value? That is, do myths and mythology, in the forms given them by Greek civilization, belong to the field of religion or to that of literary history?

For the scholars of the Renaissance, as for the great majority of the scholars of the nineteenth century, the reply was self-evident. In their eyes, Greek religion was, above all, an abundant treasure of legendary tales transmitted to us by the Greek authors (assisted by the Romans) in which the spirit of paganism remained alive long enough to offer the modern reader in a Christian world the surest path to a clear view of ancient polytheism.

Actually, in taking this standpoint, they simply walked in the footsteps of the ancients. In the sixth century BCE, Theagenes of Rhegium and Hekataios inaugurated a critical approach to the traditional myths, as recounted by Homer in particular. They subjected these stories to a reasoned examination or applied to them a method of allegorical exegesis. In the fifth century, work was begun that would be systematically pursued in essentially two directions. First, chroniclers undertook the collection and inventory of all the legendary oral traditions peculiar to a city or a sanctuary. Like the *athidographs* of Athens, these scholars attempted to set down in writing the history of a city and its people from its earliest beginnings, going back to the fabulous time when the gods mingled with men, intervening directly in their affairs to found cities and to beget the first reigning dynasties. Thus was made possible, from the Hellenistic period onward, the enterprise of scholarly compilation that led to the drafting of veritable repertories of mythology: the *Bibliotheca* of “Apollodorus,” the *Fabulae* and *Poetica Astronomica* of Hyginus, book 5 of the *Bibliotheca historica* of Diodorus Siculus, the *Metamorphoses* of Antoninus Liberalis, the three miscellaneous collections known as the *Mythographi Vaticani*.

Parallel to this effort, which aimed at a systematic summary of the legends common to all Greeks, there became apparent a certain hesitation and uneasiness—already perceptible among the poets—about how much credit should be accorded to the scandalous episodes that seemed incompatible with the eminent dignity of the divine. But it was with the development of history and philosophy that interrogation reached full scale; from then on criticism assailed myth in general. Subjected to the investigations of the historian and the reasonings of the philosopher, the fable, as fable, was deemed incompetent to speak of the divine in a valid and authentic fashion. Thus, at the same time that they applied themselves, with the greatest care, to setting down their legendary heritage, the Greeks were led to challenge the myths, sometimes in the most radical manner, and to raise the problem of the truth—or falsehood—of the myth. The solutions varied from rejection, or pure and simple negation, of the myths to the multiple forms of interpretation that permitted them to be “saved”; for example, a banal reading might be replaced with learned hermeneutics that brought to light a secret lesson underlying a narrative and analogous to those fundamental truths—the privilege of the wise—which, when known, reveal the only real sure access to the divine. Yet, from one point of view, no matter if the ancients were carefully collecting myths, if they interpreted or criticized them or even rejected them in the name of another, truer kind of knowledge—it all came down to recognizing the role generally assigned to myths in the Greek city-state, namely, to function as instruments of information about the other-world.

During the first half of the twentieth century, however, historians of Greek religion took a new direction. Many refused to consider the legendary traditions as strictly religious documents that could be useful as evidence of the real state of the beliefs and feelings of the faithful. For these scholars, religion lay in the organization of the cult, the calendar of sacred festivals, the liturgies celebrated for each god in his sanctuaries. Next to these ritual practices, which constitute the “real” religious comportments, the myth appears as a literary outgrowth, a mere fabulation. As a more or less gratuitous fantasy of the poets, myth could be only remotely related to the inner convictions of the believer, who was engaged in the concrete practice of cult ceremonies and in a series of daily acts that brought him into direct contact with the sacred and made him a pious man.

In the chapter on Greece in *Histoire générale des religions* (1944), A.-J. Festugière warned the reader in these terms:

No doubt poets and sculptors, obeying the requisites of their art, were inclined to represent a society of highly characterized gods; form, attributes, genealogy, history, everything is clearly defined, but the cult and popular feeling reveal other tendencies. Thus, from the beginning, the field of the religious is enclosed. In order to understand fully the true Greek religion, forgetting therefore the mythology of the poets and of art, let us turn to the cult—to the earliest cults.

What are the reasons for this exclusive bias in favor of the cult and for the importance attributed to its most archaic elements? There are two, very distinct reasons. The first is of a general nature and has to do with the personal philosophy of the scholar and with his idea of religion. The second is a response to more technical requirements: the progress of classical studies—in particular, the strides made in archaeology and epigraphy—opened new areas of investigation, besides the mythological field, to students of antiquity. These advances led scholars to call into question, and sometimes even modify profoundly, the image of Greek religion furnished by literary tradition alone.

Today, the rejection of mythology is based on an anti-intellectualist presumption in religious matters. Scholars of this standpoint believe that behind the diversity of religions—just as beyond the plurality of the gods of polytheism—lies a common element that forms the primitive and universal core of all religious experience. This common element, of course, cannot be found in the always multiple and varying constructions that the mind elaborates in its attempt to picture the divine; it is placed, therefore, outside of intelligence, in the sacred terror that a human being feels each time he or she is compelled to recognize, in its irrecusable strangeness, the presence of the supernatural. The Greeks had a word for this effective, immediate, and irrational reaction in the presence of the sacred: *thambos* (“reverential awe”). Such awe would be the basis of the earliest cults, the diverse forms taken by the rites answering, from the same origin, to the multiplicity of circumstances and human needs.

Similarly, it is supposed that behind the variety of names, figures, and functions proper to each divinity, a ritual brought into play the same general experience of the divine, considered a suprahuman power (*kreitton*). This indeterminate divine being (Gr., *theion*, or *daimonion*), underlying the specific manifestations of particular gods, took diverse forms according to the desires and fears to which the cult had to respond. From this common fabric of the divine, the poets, in turn, cut singular characters; they brought them to life, imagining for each a series of dramatic adventures in what Festugière does not hesitate to call a “divine novel.” On the other hand, for every act of the cult, there is no other god but the one invoked. From the moment he is addressed, “in him is concentrated all divine force; he alone is considered. Most certainly, in theory he is not the only god since there are others and one knows it. But in practice, in the actual state of mind of the worshiper, the god invoked supplants at that moment all the others” (Festugière, 1944, p. 50).

Thus the refusal of some scholars to take myth into account becomes clear: it leads exactly to that which from the beginning was meant, more or less consciously, to be proved. By effacing the differences and the oppositions that distinguish the gods from one another, any true difference is effaced between polytheisms of the Greek type and Christian monotheism, which then becomes a model. This flattening out of religious realities to make them fit a single mold can-

not satisfy the historian. Must not his first concern be, on the contrary, to define the specific traits that give each great religion a character of its own and that make it, in its unicity, an entirely original system? Apart from reverential awe and a diffused feeling of the divine, the Greek religion presents itself as a vast symbolic construction, complex and coherent, that allows room for thought, as well as feeling, on all levels and in all aspects, including the cult. Myth played its part in this system in the same way as ritual practices and representations of the divine. Indeed, myth, rite, and figurative portrayals were the three modes of expression—verbal, gestural, and iconic—by which the Greeks manifested their religious experience. Each constituted a specific language that, even in its association with the two others, responded to particular needs and functioned autonomously.

The work of Georges Dumézil and Claude Lévi-Strauss on myth led to a totally different presentation of the problem of Greek mythology: How should the texts be read? What status did they assume in Greek religious life? The days when one could discuss myth as if it were a poet's individual fantasy, a free and gratuitous romantic invention, are gone. Even in the variations to which it lent itself, a myth obeyed the severe constraints of the community. During the Hellenistic period, when an author, such as Callimachus, wrote a new version of a legendary theme, he was not free to modify the elements or to recompose the scenario as he pleased. He belonged to a tradition; whether he conformed to it exactly or deviated on a certain point, he was restrained and supported by it and had to refer to it, at least implicitly, if he wanted the public to hear his tale. As Louis Gernet (1932) noted, even when a narrator seemed to have completely invented a tale, he was actually working according to the rules of a "legendary imagination" that had its own functioning, internal necessities, and coherence. Without even knowing it, the author was obliged to submit to the rules of the play of associations, oppositions, and homologies that had been established by a series of previous versions of the tale and that composed the conceptual framework common to the type of narrative. To have meaning, each variation of a myth had to be linked to, as well as compared with, the other variations. Together, they composed one semantic space, whose particular configuration appears as the characteristic mark of Greek legendary tradition. By analyzing a myth in all its versions, or a corpus of diverse myths centered around the same theme, we are able to explore this structured and organized mental space.

Interpretation of a myth, therefore, operates along lines different from those characterizing the study of literature and must meet other goals. It seeks to determine the conceptual architecture of the very composition of the fable, the important frameworks of classification that are involved, the choices made in the division and the coding of reality, and the network of relationships that the story, by its narrative procedures, establishes between the various elements of the plot. In short, the mythologist seeks to reconstitute what Dumézil calls the "ideology," that is, the conceptualization

and appreciation of the great forces that in their mutual relationships and their perfect equilibrium govern the natural and supernatural worlds and human society and makes them what they ought to be.

In this sense myth, which should not be confused with ritual or subordinated to it, does not conflict with ritual as much as has been supposed. In its verbal form, myth is more explicit than rite, more didactic, more apt to theorize. It thus contains the germ of that knowledge that—on another level of language and thought—is the concern of philosophy when it formulates its assertions using concepts and terms that are removed from any reference to the gods of the common religion. The cult is more engaged in considerations of a utilitarian nature. But it is no less symbolic: a ritual ceremony unfolds according to a scenario whose episodes are as strictly organized and as fraught with meaning as the sequences of a narrative. Every detail of this *mise-en-scène*, in which the worshiper in defined circumstances undertakes to act out his relationship with one god or another, has an intellectual dimension and goal: it implies a certain idea of the god, the conditions for his approach, and the results that the various participants, according to their role and status, have the right to expect from this means of entering into symbolic commerce with the divinity.

Figurative representation is of the same nature. Although it is true that during the Classical period the Greeks gave a privileged place in their temples to the great anthropomorphic statues of the gods, they were familiar with all the forms of divine manifestation: aniconic symbols, either natural objects, such as a tree or a rough stone, or products shaped by the human hand (e.g., a post, a pillar, a scepter); diverse iconic figures, such as a small, rough-hewn idol whose form was completely hidden by clothes; monstrous figures mingling the bestial and the human; a simple mask whose hollow face and fascinating eyes evoked the divine; a fully human statue. These figures were not all equivalent, nor were they indiscriminately suited to all the gods or to all aspects of the same god. Each had its own way of translating certain aspects of the divine, of "making present" the beyond, of locating and inserting the sacred in the space of the here and now. Thus, a pillar or post driven into the ground had neither the same function nor the same symbolic value as an idol that was ritually moved from one place to another; as an image locked away in a secret repository, its legs bound to prevent its escape; or as a great cult statue whose permanent installation in a temple demonstrated the lasting presence of the god in his house. Each form of representation implied for the specific divinity a particular way of making himself known to man and of exercising, through his images, his supernatural powers.

If, following various modalities, myth, image, and ritual all operate on the same level of symbolic thought, it is understandable that they combine to make each religion a complete whole in which, to quote Dumézil in *L'héritage indo-européen à Rome* (Paris, 1949, p. 64), "concepts, images and

actions fit together and by their relations form a kind of net in which, potentially, all the matter of human experience must be caught and distributed.”

**THE WORLD OF THE GODS.** To find the lines of the net, to pick out the configurations shaped by its meshes: such must be the historian’s task. In the case of Greek religion, this proves to be far more difficult than with the other Indo-European religions, in which the pattern of the three functions—sovereignty, war, and fertility—is maintained. Where it is clearly attested, this structure serves as the framework and keystone of the entire edifice and provides a unity that seems to be lacking in Greek religion.

Indeed, Greek religion presents an organization so complex that it excludes recourse to a single reading code for the entire system. To be sure, a Greek god is defined by the set of relationships that unite or put him in opposition to other divinities of the pantheon, but the theological structures thus brought to light are too numerous and, especially, too diverse to be integrated into the same pattern. According to the city, the sanctuary, or the moment, each god enters into a varied network of combinations with the others. Groups of gods do not conform to a single model that is more important than others; they are organized into a plurality of configurations that do not correspond exactly but compose a table with several entries and many axes, the reading of which varies according to the starting point and the perspective adopted.

Take the example of Zeus. His name clearly reveals his origin, based on the same Indo-European root (meaning “to shine”) as Latin *dies/deus* and the Vedic *dyeus*. Like the Indian Dyaus Pitṛ or the Roman Jupiter (Iovpater), Father Zeus (Zeus Pater) is the direct descendant of the great Indo-European sky god. However, the gap between the status of the Zeus of Greece and that of his corresponding manifestations in India and in Rome is so evident, so marked, that even when comparing the most assuredly similar gods one is compelled to recognize that the Indo-European tradition has completely disappeared from the Greek religious system.

Zeus does not appear in any trifunctional group comparable to the pre-Capitoline Jupiter-Mars-Quirinus, in which sovereignty (Jupiter) is contrasted with the action of the warrior (Mars) and the functions of fertility and prosperity (Quirinus). Nor is he associated, as Mitra is with Varuṇa, with a sovereign power that expresses not only legal and juridical aspects but also the values of magic and violence. Ouranos, the dark night sky, who has sometimes been compared with Varuṇa, is paired in myth with Gaia, the earth, not with Zeus.

As sovereign, Zeus embodies greater strength than all the other gods. He is the supreme power: with Zeus on one side and all the assembled Olympians on the other, it is Zeus who prevails. Confronted by Kronos, whom he dethroned, and the Titan gods, whom he fought and imprisoned, Zeus represents justice, the fair distribution of honors and offices, respect for the privileges to which each person is entitled,

concern for what is due even to the weakest. In him and by him, order and power, law and violence are reconciled and conjoined. “All kings come from Zeus,” wrote Hesiod in the seventh century BCE, not to oppose monarch, warrior, and peasant, but to affirm that there is no true king who does not set himself the task of quietly making justice triumph. “From Zeus are the kings,” echoes Callimachus four centuries later, but this kinship between kings and the royalty of Zeus does not fit into a trifunctional framework. It crowns a series of similar statements that link a particular category of men to the divinity who acts as its patron: blacksmiths to Hephaistos, soldiers to Ares, hunters to Artemis, and singers accompanied by the lyre to Phoibos (Apollo).

When Zeus enters into the composition of a triad, as he does with Poseidon and Hades, it is to delimit by their apportionment the cosmic levels, or domains: the heavens to Zeus, the sea to Poseidon, the subterranean world to Hades, the surface of the earth to all three. When he is paired with a goddess, the dyad thus formed brings out different aspects of the sovereign god, depending on the female divinity who is his counterpart. Joined with Gaia (“earth”), for example, Zeus is the celestial principle, male and generative, whose fertilizing rain reaches deep in the ground to animate young sprouts of vegetation. United with Hera in a lawful marriage that engenders a legitimate line, Zeus becomes the patron of the institution of matrimony, which, by civilizing the union of man and woman, serves as the foundation of every social organization; the couple formed by the king and queen is the exemplary model. Associated with Metis, his first wife (whom he swallowed and assimilated entirely), Zeus the king is identified with cunning intelligence and with the underhanded shrewdness needed to win power and to keep it. He is able to ensure the permanence of his reign and to protect his throne from traps, snares, and surprises, for he is always prompt to foresee the unexpected and to ward off dangers. Taking Themis for his second wife, he fixes, once and for all, the order of the seasons, the balance of human groups in the city (order and balance represented by the Horai, daughters of Zeus and Themis), and the ineluctable course of the Fates (the Moirai). He becomes cosmic law, social harmony, and destiny.

Father of the gods and humankind, as he is designated already in the *Iliad*—not because he sired or created all beings but because he exercises over each of them an authority as absolute as that of the head of a family over his household—Zeus shares with Apollo the epithet *patrōios* (“the ancestral”). Together with Athena Apatouria, Zeus, as Phratrios, ensures the integration of individuals into the diverse groups that compose the civic community. In the cities of Ionia, he makes of all the citizens authentic brothers, celebrating in their respective phratries, as in one family, the festival of the Apatouria, that is, of those who acknowledge themselves children of the same father. In Athens, joined with Athena Polias, Zeus is Polieus, patron of the city. Master and guarantor of political life, Zeus forms a couple with

the goddess, whose function as titular power of Athens is more precise and, one might say, more localized. Athena watches over her city as a particular city distinguished from the other Greek city-states. She favors Athens, according to the dual privileges of concord within the city and victory outside of it.

Celestial and judicious wielder of supreme power, founder of order, guarantor of justice, governor of marriage, father and ancestor, and patron of the city, the tableau of the sovereignty of Zeus includes still other dimensions. His authority is domestic as well as political. In close connivance with Hestia, Zeus has supreme control not only over each private hearth—that fixed center where the family has its roots—but also over the common household of the state in the heart of the city, the Hestia Koinē, where the ruling magistrates keep watch. Zeus Herkeios, the god of the courtyard and the household, circumscribes the domain within which the head of the house has the right to exercise his power; Zeus Klarios, the divider of estates, delineates and sets boundaries, leaving Apollo and Hermes in charge of protecting the gates and controlling the entries.

As Zeus Hikesios and Zeus Xenios, he receives the suppliant and the guest, introduces them into the unfamiliar house, and ensures their safety by welcoming them to the household altar, although he does not assimilate them entirely to the members of the family. Zeus Ktesios, the guardian of possession and wealth, watches over the property of the head of the house. As an Olympian and a celestial god, Zeus opposes Hades; yet as Ktesios, Zeus's altar is deep in the cellar, and he takes on the appearance of a serpent, the most chthonic of animals. The sovereign can thus incorporate that chthonic part of the universe normally controlled by the powers of the underworld but occasionally incarnated by Zeus himself in a kind of internal tension, polarity, or even a double image. The celestial Zeus, who sits at the summit of the shining ether, is mirrored by a Zeus Chthonios, Zeus Katachthonios, Zeus Meilichios, a Zeus of the dark underworld, who is present in the depths of the earth where he nurtures, in the proximity of the dead, the riches or retributions that are ready, if he is willing, to surge into the light led by the chthonic Hermes.

Zeus connects heaven and earth by means of the rain (Zeus Ombrios, Huetios, Ikmaios, "rainy," "damp"), the winds (Zeus Ourios, Euanemos, "windy," "of a good wind"), and the lightning (Zeus Astrapaios, Bronton, Keraunios, "wielder of thunderbolts," "thunderer"). He ensures communication between high and low through signs and oracles, which transmit messages from the gods of heaven to mortals on the earth. According to the Greeks, their most ancient oracle was an oracle of Zeus at Dodona. There he established his sanctuary at the site of a great oak, which belonged to him and which rose straight as the tallest column toward heaven. The rustling of the leaves of the sacred oak above their heads provided the consultants with the answer to their questions to the sovereign of heaven. Moreover, when Apollo pro-

nounces his oracles in the sanctuary of Delphi, he speaks not so much for himself as in the name of his father, with whom he remains associated and, in his oracular function, seems to obey. Apollo is a prophet, but he is the prophet of Zeus: he voices only the will and decrees of the Olympian so that here—at the navel of the world—the word of the king and father may resound in the ears of those who can hear.

The different epithets of Zeus, wide as their range may be, are not incompatible. They all belong to one field and emphasize its multiple dimensions. Taken together, they define the contours of divine sovereignty as conceived by the Greeks; they mark its boundaries and delimit its constituent domains; they indicate the various aspects that the power of the king-god may assume and exercise in more or less close alliance (according to circumstances) with the other divinities.

An entirely different matter is the Zeus of Crete, the Kretagenes, Diktaios, or Idaios, the youthful god whose infancy was associated with the Curetes, with their dances and orgiastic rites and the din of their clashing weapons. It was said of this Zeus that he was born in Crete and that he also died there; his tomb was shown on the island. But the Greek Zeus, in spite of his many facets, can have nothing in common with a dying god. In the *Hymn to Zeus*, Callimachus firmly rejects the tradition of these stories as foreign to his god, "ever great, ever king." The real Zeus was not born in Crete, as those lying Cretans told it: "They have gone so far as to build you a tomb, O King; Nay, you never died; You are for eternity."

In the eyes of the Greeks, immortality, which sets a rigorous boundary between the gods and mortals, was such a fundamental trait of the divine that the ruler of Olympus could in no way be likened to one of the Oriental deities who die and are reborn. During the second millennium, the framework of the Indo-European religious system, whose influence is reflected in the name of Zeus, may well have collapsed among those people speaking a Greek dialect, who came in successive waves to settle Helladic soil and whose presence is attested as far as Knossos in Crete from the end of the fifteenth century BCE. Contacts, exchanges, and intermixing were numerous and continuous. There were borrowings from the Aegean and Minoan religions, just as there were from the Oriental and Thracio-Phrygian cults when the Greeks later expanded throughout the Mediterranean. Nevertheless, between the fourteenth and the twelfth centuries, most of the gods revered by the Achaeans—and whose names figure on the Linear B tablets from Knossos and Pylos—are the same ones encountered in the classical Greek pantheon: Zeus, Poseidon, Eualios (Ares), Paeon (Apollo), Dionysos, Hera, Athena, Artemis, and the Two Queens, that is, Demeter and Kore.

The religious world of the Indo-European invaders of Greece could well have been modified and opened to foreign influences, but while it assimilated some concepts, it kept its specificity and the distinctive features of its own gods. From

the religion of the Mycenaeans to that of the age of Homer, during those obscure centuries that followed the fall or the decline of the Achaean kingdoms after the twelfth century, continuity was not only marked by the persistence of the names of the gods and cult places. The continuity of certain festivals celebrated by the Ionians on both shores of the Mediterranean proves that these festivals must already have been customary in the eleventh century at the outset of the first wave of colonization, whose point of departure may have been Athens, the only Mycenaean site to remain intact, and which established groups of emigrants on the coast of Asia Minor to found Greek cities.

This permanence of Greek religion must not be misleading, however. The religious world evoked by Homer is no more representative of the religion of an earlier period than the world of the Homeric poems is representative of the world of the Mycenaean kings, whose exploits the bard, after an interval of four centuries, undertook to evoke. During this time a whole series of changes and innovations were introduced: behind apparent continuities was a veritable rupture (that the epic text effaces but whose extent can be measured through archaeological research and a reading of the tablets).

**THE CIVIC RELIGION.** Between the eleventh and eighth centuries, technical, economic, and demographic changes led to what the English archaeologist Anthony Snodgrass called the “structural revolution,” which gave rise to the city-state (*polis*). The Greek religious system was profoundly reorganized during this time in response to the new forms of social life introduced by the *polis*. Within the context of a religion that from then on was essentially civic, remodeled beliefs and rites satisfied a dual and complementary obligation. First of all, they fulfilled the specific needs of each group of people, who constituted a city bound to a specific territory. The city was placed under the patronage of its own special gods, who endowed it with a unique religious physiognomy. Every city had its own divinity or divinities, whose functions were to cement the body of citizens into a true community; to unite into one whole all the civic space, including the urban center and the *chora*, or rural area; and to look after the integrity of the state—the people and the land—in the presence of other cities. Second, the development of an epic literature cut off from any local roots, the construction of great common sanctuaries, and the institution of pan-Hellenic games and panegyrics established and reinforced, on a religious level, legendary traditions, cycles of festivals, and a pantheon that would be recognized equally throughout all of Hellas.

Without assessing all the religious innovations brought about during the Archaic period, the most important should be mentioned. The first was the emergence of the temple as a construction independent of the human habitat, whether houses or royal palaces. With its walls delimiting a sacred enclosure (*temenos*) and its exterior altar, the temple became an edifice separated from profane ground. The god came to reside there permanently through the intermediacy of his great anthropomorphic cult statue. Unlike domestic altars and pri-

vate sanctuaries, this house of the god was the common property of all citizens.

To mark and confirm its legitimate authority over a territory, each city built a temple in a precise place: in the center of the city, the *acropolis* or *agora*, the gates of the walls surrounding the urban area, or in the zone of the *agros* and the *eschatiai*—the wilderness that separated each Greek city from its neighbors. The construction of a network of sanctuaries within, around, and outside the city not only punctuated the space with holy places but also marked the course of ritual processions, from the center to the periphery and back. These processions, which mobilized all or a part of the population on fixed dates, aimed at shaping the surface of the land according to a religious order.

Through the mediation of its civic gods (installed in their temples), the community established a kind of symbiosis between the people and their land, as if the citizens were the children of an earth from which they had sprung forth in the beginning and which, by virtue of this relationship with those who inhabited it, was itself promoted to the rank of “earth of the city.” This explains the bitterness of the conflicts, between the eighth and the sixth centuries, that pitted neighboring cities against each other in the appropriation of cult places on those borders that were held in common by more than one *polis*. The occupation of the sanctuary and its religious annexation to the urban center were equivalent to legitimate possession. When it founded its temples, the *polis* rooted them firmly in the world of the gods so that its territorial base would have an unshakable foundation.

Another innovation with partly comparable significance left its mark on the religious system. During the eighth century, it became customary to put into service Mycenaean buildings, usually funerary, that had been abandoned for centuries. Once they were fitted out, they served as cult places where funeral honors were rendered to legendary figures who, although they usually had no relationship to these edifices, were claimed as ancestors by their “progeny,” noble families or groups of *phratries*. Like the epic heroes whose names they carried, these mythical ancestors belonged to a distant past, to a time different from the present, and constituted a category of supernatural powers distinct from both the *theoi*, or gods proper, and the ordinary dead. Even more than the cult of the gods (even the civic gods), the cult of heroes had both civic and territorial value. It was associated with a specific place, a tomb with the subterranean presence of the dead person, whose remains were often brought home from a distant land.

The tombs and cults of the hero, through the prestige of the figure honored, served as glorious symbols and talismans for the community. The location of the tombs was sometimes kept secret because the welfare of the state depended on their safety. Installed in the heart of the city in the middle of the *agora*, they gave substance to the memory of the legendary founder of the city (the tutelary hero or, in the case of a colony, the colonizing hero), or they patronized

the various components of the civic body (tribes, phratries, and demes). Disseminated to various points of the territory, the cults consecrated the affinities that united the members of the rural areas and villages (the *kōmai*). In all cases their function was to assemble a group around an exclusive cult that appears to have been strictly implanted in precise points of the land.

The spread of the cult of the hero did not just comply with the new social needs that arose with the city; the adoration of the heroes had a properly religious significance. Different from the divine cult, which was obligatory for everyone and permanent in character, and also from the funerary rites, which were limited in time as well as to a narrow circle of relatives, the heroic institution affected the general stability of the cult system.

For the Greeks, there was a radical opposition between the gods, who were the beneficiaries of the cult, and mortals, who were its servants. Strangers to the transience that defines the existence of mortals, the gods were the *athanatoi* ("the immortals"). Humans, on the other hand, were the *brotoi* ("the mortals"), doomed to sickness, old age, and death. Consequently, the funeral honors paid to the dead were placed on a different level from the sacrifices and devotions demanded by the gods as their share of honor, their special privilege. The narrow strips of material decorating the tombs, the offerings of cakes for the dead person, the libations of water, milk, honey, or wine that had to be renewed on the third, ninth, and thirtieth day after the funeral and again each year on the festival of the Genesia appear to have been the temporary continuation of the funeral ceremony and mourning practices rather than acts of veneration toward the higher powers. The intent of opening the doors of Hades to the dead person was to make him disappear forever from this world, where he no longer had a place. At the same time, through the various procedures of commemoration, the funeral transformed his absence into a presence in the memory of the survivors—an ambiguous, paradoxical presence, as of one who is absent, relegated to the realm of shadows, reduced henceforth to the social status of a dead man by the funeral rites. Even this status, however, is destined to sink into oblivion as the cycle of generations is renewed.

The heroes were quite another matter. To be sure, they belonged to the humankind and thus knew suffering and death. But a whole series of traits distinguished them, even in death, from the throng of ordinary dead. The heroes had lived during the period that constituted the "old days" for the Greeks, a bygone era when men were taller, stronger, more beautiful. Thus the bones of a hero could be recognized by their gigantic size. It was this race of men, later extinct, whose exploits were sung in epic poetry. Celebrated by the bards, the names of the heroes—unlike the names of ordinary people, which faded into the indistinct and forgotten mass of the nameless—remained alive forever, in radiant glory, in the memory of all the Greeks. The race of heroes formed the legendary past of the Greece of the city-states and

the roots of the families, groups, and communities of the Hellenes.

Although they were mortals, these ancestors seemed in many ways nearer to the gods, less cut off from the divine, than the rest of humanity. In their day, the gods still mingled readily with mortals, inviting themselves to their homes, eating at their tables, and even slipping into their beds to unite with them and—by mixing the two races, the mortal and the immortal—to beget beautiful children. The heroic figures whose names survived and whose cults were celebrated at their tombs were very often presented as the fruit of these amorous encounters between the divinities and human beings of both sexes. They were, as Hesiod said, "the divine race of heroes called demigods." If their birth sometimes endowed them with a semidivine origin, their death also placed them above the human condition. Instead of descending into the darkness of Hades, they were "abducted" or transported by means of divine favor—some during their lifetime but most of them after death—to a special, separate place on the Isles of the Blessed, where they continued to enjoy in permanent felicity a life comparable to that of the gods.

Although it did not bridge the immeasurable gulf that separates mortals from the gods, heroic status seemed to open the prospect of the promotion of a mortal to a rank that, if not divine, was at least close to divinity. However, during the entire Classical period, this possibility remained strictly confined to a narrow sector. It was thwarted, not to say repressed, by the religious system itself. Indeed, piety, like wisdom, enjoined mortals not to pretend to be the equal of a god; the precepts of Delphi—"know who you are, know thyself"—have no other meaning than that. Humanity must accept its limits. Therefore, apart from the great legendary figures, such as Achilles, Theseus, Orestes, and Herakles, the status of the hero was restricted to the first founders of the colonies or to persons, such as Lysander of Samos and Timoleon of Syracuse, who had acquired exemplary symbolic worth in the eyes of a city.

We know of few cases of men who were heroized during the Classical period. They never concerned a living person but always one who after his death appeared to bear a *numen* (or formidable sacral power) because of his extraordinary physical characteristics (size, strength, and beauty), the circumstances of his death (if he had been struck by lightning or had disappeared leaving no trace), or the misdeeds attributed to his ghost, which it seemed necessary to appease. For example, in the middle of the fifth century, the boxer Cleomedes of Astypalaia, who was exceptionally strong, killed his adversary in combat. Denied a prize by the decision of the jury, he returned home mad with rage. He vented his fury on a pillar that held up the ceiling of a school, and the roof caved in on the children. Pursued by a crowd that wanted to stone him, Cleomedes hid in a chest in the sanctuary of Athena, locking the lid on himself. His pursuers succeeded in forcing it open, but the chest was empty: no Cleomedes, living or dead, was to be found. The Pythia, when consulted,

advised the establishment of a hero cult in honor of the boxer, whose strength, fury, misdeeds, and death set him above ordinary mortals. Sacrifices were to be made to him as “no longer a mortal.” But the oracle manifested her reservations by also proclaiming that Cleomedes was the last of the heroes.

However much the heroes constituted, through the honors paid to them, a category of superior beings, their role, their power, and the domains in which they intervened did not interfere with those of the gods. They never played the role of intermediary between earth and heaven; they were not intercessors but indigenous powers, bound to the spot of ground where they had their subterranean homes. Their efficacy adhered to their tombs and to their bones; there were anonymous heroes designated only by the names of the places where their tombs were established, such as the hero of Marathon. This local quality was accompanied by a strict specialization. Many heroes had no other realities than the narrow function to which they were dedicated and which defined them entirely. For example, at Olympia, at the bend of the track, competitors offered sacrifices at the tomb of the hero Taraxippos, the Frightener of Horses. Similarly, there were doctor heroes, doormen, cook, fly-catcher heroes, a hero of meals, of the broad bean, of saffron, a hero to mix water and wine or to grind the grain.

If the city could group into the same category of cults the highly individualized figures of heroes of long ago, whose legendary biographies were fixed in their epics, of exceptional contemporaries, of anonymous dead of whom all that remained were funerary monuments, and of all sorts of functional daemons, it was because inside their tombs they manifested the same contacts with the subterranean powers, shared the same characteristic of territorial localization, and could be used as political symbols. Instituted by the emerging city, bound to the land that it protected and to the groups of citizens that it patronized, the cult of the hero did not, in the Hellenistic period, lead to the divinization of human figures, nor did it lead to the establishment of a cult of sovereigns: these phenomena were the product of a different religious mentality. Inseparable from the *polis*, the hero cult declined with it.

The appearance of the hero cult, however, was not without consequences. By its newness it led to an effort to define and categorize more strictly the various supernatural powers. Plutarch noted that Hesiod was the first, in the seventh century, to make a clear distinction between the different classes of divine beings, which he divided into four groups: gods, daemons, heroes, and the dead. Taken up again by the Pythagoreans and by Plato, this nomenclature of the divinities to whom men owed veneration was common enough in the fourth century to appear in the requests that the consultants addressed to the oracle of Dodona. On one of the inscriptions that have been found, a certain Euandros and his wife question the oracle about which “of the gods, or heroes, or daemons” they must sacrifice to and address their prayers to.

**THE SACRIFICIAL PRACTICES.** To find his bearings in the practice of the cult, the believer, therefore, had to take into account the hierarchical order that presided in the society of the beyond. At the top of the hierarchy were the *theoi*, both great and small, who made up the race of the blessed immortals. These were the Olympians, grouped under the authority of Zeus. As a rule they were celestial divinities, although some of them, such as Poseidon and Demeter, bore chthonic aspects. There was indeed a god of the underworld (Hades), but he was in fact the only one who had neither temple nor cult. The gods were made present in this world in the spaces that belonged to them: first of all, in the temples where they resided but also in the places and the objects that were consecrated to them and that, specified as *hiera* (“sacred”), could be subject to interdiction. These include the sacred groves, springs, and mountain peaks; an area surrounded by walls or boundary markers (*temenos*); crossroads, trees, stones, and obelisks. The temple, the building reserved as the dwelling of the god, did not serve as a place of worship. The faithful assembled to celebrate the rites at the exterior altar (*bōmos*), a square block of masonry. Around it and upon it was performed the central rite of the Greek religion, the burnt offering (*thusia*), the analysis of which is essential.

This was normally a blood sacrifice implying the eating of the victim: a domestic animal, crowned and decked with ribbons, was led in procession to the altar to the sound of flutes. It was showered with water and fistfuls of barley seeds, which were scattered on the ground and on the altar as well as on the participants, who also wore crowns. The head of the victim was then lifted up and its throat cut with a *machaira*, a large knife concealed under the seeds in the *kanoun*, or ritual basket. The blood that gushed onto the altar was caught in a receptacle. The animal was cut open and its entrails, especially the liver, were drawn out and examined to see if the gods accepted the sacrifice. If accepted, the victim was immediately carved. The long bones, entirely stripped of flesh, were laid on the altar. Covered with fat, they were consumed with herbs and spices by the flames and, in the form of sweet-smelling smoke, rose toward heaven and the gods. Certain internal morsels (*splagchna*) were put on spits and roasted over the same fire that had sent to the divinity his share, thus establishing a link between the sacred powers for whom the sacrifice was intended and the performers of the rite for whom the roasted meat was reserved. The rest of the meat was boiled in caldrons, divided into equal parts, and eaten by the participants on the spot, taken home, or distributed outside to the community at large. The parts that were thought to confer honor, such as the tongue or the hide, went to the priest who presided at the ceremony, though his presence was not always indispensable.

As a rule, any citizen, if he was not impure, had full authority to perform sacrifices. The religious significance of this must be defined by bringing out its theological implications. From the start, however, several points are essential. Certain divinities and certain rituals, such as that of Apollo

Genetor in Delphi and Zeus Hupatos in Attica, required, instead of a blood sacrifice, food oblations: fruit, palms, grain, porridge (*pelanos*), and cakes sprinkled with water, milk, honey, or oil; no blood or even wine was offered. There were cases in which this type of offering, usually consumed by fire but sometimes simply deposited on the altar without being burned (*apura*), was characterized by marked opposition to customary practice. Considered pure sacrifices, unlike those involving the killing of living creatures, they served as models for sectarian movements. Orphics and Pythagoreans referred to them in advocating a ritual behavior and an attitude toward the divine that, in rejecting the blood sacrifice as impious, diverged from the official cult and appeared foreign to the civic religion.

In addition, blood sacrifice itself took two different forms according to whether it addressed the heavenly and Olympian gods or the chthonic and infernal ones. The language already made a distinction between them: for the first, the Greeks employed the term *thuein*; for the second, *enagizein* or *sphattein*.

The *thusia*, as we have seen, was centered on an elevated altar, the *bōmos*. The chthonic sacrifice had only a low altar (the *eschara*) with a hole in it to let the blood pour out into the earth. Normally the celebration took place at night over a ritual pit (*bothros*) that opened the way to the underworld. The animal was immolated with its head lowered toward the earth, which would be inundated with its blood. Once its throat was cut, the victim was no longer the object of ritual handling; because it was offered in holocaust, it was burned entirely without the celebrants having the right to touch it or to eat it. In this kind of rite, in which the offering is destroyed in order to be delivered in its entirety to the beyond, it was less a matter of establishing with the divinity a regular commerce of exchange in mutual confidence than of warding off the sinister forces, of placating a formidable power who would approach without harm only if defenses and precautions were taken. One might say that it was a ritual of aversion rather than one of reconciliation or contact. Understandably, its use was reserved for the cult of the chthonic and infernal deities, for expiatory rites, or for sacrifices offered to heroes and to the dead in their tombs.

In the Olympian sacrifice, the orientation toward the heavenly divinities was marked not only by the light of day, the presence of an altar, and the blood gushing upward when the throat of the victim was cut. A fundamental feature of the ritual was that it was inseparably an offering to the gods and a festive meal for the human participants. Although the climax of the event was undoubtedly the moment that, punctuated by the ritual cry (*ololugmos*), life abandoned the animal and passed into the world of the gods, all the parts of the animal, carefully gathered and treated, were meant for the people, who ate them together. The immolation itself took place in an atmosphere of sumptuous and joyful ceremony. The entire staging of the ritual—from the procession in which the untied animal was led freely and in great pomp

to the concealment of the knife in the basket to the shudder by which the sprayed animal, sprinkled with an ablution, was supposed to give its assent to the immolation—was designed to efface any traces of violence and murder and to bring to the fore aspects of peaceful solemnity and happy festivity. Furthermore, in the economy of the *thusia*, the procedures for cutting up the victim, for roasting or boiling the pieces, for their orderly distribution in equal parts, and for their consumption, either on the spot or elsewhere, were no less important than the ritual killing. The alimentary function of the rite is expressed in a vocabulary that makes no distinction between sacrificer and butcher. The word *hiereion*, which designates an animal as sacrificial victim, at the same time qualifies it as an animal to be butchered, as one suitable for eating. Since the Greeks ate meat only on the occasion of sacrifices and in conformity with sacrificial rules, the *thusia* was simultaneously a religious ceremony in which a pious offering, often accompanied by prayer, was addressed to the gods; a ritualized cooking of food according to the norms that the gods required of humans; and an act of social communion that reinforced, through the consumption of the parts of one victim, the bonds that were to unite all citizens and make them equal.

As the central moment of the cult, the sacrifice was an indispensable part of communal life (whether family or state) and illustrated the tight interdependence of the religious and the social orders in the Greece of the city-states. The function of the sacrifice was not to wrest the sacrificer or the participants away from their families and civic groups or from their ordinary activities in the human world but, on the contrary, to install them in the requisite positions and patterns, to integrate them into the city and mundane existence in conformity with an order of the world presided over by the gods (i.e., “intraworld” religion, in the sense given by Max Weber, or “political” religion, in the Greek understanding of the term). The sacred and the profane did not constitute two radically opposite, mutually exclusive categories. Between the “sacred” in its entirely forbidden aspect and its fully accessible one a multiplicity of configurations and gradations existed. In addition to those realities dedicated to a god and reserved for his use, the sacred was also to be experienced by way of objects, living creatures, natural phenomena, and both the everyday events of private life—eating a meal, departing on a journey, welcoming a guest—and the more solemn occasions of public life. Without any special preparation, every head of a family was qualified to assume religious functions in his home. Each head of a household was pure as long as he had not committed any misdeed that defiled him. In this sense, purity did not have to be acquired or obtained; it constituted the normal state of the citizen.

As far as the city was concerned, there was no division between the priesthood and the magistracy. There were priesthoods that were devolved and practiced as magistracies, and every magistrate was endowed by virtue of his duties with a character of holiness. For any political power to be

exercised, for any common decision to be valid, a sacrifice was required. In war as in peace, before giving battle as well as when convening an assembly or inaugurating a magistrate, the performance of a sacrifice was just as necessary as it was during the great religious festivals of the sacred calendar. As Marcel Detienne so accurately observes in *La cuisine du sacrifice en pays grec*: “Until a late period, a city such as Athens maintained the office of archon-king—one of whose major functions was to administer all of the sacrifices instituted by the ancestors, that is, all the ritual gestures that guaranteed the harmonious operation of society” (Detienne, 1980, p. 10).

If the *thusia* was indispensable for ensuring the validity of social undertakings, it was because the sacrificial fire, by causing the fragrant smoke of the burning fat and bones to rise toward heaven while at the same time cooking food for people, opened the lines of communication between the gods and the participants in the rites. By immolating a victim, burning the bones, and eating the flesh according to ritual rules, the Greeks instituted and maintained with the divine a contact without which their entire existence, left to itself and emptied of meaning, would have collapsed. This contact was not a communion; even in a symbolic form, the Greeks did not eat the god in order to identify with him and to participate in his strength. They consumed a victim, a domestic animal, and ate a part different from that offered to the gods. The link established by the sacrifice emphasized and confirmed the extreme distance that separated mortals and immortals, even when they communicated.

Myths about the origin of the sacrifice are most precise in this respect. They bring to light the theological meanings of the ritual. It was the Titan Prometheus, son of Iapetus, who was said to have instituted the first sacrifice, thus establishing forever the model to which humans were to conform in honoring the gods. This took place during the time when gods and men were not yet separate but lived together, feasted at the same tables, and shared the same felicity far from all evils and afflictions. Men were still unacquainted with the necessity of work, sickness, old age, fatigue, death, and women. Zeus had been promoted king of heaven and had carried out an equitable distribution of honors and privileges. The time had come to define in precise terms the forms of life appropriate for men and for gods.

Prometheus was assigned the task. He brought before the assembled gods and men a great steer, killed it, and cut it up. The boundary that exists between gods and mortals follows, therefore, the line of division between the parts of the immolated beast that went to the gods and those that went to men. The sacrifice thus appears as the act that, as its first accomplishment, consecrated the distinction of divine and human status. But Prometheus, in rebellion against the king of the gods, tried to deceive him for the benefit of men. Each of the two parts prepared by the Titan was a ruse, a lure. The first, camouflaged in appetizing fat, contained only the bare bones; the second, concealed in the skin

and stomach and disgusting in appearance, constituted all that was edible in the animal.

Honor to whom honor is due: it was for Zeus, in the name of the gods, to be the first to choose a portion of the sacrifice. He saw the trap but pretended to be tricked, the better to take his revenge. He chose, therefore, the outwardly enticing portion, the one that concealed the inedible bones under a thin covering of fat. For this reason, men burned the white bones of the victim for the gods, then divided the meat, the portion that Zeus did not choose, among themselves. Prometheus had imagined that in allotting the flesh to humans he was reserving the best part for them. But shrewd as he was, he failed to suspect that he was giving them a poisoned gift. By eating the meat, men sentenced themselves to death. Driven by their hunger, they behaved from then on like all the animals that inhabit the earth, the water, or the air. If they take pleasure in devouring the flesh of an animal that has lost its life, if they have an imperious need for food, it is because their hunger, never appeased but constantly renewed, is the mark of a creature whose strength fails gradually, who is doomed to weariness, old age, and death. By contenting themselves with the smoke from the bones and living off smells and fragrances, the gods bore witness that they belonged to a race whose nature was entirely different from that of men. They, the immortals, were everlasting and eternally young; their being contained nothing perishable and had no contact with the realm of the corruptible.

But the vengeance of the angry Zeus did not stop here. Even before he created out of the earth and water the first woman, Pandora, who introduced among men all the woes hitherto unknown to them—birth from procreation, fatigue, toil, sickness, age, and death—he decided, as retribution for the Titan’s partiality toward mankind, to never again allow men access to the celestial fire. Deprived of fire, were men thus obliged to eat raw meat like beasts? Prometheus then stole a spark, a seed of fire, in the hollow of a stick, and brought it down to earth. Although they would no longer have the flash of the thunderbolt at their disposal, men were given a technical fire, more fragile and mortal, one that would have to be preserved by constant feeding. By cooking their food, this second fire—contingent and artificial, in comparison with the heavenly fire—differentiates humans from animals and establishes them in a civilized life. Of all the animals, only men share the possession of fire with the gods. Thus it is fire that unites man to the divine by rising toward heaven from the lighted altars. But this fire, celestial in origin and destination, is also, in its all-consuming ardor, as perishable as the living creatures subjected to the necessity of eating. The frontier between gods and men is both bridged by the sacrificial fire, which unites them, and accentuated by the contrast between the heavenly fire in the hands of Zeus and the fire that Prometheus’s theft made available to mankind. Furthermore, the function of the sacrificial fire is to mark the portion of the victim belonging to the gods (totally consumed in the flames) and that of men (cooked just enough not to be eaten raw).

The ambiguous relationship between men and gods in the sacrifice was coupled with an equally equivocal relationship between men and animals. In order to live, both must eat, whether their food be animal or vegetable, and so they are equally perishable. But it is only man who eats his food cooked according to rules and after having offered in honor to the gods the animal's life, dedicated to them with the bones. If the barley seeds showered on the head of the victim and on the altar were associated with the blood sacrifice, the reason was that cereals, as a specifically human food involving agricultural labor, represented in the Greek view the paradigm of cultivated plants symbolizing, in contrast to a savage existence, civilized life. Cooked three times (by an internal process that assists the cultivation, by the action of the sun, and by the human hand that turns it into bread), cereal was an analogue to the sacrificial victim, the domestic animal whose flesh had to be ritually roasted or boiled before it was eaten.

In the Promethean myth, sacrifice comes into being as the result of the Titan's rebellion against Zeus at a time when men and gods needed to separate and establish their respective destinies. The moral of the story states that one could not hope to dupe the sovereign god. Prometheus tried to deceive Zeus; man must pay the price of his failure. To perform a sacrifice was both to commemorate the adventure of the Titan, the founder of the rite, and to accept its lesson. It was to recognize that through the accomplishment of the sacrifice and all that it entailed—the Promethean fire, the necessity of work and of women and marriage in order to have children, the condition of suffering, old age, and death—Zeus situated man between animals and gods for all time. In the sacrifice, man submitted to the will of Zeus, who made of mortals and immortals two separate and distinct races. Communication with the divine was instituted in the course of a festive ceremonial, a meal recalling the fact that the commensality of former times was no more: gods and men no longer lived together, no longer ate at the same tables. Man could not sacrifice according to the model established by Prometheus and at the same time pretend in any way to equal the gods. The rite itself, the object of which was to join gods and men together, sanctioned the insurmountable barrier that separated them.

By means of its alimentary rules, sacrifice established man in his proper state, midway between the savagery of animals that devour one another's raw flesh and the perpetual bliss of the gods, who never know hunger, weariness, or death because they find nourishment in sweet smells and ambrosia. This concern for precise delimitations, for exact apportionment, closely unites the sacrifice, both in ritual and in myth, to cereal agriculture and to marriage, both of which likewise define the particular position of civilized man. Just as, to survive, he must eat the cooked meat of a domestic animal sacrificed according to the rules, so man must feed on *sitos*, the cooked flour of regularly cultivated domestic plants. In order to survive as a race, man must father a son by union

with a woman, whom marriage has drawn out of savagery and domesticated by setting her in the conjugal home. By reason of this same exigency of equilibrium in the Greek sacrifice, the sacrificer, the victim, and the god—although associated in the rite—were never confused.

The fact that this powerful theology should have its base on the level of alimentary procedures indicates that the dietary vagaries of the Orphics and Pythagoreans, as well as certain Dionysian practices, had a specifically theological significance and constituted profound divergences in religious orientation. Vegetarianism was a rejection of blood sacrifice, which was believed to be like the murder of a close relation; *omophagia* and *diasparagmos* of the Bacchantes—that is, the devouring of the raw flesh of a hunted animal that had been torn to pieces while still alive—inverted the normal values of sacrifice. But whether sacrifice was circumvented, on the one hand, by feeding like the gods on entirely pure dishes and even on smells or, on the other, by destroying the barriers between men and animals maintained by sacrificial practice, so that a state of complete communion was realized—one that could be called either a return to the sweet familiarity of all creatures during the Golden Age or a fall into the chaotic confusion of savagery—in either case, it was a question of instituting, whether by individual asceticism or by collective frenzy, a type of relationship with the divine that the official religion excluded and forbade. Furthermore, although employing opposing means with opposite implications, the normal distinctions between sacrificer, victim, and divinity became blurred and disappeared. The analysis of sacrificial cuisine thus leads to an understanding of the more or less eccentric—sometimes integrated and sometimes marginal—positions occupied by various sects, religious movements, or philosophical attitudes, all of which were at odds both with the regular forms of the traditional cult and with the institutional framework of the city-state and all that it implied concerning the religious and social status of man.

**GREEK MYSTICISM.** Blood sacrifice and public cult were not the only expressions of Greek piety. Various movements and groups, more or less deviant and marginal, more or less closed and secret, expressed different religious aspirations. Some were entirely or partly integrated into the civic cult; others remained foreign to it. All of them contributed in various ways to paving the way toward a Greek "mysticism" marked by the search for a more direct, more intimate, and more personal contact with the gods. This mysticism was sometimes associated with the quest for immortality, which was either granted after death through the special favor of a divinity or obtained by the observance of the discipline of a pure life reserved for the initiated and giving them the privilege of liberating, even during their earthly existence, the particle of the divine present in each.

In this context, a clear distinction must be made between three kinds of religious phenomena during the Classical period. Certain terms, such as *teletē*, *orgia*, *mustai*, and *bakchoi*, are used in reference to all three, yet the phenomena

they designate cannot in any way be considered identical. Despite some points of contact, they were not religious realities of the same order; nor did they have the same status or the same goals.

First, there were the mysteries. Those of Eleusis, exemplary in their prestige and their widespread influence, constituted in Attica a well-defined group of cults. Officially recognized by the city, they were organized under its control and supervision. They remained, however, on the fringe of the state because of their initiatory and secret nature and their mode of recruiting (they were open to all Greeks and based not on social status but on the personal choice of the individual).

Next there was the Dionysian religion. The cults associated with Dionysos were an integral part of the civic religion, and the festivals in honor of the god had their place like any other in the sacred calendar. But as god of *mania*, or divine madness—because of his way of taking possession of his followers through the collective trance ritually practiced in the *thiasoi* and because of his sudden intrusion here below in epiphanic revelation—Dionysos introduced into the very heart of the religion of which he was a part an experience of the supernatural that was foreign and, in many ways, contrary to the spirit of the official cult.

Finally, there was what is called Orphism. Orphism involved neither a specific cult, nor devotion to an individual deity, nor a community of believers organized into a sect as in Pythagoreanism, whatever links might have existed between the two movements. Orphism was a nebulous phenomenon that included, on the one hand, a tradition of sacred books attributed to Orpheus and Musaios (comprising theogonies, cosmogonies, and heterodox anthropogonies) and, on the other, the appearance of itinerant priests who advocated a style of existence that was contrary to the norm, a vegetarian diet, and who had at their disposal healing techniques and formulas for purification in this life and salvation in the next. In these circles, the central preoccupation and discussion focused on the destiny of the soul after death, a subject to which the Greeks were not accustomed.

What was the relationship of each of these three great religious phenomena to a cult system based on the respect of *nomoi*, the socially recognized rules of the city? Neither in beliefs nor in practices did the mysteries contradict the civic religion. Instead, they completed it by adding a new dimension suited to satisfying needs that the civic religion could not fulfill. The goddesses Demeter and Kore (Persephone), who together with several acolytes patronized the Eleusinian cycle, were great figures of the pantheon, and the narrative of the abduction of Kore by Hades, with all its consequences (including the founding of the *orgia*, the secret rites of Eleusis), is one of the basic legends of the Greeks. The candidate had to take a series of steps to attain the ultimate goal of initiation—from the preliminary stage of the Lesser Mysteries of Agrai to renewed participation in the Greater Mysteries at Eleusis, the *mustēs* having to wait until the fol-

lowing year to acquire the rank of *epoptēs*. The entire ceremony (at Athens itself, at Phaleron for the ritual bath in the sea, and on the road from Athens to Eleusis in a procession that followed the sacred objects and included the Eleusinian clergy, the magistrates of Athens, the *mustai*, foreign delegations, and throngs of spectators) took place in full daylight before the eyes of everyone. The archon-king, in the name of the state, was in charge of the public celebration of the Greater Mysteries, and even the traditional families of the Eumolpides and the Kerukes, who had a special relationship with the two goddesses, were responsible to the city, which had the authority to regulate by decree the details of the festivities.

Only when the *mustai* had entered the sanctuary was secrecy imposed and nothing allowed to escape to the outside world. The interdiction was sufficiently powerful to be respected for centuries. But although the mysteries have kept some of their secrets till this day, some points about them can be considered certain. There was no teaching, nothing resembling an esoteric doctrine, at Eleusis. Aristotle's testimony on this subject is decisive: "Those who are initiated have not to learn something but to feel emotions and to be in a certain frame of mind." Plutarch describes the mood of the initiates, which ranged from anxiety to rapture. Such inner emotional upheaval was brought about by the *drōmena*, things played and mimed; by the *legomena*, ritual formulas that were pronounced; and by the *deiknumena*, things shown and exhibited. It is probable that they were related to the passion of Demeter, the descent of Kore into the underworld, and the fate of the dead in Hades. It is certain that after the final illumination at the end of initiation, the believer felt that he had been inwardly transformed. From then on, he was bound to the goddesses in a close personal relationship of intimate connivance and familiarity. He had become one of the elect, certain to have a fate different from the ordinary in this life and in the next. Blessed, asserts the *Hymn to Demeter*, is he who has had the full vision of these mysteries; the uninitiated, the profane, would not know such a destiny after they died and went to the realm of the shades. Although they neither presented a new conception of the soul nor broke with the traditional image of Hades, the mysteries opened the prospect of continuing a happier existence in the underworld. This privilege was available to believers who freely decided to submit to initiation and to follow a ritual course, each stage of which marked a new progress toward a state of religious purity.

On returning home to his family and to his professional and civic activities, nothing distinguished the initiate either from what he had been before or from those who had not undergone initiation—no external sign, no mark of recognition, not even a slight modification in his way of life. He returned to the city and settled down again to do what he had always done with no other change but his conviction that through this religious experience he would be among the elect after his death: for him, there would be light, joy, danc-

ing, and song in the world of darkness. These hopes concerning the hereafter would later be nourished and developed among the sects, which would also borrow the symbolism of the mysteries, their secrecy, and their hierarchical system. But in the city that patronized them, the mysteries became part of the official religion.

At first glance, the status of Dionysism may seem comparable to that of the mysteries. This cult also consisted of *teletai* and *orgia*, initiations and secret rites open only to those who were invested as *bakchoi*. But the winter festivals of Dionysos at Athens—Oschoporia, rural Dionysia, Lenaea, Anthesteria, urban Dionysia—did not form a coherent and self-contained whole or a closed cycle as they did at Eleusis; they were instead a discontinuous series spread throughout the calendar along with the festivals of the other gods and revealing the same norms of celebration. All of them were official ceremonies, fully civic in character. Some of them carried an element of secrecy and required specialized religious personnel, for example, the annual marriage of the queen, the wife of the archon-king, to Dionysos, which was performed in the Boucoleion during the Anthesteria. The Gerarai, a group of fourteen women, who assisted the queen in her role as wife of the god, performed secret rites in the sanctuary of Dionysos in the marshes, but they did this “in the name of the city” and “following its traditions.” The people themselves prescribed the procedures of the wedding and ensured their safety by having them engraved on a stele. Thus the queen’s secret marriage was equivalent to the official recognition by the city of the divinity of Dionysos. It consecrated the union of the civic community with the god and represented his integration into the religious order of the community.

The Thyiads, or Bacchantes, of Athens, women who participated in the orgiastic rites of Dionysos, met their counterparts from Delphi at Mount Parnassus every three years. They performed their secret rites in the name of the city. They were not a segregated group of initiates, a marginal sisterhood of the elect, or a sect of deviants: they formed an official female cult, entrusted by the city with the task of representing it before the Delphians. They operated according to the framework of the cult rendered to Dionysos in the sanctuary of Apollo. There is no evidence of private Dionysian associations that recruited adepts to celebrate secretly a specific cult under the protection of the god in Attica, or even in continental Greece, in the fifth century, as was the case several centuries later with the Iobakchoi. Toward the fifth century, when the city of Magnesia, on the Meander River, decided to organize a cult dedicated to Dionysos, it founded, after consulting Delphi, three *thiasoi* (three official female colleges placed under the direction of qualified priestesses who had come from Thebes especially for that purpose).

What then constituted, in comparison with the other gods, the originality of Dionysos and his cult? Dionysism, unlike the mysteries, did not exist as an extension of the civic

religion. Instead, it expressed the city’s official recognition of a religion that in many ways eluded the city, contradicting it and going beyond its control. It established, in the midst of public life, a religious behavior that displayed aspects of eccentricity in an allusive, symbolic form or in an open manner.

Even in the world of the Olympian gods, to which he had been admitted, Dionysos personified, as expressed so well by Louis Gernet, the presence of the Other. He did not confirm and reinforce the human and social order by making it sacred. Dionysos called this order into question; indeed, he shattered it. In so doing he revealed another side of the sacred, one that was no longer regular, stable, and defined but strange, elusive, and disconcerting. As the only Greek god endowed with the power of *māyā* (“magic”), Dionysos transcends all forms and evades all definitions; he assumes all aspects without confining himself to any one. Like a conjurer, he plays with appearances and blurs the boundaries between the fantastic and the real. Ubiquitous, he is never to be found where he is but always here, there, and nowhere at the same time. As soon as he appears, the distinct categories and clear oppositions that give the world its coherence and rationality fade, merge, and pass from one to the other. He is at once both male and female. By suddenly appearing among mortals, he introduces the supernatural in the midst of the natural and unites heaven and earth. Young and old, wild and civilized, near and far, beyond and here-below are joined in him and by him. Even more, he abolishes the distance that separates the gods from humans and humans from animals.

When the Maenads give themselves over to the frenzy of the trance, the god takes possession of them, subjugating and directing them as he pleases. In frenzy and enthusiasm, the human creature plays the god, and the god, who is within the believer, plays the human. The frontiers between them are suddenly blurred or obliterated in a proximity through which humans are estranged from their daily existence or ordinary life, alienated from themselves, and transported to a distant elsewhere. This contiguity with the divine, accomplished by the trance, is accompanied by a new familiarity with animal savagery. On the mountains and in the woods, far from their homes and from cities and cultivated lands, the Maenads play with serpents and suckle the young of animals as their own, but they also pursue, attack, and tear to pieces living animals (*diasparagmos*) and devour their raw flesh (*omophagia*). Through their eating behavior, they assimilate themselves to wild beasts that—unlike human beings, who eat bread and the cooked meat of ritually sacrificed domestic animals—eat one another and lap up each other’s blood, knowing no rule or law but only the hunger that drives them.

Maenadism, which was limited to women, carried in its sudden outburst two opposing aspects. For the faithful, in happy communion with the god, it brought the supernatural joy of momentary escape to a kind of Golden Age where all

living creatures meet again, mingled like brothers and sisters. However, for those women (and cities) who rejected the god and who had to be constrained by punishment, *mania* led to the horror and madness of the most atrocious of pollutions: a return to the chaos of a lawless world in which maddened women tear apart the bodies of their own children as if the children were animals and devour their flesh. A dual god, combining in his person two facets, Dionysos, as he proclaims in *The Bacchae* of Euripides, is both “the most terrible and the most gentle.”

In order that he may show himself beneficent in his gentleness, Dionysos—whose strangeness, irrepressible exuberance, and intrusive dynamism seem to threaten the stability of the civic religion—must be welcomed into the city, acknowledged as belonging to it, and assured a place beside the other gods in the public cult. The entire community must solemnly celebrate the festivals of Dionysos: for its women, it must organize a form of controlled and ritualized trance within the framework of the official *thiasoi*, promoted public institutions; for its men, an estrangement from the normal course of things in the joyfulness of a revelry consisting of wine and drunkenness, games and festivities, masquerades and disguises; and, finally, it must found the theater on whose stage illusion acquires substance and comes to life and the imaginary is displayed as if it were reality. In each case, the integration of Dionysos into the city and its religion meant installing the Other, with all honors, in the heart of the social establishment.

Ecstasy, enthusiasm, and possession; the joy of wine and festival; the pleasures of love; the exaltation of life in its outpouring and unexpectedness; the gaiety of masks and disguises; the happiness of everyday life—Dionysos can bring all of these if men and cities are willing to recognize him. But never does he come to announce a better fate in the hereafter. He does not advocate flight from the world, nor does he teach renunciation or offer the soul access to immortality through an ascetic way of life. He conjures up the many faces of the Other in this life and world, around us and within us. He opens before us, on this earth and even in the framework of the city, the way of escape toward a disconcerting strangeness. Dionysos teaches or forces us to become other than what we ordinarily are.

Undoubtedly, it was this need to escape, this nostalgia for a complete union with the divine, that—even more than his descent into the underworld in search of his mother, Semele—explains the fact that Dionysos could be associated, sometimes quite closely, with the mysteries of the two Eleusinian goddesses. When the wife of the archon-king went to celebrate her marriage with Dionysos, she was assisted by the sacred herald of Eleusis; and, at the Lenaea, perhaps the most ancient of the Attic festivals of Dionysos, it was the torchbearer of Eleusis who led the invocation taken up by the public: “Iacchos, son of Semele.” The god was present at Eleusis as early as the fifth century and had a discreet presence and a minor role even in those places where he had neither tem-

ple nor priest. He intervened as the figure of Iacchos, to whom he was assimilated and whose function was to preside over the procession from Athens to Eleusis during the Greater Mysteries. Iacchos was the personification of the joyful ritual cry given by the cortege of *mustai* in an atmosphere of hope and festivity. In the representations of a hereafter to which the faithful of the god of *mania* seemed quite indifferent (with the exception perhaps of those in southern Italy), Iacchos was imagined as leading the blessed chorus of initiates in the underworld while Dionysos led his *thiasoi* of Bacchantes on earth.

The problems of Orphism are of another order. This religious movement, in all of its diverse forms, belonged essentially to late Hellenism, in the course of which it took on increasing importance. But several discoveries during the twentieth century have confirmed that Orphism had a role in the religion of the Classical period. Let us begin with the first aspect of Orphism: a tradition of written texts and sacred books. The papyrus of Derveni, found in 1962 in a tomb near Salonika, proves that theogonies from the sixth century may have been known to pre-Socratic philosophers and to have partly inspired Empedocles. Thus Orphism’s principal feature appears from its beginning: a doctrinal form that opposed it to the mysteries and to Dionysian religion, as well as to the official cult, while relating it to philosophy. These theogonies are known to us in many versions, but the basic orientation is the same: they take an opposite view from that of the Hesiodic tradition. For Hesiod, the divine world is organized in a linear progression leading from disorder to order, from an original state of indistinct confusion to a differentiated world organized into a hierarchy under the immutable authority of Zeus. For the followers of Orphism, the reverse was true: in the beginning the first principle, primordial Egg or Night, expresses perfect unity, the plenitude of a self-contained totality. But the nature of “being” deteriorates as its unity is divided and dislocated, producing distinct forms and separate individuals. To this cycle of dispersion there must succeed a cycle during which the parts are reintegrated into the unity of the whole. This is to take place during the sixth generation with the coming of the Orphic Dionysos, whose reign represents a restoration of the One, the recovery of the lost plenitude.

But Dionysos does not just play a part in a theogony that substitutes for the progressive emergence of a differentiated order a fall into division, followed (as if redeemed) by a reintegration into the whole. According to one tale, Dionysos, who had been dismembered and devoured by the Titans, was reconstituted from his heart, which had been preserved intact; the Titans were then struck down by Zeus’s thunderbolt, and the human race was born from their ashes. This story, to which Pindar, Herodotus, and Plato seem to make allusions, is attested in the Hellenistic period. In it, Dionysos himself assumes the double cycle of dispersion and reunification in the course of a “passion” that directly engages the life of humankind since it mythically founds the misfortune of

the human condition and, at the same time, offers mortals the prospect of salvation. Born from the ashes of the Titans, the human race carries as a legacy the guilt of having dismembered the body of the god. But by purifying himself of the ancestral offense by performing rites and observing the Orphic way of life, by abstaining from all meat to avoid the impurity of the blood sacrifice—which the city sanctifies but which recalls for the Orphics the monstrous feast of the Titans—each man, having kept within himself a particle of Dionysos, can return to the lost unity, join the god, and find a Golden Age type of life in the hereafter.

The Orphic theogonies therefore led to an anthropology and a soteriology that gave them their true meaning. In the sacred literature of Orphism, the doctrinal aspect cannot be separated from the quest for salvation: the adoption of a pure life, the avoidance of any kind of pollution, and the choice of a vegetarian diet expressed the desire to escape the common fate of finitude and death and to be wholly united with the divine. The refusal of blood sacrifice was more than just a deviance from common practice, for vegetarianism contradicted precisely what sacrifice implied: the existence of an impassable gulf between humans and gods, even in the ritual through which they communicate. The individual search for salvation was situated outside the civic religion. As a spiritual movement, Orphism was external and foreign to the city, to its rules and to its values.

Its influence was nonetheless exercised along several lines. From the fifth century on, certain Orphic writings seem to have concerned Eleusis, and whatever the differences, or rather the oppositions, between the Dionysos of the official cult and the one of the Orphic writings, assimilation between the two might have occurred quite early. In *Hippolytus*, Euripides suggests such an assimilation when he makes Theseus speak of the young man “playing the Bacchant under the direction of Orpheus,” and Herodotus attributes the interdiction from being buried in woolen clothes to “the cults called orphic and bacchic.” These convergences are not decisive, however, as the term *Bacchic* is not reserved exclusively for Dionysian rituals. The only evidence of a direct encounter between Dionysos and the Orphics, and at the same time of an eschatological dimension to Dionysos, is to be found on the fringes of Greece, on the edges of the Black Sea, in the Olbia of the fifth century. Here, the words *Dionusos Orphikoi*, followed by *bios thanatos bios* (“life death life”), were discovered on bone plates. But, as has been observed, this puzzle remains more enigmatic than enlightening, and in the present state of documentation, its singular character attests to the peculiarities of religious life in the Scythian environment of the colony of Olbia.

In fact, Orphism had two major impacts on the religious mentality of the Greeks during the Classical period. On the level of popular piety, it nourished the anxieties and the practices of the superstitious, who were obsessed with the fear of impurity and disease. Theophrastus, in his *The Superstitious Man*, shows the protagonist going every month to

renew his initiation and discovering, together with his wife and children, the Orpheotelestai. Plato, for his part, described the Orpheotelestai as beggar priests and itinerant holy men who took money for their alleged competence in performing purifications and initiations (*katharmoi* and *teletai*) for both the living and the dead. These marginal priests, who made their way from city to city and based their science of secret rites and incantations on the authority of the books of Musaios and Orpheus, were readily identified as a band of magicians and charlatans who exploited public credibility.

But on another, more intellectual level, the Orphic writings belonged, along with others, to the movement that, in modifying the framework of the religious experience, shifted the direction of Greek spiritual life. Orphism, like Pythagoreanism, belonged to a tradition of outstanding figures with exceptional prestige and powers. From the seventh century on, these “god-men” used their abilities to purify the cities; they have sometimes been defined as representing a Greek version of shamanism. In the middle of the fifth century, Empedocles testified to the vitality of these maguses, who were capable of commanding the winds and of bringing the dead back from Hades and who presented themselves, not as mortals, but as gods. A striking characteristic of these singular figures—who included not only Epimenides and Empedocles but also a number of inspired and more or less legendary missionaries, such as Abaris, Aristreas, and Hermotimos—was that their disciplined lives, spiritual exercises in the control and concentration of their breathing, and techniques of asceticism and recollection of former lives placed them under the patronage, not of Dionysos, but of Apollo, a Hyperborean Apollo, the god of ecstatic inspiration and purifications.

In the collective trance of the Dionysian *thiasos*, the god came down to take possession of his group of worshippers, riding them and making them dance and jump about according to his will. Those who were possessed did not leave this world, but they were made different by the power that inhabited them. In contrast, among the god-men, for all their diversity, it was the human individual who took the initiative, set the tone, and passed to the other side. Thanks to the exceptional powers that he had succeeded in acquiring, a god-man could leave his body, abandoned as if in a cataleptic sleep, and travel freely into the other world, then return with the memory of all that he had seen in the beyond.

This type of man, by the way of life that he had chosen and his techniques of ecstasy, demonstrated the presence of a supernatural element within him, an element foreign to earthly life, a being from another world, in exile, a soul (*psuchē*) who was no longer, as in Homer, a shadow without force or an insubstantial reflection but instead a *daimon*, or “spirit,” a power related to the divine and longing to return to it.

To possess the control and mastery of this *psuchē*, to isolate it from the body, to focus it in itself, to purify it, to liber-

ate it, and by means of it to return to the heavenly place for which the heart still yearns—such may have been the object and the end of the religious experience in this tradition of thought. However, as long as the city-state remained alive, no sect, religious practice, or organized group expressed the need to leave the body and to flee the world in order to achieve an intimate and personal union with the divine. The renouncer was unknown to the traditional Greek religion. It was philosophy that relayed this concept by interpreting in its own terms the themes of asceticism and of purification of the soul and its immortality.

For the oracle of Delphi, “know thyself” meant “know that you are not a god and do not commit the sin of pretending to become one.” For Socrates and Plato, who adopted the maxim as their own, it meant: know the god who, in you, is yourself; try to become, as much as is possible, a likeness of the god.

## BIBLIOGRAPHY

### General Works

- Bianchi, Ugo. *La religione greca*. Turin, 1975. For the general reader, this book presents the results of a number of erudite studies on Greek religion (those, for example, of Wilamowitz, Nilsson, Petazzoni, Guthrie, Kern, Kerényi, et al.) and includes a methodical bibliography and a large number of significant illustrations.
- Burkert, Walter. *Griechische Religion der archaischen und klassischen Epoche*. Stuttgart, 1977. Translated as *Greek Religion* (Cambridge, Mass., 1985). This synthesis, supported by an abundant bibliography, covers both the Archaic and Classical periods, examining Minoan and Homeric religion, the ritual, the principal divinities, hero cults, cults of the chthonic deities, the place of religion in the city, the mysteries, and the “religion of the philosophers.”
- Festugière, A.-J. “La Grèce: La religion.” In *Histoire générale des religions*, edited by Maxime Gorce and Raoul Mortier, vol. 2, pp. 27–147. Paris, 1944. A general portrayal of ancient Greek religion, organized under four principal headings: origins, the Olympians, the organization of the divine, and the emergence of the individual.
- Gernet, Louis, and André Boulanger. *Le génie grec dans la religion*. Paris, 1932. Reprinted in 1969 with a complementary bibliography. Discusses the complex origins of religious concepts in ancient Greece, the rise of civic religion, and the transformation of religious feeling and the decline of the gods of Olympus during the Hellenistic period.
- Nilsson, Martin P. *Den grekiska religionens historia*. 2 vols. Stockholm, 1921. Translated by F. J. Fielden as *A History of Greek Religion* (1925); 2d ed., Oxford, 1949), with a preface by James G. Frazer.
- Nilsson, Martin P. *Geschichte der griechischen Religion* (1941–1957). 2 vols. 3d rev. ed. Munich, 1967–1974. The basic “manual” for any study of the religion of ancient Greece; a truly comprehensive work, indispensable, especially for its wealth of documentation.

Vian, Francis. “La religion grecque à l’époque archaïque et classique.” In *Histoire des religions*, edited by Henri-Charles Puech, vol. 1, pp. 489–577. Paris, 1970. A general study of the formation of Greek religion and its basic components: the nature and agrarian cults, the religion of the family and the city, the federative and pan-Hellenic cults, and the mysteries and ecstatic cults.

### Gods and Heroes

- Brellich, Angelo. *Gli eroi greci*. Rome, 1958. From the viewpoint of a general history of religions, this book analyzes the role of the Greek heroes in myth and cult and examines their relations with other mythical figures in order to bring out the specific morphology of the Greek hero.
- Farnell, Lewis R. *Greek Hero Cults and Ideas of Immortality* (1921). Oxford, 1970. An investigation of the origin of the Greek heroes, proposing a compromise theory between the thesis of Erwin Rohde, who considered the heroes as spirits of the dead, and that of Hermann Usener, who upheld the theory of a divine origin of the heroes.
- Guthrie, W. K. C. *The Greeks and Their Gods*. London, 1950. A still useful work on Greek religion, conceived and written for nonspecialists.
- Kerényi, Károly. *The Heroes of the Greeks*. Translated by H. J. Rose. London, 1959. Discusses the life, exploits, and deaths of the Greek heroes.
- Otto, Walter F. *Die Götter Griechenlands: Das Bild des Göttlichen im Spiegel des griechischen Geistes*. Bonn, 1929. Translated by Moses Hadas as *The Homeric Gods: The Spiritual Significance of Greek Religion* (1954; Boston, 1964). A study of the nature and essence of the gods of Homer, who is treated as a great religious reformer.
- Séchan, Louis, and Pierre Lévêque. *Les grandes divinités de la Grèce*. Paris, 1966. A complete scientific file on the principal figures of the Greek pantheon, whose origins, cult manifestations, and figurative representations are analyzed by the authors.
- ### Myth and Ritual
- Burkert, Walter. *Structure and History in Greek Mythology and Ritual*. Berkeley, 1979. An analysis of the concepts of myth and ritual from a historical perspective, which seeks to demonstrate the existence of a continuous but constantly transformed tradition from primeval times, through the Paleolithic period, to the Greek and Oriental civilizations.
- Detienne, Marcel. *L’invention de la mythologie*. Paris, 1981. Through the study of the status of the “fable” in the eighteenth century, the discourse of the mythologists of the nineteenth century, and the place of myth in ancient Greek society, the author makes an epistemological investigation of mythology, reconsidered as an object of knowledge as well as an object of culture.
- Deubner, Ludwig. *Attische Feste* (1932). Hildesheim, 1966. The most complete discussion of the festivals of Attica, indispensable for the wealth of texts cited; places iconographic material in relationship to certain festivals.
- Farnell, Lewis R. *The Cults of the Greek States (1896–1909)*. 5 vols. New Rochelle, N. Y., 1977. A veritable “encyclopedia” of Greek cults, invaluable for the broad range of materials brought together and analyzed under the name of each divinity of Greece.

Kirk, G. S. *Myth: Its Meaning and Functions in Ancient and Other Cultures*. Berkeley, 1970. Studying the relationship between myth, ritual, and fable, the limits of the structuralist theory of Claude Lévi-Strauss, as well as the specific character of Mesopotamian and Greek myths, the author examines the status of myths as expressions of the subconscious and as universal symbols.

Nilsson, Martin P. *Griechische Feste von religiöser Bedeutung: Mit Ausschluss der Attischen* (1906). Stuttgart, 1957. The best-documented study of the festivals of ancient Greece, with the exception of Attic festivals, classified and analyzed under the name of each divinity.

Parke, H. W. *Festivals of the Athenians*. Ithaca, N.Y., 1977. A description of the festivals of the ancient Athenians, analyzed according to the calendar; accessible to nonspecialists of the Greek world.

Rudhardt, Jean. *Notions fondamentales de la pensée religieuse et actes constitutifs du culte dans la Grèce classique*. Geneva, 1958. A pertinent analysis of the notion of the divine; beliefs concerning the gods, the dead, and the heroes; and the acts of the cult (dances, ritual meals, purifications, religious songs, prayers, sacrifices, etc.).

Vernant, Jean-Pierre. *Mythe et pensée chez les Grecs* (1965). 2 vols. 3d ed. Paris, 1971. Translated as *Myth and Thought among the Greeks* (London, 1983).

Vernant, Jean-Pierre. *Mythe et société en Grèce ancienne*. Paris, 1974. Translated as *Myth and Society in Ancient Greece* (Atlantic Highlands, N. J., 1980). Attempts to determine the intellectual code proper to the Greek myth and to define the logical form that the myth brings into play (a logic of ambiguity, equivocality, and polarity); examines the relationship between the intellectual framework brought out by structural analysis and the sociohistorical context in which myth was produced.

### Divination and Oracles

Bouché-Leclercq, Auguste. *Histoire de la divination dans l'antiquité* (1879–1882). 4 vols. Brussels, 1963; New York, 1975. The fundamental book on ancient divination, although outdated on numerous points.

Parke, H. W., and D. E. W. Wormell. *The Delphic Oracle*. 2 vols. Oxford, 1956. The most complete synthesis devoted to the oracle of Delphi, treating all the ancient accounts in the light of archaeological discoveries.

### Sacrifice

Burkert, Walter. *Homo Necans: Interpretationen altgriechischer Opferriten und Mythen*. Berlin, 1972. Translated by Peter Bing as *Homo Necans: The Anthropology of Ancient Greek Sacrificial Ritual and Myth* (Berkeley, 1983). Continuing the work of Karl Meuli, the author attempts to articulate a general theory of sacrifice in which the ritual murder of the victim is central to the entire ceremony.

Casabona, Jean. *Recherches sur le vocabulaire des sacrifices en grec, des origines à la fin de l'époque classique*. Aix-en-Provence, 1966. An excellent semantic study of the vocabulary of sacrifice and libations, supported by a meticulous examination of literary texts (from Homer to Xenophon) and epigraphic texts.

Detienne, Marcel, and Jean-Pierre Vernant, eds. *La cuisine du sacrifice en pays grec*. Paris, 1980. An anthropological analysis of

the Greek sacrifice as a ritual and civic act situated in the center of the alimentary practices and politico-religious thinking of the city; leads to questioning the pertinence of a Judeo-Christian model pretending to be unitarian and universal. With contributions by Jean-Louis Durand, Stella Georgoudi, François Hartog, and Jesper Svenbro.

Meuli, Karl. "Griechische Opferbräuche." In *Phyllobolia für Peter von der Mübli zum 60. Geburtstag*, edited by Olof Gigon and Karl Meuli, pp. 185–288. Basel, 1946. A comparison between the "Olympian sacrifice" of the Greeks and certain rites of the hunting and herding peoples of northeastern Europe and northern Asia; discerns a sacrificial structure originating in this primitive world and surviving in ancient Greece.

Reverdin, Olivier, ed. *Le sacrifice dans l'antiquité*. Geneva, 1981. Contributors approach questions of method, not in a theoretical and general manner, but through the study of a choice of specific and varied sacrificial rites.

### Mysteries, Dionysism, Orphism

Guthrie, W. K. C. *Orpheus and Greek Religion: A Study of the Orphic Movement*. 2d ed., rev. London, 1952. A study of Orpheus and Orphic beliefs, in which the author tries to analyze and assess the influence of Orphism on the life and thought of the Greeks.

Jeanmaire, Henri. *Dionysos: Histoire du culte de Bacchus*. 2 vols. Paris, 1951. A study devoted to the major institutions and the characteristic elements of the Dionysian religion as it was constituted especially in the Archaic period; also analyzes the development of the Dionysian myth and mystic speculation in the Hellenistic and Greco-Roman environment.

Kerényi, Károly. *Dionysos: Archetypal Image of the Indestructible Life*. Translated by Ralph Mannheim. Princeton, 1976. Considering the Dionysian element as a chapter of the religious history of Europe, the author retraces the itinerary of the Dionysian religion from "the Minoan period to the Roman empire" with the aid of linguistic, archaeological, philosophical, and psychological research; includes 146 illustrations and a rich bibliography.

Linforth, Ivan M. *The Arts of Orpheus* (1941). New York, 1973. A critical study of texts relating to Orphism and the legend of Orpheus as well as the myth of Dionysos.

Mylonas, George E. *Eleusis and the Eleusinian Mysteries*. Princeton, 1961. An archaeological study of the sanctuary and mysteries of Eleusis, retracing the history of the cult from the first houses of the Bronze Age to the imperial era of Rome.

Otto, Walter F. *Dionysos: Mythos und Kultus*. Frankfurt, 1933. Translated by Robert B. Palmer as *Dionysos: Myth and Cult* (Bloomington, Ind., 1965). Emphasizes the Archaic and pan-Hellenic character of this "god of paradox" and the theme of his "persecution" as well as the typology of his multiple epiphanies.

Sabbatucci, Dario. *Saggio sul misticismo greco*. Rome, 1965. An essay on the Greek concepts of salvation and Orphism, Pythagoreanism, Dionysism, and Eleusianism as alternatives to the politico-religious system of the city.

JEAN-PIERRE VERNANT (1987)  
Translated from French by Anne Marzin

**GREEK RELIGION [FURTHER CONSIDERATIONS].**

The most important religion for Western European scholars attempting to gain a better understanding of the phenomenon of religion has long been the Greek. Great historians of religion, from Vico and Herder to Friedrich Max Müller, Jane Ellen Harrison, and Sir James Frazer of *The Golden Bough*, all steeped themselves in the religious legacy of the Greeks, whom they considered superior to all other nations of the past. The study of Greek religion, then, is already several centuries old. The persistent efforts of classicists to collect and analyze the ancient Greek sources—coins, texts, vases, statues, inscriptions, and excavations—have supplied a basis that is more firm and varied than is available for the study of any other ancient religion.

The basic character of Greek religion is clear. Like the other religions of the ancient Mediterranean and Near East, Greek religion was embedded. In other words, there was no sphere of life without a religious aspect. “Church” and “state” were not yet separated, as is the rule in the modern world, with the exception of a number of countries, such as Islamic Iran and Saudi Arabia or the Roman Catholic Philippines. Consequently, there is no Greek term for “religion,” which as a concept is the product of eighteenth-century Europe. This absence also meant that there was no strong distinction between sacred and profane, as became conceptualized only in Western Europe around 1900. The Greeks did not even have a term for “profane,” although they had a relatively large vocabulary for “holy.” The most important term was *hieros*, which is everything that has to do with sacred objects, sacred times, and sacred buildings; in the felicitous formulation of Walter Burkert, *hieros* is “as it were the shadow cast by divinity.” This is also the term that lies at the basis for the Greek word for priest, *hierous*, which is already found in Mycenaean times. At the same time, this “embeddedness” also meant the absence of atheism. People could and did question the existence of the gods, but, unlike in modern times, as an ideology atheism remained unthinkable.

Religion was a public affair. Unlike modern European society, where religion seems more and more to become a matter of the private sphere, Greek cult was always a public, communal activity. Worship outside that framework was suspect, and magic became conceptualized only in the fifth century. Yet there was an enormous difference with the adjacent countries of the Near East. Among the Greeks, religion was not used to support theocracies, as in Babylon or Egypt, or to limit access to the sacred to the aristocracy, as was the case in Rome. In Greece any citizen could bring sacrifices, and there never developed a professional priestly class, like the Israelite priests, the Indian Brāhman̄s, the Celtic Druids, or the Iranian mullahs.

Like Islam, Orthodox Judaism, and Christianity, Greek religion was very much male dominated. The inferior position of women manifested itself in the modest place they occupied in the rituals but also in the fact that women were considered to be more impure than men. Giving birth was

sometimes linked with urinating and defecating as taboos in sanctuaries. Women were denied access to sanctuaries of macho gods and heroes like Poseidon and Herakles, and even statues of goddesses were washed more often than those of male gods.

Unlike Christianity, Judaism, and Islam, Greek religion was polytheistic. However, the gods were not just separate individuals but all belonged to a pantheon that was supported by a Greek city, the polis. Admittedly, the great early poets, such as Homer and Hesiod (both probably living in the seventh century BCE), had created a kind of unity in that all these gods were accepted and recognizable all over Greece. Moreover, important cultural and cultic centers, like Olympia and Delphi, helped to establish a degree of homogeneity in worship. Yet every polis worshiped its own pantheon that, to a certain extent, was unique. In Sicily, for example, Demeter was the most prominent divinity; in Athens, Athena; and on Chios, Dionysos. Moreover, small cities could support only a small pantheon, but a big city like Athens had dozens of sanctuaries with their corresponding divinities. Our model, then, is basically a Panhellenic one, and the investigation of local religion as a reflection of local identity is still in its initial stages.

It was typical of polytheism that its gods covered only a limited area of life. Unlike God, Jehovah, or Allāh they were not loving, omnipresent, or omnipotent. That is why piety never meant devotion to one god but rather the proper performance of religious ritual. As the fourth-century politician Isocrates (7.30) observed: “piety consists not in expensive expenditures, but in changing nothing of what our ancestors have handed down.” Impiety, on the other hand, came closer to our own ideas. It included temple robbery, killing suppliants, and the introduction of religious innovations without the consent of the community. Socrates, for example, was executed on the charge of proposing new gods. Tolerance is not a great virtue of either polytheism or monotheism.

The many gods were also useful in explaining the vicissitudes of life in an age without insurance or social welfare. Dreams, accidents shipwrecks, plagues, and earthquakes—all could be traced to particular gods and thus be given a place in the Greek worldview. And when the known gods failed, there were always the anonymous gods to take their places, in particular when the gods requested a human sacrifice, with which Greek mythology abounds but which does not seem to have been practiced in historical times.

The gods set boundaries that people should not overstep. If they nevertheless did so, the most important consequence was the incurring of pollution. In the Greek world, fear of pollution helped to keep the social and religious order intact, even though purity did not play the same role it does in normative Judaism and Islam. Overstepping the divine boundaries could have even cosmic effects, as the Greeks did not yet separate the human and divine spheres, as in modern Christianity. Grave crimes, like incest or murder, could have

the effect that the gods intervened by sending a plague, as was the case when Oedipus married his mother and Agamemnon offended Apollo's priest Chryses. Pollution was even invoked by the Greeks in cases where modern society would use a rather different kind of vocabulary. Men who practiced passive homosexuality or women who prostituted themselves were considered impure and thus refused entry into sanctuaries.

Like older Judaism, but unlike medieval Christianity and Islam, Greek life was decidedly directed at this life, not that of the hereafter. In fact, the early Greeks had hardly developed a view of the afterlife. This changed in some circles in Classical times, but the percentage of Greeks strongly interested in the destination of their soul always remained small. Moreover, as the Greeks had no *holy* book or dogmas, it was especially in this area that idiosyncratic ideas could flourish. In other areas of life, religion was fairly traditional. Religious education was a "hands-on" business that children received in the family. As they grew up, they were gradually socialized in the festivals and rituals of men and women, which only slowly adapted themselves to changing times. New ideas were long the territory of the poets who did the circuit of aristocratic courts and wove new ideas about the afterlife or unusual themes from the Near East into their poems. For example, in his *Iliad* Homer adapted cosmogonic themes from the great Near Eastern epics *Atrahasis* and *Enuma elish*, and the poet Pindar clearly adapted Orphic (below) views in his first *Olympian Ode*. Yet, on the whole, Greek religion changed only slowly during the archaic and Classical periods (c. 800–300 BCE).

**MYCENAEAN RELIGION.** Mycenaean religion (c. 1400–1200 BCE) is the oldest stage of Greek religion that we can reconstruct with some confidence. The many excavations and the decipherment of the Greek language of the period, the so-called Linear B, enable us to see that many of the Greek divinities already go back to the second millennium. The tablets that survived through the fires that destroyed the palaces in Pylos, Thebes, and on Crete have given us the names of Zeus, Hera, Athena, Artemis, Dionysos, and Hermes, but not Apollo. Even relatively small gods, such as Paiaon and Enyalios, already existed. On the other hand, some divinities did disappear in the course of time. Zeus's wife Diwija and Poseidon's other half Posidaeja no longer existed in the Classical period. As one tablet mentions Zeus, Hera, and "Drimios, son of Zeus," we may also safely accept some kind of Mycenaean mythology; the existence of several Indo-European themes in Classical Greek mythology, such as the kidnapping of Helen, points in the same direction.

Continuity of names, though, is no guarantee for continuity in practices. There are very few cult places that can be demonstrated to have survived as such into Classical times, and the Mycenaean ritual is hard to recover in the absence of detailed descriptions. There is some evidence for the dedication of objects but hardly for burnt offerings. Sanctuaries did not yet have temples, which arrived in Greece only in

the eighth century BCE, although the Linear B tablets mention servants, priests, and priestesses. Unlike Classical times, the sanctuaries were clearly controlled by the palaces and were thus comparable to, if not influenced by, the contemporary Near Eastern states.

**HOMERIC RELIGION.** Homeric religion may have preserved some of these older stages, but scholars have increasingly become reticent in postulating them. Contemporary attention is directed especially toward the influence of the Near East and the function of the gods in the epics. The latter have a clear narrative role in that they help to organize the poems and its plots, but they also create a kind of antiworld in which the gods feast on Olympus free from human toils and troubles and thus emphasize the difference between mortals and immortals. Gods and goddesses can intervene in the human world, even start relationships with them or form special friendships with individual humans, like Athena with Odysseus. Yet they cannot change the natural course of things and save their favorites from death. The gods, too, are subject to Moira, the embodiment of fate.

As poets had to be able to recite and revise the poems of Homer all over Greece, the poems contain few specific ritual names, such as festivals or months, and clearly give a highly stylized picture of contemporary religion. They mention those rituals that were widespread, such as sacrifice, prayer, or the funerary rituals, but leave rites of initiation, which must have been still very much alive in the early archaic period, in the background. On the other hand, they avoid as much as possible mention of rites that later times called magical, and neither do they report those strange details that make studies of local religion often so fascinating. Occasionally, the poets may have even invented rituals, such as the human sacrifice performed by Achilles in honor of his friend Patroclus.

**ARCHAIC AND CLASSICAL RELIGION.** Archaic and Classical religion received its specific "color" from the gods, whose statues were everywhere and whose exploits could be seen on the thousands of vases that ornamented Greek homes. The distinctive nature of a god was determined by various aspects. First, there was his name, which was often further determined by his epithet, a typically Greek habit, although not unknown in Rome too. Some divinities received the epithet from their place of worship, if they dominated that place, such as Apollo Anaphaios (the small Cycladic island of Anaphe), Artemis Ephesia (Ephesus), Demeter Eleusinia (Eleusis), or Herakles Thasios (Thasos). Other epithets indicated the function of the god: Artemis Phosphoros ("Bringer of light, salvation"), Hermes Agoraios ("Of the market"), or Zeus Ktesios ("Protector of possessions"). Second, the myths about the divinities related their families and deeds. The *Homeric Hymn to Demeter*, for example, detailed the kidnapping of Persephone by Hades and the ways Demeter responded by instituting the Eleusinian mysteries. The myth thus closely connected Demeter with the institution that glorified her. Myth also told that the goddess Leto had two children, Arte-

mis and Apollo. As all three divinities were connected with initiation, this function probably helped to create their family; at the same time, all three were also closely connected to (southwestern) Anatolia, and their probable geographical origin may have also contributed to their being a family. Art must have helped to visualize the gods. Vases, statues, and mirrors were highly standardized and in this way helped to create a mental image of the gods: Zeus with his lightning, Athena with the owl, and Poseidon with his trident. In addition, all kinds of ritual aspects, such as the place of a divinity's festival in the calendar, the location of the sanctuary, and the nature of the sacrifices received, contributed to the place of the divinity in the community. It was the sum total of all these factors that created the persona of a Greek divinity.

Unlike the Egyptian gods, Greek gods were very much anthropomorphic. Their frivolous adventures were popular themes in Greek poems, and their uncanny behavior was frequently explored in tragedy. Hesiod related their genealogy in his *Theogony*, in which he was heavily dependent on the epics of the ancient Near East. His poem established the classic family relationship in which Zeus and Hera were the leading divinities who, together with their brothers, sisters, and (half-)children, live on Olympus. Later times liked to think of them as a group of twelve, of whom Zeus, Hera, Poseidon, Demeter, Athena, Aphrodite, Apollo, and Artemis are always mentioned, but Dionysos, Herakles, and Hestia less regularly. Their parents Kronos and Rhea were relatively unimportant, as were their grandparents Tethys and the castrated Ouranos; their great-grandmother Gaia is only a shadowy figure. The occurrence of Near Eastern motifs in the *Theogony* makes it likely that this genealogical system is relatively late and almost certainly postdates the Mycenaean era.

The gods have been systematized in various ways. The Greeks themselves opposed the heavenly gods to the subterranean ones, in particular Hades and his wife Persephone, who, due to their inferior position, hardly receive cultic honors. Late antiquity introduced the opposition Olympian and chthonic, which it associated with different altars and types of worship. Yet recent scholarship has increasingly seen that the distinction is not supported by the pre-Hellenistic evidence. That is why we opt for a distinction between "orderly" and "disorderly" or "central" and "ec-centric" gods: gods who support the social order and gods who are more removed from or in opposition to that order.

The most important Greek god was undoubtedly Zeus, one of the few Greek gods with an uncontested Indo-European name. At one point he must have progressed from a position as weather god to the supreme divine ruler. It seems likely that some Anatolian influence played a role, but gods do not exist separate from their worshipers and the mechanics of these shifts in the Greek pantheon (or other *panthea*) are still only dimly understood. It is clear, though, that his promotion to the top took place relatively late, as he had only a few festivals and hardly any months named after him. He never occupied the same position in cult that we can see in the case of Roman Jupiter or Babylonian Marduk.

Just as Poseidon had a wife, Posidaea ("Mrs. Poseidon"), in Mycenaean times, so Zeus's first wife must have been Dione ("Mrs. Zeus"), a goddess later worshiped only at the edges of the Greek world. In Homer, though, Hera is already his permanent wife, even though the relationship is not pictured as a happy one. In the *Iliad*, Hera is jealous and Zeus regularly has to penalize her. The difficult relationship perhaps reflects the ambivalent position of Hera within the social order. On the one hand, she is the goddess who "keeps the keys of wedlock," as Aristophanes says in his *Thesmophoriazusa* (973), but that function seems to have been the consequence of her position as wife of Zeus; her cult as goddess of marriage was certainly Panhellenic but not prominent. An older layer becomes visible in the centers of her worship, Argos and Samos. Here Hera's festivals display strong signs of ancient New Year festivals. Moreover, here she is also closely connected with the coming of age of both boys and girls, who perhaps demonstrated the newly acquired status of adulthood during the New Year festivals. In the course of time this older function receded for the newly found one of goddess of marriage.

The divinity closest to Zeus was Athena, who was born from his head. The myth surely reflects the aspect of intelligence that is prominent in Athena: she is closely connected with women's crafts like weaving and male artisans like the smiths; even the Trojan horse was built by a carpenter under her supervision. Originally, Athena seems to have been a tutelary goddess of cities, which is probably her oldest recoverable layer, as in Mycenaean times she received the title Potnia, "Mistress." Her temple is attested on many an acropolis, the strategic heart of a Greek city. Her statuette, the Palladium, the name of which comes from her still unexplained title, Pallas, functioned as a polis talisman and as such even played a role in Vergil's *Aeneid*. It is not surprising, then, that she often received the epithet Polias or, more literary, Poliouchos. Given this protective role of the city, Athena, like Hera, is also associated with the growing up of the young generation, especially in Athens.

Apollo's name has been tied to the yearly Doric assembly, the *apellai*, in recent decades, but etymological rules and the geographical distribution of his name make this less likely. As he was still absent from the Mycenaean tablets, he probably entered Greece from Lycia, where his mother, Leto, was a highly prominent goddess. His connection with initiation has clearly shaped his divine nature to an extent that is hard to parallel with other gods. Aristocratic male youths had to be able to sing, dance, and play the lyre, and this explains why Apollo was closely connected with these activities. Male initiation also meant the entering of a new stage of life in which political activities were highly important. That is why Apollo is often associated with the center of political institutions of the polis. In this role he is regularly worshiped as Apollo Lykeios or Delphinios; the latter non-Indo-European epithet even strongly suggests that in this capacity Apollo had taken over pre-Greek institutions. Finally, the comple-

tion of the male initiatory ritual was often celebrated in a kind of New Year festival. That is why Apollo was also the god of the new beginning, be it the god of the new moon, the god of purification, the god of healing, or the god of divination, which often made an end to a period of confusion and uncertainty.

Apollo's sister Artemis goes back to a time in which hunting was still of prime importance; witness her title "Mistress of the Animals." Such protecting goddesses were often also initiatory divinities, as was the indeed the case with Artemis. She was in particular associated with the raising of girls at the margin of civilization in areas that were well watered or near rivers or lakes. Their lush nature reflected that of the maturing maidens whose beauty the male Greeks so highly admired. Rather strikingly, these areas were also often border areas, and just as initiates were on the critical border between youth and adulthood, so Artemis also functioned in other decisive moments like the critical phase of a battle, where she was the one to give victory.

If Zeus, Athena, and Apollo were the gods who stood in the center of the Greek polis, other gods were more "off center." Poseidon must once have been a very powerful god, but in the course of the post-Mycenaean age he was displaced by Zeus. He was the ancestor of several tribes and associated with men's associations, such as the pan-Ionic league. This function also connected him to male initiation in some places. Moreover, Poseidon was the god of brute force in men and animals. That is why he was also considered to be the god of earthquakes and such powerful animals as horses. That is also why in more settled times Poseidon's domain was largely relegated to the sea, the area of the marginal fishermen but also the area that was feared by the Greeks because of its dangers and unpredictability.

In many places Poseidon was closely connected with Demeter. The association must go back to an early stage in Greek religion, as is illustrated by Poseidon's metamorphosis into a stallion when Demeter tried to flee from him in the shape of a mare—a type of myth that has clear Indo-European parallels. Poseidon's ancient political side probably explains why at various places Demeter was also connected with political power; she even seems to have been connected with initiation in some places before the rise of the mysteries (below). However, Demeter was celebrated in particular during the festival of the Thesmophoria, the most popular women's festival in ancient Greece. During several days all the women of the community assembled to celebrate this fertility festival, from which men were excluded. The occasional symbolic exclusion from power made men nervous, and they saw to it that the women assembled only in local communities and never in cities as a whole.

If Demeter is certainly "ec-centric," the god of the "anti-order" par excellence was Dionysos. Myth designated him as the stranger among the gods, as it related his arrival from Thrace. Earlier generations of scholars usually interpreted these stories as reflections of a historical development, but

a more recently published Linear B tablet has shown that Dionysos was already worshiped in Mycenaean Crete. Consequently, these myths of arrival are better interpreted as ways of expressing the nature of Dionysos as "stranger" in the Greek world. This aspect of his nature becomes apparent from his festivals, where we can find the split-up of society in its two gender halves, the equality of slaves, or the prominence of the phallus in a procession. In some communities, Dionysos was even associated with human sacrifice (in myth, not reality). In this capacity he was worshiped on Lesbos as Dionysos Omestes, "Eater of Raw Meat." A similar "antisocial" nature appears from Dionysos's mythical followers, the satyrs and maenads. The latter could commit heinous crimes, as Euripides' *Bacchae* so well illustrates. The former showed themselves on the Greek vases in such antisocial activities as masturbation and sex with animals. Dionysos was a more problematic god than the many scenes of him happily drinking suggest.

Other gods were less influential. Hephaestus was the god of the smiths, who seems to have played a more important role in the early archaic period than in later times. His main place of worship was Lemnos, an island where the inhabitants once spoke a language related to Etruscan and that was conquered only in the late sixth century by the Greeks. This means that originally Hephaestus was the god of a pre-Greek population.

Hermes was the messenger of the gods and thus also moved between the upper world and the underworld. In many ways he is the personification of the more marginal persons in ancient Greece, such as the wanderers and the merchants. He was sometimes connected with Aphrodite, the goddess of love, who had a clear background in ancient Near Eastern goddesses like Ishtar. However, this love was not only physical but also political. Aphrodite was often associated with the people as a whole or with smaller councils of magistrates. Her worship supposedly promoted the harmony and unity of those concerned. It is the Near Eastern connection that made her also into a goddess of military affairs, and in several cities her statue was armed. The connection also received expression on a mythological level: Aphrodite was the beloved of Ares, the god of war.

Like Dionysos, Ares was also reputed to come from Thrace to express his outsider position in the Greek pantheon. In Homer, Ares is already closely identified with another war god, Enyalios, but in cult the two remained separated. Ares was the god of the bloodthirsty side of war. This made him an unpopular god who had few cults and whose sacrificial animal, the dog, was not normally eaten at sacrificial banquets.

The gods of the underworld, Hades and his wife, Persephone, mainly had a mythological life. There were no temples for them, and their place in Greek cult was negligible.

In addition to these major divinities there were also smaller ones, like Gaia, ("Earth"), Hestia ("Hearth"), Eirene

(“Peace”), Thanatos (“Death”), Arete (“Virtue”), and other personifications. Yet the Greek pantheon was much smaller than, say, the Hittite or Roman one. The reason for these differences is still unexplored, just as the nature of polytheism and the implications of the difference with monotheism are still largely terra incognita.

On the other hand, we have reached a better understanding of the mutual relations within the pantheon. Although divinities have each their own sphere or mode of action, they can also combine their influence or display their powers in opposition to other gods. For example, the fact that Apollo and Artemis are siblings cannot be separated from their connection with initiation (above). Hera and Aphrodite are both associated with love and marriage, but whereas Hera is responsible for the protection of marriage as such, Aphrodite promotes its sexual part. Ares and Aphrodite were already a pair in Homer. Both divinities were at the margin of the pantheon but also each other’s opposites. There is a Poseidon Hippios and an Athena Hippia. Both divinities are clearly concerned with horses, but whereas Poseidon is responsible for the power and fierceness of horses, Athena is the goddess who gives man the power to use the animal in an intelligent manner. It becomes more complicated when we see that the Athenian ephebes worshiped Ares and Athena Areia. Evidently, Ares was responsible for their courageous behavior in battle, but Athena must have helped them to do this in a strategically intelligent manner. In a different way, myth often told of Poseidon’s defeat by other gods, in particular Apollo and Athena. This shows that Greek gods were not only persons but also embodied powers, as in this case Poseidon’s defeat symbolized the conquest of “chaos” by the powers of order, intelligence, and civilization. Both the aspect of “person” and of “power” should always be taken into account when looking at individual Greek gods.

**HEROES.** It is hard to find parallels to heroes, the “demigods” between gods and men, in other religions. Their origin has been much discussed but rarely with the right attention to an important terminological question. Surely, it is impossible to speak of a hero cult before there was a category of heroes named and conceptualized in opposition to the category of the gods. Unfortunately, this simple truth is rarely taken into account in scholarly literature. Yet the religious meaning of the Greek word *herôs* as “demigod” did not start to materialize before the last decades of the sixth century. In fact, the order gods-heroes-men does not occur in extant Greek literature before Pindar’s *Second Olympian Ode* (2) of 476 BCE, in which the poet wonders: “What god, what hero and what man should we celebrate?” It is not easy to explain this development, but it is clear that in the later sixth century BCE a gradual hardening took place of the division between the main gods of the Greeks and all other (for lack of a better word) supernatural beings worthy of worship. This development was perhaps the result of the growing status of Homer, but as there was no independent authority to decide who belonged where, some heroes stayed hovering on the edge, such

as Achilles and Herakles, whose precise status—hero or god?—remained debated. The development took a long time to materialize fully and should not be retrojected into earlier centuries. In that period we have tomb cults, cults of the ancestors, and cults of founders of cities, but it is only from the late archaic period onward that we start to have hero cults in the technical sense of the word. Consequently, we should avoid speaking of hero cult in the earlier archaic period.

Because of their origin, the category of the heroes turned out to be the lowest common denominator of a motley group of “supernatural beings,” such as faded goddesses like Helen, culture heroes like Prometheus, and mythological supermen like Herakles. In the later fifth century the category became expanded to fallen generals like the Spartan Brasidas, who was killed in action in 422 BCE. As time went on, the Greeks started to connect their great mythological heroes, like Agamemnon and Odysseus, with older graves or grottoes, and scholars have all too long thought that these late connections also implied age-old continuities.

Yet the connection with graves does point to an important quality of the heroes: their local association. Unlike the gods, heroes are nearly always associated with a family, a political or social group, or a city. Many people gave regular greetings and offerings to the shrine of their neighborly hero and clearly expected something positive in return. Armies could see heroes on their side, just as in the First World War German and English soldiers saw angels coming to their assistance. The Locrians even left a gap in their phalanx where Ajax was supposed to defend the ranks. However, heroes could also be nasty and mean. The chorus of Aristophanes’ *Heroes* sings: “we are the guardians of good things and ill; we watch out for the unjust, for robbers and footpads, and send them diseases—spleen, coughs, dropsy, catarrh, scab, gout madness, lichens, swellings, ague, fever [some words missing]. That’s what we give to thieves” (tr. Robert Parker). There is always something ambivalent about the heroes, as there is about the gods.

**RITUAL.** Ritual was the basis of Greek religion, although the all-embracing category “ritual” is a relatively modern invention that originated around 1890. The Greeks did not yet have such a term but called their rituals *teletai* (connected to Greek *telos*, “goal”), *drômena*, “what is done,” or *nomizomena*, “what is customary.” Rituals accompanied the most important stages of Greek lives, such as the birth, coming of age, the wedding, and death, but also political activities, entertainment such as the symposium, divination, or purifications from pollutions. In addition, the Greek year was interspersed with festivals, if more in winter than in summer. In this short compass it is impossible to pay attention to all manifestations of ritual. We therefore just mention hymns, dances, and processions and limit the discussion to a more detailed extension of sacrifice (the most important ritual), to sanctuaries (the places where many of the rituals took place), prayer, and the main women’s festival, the Thesmophoria.

Sacrifices already abound in the oldest literary source, Homer (c. 700 BCE). His preferred victim is the cow, the largest domesticated animal available and the predominant victim in literature and art. Yet after the Dark Age most sacrifices were not of cattle, and smaller animals were the rule for small communities and private sacrifice. As a symbolic statement, cattle remained the preferred animal, and Athenian colonies and allies had to send a sacrificial cow to the festival of the Panathenaia. The next expensive full-grown sacrificial victim was the pig, although it was not the most popular animal in sacrifice. Pigs were not much employed in the great sanctuaries, except perhaps in Cypriot sanctuaries of Aphrodite, and no god was connected with the pig in particular. The main exceptions were Demeter and Dionysos, both divinities in some opposition to the social order, as we have seen. The low appreciation of the pig was not only shared by the Jews, whose abhorrence of the pig is well known, but also by the ancient Egyptians and, later, Islam. It thus fits a larger Mediterranean and Near Eastern phenomenon.

The predominant sacrificial victims were sheep and goats, animals whose bones are often very difficult to distinguish. In the case of Aphrodite, even cheaper offerings were quite normal, and the sacrifice of kids and lambs fits this picture. There were also a number of more marginal animals. Dogs were used for purificatory purposes but not normally eaten, except at the margin of the Greek world, such as Didyma and Cyprus. The Greeks themselves thought of this sacrifice as typical of foreigners, such as Carians and Thracians, and used it to differentiate cruel Ares and spooky Hekate from the more civilized gods. Birds were brought to Aphrodite, and cockerels to Asklepios—both less important gods, whose status reflected itself in the gifts they received. Basically, then, the Greeks selected only domesticated cattle for their sacrifice, and the origin of sacrifice does indeed not seem to go back before the time when cattle became domesticated in the ancient Near East. Yet in Artemis's sanctuary in Kalapodi, excavators have found bones of boars and deer; the latter have also come to light in the Theban Kabirion and the Samian Heraion. In ancient Israel, too, excavations have demonstrated incidental sacrifices of fallow deer. Evidently, there were sometimes fuzzy edges at the boundaries of the accepted sacrificial victims in order to include the most popular game.

In addition to the nature and age of the victim, worshippers also had to make decisions about the sex and color of the victims. In general, male gods preferred male victims, whereas goddesses rather had female ones. Yet this was not a fixed law but rather a rule with notable exceptions, as in the Samian Heraion bones of bulls, rams, and boars have been found. Sacrificial regulations also often specified the color of the victim, black being the preferred color for chthonic deities.

Sacrifice was a festal moment. Victims were adorned with ribbons and garlands around their heads and bellies, and the sacrificers took a bath, put on festive white clothes, and, similarly, wreathed themselves. The Classical period

had clearly dramatized the beginning of sacrifice by the organization of a sacrificial procession. At the front an aristocratic girl (the *kanêphoros*) walked with a beautiful basket on her head, which contained the sacrificial knife covered up by barley groats and ribbons. Male adolescents led along the victim, and a male or female piper played the music indicating the walking rhythm. Music had become such an integral part of the ritual in post-Homeric times that the fifth-century historian Herodotos (1.132) was struck by its absence in Persian sacrifice. Then adult males and females followed in a throng. The whole community played a part in this ritual of rituals. When the actual sacrifice began, the sacrificer purified the participants, the altar, and the sacrificial victim. This inaugural act separated the sacrificial participants from the rest of the population and constituted them as a distinct social group.

After a prayer, the officiant took the knife and cut a few hairs from the brow and threw them in the fire, the beginning of the actual killing. In the meantime, the victim had given its consent by shaking its head. Voluntariness of the victim was an important part of the Greek sacrificial ideology, which stressed that the victim was pleased to go up to the altar, sometimes could even hardly wait to be sacrificed. Obviously, ideology and practice did not always concur, and vases show us ephebes struggling with the victim or the ropes tied to its head or legs in order to restrain it. The participants to the sacrifice now lifted up the (sometimes stunned) victim with its head up high, toward heaven, and a priest or another officiant cut the throat with the sacrificial knife. At this very emotional moment the women present raised their high, piercing cry, *ololyge*, which Aeschylus in the *Seven against Thebes* (269) calls the "Greek custom of the sacrifice cry" (*ololygmos*). Great care was taken not to spill the blood of the victim on the ground. In the Classical period the blood is prominently present on the altars as many vase paintings show—the lasting proof of the otherwise perishable gifts to the gods.

It was now time to skin the victim and carve it up. In addition to the thigh bones, the gods also received some other parts, such as the gallbladder and the tail. In Classical times the gods also seem to have received a share of the innards, *splanchna*, in which the Greeks included the spleen, kidneys, liver, and probably the heart and lungs. These parts of the victim were the first to be eaten. Together with the food, the gods received a libation of mixed wine. The meat was evenly divided between the participants, and egalitarian inclusiveness was very important for the Greeks: for the Jews the purity of sacrifice became an important guardian of monolatrous Yahwism, but foreigners were always invited to partake of Greek sacrifice.

There were also sacrifices where food was absent or on purpose denied to the sacrificial participants. First, the victim could be drowned: the Argives submerged a horse with bridle in the sea for Poseidon, and the Rhodians, wealthy as they were, a chariot with four horses for Helios. These costly

sacrifices must always have been rare, and they seem to go back to great antiquity. Second, there were extremely cheap, purificatory sacrifices, usually piglets, who after the sacrifice were thrown out in order to carry away the pollutions. Piglets were also sometimes used for a preliminary sacrifice, in which case they were burned whole. Third, the Greeks often swore an oath while grasping an object, the *horkos* (which gave its name to the Greek *oath*), embodying the powers invoked; so the gods swore holding a jug with water from the Styx. Four, sometimes a pregnant animal was sacrificed. This happened especially in the cult of Demeter and, seemingly, in some maturation rituals. The victims were probably burned whole, a practice the Greeks had taken over from the Syro-Palestine area. In all these sacrifices the most plausible explanation is that they lacked the required relaxed atmosphere of a good banquet. Banquets were naturally also absent from other emotionally laden sacrifices, such as that just before a battle. On the other hand, epigraphical evidence has increasingly made clear that sacrifices to heroes, the so-called chthonic sacrifices, which many generations of scholars supposed to have been burned whole, normally ended in a happy banquet. The whole notion of chthonic sacrifice, like the one of chthonic gods, is in urgent need of revision. That is not to say that sacrifices for gods were always totally similar to those for heroes. The latter received more often cakes and fruit.

Finally, what did the collective imagination as expressed in myth single out as significant? Hesiod's *Theogony* (535–561) connects the origin of sacrifice with the invention of fire and the creation of woman. In order to settle a quarrel between gods and mortals, Prometheus took refuge in a trick. He let Zeus choose between, on the one hand, the flesh and fatty entrails of a slaughtered bull and, on the other, the white bones covered with glistening fat. Zeus opted intentionally for the bones, and “since then the race of men on earth burn white bones for the immortals on smoking altars.” Hesiod's account locates the origin of sacrifice at the precise moment that gods and mortals were in the process of parting their common ways. Clearly, sacrifice was *the* preeminent act of the “*condition humaine*,” which definitively established and continued the present world order, in which man dies and immortals have to be worshiped.

Sacrifice took mostly place in sanctuaries. Unlike Christian churches, Islamic mosques, or Jewish synagogues, these need not always have been proper buildings. For the Greeks only the presence of an altar was essential, but sanctuaries often had a sacred grove, water for purification, and a temple. Priests were useful but not indispensable, except in the larger sanctuaries. Vases often portray them in white robes, and priestesses often carry a big key, the symbol of their supervision of the sanctuary. In addition to priests, there were also seers, but they were often less officially connected with sanctuaries, even though two seer families officiated in Olympia. Many seers wandered through Greece, and their status was often not very high, with the exception of the military seers

who could rise to great fame through their strategic insights. Instead of seers, many people consulted the main oracles, Delphi and Dodona, which were situated at quite a distance from important cities, as divination had to look objective to be credible. As in many cultures, their function was more to help to make a choice or to set a seal on decisions than to forecast the future.

The temples contained the statues of the gods but also the many votives of the worshipers, ranging from precious golden objects to the anatomical votives of vulvae and phal-luses after a successful healing; in addition they functioned as banks and often received asylum seekers onto their sometimes extensive lands: like the medieval church, some Greek sanctuaries were the largest landowners of ancient Greece.

The location of sanctuaries once again reflected the nature of their gods: Zeus, Athena, and Apollo usually had temples in the center of the polis, Apollo and Demeter were more often located away from the center, and Hera, Poseidon, Artemis, and Dionysos were usually located out of the city. The location of heroic sanctuaries also depended on the place of the hero in the community. For example, if he was the founder of the city, his heroön (sanctuary) would be on the agora in the center of the city, but Trophonios, the owner of an oracle, was worshiped away from the civilized world.

**PRAYER.** Prayer had a place in many rituals and usually followed a standard structure of invocation, claim for attention, and request. Moreover, the earlier Greeks never kneeled for their prayers, like Christians in several churches still do, but they prayed standing erect with hands raised. In principle everybody (man and women, old and young, slaves and free) could pray everywhere—at home, in a sanctuary, or on a ship. However, prayers were often pronounced on behalf of the city or a smaller social group by priests or heralds. Unlike the Christian God, Greek deities were not omnipresent and the worshipers had to call out for their attention. Thus, a prayer often contained the invitations “hear” and “come”; moreover, it was important to mention the name of the divinity and his or her epithet. Yet to be absolutely certain that the right divinity would hear their prayers, worshipers often visited a temple and prayed in front of the deity's statue, often in its very ear. When praying, the Greeks could freely improvise and, unlike Rome or India, they did not have archaic fixed-prayer formulae. In their prayers there was a strong element of reciprocity. The worshiper referred to earlier sacrifices or made a small gift that enlarged the chances of being heard. Unlike Jewish and Christian prayers, Greek prayers therefore rarely contained a feeling of gratitude. What did people pray for? Strangely, very few nonliterary prayers have survived, and our knowledge about the content of Greek prayers is almost exclusively literary. Perhaps in opposition to many modern prayers, the Greeks did not shrink from praying that the worst might befall their enemies, but they certainly mostly prayed for their own good. Unlike modern Christian attitudes, they would rarely pray for others, and Herodotos (1.132) expresses amazement about the

fact that the Persians prayed for the well-being of their king. Finally, although Christians, Jews, and Muslims often pray aloud in public or religious services, silent prayers are perhaps the norm for the modern individual. In Greece praying aloud was the norm, but antisocial and magical prayers were probably performed in silence.

**FESTIVALS.** Festivals were the main religious occasions at which the community (the city but also subdivisions of the city and the family) manifested itself. Festivals derived their names from the most striking parts of the festivities, such as the Plynteria from the “washing” of a statue, or from the names of the gods, such as the Kronia, the festival for Kronos. In turn, months often took their names from the festivals, such as the Ionian month Anthesterion from the name of the festival Anthesteria. As with Greek religion in general, local calendars regularly differed, and festivals could change places in the calendar in the course of history.

There were several types of festivals. Some were connected with the rites of initiation, such as the Spartan Hyakinthia and Karneia or the Cretan Ekdysia. In these festivals the youths of the cities demonstrated their prowess or beauty. Others celebrated New Year, everywhere an important festival and perhaps in Greece even influenced by those of the ancient Near East. In Athens it can best be seen as a complex that lasted for three months. In the penultimate month of the year, Thargelion, the so-called scapegoat ritual purified the city; in the ultimate month, Skirophorion, several festivals took place away from the political center, the acropolis; and the first festival of the first month of the new year, Hekatombaion, was the Kronia, in which the social order was reversed, as slaves and masters dined at equal footing. The celebration of the city’s foundation in the Synoikia and the Panathenaia, Athen’s most prestigious festival, reestablished the social, political, and religious order. Festivals, then, were often related to one another, and a proper study should always look at the whole festive cycle.

The most important women’s festival was the Thesmophoria, a three-day festival for Demeter. The exclusive female participation made the festival somewhat suspect in male eyes, and several stories told of males spying on the women during the rituals. Male suspicion probably also meant that in Athens the women could not celebrate their festival in one sanctuary but only separately in the demes. Its “ec-centric” character was indicated by several oppositions with normality. The women did not live in houses but in huts, slept on antaphrodisiac plants, and sacrificed pigs, whereas as a rule the males were the sacrificers in Greece. On the second day Athens suspended court sessions and council meetings; other places in Greece may well have done the same. There probably also was ritual fasting, sham fights, and indecent speech on this day. After all this “abnormal” behavior, women returned to “normality” on the third day. On this last day, which was called Kalligeneia, “Beautiful birth,” the women fetched the decayed remains of piglets from subterranean pits and placed them on altars as future manure. As the festival

took place at sowing time, the women clearly celebrated human and agricultural fertility at the same time.

**MYSTERIES.** Mysteries originally was the name of the festival celebrated in the sanctuary of Demeter outside Eleusis in the month Boedromion in early autumn. From there the Greeks applied the name also to cults with a related structure, such as the cults of the Kabeiroi in Thebes and of the Megaloi Theoi of Samothrace. Unfortunately, it was a characteristic of the mysteries, and hence our use of the term, that the initiates were not allowed to divulge the secrets of the rites. The Eleusinian sanctuary dates from the late eighth century BCE, and the widespread occurrence of Demeter Eleusinia in Ionia and the Peloponnese demonstrates an early popularity of her cult. The combined evidence of the Peloponnesian and Ionian cults does point into the direction of an initiatory cult of an aristocratic family; iconographic evidence from the sanctuary of the Theban Kabeiroi points in the same direction. Apparently, the ritual became restructured and reinterpreted after the disintegration of the archaic puberty rites at the end of the seventh century, as the *Homeric Hymn to Demeter* (c. 650 BCE) is evidently related to the Eleusinian mysteries. However, without corroborating evidence it is impossible to reconstruct the mysteries from the *Hymn*. It is only in Christian times that former pagans start to communicate the details that give us an impression of what happened in that era; whether we can retroject these details into Classical times remains a matter of debate. The earlier Eleusinian mysteries very much remain a mystery.

The main rituals started with a procession from Athens to Eleusis along the still existing Sacred Way. After preparatory rites of purification and fasting, the climax took place in the Telesterion (“House of rituals”), which survived well into Roman times. It was a fifty-one-square-meter roofed building that evidently cannot have held that many initiates at the same time. At night, light effects must have played a role, and texts suggest a plurality of emotions. The high point seems to have been the moment when the hierophant showed a “single harvested ear of grain” and shouted out at the top of his voice: “the Mistress has given birth to a holy child, Brimo to Brimos,” as the Church Father Hippolytus informs us. The ear must have been symbolic of the gift of corn, which the Athenians had associated with the mythological Eleusinian king Triptolemus. In the heyday of the Athenian empire the Athenians evidently claimed the invention of agriculture, which for the Greeks signaled the arrival of the present cultural order. After the decline of the empire, the emphasis of the mysteries shifted to eschatological promises: the Eleusinian priests were clever entrepreneurs who kept their mysteries moving with the times.

The relative late rise of eschatology as an important motif in the mysteries is also confirmed by its absence from the mysteries of Thebes and the islands Lemnos and Samothrace. In the latter, we can see a triad of two males with a Great Goddess. Its geographical location and the details of the ritual point to a pre-Greek background in the world of

initiation and men's societies, which on the island of Lemnos seems to have developed into a society of smiths and their god Hephaestus. Both on Lemnos and in Thebes remnants have been found of wine amphorae suggesting communal drinking rituals, but on Samothrace the emphasis seems to have been reoriented to salvation at sea.

The immediate success of the Eleusinian mysteries may well have been the stimulus for the development of a different type of mysteries that were not tied to one particular sanctuary. From about 500 BCE we hear of Bacchic mysteries that were propagated by what Plato and Theophrastus call Orpheotelestai, "Initiators of Orpheus." These wandering priests and priestesses apparently initiated people, men and, it seems, especially women, against payment into small cultic groups that practiced the Dionysiac ecstasy but presented their views under the aegis of Orpheus, who at the time was the most famous Greek singer. Orphism presented an origin of humankind, whereas traditionally the Greeks had very few anthropogonic myths. It also had developed a view of an attractive afterlife that had been absent so far in Greek religion and that eventually would influence Jewish and Christian ideas of the afterlife. Moreover, it developed the idea of a kind of "original sin" by stating that Dionysos had been murdered by the Titans, our ancestors. In order to atone for this murder the Orphics had to live a life of purity and to practice vegetarianism. Only in this way they would be acceptable to Persephone.

Recent decades have given us not only a new papyrus with a commentary on an Orphic cosmogony (the Derveni papyrus), but also a number of the so-called Orphic gold leaves, minute tablets that were, so to speak, passports to the underworld and taught the deceased how to behave when meeting Persephone. Unfortunately the literary evidence for the Bacchic mysteries is rather poor, and it remains virtually impossible to reconstruct the rituals of these mysteries in any detail and with any certainty. It seems that we must reckon with a whole spectrum of local varieties, but unless new evidence turns up we will remain groping in the dark for these Bacchic mysteries despite our increased knowledge of Orphism.

**PHILOSOPHY.** Philosophers started to question the traditional views of Greek religion from about 500 BCE. They give us a valuable insider view of what intellectuals thought of the traditional myths, rituals, and cosmological and cosmogonical concepts. Xenophanes of Colophon (on the west coast of modern Turkey) no longer accepted tradition but propagated "what is fitting." He radically polemicized against the leading poets Homer and Hesiod and questioned the anthropomorphic form of the gods by pointing out that the Thracians and Ethiopians imagined their gods to look like themselves. He did not do away with the gods, though, but already tried to reduce the number of gods by claiming "One god is greatest among god and men." Misgivings about traditional polytheism were clearly in the air, since Orphism, according to the Derveni papyrus, stressed the position of

Zeus: "Zeus is the head, Zeus the middle, through Zeus all things come to pass." Pythagoras, their contemporary, went even further. His prescriptions meant the first total break with traditional Greek lifestyle, and gods hardly seem to have played a role in his teachings. Nor did ritual come away unscathed, as Heraclitus of Ephesus attacked purification rituals and praying before the statues of the gods, as if one could converse "with houses," as absurd.

The seeds of these philosophies came to fruition in the second half of the fifth century through the so-called Sophists. These wandering teachers exercised a great fascination on the Greek *jeunesse dorée*, and their influence can hardly be exaggerated. Among them, Prodicus from the island of Keos introduced a completely new view about the gods by claiming that "primitive man, [out of admiration, deified] the fruits of the earth and virtually everything that contributed to his subsistence." In other words, the gods had not been there all along as immortal beings, but they were the product of human imagination. Protagoras of Abdera even went further and stated that we cannot have any certain knowledge about the gods. It is not surprising that atheistic positions now became debated in Athenian tragedy, even if preferentially through the mouth of young males, not sensible older men.

With Plato these tendencies became part and parcel of the enlightened Greeks. He rejected the teachings about the gods by the poets and traditional piety. The divine adulteries, their fantastic genealogies, the gods as the causes of our evils—all that is fit only for children and old women, according to Plato. Equally, the thought that prayers or sacrifices could influence the gods without a corresponding proper moral behavior is completely rejected. God is now proclaimed to be absolutely good, but also without lies, always the same, without envy, omnipresent, that is, an intellectually satisfactory but bloodless being that is so much above us that it is hard to speak about him with any certainty. In his *Timaeus* Plato even introduced a creator god, an idea totally alien to traditional Greek religion. These ideas transformed the ways people would think about religion. Greek rituals may still have been practiced for many a century, but the traditional views of Greek religion would never recover from the attacks of the Greek philosophers.

#### BIBLIOGRAPHY

Walter Burkert, *Greek Religion* (Oxford, 1985) is a brilliant handbook with excellent bibliographies but basically reflecting the scholarly positions of the earlier 1970s. For later views and bibliographies see Fritz Graf, "Griechische Religion," in *Einführung in die griechische Philologie*, edited by H. Nesselrath, pp. 457–504 (Stuttgart and Leipzig, 1997); J. N. Bremmer, *Greek Religion*, 2d ed. (Oxford, 1999); J. D. Mikalson, *Ancient Greek Religion* (Oxford, 2005). For a *Forschungsgeschichte* of Greek religion and some of its terminology see J. N. Bremmer, "'Religion,' 'Ritual,' and the Opposition 'Sacred vs. Profane,'" in *Ansichten griechischer Rituale. Für Walter Burkert*, edited by F. Graf, pp. 9–32 (Stuttgart and Leipzig, 1998); Ricardo di Donato, *Hierà* (Pisa, 2001). For the older

- bibliography I refer to the above surveys, but in the following I concentrate on the most important publications since the mid-1990s although mentioning some authoritative studies of the subjects discussed above.
- Magic:** Fritz Graf, *Magic in the Ancient World* (Cambridge, Mass., 1997); J. N. Bremmer, "The Birth of the Term 'Magic,'" *Zeitschrift für Papyrologie und Epigraphik* 126 (1999): 1–12.
- Gender:** U. Kron, "Priesthoods, Dedications, and Euergetism: What Part Did Religion Play in the Political and Social Status of Greek Women?," in *Religion and Power in the Ancient Greek World*, edited by P. Hellström and B. Alroth, pp. 139–182 (Uppsala, 1996); M. Dillon, *Girls and Women in Classical Greek Religion* (London and New York, 2002).

- Festivals:** F. Graf, "Griechische Religion," in *Einleitung in die griechische Philologie*, edited by H. Nesselrath, pp. 483–490 (Stuttgart and Leipzig, 1997) (excellent survey of the various types of festivals); J. N. Bremmer, *Greek Religion*, 2d ed. (Oxford, 1999), pp. 44–50; the calendar, C. Trümper, *Untersuchungen zu den altgriechischen Monatsnamen und Monatsfolgen* (Heidelberg, 1997); for the Thesmophoria, H. S. Versnel, *Transition and Reversal in Myth and Ritual* (Leiden, 1993), pp. 228–288; Kevin Clinton, "The Thesmophoria in Central Athens and the Celebration of the Thesmophoria in Attica," in *The Role of Religion in the Early Greek Polis*, edited by R. Hägg, pp. 111–125 (Stockholm, 1996).
- Mysteries:** Walter Burkert, *Ancient Mystery Cults* (Cambridge, Mass., and London, 1987); on Eleusis, Kevin Clinton, *Myth and Cult: The Iconography of the Eleusinian Mysteries* (Stockholm, 1992); Paolo Scarpi, *Le religioni dei misteri*, 2 vols. (Milan, 2002). The best introduction to Orphism is Robert Parker, "Early Orphism," in *The Greek World*, edited by A. Powell, pp. 483–510 (London and New York, 1995); Chris-

troph Riedweg, "Initiation—Tod—Unterwelt," in *Ansichten griechischer Rituale. Für Walter Burkert*, edited by F. Graf, pp. 359–398 (Stuttgart and Leipzig, 1998) (best edition of the gold leaves); Richard Janko, "The Derveni Papyrus: An Interim Text," *Zeitschrift für Papyrologie und Epigraphik* 141 (2002): 1–62; note also the many studies of Alberto Bernabé, who is preparing a new edition of the Orphic fragments (Munich, 2005).

JAN N. BREMMER (2005)

**GREGORY I** (c. 540–604), called the Great, was bishop of Rome from 590 until his death, and one of the most remarkable figures to occupy the Roman see. Gregory was born into a landowning, aristocratic Roman family; he was related to popes Agapetus I (r. 535–536) and Felix III (r. 483–492). There is no direct evidence about his early life and education, but his correspondence, the main historical source, suggests that he received sound legal training and acquired wide experience in the management of landed estates. Gregory's own testimony relates that he spent some years in a public career as prefect of the city of Rome. Although one must assume that his education brought him into contact with Latin classical authors, there are few echoes of their works in Gregory's writings; in this he was very different from Jerome and Augustine. What is known about his origins suggests a pious family background in which Christian authors and values prevailed.

During his term as prefect he apparently felt called to become a more perfect Christian by embracing the monastic life. He speaks of having delayed his "conversion" for a long time. When the decision was finally made—probably after his father's death—he established a monastery dedicated to Saint Andrew in his paternal home, where he gathered a community and appointed an abbot, and where he himself lived, by his own choice, as a monk. Despite the traditional view that Gregory was a Benedictine monk, it is by no means certain that the rule of Saint Benedict governed the life of this new monastic house.

Gregory's skills as administrator and negotiator were too widely known to be eclipsed by his entry into seclusion. Pelagius II was no sooner elected bishop of Rome (r. 579–590) than he summoned Gregory from his monastery, ordained him deacon, and sent him as papal representative (*apocrisarius*) to Constantinople. Gregory apparently accepted this mission on the condition that he could take monks from Saint Andrew's with him and set up a quasi-monastic household in the imperial city. Gregory remained in the East until about 586, when he returned to Rome to resume his monastic life and to assist and advise Pelagius II, even drafting some of the pope's later letters.

Without much delay, and without waiting for the imperial consent, the Senate, clergy, and populace elected Gregory bishop of Rome after Pelagius's death in 590. Later tradition maintained that Gregory fled the city to avoid this burden

but was captured after three days and brought back. Gregory always lamented the imposition of this heavy burden, which deprived him of his "beloved solitude," but he continued to view himself as a monk and aimed to set up his household, as at Constantinople, in the form of a small community made up of monks and clerics who would live together and share all things in common.

The fourteen years of Gregory's pontificate (590–604) are well documented, particularly on the strength of his correspondence, which depicts a man who showed a superb command of estate and personnel management and from whom emanated good sense, moderation, and tact, allied to shrewd, businesslike efficiency. He was fully conversant with the laws of the imperial code but could temper them with goodwill and humanity. He exhibited a firmness allied to fairness that was in the best Roman tradition. These qualities were constantly at play in Gregory's attempts to introduce greater order and efficiency into the administration of the patrimony of Peter (the possessions held by the church of Rome not only in Italy and Sicily but also in Gaul, Africa, and elsewhere), and in his handling of the affairs of dioceses and monasteries, and ecclesiastical disputes of all kinds. The correspondence also gives rise to the impression that in becoming bishop of Rome Gregory was in fact assuming again some of the duties of the prefect of Rome, concerning himself with food and water supplies, appointing commanders and paying for troops, and taking a leading role in negotiating truces and treaties with the threatening Lombard invaders. Although there had been previous occasions when popes assumed leadership of the city of Rome, particularly in crisis, Gregory's pontificate is the first and best example of ecclesiastical authority replacing, throughout the machinery of government, the political power of a declining state.

Here and there in his letters a note of rigor and acerbity emerges perhaps native to the Roman patrician and professional administrator, but for the most part these elements were held in check by Gregory's reverence for the gospel teaching of humility and charity, in whose light he constantly examined and formed his own conduct. His preoccupation with saving souls and helping the poor is ever present. John the Deacon, Gregory's biographer, refers to a "very large papyrus volume" (the first of its kind to be drawn up by a bishop of Rome), in which Gregory, with his usual efficiency, caused all pensions, rent reductions, subsidies, and charitable outlays to be recorded so that none would be forgotten or overlooked in future years. Gregory's concern for the good of souls likewise appeared in missionary activities directed toward heretics or pagans, the most noteworthy being his sending, in 596 and 601, groups of monks from his own monastery, under the leadership of Augustine, to evangelize the Anglo-Saxons.

Despite the incessant preoccupations of his years as bishop of Rome, and despite a debilitating malady that seems to have afflicted him for years, Gregory consistently found time to pursue the activity that lay nearest his heart, namely,

to study and interpret holy scripture for the group of close associates with whom he lived, in an effort to bring out its hidden meaning as a guide for moral life. Gregory had begun such a discourse, on the *Book of Job*, during his stay at Constantinople. In the period between his return to Rome from the East (586) and his election as bishop (590), he reorganized these spontaneous discourses into book form. The result was the vast *Magna moralia in Job*, a work in thirty-five books divided into six codices, which had a lasting influence on the whole Middle Ages. During the first years of his pontificate he discoursed in church and before the people not only on the gospel lessons of the day but also on the opening and final chapters of *Ezekiel*, chapters that seemed particularly relevant in those grim years when events seemed to presage the end of the world. However, he found talking to a large audience in church a trying experience that overtaxed his health. After his first years as pope he gave up the practice, but continued to discourse to a smaller group of intimates. He himself listed the books on which he spoke: *Proverbs*, *Song of Songs*, the books of the prophets, *Kings*, and the *Hep-tateuch*. Only the commentary on *1 Kings* and two homilies on *Song of Songs* are extant.

In addition to his scriptural works and his letters, Gregory also wrote a book of dialogues (between himself and his deacon Peter), recounting the miracles performed through God's power in Italy in his own time. The aim of this work was to revive the religious faith of the Roman people, beset at that time by war, plague, and famine. The second book of the *Dialogues* is devoted entirely to one figure, Benedict, the founder of Monte Cassino and author of the Benedictine rule; it embodies the earliest traditions about Benedict, including stories gathered by Gregory from Benedict's own disciples.

His *Regula pastoralis* (Pastoral rule), probably the best known and most used of Gregory's works in the Middle Ages, was the first work of his pontificate. No sooner had he been consecrated in 590 than he set about constructing a standard of conduct for the ideal shepherd of souls. In this one can perhaps perceive an attempt to redefine his own insights as a skilled administrator and negotiator on a level higher than that of practical affairs; that is, on a universal, spiritual plane. Gregory always maintained that if bishops lived up to their true ideal the church of Christ, spread throughout the world, would prosper. In writing the *Regula pastoralis* he sought to instruct himself as well as others.

As the years of his pontificate proceeded, Gregory continued to reflect on the implications of his position as bishop of Rome, a see that claimed preeminence in the church over all other sees, including those that were also patriarchal. Here he reached views that differ markedly from those that later formed the traditional papal attitude. Gregory sought to limit the Roman claim to what he considered its essential elements. He believed that a supreme authority was needed in the church, but only so that things might be put right if they went wrong; if simony were practiced in Gaul or in Alexan-

dria, it was his duty to remonstrate, "but when fault does not intervene, we [bishops] are all equal by reason of humility." Gregory was tireless in underlining the danger of pride and the need for humility in those who govern the church. For this reason, he rejected the title of ecumenical patriarch, not only when applied to the patriarch of Constantinople but also for himself. Ecumenical means universal, and he who is universal has no rivals in rank; on that level, others have no standing. Therefore, he wrote to his friend Eulogius, patriarch of Alexandria, "you deny your own standing as bishop when you assert that I am universal as bishop and pope." On the level of custom and usage, including liturgical usage, Gregory did not believe that the Roman see held any monopoly of good things. It is here that he contrasts most markedly with his predecessor Innocent I, who maintained that all the churches in the West needed to follow Roman usage. Gregory's legal training had familiarized him with customary law, and he had observed that good things might be found everywhere. "We should love places because of the good things they possess and not things because of the places from which they come," he wrote to Augustine of Canterbury in his so-called *Libellus responsionum*, urging him to borrow liturgical usages from Gaul as well as from his native Rome for the newly converted Anglo-Saxons. Such a statement fitted into Gregory's larger view that claims to monopoly were detrimental to charity, which was fostered by diversity and interchange. Diversity on the level of custom was allowable and even desirable, as long as unity was always maintained in Christian faith. The medieval papacy would have evolved very differently if Gregory's precepts in these matters had prevailed.

It is now recognized that Gregory the Great had relatively little to do with the sacramentary or with the chant that still bears his name. He unquestionably composed certain prayers and prefaces that eventually found their way into the Roman sacramentary, but these are limited in number, a total of 82 out of 927 formulas. The liturgical traditions associated with Gregory's name go back to Carolingian times and derive from Gregory II rather than Gregory the Great.

#### BIBLIOGRAPHY

The collected works in *Patrologia Latina*, edited by J.-P. Migne, vols. 75–79 (Paris, 1849–1878), reproduce the Maurist edition of 1704. Dag Norberg's new edition of Gregory's Register of Letters, *S. Gregorii Magni registrum epistularum*, in *Corpus Christianorum, Series Latina*, vols. 140 and 140A (Turnhout, Belgium, 1982), provides the most dependable Latin text, superseding *Gregorii I Papae registrum epistolarum*, in the *Monumenta Germaniae Historica, Epistolae*, vols. 1 and 2 (Berlin, 1887–1899); nevertheless, the *Monumenta* edition remains indispensable by reason of its elucidatory notes. Norberg has established a new order for the letters, so their numbers in his edition do not necessarily coincide with those of the *Monumenta*; he provides a concordance. A new edition of the *Moralia in Iob* by Marci Adriaen can be found in *Corpus Christianorum, Series Latina*, vols. 143 and 143A (Turnhout, Belgium, 1979). For fragments

of the homilies on the *Song of Songs* and the commentary on *1 Kings*, see volume 144 in the same series, *Sancti Gregorii Magni expositiones*, edited by Patricius Verbraken (Turnhout, Belgium, 1963). The *Dialogues* were edited by Umberto Moricca in *Gregorii Magni dialogi* (Rome, 1924), but with a text long recognized to be unsatisfactory. The most useful edition, comprising Latin text, French translation, introduction, and notes is by Adalbert De Vogüé, *Dialogues: Grégoire le Grand*, in *Sources chrétiennes*, vols. 251, 260, and 265 (Paris, 1978–1980); to the long bibliography on the *Dialogues* should be added an important article by Pierre Boglioni, “Miracle et nature chez Grégoire le Grand,” *Cahiers d'études médiévales* (Montreal) 1 (1974): 11–102. The best English translation of the *Dialogues* is Odo John Zimmerman's *Saint Gregory the Great: Dialogues* (New York, 1959). The earliest biographies of Gregory date from Carolingian times: *The Earliest Life of Gregory the Great, by an Anonymous Monk of Whitby*, edited by Bertram Colgrave (Lawrence, Kans., 1968); the life of Gregory by Paul the Deacon in H. Grisar's “Die Gregorbiographie des Paulus Diaconus in ihrer ursprünglichen Gestalt, nach italienischen Handschriften,” *Zeitschrift für katholische Theologie* 11 (1887): 158–173; and that by John the Deacon, in *Patrologia Latina*, vol. 75, cited above. These and other early accounts of Gregory's life, including those of the *Liber Pontificalis* and Bede's *Ecclesiastical History* (2.1), present only those facts that can be found in Gregory's works or correspondence, which remain the primary sources.

A good overall study of Gregory has yet to be written. F. H. Duden's *Gregory the Great*, 2 vols. (London, 1905), is recognized to be outdated. The two long chapters (4 and 5) in Erich Caspar's *Geschichte des Papsttums*, vol. 2 (Tübingen, 1933), retain much value but stand in need of additions and corrections. Claude Dagens's *Saint Grégoire le Grand: Culture et expérience chrétiennes* (Paris, 1977) is a long, diffuse work, seeking mainly to explore Gregory as a spiritual writer, and often lacking historical perspective; see the review by Robert A. Markus in *Journal of Ecclesiastical History* 29 (April 1978): 203–205. Jeffrey Richards's *Consul of God: The Life and Times of Gregory the Great* (London, 1980) gives an excellent picture, drawn from the correspondence, of Gregory's activity as bishop of Rome but does not deal adequately with his other writings and thought.

The view that there was little originality in Gregory's spiritual teaching has been dispelled by numerous recent studies. A pioneer effort is Michael Frickel's *Deus totus ubique simul: Untersuchungen zur allgemein Gottgegenwart im Rahmen der Gotteslehre Gregors des Grossen* (Freiburg, 1956), which demonstrates that Gregory's special vocabulary could provide a key to his thought; his temperament was introspective by nature, and his originality lies mainly in exploring the inward dimensions of Christian behavior. For Gregory's motives in sending missionaries to England, see Robert A. Markus's “Gregory the Great and a Papal Missionary Strategy,” *Studies in Church History* (Cambridge U.K.) 6 (1970): 29–38, and “Gregory the Great's Europe,” *Transactions of the Royal Historical Society*, 5th series 31 (1981): 21–36. On the authenticity of the *Libellus responsionum* connected with this mission, see my essays “Diversity within Unity, a Gregorian Theme,” and “Bede's Text of the *Libellus responsionum* of Gregory the Great to Augustine of Canterbury,” in my *Bene-*

*dict, Gregory, Bede and Others* (London, 1977). On Gregory's authorship of some liturgical formulas, see Henry Ashworth's “The Liturgical Prayers of St. Gregory the Great,” *Traditio* 15 (1959): 107–161.

Gregory was the only pope to win the admiration, even the affection, of some Protestant reformers; see the references in L. K. Little's “Calvin's Appreciation of Gregory the Great,” *Harvard Theological Review* 56 (April 1963): 145–157, and my “Gregory the Great and the Theme of Authority,” in *Benedict, Gregory, Bede and Others* (cited above).

PAUL MEYVAERT (1987)

**GREGORY VII** (Hildebrand, c. 1020–1085), pope of the Roman Catholic Church (1073–1085). The facts of Hildebrand's youth and education are hazy. He was born in Tuscany, perhaps at Soana, at an undetermined date: c.1015 according to Cowdrey; Blumenthal says 1020/1025. He went to Rome early in his life and became a professed religious. The tradition that Hildebrand was a monk, perhaps at the Benedictine house of Santa Maria del Priorato on the Aventine, is strong, although recently Blumenthal suggested that he was instead a regular canon. For a time he was a student of the learned and exiled Bishop Laurentius of Amalfi, and also was active in the service of Pope Gregory VI (1045–1046), with whom he had a familial connection. In January 1047, Hildebrand accompanied this pontiff into exile in Germany, after Gregory's deposition by Emperor Henry III and the Synod of Sutri (December 1046). That exile is the first precisely datable event in the future pope's life. A later tradition that Hildebrand became a monk at Cluny almost certainly is erroneous, although he may well have stayed in that house for a time before his return south. That return occurred in the company of Bishop Bruno of Toul, who in 1049 journeyed to Rome to become Pope Leo IX (1049–1054).

Leo's pontificate is generally considered to mark the emergence of a reform movement centered on Rome and which became predominant among other initiatives for renewal in the eleventh-century church. Pope Leo brought to Rome a group of reform-minded churchmen from both Italy and the north, and Hildebrand's career developed in conjunction with important individuals such as Peter Damian and Humbert of Moyenmoutier. He was designated by Leo as abbot and rector of the Benedictine house of San Paulo fuori le Mura, and his importance in the evolving administrative operations of the church is seen in his appointment several times in the 1050s as a papal legate north of the Alps. During one such legation, in 1054 in France, Hildebrand presided over a synod at Tours that considered the question of the eucharistic views of Berengar of Tours, whose career would stretch into the 1070s and who would be called to Rome during Gregory's pontificate for an examination of his teachings. It would be a mistake to view Hildebrand as the chief papal adviser at this juncture, but with appointment as

archdeacon under Nicholas II (1059–1061), and with the death of Humbert and the election of Alexander II in 1061, his importance grew. During Alexander's long reign he has been considered, perhaps with only slight exaggeration, as the power behind the papal throne.

Alexander II died on April 21, 1073. During the ceremony for his burial Hildebrand was acclaimed by the Roman populace as Alexander's successor. That public display was at variance with the terms of the well-known decree of Pope Nicholas II (1059), which placed the choice of a pope essentially in the hands of the cardinal bishops. In the spring of 1073 public acclaim preceded selection by the cardinals, and this variance with the decree of 1059 later opened Hildebrand to the charge that his elevation to the papacy was illegitimate. He chose the papal name Gregory, probably in honor both of Gregory I, one of the fathers of Latin Christianity and a venerable monastic pope, and of his relative and onetime patron, Gregory VI. Gregory's consecration as bishop of Rome was on June 30, 1073, a date carefully selected for it is the feast day of the two great saints of the Roman church, Peter and Paul.

The significance of Gregory VII's twelve-year reign must be assessed within the framework of the reforming movements underway at the time throughout Latin Christendom. For decades sensitive churchmen had criticized abuses in religious structure and administration. Chief among those problems was simony, the gaining of an ecclesiastical office by means of payment rather than according to canonical norms. Various circles of ecclesiastical reform in the eleventh century were also adamant in condemning sexual incontinence among the higher orders of the clergy. The offensive against simony and clerical sexual activity marked an effort to purify the hierarchy and the sacramental life of the Latin church, and the notion of *puritas ecclesiae* ("purity of the church") became a common reform theme.

From the pontificate of Leo IX, however, and especially from the reign of Nicholas II, the papacy was increasingly in a position of leadership in these efforts to purify the church. Repeatedly, in papal letters, conciliar decrees, and through legatine missions, the Roman church fostered reform, aiming particularly at eradicating the aforementioned abuses. It must be stressed, however, that these initiatives did not involve merely administrative changes in the ecclesiastical structure. The theological and practical importance of the changes being sought reached deep into the religious mentality of Latin Christendom, and had profound effects on eucharistic theology, the cult of saints, attitudes toward property, and the role of laymen in designating appointees to church positions. Concomitant with this evolving reform activity an ecclesiology developed centering on the Roman see. The roots of this doctrine reach deep into the history of Latin Christianity, but from the mid-eleventh century the potential and the prerogatives of the Roman church gained increased attention as reform progressed.

Reform of the church in general and increased visibility and power for the Roman church occurred side by side. This new perception of Roman authority was not, however, the invention of eleventh-century thinkers. The dossiers of claims, traditions, and incidents on which Roman leadership rested reach as far into the past as the New Testament and the so-called Petrine passages (*Mt.* 16:13–19). Popes such as Leo I, Gelasius I, and Gregory I were pivotal figures in antiquity who advanced claims that contributed to the special status of the Roman church and its bishop; and in the ninth century Pope Nicholas I was a vigorous proponent of those claims and that status. Yet in the eleventh century from the reign of Leo IX onward the uniqueness and the authority of Rome was stressed increasingly and with new vigor. As the reformers, now in control of the papal office, sought to promote their aims, the prestige and potential of the Roman church became a vehicle for this strategy. As the reform progressed the theoretical authority believed for centuries to be vested in the Roman church became increasingly real, and attention was given in practice as well as theory to the rights and powers of Rome, its clergy, and its bishop.

Such was the general situation confronting Gregory VII at the beginning of his reign. Given his long association with papal reform, it was to be expected that the initiatives for purity in the church would continue. Yet these policies, along with the pope's strong personality and intense devotion to the Roman church, were on a collision course with events growing out of the final years of the pontificate of Alexander II. King Henry IV of Germany, having reached maturity, was determined to exercise control over affairs within his sphere of influence. At issue specifically were claims to authority in both secular and church matters in important cities in northern Italy, especially in Milan. Thus in the early 1070s Henry supported one candidate for the archbishopric of that city while the papacy supported another. There were two questions. Did Henry have a right to grant churches on his own, to whomever he chose; and could Henry ignore directives about ecclesiastical matters from the Roman church and its bishop?

Historians are fortunate to possess from Gregory VII an official papal register—a unique survival from the eleventh-century papacy—in which the development of events and ideas often can be followed in detail. In the register, under March, 1075, appears a series of twenty-seven epigrammatic statements that were drafted by Gregory and his advisers (the so-called *Dictatus papae*), perhaps as titles for a new canon law collection where texts would have been presented from the canonical tradition to support each proposition. The unusual form and special content of these texts has received much attention from historians, for contained therein is a series of strong statements asserting the superiority of ecclesiastical over secular authority, and the absolute authority of the Roman church and its bishop over all churches and bishops. Here is found, for example, in number 12, the statement that the pope may depose emperors, and in number 27, the claim

that the pope may absolve subjects of unjust men from their fealty. From the outset of his reign, therefore, Gregory VII was concerned not only to advance policies to bring about *puritas ecclesiae*, but also, as part of a larger plan, he was eager to define and command obedience to the policies of the Roman church.

The decade between 1075 and Gregory's death in 1085 saw the genesis and development of a church-state controversy between Gregory and Henry that would outlive both leaders. Issues arose about the interaction of the ecclesiastical and secular realms of society that would be debated for centuries. Gregory maintained that he had the right to remove Henry's kingship and to release his subjects from their oaths of loyalty. Henry, on the other hand, claimed that he reigned by the grace of God, not of the pope, and that he possessed the right to control the churches in his realm. Because of what he saw as the indefensible novelty of Gregory's positions he condemned him as a "false monk" and usurper of the papal throne. The battle extended beyond rhetoric and exchanges of letters. In 1076 Gregory excommunicated Henry and forbade him to exercise his royal duties. After a period of complicated diplomatic maneuvering, however, in the early 1080s Henry invaded Italy, drove Gregory from Rome into Norman territory in the south, and installed in his place another pontiff, the so-called antipope, Clement III (Archbishop Wibert of Ravenna). The controversy offers historians compelling vignettes such as the famous episode that occurred in January, 1077, at Canossa in northern Italy. At this crucial stage of the dispute Henry, beleaguered in both Germany and Italy, presented himself to Gregory as a penitent, parading barefoot in the snow to seek forgiveness from the pope. After watching that performance from within the castle for three days, Gregory forgave Henry, and lifted the sentence of excommunication (but probably did not intend to reinstate him as king). What political advantage was gained or lost on each side has been much debated, but Gregory's action in forgiving Henry was the response of a pastor of souls and not of a power-crazed fanatic.

The prohibitions that Gregory formulated against laymen investing individuals with bishoprics and abbeys have been accorded a great deal of attention. In fact, the term Investiture Conflict has sometimes awkwardly been applied to the entire eleventh-century papal reform movement, with the controversy about lay investiture, especially in the German empire, wrongly seen as the cornerstone of Gregory's policy to promote reform. Gregory's decree against lay investiture was probably issued first not in 1075 as once was assumed but only in 1078. The transmission of these rulings must be closely examined to determine the extent to which they were promulgated and applicable at different points throughout Latin Christendom, for the programs of the reformers were not disseminated everywhere in the same manner.

An assessment of Gregory's policies must be given within the general history of the eleventh-century reform and

from the perspective of his fascination with and devotion to the Roman church and the papal office. From that perspective the events and the turmoil of his reign appear as outcroppings of a desire to continue the reforming work of his predecessors, and also to establish what he deemed to be the proper order of Christian society. Using the Bible as his chief source, and infused with religious fervor and a deep sense of Roman ecclesiastical possibilities, Gregory believed that the whole world ought to be subject to the leadership of the church, for churchmen were responsible for promoting the kingdom of God on earth and would be held accountable for human souls on judgment day. It was Peter, the founder of the Roman church, to whom Christ gave supreme authority over the terrestrial church, and thus Peter's vicar, the bishop of Rome, was to be obeyed as the supreme authority on earth and must be prime in both ecclesiastical and secular domains. Both realms—the secular (*regnum*) and the religious (*sacerdotium*)—should attend to its own proper duties, but by seeking to do God's will under the headship of the church and ultimately under its chief bishop.

No less than laymen, Gregory expected churchmen to be loyal devotees of Peter and his vicar. The papal office, furthermore, was an awesome responsibility. Gregory believed that it was his divinely enjoined duty not only to protect the church from the stain of abuses such as simony, but also to free it from every distraction that would impede the performance of God's work in the world. The desire for *puritas* blended into a drive for the liberty of the church (*liberts ecclesiae*). It often was necessary, consequently, to instruct and admonish all sectors of society about their duties in the world, and about proper reverence for and obedience to Peter and his successors. Gregory prohibited lay investiture, promoted closer ties between Rome and outlying bishoprics and abbeys, granted detailed powers to papal legates, stressed the need for liturgical harmony with Roman usages, ordered special commissions to investigate the eucharistic teachings of Berengar of Tours, and even proposed early in his pontificate an expedition to the East to beat back the infidel from the Holy Land. Gregory was neither a canon lawyer nor a theologian, although he was concerned with both areas, and he insisted that he was not an innovator. Perhaps he can be understood best as an eleventh-century monk (or regular canon) of intense devotion and energy. He sought to realize what he considered a properly structured Christian society and used the expanded authority of the papal office in his efforts.

At the time of his death in 1085 Gregory was an exile from Rome, driven to southern Italy by Henry IV and an irate Roman populace. He had been deserted by many of his supporters, and many reforming churchmen thought he had gone too far in his battle with Henry. By reason of that battle, however, and because of his powerful personality, Gregory's name has been attached to the entire reform movement of the age, and the term Gregorian Reform is well-known to those who study medieval history. Although his importance is undeniable, the extent to which the cause of church

reform was aided or hindered by his pontificate is a complicated issue. Many twelfth-century writers remembered Pope Urban II (1088–1099), not Gregory, as the great figure of the preceding age of reform. Even so, Urban forcefully acknowledged himself to be a disciple of Gregory, although the extent to which Urban is a true “Gregorian” can be debated. As decades passed Gregory would be cited less and less frequently by his successors and by canon lawyers, but the issues that dominated his reign could not be ignored. Because of the claims that Gregory made, particularly those detailing the relation between secular and ecclesiastical authority, medieval church-state relations had been fundamentally altered and could never again be seen as had been the case prior to 1075.

#### BIBLIOGRAPHY

Two new biographies of Gregory VII recently have appeared and are the starting point for all further study and bibliography: H. E. J. Cowdrey, *Pope Gregory VII, 1073–1085* (Oxford, 1998), and Uta-Renate Blumenthal, *Gregor VII*. (Darmstadt, 2001). The volumes of the journal *Studi Gregoriani*, edited by G. B. Borino and others (Rome, 1947–), appear at irregular intervals and contain scholarly articles about the Gregorian Age in many languages. Of special significance are the two volumes of papers from an international Congress held at Salerno in 1985, commemorating the 900th anniversary of Gregory’s death in that city: vol. 13 (1989), and vol. 14 (1991). The critical edition of Gregory’s register is by Erich Caspar, *Das Register Gregors VII*, “Monumenta Germaniae historica, Epistolae selectae,” vol. 2 (Berlin, 1920–1923). Many sections of the register, following Caspar’s edition, have been translated by Ephraim Emerton, *The Correspondence of Pope Gregory VII* (New York, 1932; reprint 1991). Emerton’s introduction, albeit dated, is still useful for discussion of the diplomatic questions raised by the surviving copy of the register in the Vatican Archives, although much has been written on this issue in the past sixty years: see, for example, Hartmut Hoffmann’s “Zum Register und zu den Briefen Papst Gregors VII.,” *Deutsches Archiv* 32 (1976): 86–130. Emerton’s translation has been superseded by a complete English translation of the register by H. E. J. Cowdrey, *The Register of Pope Gregory VII, 1073–1085* (Oxford, 2002). For those letters of Gregory which are not to be found in the register, see the edition and translation by Cowdrey, *The Epistolae vagantes of Pope Gregory VII* (Oxford, 1972); and for the papal privileges issued by Gregory see Leo Santifaller et al., *Quellen und Forschungen zum Urkunden- und Kanzleiwesen Papst Gregors VII*, *Studi e testi*, vol. 190 (Vatican City, 1957).

ROBERT SOMERVILLE (1987 AND 2005)

**GREGORY OF CYPRUS** (1241–1290), known as Gregory II, was a patriarch of Constantinople. Born in Frankish-occupied Cyprus, Gregory traveled to Ephesus, Nicaea, and finally Constantinople, where he studied under Gregory Akropolites. His exceptional proclivity toward humanism gained for him a place in the select circle of academi-

cians at the patriarchal school where he lectured on the Pauline letters. As one of the more creative personalities of the late thirteenth century, he was the very embodiment of the Paleologian renaissance that synthesized a renewal of ascetic spirituality and classical learning.

Upon his ascendancy to the patriarchate in 1283, Gregory inherited the political and religious problems that had been festering since the Fourth Crusade (1204) and the Council of Lyons (1274). Under the aggressive unionist attempts of Emperor Michael VIII and Patriarch John XI Beccus (r. 1275–1282), these issues became entangled with the *filioque* controversy.

The Synod of Blachernae (spring 1285) proved to be a short-lived victory for Gregory in his efforts to reconcile the Arsenites (the hard-line conservatives) with the unionists. The importance of this synod, however, was, by way of its condemnation of Beccus, its reaction to and rejection of the 1274 Roman formulation. Gregory’s role was pivotal because of his synodal paper (*Tome*), which, however, was not subsequently recognized for what it was—the definitive refutation of Beccus’s theological innovation. Gregory’s subsequent writings (among them the *Pittakion*, which was addressed to his benefactor and supporter, Andronicus II Palaeologus) constitute a defense of his stand against the *filioque*.

Gregory’s theological contribution offered an insightful solution to the *filioque* debate. Rather than being one of provisional accommodation (Beccus) or of rigorous adherence to the formulations of Photios and Athanasius, his solution worked out the implications of the Cappadocians and of John of Damascus on the procession of the Holy Spirit. For Gregory, it was not enough to accept the authenticity of a particular scriptural or patristic reference; its correct interpretation was essential as well.

Gregory addressed Photios’s thesis that the Spirit eternally proceeds from the Father alone by raising the question of the relationship of the Spirit and the Son outside of time, as expressed in the formula “through the Son.” His argument distinguishes between the essence and energies of God, or between God’s unknowability and his perceivable manifestation in the world. By emphasizing the notion of energetic revelation in Greek patristic thought, Gregory remained, indeed, in the mainstream of Byzantine apophatism and also became the forerunner of fourteenth-century Palamite theology.

The impact of Gregory’s insights on the Palamite synthesis as well as his solution to the *filioque* debate is increasingly recognized by scholars as being far more valuable and genuine than the theology of unionism. Unfortunately, Gregory’s contemporaries, unlike his successors, did not share the same sentiments toward their prelate. Even though they tacitly accepted his orthodoxy, they insisted that he resign and solemnly removed his name from the hierarchical list of the *sunodikon*. Was his self-imposed abdication from

the patriarchate the most prudent action to take against a small yet influential band of opponents? That he did so proves not his weakness but his pastoral sensitivity to the importance of healing the political divisions that had torn the church during his lifetime.

#### BIBLIOGRAPHY

The published works of Gregory II can be found in *Patrologia Graeca*, edited by J.-P. Migne, vol. 142 (Paris, 1865). Of note is his autobiography, translated into French by William Lameere in *La tradition manuscrite de la correspondance de Grégoire de Chypre* (Brussels, 1937), pp. 176–191.

The most definitive work on Gregory, with an extensive bibliography, is Aristeides Papadakis's *Crisis in Byzantium: The Filioque Controversy in the Patriarchate of Gregory II of Cyprus 1283–1289* (New York, 1983). For a critical approach to Gregory's analysis in light of Gregory Palamas (fourteenth century) and Joseph Bryennios (fifteenth century), see Dumitru Staniloae's "Trinitarian Relations and the Life of the Church" (in Romanian), *Orthodoxia* (Bucharest) 16 (1964): 503–525, reprinted in *Theology and the Church* (New York, 1980), pp. 11–44.

JOHN TRAVIS (1987)

**GREGORY OF DATEV** (1346–1410), or, in Armenian, Grigor Tatevatsi, was a Christian theologian, philosopher, and saint of the Armenian church. Gregory of Datev was born in T'mkaber, a city in the province of Vayots Dzor, in northeastern Armenia. At the age of fifteen, he entered the Monastery of Aprakunik' to study under the famous philosopher and theologian Hovhannes of Orot'n (1315–1388), with whom he remained for twenty-eight years. With his teacher, Gregory traveled in 1373 to Jerusalem, where he was ordained a celibate priest. He received the degree of doctor of the church in Erzinka (present-day Erzincan, eastern Turkey) and in 1387 was elevated to the rank of supreme doctor of the church at the Monastery of Aprakunik'. At the death of Hovhannes and upon his express wish, Gregory became the dean of the theological school, which in 1390 moved to the Monastery of Datev.

In addition to classical Greek philosophy, biblical exegesis, and both Greek and Latin patristic thought, Gregory's students were also introduced to music, calligraphy, and the art of painting illuminated manuscripts. An erudite thinker, Gregory knew Greek, Latin, and Arabic. He died at the Monastery of Datev at the age of sixty-four and was buried there, where his tomb lies to this day. Venerated by following generations as "Second Illuminator," "eternally shining sun," "heavenly champion," and "great teacher," Gregory of Datev dominated the thought and orientation of the Armenian church in the fourteenth and fifteenth centuries as monk, author, educator, theologian, philosopher, scientist, orator, apologist, painter, calligrapher, and polyglot.

Well versed in the scholastic manner of demonstration, Gregory used syllogistic argumentation throughout his

works with the intention of eventually manifesting the orthodoxy of the Armenian church against the unitive attempts of Rome. His most important theological tracts are *Girk' Hartsmans* (Book of questions; 1397) and *Oskep' orik* (Book of golden content; 1407). In these Gregory addresses himself to such topics as the Holy Trinity, the divinity of Christ, and Christ's birth, baptism, death, and resurrection. In *Oskep' orik*, Gregory taught that rational examination can prove the existence of God without recourse to faith, because the existence of creatures implies the reality of the creator. In this work he also formulated a profession of the Orthodox faith based on the creeds of the councils of Nicaea and Constantinople and included the teachings of the Armenian church and its early fathers, especially Gregory the Illuminator (c. 239–c. 326). In continuous use, this credo is recited also during ordination ceremonies by the ordinand.

Criticizing Plato, Gregory taught in his *About the Structure of Man* that the spirit does not exist prior to the corporeal (body or matter) nor apart from it but issues concurrently and works through the mechanisms that the corporeal provides. There are different types of spirit—the vegetative, the animal, and the rational. Through the initiative of God, the corporeal, whether body or matter, contains "formative power" or spirit, which is immortal, and which has heat, motion, and action. According to Gregory, faith and science do not exclude each other but belong properly to two different realms. Science is bereft of the means to consider the supernatural realm and by faith alone one cannot understand nature. Knowledge of the natural world is acquired through reason, training, and experience (by way of the five senses). The rational spirit of humankind is like a clean parchment and receives whatever is impressed on it, whereas through God's grace one can understand theological truths.

An industrious writer, Gregory produced twenty-eight volumes on biblical, liturgical, pastoral, theological, and philosophical topics. Most of his works have not had a comprehensive critical evaluation. Such a task would enhance the proper understanding of the beliefs of the Armenian church through the writings of one of its most loyal sons.

#### BIBLIOGRAPHY

##### Works by Gregory

*Girk' Hartsmans*. Constantinople, 1729. Written in 1397, this work, composed of ten volumes of an encyclopedic nature, provides a comprehensive account of the beliefs of the Armenian church. An excellent apologist, Gregory analyzes such varied theological topics as creation, incarnation, resurrection, and eschatology.

*Karozgirk'*. Constantinople, 1741. This book of homilies was completed in 1407. Both volumes together contain 344 sermons written partly in defense of the Armenian church against the unitive attempts of the Roman church. As originally intended, it is also an excellent textbook on homiletics.

##### Works about Gregory

Khachikian, Levon S. *XV Dari Hayeren Tseragyeri Hishadakaranner*, part A, 1401–1450. Yerevan, 1955–1967. This book in-

cludes a reprint of the concise but authoritative account of the life of Gregory written probably by his pupil Matheos Joughayatsi (b. 1360). Included are facts of his early background, education, influences, death, and burial.

Krikorian, Mesrob K. "Grigory of Tat'ev: A Great Scholastic Theologian and Philosopher." In *Hygazian Hyagitagan Hantes*, vol. 9, edited by Yervant Kasouni, pp. 71–79. Beirut, 1981. A short but informative article portraying Gregory as scholastic theologian and nominalist philosopher.

Ormanian, Mal'achia. *Azgapatowm* (1912–1927). 3 vols. Reprint, Beirut, 1959–1961. This history of the Armenian nation is an extremely comprehensive study of the events and people who shaped the orientation and theology of the Armenian church as well as the politics of the Armenian nation. Of particular relevance to the study of Gregory are paragraphs 1367, 1379, and 1397–1404.

AVAK ASADOURIAN (1987)

**GREGORY OF NAREK** (c. 945–c. 1010), or, in Armenian, Grigory Narekatsi, was a Christian mystic, poet, and saint of the Armenian church. Gregory was born in the village of Narek in the region of Vaspourakan (present-day Van, eastern Turkey). His father, Khosrov Antsevsatsi, bishop of the nearby province of Antsevsatsik', built a monastery, where Gregory obtained his elementary schooling. He continued his education in the Monastery of Narek, where after ordination he spent the remainder of his life.

The rulers of the kingdom of Vaspourakan favored ties with Byzantium. Consequently, the Monastery of Narek trained its novices in the trivium and quadrivium, having incorporated the syllabi used in the educational centers throughout the Eastern Christian empire. Thus Gregory was well versed in Greek philosophy, especially in the thought of Plato, Aristotle, and the Neoplatonic school, which by the tenth century had been clothed in Christian garb. Gregory was also well read in the Armenian church fathers of the fourth through seventh centuries and was familiar with the thought of Ignatius of Antioch, the Cappadocian fathers, and Chrysostom.

Gregory's major work, the *Book of Lamentation*, popularly known as *Narek*, is a prayer book still much venerated. In it the penitent is made aware of the total otherness of God and of humanity's utter dependence on God, who is the source of all reality. The *Book of Lamentation* is an analysis of Gregory's own spiritual progress, realized through a fundamental knowledge of Christ and a radical knowledge of himself as sinner. The work also exhibits detailed knowledge of the scriptures and familiarity with agriculture, architecture, mathematics, astronomy, nautical art, and medicine. Among his other literary achievements are twenty-one hymns, or odes; four panegyric orations, containing historical accounts of the era; and ten discourses, actually spiritual songs, consisting of invocations and supplications. Of special interest is the historical information these discourses contain concerning the stratification of society during the times of Gregory.

Gregory was and remains the mystic of the Armenian church. Central to his mysticism is the belief in a cathartic process that ultimately would lead humankind to a reacquisition of divine similitude, or the likeness of God. The mysticism espoused by Gregory is a uniquely human undertaking whereby humanity tries to encounter God. To meet the Almighty, humanity must rid itself of transgressions. In order to encounter God, who transcends all being and all knowledge, it becomes necessary to renounce all sense gathered through the workings of reason. This apophatic approach to knowledge of God takes the form of negating all meaning in order to emphasize the absolute unknowability of God. According to Gregory, God is incomprehensible, invisible, ineffable, beyond totality, unspeakable, unobservable, without beginning, and without time.

Gregory, however, also embraced the cataphatic approach to God by stressing God's actions in history, which manifest God's love and concern for humankind. In the *Commentary on the Song of Songs of Solomon*, Gregory emphasizes the parallelism between the union of Yahveh with Israel and the marriage of the incarnate Logos with the church. As the Lord of compassion and mercy, the Christian God is distinctly a God of action, that is, a living God. Gregory began all his prayers by declaring, "from the depth of heart, a conversation with God."

#### BIBLIOGRAPHY

Gregory's *Odes* and *Discourses* are available in the original classical Armenian in *Tagher Yev Gantser*, edited by Armine K'oshkerian (Yerevan, 1981). The *Book of Lamentation* can be obtained in classical Armenian as *Matean Oghbergowt'en* (Jerusalem, 1964). This work is also available in a bilingual edition, with Russian translation by Naum Grebnev and interlinear translations by Levon Mkrtchian and Margarita Darbinian, as *Madyan Voghbergoutian/Kniga skorbi* (Yerevan, 1977). Parts of the *Book of Lamentation* are also available in English translation by Mischa Kudian as *Lamentations of Narek: Mystic Soliloquies with God* (London, 1977). See also the complete French translation by Isaac Kéchichian, *Le livre de prières* (Paris, 1961). Gregory's *Commentary on the Song of Songs of Solomon* is published as *Meknoutyoun Yerg Yergots Soghomoni* (Beirut, 1963). For further discussion of Gregory, see Mal'achia Ormanian's *Azgapatowm*, 3 vols. (1912–1927; reprint, Beirut, 1959–1961), a comprehensive study of the Armenian church as well as the politics of the Armenian nation. Of particular relevance to Gregory are paragraphs 790, 791, 793, 813, and 814.

AVAK ASADOURIAN (1987)

**GREGORY OF NAZIANZUS** (c. 329–c. 391) was one of the Cappadocian fathers, known to Christian tradition as "the Theologian" by virtue of his rhetorical erudition and the consummate skill with which he combated the perceived heresies of those who in any way detracted from or denied the validity of the established orthodoxy of his day. One of those "heretics" was his own father, Gregory the

Elder, who in his youth had been a member of an obscure but apparently popular sect known as the Hyspistarii. But inasmuch as his father was later converted to orthodoxy and subsequently consecrated bishop, his son could say of him that he was one whose “character anticipates their faith” (Oration 18) and that he was “well grafted out of the wild olive tree into the good one” (Or. 7). It was by his mother, Nonna, however, that Gregory was to be most enduringly influenced, for it was she who, by her tears and by her prayers, persuaded him to embrace the ascetic life. Gregory said of her, “Who had a greater love of virginity, though patient herself of the marriage bond?” (Or. 18). Gregory was one of three children; Gorgonia, his older sister (“One red tint was dear to her, the blush of modesty,” Or. 8), and a younger brother, Caesarius (“Neither by his fame [as a physician] nor by the luxury which surrounded him was his nobility of soul corrupted,” Or. 7), both predeceased Gregory. The funeral orations Gregory preached for his sister and brother remain classics of their genre, panegyrics of the most elaborate sort.

Gregory’s education was undertaken at Cappadocian Caesarea, at Palestinian Caesarea, at Alexandria, and finally at Athens. Upon completion of these extensive studies, Gregory had hoped to retire to a life of contemplative solitude (“with no contact with human affairs except when necessary,” Or. 2), but this desire was thwarted when his father, now a bishop, ordained him priest and set him on the stormy road of pastoral and ecclesiastical responsibilities. The “tyranny” he experienced at his father’s hand was repeated when his close friend Basil of Caesarea consecrated him suffragan bishop of the “exceptionally abominable and narrow little village” (Or. 10) of Sasima. Upon his father’s death, however, Gregory returned to Nazianzus to pursue what he hoped would be a quiet and undisturbed episcopate.

This was not to be so. During the “heretical” emperor Valens’s reign, the Arian party had gained strength, so Gregory was (again reluctantly) persuaded to go to Constantinople, the capital city, and preach on behalf of the outnumbered “orthodox.” Arius and his followers had called into question the eternal divinity of Christ (a dogma that the Council of Nicaea, in 325, had promulgated in direct opposition to Arius), while others had denied the full divinity of the Holy Spirit. Such views offended Gregory deeply, so he set out in a series of five long discourses, commonly known as his *Theological Orations* (Or. 27–31), to articulate, with both depth of learning and clarity of thought, what he believed to be the true doctrine of the Trinity. The core of his teaching consisted in his assertion that the salvation of humankind is possible only if the agents of that salvation (i.e., Father, Son, and Holy Spirit) share fully in the divinity of the one godhead. Defending the so-called Nicene faith against its Arian detractors, however, took its toll on Gregory, as did his other episcopal duties, including his unwilling participation in ecclesiastical politics. It is no surprise, then, that during the Council of Constantinople in 381 (where

many of his views were adopted) he retired to the contemplative life that he had so fervently desired from the beginning.

But Gregory’s retirement years, as his extant letters clearly indicate, were far from idle. Chief among his concerns during this period of his life was yet another “heresy,” this time authored by Apollinaris, bishop of Laodicea. In an attempt to solve the question of how the Son of God (or Word) could become incarnate in the human Jesus, Apollinaris suggested that the Word (Gr., *logos*) took the place of Jesus’ mind (or rational faculty), thus ensuring the unity of the incarnate person and also implying that everything Jesus did or said could be attributed to divine authorship. Gregory, in three closely argued dogmatic letters (101, 102, 202), called this a “mindless” Christology, insisting—again, out of a concern for the need for salvation and for humanity’s ultimate goal of union with God—that “only that which is assumed [i.e., by the Logos] can be saved.” It must be the whole person, the mind included, that was assumed by the Word at the time of the incarnation, if the whole person is to be saved. If the whole person is not assumed, then salvation itself is imperiled. Gregory’s powerful and incisive arguments won the day, and Apollinaris’s bold attempts to explain the incomprehensible were condemned.

If Gregory were to be remembered, within the relatively narrow confines of the history of doctrine, only as “the Theologian,” and if he were understood solely as the defender of true faith against heretical encroachments, it would be doing him an injustice. As important as his Christological and Trinitarian concepts were to the debates of his day, his more enduring (and often overlooked) significance may lie elsewhere. Caught, as he was, between the desire for solitary retirement (“For me the greatest business is to be free of business,” Epistle 49) and his vehement dislike of ecclesiastical and political machinations (“For my part . . . my inclination is to avoid all assemblies of bishops, because I have never seen a council come to a good end or turn out to be a solution for evils,” Ep. 130), he nevertheless manifested in his own person a delicate balance between a genuine concern for his fellow Christians’ spiritual well-being and an intuitive grasp of those divine mysteries that transcend logical or rational boundaries. This balance is seen less in his exclusively doctrinal discourses than in his poetry, for it is in the latter that one glimpses a sensitivity at once aesthetic and mystical.

While Gregory’s orations address theological issues with precision and directness, his poems—many of them no less theological—are less rigid, more given to deep self-understanding and to a broad, inclusive generosity of spirit. Gregory may be one of the earliest Christian theologians to realize, instinctively, that poetry is a more appropriate medium for theological articulation than is prose, however well ordered, systematic, and architectonic that prose might be. He would have delighted, one dares suppose, in the claim of the nineteenth-century Scottish poet John Campbell Shairp that “whenever we come face to face with truth then poetry begins.” It is as if Gregory’s dogmatic discourses were

true to his (albeit grudging) acceptance of the ecclesial responsibilities laid on him, whereas his poems gave voice to his capacity for a deep inner awareness of his relationship to God, a relationship of which both his constancy in ascetic discipline and his unending search after truth were genuine symbols. The balance, then, between theological precision in the interests of orthodoxy and his poetic sensitivities was, for Gregory, perhaps more of a tension than a balance. Yet he had a vision of the future state in which the balance would be restored and the tension resolved. And this he could express both poetically and theologically:

No longer from afar will I behold the truth,  
As if in a mirror reflected on the water's surface.  
Rather, the truth itself will I see with eyes unveiled,  
The truth whose first and primary mark the Trinity is,  
God as One adored, a single light in tri-equal beams.

#### BIBLIOGRAPHY

The most extensive collection of Gregory's writings in English translation is to be found in *Saint Cyril of Jerusalem, Saint Gregory Nazianzus*, edited and translated by Charles Gordon Browne and James Edward Swallow, in volume 7 (2d series) of "A Select Library of Nicene and Post-Nicene Fathers" (New York, 1894), which comprises but a small portion of the extant corpus published (in Greek) in *Patrologia Graeca*, vols. 35–38 (Paris, 1857–1862), edited by J.-P. Migne. The secondary literature on Gregory is vast, but any of the following titles may be consulted for their extensive bibliographies. Paul Gallay's *La vie de Grégoire de Nazianze* (Lyons, 1943) is a lively and appreciative work, complementing but not superseding the earlier *Saint Grégoire de Nazianze: Sa vie, ses œuvres, son époque* (1884; reprint, New York, 1973) of Alphonse Benoit. Jean Plagnieux's *Saint Grégoire de Nazianze Théologien* (Paris, 1952) is a splendid survey of Gregory's overall theological significance, while Heinz Althaus's *Die Heilslehre des heiligen Gregor von Nazianz* (Münster, 1972) and Donald F. Winslow's *The Dynamics of Salvation: A Study in Gregory of Nazianzus* (Cambridge, Mass., 1979) address specific doctrinal issues in greater detail. Finally, an important work is Anna-Stina Ellverson's *The Dual Nature of Man: A Study in the Theological Anthropology of Gregory of Nazianzus* (Uppsala, 1981).

DONALD F. WINSLOW (1987)

**GREGORY OF NYSSA** (c. 335–c. 395), also known as Gregory Nyssen, was a Christian theologian. With his elder brother, Basil of Caesarea (c. 329–379), and Basil's lifelong friend, Gregory of Nazianzus (c. 329–c. 391), Gregory of Nyssa was a principal architect and interpreter both of the trinitarian settlement canonized by the ecumenical Council of Constantinople (381) and, in his later years, of the ascetic and mystical tradition of Eastern monasticism.

Little is known of the details of Gregory's life. The child of an aristocratic Christian family of Cappadocia, he had two bishops among his brothers, while his elder sister, Macrina, whose biography is numbered among his works, was a noted

and saintly ascetic. Destined for an ecclesiastical career, Gregory was early made a lector in the church and was educated in the local schools at Caesarea, thus missing the opportunity to study, as Basil had, at one or more of the great cosmopolitan centers of learning. Nevertheless, Gregory decided in favor of marriage (with a woman named Theosebeia) and the career of a professional rhetorician, which he took up in earnest around 365.

Gregory's first known work was the treatise *On Virginity*, which he wrote in defense of the ascetic life, apparently at the behest of Basil. Shortly after its composition, Basil, now the metropolitan bishop of Caesarea, found himself badly in need of episcopal allies in his struggle with the Arian orthodoxy of the imperial court. Accordingly, he induced Gregory to be ordained bishop of Nyssa (371), a small town on the river Halys, some eighty miles northwest of Caesarea. The job fit neither Gregory's tastes nor his talents, but he carried on until a synod of Arian bishops, assembled at Nyssa in his absence, deposed him (376) on a charge of maladministration of funds.

The year 379, which saw both the death of Basil and the accession of an anti-Arian, pro-Nicene emperor in the person of Theodosius I, marked a turning point in Gregory's life. For one thing, it raised him to prominence in the life of the church: He was chosen (though by his own choice he did not long remain) the metropolitan bishop of Sebaste in Armenia I; he figured prominently at the Council of Constantinople in 381; and he functioned as a regular "special preacher" in Theodosius's capital.

More important still, Gregory, on the death of Basil, took up the cudgels against his brother's principal theological opponent, the radical Arian Eunomius. In all he composed four treatises entitled *Against Eunomius* during the years 380–383. His continuation of his brother's work in the debate with Arianism was paralleled by his completion of Basil's exegetical homilies on the creation story of *Genesis* 1. To this end Gregory wrote a lengthy treatise, *On the Making of Man*, many of whose themes and issues are echoed in his contemporary *Dialogue on the Soul and the Resurrection*, which he presents as a conversation between himself and his dying sister Macrina. In all of these works Gregory exhibits a remarkable knowledge not only of the Origenist tradition in Christian theology, which Basil and Gregory of Nazianzus had "rediscovered," but also of pagan philosophy in the Neoplatonic idiom; and his indebtedness to these traditions is not the less obvious because he is critically aware of the problems they created for Christian theology.

In his defense of the orthodoxy of the Nicene tradition (i.e., of the doctrine that Son and Spirit are "of one being" with God), Gregory insists, with Basil and Gregory of Nazianzus, that the three hypostases of Father, Son, and Holy Spirit share a single being or substance (*ousia*): Each is all that the others are. Furthermore, every action or operation of God is one in which all three hypostases share: As there is one divine being, so there is one divine *energeia*. What differ-

entiate the “persons” is solely the relations of causation or origination in which they stand to one another. God appears in Gregory’s thought as a single being that is articulated through relations of strict self-reproduction.

In taking this stand, Gregory repudiated the Arian hierarchy of divine hypostases, which established the identity of the Son, or Word, and the Spirit by insisting that they were things of a different (and inferior) order in relation to God, mediating between God and world. The fundamental error in this Arian position, as Gregory saw it, lay in the belief that the being of God is definable and hence limited: that Son and Spirit can be distinguished from God because their definitions are different from God’s. He insists, on the contrary, that no human words or ideas grasp the *ousia* of God, which is infinite and illimitable Good; and for this reason the distinction of Father, Son, and Spirit belongs not to the order of being but to that of cause or relation.

This doctrine of the divine infinity is closely related to a central anthropological theme that appears in Gregory’s treatise *On the Making of Man* as well as in certain of his later ascetic works. As might be expected in one whose thought was so closely allied to Platonist and Christian-Platonist traditions, Gregory, like Origen before him, has difficulties about the bodily dimension of the human being. On this score he corrects Origen by insisting that soul and body come simultaneously into being and that embodiment is no product of a previous fall. Nevertheless he makes this critical move with a caution that reveals his sympathy with Origen’s deprecation of the body. Where he corrects Origen most firmly is in the latter’s treatment of human finitude and mutability. For Gregory, mutability, the capacity for unending change, is the characteristic of the human creature that corresponds to divine infinity and incomprehensibility. It is envisaged not primarily as the ever-present possibility of departure from God, but even more as the condition of eternal progress into the infinite Good—Gregory’s definition of salvation.

These theological themes are developed in Gregory’s later ascetic writings (especially in his *Life of Moses* and his fifteen *Homilies on the Song of Songs*) into the beginnings of a mystical doctrine that is closely integrated with his understanding of baptism and the life that it initiates. For him the processes of moral purification and spiritual illumination come to no final end precisely because there is no end to the Good that they seek. They issue, as did Moses’ pilgrimage, in an entrance into “the cloud” that symbolizes divine incomprehensibility and infinity. In Gregory’s spiritual teaching, therefore, there is an anticipation of the path that apophatic mysticism was to take in the writings of Dionysius the Areopagite.

RICHARD A. NORRIS (1987)

**GREGORY OF SINAI** (d. 1347) was an ascetic and mystic canonized by the Eastern Orthodox church. The Greek church commemorates his life on February 11 and the Slavic churches on August 8. Much of the life and writings of this great church father is known from the life composed by his disciple Kallistos I, patriarch of Constantinople.

Born in Asia Minor, Gregory took his monastic vows on Mount Sinai. After travels to Cyprus and Crete he came to Mount Athos. Disturbed to find the holy men of Athos in ignorance of true silence and contemplation, he undertook to instruct both monks and solitaries in the contemplative art. Further travels took him to Constantinople and to Thrace, where he founded monasteries and taught the techniques of mental prayer.

Gregory did not write extensively. Most of his works are concerned with mental prayer and hesychasm, the spiritual life of inner wakefulness. He taught that through obedience, mourning, tears, and the power of pure contemplation the mind is cleansed and led to a vision of the “uncreated light” of God. Spiritual perfection is finally achieved in deification (*theōsis*).

The contemplative art practiced and taught by Gregory is known as “prayer of the heart.” In his *Instructions to Hesychasts* he describes a method whereby the mind is forced to descend from head to heart and is then held in repeated invocation of the name of Jesus Christ. Mental prayer is thus remembrance of God through a pure and imageless contemplation. He urged his disciples to keep their minds “colorless, formless, and imageless” and emphasized the use of such physical aids as rhythmic breathing for attainment of inner stillness. But, because human effort alone cannot accomplish meditative union, he urged that “no one can hold the mind by himself, if it be not held by the Spirit.” As humans work at prayer, the prayer works in them, and the mind rejoices with the presence of the Holy Spirit and is strengthened in its striving for perfection.

#### BIBLIOGRAPHY

- The largest compilation of Gregory’s works is published in English in Eugène Kadloubovsky’s and G. E. H. Palmer’s *Writings from the Philokalia on the Prayer of the Heart* (London, 1951). An excellent account of Gregory’s theology can be found in Kallistos Ware’s “The Jesus Prayer in St. Gregory of Sinai” in *Eastern Churches Review* 4 (1972): 3–22. It includes a complete bibliography. An account of Gregory’s life can be found in John Maximovitch’s “The Life of St. Gregory of Sinai” in *The Orthodox Word* 5 (1969): 165–179.

GEORGE S. BEBIS (1987)

**GREGORY PALAMAS** (1296–1359) was the most important Orthodox theologian of the fourteenth century and one of the greatest theologians in the history of the Orthodox church. Raised in the Byzantine imperial court, he later became a monk and wrote important theological works that refer primarily to the experience of communion with God. He was elected archbishop of Thessalonica and immediately following his death was recognized as a saint of the Orthodox church. Gregory's memory is celebrated twice per year: on November 14, the day of his death, and on the second Sunday of Lent. This second celebration, which serves in effect as an extension of the Sunday of Orthodoxy, reveals the special importance the Orthodox church attaches to his person and teachings.

The works of Gregory Palamas summarize the entire earlier patristic tradition, offering it in a new synthesis that has as its central theme the *theōsis* (deification) of humanity. This *theōsis* is realized through the participation of humankind in the uncreated energies of God. For this reason, the rejection of the uncreated energies of God, which has as a consequence the rejection of the possibility for humankind to achieve *theōsis*, was not considered by Palamas to be merely another typical Christian heresy but rather the summarization of all heresies, and, ultimately, the negation of the God who is revealed in the scriptures and the church.

Gregory was born in 1296 in Constantinople. When he was seven years old he lost his father, Constantine, but he continued to reside in the imperial court in Constantinople under the protection of the emperor Andronicus II Palaeologus. He received a rich education there, particularly in philosophy. Even though the emperor had destined him for high public office, the young Gregory had become increasingly occupied with ascetic practices and noetic prayer, and he eventually chose to enter the monastic life. At the age of twenty, he left with his two younger brothers for the monastic center of Mount Athos. He remained there first with a hesychast in the vicinity of Vatopediou Monastery, then as a member of the *koinobion* (brotherhood) of the great monastery of the Lavra, and finally in the hermitage of Glossia.

In 1325, Turkish incursions compelled him and other monks to leave the Holy Mountain. While on a visit to Thessalonica, he was ordained a priest; he left soon after for Beroea, where he lived for five years at a hermitage outside the city, under even more austere conditions of asceticism. In 1331, Serbian raids became a serious threat, and he was forced to abandon Beroea and return to Mount Athos. Resuming again the hesychast life, he resided for the most part at the hermitage of Saint Sabbas, near the great monastery of the Lavra, except for one year, during which he served as abbot of the monastery of Esphigmenou.

It was at Saint Sabbas that Gregory first was exposed to the antihesychast opinions of Barlaam of Calabria, a monk and philosopher of Greek ancestry from southern Italy. While representing the Orthodox church during preparatory

discussions with papal legates on the question of church union during the years 1333–1334, Barlaam had refuted the *filioque* by invoking the unapproachability and unknowability of God. The agnostic character of Barlaam's theology disturbed many Orthodox theologians, including Gregory. He composed his *Apodictic Treatises concerning the Procession of the Holy Spirit* (1335) without, however, ever referring to Barlaam by name. It was the attack of Barlaam against the ascetic method of the hesychasts that eventually provoked an open rift between him and Gregory. Relying on simplistic and incomplete information concerning the psychosomatic method of prayer used by the hesychasts, Barlaam assailed them in the most severe terms, characterizing them as *omphalopsuchoi* ("men with their souls in their navels") and as Massalians, a heretical group that claimed salvation is obtained only through the power of prayer and not through the sacraments of the church. The defense of the hesychasts was undertaken by Gregory. It was for this purpose that he wrote his famous work *Triads in Defense of the Holy Hesychasts* (c. 1338). The positions taken by Gregory were approved from the beginning by the church. They were sanctioned as well by various synodal decisions, which have a special importance for Orthodoxy.

The first official recognition of Gregory's teachings, with a parallel condemnation of the views of Barlaam, came about through the approval of the *Hagioretic Tome*, which Gregory himself wrote in 1340 and which was signed by representatives of the monasteries of Mount Athos. In June 1341, a council was convened in Constantinople that condemned the positions taken by Barlaam, who confessed his error and finally was compelled to return to the West.

The definitive resolution of the debate was delayed, however, by the untimely death of the emperor, Andronicus III Palaeologus, which occurred immediately following the conclusion of the work of the council and before he had had a chance to sign its decisions. The situation was complicated by the political controversy that soon arose over the question of the imperial succession and that led to a civil war. Thus, a new period of struggle began for Gregory, a struggle that lasted until 1347. His new opponent was Gregory Akindynos. During this period, when the strong man in Constantinople was Patriarch John Calecas, Gregory was banished, imprisoned, and excommunicated from the church (1344), while his adversary Akindynos, who had already been condemned by the church for his views (August 1341), was gradually restored to prominence and even ordained a priest. Calecas's tactic, however, eventually undermined his position. Anne of Savoy, mother of the underage emperor John V Palaeologus, had set Gregory free. A new council, convened at the beginning of 1347, condemned Patriarch Calecas at the same time that the victorious John VI Cantacuzenus was entering the city as coemperor. The patriarchal throne was assumed by the hesychast Isidore, and Gregory was elected archbishop of Thessalonica. However, the zealots, who were occupying Thessalonica and who refused to

recognize the legitimacy of Cantacuzenus, prevented the new bishop from entering his see. Thus, Gregory only formally undertook his pastoral responsibilities at the beginning of 1350, after Cantacuzenus had captured that city as well.

Gregory's first act as archbishop of Thessalonica was to reestablish peace within his flock. In the meantime, he had to contend with a new attack against the hesychasts, this time from the Byzantine humanist Nikephoros Gregoras. A new council, called in Constantinople in 1351, decided once again in favor of Gregory and reconfirmed his teachings, especially those having to do with the distinction between essence and energy in God. In 1354, while traveling to Constantinople, Gregory was captured by the Turks and remained their prisoner for approximately one year in Turkish-occupied areas of Asia Minor. There he had the opportunity to come into contact with local Christian communities, as well as to converse with Muslim theologians. After the payment of a ransom, he was set free by the Turks. While passing through Constantinople, he held public debates with Nikephoros Gregoras, against whom he also composed several new treatises. In 1355 he returned to Thessalonica, where he continued his pastoral work. He died on November 14, 1359.

Gregory left numerous writings, which are preserved in many manuscript codices. For the most part, these have been published. His dogmatic and apologetic writings include the *Apodictic Treatises*, in which Gregory propounds his compromise with the Latin teaching on the *filioque* by stating that the Holy Spirit, who proceeds eternally from the Father, is poured out on the faithful also from the Son. In his *Triads* he discusses the value of secular studies, various aspects of prayer (including the participation of the human body in prayer and the vision of the uncreated light), and the impossibility of participation in the imparticipable essence of God. Finally, the *Hagioretic Tome* presents God's unfolding revelation and the need for obedience to the saints who have had the experience of the mystical energies of the Holy Spirit.

Gregory's writings on the spiritual life include *The Life of Peter the Athonite* (1334); *One Hundred and Fifty Physical, Theological, Moral and Practical Chapters* (1347), in which basic dogmatic, anthropological, moral, and ascetic themes are presented; *To Xenii* (1345), which analyzes the anthropological and theological presuppositions of the spiritual life; and *Exposition of the Decalogue*, a synopsis of Christian morality. Most of the sixty-three homilies of Gregory that have survived were preached during his tenure as archbishop of Thessalonica. These sermons help to reveal the multifaceted personality of Gregory—his lively interest in the spiritual uplifting of his flock, as well as his concern for peace, social justice, and the everyday problems of the faithful. Some of these homilies, such as the sixteenth and the fifty-third, are complete theological treatises. Most of his letters have been preserved, as well as numerous other theological treatises.

The theology of Gregory has an empirical character. The prophets, the apostles, and the fathers of the church

based their theology on the experience of the revelation of God within history. However, true theology is also organically combined with the vision of God; it is the fruit and expression of this vision.

The vision of God is possible because God, who is unapproachable and imparticipable according to his essence, becomes accessible to human beings through his uncreated grace or energy. To have the vision of God, a person must cleanse his or her heart from the stain of sin. Before the incarnation of Christ, the uncreated grace of God illumined the just from without. After the incarnation, God is united to humankind through the sacrament of the Eucharist and is manifested as light within one's inner being—provided that the person has tried, through prayerful contemplation, to collect his or her Nous (intellect), which is usually distracted by the things of this world, and to cleanse it from sin. This interpretation of the theory of the uncreated light can be found not only among the hesychast monks, but, more generally, in the teaching of the Orthodox church regarding the renewal and *theōsis* (deification) of humanity. By participating in the uncreated grace or energy of God, humankind becomes itself a god by grace. The experience of *theōsis* begins already in this life and is fulfilled in the kingdom of God. Christ, who is the Son of God become man and who came into the world as the brother of all human beings, is at the same time also the father of all in the faith, who leads them into the eternal and everlasting glory of the kingdom of God: "for in the glory of the Father, Christ is come, and in the glory of their Father Christ, the righteous shine as the sun and will become light and see light, the pleasing and all-holy vision which is only accessible to the purified heart" (Christou, ed., vol. 1, p. 599).

The influence of the theology of Gregory on Eastern Orthodoxy remains historically important. His tradition of theology served as the best source of counsel for the life of the Orthodox during the dark period of Turkish domination. His teaching, as well as the hesychast tradition, was propagated not only within the bounds of the Byzantine Empire but also throughout the entire Orthodox world, giving new inspiration to ascetic and ecclesiastical life. The basic principles of Palamite theology, revived in the early twentieth century by the publication of more of his works as well as numerous studies, has become the starting point for the renewal of Orthodox theology and spiritual life, which, during recent centuries, has sustained intense influence from the West.

GEORGIOS I. MANTZARIS (1987)  
Translated from Greek by Christopher H. Bender

**GREGORY THE ILLUMINATOR** was the chief bishop of Armenia from circa 314 to 325, one of the major saints of the Armenian church, and author of the conversion of the Armenian people to Christianity. Information about him derives mainly from two fifth-century sources, Agathangelos's *History of the Armenians* and the Greek *Life of Gregory*.

According to Agathangelos's legendary account, Gregory was the son of the Parthian prince Anak who killed his kinsman King Khosrov of Armenia. The Armenians retaliated by killing Anak's family, Gregory being the sole survivor. He was taken to Caesarea Mazaca (modern Kayseri, Turkey), where he was raised a Christian. There he married a Christian woman with whom he had two sons. He entered the service of King Tiridates III of Armenia (298–330), accompanying him to Greater Armenia in 298 when the Romans restored the king to the throne of his ancestors. Gregory's refusal to offer sacrifice to the idol of the goddess Anahita provoked the king to torture him and condemn him to imprisonment in the Khor Virap ("deep pit") of Artashat. There Gregory miraculously survived for thirteen years until he was released to cure the king of a severe ailment. Succeeding in his mission, Gregory converted the king, the royal family, and the army, and set out to proselytize the Armenian nation. He destroyed six major shrines of the prevailing deities of ancient Armenia, erected crosses throughout the country, and built baldachins over the graves of the forty Christian virgins martyred by Tiridates III.

About 314 Gregory received episcopal ordination in Caesarea. Returning to Armenia, he destroyed the pagan shrine at Ashtishat and founded the first church in Armenia. Tradition reports that he baptized the entire Armenian nation in the waters of the Arsenias River, built several churches, founded monasteries, and ordained bishops. Finally, after handing over his episcopal duties to his younger son, Aristakes, he retired to a solitary life. The office of the chief bishop of Armenia became intermittently hereditary in his family until 439. The cult of Gregory and the veneration of his relics became popular in the second half of the fifth and especially in the sixth and seventh centuries.

The Armenian tradition ascribes to Gregory the authorship of canons, a book of homilies (the *Yachakhapatum*), and the liturgical books that are used in the Armenian church. Modern scholarship, however, has shown that none of these works could have been composed before the fifth century.

KRIKOR H. MAKSOUDIAN (1987)

**GRIAULE, MARCEL.** Marcel Griaule (1898–1956) was a pioneer of French ethnographic research in Africa, an emblematic figure of French ethnography, and a catalyst to the emerging discipline's professionalization. After serving in World War I as an air force pilot, he obtained a degree in living Oriental languages (Amharic and Gueze) before studying with sociologist Marcel Mauss. Griaule was among the first ethnographers trained by the Institute of Ethnology at the Sorbonne, and his career paralleled every stage of the discipline's development. An energetic promoter of innovative technological aids, Griaule introduced the ethnographic film. He also founded the Société des Africanistes and its journal. In 1942, he was named the first chair of ethnology at the University of Paris. Like the discipline itself, Griaule's career took progressive distance from colonial interests. As an advisor to the French Union and the president of France's Commission on Cultural Affairs, Griaule championed respect for African culture and criticized the politics of cultural assimilation.

In the first ten years of his career, Griaule led the principal French ethnographic expeditions to Africa. His first expedition was a year-long mission to Ethiopia in 1928, but his most celebrated journey was the Dakar-Djibouti mission. Over twenty-one months (1931–1933), it traversed sub-Saharan Africa from the Atlantic to the Red Sea. Enthusiastically followed by the French press, the mission also forged links with the literary and artistic avant-garde. Griaule gathered an imposing ethnographic harvest—more than 3,600 objects to enrich the holdings of the Trocadéro Museum, plus thousands of photographs, films, and recordings.

During this mission Griaule encountered the Dogon at the bend of the Niger River. Favoring intensive study of individual societies, Griaule and his colleagues subsequently made regular expeditions to pursue research on Dogon culture as a team. A sense of urgency to archive and safeguard

disappearing cultures provoked a method of collaborative interdisciplinary investigation. Teamwork provided multiple accounts of an event for analysis, and also enabled the same cultural phenomenon to be considered from various frames of expertise, a factor Griaule termed “plural observation.” Splicing observations into a “synoptic account” verified by informants, the method purportedly reconstructed a “typical” instance, purged of modifications that would destroy what Griaule called “its ideal harmony” (Jolly, 2001, p. 164). Griaule progressively extended his team to include “native collaborators,” whom he described as “precious auxiliary.” The project, beginning in 1935 and spanning five decades, made the Dogon one of the best-known societies on the continent.

In the initial period of his career, Griaule avoided infusing explanation into data, and he approached the ethnographic object as the only reliable “witness” to a society’s meanings. Minute documentation characterized his doctoral thesis, which produced two outstanding works, a study of masks, *Masques dogons* (1938), and games, *Jeux dogons* (1938).

Deprived of the opportunity for fieldwork for six years during World War II, Griaule elaborated his theory of mythology as an “ordered system” reflected in social organization. His return to Africa in 1946 reinforced this shift. At the behest of Dogon elders, a blind old sage, Ogotemméli, was charged with revealing to Griaule a deeper, esoteric level of mythological knowledge, reserved for initiates. This post-war phase of Griaule’s career was therefore governed by dialogue and a new conception of the ethnographic inquiry as initiation. Griaule focused his research on the complex cosmogony Ogotemméli expounded, asserting it amounted to “a metaphysic, a religion that puts them on the same level as the peoples of Antiquity.”

Presented as a daily chronicle of the old man’s revelations in an accessible style, Griaule’s account, *Dieu d’eau* (1948), translated as *Conversations with Ogotemméli*, became a bestseller. Foreshadowing a postmodern self-consciousness, Griaule injected himself into the narrative as “the European,” “the Stranger,” and “the Nazarene.” This literary device suggests a frank acknowledgment of roles ascribed to him in the ethnographic situation. Nevertheless, of Griaule’s 170 publications, it is the most contested. The book’s critics contend that it amounts to unrepresentative theological speculations or mythopoetic invention (Goody, 1967).

After Griaule’s untimely death in 1956, his close associate, Germaine Dieterlen, furthered work on Dogon myth and religion, publishing under both their names the monumental synthesis of cosmology, *Le renard pâle* (1965).

The work of Marcel Griaule and his followers is “one of the classic achievements of twentieth-century ethnography,” self-conscious about method and unparalleled in its comprehensive detail (Clifford, 1983, p. 124). However, Griaule’s oeuvre has come under sharp scrutiny since the

1960s, criticized for essentializing cultural patterns and privileging a romanticized past over a historically conditioned present. A constant refrain of Griaule’s detractors is that he reified “the Dogon.”

British anthropologists were especially skeptical of Griaule’s reliance on translators and select informants; they charge that he neglected case histories and details of daily existence in favor of metaphysics, which presents a “too perfectly ordered vision of Dogon reality” (Richards, 1967; Douglas, 1967; Goody, 1967). Dutch anthropologist Walter van Beek (1991) continued the polemic, attempting to debunk Griaule’s fieldwork with his own contemporary data; however, van Beek’s own lack of accountability weakened his verdict. James Clifford explored the complex role played by a group of influential Dogon in the evolution of Griaule’s work with greater sophistication, concluding that Griaule’s writings “express a Dogon truth, a complex, negotiated, historically contingent truth specific to certain relations of textual production” (1983, p. 125).

That the Dogon celebrated exceptional funerary rites in Griaule’s honor proves the degree to which they held the researcher in esteem, recognizing him as one of their own.

LAURA S. GRILLO (2005)

**GRIMM BROTHERS.** Jakob Ludwig Karl Grimm (1785–1863) and his brother Wilhelm Karl (1786–1859) were born in Hanau, Germany, where their father was town clerk and later *Amtmann* (local administrator). Their happy childhood ended with his death in 1796; thereafter they had a constant struggle against poverty, with several younger children to support. The brothers worked in close harmony all their lives, and their researches into early Germanic language, literature, antiquities, and religion formed the basis for future studies in these fields.

At the university in Marburg the brothers became interested in medieval literature. The family moved to Kassel, and Jakob worked as a clerk in the War Office and later as secretary to the legation in the war against Napoleon. Finally both brothers were employed in the library of the elector of Hanover. From about 1806 they were collecting popular tales and encouraging their friends to do so, believing that this material, never previously taken seriously by scholars, was essential for the study of Germanic mythology. The first volume of *Kinder- und Hausmärchen* (Household and children's tales) appeared in 1812. The brothers worked unceasingly, reading manuscripts, recording oral material, and continually exploring new fields. They published poems from the Icelandic Eddas, corresponded with Walter Scott (with whom they compared Scottish and Danish ballads), and worked on runic inscriptions and Slavic languages. In 1816 and 1818 they brought out *Deutsche Sagen* (German legends) taken from printed and oral sources. Jakob concentrated on philology and early law, publishing *Deutsche Grammatik* (German grammar) in 1819 and *Deutsche Rechtsaltertümer* (German legal antiquities) in 1828. Wilhelm worked mainly on medieval German literature and the heroic epics, and brought out *Die deutschen Heldensagen* (The German heroic sagas) in 1829.

At first they refused teaching posts, but unsympathetic treatment by the elector forced Jakob to become professor of philology at Göttingen in 1830; Wilhelm joined him there and proved a brilliant lecturer. Wilhelm married Dorothea Wild in 1825; it was a happy marriage, and Jakob continued to live with his brother and sister-in-law. In 1835

Jakob published *Deutsche Mythologie* (Germanic mythology), which established the link between German and Scandinavian myth and led to a new interest in Germanic antiquity throughout Europe. Many English students came to Göttingen, among them the Anglo-Saxon scholar John Kemble. However, once more the brothers had to leave when the reactionary duke of Cumberland became king of Hanover.

They were invited to work in Saxony on a comprehensive dictionary of the German language, and when the liberal Friedrich Wilhelm became king of Prussia in 1840 he persuaded them to move to Berlin, to live in financial security and lecture at the university and the academy. This meant a great change in their lives, but a happy one, and both brothers worked indefatigably until the end, Jakob surviving Wilhelm by four years. By their lives of devoted scholarship they made a major contribution to the serious study of folk tales and comparative mythology, and showed how language could be studied scientifically as a means of exploring humankind's early religious beliefs.

*Revised Bibliography*

**GROOT, J. J. M. DE** (1854–1921), Dutch Sinologist and ethnographer. Born in Schiedam, Holland, Johannes Jacobus Maria de Groot enrolled in the polytechnic school at Delft in 1872. He subsequently studied Chinese with Gustave Schlegel at the University of Leiden.

In 1876 de Groot went to Amoy (present-day Xiamen, China) to continue his study of Chinese, and his stay in Amoy led to the publication of his first book, *Les fêtes annuellement célébrées à Emoui (Amoy): Étude concernant la religion populaire des Chinois* (translated from Dutch into French by Édouard Chavannes and published in 1886). From 1878 to

1883 de Groot traveled through Java and Borneo working as a Chinese interpreter. De Groot returned to Holland in 1883, but was likely working for the government of the Dutch East Indian Colonies since 1878, and in their employ he returned to China and lived there from 1886 to 1890, collecting the data later published in six volumes as *The Religious System of China: Its Ancient Forms, Evolution, History and Present Aspect; Manners, Customs and Social Institutions Connected Therewith* (1892–1910).

De Groot was appointed professor of ethnography at the University of Leiden in 1891. In 1904 he succeeded his mentor Schlegel as professor of Chinese, and in 1912 he assumed the chair of professor of Chinese at the University of Berlin.

De Groot was made a corresponding member of the Netherlands Royal Academy of Sciences in 1887 and a full member in 1891. His election to membership in the Dutch Society of Literature came in 1893. In 1894 de Groot shared the prestigious Stanislas Julien Prize with Édouard Chavannes. He was named *correspondant de l'institut* by the French Académie des Inscriptions et Belles-Lettres in 1908. In 1910–1911 de Groot came to the United States to deliver the American Lectures on the History of Religions, a traveling lecture series, and at that time was awarded an honorary doctorate by Princeton University. In 1918 the kaiser presented him with the Service Cross for his help during World War I.

De Groot's two most important works are *The Religious System of China* and *Religion in China: Universalism, a Key to the Study of Taoism and Confucianism* (1912; a revised and enlarged edition appeared in German in 1918), which is the published form of the lectures delivered in the United States in 1910–1911. The former is a detailed description of the funeral customs of the Chinese and of their ideas concerning the soul. It remains an important source of information on funeral rites, ancestor worship, geomancy (*feng-shui*), exorcism, and possession. In *Religion in China: Universalism*, de Groot argues that worship of the universe and its ways, its fluctuations between yin and yang, constitutes the root religion of the Chinese, from which Confucianism, Daoism, and Buddhism developed as three branches from a common stem. When Confucianism assumed the dominant position during the Han dynasty, it failed to develop as a religion and prevented religious growth of Daoism and Buddhism as well.

#### BIBLIOGRAPHY

Besides those mentioned in the text, other works by de Groot include *Le code du Mahâyâna en Chine: Son influence sur la vie monacale et sur la monde laïque* (Amsterdam, 1893); *Sectarianism and Religious Persecution in China: A Page in the History of Religions*, 2 vols. (Amsterdam, 1903–1904); and *The Religion of the Chinese* (New York, 1910). *Le code du Mahâyâna* includes a translation of *Fo-shuo fan-wang ching* (The sūtra of Brahma's net preached by the Buddha). In *Sectarianism and Religious Persecution*, de Groot draws attention to the genuinely religious nature of rebel sects in the Qing.

ROBERT G. HENRICKS (1987)

**GROTIUS, HUGO** (1583–1645), or Huigh de Groot, was a Dutch lawyer, diplomat, historian, poet, philologist, and theologian. Grotius was born at Delft on April 10, 1583, into a socially and politically influential family. Following three years at the University at Leiden and a brief period accompanying a diplomatic embassy to Paris, he returned to Holland at the age of sixteen to become an advocate at the courts of the Hague. In 1607 Grotius was appointed to the office of Advocate-Fiscal (attorney general) of Holland. He married Maria van Reigersberch in 1608.

As a result of an association with the Dutch East India Company, Grotius wrote his first major legal treatise, *De jure praedae* (On the law of prize, 1604–1605), which presents a theory of natural law based on divine will. In 1625 he published his most important book, *De jure belli ac pacis* (On the law of war and peace), in which he again pursued the topic of natural law and its role in international relations. Here Grotius reveals his concern for the lack of restraint in waging war in the Christian world. He examines the theoretical justification for war and the rules that govern the actual waging of war. He then distinguishes natural law (identical with the law of God but knowable apart from divine revelation) from the voluntary laws of nations that exist between civil communities. Both these types of law he finds binding in relations between states. In the case of a conflict between natural and voluntary law, the law of nature should prevail, although the application of this principle is qualified. In addition to delineating the conditions of waging a just war, Grotius also advocates *temperamenta*, or mitigations, in the conduct of war. To avoid unnecessary suffering, he counsels communities to circumscribe their tactics in keeping with the perfect law of Christ, which, though itself not a basis of law, provides an ideal.

Grotius was also involved in the religious affairs of his day and strongly committed to the cause of Protestant unity. In his 1612 correspondence with Isaac Casaubon at the court of James I of England, he advocated a synod of Protestant churches in order to establish a common confession of faith that would protect against the development of heresy in the individual churches, help them present a united front against any papal aggressions, and yet allow moderate Roman Catholics to see their integrity. Grotius's hopes for such a meeting were, however, disappointed, in part because he was already involved in a heated religious and political controversy. He represented the States of Holland in a conflict that began with the appointment of a professor of theology and escalated into a major battle between church and state and between the local and the central governments within the Republic of the United Netherlands.

After Prince Maurits came to power Grotius was sentenced to life imprisonment (May 18, 1619). While in prison he wrote *Introduction to the Jurisprudence of Holland, Annotations of the Gospels*, and *On the Truth of the Christian Religion*, an apologetic work in which he attempts to prove the truth of the Christian faith based on reason and the testi-

many of works outside the Christian tradition. On March 22, 1621, his wife Maria contrived to smuggle Grotius out of prison in a chest used to transport books, and he fled to Paris. Grotius subsequently held various diplomatic and legal positions including the office of Swedish ambassador to France. In March of 1645, he was permitted to visit Rotterdam and Amsterdam on his way from Paris to Stockholm. On August 28 of that same year Grotius died while traveling from Stockholm to Lübeck.

#### BIBLIOGRAPHY

Printed editions of Grotius's works are listed in Jacob ter Meulen and P. J. J. Diermanse's *Bibliographie des écrits imprimés de Hugo Grotius* (The Hague, 1950). No complete critical edition of Grotius's works exists. For commentary on the state of Grotius scholarship, see Christian Gellinek's *Pax optima rerum: Friedensessays zu Grotius und Goethe* (New York, 1984), pp. 93–101.

For introductions to Grotius's thought and influence, see Charles S. Edwards's *Hugo Grotius: The Miracle of Holland, A Study in Political and Legal Thought* (Chicago, 1981), Peter Haggemacher's *Grotius et la doctrine de la guerre juste* (Paris, 1983), and Hamilton Vreeland, Jr.'s *Hugo Grotius: The Father of the Modern Science of International Law* (New York, 1917).

ANNE CLARKE (1987)

**GRUNDTVIG, NIKOLAI FREDERIK SEVERIN.** Nikolai Frederik Severin Grundtvig (1783–1872) was an influential Danish theologian, philosopher, historian, educationist, and writer. Each of his writings expresses one of his numerous professional voices, centered in his own heart. His childhood, the often turbulent course of his life, and his relationships with women, men, children, and diverse contemporary groups are all reflected in his authorial voices. His life was inseparably linked with the natural landscape, geography, and cultural milieu of Denmark-Norway, which he viewed from the perspective of a distinctive historical and universal consciousness. Grundtvig was founder of much that in the spheres of church, “folk,” and politics is today perceived as characteristically Danish.

**BIOGRAPHY.** Born into a clerical family in Udby in eastern Denmark, Grundtvig was influenced by his upbringing in an orthodox Lutheran, pietistic parsonage. However, his theological studies (1800–1803) led him eventually to a rationalistic theistic faith. When working as a private tutor on the Egeløkke estate on the island of Langeland, he fell in love with a married woman, and this experience of the challenging power of love created a new crisis, leading to a romantic awakening. Through this experience his interest in Nordic mythology and romanticism was created and confirmed. From 1808 to 1811 he worked as a secondary school teacher in Copenhagen, where he went through another crisis of faith. This led him back to his roots, both theologically and physically, insofar as he accepted in 1811 his father's wish

to be an assistant pastor in Udby. But in 1813 he went back to Copenhagen, where he lived from 1816 to 1821 exclusively as a writer. From 1821 onwards he worked as a priest and discovered his own theological foundation, expressed as a “peerless discovery.” He realized that the foundation of the church is not the Bible but the living Christ himself, present in a living, historical tradition, with baptism and the Eucharist as sacramental signs of his presence. His pamphlet *Kirkens gienmæle* (The church's retort), directed against Henrik Nikolai Clausen, a theologian at the University of Copenhagen, gives strong expression to this fundamental approach. But he was censured for this work and had to become a freelance writer.

Grundtvig made four trips to England (three between 1829 and 1831). English literature (*Beowulf*, *Exeter Book*, etc.) and the nation's mentality made a considerable impression on him. After 1832 his censure was lifted, and in 1839 he agreed to become a pastor at the Spital Church at Vartov in Copenhagen. From 1848 to 1858 he was also a member of Parliament. Grundtvig had a close relationship to Norway, and for some time he considered emigrating there. Norway had been a part of Denmark during large parts of its history, but in 1814 Norway separated from Denmark, a political development that Grundtvig deeply regretted.

Grundtvig was married three times and the father of five children. Until his death in 1872 he went on writing. One of his last poems, *Gammel nok jeg nu er blevet* (Long enough now has my life run, 1872), stands as a permanent sign of his way of living through writing and of writing his whole life into his work.

**GRUNDTVIG'S THEOLOGY OF THE HEART'S DIFFERENT VOICES.** With extraordinary symbolic power, Grundtvig recreated in his writings a traditional concept of heart-rhetoric, closely connected with the dynamic theological concept of the Christian idea of “the Living Word.” “Heart” refers to all thinkable levels and subjects within his wide-ranging engagements, where diverse voices express themselves and demand new expressions, mediated through his texts.

Grundtvig belongs inseparably within the nineteenth-century Romantic period, yet he also stands in contrast to romanticism, pointing both backwards and forwards in time. This is apparent not least in his anthropology. For him, the human being is a divine experiment. His religious philosophy is characterized by a poetic micro/macro pattern of thinking, with humankind at the center, created in God's image, in a heart-relationship with God, created and creative. Human existence is therefore a graced condition, and life amid God's material creation is a time not of religious penance as the way to Christ but of creative fulfillment of God-granted human potential: *Menneske først, kristen så*, “first a human being, then a Christian.”

In his philosophy of history, as expressed, for example, in *Christenhedens Syvstjerne* (The seven stars [or pleiades] of Christendom) (1860) and *Sang-Værk til den Danske Kirke*

(Song-work [or carillon] for the Danish church) (1836–1837), we find in coded form those historical-cultural voices out of which he constructs his narratives concerning the past. He speaks of a cultural and religious community of tongues in interactive entities (*Sangskoler*, “song-schools”), which between them chart the historical progress of Christendom. They proceed like a chorus of voices: the Hebrew “song-school,” the Greek, the Roman, the Anglo-Saxon, the German, the Nordic, and—the seventh and last—the future, or the “unknown,” which Grundtvig may have expected to be the Indian voice from Asia. A chief warranty of each of these voices is that they articulate themselves in the true language of the heart, the local mother tongue.

Grundtvig’s concept of love gathers all his thinking into one domain. He perceived love as the center of all life that is lived, its wellspring, way, meaning, and goal. In some fifteen hundred hymns he interpreted and renewed the Nordic-European ecumenical hymn rhetoric in order to mediate his existentialist-nuanced philosophy of love. He developed in new directions the metaphorical, gendered mode of expressing the divine, with special focus upon the relationship with God, in a comprehensive relationship discourse. The human being in the world is a loving and loved microcosm. Language, gender, body, continuity, process, and metamorphosis—all have a central place in the hymn rhetoric, in which he gave fresh currency to the spiritualized erotic and to erotic spirituality without ignoring the hazard of sexism. As one of the most frequently used words in his hymns, *heart* embodies both the center and wellspring of the human body and of the written texts.

In his liturgy-shaping hymn texts, Grundtvig’s gendered language of the human relationship with God comes fully into its own. He envisages the relationship with God in three main models of a dialogue modulated by the heart: the relationships between parent and child, between friends, and between lovers. This entails his construing the Trinity in different ways, to mirror human life as truly and flexibly as possible, characterized not only by multiple relational models but by androgynous conceptual models and by reciprocity as an ideal.

With the creative principle as his primary category, he re-created and renewed the European hymn tradition in a comprehensive gift rhetoric. The individual praising God in psalmody is, in Grundtvig’s linguistic-philosophical and intertextual hymn rhetoric, a representative microcosm that mirrors the macrocosm. We also meet representations of “The Daughter of God” equivalent to “The Son of God” within his experimental concept of the Trinity. In an 1870 sermon he argued—with the help of his evolved classical, gendered rhetoric of “the heart”—for women priests. A crucial point in his argument is that the absence of thoughts and feelings, germane to women and springing from the heart, harms the church at the core of its own heart.

**THE CONTRIBUTION OF HIS HYMNS.** Grundtvig’s hymns have exercised a wide, profound influence in Denmark and

beyond, notably in Norway, where they are reckoned as the country’s own cultural treasure, together with the legacy of two other great Danish hymn writers, Thomas Kingo (1634–1703, orthodoxy) and Hans Adolf Brorson (1694–1764, pietism). In the Danish *Hymnal*, Grundtvig is represented by over 250 original and reworked hymns; in the Norwegian *Hymnal*, by more than 40. The Danish hymn tradition stands in direct descent from Martin Luther’s musical-poetical hymn project used as a medium of reformation in the 1500s. The vital, musical, and ecstatic word, in glorification of the life force and in protection against the power of death, is the primary impulse in Grundtvig’s contribution to this Protestant and popular aesthetic.

**LASTING INFLUENCE AND SIGNIFICANCE.** Through his countless textual voices and his cultural, political, educational, and church activities, Grundtvig wrote himself into Danish history with a distinctive Nordic, European, and universal rhetoric. He has exercised an enormous influence on Scandinavian liturgical practice, theology, and education. In the present time, his influence on educational matters has also increased outside Scandinavia through the so-called Grundtvig Initiative, which is part of the European Union’s adult educational initiative and represents a concept that, in the modern search for popular models of social participation in a global context, has gained a substantial international foothold.

## BIBLIOGRAPHY

### Primary Sources

Grundtvig’s works are available in English in *Selected Writings*, translated by J. Knudsen (Philadelphia, 1976). In Danish, the standard text is *N. F. S. Grundtvigs Udvalgte Skrifter*, 10 vols., edited by H. Begtrup (Copenhagen, 1904–1909). Among Grundtvig’s overwhelmingly abundant output, the following represent the rich diversity of his textual voices. In 1812–1814 the philosopher-historian was active with his revised edition of *Kort Begreb af Verdens Krønike, betragtet i Sammenhang* (Concise view of world-chronicle, considered in context). Between 1833 and 1843 his historical universal voice was again heard through his three-volume *Haandbog i Verdens-Historien* (Handbook on world history). In 1816–1819 we see the philosopher of religion, literary critic, and antiquarian in his periodical *Danne-Virke*. In 1824 he wrote *Nyaars-Morgen* (New-year’s morning), which displays and gives promise of the poet and self-symbolist. In *Kirkens Gienmale* (The church’s retort; 1825), following his “peerless discovery,” he identifies himself as fierce defender of the unity, antiquity, and authority of the church. *Nordens Mythologi eller Sind-billed Sprog* (Mythology of the north, or the language of myth), displaying Grundtvig the mythologist, came out in 1832. The shaper of liturgy reveals himself in the first volume of *Sang-Værk til den Danske Kirke* (Song-work [or carillon] for the Danish church; 1837). The educationist is represented in the text *Skolen for Livet og Akademiet i Soer* (School for life and the academy at Sorø; 1838). In *Den*

*christelige Børnelærdom* (Christian instruction for children; 1868), the mature theologian declares himself. The church-historical visionary poet reveals himself most clearly in *Christenhedens Syvstjerne* (The seven stars [or pleiades] of Christendom; 1860). The philosophy of history that permeates this work is the same as that forming the foundation of the structure and strategy of *Sang-Værk til den Danske Kirke*. Finally, the confessional Grundtvig speaks through many sermons, for example in the three-volume collection *Christelige Prædikener eller Søndags-Bog* (Christian sermons, or the Sunday book; 1827–1830).

### Secondary Sources

Since 1963 Grundtvig scholarship has been dominated by the work of Kaj Thaning, principally his three-volume *Menneske først—Grundtvigs opgør med sig selv* (First a human—Grundtvig's battle with himself; Copenhagen, 1963), but current scholarship increasingly dissents from Thaning's interpretation. Leading works on Grundtvig's educational ideas and on Grundtvig as poet in the early nineteenth-century context are, respectively, K. E. Bugge's *Skolen for Livet. Studier over N. F. S. Grundtvigs pædagogiske tanker* (School for life: studies in N. F. S. Grundtvig's pedagogic thinking; Copenhagen, 1965), and Flemming Lundgreen-Nielsen's *Det handlende ord. N. F. S. Grundtvigs digtning, litteratur-kritik og poetik, 1798–1819* (The operative word: N. F. S. Grundtvig's authorship, literary criticism and poetics, 1798–1819; Copenhagen, 1980).

Studies in English include Christian Thodberg et al., eds., *N. F. S. Grundtvig: Tradition and Renewal* (Copenhagen, 1983); Steven M. Borish, *The Land of the Living: The Danish Folk High Schools and Denmark's Non-violent Path to Modernization* (Nevada City, Calif., 1991); A. M. Allchin et al., eds., *Heritage and Prophecy: Grundtvig and the English-Speaking World* (Aarhus, 1993); A. M. Allchin, *N. F. S. Grundtvig: An Introduction to His Life and Work* (Aarhus, 1997); and A. M. Allchin et al., eds., *Grundtvig in International Perspective: Studies in the Creativity of Interaction* (Aarhus, 2000).

SYNNØVE HEGGEM (2005)

**GUÉNON, RENÉ** (1886–1951), French traditionalist, metaphysician, and scholar of religions. René Guénon was born in Blois, the son of an architect. He carried out his early studies in his place of birth and went to Paris in 1904 where he pursued the field of mathematics and then philosophy, which he was later to teach. During his youth, Guénon was attracted to various occultist circles and to Freemasonry; he entered several of these orders, including the Hermetic Ordre Martiniste and the Église Gnostique. As a member of this “gnostic church” he adopted the name of Palingenius (under which he wrote several articles in the review *La gnose*) and encountered Léon Champrenaud (who had been initiated into Sufism under the name of Abdul-Haqq) and Albert de Pounourville (who had received Daoist initiation and was known as Matgioi).

Guénon left Parisian occultist circles as he became more and more aware of Eastern doctrines. In 1912 he embraced

Islam, receiving through Abdul-Hadi, a Swedish initiate, initiation and the blessing of the Egyptian Sūfī master Shaykh ʿAbd al-Raḥmān ʿIllaysh al-Kabīr. Guénon continued, however, to be deeply involved in the intellectual life of Paris, encountering such well-known figures as Jacques Maritain, René Grousset, and others; in 1921 he published his first book, *Introduction générale à l'étude des doctrines hindoues*, a work originally prepared as a doctoral thesis at the Sorbonne, a work that marked a major turning point in the study of Eastern doctrines in the West.

In 1930 after the death of his French wife, Guénon set out for Egypt. He spent the rest of his days in Cairo living as a Muslim and was known as Shaykh ʿAbd al-Wāḥid Yahyā. There he was to take an Egyptian wife, by whom he had two daughters and two sons. He associated closely with certain eminent Muslim authorities of Egypt, such as Shaykh ʿAbd al-Ḥalīm Maḥmūd, later to become Shaykh al-Azhar. Guénon also carried out extensive correspondence with scholars and traditional authorities throughout the world, including Ananda K. Coomaraswamy, Marco Pallis, Leopold Ziegler, Giulio Evola, and Titus Burckhardt. He was also visited by many Westerners in search of traditional teachings and by some of those in the West who, like him, were seeking to revive tradition. Foremost among the latter group was Frithjof Schuon, who visited Guénon twice in Cairo and who corresponded with him until the end of Guénon's life. During the night of January 7, 1951, Guénon died after a period of illness and was buried according to Islamic rites in a cemetery outside of Cairo.

While in Cairo, Guénon continued the incredibly fruitful intellectual life that he had begun in France, and numerous books, articles, and reviews continued to flow from his pen. The articles appeared mostly in the journal *Le Voile d'Isis*, which changed its name to *Les études traditionnelles*. The writings of Guénon include some twenty-nine books and some five hundred articles and reviews ranging over the domains of religion, metaphysics, the traditional sciences, sacred art and symbolism, occultism and esotericism, and the criticism of the modern world.

The monumental corpus of the writings of Guénon can be classified into several categories, though because of the traditional nature of his thought there is an interrelation among his various books. The *Introduction générale à l'étude des doctrines hindoues* was not simply his first work to be published; it also serves as a general introduction to all the major themes of his writings including his exposition of tradition, his criticism of the modern world, and his discussion of Eastern doctrines based upon the purely metaphysical aspects of their teachings.

A number of books by Guénon are devoted more specifically to the criticism of the modern world and to the discussion of the significance of Eastern traditions in the process of rediscovery of tradition in the West. They include *Orient et occident* (1924), *La crise du monde moderne* (1927), and *La regne de la quantité et les signes des temps* (1945). A group of

his books turn to the study of initiation and esotericism as well as the criticism of occultism and “spiritualism” as distortions and caricatures of authentic esoterism. These include *Aperçus sur l’initiation* (1946), *Le théosophisme: Histoire d’une pseudo-religion* (1921), *L’erreur spirite* (1923), and *Initiation et réalisation spirituelle* (1952). The works of Guénon dealing with metaphysics and Eastern doctrines include *L’homme et son devenir selon le Védānta* (1925), *La métaphysique orientale* (1939), *Le symbolisme de la croix* (1931), *Les états multiple de l’Être* (1932), and posthumous collections of articles such as *Études sur l’hindouisme* (1968) and *Aperçus sur l’ésotérisme islamique et le taoïsme* (1973). Guénon also wrote a number of major works on the traditional and modern sciences from the traditional point of view, such as *La grande triade* (1946), *Les principes du calcul infinitésimal* (1946), and the posthumous collections of essays, *Symboles fondamentaux de la science sacré* (1962) and *Formes traditionnelles et cycles cosmiques* (1970). Furthermore, Guénon dealt with the social and political dimensions of tradition, devoting many essays as well as his books *Autorité spirituelle et pouvoir temporel* (1929) and *Le roi du monde* (1927) to this subject. The latter work, dealing with the supreme center of tradition in this world, has remained Guénon’s most enigmatic and controversial book for later traditionalist thinkers.

In treating various traditions Guénon concentrated most of all upon the East, dealing especially with Hinduism, Daoism, and Islam (though hardly at all with Buddhism, whose traditional character he did not confirm until later in his life). But Guénon did also concern himself with the Christian tradition although not orthodoxy, devoting such works as *Aperçus sur l’ésotérisme chrétien* (1954), *L’ésotérisme de Dante* (1925), and *Saint Bernard* (1929) to specifically Christian themes. Guénon, however, identified Christian esoterism mostly with the hermetic and other esoteric currents that became integrated into the Christian tradition rather than with the Christ-given initiation at the heart of Christian rites.

Guénon’s influence continues to expand as the decades go by. His works are marked by emphasis upon tradition, universality, orthodoxy, and essentiality. Guénon appeared suddenly on the intellectual stage of Europe and sought to sweep aside with an unprecedented intellectual rigor and an iconoclastic zeal all the “isms” prevalent in modern thought ranging from rationalism to existentialism. To present the truth of tradition, he believed, he had to clear away completely all those conceptual schemes that have cluttered the mind of Western scholars the end of the Middle Ages and that have prevented them from understanding the perennial truths of tradition. Against the relativism of the day, Guénon understood these truths as principles of a divine and sacred nature from which have issued the great civilizations of East and West, including the Far Eastern, Hindu, Islamic, and traditional Christian civilizations. For Guénon the central concept of tradition does not refer to custom or habit but rather to truths rooted in ultimate reality and the spiritual

world, and to the ramifications, applications, and historical unfolding of these truths, which are made available to human beings through the revelation that lies at the heart of all religions. Guénon distinguishes between the esoteric and exoteric dimensions of tradition and asserts the necessity of the existence of both dimensions. He also distinguishes between reason and intellect and insists upon the centrality of pure intellectuality, which for him is practically synonymous with spirituality.

Guénon, moreover, insists upon the universal nature of traditional truth, which lies at the heart of diverse religious forms. He refers repeatedly to the inner unity of truth and of traditional forms, standing united in opposition to the modern world, which is based upon the forgetting of the principles of tradition.

Guénon also emphasizes the importance of orthodoxy, which he does not limit to the exoteric realm. For him tradition and orthodoxy are inseparable. To understand tradition means to grasp the significance of orthodoxy and the necessity of remaining within its fold. Guénon’s whole message is in fact based upon not only the theoretical grasp of tradition but the necessity of living within an orthodox, traditional way, without which no metaphysical truth can possess efficacy even if it is understood theoretically. There is for him no spiritual realization possible outside tradition and orthodoxy.

Guénon was also concerned with the essence of doctrines, ideas, forms, images, and symbols. His writings shed a penetrating light upon doctrines and symbols that have become opaque and meaningless in the West as a result of the loss of metaphysical knowledge. He bestowed once again upon traditional concepts and symbols their essential meaning lost for the most part in the West since the Renaissance. He also presented to the West for the first time the essential teachings of the Eastern traditions in an authentic manner, and his presentation was accepted by the living authorities of those traditions. Moreover, Guénon sought to revive tradition in the West in the light of essential, metaphysical truth and to provide the weapons necessary to combat the errors of the modern world.

Guénon must be considered as the first expositor in the West of the traditionalist school in its fullness, a school that is also identified with “perennial philosophy.” He was followed in his task of reviving traditional teachings in the West by many others, chief among them Coomaraswamy and Schuon, whose writings perfected the exposition of the *sophia perennis* and of traditional doctrines. The influence of Guénon has, furthermore, gone beyond the traditionalist school to touch numerous scholars of religion, theologians, and philosophers who often without acknowledgment have adopted some of his doctrines and teachings.

**GUHYASAMĀJA.** The term *Guhyasamāja* (“Secret Assembly”) applies to the Tantra so-named, the assembly of deities in the *maṇḍala* described in this text, and sometimes to the *maṇḍala*'s central deity. The *Guhyasamāja Tantra* was composed in India by the early eighth century. The earliest datable reference to the Tantra is in a text written by Amoghavajra, a Sogdian monk active in China, namely his *Index of the Vajrasāekhara Sūtra Yoga in Eighteen Sections (Jing-gang-ding yu-qie shi-ba-hui zhi-gui*, T. 869), which he composed during the mid-eighth century. In it, Amoghavajra lists a text called the *Guhyasamāja Yoga (mi-mi-hui yu-qie)*, his description of which is clearly identifiable with portions of the Tantra. Most likely the text at this period was somewhat shorter than the ultimate version, which was established by the late tenth century when it was translated into Chinese and Tibetan.

The *Guhyasamāja Tantra* consists of eighteen chapters, the last of which is clearly a late addition and is often treated as a separate text titled the *Uttara Tantra*. It is notable for its erotic language and its avocation of transgressive practices, including the sacramental consumption of sexual fluids, as well as the consumption of other substances deemed impure by contemporary Indian society, such as feces. The *Guhyasamāja* is also one of the first Buddhist Tantras to depict its central buddhas in sexual union with consorts. The *Guhyasamāja maṇḍala* is built upon the foundation established by the *Sarvatathagāta-Tattvasamgraha*, taking the core of that *maṇḍala*, a central buddha surrounded by four other buddhas in the cardinal directions, and giving each a consort. The *maṇḍala* is thus centered upon five deity couples in sexual union. Matching this imagery, the text is replete with erotic language, most notably in its infamous opening verse: “Thus have I heard: At one time the Blessed Lord resided in the vulvas of the Adamantine Ladies [*vajrayoṣidbhageṣu*], the essence of the Body, Speech, and Mind of all *Tathāgatas*.”

The *Guhyasamāja Tantra* was revolutionary in being one of the earliest Buddhist Tantras to openly proclaim the

teaching that human sexuality could be an important or even essential component of the spiritual path. This teaching was highly controversial, as the text itself admits in chapter one, when it states that it “is a cause of doubt even for all *Tathāgatas*.” Because the literal interpretation of these textual passages was considered problematic in the Mahāyāna Buddhist monastic settings in which the Tantra has long been studied and put into practice, Indian Buddhists developed a complex hermeneutical system for the interpretation of this and other related Tantric texts. These systems were based upon the premise that the true import of the text is often not the literal meaning, but rather the secret or symbolic meanings accessible via systems of interpretation handed down in lineage instructions by masters of the traditions.

There were two traditions of exegesis and practice centering upon the *Guhyasamāja Tantra* that developed in India. The first is called the Jñānapāda school, named after its founder, Buddhajñānapāda, who lived in India during the eighth century. While not an important tradition from the perspective of contemporary Tibetan Buddhist practice, it is an important tradition historically because the writings of Buddhajñānapāda and his students contain numerous quotations from the root scripture, demonstrating that it was established by the late eighth century. The *maṇḍala* of this tradition is a relatively simple one, centering around the Buddha Mañjuvajra, who is in turn surrounded by four other buddhas: Vairocana (east), Ratnaketu (south), Amitābha (west), and Amoghasiddhi (north)—together with their consorts, Locanā, Māmakī, Pāṇḍarā, and Tārā. This inner circle is in turn surrounded by the ten “Fierce Kings,” *krodharājas*, for a total of nineteen deities.

The second school, which developed somewhat later, is known as the “Noble” (*ārya*) school, since its primary texts are attributed to Nāgārjuna (second century CE), Āryadeva (c. 170–270 CE), and Candrakīrti (c. 600–650 E). It superseded the former school, and also advocated an expanded *maṇḍala* with thirty-two deities. Its central deity is Akṣobhya Buddha, in sexual union with his consort, Sparśavajrā. In addition to the four buddha couples and ten Fierce Kings, it also added eight *bodhisattvas* and four additional goddesses. It was this school that was primarily responsible for the sophisticated system of hermeneutics that became greatly influential in Tibetan Buddhist circles.

While the *Guhyasamāja* tradition, like all other Buddhist traditions, disappeared in India during the late medieval period, its texts and practice was preserved in Nepal. In addition, the tradition was also disseminated to Tibet and East Asia. The *Guhyasamāja Tantra* was translated into Chinese by Dānapāla around 1002 CE. The ritual and practice tradition associated with it, however, did not take root in East Asia. The tradition was successfully transmitted to Tibet. The standard Tibetan version was translated by the Tibetan scholar Rin chen bzang po (Rinchen Zangpo, 958–1055 CE) and the Kāśmīri scholar Śradhākara varman around the same time, circa 1000 CE. From Tibet it was also

transmitted to Mongolia, where it remained an important and popular tradition up until the decimation of Buddhism there under the Communists. In Tibet it remained an important element of contemporary Buddhist practice. It is studied and practiced by all Tibetan Buddhist schools, although it is particularly emphasized by the Dge lugs (Gelug) school. While Buddhism in Tibet has suffered under Communist Chinese rule, the tradition remains in practice among Tibetan communities in diaspora, as well as among the Buddhist groups founded by Tibetan lamas in exile around the world.

#### GUIDE, SPIRITUAL SEE SPIRITUAL GUIDE

#### GUILT SEE SIN AND GUILT

**GUNAS.** *Guṇa* is a Sanskrit word etymologically suggesting a "strand" or "thread," several of which when intertwined make up a rope. The term is defined and applied in numerous ways, depending on the governing systematic assumptions and/or philosophical contexts. Four of the most common usages are described below.

The *guṇas* or "virtues" of an animate or inanimate object can be contrasted with its *doṣas*, or "faults." This sense

of the word is found in medical parlance but is not confined to that context. It is also found in Mimamsa exegesis of the merits of action, including mental and verbal activities.

Perhaps related to the foregoing, Sāṃkhya metaphysics postulates three *guṇas* as the constituents of *prakṛti*, or material nature. These three qualities are known as *sattva*, *rajas*, and *tamas*, terms that are somewhat difficult to translate into simple English. *Sattva* connotes the bright, light, buoyant, wise, good, transparent aspects of nature and all creations. *Tamas* connotes their opposites, hence what is dark, heavy, dull, bad, opaque. *Rajas* is viewed in Sāṃkhya as the catalytic or dynamic principle in things that accounts for all spiritual and material change and activity. According to Sāṃkhya, all substance, whether mental or physical, consists of a mixture of these three *guṇas* in certain proportions. During *pralaya*, the period when the material universe is reabsorbed into its unmanifest state, the three *guṇas* are in equilibrium. At the time of creation, that is, at the onset of another cycle of manifestation of the universe, an imbalance among the *guṇas* occurs, and thus differentiation takes place.

In the Vaiśeṣika system of classification, *guṇa* is the name of the second of seven categories of being. A *guṇa* in this system is a particular characteristic of an individual substance, for example, the specific patch of color that is displayed in a certain piece of cloth at a given instant. A *guṇa* for Vaisesika is a fleeting quality related for only a few moments to its possessor, which must be a substance (*dravya*). Particular colors, tastes, sounds, smells, and textures are *guṇas*; so too are numbers, contacts and disjunctions, desires and aversions, effort and awareness, as well as karmic and memory traces.

In Jainism, *guṇa* is one of three inherent qualities of every material thing (*pudgala*). Each bit of matter is a *dravya* possessing certain kinds of features (*guṇas*) that are presented in various modes (*paryāyas*). Thus a *guṇa* in Jainism is not substantial, as Sāṃkhya *guṇas* are, but neither is it adventitious or evanescent, as are Vaisesika *guṇas*. A Jain *guṇa* is a generic feature of the kind of substance comprising an individual object—earthy, hot, and so forth. The quantitative and qualitative variations of these features are their modes.

Potter (Princeton, N. J., 1977). Jain views are discussed in Padmanabh S. Jaini's *The Jaina Path of Purification* (Berkeley, Calif., 1979).

KARL H. POTTER (1987)

**GUO XIANG** (d. 312 CE), Chinese thinker associated with the *xuanxue* (“dark learning” or “school of mystery”) movement. A rationalist mystic and naturalist pantheist, Guo Xiang is the author of a commentary on the *Zhuangzi*, the only text of his still extant and the best known and oldest of all the *Zhuangzi* commentaries still in existence. Guo Xiang also edited the text of the *Zhuangzi* itself. In establishing the version we have today he reduced the size of the text, chose what seemed to him to be “the best and most complete parts” to make a coherent whole, rejected some parts, and arranged the whole in thirty-three chapters. All the complete versions of the *Zhuangzi* known at present are derived from his.

Guo Xiang’s commentary both develops a personal philosophy and makes a radical reinterpretation of the *Zhuangzi*. That the universe produces itself and is not produced by another is the starting point and the central concept of Guo Xiang’s system. The universe contains all the attributes of the Absolute: it exists eternally and necessarily and is self-sufficient. Beings come into existence of themselves; their true nature is their self-beingness. They are defined as identical to themselves, and this identity is identical in each of them: thus Guo Xiang understands *Zhuangzi*’s “identity of beings” as a type of monism. The Great One (*tai*) or, sometimes, the Ether (*qi*) is the universal force that is the source of the self-production of beings; every phenomenon represents a varying state of dispersion or condensation of the Ether. But Guo Xiang escapes complete monism by admitting the notion of *fen*, “allotment” or “limit.” Beings are differentiated by the congenital limitations of their existential and social possibilities (their span of life, their natural endowment, their place in society). These limitations assign the place they must take in society and the universe, which place in turn actualizes and manifests their being. The relation that obtains between these limitations of beings (*fen*) follows a natural pattern (*li*), an immanent principle of order that is established spontaneously (*ziran*) without any external agent. In order to achieve their own totality, individuals must accept the elements that compose their being: spontaneity (a universal, natural, and nonpersonal force that lies within each of us and is distinct from the ego), limitations in time and society (*fen*), and, finally, “daily renewal” (an incessant state of change characteristic of all beings). In this way, individuals enter into a “marvelous coincidence” with themselves and with the oneness of the world, into that mystic fusion with the immanent force that produces everything and has no beginning or end.

Guo Xiang was not a Confucian. He valued Confucian virtues after the fashion of Daoists; he did not believe in a life after death, a denial incompatible with the ancestor cult. He also advocated governing by *wuwei* (noninterference), a Daoist emphasis. If he acknowledged a social life, it was because society was an inescapable fact, but he held that “names” (titles and official functions) in society were external aspects that must be “forgotten” in order to gain union with

the unutterable reality. In avowing that names were an incomplete expression of the hidden source of existence, Guo Xiang was writing against the Confucian perspective as it developed in the “school of names” (*mingjiao*). The “determinism” Guo Xiang showed was nothing more than common sense: we must cope with what is unavoidable. Yet the participation in the world he advocated was a mystical one, very near the Daoist ideal. Guo rejected everything supernatural and by so doing he came close to the Chinese “rationalists” such as Wang Chong, but because he allotted a large place to *xuan*, the Mystery, the undefinable, he is associated with *xuanxue*. Nevertheless, in denying the central role of the concept of *wu* (nonbeing)—Guo Xiang maintains *wu* is a mere negation, that it simply serves to negate the existence of anything that gives birth to beings outside themselves, and that *wu* implies a total absence of a source other than an immanent one—he is at odds with Wang Bi, the movement’s most prominent exponent. By his treatment of some of *Zhuangzi*’s terms, Guo Xiang prepared the way for the diffusion of the *Zhuangzi* among Buddhist thinkers.

ISABELLE ROBINET (1987)

**GURDJIEFF, G. I.** Georgii Ivanovich Gurdzhiv (1866–1949) was a spiritual teacher of esoteric knowledge who claimed to have discovered specific methods for developing the human consciousness toward a more awakened state. Gurdjieff was born of a Greek father and Armenian mother in Alexandropol in the Cappadocian Greek quarter on the Russian side of the Russian-Finnish border. The date of his birth is disputed to be as much as eleven years later, due perhaps to a mistake on his passport. Gurdjieff himself maintained that he was born in 1866, a date that is corroborated by a number of sources.

The gifted boy, who came to use the Russian name Gurdjieff, was carefully schooled for a career in either the Orthodox priesthood or in medicine. However, even as a teenager he was convinced of the existence of perennial wisdom and secret knowledge that held the answers to life’s ultimate questions. For this reason, Gurdjieff left the academic world

and engaged in a quest that took him to Central Asia, including upper Tibet, and the Middle East. Some of the significant events of this journey are recorded in *Meetings with Remarkable Men* (begun in 1927 and revised over the years; first published in 1963), which British director Peter Brook made into a movie in 1979.

In 1912 Gurdjieff took up residence in Moscow and attracted a circle of students there and in Saint Petersburg. Having previously read the *Tertium Organum* published in Russian in 1911 (1920 in English) by P. D. Ouspensky (1878–1947), Gurdjieff accepted Ouspensky as a pupil in 1915. The musician and composer Thomas de Hartmann (1885–1956) and his wife Olga also joined the circle. To avoid the difficulties of life during the Bolshevik Revolution, Gurdjieff led his followers to the Caucasus and stayed in Tbilisi, Georgia. There in 1919, he accepted the artist Alexandre de Salzmann (1874–1934) and his wife Jeanne as disciples. In collaboration with de Hartmann, Gurdjieff composed music based on an inversion of the Greek diatonic Dorian mode (EDCBAGFE) found in Plato's *Timaeus*. Working with his gifted pupils, Gurdjieff also choreographed 250 ensemble movements of *Sacred Dances*, which illustrated his spiritual teachings and were performed in public. He then traveled to Constantinople and to London, where the prominent editor A. R. Orage (1873–1934) joined his group.

Finally settling in France, Gurdjieff opened the Institute for the Harmonious Development of Man at Prieuré des Basses Loges at Fontainebleau-Avon in 1922. There he attracted international pupils, including the dying author Katherine Mansfield (1888–1923) from New Zealand. In 1924 he toured with a group of dancer-disciples that performed *Sacred Dances* in New York, Chicago, Boston, and Philadelphia. While in the United States he attracted other prominent students, including the editor and writer Jane Heap (1887–1964).

After surviving a near fatal auto accident in 1924 and the trauma of his wife's death in 1926, Gurdjieff continued to teach in Prieuré until financial problems forced its closure in 1933. After another visit to the United States, he settled permanently in Paris. There he constituted an exclusively lesbian group, including the author of *The Nun's Story* (1956), Kathryn Hulme (1900–1981). In 1930 René Daumal (1908–1944) and his wife Vera joined Gurdjieff's other Parisian circle. Gurdjieff remained in Paris during the Nazi occupation. His followers helped hide Jewish members of their group. He continued to teach, and died in 1949 in Neuilly, France.

Gurdjieff remains a mysterious and controversial figure even into the twenty-first century. He has been called everything from a charlatan to a master of wisdom. Those who knew him well considered him to be a profound seeker after truth, which included the meaning in life, the origins and reasons for human existence, and the potentiality for humans to expand their consciousness. In order to achieve these ends, Gurdjieff was willing to break the rules of custom, to live an

unconventional life, and to take great risks in travel and spiritual practice.

The central idea in Gurdjieff's thought is that human consciousness can be awakened to a much greater degree than most people experience. In fact, there is a "Real I" inside all people, which can be uncovered, but only by those who are devoted to finding this divine essence in themselves. His monumental work, *Beelzebub's Tales to His Grandson* (1949), is an allegory of a being in a spaceship who observes the "hell" of life on earth and the misery of the "three-brained beings" who inhabit the planet. Humans are composed of ordinary waking consciousness, which is fictitious; the subconscious, which is closer to reality; and the state of transformation or higher consciousness, which religions might call "spirit" (*pneuma*, *buddhi*, or *ātman*). Beings who live only by the perceptions of waking consciousness are disrespectfully called "slugs" by Beelzebub's grandson, a truth seeker.

Methods for attaining the Real I included meditation at dawn and dusk, meditation on sacred music, and intense self-observation to assess one's automatic, as opposed to truly conscious, actions. The teachers Gurdjieff encountered in Russia and in the Middle and Far East were described as being on the verge of attaining or having attained this higher consciousness. At the end of *Meetings with Remarkable Men*, having discovered a sacred place, Gurdjieff wrote that "among the adepts of this monastery were former Christians, Mohammedans, Buddhists, Lamaists, and even one Shamanist. All were united by God the Truth" (p. 239).

In spite of his emphasis on experience, Gurdjieff's contribution was concerned with cosmology, metaphysics, and evolution. For example, Beelzebub teaches his grandson that all beings were "Rays of Creation" from the "Common Father Endlessness Himself" (one of the many names for the Absolute [God]). According to Gurdjieff, Charles Darwin (1809–1882) had explained little about human evolution because he did not account for the human inner nature as divine emanations. Human beings on the "minor planet earth" have lost touch with their origins and reasons for existence due to mindlessly following conventional religions and political leaders. Humans are actually governed by cosmic laws, which are a part of their psychic makeup. Tragically, humans are caught up in materialism, external success, and the unattainable goal of happiness. They are hopelessly lost unless they can return to the Real I. The final part of the *All and Everything* series, *Life Is Real Only Then, When "I Am"* (1950) deals with aspects of this teaching that are accessible only to his most devoted students. Ouspensky, in his record of Gurdjieff's talks, *In Search of the Miraculous* (1949), explains these ideas further. In 1924 Gurdjieff and Ouspensky broke off their association in spite of their similar teachings.

Gurdjieff's work was carried on by his pupil, Jeanne de Salzmann (1889–1990), who organized the Gurdjieff Foundation in 1953 in New York. The foundation dispenses the teachings of Gurdjieff and Ouspensky in London, Paris, San Francisco, and centers all over the world. The quarterly

*Gurdjieff International Review* publishes essays and commentary about Gurdjieff and his teachings.

Gurdjieff, G. I. *Herald of the Coming Good*. Paris, 1933; reprint, New York, 1970. Gurdjieff discusses the great future for the human race during the dark days prior to World War II.

Gurdjieff, G. I. *Meetings with Remarkable Men*. New York, 1974. An autobiographical account of Gurdjieff's travels and encounters with people who attained spiritual realizations on the path.

Gurdjieff, G. I. *Views from the Real World: Early Talks in Moscow, Essentuki, Tifli, Berlin, London, Paris, New York, and Chicago as Recollected by His Pupils*. New York, 1975. A discussion by Gurdjieff regarding what it would be like to view things as they really are from an objective enlightened state.

Gurdjieff, G. I. *Life Is Real Only Then, When "I Am."* New York, 1982. Gurdjieff's friendly advice for getting in contact with the real "other being" beyond the instinctive, emotional, and thinking person.

Gurdjieff, G. I. *Beelzebub's Tales to His Grandson: An Objectively Impartial Criticism of the Life of Man*. New York, 1999. A allegory of the problems and potential of the human race as seen by a great being from outer space.

### Works from Sources Close to Gurdjieff

Anderson, Margaret. *The Unknowable Gurdjieff*. New York, 1962. A clearly written work by an intimate of his circle, which included Jane Heap and Kathryn Hulme, discussing the difficulties of understanding Gurdjieff and his doctrines.

Bennett, J. G. *Gurdjieff: Making a New World*. New York, 1973. A discussion of Gurdjieff's life and teaching and a portrait of him as a man by one of his associates.

Driscoll, J. Walter, and the Gurdjieff Foundation. *Gurdjieff: An Annotated Bibliography*. New York, 1985. Compiled by Jeanne de Salzmann and others.

Moore, James. *Gurdjieff and Mansfield*. London, 1980. A portrait of the relationship between Gurdjieff and Katherine Mansfield.

Moore, James. *Gurdjieff, the Anatomy of a Myth: A Biography*. Dorsett, U.K., 1991. An attempt to reveal and differentiate truths, with good stories about Gurdjieff and his doctrines.

Nicoll, Maurice. *Psychological Commentaries on the Teaching of Gurdjieff and Ouspensky*. London, 1952–1956; reprint, Boston, 1984. A difficult work setting forth the major ideas that Gurdjieff and Ouspensky held in common on psychology and the spiritual evolution of the human race.

Ouspensky, P. D. *In Search of the Miraculous: Fragments of an Unknown Teaching*. New York, 1949. Ouspensky's notes and records of Gurdjieff's most important teachings and discussions with his pupils.

Pauwels, Louis. *Gurdjieff*. New York, 1972. A portrait of Gurdjieff's personal interaction with his groups in Paris, New

York, and Fontainebleau. Includes interesting paintings by Felix Labisse and George Rahner Ferro.

Pentland, John. *Exchanges Within: Questions from Everyday Life*. New York, 1997. Gurdjieff's teaching about life's basic questions and his interaction with his students.

Peters, Fritz. *Boyhood with Gurdjieff*. New York, 1964. A boy who grew up in Gurdjieff's circle shows him to be "all too human" while retaining a deep reverence for him.

Peters, Fritz. *Gurdjieff Remembered*. New York, 1965. An intimate of the Gurdjieff circle discusses teachings, arguments, and problems that led to the split between Gurdjieff and Ouspensky.

Speeth, Kathleen Riordan. *The Gurdjieff Work*. New York, 1989. A clearly written book on Gurdjieff's fundamental ideas and how his "Fourth Way" teachings were diffused in the West, influencing such individuals as the physiologist Moshé Feldenkreis, the painter Georgia O'Keeffe, and many writers.

Walker, Kenneth. *The Making of Man*. London, 1963. A short, readable book on the teachings of Gurdjieff and Ouspensky on cosmic consciousness and cosmic laws.

Webb, James. *The Harmonious Circle: The Lives and Work of G. I. Gurdjieff, P. D. Ouspensky, and Their Followers*. New York, 1980. A discussion of Gurdjieff's experiments to implement harmony and personal development in his inner circle.

### Critical Perspectives

Needleman, Jacob, George Baker, and Bruno de Panafliu, eds. *Gurdjieff: Essays and Reflections on the Man and His Teaching*. New York, 1996. A collection of essays that attempt to objectively evaluate the life and work of Gurdjieff.

Woodson, Jon. *To Make a New Race: Gurdjieff, Toomer, and the Harlem Renaissance*. Jackson, Miss., 1999. A critical look at Gurdjieff's ideas and an interesting view of his influence on the poet Jean Toomer.

JUDY D. SALTZMAN (2005)

**GURŪ.** The word *gurū* refers to a spiritual master or teacher whose gift or skill bears an esoteric dimension. Though derived from the Hindu tradition, the term *gurū* has also come to be applied to spiritual masters of other religious traditions, and to masters in other areas of expertise, such as music, dance, and even business. The Sanskrit term *gurū* was originally used in its Vedic context as an adjective meaning "heavy" or "weighty." In the Upaniṣads, it came to refer to a person who had reached the highest state of spiritual real-

ization (*mokṣa*) and who was able to lead others to the same. The *gurū* may be distinguished from a Hindu *sadhu*, in that the role of the *gurū* consists mainly in teaching disciples (*śiṣhyas*), and from an *ācārya* or *paṇḍit* in that the teaching of the *gurū* is based primarily on personal spiritual experiences rather than on traditional religious knowledge. As such, the *gurū*-disciple relationship represents the Hindu form of the phenomenon of spiritual direction that may be found in most religious traditions. The *gurū* may be regarded as the Hindu equivalent to the figure of the *kalyāna mitra* in Theravāda Buddhism, the *roshi* in Zen Buddhism, or the *lama* in Tibetan Buddhism. Parallels to the *gurū* may also be found in the figures of the *tsaddiq* within the Hasidic tradition of Judaism, the *shaykh* or *pir* in Sufism, the *stars* within the Eastern Orthodox tradition of Christianity, or the novice master and spiritual director in Catholic monasticism. In each case, the spiritual master is believed to represent the highest spiritual realization within that particular tradition, and is expected to lead others to that state both by example and by teaching. All spiritual traditions emphasize the importance of the complete surrender of the disciple to the spiritual master as a condition for spiritual growth. While most traditions regard the master-disciple relationship as only one form of religious observance, often reserved for a spiritual elite, within the Hindu religious tradition the figure of the *gurū* has come to play a central role.

**TRADITIONAL UNDERSTANDINGS OF THE GURŪ.** The importance of the *gurū* within the Hindu tradition is directly related to the pursuit of *mokṣa* (liberation) as the highest and ultimate religious goal. In the Upaniṣads, this state of *mokṣa* is expressed in terms of the realization of the nonduality of *ātman* (deepest Self) and *brahman* (ultimate reality). The *gurū* came to be regarded as the embodiment of this state, and as the only means through which it could be attained. Since the experience of *mokṣa* is considered to be unfathomable in words, it could only be exemplified and pursued through one who had already reached that state.

Thus, the *Muṇḍaka Upaniṣad* states, “nothing that is eternal (not made) can be gained by what is not eternal (made). Let him, in order to understand this, take fuel in his hand and approach a Guru who is learned and dwells entirely in Brahman” (1:2:12). In the *Maitrī Upaniṣad* the disciple addresses the *gurū* with the following words: “In this world I am like a frog in a dry well. O Saint, thou art my way, thou art my way” (1:4). Thus, the figure of the *gurū* effectively became, as David Miller put it, the “centre of sacredness” in Hinduism.

As the embodiment of the ultimate state of realization, the *gurū* came to be endowed with divine attributes. In the *Muṇḍaka Upaniṣad* it is said that “he who knows that highest Brahman, becomes even Brahman” (3:2:9). There is no higher authority in Hinduism than the one who has attained the knowledge of *brahman*. The *gurū* thus came to be regarded as God, and recognition of the divinity of the *gurū* was seen as a condition for reaching liberation: “If these truths

have been told to a high-minded man, who feels the highest devotion for God, and for his Guru as for God, then they will shine forth,—then they will shine forth indeed” (*Śvetāśvatara Upaniṣad* 6:23). Disciples generally recognize the teachings of a *gurū* as the ultimate truth. While Hindu *gurūs* acknowledge the authority of the Hindu scriptures, they are autonomous in interpreting these scriptures. This explains the rich diversity of teaching traditions within Hinduism.

While a *gurū* may be regarded as God in the Hindu tradition, the authority of the *gurū* is still constituted solely by a disciple’s recognition of this divinity. It is often said in Hinduism that it is the disciple who makes the *gurū*. In the Upaniṣads, a disciple approached the *gurū* with fuel in the hand, expressing a desire to serve the *gurū* (by tending to his sacrificial fire). Upon acceptance, the disciple underwent a formal initiation (*dīkṣhā*) symbolizing a new birth from the *gurū* and incorporation within the *gurū*’s household (*gurūkula*). Disciples often remained with the *gurū* for more than a decade, practicing various forms of asceticism and self-abnegation under the guidance of the *gurū*. In later times, the religious community surrounding a *gurū* came to be called an *āśrama* (ashram). *Āśramas* usually consist of a group of core members who are totally devoted to the *gurū* and have often taken vows of celibacy and renunciation (*sannyāsa*), and of a larger group of followers who may come and stay with the *gurū* for various lengths of time without renouncing the world. However, some *gurūs* may instead adopt a more itinerant lifestyle and visit disciples in their own villages and homes.

From the outset, each relationship between *gurū* and disciple has been regarded as unique or irreplaceable. The *gurū* generally adapts the teaching to the spiritual needs and level of spiritual development of the disciple. This has at times generated an image of the *gurū* as being unpredictable. *Gurūs* often act and relate to disciples in ways that defy common sense. Disciples are expected to uncritically accept the particular teaching and discipline imparted upon them by the *gurū* and to maintain faith in the *gurū*’s capacities of discernment. Since the ultimate goal of the *gurū*-disciple relationship is not the acquisition of objective knowledge but realization of the deepest Self (*ātman*), not only the path, but also the goal of every *gurū*-disciple relationship is considered to be unique. It is only the *gurū* who is able to acknowledge the attainment of self-realization in the disciple, since, as it is said, the one who attains it “does not know, yet he is knowing, though he does not know” (*Bṛhadāraṇyaka Upaniṣad* 4:3:30). While the attainment of the state of realization marks the end of the *gurū*-disciple relationship, Hindus generally maintain a reverence for their *gurū* throughout their lives.

The *gurū*-disciple relationship has formed the basis for the development of various teaching traditions (*sampradāyas*) within Hinduism. Each *sampradāya* is based on a lineage of teachers (*gurūparamparā*) in which the authority of a *gurū*

is legitimated by the previous *gurūs*. In the end, however, it is the capacity of a *gurū* to generate and maintain a religious commitment from disciples that sustains a tradition. Teaching traditions may disappear and new ones may emerge at any given time.

**DIFFERENT ROLES AND FUNCTIONS OF THE GURŪ.** The status and role of the *gurū* may be variously defined and legitimated within any particular teaching tradition. Certain general characteristics distinguish the conception of the *gurū* within the traditions of Advaita Vedānta, Bhakti, and Tantrism. Within Advaita Vedānta, the *gurū* is predominantly regarded as a teacher who imparts spiritual wisdom to the disciple. Śaṅkara (788–820), the founder of this tradition, framed the relationship between *gurū* and disciple in terms of *śravaṇa* (listening), *manana* (contemplation), and *nididhyāsana* (meditation). High demands are put upon a disciple who must be “a seeker after final release whose mind has been calmed, whose senses have been controlled, whose faults have been abandoned, who is acting as prescribed [in the scriptures], who is endowed with virtues, and who is always obedient” (*Upadeśasāhasrī* 1:16:72). The *gurū*, on the other hand, must be endowed with tranquility, self-control, lack of attachment to enjoyments “visible and invisible,” and freedom from faults such as “deceit, pride, trickery, wickedness, fraud, jealousy, falsehood, egotism, [and] self-interest” (*Upadeśasāhasrī* 2:1:6). The *gurū* must not only be liberated (*jīvanmukti*) but also filled with compassion and a willingness to share spiritual knowledge with others. Śaṅkara institutionalized the *gurū*-disciple relationship through the establishment of five monasteries (*maṭhas*) in Sringeri, Kanchi, Dwaraka, Puri, and Badrinath. The heads of these monasteries are called *jagadgurūs*, or “world teachers.” These teachers differ from other *gurūs* in that their responsibilities also include administration and their authority generally extends beyond their own immediate group of disciples.

Within the devotional (*bhakti*) traditions of Hinduism, the relationship between *gurū* and disciple is generally of a more affective nature. It is the love and grace of the *gurū* that is here regarded as the principal means of salvation. The *gurū* may be regarded as a divine incarnation or *avatāra*, who has the capacity to remove spiritual obstacles in the disciple. Much of the spiritual practice consists of expressions of loving devotion to the *gurū*, who is worshiped as a God. In the absence of the *gurū*, it is customary to worship the slippers, seat, statue, or picture of the *gurū*.

In the Tantric tradition, the role of the *gurū* is concentrated in the imparting of *dīkshā*, or initiation. It is here that the idea of the indispensability of the *gurū* reaches its highest expression. A disciple cannot conceive of the possibility of liberation without receiving a *mantra* and the transmission of power (*śaktipāt*) from the *gurū*. In the tradition of Kashmir Śaivism, this power is believed to awaken the spiritual energy (*kuṇḍalinī*) in the disciple, transforming him or her from within. Here, the *gurū* is often regarded as superior to God. The refrain of the *Gurū Gītā*, a text widely used within

the Tantric tradition, states, “There is nothing greater than the *gurū*.”

All three functions of the *gurū*—teaching, initiation, and imparting love and grace—may be found to various degrees in any particular *gurū*. While some *gurūs* may be clearly situated within one or the other tradition of Hinduism, most combine elements from the different Hindu traditions and even from other religious traditions within their teachings and practices.

Because of the absolute authority of the *gurū*, the Hindu tradition has always been conscious of the possibility of abuse of this authority by false *gurūs* or pseudo-*gurūs* who exploit disciples for their own purposes. In the *Muṇḍaka Upaniṣad*, one is warned of “fools dwelling in darkness, wise in their own conceit, and puffed up with vain knowledge, [who] go round and round staggering to and fro, like blind men led by the blind” (1:2:8). This is why many Hindu texts enumerate in great detail the various qualities that characterize a real *gurū*. Among these, complete freedom from desire and from conceit plays a central role.

The *gurū* is of central importance in Sikhism, which is based on a lineage of ten human *gurūs*, from Sikhism’s founder Gurū Nānak (1469–1539) to its tenth leader, Gurū Gobind Singh (1666–1708), after whom *gurū*ship became enshrined in the collection of hymns known as the *Gurū Granth Sāhib*, or Sikh scriptures. God is considered as the “*Gurū* of *Gurūs*,” and some Sikhs also believe in a living *gurū*.

**MODERN DEVELOPMENTS.** Since the beginning of the twentieth century, the concept of the *gurū* has undergone a number of changes. While the function of the *gurū* was traditionally limited to the spiritual sphere, *gurūs* have become increasingly more active in the political and social realm, contributing to Indian nationalist movements and causes. Figures such as Swami Dayananda Saraswati, founder of Ārya Samāj, formulated an ideology in which spirituality was inseparable from national identity. The combination of spiritual and political authority was also evident in a figure like Mohandas Gandhi. Many Hindu *gurūs* are actively involved in the Vishwa Hindu Parishad (VHP), the religious or ideological branch of the political Bharatiya Janatha Party (BJP). While *gurūs* traditionally focused on individual and purely spiritual relationships with disciples, these *gurūs* have developed more public roles as advisors to political leaders and advocates of political agendas.

A second development has been the internationalization of the mission and following of Hindu *gurūs*. The popularity of a number of Hindu *gurūs* (Rāmākrishna Paramahansa, Aurobindo Ghose, Ramana Maharshi, Paramahansa Yogānanda, Maharishi Mahesh Yogi, Swami Muktaṇanda, Krishnamurti, Bhagavan Shree Rajneesh, Sathya Sai Baba, etc.) has led to the development of *āśramas* and centers in many countries outside India and to new challenges of tending to the spiritual needs of disciples from very different cul-

tural and religious backgrounds, including many who live a great distance from the *gurū*. While most of the more famous *gurūs* have come to spend much of their time traveling throughout the world visiting disciples who gather in large numbers to receive their *darśan* (vision), others remain in India and have disciples from all over the world visit them there. The international outreach of some *gurūs* and the increase in funds and material support has also led to new styles of teaching through high-tech means of communication. This has led to shifts in the traditional concept of the *gurū*-disciple relationship. Whereas a personal relationship with the *gurū* was traditionally regarded as an essential dimension of spiritual growth, such intimacy and personal guidance has come to be replaced by very brief moments of nonverbal exchange. In most cases, however, the belief that the *gurū* knows each disciple personally and attends from a distance to his or her spiritual needs has been preserved. Another result of the internationalization of Hindu *gurūs* is the rise of non-Indian disciples to the status of *gurū*. This may occur through appointment and succession within an established lineage of *gurūs*, or through independent forms of imitation of the Indian *gurū*-disciple relationship. Such developments have raised questions regarding the traditional understanding of Hindu identity.

One of the most remarkable developments of the twentieth century was the emergence of female *gurūs*. While women were never explicitly excluded from the possibility of assuming spiritual authority in Hindu texts, and while a number of women have been recognized as important Hindu saints in the course of history, women did not assumed roles of spiritual leadership until the beginning of the twentieth century. One of the first renowned female *gurūs* was Ānandamayī Mā (1896–1982). Though a wandering ascetic, she came to be widely sought out for spiritual direction and advice. Numerous other female *gurūs* have since gained popularity and fame, including outside India. Some of these female *gurūs* were appointed as successor to their own male *gurū*. But some became recognized purely on the basis of their own spiritual power and authority. Though female *gurūs* are generally considered to be beyond gender, they are more often identified with the goddesses of India, and their affection for disciples is often expressed in explicitly nurturing gestures (such as touching or hugging). Female *gurūs* may be found in all strands of Hinduism, from the contemplative and nondualist traditions and the Tantric schools to the more devotional traditions. They continue the long Hindu tradition of the importance of personal spiritual experience and realization, and enrich that tradition with a distinctive form and flavor. The figure of the *gurū* thus remains at the heart of Hinduism, even as this religion and its concept of the *gurū* continue to change over time.

## BIBLIOGRAPHY

The first systematic treatments of the figure of the *gurū* in Western languages may be found in Louis Renou's introduction to *Hinduism* (New York, 1962) and in Jan Gonda's *Change and Continuity in Indian Religion* (The Hague, 1965). The theme of the absolute centrality of the *gurū* in Indian religion is developed by David Miller in "The Guru as Centre of Sacredness," *Studies in Religion* 6, no. 5 (1976–1977): 527–533. More specialized studies of the role of *gurū* in particular schools or traditions of Hinduism may be found in William Cenkner's *A Tradition of Teachers: Śaṅkara and the Jagadgurūs Today* (Delhi, 1983), which discusses the *gurū* in the tradition of Advaita Vedānta, and in Daniel Gold's books *The Lord as Guru: Hindi Saints in the North Indian Tradition* (New York, 1987) and *Comprehending the Guru: Toward a Grammar of Religious Perception* (Atlanta, 1988), which focus predominantly on the Hindu Saint tradition. The dynamics of the *gurū*-disciple relationship has been approached from a psychoanalytical perspective in Richard Lannoy's book *The Speaking Tree: A Study of Indian Culture and Society* (London, 1974) and in Anthony Storr's *Feet of Clay: A Study of Gurus* (London, 1996.) For a brief discussion of the role of the *gurū* in Sikhism, see W. Owen Cole's *The Guru in Sikhism* (London, 1982).

Cross-cultural comparisons of the figure of the spiritual master and the religious appropriation of the category of the *gurū* within a Christian context may be found in Catherine Cornille's *The Guru in Indian Catholicism: Ambiguity or Opportunity of Inculturation?* (Louvain, Belgium, 1991) and in M. Thomas Thangaraj's *The Crucified Guru: An Experiment in Cross-Cultural Christology* (Nashville, 1994). Numerous books offer devotional and/or historical accounts of particular *gurūs*. Among these, works of scholarly interest are: Lawrence Babb's *Redemptive Encounters: Three Modern Styles in the Hindu Tradition* (Berkeley, Calif., 1986), focusing on the Radhasoami Faith, the Brahma Kumaris, and Sathya Sai Baba; and Lisa Lassell Hallstrom's *Mother of Bliss: Ānandamayī Mā* (Oxford, 1999).

On the topic of female *gurūs*, a volume edited by Karen Pechilis, *The Graceful Guru: Hindu Female Gurus in India and the United States* (New York, 2004), offers a collection of studies of the figures of Gauri ma, Sita Devi, Anandamayī ma, Jayashri Ma, Meera Ma, Ma Jaya Satī Bhagavati, Karunamayī Ma, Shree Maa, Mata Amritanandamayī, and Gurumayī.

CATHERINE CORNILLE (2005)

## GURŪ GOBIND SINGH SEE SINGH, GOBIND

**GURŪ GRANTH SĀHIB.** The Sikhs' full title for their scripture, the *Ādi Granth*, is *Ādi Srī Gurū Granth Sāhibjī*. More generally they refer to it as *Gurū Granth Sāhib*. *Srī*, *Sāhib*, and *jī* are all honorifics, conveying the Sikhs' reverence for this volume of scripture. This entry complements the encyclopedia's *Ādi Granth* entry by focusing upon the text as *Gurū* and the practical implications of this status,

rather than upon its content, structure, and message. Sikhs regard the *Ādi Granth* as their living Gurū in succession, at his command, to Gurū Gobind Singh and his nine human predecessors, starting with Gurū Nānak. According to his follower, Bhāi Nand Lāl, Gurū Gobind Singh's last words before his death in 1708 were: "Whoever wishes to hear the Gurū's word should wholeheartedly read the *Granth* or listen to the *Granth* being read." Whereas the word *gurū* in Hindu usage refers to teachers generally, and in contemporary parlance more widely it is applied to any expert, Sikhs reserve the word for their ten Gurūs, for the *Gurū Granth Sāhib*, and for God—hence the need for a capital *G* in the Roman alphabet.

The Sikhs' place of worship, the *gurdwārā* (i.e., "doorway of the Gurū"), is such only by virtue of the presence of the Gurū in the form of the *Gurū Granth Sāhib*. Conversely, any room in which the *Gurū Granth Sāhib* is appropriately installed is a *gurdwārā*. Those who enter do so only after taking off their footwear and covering their heads (if they are not already wearing a turban).

**USE OF TEXT IN WORSHIP.** The text of the scripture plays several roles in Sikh worship. Each day the pages are opened at random for a *vāk* (utterance) or *hukam* (order) that is regarded as guidance for the day. The passage that is read is the first stanza on the left hand page, which will be read from the beginning even if this is on the previous page. The *vāk* from Sikhs' holiest shrine, the Harmandir Sāhib (the Golden Temple) in Amritsar (Punjab, India) is now disseminated worldwide by the internet, as the daily *hukam-nāmā* (command, edict). Some of the *vāks* from the Harmandir Sāhib have attained historic status because of their pertinence to a particular situation. In 1920, for example, a *vāk* resolved (in the affirmative) the question of whether converts from the lowest caste should be allowed to offer *prasād* (blessed food) that is distributed to the congregation.

The scriptures are read aloud in worship and also sung. Almost the entire text is arranged according to musical modes (*rāgs*, i.e., *rāgas*). The *shabads* (hymns) are sung by *rāgīs* (musicians) to the accompaniment of instruments. These usually include the *tablā* (pair of hand drums) and at least one harmonium, and often a *saurangī* (similar to a violin) and a *chimtā* (literally "fire tongs") that is inset with disks like those in a tambourine. By singing and listening one is steeped in the *gurbānī* (the Gurū's utterance) and so this is a form of *nām simaran* (i.e., remembrance of the Name, in the sense of divine reality encapsulated). Musical rendering of the scripture is known as *kīrtan* and in this way Sikhs express their devotion.

*Pāth* (pronounced like English *part*) is the word for a reading of the scripture. *Akhand pāth* means unbroken reading and so denotes a forty-eight-hour reading of the entire *Gurū Granth Sāhib*. Such readings are held to mark both happy and sad occasions. Most people gather for the commencement and the culmination of the reading. Individual

readers take turns to read in shifts, and the family who organize the *akhand pāth* provides food for all who read or attend.

The *Gurū Granth Sāhib* plays a part at significant life cycle rites, commencing with the naming of infants. When parents bring their baby to the *gurdwārā*, the *granthī* opens the volume at random, as for a *vāk*, and reads out the initial for the child's forename. This is the first letter of the stanza with which the left hand page starts.

A Sikh couple is deemed to be married when they have completed the central marriage rite of circumambulating the volume four times. In this way the *Gurū Granth Sāhib* is at the heart of the ceremony, as its witness. Moreover, it provides the Lāvān hymns that are read and then sung as the couple proceeds round. The Lāvān, composed by the fourth Gurū, Rām Dās, celebrate the soul's movement towards full union with God.

Although the *Gurū Granth Sāhib* is not present at a cremation, it is the Sohilā, the hymns from the *Gurū Granth Sāhib* that mark the close of the day, that will be sung at this time. It is also customary for a complete reading of the scriptures to take place following a death. The reading may be an *akhand pāth* or may be an intermittent reading over seven or ten days.

Like the life cycle, daily life too is punctuated by the reading or hearing of select passages of scripture. Devout Sikhs begin each day by bathing (between 3:00 and 6:00 AM) and singing or chanting Gurū Nānak's Japjī. A selection of hymns, known as Sodar Rahirās, is recited in the early evening and the day ends with the selection of hymns entitled Sohilā.

Sikhs' annual festivals are preceded by an *akhand pāth*, which concludes on the morning of the festival day, and the largest-scale celebrations involve bearing the *Gurū Granth Sāhib* in a procession, known as a *nagar kīrtan*, through the streets. Often the volume is carried in a vehicle serving as a temporary mobile *gurdwārā*.

**GURŪ GRANTH SĀHIB AS THE GURŪ'S EMBODIMENT.** The litany at the conclusion of Sikhs' principal congregational prayer, the Ardās, affirms that the scriptures are "*paragat gurān kī deh*," "the Gurū's body made manifest." This dictates the physical treatment of the volume in ways appropriate for a revered Indian spiritual teacher. Account is taken of whether it is day or night, and other details such as seasonal temperature may also be considered in deciding where the volume is placed at night or how warmly it is covered. The *Gurū Granth Sāhib* spends the day reposing on a cushioned, canopied stand, the *pālkī* (literally palanquin). When not being read it is covered by *rumālās*, brightly colored covers which devotees make from velvety or satiny fabric. When open the volume is fanned by an attendant who waves a *chaur* (*chaurī* or *chanwar*) above it. The *chaur* usually consists of a switch of silvery hair from a horse or yak's tail that is mounted in a wooden or metal handle. Like the *pālkī* and *chananī* (canopy) this has come to symbolize sovereign au-

thority, because in the heat of India in the days before electricity dignitaries would be kept cool by being fanned in this way by a servant.

In the late evening the *Gurū Granth Sāhib* is carried ceremonially (on a Sikh's head) to its place of rest. This is often a room in which the volume is literally put to bed. For this bedroom the name is *sach-khand*, the realm of truth, a name which it shares with the last stage of the spiritual journey as mapped out by Gurū Nānak.

Because the *Gurū Granth Sāhib* is treated as a living Gurū relatively few Sikhs have a copy at home, unless they can set aside a room for its use. Instead Sikhs usually keep a *gutkā* (handbook) containing the *nitnem*—that is, those passages from the *Ādi Granth* and from the *Dasam Granth* (the scripture traditionally attributed to Gurū Gobind Singh) that are used liturgically. If a family holds an *akband pāth* at home, a room will be cleared of furniture, the *Gurū Granth Sāhib* is brought from the *gurdwārā* and installed under a canopy. While the Gurū is in the house no nonvegetarian food is cooked, and before coming into the Gurū's room people remove footwear and cover their heads.

The sanctity of the *Ādi Granth* as the Gurū's physical embodiment means that the scripture is printed, bound, and transported with special care. Employees of the press in Gurdwārā Rāmsar, Amritsar, undertake to abstain from tobacco and alcohol. Any "waste paper" is cremated in accordance with Sikh tradition. The bound copies are individually wrapped in a *rumālā* and transported to *gurdwārās* in specially appointed luxury buses.

**TEXTUAL SCHOLARSHIP AND TRANSLATION.** Sikhs' reverence for the scripture as the living Gurū has discouraged scholarly analysis of the text. During the latter half of the twentieth century, however, some scholars, including Gurinder Singh Mann, sought to understand the complexities of the *Ādi Granth's* compilation. Textual study by Hew McLeod from New Zealand and the Sikh scholars Piar Singh and Pashaura Singh resulted in hostile outbursts from some Sikhs and the boycotting of the scholars concerned. The sense of outrage has to be understood in the context not only of Sikhs' veneration of the *Gurū Granth Sāhib* as the Gurū's living embodiment, but also of their insecurity as a religious minority during a period (the 1980s and 1990s) of violent political instability in Punjab.

One controversial textual issue is why there are discrepancies between different recensions (*bīrs*) of the *Ādi Granth*—that is, between the early-seventeenth-century Kartārpur *bīr* and the early-eighteenth-century Damdamā *bīr*, on the one hand, and on the other hand another seventeenth-century recension known as the Banno *bīr*, which came to be widely respected by eighteenth-century Sikhs. According to a long-accepted view, while the Kartārpur *bīr* was being taken for binding to Lahore, another was prepared by Bhāi Banno, but his additions were not approved by Gurū Arjan Dev. Another theory (Pashaura Singh's on the basis of

extensive study) is that the Banno group, who held to a less militant style of Sikhism than was emerging after the fifth Gurū's violent death, supported the Banno *bīr* which omitted *dhunīs* (heroic tunes) and included, *inter alia*, a verse by Mīrā Bāī, a woman devotee of Kṛṣṇa, and a poem mentioning a Hindu head-shaving rite.

Translation of the text also began contentiously as Ernst Trumpp, the first translator, was conspicuously insensitive to Sikh sentiment. Subsequently, and thanks in no small part to the devoted labors of the next translator, Arthur Max Macauliffe, translation has been less controversial than textual criticism. English translations of the entire text have been appearing since Trumpp's 1877 version but not for liturgical use. The *Gurū Granth Sāhib* that is installed in *gurdwārās* is always the 1,430-page *Gurmukhī* text, in fact a copy of the *Damdāmā bīr*. (*Gurmukhī*, literally "from the mouth of the Gurū," is the name for the script used both by the Sikh scripture and for the modern Punjabi language.)

Some attempts to translate the *Gurū Granth Sāhib's* medieval mystical verse into a contemporary non-Indic language have produced stilted English and/or a skewing of underlying concepts. The fact that the opening formula "*ik oan kāṛ*" can—arguably less tendentiously—be translated as "One reality is" (Nikky-Guninder Kaur Singh) as well as the popularly accepted "There is one God," epitomizes the difficulty for translators. The gendering of language about the divine reality by successive translators has conveyed the impression of a male God, which Nikky-Guninder Kaur Singh and other contemporary scholars have challenged. For example, the original text contains no equivalent to the English words *he* and *his*, which are introduced by most translators in the interests of a fluent English rendering of many verses about the divine principle.

**GURŪ NĀNAK** SEE NĀNAK

**GU YANWU** (*tzu*, Ningren; *hao*, Tinglin; 1613–1682), a founder of the “school of evidential research” (*kaozheng*). Gu Yanwu was born to the scholarly life. He was from Kunshan, Jiangsu province, in Southeast China, a region renowned for its historians and philosophers. His forebears were distinguished intellectuals, passionate readers and collectors of books. From the age of eleven, Gu was taught to read the encyclopedic originals of historical works rather than the standard abridgments. His upbringing instilled in him the highest standards of Confucian moral conduct.

At an early age, Gu’s parents sent him to be adopted as the heir of his father’s cousin, who had died in his teens. He was raised by his adoptive grandfather and by the fiancée of the deceased cousin, who insisted on living as his widow. This woman’s extraordinary devotion to her fiancé’s family won her public recognition and an imperial title, “Chaste and Filial.” Gu Yanwu later expressed his admiration for his foster mother in a laudatory biography.

In 1644 the Manchus conquered North China, bringing an end to the Ming dynasty (1368–1644). The next year they drove south and conquered Jiangsu. During the siege, in which several of his relatives were killed or wounded, Gu fled with his foster mother to a remote village. When the Manchu victory was imminent, his mother starved herself to death as an act of loyalty to the Ming, exacting from her son a vow never to serve the Manchus.

In the early years of Manchu rule, Gu Yanwu, like many in the Southeast, resented the Manchus and clung to the hope that the Ming might be restored. Gu may even have covertly aided the resistance government headed by an exiled Ming prince. As time passed, many accepted the finality of the Ming defeat and made their peace with the new regime. The Manchus, for their part, courted the holdouts by means of the *boxue hongci*, a special examination in 1679 to select candidates for a lavish imperial project on Ming history. The court invited the support of leading intellectuals to dissipate the last vestiges of resistance in the Southeast; the “invitation” was in fact a command performance. Gu Yanwu was one of the few who did not take this examination; he escaped by working behind the scenes to have friends remove his name from the invitation list. Even after he had personally accepted the finality of the Ming defeat, he felt bound to honor his vow to his mother.

In 1657, Gu Yanwu narrowly escaped assassination by a personal enemy with whom he had been embroiled in a

land dispute. To avert further harassment, Gu moved north and spent the remainder of his life separated from family and regional friends. In earlier years, he had turned in times of trouble to ancestral veneration, both to honor the heritage of his ancestors and to seek their guidance. In the North, he worshiped regularly at the tombs of the Ming imperial family, ritually renewing his commitment never to serve the Manchus, and hence honoring the memory of his mother.

The values and ritual practices of Confucianism gave meaning and structure to the life of Gu Yanwu. His scholarship was inspired and informed by his deep personal commitment to the Confucian Way.

Gu Yanwu charged that Confucian scholarship of the Song (960–1279) and Ming was so speculative and tainted by Buddhism that it lost sight of the core of the tradition. He echoed the scholars of the late Ming in their call for practical learning (*shixue*). Confucian scholarship could be effective only if it were solidly grounded in the authentic Way of the sages, which was expounded in the Confucian classics. For many centuries, however, Confucians, while venerating the classics as a kind of sacred canon, had distorted their true meaning by citing passages out of context or fabricating baseless interpretations. Inspired by Han dynasty (206 BCE–220 CE) commentaries, Gu advocated a close reexamination of the classics, seeking to reconstruct the actual pronunciations and meanings of the original texts. He built on late Ming scholarship in phonology and philology, broadening the method by bringing to bear an enormous range of evidence. His work became the benchmark of evidential research.

Gu extended the methodology of *kaozheng* beyond classical studies. The broad-ranging collection of evidence and meticulous cross-checking of data were applied to such areas as water management, geography, and epigraphy. Gu did not limit his research to written materials; he made use of artifacts, interviews, and trips to the field. His energetic scholarship inspired several generations of intellectuals, many of whom did not appreciate the commitment to the Confucian Way that motivated his work.

Scholars have compared the legacy of *kaozheng* to the European Renaissance (Liang, 1959, p. 11, and Yü, 1975, p. 128) or to the Reformation (Hou, 1962–1963, p. 250). A more appropriate comparison might be made to the historical-critical movement in biblical scholarship, which arose alongside the European Enlightenment. Both movements claimed that misinterpretations of the canon had obscured the true teachings and exposed their traditions to dangers and heresies. Both sought to recover the true core of the teachings by means of the most rigorous historical and critical tools available. Both were occasionally misconstrued as secularizations of their traditions. Gu Yanwu devoted himself to rigorous scholarship in order to recover the solid foundations of the Way of the sages.

**BIBLIOGRAPHY**

Gu Yanwu’s *Yinxue wushu* in 38 *juan* (1667), 8 vols. (Taipei, 1957), established a model for the method of evidential re-

search. His broader scholarly approach is best embodied in his *Rizhi lu* in 32 *juan*, "Guoxue jiben congshu," vol. 14, edited by Wang Yunwu (Taipei, 1968), a collection of erudite notes on a wide range of subjects that were revised throughout his life whenever he found a new bit of relevant information. The *Gu Tinglin shi wenji*, "Guoxue jiben congshu," vol. 317, edited by Wang Yunwu (Taipei, 1968), contains important letters and prefaces that articulate in succinct form the principles behind his scholarly approach.

There are two standard sources for Gu Yanwu's life. Fang Chaoying's biography in *Eminent Chinese of the Ch'ing Period, 1644–1912*, 2 vols., edited by Arthur W. Hummel (Washington, D.C., 1943–1944), includes a valuable overview of Gu's scholarly contributions, pp. 421–426. Willard J. Peterson's "The Life of Ku Yen-wu, 1613–1682," *Harvard Journal of Asiatic Studies* 28 (1968): 114–156 and 29 (1969): 201–247, offers a thoughtful analysis of the historical and familial forces that shaped Gu's career.

On Gu's thought and scholarship, the best works are Hou Wailu's *Zhongguo sixiang tongshi*, vol. 5 (Beijing, 1962–1963), pp. 204–250, and Qian Mu's *Zhongguo jin saibainian xueshu shi*, 2 vols. (1937; reprint, Taipei, 1957), pp. 121–153. There is as yet little in Western languages. Liang Qichao's *Intellectual Trends in the Ch'ing Period*, translated by Immanuel C. Y. Hsü (Cambridge, Mass., 1959), offers a brief introduction in English. Yü Ying-shih's article "Some Preliminary Observations on the Rise of Ch'ing Confucian Intellectualism," *Tsing-hua Journal of Chinese Studies*, n.s. 11 (1975): 105–146, is the most helpful source on the origins and significance of the *kaozheng* movement.

JUDITH A. BERLING (1987)  
*Revised Bibliography*

**GYNOCENTRISM** (derived from the Greek *gyno*, meaning "woman," and *kentron*, meaning "center") is a radical feminist discourse that champions woman-centered beliefs, identities, and social organization. It also challenges the androcentric promotion of masculine standards as normative, and the presentation of those standards as neutral rather than gendered. Consequently, from a gynocentric perspective, the assumption of masculine-neutral norms has meant that femininity has traditionally been presented as deficient, secondary, and lacking. Gynocentric feminism is concerned, therefore, to revalue sexual difference and femininity positively.

**THEORIES OF GYNOCENTRISM.** The literary scholar Elaine Showalter was one of the first feminists to develop a systematic program that was critical of the androcentrism of mainstream literary studies and that sought instead to illuminate the "subculture" of women writers and readers. She coined the term *gynocritics* to refer to this project, suggesting in her article "Towards a Feminist Poetics" (1986) that:

The program of gynocritics is to construct a female framework for the analysis of women's literature, to develop new models based on the study of female experience, rather than to adapt male models and theories. Gynocritics begins at the point when we free ourselves from the linear absolutes of male literary history, stop trying to fit women between the lines of male tradition, and focus instead on the new visible world of female culture. (p. 131)

Showalter thus argued for the realignment of the conceptual standpoints of literary studies by seeing women's writing as primary, rather than as marginal. For her, it was a matter of identifying the difference in women's writing and of demonstrating how the psychodynamics of female creativity shaped women's literary productions and readings differently from those of men. In order to identify female difference, the gynocritical approach sought to study the history, styles, themes, genres, and structures of writing by women, as well as the constraints on, and impact of, female literary traditions. The aim of gynocritics was the transformation and redefinition of the androcentric parameters of the study of literature.

Showalter's gynocritical approach coincided with, and reflected, a shift in second wave feminism away from the promotion of the humanist ideal of gender-neutral equality, towards a model of liberation that affirmed female experience. Iris Marion Young, in her essay "Humanism, Gynocentrism, and Feminist Politics" (1990), outlines the benefits of this change in emphasis, arguing that:

[G]ynocentric feminism finds in women's bodies and traditional feminine activity the source of more positive values. Women's reproductive processes keep us linked with nature and the promotion of life to a greater degree than men's. Female eroticism is more fluid, diffuse, and loving than violence-prone male sexuality. Our feminine socialization and traditional roles as mothers give us a capacity to nurture and a sense of social cooperation that may be the only salvation of the planet. (p. 79)

Gynocentric feminism thus promoted a vision of femininity at odds with traditional androcentric and misogynist formulations, neatly reversing the values that had been traditionally assigned to women. In doing so, it simultaneously rehabilitated those aspects of femininity that were historically belittled or maligned, and articulated a theory of female difference in contrast to, and against, a masculine logic of neutrality.

For Showalter, writers like Adrienne Rich and Susan Griffin have exemplified gynocritical writing, as has Hélène

Cixous's theorization of *l'écriture féminine* (feminine writing and language). Within religious studies, the gynocentric approach has been epitomized by the feminist theologian Mary Daly, and by Goddess feminists who have argued that patriarchal religions have promoted detrimental and erroneous models of femininity, which can only be corrected by developing an inspirational, woman-centered ontology rooted in female experience.

**CRITIQUES OF GYNOCENTRISM.** However important the restoration of dignity to women may have been for many feminists, the viability of the gynocentric approach has been subject to sustained criticism for some time. The most common critique has been the suggestion that reliance on a theory of sexual difference—where femininity is promoted as the source of values by which to criticize androcentrism and to realize a better society—is problematic in that it depends on ahistorical, essentialist, and universalist ideas about gender attributes. Moreover, it is contradictory for feminists to advocate binary thought (in this case male/female, with the qualities that accrue to each member of the pair simply reversed). The idea of an essentialized femininity confronting an equally essentialized masculinity is not a coherent feminist strategy for the defeat of misogyny; on the contrary, it reifies the very system it seeks to undo by invoking the dichotomous logic that many feminists have argued is the mechanism by which male-dominant hierarchies are sustained (see Moi, 1989, pp. 125–126; and Young, 1990, pp. 87–90, for a more detailed critique of gynocentric feminism). Gynocentrism is perhaps best seen as a transitional phase in feminist theory, one that was probably necessary for addressing the wholesale marginalization of women's voices, but which has been critically adjusted as gender theory has emerged as a preferable mode for understanding sexual identity and for challenging notions of gender neutrality.

## BIBLIOGRAPHY

- Belsey, Catherine, and Jane Moore, eds. *The Feminist Reader: Essays in Gender and the Politics of Literary Criticism*. Basingstoke and London, 1989; 2d ed., 1998. This anthology surveys the range of feminist critical theory on writing and language that followed early feminist interventions in literary studies, and includes some of the main criticisms of gynocritics. Contributors include Hélène Cixous, Julia Kristeva, Toril Moi, Gayatri Chakravorty Spivak, and Dale Spender.
- Cixous, Hélène. "The Laugh of the Medusa." In *French Feminism Reader*, edited by Kelly Oliver, pp. 257–275. New York and Oxford, 2000. In this essay Cixous begins to develop her theory of *l'écriture féminine*, and calls for women to return to their bodies in writing the feminine as a way of subverting phallogocentric reason. Cixous characterizes this kind of writing as tactile, bodily, and interior, and one that embodies a giving without taking back and without expectation of return, drawing on metaphors of a mother's milk and menstrual blood.
- Daly, Mary. *Gyn/Ecology: The Metaethics of Radical Feminism*. Boston, 1978. *Gyn/Ecology* (a deliberate pun on *gynecology*) is a lively, iconoclastic, and provocative book that maps male domination of women in a wide range of contexts, from Chinese footbinding to American gynecology and the European witch craze. In drawing sweeping parallels between such a diversity of practices, and insisting on their connection, Daly is able to sketch a universal pattern of misogyny that exemplifies the gynocentric approach.
- Griffin, Susan. *Woman and Nature: The Roaring inside Her*. New York, 1978. Griffin writes in her preface to this book that, "I found that I could best discover my insights about the logic of civilized man by going underneath logic, that is by writing associatively, and thus enlisting my intuition, or uncivilized self" (p. xv). What follows in the book is a poetic and fluid, gynocentric exploration of the connections between the female body and nature as a challenge to the history of man's domination over woman and nature.
- Moi, Toril. "Feminist, Female, Feminine." In *The Feminist Reader: Essays in Gender and the Politics of Literary Criticism*, edited by Catherine Belsey and Jane Moore, pp. 117–132. Basingstoke and London, 1989. The title of this essay alludes to the three categories of writing identified by Elaine Showalter in *A Literature of Their Own*. Moi critiques the belief that female experience is the basis of feminism, and argues that the gynocentric approach fails to avoid the dangers of biological essentialism in its depictions of men and women.
- Moi, Toril. *Sexual/Textual Politics: Feminist Literary Theory*. 2d ed. London and New York, 2002. Moi examines the strengths and limitations of the two main strands in feminist criticism, the Anglo-American and the French, and argues against the essentialism of gynocentric approaches to literature, paying particular attention to the works of Cixous, Irigaray, and Kristeva.
- Rich, Adrienne. *Of Woman Born: Motherhood as Experience and Institution*. New York, 1977. Rich's influential and landmark investigation links the experiences of women with the institutions (like motherhood) that are imposed on them and that determine their sense of self. It is also a celebration of motherhood that seeks to revalorize women's identity in gynocentric terms.
- Showalter, Elaine. *A Literature of Their Own: British Women Novelists from Brontë to Lessing*. Princeton, 1977. This work has become a classic of feminist literary criticism and, through a close study of female novelists, presents a detailed argument for gynocritics.
- Showalter, Elaine, ed. *The New Feminist Criticism: Essays on Women, Literature, and Theory*. London, 1986. A useful collection that brings together some of the most influential and controversial essays on the feminist approach to literature that followed from Showalter's development of gynocritics. Particularly relevant are the two articles by Showalter in the volume: "Towards a Feminist Poetics" (pp. 125–143), which is a good summary of gynocritics, and "Feminist Criticism in the Wilderness" (pp. 243–270), which reiterates some of her earlier descriptions of the gynocritical approach and seeks to outline future directions for the feminist study of literature. Other authors in the volume include Rosalind Coward, Sandra Gilbert, Susan Gubar, and Carolyn Heilbrun.
- Showalter, Elaine, ed. *Speaking of Gender*. New York and London, 1989. This volume brings together influential essays by male

and female critics dealing with a broad range of topics in literary studies where gender theory has been applied to the production, reception, and interpretation of texts. Showalter's introduction shows a subtle shift in her earlier commitment to gynocritics, so that it has become possible to start asking questions about the construction of masculinity and its relationship to literature.

Young, Iris Marion. *Throwing Like a Girl and Other Essays in Feminist Philosophy and Social Theory*. Bloomington and Indianapolis, Ind., 1990. See especially chapter 5, "Humanism, Gynocentrism, and Feminist Politics" (pp. 73–91), which assesses the benefits and pitfalls of gynocentric feminism.

SIÂN HAWTHORNE (2005)

**GYŌGI** (670–749), born Koshi no Obito, was a Buddhist monk who popularized Japanese Buddhism during the Nara period (710–784). According to the *Genkō shakusho*, a collection of biographies of priests, Koshi no Obito was born in the Kubiki district of Echigo (present-day Niigata prefecture) to a family that claimed to be descended from Korean royalty. In his youth, because he was so often in the company of birds and cows, he was called Ushitori ("cowbird"), but he soon began to concern himself instead with the needs of his fellow people. His ministrations on behalf of common people attracted hundreds of followers. At the age of fifteen, he "left the world" (i.e., took mendicant orders) and entered Yakushiji, one of the seven great Nara temples. Under the guidance of the monks Eki, Dōshō, and Gien he became acquainted with the doctrines of the Hossō (Skt., Yogācāra) school of Buddhism.

In 694 Gyōgi was ordained a monk by Tokuei, who administered the 250 full monastic precepts (*gusokukai*; Skt., *upasampadā*). He later retired with his mother to Mount Ikona in order to practice austerities. In this action Gyōgi, whose religious name means "foundation of ascetics," followed the example of the mountain ascetic (*hijiri*) En no Gyōja, who had done the same a few decades earlier.

Gyōgi did not persist in this life of retreat, however. Soon he started to travel extensively and to propagate Buddhism, not only in its religious, but also in its magical aspects. At the same time he undertook numerous projects that demanded strenuous physical labor: He constructed roads, built bridges and dikes, and planned and dug out irrigation canals. Gyōgi was a remarkable sculptor and artisan; he in-

vented a new kind of earthenware and is credited with the introduction of the potter's wheel. Also active in welfare work, he built free clinics and lodging houses. In the province of Kii he built forty-nine Buddhist temples. In all these activities he was convinced that his engagement in manual labor was an "expedient means" (*upāya*) to *nirvāna*. Hence his testimony: "That I have attained [understanding of] the *Lotus Sūtra* was possible only through making firewood, gathering herbs, drawing water, and laboring thus." In his sermons he stressed that there was no antagonism between Shintō and Buddhism, and he tried to reconcile Shintō gods and buddhas. It is not accurate, however, to trace to Gyōgi the origin of Ryōbu Shintō, or Shintō-Buddhist syncretism.

Gyōgi's activities and sermons earned the high esteem of Emperor Shōmu (r. 724–749). In 745 he appointed Gyōgi to the office of *daisōjō*, the highest office in the Buddhist hierarchy. At that time, Gyōgi was also sent by the emperor to the sun goddess Amaterasu's shrine at Ise, bearing a Buddhist relic as a present to the deity. By that gift he hoped to receive her approval for the construction of a huge statue of Buddha Vairocana (the Daibutsu) to be erected in the Tōdaiji in Nara, a large temple that had been completed a few years earlier. In a dream Shōmu received the answer of the sun goddess, who said: "This land is the country of the gods. [The people] should worship them. But the wheel of the sun is Dainichi Nyorai [Skt., Mahāvairocana]." With these words Amaterasu identified herself with Buddha Vairocana. Thereupon, Gyōgi traveled about the country to collect money and gold for the construction of the Daibutsu. Although in his lifetime Gyōgi was already considered a *bodhisattva*, he was not granted this title by the emperor until the year of his death. He is considered to be the manifestation of Mañjuśrī, the *bodhisattva* of divine wisdom. Gyōgi died in Tōnanin Hall of Sugiwarara Temple in 749.

**SEE ALSO** En no Gyōja.

#### BIBLIOGRAPHY

Traditional accounts of Gyōgi's life can be found in many sources, including the *Shoku nihongi*, the *Nihon ryōiki*, and the *Genkō shakusho*. For modern secondary sources, see especially Hori Ichirō's *Folk Religion in Japan*, edited and translated by Joseph M. Kitagawa and Alan L. Miller (Chicago, 1968), and H. H. Coates and Ishizuka Ryūgaku's *Hōnen, the Buddhist Saint*, 5 vols. (Kyoto, 1949).

J. H. KAMSTRA (1987)

# H

**HAAVIO, MARTTI** (1899–1973) was a Finnish poet, folklorist, and scholar of comparative mythology and phenomenology of religion whose multifaceted career and comprehensive scholarship stemmed from a deep knowledge of Finnish history. After a childhood spent in Lutheran vicarages in Ostrobothnia, Tavastia, and southwestern Finland, which gave him a taste of the diversity of Finnish folklife, he became one of its leading scholars, analyzing Finnish language, literature, folklore, religion, and culture. As a poet who published under the pseudonym P. Mustapää, Haavio also introduced modernism into Finnish poetry while emphasizing its roots in the past.

Haavio began his scholarly work as a student of Kaarle Krohn, who was the University of Helsinki's first professor of Finnish and comparative folklore, in 1908. Haavio's doctoral dissertation *Kettenmärchenstudien* was based on the principles set forth in Krohn's *Der finnische Arbeitsmethode* (The Finnish work method). The dissertation was published in *Folklore Fellows Communications* (FFC) in 1929, a long-standing folklore series that was later edited by Haavio himself.

In the 1930s field experience and work as director of the Folklore Archives of the Finnish Literature Society made Haavio an expert on various folklore genres, both prose narrative and oral poetry as well as folk beliefs. The genre of Karelian saints legends was introduced as a result of his fieldwork with Nastja Rantsi, a narrator and singer of saints' legends in Onega. Haavio's archive-oriented research produced numerous titles, including *Suomalaisen muinaisrunouden maailma* (The world of Finnish old poetry, 1935); *Suomalaiset kodinhaltijat* (Finnish guardian spirits, 1942), a geographical and psychological study of Finnish folk belief; and *Viimeiset runonlaulajat* (The last rune singers, 1943).

Haavio's rich scholarly output deserves a more thorough presentation than this brief article can undertake. Unfortunately the bulk of his work remains untranslated, despite its many valuable insights into the study of comparative religions. The few samples translated include *Väinämöinen, Eternal Sage* (FFC 144, 1952), a study on the roles of the main hero of the Kalevala (the Finnish national epic) as Orpheus, creator god, and shaman and the oral tradition behind them; *Essais folkloriques* (Studia Fennica 8, 1959), a comparison

---

CLOCKWISE FROM TOP LEFT CORNER. *Vitruvian Man* by Leonardo da Vinci, c. 1490. [©Bettmann/Corbis]; Thirteenth-century relief of the wheel of the sun chariot from Sūrya Temple in Konarak, India. [The Art Archive/Dagli Orti]; Wooden figures of gods at Marae, a temple site near Honaunau, Hawai'i. [©Werner Forman/Art Resource, N.Y.]; The ancient Egyptian god Horus, at Edfu, Egypt. of Finnish sacred vocabulary with Homer, the *Edda*, and other mythological traditions; *Heilige Haine in Ingermanland* (FFC 189, 1963), which compares regional phenomenology of religion on Ingrian sacred groves to Greek *temenos* and Egyptian Osiris.

Haavio's contributions to the disciplines of comparative religion, mythology, and phenomenology of religion in particular could be better appreciated if more of his research were translated. His ability to analyze and write is comparable to that of the well-known religious historian Mircea Eliade. What unites these two scholars is their shared ability to build an intuitive bridge from a single mythical symbol or sacred space to universal spheres of meaning and comprehension.

In his fieldwork Haavio was a master of qualitative methods. He rejected the quantification typical of Krohn and the Finnish Folklore School as well as the sociological approach that emerged after World War II. His emphasis on field observations as purely individual experiences that could not be replicated by any other observer stem from his training in Finnish ethnography but are also related to his perspective as a mainstream scholar and poet.

Haavio's first memoir *Nuoruusvuodet* (Years of youth) is a chronicle of the years 1906 to 1924, but it was not published until 1972. After his death in 1973, his notes and correspondence were compiled by his wife, Aale Tynni, an Ingrian-born poet, and his daughter Katariina Eskola completed their publication through 2003 as a series of books of his correspondence with *Autius lehtipuissa*, a unique narrative history of Finland, filtered through the life and times of a multitalented man.

**HABOUS** SEE WAQF

**HADAD** SEE ADAD

**HADES** is the Greek name for the underworld and its ruler. The spelling of the name sometimes varies (Aides, Hades, Aidoneus), but the etymology seems now reasonably clear. Appropriately, it is linked to the root *\*a-wid-* (invisible, unseen): Hades' wolf's cap is worn by the goddess Athena in the *Iliad* and makes her invisible (5.844–845). Most likely, Hades first denoted a place name and was personified only later.

Hades is a shadowy god in Greece. He has few myths, fewer cults, and is not even represented with certainty on archaic Greek vases. Homer (*Iliad* 15.187–193) mentions that Hades acquired the underworld through a lottery with his brothers Zeus and Poseidon. The passage is one more example of the increasingly recognized Oriental influence on early Greek literature, since it ultimately derives from the Akkadian epic *Atrahasis*. There is an obscure allusion in the *Iliad* (5.395–397) that Hades was wounded by Heracles "at Pylos among the dead." This myth is probably part of Heracles' function as Master of Animals and suggests that the personification of Hades dates back to the Bronze Age.

However, the most famous myth of Hades is his abduction of Persephone, which was localized at various spots in the Greek world. The oldest version is related by the *Homeric Hymn to Demeter*, which probably dates from the first half of the sixth century BCE. When Persephone was frolicking with her friends, "the deep-bosomed daughters of Ocean," on a meadow, picking flowers, Hades carried her off on his golden chariot. Her mother, Demeter, went everywhere to search for her daughter, but eventually it was Hermes who persuaded Hades to release Persephone. However, before doing so, he tricked her into eating seeds of the pomegranate. This meant that she had to spend part of the year with Hades in the underworld and part of the year with her mother in the upper world. The couple became worshiped as Plouton and Kore or, as in Eleusis, Theos and Thea. Understandably, the Greeks could not imagine them to be with children, as the underworld was imagined to be an infertile place. As Persephone was also associated with love and marriage and an abduction was part of Spartan wedding rites, the myth would originally have been a narrative representation of prenuptial girls' rites, although at some point it had become connected with the Eleusinian mysteries.

A god like Hades could hardly receive a cult, and Elis seems to have been the only place that worshiped him in a temple, which could be opened only once a year, with only the priest having access to the temple. Hades was indifferent to offerings and not moved by prayer. His connection with the underworld made him "horrible" (*Iliad* 8.368) and even an eater of corpses (Sophocles, *Electra* 542–543). Fear made people euphemistically refer to him as, for example, "Zeus of the Underworld" (*Iliad* 9.457), "the chthonian god" (Aes-

chylus, *Persians* 629), or even “the god below” (Sophocles, *Ajax* 571).

Evidently, there was not an authoritative tradition about Hades’ appearance. In his *Alcestis* (259–262) Euripides lets the homonymous heroine exclaim: “He stares at me from under his dark-eyed brow. He has wings: it’s Hades,” but normally Hades was wingless in Greek art. In representations of the kidnapping of Persephone, Hades is sometimes depicted as a young man, but he can equally be mature or even old. His positive side comes to the fore in later representations through his holding the cornucopia. Typically, he is sometimes looking away from the other gods—even they did not like him.

In the *Iliad* a soul of the dead goes straight to the underworld, whose gates are guarded by the canine Kerberos (*Iliad* 5.646). The underworld is situated under the earth, but also in the west—perhaps a sign of a conflation of different ideas about the underworld; its deepest part is called the Tartaros. The soul can reach this “mirthless place” (*Odyssey* 11.94) only by crossing a river, the Styx. The picture of the underworld is bleak and somber, as dead Achilles says: “do not try to make light of death to me; I would sooner be bound to the soil in the hire of another man, a man without lot and without much to live on, than be ruler over all the perished dead” (*Odyssey* 11.489–491). It is only somewhat later that we hear of the old (youth is out of place in the gloomy underworld) ferryman of the dead, Charon, and of Hermes as the guide of the dead.

Death was considered to be “common to all men” (*Iliad* 3.236–238). In contemporary mythology, personified death (Thanatos) is the brother of personified sleep (Hypnos). This appears to be another way to express the feeling that death is something natural. Yet these rather bleak pictures could not satisfy everybody, and in Book 4 of the *Odyssey* we already hear of an abode for select dead, “the Elysian Plain at the ends of the earth” (563–567). The somewhat later Hesiodic *Works and Days* (167–173) mentions the Islands of the Blessed, the destination of many heroes at the end of their lives on earth. This changing conception of the underworld went concomitant with a growing interest in the afterlife that reflected itself in accounts of a descent into the underworld, as in the myths of Heracles, Theseus, and Orpheus.

In the same process the underworld also gradually became “upgraded.” At the Eleusinian mysteries there had long been a promise of a better life in the hereafter, as is illustrated by Sophocles’ words: “Thrice blessed are those mortals who have seen these rites and thus enter Hades: for them alone there is life, for the others all is misery” (frag. 837, Radt). In Pythagorean and Orphic circles, however, the idea arose of a “symposium of the pure” (Plato, *Republic* 2.363c). At the same time, the Orphics developed the idea of a kind of hell, where sinners had to wallow in the mud. Hades only now developed into a judge of the dead.

This reevaluation of the afterlife reflected itself also in the early fifth century when Hades became identified with an

originally different god, Plouton, “wealth” personified, who was related to the Eleusinian cult figure Ploutos, and in this capacity even received a priestess. Hades now became the god who sent up “good things” to the mortals from below. The connection between the underworld and material wealth also reflected itself in new terms to denote the dead. Whereas in Homer the dead were preferably called the “feeble heads of the dead,” they now become the “blessed” in a materialistic sense: the dead were people blessed with material goods and better off than the living. In the later fifth century these ideas about the “good life” in the underworld were even exploited by Athenian comedy, which portrayed the world of Hades as a Land of Cockaigne with beautiful maidens and boisterous banquets.

Yet on the whole the Athenian public did not firmly believe in rewards or punishments after death. In fact, they do not seem to have expected very much at all. “After death every man is earth and shadow: nothing goes to nothing,” states a character in Euripides’ *Meleagros* (frag. 532, Nauck, 2d ed.). In Plato’s *Phaedo* Simmias even claims that it is the fear of the majority that their soul is scattered at death “and this is their end” (77b). Most Athenians may therefore have agreed with the statement in Euripides’ *Hypsipyle* that: “One buries children, one gains new children, one dies oneself. Mortals do take this heavily, carrying earth to earth. But it is necessary to harvest life like a fruitbearing ear of corn, and that the one be, the other not” (vv. 234–238, in the edition by J. Diggle).

The early Greek ideas about the afterlife remarkably resemble those of Rome and ancient Israel. In ancient Rome people seem hardly to have believed in a life after death at all, even if they worshiped their ancestors at certain festivals; the Etruscans certainly took over Hades from the Greeks in the shape of their Aita, but lack of texts (albeit plenty of illustrations) does not allow us to reconstruct their “infernal” ideas. It was perhaps not that different in ancient Israel. In historical times the hereafter was called She’ol, which in the Greek translation of the Hebrew Bible, the Septuagint, normally is translated as *Hades*. Yet in the oldest Israelite ideas the grave must have played an important role, since “to go down into the grave” (*Ps.* 16:10, 28:1, etc.) is equivalent to “to go down into She’ol” (*Gn.* 37:35, 42:38, etc.). She’ol was located beneath the earth (*Ps.* 63:10), filled with worms and dust (*Is.* 14:11, 26:19), and impossible to escape from (*Jb.* 7:9ff). Its shadowlike (*Is.* 14:9) inhabitants no longer thought of the living (*Jb.* 21:21), or even of God himself (*Ps.* 88:13). It is only in a relatively late prophet like Ezekiel (*Ez.* 32:19–28) that we hear about different areas of She’ol for different orders of dead. However, it would still be quite a while before radical new ideas about the resurrection from the dead would take shape.

The dominant idea of the underworld in the ancient Mediterranean, then, seems to have been a relatively dim underworld with people focusing on life on this earth. This attitude proved to be highly tenacious, and, even if minority

views existed about a happier hereafter, it lasted well into Byzantine times before the more joyful ideas about the Christian heaven started to prevail over the traditional, grimmer views of the ancient Hades.

JAN N. BREMMER (2005)

**HADĪTH.** The Arabic word *ḥadīth* literally means *speech* and also *new*: because speech is created as it is uttered, it is always new. Following Prophet Muḥammad's death (632 CE), people engaged in speech about him so much that the word *ḥadīth* was eventually reserved for speech related to the Prophet, including his own speech; it then came to refer to the sayings of the Prophet and his companions, and finally only to the sayings of the Prophet himself.

*Sunnah* (lit., a beaten track) is a parallel word to *ḥadīth*, as both refer to the speech and conduct of the Prophet, yet the two usages initially signified different shades of meaning. *Ḥadīth* denoted speech or word whereas *sunnah* signified actual conduct, or the way of doing something. It was, however, difficult to draw a clear line between words and deeds, especially in light of the fact that the narrations of compan-

ions referred to both the sayings and the deeds of the Prophet. Hence the difference between *sunnah* and *ḥadīth* gradually faded and they became synonymous. This was further confirmed by Imām Muḥammad ibn Idrīs al-Shāfi'ī (d. 820), who maintained that no *sunnah* could be proven without a valid *ḥadīth*, and the view thus prevailed that *ḥadīth* signifies not only the speech but also the acts and conduct of the Prophet. A technical difference that still remains, however, is that *sunnah* refers to the law or value that is contained in a *ḥadīth*; hence, a *ḥadīth* does not necessarily contain a *sunnah*. *Sunnah* (or *ḥadīth*) is the most authoritative source of Islam next to the Qur'ān; it is both explanatory in relation to the Qur'ān and a source in its own right. The Qur'ān provides the affirmation that "he (the Prophet) speaks not of his desire and what he says is based on revelation And whatever the Messenger brings to you, take it, and whatever he forbids you, abstain from it" (53:3). Elsewhere the Qur'ān also makes it a religious obligation of every Muslim to obey the Prophet (4:59; 59:7). To this al-Shāfi'ī (d.820) added the argument, which seems to have been current before this time, that when the Qur'ān spoke of "the Book and the Wisdom (*al-kitāb wa'l-hikmah*)," which it does on seven occasions in this order, it meant Qur'ān and Sunnah. The *ḥadīth* thus represented divine guidance, and the conclusion was drawn that all authentic *ḥadīths* must be unquestioningly accepted and obeyed.

*Khabar* (lit., "news"; pl. *akhbār*) is also synonymous with *ḥadīth*, especially among the Shī'ī writers, as they include not only *ḥadīths* but also the sayings of their recognized *imāms* within the meaning of *khabar*. The Shī'ī *imām*, being a member of the Prophet's family (i.e., the *ahl al-bayt*) is deemed to have inherent knowledge (*al-'ilm al-ladunni*) of the Sunnah of the Prophet, transmitted from father to son down the line of descent. There is, however, a tendency among Shī'ī writers, too, to reserve *Sunnah* for the Sunnah of the Prophet alone, whereas *khabar*, and *ḥadīth* can include both the *ḥadīth* proper as well as the sayings of the *imām*.

Lastly, *āthār* (lit., "vestige") refers to the sayings, opinion (*fatwa*), and precedent of the companions. The phrase *'ilm al-ḥadīth* ("science of *ḥadīth*") refers to *ḥadīth* literature as well as to the methodology and critical standards used to authenticate the *ḥadīth*.

*Ḥadīth qudsī* ("sacred *ḥadīth*") is the name given to a unique variety of *ḥadīth* wherein the Prophet attributes what he says directly to God. In the eleventh century CE, the question arose whether the *ḥadīth qudsī* was to be regarded as part of the Qur'ān, which by definition consisted of the revealed speech of God, or was to be attributed to the Prophet. *Ḥadīth* scholars concluded that while the message of the *ḥadīth qudsī* comes from God, it is in the words of the Prophet—and thus cannot be considered part of the Qur'ān. For this reason only the Qur'ān, and not the *ḥadīth qudsī*, may be recited during ritual prayer (*ṣalāh*). Even so, *ḥadīth* scholars generally treat the *ḥadīth qudsī* as a superior class of *ḥadīth*. A total of about one hundred *ḥadīth qudsī* have

been recorded, and their authenticity is measured by the same criteria and standard as are applied to *ḥadīths* generally. Muhyī al-Dīn ibn al-‘Arabī (d. 1240) compiled a collection of 101 *qudsi ḥadīths* bearing the title *Mishkat al-Anwar*. Later Mulla ‘Alī al-Qari (d. 1605) selected forty such *ḥadīths*, and this collection has become widely adopted by many subsequent authors.

**RECEPTION AND DOCUMENTATION.** As a general rule, every *ḥadīth* must be supported by a reliable *isnād* (chain of transmission) consisting of the names and identity of its transmitters. The number of transmitters in the *isnād* tends to increase with every successive generation. Sometimes a *ḥadīth* that is transmitted by one companion is then transmitted by a number of persons in the next generation who may happen to be residing in different localities. This raises the question of how the particular transmitter obtained the information from his immediate source. Was it through direct hearing (*samā’*) and personal contact, or through other means of communication? Various methods of reception (*tahammul*) have thus been identified, which include, in addition to *samā’*, such methods as submission (*‘ard*) and recitation (*qirā’at*) of a *ḥadīth* to the master for his approval, permission (*ijāza*) to transmit *ḥadīth*, handing over (*munawala*) of the master’s materials to the student, correspondence (*mukataba*), declaration (*i’lam*) by the master of his own source, bequest (*wasiyya*), and finding (*wijada*) by the student of *ḥadīth* in the master’s handwriting. Following the large-scale documentation of *ḥadīths* in the ninth century, most *ḥadīth* scholars began to employ special terms in the *isnād* literature that indicate the method by which the *ḥadīth* had been transmitted; this has remained the most common method to this day. Most people nowadays find *ḥadīths* in one of the standard collections and when quoting them make reference to the latter.

*Isnāds* can consist of one or two links, or of as many as half a dozen or more; the smaller the number of links, the shorter the time lag between the demise of the Prophet and the transmission of the *ḥadīth*. Thus *isnāds* are divided into two types, namely *elevated* (*al-isnād al-‘alī*), which consist of fewer links and transmitters, and *descended* (*al-isnād al-nāzil*), which may involve a large number of transmitters. Most *ḥadīths* were compiled long after the time of the Prophet, but some were compiled relatively early. Ḥammām ibn al-Manabbih (d. 722), for instance, recorded his collection (*sahīfa*) around 672. His *ḥadīths* consisted mainly of one link, namely a companion. Imām Mālik (d. 796) related *ḥadīths* in his *Muwatta* (Straightened path) that had been told to him by Nāfi’, who had heard them from ‘Abd Allāh ibn ‘Umar, who had heard them from the Prophet, thus making for two intervening links. Elevated *isnāds* of this kind are also frequent in the collection of *ḥadīths* compiled by the renowned Muḥammad ibn Muslim ibn Shihāb al-Zuhrī (d. 742). Shorter *isnāds* are naturally preferable, which is why some of them have been variously labeled *silsilat al-dhahab* (“golden chain”), or *asahh al-asānid* (“soundest of *isnāds*”) and so forth. *Ḥadīth* scholars are of the view that because

*isnād* is the conveyor of the teachings of the Prophet, it is a part of the religion. Hence a diligent and conscientious rendering of *isnād* is believed to be an act of merit that gains the pleasure of God.

The Prophet is reported to have discouraged documentation of his own sayings in order to prevent confusion between the Qur’ān and *ḥadīth*. Many of his leading companions were consequently against documentation of *ḥadīth*; at the same time, however, many others among them considered it permissible and actually wrote *ḥadīths* for their own collections. There are also reports that during the latter part of his ministry, that is, when much of the Qur’ān had already been documented, the Prophet permitted some of his companions to write *ḥadīths*, and even instructed them “to preserve knowledge through writing.” It seems, then, that after an initial period of hesitation, the basic permissibility of writing and documenting *ḥadīths* was accepted and this activity became, in due course, a major preoccupation of the ‘ulamā’ during the second and third centuries of Islam. But even in the early stages, renowned companions such as ‘Alī ibn Abī-Ṭālib (d. 661), ‘Abd Allāh ibn ‘Umar (d. 690), Sa’d ibn ‘Ubada (d. 671), and Samura ibn Jundub (d. 681) are known to have documented *ḥadīths* in small booklets, or *sahīfas*. Jābir ibn ‘Abd Allāh (d. 699) compiled a larger *sahīfa*, and ‘Abd Allāh ibn ‘Amr ibn al-‘Āṣ (d. 681) compiled one that became known as *al-sahīfa al-sādiqa* (“the true collection”). One of the earliest documented *ḥadīths* of that period to have survived in its original form is the renowned *Constitution of Madina* (*Dustūr al-Madina*, c. 622).

Recent research by Muslim scholars concerning the early documentation of *ḥadīths* has suggested the need for a revision of some of the negative conclusions Western Islamologists have drawn regarding the time frame and authenticity of the early collections. Twentieth-century scholars including Muḥammad Hamīdullāh, Subhī al-Sālih, Abul Ḥasan al-Nadwī, and Muḥammad Muṣṭafā A‘zamī have questioned the conclusions of Ignác Goldziher, Joseph Schacht, G. H. A. Juynboll, and others who cast doubt on the authenticity of the bulk of *ḥadīths*. The most extreme position on the authenticity of the *ḥadīths* is that of Joseph Schacht, who took Goldziher’s observations a step further to conclude that “every legal tradition from the Prophet, until the contrary is proved, must be taken, not as an authentic . . . statement . . . but as a fictitious expression of a legal doctrine formulated at a later stage” (*The Origins of Muhammadan Jurisprudence*, 1950, p. 149). For their part, Muslim commentators have maintained that documentation of *ḥadīths* took place much earlier than suggested by Schacht and others. Two decades after the publication of *The Origins of Muhammadan Jurisprudence*, Nabia Abbott tried to balance Schacht’s somewhat sweeping conclusions. Based on a group of papyri dealing with *ḥadīths*, she concluded that several thousand authentic *ḥadīths* had been documented during the first century of Islam. Her study also emphasized the attentiveness and care of important *ḥadīth* scholars, such as

al-Zuhrī and others after him. A more direct rebuttal of Schacht's position can be found in Muḥammad Muṣṭafā A'zamī's *On Schacht's Origins of Muhammadan Jurisprudence* (1985), which argues that many of Schacht's conclusions on the authenticity and documentation of *ḥadīths* are exaggerated and unreliable.

**TYPES OF HADĪTH.** The pious Umayyad Caliph 'Umar II (d. 711) asked the leading scholars of Mādina, Abū Bakr Muḥammad ibn Ḥazm (d. 715), al-Qasim Muḥammad ibn Abū Bakr (d. 728), and al-Zuhrī to collect and document *ḥadīths*, while taking care to "accept nothing other than the *ḥadīth* of the Prophet." But the caliph died soon afterwards and it was al-Zuhrī, the teacher of Imām Mālik, who persisted and attempted what proved to be the first major documented collection of *ḥadīths*. Al-Zuhrī's work marked the beginning of a movement that was to be continued by many others in the eighth and ninth centuries. Yet al-Zuhrī's own collection was subject-oriented and consisted of separate booklets for individual subjects that were neither well consolidated nor classified. He documented all the information that he had received from the companions and followers (*tābi'ūn*) concerning *ḥadīths*, and often integrated the companion's own statement into the prophetic *ḥadīths*. This manner of treatment can also be seen in Imām Mālik's *Muwatta*, one of the earliest collections of *ḥadīths* after al-Zuhrī's, which would probably have been the most authoritative, even among the standard collections, had it not been for its tendency to confound the *ḥadīth* with the *āḥbār* of companions. To distinguish these two and separate them from one another became one of the principal preoccupations of collections from later periods. The major ninth-century collections, discussed below, employed new methodology and critical standards. They attempted to more carefully verify the reliability of the *isnāds* and began to classify and distinguish the *sahīh* ("sound," "reliable") *ḥadīth* from the *da'if* ("weak") *ḥadīth*.

*Ḥadīth* literature has developed in several stages, each marking some new development in the writing methods and classification of *ḥadīths*. The *sahīfa* collections, to which reference has already been made, contained the earliest documented *ḥadīths* on record, but were not classified; they consisted simply of written records of *ḥadīths* on a variety of subjects, and were mainly written for the personal use of their authors. Many companions recorded *ḥadīths* in this form, which naturally come first in order of reliability and closeness to the source. Next came the *musannaf* ("classified") collections, which collated *ḥadīths* on separate themes, organizing them under headings and into chapters. Famous in the *musannaf* category were the *Muwatta* of Imām Mālik, the *Musannaf* of Ma'mar ibn Rāshid (d. 770), and the *Musannaf* of 'Abd al-Razzāq ibn Humam al-San'ani (d. 827).

Then followed the *musnad* (lit., "supported") collections, which favored *isnāds* that linked a *ḥadīth* to the Prophet through the reports of companions. All *ḥadīths* that were

narrated by one companion, regardless of subject matter, were put under his or her name, the main purpose being to preserve the largest possible number of *ḥadīths*. Famous in this category was the *Musnad* of Imām Aḥmad ibn Ḥanbal (d. 855), which contains about 40,000 *ḥadīths*, including 10,000 repetitions, reported by about seven hundred companions. Other works in this category include the *Musnad* of Abū Dāwūd Sulaymān al Ṭayālīsī (d. 819), and the *Musnad* of ibn Najjār (d. 876), among many others. Some of the *musnad* works are arranged alphabetically and some according to region and tribe. Although considered to be richest of all in scope and content, the *musnad* collections are not easy to use because they are not classified by subject.

The *sahīh* ("sound," "reliable") collections marked the fourth and basically the last stage in the development of *ḥadīth* literature. The six standard Sunnī collections of *ḥadīths*, known as *al-sihāh al-sitta*, were all compiled around the mid-ninth century and have remained the most authoritative to this day. *Sahīh al-Bukhārī* and *Sahīh Muslim* are often referred to collectively as *sahīhayn* ("the two sound collections"), but even so, they do not include all the *sahīh ḥadīths* on record, as some have appeared in other collections. Because their compilers, Muḥammad ibn Ismā'il al-Bukhārī (d. 870) and Muslim ibn al-Hajjāj (d. 875), did not set out to include every *sahīh ḥadīth* in their collections, it follows that a *ḥadīth* may not be labeled unsound or unreliable simply because it did not appear in either of these two collections.

Before discussing the six standard *ḥadīth* collections in some detail, it is necessary to introduce the three-fold classification of *ḥadīths* into the *sahīh*, *ḥasan*, and *da'if* categories.

The *sahīh ḥadīth* is defined as one with an unbroken chain of transmission, consisting of upright persons who also possessed retentive memory, going all the way back to the Prophet or a companion; its content is not outlandish (*shādh*)—in the sense that it does not contradict another reliable *ḥadīth*—and it is free of both obvious and subtle defects. It is, in other words, a *ḥadīth* that is free of defects in respect both to its *isnād* and its content (*matn*). *Sahīh ḥadīth* are also subdivided into those on which there is general agreement, and those on which the 'ulamā' have disagreed. Furthermore a *ḥadīth* may be *sahīh* in its own right (*sahīh li-dhātih*), in that it fulfills all the requirements of *sahīh*, or it may be *sahīh* due to an extraneous factor (*sahīh li-ghayrih*), as in cases where doubts about the memory of a *ḥadīth*'s narrator have been removed due to confirmation from another source.

*Ḥadīth* transmitters have been classified into a number of categories, with respect to their uprightness, reliability, and retentiveness. Without entering into technical details, it can be said that a *sahīh ḥadīth* is one for which the transmitters belong to the first three most reliable classes of narrators: the companions, the renowned *imāms*, and scholars of *ḥadīths*. As opposed to this, a *ḥasan* ("fair") *ḥadīth* is one for which the transmitters belong to the next three categories, consisting of those who are not among the most prominent

and about whom some doubt persists concerning the retentiveness of their memory and the accuracy (*dabt*) of their reports. A *daʿif* (weak) *ḥadīth* is defined as one that fails to meet the requirements of the *sahīh* and *ḥasan* classifications, and its transmitters include one or more persons of questionable reliability. The weakness in a *daʿif ḥadīth* may be in the *isnād* or in the text. There are many subvarieties of the *daʿif* category. The term *mursal* (lit., “sent free”), for example, refers to a *ḥadīth* with an *isnād* that is missing a link at the level of a companion—in other words, a follower (*tābiʿī*) has directly relayed it from the Prophet. But even the *mursal* is sometimes accepted if it is reported by a highly reliable person, such as the *imāms* al-Shāfiʿī or Mālik.

*Ḥadīths* have also been classified into three types based on the number of their narrators. The first of these is the *mutawatir* (“continuously recurrent”) type, those that have been reported by a large enough number of people to preclude the possibility of collusion or fabrication. A *ḥadīth* that is reported by only a small group of individuals is known as an *aḥad*, or solitary *ḥadīth*, and, finally, a *ḥadīth* that is called *mashhūr* (“well-known”) is one that became widespread during the first three generations following the demise of the Prophet.

**THE SIX STANDARD COLLECTIONS.** The compiler of the *Sahīh al-Bukhārī*, al-Bukhārī, came from Bukhara in Asia Minor. He traveled widely and devoted some sixteen years to the compilation of his *Sahīh*. He interviewed over a thousand *ḥadīth* transmitters in the Hijāz, Egypt, Iraq, and Persia and collected as vast number of about 600,000 *ḥadīths*, from which he selected 9,082 *ḥadīths*. Discounting all the repetitions, *Sahīh al-Bukhārī* contains 2,602 *ḥadīths*, divided into 106 chapters and under numerous subheadings. The repetitions here, as in other collections of *ḥadīths*, occur on account of the presence of more than one chain of *isnād* for one and the same *ḥadīth*. They are all listed on the assumption that multiple *isnāds* add to the reliability of a *ḥadīth*. It was al-Bukhārī’s declared purpose to include in his collection only *sahīh ḥadīths* narrated by upright and retentive individuals who had met with one another within the same generation or within two adjoining generations. Al-Bukhārī followed al-Zuhrī’s methodology and criteria in the selection of *ḥadīths*. The first link in al-Bukhārī’s *isnād* is usually a verified companion. This is followed, in turn, by two upright followers, or by one follower who is verified by at least two other narrators. The third link in al-Bukhārī’s chain of *isnād* usually consists of an upright and retentive successor (*tābiʿī tābiʿī*) from whom other narrators have also reported. The fifth link in al-Bukhārī’s *isnād* is likely to be his own teacher, or *shaykh*. It was important for al-Bukhārī to ensure that at any stage of the *isnād* a *ḥadīth* had been narrated by at least two people, be it a companion, follower, or successor. This is only a general characterization of al-Bukhārī’s *isnād*, as exceptions are found—for example, in the case of a companion, Midras al-Aslamī, whose *ḥadīths* al-Bukhārī included, even though only one person, Qays ibn Hazim, has reported *ḥadīths* from him.

Al-Bukhārī himself entitled his work *al-Jamīʿ al-Sahīh al-Musnad al-Mukhtasr min Ḥadīth Rasūl Allāh wa Sunanih wa Ayyamih*. This name is indicative of al-Bukhārī’s methodology and approach: the word *al-Jamīʿ* (lit., “comprehensive”) signifies that the work’s coverage extends to eight areas. These are dogmatics (*ʿaqāʿid*), legal rules (*ahkām*), moral teachings (*al-riqāq*), the etiquette of eating and drinking (*adab al-taʿam waʿl-sharāb*), Qurʾanic commentary, the history and biography of the Prophet (*al-tafsīr, waʿl-tārīkh waʿl-siyar*), travel and movement (*al-safar waʿl-qiyām waʿl-quʿud*), turmoil and tumults (*al-fitān*), and the virtues of the Prophet and his companions (*al-manāqib*). The word *al-Sahīh* in al-Bukhārī’s title signifies that he did not knowingly include a weak (*daʿif*) *ḥadīth* in his collection, whereas the word *al-Musnad* implies that all the *ḥadīths* he compiled were supported by verified *isnāds* going all the way back to the Prophet. Al-Bukhārī was the first to compile a comprehensive collection of this kind, and his methodology was generally followed by Muslim ibn al-Hajjāj.

Muslim ibn al-Hajjāj’s *Sahīh Muslim* is the next most authoritative of the six collections of *ḥadīths* that are currently in use, except in North Africa and the Maghreb, where *Sahīh Muslim* is ranked first. This reverse order of ranking is basically due to *Sahīh Muslim*’s superior classification system, which makes it easier to use than *al-Bukhārī*. *Sahīh Muslim* consists of 10,000 *ḥadīths* that can be reduced to just over 3,000 without the repetitions. Muslim ibn al-Hajjāj also traveled extensively in search of *ḥadīths* and interviewed a large number of transmitters over a period of fifteen years. Muslim ibn al-Hajjāj went on record to say, in the introduction to his *Sahīh Muslim*, that he showed his work to Abū Zaurʿa al-Rāzī, the renowned scholar and teacher of *ḥadīth* of his time and that Al-Rāzī had criticized some *ḥadīth* transmitters that Muslim had included in his chains of *isnad* as being unreliable and that al-Rāzī had found a hidden defect (*ʿillah*) in others. Muslim then added that he removed what al-Rāzī had criticized and doubted and included everything he had approved as *sahīh* (sound) *ḥadīths*. He also wrote that he intended to purify the *ḥadīths* of the accretions of storytellers, the input of those who were moved by ignorance and prejudice, and the influence of heretics.

A point of difference between al-Bukhārī and Muslim ibn al-Hajjāj can be noted with regard to their respective treatment of the *isnād*. Al-Bukhārī not only verified that contiguous links in the *isnād* were contemporaries, he also made sure that they had actually met. For Muslim ibn al-Hajjāj it was sufficient if the two were contemporaries, even if he could not prove they had not actually met. Muslim ibn al-Hajjāj was content, in other words, with the possibility of an actual encounter between teacher and disciple.

Commentators have noted that more of al-Bukhārī’s narrators meet the requirements of just character (*ʿadala*) and retentiveness (*dabt*) than do those of Muslim ibn al-Hajjāj. Of the total of 430 or so of al-Bukhārī’s narrators, the critics have identified 80 as being of questionable stand-

ing or weak, whereas 160 of the total of 620 of Muslim ibn al-Hajjāj's narrators are said to be weak. About 89 of al-Bukhārī's *ḥadīths* have been identified as having some defect, whereas for Muslim ibn al-Hajjāj the figure stands at one hundred.

The *Sunan* (pl. of *sunnah*, lit., “beaten track”) collections specialize in legal *ḥadīths*, known as *ahādīth al-abkām*. The various chapters of *sunan* works are thus devoted to topics such as rules pertaining to cleanliness, prayers, fasting, and the *ḥajj* pilgrimage, as well as marriage, divorce, child custody, inheritance, and so forth. The *Sunan Abū Dāwūd* of Sulaymān ibn Ash'ath al-Sijistānī (d. 888), which consists of 4,800 *ḥadīths*, stands out for its comprehensive treatment of legal *ḥadīths*. Abū Dāwūd did not confine his *Sunan* to the compilation of *sahīh ḥadīths*, but also included *ḥadīths* in the *ḥasan* (“fair”) category. Abū Dāwūd claimed, however, that whenever a *ḥadīth* seemed weak to him, he identified it as such and specified its point of weakness. This would imply that when he did not specify any weakness in a *ḥadīth*, it was deemed to be *sahīh*. *Sunan Abū Dāwūd* has been ranked third in order of reliability after *al-Bukhārī* and *Muslim*. Abū Dāwūd also traveled widely in his quest to collect and verify *ḥadīths* and acquired such a reputation as a teacher of *ḥadīths* that students came to him from wide and far.

The *Sunan al-Nasā'ī* of Ḥāfiz Abū 'Abd al-Raḥmān Aḥmad ibn Shy'ayb al-Nasā'ī (d. 915) stands next in order of ranking to after the *Sunan Abū Dāwūd*, and consists of 5,000 legal *ḥadīths*, of which a great deal had already appeared in previous collections. Nasā'ī wrote his *Sunan* in two stages. His initial collection, entitled *Al-Sunan al-Kubrā* (the greater *sunan*), contained *ḥadīths* in the three categories of Sound, Fair, and Weak, and was presented to the Abbasid ruler of Ramla in Palestine. Nasā'ī was then asked to compile a work that only contained *sahīh ḥadīths*, and so he winnowed the *Al-Sunan al-Kubrā* down to a smaller collection named *Al-Mujtaba min al-Sunan* (The select from the *sunan*). This version is the one currently in use and is said to contain very few defective or weak *ḥadīths*. *Al-Nasā'ī* is ranked equally with the *Sunan Abū Dāwūd*, yet the latter is preferred as it provides additional insights of interest to jurists.

Next in the *sunan* category is *Sunan al-Tirmidhī* by Abū 'Isā Muḥammad al-Tirmidhī (d. 915), which is also included among the six standard collections. *Ḥadīth* scholars have placed this work in the *sunan* category due to its arrangement and the style of its chapters, which are both in line with works of jurisprudence (*fiqh*). Some have also placed *al-Tirmidhī* in the *jamī'* (“comprehensive”) category, as it is not strictly confined to legal *ḥadīths*. One of the distinctive features of this work is that it first gives the principle *isnād* of a *ḥadīth*, and then gives other alternative *isnāds*. It focuses on *ḥadīths* that were practiced and generally accepted by Muslim jurists, and is thus thought to be free of spurious *ḥadīths*, even though it is not totally devoid of ones that are weak or defective.

The last of the *sunan* among the six standard collections is *Sunan Ibn Mājah*, by Muḥammad ibn Yazīd al-Qazwīnī, better known as ibn Mājah (d. 886). The book contains 4,341 *ḥadīths*, of which 3,002 had been recorded by previous authors, leaving 1,339 *ḥadīths* recorded by ibn Mājah alone. *Sunan Ibn Mājah* contains *ḥadīths* in all three categories of Sound, Fair, and Weak, which is why it was not included among the six standard collections until the early twelfth century, when Muḥammad ibn Ṭāhir al-Maqīsi (d. 1227) included it among a list of reliable works—after which other writers followed suit. Until that time, the *Muwatta* of Imām Mālik had been ranked as the sixth of the leading *ḥadīth* collections, but the *Muwatta* contained very little that was not already known, and thus came to be considered less important than the *Ibn Mājah*.

**CRITICISM.** The main purpose of *ḥadīth* criticism is to verify the authenticity of a *ḥadīth* through methods of enquiry that roughly resemble double-checking and cross-examination. The Prophet is reported to have said in a *ḥadīth*, “One who intentionally tells a lie about me, let him be sure of his place in Fire (of Hell).” This and other similar prophetic warnings led to a cautious approach on the part of the companions and other *ḥadīth* transmitters, who were mostly careful not to narrate *ḥadīths* about which they had doubts. The four early Islamic caliphs (*khulafā' rāshidūn*) made a point of criticizing some of their fellow companions who narrated *ḥadīths* that were not directly known to them, or that they had doubts about. Some of the less reliable seeming were asked to produce evidence of the veracity of their reports. The subsequent spread of *ḥadīths* to remote parts of the Islamic domain also gave rise to apprehensions about the presence of error and distortion in *ḥadīths*. A separate branch of *ḥadīth* studies, known as *al-jarḥ wa'l-ta'dīl* (“impugnment and validation,” also known as *naqd al-ḥadīth*, or *ḥadīth* criticism), was developed as a result, and numerous writers in almost every period contributed to its growth. Yaḥyā ibn Ma'īn (d. 847), 'Alī al-Madīnī (d. 848), and Imām Aḥmad ibn Ḥanbal were the early pioneers, after which almost every leading scholars of *ḥadīths*, including al-Bukhārī, Muslim ibn al-Hajjāj, Abū Dāwūd, Nasā'ī, and others wrote one or more books on the biographies of *ḥadīth* transmitters, their strengths and weaknesses, and factors that influenced the reliability of their reports. A vast body of biographical literature, known as *asmā' al-rijāl* (lit., “names of authorities”) and *tabaqāt* (“generations of *ḥadīth* transmitters”), developed as a result.

Whenever the reliability of a *ḥadīth* transmitter is questioned, two approaches are possible: one is to attempt a validation (*al-ta'dīl*) of the transmitter's reliability and uprightness, the other is to enter into a process of disqualification known as *al-jarḥ* (lit., “wounding,” “impugnment”). The methods by which impugnment is attempted are, on the whole, more rigorous than what is usually required for validation. *Ḥadīth* scholars have employed special terms that indicate grades of reliability, and also ones that suggest degrees of weakness. Terms such as *thabṭun* (“proof”), *hujjatun* (“strong,” “firm”), *ḥāfiz* (“retentive”), and *dabīṭ* (“accurate”),

in reference to transmitters, indicate the first degree of *ta' dīl*, whereas expressions such as *ṣadūq* ("truthful"), *sāliḥ al-ḥadīth* ("fit to narrate ḥadīth"), and *la bā sa bibi* ("no objection") tend to come next in ranking. Impugnment is established through the use of terms such as *majhūl* ("obscure"), *dā'if* ("weak"), *matruk* ("abandoned"), *mut-taham bi'l-kidhb* ("accused of lying"), and *kadhḥāb/waddā'* ("liar," "forger"). Broadly speaking, specifying the grounds for one's assessment is necessary for impugnment, but not for validation. *Ḥadīth* scholars thus tend to validate transmitters in a few words without elaborating on their good qualities, whereas brevity of this kind is not enough for purposes of impugnment.

Comparison of sources and checking on dates and localities are among the most commonly employed methods of *ḥadīth* criticism. To verify the accuracy of a doubtful *ḥadīth*, comparison is attempted between the various versions of the *ḥadīth* reported by different students of one scholar, or between statements made by the same scholar at different times, or between the *ḥadīth* and the relevant text of the Qur'ān, and so forth. In some cases where a disciple claims to have received a *ḥadīth* directly from a teacher, further examination of their respective localities and dates proves that the two could not have met. Some other grounds of impugnment that *ḥadīth* scholars have listed include:

1. Attribution of lies and falsehood to the Prophet.
2. A reputation for telling lies, even if no specific charge is proven.
3. A reputation for negligence and mistakes.
4. Sinful conduct, whether consisting of words or acts.
5. A reputation for making improbable statements and indulgence of the imagination (*wahm*).
6. Disagreement with reliable authorities and narrators.
7. Obscurity and lack of clear personal identification.
8. Advocacy of pernicious innovation (*bid' ah*).
9. Bad memory.

Validation and impugnment are only acceptable from qualified and impartial persons. Although backbiting (*ghība*) is normally forbidden, *ḥadīth* scholars have generally held it to be permissible to the extent that it is necessary in the context of impugnment.

**AUTHENTICITY.** The prerequisites that every *sahīh ḥadīth* must fulfill to be considered authentic may be summarized as follows:

1. The *ḥadīth* must be supported by a sound and verified *isnād*.
2. It is required that every link in the *isnād* was known as an upright and respected person (*'adl*) at the time they reported the *ḥadīth*, even if they did not yet have that reputation when they received it. The minimum requirement of uprightness (*'adala*) is that the person be

free of grave sins (*kabā'ir*) and not have persisted in committing minor sins (*saghā'ir*) or degrading or profane acts, such as associating with persons of ill-repute, making silly jokes, or exhibiting antisocial behavior. The fundamental positive behaviors that *'adala* is associated with are observance of religious duties and personal decorum (*murū'a*). The different schools of law tend to differ on such issues as whether or not the holding of views that amount to pernicious innovation (*bid' ah*) or caprice (*hawā'*) is grounds for disqualification—though generally such views are permitted in a narrator, unless the person is actively engaged in inviting others to embrace them. Various methods have been identified by which to verify the probity of person, including, for example, *tazkiya* (lit., "purging"), which may consist of testimony from witnesses, character references from colleagues, or consideration of general local reputation.

3. None of the transmitters in an *isnād* can be implicated in forgery, or in sectarian, political, or theological disputes, especially in cases where such disputes are actually related to the theme of the *ḥadīth*.
4. The transmitter must be a contemporary of the teacher on whose authority he related the *ḥadīth*. As mentioned above, al-Bukhārī further stipulated that the two must have actually met. Some have also specified that it is necessary for the narrator to have been certain of the reliability of his teacher.
5. The transmitter must qualify as *dabt*—that is, they must possess a retentive memory and be capable of accurate renderings of *ḥadīths*.
6. The transmitter must not be obscure or unknown (*majhūl*): at least two upright persons must have narrated a *ḥadīth* from them. Only the companions are exempt from this requirement.
7. The text (*matn*) of a *ḥadīth* must be in the dignified style of the prophetic language. The presence, therefore, of obscene, ridiculous, or objectionable elements is taken as a sign of forgery.
8. The text and message of a *ḥadīth* must be consistent with the Qur'ān. A clear and irreconcilable conflict with the Qur'ān would thus render the *ḥadīth* unacceptable.
9. A *ḥadīth* is also rejected if it fails the test of historical evidence. A *ḥadīth*—for example, that the Prophet said such and such in a public bath in Medina—is rejected simply because no public bath existed in Medina at the time.
10. The text of a *ḥadīth* must not be contrary to reason. For instance, a *ḥadīth* claiming that the parents of the prophet Muḥammad rose from the dead to embrace Islam would be rejected.

**MODERN ATTITUDES.** Modern Islamic scholars and the majority of Muslims continue to consider *ḥadīths* a part of es-

tablished dogma, and authoritative proof of the tenets, laws, and values of Islam, next only to the Qurʾān in importance. The spread of a modern scientific mindset has, however, led to much discussion of the authenticity of individual *ḥadīths*. The presence of forgery in the larger mass of *ḥadīths* is not denied, and many *ḥadīth* scholars have been involved in painstaking efforts to identify and isolate unreliable *ḥadīths*, which have been gathered together in collections under the general heading *mawduʿat* (“forgeries”). Despite this meticulous work, however, doubts remain.

While acknowledging that most of the forged *ḥadīths* had been isolated in the *mawduʿat* literature, Muḥammad Zubayr Siddīqī, writing in 1962, argued that there were still “some weak or forged” *ḥadīths* in the standard collections, which he identified with certain topics, such as the antichrist (*dajjāl*) and the last guide (*mahdī*). Muḥammad al-Ghazālī (d. 1993) drew attention to *ḥadīths* in the standard collections that are at odds with the Qurʾān. He then categorized a number of such *ḥadīths* as “rejected” or “discarded” (*al-aḥadīth al-marduda*).

The late Shaykh of al-Azhar, Maḥmūd Shaltūt, criticized (c. 1965) the “strange phenomenon” of *ḥadīths* being labeled *mutawatir* (“continuously recurrent”) even though they do not meet the requirements of that category, simply because of their diffusion and frequent occurrence in scholarly works. This tendency can even be observed in some of the Qurʾān commentaries, in which weak *ḥadīths* are sometimes labeled *mutawatir*.

The contemporary scholar Yūsuf al-Qaradāwī has drawn attention to *ḥadīths* in the category of *al-tarḥīb waʿl-tarḥīb* (“encouragement and warning”), which *ḥadīth* scholars have often uncritically accepted, thus undermining the reliability of *ḥadīths* generally. This is because scholars have often neglected to apply the conditions of admissibility to this category of *ḥadīth*—on the assumption that they consist of moral advice and are in any case optional. Works of Qurʾān exegesis are also not free of weak and even forged *ḥadīths* on such topics as the relative superiority and virtues of the various chapters and verses of the Qurʾān. Even prominent Qurʾān commentators “such as al-Zamakhsharī, al-Thaʿālibī, al-Bayḍāwī and others have persisted in quoting fabricated statements in the name of *ḥadīth*” (al-Qaradāwī, *Kayfa Nataʿamalū maʿ al-Sunna al-Nabawiyah*, p. 36).

Writing in 1961, the Shīʿī author Muḥammad Najmī Zanjānī offered an evaluation representative of both Shīʿī and Sunnī opinion when he claimed that *ḥadīth* scholars have generally placed much emphasis on *isnāds* and the reliability of *ḥadīth* transmitters, but not enough on the text and message of *ḥadīths*. The Egyptian scholar Fahmī Huwaydī, while acknowledging (1989) this weakness of the *ḥadīth* collections, pointed out that many unqualified people with little insight into *ḥadīth* methodology have lightly dismissed *ḥadīths* and advanced ill-considered views in the name of reform and *ijtihād* (“independent reasoning”). Huwaydī ex-

tended this critique to the work of scholars at some Egyptian universities, including the renowned al-Azhar.

Yūsuf al-Qaradāwī has stressed the need for compilation of no less than three comprehensive encyclopedias on *ḥadīths*, one on *ḥadīth* narrators and their biographies, another containing the text (*matn*) of *ḥadīths*, and a third one to be drawn from the first two and devoted exclusively to *ḥadīths* in the *sahīh* and *ḥasan* categories. Selection of material should be made strictly according to the scientific criteria that leading *ḥadīth* scholars have developed, and modern research tools, such as computers and comprehensive indices, should be employed.

In *Ḥadīth Methodology* (2002) the present writer observed that the existing methodology and criteria of *ḥadīth* criticism were basically adequate and that *ḥadīth* scholars were also reasonably successful in their efforts to isolate the fabricated matter in their *mawduʿat* collections. However, much of the *mawduʿat* literature was written long after the standard collections of al-Bukhārī and Muslim ibn al-Hajjāj. In addition, some of the more refined methods of *ḥadīth* criticism were developed after the time of al-Bukhārī and Muslim ibn al-Hajjāj. There is good reason, therefore, to undertake an extensive review and consolidation of *ḥadīths* with the aid both of the existing *ḥadīth* methodologies and of more modern means and methods of research.

**SHĪʿĪ HADĪTH.** The Shīʿah Ithna Ashariyah (or the Twelver Shīʿah), who represent the largest group of Shīʿah and mainly reside in Iran and Iraq, rely on their own collections of *ḥadīths*. Of the four most authoritative Shīʿī collections, *Al-Kāfī fī ʿIlm al-Dīn* (What is sufficient for knowledge of religion) by Abū Jaʿfar Muḥammad al-Kulaynī (d. 939) is rated first, followed, in order of priority, by the *Man lā Yahduruhu al-Faqīh* (One who is not visited by a jurist) of Ibn Bābawayhi (al-Shaykh al-Ṣadūq ibn Bābūyah al-Qummī; d. 991), and by the two works of Shaykh Muḥammad ibn al-Ḥasan al-Ṭūsī (d. 1067), namely *Al-Istibsār fīmā Ukhṭulifa min al-Akḥbār* (Examination of what is in dispute among the reports) and *Tahdhīb al-Aḥkām* (Verified rulings). *Al-Kāfī* has 326 chapters and 16,199 *ḥadīths* from the Prophet and the *imāms*. It deals with three basic themes, namely, theology and the imamate, which are the basics of religion (*uṣūl*); the *furūʿ*, or details of positive law; and *al-rawḍa min al-Kāfī* (“flowers from *al-Kāfī*”), which include miscellaneous topics related to *fiqh*. Ibn Bābawayhi’s collection, which records 5,963 *ḥadīths*, was compiled with the goal, as the title suggests, of diminishing the reader’s need to consult a jurist. Al-Ṭūsī’s *Tahdhīb* is the next largest of the four collections, containing 13,590 *ḥadīths*, while *Al-Istibsār* contains 5,511 *ḥadīths*. The former lays greater emphasis on methodology in its verification of the rulings of *ḥadīths*, whereas the latter was basically intended to be a supplement to *Tahdhīb*. Whereas the leading Sunnī scholars, such as al-Shāfiʿī, emphasized accuracy in the *isnād* and text of *ḥadīths*, al-Ṭūsī was largely concerned with the practicableness of the *ḥadīths*’ contents. All four collections rely on *isnāds* reaching

back only to the recognized Shī'ī *imāms*. Two of the *imāms* who feature most prominently in these works are the fifth and sixth *imāms*, Muḥammad al-Bāqir (d. 735) and Ja'far al-Šādiq (d. 765), esteemed members of the Prophet's household who are credited with having changed Shiism from a primarily political movement into something with a juridical and scholastic focus.

Unlike their Sunnī counterparts, Shī'ī scholars were not preoccupied with the search for sound *isnāds* reaching back to the Prophet, because the infallibility (*‘iṣmah*) of the *imāms* precluded the need for such verification. Shī'ī *ḥadīths* were mainly collected in the tenth through eleventh centuries, in part because of the “occultation” of the Shī'ah's living *imām* in 873, and also because the Buyid rulers who were friendly to the Shī'ah only came to power in 945. Although a great deal of the Sunnī and Shī'ī *ḥadīths* are similar in content and message, Sunnī and Shī'ī scholars tend to differ widely in their respective approaches to authenticity and *isnād*. A four-fold classification of *ḥadīths* is employed in Shī'ī collections:

1. The *sahīh* or sound *ḥadīth* is one with an *isnād* that connects it without a break to one of the *imāms*.
2. The *mūwaththaq*, or reliable, *ḥadīth* is one supported by an *isnād* in which the companion of an *imām* unequivocally declares it acceptable.
3. The *ḥasan*, or Fair, *ḥadīth* is one with an *isnād* including a transmitter (from the *imām*) whose uprightness (*‘adala*) is not unequivocally established.
4. The *da‘if*, or weak, *ḥadīth* is one that does not fall within the first three categories.

Like their Sunnī counterparts, Shī'ī scholars have expressed reservations about the reliability of some material in their *ḥadīth* collections. They have also questioned the reliability of using *aḥad* (solitary) *ḥadīths* to establish a decisive legal or religious ruling. Like most Sunnī scholars, the Shī'ah maintain that all the obligatory rulings of *ḥadīths* must be proven as a matter of certainty. Because *aḥad ḥadīths*, those reported by a small number of unconnected individuals, do not qualify as *mutawatir*, they are not enough to establish a decisive *sharī‘ah* ruling.

#### BIBLIOGRAPHY

A comprehensive treatment of the various aspects of *ḥadīth* studies can be found in Mohammad Hashim Kamali's *Ḥadīth Methodology: Authenticity, Compilation, Classification, and Criticism of Ḥadīth* (Kuala Lumpur, 2002). The same author's other book, *Principles of Islamic Jurisprudence*, 3d rev. ed. (Cambridge, U.K., 2003), provides a chapter (pp. 85–117) on *sunnah* as a source of Islamic law. Muḥammad Zubayr Siddīqī's *Ḥadīth Literature: Its Origins, Development, Special Features, and Criticism* (Calcutta, 1961) also provides concise information on historical developments in the *ḥadīth* and on major collections that are currently in use. There are many

useful works on *ḥadīths* available in Arabic. Subhī al-Sālih's *‘Ulūm al-Ḥadīth wa-Mustalahub* (Beirut, 1966), Mannā‘ Kalīl al-Qattān's *Mabāhith fī ‘Ulūm al-Ḥadīth* (Cairo, 1992), and Muṣṭafā Dīb al-Bughā's *Buhūth fī ‘Ulūm al-Ḥadīth wa Nususuh* (Damascus, 1990) are all concise, yet comprehensive, and stay clear of burdensome extrapolations. A more detailed treatment of the entire range of *ḥadīth* sciences can be found in Muḥammad Abū Shahba's *Al-Wasit fī ‘Ulūm wa Mustalah al-Ḥadīth* (Jeddah, 1983). *An Introduction to the Science of Tradition*, edited and translated by James Robson (London, 1953) from a work of al-Hākīm al-Nīshāpūrī, and Aḥmad Amīn's *Fajr al-Islām*, 14th ed. (Cairo, 1986), both provide information on early developments in the *ḥadīth*. Fazlur Rahman's *Islamic Methodology in History* (Karachi, 1965) and Muḥammad Muṣṭafā A‘zami's *Studies in Ḥadīth Methodology and Literature* (Indianapolis, 1977) are informative on modern *ḥadīth* issues as well as on the Orientalist critique concerning the authenticity of *ḥadīths*. A‘zami's second and now well-recognized work, *On Schacht's Origins of Muhammadan Jurisprudence* (Riyadh, 1985), is highly critical of, and manages to successfully refute, many of Schacht's conclusions concerning the authenticity of *ḥadīths*. Muḥammad Hamīdullāh's *The Emergence of Islam: Lectures on the Development of Islamic World-View, Intellectual Tradition, and Polity* (Islamabad, Pakistan, 1993) and Fazlur Rahman's *Islam* (Chicago and London, 1979) both contain concise and readable chapters on the history of the *ḥadīth* and on issues concerning the documentation and authenticity of *ḥadīths*. Coverage of modern debates and contemporary concerns vis-à-vis *ḥadīths*, especially in the Egyptian context, can be found in G. H. A. Juynboll's *The Authenticity of Tradition Literature: Discussions in Modern Egypt* (Leiden, 1969).

Yūsuf al-Qaradāwī's *Kayfa Natā‘ amalu ma‘a al-Suna al-Nabawīya* (Herndon, Va., 1990) and Muḥammad al-Ghazālī's *Turāthunā al-fikrī fī Mizān al-Shar‘ wa al-‘Aql* (Herndon, Va., 1991) both provide insight into some of the prominent issues surrounding the *ḥadīth* and put forward proposals for reform. Maḥmūd Shaltūt's renowned *Al-Islām ‘Aqīda wa Sharī‘ah* (Kuwait, c. 1966) contains a useful chapter on the *sunnah* in which he addresses various issues and proffers a word of advice for contemporary readers of the *sunnah* and *ḥadīth*.

A brief but sound discussion of Shī'ī *ḥadīths* can be found in Murtazā Mutahharī's *Jurisprudence and Its Principles*, translated from Persian by Mohammad Salam Tawheedi (Elmhurst, N.Y., 1981). Muḥammad Najmī Zanjānī's *Tārīkh-e Firāq-e Islāmī* (Tehran, 1961) provides a more detailed treatment of the subject, as well as a survey of modern studies and significant issues concerning the Shī'ī *ḥadīth*. Dwight M. Donaldson's *The Shi'ite Religion* (London, 1933) contains information on the *ḥadīth*.

MOHAMMAD HASHIM KAMALI (2005)

HAFETS HAYYIM SEE KAGAN, YISRA'EL ME'IR

HĀFIZ SHĪRĀZĪ (AH c. 726–792/c. 1326–1390 CE), in fuller form Shams al-Dīn Muḥammad Ḥāfīz-i Shīrāzī,

was a Persian lyric poet and panegyrist, supreme master of the *ghazal*. He was born in Shīrāz, spent the greater part of his life in the area, and died there as well; his tomb is now a showplace. Much of his career was in the service or the ambience of a minor dynasty, the Muzaffarids, whose overall reign was approximately coeval with his own life-span. As usual with Persian literary figures, Ḥāfiz's exact dates and the details of his life are much disputed: The traditional biography leans heavily on anecdotal pieties, casual references in a variety of sources, and possible allusions in his own corpus, the text of which is still far from being in a definitive form.

He is said to have had an impoverished childhood, part of it as an orphan, and to have worked at various menial tasks, but in the culture of the time these circumstances were no obstacle to his acquiring a sound education in the traditional disciplines. His pen name, Ḥāfiz, ostensibly signifies that he had memorized the Qurʾān, and his poetry itself displays a confident acquaintance with Arabic, the so-called Islamic sciences, various branches of secular knowledge, and Persian literature to his own day. By the age of thirty he appears to have gained some acceptance as a panegyrist to princes and influential ministers of state, and he continued thus—with various vicissitudes of fortune—for most of his life. At no time, however, does he seem to have enjoyed a regular appointment or any considerable wealth. Indeed, because some of his patrons were rigidly orthodox Sunnīs, his generally libertine and laissez-faire attitudes—whether actual or merely professed—often landed him in a measure of disgrace, if not in outright persecution.

It has sometimes been suggested, and as often denied, that Ḥāfiz was even of Shīʿī allegiance, and certainly various passages in the poems can be read in this sense. Nor, in the light of modern scholarship, would his celebrated Šūfī leanings necessarily conflict with such loyalties. The precise truth can hardly be discovered at this date, especially because ambiguity is in the nature of the case for any poet beholden to an establishment: In this case, Ḥāfiz would have had to be extremely ambiguous in his poetry in order to avoid offending various religious, political, or social interests. What seems clear, however, is that he generally carried, and made frequent reference to, a reputation for aggressive non-conformity.

Ḥāfiz's unique literary position rests on his *Dīvān*, the collection of his poems, practically all in the *ghazal* form (a sort of ode, ranging from a few monorhyming couplets to twelve, fifteen, or more). Unfortunately, no more than a few brief excerpts in translation can be cited here, but perhaps these opening lines from three separate *ghazals* will give the reader a sense of Ḥāfiz's work:

If that Shīrāzī Turk will take my heart into his hand  
I'll give up, for his Indian beauty spot, all Samarkand and  
Bukhara.

The green fields of heaven I saw and the new moon's  
sickle

And I was minded of what I'd sown and the reaping day  
to come.

I'll hold not my hand from wanting till my desire is  
realized;

Either my body attains my heart's beloved, or my heart  
will leave my body.

Ḥāfiz is said to have produced his own definitive recension some twenty years before his death, but no manuscript of this has ever come to light (and given the constant wear and tear on this particular poet's work over the centuries, it seems unlikely that any ever will). All known versions are believed to depend on an edition allegedly produced at some point after his death by a disciple. Whatever Ḥāfiz's own intentions may have been (at an earlier date or at various later times), the actual textual situation, quite apart from variant readings, is extraordinarily chaotic. In the thousands of extant manuscripts from all periods and places, and consequently in the more than a hundred printed editions, the number of poems ranges from about five hundred to almost one thousand, although the lower figures are commonly taken to be the more reliable. Moreover, in these recensions the order and number of lines in any particular poem can vary greatly, with virtually only the first (the internally rhymed quote-line) and the last (containing the poet's name) remaining stable. This is not at all abnormal in classical Persian poetry, where each line is designed to have a degree of self-containment and "finish" unfamiliar in Western literatures. What is unusual in the present case is the extent of variability, and this feature has given rise to a whole critical literature in its own right. Other factors of confusion are the idiosyncratic cultural tendencies for lesser poets to father their works onto famous names, or for all writers to borrow freely from each other where a line or two may seem particularly apt. Nor, in a culture where memory and oral tradition also play an important part, can the standard methods of scholarship (the oldest manuscript is normally the best, the simplest solution is likely to be wrong, and so forth) be applied with full confidence. In short, the text as it stands is neither authoritative in itself nor reliable in its possible relationship to the poet's life, and it may never become so.

Once this is said, and the rich (but often falsely romantic) accretions draped around the figure of Ḥāfiz in Western renderings have been stripped away as far as possible, one is still left with a body of poetic utterance that is regarded by Persian-speakers as sublime to the point of near-sacredness. Ḥāfiz's *Dīvān* is read or memorized, and quoted, at all levels of society, but it is also used—by those who call it a "Qurʾān in Persian"—in all solemnity to take random auguries at such important moments in life as a projected marriage, a business or medical decision, the start of a lengthy journey, and so on. Persian-speakers may or may not fully appreciate the linguistic and literary mastery Ḥāfiz constantly displays; they may not always relish his ambiguities and the alternating and interpenetrating themes—mystical, melancholy, pessimistic, hedonistic, or panegyric—but they all believe they

hear in him a voice of infinite wisdom and transcendence. Nor does this apply only to those whose usual language or mother tongue is Persian, for Ḥāfīz was for centuries as revered in regions where Turkish (the Ottoman Empire) and Urdu (various princely states of India) were the local languages. Indeed, many of the best earlier studies, translations, and commentaries have emanated from those centers, because Iranian scholarship as such in Ḥafiziana is largely a twentieth-century development and is in some degree indebted to these as well as to the West.

#### BIBLIOGRAPHY

Ḥāfīz naturally receives major and special treatment in the standard reference works, including both editions of *The Encyclopaedia of Islam* (different articles) and the several Western histories of Persian literature. Editions in Persian (none of them fully satisfactory) are numerous, while studies on him and translations of many of the poems abound in most Western languages. Unfortunately, a high proportion of the latter are of indifferent scholarly quality or make no claim to be more than popular and imaginative reworkings; most of them are in any case long since out of print. Some of the best critical studies are recent ones in Persian, and these have not been translated.

Two useful and accessible works are Michael C. Hillmann's *Unity in the Ghazals of Hafez*, *Studies in Middle Eastern Literatures*, no. 6 (Minneapolis, 1976), and A. J. Arberry's *Fifty Poems of Ḥāfīz*, rev. ed. (Cambridge, U.K., 1962). Both of these include bibliographies, and Hillmann's is comprehensive.

G. M. WICKENS (1987)

**HAIDA RELIGIOUS TRADITIONS.** The Xaada Gwaay or Haida Gwaii, the island of the Haida people, is a land of intense natural beauty, a misty archipelago composed of two large islands, Graham and Moresby, and some 150 small islands on the borderlands between southern Alaska and northern British Columbia. The intensity and subtlety of the territory is apparent in its dense rain forests, miles of pristine sandy shores, craggy mountain cliffs, and unpredictable weather patterns.

The elaborate Haida culture is as rich in mythological heritage as it is in natural beauty and resources. This complex mythological landscape parallels and represents the complexity of traditional Haida religious practice and its influences in contemporary Haida society. It is the land and the spirits of the land that inspired Haida stories and myths.

Though their islands were inhabited by many villages in traditional times, there are three remaining Haida villages in the contemporary landscape: Old Massett Village and Skidegate, both on the Queen Charlotte Islands in British Columbia, and Hydagberg, on the southeastern tip of Alaska.

Just as the land provides the source of inspiration for myth, traditional mythological elements of the Haida culture

are inextricably linked in ancient and modern society to the social, political, and economic lives of the Haida people. Myths provide the foundation for ancient religious practices and influence many aspects of the contemporary life of the Haida people.

**THE SUPERNATURAL.** In his *Contributions to the Ethnology of the Haida* (1905) and *Haida Tests, Masset Dialect* (1908), John R. Swanton provides the earliest comprehensive texts documenting Haida myths and stories. His interpretations describe the ever-changing nature of what he calls "Haida spirit theory." There is such a close relationship between all of the forces of the natural world that they are easily interchangeable. The world of the Haida is characterized by allusion and pun and the nature and character of the land and Haida mythological powers can be described as intelligent, unpredictable, creative, ambiguous, dangerous, friendly, and transformative. Supernatural beings have a great deal of power and can easily disguise themselves to become Salmon People, Herring People, Forest People, Bear People, Ocean People, Mouse People, or any number of other "supernatural" beings.

To the Haida, the world is one seamless existence. Natural and supernatural are categories in which nature rules. Phenomena change rapidly depending on the time and space of perception, the weather, the occasion. In ritual space, natural and supernatural beings and creators come very close and are perceived in elaborate masks, dances, musical expressions, and poetic oratory. Supernatural beings can play with humans, harm them, marry them, and appear and disappear at a moment's notice, depending on their moods.

**HAIDA MYTHS AND STORIES.** The Haida creation story plays a prominent role in their mythological belief system. Raven created the world by teasing the humans into existence while they cowered on the beach under a clam shell. Raven is a sacred trickster and transformer who sings, plays, teases, and even lies to inspire deep transformation. There are numerous versions of Raven stories and new ones are being created every day. One of the most famous is Bill Reid's well-known interpretation *Raven Steals the Light* (1984). This retelling of the Raven myth is widely read and has been translated into several languages.

Killer Whale is another important mythological character. Because the Haida relied heavily on the abundance of the sea for their sustenance, they have many stories about Killer Whale's power and ability to rule the sea creatures. Many Killer Whale stories describe the loss of lives at sea and the transformation of humans into sea creatures who will later support or harm fishermen.

**THE SOCIAL ORGANIZATION OF HAIDA SOCIETY.** The matrilineal social structure of the Haida reflects mythological characters in the form of clans. A clan system assigns associative categories between animals and human beings, who can obtain powers through these associations. The two primary clans are Raven and Eagle. Each clan is further organized

around family crests that are also associated with animals prevalent in Haida territory.

Traditionally, Haida were not allowed to marry within their own clan. This system of intermarriage used moieties to govern marital alliances, economic structures of reciprocity and ownership of property. This system of organization also included the supernatural beings associated with human clan systems. "This dual classification imposes order on the universe not only in the sense of categorizing nature in analogy to human society, but also in the sense of perceiving things as belonging, in the double sense of being owned and being part of" (Boelscher, p. 29).

In the past, these clans played a dominant role in the management of tribal affairs. In contemporary society, they function as influential family affiliations in an electoral governance system established during the period of colonization. The political life of the Haida is also complex. In this hybrid governance system, elements of the secular and the sacred interact. Elected chiefs and hereditary chiefs share the responsibilities of leadership in Haida communities and serve as models for ethical lives based on generosity, strength of character, and strong family ties. Haida ethics are based in reciprocity that is expressed on a daily basis through generous gift giving, especially during the potlatches. Gift giving also functions to maintain a fair distribution of wealth in the community.

**THE POTLATCH.** Haida have many elaborate ceremonies and rituals. These events are generally categorized as potlatches, ceremonial events in which generosity is expressed by the giving of gifts, feasting, and traditional Haida dancing and singing. Though potlatch was forbidden during the period of colonization, the revitalization of traditional Haida customs that began in the 1970s reinstated the practice, and potlatches are frequently organized in all three Haida villages. They are occasions in which to express and reinforce the communal values and beliefs of the people, to socialize as a community, to grieve loss or celebrate birth, to commemorate great leaders, and other occasions.

In traditional Haida societies, there were many ceremonies to acknowledge the passing of community members into the spirit world. Mortuary poles were commissioned and potlatches were attended by relatives and friends who traveled great distances to participate. In contemporary Haida society, the ritual of the memorial feast, which is held one year after the death of a family member, includes the moving of the headstone onto the grave, blessings, a potlatch, and speeches honoring the Haida who has passed into the spirit world. At these memorial feasts, participants are instructed by religious leaders and elders to "put aside the grief" because it is the end of the official one-year mourning period (Kenny, p. 1218).

Haida also believe in the constant presence of the ancestors. Rituals are powerful ceremonies, even in contemporary times, reminding the Haida of their ancient roots, their elab-

orate belief systems, and the importance of strong relationships among the people.

**THE RENAISSANCE OF HAIDA CULTURE.** The creation of art is an important functional aspect of Haida identity and serves as the primary mechanism for the expression of an important set of beliefs about the world. Many Haida artists will say the "art is who we are" (Kenny, p. 1219). There is no word for *art* in the Haida language because the arts are embedded in the daily lives of the Haida people. The Haida and their vision of the world were rejected during the period of colonization. Haida leader Ernie Collison explains:

Over the years, since the time of colonization, the visual arts suffered because of the potlatch laws and with the introduction of Christianity. There was a banishment of visual icons of Haida. . . . Those influences manipulated the view of the Haidas about their traditional civilization, with the "art," the Haida passion for identifying and decorating everything with drawings and paintings and carving, and it went underground. Objects and ceremonies were kept out of sight of the missionaries and government agents. (Kenny, p. 1219)

Historically, the bounty of the land and sea was reflected in the lavishness of Haida ceremonies, which have grown over the years in spite of many efforts to eliminate their presence in the community. In contemporary society, the Haida mystical vision of the world and its powers, as represented in their arts, has reemerged. "Their passion for carving, sculpting, painting, and weaving and for decoration generally overflowed onto the most utilitarian of objects" (Dickason, p. 212).

Totem poles were used to protect homes and longhouses or community gathering structures. Fragments of the ancient totem poles can still be viewed along the coastal beaches and in the forests of the Haida territory. Archaeologists also excavated many Haida poles and relocated them to museums around the world. The Haida are attempting to repatriate many of these poles, often with the help of modern archaeologists who work in conjunction with them to create museums on Haida territory that are managed by the Haida themselves.

In an ongoing revitalization process that began in the 1970s, Haida arts play prominently in recovering the health and well-being of the people through an open expression of their identities and mystical beliefs. Northwest coast arts, and particularly Haida arts, are probably the most heavily represented of any of the tribal arts in the world and can be viewed in museums around the world. Haida sculptures in argillite, carved jewelry in silver and gold, and contemporary Haida masks draw thousands of dollars in the world market. The marketing of these products brings an aspect of economic sustainability to Haida artists. Haida artists such as Bill Reid and Robert Davidson have been central in bringing Haida art into the most sophisticated art circles around the world.

The revitalization process is recovering many totem poles and other precious cultural objects from museums, uni-

versities, and private collections for repatriation to the Haida nations. There is also a successful process of repatriation for ancestral remains. Representatives of the Haida nations travel around the world to gather the remains of their ancestors and bring them home. Many ceremonies surround the repatriation of ancestral remains, including welcoming the ancestors into the arms of the people upon receipt of the remains and reburial in traditional territory. Repatriation ceremonies have brought back many traditional religious practices, but in a modern context. Many of these ceremonies remain private.

In contemporary society, Haida religious practices often combine elements of the old ways with practices in the Anglican, Catholic, or United churches. By the end of the twentieth century there were very few remaining Haida elders who remembered things as they were at the beginning of the twentieth century. Because of the remoteness of the Haida Gwaii, the Haida people were protected from early contact with European settlers and were able to maintain their religious and cultural practices for much longer than many indigenous peoples in the Americas. At the turn of the twenty-first century, the remaining Haida elders are involved in the renewal of the old ways. Many are dedicated to saving the Haida linguistic, religious, and cultural traditions.

Yet, many did attend residential schools that forbade them to exercise their rights to a distinct and unique culture. In residential schools children were often punished severely for speaking their native language or making any reference to religious beliefs associated with their native culture. In modern society, these elders and their children, grandchildren, great-grandchildren, and great-great-grandchildren, along with a few academics, are rebuilding the Haida culture, bringing it from its underground existence into the fullness of expression in a modern world.

Haida often join with other Northwest coast native peoples in the rebuilding of their cultures. They have also joined the International Indigenous Peoples movement and travel to conferences and gatherings for cultural exchange. The Haida are on the internet and are in constant communication with indigenous peoples around the world. This initiative serves to showcase the identity and strength of the Haida people in the modern world.

CAROLYN BEREZNAK KENNY (2005)

**H'AI GAON** (939–1038), Babylonian halakhist. H'ai succeeded his father, Sherira', as head of the academy at Pumbedita and occupied the post for forty years, during which time he penned hundreds of *responsa*, composed significant halakhic monographs, and trained Jewish students from all over the world. The Geonic period reached its apogee with H'ai, who as its crowning figure also witnessed its irreversible decline.

The quantity of H'ai's *responsa*—about one-third of all preserved Geonic *responsa* are attributed to him—indicates that he was considered the leading legal authority of his time, a status underscored by the far-flung provenance of his correspondence and the fact that he was appealed to by scholars of the first rank. In eleventh- and twelfth-century rabbinic writing, "the gaon" invariably means H'ai. He saw the Talmud as the decisive factor in all Jewish law (the characteristic posture of all Geonim), after which ranked the decisions and enactments of his Geonic predecessors, and the force of custom. In addition to *responsa*, H'ai also wrote major halakhic monographs in both civil and religious law; here he ordered the welter of Talmudic discussion into topically organized units and brought this Geonic literary form to a height surpassed only by Maimonides.

H'ai's attitude toward Talmudic legend and his theological comments combine a moderate rationalism with mystical interests. Continuing the philosophical tradition of Sa'adyah, H'ai reinterpreted legends with anthropomorphic features, argued for a nonliteralistic approach to *aggadot*, and in general denied the authoritative status of these rabbinic materials. At the same time, he recoiled from the suggestion of Shemu'el ben Hofni (his father-in-law) that the Witch of Endor had simply tricked Saul into thinking she had raised the ghost of Samuel (*I Sm.* 28). H'ai also wrote a short treatise on the nature of the messianic redemption and discussed the esoteric teachings of *merkavah* mysticism.

#### BIBLIOGRAPHY

Isaac Hirsch Weiss's *Dor dor ve-dorshav*, vol. 4 (Berlin, 1924), pp. 174–192, remains the best single treatment of H'ai as a legal authority and religious thinker. The fifth through eighth volumes of Salo W. Baron's *A Social and Religious History of the Jews* (New York, 1952–1980), peppered with references to H'ai, provide the social and historical dimension as well as bibliographical information. Tsvi Groner's *Rav Hai Gaon: His Halakhic Methodology* (in Hebrew; Ph.D. diss., Hebrew University, 1974) details H'ai's legal method.

GERALD J. BLIDSTEIN (1987)

**HAIR.** Words are related to the things they denote only by the conventions of language, but symbols, unlike words, are inherently appropriate to what they signify. Thus, since most animals are much hairier than human beings, some cultures may use this difference to express the distinction between the realms of nature and culture, as in myths that describe the first men as very hairy, and also as ignorant of fire and of the rules of correct behavior toward their kin. But symbolic meanings are not simple reflections of natural phenomena. So, in other societies, the symbolic opposition between “hairy” and “hairless” may be related not to the distinction between nature and culture but rather to the categories of youth and age; in this case “hairy” will symbolize the health and vitality of young people, whereas “hairless” will signify the baldness and infirmity of old age. Again, we may find that long hair is considered appropriate to the female sex because it appears soft and rounded, while close-cropped hair is associated with males because it allows the shape of the skull to appear, giving an appropriately hard and angular appearance. Or again, short hair may express puritan values, and long hair their opposite. So, opposition between the hairy and the hairless may symbolize such diverse categorical relations as animal and human, youth and age, male and female, and puritan and worldly. It is also quite possible for one and the same symbolic use of hair to have several different meanings simultaneously.

All symbolism accommodates to the natural properties and associations of objects, but it also assimilates these prop-

erties and associations into cultural systems of meaning in a selective, creative, and coherent way. Because symbols are derived from man's interaction with the physical world, we must also be alert to the possibility that an apparently symbolic custom is really nothing more than a practical expedient. In some African societies, for example, the shaving of children's heads has no symbolic meaning and is merely undertaken to prevent lice. On the other hand, we must not assume too readily that practical explanations such as hygiene will normally be adequate to explain the symbolic uses of hair.

In attempting to explain the different symbolic uses of hair, then, we must keep in mind its basic properties and associations, especially its associations with animals, with growth and vitality, and with youth and puberty as opposed to old age. That it has great potential for manipulation, can be cut painlessly, and is closely associated with two socially significant areas of the body—the head and the genitals—is also of great importance. Because of this variety of properties and associations, no single theory can account for all symbolic uses of hair. But there are, nevertheless, a limited number of themes in hair symbolism that are found all over the world.

**HAIR SYMBOLISM IN FREUDIAN THEORY.** Freudian theory maintains that the head is a phallic symbol, that the hair symbolizes semen, and that haircutting is a symbolic castration. In some instances, the head and its hair do clearly have explicit sexual associations. In ancient Greek and Roman belief, the head was the source of semen in the form of cerebrospinal fluid, and hair was an indication of sexual vigor. The same belief is held by the Punjabis of India, who suppose that true ascetics are able to store up their semen and concentrate it in the form of spiritual power at the top of their heads. Quite apart from these physiological beliefs, the head resembles the genitoanal region because these are the only two areas of the body with orifices, and each embraces radically opposed functions: social relations on the one hand, and physical functions on the other. Because the realm of nature confronts that of the social and the intellectual so blatantly in these two regions, it is not surprising that they can be substituted for one another in humor, in magical and religious contexts, and in popular and prescientific sexual lore. Thus the nose and tongue become analogues of the penis; the eyes represent the testicles; the mouth and ear correspond to the vagina or anus; and head hair corresponds to pubic hair. It may be for this reason that among the Chickrí of central Brazil a woman may wear her hair long only after the birth of her first child and that in traditional Dobuan society of the western Pacific an adulterer would publicly cut the hair of a woman he had seduced if he wished to defy her husband. In that society care of the hair is a reciprocal service between spouses and is associated with sexual intercourse.

Sexual potency, however, is only one aspect of vitality, physical strength, and animality in general. Samson's strength lay in his hair, but we have no warrant for attribut-

ing any narrowly sexual significance to the association, nor for regarding the cutting of his hair as castration. There are, in addition, numerous symbolic acts of haircutting that are even less plausibly interpreted as castration, such as cutting women's hair at marriage and the shaving of infant boys, slaves, military recruits, pilgrims, and returning travelers. Further, we find certain categories of persons, such as religious ascetics, who do not cut their hair but who conventionally abstain from all sexual relations, while the stereotype of the long-haired intellectual in our own culture is entirely free of any erotic association. The Freudian hypothesis cannot therefore be supported by the facts, except in a few instances.

**HAIR AS A SYMBOL OF ANIMALITY, STRENGTH, AND THE SUPERNATURAL.** As already noted, hair is a prominent feature of animals, and the persistent growth of hair, most noticeably on the head, is analogous to the growth of vegetation. Not surprisingly, therefore, hair is a common symbol of vitality, physical strength, nature, and supernatural beings or forces closely associated with nature. The culture hero *Dribidu* of the Lugbara tribe of Uganda is a good example of this association. The culture heroes were not members of clans, like modern Lugbara, but lived in isolation in a world without clans. *Dribidu* means "the hairy one," for this culture hero had long hair over most of his body. He was also known as Banyale ("eater of men"), since he ate his own children. In a myth of the Kukukuku of Papua, men at first had long hair all over their bodies and were ignorant of fire, cooking their food over women's genitals. When they were shown how to make fire and to cook their food over it in the ordinary way, the long hair fell off their bodies and they became fully human.

In Stith Thompson's *Motif-Index of Folk-Literature* (Copenhagen, 1955), there are twenty instances of hairiness associated with supernatural or half-human beings such as fairies, dwarfs, giants, water and wood spirits, devils, and mermaids; seven associations with animal-human relationships; three with vegetable-human relationships; three with witches; seven with the soul or vitality; and six with asceticism. The ascetic, particularly the solitary anchorite of fourth-century Egypt and Syria or the Hindu *samnyāsīn*, abandons ordinary society and even the company of fellow ascetics to lead a completely solitary life, frequently naked and unkempt. In *The Decline and Fall of the Roman Empire* (1776–1788), the historian Edward Gibbon wrote of the anchorites of the Egyptian desert:

All superfluous incumbrance of dress they contemptuously cast away, and some savage saints of both sexes have been admired, whose naked bodies were only covered with their long hair. They aspired to reduce themselves to the rude and miserable state in which the human brute is scarcely distinguished above his kindred animals. . . . They often usurped the den of some wild beast whom they affected to resemble. (chap. 37)

Hair, particularly of the head and beard, is often believed to be the seat of physical strength and supernatural

power, the two of which may not be clearly differentiated. The early Frankish kings, who were essentially warriors, were celebrated for their long hair, which was a distinctive mark of their royal status, so that cutting the hair disqualified a member of the royal family from succession to the throne. Maori chiefs were also forbidden to cut their hair, as were the priests of a number of societies, such as the Aztec and the two moieties of the Borana Galla of Ethiopia. Divine beings may likewise be represented as long-haired. The Aryans so depicted the sun, whom they also described as having flaming or golden hair. The Egyptians referred to the sun god Re as adorned with golden locks. During the sixteenth and seventeenth centuries, when the persecution of witches was at its height in Europe, it was believed that the power to bewitch lay especially in the hair. Accordingly, it was standard practice not only to shave witches' heads but to depilate their entire bodies in order to render them harmless before execution. For centuries it was also customary to shave the heads and bodies of the insane.

**HAIRCUTTING, SOCIAL CONTROL, AND INITIATION.** Insofar as the hair is an expression of life, strength, and magical and religious power or is associated with animality or the condition of being in some way outside society, cutting or shaving the hair is an appropriate symbol for the imposition of some form of social discipline or restraint and is also a means of signifying a person's transition from one social status to another. In this context haircutting, like the cooking of food, is a fitting metaphor for the imposition of social control on nature, and also for transition and rites of passage in general.

Orlando Patterson, in his *Slavery and Social Death* (Cambridge, Mass., 1983), notes the ubiquity of the shorn head as the mark of the slave:

In Africa we find the shorn head associated with slaves among peoples as varied as the Ila and the Somali. In China, in highland Burma, among the primitive Germanic peoples, the nineteenth century Russians, the Indians of the northwest coast, and several of the South American and Caribbean tribes, the heads of slaves were shorn (in the ancient Near East so was the pubic hair of female slaves). In India and pharaonic Egypt slaves wore their hair shorn except for a pigtail dangling from the crown. (p.60)

In the Americas, however, slaves were not shorn, because the characteristic hair type of the African was a more effective indicator of servile status. The shaving of the head has also been prominently associated with the punishment of criminals, as in the pillory, and as a mark of convict status. In modern times it has been closely associated with military discipline, especially as an initiation rite for recruits, and in tribal societies boys often have their hair cut as part of their initiation into adult status.

Haircutting may also be an initiation into society. When a son is born to him, a Muslim has seven obligations, according to Julian Morgenstern: to give the newborn a name; to cut his hair; to give as alms the weight of the hair

in silver or gold; to sacrifice an animal; to smear the baby's head with saffron; to circumcise him; and to distribute to the neighbors portions of the animal sacrificed (Morgenstern, 1966, p. 41). The convert to Islam from an unsanctified religion, in addition to being washed or anointed with water, might also have his hair cut off. Muslim travelers returning from long and dangerous journeys, as well as pilgrims, cut off their hair. Participation in sacred events may have been regarded in some societies as taking place outside society; thus it was forbidden to cut one's hair until the end of the Passover and Sukkot festivals, and a traditional English superstition held that it was unlucky to cut one's hair on a Sunday.

The Bible provides a number of instances of hair symbolism in which hairiness is associated with the life of the hunter, wild beasts, physical strength, rebellion, or special sanctity, while cutting or shaving the head is associated with rejoining society, with submission to some specific authority within society, or with a rite of passage. Esau, the hunter of wild beasts, was a hairy man, while his brother Jacob, a herdsman dwelling in tents, was a smooth man (*Gn.* 25:23–27). In *Leviticus*, it is prescribed that when a leper, by definition an outcast, is cured and ready to be reincorporated into society, he shall have all his hair shaved off (*Lv.* 14:8–9). The Nazarenes, who consecrated themselves unto the Lord by a vow, allowed their hair to grow until the end of the period of their vow, when it was formally shaved off at the Tabernacle (*Nm.* 6:1–18). Female prisoners of war, if made wives, were required to pare their nails and shave their heads (*Dt.* 21:10–14). Samson's strength lay in his hair; when it was cut off, he was as weak as any other man (*Jgs.* 16:17–19). Absalom, who rebelled against David, his father and sovereign, was remarkable for his long hair (*2 Sm.* 14:26). When Nebuchadnezzar was overthrown and made an outcast, "he was driven from men, and did eat grass as oxen, and his body was wet with the dew of heaven, till his hairs were grown like eagles' feathers, and his nails like birds' claws" (*Dn.* 4:33). For women, uncovered hair was symbolic of maidenhood, while the covering of the hair was symbolic of marriage and the acceptance of the husband's authority; it was also an ancient Jewish custom to cut off a woman's hair at marriage.

The imposition of authority is not necessarily symbolized by the cutting of hair, however. On the Pacific island of Tikopia, commoners loosen their hair to express submission to a chief, because in so doing, they signify their openness to control and influence. (On the same island, women cut their hair short, and men wear theirs long.)

**THE USE OF HAIR IN MAGIC, SACRIFICE, AND MOURNING.** Magical and sacrificial uses of hair seem to form a somewhat separate category from those considered so far, since they involve the nature of something detached from the body. One of the commonest uses of hair is in hostile magic, when the hair clippings of an intended victim are obtained and ensorcelled, together with, or as an alternative to, nail parings, blood, saliva, semen, or other bodily secretions. In primitive

thought, we frequently find that the human person is believed to have "extensions" that may include not only hair and the other bodily secretions but also personal names and belongings such as garments, shadows, and even footprints, all of which may be used to cast spells on a victim. In some societies, a sorcerer may cast a spell by including one of his own hairs in something given to the intended victim. Thus, in Papua a man may put one of his pubic hairs in a cigarette and give it to a woman who, it is believed, will then form a passionate attachment to him.

In many societies, fear of sorcery leads to the burning, burying, or hiding of hair. The Konso of Ethiopia take great care to hide these clippings: they cannot burn them since, according to their belief, doing so will cause their own sickness or death. As an alternative, in some cultures the cutting of hair or nails is forbidden for infants or others thought to be specially vulnerable to magical dangers.

Hair may also be used to transfer disease to another person, animal, or thing. In the Hebrides, it was the custom to cure epilepsy by burying a black cock with some clippings of hair and nails from the patient. In Devon and Yorkshire, the hair of a child with whooping cough was placed between two slices of bread and given to a dog; when the dog coughed, it was a sign that the disease had been successfully transferred. Conversely, the hair of a sick person might be put into a hole or hung in the branches of a healthy tree, so that the patient might derive health from the tree.

A related use of hair is in sacrifice. This was once very common, particularly among the ancient Greeks and Romans, who established relations with various gods by placing locks of hair on their altars. On reaching manhood, youths offered their first beard to Apollo, one of whose functions was to promote the fertility of crops, or gave their hair to the local river god. Nero offered his first beard to Jupiter, and Phoenician women sacrificed their hair to Adonis at the annual spring festival. Greek women offered their hair to deities before marriage, while Hygieia, goddess of health, was given offerings of women's hair before or after childbirth.

Hair is also used in a number of cultures to maintain a relationship with the dead; it may be placed with the corpse or on the tomb. In Islamic society, boys who had been dedicated to a saint at birth had their heads shaved sometime between eight and twelve years of age, and their hair was placed on the saint's tomb. Conversely, among the Iroquois, a lock of hair from the dead was given to the nearest relative of the deceased, while the Zuni believed that to burn the hair of a deceased friend and inhale the smoke would produce good health. Among the Arabs, the hair or beard is regarded as the seat of vitality and thus is specially suited to serve as the substitute for a life. As part of a reconciliation ceremony, a murderer has some of his hair or beard shaved off, as a token of the life that might have been demanded.

The cutting or tearing out of hair in mourning is one of the most commonly reported uses of hair. Since it is al-

most invariably associated with other forms of bodily mutilation, such as the gashing of the skin or even the severing of finger joints, it is most simply interpreted as self-directed aggression produced by grief. Mourning may also be signified by disheveling the hair or by covering it with dirt, ashes, mud, and so on. In all such cases the hair is also a convenient symbol indicating that the mourners temporarily hold a special status.

In hair symbolism, then, a relatively small number of basic themes constantly recur in the mythology, ritual, and social relations of peoples all over the world. But these themes are only a general guide; each case must be analyzed within the context of the particular culture in which it occurs.

#### ĤĀJJ SEE PILGRIMAGE, *ARTICLE ON MUSLIM PILGRIMAGE*

**HAKUIN** (1686–1769), more fully Hakuin Ekaku, was a mid-Tokugawa period (1603–1868) reviver of Rinzai Zen. Hakuin was born to a commoner family in Hara, present-day Shizuoka prefecture. Entering Buddhism at an early age, he studied widely both Buddhist canonical works and Zen literature. He was also well versed in the secular literature of China and Japan, and in popular Japanese poetry and song. At age twenty-two he set out on his studies, visiting a succession of Zen masters and practicing meditation at various temples. At twenty-four he visited the Zen master Shōju Rōjin (Dōkyō Etan, 1643–1721), and after an arduous eight-month stay, was granted his teacher's sanction. For the next eight years Hakuin traveled to various temples, perfecting his understanding of Zen, eventually returning to his temple, the Shōinji in Hara, in 1718. Here he concentrated on teaching a considerable number of disciples. Hakuin also devoted much time to itinerant preaching and lecturing and to the instruction of laymen. He passed away in 1769.

Shortly after its inception the Tokugawa shogunate established strict control over all Buddhist sects, establishing a system of main and branch temples and in many ways restricting the activities of the Buddhist clergy. Buddhism in the Tokugawa period is generally described as effete and corrupt, yet in many respects it flourished greatly. Their activities severely restricted, some Buddhist priests turned to scholarship and study; others sought to reform and revitalize their teachings. This trend was especially evident in Zen: The Sōtō sect underwent reforms at the hands of a group of scholar-priests; Rinzai was revitalized by Hakuin and his heirs.

In Hakuin's time, Zen study and practice had degenerated into a sterile and formalized *kōan* study or had moved toward a popular Zen that rejected the *kōan*, minimized meditation practice, and frequently admitted elements of Pure Land Buddhism. Hakuin revolted against these tendencies. Turning back to the Zen that had been introduced to Japan from Song China in the early Kamakura period (1185–1333), Hakuin taught a strict form of *kōan* Zen based on the teachings of Nampo Jōmin (Daiō Kokushi, 1235–1308), Shūhō Myōchō (Daitō Kokushi, 1282–1337), and

Kanzan Egen (Musō Daishi, 1277–1360) and the school centered at the Daitokuji and Myōshinji temples in Kyoto (known after its founders as the O-Tō-Kan school). The exact details of the *kōan* system Hakuin used are not clear; his descendants in the second generation, Inzan Ien (1751–1814) and Takuju Kōsen (1760–1833), established a formalized system of *kōan* study that persists to this day. Under this system, students were required to meditate on and respond to a specific series of *kōans*. Often, as the monk progressed he would reinvestigate *kōans* previously studied, until those few who survived the rigorous, lengthy training were themselves sanctioned as teachers. Before taking up teaching duties it was customary for the priest to spend several years in isolation, perfecting his own understanding.

In his teaching Hakuin emphasized disciplined meditation under a teacher's guidance, "see into one's own true nature" (*kenshō*). He emphasized meditation in the midst of activity, or meditation at all times and in all places, in contrast to quiet sitting in secluded areas, a practice that he vehemently condemned. Hakuin was opposed to all methods of Zen other than his own and inveighed against popular forms that simplified his teaching.

Hakuin was a prolific writer, adept in a variety of genres. For the practicing monk he wrote several major works, highly technical in nature, designed as aids to their studies. A large body of his writing consists of letters to feudal lords and to other priests and nuns in which he champions the virtues of Zen and calls strongly for humane government and adequate consideration for farmers. Some of his works are simple preachings on Buddhism in general, directed toward his lay followers; other works imitate popular songs or recitations of the day. Of great popularity were several pieces, including *Yasen kanna* (Talks on a boat in the evening) and parts of *Orategama* (Embossed teakettle), that deal with Hakuin's theories for nurturing health and prolonging life.

Hakuin is noted for his painting and calligraphy, of which many specimens remain. His work is bold and amusing and includes caricatures of his parishioners, brushstroke drawings of Zen figures, poems, Zen sayings, and single characters, all boldly drawn in his untrained yet original hand.

Hakuin is the dominant figure in the history of Rinzai Zen in Japan. By turning back to the Song-era Zen that had been introduced in the Kamakura period he organized a strict and austere course of *kōan* study and provided for a revival of Rinzai Zen that had hitherto been in extreme disarray. All Rinzai masters practicing today trace their lineage to Hakuin.

## HALAKHAH

*This entry consists of the following articles:*

HISTORY OF HALAKHAH  
STRUCTURE OF HALAKHAH

### HALAKHAH: HISTORY OF HALAKHAH

Jewish law (*halakhah*) was the major integrative factor in Jewish life from early geonic times (eighth century) until the onset of the modern era. With Jewry's ever-increasing geographic dispersion and political incapacity, Jewish identity was shaped increasingly by Jewish law. It defined the broad sphere of religious observance and significantly influenced the norms and practice of communal governance, and its study was a central spiritual and intellectual experience. Jewish law was created in rabbinic academies and courts by individual scholars and by communal custom and enactment. Until the modern period, Jewish law responded to the major challenges in Jewish life, and the historical-geographic grid of legal creativity paralleled the development of the major centers of Jewish life.

**CHRONOLOGICAL PERIODS, GEOGRAPHIC CENTERS, AND AUTHORITIES.** The geonic period most likely begins with the Islamic conquest of Babylon in about 650; indeed it seems that the establishment of this more centralized Muslim administration was paralleled in the Jewish institutional structure. The gaonate (sg., *ga'on*, "splendor," derived from the formal name of the academy in Sura, Splendor of Ya'aqov) shared the governance of Babylonian Jewish society with the exilarch and claimed halakhic and spiritual authority over world Jewry. The central academies of Sura and Pumbedita (both in the general vicinity of Baghdad and eventually located in that city) were each headed by a gaon; all other scholars have remained anonymous in the literature. The major contribution of the geonic period to the development of Jewish law lies in the stabilization and standardization it brought to the relatively fluid situation in Talmudic times.

The gaonate successfully asserted the supremacy of the Babylonian over the Palestinian Talmud (a reflection of the

historical ascendancy of Babylonian Jewry) and brought much indecisive Talmudic discussion to a binding conclusion. The liturgy, in particular, reached a high degree of regulation with the publication of prayer-texts and rules in the *siddurim* of ‘Amram (fl. 856) and Sa’adyah (fl. 928). Geonic pressures toward standardization in this and other ritualistic areas were especially stimulated by the need to combat the competing Karaite movement and other sectarian groups. The growing urbanization of Jewish society and its commercial involvement also required, and received, legal guidance through the elaboration of Talmudic materials and explicit enactment, such as that enabling debtors to collect from the movable properties of orphans. Leading geonic figures include Yehud’ai, Naṭron’ai, ‘Amram, Sa’adyah, and Shemu’el ben Ḥofni, all of Sura; Paṭṭoi, Sherira’, and H’ai, all of Pumbedita. An auxiliary center of legal study during this period developed in North Africa; its central figure was Ḥanan’el, who was heavily influenced by H’ai.

Though geonic activity continued after the eleventh century (the twelfth-century Maimonides engaged in correspondence with the Baghdad gaonate), the weight of legal development passed to western Europe as the period of the *ri’shonim* (“first ones, early ones”) began. The death of the Babylonian H’ai in 1038 and the birth of Rashi (Shelomoh ben Yitshaq) in France in 1040 conveniently symbolize the shift. Perhaps paralleling the political decentralization of Christian Europe, rabbinic authority in Ashkenazic Europe was not centralized or even institutionalized—a striking contrast to the geonic structure. Scholars reached eminence by popular acknowledgement of their authority, not by appointment or election; law derived largely from learning, not from institutionalized structure. Men like Gershom ben Yehudah, Rashi, his grandson Ya’aqov ben Me’ir Tam, Eli’ezer ben Natan, Yesha’yah di Trani, Me’ir ben Barukh of Rothenburg, and his student Asher ben Yehi’el were the leading teachers of their time, but neither they nor their schools had any official status; at the most, some might have been judges in communal courts.

The *ri’shonim* generally continued the explication and development of Talmudic law, though certain topics—mercantile law, Jewish-Gentile relations, and communal governance—did demand more original treatment. The desire to base communal governance on Jewish law and its principles forced legists to hammer out basic political issues, such as the rights of majority and minority, equity in tax law, and election procedures, with little in the way of Talmudic precedent to guide them. Halakhic development in Provence and Spain may be characterized in a similar fashion, though the Sefardic rabbinate of the Iberian Peninsula during the Christian reconquest, reflecting the general political situation, was more centralized than its Ashkenazic counterpart and also more influenced by geonic legal patterns. Men like Avraham ben Yitshaq and Avraham ben David of Posquières; Yitshaq ben Ya’aqov Alfasi in North Africa; Moses Maimonides in Egypt; and Me’ir Abulafia, Moses Nahmanides, Shelomoh

moh ibn Adret, and Nissim Gerondi in Spain were teachers and judges whose commentaries and *responsa* carried their decisions and opinions around the world.

The work of the geonim and *ri’shonim* was brought to authoritative and influential summation by Ya’aqov ben Asher (d. 1343) in his *Arba’ah ṭurim* (*Ṭur*). The period from its appearance till the publication (in 1550–1571) of the *Shulḥan ‘arukh* of Yosef Karo and Mosheh Isserles is one of transition to the period of the *aḥaronim* (“later ones”) and also marks the migration of Jewry and its legal centers eastward: Ashkenazic Jewry to eastern Europe and Sefardic Jewry, after the 1492 expulsion from Spain, to Greece, Turkey, and the Land of Israel. The halakhic achievement of the *aḥaronim*, especially in the ranks of Ashkenazic legists, tends to the derivative. (This was despite the influence of Yisra’el Isserlein of Austria and the originality of Yosef Qolon of Italy in the fourteenth century; the achievement and influence of Ya’aqov Weill, Ya’aqov Landau and Yisra’el Bruna, all in the fifteenth century, were in the area of religious custom rather than in creative legal thought.) It is possible that continual political harassment, capped by pogroms and expulsions in the wake of the Black Death, sapped the intellectual energies of Ashkenazic Jewry. Furthermore, influential masters such as Ya’aqov Pollack and Shalom Shakhna preferred not to publish at all, arguing for a return to the more pristine concept of oral law, but their impact was to be felt in the revival of the sixteenth century. Sefardic halakhists, however, met new problems raised by commercial advance in the eastern Mediterranean region and the difficulties that emerged after the expulsion from Spain and Portugal such as the reabsorption of converts, fixing of personal status, and the forging of common patterns of governance and practice from the disparate communal traditions of the sixteenth century.

After 1492 the Sefardic settlements in Greece, Turkey, Egypt, and the Land of Israel constituted a single sphere of intellectual discourse and enjoyed an impressive level of halakhic activity. Foremost among the scholars of this era were David ibn Zimra’, Levi ben Ḥaviv, and Yosef Karo, all born in Spain before the expulsion; Mosheh di Trani, Yosef ben Lev, and Shemu’el de Medina. By the mid-sixteenth century, Ashkenazic Jewry had achieved a large degree of stability in Poland and Lithuania, and its halakhic focus was found in cities like Cracow and Lublin, where authorities such as Shelomoh Luria (c. 1510–1574), Mosheh Isserles, and Mordekhai Jaffe taught and wrote.

The publication of the *Shulḥan ‘arukh* by Karo and its annotation by Isserles marks the most significant watershed in the codification of *halakhah* until modern times. The bulk of the work was published by Karo (a member of the Safad community of mystics and halakhists) as a self-contained entity in 1565–1566; he had already collated the Talmudic and medieval sources in his massive commentary to the *Ṭur*, *Beit Yosef* (House of Joseph), which also frequently indicates the direction in which he would move as an authority in rabbinic law. Isserles, rabbi in Cracow, published glosses (the *mappah*,

“tablecloth,” to the *Shulḥan ʿarukh* in 1571 that registered the Ashkenazic variants to the Sephardic traditions of Karo and gave greater weight to the force of communal custom than Karo’s work alone had done. Isserles’s glosses also constituted an approval of Karo’s work, which overcame in a fairly short period its antagonists—legists of stature, such as Yosef ben Lev and Yehudah Löw ben Betsal’el, who opposed the reduction of rich tradition to the bare paragraphs of an authoritative code—and its competitors. The times were ripe for a new summation, as was evidenced by the existence of other, if more prolix, attempts: the *Levushim* (Garments) of Jaffe, and the *Yam shel Shelomoh* (Sea of Solomon) of Luria. Rabbinic scholarship now set about producing commentaries and supercommentaries on the *Shulḥan ʿarukh* in a process that both legitimated the code and made it a central document in the study and practice of Jewish law.

Despite the overall decline in the physical conditions of Jewish life by the late eighteenth century and its religious and ideological fissures, the period of the *aḥaronim* produced an extensive halakhic literature. Three characteristics deserve mention. (1) With the rise of the nation-state and the concomitant elimination of self-governing estates and religious communities, halakhists have addressed themselves less and less (except for textual or theoretical discussions) to issues of civil or criminal law. (2) With the rise of the Reform movement, Ashkenazic halakhists of the modern period have become more defensive and hence more conservative than their predecessors. (3) Communication and interaction between Ashkenazic and Sephardic halakhists have declined. It is too early to judge whether the existence of Israel as a Jewish state will have any effect on these tendencies.

Since the publication of the *Shulḥan ʿarukh*, the two major avenues of practical halakhic development in modern times have been the commentatorial activity centered on the *Shulḥan ʿarukh* and the *responsa* literature. Major commentaries were written on different sections of the code by Yehoshu’a Falk, David ha-Levi, Shabbetai Kohen, Yitshaq Lima, Shemu’el Feibish, and Ḥizqiyah di Silow, among others. These works explicate the code but also deal with issues growing out of its rulings and occasionally prefer their own opinions based on alternative sources. This tendency may also be noted in the work of Eliyahu ben Shelomoh Zalman of Vilna, which is devoted especially to tracing critically the Talmudic sources of the code. Subsequently, a more popular literature developed, which presented the results of these discussions in digest form, focusing especially on ritual law: *Hayyei adam* (Man’s Life) and *Hokhmat adam* (Man’s Wisdom) by Avraham Danzig and *Qitsur Shulḥan ʿarukh* (Short *Shulḥan ʿarukh*) by Shelomoh Ganzfried of Hungary, for example. A more expansive format is found in the works of Yisra’el Me’ir Kagan (for example, in *Mishnah berurah*), and Ya’aqov Sofer (in *Kaf ha-ḥayyim*), which have molded the consensus of Ashkenazic and Sephardic Jewries, respectively, in the area of ritual law.

Halakhic authorities, many of whom were communal rabbis or judges on the communal religious court, continued

to influence the course of *halakhah* in their *responsa*. Representative figures from the seventeenth century are Ḥayyim Ya’ir Bachrach of Germany, Yosef ben Mosheh di Trani of Turkey, and Shemu’el Aboab of Italy; from the eighteenth century, Ya’aqov Emden of Germany and Yehezqel Landau of Poland, Mosheh Hagiz and Yom-Ṭov Algazi of the Land of Israel, and Yehudah Ayash of North Africa; from the nineteenth century, ‘Aqiva’ Eiger of Germany, Mosheh Sofer of Hungary, Yitshaq Elḥanan Spektor of Russia, and Yosef Ḥayyim al-Ḥakham of Iraq. Sofer (known as Ḥatam Sofer) was a crucial figure in the nineteenth-century Orthodox response to Reform, coining the motto that in matters of law “novelty is forbidden by the Torah.”

Halakhic activity in the modern period reflects the historic fortunes of the people: Ashkenazic Jewry witnessed a flowering in eastern Europe (Poland, Lithuania, Galicia, Hungary) and a relative decline in western Europe; Sephardic Jewry continued its development in the Balkans, North Africa, and Iraq. Since the destruction of Jewries in World War II and the exodus from Arab lands after 1948, Israel and the United States have become the centers of halakhic creativity, buttressed by the revival of learning and observance in the latter half of the twentieth century. Much current halakhic activity simply elaborates medieval doctrine, but the rise of modern technologies has stimulated halakhic thinking in the areas of Sabbath law and medical ethics. The most major change in modern Jewish existence, namely the secularization of the mass of Jewish people, has not yet significantly affected the halakhic system.

**LITERARY GENRES AND INTELLECTUAL CURRENTS.** With the onset of the geonic period, halakhic literature developed in genres that have remained fairly constant until modern times: (1) monograph-code, (2) commentary, and (3) *responsa*. The antecedents of the first two genres are essentially Talmudic: the Talmud frequently undertakes to comment on and explicate the Mishnah, while the Mishnah, especially as it detached itself from scripture and Midrash, was formed as a monograph-code. A fourth genre—communal enactments—is more representative of the interaction of lay and rabbinical leadership. These different genres reflect different intellectual postures and tasks. Different geographic centers also devote themselves with varying intensity to one genre or another, yet no center or historical period abandoned any one of the genres, so that the materials found in each were in a state of constant interaction, and a substantial body of substance and method was shared by all.

**Monograph-codes.** The monograph-code of the geonic period had a functional goal: it was meant to provide for the crystallization of normative, standard practice and make this practice accessible to students, judges, and religious leaders. The geonim developed rules by which Talmudic literature was sifted and compiled the results of this process. From a substantive point of view, the major achievement of the geonic monograph-code lies in its reduction of Talmudic discussion to geonic decision. From a structural point of

view, the basic challenge lay in the reorganization of the material contained in the Talmudic debate into topical units; this process demanded not only the paring down of Talmudic pericopes but, in the more advanced monograph-code, the development of new topics.

A classic and early monograph-code is the ninth-century *Halakhot gedolot* (Major *Halakhot*), variously assigned to Shim'on Qayyara and Yehud'ai Gaon. The extensive Talmudic discussion is considerably reduced and canalized into a conclusive decision. The basic outline is Talmudic, but new topical units are occasionally introduced to unite scattered Talmudic materials into a new framework. Virtually all inoperative law, such as laws of sacrifices, purities, and impurities, is eliminated. Despite its new features, *Halakhot gedolot* is, in essence, an abridgment of the Talmud, a form that reaches its apogee in the eleventh-century *Halakhot* of Alfasi. Other geonic monographs are radical departures from the Talmudic model. The *Sefer ha-miqqah ve-ha-mimkar* (Book of Purchase and Sale) of H'ai, for example, a work on oaths, and the monograph on benedictions by Shemu'el ben Hofni both reorganize Talmudic law, which is presented in coherent form as a rule-structured system. The author elicits the rule underlying the concrete Talmudic discussion and strives for maximal generalization. At the same time, he usually retains the legitimating Talmudic source.

The geonic monograph-code reached fullest expression in Maimonides' *Mishneh Torah* (Second Torah; 1187), which is probably the single most prominent work in all post-Talmudic halakhic literature. In addition to bringing this traditional form to perfection through an architectonic vision of the entirety of Jewish law, Maimonides' code also served as an innovating document: the codified law is completely detached from Talmudic authorities and citations; Mishnaic Hebrew is revived to serve as the language of a new code; matters of belief, ideology, and metaphysics are integrated as normative aspects of Jewish law; and new topics are fashioned (for example, "Laws of Repentance," "Laws of Kings and Their Wars").

While Maimonides' immediate purpose in compiling his code was to provide a practical summary of law for the use of both layman and judge in what he considered a period of intellectual decline, *Mishneh Torah* is also a statement of the content and nature of Judaism as he saw it. Maimonides' code has become a central document in halakhic discussion, but it has not brought an end to the process of further development outside it. Prominent halakhists have always claimed that codes freeze the open-ended Talmudic process and are a stultifying concession to mediocrity, and Maimonides' elimination of the Talmudic bases for his decisions raised the hackles of his contemporaries (such as Avraham ben David of Posquières) even more. Subsequent codes, such as the *Arba'ah turim* of Ya'aqov ben Asher and Karo and Isserles's *Shulhan 'arukh*, lowered their sights considerably: the sense of an ordering structure declines considerably, purity of line is lost, and Temple-oriented topics as well as metaphysics

and beliefs are eliminated. No new codes have been produced since the sixteenth century, though the *Shulhan 'arukh* has been rewritten twice in attempts to integrate new materials or to combine the code with its earlier sources: see the *Shulhan 'arukh* of Shne'ur Zalman of Lyady (1745–1813) and the *'Arukh ha-shulhan* of Yehi'el M. Epstein (1829–1908).

**Commentary.** In geonic times commentary was, of course, commentary on the Talmud. So as to facilitate study of this protean and involuted document, geonim produced lexicographical aids that explained difficult terms and wrote explanatory material to clarify difficult Talmudic pericopes and chapters. Thus we possess H'ai's lexicographical commentary to *Tohorot* as well as parts of his running commentary to tractate *Berakhot*. The classic running commentary to the entire Talmud was written in France by Rashi. Based on oral traditions, Rashi's explication made the Talmud accessible to all students.

Rashi's grandchildren (the most prominent of whom was Ya'aqov ben Me'ir Tam) inaugurated the tosafist ("additions") school. Now commentary no longer addressed itself to the words and sentences of one specific text and context but undertook a synthetic analysis of all related Talmudic passages. This seminal work was based on a thorough mastery of the entire Talmud, an acute analytical sensibility, and the intellectual boldness necessary to produce novel concepts. In a sense, the tosafists continued the Talmudic process itself, producing new legal doctrines in the course of harmonizing disparate Talmudic opinions. Their techniques and results quickly spread to Spain and Italy: men like Nahmanides (and his students) in the thirteenth century and Yesha'yah di Trani absorbed the new mode. By the fourteenth century, analysis of Rashi was no longer a springboard for tosafist revision alone but became a subject in its own right in the work of Yom Tov Ashbilli.

Maimonides' code received the first of many sustained commentaries in Vidal di Tortosa's *Maggid mishneh* (The second speaker), a work that struggles with the code's relationship to Talmudic sources. Maimonidean commentary grew to the dimensions of a subdiscipline, an ironic outcome for a code perhaps designed to be a final statement of Jewish law.

New trends also asserted themselves: Isaac Campanton of Castile (late fifteenth century) pioneered a return to close reading of specific Talmudic texts utilizing categories of medieval logic; German and Polish Talmudists of the sixteenth century extended tosafist dialectic to a *pilpul* (lit., "pepper," in the sense of casuistry) based on subtle and frequently artificial comparisons and contrasts. Two modes of halakhic scholarship have become prominent in modern times: the analytic school that is identified with Hayyim Soloveichik of Brest-Litovsk but that had its inspiration in the *Qetsot ha-hoshen* (Ends of the breastplate) of Aryeh Leib ha-Kohen and, ultimately, in aspects of tosafist thought, and the text-critical and historical studies that derive in part from similar

models of Western scholarship. This latter mode, however, has made little impact on devotees of halakhic study.

**Responsa.** In contrast to commentary, *responsa*—along with the codes and their related literature—are attempts to mold halakhic practice by responding to specific problems as they arise. This genre developed massively in the geonic period. While both commentary and code are basically explanations or restatements of Talmudic law, the *responsum* applies that law to a new, concrete situation as the respondent functions at the intersection of law and practical reality. The *responsum* was the major instrument of direct geonic authority, and thousands of geonic responses to their far-flung questioners have been preserved. The *responsa* are the case law of the halakhic system, and the centrality of halakhic figures can often be gauged by their position in the *responsa* network. The decision rendered in a concrete situation is considered by many experts to be more authoritative than the codified generalization.

Two overall tendencies of this genre ought to be noted. (1) Inasmuch as a respondent was questioned in matters of conflict or situations reflecting new conditions, the bulk of *responsa* till the modern period focused on civil law, matters of personal status, and the application of halakhic categories to new economic conditions. Ritual law became a dominant subject of this literature only in relatively modern times, as Jews began to turn to the civil authorities for melioration of many of the problems listed above. (2) From the fifteenth century on (probably beginning with the *Terumat ha-deshen* [The Collected Ashes] of Yisra'el Isserlein), the *responsum* also became an artificial literary form in which a scholar elaborated on any problem of interest to him rather than communicating to an actual questioner. Thus the *responsa* literature includes central works of halakhic theory, such as the *Responsa sha'agat Aryeh* (Lion's roar) of Aryeh Leib of Mez. (A similar phenomenon is present in Maimonidean commentary, which has been used as a literary framework for discussion of general problems of Talmudic law.) This development notwithstanding, *responsa* remain the major forum in which modern halakhists consider the varied problems raised by contemporary civilization, as is seen in the multivolume works of Moshe Feinstein (1895–1986) of the United States and 'Ovadyah Yosef (b. 1920) of Israel. The *responsa* is well suited to *halakhah*: it allows a focus on the specific and the concrete; and inasmuch as the respondent is approached by virtue of his scholarship and reputation, *responsa* function in the absence of a formal hierarchical structure.

**Enactments.** Works classified as enactments (*taqqanot*) could be communal, rabbinical, or, frequently, authorized by both lay and rabbinical leadership. Enactments included in the Talmud are assumed to have universal application, and some medieval enactments have also achieved very wide observance (thus the ban [*herem*] on polygyny). But the vast majority of *taqqanot* were local in scope and origin. They were often communal or rabbinical responses to acute problems and carried communal sanctions. More than any other

aspect of the halakhic system, *taqqanot* (called *haskamot*, “agreements,” in the Sephardic sphere) represent *vox populi*; they would often be signed by the lay leadership (with the rabbinate concurring) and were frequently adopted by communal oath in the synagogue. *Taqqanot* are often preserved as independent documents or in communal registers and so constitute a literary genre of their own.

**MODERN SCHOLARSHIP.** Modern scholarly treatment of the history of medieval and modern *halakhah* has passed through a number of phases. Nineteenth-century historians, who often placed Jewish literary culture at the center of their interest, also focused on the careers of the great halakhists. But this focus often spent itself on biographical and literary issues; the history of law and legal theory was barely touched. With the rise of twentieth-century historiography, the major focus moved to the social, economic, and geopolitical aspects of Jewish life; now halakhic materials were combed as sources of historical data. A considerable amount of work was also devoted to the impact of general historic conditions of halakhic rulings and was often designed to show how flexible earlier halakhists had been. In recent decades, scholarship has looked for the complex interactions of legal theory and practice with historical reality as well as the internal dynamic of the halakhic system.

Modern scholarship has been able to utilize manuscript materials to gain a fuller picture of the past. Although no scientific editions of any medieval or modern halakhic text exist as yet, many new sources have been published or are consulted by scholars. The rich *genizah* (“storehouse”) of Cairo, in particular, has yielded much material emanating from the Babylonian and, even more important, from the obscure Palestinian gaonate. For example, by studying the legal documents found in the *genizah*, Mordecai A. Friedman has been able to reconstruct Palestinian marriage law, which went further in equalizing the rights of husband and wife than did Babylonian law (*Jewish Marriage in Palestine*, 2 vols., Tel Aviv, 1980).

The sociological investigation of Jewish law has been pioneered principally by Jacob Katz. Katz utilizes halakhic sources to shed light on social processes, but in his work on law governing Jewish-gentile relations (*Exclusiveness and Tolerance*, London, 1961) and in a number of papers on Jewish ritual law, he has also shown how social realities have affected the halakhic process. Recently, though, Haym Soloveitchik has indicated that the halakhic response has not always accommodated the social or economic need (see, for example, his paper “Can Halakhic Texts Talk History?” in *AJS Review* 3, 1978, pp. 152–196) but has developed through the interpretation of its textual traditions as well. Since Jewish legists generally functioned in close proximity to their Christian and Muslim contemporaries, the question of mutual influence arises. It appears that Jewish legists absorbed terminology and occasionally legal theory from their surroundings. A more substantive claim for the impact of Christian marriage law has been made by Ze'ev W. Falk in *Jewish Matrimonial*

*Law in the Middle Ages* (Oxford, 1966), and that for Muslim law of prayer has been made by Naftali Wieder in *Islamic Influences on the Jewish Worship* (Oxford, 1947; in Hebrew). This area of research is in its infancy.

The issue of halakhic openness arises in other contexts as well, for example, regarding the impact of Jewish pietistic movements on Jewish law and the degree to which legists integrate their other intellectual commitments into their legal views. The researches into Maimonidean *halakhah* by Jacob Levinger (*Darkhei hamahshavah ha-hilkhatit shel ha-Rambam*, Jerusalem, 1965) and Isadore Twersky (*Introduction to the Code of Maimonides*, New Haven, 1980) indicate that Maimonides' halakhic corpus is conditioned by his philosophic attitudes. Katz's work on the relationship of Qabbalah to *halakhah* reveals, as well, the influence of spiritualism on certain aspects of Jewish law (see, for example, his Hebrew papers in *Tarbiz* 50, 1980–1981, pp. 405–422; 51, 1982, pp. 59–106; and in *Da'at*, 1981, pp. 37–68). Nonetheless, the halakhic system has retained a great measure of integrity as a self-contained system.

The most rounded analysis of the history of *halakhah*, treating both systemic-conceptual development and the place of law in society and history, is that associated with the school of *mishpat 'ivri* ("Hebrew law") in Israel. Although its scholarly and ideological assumptions have been subjected to sharp disagreement (see the debate between Izhak Engeland and Menachem Elon in *The Jewish Law Annual, Supplement 1*, 1980), this school surveys topics of Jewish law in fuller scope than do other methods. Significant work produced by its historians includes Aaron Freimann's study of conditional marriage, M. Elon on the freedom of the debtor's person, and Shmuel Shiloh on Jewish reception of non-Jewish law. A fine English-language exemplar of this method is David Feldman's *Birth Control in Jewish Law* (New York, 1968), which surveys Jewish law on birth control and abortion from biblical times until the present.

SEE ALSO Tosafot.

#### BIBLIOGRAPHY

The best overall survey of the processes of Jewish law, its history and literature (despite its focus on criminal, personal, and civil rather than religious law), is Menachem Elon's *Ha-mishpat ha-'ivri*, 2d ed., 3 vols. (Jerusalem, 1973); much of this material is also accessible in *The Principles of Jewish Law*, edited by Elon (Jerusalem, 1975). The most sustained treatment of the major figures and periods is Haim Chernowitz's *Toledot ha-posqim*, 3 vols. (New York, 1946–1947), which begins with the geonic period and reaches seventeenth-century Europe. In general, much more work has been done on the high medieval period than on early modern and modern *halakhah*. Salo W. Baron's "The Reign of Law," in his *A Social and Religious History of the Jewish People*, vol. 6, *Laws, Homilies and the Bible*, 2d ed., rev. (New York, 1958), pp. 3–151, 321–398, provides a stimulating and well-annotated discussion of geonic and high medieval *halakhah* from a historical perspective; the fifth and seventh volumes

of this series are also liberally peppered with references to halakhic history. Simḥa Assaf, in *Te-qufat ha-ge'onim ve-sifrutah* (Jerusalem, 1955), surveys the geonic period with a heavy stress on the halakhic development.

There are a number of outstanding treatments of individual figures or specific movements: E. E. Urbach's *Ba'alei ha-tosafot*, 4th ed. (Jerusalem, 1980), details the milieu and contribution of the seminal tosafist movement; Isadore Twersky's *Introduction to the Code of Maimonides* (New Haven, Conn., 1980) is a magisterial analysis of various literary aspects of the code and the relationship of Maimonides' *halakhah* and his philosophical views. Louis Finkelstein provides translation and discussion of the major European *taqqanot* until the fifteenth century in his *Jewish Self-Government in the Middle Ages* (1924; reprint, Westport, Conn., 1972), and Solomon B. Freehof's *The Responsa Literature* (Philadelphia, 1955), is an informative introduction to this genre.

Although research in Jewish law is published in various journals, a number of publications are devoted exclusively to this topic: *Shenaton ha-mishpat ha-'ivri* (1974–), *Dinei Yisrael* (1970–), and the *Jewish Law Annual* (1978–).

GERALD J. BLIDSTEIN (1987)

#### HALAKHAH: STRUCTURE OF HALAKHAH

*Halakhah*, in the general sense of the word, is the entire body of Jewish law, from scripture to the latest rabbinical rulings. It is a complete system of law governing every aspect of human life. It has been traditionally viewed as wholly rooted in God's revealed will (B. T., *Hag.* 3b) but subject to the ongoing interpretation of the Jewish jurists (B. T., *B. M.* 59b).

In its more specific sense *halakhah* (pl., *halakhot*) refers to those laws that were traditionally observed by the Jewish people as if they were scriptural commandments (*mitsvot*) even though they were nowhere explicitly found in scripture. The term itself, according to Saul Lieberman in *Hellenism in Jewish Palestine* (New York, 1962), seems to refer to the statement of a juristic norm as opposed to actual case law. The task of much rabbinic exegesis, especially during the tannaitic period (c. 70–200 CE), was to show that through the use of proper hermeneutics the *halakhot* could be derived from the text of scripture, especially the Pentateuch. When this could not be done, the specific *halakhah* was termed "a law of Moses from Sinai."

**ORIGINS.** Concerning the origins of *halakhah* there are three main theories.

The first, the traditional, rabbinic approach, is founded on the literal meaning of "a law of Moses from Sinai," namely, that Moses received two sets of teachings at Mount Sinai, one written (the Pentateuch) and the other oral (*torah she-be'al peh*), and that the oral Torah is the authoritative explanation of the written Torah (B. T., *Ber.* 5a). Thus all subsequent interpretation is in effect recollection of what had already been revealed at Sinai (J. T., *Meg.* 4.1.74d). This theory explains that the constant rabbinical disputes over vir-

tually every point of *halakhah* are due not to any inherent ambiguity in the tradition itself but, rather, to insufficient mastery of the tradition by the rabbis (Tosefta, *Soṭ.* 14.10).

The second theory is that of Moses Maimonides (Mosheh ben Maimon, 1135/8–1204). Although he too reiterated the literal meaning of the totally Mosaic origin of *halakhah*, in his specific treatment of the constitution of halakhic authority he states that *halakhah* is based on scripture and, equally, on the rulings of the Great Court in Jerusalem (*Mishneh Torah*, Rebels 1.1ff.). This is Mosaic law in that the members of the Great Court are Moses' authoritative successors. Maimonides explains the fact of constant rabbinical disputes in *halakhah* as due to the loss of political sovereignty, which led to the demise of the Great Court's jurisdiction. By this theory Maimonides places both rabbinical legislation and traditional *halakhah* on the same level.

The third theory is that of Zacharias Frankel (1801–1875). Expanding certain medieval comments into a more general theory, Frankel, in *Darkhei ha-Mishnah* (Leipzig, 1859), saw the term “a law of Moses from Sinai” as primarily referring to ancient laws that had become widespread in Jewish practice and whose origins were obscure. They were regarded as if they had come from the actual time of Moses. Frankel's theory, which received severe criticism from more orthodox scholars, reflected the growing historical consciousness of nineteenth-century Jewish scholarship and, also, stimulated research into the different historical origins of various *halakhot*. Frankel, then, along with other scholars of his time, laid the foundation for the historical understanding of *halakhah* as a developmental phenomenon.

**SCRIPTURAL EXEGESIS.** Because of the Pharisaic and rabbinic emphasis on the essential unity of the written Torah and the *halakhah*, in contradistinction to the Sadducean, which accepted only the former as authoritative (B. T., *Hor.* 4a), an elaborate hermeneutical system was worked out to derive as many of the *halakhot* as possible from the words of scripture, which was considered normatively unintelligible without the process of specifically relating it to the *halakhah* (B. T., *Shab.* 31a). This entire process was called *midrash*, literally meaning “inquiry” into scripture. The most important statement of this rabbinic hermeneutic is the “Thirteen Methods of Rabbi Yishma‘el” (*Sifra*, intro.). The most widely used of these methods and the most typical was the *gezerah shavah*; namely, the process by which a word in one scriptural context was interpreted according to its meaning in another context. Since this type of interpretation was only for buttressing already normative *halakhot*, what it accomplished was a much wider latitude for tradition to determine the meaning of scripture (J. T., *Pes.* 6.1, 33a). However, not only did such hermeneutical methods support already normative *halakhot*, but they also led to the formulation of new norms. The most prominent proponent of this constructive exegesis was the second-century sage ‘Aqiva ben Yosef, although his oftentimes daring interpretations elicited the criticism of his more conservative teachers and colleagues (B. T., *Men.* 89a).

In tannaitic texts a distinction is made between direct scriptural exegesis (*derashah*) and indirect exegesis. In a purely normative sense, however, it is difficult to see any authoritative difference between laws buttressed by the latter as opposed to the former. Both sets of laws were regarded as traditional *halakhot*; the only difference is that the former were more satisfactorily based on scripture.

**RABBINIC LAW.** In the amoraic period (c. 220–c. 500) there emerged a more clear-cut distinction between laws considered scriptural (*de-oraita*) and laws considered rabbinic (*de-rabbanan*). The difference between scriptural law and rabbinic law by this time was that the latter was considered to be evidently rational. As for scriptural law, despite attempts to discover “reasons for the commandments” (*ta‘amei ha-mitsvot*), God's will was considered sufficient reason for it. “I have made a statute; I have decreed a decree; you are not permitted to violate my decrees” (*Nm. Rab.* 19.1). This phrase was used to refute any suggestion that only those laws whose reasons were evident were authoritative. In fact, certain scriptural laws were admitted to be rationally incomprehensible, but their authority was nevertheless emphasized as being because “my father in heaven has decreed such for me” (*Sifra*, Shemini, ed. Weiss, 93b).

Rabbinic law, although occasionally justified by indirect scriptural exegesis (*asmakhta*), was then usually justified as being for the fulfillment of some religious or social need (B. T., *Ber.* 23b). This developed to such an extent that it was claimed that there were only three rabbinic laws for which no reason could be immediately discerned (B. T., *Git.* 14a). Furthermore, the lines between direct and indirect exegesis were considerably blurred (B. T., *Pes.* 39b). Finally, Rava, a fourth-century Babylonian sage who became the most prominent advocate of rational jurisprudence, indicated that the rabbis actually had more legislative power than even scripture (B. T., *Mak.* 22b). Nevertheless, although in theory the punishment for the violation of rabbinic law could be even more severe than that for the violation of scriptural law (*San.* 11.3), in reality it was almost always more lenient (*Naz.* 4.3). In case of doubt, in matters concerning scriptural law the benefit of the doubt favored the law, but in rabbinic law it favored the accused (B. T., *Beits.* 3b).

The question of the extent of scriptural law versus rabbinic law was deeply debated among the medieval Jewish jurists. Maimonides, following the Talmudic opinion that scriptural law is limited to 613 Pentateuchal commandments (B. T., *Mak.* 23b), considered any other laws, whether traditional or formulated through exegesis or rabbinical legislation, as having the status of rabbinic laws (*Sefer ha-mitsvot*, intro., sec. 2). Moses Nahmanides (Mosheh ben Naḥman, c. 1194–1270), on the other hand, was of the opinion that anything designated by the rabbis as scriptural law, especially those laws derived hermeneutically in rabbinic literature, has the status of scriptural law. Only those laws specifically designated by the rabbis as rabbinic are to be considered as such. This difference of opinion concerning the very character of

*halakhab* is philosophical. Maimonides' prime concern seems to have been with the process of legislation, that is, with the ability of the duly constituted authorities to make new laws and repeal old ones. Nahmanides' prime concern seems to have been with a revival of the whole process of rabbinical exegesis. This distinction can be seen in the fact that Maimonides' chief halakhic contribution was that of a highly innovative codifier, whereas Nahmanides' was that of an exegete. This difference of approach can be seen in the Talmud and throughout the history of the *halakhab*, namely, the apodictic approach (B. T., *Nid.* 73a) as contrasted with the expository approach (B. T., *B. M.* 33a).

Rabbinical legislation was considered the original prerogative of the Great Court in Jerusalem (*Sifrei*, Shoftim, ed. Finkelstein, no. 144). With the diminution of its powers even before the destruction of the Second Temple in 70 CE and its full demise at that time, how much of its power could be transferred to subsequent courts became the subject of considerable discussion.

Sometimes Jewish juridical power was limited because of the lack of political sovereignty; however, internal Jewish political considerations played an even more important role in determining the extent of juridical authority in certain times and places. Despite the destruction of the Second Temple and the demise of the Great Court, there was a strong attempt to retain prime rabbinical authority in the Land of Israel. Thus unqualified rabbinical ordination (*semikhah*), which was seen as an institution originating with Moses himself, was limited to those rabbis who functioned in the Land of Israel. When in the third century Rav (Abba' bar Ayyvu) left Israel for Babylonia, where he led the revival of the Jewish community, he was granted a qualified ordination, with authorization to adjudicate only in certain questions of law (B. T., *San.* 5a). Nevertheless, with the exception of adjudicating in the area of scripturally fixed fines (*qenasot*, B. T., *B. Q.* 84b), as the Babylonian community grew and developed its own institutions, its rabbis began to claim virtually all of the halakhic prerogatives of the rabbinate of the Land of Israel (B. T., *Git.* 88b). Generally, this set the pattern for subsequent rabbinical authority, namely, that the rabbis in every time and place exercised as much halakhic authority as political and religious conditions both allowed and required (Tosefta, *R. ha-Sh.* 1.18). Moreover, it was recognized that in emergency situations the rabbis had the right to override existing laws temporarily (*hora'at sha'ah*), even scriptural ones (B. T., *Yev.* 90b). Finally, it was recognized that the rabbis even had the power to abrogate certain aspects of scriptural laws, although this power was considerably qualified (*ibid.*, 89b).

**Types of rabbinical legislation.** Rabbinical legislation can generally be divided into two classes: decrees (*gezerot*) and enactments (*taqqanot*).

Decrees were justified by the principle traced back to the period of Ezra (sixth century BCE) that "a fence is to be made around the Torah" (*Avot* 1.1). This "fence" consists of

prohibitions designed to protect scriptural law from probable transgression. Thus, for example, numerous additional restrictions (*shevut*) were enacted to protect the thirty-nine scriptural prohibitions of Sabbath labor from being carelessly violated, to enhance the overall sanctity of the day, and to guard against behavior that the rabbis saw as inconsistent with the spirit of the law (*Beits.* 5.2). However, to distinguish rabbinical legislation from scriptural law and to prevent an infinite multiplication of strictures, the rabbis emphasized that laws were not to be enacted to protect their laws (B. T., *Beits.* 3a).

Rabbinical enactments were justified by the scriptural prescription that "you not deviate from what the judges will tell you" (*Deut.* 17:11). Although this probably refers to the simple necessity of applying scriptural law, the rabbis saw it as mandating their power to add to it if circumstances warranted doing so. These enactments were of three kinds.

1. Enactments were made to commemorate postbiblical Jewish events. Thus, for example, the recitation of the liturgical formula "Blessed are you, Lord . . . who has commanded us" was justified for the ritual of kindling Hanukkah lights on the grounds that the rabbinical legislation that mandated it is itself prescribed by scripture (B. T., *Shab.* 23a). As the rabbis often put it, "It is a commandment to listen to the words of the sages" (B. T., *Yev.* 20a).
2. Enactments were made to alleviate hardships arising from the widening gap between scriptural law and social and economic realities. Thus, for example, the scriptural law prescribing the cancellation of debts every seventh year (*Deut.* 15:1ff.) proved to be a deterrent to lending money to those who needed it most in a commercial economy, where longterm loans were becoming more and more common. To alleviate this situation, in accordance with the overall purpose of the Torah, that is, to promote social justice and well-being, Hillel the Elder (first century CE) enacted the institution of *prozbul*, whereby a creditor handed over his note to a court. Since the court collected the debt, the lender avoided the prohibition of personally collecting the debt after the Sabbatical year (*Git.* 4.3).
3. Enactments were made to curtail individual rights, the exercise of which was seen as contrary to the common good. Thus, for example, the third-century Babylonian sage 'Ula' ruled that although scripture permitted repayment of a debt with merchandise of any quality (*Deut.* 24:11), the debtor must repay a debt with at least medium-grade merchandise so as not to discourage lending (B. T., *Git.* 50a). This same type of curb on what was perceived to be the antisocial exercise of individual privileges was the basis of the numerous laws enacted in medieval communities (*taqqanot ha-qehillot*). The most famous of these was the ban on polygyny issued for Ashkenazic (northern European) Jewry by Gershom ben

Yehudah of Mainz (c. 965–1028) even though both the Bible and the Talmud permit the practice.

**Rabbinic legal procedures.** Rabbinical legislation was conducted according to a number of procedural rules. Although the reason for a specific rabbinical enactment did not have to be immediately publicized (B. T., *A. Z.* 35a), there certainly had to be a clear and compelling religious or social need for it to be enacted. Rabbinical legislation was considered general in scope and was not to be formulated as case law (B. T., *Eruv.* 63b).

The question of how long a rabbinical enactment was considered binding and what power of repeal subsequent rabbis have is a complicated one and is debated by scholars. Thus an important passage in the Mishnah states that “one court may not repeal [*mevatef*] the decrees of a fellow court unless it is greater than it in wisdom and in numbers” (*Eduy.* 1.5). Some scholars have interpreted this as applying to a contemporary court only. Others have interpreted it as applying to a subsequent court. “Greater in numbers” has been interpreted to mean a greater number of disciples. However, it was highly unusual for a subsequent court to regard itself as wiser than an earlier one. The rabbis generally were too reverent of tradition to attempt to repeal it overtly. The Talmudic statement “If earlier generations were angels, we are but men” (B. T., *Shab.* 112b) reflects this typical attitude. Therefore, repeal usually took the form of more subtle reinterpretation of earlier enactments. However, even when the reason for an enactment was no longer extant, it was still considered binding unless there was a strong reason for reinterpretation.

The question of rejection of a rabbinical enactment by the people was debated in the Middle Ages. The Talmud states that “a decree is not to be made unless the majority of the community are able to abide by it” (B. T., *A. Z.* 36a), and this was interpreted to mean that it had to have been accepted as normative by the majority of the community. (There does not seem to have been, however, any procedure for an actual plebiscite.) Rashi (Rabbi Shelomoh ben Yitshaq, 1040–1105) restricts this right to the generation of the enactment itself; that is, if they accept it the enactment is binding irrespective of the possible rejection by subsequent generations. Maimonides, on the other hand, extends the right of rejection even to subsequent generations; that is, if an earlier rabbinical enactment had fallen into disuse, then a subsequent court may regard it as no longer binding (*Mishneh Torah*, Rebels 2.7). Following the same logic, in another ruling Maimonides opts for the ancient Babylonian practice of publicly reading the Torah in the synagogue in an annual cycle over the ancient Palestinian practice of reading it in a triennial cycle, simply because the former practice had acquired universal Jewish acceptance.

**CUSTOM.** *Minhag* (“custom”) is the third constituent element in *halakhah*, after scriptural exegesis and rabbinic law. It basically has three functions.

1. Custom is invoked when the law itself is ambiguous. If

there are two reputable opinions as to what a law is, then there are two ways of deciding what is to be done. Either the majority view of the sages is followed (B. T., *Hul.* 11a), or the popular practice of the people is consulted and followed (J. T., *Pe'ah* 8.2, 20c). In the latter situation custom does not establish law but distinguishes between which law is considered normative (*halakhah le-ma'aseh*) and which law is considered only theoretical (*ein morin ken*, J. T., *Yev.* 12.1, 12c). Popular acceptance of one practice over another is considered a valid criterion of juridical choice because “if the people of Israel are not prophets, they are the children of prophets” (J. T., *Pes.* 6.1, 33a). In other words, popular practice is indicative of an unbroken chain of tradition.

2. Custom is considered a valid form of law, supplementing scriptural commandments and formal rabbinical legislation. Certain customs are considered universally Jewish. For example, the Orthodox objection to the modern practice of men and women sitting together in non-Orthodox synagogues, although some have attempted to find formal halakhic objections to it, is actually based on the fact that theretofore separation of the sexes in the synagogue was undoubtedly universal Jewish custom. Earlier in the nineteenth century the same invocation of the authority of custom was used to object to the introduction of the organ into synagogues in western Europe, with the additional point that such a practice constituted “walking in the ways of the Gentiles.”

Other customs are considered local and binding only on members of a particular locality. Generally, the rule is that if one is in a different locality from one's own, one should do nothing there to cause any scandal or controversy (*Pes.* 4.1). The force of the authority of local custom can be seen, especially, in the diversity of liturgical rites among Jews even to this day. These differences of custom to a large extent reflect differences of local environment and the social, political, and economic conditions within the respective Jewish communities. In new localities, where there are Jews from varying backgrounds, the general approach is to attempt to devise a unified rite so that there not be numerous groups (B. T., *Yev.* 13b). More frequently than not the rites of the more dominant group in the new locality prevail over everyone.

3. Custom sometimes takes precedence over established Jewish practice even when it has no foundation in *halakhah*. Usually this power of custom was used to rescind privileges the *halakhah* had earlier granted (Elon, 1978, pp. 732ff.). However, sometimes custom even had the power to abrogate, *de facto*, scriptural law. For example, the law that certain portions of slaughtered animals be given to descendants of Aaronic priests irrespective of time and place was not considered binding because of customary neglect.

**EXTRAHALAKHIC FACTORS.** The role extrahalakhic factors have played in the development of the *halakhah* is one of considerable debate among scholars. Aside from the question of the influence of history and general philosophy, which could be seen as extraneous modes of thought, there is the question of the influence of the nonlegal body of rabbinic thought, largely theological, known as *aggadah*. Generally it was held that one could not decide the law based on *aggadah* alone. Nevertheless, it can be shown that aggadic factors were influential in formulating halakhic opinions. This becomes evident when the views of the various rabbis, who were both halakhists and aggadists, are examined.

Thus, for example, 'Aqiva', in a discussion of capital punishment, states that had he been a member of the Sanhedrin when capital punishment was practiced, no one would have ever been executed (*Mak.* 1.10). The Talmud attempts to find a legal basis for this opinion inasmuch as capital punishment is prescribed by scripture for a number of crimes. The halakhic conclusion (written long after the time of 'Aqiva') is that he would have interpreted the laws of evidence so strictly as to make conviction for a crime punishable by death a practical impossibility (B. T., *Mak.* 7a). However, one can find an aggadic statement, recorded in the name of 'Aqiva' himself, that "whoever sheds human blood diminishes the divine image" (Tosefta, *Yev.* 8.7). Since even a convicted criminal has not forfeited that divine image (Tosefta, *San.* 9.7), one can see that 'Aqiva' had theological objections against any sort of bloodshed. It would seem that his theology was the authentic influence on his halakhic opinion, although subsequent legalists had to find a halakhic reason for it lest the authority of the law be reduced to theological opinion, something that was generally avoided (J. T., *Hor.* 3.9, 48c).

One can see further evidence of this in the relation between *halakhah* and Qabbalah (Jewish mystical literature), especially if Qabbalah is taken to be a subsequent development of *aggadah*. On the one hand, despite the growing popularity in the Middle Ages of the *Zohar* (the most important qabbalistic text), there were halakhists who regarded it as nonauthoritative, whether or not they approved of its theology. On the other hand, there were legalists who regarded it as divine revelation and *ipso facto* authoritative. A compromise was reached between these two opinions by David ibn Avi Zimra' (1479–1573), who ruled that when the Talmud was inconclusively divided on a certain law, the *Zohar* could be invoked to decide in favor of one of the Talmudic opinions. However, the *Zohar* could not be so invoked when the Talmud was conclusive.

**SUBDIVISIONS OF HALAKHAH.** For descriptive purposes it is helpful to see *halakhah* as divided into the following areas: (1) ritual law, (2) law of familial and personal status, (3) civil law, (4) criminal law, and (5) law pertaining to non-Jews.

**Ritual law.** Although including inoperative laws pertaining to the Temple cult and most matters of ritual purity, ritual law can be seen today as confined to matters of wor-

ship, the Sabbath and festivals, diet, clothing, and sex. In the four-part *Shulhan 'arukh* of Yosef Karo (1488–1575), which has become the most authoritative halakhic code, ritual law is the subject of all of the first part, *Orah hayyim*, and most of the second part, *Yoreh de'ah*.

One of the most important principles to emerge in the development of ritual *halakhah* is that in cases where the observance of the law poses a distinct danger to human life, the law is not to be observed. The origins of this seminal principle can be seen as early as the Maccabean revolt against the Seleucid rulers of the Land of Israel (166–164 BCE). In that revolt the pietists refused to fight on the Sabbath. This led to their being frequently massacred on the Sabbath by their enemies, who quickly became aware of this restriction. It was argued (*1 Mc.* 2.39–42) that this insistence on unqualified Sabbath observance would lead to the total extermination of the Jewish people. In the early second century, under similarly oppressive circumstances, the rabbis meeting secretly at Lod ruled that one was to transgress the law rather than die a martyr's death. The only exceptions were if one were ordered on pain of death to practice idolatry overtly, commit murder, or initiate an act of adultery, homosexuality, or bestiality (B. T., *San.* 74a). All of this was based on the scriptural command "You shall live through them" (*Lv.* 18:5), which was interpreted to mean "You shall live through them but not die because of them" (*Sifra*, Aḥarei-mot, 86b). This principle, in one form or another, was invoked on numerous occasions and led to such corollaries as "Danger to life takes precedence over a ritual infraction" (B. T., *Hul.* 10a).

**Law of familial and personal status.** The law of familial and personal status is the subject of *Even ha'ezer*, the third part of the *Shulhan 'arukh*, and of some sections of *Yoreh de'ah*, the second part. In this area of *halakhah* the question that has become the subject of widest discussion and deepest controversy since 1948 is that of who is a Jew.

**Jewish identity.** According to scriptural law it would seem that Jewish identity is patrilineal, as suggested by such statements as "The whole community were registered by the clans of their ancestral houses [*le-veit avotam*; lit., 'the houses of their fathers']" (*Nm.* 1:18; J. T., *Qid.* 64d). Furthermore, when Ruth the Moabite married the Israelite leader Boaz, without specific mention of any formal conversion, her descendants were automatically considered as following her husband's patrimony (*Ru.* 4:21–22). Nevertheless, according to the Talmud Jewish identity is considered matrilineal (B. T., *Qid.* 68b). The origins of this approach can perhaps be seen in the beginnings of the postexilic period (c. 516 BCE), when at the urging of Ezra the people banished not only their non-Jewish wives but also "those born of them" (*Ezr.* 10:3).

Once one is born of a Jewish mother, or he or she has properly converted to Judaism, that status is considered irrevocable (B. T., *San.* 44a, *Yev.* 47b). However, the community can revoke various privileges of Jewish status from apos-

tates and other persons as well who have removed themselves from basic Jewish identification and observance.

**Marriage and divorce.** The subject of the most extensive halakhic structure is marriage and divorce. Marriage originally consisted of two parts. The first part, *erusin* (“betrothal”), was initiated when the man, with the consent of the woman, designated her as his wife before at least two bona fide witnesses, usually by giving her an article of stipulated value (*Qid.* 1.1). The woman, however, continued to live with her parents; her father now had joint responsibility for her, along with her husband. After a period of time, usually one year, the bride left her parental home and went to live with the groom (*nissu’in*), and the couple consummated the marriage. The status of the woman was greatly enhanced by the marriage contract (*ketubbah*), which provided a considerable payment in the event of her being divorced or widowed (Epstein, 1927).

Divorce required that the husband present his wife with a formal bill of divorce (*get*), drawn up at his instigation by a rabbinical court. Although the school of Shammai made adultery the only grounds for divorce, the *halakhah* followed the more lenient view of the school of Hillel, which made virtually any incompatibility sufficient for divorce to be effected (*Git.* 9.10). Although the woman herself could not instigate divorce proceedings, she could, nevertheless, when there was clearly sufficient incompatibility, request that a rabbinical court force her husband to grant her a divorce (*Ket.* 7.10). Indeed, nonfulfillment of the basic husbandly duties of support and regular sexual intercourse obligated a man to do so (*Ket.* 5.6).

**Civil law.** Jewish civil law regulates all areas of life involving property. It is the subject of the greatest discussion in *Hoshen mishpat*, the fourth part of the *Shulhan ’arukh*.

Of all the areas of *halakhah*, civil law has been the most flexible. The underlying basis of this flexibility is perhaps best expressed in the rabbinic dictum “The Torah cares about property of Israel” (*Neg.* 12.5). In other words, although there was a consistent commitment to general principles of justice, it was understood that the law, especially in the unstable and diversified area of economics, must be responsive to the needs of the times. This characteristic, it might be added, was limited to the area of civil law, and for this reason one could not apply most of the principles developed there to the more conservative area of ritual law (B. T., *Ber.* 19b).

Although the *halakhah* developed its own standards for various commercial activities, the operative principle is “Everything is according to the practice [*minhag*] of the locality” (*B. M.* 7.1). Thus, even conditions contrary to the law of the Torah, which under all other circumstances are null and void, in monetary matters are considered valid if freely agreed upon by both parties to a contract (B. T., *Qid.* 19b), except where the prohibition of one Jew taking interest from another Jew is involved. However, even here the *halakhah*

eventually evolved a procedure (*better ’isqa*) whereby interest could be charged for commercial loans using the legal fiction of designating the creditor as a partner of the debtor in a joint venture (Elon, 1975, pp. 504–505). Furthermore, flexibility in this area of *halakhah* is evidenced by the fact that in monetary disputes informal arbitration was encouraged in lieu of formal adjudication.

Private property was not considered an absolute right by the *halakhah*. Although there is an elaborate system of adjudicating claims and counterclaims between private parties in such areas as torts and contracts, the court had the power to declare private property ownerless (*hefker*) if this was in the interest of the common good (B. T., *Yev.* 89b). It must be added, however, that this principle was used sparingly, and it seems as though for the *halakhah* a limited free-enterprise system is considered both the norm and the desideratum.

**Criminal law.** Jewish criminal law, also dealt with in *Hoshen mishpat*, is concerned with capital and corporal punishment. Capital punishment is mandated for such interpersonal acts as murder and adultery as well as for such ritual acts as public violation of the Sabbath. Corporal punishment (lashing) is mandated for various ritual infractions (*Mak.* 3.1ff.). Most personal injury, however, was treated as a civil tort rather than as a criminal act per se. Thus the scriptural *lex talionis* (“an eye for an eye,” *Ex.* 21:24) was interpreted by the rabbis as prescribing monetary compensation for the victim rather than the actual mutilation of the perpetrator.

Even after the Roman rulers of the Land of Israel had removed the power of the Jewish courts to administer capital punishment, sometime before 70 CE, the rabbis were sharply divided about its desirability. Although the institution itself, because it was scripturally prescribed, could not be explicitly abrogated, a number of rabbis were obviously opposed to it in practice if not in principle (B. T., *San.* 71a). This tendency to oppose capital punishment is also seen in the rabbinic institution of *hatra’ah*, according to which one could not be convicted of a capital crime unless he or she had been explicitly forewarned by the same two witnesses who actually saw the crime and the criminal had explicitly indicated that he or she was aware of both the criminal status of the act to be done and the exact type of capital punishment it entailed (B. T., *San.* 40b–41a). Such an institution would seem to limit sharply the number of legal executions. Whether *hatra’ah* was actually practiced when the Jewish courts had the power of capital punishment is questioned by some modern scholars. Nevertheless, it does reflect a definite tendency in rabbinic theory if not in actual practice.

On the other hand, a number of prominent and influential halakhists expressed the view of the second-century sage Shim’on ben Gamli’el II that capital punishment is necessary to maintain social order (*Mak.* 1.10). Indeed, the Talmud is followed by many subsequent authorities in advocating capital punishment even for crimes not specified as capital crimes in the legal sources if the court believed that

“the hour required such” in cases of gross public provocation. In the thirteenth century the important halakhist Shelomoh ben Avraham Adret stated that were all the traditional qualifications of capital punishment in the *halakhah* to be followed, “society would be destroyed.” His statement, furthermore, was probably not just theoretical in that it is known that Spanish Jewish communities at that time did have the power to execute criminals (Elon, 1978, p. 9).

The actual practice of Jewish criminal law, and to a large extent Jewish civil law as well, has frequently required the type of political sovereignty that Jews did not have. Thus in the third century the Babylonian authority Shemu’el of Nehardea formulated the seminal juridical principle that “the law of the kingdom is the law” (B. T., *B. B.* 54b). This principle was justified in several ways; the most cogent is that the Jewish court has the power to transfer its authority in civil and criminal matters. Historically this relegated all Jewish criminal law and much Jewish civil law to the realm of the theoretical. Thus some medieval authorities seem to have thought that this principle was too radical in that it gave away too much Jewish legal sovereignty. It is still too early for the most part to see if and how Jewish criminal and civil law can be revived in the state of Israel, which, at the present time at least, is constituted as a secular state not subject to the authority of the *halakhah* except in limited areas (see below).

**Law regarding non-Jews.** The area of Jewish law pertaining to non-Jews has been called “the seven commandments of the sons of Noah” (Tosefta, *A. Z.* 8.4). These commandments are (1) the obligation to adjudicate cases according to defined statutes and the prohibitions of (2) blasphemy, (3) idolatry, (4) homicide, (5) adultery, homosexuality, and bestiality, (6) robbery, and (7) eating a limb torn from a living animal. A number of commentators saw these seven commandments as seven general legal categories rather than seven specific norms.

One of the most important historical questions about this area of *halakhah* is whether or not it was actually enforced among non-Jews. Some scholars consider this highly unlikely inasmuch as no actual case is reported in the rabbinic sources, where these laws were the basis of adjudication, and there do not seem to have been free Gentiles living under Jewish legal jurisdiction in the rabbinic period. Indeed, only in Maimonides’ *Mishneh Torah* (Code of Law), which deals with every area of *halakhah*, even those no longer (if ever) operative, are the Noachic laws systematically presented and discussed (Kings and Wars 8.10ff.). It is, moreover, important to note that non-Jewish slaves, who were certainly owned by Jews at that time, were subject to a body of law containing many more distinctly Jewish practices and prohibitions than the Noachic laws (B. T., *Hag.* 4a).

Nevertheless, the concept of a law governing non-Jews, which was considered to have been normative for Jews as well before the Sinaitic revelation of the 613 commandments of the Mosaic Torah, had a profound effect on the development

of Judaism. In terms of *halakhah* the Noachic laws were considered to be the minimal normative standards upon which the Mosaic Torah was based. Thus the Talmud in more than one place states that “there is nothing prohibited to non-Jews that is permitted to Jews” (B. T., *San.* 59a). In another place it states that Jewish law must be stricter lest it appear as “a lower form of sanctity” (B. T., *Yev.* 22a).

In terms of Jewish-Gentile relations the Noachic prohibition of idolatry became the basis of determining which non-Jewish societies were actually idolatrous and which were merely following “ancestral custom” (B. T., *Hul.* 13b). This distinction had great practical importance in that Jewish dealings with confirmed Gentile idolators were proscribed in many areas, including in various business transactions (*A. Z.* 1.1). In the Middle Ages the Noachic prohibition of idolatry became the standard for determining the Jewish view, both theoretical and practical, of Christianity and Islam. Islamic monotheism was, of course, much easier to justify on Jewish grounds than were Christian incarnationism and trinitarianism. Indeed, a number of medieval halakhists, usually themselves living under Muslim regimes, considered Christianity a form of idolatry entailing all the Talmudic proscriptions pertaining to idolatry and idolators. However, other legalists, usually living under Christian regimes, drew upon earlier Talmudic distinctions between stricter criteria for Jews than for Gentiles, especially in areas of religious conviction, and so considered Christianity a mediated monotheism.

In those democratic countries where Jews are full participants, there has been renewed interest in this area of *halakhah* as a source for determining “the Jewish point of view” on various issues of public concern as widely divergent as abortion, capital punishment, and prayer in American public schools. How pertinent, however, many of these sources are to the areas of public concern to which they have been related, without thorough critical historical and philosophical examination and reinterpretation, is itself a source of great difference of opinion among contemporary Jewish thinkers.

**CURRENT ROLE OF HALAKHAH.** Although *halakhah* is a system of law governing every aspect of personal and communal life, there is no Jewish community in the world today where *halakhah* is the sole basis of governance. This inherent paradox—namely, a total system of law forced by historical reality to share legal authority with another system of law, if not to be actually subordinate to it—has led to a number of tensions both in the state of Israel and in the Diaspora.

**Halakhah in the state of Israel.** In the state of Israel, *halakhah*, as adjudicated by the rabbinical courts, is recognized as the law governing all aspects of public Jewish religious ritual and all areas of marriage and divorce. (The same privilege is extended to the respective systems of law of the various non-Jewish religious communities there.) This political arrangement has led to a number of areas of tension. Thus many secularist Israeli Jews object to having to submit in

questions of personal and familial status to the authority of religious courts, whose very religious justification they do not accept. This conflict has manifested itself in the demand by many secularist Israelis for civil marriage and divorce in the state of Israel, something that *halakhah* rejects as unacceptable for Jews. Even more profound is the fact that there is a conflict between *halakhah* and Israeli law on the most basic question of Jewish identity, that is, who is a Jew. According to *halakhah*, anyone born of a Jewish mother or himself or herself converted to Judaism is considered a Jew. According to the Israeli Law of Return (Hoq ha-Shevut), any Jew (with the exception of one convicted of a crime in another country) has the right of Israeli domicile and Israeli citizenship. However, in 1962 in a famous decision the Israeli Supreme Court ruled that Oswald Rufeisen, a Jewish convert to Christianity and a Roman Catholic monk, was not entitled to Israeli citizenship as a Jew because in the popular sense of the term he was not a Jew even though he was one in the technical, halakhic sense. On the other hand, in 1968, in another famous decision, the Israeli Supreme Court ruled that the wife and children of an Israeli Jew, Binyamin Shalit, were not to be considered Jews for purposes of Israeli citizenship because they had not been converted to Judaism, even though they identified themselves as Israeli Jews in the secular sense of the term. In this case, unlike the earlier one, the court accepted a halakhic definition of who is a Jew.

At the present time, furthermore, there is considerable debate in the state of Israel and the Diaspora about what actually constitutes valid conversion to Judaism. All Orthodox and most Conservative halakhists have rejected the conversions performed under Reform auspices because in the great majority of such cases the objective halakhic criteria of conversion—circumcision for males and immersion in a ritual bath (*mikveh*) for both males and females (B. T., *Yev.* 47b)—have not been fulfilled. Even the conversions performed under Conservative auspices, although fulfilling these objective criteria, are also rejected by many Orthodox legalists, who claim that Conservative rabbis lack the requisite commitment to *halakhah* to function as acceptable rabbinical judges. All of this is evidence of the widening division among the branches of contemporary Judaism.

**Halakhah in the Diaspora.** In the Diaspora, where adherence to *halakhah* is a matter of individual choice in practically every country that Judaism may be freely practiced, there is little ability to enforce the communal authority inherent in the halakhic system itself. This has led to a number of vexing problems. For example, the Talmud empowers a rabbinical court to force a man to divorce his wife for a variety of objective reasons that make normal married life impossible. When Jewish communities enjoyed relative internal autonomy, such enforcement could be carried out regularly. However, today, because of the loss of such communal autonomy, such enforcement is impossible, and many Jewish women, although already civilly divorced and no longer living with their former husbands, are still considered married

according to *halakhah* and are unable to remarry because of the refusal of their former husbands to comply with the order of a rabbinical court.

This growing problem in societies where mobility and anonymity are facts of life has led to basically three different approaches. Many in the Orthodox community have attempted to resort to legal measures in the civil courts to force compliance with *halakhah*. In addition to a lack of success heretofore, this has raised, especially in the United States, the constitutional issue of governmental interference in private religious matters. On the other hand, the Conservative movement since 1968 has revived the ancient rabbinical privilege of retroactive annulment (B. T., *Git.* 33a) in cases where it is impossible to obtain a Jewish divorce from the husband. The Reform movement, not being bound by the authority of *halakhah*, accepts a civil divorce as sufficient termination of a Jewish marriage. These three widely divergent approaches to a major halakhic problem are further evidence of the growing divisiveness in the Jewish religious community in both the state of Israel and the Diaspora.

**Reconstitution of the Sanhedrin.** The only chance for effecting any halakhic unanimity among the Jewish people would be the reconstitution of the Sanhedrin in Jerusalem as the universal Jewish legislature and supreme court. This proposal was actually made by the first minister of religious affairs in the state of Israel, Judah Leib Maimon (1875–1962). However, considering the fact that this reconstitution itself presupposes much of the very unanimity it is to effect, it would seem that it is rather utopian, something the Talmud euphemistically called “messianic *halakhah*” (B. T., *Zev.* 45a).

## BIBLIOGRAPHY

Considering the enormous quantity of halakhic literature, it is most unlikely that even a considerable portion of it will ever be translated into English or any other non-Hebrew language. However, some of the classic sources and some excellent secondary sources are available in English translation.

The Mishnah translation most widely used and accepted is that of Herbert Danby (Oxford, 1933). The Babylonian Talmud has been completely translated in the usually adequate Soncino edition (London, 1935–1948). The Palestinian Talmud is now being translated by Jacob Neusner under the title *The Talmud of the Land of Israel* (Chicago, 1982–); several volumes have already appeared. The Tosefta is also being translated by Neusner (New York, 1977–), and a number of volumes have appeared so far. Most of Maimonides’ *Mishneh Torah* has been published as *The Code of Maimonides*, 13 vols. (New Haven, Conn., 1949–), in a uniformly excellent translation.

The most comprehensive treatment of halakhic institutions in English is *The Principles of Jewish Law*, edited by Menachem Elon (Jerusalem, 1975), although more detailed questions are dealt with in Elon’s Hebrew work, *Ha-mishpat ha-ivri*, 2d ed. (Jerusalem, 1978). Another helpful work, especially regarding Jewish civil law, is Isaac H. Herzog’s *The Main Institutions of Jewish Law*, 2 vols., 2d ed. (New York, 1965).

Still the best treatment of the history of *halakhah* is Louis Ginzberg's "Law, Codification of" in the *Jewish Encyclopedia* (New York, 1905). Ginzberg's "The Significance of the Halachah for Jewish History," translated by Arthur Hertzberg in *On Jewish Law and Lore* (Philadelphia, 1955), is a fascinating but controversial treatment of early *halakhah* from a socioeconomic point of view. Another important general treatment is the article "Halakhah" by Louis Jacobs and Bert De Vries in *Encyclopaedia Judaica* (Jerusalem, 1971).

The number of good monographs on halakhic topics in English is steadily growing. One can read and consult with profit the following finely researched and written works: Boaz Cohen's *Jewish and Roman Law: A Comparative Study*, 2 vols. (New York, 1966); Louis M. Epstein's *The Jewish Marriage Contract* (1927; reprint, New York, 1973); David M. Feldman's *Birth Control in Jewish Law* (New York, 1968); Solomon B. Freehof's *The Responsa Literature* (Philadelphia, 1955); Aaron Kirschenbaum's *Self-Incrimination in Jewish Law* (New York, 1970); Isaac Klein's *A Guide to Jewish Religious Practice* (New York, 1979); Leo Landman's *Jewish Law in the Diaspora* (Philadelphia, 1968); Samuel Mendelsohn's *The Criminal Jurisprudence of the Ancient Hebrews* (Baltimore, Md., 1891); and my own *The Image of the Non-Jew in Judaism* (New York, 1983).

The articles in *The Jewish Law Annual*, vols. 1–4, edited by Bernard S. Jackson (Leiden, 1978–1981), generally represent some of the best critical scholarship on halakhic topics in English today. A good sampling of the current theological debate over the authority and scope of *halakhah* can be found in a symposium in *Judaism* 29 (Winter 1980).

DAVID NOVAK (1987)

## HALEVY, JUDAH SEE YEHUDAH HA-LEVI

**HALL, G. STANLEY** (1844–1924), was an American psychologist and educator. Granville Stanley Hall was born in western Massachusetts, in a conservative Protestant environment. He was educated at Williams College, at Union Theological Seminary (New York), at several institutions in Germany, and finally at Harvard, where he studied under William James. Hall was a significant figure in the early period of American psychology. He is remembered primarily as an organizer, teacher, and editor, and as the president of Clark University. He founded North America's first formally accepted university psychology laboratory, the continent's first psychology journal, and its first professional organization for psychologists.

Early in his career, Hall was influential in promoting experimental over "philosophical" methods in psychology. He was a key figure in the "child study" movement, which was influential in introducing questionnaire techniques and the direct observation of children into psychology, and which also spurred the development of "progressive" educational methods. With his two-volume work *Adolescence* (1904), Hall gave the psychological concept of adolescence its first

formal articulation. He was instrumental in bringing psychoanalysis to American attention by inviting Freud for his only visit to the New World.

Through his own work and, more importantly, through the work of his students E. D. Starbuck and James Leuba, Hall was influential in creating psychology of religion as an empirical discipline. He pioneered the empirical study of individual religious experience by assembling data on the religious experiences of children, and in 1904 he founded *The American Journal of Religious Psychology and Education*. Hall's most important substantive contribution to the psychology of religion was his observation that most conversions occur in adolescence. This observation developed into a characteristic theme in Hall's work: the linking of adolescence, conversion, and the life of Jesus. Hall argued that to complete adolescence successfully, a person must undergo a transformation in which "the older, lower selfish self is molted and a new and higher life of love and service emerges." Religious conversion is the most effective and "natural" vehicle of this transformation and "the Gospel story is the most adequate and classic, dramatic representation of . . . [this] most critical revolution of life" (*Adolescence*, vol. 2, p. 337).

## BIBLIOGRAPHY

The two major works by Hall that deal with psychology of religion are *Adolescence: Its Psychology and Its Relations to Physiology, Anthropology, Sociology, Sex, Crime, Religion and Education*, 2 vols. (New York, 1904), and *Jesus, the Christ, in the Light of Psychology*, 2 vols. (Garden City, N.Y., 1917). Dorothy Ross's *G. Stanley Hall: The Psychologist as Prophet* (Chicago, 1972) is the definitive biography and a study of Hall's work in psychology.

*Revised Bibliography*

**HALLĀJ, AL-** ("the cotton carder"), al-Husayn ibn Manṣūr (AH 244–309/857–922 CE), was known among Muslims as "the martyr of mystical love." Although he has been maligned in some circles for his "heretical" teachings and his alleged claim to divinity, his place in the world of Islamic poetry is undisputed: There, the name al-Husayn ibn Manṣūr, or simply Manṣūr, stands as one of the major symbols of mystical union and of suffering in love.

Born in southern Iran, he spent some of his youth with Sahl al-Tustarī, the mystic to whom Sufism owes the first

systematic theory of *nūr Muḥammad* (“the light of Muḥammad”), which forms an important aspect of al-Ḥallāj’s later thought. From Basra, al-Ḥallāj proceeded to Baghdad, the center of mystical learning during the late ninth century, and frequented such Ṣūfī masters as al-Junayd. This mystic, a representative of the so-called sober trend in Sufism, had developed the art of speaking in *ishārāt* (“hints”), lest the orthodox take offense at the teachings of mystical *taḥḥīd* (unification with God). Al-Ḥallāj married a Ṣūfī’s daughter but fell out with other mystics in Basra. Setting out for Mecca on his first pilgrimage, he performed extraordinary ascetic feats, but according to legend, the decisive incident of his life occurred after his return. When he knocked at al-Junayd’s door, he was asked who was there; he answered, “Anā al-ḥaqq” (“I am the Creative Truth”). The accuracy of this legend cannot be ascertained, but the phrase “Anā al-ḥaqq” appears in an important context in his *Kitāb al-ṭawāsīn*, which he composed toward the end of his life.

After the clash with al-Junayd, or for other reasons, al-Ḥallāj discarded the Ṣūfī gown and wandered through Iran and Khorasan before making his second pilgrimage, along with four hundred disciples. He next set out for India, “to learn magic,” according to his adversaries, “to call the people to God,” by his own account. From Gujarat he wandered through Sind and the Punjab and reached Turfan, probably via Kashmir. When he returned to Baghdad, he was met with even greater hostility from both the orthodox and the Ṣūfīs, and he undertook a third pilgrimage. Apprehended on the road to Sūs, he was exposed on a pillory and finally imprisoned in Baghdad in 913. The protection of the chamberlain Naṣr al-Qashūrī and the friendship of the mother of the infant caliph al-Muqtadir made his life in prison tolerable, and quite a few miracles are recounted for this period. Of his visitors in prison, the last was Ibn Khafīf, a young ascetic from Shiraz who noted down some of his sayings and who can therefore be considered the first link in the spiritual chain that leads to Rūzbihān-i Baqlī of Shiraz (d. 1209), the commentator on the *shahīdyāt* (“theopathic locutions”) of al-Ḥallāj and other Ṣūfīs.

In March 922, the government succeeded in drawing up a death sentence for al-Ḥallāj and declaring it “lawful to shed his blood.” The Persian writer ‘Aṭṭār (d. 1221) sums up al-Ḥallāj’s end in his *Tadhkirat al-awliyā* (Biographies of the Saints): “A dervish asked him, ‘What is love?’ He answered, ‘You will see it today and tomorrow and day after tomorrow.’ That day they killed him, the next day they burned him, and the third day they gave his ashes to the wind.” Al-Ḥallāj went dancing in his chains to the gallows, and his last words were “All that matters for the ecstatic is that the Unique should reduce him to Unity.” He died on March 26, 922 (24 Dhū al-Qa’dah 309), and many decades later people in Baghdad were still seen waiting for his return at the banks of the Tigris, on whose waves his ashes had formed the words *anā al-ḥaqq*.

The explanations for al-Ḥallāj’s execution are manifold. The Ṣūfī tradition claims that his death was a punishment

for *ifshā’ al-sirr* (“divulging the secret”), for it is not permissible that a mortal should speak up and say “I am the Creative Truth, or,” as *ḥaqq* was usually translated, “I am God.” That is against the law of love, where secrecy is a most important ingredient. One may doubt, however, whether the famous statement “Anā al-ḥaqq” was really the reason for the government’s decision; political and practical problems certainly played an important role. The French scholar Louis Massignon has shown how confused the political situation in Baghdad was during those decades; the caliphs were powerless and the viziers, in whose hands the true power lay, changed frequently. Sunnī and Shī‘ī allegiances were played out against each other, and fear of the Qarāmiṭah, who threatened the Abbasid empire from their stronghold in Bahrain, made unusual religious claims appear particularly dangerous.

Was it not possible, so the authorities asked, that al-Ḥallāj had been in touch with the Qarāmiṭah, who had just founded a principality in Multan and who ruled northern Sind? Besides, the letters that al-Ḥallāj received from various parts of the Islamic world addressed him with strange-sounding titles, and some of them were beautifully decorated and written in mysterious characters, similar to the Manichean books from Inner Asia. There is also no doubt that al-Ḥallāj, like his friend the chamberlain Naṣr, was in favor of more equitable taxation; even worse, he had spoken publicly of the *isqāt al-farā’id*, the possibility of making substitutions for the personal obligations of fasting or even the pilgrimage. Such ideas were anathema to orthodox Muslims.

It was also told that al-Ḥallāj, preaching in the mosques of Baghdad, would call people to God, to a deeper personal realization of the mysteries of faith, and that he would then implore them to kill him, for thus, he said, he would be rescued from this life and they would receive recompense for killing a heretic. Such eccentric behavior, coupled with extreme asceticism and the punctual performance of religious duties, was difficult for ordinary believers to accept. Furthermore, al-Ḥallāj’s burning love of God, which he expressed in short, tender verses, aroused the anger of the Zāhirīyah, who denied the possibility of real love between humans and God. Thus, almost all factions in the religious circles of Baghdad were against al-Ḥallāj for various reasons, and many regarded him as a crafty man who practiced magic and tried to seduce people, nay, even went so far as to lay claim to divinity.

In later centuries, especially in the folk and high poetry of Persianate countries, al-Ḥallāj was considered the foremost representative of *waḥdat al-wujūd* (“unity of being”), someone who, as Friedrich A. G. Tholuck (1821) said, “with incredible audacity tore away the curtain from pantheism.” Massignon, however, has proved that al-Ḥallāj was anything but a pantheist; rather, he represents the *waḥdat al-shuhūd* (“unity of witness”). To understand his attitude it suffices to read his long, touching prayers in which he tries to circumscribe the primordial and eternal God who is forever separat-

ed by his *qidam*, his pre-eternal being, from human being, which is created in time.

How can one describe him who is too high to be reached by human eyes and yet is evident everywhere? Al-Ḥallāj's prayer-poems oscillate between the burning longing for the transcendent God who is separated from him by the little human "I" and the consoling experience of this God's presence in the human heart, "flowing between the heart and its sheath as tears flow from the eyelids." In rare moments of ecstasy, the uncreated divine spirit can enwrap the created human spirit and speak through the human tongue, as God once spoke through a burning bush. Then the mystic feels that "my spirit has mingled with thine like water and wine" or "like amber and musk" (for such claims, al-Ḥallāj was accused of believing in *ḥulūl*, "incarnation"). The painful feeling of duality is wiped out, and God attests his unity through the tongue of the lover, for, as Abū Bakr al-Kharrāz (d. 890/9) had stated, "No one has the right to say 'I' but God." In such moments the saint becomes the living witness of God (*huwa huwa*, "he is He"), and he can exclaim "Anā al-ḥaqq" as the true witness of God's unity because God has taken away from him everything, including his "I."

Al-Ḥallāj tried to awaken the sense of personal relationship between the believer and God, and his whole life was devoted to the realization of the deepest truth of *islam*, complete surrender to the one God. The numerous anecdotes collected in the *Akbbār al-Ḥallāj* reveal this feeling (with some embarrassing details), and his poetry, though sometimes using mystical letter symbolism, is pure and completely devoid of sensuality. Some of his verses, such as his *qaṣīdah* "Uqtulūnī,"

Kill me, O my trustworthy friends,  
for in my being killed is my life . . .

have been quoted by later authors time and again (by Rūmī, for example). Only a few fragments of al-Ḥallāj's interpretation of the Qur'ān are preserved, among them the statement that seems to sum up the secret of his life: "Happiness comes from God, but affliction is he himself." There are also his *riwāyāt*, the *ḥadīth* whose contents are perfectly orthodox but whose chains of transmission go not through human transmitters but through mythical and heavenly creatures.

The only book by al-Ḥallāj that has been preserved in full is his *Kitāb al-ṭawāsīn* (alluding to *ṭa* and *sīn*, the mysterious letters at the beginning of surah 27 of the Qur'ān). In this small treatise, probably written while he was in prison, al-Ḥallāj introduces into Sufism the parable of the moth and candle: The moth that sees the light, feels the heat, and finally immolates itself in the flame, never to return to its peers, is the model for the lover who has found "the reality of Reality." This image was to become a favorite with Persianate poets and reached Europe through translations around 1800; Goethe used it in his famous poem "Selige Sehnsucht" in *West-östlicher Divan* (1819) to express the mystery of "dying before one dies."

The *Kitāb al-ṭawāsīn* also contains one of the finest early descriptions of the Prophet, who is celebrated in exquisite rhyming prose as light from the divine light and source of the lights of the prophets. But there is also the embarrassing chapter in which al-Ḥallāj confronts himself with Pharaoh and Iblīs and claims that he will not recant from his "Anā al-ḥaqq" any more than Pharaoh will recant from his statement "I am your highest Lord" (surah 79:24) or Satan from his remark vis-à-vis Adam that "I am better than he" (surah 7:11). Small wonder that such sentences shocked the Muslims of Baghdad and that more than once it was asked what, then, was the difference between the "I" of al-Ḥallāj and that of Pharaoh. Rūmī answered in his *Mathnavī* that "Pharaoh saw only himself while al-Ḥallāj saw only God—hence his claim was a sign of grace while Pharaoh's claim turned into a curse."

Al-Ḥallāj's Satanology has deeply impressed one trend in later Sufism (including Aḥmad al-Ghazālī, Sarmad, and Shāh 'Abd al-Laṭīf, among others). He sees Iblīs caught between the divine order to fall down before the newly created Adam and the divine will that nothing besides God himself should be worshiped. Iblīs prefers to obey the divine will and to prove himself as the true monotheist who looks only at God, as a faithful lover who happily wears the garment of curse that is given him as a result of his obstinacy, although he avers, according to al-Ḥallāj, "Juḥūdī laka taqdīs" ("My rebellion means to declare thee holy").

It has been said that al-Ḥallāj tried to live in accordance with the Qur'anic description of Jesus, and his use of such Christian theological terms as *nāsūt* ("humanity") and *lāhūt* ("divinity") in speaking of God has led several scholars in East and West to believe that he was a crypto-Christian. His death on the gallows, as on the cross, would fit well into this picture.

Šūfīs of the following generations often quoted the sayings of al-Ḥallāj without identifying him, but, on a larger scale, his true revival began in the twelfth century. Rūzbihān-i Baqlī continued the tradition that must have been alive in Shiraz thanks to Ibn Khafīf, and in northeastern Iran, 'Aṭṭār was initiated into Sufism by the spirit of al-Ḥallāj. 'Aṭṭār devoted the most moving chapter of his *Tadhkirat al-awliyā'* to the martyr-mystic and succeeded in conveying to his readers al-Ḥallāj's daring love and willingness to suffer. This chapter became the source for virtually all later descriptions of al-Ḥallāj's life and death in the Persianate world, be it in Persian verse, Sindhi drama, or Turkish poetry. The great mystical poets quoted him, although Rūmī held that his master, Shams al-Dīn, was much superior to al-Ḥallāj, who, he said, was only a lover, not a beloved. The sober Šūfī orders likewise remained critical of him; they accused him of not having reached true annihilation, for "the water makes noise only so long as it does not yet boil," and they pointed out that the vessel of his spirit was too shallow to keep the contents of love as it behoves.

But wherever the dangerous power of love is described, the name *Manṣūr* appears. Interestingly, it is most prominent in the folk poetry of Sind and the areas through which al-Ḥallāj wandered shortly after 900 (even in the Ismaʿīlī verses called *gināns*). There, the bards sing how “the gallows became his bridal bed” and praise him as the one who drank and dispensed intoxicating spiritual wine, the wine of unity. In the Turkish tradition, his name is particularly connected with the Bektashī order of Ṣūfīs, whose initiation takes place at the *dār-i Manṣūr* (“Manṣūr’s gallows”), for the novice has to die within himself before being revived in the order. Popular Arabic tradition invokes Manṣūr’s name less frequently than does Persianate mystical poetry, but everywhere he was used as a model of “pantheistic” Sufism—hence the aversion of the orthodox (headed by Ibn Taymīyah) to him.

It was thanks to Massignon’s lifelong studies that a new approach to al-Ḥallāj’s personality developed in the Islamic countries as well as in the West. The Indian thinker Muhammad Iqbal, the first to rediscover al-Ḥallāj’s “dynamic” teachings, praised him in his *Jāvidnāmāh* (1932) as a kind of forerunner of himself, “who brought resurrection to the spiritually dead.” After World War II, al-Ḥallāj became more prominent among the Arabs. Classified as an “Islamic Kierkegaard” by ʿAbd al-Rahmān Badawī, he figures in the works of progressive Arab writers as an important symbol of freedom and struggle against the establishment. In a drama devoted to him, *Māʿsat al-Ḥallāj* (1964) by Ṣalāḥ ʿAbd al-Ṣabūr, his social engagement is emphasized, and in the verse of Adonīs and al-Bayatī he appears in surrealist, paradoxical forms. In the Indian subcontinent, his name and numerous allusions to gallows and rope have been used to point to those who fought for freedom from colonial powers or against unjust governments. In Iran, the name Ḥusayn ibn Manṣūr is uttered along with that of Ḥusayn ibn ʿAlī, the Prophet’s grandson, in Shīʿī Muḥarrām processions.

Thus, al-Ḥallāj, “who left the pulpit and spoke out his heart’s secret on the gallows,” is still very much alive. Even though much of his subtle theology is not properly understood by the general populace, his joy in suffering for love of God has made him a favorite symbol for those who believe in personal piety rather than dry legalism and for those who are willing to suffer for their ideals, be they political or religious.

#### BIBLIOGRAPHY

The major source for al-Ḥallāj’s life and thought is Louis Massignon’s *The Passion of al-Hallaj, Mystic and Martyr of Islam* (1922), 4 vols., translated by Herbert Mason (Princeton, N.J., 1981). Besides writing this great work, and numerous articles devoted to the survival of al-Ḥallāj, Massignon also edited the *Kitāb al-tawāsīn* (Paris, 1913), the *Dīvān*, or collected poems (first in *Journal asiatique* 218, January–March 1931, then in several subsequent editions, with constant changes of translation), and, with Paul Kraus, *Akbbār al-Ḥallāj* (1936), 3d ed. (Paris, 1954). The article on al-Ḥallāj by Massignon and Louis Gardet in the new *Encyclopaedia of Islam* (Leiden, 1960–) gives a good survey.

Further, chapters on al-Ḥallāj can be found in every history of Sufism, from Friedrich A. D. Tholuck’s *Sufismussive theosophia Persarum pantheistica* (Berlin, 1821) to my own *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975). I have also made a survey of al-Ḥallāj’s life and work and of his survival in Muslim poetry in *Al-Halladsch, Märtyrer der Gottesliebe* (Cologne, 1968), and I have devoted a number of articles to al-Ḥallāj’s survival in Sindhi, Indo-Persian, and Urdu poetry. The question of al-Ḥallāj’s Satanology is discussed extensively in Peter J. Awn’s *Satan’s Fall and Redemption* (Leiden, 1983). The problem of his *shathīyāt*, or “theopathic locutions,” is treated in Carl W. Ernst’s *Words of Ecstasy in Sufism* (Albany, N.Y., 1985); indispensable for the understanding of the *shathīyāt* is Rūzbihān-i Baqlī’s *Sharḥ-i shathīyāt*, edited by Henry Corbin (Tehran and Paris, 1966).

ANNEMARIE SCHIMMEL (1987)

**HALLOWEEN**, or Allhallows Eve, is a festival celebrated on October 31, the evening prior to the Christian Feast of All Saints (All Saints’ Day). Halloween is the name for the eve of Samhain, a celebration marking the beginning of winter as well as the first day of the New Year within the ancient Celtic culture of the British Isles. The time of Samhain consisted of the eve of the feast and the day itself (October 31 and November 1). This event was a crucial seam in the social and religious fabric of the Celtic year, and the eve of Samhain set the tone for the annual celebration as a threatening, fantastic, mysterious rite of passage to a new year.

The religious beliefs of the Celts emphasized pastoral deities, and Celtic festivals stressed seasonal transitions. Beltene, the beginning of summer, was celebrated at the end of April and the beginning of May. Samhain signaled the commencement of winter and, together with Beltene, divided the year into cold and hot seasons. Samhain marked the end of preparations for winter, when flocks and herds had been secured and harvested crops had been stored.

The eve of this festival brought with it another kind of harvest. On this occasion, it was believed that a gathering of supernatural forces occurred as during no other period of the year. The eve and day of Samhain were characterized as a time when the barriers between the human and supernatural worlds were broken. Otherworldly entities, such as the souls of the dead, were able to visit earthly inhabitants, and humans could take the opportunity to penetrate the domains of the gods and supernatural creatures. Fiery tributes and sacrifices of animals, crops, and possibly human beings were made to appease supernatural powers who controlled the fertility of the land. Not a festival honoring any particular Celtic deity, Samhain acknowledged the entire spectrum of non-human forces that roamed the earth during that period.

Given the upheaval of normal human activities and expectations on the eve and day of Samhain, it was also thought to be an especially propitious time for ascertaining information about the future course of one’s life. Various methods

of divination were used by individuals attempting to discover their fortunes, good or ill, and to foretell events such as marriage, sickness, or death.

Samhain remained a popular festival among the Celtic people throughout the Christianization of Great Britain. The British church attempted to divert this interest in pagan customs by adding a Christian celebration to the calendar on the same date as Samhain. The Christian festival, the Feast of All Saints, commemorates the known and unknown saints of the Christian religion just as Samhain had acknowledged and paid tribute to the Celtic deities. The eve of the Celtic festival was also Christianized, becoming the Vigil of All Saints or Allhallows Eve (with special offices existing in both the Anglican and Roman churches). The medieval British commemoration of All Saints' Day may have prompted the universal celebration of this feast throughout the Christian church.

The customs of Samhain survived independently of the Christian holy day. Gradually, the eve of Allhallows (Halloween) lost much of its Celtic religious significance for the masses, and it became a secular observance, although many traditionally Celtic ideas continued to be associated with the evening. Divination activities remained a popular practice. Adults, dressed in fantastic disguises and masks, imitated supernatural beings and visited homes where occupants would offer tributes of food and drink to them. A fear of nocturnal creatures, such as bats and owls, persisted, because these animals were believed to communicate with the spirits of the dead.

Halloween was celebrated only in the Celtic areas of Great Britain: Ireland, Scotland, Wales, and northern rural England. In non-Celtic England, many of the customs of Halloween were assimilated into a commemorative festival that arose in the seventeenth century as the celebration of Guy Fawkes Day (November 5). English Protestant settlers in the New World did not bring the custom of Halloween with them. Irish and Scottish immigrants introduced scattered Allhallows Eve observances to America, but it was only in the years after the massive immigration of the Irish to the United States during the potato famine (1845–1846) that Halloween became a national event.

Modern Halloween activities have centered on mischief making and masquerading in costumes, often resembling otherworldly characters. Folk customs, now treated as games (such as bobbing for apples), have continued from the various divination practices of the ancient celebrants of this occasion. Supernatural figures (such as the ghost, the witch, the vampire, the devil) play a key role in supplying an aura of the mysterious to the evening, whether or not they originally had an association with the festival. Children are particularly susceptible to the imagery of Halloween, as can be seen in their fascination with the demonic likeness of a carved and illuminated pumpkin, known as the jack-o'-lantern. In recent times, children have taken up the practice of dressing in Halloween costumes and visiting homes in search of edible

and monetary treats, lightly threatening to play a trick on the owner if a treat is not produced. There also has been renewed interest in Halloween as a time when adults can also cross cultural boundaries and shed their identities by indulging in an uninhibited evening of frivolity. Thus, the basic Celtic quality of the festival as an evening of annual escape from normal realities and expectations has remained into the present.

#### BIBLIOGRAPHY

The definitive scholarly work on Halloween has yet to be written. Ralph Linton and Adelin Linton's *Halloween through Twenty Centuries* (New York, 1950) is an adequate introduction, though dated. Lacking substantial citations, it should be read along with other texts to ensure its accuracy. An excellent volume on Celtic belief systems, and especially the feast of Samhain, is Marie-Louise Sjoestedt-Jonval's *Dieux et héros des Celtes* (Paris, 1940), translated by Myles Dillon as *Gods and Heroes of the Celts* (London, 1949). A useful ethnographic approach to the study of Halloween was taken by Helen Sewell Johnson in her article on "November Eve Beliefs and Customs in Irish Life and Literature," *Journal of American Folklore* 81 (1968): 133–142. A contemporary look at Halloween customs in the United States can be found in folklorist Jack Santino's "Halloween in America: Contemporary Customs and Performances," *Western Folklore* 42 (1983): 1–20.

LEONARD NORMAN PRIMIANO (1987)

#### HALLUCINOGENS SEE PSYCHEDELIC DRUGS

#### HALO SEE NIMBUS

**HANĀBILAH** (sg., Ḥanbālī) is the name used to denote the followers of Aḥmad ibn Ḥanbal, just as the names Shāfi'īyah, Mālikīyah, and Ḥanafīyah are used to denote the followers of al-Shāfi'ī, Mālik, and Abū Ḥanīfah, respectively. Of these four groups, the Ḥanābilah has been considered anomalous, and rightly so, although not for the reasons usually given. Western writers have reiterated that this group was the smallest of the four; that it fought against the theology of *kalām*, which is quite true; that it fought against Sufism, which is definitely false. It is clear that the Ḥanābilah fought against philosophical theology (*kalām*) and philosophical Sufism (monism, incarnationism), but certainly not against theology in its juridical form, nor against Sufism in its traditionalist, ascetic form. Some writers have described the Ḥanābilah as conservative; others, echoing the biased sources they use, have resorted to a wide range of pejorative epithets: fanatical, inflexible, anthropomorphic, obstructionist, intolerant, insignificant, and the like.

**EMERGENCE OF THE MADHHAB.** The Ḥanābilah, like the Ḥanafīyah, Mālikīyah, and Shāfi'īyah, maintained schools

in which it taught law as the principal subject. Nonetheless, the group called Ḥanābilah cannot be understood in its historical genesis and development as merely a “school of law,” as it has been characterized heretofore. In modern Arabic, the term for “school of law” would be expressed by a literal equivalent of the English, something like *madrasat al-fiqh*. The classical Arabic term is *madhhab*, which means “a way of going,” “direction,” and, technically, “thesis” or “opinion.” Each *madhhab* of law had institutions of learning—colleges of law—exclusively for its own members. This institution was at first the noncongregational mosque, or *masjid*, and later the *madrasah*, a term that in modern Arabic means “school.” The *madhhab* itself was not a school; it was a guild in whose name schools were maintained.

“**Personal schools.**” The emergence of these guilds of jurists dates from around the middle of the ninth century. Before that time, the jurists were grouped geographically, as, for instance, the Iraqis, the Medinese, the Kufans, the Basrans, and the Syrians. The groups that came to be identified by the names of persons after the mid-ninth century have been referred to as “personal schools,” to distinguish them from the earlier “geographical schools.” The natural tendency has been to associate their chronological emergence with the dates of their eponyms: Abū Ḥanīfah (699–767), Mālik (707–795), al-Shāfi‘ī (767–820), and Ibn Ḥanbal (780–855).

The historical reality was somewhat different; in fact, it may well have followed the exact reverse of this order. The “personal schools,” according to Joseph Schacht, were so designated “soon after the time of Shāfi‘ī,” beginning with the Shāfi‘ī *madhhab*. Henri Laoust placed the constitution of the Ḥanbālī *madhhab* “during the period from the Sunni reactionary movement of [Caliph] al-Mutawakkil (232–47/847–61) to the advent of the Buyids in 334/945.” There is, of course, no way to determine the precise date of the emergence of a *madhhab* of law, or that of its extinction: The *madhhab*, though a guild, was neither founded nor dissolved by a formal act; its colleges of law were founded by such a formal act, the *waqf*, as charitable trusts, but not the *madhhab*. Its disappearance could, however, be determined through the disappearance of its representatives in a given locality—when the biographer of a jurist of a given *madhhab* declares that the biographee was the last member of that *madhhab* in his locality—but the date of death would indicate the date of the *madhhab*'s extinction in that locality, not the date of the loss of its effectiveness, which no doubt had already taken place.

A *madhhab* came into existence because its members had interests to protect and to advance. What could these common interests have been for the Ḥanbālī *madhhab*? It was, like the three other surviving Sunnī *madhhabs*, a *madhhab* of law; as such it simply served the purpose of bringing together its member-jurists. Consensus, *ijmā‘*, was constituted on the basis of the legal opinions of the jurists. But a legal opinion was issued by an individual jurist

consult, not by a “school” of jurists, or even by a committee. Similarly, the practice of *ijtihād*—consulting the sources of the law to arrive at a solution for a legal question—was carried out by a single jurist acting as an independent free agent.

**Religious issues: traditionalism vs. rationalism.** The *madhhabs* were guilds of law, but their genesis was due to reasons of religious philosophy. They issued from, and represented, the traditionalist movement, in opposition to the movement of rationalism in Islam. Were it not for this antagonism, the *madhhabs* of law might not have emerged as they did. Their traditionalism is indicated by their emulation of the Prophet. The founding members of the *madhhab* chose a great imam as their eponym and referred to themselves as his companions, in emulation of the greatest imam, the Prophet, and his companions.

The supreme struggle between traditionalists and rationalists came about in the Inquisition (*mihnah*) of the ninth century. It hinged on the question of whether the Qur‘ān was the created or uncreated word of God. The inquisitors belonged to the rationalist theological movement of the Mu‘tazilah. The Mu‘tazilī thesis was that the Qur‘ān is the created word of God; to say that it is his uncreated word would make it coeternal with God, a violation of God’s unicity (*tawḥīd*) and hence of the very monotheistic character of Islam itself. The traditionalist thesis was that God’s word is eternal. His *fiat* (“*kun!*”) could not itself be created, because it is by this, his word, that God creates; a created thing could not bring other things into existence.

When the end of the Inquisition in 848 brought an end to the Mu‘tazilah as a political force, Aḥmad ibn Ḥanbal, flogged severely and imprisoned for refusing to adopt the Mu‘tazilī thesis, emerged as the charismatic hero of Islam. The struggle that Ibn Ḥanbal undertook and carried to its termination had already been started by al-Shāfi‘ī, a long-time foe of the Mu‘tazilah whose life’s work was dedicated chiefly to supporting the traditionalist movement. Al-Shāfi‘ī did not live to see the end of the Mu‘tazilī menace. The period following his death was witness to the apex of the Mu‘tazilah’s political power. But by the time of Ibn Ḥanbal (d. 855), who followed in his traditionalist footsteps, the formidable foe met its decisive downfall.

The Inquisition cleared the way for the rise of the *madhhabs*, which began to flourish, organizing the traditionalist movement. Many such guilds of law were founded; many disappeared from the scene, their membership absorbed by other guilds. In the eleventh century their number crystallized into the four *madhhabs* surviving today.

In a period of two centuries (mid-ninth to mid-eleventh), the mainstream of Muslim history moved relentlessly in the direction of traditionalism, engulfing all obstructions set up against it. The landmarks of this mainstream are unmistakable.

1. *Al-Shāfi‘ī’s Risālah (before 813/4)*. From elements for the most part already at hand, al-Shāfi‘ī forged a new sci-

ence, a juridical theology, namely a study of God's law, with which he meant to replace *kalām*, a study of God himself. Juridical theology studies God's commands and prohibitions, not whether God is, or what he is. It deals with the fundamentals of obedience to God (religion), not just idle words (*kalām*) about God himself, which may well lead to perdition.

2. *The Inquisition (833–848)*. The Inquisition ended with the decisive political demise of its masters and the victory of its victims.

3. *The Professions of Faith ('aqā'id; sg., 'aqīdah)*. The period following the Inquisition brought in a rich harvest of creeds by members of the traditionalist movement, headed by Aḥmad ibn Ḥanbal, six of whose creeds have survived. He apparently took his lead from al-Shāfi'ī, one of whose creeds has come down to the present. Among subsequent creeds, two are of particular significance, belonging as they do to the fundamental teachings of traditionalism: one by the great mystic al-Ḥallāj (d. 922), the other by al-Ash'arī (d. 936?).

4. *The Retraction of Ibn Shannabūdh (935)*. Ibn Shannabūdh abjured his Qur'anic variant readings as aberrant and unlawful. His retraction emphasized the sacred character of the Qur'ān in the Vulgate of the caliph 'Uthmān, and pointed to the success of the traditionalist thesis vindicated by Aḥmad ibn Ḥanbal during the Inquisition.

5. *The Defection of al-Ash'arī*. Forsaking the teachings of Mu'tazilī rationalism, al-Ash'arī rallied to the doctrines of Aḥmad ibn Ḥanbal and placed himself squarely under the Hanbālī banner.

6. *The Qādirī Creed (first third of the eleventh century)*. Proclamations of the caliph al-Qādir in 1017, 1018, and 1029 culminated in a profession of faith bearing the name of the caliph, Al-i'tiqād al-Qādirī, read by order of the caliph in 1040/1. Its contents, steeped in traditionalism, are directed chiefly against the Mu'tazilah, the Ash'ariyah, and the Shī'ah. In contrast with Ma'mūn's inauguration of the Inquisition, the Qādirī creed, formulated two centuries later, dramatizes the distance traveled by traditionalism and proclaims its triumph in very clear terms.

7. *The Organization of Knowledge*. The success of traditionalism is clearly manifested in the development of the institutions of learning following the failure of the Inquisition. By the middle of the eleventh century, the rationalist institutions (*dār al-'ilm* and others), essentially libraries where books on the "foreign sciences," such as Greek philosophy, were available for reading and discussion, had disappeared from the scene. Libraries became annexed to the *madrasas*, where books on the "foreign sciences" could be read privately but never formed part of the regular curriculum.

All "personal schools" of law emerged from the traditionalist movement of the *ahl al-ḥadīth* (literally, "people of the *ḥadīth*," traditionalists). The transition from "geographical" to "personal" *madhhabs* came in response to the threat of the philosophical theologians, who had succeeded in gain-

ing the support of the central power. The task of the traditionalists was not merely to counterbalance the force of their opponents but to tilt the scales in their own favor.

**Economic issues: the waqf.** To this religious weapon the traditionalists added an economic one: the charitable trust (*waqf*). As lawyers they were both the interpreters and the guardians of its law. A basic principle of its law was that nothing could be based on *waqf* that would be inimical to the tenets of Islam. Through their legal opinions they determined what was, and what was not, inimical. Furthermore, *waqfs* were founded by Muslim individuals, with individually owned private property. When caliphs, sultans, emirs, viziers, or any other official or functionary instituted *waqfs*, they did so as private Muslim individuals. There was no provision in the law for "official" *waqfs*. The object of *waqf* was charitable, immediately or eventually, and the founder's chief motive was *qurbah*, to draw near to God, through good works endowed in perpetuity.

All institutionalized learning in Islam was funded through such religious foundations. The lawyers designated as inimical to Islamic beliefs Greek philosophy, the foreign sciences, and *kalām*-theology, which, they felt, was tainted with philosophy. The *kalām*-theologians were thus excluded as such from the curriculum of the *madrasas* and cognate institutions; eventually, the *dār al-'ilm* and its cognates, libraries that were meeting places of the rationalists, ceased to exist.

The exclusionary rule of *waqf* left out the philosophers and philosophical theologians. No longer in a position to beat the traditionalists, they joined them by infiltrating the juridical *madhhabs* as jurisconsults. The Mu'tazilī theologians found a home in the Ḥanafī *madhhab*, and later the Ash'ariyah found theirs in the Shāfi'ī *madhhab* (there were some rare instances where a Mu'tazilī theologian was a Shāfi'ī jurisconsult and an Ash'arī theologian, a Ḥanafī jurisconsult). One's Sunnī orthodox identity was determined by his membership in one of the Sunnī *madhhabs*. The *madhhabs* accepted one another; transfers from one to any other was unrestricted at any point in a member's lifetime.

**Misconceptions concerning the Ḥanābilah.** One particular misconception concerning the Hanbālī *madhhab* was its relatively reduced representation in the Islamic world when compared with the other *madhhabs*. This fact kept cropping up in the early studies on the Ḥanābilah, and its repeated mention is indicative of the scholars' perplexity when they were confronted with what appears to be the disproportionate attention this *madhhab* received from the annalistic sources in descriptions of riots. The explanation lies in its makeup in comparison with the Ḥanafī and Shāfi'ī *madhhabs*. (The Mālikī *madhhab* had a sparse membership in tenth-century Baghdad, and its last representative there left for points west in the eleventh century.) The Ḥanafī and Shāfi'ī *madhhabs*, as already mentioned, were infiltrated by the Mu'tazilah and Ash'ariyah, respectively. This situation gave each of these two *madhhabs* an internal structure made

up of two antagonistic groups, fundamentally opposed to each other on the theological level: one group belonging to the *ahl al-ḥadīth* (traditionalists) from which it issued, and the other belonging to the *ahl al-kalām* (rationalists). In Baghdad, there remained only one Sunnī *madhhab* representative of the *ahl al-ḥadīth* alone, free of infiltration by either group of *ahl al-kalām*: the Ḥanbālī *madhhab*.

Another factor to be considered is the reluctance of the religious intellectual to attack a fellow intellectual belonging to the same *madhhab*. This inhibition, from which a Ḥanafī or Shāfi'ī jurisconsult might suffer vis-à-vis a fellow jurisconsult of the same *madhhab* who happened to be also a philosophical theologian, did not afflict the Ḥanbālī jurisconsult. He felt free to fight not only any signs of rationalistic tendencies within his own *madhhab*, but also any and all groups hostile to the *ahl al-ḥadīth*. The Ḥanābilah fought as members of the *ahl al-ḥadīth*. Though their numbers were relatively small as members of the Ḥanbālī *madhhab*, they represented the overwhelming majority of Sunnī Islam as members of the traditionalist movement. Many a Shāfi'ī and Ḥanafī traditionalist passed undetected in the ranks of the *ahl al-ḥadīth*. A perusal of the biographical dictionaries of Ḥanafī and Shāfi'ī jurisconsults would show the preponderance of traditionalist jurisconsults in their ranks, as compared with philosophical theologians.

The annalists, referring to struggles between antagonistic socioreligious groups, are apt to throw the historian off track by the way they identify the groups. The terms used may well hide their true identity. *Ḥanafī* may be used for *Mu'tazilī*, and *Shāfi'ī* for *Ash'arī*, while *Ḥanbālī* remains a constant. This is why the Ḥanābilah must be seen in the light of their membership in the traditionalist movement, which encompassed all four *madhhabs*. In this movement, the Ḥanābilah played the role of spearhead. Because of the uniform structure of their *madhhab*, they were the group most frequently mentioned in the annals. It was easy to arrive at the conclusion that of all the groups they were the most contentious, considering the relatively small size of their *madhhab*. In reality they were but a fraction of the traditionalist movement, the mere tip of the iceberg.

Other misconceptions regarding the Ḥanbālī school that have developed in Islamic studies over the years arise from the uncritical use of sources hostile to the Ḥanābilah and from the neglect of sources that could have been used to provide some control and a more balanced account. The following misconceptions are perhaps those that die the hardest.

Aḥmad ibn Ḥanbal is often represented as a disciple of al-Shāfi'ī, a notion that can be construed to give two opposing views of their relationship. One—which would be true—is that there was a kinship of spirit between the two great imams. The other—which would be false—is that Aḥmad must have had a falling-out with al-Shāfi'ī and that he must have rejected the Shāfi'ī school in order to found one of his own. Both imams belonged to the traditionalist *ahl al-ḥadīth*

movement from which all the *madhhabs* emerged. Aḥmad and al-Shāfi'ī were the “patron saints” of two traditionalist *madhhab* guilds whose chief concern was not only to raise the prophetic traditions to the level of sacred scripture—in this, al-Shāfi'ī led the way, and Aḥmad followed in his footsteps—but also to fight for the primacy of faith and thus put a stop to the spread of rationalism.

The Ḥanbālī outlook is often regarded as basically legalistic and therefore incompatible with the interior life of Ṣūfī mysticism. The hostile attitude of Ibn Ḥanbal and his followers, particularly Ibn al-Jawzī and Ibn Taymīyah, seemingly gives credence to such a view. But such hostility, when it existed, was directed toward certain Ṣūfīs and certain Ṣūfī practices. At no time has the Ḥanbālī *madhhab*, or the followers just mentioned, condemned Sufism as such, or all adepts of Sufism. The reason for this is clear and rather simple. Sufism, like the Ḥanābilah, issued from the *ahl al-ḥadīth* movement, and the Ḥanbālī *madhhab* boasted of many Ṣūfīs. Close to a third of the notices in Ibn Rajab's biographical work on the Ḥanbālī *madhhab* are devoted to Ṣūfīs. Among the great Ḥanbālī Ṣūfīs are Ibn Sam'ūn (d. 997), al-Ḥarawī al-Anṣārī (d. 1088), and 'Abd al-Qādir al-Jīlānī (d. 1166), head of the first Ṣūfī order in Islam that has come down to this day, which included among its members Ibn Taymīyah, a so-called enemy of Sufism. What the Ḥanābilah did indeed condemn in Sufism were Ṣūfīs steeped in pantheism (*ittiḥādīyah*) or incarnationism (*ḥulūṭīyah*).

Members of the Ḥanbālī *madhhab* have been criticized as rigidly opposed to reason, as partisans of a literalist interpretation of the Qur'ān and *ḥadīth*, professing the most rigidly dogmatic doctrines in comparison with the other *madhhabs*, as steeped in obscurantism and crass anthropomorphism, as fanatical and intolerant. These judgments by Western Orientalists of the nineteenth and twentieth centuries are in great measure attributable to the paucity of printed sources available at the time and to the one-sidedness of these sources, hostile to the Ḥanābilah and utilized without testing the authors' bias.

**AḤMAD IBN ḤANBAL.** Aḥmad ibn Ḥanbal, like al-Shāfi'ī before him, was of pure Arab stock, and like al-Shāfi'ī, whom he greatly admired, he gave a preponderant place to the *sunnah* of the Prophet as sacred scripture alongside the book of God, the Qur'ān. His teachings form the doctrinal basis of the *madhhab* that bears his name.

**Life.** Born in Baghdad in December 780, Aḥmad ibn Ḥanbal died there in July 855. A biographer says of him: “He left Merv in his mother's womb, was born in Baghdad, grew up there, and died there.” He was known as “the imam of Baghdad.” Profoundly interested in the study of *ḥadīth*, he began to devote himself to it at the age of fifteen and made his way throughout the lands of the eastern caliphate in search of its authoritative transmitters. He traveled in Iraq (Kufa, and especially Basra), the Hejaz, Yemen, and Syria, the regions of the so-called geographical schools of law. Between the ages of twenty-three and thirty-four he made the

pilgrimage to Mecca five times, along with two pious retreats in Medina.

Though a great admirer of al-Shāfiʿī, and one who was ready to lay down his life for the same religious ideals, Ibn Ḥanbal cannot be considered simply as the disciple of the great imam. He studied under a great number of *ḥadīth* experts of this day, and many transmitted *ḥadīths* on his authority, among them the authors of the “six books” of *ḥadīth*: al-Bukhārī, Muslim, and Abū Dāwūd directly; al-Tirmidhī, al-Nasāʿī, and Ibn Mājah indirectly, through his disciples. Al-Shāfiʿī himself is said to have transmitted on Ibn Ḥanbal’s authority. Ibn al-Jawzī, in his biography of Ibn Ḥanbal, gives the names of his teachers of law: Hushaym ibn Bashīr (d. 799), a disciple of Ibrāhīm al-Nakhaʿī, and after Hushaym’s death, Sufyān ibn ʿUyaynah (d. 814). Among Ibn Ḥanbal’s other important teachers was ʿAbd al-Raḥmān ibn Mahdī (d. 814), in answer to whose request al-Shāfiʿī had written his famous *Epistle*.

Aḥmad ibn Ḥanbal’s persistent passive resistance to the Inquisition earned him the undying respect and admiration of the following generations down to this day. His funeral, the scene of genuine popular emotion, was followed by a procession that numbered in the hundreds of thousands. His tomb became one of the most visited places of pilgrimage. Poets hailed him as the hero (*fatā*) of Islam. The scars he carried to his grave were the badges of his bravery.

**Works.** Among Aḥmad’s works are the *Radd ʿalā al-jahmiyah wa-al-zanādiqah*, *Kitāb al-sunnah*, and *Kitāb al-masāʿil*, which present answers to questions addressed to him on dogmatics, law, and ethics, and the *Kitāb al-ṣalāt*, on ritual prayer and its performance. The *Kitāb al-waraʿ*, on asceticism, is quoted extensively by Abū Ṭālib al-Makkī in his *Qūt al-qulūb* (Sustenance of the souls), and again by al-Ghazālī, whose *Ihyāʿ ʿulūm al-dīn* (Revivification of the religious sciences) is based on al-Makkī’s work.

By far the most celebrated work of Ibn Ḥanbal is his *Musnad*, a title that designates a collection of *ḥadīths* resting on the authority of the persons by whom they have been transmitted, traced back to the Prophet himself and arranged under the names of the first guarantor of the *ḥadīths*. This arrangement is distinguished from the one followed by the generation after that of Aḥmad ibn Ḥanbal and referred to as the *Ṣaḥīḥs*, or collections of “sound” *ḥadīths*. It has often been said that these books constitute a codification of *ḥadīths* in Islam, and because the *Musnad* of Ibn Ḥanbal is not included among the “six books,” the implication is that its contents were not reliable. In contrast, the two *ṣaḥīḥs* of al-Bukhārī and Muslim were seen as the most important works on *ḥadīth* and the most “sound.” This interpretation is misleading.

In fact, legal studies were in the process of development in the newly founded colleges of law that were flourishing at the time. Because of the recent achievements of al-Shāfiʿī and Ibn Ḥanbal, institutionalized education had taken on a

strong traditionalist orientation, and law, based heavily on the study of *ḥadīth*, had become the queen of the Islamic sciences. To make the collections of *ḥadīths* more easily studied for their legal content, the order was changed to accommodate students of law. Instead of arranging *ḥadīths* according to their chains of transmitters (*isnād*, whence the term *musnad*), they were chosen for their legal content and arranged according to the chapters of books on law. The new collections were referred to as “sound” (*ṣaḥīḥ*), not in the sense that former collections were less so, but rather to emphasize that the new collections were also sound, in spite of their innovative arrangement according to subject, rather than according to their authoritative transmitters.

Great *musnad* collections date after as well as before the so-called Six Books, and they specialize in one or more transmitters or groups of transmitters. Aḥmad’s *Musnad* is a collection of several *musnads* including those of the first four “Rightly Guided” (Rāshidūn) caliphs, the principal companions of the Prophet, the Anṣār, the Meccans, the Medinese, the Kufans, the Basrans, and the Syrians.

**Followers of Ibn Ḥanbal.** Aḥmad left two sons, who were half brothers: Ṣāliḥ (818–880), *qāḍī* (“judge”) of Isfahan and a transmitter of his father’s legal opinions; and ʿAbd Allāh (828–903), a transmitter of most of his father’s works. In addition to the sons, a number of disciples carried on the transmission of Aḥmad’s legal thought contained in his *masāʿil*, including: (1) al-Kawsaj, a native of Merv who settled in Nishapur and died there in 865; he was a source for al-Bukhārī, al-Tirmidhī, and Ishāq ibn Rāhawayh; (2) al-Athram (d. 874 or 875), who arranged what he collected of the *masāʿil* according to the chapters of law books; (3) Ḥanbal ibn Ishāq (d. 886), Aḥmad’s first cousin; (4) al-Maymūnī (d. 887), of Raqqah, a disciple of Aḥmad from 820 to 842 (al-Mardāwī, in his *Inṣāf*, attributes to al-Maymūnī one sixteen-volume work and two other large volumes, containing Aḥmad’s *masāʿil*); (5) al-Marwazī (d. 888), one of Aḥmad’s favorite disciples and the transmitter of his *Kitāb al-waraʿ*; (6) Abū Dāʿūd al-Sijistānī (d. 888), author of *Kitāb al-sunan*, one of the “six books,” so highly regarded that he was often compared with his professor Aḥmad in learning and piety; (7) Abū Ḥātim al-Rāzī (d. 890), author of a characteristically Ḥanbalī traditionalist profession of faith (*ʿaqīdah*) against the legitimacy of philosophical theology (*kalām*); (8) Ḥarb al-Kirmānī (d. 893), a Ṣūfī, who transmitted *masāʿil* of Aḥmad and of Ibn Rāhawayh; (9) Ibrāhīm al-Ḥarbī (d. 898), a philologist and *ḥadīth* expert who was Aḥmad’s disciple for twenty years and was often compared with him in learning and piety.

**Tenth century.** The tenth century ushered in the rise of Ḥanbalī literature. The name that dominates the early part of this period is that of Abū Bakr al-Khallāl (d. 923). He was a student of al-Marwazī, had a teaching post in the mosque of al-Mahdī, and knew Aḥmad’s son ʿAbd Allāh personally. It is to his scholarship that the Ḥanbalī *madhhab* owes its first *corpus juris* and the first biographical history of the *mad-*

*hhab*, *Ṭabaqāt al-ḥanābilah*, of which some folios have survived and are preserved in the *Zāhiriyyah*, the National Library of Damascus.

Two other names dominate the first half of this period: al-Barbahārī and al-Khiraqī. Al-Barbahārī (d. 941), a disciple of al-Marwazī and the Ṣūfī Sahl al-Tustarī, was an activist who struggled against the Shīʿah and the Muʿtazilah and fought for the reform of the Sunnī caliphate, now under the influence of the Buyids. A true traditionalist, al-Barbahārī was hostile to *kalām* and opposed al-Ashʿarī, his contemporary. It is said that al-Ashʿarī wrote his *Ibānah* after a discussion with al-Barbahārī, which, if true, would explain partly al-Ashʿarī's rallying to the banner of Ibn Ḥanbal. Al-Barbahārī is a key figure in the social and political history of this period.

Al-Khiraqī (d. 946) gave the Ḥanābilah one of its most important works, *Al-mukhtaṣar fī al-fiqh* (The Epitome on Law), on which the fifteenth-century Ḥanbālī Yūsuf ibn ʿAbd al-Hādī reports that three hundred commentaries were written over the centuries. Al-Khiraqī is said to have written many other works that did not enjoy wide diffusion. The reason given is that he had left Baghdad, and his books, apparently lacking the diffusion they would have received had he remained there, were eventually destroyed when his house burned. Among his disciples were three members of the Ḥanābilah famous in their day: Ibn Baṭṭah, Abū al-Ḥasan al-Tamīmī, and Ibn Samʿūn.

Other Ḥanbālī followers of repute belonging to this period include Abū Bakr al-Sijistānī (d. 928), Abū Muḥammad al-Rāzī (d. 939), and Abū Bakr al-Najjād (d. 959), a Ṣūfī and *ḥadīth* expert. This period also witnessed some of the most fervently Sunnī professions of faith (*ʿaqīdahs*), a constant in Ḥanbālī history.

The names that stand out in the second half of this century are those of Ibn Samʿūn, Ibn Baṭṭah, and Ibn Ḥāmid. Ibn Samʿūn was a famous Ḥanbālī Ṣūfī who had studied under the direction of a number of Ṣūfīs, among them Abū Bakr al-Shiblī and al-Ḥuṣrī (d. 981). Ibn Samʿūn studied *ḥadīth* under Ibn Abī Dāwūd, and held a number of sessions in which he dictated *ḥadīths*. Highly regarded in his own *madhhab*, he had a reputation—and disciples—far beyond it. He is mentioned in the twenty-first of the *Maqāmāt* (Assemblies) of al-Ḥarīrī, “Al-Rāzīyah.” The two Ashʿarī scholars, al-Bāqillānī (d. 1013) and al-Isfarāʿīnī (d. 1027), as a mark of high respect when greeting him, used to kiss his hand. Ibn Baṭṭah is known especially for his two works *Al-ibānah al-kubrā* and *Al-ibānah al-ṣuḡhrā*, the second of which was translated and studied by the eminent Islamicist Henri Laoust. Other important Ḥanbālī personalities of this period include Abū Bakr al-Ājurrī (d. 971) and al-Ṭabaranī (d. 971). Al-Ājurrī, a Ṣūfī and *ḥadīth* expert, is claimed by both the Ḥanbālī and Shāfīʿī *madhhabs*, a phenomenon of rather frequent occurrence, because both *madhhabs* are profoundly traditionalist and may well have come into existence as “personal *madhhabs*” at approximately the same time.

Al-Ājurrī authored a *Kitāb al-sharīʿah* on Islamic law. Al-Ṭabaranī wrote three famous *muʿjams*, a *Kitāb al-sunnah*, and a *musnad* of the Syrian *ḥadīth* experts.

**Eleventh century.** The eleventh century ushered in the final phase of the period that brought about the restoration of Sunnī traditionalism following the collapse of the rationalist-inspired Inquisition. It was a century that witnessed the emergence of the Ḥanābilah at the head of a movement that was the mainstay of the caliphate. A Ḥanbālī of this century, Ibn Baqqāl (d. 1048), expressed the matter in this statement made in the caliphal court in the presence of the vizier Ḥājib al-Nuʿmān: “The caliphate is a tent, and the Ḥanābilah are its tent ropes; should the tent ropes fall down, the tent would topple over.” The implication was clear. The caliphate must give its support to traditionalism, whose adherents are the guardians of the source of its legitimacy.

The name that leads the first half of this century is that of Ibn Ḥāmid (d. 1012), the greatest Ḥanbālī master and jurisconsult of his time. His *Kitāb al-jāmiʿ*, in four hundred volumes, treated the divergences in legal opinions among the jurisconsults. He wrote extensively on theology and on law and its theory and methodology, but none of his works is extant.

Al-Sharīf Abū ʿAlī al-Ḥāshimī (d. 1037), a disciple of Abū al-Ḥasan al-Tamīmī, wrote many works, among them *Kitāb al-irshād* on law, and a commentary on al-Khiraqī's epitome on law. He had a study circle in the mosque of Manṣūr for legal opinions and notarial work. His *ʿaqīdah* has been preserved in his biographical notices.

Abū ʿAlī al-ʿUkbarī, known as Ibn Shihāb (d. 1037), a disciple of Ibn Baṭṭah, was a Ḥanbālī of broad culture, expert in the fields of law, belles lettres, Qurʾanic science, *ḥadīth*, and poetry, and was known for his legal opinions. He was also a copyist, a profession that did not simply furnish him with his livelihood but actually made him rich. In his will he left one-third of his property for the benefit of Ḥanbālī students of law, but they received none of it: The sultan is said to have confiscated the estate. Al-ʿUkbarī, in an autobiographical note, said that he earned 25,000 dirhams from copying manuscripts, a good part of this coming from his specialty of copying the *Dīwān* (Collected works) of the poet al-Mutanabbī in three nights, on paper that cost him five dirhams, which he would then sell for a sum between 150 and 200 dirhams.

The second half of this century is led by Qādī Abū Yaʿlā (d. 1066), whose name is cited extensively in the works of his successors. He was a favorite disciple of Ibn Ḥāmid, who chose him from among his students to teach the others during the master's absence on the pilgrimage to Mecca. With Abū Yaʿlā is at the beginning of the period of Ḥanbālī history better served by the sources: More of its literature has been preserved in the libraries of the Islamic and Western worlds. Abū Yaʿlā was a successful master jurisconsult under whose direction some of the great Ḥanbālī intellectuals studied and

became master jurisconsults in turn. It is in this period that *madrasabs* began to flourish in Baghdad. This is also the period in which rationalist influences succeeded in getting a hearing among some of the leading lights of the Ḥanābilah. Abū Yaʿlā is one, and Ibn ʿAqīl, who belongs to this period and the next, is another. The parents of both intellectuals were of the Ḥanafī *madhhab*, where the ideas of the Muʿtazilah may well have been familiar to members of the family circles. That Abū Yaʿlā was influenced by *kalām*-theology may be clearly seen in his *Muʿtamad fī uṣūl al-dīn* (The reliable book on the fundamentals of religion), where the influence of Ashʿarī doctrines is palpable, although the author avoids the term *kalām* in the title and uses the more traditionalist term *uṣūl al-dīn* for “theology.”

Among Abū Yaʿlā’s many works, *Al-muʿtamad* survives only in his abridged version; other important writings include *Al-ahkām al-sulṭānīyah*, a treatise on government and public administration with the same title and, for the most part, the same text as the work of al-Māwardī (d. 1058); *Al-ʿumdah fī uṣūl al-fiqh*, on legal theory and methodology, still in manuscript (Cairo); and *Kitāb al-riwāyatayn*, on positive law and also unpublished (Istanbul). Abū Yaʿlā’s standing in the Ḥanbālī *madhhab* is such that he came to be referred to simply as “the judge” (*al-qāḍī*), the organizer of his *madhhab* and one of its great teachers.

Two of Abū Yaʿlā’s students especially helped to spread the *madhhab* beyond the confines of Baghdad. Qāḍī Ḥarrān (d. 1083), whom Abū Yaʿlā appointed as his judicial representative in Ḥarrān, was the author of works on law, legal theory and methodology, and theology, none of which has survived. Abū al-Faraj al-Shīrāzī (d. 1094), who is credited with carrying the Ḥanbālī *madhhab* to Jerusalem and Damascus, wrote on law and legal theory and methodology, as well as on traditionalist theology, which involved him in recurrent altercations with Syrian rationalists of the Ashʿarī movement. Al-Shīrāzī stands at the head of a long line of Ḥanbālī descendants known collectively as “the family of Ibn al-Ḥanbālī.”

One of Abū Yaʿlā’s students who deserves special mention is the *sharīf* Abū Jaʿfar (d. 1077), an activist of the stamp of al-Barbahārī who was in constant struggle against what he considered to be the heretical innovations of his period. His fight against corrupt practices—prostitution and illicit alcoholic beverages—brought him into conflict with officials of the Seljuk sultan, as well as with those of the caliph, who was his first cousin. He was intransigent in his attitude against the two rationalist movements, the Muʿtazilah and the Ashʿarīyah, in their attempt to strengthen their footholds in the capital. Among his writings, the best known is his *Ruʿūs al-masāʾil*, a work on positive law in which he argues in favor of the legal opinions of Aḥmad ibn Ḥanbal, a manuscript of which is in the Zāhirīyah in Damascus. Ibn ʿAqīl, in his *Kitāb al-funūn*, has preserved a legal opinion of Sharīf Abū Jaʿfar that throws some light on the Seljuk forces who invaded Baghdad in mid-century, long hailed as the saviors of

Sunnism against the Buyid Shīʿah. The Seljuks pillaging the inhabitants of Baghdad in 1055, said the *sharīf*, should be brought to justice as highway robbers, because the inhabitants had no defense against them. Abū Jaʿfar led a turbulent life, which often put him under house arrest or in prison. His biographers seem to think that he did not die a natural death. At his funeral, the popular masses, his powerful arm against enemies, cried out during the procession: “Invoke God’s mercy upon the *sharīf*—martyred, assassinated, poisoned.”

The other students of Abū Yaʿlā finished their careers in the first half of the twelfth century. Some who had begun their legal studies with him completed them after his death with one or another of his older disciples. Among the Ḥanābilah of this period are Abū al-Fath al-Ḥulwānī, al-Mukharrimī, and Ibn Abī Yaʿlā. Al-Ḥulwānī (d. 1112), like Abū Jaʿfar, was a jurisconsult and ascetic. He studied law first with Abū Yaʿlā, then with the *sharīf* and Yaʿqūb al-Barzabānī. He is the author of the *Kitāb al-mubtadī fī al-fiqh*, a textbook on law for beginners. Ibn Abī Yaʿlā (“son of Abū Yaʿlā,” d. 1131) was the second of Abū Yaʿlā’s three sons, and his name attests to the great renown of the father as well as to that of this particular son. Ibn Abī Yaʿlā is known especially for his biobibliographical history of the Ḥanbālī *madhhab* from its beginnings down to his day.

A great Ḥanbālī mystic of this period is the celebrated ʿAbd Allāh al-Anṣārī al-Ḥarawī (d. 1088), of Herat (Persia) as indicated by his name. He studied in his hometown and also in Nishapur, Ṭūs, Bisṭām, and Rayy. The origins of his membership in the Ḥanbālī *madhhab* are not known, but there is no doubt that he was a Ḥanbālī, and a pugnacious one to boot. He made this clear in his declarations, as well as in his writings, which include *Dhamm al-kalām*, a condemnation of *kalām*-theology; *Manāqib al-Imām Aḥmad*, a biographical work extolling the excellence of Ibn Ḥanbal’s virtues; and *Manāzil al-sāʾirīn*, the most important Ḥanbālī treatise on mysticism. The last-named work attracted many commentaries, including one by the Ḥanbālī jurisconsult and mystic Ibn Qayyim al-Jawzīyah, the disciple of Ibn Tay-mīyah, himself a jurisconsult and theologian, and a member of the Qādirīyah Ṣūfī order. Al-Anṣārī also wrote a *Qaṣīdah dālīyah* (Ode rhyming in dāl [the eighth letter of the alphabet]), a profession of faith in defense of Ḥanbālī beliefs; the title was later taken up by al-Kalwadhānī for the same purpose. The biographer Ibn Rajab cites some of al-Anṣārī’s other verses in which he declares that “My *madhhab* is the Ḥanbālī *madhhab*,” and again, “I am a Ḥanbālī and shall be one as long as I live, and, on my death bed, my last will and testament to my fellow Muslims will be that they follow the principles of Ibn Ḥanbal.” What al-Anṣārī meant was that they should become traditionalists in opposition to the rationalism of the Ashʿarī movement that he opposed: “Our God shall be seen sitting on his throne [i. e., beatific vision]; his word is eternal [i. e., the Qurʾān is not created]; his prophet is Arab. Anyone who says other than this is an Ashʿarī!”

Ya'qūb al-Barzabīnī (d. 1093) was a classmate of Sharīf Abū Ja'far. They completed their legal studies together, were both received as notaries by the chief *qāḍī* Damaghanī, and then began to teach law during the lifetime of their master, Abū Ya'lā. Al-Barzabīnī wrote a *ta'līqah (summa)* that was the abridgment of that of his teacher Abū Ya'lā; extracts from it appear in the *Dhayl* of Ibn Rajab. Ṭalḥah al-Āqūlī (d. 1118), who began his legal studies under Abū Ya'lā, was one of al-Barzabīnī's first students. Like both his teachers, he too became a *qāḍī* and professor of law; he taught two works of Abū Ya'lā on the latter's formal authorization and had a post in the mosque of Manṣūr, where he held sessions of legal disputation. Ibn Qudāmah cites him in the *Mughnī* and his *Kāfī*.

Abū Sa'd al-Mukharrimī (d. 1119), jurisconsult and Ṣūfī, headed the first Ḥanbālī *madrasah* in Baghdad; heretofore the *madhhab*'s institutions of learning had been mainly mosque-colleges (*maṣjids*). His legal studies took place with the *qāḍī* Abū Ya'lā, then with the *sharīf* Abū Ja'far, and finally with the *qāḍī* Ya'qūb al-Barzabīnī. He too was a *qāḍī* in the Bāb al-Azaj quarter on Baghdad's east side, where he built his *madrasah* sometime between 1102 and 1117. This was the *madrasah* that later became known as that of the Ḥanbālī Ṣūfī 'Abd al-Qādir al-Jilānī. Al-Jilānī enlarged it and made it into a *madrasah* and *ribāṭ* (monastery) for jurisconsults and Ṣūfis. Ibn Rajab emphasizes that Abū Sa'd al-Mukharrimī stood at the head of a long line of Ṣūfis, ascetics, and *ḥadīth* masters. His name occurs in the Ṣūfī pedigrees of later Ḥanbālī scholars.

Abū Khāzim ibn Abī Ya'lā (d. 1133), born one year before the death of his famous father, was the last of Abū Ya'lā's three sons and bore the name of his paternal uncle, Abū Khāzim. He studied law, the disputed questions, and legal theory and methodology with al-Barzabīnī. He wrote on the disputed questions and issued a commentary on al-Khiraqī's *Epitome*.

Abū al-Khaṭṭab al-Kalwadhānī (d. 1116) was one of the great disciples of Abū Ya'lā. Essentially a jurisconsult, al-Kalwadhānī excelled in law and its disputed questions. His reputation in law was so great that the celebrated Shāfi'ī jurisconsult and ambassador of the sultan Burkiyārūq to the caliph would exclaim at the approach of al-Kalwadhānī: "Here comes Law." His writings include the unpublished *Al-tambīd* on legal theory and methodology (Zahiriyyah) and *Al-tahdhīb fī al-farā'id*, on decedents' estates, also unpublished (Munich), which was criticized by the Ḥanbālī vizier Ibn Yūnus (d. 1197) in his *Awhām Abī al-Khaṭṭab*. Among his other works are the "Ode rhyming in dāl" (Damascus, 1908), the profession of faith that is his only known work treating of theology, and numerous treatments of positive law.

The most brilliant and successful student of al-Kalwadhānī was Abū Bakr al-Dīnawarī (d. 1138), who was in turn the professor of law of the well-known polymath Ibn al-Jawzī (d. 1200), as well as of Ibn al-Munā (d. 1187) and

the Ḥanbālī vizier Ibn Hubayrah (d. 1165). The caliph al-Mustazhir appointed al-Dīnawarī to the chair vacated by the death of his professor al-Kalwadhānī in the mosque of Manṣūr, and the event is reported by Ibn 'Aqīl along with the disputations on law that usually took place in honor of the inauguration of the new professor of law.

Abū al-Ḥasan al-Zāghūnī (d. 1132), a contemporary of Ibn 'Aqīl, was the Ḥanbālī master jurisconsult who came closest to Ibn 'Aqīl in breadth of knowledge. The extensive list of his books given by Ibn Rajab includes works on positive law, disputed questions of law, decedents' estates, theology, and legal theory and methodology, a collection of his academic sermons, a history, collections of legal opinions (*fatāwā*), and *ḥadīth*, none of which has survived. He had a chair for legal disputations and academic sermons in the mosque of Manṣūr. Two great Ḥanbālī scholars were his students: Ṣadaqah ibn al-Ḥusayn and Ibn al-Jawzī.

Among the original minds of the century stood the towering figure of Ibn 'Aqīl (d. 1119). His family background was Ḥanafī-Mu'tazilī. At the age of sixteen he began his legal studies in the Ḥanbālī *madhhab*. During his graduate years he studied Mu'tazilī *kalām*-theology privately and in secret. After the death of his rich and powerful Ḥanbālī patron, Abū Manṣūr ibn Yūsuf, in 1067, he was pursued by a faction of his Ḥanbālī *madhhab* and was forced to go into hiding for a period of five years. Finally in 1072, in order to regain his freedom, he signed a retraction in which he abjured the Mu'tazilah and the veneration he had shown for the great mystic al-Ḥallāj in a treatise. Reflecting on this retraction in later life, Ibn 'Aqīl said that his companions had misunderstood his intention in studying under the direction of Mu'tazilī masters: "My Ḥanbālī companions demanded that I cease my relations with a certain group of intellectuals, and this prevented me from acquiring useful knowledge." As for his treatise in veneration of al-Ḥallāj, it appears to have remained in circulation among Ṣūfis of the Ḥanbālī *madhhab*.

With Ibn 'Aqīl traditionalist thought reached new heights of achievement. His writings give evidence of a genuine attempt to achieve harmony between faith and reason. His two outstanding works are *Kitāb al-funūn*, of which only one of two hundred volumes has survived, and *Al-wāḍiḥ fī uṣūl al-fiqh*, a *summa* on legal theory and methodology written according to the scholastic method later to be used in the Christian West.

Besides the schools of Harran, Damascus, and Herat, the Ḥanābilah, by this time, had also spread to Isfahan, where 'Abd al-Raḥmān ibn Mandah (d. 1077) was as much an activist as the Ṣūfī al-Ḥarawī al-Anṣārī was in Herat. Among Ibn Mandah's works is a refutation of the Jahmīyah.

*Twelfth century.* The Ḥanbālī names that dominate the twelfth century are those of Ibn Hubayrah, 'Abd al-Qādir al-Jilānī, and Ibn al-Jawzī. Less famous, but no less interesting because of his membership in the Ḥanbālī *madhhab*, is the unusual figure of Ṣadaqah ibn al-Ḥusayn.

Ibn Hubayrah received his Ḥanbālī education under Abū al-Ḥusayn ibn al-Farrā' (d. 1132), Ibn al-Zāghūnī, and Abū Bakr al-Dīnawarī and studied the literary arts under al-Jawālīqī, the Ḥanbālī grammarian who succeeded his master al-Tibrizī to the post of grammarian in the Madrasah Niẓāmīyah. Ibn Hubayrah became vizier of Caliph al-Muqtafī in 1149 and remained in that post under al-Mustanjid for a total of sixteen years, until his death in 1165. He founded a *madrasah*, endowed it, and established his own library in it as a *waqf* in perpetuity. He wrote a work on grammar, *Al-muqtaṣid*, an epitome of Ibn al-Sikkīt's *Iṣlāḥ al-manṭiq*, and a work on the five pillars of Islamic worship, *Al-ʿibādāt al-khams*. But his most important work is his *Kitāb al-iṣṣāḥ* (Aleppo, 1928), a commentary on the *ḥadīth* collections of al-Bukhārī and Muslim, within which a whole independent work on law was written as commentary on a single one of its *ḥadīths*. In preparation for the writing of *Kitāb al-iṣṣāḥ*, the vizier spent 113,000 dinars to invite scholars from all parts for discussions on law. The work contains those doctrines on which there was unanimity among the four eponymous imams of the Sunnī *madhhabs* as well as questions that remained in dispute. The *Kitāb al-iṣṣāḥ* was copied and used far and wide.

ʿAbd al-Qādir al-Jīlānī is the famous Ḥanbālī Ṣūfī whose Ṣūfī brotherhood is still prosperous in the present day. He studied law under al-Mukharrimī, al-Kalwadhānī, Ibn ʿAqīl, and Abū al-Ḥusayn ibn al-Farrā'. In a recently published Ṣūfī *silsilah* ("chain") of initiation for Ibn Qudāmāh, al-Mukharrimī, previously known only as a jurisconsult, appears for the first time as the Ṣūfī who passed on the Ṣūfī cloak (*khirqah*) of initiation to ʿAbd al-Qādir. It was also the *madrasah* of al-Mukharrimī to which ʿAbd al-Qādir succeeded as administrator, professor of law, and Ṣūfī master; under his direction the institution was enlarged, and it has been maintained on Baghdad's east side down to this day. He studied Sufism under the Ṣūfī shaykh Ḥammād al-Dabbās (d. 1131), who was severely criticized by Ibn ʿAqīl. ʿAbd al-Qādir wrote two well-known works: *Al-ghunyah li-ṭālībī ṭariq al-ḥaqq* (The seeker's sufficiency in search of the truth), in which, basing his teachings on the Qurʾān and the *sunnah*, he included an *ʿaqīdah* of profoundly orthodox inspiration that is a succinct presentation of Ḥanbālī traditionalist beliefs. He was severely criticized by his Ḥanbālī contemporary Ibn al-Jawzī, no doubt because of scholarly rivalry, but was ably defended by ʿAbd al-Ghanī al-Maqdisī, Ibn Qudāmāh, and Ibn Taymīyah. The last two are known to have belonged to the Ṣūfī order of ʿAbd al-Qādir, and perhaps also ʿAbd al-Ghanī, who, with his cousin Ibn Qudāmāh, had studied with ʿAbd al-Qādir for the period of forty days that preceded the Ṣūfī master's death.

Ibn al-Jawzī, whose life spanned all but thirteen years of this twelfth century, was a jurisconsult, *ḥadīth* expert, historian, preacher, and polemist. A prolific author, he wrote his first work—a "bibliography of works pertaining to the

Qurʾān and its sciences," according to an autobiographical note—at the age of thirteen. A famous preacher and sermon writer whose talents were highly praised by the Spanish Muslim traveler Ibn Jubayr, Ibn al-Jawzī said he preached his first sermon at the age of seventeen. Into the works of this polymath passed a great amount of the writings of Ibn ʿAqīl, Ibn Hubayrah, and others otherwise lost. He first studied law under the direction of Ibn al-Zāghūnī, whom he was later to criticize; after Ibn al-Zāghūnī's death he studied with al-Dīnawarī, Abū Yaʿlā the Minor, grandson of Qādī Abū Yaʿlā, and al-Nahrawānī, under whom he worked as repetitor (*muʿīd*), and whom he succeeded as professor of law in his two *madrasahs*. By the year 1179, he held five professorships of law in *madrasahs* of which he was also the administrator. That date also coincides with the date his history of Baghdad, *Al-muntaẓam*, is terminated. With Ibn al-Jawzī, the Ḥanbālī *madhhab* reached the apex of its influence in the Abbasid capital, owing in large measure to his own weight with the caliph. Under the vizierate of the Ḥanbālī Ibn Yūnus (d. 1197), Ibn al-Jawzī was once again active in public life, but he lived the life of an exile in Wāsiṭ from 1194 to 1199, when he was allowed, through the intervention of the caliph's mother, to return to Baghdad. He died two years later.

Ṣadaqaḥ ibn al-Husayn was the most atypical Ḥanbālī intellectual, a veritable maverick of his *madhhab*. He was a jurisconsult, belletrist, poet, philosophical theologian, and historian. Unfortunately, none of his works are extant. He studied dialectic, *kalām*, decedents' estates, and, in secret, logic and philosophy. Unlike his contemporary Ibn al-Jawzī, he lived a secluded life teaching in his mosque-college in the Badrīyah quarter (Bāb Badr) on Baghdad's east side, where he led the people in prayer, issued legal opinions to those who solicited them from him, and taught various subjects to students who frequented his mosque. One of his works, on theology, is entitled *Ḍawʿ al-sārī fī maʿrifat al-Bārī* (A torch in the night to light the way toward God); his history is a continuation of that of his teacher Ibn al-Zāghūnī covering the period from the latter's death in 1132 to a period close to his own death. Like the *Muntaẓam* of Ibn al-Jawzī, it was an annalistic and biographical work.

*Later period.* From this point to the fall of Baghdad to the Mongols in the middle of the thirteenth century, the Ḥanābilah no longer boast of names comparable in reputation to those just treated. Nevertheless, there are some figures worthy of a place in the history of Ḥanbālī thought. Ibn al-Ghazzāl (d. 1218), known as a sermon writer, wrote a treatise on the mystic al-Ḥallāj in which he made use of Ibn ʿAqīl's earlier work on this mystic. Ibn Nuqṭah (d. 1232) was a *ḥadīth* expert and historian whose history, not extant, is often cited as a source. Al-Qaṭīʿī (d. 1237), a disciple of Ibn al-Jawzī, wrote a continuation of al-Samʿānī's (d. 1168) continuation of the *History of Baghdad* of al-Khaṭīb al-Baghdādī (d. 1071). Al-ʿUlthī (d. 1237) was a pious ascetic who criticized the policies of Caliph al-Nāṣir, the Ṣūfī practices of a

disciple of 'Abd al-Qādir al-Jīlānī, and Ibn al-Jawzī's allegorical interpretation of the divine attributes. Muḥyī al-Dīn Yūsuf (d. 1258), son of Ibn al-Jawzī, was a Ṣūfī and held the post of *muhṭasib* (market superintendent) of Baghdad under Caliph al-Nāṣir. He was considered more expert than his father in jurisprudence and dialectic. He wrote several works, including *Al-īdāh fī al-jadal* (Dialectic Made Clear), which is still in manuscript. While on an official visit in Damascus in 1254, he founded a *madrasah* called al-Jawzīyah. Returning to Baghdad, he was killed, with his three sons, during the Mongol invasion four years later.

With the fall of Baghdad, Damascus became the center of learning for the Ḥanbālī *madhhab*, whose masters had perfected their studies in Baghdad. Important Ḥanbālī intellectual dynasties developed in Damascus over the years: the descendants of the eleventh-century al-Shīrāzī who became known as the family of "Ibn al-Hanbālī," the Munajjā family founded by Wajih al-Dīn As'ad ibn Munajjā (d. 1209), and the Qudāmah family, also referred to as the Maqādisah (sg., Maqdisī), meaning those who came to Damascus from Palestine (Jammā'īl, a place near Jerusalem, Bayt al-Maqdis). The most well-known member of the third family is Muwaffaq al-Dīn ibn Qudāmah (d. 1223). Ḍiyā' al-Dīn al-Maqdisī (d. 1245), who had gone to Baghdad to perfect his studies, brought back to Damascus works with which he later endowed the *madrasah* he founded in Baghdad called the *Ḍiyā'īyah*. Many of the works of this *madrasah* are now in the Zāhirīyah in Damascus.

Another exodus from Ḥarrān brought to Damascus the Taymīyah family, the most illustrious member of which was Aḥmad ibn Taymīyah (d. 1328). Two other members of the family were Fakhr al-Dīn ibn Taymīyah (d. 1226), a disciple of Ibn al-Jawzī and professor of law in the *madrasah* founded by Nūr al-Dīn in Harran; and Majd al-Dīn ibn Taymīyah (d. 1254), nephew of Fakhr al-Dīn and grandfather of the famous Ibn Taymīyah. The son, 'Abd al-Ḥalīm (d. 1283), *qāḍī* of Harran, was the one who fled from the Mongols and took the family to Damascus. The famous son, Taqī al-Dīn Aḥmad ibn Taymīyah, the father, and the grandfather collaborated, each after the other, on a work in the field of legal theory and methodology called *Al-musawwadah* (The draft), of which Aḥmad ibn Taymīyah's disciple, Shihāb al-dīn Aḥmad al-Ḥarrānī al-Dimashqī (d. 1344), made a fair copy, distinguishing between the contributions of the three authors (Damascus, 1964).

Among Aḥmad ibn Taymīyah's disciples, by far the most famous was Ibn Qayyim al-Jawzīyah, a Ṣūfī like Ibn Taymīyah. Just as Ibn Taymīyah wrote a commentary on the Ṣūfī work of 'Abd al-Qādir, *Futūḥ al-ghayb*, Ibn Qayyim commented on the *Manāzil al-sā'irīn* of al-Anṣārī al-Ḥarawī. He also wrote *I'lām al-muwaqqi'īn*, on legal theory and methodology, and a profession of faith in verse (rhyming in the letter *nūn*), *Al-nūnīyah*. Ibn Rajab, a disciple of Ibn Qayyim, wrote the well-known history of the Ḥanābilah from 1068 as a continuation of Ibn Abī Ya'lā. His

*Qawā'id* (Cairo, 1933) is an important work on jurisprudence.

Of the Mufliḥ family, Shams al-Dīn ibn Mufliḥ (d. 1361), a student of Ibn Taymīyah, is the author of *Al-ādāb al-sbar'īyah* (3 vols., Cairo, 1929–1930), and the chief *qāḍī* Burhān al-Dīn ibn Mufliḥ (d. 1480) authored a history of the Ḥanābilah, not extant. A member of the 'Abd al-Hādī family also deserves mention: Yūsuf ibn 'Abd al-Hādī (d. 1503), a prolific author, many of whose works are preserved in the Zāhirīyah. He was a voracious reader, and his signature is found on the margins of a great many manuscripts in that library and elsewhere. One of his students in *ḥadīth*, the Ḥanafī historian Ibn Ṭūlūn (d. 1546), wrote his biography. Among the other Ḥanbālī scholars worthy of mention, the following may be cited: al-Mardāwī (d. 1481), author of *Kitāb al-inṣāf*; a twelve-volume work on law, and *Kitāb al-taḥrīr*, on legal theory and methodology; al-Hujawī (d. 1561), whose *Iqnā'* is a basic manual on Ḥanbālī law; al-Bahūtī (d. 1641), the well-known Ḥanbālī author who taught at al-Azhar; Ibn al-'Imād (d. 1679), author of a history, mainly biographical, from the year AH 1 to the year AH 1000 (622–1592 CE); 'Abd al-Raḥmān al-Ba'ī (d. 1778), Ṣūfī disciple of 'Abd al-Ghanī al-Nābulūsī who introduced him to the Sufism of Ibn 'ArAbī and Ibn al-Fāriḍ.

The Ḥanābilah, through Ibn Taymīyah, influenced two modern movements, the Wahhābīyah and the Salafīyah. It is through these two movements, in Arabia and Egypt respectively, that works of the Ḥanābilah and their teachings, especially those of Ibn Taymīyah, were made known. And it is in connection with the Wahhābī movement, which was misrepresented and opposed by the Ottomans, that misconceptions developed among modern scholars regarding the Ḥanābilah.

GEORGE MAKDISI (1987)

**HANDS** are a key factor in what it means to be human, because they interact with the intelligence in probing, manipulating, and transforming matter for cultural ends. The hands are also the most expressive and versatile members of the body for symbolic and ritual gestures and tasks, whether social, religious, or magical. Hands give and receive, grasp and relinquish; they strike, protect, punish, and caress. Hands beckon, greet, and wave goodbye; they warn, admonish, and direct; they also pull apart and dismantle, heal and repair, assemble, divide and gather.

**AS SYMBOLS OF DEITY.** The Qurʾān speaks of God’s hand bestowing bounty and blessing as well as exercising power over all things (67:1). The hand is mentioned often in the Bible as a symbol of God’s power and guidance. In Hindu iconography, some representations of deity—preeminently Śiva Nāṭarāja, lord of the dance—have multiple hands and arms, symbolizing omnicompetence; this meaning is further enriched by the precise symbolism in Hindu thought of fingers, palms, and other parts of the hand.

In religious iconography overall, hands occur in a wide variety of gestures. For example, Christ as cosmic ruler is depicted with raised right hand, palm facing outward in a gesture of benediction and peace. Images and pictures of the Buddha feature various *mudrās*, that is, signs or gestures made by the hands—such as the “fear not” position, which resembles the blessing of Christ. Other *mudrās* include extending the hand toward the ground to call the earth to witness and “preaching the Dharma,” both hands raised in front of the chest. Even in aniconic Islam, the talisman known sometimes as the ‘Hand of Faṭimah’ is a prominent anthropomorphic symbol of divine protection. Depending on whether one is Sunnī or Shīʿī, the fingers represent either

the Five Pillars of Islam (*shahādah*, “testifying” to the unity of God and the apostlehood of Muhammad; *ṣalāt*, “ritual prayer”; *zakāt*, “almsgiving”; *ṣawm*, “fasting”; *ḥajj*, “pilgrimage”) or the five holy personages (Muḥammad, Faṭimah, ʿAlī, Ḥasan, and Ḥusayn).

The frequent attribution of hands to deity in religions both ancient and contemporary bears witness to a peculiar anthropomorphic persistence. In the Hindu religion, the arms and hands of Śiva seem furthermore to challenge the preeminence of the primordial and creative word, which is also at the core of creation in the Abrahamic traditions of Judaism, Christianity, and Islam. Similarly, although God is depicted as creating by means of speech in both the Bible and the Qurʾān, in both he is also represented as having created humankind, alone among creatures, with his hands. “When thy Lord said to the angels, ‘See, I am creating a mortal of a clay. When I have shaped him, and breathed my spirit in him, fall you down, bowing before him!’ Then the angels bowed themselves all together, save Iblīs; he waxed proud, and was one of the unbelievers. Said he, ‘Iblīs, what prevented thee to bow thyself before that I created with my own hands?’” (Qurʾān 38:72–76). Regardless of whether this passage is interpreted literally or symbolically, it testifies to a special link between God and humankind in which spirit, clay, and molding hands figure centrally.

**WORSHIP, PRAYER, AND MEDITATION.** The most general use of hands ritually is in prayer. In the Christian tradition, many Protestants hold the hands palm to palm with fingers interlocked, as did ancient Romans and Sumerians. Roman Catholics have often preferred to place the palms together with fingers pointing upward, a position found also in Hindu and Buddhist piety. Romans and Greeks prayed to the deities of the underworld with hands pointing downward. Many peoples touch altars and shrines with their hands while praying for blessings. Ancient Christians in the catacombs are known to have prayed with arms and hands stretched out to the sides in imitation of crucifixion. In Muslim petitionary prayer (*duʿāʾ*), the hands are held out in front of the body with palms open upward; after the words have been uttered, the palms are rubbed across the face. The clapping of hands in praise was known among the ancient Hebrews and Egyptians, and it is still practiced in certain ritual contexts by Africans, Chinese, and Japanese. The Sioux were known to raise their arms with the palms of the hands turned toward a sacred presence, after which they would lower the hands toward the earth. Raising the hands has sometimes been a gesture of adoration of deity, for example, when the priest raises the Host and the chalice during the celebration of the Christian Eucharist. Ancient Egyptians raised both hands with palms facing the shrine.

The Hindu and Buddhist ritual hand gestures known as *mudrās* are the most highly elaborated in religious history. *Mudrā* as a sacred hand language is widely employed in the ritual, dance, drama, and iconography of South and Southeast Asia. The great Vajrayāna stupa of Borobudur, in Cen-

tral Java, contains hundreds of sculptures and reliefs portraying Buddhas whose hands form *mudrās* symbolizing the whole range of Buddhist teachings.

**BLESSINGS, OATHS, AND CONSECRATIONS.** The use of the hand in blessing is widely known. In the Bible, the hand is raised over or toward those to be blessed (*Lv.* 9) and sometimes placed on the head of a person (*Gn.* 48:14). A central Christian blessing is the sign of the cross made with the hands, a gesture performed slightly differently by Roman Catholics and Greek Orthodox: The former move the hand from the forehead to the breast and then from the left to the right shoulder, whereas the latter perform the final motion from right to left shoulder. The hand is also used in Christianity to sprinkle holy water, to baptize either by sprinkling or pouring, and to anoint.

The laying on of hands in ordinations and other forms of consecration is known from the Bible and other sources. A similar gesture was performed in ancient Egypt, where the gods were believed to lay their hands on the head of the new pharaoh. In some Christian groups, for example, among Baptists, a “right hand of fellowship” is extended by the members of the congregation to newly baptized communicants.

A very prominent and widespread category of hand gestures has existed in connection with oath taking; among these are raising the hand, touching a sacred object (e.g., Bible, altar, scepter, weapon), clapping hands, pointing at a holy thing, and touching one’s own breast. In medieval Islam, new caliphs were acknowledged and legitimized by the *bay‘ah*, a survival of an ancient Arabian oath of allegiance symbolized by raising the right hand and then clapping the hand of the ruler or his designated representative, with God as witness.

**APOTROPAIC AND MAGICAL USES.** The sign of the cross has been made for a great variety of reasons, not the least of which has been to ward off demons and other evils. Another potent hand gesture has been the sign of the “horns,” a fist with the index and little finger extended, thought to be efficacious against harmful spells and persons. Alternatively, a person who felt threatened by an occult danger might extend all the fingers of a hand toward the antagonist (real or imagined) and say, “Five in the eye!” This archaic apotropaic gesture of the Mediterranean Basin is often expressed in North Africa and Egypt by means of a talisman in the shape of a hand or by grains of wheat.

Positive and negative imprints of human hands, for example, in red ochre, appear frequently in prehistoric cave art as well as in many contexts since. Such imprints are often thought to protect against the evil eye and other misfortunes.

Magical healing often features hand gestures and touches. Christ is reported to have healed by his touch (see, e.g., *Mt.* 9:20). Royal personages have also been known to heal with their hands, as for example the British monarch Charles II’s famous cures of scrofula. Even the hands of dead persons

have been used in healing as well as in other magical operations.

Decoration of the hands, such as by tattooing, is known widely. Men of the Mentawai Islands, near Sumatra, tattoo their hands in order to wipe out the evil influences of blood spilled in their village. Coptic Christians in Egypt have traditionally worn on the back of the hand or on the wrist a tattooed cross, employed for identification as a Christian in case of death among strangers in that predominantly Muslim country. At festive times, such as Arabian tribal weddings, women sometimes color their hands with henna. In many parts of India as well, women decorate their hands with henna on festive occasions. Hands are also frequently adorned with rings, intended for protection as well as for fashion. In Java, men wear rings set with various stones believed to act as powerful amulets against harmful spirits and spells as well as against more tangible dangers such as poisonous snakebite. Javanese men commonly allow their thumbnails to grow very long in imitation of a mythical hero, Warkudara, who persisted steadfastly in all endeavors and could not be cheated. He is depicted in shadow puppetry (*wayang kulit*) with bladelike thumbnails, symbols of his valor and fighting skills.

**RITUAL AVOIDANCES AND MUTILATIONS.** Washing the hands has been a widespread symbol of cleansing the self of sin and guilt, and a symbol of ritual purity generally. Veiling the hands has also been practiced, usually because their uncleanness in the presence of sacred things threatens the efficacy of ritual. Sometimes covering the hands has symbolized a person’s inferior social or ritual status.

The left hand is widely considered to be unclean, and performing a task or keeping something in place with this hand is generally considered inappropriate. The reasons are probably not so simple as that the left hand is reserved for humble tasks, such as the toilet; perhaps such use is recommended because the left hand and the left side of the body generally are thought to be inherently inferior to the right. The predominance of the right hand among all peoples is well known, and even when a child’s natural preference may be for the left hand, he or she is often trained to use the right hand instead. The auspicious character of the right hand is maintained in the English word *dexterous* (Lat., *dextra*, “right”); the word *sinister* (Lat., *sinistra*, “left”), too, speaks for itself.

In predominantly Muslim regions such as Malaysia and Indonesia, as well as in other Islamic countries, the right hand is used for greeting, gesturing, handing over or receiving objects, and touching others. It is considered extremely rude as well as inauspicious to use the left hand for any of those functions. In the Qur’ān, God is said to give, on Resurrection Day, each person’s book of deeds either into the right hand, symbolizing salvation, or into the left, indicating damnation (69:19). When eating, especially from a common dish, Muslims use only the right hand. According to the Islamic *sharī‘ah*, or law, the strict punishment for the habitual

thief is amputation of the right hand, which precipitates a shameful condition that persists for life and in certain social groups condemns the guilty person to eating alone.

Prehistoric imprints of human hands sometimes show loss of fingers or joints, evidence perhaps of ritual deformation of the hand, either undergone voluntarily or performed as a punishment on captured enemies; both forms are known in ethnography. The severed hands or fingers both of dead persons, such as those killed in battle or by execution or assassination, and of children who died in the womb or at birth have been thought to possess extraordinary powers and therefore have been used in a variety of magical rituals by witches, medicine men, conjurers, and others. American Indians used to wear the hands or fingers of vanquished enemies as powerful medicine. In West Africa, the hand or finger of a deceased relative was often kept as a potent ingredient in magical charms and spells. There are many other magical and superstitious ideas and practices that involve the hands and that have only remote relevance, if any, to religious belief and symbolism, but closer connections with the hands' quite remarkable profane qualities and abilities: One example is chiromancy, the practice of "reading" the hand and especially the palm for purposes of divining the future fate of an individual—a tradition based upon the belief that the hand is the person in miniature.

#### BIBLIOGRAPHY

J. A. MacCulloch's article entitled "Hand," in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 6 (Edinburgh, 1913), offers much factual material drawn from many periods and places. For a useful research tool, consult Betty J. Bäuml and Franz H. Bäuml's *A Dictionary of Gestures* (Metuchen, N. J., 1975); see pages 120–196 for a lengthy discussion of the hand together with a multilingual bibliography for additional sources.

*La main* (Paris, 1968) by Jean Brun offers a sumptuously illustrated and provocative essay on the hand. Also highly recommended is E. Dale Saunders's *Mudrā: A Study of Symbolic Gestures in Japanese Buddhist Sculpture* (New York, 1960). Finally, Robert Hertz's "The Pre-Eminence of the Right Hand," in *Right and Left: Essays on Dual Symbolic Classification*, edited by Rodney Needham (Chicago, 1973), pp. 3–31, should be consulted.

FREDERICK MATHEWSON DENNY (1987)

**HANDSOME LAKE** (1735–1815) was a Seneca shaman, prophet, and sachem of the Six Nations of the Iroquois; known in Iroquois as Ganio' Daí Io'. He was born on the Genesee River opposite modern-day Avon, Livingston County, New York. Handsome Lake's life mirrors the history of the Iroquois people. Born at the zenith of Iroquois power and influence, he participated in major battles against Indian and American opponents and witnessed his people's

loss of land and pride following the Revolutionary War. He later suffered a debilitating illness, exacerbated by bouts of drunkenness, but was revived by a series of dream-vision experiences and led the way to a national revitalization of Indian values.

Early in 1799 Handsome Lake was confined to bed with a serious illness and seemed near death. During a series of dream-vision experiences in June and August 1799 he received many messages from the Creator through four intermediaries whom the prophet referred to as the Four Messengers or the Four Angels. They instructed him about his mission, guided him on a sky journey to the land of the damned and the blessed, and promised him shamanic powers. Handsome Lake recovered, and his sense of physical and spiritual rebirth intensified as he preached and worked for reform.

The earliest messages the prophet received condemned alcohol, witchcraft, abortion, and charms. The Creator was also displeased with wife beating and desertion by husbands, as well as by adultery, undisclosed multimarriages, interference in marriages by mothers-in-law, and the neglect and abuse of children and the elderly. Such activities reflected a serious breakdown in the traditional Iroquois way of life. Handsome Lake now called for a breakup of the longhouse dwelling and instituted the building of single-family houses following the Quaker model. More radically, he preached that men must give up their rapidly declining occupations of hunting and waging war and instead take up farming, the traditional domain of women. At the same time, he warned against the private ownership of property as destructive of traditional Iroquois values, and he encouraged cooperative farming and other communal activities. He also condemned the cruelty to farm animals evident among many whites. Fearful of the corrosive effects of white education on Iroquois traditions, he said that only a few Iroquois children should be educated, and those for the express purpose of enabling the Iroquois to deal with the whites in legal and political matters.

As a prophet, Handsome Lake differed from the Native American cultic and nativistic prophets. The cultic prophets claimed that renewal would occur only when the people returned to the sacrifices and rituals they had neglected. The divine would then send forth its power and restore them. The nativistic prophets proclaimed that the whites would be destroyed if the people rejected all white influences and returned to the old ways. In contrast, Handsome Lake was an ethical-eschatological prophet. He spoke in the name of a transcendent moral being who was seriously displeased with the sins of his people and would either reward them or punish them after death depending on whether they reformed themselves. The Creator did not promise that the whites would be destroyed or driven away but rather said that personal and social reforms would enable the Iroquois to be strong enough to maintain their own independence and to survive in a world increasingly controlled by whites. Reject-

ing both the assimilationism of the Mohawk Joseph Grant and the nativism of the Seneca Red Jacket, Handsome Lake presented the Iroquois with the will of the Creator: They must either accept the *gaiwio* (“good word”), that is, the revelations and injunctions received by Handsome Lake, by repenting their deeds and embracing personal and social reform, or be lost in both a personal-eschatological and a sociohistorical sense.

Unlike the biblical prophets, Handsome Lake’s concern with ethical behavior and eschatology was not accompanied by a desacralization of nature. Although he rejected any cultic prescription for the ills of his people, Handsome Lake affirmed as integral to the Iroquois tradition the necessity of maintaining correct relationships with the spirit forces through ceremonial life. Only by enacting the moral and socioeconomic reforms enjoined by the *gaiwio* could the Indian tradition be fully effective.

Corresponding to Handsome Lake’s integration of eschatological and cosmic elements was his idea of the holy as both a transcendent moral being and an immanent presence and power. The present-day Longhouse religion, or Handsome Lake religion, while basing itself on the prophet’s teachings, incorporates them into a religious structure that includes shamanic institutions and practices, agricultural and gathering ceremonies, and organizational meetings such as the Six Nations Conference.

Places Handsome Lake’s dream-visions and their impact within an Iroquois religious history largely influenced by dreams. Examines his shamanic and prophetic roles and the implications of the acceptance of his message as normative revelation.
- Tooker, Elisabeth. “On the New Religion of Handsome Lake.” *Anthropological Quarterly* 41 (October 1968): 187–200. Explains the success of Handsome Lake and his choice of values in terms of the economic and social changes in moving from a mixed hunting-gathering-agricultural way of life to a heavily agricultural one. Questions Wallace’s revitalization model.
- Wallace, Anthony F. C. “Cultural Composition of the Handsome Lake Religion.” In *Symposium on Cherokee and Iroquois Culture*, edited by William N. Fenton and John Gulick. Washington, D.C., 1961. Examines the themes and values found in the teachings of Handsome Lake and relates his activities to the founding of the Handsome Lake religion. Sees the prophet’s success in terms of its response to the demoralized condition of the Seneca.
- Wallace, Anthony F. C. *The Death and Rebirth of the Seneca*. New York, 1972. A thorough study of the history of the Seneca, containing valuable excerpts from Quaker journals relating

to Handsome Lake’s early visions. Treats extensively the life and teachings of the prophet.

DONALD P. ST. JOHN (1987)

#### HAN FEI-TZU SEE HAN FEI ZI

**HAN FEI ZI** (c. 280–233 BCE), or Master Han Fei, a Chinese philosopher of the late Warring States period (403–221 BCE), was important as the main consolidator and most forceful advocate of a set of earlier ideas later to be given the label of “legalism” (*fajia*). Historical accounts tell us that he was a noble scion of the relatively weak state of Han, and that he created his writings in response to the ineptitude of Han’s governance after failing to gain the ear of its ruler. He would later be sent as an envoy to the powerful western state of Qin, where he would eventually succumb to political intrigue and be forced to commit suicide just twelve years prior to the Qin’s unification of the Chinese world. The book of Han Fei Zi is comprised of fifty-five individual essays and anecdotal collections, most of which were likely written by Han Fei prior to his journey to Qin and eventually compiled into a single work bearing the author’s name; with a few exceptions, the bulk of the work is considered to be authentic. Han Fei is known as much for his lucid writing and persuasive style of argumentation as for his philosophy itself, and his writings are full of some of early China’s most engaging and illustrative stories and analogies.

Han Fei’s main “legalist” precursors included Shang Yang (c. 390–338 BCE), Shen Buhai (c. 400–337 BCE), and Shen Dao (fl. fourth century BCE), who, in the traditional, if overly neat, categorization of their main ideas, respectively proffered such notions as rulership through strict enforcement of clear laws (*fa*), management of officials through bureaucratic method (*shu*), and reliance on advantageous position (*shi*), all of which would, to one degree or another, find their way into Han Fei’s thought. Han Fei was also loosely associated with the Huang-Lao tradition, and he was influenced by the book of Laozi (*Dao de jing*), from which he and his predecessors borrowed the term *nonaction* (*wuwei*) to describe the stance of the ideal ruler. Most directly, Han Fei was also ostensibly a student of the Confucian philosopher Xunzi, though if this is true he would end up radically departing from his teacher on many fronts.

If Han Fei inherited anything from Xunzi, it was certainly the idea that human nature, if left to its own devices, would only lead the people toward struggle and chaos, as humans tended to act out of their own self-interest (as demonstrated, for Han Fei, by the fact that people normally congratulated each other when a son was born, but sometimes killed the child if it was a “useless” daughter). Both employed the analogy that one rarely finds perfectly straight or perfectly rounded wood in nature, and so just as one needs carpen-

try tools to fashion wood into arrows or wheels, the ruler likewise needs analogous devices to mold human behavior in order to achieve political order and stability. Yet whereas for Xunzi such devices lay first and foremost in education through ritual, music, and moral suasion, for Han Fei it was only the coercive force of punishments and the attraction of rewards that would do the trick, as he viewed the Confucian virtues of humanity and propriety (*renyi*) as unteachable aspects of human nature that only a small minority of people possessed. Thus only the rule of might could possibly bring the whole state in line: “For the sage rules not by relying on people to do good for him, but rather utilizes their inability to do wrong. . . . The ruler of method does not follow after chance goodness, but rather implements the way of inevitability” (*Xianxue*). Likewise, Han Fei cautions the ruler against aiming to “win over the people’s hearts,” because the people, like children, do not understand what is ultimately good for them and what hardships must be endured in order to achieve it.

Han Fei’s writings often take the form of polemic against common views and practices supported or encouraged by his opponents, and they concentrate on showing the contradictions inherent in these rival philosophies, the two most prominent being those of the Confucians and the Mohists. For instance, Han Fei vigorously called into question their common insistence that the rulers of the present adhere to the ways of the ancient sage kings, on the grounds both that those ways were too remote to be known (as evidenced by their contradictory philosophies attributed to the same ancient models) and that it was foolish to blindly follow the ways of the past in the first place, given that former circumstances no longer hold true today. “Thus the sage aims neither to cultivate the ancient nor to emulate anything of constant admissibility” (*Wudu*); by showing how circumstances continually change and have always done so, Han Fei advocates a sense of historical perspective over against his rivals’ views of historical constancy. Thus, rather than wasting time listening to the praises of the former kings, Han Fei’s ruler would give credence only to practical wisdom on how to achieve order in the present. Indeed, Han Fei saw it as a common tendency for rulers to become beguiled by clever persuaders acting out of their own self-interest and thereby reward values and promote characteristics that did not serve the good of the state, an obvious recipe for chaos. Given this, the issue of practical applicability was always his litmus test by which to judge the value of any doctrine. An example of this is his argument against the policy of welfare, one that fails because taxing the wealthy to give to the poor only encourages wastefulness and indolence at the expense of industriousness and frugality; in similar fashion, he also decries the valuing of personal integrity to the detriment of social good, scholastic erudition at the cost of agricultural production, and private vengeance at the expense of military valor.

At the heart of Han Fei’s own program for wealth, strength, and social order lay a clear set of laws and an invari-

able system of rewards and punishments—the “two handles” of the state—strictly applied to all members of society. If people inherently tended to act out of their own self-interest, then surely it was only the enticement of rewards or abhorrence for punishments that would encourage them to take appropriate action or deter them from committing misdeeds. Equally crucial, according to Han Fei, was that these “two handles” lie firmly within the grasp of the ruler himself, and that none of his real power ever be relegated to his ministers. The method by which the ruler could thus take full advantage of his might and position involved the practice of matching “names” with “realities” (*xingming*), of letting the ministers do all the work within their specifically delimited jurisdictions—each appropriate to his individual talents—and judging their performances solely on how well their actual accomplishments lived up to their proposals or allotted tasks. And to ensure the efficacy of this method and thus avoid the possibility that ministers would act out of interests other than those of the ruler, an impartial and invariable system of promotion and censure based wholly on this method was required.

Thus the key to successful rulership for Han Fei lay in the ruler acting at all times in accordance with inviolable standards and never involving himself in hands-on administration or making political decisions on a personal basis. The legal methods at the ruler’s disposal are the precision tools of governance that even the wisest of rulers may not forsake, lest he risk the loss of his power and stability. In this regard, Han Fei (following Shen Buhai) took the Dao and nonaction of the Laozi and made them even more explicitly stand for the principles of wise governance, in which he poetically described the ideal ruler as a purposefully mysterious and unknowable entity who simply waited in quiescent tranquility for affairs to take care of themselves: “Empty, he knows the true nature of realities; still, he is the source of rectitude for those in motion” (*Zhu dao*). For Han Fei, such terms by no means symbolized a state of lofty nebulousness—something he expressly opposed—but always translated into a concrete and effective means of political orchestration.

Although Han Fei himself would meet with an unfortunate end in Qin, many of the ideas espoused in his writings would later be adopted into the “legalist” policies of the short-lived Qin dynasty (221–206 BCE). After undergoing a certain amount of modification, they would soon come to be reconciled and blended with Confucian thought to form a core component of the orthodox “Confucianism” of the Western Han (206 BCE–9 CE) and subsequent dynasties, thereby living on, in a somewhat different form, to carry their influence throughout imperial China, and even, in yet other forms, on into the present day.

SCOTT COOK (2005)

**HANUKKAH** ("dedication") is the Jewish winter festival that falls on the twenty-fifth of the month of Kislev and lasts for eight days. It celebrates the victory of the Maccabees over the forces of Antiochus after a three-year battle in the second century BCE. The major sources on the festival's origin are two apocryphal books, *1 Maccabees* and *2 Maccabees*. It is stated there (*2 Mc.* 10:6–8) that the altar was rededicated and the festival of eight days introduced because during the war the Jews were unable to celebrate the eight-day festival of Sukkot. Thus in the earliest period there is no reference to Hanukkah as a feast of lights. That it became such is due to the Talmudic legend (B.T., *Shab.* 21b) that the Maccabees found only one small jar of oil for the kindling of the menorah ("candelabrum") in the Temple. This was sealed with the seal of the high priest but contained only sufficient oil to burn for a single night. By a miracle the oil lasted for eight nights. It was consequently ordained that lights be kindled on the eight nights of Hanukkah. However, it is stated in the Talmud (B.T., *Shab.* 21b) that the Shammites and Hillelites, at the beginning of the present era, debated whether the lights were to be kindled in descending order (eight the first night, seven the second, etc.) or in ascending order (one the first night, two the second, etc.). If this statement is historically correct, it demonstrates either that the legend of the oil was already known at that time or that, at least, there was an association of Hanukkah and light even at this early period. According to some historians, the origin of the festival

is to be found in pagan festivals of light in midwinter. The prayers for Hanukkah refer only to the victory, but in practice the kindling of the lights is the main feature of the festival.

It has long been the custom for each member of the household to kindle the Hanukkah lights in an eight-branched candelabrum frequently called a menorah (though the menorah in the Temple had only seven branches) but nowadays also known as a *hanukkiyyah*. The lights are kindled in the synagogue as well as in the home. The older practice was to use only olive oil, and this is still customary among the more pious, but the majority of Jews use candles for the Hanukkah lights. Rabbinical authorities have discussed whether electric lights may be used for this purpose, the consensus being to permit them. One light is kindled on the first night, two on the second night, three on the third night, and so on until all eight are lit. In order to avoid lighting the candles one from the other, an additional candle known as the *shammash* ("retainer") is used to light the others. A declaration is recited:

We kindle these lights on account of the miracles, the deliverances, and the wonders which thou didst work for our ancestors, by means of thy holy priests. During all the eight days of Hanukkah these lights are sacred, neither is it permitted to make any profane use of them; but we are only to look at them, in order that we may give thanks unto thy name for thy miracles, deliverances, and wonders.

A popular Hanukkah hymn is *Ma'oz tsur* (O fortress rock), sung to a familiar melody said to have been originally that of a German drinking song.

Medieval Jewish thinkers understood the Hanukkah lights as representing spiritual illumination. The festival is a time for intensive study of the Torah as well as for almsgiving. Hanukkah is consequently treated as a more "spiritual" festival than the boisterous Purim, so that although fasting is forbidden on Hanukkah, there is no special festive meal. The Torah is read on each day of the festival; the passages chosen are from the account of the gifts brought by the princes at the dedication of the Tabernacle (*Nm.* 7) and the command to kindle the light of the menorah (*Nm.* 8:1–7). The Prophetic reading on the Sabbath of Hanukkah is from the vision of the menorah seen by Zechariah (*Zec.* 2). An addition to each of the daily prayers thanks God for delivering the strong into the hands of the weak, the many into the hands of the few, the impure into the hands of the pure, and the wicked into the hands of the righteous.

It is nowadays customary for Hanukkah presents to be given to children. This practice is found in none of the early sources and seems certain to have been introduced to offset the giving of Christmas presents at this season of the year.

Children and some adults play a game with a spinning top (dreidel) on each side of which is a different letter representing a move in the game. These letters are the initial letters of the Hebrew words making up the sentence "A great

miracle happened there.” To the consternation of the more conventional rabbis, cardplaying is often indulged in on Hanukkah.

The Talmudic rabbis stress the need for proclaiming the miracle by kindling the Hanukkah lights outside the door of the home, but eventually this practice was discouraged because it could be misinterpreted by non-Jews as a desire to demonstrate Jewish reluctance to live among their gentile neighbors. The less obtrusive practice of kindling the lights near the door but inside the home became the norm. In modern Israel it is far from unusual to see huge Hanukkah candelabra on top of public buildings and synagogues.

LOUIS JACOBS (1987)

**HANUMĀN** is the name of a Hindu monkey god widely venerated throughout India. One of the principal characters of the Hindu epic *Rāmāyaṇa*, Hanumān is also called Sundara (“beautiful”), and the fifth book of the *Rāmāyaṇa*, in which Hanumān plays a central role, is called *Sundara Kāṇḍa* (Book of the Beautiful One). Here Hanumān, a minister for the monkey king Sugrīva, first comes to know of Rāma, who is searching for his wife, Sītā, who has been kidnapped. Hanumān negotiates friendship between Rāma and Sugrīva and later flies across the ocean to Lanka in order to locate Sītā. Finding her under an *asoka* tree, he presents Rāma’s signet ring as a token of recognition, conveys Rāma’s message of consolation, and assures her that Rāma will come to rescue her. He then destroys a large part of Lanka, but is captured and brought before the demon king Rāvaṇa. When Hanumān coils his long tail and sits on it at a level higher than that of Rāvaṇa, the king orders that an oil-soaked cloth be wrapped around Hanumān’s tail and then ignited. Hanumān flies about with his fiery tail and burns large parts of the city. He returns to Rāma to bring the message from Sītā. During the ensuing battle, Hanumān is sent to the mountains to bring *sanjīvini* (“reviving”) herbs for Rāma’s brother Lakṣmaṇa, who is wounded. Unable to identify the herbs, Hanumān brings the entire mountain.

There are several stories of Hanumān’s miraculous and divine birth. His mother was the *apsaras* Anjanā, who was married to Kesari, but who conceived Hanumān when Vāyu, the wind god, overcome by her beauty, made love to her. Another story tells of Vāyu entering into Anjanā’s body through her ear, thus causing Hanumān’s conception.

When Hanumān was born he was so hungry that his mother’s milk could not satisfy him. He therefore flew into the sky to eat the sun, which he thought was a fruit. The god

Indra threw his thunderbolt to stop him, injuring the boy’s chin. Angered by this act, the wind god took Hanumān into a cave to shelter him. But when Vāyu disappeared the people in the world were no longer able to breathe. At the request of the gods, Brahmā entered the cave and healed Hanumān’s wounds. The other gods also blessed Hanumān and conferred on him various boons, including eloquence of expression. Because of his injury, which left his jaw swollen, the child was known as Hanumān, “having a large jaw.”

In folk traditions Hanumān is worshiped as a deity with magical powers and the ability to conquer evil spirits. As an unmarried god who never spilled his seed he is especially popular with body builders, because it is believed that one must be celibate in order to have a strong body. In the Jain *Rāmāyaṇas*, Hanumān is not a bachelor, but is married to the daughters of Khara and Sugrīva. Whereas in the *Rāmāyaṇa* of Vālmīki Hanumān plays the role of the minister, the messenger, and the trusted servant of Rāma, in the later *bhakti* *Rāmāyaṇas* Hanumān is described as the supreme devotee of Rāma, and is therefore considered the model of devotion. It is believed that Hanumān first wrote the story of Rāma, but that he threw it into the ocean to give an opportunity for Vālmīki’s *Rāmāyaṇa* to gain prominence.

**HAOMA.** Both a “being worthy of worship” (*yazata*), or deified personification, and a substance ingested during Zoroastrian ritual sacrifices, *haoma* has an exact parallel in the *soma* of ancient India: *\*sauma*, from the verb *sav* (“to press, to crush”), is the reconstructed Indo-Iranian form. What the substance was originally—a plant or its sap, or a hallucinogenic mushroom such as *Amanita muscaria* (Wasson, 1968)—is not certain. What is certain, however, is that the Indo-Iranian form serves as evidence of a common ritual background in Iran and India. We also know that in both countries the original substance has been substituted with another; for centuries Zoroastrians have continued to use a species of *Ephedra* in their ritual sacrifices. This plant grows in many regions of Central Asia and Iran and yields a juice with hallucinogenic properties. *Haoma* must have been both a hallucinogen and a stimulant: it was reported in the ancient texts to give strength, victory, health, and wisdom and to induce an ecstatic state.

The cult of *haoma*, later to become an essential part of Zoroastrian rites, was originally denounced by Zarathushtra, who refers to it in the *Gāthās* in negative terms: *Haoma* is the “urine” of an intoxicating drug (*Yasna* 48.10). Several scholars have opposed such an interpretation, maintaining that neither animal sacrifice nor *haoma* was ever denounced by the prophet (R. C. Zaehner, Marijan Molé, and Mary Boyce), but their arguments are not convincing. The complex of rites, myths, and legends connected with *haoma* belongs to the pre-Zoroastrian Indo-Iranian tradition and is at the center of a scenario dominated by the warlike god Indra, who, in Zoroastrianism, was relegated to the rank of demon. It is most likely, then, that the acceptance and use of the drug was a reintegration that occurred in the religion after the time of the prophet. In the later texts of the Avesta, *Haoma*, like other beings readmitted to the cult, is a *yazata* to whom a hymn, the *Hōm Yasht* (*Yasna* 9–11), is dedicated. The hymn is recited during one of the most important parts of the complex ceremony of the *Yasna*. At the end of the recitation, the officiating priest drinks *haoma* that has already been prepared and consecrated ritually according to meticulous rules of purification, presumably in order to induce an ecstatic state.

HAQĪQAḤ MUḤAMMADĪYAH SEE NŪR  
MUḤAMMAD

**HARAM AND HAWṬAH.** Arabian society may be described as a conglomeration of individual tribal units normally in a state of war, truce, or alliance with other tribal units, whether these tribes are settled in villages and towns or are migratory herders. Unarmed traders, artisans, and peasants are subject to the noble (*sharīf*) tribes, who consider them weak (*daʿīf*) and ignoble. Occasions inevitably arise when tribes, even if at war, must meet on neutral ground in physical security: to attend markets, to make political arrangements such as a truce, and for purposes of religion. Since tribal lords find it hard to accept the authority of their peers, when it becomes necessary for someone to preside over tribal arbitrations, to provide a secure forum for their meetings and even to impose certain sanctions upon them, they require an authority with supernatural backing to preside in territory not subject to tribal law. Consequently, they turn to a family regarded as having holy attributes, deriving supreme authority from a divine source, and so exercising the functions committed to it through a prophet or saint.

The institution known in ancient Arabia as *ḥaram* (and probably also *maḥram*), and in parts of contemporary south Arabia as *ḥawṭah*, is closely associated with such holy houses. It is a sacred enclave containing a shrine, administered in Shāfiʿī territory by a lord called a *manṣab* (or sometimes *manṣūb*), subject to divine law and independent of the surrounding tribal territory (*aḥ-bāʿ*). The inviolability of the sacred enclave is guaranteed by its tribal supporters (*anṣār*) as in the case of Medina and, for example, Anṣār Mawlā al-Dawīlah in Wādī Ḥaḍramawt. *Ḥaram* and *ḥawṭah*, the terms for the inviolable sacred enclave, appear to be related semantically to *maḥjar* and *ḥimā*, terms for interdicted pastures: the root of each of these commences with the root letter *ḥāʾ*. In addition, the *ḥimā* of al-Ṭāʿif appears to have had religious associations.

The *ḥijrah* of northern Zaydi Yemen, while distinct from *ḥaram* and *ḥawṭah*, is an institution of related pattern. Although it is not attested in the first Islamic centuries, it seems to be foreshadowed in certain pre-Islamic inscriptions. For example, in the expression “wbʾshʾb dhhmdn whgrhmw wʾrbhmw” (“the tribes of Hamdan and their protected persons [*ḥijrah*] and their tribal [bedouin] Arabs”), the term *ḥijrah* (sg., *ḥijrah*) means both the protected persons and the place where they reside.

The sacred enclave in its most primitive form is probably exemplified by the *ḥawṭah* of Mughshin (northeast of Ṣafār, on the edge of the Arabian sands), where to cut bush or to kill hares brings misfortune. As in the simple desert *ḥawṭah*, bush may not be cut nor may birds or animals be slain in the Meccan *ḥaram*, a highly developed institution.

*Ḥrm* and *mḥrm*, translated as “sanctuary,” are attested in the *Sabaic Dictionary* (Louvain, 1982). Maḥram Bilqīs, the name the Arabs give to the ruins of the pre-Islamic temple of Ilumquh at Mārib, is well known. The sanctuary of the god Dhū Samāwī at al-Ḥazm of the Yemenite Jawf was set in a sacred enclave: the inscription identifying it refers to

a *maḥram* and *mnṣbt*. *Mnṣbt* means a place of *anṣāb* or boundary stones which, as is known, marked the Meccan *ḥaram*, and when Muḥammad founded the *ḥaram* at Yathrib (the pre-Islamic name of Medina) he had its bounds marked out in the same way. Oaths were taken by the Anṣāb al-Ka'bah and sacrifices made to them. The *ḥawṭah* is also marked out with boundary cairns, and on entering it one dismounts out of respect for it.

**INVIOLABILITY OF THE ENCLAVES.** The tribes recognized the inviolability of the *ḥaram* or *ḥawṭah* to such an extent that in ancient times the Quraysh would raid outside Mecca but find safety by returning to its *ḥaram*, a pattern also followed by the tribes of Musaylimah's *ḥaram*. It cannot, however, be assumed that they thereby escaped scot-free, for, to judge from procedure at the *ḥawṭah* in our times, a case would still be brought by the injured party against those tribes; this may indeed almost be deduced from episodes connected with Musaylimah's *ḥaram*.

The deed of Muḥammad's foundation of the Yathrib *ḥaram*, which subsequently became Madīnat al-Nabī, "the prophet's town," is conveyed in documents F and H of the "Eight Documents" (the so-called Constitution of Medina). The regulations they contain, along with those quoted by the historian Wāqidi and the geographer Yāqūt, can also reasonably be considered to represent the law of the pre-Islamic era. Document F states that "this writing does not intervene between a wrongdoer and one committing a criminal act." In his geographical dictionary the Mu'jam, Yāqūt says, "Who-soever enters it [the Meccan *ḥaram*] is secure, and he who commits an aggression in any other territory, and then takes refuge in it, is safe when he enters it and when he leaves it the punishments are applied to him." Similarly, the *manṣab* will take a murderer who has sought refuge in the *ḥawṭah* under his protection and conduct the man back to his tribe; the two tribes affected will then have the case brought to the *manṣab* for arbitration.

Murder in the *ḥaram* or *ḥawṭah* is a heinous crime: the murder of the caliph 'Uthmān in the Medinese *ḥaram* was pointed to as a major offense by his relative Mu'āwiyah. In such a case the *manṣab* of the *ḥawṭah* writes to the chief of the offending clan and the chiefs of all of the other tribes, making them responsible for dealing with the crime. The guilty clan hastily sends the *manṣab* a propitiatory gift, *suqtān* (corresponding to *sarf wa-'adl* in the "Eight Documents"). All the *ḥawṭah* tribes then assemble at the *manṣab*'s house, and the headman of the guilty clan, or even the *manṣab* himself, will take the murderer's dagger and slash his brow with it until it bleeds, to demonstrate that the man's honor (*wijh*) has been besmirched. This symbolic action is referred to in a Minean inscription and also in the biography (*sīrah*) of the prophet Muḥammad, where it is called *tajbīh* and is accompanied by blackening the face. To expiate the offense the guilty tribe must execute one of its own members, not necessarily the murderer, or else all of the other tribes will unite to attack it until atonement is exacted by slayings adequate to the seriousness of the crime of violation.

As any offense against the *manṣab* or persons under his protection is regarded as infringing on respect to him, an astute *manṣab* can attain great power by playing off one tribe against another. He may even succeed in forming a small theocratic state. Given the tribes' need for a supreme authority deriving power from a divine source, the theocratic state seems a natural development in Arabia, and it is thought that the pre-Islamic *mukarribs* ruled over theocracies. Leaving aside questions of revelation, there are obvious political parallels between this pattern and the process whereby Muḥammad established himself in Yathrib.

**HIJRAH.** At this point the *hijrah* must be reconsidered in terms of its Yemeni usage and as Muḥammad's Hijrah, nowadays usually translated as his "migration" from Mecca to Medina. "Muḥammad's *hijrah* chiefly involves the concept of seeking protection with powerful armed tribes, even if *hijrah* does [also] mean one's physical transference from one place to another" (Serjeant and Lewcock, 1983, p. 40b). He left the protection of his own tribe, Quraysh, for that of the arms-bearing tribes of Yathrib. In the Yemen sayyids or others (e.g. the Mashāyikh Bayt al-Aḥmar, who are the *hijrah* of the Ḥāshid confederation) may seek tribal protection. The tribes assemble and decide to grant *hijrah* on the basis of the applicant's sanctity, learning, and other qualities. A person thus protected does not fight or contribute to blood-wit or any levy (*ghurm*) the tribe imposes on itself for war, blood-wit, or entertainment. The *hijrah*, if a man of religion, is considered an ultimate arbiter (*marja'*) and an example to be imitated (*qudwah*), judging in quarrels, marriage, and divorce, and writing amulets for people and cattle. So *hijrabs* often become centers of religious learning. Sanaa city is *muhajjar*, that is, protected by seven large tribal groups in its vicinity. A tribesman slaying there must restore the city's respect (*tahjīr*) by paying a fine and slaughtering an *'aqirah* ("sacrificial animal") at the gate of the city. The prophet Muḥammad became the ultimate arbiter (*marja'*) at Yathrib, exercising functions not dissimilar to those of the *hijrah* sayyids and *manṣabs* of *ḥawṭahs*, although he did not write amulets.

The pre-Islamic *ḥaram* would be protected by the god whose shrine it contained. In Mecca this was the Ka'bah, which the *ḥadīth* suggests was a tent, probably a symbolic form of the square black tent known in the south as *karbah*. It was the sanctuary of Allāh of Quraysh, known as Quraysh Allāh. With the growth of Quraysh power in Arabia a pantheon seems to have accrued to the original cult. Infringement of the *ḥaram* laws brought divine punishment because the *ḥaram* was regarded as able to defend itself by supernatural means, as Yathrib did at the Battle of the Trench, following which the Prophet established his *ḥaram* there.

The annual pilgrimage to the Meccan *ḥaram* was the major event of the year; entertainment was provided through a tax levied for the purpose and through private contributions. The pilgrims came in chanting the *talbiyah*, verses addressing the god, as today they would call out "Ya Hūd!" and

chant the *tabwīd* to the prophet Hūd at his annual pilgrimage. The Meccan pilgrimage was of a pattern common to the Arabian Peninsula to judge by an inscription which details regulations for the pilgrimage to Almaḡah at Mārib. There the god Ta'lab is to receive tithes from which he will provide a banquet. Animals under Ta'lab's protection are not to be hunted.

Islam abolished the gods of paganism and left no partner to Allāh, but the sacred enclaves have remained, the *ḥawṭabs* with their pilgrimages. Those pilgrimages are either annual events or are made out of season for special private requests of the saints whose tombs are usually found in the *ḥawṭabs*: the pilgrims circumambulate the tombs, grasping the four corner-posts as they pass. To this day also the *manṣab* must provide from his revenues for a feast at pilgrimage time and entertain visitors throughout the year.

#### HARAPPA SEE INDUS VALLEY RELIGION

**HARNACK, ADOLF VON** (1851–1930), was a German Protestant church historian and theologian. Carl Gustav Adolf von Harnack was born in Dorpat (now Tartu), in the Russian province of Livonia, where his father, Theodosius Harnack (1817–1889), was a professor of theology at the German-dominated university. He was educated at the universities of Dorpat and Leipzig, received the Ph.D. in 1873, and began lecturing on church history at Leipzig in 1874. In 1879 he went, as full professor, to Giessen, in 1886 to Marburg, and in 1888 to the University of Berlin, where he taught until his retirement in 1921, thereafter lecturing as emeritus professor until the spring of 1929.

Harnack was the premier historian in modern times of early Christianity and, with Ernst Troeltsch (1865–1923), the foremost spokesman of a liberal Protestantism that sought to "overcome dogma by history." He insisted that the rise and development of Christianity could be understood

solely by the use of the historical-critical method, that is, by impartial study of the extant Christian literature, to the exclusion of all metahistorical sources and standards of judgment such as authoritative church dogma or belief in an infallible teaching office or an inerrant Bible.

History, for Harnack, meant above all documentary history. Building on the seminal studies of early Christianity by F. C. Baur (1792–1860) and Albrecht Ritschl (1822–1889), he established early church history on secure textual foundations. Many of his more than sixteen hundred publications were critical editions of patristic texts, and he supervised the publication of hundreds of others, chiefly in the series "Texte und Untersuchungen zur Geschichte der altchristlichen Literatur" (1882–), of which he was a founder. He summarized the results of this textual scholarship in his *Geschichte der altchristlichen Literatur bis Eusebius* (1893–1904).

Harnack wrote penetrating studies of monasticism and of church polity in Christianity's first two centuries. He also wrote what is still the foundational history of the early Christian missionary enterprise, *Die Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten* (1902; translated as *The Mission and Expansion of Christianity in the First Three Centuries*, 1908). His true métier, however, was not institutional history but the history of doctrine—research that culminated in his monumental *Lehrbuch der Dogmengeschichte* (1885–1890; translated as *History of Dogma*, 1894–1899). Dogma, in Harnack's narrow definition, referred exclusively to the trinitarian and christological dogmas formulated by general church councils in the fourth and fifth centuries. Whereas Ritschl had stressed the gradual de-judaization of Christianity as the central factor in the development of early Christian doctrine, Harnack emphasized the progressive hellenization of Christianity, holding that Christian dogma was "a work of the Greek spirit on the soil of the gospel." This did not mean that the gospel (the original teaching of Jesus) had entirely disappeared into dogma, or that the dogmas of the Trinity and the Incarnation were sheer speculation, but that Greek philosophy of religion and its attendant intellectualism had shaped Christian dogmatic thought from its inception. Thus Christian faith came to be dependent on metaphysics and, most shocking of all to Harnack, a "fancied Christ" had been put in the place of the real, historical one.

In Harnack's judgment, moreover, the mainline Protestant reformers had failed to break decisively with "dogmatic Christianity," though their root religious principles actually undermined the authority of all dogma. Martin Luther, for example, had delivered the Christian faith from moralism, ritualism, hierarchicalism, and philosophical speculation, yet he continued to adhere to the old dogmas, even grounding his piety on them, and thus gave them a new vitality and authority within the Evangelical church. The result of this "unfinished Reformation" was a Protestantism beset by ordinance, doctrine, and ceremony. What was urgently required, therefore, was a "critical reduction of dogma," to be carried

out in fidelity to the animating concerns of Reformation religion and to be achieved by a rigorous historical criticism that would distinguish between the timeless “kernel” of Christianity and its timebound “husks.” Harnack took up this task in his most popular book, *Das Wesen des Christentums* (1900; translated as *What Is Christianity?*, 1903), based on lectures to students of all faculties at Berlin in 1899–1900.

The “essence of Christianity”—its element of permanent validity as distinguished from its transient historical forms—is the gospel, above all as Jesus proclaimed it but also as it has repeatedly found expression in the course of Christian history. Appropriating the leading theological themes of his mentor, Ritschl, Harnack contended that the gospel is a simple and self-authenticating phenomenon, centering on the rule of the holy God in the trusting heart, on the experience of God as loving father and thus the assurance of the infinite value of the human soul, and on an ethical life marked by an abiding disposition to the good, under God’s grace, and by neighborly love and mercy. Hence the gospel is essentially timeless, and it addresses a human nature that, religiously viewed, is also unchanging—ever yearning for “the presence of the Eternal in time” and so for a vindication of the ultimate worth of the human spirit over against an indifferent natural order. This gospel, accordingly, requires no metaphysical foundations, no articulation in binding dogmas, no elaborate ritual, and no institutional guarantees. The religion of the Christian gospel, Harnack concluded, is not only “undogmatic” and “perennial,” but also shows itself to be a “cultural” religion in the proper sense, namely, one uniquely responsive to modern humanity’s insistent quest for the meaning of life.

Controversy surrounded Harnack throughout his career. The most bitter conflict broke out in 1892, when he proposed that the Apostles’ Creed be replaced in liturgical worship by a shorter confession of faith based on Reformation principles and on the results of modern historical scholarship. Though denied all official recognition by the Evangelical church, he was the most widely honored theologian of his time. In 1890 he was elected to the Prussian Academy of Sciences and in 1900, on the occasion of its two-hundredth anniversary, he wrote the academy’s official history. He was a founder and the first president (1903–1911) of the Evangelical-Social Congress. From 1905 to 1921 he was director general of the Royal Library in Berlin. He served as the first president (1911–1930) of the Kaiser Wilhelm Gesellschaft for the Advancement of the Sciences (now called the Max Planck Gesellschaft). In 1914 he was raised to the dignity of hereditary nobility by Kaiser Wilhelm II.

Harnack’s theology went into eclipse soon after his death, largely owing to its repudiation by Karl Barth (1886–1968) and other leaders of the regnant Protestant neoorthodoxy. Church historians and theologians otherwise sympathetic to Harnack’s program have criticized his narrow definition of dogma, his thesis of hellenization, and his cardinal notion of a “timeless gospel” for a “timeless humanity.” Nev-

ertheless, his reputation as the greatest modern student of the ancient church is secure, and his insistence that Christianity must be interpreted by the historical method has been upheld.

#### BIBLIOGRAPHY

The indispensable biography is that by his daughter, Agnes von Zahn-Harnack: *Adolf von Harnack* (1936; 2d ed., Berlin, 1951). His collected essays and speeches were published under the title *Reden und Aufsätze*, 7 vols. (Giessen, 1904–1930). Friedrich Smend compiled a complete listing of his writings, *Adolf von Harnack: Verzeichnis seiner Schriften* (Leipzig, 1927), supplemented by *Verzeichnis seiner Schriften (1927–1930)* (Leipzig, 1931).

Harnack’s thought has been discussed most fully by Karl H. Neufeld, S.J., in two works: *Adolf von Harnack: Theologie als Suche nach der Kirche* (Paderborn, 1977) and *Adolf von Harnacks Konflikt mit der Kirche* (Innsbruck, 1979). The best treatment to date in English is by G. Wayne Glick, *The Reality of Christianity: A Study of Adolf von Harnack as Historian and Theologian* (New York, 1967), to be supplemented by Wilhelm Pauck’s *Harnack and Troeltsch: Two Historical Theologians* (Oxford, 1968), a masterly essay by a former student of Harnack at Berlin. Harnack’s interpretation of Luther and of Reformation thought is considered by Jaroslav Pelikan in his essay “Adolf von Harnack on Luther,” in *Interpreters of Luther: Essays in Honor of Wilhelm Pauck*, edited by Pelikan (Philadelphia, 1968), pp. 253–274. Harnack’s indebtedness to Albrecht Ritschl and his controversy with Karl Barth are discussed, respectively, by E. P. Meijering in *Theologische Urteile über die Dogmengeschichte: Ritschls Einfluss auf von Harnack* (Leiden, 1978) and by H. Martin Rumscheidt in *Revelation and Theology: An Analysis of the Barth-Harnack Correspondence of 1923* (Cambridge, 1972).

DAVID W. LOTZ (1987)  
*Revised Bibliography*

**HARRIS, WILLIAM WADE** (c. 1865–1928), was the leader of a mass movement to Christianity in Africa that

inspired creation of an African Christian church. The prophet Harris created the largest mass movement to Christianity in the history of the African continent and revolutionized the religious life of the southern Ivory Coast. He paved the way for the growth of the Catholic church and the establishment of the Protestant church and for the creation of several indigenous religious institutions. Most significant among these is the Harrist Church of the Ivory Coast, which institutionalized his teachings. His impact was unique among the movements to Christianity led by African prophets in that it reflected totally indigenous initiative in a population not previously Christianized by missionaries.

A Grebo from southeastern Liberia, Harris was familiar with Western customs and literate in both English and Grebo as a result of mission schooling. He became an Episcopalian lay preacher, taught in a mission school, directed a boarding school, and worked as a government interpreter.

When antagonism between the Grebo and the Liberian government broke out, Harris led several acts of rebellion against the government. In 1909 he was imprisoned for treason for leading an alleged coup d'état attempt. During his imprisonment he had a vision of the angel Gabriel that convinced him he was God's last prophet, charged with the divine mission of bringing Christianity to all those people not yet converted. In 1913, after his release from prison, Harris went to the Ivory Coast, where his message was well received. The Ivoirians, who found their traditional spiritual guardians ineffective in warding off the colonial onslaught, welcomed Harris's message of a stronger spiritual force.

Harris told them to destroy the altars, masks, and other material representations associated with their indigenous religion and to worship the Christian god as he taught them. In little more than one year, he had baptized what colonial officials estimated at from 100,000 to 120,000 people; Catholic missionaries, who had been summoned by the colonial government to inculcate loyalty to France among its new subjects, had succeeded in baptizing only four hundred people in the previous two decades.

To complete the Christianization of those he baptized, Harris sent them to the Catholic missions and to his Protestant disciples from Sierra Leone and the Gold Coast (now Ghana) who were working in the Ivory Coast. In areas where there were neither missions nor disciples, Harris delegated village leaders to teach their fellow villagers what they had learned from him.

The Catholic missions were inundated with Harris's converts, and his African Protestant disciples continued to convert and teach multitudes in the prophet's name. When a Protestant missionary from Europe arrived in the Ivory Coast in 1924, expecting to find no Ivoirian Protestants because there had been no European Protestant missionaries there, he encountered tens of thousands of Ivoirians worshipping autonomously, calling themselves Harrist Protestants and exhorting him to send the "teachers with Bibles" Harris had said would come to teach them the word of God.

Although some of the Ivoirians who had been worshipping autonomously were initially drawn to the Protestant missionaries, they became disaffected when the Protestants attacked fundamental social institutions such as polygamy and sought to undermine the power of Harris's disciples. In 1926 a Protestant delegation returned from a visit to Harris in Liberia with a message telling his converts to join the Protestant church, but in 1928 an Ivoirian delegation went to tell the prophet of their grievances against the missionaries. This group returned from Liberia with a "last will and testament" from Harris that supported their desire to worship independently. John Ahui, the young member of the delegation whom Harris chose to continue his mission, perpetuated the prophet's teachings and founded the Harrist Church of the Ivory Coast, of which he remains the patriarch.

Harris's message to the Ivoirians was both spiritual and secular. He urged them to stop worshipping the nature spirits that had failed to protect them from conquest by the French and instead to worship the omnipotent creator god who would bring them prosperity, a return to their state of sovereignty, and access to the knowledge and technology of their conquerors. He offered them his own example as an African who, as a result of his schooling and resultant professional positions, could function in the world of the Europeans and Americans as well as in an African milieu. Thus the unprecedented movement of religious conversion that missionaries characterized as a "tidal wave" or "avalanche" to Christianity also had a secular influence; Harris's movement inspired Ivoirians to learn the pragmatic tactics necessary to regain their sovereignty and to create new institutions within which to do so.

Because he inspired Ivoirians to such manifestations of collective indigenous initiative, which the colonial administration perceived as a direct threat to its control over its subjects, Harris was expelled from the Ivory Coast in 1914. Those who persevered in worshipping as Harris had taught them were persecuted by the colonial officials, often with the assistance of the Catholic missionaries.

The Harrist church appealed to Ivoirians because it represented a form of Christianity based on indigenous organizational, conceptual, and ritual structures. Harris had such appeal to the Ivoirians not only because he considered the conceptual structures and preoccupations of the traditional religion but also because he offered desirable solutions to the immediate problems engendered by the colonial situation. Additionally, Harris's style of presentation corresponded to the indigenous mold pioneered by priests of the traditional nature spirits.

That the prophet Harris was a native Liberian is significant because of Liberia's special meaning in Africa. Created by African Americans seeking freedom from the oppression of American racism, Liberia was a symbol of the possibility of the redemption of Africa from European exploitation by and for Africans and their descendants abroad.

Influential African American leaders in Liberia, such as Edward Wilmot Blyden, believed that African Americans could share with the Africans the benefits of Western knowledge and experience, to be synthesized with the Africans' own wisdom and techniques for the creation of a new sovereignty. It is therefore particularly appropriate that William Wade Harris, a symbol of African potential for the Ivoirians, should have brought his message from Liberia, a symbol of African potential and freedom from oppression.

#### BIBLIOGRAPHY

*The Prophet Harris* by Gordon Mackay Haliburton (London, 1971) is a biography of the Liberian prophet based on both the oral tradition and archival data. René Bureau's *Le prophète Harris et la religion harriste* (Abidjan, 1971) is a description of the current structure and functioning of the Harrist church today. My book *The Religious Revolution in the Ivory Coast: The Prophet Harris and the Harris Church* (Chapel Hill, N.C., 1983) is the first complete analysis of the growth and evolution of the Harrist church out of the phenomenal mass movement to Christianity created by William Wade Harris. For an analysis of other religious movements that arose from varying interpretations of the prophet Harris's message by different populations and leaders (e.g., Crast-chotche, the Deima church, the churches of Bodjo Aké, Jonas Zaka, Bébéh Gra, and Papa Nouveau in the Ivory Coast, and the Church of the Twelve Apostles in Ghana), see my study "The Message as the Medium: The Harrist Churches of the Ivory Coast and Ghana," in *African Christianity: Patterns of Religious Continuity*, edited by George Bond, Walton Johnson, and me (New York, 1979).

SHEILA S. WALKER (1987)

**HARRISON, JANE E.** (1850–1928), English authority on ancient Greek religion. Harrison, one of the first female students of the University of Cambridge, taught classics throughout her career at Newnham College, Cambridge. Her reputation rests primarily on three works: *Prolegomena to the History of Greek Religion* (1903), *Themis* (1912), and *Epilegomena* (1921).

*Prolegomena*, published when its author was fifty-three years old, testifies to her recognition of the importance of the still comparatively new disciplines of archaeology and anthropology at a time when most teachers of the Greek and Latin classics were convinced not only that the objects of their study contained nothing of the "primitive" but also that the behavior of "primitive" societies could teach them nothing relevant to their studies. For Harrison, the living essence of Greek religion was not the Olympians, so prominent in the literature and in the major temples of Greece, but the ancient rituals, performed long after their original significance was forgotten. In the spirit of the anthropology of her day, she was both evolutionist and comparatist, but for her, evo-

lution did not necessarily result in progress. In the introduction to *Themis* she characterized the gods of Homer, the sculptors, and the mythographers as "like a bouquet of cut flowers, whose bloom is brief, because they have been severed from their roots." The goal of *Prolegomena* was to discover those roots.

Harrison was always open to new influences: in the introduction to *Themis* Bergson and Durkheim appear, joined in the preface to the second edition (1927) by Freud, who, together with Gilbert Murray, had convinced her that "the full-blown god, the Olympian, has a biological function which could never be adequately filled by the [eniautos-] daimon [that is, the 'year-spirit'] who lies behind each and every primitive god." The analysis of the year-spirit, together with his ritual, is the goal of *Themis*. Harrison did not abandon belief in the *eniautos-daimon*, of whose importance field anthropologists were by this time supplying evidence, but she now acknowledged that the Olympians were not merely the products of art and literature and that they served a religious function. The balance had already been corrected in *Epilegomena*, whose publication preceded the second edition of *Themis*. In *Epilegomena* the influence of Freud and Jung is everywhere apparent, together with that of "the greatest of Russian philosophers," Vladimir Solov'ev.

For a variety of reasons *Themis* was not well received. It presented so many new ideas, and drew on so many disciplines, that even workers in the field who sympathized with Harrison's approach to her subject confessed themselves puzzled by some of the work. The introduction to *Themis* claims to give a simple account of the book's contents, but the account merely highlights the complexity. Harrison had an insatiable appetite for new material, for fresh light on the world and its ways. When she wrote *Themis* her ideas, stimulated by the new material, were still in ferment. The book's plan and argument are less clear than its author supposed at the time of publication. In addition, some readers found the book threatening. *Prolegomena* concerns ancient Greece, and indeed a period long antedating the Greek classics. *Themis* may be concerned with explaining certain Greek cults and rituals, but its thesis of the development of deities from the collective representations of group rituals evidently had a wider relevance. Harrison, an agnostic and a lifelong member of the Rationalist Association, had come to value the religious impulse as an attempt to "apprehend life as one, as indivisible, yet as perennial movement and change." But all dogmas and creeds and the gods associated with them were in her eyes "the *eidola* of man's marketplace . . . dead men, hollow ghosts."

*Epilegomena* exhibits a change. Its preface states the book's goal as not merely to summarize the results of many years' work on the origins of Greek religion but to indicate the bearing of these results on religious questions of today. Its third chapter, "The Religion of Today," presents an ascetic view of life which commands her approval. *Epilegomena* most clearly charts Harrison's intellectual development; read

before *Prolegomena* and *Themis*, it clarifies the views expressed in her earlier books.

Breadth of vision, empathy, and enthusiasm characterize Harrison's work. Its fate is inevitably linked with that of the anthropologists, psychologists, and philosophers whose thought stimulated and molded her own. Some of her conclusions, inevitably, are now of merely historic interest, but the subsequent development of the study of Greek religion has been profoundly influenced by her work.

#### BIBLIOGRAPHY

Each of Harrison's three principal works on Greek religion is currently available in a reprint edition: *Prolegomena* (1903; reprint, Atlantic Highlands, N.J., 1981), *Themis* (1912; reprint, Boston, 1963), and *Epilegomena* (1921; reprint, New Hyde Park, N.Y., 1962). A standard biography is Jessie G. Stewart's *Jane Ellen Harrison: A Portrait from Letters* (London, 1959).

*Revised Bibliography*

**HARTLAND, E. SIDNEY** (1848–1927), was an English folklorist and armchair anthropologist. Hartland is a good example of the polymaths produced by the Victorian era, contributing prolifically to a wide range of topics but practically forgotten today. Although he wrote books on primitive law, primitive society, and the priority of matrilineal kinship, Hartland's favorite subject was religion, and his opinions obtained attention not only in his native Britain but from such leading figures of the day as the French comparativist Marcel Mauss and the Austrian theorist and historian of religion Wilhelm Schmidt.

Among Hartland's contributions to the study of religion may be mentioned his theory of magic and religion. He considered that the early humans' awe and wonder were aroused by their sense of a power behind appearances. Through personification early humankind shaped gods or spirits with humanlike dispositions, making it natural to attempt to placate or control them ritually. Thus, although magic and religion can be distinguished—the one using coercive ritual procedures, the other propitiatory—they spring from the same psychological root and are interwoven in human practice.

A like reductionism appears in Hartland's study of Celtic and Teutonic fairy tales. Assuming the unity of the human imagination, he held that questions concerning the nature and distribution of these tales lead into the domain of psy-

chology. But it is a psychology that must be reconstructed from the simplest and most archaic phenomena that anthropological research can discover. The pursuit of this method led Hartland from Celts and Teutons to other European peoples and, beyond them, to Pacific islanders and American Indians, among others. The result was that stories familiar to some of Hartland's Western contemporaries were traced to a more primitive state of society and a more archaic plane of thought.

In criticizing such writers as Hartland, Mauss pointed out that they explained the form of religious institutions by appealing to individual mental processes to the neglect of social needs and interrelationships among institutions. This premise fell into disfavor late in Hartland's life with the rise of a socially and culturally oriented anthropology. Similarly the emphasis on intensive local fieldwork made the comparative method applied by Hartland seem antiquated.

#### BIBLIOGRAPHY

*The Science of Fairy Tales* (London, 1891) offers a most readable entry to Hartland's thinking about traditional oral literature and to his application of the comparative method, while the three volumes of *The Legend of Perseus* (London, 1894–1896) show his sustained and detailed attempt to trace the appearances of a single story and to relate them to "custom" and "superstition." Both these early works invite comparison with later ventures toward a science of mythology. Hartland's opinions on a range of religious topics are conveniently collected in *Ritual and Belief: Studies in the History of Religion* (London, 1914).

KENNETH MADDOCK (1987)

**HARVA, UNO** (1882–1949), was a Finnish scholar of religion and a specialist in the religious traditions of Finno-Ugric and Siberian peoples. Harva became one of the first advocates for comparative religion studies in Finland during the first decade of the twentieth century (Finland was a grand duchy of Russia until 1917). Harva dedicated his academic endeavors to advance pluralistic cultural values in the name of the Enlightenment and an awareness of the accomplishments of the Finns and other Finno-Ugric peoples as agents of history. Under the tutelage of Edward Westermarck, Harva was introduced to the theories of cultural evolution and the methods of ethnographic fieldwork prevalent in contemporary British social anthropology. Westermarck, who held positions at both the University of Helsinki and the London School of Economics, had carried out extensive fieldwork in Morocco, beginning in 1898. Westermarck had worked closely with such prominent figures in anthropology as Charles Seligman and Alfred Cort Haddon; he instructed his Finnish disciples to collect firsthand ethnographic data on which to base comparative analyses of ethnoreligious materials. Unlike his fellow Finnish Westermarckians who embarked on anthropological studies of non-European cultures, Harva chose to specialize in the oral traditions and ethnic re-

ligions of peoples belonging to the Uralic language family. In addition, the science of ethnography had become a standard approach in Finland in the 1830s, when Finnish linguists traveled in Russia and Siberia to collect linguistic data with which to substantiate the theory of M. A. Castrén of the Altaic origin of Finnish language.

Harva was initiated into Finno-Ugric studies by Kaarle Krohn, a professor of folklore at the University of Helsinki between 1898 and 1928. Krohn's paradigmatic Finnish, geographic-historical method had received worldwide attention among folklore scholars. Harva was an adherent of both the Krohnian geographic-historical paradigm and the Westermarckian empiricism and comparativism. His aim was to unravel the origins and development of early forms of religion among the peoples speaking Uralic languages. He adopted the theory that the kinship between different Finno-Ugric peoples was based not only on language but also on other cultural factors. The theory implied that the beliefs and practices that still prevailed among other technologically and socially "less developed" Finno-Ugric peoples living in Russia and in Siberia could shed light on religious evolution among the Finns and Hungarians. Harva created a comparative-typological method by which to explore the forms and structures of religious expression and the processes of transition from the cultural stage of hunting and fishing to the agricultural stage. The theory was concerned with indigenous religious elements; only marginal attention was given to the spread of organized world religions. Geographically, Harva's field of vision extended from the Finnic peoples in the cultural area of the Baltic Sea and the Saami living in the Lapland territory across northern Sweden, Norway, Finland, and Russia to the Permians (Udmurt and Komi), the Volga Finns (Meadow and Hill Mari), and Mordvinians (Ersä and Moksa) as well as the Ob-Ugrian ethnic groups (Khanty and Mansi) in Siberia. Harva conducted fieldwork among the Udmurt (previously Votyaks) and the Mari (Cheremiss) in 1911 and 1913 and among the Ket (Yenisei Ostiaks) and the Evenk (Tungus) in Siberia in 1917.

Born in 1882 in Ypäjä, in southwestern Finland, Harva first trained as a theologian and even served as a priest for one year in a small parish in central Finland. His father was a minister of the Evangelical Lutheran Church and an active member of the evangelical revivalist movement. Harva, however, experienced a spiritual crisis and resigned his position in 1907 to return to Helsinki to pursue further academic studies in comparative religion. In addition to participating in a seminar led by Westermarck, Harva was invited by Kaarle Krohn to contribute articles on Saami (Lapp) shamanism to the *Encyclopaedia of Religion and Ethics* (1928). The editor of the encyclopedia, James Hastings, had approached Kaarle Krohn in 1904 as "the highest authority on the ancient religions of the Finns" to contribute to the encyclopedia. (Letters of Kaarle Krohn, James Hastings to Kaarle Krohn, June 10, 1904).

Krohn organized opportunities for other scholars as well and signed a contract with one of the major publishing com-

panies in Helsinki to produce a series of monographs on the indigenous religions of the peoples related to the Finns (in Finnish, *Suomen suvun uskonnot*, 1918). Krohn asked Harva to write three volumes—on the religions of the Permians, the Mari (Cheremiss), and the Saami (Lapp) peoples. The first two monographs were published in Finnish in 1914 and the one on the Saami in 1915. In 1913 Harva defended his doctoral dissertation, a study of the water gods of the Finno-Ugric peoples (*Die Wassergöttheiten der finnisch-ugrischen Völker*; 1913). After the intense and extremely productive first years of his academic career, Harva was invited to contribute to the *Mythology of All Races* (1916). The volume on Finno-Ugric and Siberian mythology was written by the spring of 1916 but was not published until 1927.

Harva was a historian of religion, an ethnologist, and a folklorist. He explored mythic structures in the ancient cosmologies of peoples living in the vast geographical area extending from Scandinavia in the west to the Bering Straits in the east and to the old areas of Central Asia and Asia Minor in the south. He showed morphologically related themes in the mythic narratives of shamanic hunters, cattle-breeding agriculturalists, and nomadic pastoralists. These included center of the world (*axis mundi*) symbolism and analyses of motives in Mother Goddess (Magna Mater) traditions; they also dealt with themes and motives in shamanistic traditions, such as the significance of the shaman costume, the shaman's tree, and his ascent to the sky. Harva's achievements as a student of myth, cosmology, and ritual have been valued highly by Mircea Eliade, Bronislaw Malinowski, and Weston LaBarre among others.

In his works *Der Baum des Lebens* (1922); *Finno-Ugric, Siberian [Mythology]* (1927); and *Die religiösen Vorstellungen der altaischen Völker* (1938; translated into French in 1954 and 1959 and into Japanese in 1971 and 1981), Harva created a distinctive way of systematizing mythological and religious materials. He identified in the traditional religions of all peoples a fundamental body of structure beliefs that dominated premodern thought and behavior. Harva did not draw a sharp distinction between the notion of religion and that of tradition. According to him, any popular, or nontheological, religion is based on the oral transmission of local knowledge revolving around ritual interaction between people and invisible terrestrial and celestial forces. Such components as beliefs in gods and souls, veneration of the dead, hero cults, animated and anthropomorphized natural phenomena, genius loci of sacred places in inhabited and uninhabited areas, or the location of ritual behavior during the critical boundary points of the annual economic cycle are integral to any indigenous religious tradition.

Harva was a rationalist who looked for order and systematic structure in the empirical materials under scrutiny. In his mature years he felt a reluctance to engage in theoretical discussions of religion. However, he was not methodologically naive. His work reflected the anthropogeographic ideas put forward by the German geographer Friedrich Ratzel

(1844–1904), and he became an adherent of the culture-historical school in ethnology. He adopted the tenets of logical empiricism as his epistemological point of departure. He was fascinated by the idea of finding an explanation of folk-religious beliefs and practices in the work of biologists. On some occasions, however, this fascination led him astray. Drawing on association psychology, he believed he could uncover the working of the ordinary mind. In explaining, for instance, folk narratives about a mythical milk-stealing being in the Finnish and Scandinavian agrarian belief tradition, he reduced the belief to the perception of ball lightning. Similarly, beliefs in haunting by dead beings were generated by the sounds of specific birds. Harva considered that belief traditions are firmly founded on human auditions and visions; due to a lack of real (i.e., scientific) knowledge about phenomena in the biotic world, however, people tend to draw false conclusions about the origin of such phenomena.

Harva's remarkable contributions to comparative religion led to a discussion regarding the establishment of a university chair in the discipline in Finland. This did not happen, however, and the only permanent position Harva held during his academic career was a professorship in sociology at the University of Turku between 1926 and 1949. After being invited to the professorship in 1926, he abandoned his Swedish name, Holmberg, and changed it to Harva in 1927. As a sociologist he lectured and wrote on Finno-Ugric systems of relationship, on marriage customs (especially the relationship between the kin of the bride and the bridegroom), on gender distinctions and the position of women in the social structure of various Finno-Ugric societies, and most specifically on calendar systems and the popular reckoning of time. Harva's major theoretical concern was the relationship between the individual and the social collective in archaic societies. While he emphasized the collective nature of social life in archaic cultures in the manner of Émile Durkheim (1858–1917), he was nevertheless more influenced by the work of Lucien Lévy-Bruhl (1857–1939).

VEIKKO ANTTONEN (2005)

#### ḤASAN AL-BAŞRĪ

(AH 21–110/642–728 CE) was a famous Muslim ascetic of the generation following the prophet Muḥammad. The son of a freed slave, he was born in Medina and brought up in nearby Wādī al-Qurā. During the First Civil War, which resulted in the rise of the Umayyad caliphate, Ḥasan moved to Basra, where he settled permanently after a brief career as holy warrior in what is now Afghanistan and as secretary to the governor of Khorasan.

To a simple religious spirit such as Ḥasan, the social and economic changes accompanying the schisms and *coups d'état* within Islam amounted to an excess of worldliness. Thus he reacted much more sharply to this disease in the hearts and behavior of the people than he did to the tyranny of the Umayyad government, then personified in al-Ḥajjāj, the governor of Iraq. Though openly critical of the Umayyads, Ḥasan refused to "bid them good and forbid them evil" (because, he said, their swords were faster than our tongues) or to participate in uprisings against them. Likewise, he advised others not to oppose by the sword a punishment or test from God, such as the tyrant al-Ḥajjāj, but to face it with patience and repentance: God, said Ḥasan, brings change and relief through these means rather than through hasty resort to violence. Thus, a Khārījī who tries to right a wrong (through violence) commits a greater wrong.

Although he was an acknowledged expert in the Islamic religious sciences of *tafsīr* (Qur'anic exegesis), *fiqh* (jurisprudence), and *ḥadīth* (traditions of the Prophet), and he was also said to have lectured and written books on these subjects, Ḥasan's fame rests on his pietistic and dogmatic concerns. Here his interest lay not in theological doctrine but in the quality of faith and action, in the inner, genuinely sincere, pious life of the heart translated into an outer, morally upright, ascetic mode of living. Equipped with extensive knowledge and a living memory of the practice of the Prophet's companions, an attractive personality, an eloquent tongue, and most of all, a fearful heart and an upright character, Ḥasan engaged in preaching against worldliness and its resulting hypocrisy. His sermons and letters are grim reminders of the transience of worldly life, the permanent value of the life in the hereafter, and the inevitability of death and divine retribution, as well as moving exhortations to fear God and foster sincere faith and upright conduct. The *munāfiqūn*, those worldlings with skin-deep faith and readiness to sin, were morally aberrant believers in acute danger of hellfire and hence urgently in need of help.

Ḥasan's doctrine of *qadar* (free will) was also morally inspired, directed as it was against the sinners' deterministic rationalizations. Challenged by Caliph 'Abd al-Malik to defend and define his position, he indicated that humans have power (*qudrāh*) to choose freely; that good and guidance come from God, who has foreknowledge of both good and evil (the latter coming from humans or the devil); that God's predestination is not coercive nor his foreknowledge prohibitive for human free choice. The reports that Ḥasan recanted his belief in free will were probably later attempts by the orthodox Sunnīs to clear his reputation of what had come to be regarded as heresy, although the possibility remains that he did partially modify his position.

The fact that both the Šūfīs and the Mu'tazilah regarded Ḥasan as one of their forerunners is a mark of his importance and influence as an ascetic and a theologian. It is even more remarkable that the Sunnīs take pains to count him among their own predecessors despite his novel attitudes in matters of piety and dogma. And it is a measure of his immediate impact that on the day Ḥasan died, evening prayers could not be held in the mosques because the whole city of Basra was busy attending his funeral.

#### BIBLIOGRAPHY

Besides numerous fragments of sermons (*mawā'iz*) and a few bits and pieces of his Qur'anic exegesis, some of Ḥasan's letters (*rasa'il*) have survived, including those addressed to caliphs 'Abd al-Malik and 'Umar II. In addition, Ḥasan has been frequently quoted as an authority in *tafsīr*, *ḥadīth*, and *fiqh* literature, as well as *ādāb* (belles lettres) and *akhlāq* (ethics, particularly exhortative).

The earliest basic source on Ḥasan's life and thought is Ibn Sa'd's *Kitāb al-ṭabaqāt al-kabīr*, edited by Edward Sachau and others as *Biographien Muḥammads, seiner Gefährten und der späteren Träger des Islams bis zum Jahre 320 des Flucht*, vol.

7, part 1, (Leiden, 1915), pp. 114–129. In his pioneering *Essai sur les origines du lexique technique de la mystique musulmane* (Paris, 1922), pp. 152–175, Louis Massignon emphasizes Ḥasan's ascetic side, in contrast to the idealistic tradition prevailing in Kufa. Helmut Ritter's "Studien zur Geschichte der islamischen Frömmigkeit: 1, Ḥasan el-Basrī," *Der Islam* 21 (1933): 1–83, provides an excellent analysis along with the edited text of Ḥasan's letter to 'Abd al-Malik, which has formed the basis for later studies. Joseph van Ess's *Anfänge muslimischer Theologie* (Beirut, 1977) and Michael Cook's *Early Muslim Dogma: A Source-Critical Study* (New York, 1981) are almost exclusively concerned with Ḥasan's theological views.

HASAN QASIM MURAD (1987)

## HASIDISM

*This entry consists of the following articles:*

AN OVERVIEW  
HABAD HASIDISM  
SATMAR HASIDISM

### HASIDISM: AN OVERVIEW

Hasidism is the common appellation of a Jewish pietistic movement that developed in eastern Europe in the second half of the eighteenth century, became, before the end of that century, a major force in modern Judaism, and has remained as such. Previous Hasidic movements in Jewish history—mainly the Ashkenazic Hasidism of medieval Germany (twelfth–thirteenth centuries) and the early *ḥasidim* of the tannaitic period (first–second centuries CE)—will not be discussed here. Rather, the movement at hand is that called, in the writings of the opponents of Hasidism and some historians, "Beshtian Hasidism," a sobriquet that refers to the movement's founder, Yisra'el ben Eli'ezer, known as the BeSHT (an acronym for Ba'al Shem Tov, "Master of the Good Name").

**ROOTS OF THE MOVEMENT.** Hasidism did not emerge, as most other Jewish religious movements did, from the schools of the higher social strata and leading intellectuals. Its first teachers belonged to a social group of popular preachers who used to wander from one community to the other, usually among the smaller and poorer Jewish communities in Podolia and the neighboring areas. Many of these preachers were suspected of Shabbatean tendencies, and they found their audience among the small merchants and the poor in peripheral areas. This fact influenced the later development of the Hasidic movement. Even after Hasidism grew dominant in larger communities, it remained faithful to the social groups that supported it in its early beginnings, and an awareness of the religious needs of the uneducated and the poor became one of the traits of the movement.

Attempts to describe Hasidism as a movement of social rebellion of the poor against the rich, the downtrodden masses against the leaders, have failed. There is no evidence that the Hasidic teachers intended to change the social structure

of Jewish communities. But Hasidism did emphasize the ability of the lower social groups to actively participate and achieve a high position in Jewish religious practice.

The religious background for the appearance of the Hasidic movement is the Shabbatean crisis. While various historians differ in their descriptions of the main reasons for the emergence of Hasidism and in their evaluation of the social and cultural reasons for its success, there is little doubt that the movement served as an answer to the most profound religious crisis that affected Judaism from the late seventeenth through the eighteenth centuries. Gershom Scholem described Hasidism as the neutralization of the messianic element in Judaism after the Shabbatean crisis, and while some scholars insisted that there are messianic elements in Hasidism, none disputed the direct relationship between Hasidic theology and the Shabbatean sects that flourished in eastern Europe in the eighteenth century.

Jewish theologians of the seventeenth and eighteenth centuries, many of whom persisted in believing in the messianism of Shabbetai Tsevi, had to develop a theology that would explain the paradox of a messiah committing the worst possible transgression against orthodox Judaism—Shabbetai Tsevi's conversion to Islam in 1666. Various theologies were developed, some of which called upon the believers to follow the messiah and convert to Islam, thereby creating a "coalition" between Judaism and Islam against Christianity; others maintained that belief in Shabbetai Tsevi could be continued within Judaism provided the believer express his attachment to the new messianic, redemptive period that began with the appearance of Shabbetai Tsevi. These expressions eventually covered a whole range of possibilities, from the most anarchistic, antinomian ones of the Frankist movement in Poland in the middle of the eighteenth century to the mild celebrations of Tish'ah be-Av (the ninth day of the month of Av, the day of the destruction of the Temple and a day of fasting, which the Shabbateans turned into a celebration of Shabbetai Tsevi's birthday).

Among the various expressions of the continued belief in Shabbetai Tsevi as the Messiah, two are of interest in understanding the beginnings of Hasidism: the most radical one and the most orthodox one. The radical Frankist movement, which proclaimed that in the new messianic world the way to preserve the Torah was to destroy it, was regarded as a sign of a deep crisis in Jewish religion and education. The Frankists, before converting to Christianity, participated in a religious dispute (in Kamenets in 1757 and in Lvov in 1759) during which they were reported to have directed a blood libel (accusation of a murder for ritual purposes) against their Jewish coreligionists. This aberrational movement, which included some very tempting ideas that captured the hearts of many, signified the need for a reformulation of Jewish organized religious life as well as for the formulation of new answers to basic theological questions, especially the interpretation of qabbalistic symbols from the thirteenth century Zohar and from the teachings of Isaac

Luria of Safad (1534–1572) that were used extensively by the Shabbateans.

The other side of the Shabbatean response to the conversion was a retreat to ultraorthodoxy or cryptoorthodoxy, often with some pietistic ("Hasidic") elements. Explaining that the crisis of the Shabbatean endeavor was caused by the insufficient spiritual support the messiah received from his followers, these Shabbateans adopted a way of life that emphasized continued practice of repentance, self-negation, and insistence on strict adherence to every detail of Jewish religious law. Groups of such *hasidim* appeared in several Jewish communities in eastern Europe that were the centers for spiritual seeking. Not all of their members were Shabbateans, and the Shabbateans themselves were divided in many ways. But when the new Hasidic movement emerged, it did so against the background of several groups or sects of *hasidim* that had already become a common phenomenon in the major centers of Jewish culture in eastern Europe.

The relationship of Hasidism to Shabbateanism and the Frankist movement is complicated. On the one hand, an early Hasidic legend tells how in the BeSHT's participation in the Lvov disputation of 1759, he defended Judaism from the accusations of the Frankists. On the other hand, another Hasidic tradition quotes the BeSHT as lamenting the conversion of the Frankists following that disputation, claiming that as long as a limb is connected to the divine body of the Shekhinah it can be cured, but once severed it is lost forever. In a similar vein, there are found motifs of understanding and closeness to the Shabbatean experience coupled with fierce negation and rejection of the Shabbatean message. The BeSHT is described as trying to save the soul of Shabbetai Tsevi from Hell, where he saw him stretched out on a table with Jesus Christ; Shabbetai Tsevi then tried to pull the Besht down, and only by a great effort did the BeSHT succeed in extricating himself. It seems that though the condemnation of Shabbateanism by the Hasidim was absolute, the idea that the Shabbateans could and should be saved also persisted in Hasidic circles. Members of the Bratslav sect of Hasidism believed that their leader, Nahman of Bratslav, was destined to correct the religious damage done by the Shabbatean movement.

**HISTORY.** The history of the early Hasidic movement can be divided into four main periods, each a major step in its development.

**1. The circle of the BeSHT (c. 1740–1760).** The BeSHT seems to have been in contact with a group of wandering preachers, like himself, who in their homiletics preached a new kind of worship and presented a new conception of the role of the elect in Jewish religion. They were qabbalists, following the main mystical symbols of the Lurianic school but emphasizing the achievements of the individual and his ability to assist his brethren in religious matters. *Devequt* (communion with God) was one of the main subjects they preached, stressing humankind's ability to attain constant communion with God. It is possible that parallel to the

BeSHT's circle of adherents there were other pietistic groups in some of the major centers of Jewish culture in eastern Europe. Some of these circles were influenced by various Shabbatean ideas; all were aware of the Shabbatean crisis.

**2. The first Hasidic center in Mezhirich (1760–1772).** After the BeSHT's death, the leadership of the Hasidic movement was assumed by his disciple, Dov Ber of Mezhirich (now Międzyrzecz, Poland). He held "court" in his home, where many young Jewish intellectuals as well as common people gathered to listen to his sermons. These were transcribed by his disciples and later published in several versions. The court of Dov Ber (called the *maggid*, i.e., "preacher") was described, among others, in the autobiography of Salomon Maimon, who had visited it in his youth. In this period begins the history of Hasidism as an organized movement, led by an accepted authority.

**3. The disciples of Dov Ber (1773–1812).** This is the most important period, in which Hasidism became a major force within Judaism. Several of Dov Ber's disciples created "courts" like that of their teacher, and led *'edot* ("communities"), around which thousands, and then tens of thousands, of adherents gathered, accepting the leadership of that disciple and making their community an alternative social and religious organization of Jews, distinct from the hegemony of the traditional rabbinate. Elimelekh of Lizhensk (now Lezajsk, Poland), Shne'ur Zalman of Lyady (Belarus), Menahem Mendel of Vitebsk, and, to some extent, Nahman of Bratslav belong to this category. In this period of Hasidic theory of the *tsaddiq* was developed and began to shape both Hasidic thought and social organization. At this same time the *Hasidim* became a distinct group, not only because of the internal development of Hasidism, but also because of the growing opposition to it from the school of Eliyahu ben Shelomoh Zalman, the "Gaon of Vilna," which published several pamphlets against Hasidic ideology and practice, denouncing them as heretics and excommunicating them, even trying to enlist the help of the Russian government against their leaders (especially Shne'ur Zalman of Lyady, founder of the Habad sect). This fierce opposition was motivated both by fears that the *Hasidim* were going to undermine the traditional Jewish social structure, which was based on the prestige of the scholars and Talmudists, and by the fear of another Shabbatean movement. There is no doubt that the growing opposition to Hasidism contributed significantly to the internal cohesion of the Hasidic communities and created clear lines of demarcation between areas in which the *Hasidim* became dominant and areas governed by their opponents.

It was in this period that Hasidic literature was initially published. The first works were those of Ya'aqov Yosef of Polonnoye, the BeSHT's greatest disciple, whose voluminous collections of sermons include most of the existing material concerning the teachings of the BeSHT (the first Hasidic work published was Ya'aqov Yosef's *Toledot Ya'aqov Yosef*, Korets, 1780). These were followed by the sermons of

Dov Ber, published by his disciples, and then many other collections of sermons by his followers. The only work published in this period in the form of an ethical work and not the usual collection of sermons was Shne'ur Zalman's *Tanya*' (see below). By the beginning of the nineteenth century the Hasidic movement had an organized leadership, prolific literature, well-defined communities and areas of influence, and an established standing in the general framework of Jewish life.

**4. The development of Hasidic "houses" or "lines of succession" (*shoshalot*).** To a very large extent this process has continued to the present. Many of Dov Ber's disciples served as founders of several Hasidic communities when their disciples scattered and each established his own "house" and community. The custom of passing Hasidic leadership from father to son or, in some cases, son-in-law, became more and more frequent, until it was universally accepted that the new leader had to be from the family of the previous leader. These "houses" usually bore the names of the towns in which they were established, even after the center was moved to another country—Poland, for instance, where many centers were located in Warsaw before the Second World War—or to another continent such as to the United States or Israel, where many of the centers are today. The history of Hasidism has since fragmented into the separate histories of various houses or schools. Only two of the communities have preserved their specific ideological and organizational profile, remaining distinct from all others, throughout this period—Habad Hasidism, founded by Shne'ur Zalman of Lyady, and Bratslav Hasidism, the followers of Nahman of Bratslav, the BeSHT's great-grandson. The rift between *Hasidim* and their opponents has obtained until this day; most Jews of east European descent belong to family lines of either *Hasidim* or *mitnaggedim* ("opponents").

**SPREAD OF THE MOVEMENT.** The spread of Hasidism after the death of Dov Ber in 1772 occurred at the same time that the opposition to the emerging Hasidic movement was growing. After that year, for a period of nearly fifty years, their opponents orchestrated repeated declarations excommunicating the Hasidic leaders and several times enlisted the help of the Russian government in their efforts, claiming that the *Hasidim*, as heretics, were undermining the foundations of the state. The documents concerning this organized opposition have been collected by Mordecai Wilensky and analyzed in a detailed, two-volume study.

The persecution by their opponents did not halt the spread of the movement, which gathered momentum and gained new communities and adherents in the end of the eighteenth century and the first half of the nineteenth century. The disciples of Dov Ber and their disciples established the great Hasidic houses. Levi Yitshaq established an important Hasidic community in Berdichev, while Menahem Nahum built the house of Chernobyl, which was continued by his son, Mordechai Twersky, and went on for many gen-

erations. Yisra'el of Rizhyn (now Ruzhin, Ukraine), a descendant of Dov Ber, built the Rizhyn-Sadigora house; his four sons who followed him made it into one of the most important and eminent Hasidic communities in Russia. Moshe Hayyim Efrayim of Sedlikov (now Sudytkow, Poland), a grandson of the BeSHT, did not lead a community, but his book, *Degel mahaneh Efrayim*, a work of Hasidic sermons that often relies on direct traditions of the BeSHT, was influential. In Poland and Lithuania Hasidism became a major force through the work of Shelomoh ben Me'ir of Karlin and Hayyim Haiqel of Amdur (Indura). Hasidic communities in the Land of Israel were established in Safad and Tiberias by Manaḥem Mendel of Vitebsk and Avraham ben Aleksander Kats of Kalisz who migrated to the Land of Israel in 1777. In the beginning of the nineteenth century a group of great leaders gave renewed impetus to the spread of Hasidism, among them Ya'aqov Yitshaq ("the Seer of Lublin"), Ya'aqov Yitshaq ben Asher of Pshischa (now Przysucha, Poland), and Avraham Yehoshu'a Heschel of Apt in Moldavia (now Opotow, Poland). Manaḥem Morgenstern established the great house of Pshischa-Kozk, and Shalom Rokeah the Belz Hasidim. Moshe Teitelbaum, a disciple of Ya'aqov Yitshaq of Lublin, created the powerful and influential Satmar Hasidism in Hungary. By the middle of the nineteenth century Hasidism was the dominant force in most Jewish communities in eastern Europe, and most Hasidic houses continued their existence and development until the Holocaust.

**THEOLOGY AND ETHICS.** It is nearly impossible to describe Hasidic theology and ethics as being distinct from previous Jewish ideologies because Hasidic teachers preached their ideas in the form of sermons, which included all layers of earlier Jewish thought. Almost all the main ideas and trends found in early-eighteenth-century Hebrew homiletical literature also appear in Hasidic thought, and attempts to define specifically Hasidic ideas, or even emphases, usually fail because similar examples can easily be produced from earlier homiletical literature. A second difficulty is that every Hasidic teacher developed his own theology and ethics and his own list of priorities that may distinguish him or his group but never characterize all the hundreds of teachers and writers who created Hasidic literature. It is unfeasible to generalize from one or a group of Hasidic teachers to the movement as a whole. Every definition is therefore a necessarily subjective one. Thus only a few general outlines, qualified by the preceding statements, can be presented concerning Hasidic theology.

**Relationship to Lurianic Qabbalah.** Hasidism relies on qabbalistic terminology and is largely based on Lurianic Qabbalah. In many specific formulations, however, the Hasidim seem to have preferred the simpler symbolism of the Zohar (the main qabbalistic work written in northern Spain in the late thirteenth century) to that of Hayyim Vital (1543–1620), the disciple of Luria who wrote the main body of Lurianic teachings.

Hasidic theology, like other qabbalistic schools of the eighteenth century, downplayed the most dramatic mythical

symbols of Lurianic mysticism, especially that of *shevirat ha-kelim* ("the breaking of the divine vessels"), the description of the catastrophe within the divine world that is the origin of evil, according to Luria. The idea of *tsimtsum* (divine self-contraction) was elaborated by the Hasidim (especially by Dov Ber), but in a completely different manner than in Luria's original thought. According to Luria, this was the drastic process of divine contraction away from the world, which vacated the space in which the cosmos was going to be created from the divine light of the godhead, the first exile of God. According to Hasidism, however, this was a necessary process, for the world could not absorb the full power of the undiluted divine light. The act of *tsimtsum*, the contraction of that light, was intended to facilitate the acceptance of divine light, in a less concentrated form, by the righteous in the created world. Instead of the original Lurianic idea of a mythological catastrophe, the Hasidim presented a theology in which this process was the result of divine benevolence toward the faithful.

The Hasidim also deemphasized the Lurianic concept of *tiqqun* (restoration), the process by which messianic redemption is enhanced by the collective efforts of the Jewish people as a whole; they preferred instead the concept of *devequt* (communion with God), a process of individual redemption by which a person uplifts his own soul into contact with the divine powers. The description of the ten qabbalistic sefirot, the ten divine hypostases, is closer in Hasidic works to the thirteenth-century system of the Zohar than to the much more complicated system of Luria.

**Extent of messianism in Hasidism.** There is an emphasis in Hasidic literature on personal religious achievement rather than on the general, national, and cosmic impact of religious life. The redemptive element, while still strong in Hasidism, often emphasizes the redemption of the individual's soul rather than that of the nation or of the cosmos as a whole. This is a slight departure from Lurianic Qabbalah, but not all Hasidic teachers shared this view, and some non-Hasidic writers, who either predated Hasidism or belonged to the opponents of Hasidism, also often stressed the emphasis on the individual in qabbalistic symbolism.

The place of the messianic element in Hasidic thought has been a subject of controversy among contemporary scholars. In a detailed study in 1955, Ben Zion Dinur tried to prove that the Hasidim, following the BeSHT himself, developed an esoteric messianic system that was hidden in most of their works but served as the main purpose and drive behind Hasidic preaching and the expansion of its influence. This approach was severely criticized by Gershom Scholem, who saw in Hasidism the neutralization of the Lurianic and Shabbatean acute messianism and a new emphasis on individual redemption through the process of communion with God. Isaiah Tishby recently analyzed early Hasidic texts and found that many of them include more messianic elements than Scholem suggested. There is no doubt that, on the whole, early Hasidism rejected the more extreme messianic

tendencies; the works of Dov Ber can be characterized as neutralizing the messianic drive. But Hasidic teachers in their various works reveal differing attitudes, and some of them may have had stronger messianic inclinations than the Maggid and even the BeSHT.

In the early nineteenth century there was a renewed messianic enthusiasm with Hasidism. Naḥman of Bratslav developed a messianic system (see below), and under the impact of Napoleon's invasion of Russia in 1812 are found several Hasidic leaders engaged in messianic activity. In contemporary Hasidism the Habad sect seems to be deeply motivated by an acute belief in an imminent messianic redemption, concentrating its activities on enhancing this process by strict adherence to religious commandments.

**Hasidic approach to God.** In early Hasidic literature there is an emphasis on direct, emotional worship of God and a deemphasis on contact with God through constant study of the Torah and Talmud and diligent observance of the particulars concerning the performance of the *mitsvot*. This does not mean that the Ḥasidim did not study the Torah or that they disregarded the *mitsvot*, as their opponents often claimed; rather, the Ḥasidim stressed the importance of mystical contact with God through *devequt*, usually attained while praying but also achieved when a person is working for his livelihood or engaged in any other physical activity.

There are many precedents for this attitude in pre-Hasidic Jewish thought, and there are many exceptions to it among Hasidic teachers. Still, it seems that on the whole, Ḥasidim perceived a wider range of modes of worship as acceptable and commendable than did their detractors, and that the mystical aspect of everyday religious life is more prominent among the Ḥasidim. This attitude led to the prevailing conception of Hasidism as oriented toward the needs of the simple believers, the uneducated, and even the ignorant—a conception based primarily on very late (end of the nineteenth and early twentieth centuries) collections of stories and one that is considerably exaggerated.

**Good and evil.** Hasidic teachers, more than non-Ḥasidim, contributed to the development of a conception of the way to fight evil within one's soul that is different from the prevailing Lurianic one. On the one hand, Lurianic theology described a common source for good and evil, claiming that both emanate from the godhead; but, according to Luria, evil cannot exist unless it is in close contact with the good and derives sustenance from it. In order to overcome evil, the righteous must separate good from evil, thus making the latter's existence impossible. Shabbatean thinkers, on the other hand, emphasized that evil can be overcome from within by correcting it. Dov Ber of Mezhrich and other Hasidic teachers insisted that evil can and should be overcome by absorbing it, uplifting and making it again a part of goodness, believing that the spiritual stature of the "corrected" or "repentant" evil is higher than that of the elements that were always good. In early Hasidic works this theory is presented

as teachings accessible to everybody and offered to all righteous Jews; later it was merged with the doctrine of the *tsaddiq*.

**Hasidism as revival of traditional spirituality.** The spiritual side of religious life holds a central place in Hasidic teachings, following the traditions of medieval Hebrew ethical and homiletical literature. Great emphasis is placed on the correct qabbalistic intentions in prayers (*kavvanot*), on spiritual repentance, on the love and fear of God, and on social justice and love for fellow people. While very few new ideas on these subjects are to be found in the vast Hasidic literature, the movement undoubtedly represents a revival of these spiritual values within the framework of everyday religious life. In this respect, then, there is no basis to the frequent descriptions of Hasidism as an original phenomenon that changed the face of traditional Judaism; but it can be claimed that the Ḥasidim collected many spiritualistic ideas and practices from previous Jewish sources and brought them to the foreground of their teachings and Jewish worship in a more central way than before. In this sense their endeavor can be described as "revivalistic."

**THE DOCTRINE OF THE *TSADDIQ*.** While these ideas characterize Hasidism, they do not distinguish the Hasidic movement from previous Jewish religious movements or from the other religious movements of that time, even that of the *mitnaggedim*. Many of these ideas are found, and emphasized, in late eighteenth-century and early nineteenth-century non-Hasidic Jewish works of ethics and homiletics. Hasidism, however, can be defined as a separate movement, different from all others preceding or contemporary to it, because of its doctrine of the *tsaddiq* ("righteous man"), which sets clear boundaries, in theory and in practice, between Ḥasidim and non-Ḥasidim.

The theory of the *tsaddiq* presented Judaism with a new concept of religious leadership that was both charismatic and mystically motivated. According to this theory, in every generation there are some righteous persons who can and should, by their outstanding mystical worship, correct the sins and transgressions of lesser-endowed people. The Ḥasid (follower) has only limited ability to approach the godhead and to carry out difficult religious tasks, especially the correction of evil, including that in his own thoughts and deeds. The leader, the righteous *tsaddiq*, whose soul emanated from a very high place in the divine realm, is the one to carry out these tasks for his generation and especially for his followers, the members of the Hasidic community that he leads. Thus the *tsaddiq* is an intermediary between the Hasid and God, bringing before the heavenly powers (the qabbalistic *sefirot*) the prayers and religious achievements of his community. He receives forgiveness for the sins of his followers and effects the elevation of the evil within them, transmuting it into good at the common source of both in the divine realm.

The *tsaddiq* himself does not contain any evil; the sins he uplifts and corrects are those of his community. One description of this transaction—found in the works of the great

formulator of this theory, Elimelekh of Lizhensk, a disciple of Dov Ber—is that the sins of the community appear to the *tsaddiq* as evil thoughts that he then uplifts and rehabilitates into good thoughts. This theory demands that the *tsaddiq* be in constant movement between good and evil, heaven and earth (*ratso' va-shov*, “ran and returned,” after *Ezekiel* 1:14). He has to be close to the evil that he is to correct, subjecting himself to the process of a “fall” (*yeridah*) or “smallness” (*qatnut*, a term used in Lurianic theology only to refer to the divine powers when they descend from their high dominion). When he uplifts evil and turns it into goodness, he is united with the divine powers in a state of “greatness” (*gadlut*). This dynamism is the most characteristic aspect of the *tsaddiq* concept, and there is no difficulty in ascertaining the source from which the Ḥasidim, probably unwittingly, derived it.

Even before Shabbetai Tsevi's conversion to Islam, his “prophet,” Natan of Gaza, described his messianic role as an intermediary between the godhead and evil on earth. The changing moods of Shabbetai Tsevi, probably caused by a manic-depressive state, were explained as resulting from his constant movement between his source and origin among the *sefirot* and the realm of the devil on earth. After his conversion, Shabbatean theologians explained that in order to overcome evil the Messiah had to merge with it and destroy or correct it from within. There are close parallels between the Shabbatean concept of the Messiah and the Hasidic concept of the *tsaddiq*, and there can be little doubt that the Ḥasidim created their system on the heels of Shabbatean theology.

Nevertheless, the Hasidic concept of the *tsaddiq* is not messianic in the same sense as its Shabbatean precursor. The *tsaddiq* is undoubtedly a quasi-messianic figure, but his influence is limited in time and place—he “redeems” only his own community in his own lifetime. The redemption that the *tsaddiq* accomplishes is not the general, national, and cosmic redemption of Shabbateanism. Rather, he effects individual redemption of the souls in his community—those of his followers—only while he is alive; after his death his successor (his son or relative) will continue in this task, while at the same time dozens of other *tsaddiqim* are performing the same task for other communities in other places. It may be stated that Hasidism broke down the Shabbatean concept of the messiah into small fragments, each of which is the *tsaddiq* for his own time and place. Instead of one messianic figure who inaugurates the historical redemption, Hasidism provides a process of constant redemption of the souls of the believers, a process carried out by every *tsaddiq* within the boundaries of his time and place. When viewed in terms of a messianic movement, Hasidism destroyed the basis for any large, messianic upsurge, replacing it with the small, everyday process of individual redemption. It is possible that the vehement opposition of the Hasidic movement as a whole, with very few exceptions, to modern Jewish nationalism and Zionism should be understood in this light. If individual redemption is assured by faithfulness to the *tsaddiq*, the importance of national redemption is diminished.

The theory of the *tsaddiq* was the focal point of Hasidic theology, shaping to a very large extent Hasidic social organizations and ways of worship as well. According to this theory, the *tsaddiq* not only provides the Ḥasidim with spiritual redemption for their souls but also promises them the basic earthly needs—their livelihood, delivery from illness, and assurances that they will have children (*banei, hayyei, mezonei*; literally, “my sons, my life, my food”). The Ḥasidim, for their part, have to give the *tsaddiq* spiritual support; their belief in his superhuman role enables him to achieve his spiritual tasks. They are also obligated to supply the *tsaddiq's* everyday needs so that he may support himself and his family.

The *tsaddiq* became the center of the Hasidic community. His court was their meeting place several times each year; his room became the place where they brought their complaints and requests; his blessing was believed to ensure both earthly and heavenly success. The Ḥasidim congregated to listen to the *tsaddiq's* prayers and sermons, worshiped with him with great qabbalistic “intentions” (*kavvanot*), and practiced the religious commandments, often with joy and happiness. The task of uplifting evil was thus taken from the shoulders of the individual Jew and consigned to the *tsaddiq* as the representative of the community and the intermediary power between heaven and earth.

Not all the *tsaddiqim* accepted this role. There were several leaders who were uncomfortable with this mode of worship; they left their communities and secluded themselves. Notwithstanding these exceptions, the basic Hasidic attitudes to social organization and everyday worship were developed according to the lines drawn by the doctrine of the *tsaddiq*.

The most important variant to this doctrine grew out of Bratslav Hasidism, founded by Naḥman of Bratslav (1772–1810), the grandson of the BeSHT's daughter. Naḥman's life passed in conflict with other *tsaddiqim*; he refused to accept their authority even over their own communities. When he died his followers chose not to nominate another *tsaddiq* but continue, to this very day, to believe that Naḥman was the “true *tsaddiq*” (*tsaddiq ha-emet*) and that the Messiah, who will redeem Israel, will be his reincarnation. In the Bratslav doctrine of the *tsaddiq* there is, to a very large extent, a return to the Shabbatean concept of one redeemer for all; the redemption therefore assumes historical dimensions.

Another important variant is that of the Habad Hasidism, founded by Shne'ur Zalman of Lyady (1745–1813), a disciple of Dov Ber. From this school is obtained the most detailed information concerning the organization of a *tsaddiq's* court. At the same time, Habad Hasidic works seem to minimize the redemptive role of the *tsaddiq*, especially as outlined in the works offered to the public as a whole, such as Shne'ur Zalman's *Tanya*. Habad developed a highly centralized global organization headed by the *tsaddiq*, with an emphasis on the teaching of Jewish ethics and practice of the *mitsvot* and basic qabbalistic theology, relegating the more

developed messianic and redemptive elements in their theology to esoteric groups among the Habad adherents. Habad is reputed to insist on a more intellectual version of Hasidism, but many other communities share this same trend.

The doctrine of the *tsaddiq* also contributed to the emergence of a special kind of hagiographic literature, for the *tsaddiq* could easily serve as a religious hero to stories of this kind. A body of legends in which the BeSHT was a central hero was collected early in the nineteenth century under the title *Shivhei ha-Beshṭ* (In praise of the BeSHT), following the earlier example of *Shivhei ha-Ari*, which was about Isaac Luria. The tales told by Naḥman of Bratslav in his last years were published as *Sippurei ha-ma'asiot le-rabbi Naḥman*, stories describing in a veiled manner the spiritual conflicts and messianic drives of Naḥman. Many stories were told by the Hasidim about their leaders, but these began to be published only in the last third of the nineteenth century, mostly by non-Hasidic authors, editors, and publishers, and later by some Hasidic publishers. Many of these stories are nothing but adaptations of ancient Jewish folktales in which the specific *tsaddiqim* are inserted as heroes. Hasidism throughout its history, including contemporary Hasidism, chose the sermon to be its basic literary genre and mode of expression. This vast body of homiletical literature is the basic and often the only source for Hasidic theology and practice. Some *tsaddiqim* prepared, or their disciples collected, brief anthologies of the sayings of the leaders, and a few *tsaddiqim* wrote ethical works, such as *Tanya*, but the dominance of homiletical literature in authentic Hasidic literature is uncontested.

**MISCONCEPTIONS ABOUT HASIDISM.** In popular works about Hasidism that focus on material derived from late Hasidic hagiography and collections of sayings of Hasidic teachers culled from their homiletical works and sermons, Hasidism is often described as a popular movement concentrated around charismatic leaders who impress their believers by various miracles and exemplary ethical behavior, without any theological or mystical basis. In some accounts even the strict adherence of Hasidim to the commandments of Judaism is missing, and Hasidism appears as a kind of “ethical Judaism” based on enthusiastic celebration of festivals and social ethics.

This erroneous image of Hasidism is the product of the literature written by Jewish writers in Hebrew and Yiddish in the early twentieth century, such as Shalom Asch, Yitshaq Loeb Perez, and Yehudah Steinberg, who portrayed Hasidism in nostalgic terms after having left traditional Judaism and embraced Western ways of life. Some scholars and writers, from Martin Buber to Elie Wiesel, followed them to an extent, perpetuating the image of Hasidism as pure, spiritual Judaism that expresses love of Israel, love of God, and love toward every human being. In their descriptions, modern writers have tended to emphasize public behavior in the Hasidic courts and to neglect the mystical, qabbalistic theology and the theoretical basis of the worship of the *tsaddiq* in Hasidism.

The studies of scholars such as Gershom Scholem, Joseph G. Weiss, Isaiah Tishby, Mendel Pierkaz, and others in the last generation restored the serious study of Hasidism and based it on philological, historical, and ideological scrutiny of the Hasidic texts themselves. Hasidism is the latest chapter in the history of Jewish mysticism, in which qabbalistic symbols became central to a wide, popular movement that produced a new type of religious leadership and introduced religious-mystical values to modern Orthodox Judaism.

#### BIBLIOGRAPHY

Several important book-length studies of Hasidism are to be found in English. Simon Dubnow's classic *Geschichte des Chassidismus*, 2 vols. (Berlin, 1931), is still the best factual description of the development of early Hasidism. A brief but profound description of Hasidic mysticism is to be found in “Hasidism: The Last Phase,” the last chapter in Gershom Scholem's *Major Trends in Jewish Mysticism*, 2d ed. (New York, 1954), pp. 325–350; the reader may use previous chapters in this book to study main qabbalistic terminology and symbols. Scholem's studies of Hasidic concepts of communion with God and messianism can be found in his collection of essays, *The Messianic Idea in Judaism and Other Essays on Jewish Spirituality* (New York 1971), pp. 176–250.

The Hasidic idea of the intermediary between God and humanity is studied in Samuel H. Dresner's book *The Zaddik* (London, 1960), and the biography of one of the creators of this idea, Naḥman of Bratslav, is presented in a profound book by Arthur Green, *Tormented Master* (University, Ala., 1980). An anthology of early Hasidic texts in English translation is to be found in my book *The Teachings of Hasidism* (New York, 1983). A selection from the works of an early Hasidic master has been translated and edited by Arthur Green in *Upright Practices: The Light of the Eyes*, by Manaḥem Naḥum of Chernobyl (New York, 1982). The most important collection of Hasidic stories about the BeSHT is *In Praise of the Baal Shem Tov*, translated and edited by Dan Ben-Amos and Jerome R. Mintz (Bloomington, Ind., 1970).

Many articles about specific problems in Hasidic history and thought were written in English. The most important ones are those of Joseph G. Weiss, especially “Via Passiva in Early Hasidism,” *Journal of Jewish Studies* 11 (1960): 137–155, and “The Kavvanoth of Prayer in Early Hasidism,” *Journal of Jewish Studies* 9 (1958): 163–192. A recent study of the theory of Hasidic leadership is to be found in Arthur Green's “The Zaddiq as *Axis Mundi* in Later Judaism,” *Journal of the American Academy of Religion* 45 (September 1977): 327–347.

Most of the scholarly work concerning the history and theology of Hasidism was written in Hebrew. Among the most important books are Rivka Schatz Uffenheimer's *Hasidism as Mysticism* (in Hebrew with English summary; Jerusalem, 1968) and her *Maggid devarav le-Ya' aqov* (Jerusalem, 1976), a critical edition of Dov Ber's collection of sermons. A general survey of the works of the main Hasidic teachers is presented in Samuel A. Horodetzky's *He-ḥasidut veba-ḥasidim*, 4 vols. in 2 (Tel Aviv, 1951). The history of the controversies

around the Hasidic movement, and scholarly edition of the relevant texts, is included in Mordecai Wilensky's *Hasidim ve-mitnaggedim*, 2 vols. (Jerusalem, 1970). The relationship between Hasidism and its sources in earlier Hebrew ethical and homiletical literature is studied in detail in Mendel Piekarz's *Bi-yemei tsemihat be-Hasidut* (Jerusalem, 1978). A study of Naḥman of Bratslav's life, works, and main ideas is to be found in Joseph G. Weiss's *Mehqarim be-Hasidut Breslav* (Jerusalem, 1970) and Mendel Piekarz's *Hasidut Breslav* (Jerusalem, 1972). A theological discussion of the theology of Habad Hasidism in the second generation is presented in Rachel Elijor's *Torat ha-elohut ba-dor ha-sheni shel Hasidut Habad* (Jerusalem, 1982). A detailed study of Hasidic narrative literature is to be found in my book *Ha-sippur be-Hasidi* (Jerusalem, 1975).

#### HASIDISM: HABAD HASIDISM

Habad is a distinctive Hasidic school founded by Shne'ur Zalman of Lyady (1745–1813) and led by a dynasty of his descendants, the Schneerson family. Because his son Dov Ber (1773–1827) settled in the Belorussian town of Lubavitch and established a Hasidic center there, the Habad movement is also widely known as Lubavitcher Hasidism. The most recent head of the movement was Menachem Mendel Schneerson (1902–1994), seventh in the line of succession. There has been no replacement. Given the movement's belief in Schneerson as a messianic figure, a future replacement is unlikely. From its New York headquarters the movement directs a vast array of religious, educational, and media ventures throughout the world.

As a theological system, Habad represents the apex of a cosmic mysticism within Judaism. Only God has real existence; all else, including the existence of the person as a separate being, is illusory. The purpose of the spiritual life, assiduously and systematically cultivated in Habad, is to bring the devotee to the realization of this truth in heart and conduct as well as in mind. Habad teaches, however, that the true conversion is first and foremost an intellectual one. Whereas other Hasidic leaders emphasized the emotional experience of God through practice, the moral life, and the virtues of simplicity, Shne'ur Zalman and his followers taught a highly abstract mystical theology and praised the virtues of contemplation and detachment. The name *Habad* (H̄aBaD), which is an acronym for *hokhmah*, *binah*, and *da'at* (three aspects of the mental function), is indicative of this.

Habad thought teaches that divinity is equally present throughout the universe, and that the existence of the universe itself is but an effulgence of light that comes from the eternal and unchanged One. This radiance, also identified with the creative speech of God, takes on the form of creation, and through it the One dons the garb of multiplicity. It does so in order that the presence of divinity will be confirmed even in the seemingly "lowliest" places, a gradation that would have no meaning if not for the existence of the corporeal world. The spreading forth of divine energy into the furthest corners of being is a constant process, without which the universe would lose even its semblance of reality.

The religious life is both a participation in this constant spreading forth of divinity, through the bodily fulfillment of the divine commandments, and a reversal of the process, in which all things are "uplifted" and returned to their source in God through inward devotion and contemplative prayer. Habad is in part a reaction to the extreme early Hasidic emphasis on prayer and inwardness alone as religious values. It insists that the physical enactment of the commandments, even without understanding, has cosmic implications. There is also a great emphasis on Torah study in Habad circles, including the study of Habad theological works, again in contrast to the conduct of some other Hasidic groups. Study and deed are taken as the activist side of the religious life, ever to be balanced with inwardness and contemplation.

Beginning in the early twentieth century, Habad took a leading role in the preservation of traditional piety, whose hold over Jewry was weakening, and in providing an avenue of return to tradition for Jews reared outside it. The previous Lubavitcher *rebbe*, Yosef Yitsh'aq Schneersohn (1880–1950), was the leading rabbinic figure in Russia after sovietization and fought valiantly for the survival of religious Jewry there. After his exile in 1927 and a period of residence in Latvia and Poland, the Lubavitch community settled in Brooklyn in 1941 and later in the town of Kefar Habad in Israel. Both centers remain vibrant. Particularly since the mid-1960s, large numbers of previously unaffiliated American Jews have joined to swell the ranks of this movement, making it the most prominent Hasidic group on the American scene. During that same period, an openness to the uses of technology, the integration of modern techniques of education and public relations, and a vague modernization of style, though carefully circumscribed within the bounds of Jewish law, have raised questions about Habad in some more traditionalist Hasidic circles.

In the latter half of the twentieth century, Habad invested much of its energy in promoting the impending messianic era, touting its leader Schneersohn as the messiah. This activity increased as their leader became infirm and no longer able to communicate. Schneersohn's own position on his messianic vocation has never been clarified. After his death on June 12, 1994, the movement underwent a spiritual crisis. One faction continued to believe he was the messiah and would "rise up" and redeem Israel and the world. Another faction took a more agnostic approach. Few in leadership positions in contemporary Habad openly state that their *rebbe* was (and is) not the messiah. The development and consequences of this remain to be seen.

This situation has sparked a vehement debate in Orthodox Jewish circles about whether Habad messianism now constitutes a Jewish heresy. David Berger, an Orthodox Jewish historian, penned a fiercely polemical book, *The Rebbe, the Messiah, and the Scandal of Orthodox Indifference* (2001), arguing that Habad messianism is indeed a Jewish heresy and should be shunned by all those who adhere to traditional Judaism. Habad countered with a book-length rebuttal of Berger's accusations, *The Messiah Problem: Berger, the Angel, and the Scandal of Reckless Indiscrimination* (2002). The controversy constitutes one of the most serious and substantive debates in traditional Judaism.

#### BIBLIOGRAPHY

Habad thought is clearly summarized and presented by Louis Jacobs in *Seeker of Unity: The Life and Works of Aaron Staroselje* (New York, 1966), as well as in the introduction and notes to his translation of Dov Ber of Lubavitch's *Tract on Ecstasy* (London, 1963). An excellent and highly original presentation is Rachel Elior's "HaBaD as a Contemplative System," in the collection *Jewish Spirituality* (New York, 1986–1987), edited by Arthur Green, vol. 14 in the World Spirituality series. Several classics of Habad thought are translated into En-

glish and published by Kehot, the Lubavitch publishing house, including Shne'ur Zalman's *Tanya* (Brooklyn, N.Y., 1956). On the Messiah controversy, see David Berger's *The Rebbe, the Messiah, and the Scandal of Orthodox Indifference* (Portland, Ore., 2001), and for the Habad response, Chaim Rapoport's *The Messiah Problem: Berger, the Angel, and the Scandal of Reckless Indiscrimination* (Ilford, U.K., 2002).

#### HASIDISM: SATMAR HASIDISM

The school of Hasidic practice known as Satmar Hasidism arose in Satu-Mare (Satmar), Transylvania, in the decades immediately preceding the Holocaust and rose to prominence primarily in the postwar years. It is identified chiefly with the personality of Yo'el Teitelbaum (1888–1982), who was rabbi in Satmar and, after his rescue from Hungary in 1944, in the Williamsburg section of Brooklyn, New York.

In a larger sense, Satmar may be said to represent the distinctive Hasidic style that developed in northern Hungary and Transylvania in the nineteenth century. Lying outside the original heartland of Hasidism, Hungarian Jewry was dominated by a learned and pious rabbinate that saw itself locked in a life-and-death struggle with the forces of assimilation and religious reform, forces that were far stronger in Western-looking Hungary than they were in Poland and the Ukraine. Here Hasidism served as a goad to the revitalization of Orthodoxy, resulting in a bitter and sometimes fanatical tone that was absent from Hasidism in other areas.

After the Holocaust, the Satmar rabbinical court in Brooklyn became a center for the many thousands of pious Hungarian Jews who had escaped the war only by the coincidence of living in the last country to come under the dominance of the "final solution" and its executors. In Brooklyn, the Jewish life of prewar Hungary was reestablished almost unchanged, and the Satmar rabbi was especially known for his generous aid in the resettling of this Jewry. He was also known for his unswerving and increasingly bitter opposition to Zionism, the state of Israel, and all forms of Judaism that differed from his own ultraorthodox way of life. His writings, while reflecting great rabbinic erudition, are polemical in character, including the often repeated charge that the Holocaust was divine punishment for the evil deeds of Zionist and assimilationist Jews. In this sense Satmar represents a "last stand" of certain traditional Jewish attitudes, but he is looked upon with hostility by most other Jewish groups, including other Hasidim, as being overly self-righteous and unrealistically antagonistic to the modern world.

#### BIBLIOGRAPHY

Two sociological studies have examined the Satmar community in its American setting. These are George G. Krantzler's *Williamsburg, a Jewish Community in Transition* (New York, 1961) and the more specifically focused *The Hasidic Community of Williamsburg* (New York, 1969) by Solomon Poll.

**HASIDUT ASHKENAZ** SEE ASHKENAZIC  
HASIDISM

**HASKALAH** SEE JEWISH THOUGHT AND  
PHILOSOPHY, *ARTICLE ON MODERN THOUGHT*

**HASTINGS, JAMES** (1852–1922), was a Scottish Presbyterian minister and compiler and editor of voluminous works dealing with Christian texts and the subject matter of religions. Born in Aberdeen, Scotland, Hastings attended the University of Aberdeen and was ordained a Presbyterian minister in 1884; he later held pastorates in Free Church parishes in Kincardineshire and Dundee. Founder of the *Expository Times*, he is best known for his indefatigable zeal as an editor of numerous works, which may be grouped into four types.

First are those comprising articles dealing with the texts of early Christianity (e.g., *A Dictionary of the Bible*, 1898–1904; *A Dictionary of Christ and the Gospels*, 1906–1908; and the *Dictionary of the Apostolic Church*, 1915–1918). Exegetical and expository in character and intended to provide students of biblical literature with the most recent findings of scholarship, the articles in these volumes were written by established (largely theologically conservative) scholars in command of the most recent methods of historical and textual criticism and philological analysis and exegesis, and their work represented a distinct advance in this field. Second are the works that are primarily homiletical in character (e.g., *Great Texts of the Bible*, 1914, and *Greater Men and Women of the Bible*, 1914). Third is a series of works on Christian doctrines, including the *Christian Doctrine of Prayer* (1915), *The Christian Doctrine of Faith* (1919), and *The Christian Doctrine of Peace* (1922).

Fourth is the renowned *Encyclopaedia of Religion and Ethics* (13 vols., 1908–1926). This work, grand in vision and impressive in accomplishment, represents a scholarly achievement of the first importance. Intended to provide an account of the various aspects of religion (beliefs, rituals, philosophies, theologies, ethics) among peoples the world over and in all ages, the encyclopedia became a reference work with no compeer for more than half a century. Exemplary of the late nineteenth- and early twentieth-century interest in producing encyclopedic collections of knowledge in various fields, the encyclopedia became both a resource for reviewing the results of scholarship concerning the study of re-

ligion and an impetus for the extension of knowledge of peoples and cultures the world over, thus transcending the prior provincialism of much of Western scholarship.

**BIBLIOGRAPHY**

Among the many works edited by James Hastings, he is chiefly remembered for the following publications.

*A Dictionary of Christ and the Gospels*. 2 vols. New York, 1906–1908.

*Dictionary of the Apostolic Church*. 2 vols. Edinburgh and New York, 1915–1918. This contains articles by one hundred different scholars treating the texts and history of the Christian community to the end of the first century.

*A Dictionary of the Bible: Dealing with Its Language, Literature and Contents, Including the Biblical Theology*. 5 vols. New York, 1898–1904.

*Encyclopaedia of Religion and Ethics*. 13 vols. Edinburgh and New York, 1908–1926.

*The Great Texts of the Bible*. 20 vols. Edinburgh, 1910–1915.

**HATAM SOFER** SEE SOFER, MOSHEH

**HATĦAYOGA** is historically the most influential, and today the best known, of the several schools of yoga derived from the classical Yoga of Patañjali's *Yoga Sūtra*. *Haṭḥayoga* differs from classical Yoga, and from its sister schools, principally in the special emphasis that it gives to certain aspects of yoga doctrine and practices. Classical Yoga depends heavily on Sāṃkhya metaphysics and tries to strike a balance between physical exercises and meditation. *Haṭḥayoga* tends to prefer esoteric mysticism to systematic metaphysics and emphasizes physical exercises over meditation. It also pays particular attention to the acquisition of supernatural powers and the conquest of disease and death. The set of mystical, supraphysical concepts contained in *haṭḥayoga* texts make it one of the principal constituents and markers of the current of Hinduism known as Tantrism.

Many of the aspects of yoga that are especially associated with *haṭḥayoga* appear to be quite ancient. As early as the *R̥gveda* (10.136) is found a description of *munis* (ascetics) who possess the power of flying on the wind. Yogic practices and concepts such as those elaborated in *haṭḥayoga* texts already are mentioned prominently in the early Upaniṣads. The supraphysical "veins" (*nāḍīs*) of the human body, which become a central feature of the mystical anatomy of *haṭḥayoga*, appear in the *Chāndogya Upaniṣad* (8.6.6). In-

cluded among these is a central vein leading to the crown of the head. Breath control is referred to, somewhat elliptically, in the *Bṛhadāraṇyaka Upaniṣad* (1.5.23). The later *Śvetāśvatara Upaniṣad* (2.8–15) describes the practices of yoga, including breath control, in some detail and notes that “he who has attained a body made of the fire of yoga will not be subject to sickness, old age or death” (2.12).

Most of the elements of *hathayoga* appear in a more developed form in the descriptions of Tantric ascetics found in the *Mālatī-mādhava* of Bhavabhūti (c. 725) and in the *Harṣacarita* of Bāṇa Bhaṭṭa (c. 650). The majority of the extant texts of *hathayoga*, however, are associated with the somewhat later sect of the Kānpaṭa Yogis, sometimes called Nāths or Nāth Siddhas. In the South the so-called Tamil Siddhas of about the tenth to fifteenth century wrote poems grounded in the concepts and vocabulary of *hathayoga*. These same concepts and vocabulary also pervade the works of Tantric Buddhism and even infiltrate the yoga literature of the austere Jains. Because of the great religious and linguistic diversity of the literature, often coupled with an intentionally hermetic style, scholarly understanding of its overall structure and history remains incomplete.

The idea of a supraphysical subtle body with its own anatomy forms the conceptual heart of *hathayoga*. Although different texts describe this mystical anatomy somewhat differently, most mention seven *cakras*, or “centers,” located in the trunk and head, connected by a network of *nāḍīs*, or “veins.” Each of these *cakras* takes the form of a lotus and is associated with a particular *yantra*, or mystical diagram; *mantra*, or mystical invocation; and god or pair of gods.

The first *cakra*, called the *mūlādhāra*, or “root,” is a lotus of four petals located in the perineal area between the anus and the sexual organs. Its *yantra* is an inverted triangle with a *liṅga* of Śiva in its center together with the *mantra* “om” and the elephant-headed god Gaṇeṣa. Coiled around the *liṅga* is a sleeping snake called Kuṇḍalinī, who blocks the top of the *liṅga* with her mouth. This Kuṇḍalinī represents the energy (*śakti*) of Śiva. The yogin attempts to awaken her and make her ascend through the central *nāḍī*, called the *suṣūmnā*, passing through each of the remaining *cakras* until she reaches the highest, called the *sahasrāra* (“lotus of a thousand petals”) or *brahmarandhra* (“opening of *brahman*”), located on the top of the head. There Kuṇḍalinī unites with Śiva, an act that produces the supernatural powers and immortality that the yogin seeks. Ultimately this union is identical with the experience of enlightenment itself.

The various physical and meditative techniques employed by the adepts of *hathayoga* to achieve this experience involve the parallel immobilization of breath, semen, and mental activity. The term *haṭha*, in fact, means “forceful suppression.” Thus, *hathayoga* is that meditative technique that involves the forceful suppression of one’s senses and control of one’s bodily processes. These techniques are described in such texts as the *Hathayoga Pradīpikā* of Svātmārāma, the *Gheraṇḍa Saṃhitā*, the *Gorakṣa Śataka*, and the

*Siddhasiddhānta Paddhati*. One of the most important of these techniques is the *khecari* (“she who moves in the sky”). The yogin inserts his tongue in his throat, thus blocking both respiration and the descent of saliva. On the plane of the subtle body, it is said that this practice blocks the descent of the nectar of immortality produced by the moon located beneath the *sahasrāra cakra*. Normally this nectar falls into the fire of the sun located in the lower body. The practice of the *khecari* enables the yogin, according to the *Hathayoga Pradīpikā*, to “drink” this nectar and thus “live many years, free of disease and with a body as soft as the stem of a lotus.”

#### BIBLIOGRAPHY

One of the best scholarly discussions of *hathayoga* is Shashibhusan Dasgupta’s *Obscure Religious Cults*, 3d ed. (Calcutta, 1969), based principally on Bengali sources. Also excellent are Kamil V. Zvelebil’s work on the Tamil Siddhas, *The Poets of the Powers* (London, 1973), and Mircea Eliade’s classic on yoga in general, *Yoga: Immortality and Freedom*, 2d ed. (Princeton, N.J., 1969). The Sanskrit text that best describes the practices of *hathayoga* is Swami Svātmārāma’s *The Haṭha Yoga Pradīpikā* (New York, 1974), which includes an English translation of the text. The mystical anatomy of *hathayoga* is described in the *Ṣaṭcakraṇirūpana* and *Pādūkāpañcaka*, jointly translated by John George Woodroffe as *The Serpent Power*, 7th ed. (Madras, 1964).

*Revised Bibliography*

**HATHOR** was an ancient Egyptian mother-goddess figure whose cult center was at Dendera in Upper Egypt. Represented as partially or totally bovine, Hathor the Great was probably an assimilation of several goddesses with similar attributes.

In the Old Kingdom Pyramid Texts (c. 2475 BCE for the earliest copy) Hathor, whose name means “house of Horus,” personified the entire Heliopolitan ennead, or family of gods, which provided the principal genealogy of the Horus-king of Egypt. These nine gods began with Atum and proceeded through three more generations to Osiris and Isis, the parents of Horus. With Hathor personifying this whole group of gods, Horus became her son and the son of her spouse, Re, the sun god, who had come to the fore by the fifth dynasty.

Hathor also figured prominently in the royal imagery, particularly in the New Kingdom, when she was frequently depicted as the cow suckling a young pharaoh, and often had shrines or chapels dedicated to her. Her great temple at Dendera, erected in the Ptolemaic and Roman periods, is unique in several respects, including its many subterranean passages and the so-called zodiacal ceiling of its roof’s kiosk.

Another small cult temple of Hathor was founded by Ptolemy IV at Deir al-Madīnah, where many earlier tombs show the “lady of the west,” a cow coming from the Theban mountain known as the Qurn. Thus as early as the New Kingdom she was associated with the necropolis of that area. “Hathor of the sycamore” is a frequent epithet, and a temple is known as far away as Sinai. There are several references in literary and medico-magical texts to the assistance rendered at birth by the seven Hathors and also to the fates they ordain for the newborn. Hathor “the golden one” was known in love poetry as goddess of love and patroness of lovers.

The sistrum is a musical instrument commonly associated with the worship of Hathor, and her son Ihy was a musician deity. Priestesses of Hathor are known from all periods, although in the later periods there was a tendency to assimilate Hathor and Isis.

LEONARD H. LESKO (1987)

**HAWAIIAN RELIGION.** The traditional religion of the Hawaiians was based on that of their Polynesian ancestors, who as fishermen and horticulturalists became long distance navigators and explorers. These were the first to settle, perhaps between the first and the seventh centuries CE, the fertile and geographically isolated Hawaiian Islands. Although inhabitants of the islands from Hawai‘i to Kaua‘i had altered some of the ancestral beliefs and practices, the similarities between Hawaiian and other Polynesian religions impressed Captain James Cook, who in 1778 was the first European to visit the islands.

Believing that supernatural forces filled sea, sky, and earth, the Hawaiians personified them in countless named and individualized deities, who controlled nature and humankind through their *mana*, or supernatural power. The people retained cosmogonic gods from the homeland, such as Kāne, Kanaloa, Kū, Lono, and goddesses like Hina and Haumea, but they added aspects to these gods and included the deified dead, beings like the volcano goddess Pele, and temperamental local spirits in their pantheon of supernatural beings. This pantheon provided the inherited or acquired guardian gods, or *‘aumakua*, of each individual, family, occupation, and profession. A god communicated its will through dreams, images, something in nature such as a shark or thunder, or a human prophet.

**PRIESTHOODS AND WORSHIP PLACES.** The priests, or *kahuna*, who mediated between gods and people, were professional specialists trained in the material techniques and rit-

uals essential for success in their calling. Upon the arrival of Captain Cook, there had evolved two major and competing priestly orders to guide the ruling chief in temple worship. The priests of the order of Kanalu were dedicated to the god Kū (mo‘oKū), and their rituals were considered to be strict and demanding. The other priestly order of Paliku was dedicated to the god Lono. Their rituals were considered more flexible and relaxed. The principal god of each order was a national god upon whose favor the expansion and prosperity of the kingdom depended. Each order’s high priest, the *kahuna nui*, was considered to be its founder’s direct descendant and an expert in every branch of religion. The high priest wielded political power by advising the ruler on how to win divine support. Failure was attributed to errors in worship, to counter-magic, or to hidden infractions of *kapu* (taboo). A system of religiously sanctioned permanent and temporary *kapu* controlled every phase of society and everyone’s life regardless of rank. The system began, tradition states, when Wākea got away from his wife Papa—giving Wākea the opportunity to seduce their daughter—by having a *kahuna* declare that the gods had made *kapu* two nights, during which husband and wife were required to separate.

Public worship took place at *heiau*, or open-air religious centers. The form, size, equipment, and location of a *heiau* depended on a chief’s power to command labor and on the *kahuna*-architect’s traditionalism or creativity. A simple un-walled rectangular *heiau* had an altar, images, and a raised platform. A complex type excluded the populace with stone or palisaded walls that enclosed several terraces, an altar, consecrated images, refuse pits, burial grounds, an oracle tower covered by a *kapa* or bark cloth (an architectural feature unique to these islands, as Captain Cook observed), and houses for a drum, other sacred objects, an earth oven, and—during *kapu* periods—for the ruler and important priests. Outside the walls was a structure called the “house of Papa,” where the highest-ranking female chiefs, who were themselves considered to be earthly goddesses, worshiped the prolific and ever-reborn Haumea (often identified with or as Papa) and the water-spirit form of a deified female chief from Maui (who was called Kihawahine), as well as other divine beings.

The walled, exclusive type of *heiau* was introduced, tradition states, by the high priest Pā‘ao, probably a Tahitian who arrived in about the twelfth century. Pā‘ao also introduced the practice of human sacrifice, a strict priestly order and ritual for Kū, and his personal god Kā‘li, who as Kū-kā‘ili-moku (“Kū the island-snatcher”) became Kamehameha I the Great’s (1758?–1819) inherited *‘aumakua* and war god. Pā‘ao widened the existing gap between chiefs and commoners by introducing new sacred royal symbols, such as the red-feather girdle, taboo standards (tapa-covered balls on sticks that were carried before chiefs as insignia of taboo), and compulsory prostration (*kapu moe*) before those male and female chiefs who were believed to be directly descended from the gods.

Only a paramount chief could build the most sacred type of *heiau*, where burned human sacrifices were offered to the highest Kū gods. This functional type of *heiau*, called a *luakini* (“many refuse pits”) or *po’okanaka* (“men’s heads”), was used at times to pray for royal health and national prosperity; but essentially it was a war temple (if a subordinate chief built one, it was a sign of rebellion). The general term *waihau* referred to “comfortable” *heiau* where less complex rituals, without human sacrifice, were conducted. Most *heiau* had economic functions relating to farming, fishing, healing, rain, tapa-making (which was women’s work), and so on. A chief had a religious duty to build these *heiau* in which to pray for divine aid for his chiefdom or to give thanks. Each deity had specific requirements as to size, number, and color of offerings. Dissatisfied gods sent drought and disease, and commoners would then abandon the chief to seek one who was more religious. But if all went well, people built smaller *heiau* on their allotted land to further enliven the earth.

**MAJOR DEITIES AND ASSOCIATED RITES.** Dominating the pantheon for chief and commoner alike were Kanaloa, Kāne, Lono, and Kū. Each, in particular but overlapping ways, fostered health, abundance, rain, and fertility. Only Kū had a destructive side. To each name, except that of Kanaloa, Hawaiians attached dozens of descriptive phrases to signify the god’s varied aspects or his subordinate gods.

**Kanaloa.** Called Tangaroa or one of many other cognate names (e.g., Tangaloa, Ta’aroa) elsewhere in Polynesia, Kanaloa was Kāne’s younger brother. For Hawaiians he was the god of squid and, because of a play on words, also sometimes associated with healing (the Hawaiian word *he’e* means both “squid” and “to put to flight”). Kanaloa rarely had his own shrine or *heiau*, but in prayers he was often named along with Kāne, Lono, and Kū, and like them he was assigned a period in the lunar month during which he was due special homage. His precise role and function in Hawai’i is obscure, partly due to some synchronistic writings of scholarly nineteenth-century Hawaiian Christian converts.

**Kāne.** Called Tane in southeastern Polynesia, Kāne, whose name connotes “male,” was the most approachable, forgiving, and revered of the four major gods. One worshiper in his prayer would chant, “You and I warm to each other, Kāne,” and other worshipers would often say, “Life is sacred to Kāne.” According to more than one myth, Kāne, while dwelling on earth with Kanaloa, had plunged his digging stick into the ground to release springs of fresh water to mix with his and Kanaloa’s *awa* or *kava* (a narcotic drink made from the pounded root of the shrub *Piper methysticum*). The release of fresh water by Kāne-of-the-water-of-life, as he was frequently called, was a symbolic sexual act, for the gesture served to fructify the earth. Before ritually consuming their offering of pork and *awa*, men prayed for forgiveness of broken taboos or for revenge for sorcery at their family’s phallic “stone of Kāne,” a single, high, conical stone situated near a stream. Sweet potato farmers prayed to their Kāne *au-*

*makua*-of-the-rain-filled-clouds; grateful fishermen left fish for Kāne and sometimes for Kanaloa at a shrine, which was usually only a rock or a pile of rocks. And after prescribed rituals that took place during an earth-shaking storm, the dead of a ruling family of the island of Maui, who considered themselves descendants of Kāne-hekili (“Kāne-thunder”), were transfigured by their ancestors and *aumakua* into thunder and lightning.

Early in the twentieth century, Robert Luahiwa, an elderly Hawaiian from the island of Kaua’i, described a ceremony that called on Kāne to bring rain and life to the land, and Luahiwa recited the prayers used by the high priest. The congregation sat silent and motionless on a *heiau* terrace until Kāne’s high priest (on a higher terrace) had, after five long prayers, lifted the taboo. The priest had invoked some seventy forms of Kāne—in clouds, rain, and forest growth—as well as the other three great gods and the goddesses of hula and of the forest greenery that decorated the *heiau* (Laka, Hi’iaka, the latter’s sister Kapo, and their oldest sister Pele, who became violent if ignored). The priest’s last prayer, heard only by the chief at his side, was delivered on the third, highest, and most sacred stage of the oracle tower, where the god revealed his will. Earlier nineteenth-century Hawaiian scholars reported that the commoners were gathered outside of the central temple, where they could only hear the prayers of the *kahuna*. The congregation would be seated in single-file rows and during certain prayers, which were voiced in unison, they would raise their right hands, remaining in that position until the prayer was completed. These scholars emphasized that the carved images of the *luakinilheiau* were never worshiped, for the images were considered to be only representations of the god.

**Lono.** The god of two related sources of abundance—peace and seasonal winter storms—Lono (called Rongo or Ro’o in southeastern Polynesia) was also a god of healing. He had numerous *heiau*, called “houses of Lono,” devoted to rainmaking and medical purposes. There was a chief with the same name, Lono, who established the Makahiki, the longest ceremonial period, which involved everyone in celebrating Lono’s annual (*makahiki*) return for four months of the rainy season to preside over rituals for health and ample rain, and over the ritualized collection of taxes, recreation, and release from work. The celebration became a focal point for the order and rituals of the priest dedicated to the god Lono, resulting in a merging or confusion of Lono the god and Lono the chief. When Captain Cook arrived in 1778, he was greeted as Lono-i-ka-makahiki the god/chief because he arrived during this period and anchored at the bay called Kealakekua (“the path of the god,” i.e., Lono), and because his masted sails resembled the Lono symbol that led the procession of tax collectors and celebratory sports on their coastal circuit of the island.

The reexamination of both native and nonnative primary sources has been reopened by anthropologists Marshall Sahlins and Gananath Obeyesekere to focus upon how Ha-

waiians interpreted Cook's presence and divinity. Although the rhetoric of their arguments developed into a larger issue about research and indigenous peoples, this reexamination has nonetheless brought intriguing and valuable analyses and insights not considered before about the first cultural encounter between the foreigners and natives.

The Lono symbol was a long staff topped with a carved human image across whose neck a crosspiece supported a rectangular white tapa flag and other sacred objects. A shorter staff led a procession in the opposite direction. The principal procession stopped at each district boundary to collect taxes placed near an altar that held another Lono symbol, a carved wooden head of a pig, representing fertility. If the collectors were satisfied with the proffered amount of pigs, dogs, vegetables, *'awa*, and the like, the Lono priest blessed the district, and the party moved on. At the ruler's compound the party was given a feast. Rites included the ruler putting a valuable whale-tooth necklace on the Lono figure, and the ruler's wife draping it with fine white tapa. Later the ruler redistributed the taxes to his subordinate chiefs who supported him in battle and who held land as a reward for their service.

While the ruler, the Lono priests, and their attendants were busy with numerous rituals for the general welfare, the populace engaged in hula, sports, and games, each activity having its guardian gods. Wrestling and boxing matches recalled that when Lono the chief learned, after killing his human wife, that she had not been unfaithful, he became for a time insane and fought violent matches. Finally he left the islands in his canoe, promising to return. To signal that the Makahiki was over and that people should return to work and chiefs could go to war again, the priests dismantled the Lono staffs and set adrift a canoe full of gifts to ensure Lono's return the next year. The ritual functions were then turned over to the priests of the order of Kū, now personified in the local ruling chief, rather than the departed god/chief.

Each morning and evening the head of a family took down the net-covered "gourd of Lono" encircling the neck of the image on the altar in the men's eating house. He prayed for his family, the commoners, and the chiefs, and he ritually ate from the gourd, the bowl of which represented the earth and its bounty; the cover, the heavens; and the handle, the rainbow. To lift the taboo on eating a new crop, he or a *kahuna* performed first-fruits rites, then put the gourd of Lono in the midst of the male guests invited to feast. He invited them again when, after weaning, his son entered the men's house, never again to eat with women. Placing a roasted pig's head on the altar and a pig's ear in the gourd of Lono (so Lono would listen), the *kahuna* prayed that the boy would thrive and bear fruit like the gourd vine. Later the boy would be subincised and ceremonially initiated into eating pork, which was men's food and taboo to women.

**Kū and Hina.** There were many gods in the class called Kū (Tu was the southern Polynesian cognate of the name). Hawaiians regarded the Kū gods either as independent gods or as aspects of a single Kū. Usually, an epithet attached to

the name suggested the special function or distinctive trait of each particular Kū god. The same principle applies to the class of goddesses called Hina (cognates of the name elsewhere in Polynesia are Hine, Sina, and 'Ina). Some Hinas had more than one name. Hina-of-the-moon is also known as Maimed Lono because, according to myth, her husband tore off her leg as she fled to the moon. Pele's sacred name is Hina-of-the-fire, and Lea's other name is Hina-of-the-*'ohi'a*-growth. (The *'ohi'a* is a kind of tree.)

Kū and Hina, as well as their varied aspects, functioned as man and wife in daily rites performed by the populace. With his sister-wife Hina (whose name means "prostrate"), Kū (meaning "upright") united the people into a single stock, for Kū and Hina represented the male and female reproductive principles. Kū also symbolized the east, the sunrise, and the right hand; while Hina symbolized the west, the sunset, and the left hand. Such antithesis was common. The couple was invoked in pregnancy and child care; their subordinate gods or aspects presided over many activities on land and sea. Kū'ula-kai (red Kū of the sea) was the fishermen's chief god, and fishing *heiau* were named *kū'ula* for him. His wife was Hina-the-sea-fossicker. Their siblings lived on upland farms and in forests. The chief forest god was Kū-moku-hālī'i (Kū the island spreader), the husband of Lea, who warned woodsmen of decayed trees by taking the form of an *'elepaio* (a flycatcher) and pecking at trees to look for insects. Kū-moku-hālī'i was also the chief god of canoe makers, whose *kahuna* conducted rites at the foot of a chosen tree, usually a koa (*Acacia koa*). Farmers venerated Kū-of-the-digging-stick. Each occupation had numerous Kū gods.

The highest form of Kū gods was invoked during national crises—war, famine, disease—after the king had first built or rebuilt a *luakini* where harsh and complex rituals called upon the Kū gods for aid. Kū-nui-ākea ("the supreme Kū") manifested himself in the ceremonies as the Kū gods of war, sorcery, and the binding of conquered chiefdoms into a kingdom. A ten-day, four-part *luakini* service required numerous men and pigs as sacrifices, and additional pigs to feed the highborn worshipers and priests. If *kapu*-breakers, war captives, or slaves were unavailable to be used as burned sacrifices, large *ulua* fish (*Carangidae*) were substituted.

The first set of rites, held in the presence of chiefs and workmen in the refurbished *luakini*, centered on a stylized parade led by a *kahuna* with a *kapu*-standard (followed by a naked man who impersonated the god Kahoali'i) and by feather-covered wicker images of gods (a Hawaiian innovation) carried by their keepers. The workers then went home. The second set of rites took the king, the "feather gods" (as the wicker images were called), and the *kahuna* to a forest, where they ritually cut *'ohi'a* trees for new images. A *kapu*-breaker was sacrificed in rites that accompanied the cutting of the first tree, and from this tree came a block of wood that would represent Kū on the altar. Marching back to the *heiau* with their logs, the members of the procession shouted loud-

ly and seized human victims along their route. After the images had been carved, dressed in red *malo* (loincloths), and consecrated, the *kahuna*, in the ceremony's third phase, chanted all night long while worshipers listened. In the fourth part of the rite, a *kahuna* prayed for an hour while the motionless worshipers, arranged in rows behind the images, sat with bowed heads and sometimes with upraised arms. The concluding rites were held in the "house of Papa," where a *kahuna* and the highest female chiefs freed the worshipers from taboo before they returned to secular life.

**GENDER TABOOS, ILLNESS, AND DEATH.** Women were considered to be polluted from menstruation, and thus were excluded from all men's *heiau* and shrines. Although history includes three female chiefs of the highest rank and status, they were exceptions. One was Keakea-lani-wahine, who, upon succeeding her mother as ruler of Hawai'i, had charge of all its *heiau* and in each *luakini* made human and pig sacrifices and other offerings. Nevertheless, she took her ritual meals apart from the men and ate no pork, bananas, coconuts, or other foods taboo to women. Food-related *kapu* were associated with the separation of Wākea and Papa and required all men and women to take meals separately and to eat food proper to their sex. All cooking was performed by men, who used separate ovens for men's and women's food. *Kapu*-breakers were slain or mutilated. (Persons threatened with death for any reason were spared, however, if they reached certain *heiau* or sites designated as places of refuge.)

Medical *kahuna* were specialists in treating particular diseases through different forms of diagnosis. They believed that an illness that proved resistant to ordinary treatment, such as by herbs, was due to an *'aumakua's* anger at broken *kapu* and therefore required prayers and offerings. Most *kahuna*, however, specialized in problems related to infertility and pregnancy and in the treatment of children's diseases.

In death a person's soul was prevented from falling into Milu (the underworld), a realm of eternal darkness, by its *'aumakua*, who ushered it to its ancestors' part of a happy realm in Pō (darkness or night). A soul without an *'aumakua* wandered homeless on earth, ate spiders and moths, and became a malevolent ghost. A soul with an ancestral god from the Pele family might be transfigured into a volcanic flame if a priest, having prayed and made offerings, cast the corpse or part of it into the crater. Other souls might be transfigured into embodiments (*kinolau*) of their gods—a shark, thunder, a water spirit, a bird, or something else. Transfigured male and female chiefs became their descendants' gods. The deification and transfiguration of ancestors is a primary example of the power of the nonpriest-based religious system that coexisted with the state or national religion that was headed by the ruling chief and the priestly orders. The nonpriest system was also manifested in family prayers, rituals involving the *pohaku o Kāne* (stone of Kāne), rituals and prayers for farming and fishing, and other religious expressions that did not require a specialized and trained *kahuna*.

Dead commoners were buried wherever it was convenient. The cleaned bones of some royalty were hidden in caves to prevent enemies from using them for fishhooks; the bones of other royalty were encased in plaited sennit caskets (*ka'ai*) of humanoid shape and deposited in the mausoleum Hale-o-Keawe on the island of Hawai'i. Sorcery was always suspected when a highborn person died. A *kahuna* trained to identify sorcerers held a *kuni* ("burn") ceremony in which he burned part of the victim's corpse. When the *kahuna's* god had revealed the sorcerer's name, the accused—even if a chief—was killed and burned.

**THE STATE RELIGION AND ITS DEMISE.** At his death in 1819, Kamehameha I, who believed his many gods had made him head of a unified feudal kingdom, left a state religion based on the *kapu* system that protected the *mana* and authority of the gods and their chiefly descendants from spiritual contamination and consequent weakness. That same year, however, Kamehameha's son Liholiho (1797–1824) took power, adopted the title Kamehameha II, and abolished both the *kapu* system of restrictions and rank and the official religion without replacing it with another. This decision, which was only reluctantly accepted by Liholiho, had principally been made by the most politically powerful of his father's wives, by his mother who was herself a sacred chief, and by the highest priest of the Kū order. Liholiho signaled the overthrow of the *kapu* system by publicly sharing a meal (consisting of food cooked in one oven) with his father's wife and his mother. Later, the Kū priests, after consulting with Liholiho, began destroying *heiau* and images. Some adherents of the traditions hid their images and worshiped in secret. Not all customs and beliefs vanished: even today, faith in the *'aumakua*, for example, lingers on. The only military resistance to the abolition of the religion came from Liholiho's cousin, who had inherited the god Kū-kā'ili-moku, but the resistance ended when the cousin lost his life in battle.

The reasons, still debated, for the overthrow of the religion have ranged from weariness of the burden of *kapu* on chiefs and commoners and on men and women, and, of course, the changes that had been wrought by Europeans and Americans. Particularly instrumental had been the introduction of a market economy, which was hampered by the chiefs' religious, social, and economic obligations to their people—a system of obligations that was based on the ancient and successful subsistence economy. Arguments have also been made that the practitioners themselves became disenchanted with the religious system when the death of Kamehameha I could not be prevented. A few months after Liholiho's act, the first band of American Protestant missionaries arrived from Boston; they were unaware of Liholiho's abolition of the traditional *kapu* system and religion until their ship was off Hawai'i's shore.

#### BIBLIOGRAPHY

Many of the volumes listed below are classics. Although David Malo, Samuel Kamakau, John Papa 'Ōi, and Kepelino be-

came Christian converts whose adopted religion sometimes colors their views of the indigenous culture, they were personally familiar with the tradition, and they also learned a great deal from their elders. 'Ōi, for example, as a boy had been an attendant of Liholiho (later Kamehameha II) and as an adult he held important positions in the government of the kingdom. Malo was born during the transitional period after arrival of Captain Cook and before the death of Kamehameha I. He was trained primarily as a genealogist or historian. Kamakau traveled extensively throughout the islands, interviewing elders and eyewitnesses of various events. The translators and editors of these works have added important explanatory notes. Martha Warren Beckwith's translation and chapters of annotation of the *Kumulipo*, the creation and genealogical chant of King Kalakaua and his sister Queen Lili'uokalani, help make the magnificent but cryptic chant comprehensible. It presents different interpretations by modern Hawaiians and discusses the importance nobility placed on descent. Beckwith's *Hawaiian Mythology* is irreplaceable as a comprehensive reference to the pantheon, and for many years it established the prevailing overview of Hawaiian religion, with its descriptions of demigods, romantic characters, and others. This work has the additional value of containing comparisons with other Pacific traditions, putting the material into cross-cultural perspective. Abraham Fornander, a nineteenth-century judge who married a Hawaiian chief, gathered an unparalleled collection of myths, traditions, tales, poems, prayers, and descriptions of religion; Thomas G. Thrum's notes shed light on obscure references. E. S. Craighill Handy's *Polynesian Religion* brilliantly discusses the interrelationships of indigenous Polynesian religions, including the Hawaiian, and illustrates the major concepts they share.

June Gutmanis published a major collection of ancient Hawaiian prayers selected from previously published and unpublished sources. Hawaiian texts are accompanied by English translations (and retractions) and by commentaries. Mary Kawena Pukui's book is written for social workers and other "members of the helping professions." Pukui, a Hawaiian, draws on her other published writings, her personal experiences, and her wide reading; with the psychiatrist E. W. Haertig, she discusses Hawaiian customs, beliefs, and rites as they relate to interpersonal relationships and the life cycle. The book includes modern case histories. The structural analysis of Marshall Sahlins and Valerio Valeri of Cook's arrival, the Makahiki celebrations, and temple worship provide provocative interpretations from primary source materials and suggest a reevaluation of the how Hawaiian religion functioned.

KATHARINE LUOMALA (1987)  
MALCOLM NĀEA CHUN (2005)

**HAWKS** SEE EAGLES AND HAWKS

**ḤAWṬĀḤ** SEE ḤARAM AND ḤAWṬĀḤ

**HAWZAH**, which comes from *hawz*, is an Arabic word that literally means "the place surrounded by a swelling border." Technically it is applied to the traditional religious institution in the Shī'ī world known as Hawzah-e Ilmiyyah (Islamic seminary). The hawzah seeks to attain two major missions: (1) training the clerics to preach the principles and practices of Islam, particularly that of the Shī'ah; and (2) training the experts in religious sciences, ones who can deduce Islamic rules from the related sources. In the early twenty-first century this Shī'ī institution works in the countries where the Shī'ah population is considerable, such as Iran, Iraq, Pakistan, India, and Lebanon. Throughout history Najaf, Hillah, Karbala, and Samirra in Iraq and Isfahan, Qom, Shiraz, and Mashhad in Iran have alternately assumed the central leadership role of the Shī'ī hawzah.

It is said that the establishment of the first hawzah goes historically back to the year 1054, when Muḥammad ibn

Ḥasan Ṭusī, known as Shaykh-e Ṭusī, settled in Najaf, a holy city of Iraq. Shaykh-e Ṭusī began training students in various branches of Islamic studies, such as jurisprudence (*fiqh*), theology (*kalām*), tradition (*ḥadīth*), and the interpretation of the Qurʾān (*tafsīr*). Accordingly the Iraqi cities Hillah, Karbala, and Samarra held a considerable position in the history of the hawzah after Najaf. During two periods (1202–1542 and 1737–1797) the hawzahs of Hillah and Karbala replaced Najaf in the premier position. Before the Islamic revolution in Iran (1979), Najaf was the most important center of religious sciences in the world for the Shīʿah. Nonetheless the Baʿth government attempted to weaken the authority of the hawzah and the marjīʿiyyat (supreme religious authority) in Najaf. Many senior clerics were arrested, killed or exiled. During that period the number of religious students in Najaf fell from ten thousand to two thousand. At that point the central leadership of the Shīʿah was transferred from Najaf to Qom. After Ṣaddām Ḥusayn's fall from power, many Iraqi clerics hoped Najaf would regain its former status.

**HAWZAH IN IRAN.** Iran has also had an extensive history regarding the Shīʿī hawzah. At the time of the Al-e Buyah dynasty (930–1054) a considerable number of *madrasahs* (religious schools) were built in Qom and Ray—the two ancient cities located near Tehran—and eminent scholars, such as Shaykh-e Saduq and his father, were there at that time. The history of the hawzah in Iran as an official institution goes back to the Safavid era (1502–1736). Isfahan, the capital of the Safavid Empire, was the most glorious center for Islamic sciences and arts in the world. Prominent scholars, such as Mullah Sadra Shirazi, ʿAllamah Majlisi, and Muhaqqiq Karaki, had significant chairs in philosophy, tradition (*ḥadīth*), and jurisprudence (*fiqh*).

Similarly the hawzah of Qom regained its previous position after a long time of stagnation. Madrasah-e Fayziyyah, the ancient and famous religious school of Qom, was established in 1524 by the order of Shah Tahmasb I. After the Safavid era the hawzah of Qom was inactive, except for a short period (1200–1231) during the time of Mirza Abul Qasim Qomi, until the twentieth century, when Grand Āyatullāh ʿAbd al-Karim Haʿiri settled in Qom in 1920 and reestablished the hawzah in Qom.

**EDUCATIONAL SCHEDULE IN HAWZAH.** The major educational schedule in the hawzah is comprised of three stages: (1) the preliminary stage (*muqaddamat*), which contains some courses in Arabic literature and logic and lasts two to three years; (2) the intermediate stage (*sutuh*), which requires learning from textbooks in *fiqh* (jurisprudence), *uṣūl* (the basic principles of jurisprudence), and philosophy and lasts four to six years; and (3) the higher stage (*dars-e kharij*), which is devoted to *fiqh* and *uṣūl*. Unlike the first and second stages, education at the third level is not restricted to textbooks. Rather, instructors give analytical lectures presenting significant views on the subject matter and evaluating those positions. This stage is intended to increase the intellectual

power of the students. One who wants to attain the qualification of *ijtihād* (expertise in *fiqh*), should pass this course, which lasts from seven to ten years depending on the amount of effort displayed by the student. One who successfully completes this stage is then called a *mujtahid* (expert in *fiqh*).

A brief look at the educational schedule of the hawzah shows that *fiqh* and *uṣūl* have been the main courses since the Safavid era. Thus the other branches of Islamic studies have not developed in Shiism. It should be noted that ʿAllamah Sayyid Muḥammad Ḥusayn Tabatabaʿi (d. 1982) revived Islamic philosophy and Qurʾanic interpretation (*tafsīr*) in Qom, and twenty-first-century students continue to study his way. After the Iranian revolution, some institutions established departments of psychology, sociology, economics, and politics in the hawzahs of Qom believing they can teach an Islamic approach to these sciences.

**HIERARCHICAL ORDER IN HAWZAH.** There are three major ranks in the hawzah: (1) *talabah* (religious student), (2) *mujtahid* (an expert in *fiqh*), and (3) *marjaʿ* (supreme religious leader). *Talabah* (the one who seeks to learn knowledge) is the name for a student of a hawzah and means the one who seeks to learn Islamic sciences. *Mujtahid* refers to the one who can derive and deduce the laws and decrees from the authentic sources of Islam, namely the Qurʾān, the *ḥadīths*, reasoning (intellect), and the consensus of ʿ*ulamāʿ* (religious scholars). Those who complete the higher education may reach this rank. A cleric before *ijtihād* is usually called *hujjatul-Islām* (the proof of Islam) and after *ijtihād* is called Āyatullāh (the sign of God).

*Marjaʿ* refers to the person who has attained the high level of piety and justice in addition to *ijtihād* and can attract a number of followers among laypeople. According to Shīʿī jurisprudence, everyone reaching adolescence should start following a fully qualified *marjaʿ*. A *marjaʿ* is normally called by the title *Āyatullāh al-uzma* (the biggest sign of God).

*Marjaʿiyyat* is the office of supreme religious authority in Shiism, and *marajīʿ* are in charge of the hawzahs, supporting the students both spiritually and financially. Shīʿah people pay them their religious tax, known as *khums* (one fifth of the annual income), and they manage the hawzahs financially with it. Traditionally, due to this direct contribution from the people, the Shīʿī hawzahs have rejected government financial help in order to keep their independence. Thus the history of the hawzah shows that Shīʿī scholars could freely declare their ideas against the governments in their countries. But after the Islamic revolution of Iran, with the direct involvement of clerics in ruling the state and in executive affairs and with the financial support of the government, the hawzah of Iran has somewhat lost its independence. There is a good chance that the hawzah of Najaf, in the post-Ṣaddām regime, will revive its independent hawzah of the Shīʿah, especially as the Najaf school does not interpret *Vilāyat-e Faqih* (the guardianship of the religious jurist) as the direct intervention of religion in politics.

Qom, with many prominent scholars in various branches of religious sciences and nearly forty thousand students, holds a unique position among Shī'ī hawzahs because only two thousand students are studying in Najaf in the early twenty-first century. Nevertheless, as a consequence of Ṣaddām's fall from power, Najaf has a valuable opportunity to regain its former glory.

MUHAMMAD KAZEM SHAKER (2005)

**HAYASHI RAZAN** (1583–1657), also commonly referred to as Hayashi Dōshun; Japanese Confucian thinker of the early Tokugawa period. Hayashi Razan was born and raised in Kyoto as the scion of a family of samurai turned urban merchants. He was sent as a child to study at Kenninji, a Zen temple, but he resisted suggestions that he become a priest. Instead, from his mid-teens he committed himself to the study of Confucianism and Chinese secular learning. He began his career as a Confucian in 1603 at the age of twenty-one by conducting public lectures on the *Analects* of Confucius as explicated by the Chinese Song Neo-Confucian philosopher Zhu Xi. In this manner Razan sought to establish Zhu Xi Neo-Confucianism as a public teaching independent of both the hermetic traditions of medieval scholarship and the Zen-accented Confucianism that flourished in the major Zen temples of the Muromachi period. Toward the same end, affiliating himself with Fujiwara Seika, Razan adopted the latter's hallmark of a scholar's garb patterned after that of the scholar-official class of China.

However, Razan's career as an independent scholar was relatively short. In 1605 he came to the attention of Tokugawa Ieyasu, founder of the Tokugawa shogunate, and in 1607 he entered the service of the shogun. Earlier military rulers had employed monks to draft legislation and handle other government matters requiring erudition and writing skills beyond the ordinary. In accordance with that tradition, one of the conditions for Razan's employment was that he shave his head and assume priestly garb and the priestlike name of Dōshun. These conditions remained in effect for the duration of his employment, which continued until his death fifty years later.

Razan's employment by the shogunate is often taken as a symbol of Ieyasu's intent to establish Zhu Xi Neo-

Confucianism as the official ideology. But as the conditions of his employment suggest, Razan was taken into service because of his general erudition rather than because of any particular expertise in Neo-Confucianism, and his official duties had little to do with the spread of Confucian teachings. Together with the Buddhist priests in shogunal employ, he oversaw the shogunal library, drafted diplomatic correspondence between the Tokugawa and the rulers of other countries, and participated in the drafting of laws and the compilation of the genealogical records of shogunal vassals. He also embarked on the writing of a major history of Japan, eventually completed after his death by his son Gahō, who inherited Razan's position with the shogunate.

Of more relevance to his background as a Confucian scholar, Razan established a private school and shrine to Confucius that eventually received shogunal support, although not on the scale of shogunal patronage of various Buddhist institutions. He wrote works elucidating various points of Zhu Xi's teachings and polemics against Christianity and Buddhism, which, in the Confucian vein, he attacked as socially disruptive and therefore immoral religions, alike in their practiced deception of a credulous, ignorant populace. At the same time, arguing that the Confucian way of government and Shintō were the same in essence, he asserted that to establish Confucianism in Tokugawa life was to restore Shintō to its true place in Japanese society.

However, by and large Razan was more noted for his wide-ranging knowledge than for the originality or compelling nature of his interpretation of Confucianism. He did not found a distinctive school comparable to that of Yamazaki Ansai or the later Ogyū Sorai. In the area of Shintō studies, his influence was also relatively slight. Perhaps out of rivalry with the Buddhist monks associated with the shogunate, who had succeeded in gaining the latter's support for their own more traditional fusion of Buddhism and Shintō (this support was reflected most graphically in the shogunate's sponsoring of the posthumous apotheosis of Tokugawa Ieyasu as a Buddhist-Shintō deity), Razan sought to establish his particular fusion of Confucianism and Shintō as the special hermetic tradition of his house. But his successors did not continue his efforts.

Thus Razan's main contribution to the establishment of Confucianism in Tokugawa life lay in his carving out a position for the professional scholar as a government adviser. At the same time, however, he was condemned by many other Tokugawa Confucians for his readiness to compromise his principles in the process of winning a place for himself. Both Yamazaki Ansai and Nakae Tōju began their careers as Confucians by denouncing Razan's acceptance of treatment as a priest despite his recognition of the evils of Buddhism. Others objected to the precedent he established for the treatment of the Confucian as a professional scholar differentiated from and subordinate to those responsible for the actual business of government. In the eyes of many Tokugawa Confucians, the career pattern for the Confucian scholar pioneered by

Razan contravened the traditional ideal of the Confucian playing a central role in society and thereby bringing his education and moral rectitude to bear on the transformation of society.

Although it is not widely available, W. J. Boot's *The Adoption and Adaptation of Neo-Confucianism in Japan: The Role of Fujiwara Seika and Hayashi Razan* (Leiden, 1983, 1992) offers both a cogent analysis of Razan's thought and translations of important passages from his writings. In Japanese, Hori Isao's *Hayashi Razan* (Tokyo, 1964) remains the standard.

KATE WILDMAN NAKAI (1987 AND 2005)

**HAYDON, A. EUSTACE** (1880–1975), was a Canadian historian of religions and a founder of the modern humanist movement in North America. Born in Brampton, Ontario, Albert Eustace Haydon attended McMaster University, where he received his B. A., Th.B., B.D., and M.A. degrees; the University of Saskatchewan, where he received another master's degree; and the University of Chicago, where he received his Ph.D. After serving as a Baptist pastor in Canada (1903–1913), a YMCA general secretary (1913–1916), and a Unitarian minister (1918–1924), Haydon joined the faculty of the University of Chicago in 1919; he became chairman of the department of comparative religion there in 1921 and a full professor in 1929, and he stayed at Chicago until his retirement in 1945.

Haydon was critical of theories of religion that understood it to be grounded in “religious consciousness” or in a response to a trans-human religious object or power, and of prior appropriations of the comparative method in the study of religion, which he saw to be apologetic in character; he in turn articulated a theory of religion that was influenced by the social sciences. Rejecting efforts to discover a unilinear evolutionary theory of religion as misdirected quests for origins, he considered religion to be basically social in character. In a manner consistent with his functionalist approach to religion, Haydon saw the religious sensibility as characterized by a shared social quest for the good (that is, the completely satisfying) life. The study of the history of religions became for him the continuing effort to describe the various manifestations of the persistent human quest to realize idealized values of the good life in diverse cultural contexts.

There were, he suggested, three components of religion: a socially envisioned set of ideal values, a program for the realization of these values, and a worldview in which the quest for these values is related to the natural and human environments. In his scholarly publications, Haydon implemented his understanding of the task of the historian of religions by describing the ways in which this human quest has been manifested in the particular religions that appear, in concrete

forms, in diverse and endlessly varied cultural and conditioning environments. He understood humanism to have an essentially religious dimension. Haydon was one of the authors of both the Humanist Manifesto of 1933 and of the revised Humanist Manifesto of 1973.

#### BIBLIOGRAPHY

##### Works by Haydon

“From Comparative Religion to History of Religions.” *Journal of Religion* 2 (November 1922): 577–587. An important essay that marks a transition from a focal emphasis on the comparative method in the study of religions to history of religions.

“Twenty-five Years of History of Religions.” *Journal of Religion* 6 (January 1926): 17–40. A discerning, comprehensive article that notes the major scholarly developments in the field.

*The Quest of the Ages*. New York and London, 1929. An artful statement of Haydon's approach to religion, which he understood as the social and shared quest for idealized human values. The author's broad knowledge of the major religious traditions and his appreciation of all forms of religion are evident.

*Man's Search for the Good Life: An Inquiry into the Nature of Religion*. New York, 1939. A further statement of Haydon's functional approach to religion as providing a synthesis of socially sanctioned values.

*Biography of the Gods*. New York, 1941. A facilely written account of the rise of the “gods” of the major religions, which are born (in Haydon's view) out of human need as projections of sought-for values and are modified correlatively with changing psychological, sociological, and cultural conditions.

##### Work Edited by Haydon

*Modern Trends in World Religions*. Chicago, 1934. A symposium of four series of lectures by sixteen scholars, each discussing aspects of the then-current situation in one of six major religions: Islam, Judaism, Christianity, Buddhism, Confucianism, and Hinduism. These were originally presented as the Haskell Lectures in Comparative Religion.

#### HEAD

*This entry consists of the following articles:*

SYMBOLISM AND RITUAL USE  
THE CELTIC HEAD CULT

#### HEAD: SYMBOLISM AND RITUAL USE

The symbolic and religious value of the head is attested by various myths that stress the theme of many-headedness

(thus calling attention to assorted aspects of divine power) as well as by numerous rituals, dating to prehistoric times, in which the human head is hunted, offered as a sacrifice, preserved, and venerated. Whatever exact meaning these myths and rites ascribe to the head, they all rest on a common, and certainly very ancient, valorization that must not be overintellectualized. In the most archaic psychology the forces of courage as well as the impulses of anger and violence have their base in the head. The Greeks of the Homeric age considered it the location of a *psuchē* difficult to control and opposed to reason and judgment, which were located in the chest and heart. In agreement with Alcmaeon of Croton, the Pythagoreans localized sperm in the head. From that localization of life force came the belief that the vital and spiritual element of a victim could be assimilated by eating his brain.

As a source of power, the skull naturally became an object of worship: its magical value came from the fact that it was supposed to be the center of life. Among the Celts, for example, the head was the container of a sacred force, whereas in other ancient and traditional cultures, the head is conceived of as the seat of vital energy, the active principle of the whole individual. From such beliefs come headhunting rituals, the offering of skulls in sacrifice, and veneration for ancestors' skulls, as well as the apotropaic talismanic value attributed to the head.

**MULTIPLE HEADS.** Indo-European mythologies represented the diverse fields of application of the divine power by endowing the gods with three heads. Hinduism recognizes the *trimūrti*, a figure with three faces on the same head, representing Brahmā, Viṣṇu, and Śiva; in other words, the creating, preserving, and destroying power of the divine One.

Śiva is often shown with three or five faces and many arms, a sign of his omnipotence. Agni (Fire), accomplishing the will of Indra in the world, is endowed with three heads. Indra, "the leader of all the gods and lord of light," will struggle against Triśiras, the son of Traṣṭr the demiurge, a young ascetic Brahmāṇ also possessing three heads: with one he reads the Vedas, with the second he eats, and thanks to the third, he surveys the whole universe. He was endowed with a threefold knowledge and a threefold will and thus risked upsetting the divine equilibrium. Indra therefore struck Triśiras with his thunderbolt and had a woodcutter chop off his three heads. In the Greek world, Hekate, the lunar goddess of night and of crossroads, has three heads: a horse's or cow's head and a dog's head that together frame the head of a young girl. She possesses an abundance of magical charms. In the same nocturnal register there corresponds the dog Kerberos, with three heads and tails of a serpent. Kerberos is the guardian of Hell, and his monstrous voracity, born of the imagination, is the incarnation of the greed of devouring death.

The Hindu god Aditi has two faces, for it is he who begins and ends each liturgical act (*Śatapatha Brahmana* 3.2.4.16). Like him, the Bifrons Janus of the Romans has a double face, for he is the god of passage in time as well as

space. His face is double, as his functions as overseer and protector of time are ambivalent. Among the Celts, the three-headed god, often identified by the Gallo-Romans with Mercury, had many representations in Aedui country and in the northeast of Gaul. Certain Celtic myths feature animal gods with three heads or three horns. This repetition signifies, as in Hinduism, the desire to represent, and thereby augment, the divine power. It is the same for the Thracian Rider, often endowed with three heads. In the nineteenth century, thousands of representations of anthropomorphic divinities with three or seven heads were destroyed during the evangelization of the Samoyeds. This many-headedness recalls the faculty of seeing and knowing everything that the Finno-Ugrians assigned to the sun, which was the principal manifestation of the god Num.

**BEHEADING.** Numerous discoveries in mountain caves have revealed the existence during the last interglacial period (150,000 years ago) of rites in which the skulls of bears were placed with long bones and preserved as if they were an offering to a divinity in charge of dispensing the spoils of the hunt. This rite seems analogous to one practiced not so long ago by the Inuit (Eskimo) of King William Island and to another rite practiced by the Samoyeds, in which a reindeer's head and long bones were exposed on some branches as an offering to Num, their supreme god. The discovery in Silesia of the skull of a young bear whose incisors and canines had been sawed and filed has been compared to a rite practiced by the Gilyak of Sakhalin Island and by the Ainu of Yezo, present-day Hokkaidō. This offering of an animal's skull and long bones appears very characteristic of hunting peoples. However, if the fact of their belief in a supreme being who is lord of the animals can be contested because of the lack of unambiguous documents, the religious character of this offering seems certain from the time of the late Paleolithic age.

It is difficult to ascertain whether it is a question here of a sacrifice of firstlings in which the brain and the marrow are offered to the god (the thesis of Alexander Gahs, 1928) or of a belief that the killed animal will not be reincarnated into another similar animal unless its bones remain intact (according to Karl Meuli's hypothesis in *Griechische Opferbräuche*, Basel, 1945). It is possible to state, however, that the idea of a ritual intended to assure the quantitative renewal of game rests upon an identical belief observed in a large zone extending from the Caucasus to Tibet, and in the entire Arctic European and North American zone. Similar indications have been found in Mesopotamia, in ancient Ugarit at the time of the Aqhat epic, as well as in the Egyptian *Book of Going Forth by Day*. Applied to the hunted animal (bear or reindeer) the belief is that life resides in the "soul of the bones," and that in offering the skull it is the whole animal, in its most vital part, that is thus consecrated to the god.

One finds the same belief, but now applied to man, in founding rituals that mention certain myths: the first decapitation is the sacrifice that founds the order of the created

world. According to the Chaldean priest Berossus (third century BCE), the god Marduk ordered the head of the first (primordial) man cut off. From a mixture of the spurting blood and the earth, Marduk then fashioned all humans and animals. The construction of a city or a temple is also found to be linked to a sacrificial decapitation in certain myths about the Kotoko of Chad.

Pliny reports (*Natural History* 23.4) that when the temple of Jupiter Capitolinus was constructed at Rome, a gigantic human skull was found during the laying of the foundations. This was interpreted as a favorable portent that Rome would be the head of the world and the capitol the seat of its power. We should also recall the Christian legend of Adam's skull, found at the very place where the cross of Christ was raised at Golgotha, "the place of the skull," as if to mark the foundation by the new Adam of the new Jerusalem of redeemed men. A completely different meaning, closer to that of hunting peoples, appears in the Aztec ritual of beheading during the sacrifice to Chicomecoatl-Xilonen, the goddess of young corn, and to Teteoinnan (Toci), the mother goddess of fertility and vegetal plenty. It should be noted that the same word, *quehcotona*, designates both sacrificial decapitation and the gathering of ears of corn.

The head-hunt, a rather common practice, is the necessary condition for being recognized as an adult and being deemed suitable for marriage. This practice is more like a ritualized war expedition than a sacrifice to the gods. It is well documented among Indo-European peoples such as the Scythians, who suspended the heads of enemies they had killed around the necks of their horses (Herodotos, 4.6.4). In ancient Greece the head hunt was an obligatory rite for initiation into the brotherhood of animal-men: Dolon the Trojan dressed himself in a wolf skin and tried one night to bring back the heads of Odysseus and Agamemnon; when he was discovered, his own head was cut off by Odysseus and Diomedes (*Iliad* 208ff.). The skull hunt was commonly practiced by the Celts. The Gauls hung the trophy skulls in their homes or nailed them to the main door after having rubbed them with cedar oil (Strabo, 4.4.5; Diodorus Siculus, 5.29.4–5). Sometimes these skulls, glazed with a thin layer of gold, served as sacred vessels for human blood libations to Teutates, and as cups strictly reserved for use by the druids and the chiefs (Livy, 23.24.12). This custom was to be maintained in Celtic Ireland and in the country of the Gauls. Gallic coins from Armorica pictured chopped-off heads as a victory symbol evoking the hero Cú Chulainn, the son of the god Lugh who brandished decapitated enemy heads in battle in order to frighten the enemy. He himself died in single combat with Lugard, who cleaved his head, since in the Celtic world death took effect only if the membranes of the brain, the adversary's seat of life and force, were reached.

In certain Semitic cultures, or cultures influenced by Semitic peoples, the head hunt is associated with the hunt for genital parts. Whether practiced in ancient Israel (*1 Sm.* 18.25–27, *2 Sm.* 3.14) or by ethnic groups in northern East

Africa, the trophy brought back is, along with the head, the foreskin or male member. Among the American Plains Indians, scalps have always been war trophies that the Cheyenne or Blackfeet hung at the tip of a pole around which they danced in honor of the forces of nature. Joseph François Lafitau (*Mœurs des sauvages américains*, vol. 2, *De la guerre*, 1724) says that the Iroquois exposed the severed head of an enemy caught apart before the battle in order to frighten their opponents, but that afterward they only scalped those who were dead or left for dead. This scalp was prepared like the skin of an animal taken in the hunt and exhibited at the end of a pole. Lafitau compares this practice to that of the Scythians and the Gauls.

In the whole Malay archipelago, the head hunt and human sacrifice have been so closely linked that among the Niassans, the same word, *binu*, designates both. Among the Dayak in central Borneo, the ideal booty consists of the head because it contains "the substance of the soul." The victims of this hunt are excluded from the kingdom of the dead, as are the hanged, those struck by lightning, and those who died in an accident. On the other hand, victorious hunters and heroes who fall in the course of a head hunt are noble, and their souls will live at the summit of high mountains in the company of the Kamangs, their ancestors. A similar practice was more recently extended to the mountainous populations of Indochina, to the Nagas studied by J. P. Mills (1926–1937), as well as to the Jivaroan people of Latin America and the Mundurum of Brazil, who carefully preserved the heads of decapitated enemies, sometimes by shrinking. Head hunts are conducted on the occasions of rites of passage and initiation, or during the foundation rites for a common house, the chief's house, or the village temple.

The close connection between the skull hunt and human sacrifice has also been noted in Assam and Burma. Under the influence of Śaiva Tantrism, the ritualistic and symbolic role of the skull in Tibetan Buddhism has often been superimposed on a very ancient stratum of local beliefs, culminating in a revalorization of prehistoric practices in a type of Tantric yoga. Such was the case with the Aghorins, Śaiva ascetics who ate from human skulls and meditated while seated on cadavers, and who also practiced ritual cannibalism up to the end of the nineteenth century. They were the successors of the Kāpālikas, or "carriers of skulls," who had certain orgiastic practices and were worshipers of Śiva the great destroyer (*Maitrāyaṇī Upaniṣad* 6.8). Forgetting the yogic significance of the corpse and the skeleton, these Aghori naturally rediscovered the most ancient practice of the cannibalistic headhunters (Mircea Eliade, *Yoga*, New York, 1958, pp. 296–298).

The Aztec decapitation ritual took place after the human sacrifice. The head, separated from the body from which the heart and the lungs had already been removed, was impaled and publicly displayed on the *tzompantli*. The skulls, perforated transversally at the level of the temples, remained there a long time. This ritual was ordinarily practiced

at the time of the sacrifices to the warrior gods, the hunting gods, or the agrarian gods, but we have not been able to uncover the deepest reason for such a practice. In a single Mexican village, Fray Bernardino de Sahagún saw seven *tzompantli* (*Florentine Codex*, appendix 2) and the conquistadors counted between 80,000 and 136,000 human heads exposed in this way, among which Cortés recognized those of fifty-three of his companions next to four heads of the first horses put to death. It is not certain that these “skull walls,” which inspired respect mixed with fear, were the result of the worship of the god of death. But it is certain that the head was a sacrificial trophy that was displayed as the personal property of the Aztec collectivity, since the handling of these heads seems always to have been reserved for the priests and dignitaries of the Aztec people (*Florentine Codex* 3.53).

Certain African ethnic groups link the skull to initiation rituals; thus, in the blood-pact rite in Benin, the skull of a traitor or one who died by accident serves as the receptacle for a beverage made of the cointiates' blood. Those who betray their oath will experience the same ignominious death as the skull's owner. In the rite of initiation into Haitian Vodou, the concepts of *por-tête*, *mait-tête*, and *lav'tête* have quasi-magic importance, as the place where the initiate, whose head hair, body hair, and nails have been gathered, unites with the *lwa*, or spirit, received at the time of initiation.

**THE HONORED HEAD.** Discoveries from the Middle and Upper Paleolithic ages, in Europe as well as in the Middle East, or in Australia, show the importance of the cult of the skulls of the ancestors. Their heads were prepared with great care and preserved. These skulls have undergone an enlargement of the occipital orifice, have been colored with red ocher, a substitute for blood as the symbol of life, and have been preserved according to a precise ritual orientation exactly like that practiced not long ago in Sulawesi. Likewise, the Aborigines of Australia preserve their relatives' skulls with great care, in order to venerate them and carry them along with them on their pilgrimages. The same care in decorating and preserving the ancestors' skulls is also found among the Andamanese of the Bay of Bengal, the Papuans of New Guinea, and the Indians of Bolivia. All of them believe that the “soul of the dead” resides in his skull and that it protects them.

In the same way, the Celts preserved the skulls of their next of kin on “encephalic” pillars with hollowed-out niches, such as those of Roquepertuse, Entremont, and Glanum. This custom was maintained for a long time in the Danube Basin where the ancestors' skulls, separated from their skeletons, were preserved under the main altar in churches. Every year, during the rites of passage, the young men took them out and wore them around their necks. Certain African ethnic groups, like the Bamileke, bring the skull of the deceased back into the home and deposit it near the family altar, where it is invoked in prayers of benediction and protection. This is because the skull, as a vessel for sacred power of divine

origin, protects its possessor against all kinds of peril and gives him health, wealth, and victory.

Belief in the oracular powers of the head follows from this worship of the ancestors' skulls. Because the head is the seat of life, it is believed that one can easily enter into a relationship with the dead by means of the skull. Those of ancestors permit one to question the spirits, a common practice in Melanesia and Polynesia. Among certain Indian ethnic groups of Latin America, the Jivaroan people in particular, the spirits manifest themselves in the shape of skulls, formidable if they belong to ancient shamans. The Inuit of Iglulik believe in the existence of tattooed flying heads, the manifestation of spirits who have taught language to the Inuit. In ancient Israel, the *terafim* show the relation between the worship of skulls and divination: small anthropomorphic domestic idols become the instrument of divination (*Gn.* 31:19; *I Sm.*, 15:23, 19:13, etc.). Commenting on these texts, medieval rabbis affirmed that the *terafim* were made from the decapitated head of a firstborn son from which the hair had been removed. The head, sprinkled with salt and castor oil, was preserved and questioned about the future according to a ritual analogous to the one reported in the tenth century among the natives of Hauran. The Greeks likewise were acquainted with the existence of oracular heads: that of Orpheus at Lesbos (Philostratus, *Heroicus* 5.704) and that of Archonides preserved by Cleomenes of Sparta (Aelianus, 12.8).

But it is especially in Celtic literature that the theme of the oracular head comes to its fullest expression. Separated from the body, heads continue to act and speak as if they preserved the vital breath they once contained, like Brân's head in the *Mabinogi*, or those of the Roman Arthurians who take up the old theme of *Fledh Bhricrenn*, in which the hero Cú Chulainn is the prototype of the knight Gawain. The Celtic theme of the severed head, still living and speaking, is the foundation of Christian legends of cephalophoric saints, the most famous of which is Saint Denis, the bishop of Paris. All these legends originated in northern Gaul, in Celtic country, and do not illustrate, as was long believed, the affirmation of Chrysostom concerning the martyrs who could present themselves with confidence at God's tribunal “carrying their cut-off heads as a testimony of their martyrdom.” It is always the same sacred power, vital and of divine origin, that is expressed by the severed head testifying to its religious faith.

*Translated from French by Kristine Anderson*

## HEAD: THE CELTIC HEAD CULT

Head-hunting as a proof of prowess and the veneration of the head as the seat of the soul and the source of spiritual potency are both far older than the dawn of the historical period. In Europe there is fairly clear evidence for them as far back as Mesolithic times. They were therefore part of the European heritage long before the Celts emerged as a distinct cultural entity. But here, as in so many other instances, what the Celts borrowed or inherited from others they soon made peculiarly their own. The veneration of the head became a central element of their ideology, a deep-set preoccupation which lasted from the birth of the Celtic peoples to their final conquest, one which left its imprint ubiquitously on their art and on their mythology.

The archaeological and artistic evidence for the head cult among the Celts is too extensive to catalog briefly. For example, at the Celto-Ligurian sanctuary of Entremont in southern Gaul (Provence), fifteen male skulls were found, several of them still bearing the marks of the spikes with which they had been fixed for display, and at Bredon Hill in Gloucestershire, England, a row of skulls uncovered near the entrance seem to have fallen from above the gate of the fort. At Entremont there are many examples of severed heads sculpted on blocks of stone, while Roquepertuse, also in Provence, has its famous decorated portico with niches in which human skulls were placed. There is also a wealth of heads sculpted in stone or carved in metal which, while not explicitly identified as severed heads, reflect clearly and sometimes very dramatically the importance accorded the head as a symbol of extraordinary power and divinity: for example, those from Heidelberg or from Mšecké-Žehrovice in Bohemia, or the pear-shaped heads on the Pfalzfeld Pillar, or the three-faced head from Corleck, County Cavan, Ireland.

Classical authors confirm the archaeological testimony. According to Posidonius, as reported by Diodorus Siculus (5.29.4–5) and Strabo (4.4.5), the Celts returned from battle with the heads of their defeated enemies hanging from the necks of their horses. The heads of their most distinguished

opponents they embalmed in cedar oil and stored carefully in a chest to be displayed proudly to their visitors, and in some instances they used the skull of a distinguished enemy as a vessel for sacred libations. These and other similar references are supported by the insular Celtic literatures, where the return of the hero carrying the heads of his foes as trophies is commonplace. Cormac's *Glossary*, which dates from around 900 CE, defines the term *mesradh Machae*, "the nut harvest of Macha (the war goddess)," as "the heads of men after they have been cut down."

But the cult of the head went far beyond the pursuit of martial glory. The head was not only a prized heroic trophy but also a profoundly religious symbol, sometimes evidently representative of a deity and generally suggestive of supernatural wisdom and power. It was a source of prosperity, fertility, and healing as well as an apotropaic agent to ward off evil from the individual and from the community as a whole. Severed heads are often associated with sacred wells—themselves instruments of healing—in the archaeological record, in the early insular literature, and in modern oral tradition, and this association was carried over into the legends of the Christian saints. There are many instances in the literature of heads continuing to live—speaking, directing, entertaining—long after they have been separated from the body. Perhaps the most striking example is that of Bendigeidvran (Brân the Blessed), whose head presided over the otherworld and protected the island of Britain since its burial at the White Mount in London. Indeed so widespread and so persistent is the image of the head in its various aspects that Anne Ross has seen fit to describe it as "the most typical Celtic religious symbol."

## BIBLIOGRAPHY

### HEALING AND MEDICINE: AN OVERVIEW

Healing occupies a singular and prominent place in religious experience throughout the world. Often the most important figure or symbol in any given religious tradition is the source of healing, and illness tends to function as a magnet for many and varied ritual responses. In addition, the existence of personal suffering in the world may serve as a springboard for theological and mythological exploration and explanation.

The aims of religious healing are consonant with the overall goals of religious life in a culture. Healing may be directed toward reestablishing ritual order, life in abundance, the expulsion of disorder and evil, redemption from condemnation, salvation from guilt and sin, liberation from existence, or extinction of existence itself. Sickness reminds religious beings to assume their peculiar role in the world, one cognizant of sacred realities and coordinated with the cosmos. Rituals of healing redress the fragmented social, personal, temporal, physical, and metaphysical tissues constituting the whole of the universe. All this is possible because the human body and its experiences comprise a knowable world of physical, spiritual, mental, cognitive, and emotional forces that reveal supernatural structures of creation. Religious healing clarifies the ways in which the individual human body lies at the center of sacred meaning.

The meaning and value of ideas and experiences associated with healing become most clear in the specific religious contexts in which they arise. Thus, for example, the passion of physical suffering has different meanings in the self-sacrifice of the Buddhist Bodhisattva Kṣemadatta who burned his own hand to become a living lamp; in the crucifixion of Christ, necessary for those who believe in him to gain everlasting life; and in the death of al-Ḥallāj (d. 922), the Muslim mystical poet who saw the human condition in both its love and painful separation of absence and death as a mirror of the divine nature and its attributes.

The following discussion deals with religious healing from a comparative perspective. The outline roughly follows the hypothetical contours of an incident of sickness and cure, moving from the origins of the disease and techniques of cure through the discovery of symptoms, their diagnosis, choice of therapy, the actions of cure, and the aftereffects of healing. Information on healing in particular religious traditions and culture areas can be found in the articles immediately following this overview.

**MYTHS OF THE ORIGINS OF DISEASE.** Images and symbols of the origins of disease help justify and rationalize sickness and exculpate (or blame) the victim of illness. They also help the community to think about the condition of sickness. However, the importance of myths of the origins of disease goes beyond the social and cognitive in that they help locate sickness as an ontological condition—a mode of being.

The supreme being itself may send afflictions. In keeping with their absolute and total character, celestial supreme beings dispatch people with summary diseases and capital punishments. The Semang of Kedah (Malaysia), for example, believe that the supreme being Kari, who created most of the universe, is omniscient and sees every offense from his dwelling place on high. He punishes wrongdoers by dropping a flower from a mysterious plant on them. Wherever the flower falls, fatal lightning strikes. Often, congenital diseases are attributed to the creator. The Mondari of southern Sudan attribute the origin of certain nervous disorders and mental sickness to Ngun Ki (Spirit-of-the-Above). Symptoms of such diseases include sudden onset, an indication that the power from above has fallen hard and swiftly. Alternately, mental incapacity that appears to be congenital is also attributed to the authorship of the creator, for the afflicted are considered bad creations that were broken or spoiled in the making.

Supreme beings and creators not only set in motion fatal and incurable diseases, they can indirectly unleash a flood of pathogenic substances on the world. This is especially the case when creators destroy their own creations through universal flood, fire, petrification, darkness, or earthquake. These catastrophes generally leave toxic residues. Left over and only partially destroyed, such fragments of the primordial world cause disease in those who come into contact with them (if these fragments should be inert substances like poisons, ashes, or brackish primordial waters) or who are attacked by

them, as in the case of leftover primordial monsters continuing to devour victims in today's world.

In the northwest Amazon area of South America, in the upper Río Negro region, the Baniwa people believe that many diseases originated when the culture hero Kuai was consumed by the fire that swept through the world at the beginning of time. From Kuai's mouth and other body orifices streamed saliva and fluids that became the poisons of this world, and from the fur on his body came the pathogenic darts and slivers that invade human beings.

At times, a co-creator, one who competes with or thwarts the efforts of the divine creative partner, introduces disease into the world. According to the Mazdean theology of the Iranian *Dēnkard* (9.37.5), the world was once perfect, immortal, and immaterial (*menog*). Even the material creation (*getig*) made by Ohrmazd, the good creator, was perfect. Only when Ahriman creates finite space does he corrupt the world with evil and sickness, a state of confusion (*gumezishm*) that will endure until the end of time. Ahriman's demonic creations inhabit human bodies, where they lodge themselves as diseases.

Often a more ambiguous divine figure introduces disease. Divine culture heroes or mythical tricksters collaborate in creation with the supreme being. However, they are rarely equal in power or status with the high god. They are usually deputies commissioned to carry out the will of the creator. In the course of discharging their duties, however, they bungle the job or meet with misadventure that lets loose disease. Bauro, the hero of Tucano-speakers of southern Colombia, for example, was entrusted with the gourd of night. This gourd would allow people to dream and to perform ceremonies if it was opened with due care. Unfortunately, the hero was unable to prevent meddlers from opening the container prematurely. Its contents flooded the earth with penetrating darkness, accompanied by the diseases of noxious vermin, stinging insects, and venomous reptiles.

In some cases, the divine or supernatural body itself gives rise to disease. This is especially true among mythic figures whose slain cadavers are dismembered to bring into being various species of plants or animals. Consumptive realities (i.e., substances to be consumed) appear not only in the forms of food but in the guise of diseases.

Ancient Daoist texts (*Huainanzi*, chaps. 2, 4; *Zhuangzi*, chap. 9; and *Shanhai jing*, chap. 13) describe the origins of madness. Ancient gods of the time of paradise drummed their bellies and created a rumble-guts of thunder and lightning, shattering the world with a primordial deluge. The belly is the location of the Yellow Court, the center of meditative techniques and mystical experiences that transmute the body, rid it of impurities, and reconceive the individual as a holy and immortal embryo. The individual who suffers madness in this way is said to know with his or her belly the ancestral gods who drummed at the time of creation.

Many diseases result from the incomplete condition of creation. According to a myth reporting the emergence of the

Navajo peoples at the beginning of time, colors were kept separate from one another in different world levels and in the baskets located at each of the cardinal directions. In the center of the universe was placed a covered basket containing whooping cough, smallpox, nervous disorders, and all manner of sickness. The basket also contained the first human being and his companions. When the mythical people emerged through the various layers of the primordial world and ascended into this one, they gradually accumulated a riot of confused colors collected from all the various world layers they had passed through. They also brought along the basket of ills. Creation, increasingly complicated over time, maintains its order only with difficulty. In the Navajo case, the failure to intercalate the myriad orders of sounds, colors, directions, supernatural beings, plants, stones, and qualities of light accumulated during the ascent through multiple worlds, brings on disorder reflected in the body as sickness.

Finally, disease can enter the world through the disobedience of a creature. Instructed by the supreme being, creator, or culture hero to keep silent, maintain vigil, stand motionless, or observe dietary restrictions, the first people disobeyed. For example, consider the story in chapter 3 of the book of *Genesis*, in which Adam and Eve fall into sin and death because of their disobedience to Yahweh.

These mythic scenarios do not exhaust the kinds of episodes portraying the origins of disease. The point is that religious healing rarely, if ever, confronts a merely biological disorder located exclusively in the body of the patient. Religious healing encounters a primordial reality: battles with supernatural forces that have existed from the beginnings of time. Healing must be an act of recreation, corrective creation, or cosmic battle waged to triumph over or annihilate miscreant primordial powers. The healer must be cognizant of the origins and nature of the realities he or she confronts through the experience of the patient. Disease forces the religious healer to reckon with the creation of the world.

**PROXIMATE CAUSES OF ILLNESS.** The mythic origins of illness serve as the ideological background for the diagnostic procedures that determine the proximate causes of illness in specific instances. In most cases, the proximate causes of illness are more immediately relevant for the diviner or diagnostician and certainly more relevant for the patient. After all, these causes are specific and individual and can be treated in the here and now. The immediate causes of the disease may be due to the castigating action of ancestors or Gods as a response to sin or moral failing of the individual. This castigation often is construed as educational in value: The affliction causes the individual to change his or her behavior for the better. In these instances, the illness may be construed as a spiritual "wake-up call" or as an opportunity to make amends and start over.

Sometimes illness is caused by the hidden malevolence of neighbors or relatives or by nasty ghosts or spirits. In traditional European societies, the evil eye was believed to cause a variety of illnesses and other misfortunes. Those who give

others the evil eye often are understood to behave out of envy, although that envy sometimes is unintentional rather than purposefully malicious.

Another frequent proximate cause of illness is the poor performance of ritual acts, such as inattention to ancestors or incorrect ceremonial etiquette. Paul, for example, pointed out to the Christians of Corinth this cause of their illnesses: "For any one who eats and drinks without discerning the body eats and drinks judgment upon himself. That is why so many of you are weak and ill and others of you have died" (1 Cor. 11:29–30). Impurity is another frequent cause of illness. Impurity sometimes is the result of ritual failings, but often is the consequence of contamination of one sort or another. Inappropriate sexuality and contact with strangers, certain animals, menstruating women, and the dead are common sources of impurity.

A particularly common cause of illness falls into the general category of bad social relations. Illness may be construed as triggered by anger or jealousy or as a manifestation of overly strong emotions. In cultures characterized by rigid gender hierarchies, illness in women often is interpreted as triggered by their rebellion or disrespect toward their husbands, fathers, or other socially dominant men.

The Malays believe that human beings are composed of minds, bodies, souls, and two other elements: *semangat*, the universal spirit that dwells in all creation and when startled may leave its container, and *angina*, the Inner Winds inherited from one's parents. These Inner Winds govern individual talent and personality. If strong Winds are not expressed in daily life, they accumulate in the body, causing physical and emotional pain. Stifled Inner Winds are suspected to be the cause of intractable illness that has not responded to straightforward medicine or simple spells.

**DIAGNOSIS.** When people fall ill and suspect that their affliction has a supernatural cause, they seek expert advice. In many social settings there is an informal but ordered network of people who help the sick person choose the best course of action. Such a therapy management group often consists of relatives, friends, neighbors, and local authorities. The group helps decide how serious the crisis is and how to face it. Should the illness endure, interrupting the productive relations of the individual and the community, special assistance is sought from someone familiar with the meaning of the symptoms. The individual who diagnoses sickness may serve as a referral center to medical practitioners specializing in one disease or another. Alternately, the diagnostician may both discern the disease and cure it. The diagnostician reads the signs of the disease manifest as symptoms and reconstructs both the mythic and social history of the sickness.

Prior to Christian evangelization, the Kaluli people of the tropical forest north of Mount Bosavi on the island of New Guinea believed the forest around them was coincident with an invisible world of spirits with whom human beings could communicate through mediums. Spirit séances would

be held to cure the sick, investigate witchcraft, uncover the cause of death, or locate lost pigs. According to Edward Schieffelin (1996), Kaluli believe illness to be caused when the invisible spirit-counterpart of a person's body is dismembered by a witch or injured by other circumstances in the spirit world. The person can be treated by asking the spirits, through a medium, to locate the patient's body-counterpart in the spirit world and repair the damage.

The competence of the diagnostician may stem from his or her personal experiences of sickness from similar diseases, from innate gifts or talents (e.g., clairvoyance), acquired techniques (e.g., special objects of power), or familiarity with spirits. Diviners sometimes master elaborate symbolic schemes accounting for the elemental substances, forces, and processes at work throughout the cosmos. Such systems of correspondence reduce the infinitely complex circumstances of mythic, cosmic, social, and personal history to a relatively few combinations of symbolic items. Some African systems of correspondence have given evidence of astounding complexity. Reputedly revealed by divinities at the beginning of time, Yoruba divinatory techniques reveal the correspondences that exist between patterns of nuts or shells cast on the ground and hundreds of lengthy, enigmatic verses memorized by the diviner. The diviner must know the nuances of meaning in the poems and be expert in applying them to new situations. The verses allude to mythic personages and events that shaped the world. The current condition of the patient is brought into line with some primordial condition of creation revealed in the poem. The sickness, its origin, and the conditions of its cure are revealed when the diviner recognizes the suitable pattern of shells, the proper verse, and its fitting interpretation. Versions of this elaborate system of correspondence have spread throughout West Africa and the Americas. Not only do diviners have keen memories and sharp intuitions; they are shrewd social analysts whose probing questions unveil the patient's medical history and uncover sources of tension and anxiety in the community.

In the Peruvian Andes, diviners use *mesas* to diagnose sickness. *Mesas* are ground cloths, tables, or boards whose divisions reflect the principle structures of the universe, namely, the three levels of the world (the heavenly realm, the inner earth, and the central world inhabited by humans) as well as the elemental structures of time (the seasons, years, night, day, and hours). On the *mesa*, the diviner locates objects representing and embodying supernatural forces with which he or she is familiar. During a nightlong ceremony in which he asks the patient a series of questions concerning the sick person's physical and social condition, the diviner arrives at a judgment concerning the nature of the sickness and the course of therapy. By successfully locating the patient in space and time, he or she defines the key supernatural relations that condition the patient's existence, including the current illness.

Other systems of correspondence use the symbolism of colors, sounds, movements, or the disposition of sacrificed

body parts such as lungs, liver, or bones. They may also use dreams and other experiences of the diviner or patient to connect the hidden conditions of the sick person to the more legible outward signs of the manifest world. The point is that all creation is isomorphic; each part bears the same arrangement of forces, qualities, and substances. If the diviner can clarify the working order or disorder of any one part of creation, he or she can see more clearly the same conditions obtaining in other areas of existence such as the affected space of the patient's body.

**MYTHS OF THE ORIGINS OF CURE.** The time of creation also proves to be important for the origins of techniques of cure. These myths of origin play a directly therapeutic role in episodes of sickness and healing. Thus, for example, in healing a newborn infant, a specialist among the Manus fisher folk of the Admiralty Islands intones the origin myths of the ginger and aromatic herbs that he passes around from one person to another during the ceremony. The myths of origin of these herbs is rather lengthy. It is sung several times, tracing the history of the curative substances from the beginning of time to the more recent period when it was acquired by the medical specialist who does the singing.

Myths of the origins of cure are often recited in the presence of the ailing patient, for only then can the therapy be effective. The rite of cure clarifies the mythic origins of the medicine that is always embedded in a cosmogonic myth. A formulaic chant-remedy for toothache in ancient Assyria begins with the time when Anu, the creator, made the heavens. In their turn, the heavens created the earth; the earth, the rivers; the rivers, the canals; and the canals made smaller pools. Eventually, the pools gave birth to the Worm of Sickness. Weeping with hunger, this pathogenic Worm went to ask the supernatural beings Shamash and Ea for something to consume. No fruits of the earth would do; the Worm would satisfy itself only with human teeth. Even while the worm is given license to devour human teeth and cause decay, it is cursed and destroyed by Ea. In times of need, the myth was recited in a ritual fashion to reenact the origins of the world and the origins of toothache and its cure. As sure as the world and dental decay exist, so too does the power, made present through the performance of the myth, to overcome the pain and its corrosive cause.

The important issue is that, at some time in the mythic past, a supernatural power of cure has vanquished the power of affliction in question. Not only does this sacred act set a precedent for healing the disease, through recitation of the myth of cure, the healer makes present once again the ancient supernatural powers and events that conquered the disorder at the beginning of time. Thus, the healer's words and deeds are effective.

The accounts of the origins of cure open up the universe of meaning that binds a culture and stimulates its creativity in the face of sickness. Each category of *materia medica* has its own origin. For centuries, Qolla-huaya healers in the Bolivian Andes, for example, have been remarkable herbal

curers. They possess a pharmacopoeia of nearly nine hundred medicinal plants, carefully classified according to local symbolic orders. This extraordinary feat seems motivated and organized by the fact that the plants are vehicles for the fluids, especially fat, blood, and water, that come from the body of Pachamama (Mother Earth), who is a divine being. She gives life to the human offspring who dwell on her mountainside. Curative powers are transferred from the body of Mother Earth to the circulatory systems of her children through the various species of plants. They are gifts of Mother Earth, and their energies are released when the plant leaves are steeped in water as a tea and drunk by the patient.

Rattles, drums, costumes, songs, and the implements and techniques of cure may have mythic origins that account for their power. In Eurasia, for example, drums are a part of the religious healer's curing practice. The studies of L. P. Potapov (1968), S. I. Vajnsstejn (1968), and Marcell Jankovics (1984) show that the myths of origins of these drums and the powers that fill them when they are played take concrete expression in their structural design and in the drawings depicted on the hides of the drumhead. The drums of Altaic peoples, such as the Shor, Teleut, and Kumandin, often depict mythic beings associated with constellations of the zodiac. Uralic peoples, such as the Selkup, Ket, Dolgans, Nganasani, Evenki, and Eveny, draw maps of the sky, centered often on the Milky Way, the supernatural path along which the healer travels to enter the original world of celestial powers. These skymaps illustrate a mythic geography and locate the principal powers pertinent to the ecstatic healer's practice.

**HEALING TECHNIQUES.** Just as myths of the origin of disease are given immediate meaning via specific understandings of the cause of particular illness episodes, myths of the origin of cures are actualized through a variety of healing techniques. Given the avidity with which human beings seek out healing and the diversity of understandings of the origins and proximate causes of illness, a comprehensive list of ritual healing techniques and procedures would be an impossibility. There are, however, several categories that can, in one form or another, be identified in many cultural settings. Although this is far from a hard and fast rule, it often is the case that the pursuit of healing begins with simpler or more straightforward (less expensive, less elaborate, less specialized) rituals and progressively moves on to more complex ones.

First, one of the simpler clusters of healing techniques centers on the manipulation of sacred or symbolic objects. This cluster was addressed prominently in the writings of early anthropologists who identified subcategories of contagious magic (i.e., contact with objects understood to carry particular power) and sympathetic magic (i.e., the use of objects understood to resemble the desired effect). Although the pejorative meanings often associated with the term *magic* are not particularly useful, the recognition that objects are ritually manipulated in particular ways is quite useful. Con-

tagious magic may include ritual healing techniques such as wearing an amulet that has been written, blessed, or manufactured by a saint or other holy person. Sympathetic magic may include ritual healing techniques such as the use of *milagros* (charms with tiny legs, arms, hearts, etc.) representing the body parts or organs in need of healing that are placed into receptacles at Catholic shrines and churches in Mexico and Texas.

A second category of healing relates particular saints to specific illnesses. In towns and villages on the north coast of Portugal, different saints are connected to the healing of different parts of the body. Saint Bras is called on for a sore throat; Saint Bento, to cure warts and rashes; and Saint Luzja, for eye diseases. Lena Gemzoe relates this explanation given her by a woman in one small town:

Not long ago I had an illness, it was chicken-pox; that came all over. . . . I got it and very, very badly. First my children, then since I was with them, it struck me. . . . I was very, very sick because I had sores on my head, on my back, on my legs. . . . I clung to Saint Bento and asked: "Oh, blessed Saint Bento, liberate me, God, from become scarred"—because it looks so ugly. If he would clean my whole body and clean my children, when the day of his feast comes I will go there and I will offer, for example a head of wax or a bust of a woman or . . . I asked for my children, I would give an entire child, two entire children of wax. (Gemzoe, 2000, p. 81)

Another cluster of healing techniques centers on prayer and meditation. The variations within this cluster are many. Who prays—the individual in need of healing or someone else on that individual's behalf? Is the prayer spontaneous and idiosyncratic, or does it follow a set liturgical formula? Is the prayer understood to be effective because it elicits divine response, or because it calms the emotions or centers the mind of the person who prays or meditates? Is the ritual silent and private or recited aloud? In contemporary American society, healing prayers occur privately, recited under the breath by millions of people going into surgery, as part of public extravaganzas, like revival meetings of various sorts, and electronically, over the internet and on television.

A third cluster of healing rituals have to do with removing the object, experience, emotion, force, spirit, or person that is understood to cause illness. Roughly speaking, this cluster includes confession, exorcism, and purification of various sorts. In many settings the removal is verbal, narrative, metaphorical, or symbolic. Public and private—and voluntary and forced—confessions of sins and misdeeds are other manifestations of extraction techniques: The sickness-causing information, guilty feeling, or wicked or aberrant thought is removed from inside the individual and, in one sense or another, dissipated or neutralized.

Sucking is a widespread technique of cure. The healer may use some technical device such as a goat's horn for cupping or a leech for drawing out blood. More often, the healer

sucks out the intruding pathogen with his or her own mouth. In such cases, the healer's mouth is a medical instrument, a womb of transformation that changes the sickening substance into something harmless or even helpful. Sucking can be a stunning spectacle. Several investigators have commented on the violence, noise, and aggressive suction that draws blood from different places on the patient's body. The healer's mouth, throat, and stomach possess special powers. The Tapirape healer of Brazil, for example, intoxicates himself with great gulps of tobacco smoke from his pipe. He deliberately makes himself sick so that he begins to vomit, but he sucks his own vomitus and accumulated saliva into his mouth. Throughout this noisy performance, he stops intermittently to suck on the body of his patient. Finally he vomits up the entire mess and searches for the intrusive object that has provoked sickness. Sometimes several healers carry on cures of this sort in joint practice and at the same time. On these occasions the sound of violent vomiting reverberates throughout the village.

Purification techniques include physical cleansing practices such as washing and spiritual practices such a meditation that eliminates impure thoughts. Often, the physical and spiritual aspects of purificatory rituals are inseparable as in the case of biblical laws of ritual immersion after menstruation or contact with the dead. Clearly, immersion in water washes away blood and other bodily effluvia. Yet the immersion also is understood to transform the individual into a spiritual state in which he or she can participate in the religious life of the community. When outsiders are targeted as the source of sickness in the body social, as has happened historically in response to some immigrant groups, the larger collective may erupt into violence and adopt ritualized forms of quarantine or expulsion—often unjustly—with the idea of purifying and healing itself.

A fourth cluster of healing techniques involve inserting something into the person in need of healing. The most obvious examples in this cluster involve the ingestion of medicine of one sort or another. The ritual aspects of this cluster take a variety of forms: techniques of ingestion, techniques of collecting or preparing the medicine, and so on. In some instances the substance that is ingested or inserted is clearly material in nature and understood to work on fairly straightforward biological principles as with an herbal tea, for example. In other instances, the substance has both material and spiritual aspects (e.g., drinking water in which a paper with a verse from the Qur'ān, a Buddhist sūtra, or the Bible has soaked). Even substances that may seem to be material can be understood to work in a nonmaterial way, such as homeopathy in which the pills that are ingested are understood to work on an energetic level. The insertion of devices like acupuncture needles adds an additional tangibility to the concept of insertion, coupled with energy manipulation, and occurs in the context of a set process. The practitioner reads the patient's pulse, looks at his or her tongue, and listens to the narrative of symptoms prior to needling.

A fifth cluster of techniques involve touch. At the most basic level, touch simply is the common human act of rubbing a body part that hurts. At the other end of the spectrum, touch is done on the astral or energetic level rather than through direct contact with the patient's skin. Reiki healing is a good example of nonphysical touch. As a healing technique, touch is particularly multivalent. Its effectiveness can be understood in physical terms such as relaxing muscles or increasing blood flow, in emotional or social terms such as creating warm and healing interpersonal connections, and in spiritual terms such as channeling the power of divine entities.

A sixth, and one of the largest, cluster of healing techniques has to do with the induction of trance and other altered states of consciousness. In many cultures either the sick individual or the healer carries out some sort of practice that results in the elicitation of healing dreams (in which the dream itself heals or healing knowledge is revealed in the dream). Healing trance and spirit possession as in, for example, the *zaar* rituals in parts of Africa are elicited through drumming and dancing. In other contexts, altered states of consciousness in the healer, the patient, or both are elicited through substances such as mushrooms or tobacco, sleep or sensory deprivation, repetitive or hypnotic types of motions, singing or chanting, or meditation.

A final cluster of ritual techniques highlight some form of cognitive restructuring (i.e., practices that encourage the patient or other participants to see or construe their affliction in a new or healthier way). Storytelling often is the means by which the cognitive restructuring is effected. Through the recitation of myths and tales that have cultural or spiritual resonance, the patient comes to see his or her own suffering as a part of a larger cosmic unfolding. Christian Science offers a clear example of cognitive restructuring: The work of the Christian Science healer is to help the patient understand that his or her suffering is not real.

**HEALERS.** The power of healers often is associated with a god or culture hero who introduced healing techniques or is understood to be the prototypical healer. In the Christian tradition, the miraculous cures of Jesus are the distinctive sign that the Messiah has come and that the new age of the kingdom of God has dawned (*Mt.* 4:23–25; 10:1; 10:7–8; 11:4–5). As the divine physician, Jesus instructs his disciples how to cure all kinds of diseases, especially by casting out unclean spirits. Any given culture may recognize a range of religious healing specialists. The diversity of religious healers is an outgrowth of the intricate and varied sets of relationships with supernatural beings who are subtly different from one another and a reflection of power relations and the importance of social hierarchies in particular settings.

The types of religious healers are many in number and diverse in style. Some are specialists in simple instrumental cure such as bonesetting, herbal remedies, and dietary prescriptions. They master a finite canon of pharmacopoeia or therapeutic protocols. Their training is often scholastic and

routinized. Of greater religious significance are the healers specialized in confronting disease through symbolic dramas, especially rituals of cure. Such healers are called to their vocations through a number of different means. Sickness is often a sign of election by a supernatural agent of cure. The isolation of serious illness, the sufferings that the candidates endure, and the deliriums they undergo can all be interpreted as an initiation to the office of healer.

The Aztec at the time of the Spanish conquest distinguished among several medical specialties. A number of sixteenth-century texts document these specialties and their procedures. The *tetonalmacani*, *tetonaltiqui*, or *tetonalliqui* cared for those patients, especially young children, who had lost their *tonalli*, a species of soul. The *teapatiani* (“healer of the crown of the head”) applied pressure to the palate of infants, massaging it in such a way as to close the fontanel in a propitious manner. Another practitioner designed figures on the body of the patient before bleeding the victim suffering dysentery. Some healers sucked out sickness and transformed the intruding pathogen into a piece of parchment, flint, pebble, or some other object. Other Aztec clinicians included bonesetters and curers of scorpion bites, gynecological disorders, and sicknesses suffered during the rites of passage through the life cycle.

Aztec mystical healers were called to their vocation when struck by lightning. Midwives demonstrated their power by dancing publicly during the great religious feasts. Deep massagers cured by warming their feet directly in fire and then walking on the affected muscles of the patient. The most esteemed specialist in the Aztec tradition was the herbalist, and the most despised was the *tetlaxiliqui*, the abortionist. In their dreams and visions, shamans of the Tunguz, Buriats, and other Siberian peoples see their own bodies tortured, pierced, cut into pieces with knives, boiled down to their bones, and then reconstituted. This mystical experience of death and resurrection qualifies them as future healers. In a concrete way, their own body has overcome death and disease. Traveling to other worlds in their ecstasies, these healers bring back medical materials (crystals, herbs, rattles, pieces of bones) as signs of their powerful relationship with sacred beings. One Siberian shaman, for example, fashioned a drum from three boughs he took from the mythical tree growing at the center of the world. That cosmic tree transects every spatial and temporal layer of the universe. During treatment, the sound of the drum transports the patient's soul through space and time to the moment and place where creation began.

The retrieval of the lost soul of the sick person is a dangerous task requiring that the healer's soul exit his or her body and travel to the margins of the universe, to the heights of heaven, or to the depths of the underworld. Ecstatic healers are frequently clairvoyants. Their vision penetrates the opaque matter of the patient's body and of the material world during their quest for the lost soul. Perilous ordeals that jeopardize the soul of the healer fill the journey to fetch

back the soul. Often, the battles that take place in the outer regions of the cosmos are acted out in the center of the healing arena or, if the healer has fallen dead while his soul journeys on high, the epic adventure is recounted in exciting detail later.

Exorcists also have previous acquaintance with spirits afflicting their patients. Although they may not have contracted the disease, they have encountered the supernatural beings who possess the sick. In their initial confrontation, exorcists learn to recognize the voice of the pathogenic spirit. That first meeting of the exorcist and the spirit of affliction amounts to a time of trial in which he or she exercises the techniques needed to expel the possessing spirit. Very frequently exorcists establish a dialogue with the disease-bearing being. In the course of the conversation and interrogation, the possessor reveals its identity either through its voice or by announcing its name. During the dialogue, the spirit also reveals to the exorcist the manner in which it may be expelled. Often the sounds of exorcism that the healer recites are the very sonic structures of the afflicting spirit. The names, songs, babbling sounds, or poems are the outward manifestations of invisible forces.

The *mau tham* (“experts in reciting words”) are exorcists in the Buddhist communities of northeast Thailand. They specialize in magic uses of sacred sound. During apprenticeship, they fall into trance, trembling and losing consciousness, while sacred Buddhist words are recited. While entranced, their teacher interrogates them and learns which sacred verses the disciples need to know to expel spirits. The spirits (*phi*) become identified with the totally incomprehensible sounds, which represent verses from Buddhist texts. The *mau tham* lives a life of strict observance and restriction. Should he or she eat forbidden foods, the knowledge inside him or her, in the form of sonic images of words, would turn into the afflicting enemies that he battles and exorcises in his patients. Exorcism has a slight twist to it because the *phi*, the possessing spirit, actually inhabits the body of a neighbor in the village. From the body of its host, it attacks the patient of the exorcist. During the ceremony, the exorcist forces the patient to pronounce the name of the person in whom the afflicting spirit resides. Then the *mau tham*, recognizing the spirit in question, forces it to leave by reciting its sounds.

In many situations, the relationship between the healer and the patient is dramatically hierarchical (although this hierarchy does not necessarily carry over into other aspects of life). Healing hierarchy can be expressed in various ways: The healer is healthy, and the patient is sick; the healer has inherent healing powers, and the patient does not; the healer has acquired specialized healing knowledge (in a variety of ways), and lay people do not have this knowledge; and the healer has a special ability to communicate with the gods or to channel divine energy, and lay people do not. The high ritual status of the healer is made known through diplomas, lingo, insignia, special clothing, and honorific titles. In many ways, the Western biomedical physician epitomizes this mode.

Years of specialized training and apprenticeship induct him or her into the culture of biomedicine, in which he or she acquires the knowledge and skills related to the practice of medicine—how to “work up” a patient, formulate a case history, arrive at a differential diagnosis, manage a case, work within a medical team, and assume the mantle of authority conferred on physicians, symbolized in the white coat. What differentiates the biomedical physician from some other types of healer is the careful distancing, on the part of biomedicine as a whole, from the notion that the physician taps into communication with the sacred. What takes its place is the power of physical evidence, understood to hold sway even as it is susceptible to the surfacing of new and more compelling data. As a concept, however, evidence functions as a quasi-absolute.

In other situations the relationship between the patient and healer is quite egalitarian with the healer serving as more of a facilitator of the patient’s own healing powers than as an expert who actually carries out the healing. A contemporary example of this mode comes from the world of hospices, hospital chaplains, and congregational nurses, many of whom describe their work as a “ministry of presence”—as simply “being there” with the one who is ill. In this minor mode, the healer accompanies patient, witnesses patient’s suffering, and supports the patient in his or her healing process.

**THE SOCIAL BODY.** With all of these techniques, the practice of religious medicine becomes public theater. The fallen condition of the physical body serves the cause of high religious drama. On the tragic or comic outcome hangs the fate of individuals and communities. Furthermore, the symbolic actions of cure—the episodic structure of the healing séance marked by shifts in music, style, color symbolism, body postures, and changes in symptoms—reveal the meaning of the sacred as it impinges on concrete existence. For this reason, religious healing rituals are well-attended event, spectacles from which flow important symbolic languages used to understand and order the world.

The role played by the community in healing rituals is highly variable. In contemporary American twelve-step programs, the community is essential to the healing process. It is the very fact of the community gathering together that effects the healing. In this maximal mode, illness in the individual often is conceptualized as a reflection of illness in the social body, thus healing must occur at the communal level. The notion that gathering in community is necessary for healing to take place has been well developed by Edith Turner and Victor Turner.

In the Mediterranean area, Western Europe, and the Balkans of Eastern Europe, medicinal dances performed by the entire community heal the sick. The whole group becomes a manifestation of the sacred displayed at their public ceremony. In quite different ways, Sūfī brotherhoods of Morocco, the Macedonian Rusalija, Serbian Kraljice-Rusalje, Romanian Calus, and peasants of southern Italy, from the

classical period of Magna Graecia into the twenty-first century, cure through the power of group dances that battle with supernatural causes of disease and death. At times, the sick patient is forced to arise and dance and, in that way, manifests the healing power in his or her own body. Curative dancing practices are ancient among these cultures. Similar group therapies exist throughout the world. Musicians, especially drummers and percussionists, play a key role. Using their ability to discern the movements of spirits, accompanists guide the community through the episodes of the cure, carefully judging the endurance of the dancers, the emotional state of the ensemble, the mood of the spectators, the nature of the supernatural powers present, and the reactions of the ailing patient.

Janet Hoskins has studied healing among the Kodi people of Sumba in eastern Indonesia. At the time of her fieldwork in the 1980s, the majority of the fifty thousand Kodi people were followers of the indigenous religion that centered on the worship of ancestors, spirits, and deities who live in the tombs, gardens, and houses along the western coast of the island. Kodi society is characterized by intense attention to exchange obligations stretching back into the past. These obligations often become the cause of social tension. Hoskins notes, "Some forms of illness and injury are diagnosed as 'social diseases'" (Hoskins, 1996, p. 273). Cure of these diseases requires elaborate performances that involve a network of kin and affines. Healers whose work is aimed at resolving these kinds of diseases enact what Hoskins calls

"talking cure" whereby all the possible causes [of the disease] are exposed in a divination, as spirits are interrogated in turn and the reasons for their anger are determined. Divination occurs in a group setting, usually with all family members sitting near the right front pillar of the house, as the diviner constructs his interpretation of the spirits' anger. . . . In many ways, his role seems more that of the catalyst for a group-therapy session than of an independent diagnostician, since after each revelation he goes back to the family members, who discuss and evaluate it and provide him with more information to continue the [divination]. (Hoskins, 1996, pp. 275–276)

The fact that the community gathers together does not necessarily mean that the role of the community is to support the patient. Although in many instances all family members gather around the bedside of one who is about to pass over into the next world and the family presence eases and facilitates that final healing, in many other instances, the role of the community is accusative. The American Christian evangelical anti-gay movement, like other deprogramming settings, falls within this category.

The role of disease and cure in reorganizing personal and social experience often leads to the reshaping of worldviews and recasting of social orders. Because sickness is regarded as an adverse form of change, resulting from the ambivalent presence of a new or unwelcome mode of being, the language of disease and cure frequently inserts itself into at-

tempts at innovation or reappraisal of tradition. In the 1560s, for example, local divinities in the Peruvian Andes reportedly swept down from the sky or rose out of their earthen shrines to enter the native population and afflict them with uncontrollable dancing diseases. The frenzied dance was expected to bring on the end of the world, overthrow Spanish overlordship, and restore power to local people and gods. By the thousands, Andean Indians became savior-gods incarnate and danced the *Taqui Onqoy* ("the dance of the Pleiades"). After nearly a decade, Spanish authorities crushed the movement and condemned some eight thousand leaders to corporal punishment or exile.

Because powers of affliction strike their victims without their consent, disease becomes a vehicle of social change, resistance, and unrest for which the restless cannot be held accountable, for they are victims themselves. In this way, symptomatology and epidemiology can indicate far-reaching social stirrings and help pinpoint latent motives for them. Conversely, cults of disease can be ways of carrying forward ancient religious traditions or sociopolitical structures in the face of the overwhelming power of a dominant religion or political authority. This is the light in which Ernesto de Martino (1957) interprets certain folk diseases and rites of musical cure in rural Italy.

At times, the language of disease and cure appears to be a vehicle for the creation of new religious forms and experiences. The spontaneity of disease, circumventing the process of institutional permissions, prompts lay people to experiment with new religious forms and combine elements of traditions that appear to be quite disparate. Many of the independent Christian churches of Africa provide an important forum for the religious interpretation of disease and rites of cure. These churches maintain long-standing traditions of African religiosity while, at the same time, they give new life and meaning to the Christianity brought by European missionaries. In Douala, Cameroon, a growing group of devotees follow two prophetic women leaders. The two prophetesses call their disciples the "sick ones of the Father" and divide them into groups, according to the categories of the sick mentioned in the Gospels: the blind, the paralyzed, the epileptic, the deaf, and the dumb, although the disciples do not actually manifest these symptoms. Eric de Rosny (1986) points out that many of them do not appear to be sick at all, but, deep within themselves, they must identify with these diseases in their inner being to qualify for participation in the group of the elect. The two prophetesses deliver lengthy discourses that reweave the imagery and understanding of traditional African and Christian belief. It is the experience of their peculiar illnesses that provides the basis for this social reshaping and rethinking.

## HEALING AND MEDICINE: HEALING AND MEDICINE IN AFRICA

Traditional African healing falls into three basic categories of treatment: common folk remedies known to most family members that usually do not require ritual observances; secret remedies handed down from mother to daughter or from father to son; and treatments administered only by priests or other specialized healers. These specialists, including priests, undergo training periods and initiations, and receive payment for their services. Africans do not distinguish between body and mind as far as treatment for illness is concerned. While much of African healing is based on practical knowledge and experience, it is also situated within specific social and religious contexts that frequently require ritual actions.

**RELIGIOUS BACKGROUND.** All African religions are monotheistic; that is, they are based on belief in a single divine being (Smith, 1950), but in most cases this Creator or Architect has lost interest in the everyday affairs of human beings. Thus, when people call on this being for help or approach him for healing or blessings, they usually make their supplications through or to intermediaries. In some cases the belief system includes other beings, the result being a pantheon of gods or more frequently a collection of spirits and shades. Some writers refer to the shades as ancestors, ancestor spirits, or the living dead who serve as intercessors.

African cultures and their associated religions should be understood within their respective geographical and ecological contexts. West Africa differs in many respects from the rest of Africa, while lesser features distinguish between east-central and southern Africa. These differences were originally highlighted in Melville J. Herskovits's discussion of culture areas in Africa, but are also obvious in the religious structure. Geoffrey Parrinder explained in his 1949 study of West Afri-

can religion that the supreme being frequently emerges as the first among equals. Examples include Onyame among the Akan people, which includes the Asante of Ghana and the Ivory Coast; Mawu among the Fon and Ewe of Benin; or Olorun among the Nigerian Yoruba. Below the supreme being are intermediary deities or chief divinities that are non-human in origin and often associated with natural forces. These gods require temporary dwelling places and priestly service. Spirits and shades, who are closer to living people than either the supreme god or lesser deities, are on the third level. Below the shades is a fourth level of sacred charms and amulets with special powers.

People in the rest of sub-Saharan Africa hold a very strong belief in deceased family members who have been ritually set apart as shades. They may ask these deceased relatives to intercede with the supreme being, who is known as Mulungu among the Kamba and uMvelinqangi (the First Being) or uNkulunkulu (the Great-Great One) among the Zulu. The Kamba recognize Mulungu as a creator and preserver, and they venerate the spirits of the departed. These people believe that their ancestors play a major role in maintaining their physical and mental health. Normally they offer the shades sacrifices or food gifts accompanied by requests for blessings, health, and cures. There need not be a special meeting, a formal setting, or a religious gathering for offerings and prayers. When people take a meal, they flick small pieces of food over the shoulder, pour out a few drops of beer, give thanks, or make a short specific request of the shades. They may also invoke the shades in praise songs and formal addresses when they offer sacrifices or perform other rituals. They may eulogize, plead with, or even threaten the shades—as when a Zulu warns an ancestor to cure or bless him by saying, “If I die, there will be no one to bring you sacrifices.”

Healing in Africa represents an attempt to answer two basic questions: How did the illness or traumatic accident happen? And why did it happen (to me or to my family)? The unseen world also contains forces, both good and evil, that must be controlled or employed by specialists in healing. An exception to this rule might be the Nuer of Sudan, who believe that all misfortunes derive from God. In fact the members of this group have very few medications and doubt even their efficacy (Evans-Pritchard, 1956).

**HEALTH.** An absence of health and well-being suggests illness (a cultural concept) or disease (a pathological concept). Patients suffer illnesses, but modern physicians diagnose and treat diseases. Traditional healers address the illness while attempting to cure the disease. In all of Africa, an imbalance in the body, or between the body and the social or natural environment, is caused by sorcery and witchcraft, which operate in the religio-magical field.

The Akan hold a representative West African concept of health in that they understand it as a correct relationship with one's environment, both natural and social (Appiah-Kubi, 1981). The Akan regard health and disease as inextricably

connected to social behavior and moral conduct. Illness represents an unbalanced relationship with the environment, although it may also result from the malevolence of an evil spirit or witch. The essential person for treating illness in this context is the priest-healer.

The Kamba of eastern Africa distinguish between God-given and natural diseases. “‘Witchcraft’ (merged conceptually with sorcery) has become a ‘catch-all’ explanation for myriad disorders in interpersonal relations. It was also a widely acceptable cause of personal failings ranging from lack of success in business, love, and school to sudden illness or strange disease, and especially barrenness and impotency” (Good, 1987, p. 223). Among the Taita, however, religious practices are directed toward turning away anger in any form and restoring peace, health, and general well-being. The Swahili regard restoration to health as the result of correcting an imbalance in the body. This view is related to the beliefs of other Muslim groups in West and East Africa (Trimmingham, 1969; du Toit and Abdalla, 1985).

The Zulu of southern Africa are representative of a wide range of Bantu-speaking peoples. The term *isifo* refers to disease manifested in somatic symptoms, various forms of misfortune, and a general state of vulnerability to misfortune and disease. Harriet Ngubane (1977) explains that illnesses among the Zulu fall into two categories. The first group is caused by biological factors associated with living and aging. Diseases in this category are not the patient's fault and can be treated or cured by potent nonritual means, including Western medicine. Diseases in the second category result from imbalances between a person and the natural environment, or in the sufferer's interpersonal relations. Treatment requires the restoration of order and balance. Good health flows from the internal and external harmony of a person's life with the social as well as the physical universe. Ideally a person is in harmony internally, in external social relationships, and in relation to nature.

**HEALING.** Illness does not necessarily involve an individual event as much as it reflects a disturbance in social relations. The effect of such disturbances in the body or the social setting may result in illness without disease. Disorder may manifest itself in physical, emotional, spiritual, or social discomfort. Treatment must therefore involve restoration of the body or of the person's overall human nature, and it must occur in the familiar social setting. The personnel involved in healing span the range from diagnosticians and healers in contact with spirits to ethnobotanical specialists and applied psychologists. In West Africa the Akan distinguish among priests or priestesses, herbalists, bonesetters, and birth attendants. The Yoruba of Nigeria differentiate between priests of the Ifá cult, the *babaláwo* who specialize in divination and psychotherapy, and *oníṣẹ̀gùn* or herbalists. It is common in East Africa to find healers categorized as diagnosticians, herbalists, birth attendants, and surgeons who perform male and female circumcisions. In southern Africa diagnosticians and herbalists are the major categories of healers, although individual practitioners may become specialists.

**Diviner-diagnostics.** Throughout Africa the diviner-diagnosticsian is essentially the person who receives and interprets communications from the supernatural world. Appiah-Kubi states that “Traditional Akan practitioners often determine the cause of disease . . . [now] patients complain that it is they who make their own diagnosis, while the modern doctor merely puts a label on their disease” (1981, p. 75). In many cases material objects are employed as receivers of messages from the spirit world. Diagnosticsians may make use of divining bones, as among the Sotho and Tonga; divining bowls, as among the Venda; or direct communication with the spirits, as among the Nguni-speakers. Nguni-speaking diagnosticsians may listen for voices or ask the patient to respond to questions. While asking the questions, the diviner is in fact watching the dilation of the patient’s eyes, listening to respirations, and touching the patient to note changes in body temperature. Edgerton (1971) describes the questions that were asked by Abedi, a psychiatrist among the Hehe of Tanzania. “Abedi was probing carefully for an understanding of the social context of the illness. Who might be an enemy? What is the patient fearful about?” (p. 296).

The peoples of West Africa distinguish among priests and assistants who are dedicated to the service of a particular god, seers, and herbalists. The priest or priestess, who is also called a medium, is found in Asante, Ewe, Fon, Yoruba and other societies. The medium enters a trance state and sits in front of the shrine while communicating with the god residing in the shrine. Among the Ga such mediums, if married, must leave their families—although male mediums are allowed to remarry following their training. The medium is appointed by the village chief or priest. Training takes two to three years and is accompanied by strict discipline. The Fon and Yoruba have “convents” for the training of mediums: the course of instruction takes nine months for a boy but three years for a girl. The Bariba of Benin regard healing at the domestic level as an extension of the nurturing role. Thus they prepare medicines for skin diseases, respiratory disorders, and gastrointestinal ailments for children and even adult members of the family. They also treat themselves for malaria or diarrhea. The adults consult female or male healers called medicine people for more severe disorders. The male medicine people, however, are always considered senior to the females. There is also a widespread belief that women of childbearing age are dangerous and may contaminate medicines; consequently only men or postmenopausal women may administer strong medicines to combat dangerous or stubborn afflictions.

In eastern, central, and southern Africa there exists a widespread therapeutic tradition based on the role of diviner-diagnosticsians. These healers’ names are variations on the root *ngoma*. The term is associated with drums and the rhythms of song and dance. Thus Victor Turner titled his 1968 study of the Zambian Ndembu therapies *The Drums of Affliction*. Typical health problems treated with *Ngoma* therapy include impotence in men, infertility in women, epi-

lepsy, snake bites (in Tanzania), the testing of dreams and visions, and personal difficulties of human or spirit origin. Some forms of *Ngoma* therapy are effective variations of psychotherapy.

A clear pattern exists in East Africa, where the Kamba recognize a category of religio-medical specialists. Although this group includes both genders, medicine women are more common than medicine men. Aided by supernatural powers, they practice divination, curing the sick, and invoking ritual protection for livestock and fields. The Giriama of Kenya recognize diviners, mostly women, who are innocent mediums through whom powerful Islamic and other foreign spirits communicate. These women practice diagnosis as well as divination. Among the Swahili the “spirit doctor” is consulted by patients who suspect that their illnesses are produced by sorcery.

Diviner-diagnosticsians among the Sotho peoples of southern Africa employ divining bones. Among the Nguni, including the Zulu, the ancestral shades are said to guide the diviner. The diviner’s profession is not hereditary. Any person can become ill, which is a sign of calling, and undergo a lengthy initiation. While the author was carrying out research in an urban area outside of Durban in 1974, a boy about thirteen years of age had dreams about the neighbors. Time and again these dreams proved uncannily correct. A short while later the author was invited to a sacrifice and farewell for the boy, who had obviously been “called” by the shades and was being sent to northern KwaZulu-Natal for traditional training. Diviners, however, are usually women who do not choose to become diviners but are chosen by the shades. The shades do not take possession of the diviner’s body but “sit” on her shoulders and whisper into her ears. Among the neighboring Swazi, the shades may also “call” an apprentice. The diviner’s training lasts an average of three years and costs several hundred dollars in cash as well as one or more cows and goats for sacrifice to the shades.

**Herbalists.** Most African societies recognize persons with specialized knowledge concerning plants and their therapeutic properties as well as diviners and spirit doctors. What is meant by pharmacopoeia in Africa, however, is best described as faith in the curative properties of compounds with a vegetal base. What these products lack in curative value is compensated by the ritual that enhances the patient’s faith. African healers have an extensive knowledge of the properties of barks, roots, leaves, and herbs, as well as the catalytic effects of plant combinations or mixtures. Every African society has a category of herbalists who dispense remedies on the basis of either spirit guidance or symptom recognition. Such plant-based remedies may be administered as plasters, sedatives, purges, or cures. Their success requires two basic ingredients: the power of the practitioner’s thought and will, and the patient’s faith. Herbalists, who may be either men or women, are “called” by the shades in dreams, visions, or waking summons.

As in many other contexts, medicinal plants in West Africa may be personified. Before digging a root or cutting a branch or leaf for treatment purposes, the herbalist must put down some eggs, a mashed yam, or a sacrificial bird; otherwise the plant will lose its potency. Among the Azande of Sudan a young person who feels called to be a herbalist will start a long and costly training period. The teacher scrutinizes the student's intent to provide medicine to strengthen the soul and confer special powers. When the training has been completed, the candidate is admitted to the society of his or her colleagues. Among the Azande, this ceremonial reception involves undergoing a public burial after which the initiate joins the association of medicine people. As long as Africans regard sickness and misfortune as religious or spiritual experiences, traditional curers will continue to practice their callings.

Herbal remedies may be selected for a variety of reasons. Their efficacy may be related to such qualities as taste, smell, appearance, and texture. Color is among the most common signatures of effectiveness. The Hausa of northern Nigeria use red plants (including henna, red root, and blood root) to treat wounds and to fortify the blood. Such yellow plants as goldthread or goldenrod are used to treat jaundice. Milky latex is used to stimulate lactation in women after childbirth. One of the most important problems that traditional doctors confront is infertility. Plants that produce copious amounts of flowers, fruits, or seeds are used as fertility enhancers in the same way that plants which readily shed their ripe fruit are used to ease the process of childbirth.

The Giriama of Kenya use the term *muganga* for both diviners and herbalists, although they also indicate a healer's field of specialization within this generic classification. Examples include a diviner who is called a "doctor of the head" and a herbalist who is called a "healer of the basket." This differentiation underscores the belief that both practitioners are doctors whose healing skills range quite widely. Swahili herbal doctors learn their profession from their fathers. They share a basic belief in the balance theory of illness with Muslims beyond Africa. The concept of balance is not limited to the body and its functions but extends to social morality as well.

The basic term for herbalist, based on the root *-nga*, appears throughout eastern, central, and southern Africa, although the specific distinctions between diagnosticians and herbalists may have become blurred in some instances. Thus the Shona (Gelfand, 1962) distinguish between *nganga* who use divining bones and *nganga* who treat ailments with herbs and other medicaments. Many groups, however, combine these healing functions in one person. Good (1987) speaks of the East African *mganga*. Elsewhere, the Shona refer to *nganga*, speakers of Sotho to *ngaka*, and speakers of Nguni to *nyanga*. These healers are called by the shades and undergo apprenticeships in which botanical and ritual knowledge is passed from mother to daughter or from father to son. Treatments or prescriptions may call for sacrifices to placate the

spirits or shades who may have been afflicting the patient with bad luck or poor health. The first form of treatment administered is purification through administration of an enema or induced vomiting. The second is the use of herbal medicines. The Zulu word *umuthi* (literally "tree" or "shrub") applies to noxious as well as curative substances of vegetable origin. The same root for *tree* is found throughout the Bantu-speaking world—*umuti* among the Lamba of Zambia, *muti* among the Shona of Zimbabwe, and *amuti* among the Herero of Namibia—and points to the vegetative base of all healing. A researcher among the Zambian Bemba explains, "I know no Bemba charm which does not contain the roots, bark, or leaves of at least two different trees" (Richards, 1961, p. 232).

**Social context.** African patients rarely consult a diagnostician or healer unless they are accompanied by a family or village member. Sickness occurs in the social setting, and therefore curing must also take place in that setting. Referring to these support groups, Charles Good (1987) refers to the "significant others," while Jan Janzen, writing in 1978 about the people of lower Zaïre (now Congo), illustrated the importance of the "therapy managing group" who must be part of the diagnosis and treatment. Members of this support group accompany the patient to consultations with the diagnostician and are involved in the rituals and administration of medications that follow such meetings.

**Childbirth.** Among the Bariba of Benin practicing midwives are usually postmenopausal women with several living children. The midwives occupy a curious position in the hierarchy of healers. Some women serve as informal assistants at problematic deliveries of neighbors and kin. Women who have served an apprenticeship under a midwife, however, may employ ritual incantations, gestures, and sympathetic magic as well as herbal medicines when they assist a woman in labor. Some Africans view midwives as true healers while others regard them as technicians.

Islamic influences are clearly present among the Wolof of Senegal and Gambia. Before a newborn infant is allowed to suckle, the child must drink a potion made from washing off a verse from the Qur'an that had been written on a wooden slate. This verse is meant to keep away malevolent spirits. A goat is also sacrificed. Rituals surrounding birth are performed not only to strengthen the mother and child, but also to keep evil forces at bay. In addition, powers in the supernatural realm always receive recognition. The Gikuyu in Kenya recognize a normal birth by secluding the mother for a few days, following which she shaves her head and the father sacrifices a sheep in thanksgiving to God and the shades. This act of sacrifice, accompanied by brewing beer, is also performed to mark the birth of a Zulu child.

**Surgery.** Traditional African healers possess an extensive knowledge of human anatomy. Some of this knowledge is gleaned from observing the carcasses of hunted or domestic animals, while other anatomical information is obtained from treating human victims of hostilities or accidents.

One form of specialization among the Akan in West Africa was the bonesetter. Such a person was skilled in treating patients with rheumatism and arthritis. The bonesetter also functioned as an orthopedic surgeon, helping to repair broken limbs.

The most common forms of surgery are related to life-cycle changes. These procedures may involve extracting the incisor teeth; scarification; and various forms of circumcision of males (removal of the prepuce, subincision, or superincision) and females (removal of the prepuce of the clitoris, clitoridectomy, or infibulation). In many societies these latter events take place in the context of elaborate rituals presenting the initiates to the shades. The addresses made on these occasions are prayers complete with supplication, praise, and personal commentary. Postsurgical treatment of patients involves herbs, poultices, and wraps with astringent or disinfectant properties.

A number of societies employ cupping, or placing a horn over a bleeding incision, as a form of therapy. The Kamba and Maasai of Kenya used thorns to suture incisions. The former of these groups are reported to have removed the uvula of patients, while the Maasai also perform amputations of limbs with hopelessly complicated fractures. The Zimbabwean Shona fill a bleeding wound with spider webs. The resulting contraction of blood vessels stanches the flow of blood. Trephination is performed in Uganda and Nigeria. Robert Anderson (1996, p. 360) recounts the method of carrying out this procedure among the East African Kisii and Bakuria. Following severe trauma to the head resulting in fracture, the patient's head is shaved and a cut made through the skin, muscle, and underlying connective tissue. Bleeding is controlled by the application of herbal powders and charcoal. The surgeon scrapes away the bone with a sharp knife, taking care to avoid penetrating the *dura mater*, which is the outermost of three layers of protective membrane surrounding the brain and spinal cord.

**Protection.** Protection may simply refer to maintaining the personal and environmental balance essential to health. It may involve matching hot and cold items, or sour and sweet substances. Rituals for protection are performed for both persons and residences. In the case of persons, such rituals are prophylactic and normally take the form of taboos. These may include meticulous avoidance of forbidden objects and the careful execution of ritual observances. A taboo limits contact between people and objects that may be defiling or between healthy persons and those who are either contaminated or weak, such as postpartum mothers, newborn infants, and others in various marginal conditions. The Yoruba have a smallpox deity served by a priest who is immune to the disease following recovery from it. They also use their left hand to handle dirty objects in order to keep the right hand clean for eating. In African villages, disease and misfortune are religious experiences and must be approached from a religious perspective. That is why these same protection rituals are currently being performed for Christians (Oosthuizen et al., 1988).

The Yoruba use the same word *oogùn* for medicine and charm. A good doctor is an *oniṣẹ̀gùn*, while a witch (the owner of medicine) is an *oloogùn*. Medicines cure while charms ward off danger. The most powerful protective charm found among the Asante as well as among the peoples of Benin and Nigeria, is a small broom of palm fibers with sacred objects attached. It is the object of sacrifices and takes evils upon itself. Most houses are protected by charms hanging above the doorway. Muslims use yellowed and dusty pieces of paper floating from the roof inscribed with texts from the Qur'ān. Nearly all the fields are protected with charms as well as the entrances to villages. Travelers in the area frequently enter a village by passing under a protective arch. The Ndebele medicine men supply medicated pegs for the gates of a new homestead. It is common to find a plant called *inthelezi* growing outside a Zulu home. These objects serve to safeguard the home and its inhabitants against sorcery, witchcraft, and, in Ethiopia, the evil eye.

**HEALING MIND AND BODY.** The mind and the body are separately recognized and treated using mystical powers. The mind can also be treated directly employing therapies, herbal preparations, and consciousness altering substances.

**Witchcraft and sorcery.** A study of African health would be incomplete without recognizing the role of mystical powers that may be manipulated by diviners and other specialists. Witchcraft and sorcery occur when people are under severe stresses and strains in life, or when they experience tension, whether actual or potential. People may believe themselves to be victims of witchcraft, or they may employ it against their competitors or enemies. The well-known Africanist Mary Douglas remarks that "the African is almost as liable to die from a poisonous idea put into his head as a poisonous herb put into his food" (quoted in Nottingham, 1959, p. 7). Such beliefs may produce illness in a person without an identifiable disease agent. (The opposite, disease without illness, is finding expression in the pandemic of HIV/AIDS.) From the point of health, sorcery and witchcraft enable people to deal with their failures and frustrations. The witch is generally believed to be inhabited by a power more evil than good that directs her or his nefarious acts. The sorcerer is a person who knowingly directs injurious magic to other persons. Magic may be either good or evil. The medicine man uses good magic essentially for the benefit of a patient, village, or society. When this power is employed maliciously it becomes black magic, evil magic, or sorcery. These terms allow people to explain away their failures or blame them on unseen evil forces or other persons employing these forces. M. G. Marwick describes the social context of sorcery in his masterful 1965 study of the Cewa of Zambia.

**Ethnopsychiatry.** "Medicine-men," says John Mbiti, "are the friends, pastors, psychiatrists and doctors of traditional African villages and communities" (1969, p. 171). For this reason, one cannot speak of ethnomedicine without also considering ethnopsychiatry. This form of treatment completes the holistic approach to illness-disease-sickness, anxi-

ety-relief, grief-causality, foreboding-interpretation, and stress-relaxation. Ethnopsychiatry is a specialty that deals with culturally defined forms of social deviance. Africans live in a world peopled by vengeful ghosts and spirits, witches and sorcerers, and angry or jealous relatives and neighbors. Akan society has cultural mechanisms that allow it to absorb most forms of psychiatric disturbance. One mechanism that is found very widely in Africa is confession, which lowers guilt and stress levels, removes social tensions and accusations, and usually decreases symptoms. The traditional healer as psychiatrist explains the causes of illness in animistic terms familiar to patients who grew up in a world peopled by spirits. The medicines that are prescribed for psychiatric problems frequently produce psychopharmacological effects. In West Africa emetics and purgatives are followed by herbal compounds that act as tranquilizers and sedatives. According to one study, however, some Yoruba patients complained that they were given “poisons” to make their madness worse so that the healer could charge higher fees. The plant that was used is a species of the genus *Datura* that contains hyoscine, or scopolamine—a hallucinogenic agent. The Yoruba also employ Rauwolfia, which is the source of reserpine. Mind-altering substances are also employed in other parts of Africa; *Cannabis sativa*, for example, is used during childbirth among the Sotho.

Robert Edgerton (1966) conducted some of the early research in East Africa dealing with this subject. Among the Hehe of Tanzania, the Sebei of Uganda, and the Pokot and Kamba of Kenya, village members can list culturally defined behaviors that identify a person as psychotic. Among these are violent actions, sleeping or hiding in the bush, wandering around naked, and talking nonsense. Edgerton explains that the social group, rather than a diagnostic label, defines abnormality. He illustrates how the negotiations among patients, healers, family members, and friends structure the definition of mental illness. It is also this group that recognizes, defines, and responds to psychosis through a process of interpersonal relations.

One of the classic cases of psychiatric treatment is derived from the work of the Nigerian psychiatrist T. A. Lambo (1964). He found numerous individuals suffering from schizophrenia and other psychotic disorders on his visits to Nigerian villages. These persons were not institutionalized but considered a part of everyday village life. In October 1954 two projects were started at a village named Aro. The first project was a day hospital that allowed patients to go home at night. This phase lasted for two years. The second phase involved extending the day hospital to a village care service. The advantages of community involvement and social acceptance of healers and patients were so clearly evident that this village hospital model was expanded to other countries. Lambo believes that cooperation with indigenous healers contributed to the understanding of psychopathology and the psychodynamics of mental illness in Africa in relation to cultural and social variables.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN THE AFRICAN DIASPORA

For more than a century, African-based religions in the Americas have been dismissed as mere superstition or titillating witchcraft. The racism that feeds such caricatures has endured into the twenty-first century even though these religions are now neither rare nor out of reach. Palo Monte, Santería, Vodou, and Rastafarianism are likely to be found in every sizeable city in Europe and the United States—as are the variety of contemporary religious practices known as Yoruba revival. Traditions such as Umbanda, Candomblé, and Shango may be scarcer, but they also have some international presence.

African-based religions are eclectic by default and in ways that emphasize both their developmental history and their innate flexibility, which has made it possible for them to survive. Broad African perspectives dominate in the diverse group of religions born from chattel slavery, but they also have absorbed South American and Caribbean autochthonous religious practices. Colonial Christianity has also had a substantial influence on African diaspora religions. Without giving up their primary focus on African-based religion, most contemporary followers of Vodou or Santería—whether in Haiti, Cuba, or New York City—publicly identify themselves as Christians. At the beginning of the twenty-first century, in both the United States and the Caribbean, attendance at Catholic churches is part of the ritual life of an initiate of Santería or Vodou.

African-based religions were shaped by two powerful forces: the cruel and dehumanizing social structures that characterized transatlantic slavery and the creative responses of the enslaved who mustered to the cause resistance, flexibility, humor, strength, and endurance.

**HEALING WITH LEAVES.** Virtually all African-based religions emanating from South America and the Caribbean are focused on healing. These religious practices present a more diverse interpretation of illness and well-being than Western allopathic medicine provides. A leader/healer in Vodou, Candomblé, Umbanda, Santería, or Palo Monte is expected to function in diverse ways, including as a stand-in parent, a psychologist, a social worker, a priest, and, very likely, an herbal doctor. All African diaspora priests are not equally educated about medicinal plants; however, those with skills in healing commonly use leaves in the curative process in one form or another.

Healing with leaves is a common theme among African diaspora religions. Herbs, most often referred to as leaves, can be a curative agent in many ways, varying from being the source of medicinal tea to serving as an important ingredient in spiritual charms or talismans. Sacred leaves are also brushed across the human body in an act of spiritual cleansing or exorcism. They can also be kneaded in water and applied to the body as a poultice. In treating something like a headache, whole leaves fresh from the bush can be laid on the forehead and secured with a scarf. In Brazil, herbal baths are administered by the *mae de santo* (mother of the saints) or the *pai de santo* (father of the saints), whereas in Jersey City, New Jersey, *santeros* administer similar baths to those awaiting initiation, and in Cuba the *casa de santo* (house of the spirit) is spiritually cleaned by sprinkling the floor with a leaf infusion, heavy with the perfume of basil. A carefully constructed series of cleansing baths followed by strengthening baths, made from leaf infusions and other ingredients such as powders, perfumes, fruits and liquors, is as likely to be prescribed for trouble in the workplace as it is for a disease. All problems—physical, spiritual or magical—can profit from herbal treatment.

#### **DIAGNOSIS AND THE THEORY OF PARALLEL CAUSALITIES.**

Diaspora priests offer healing to clients for a wide range of ailments and their causes, including professional, social, spiritual, amorous, monetary, familial, or even political. As in allopathic healing, curing begins with diagnosis and, in the African diaspora, diagnosis comes through divination. Tossing cowrie shells, gazing into water-filled glasses or burning candles, going into possession, and card reading are among African diaspora divining techniques. African diaspora divination is more of a discerning mechanism than a crystal ball, and although divination techniques are diverse, they usually work on a theory of parallel causalities. Vodou card reading provides an example: A client who goes to a Haitian *manbo* (priestess) for a card reading will not hear a prediction of the future. Instead the *manbo* will engage the client in a series of questions and answers designed to unlock the secrets of the present and reveal important things in the past that have been forgotten. The *manbo* will lay out the cards twice—once to determine what is happening among the living and a second time to see if spirits or ancestors are involved. In most traditions a particular physical ailment has no connection to a specific spiritual problem. Therefore, a connection between, for example, the inability to sleep and a troubled ancestor would emerge only through the divination process.

Once a problem is revealed, treatment will proceed on both human and spiritual levels. For insomnia, the *manbo* might suggest an herbal tea, an over-the-counter sleeping pill, or even a trip to a medical doctor. Most healers in the African diaspora tradition have accepted the skills and powers of Western allopathic medicine, and they counsel their clients to take advantage of the help a medical doctor can provide. For the *manbo*, the spiritual connection revealed in divination amounts to a second layer of causality. For her, this dimension of the client's problem is more serious—and needs more attention—than the physical problem. The *manbo's* prescriptions for healing the spiritual level of the problem might include such things as *wanga* (a charm designed to change a dysfunctional relationship), herbal baths, and even elaborate rituals such as a Catholic Mass for the dead to honor an unhappy ancestor. A strong sense of family lingers in African diaspora healing practices. It is not unusual for a client to be told that the cause of the problem is an event in the family that happened before he or she was born.

Physical ailments are sometimes diagnosed as messages from the spirits. This genre of diagnosis that is familiar to almost every individual in the African diaspora. By tracing an illness or a social problem along parallel causal paths through the land of the living and the land of spirits, that problem is firmly located in a relational connection rather than in an individual person. Guilt is thus diffused and community ties are reinforced through the palliative rituals prescribed by the healer. The client's sense of helplessness is abated, and, most important, suffering is given meaning. It is common for a religious leader to be called to his or her healing vocation through a manifestation of prolonged phys-

ical illness. The authority of any diagnosis that includes the intervention of the spirits is assured when the illness at issue is one that Western medicine can neither diagnose nor cure.

**HEATING THINGS UP: RAISING ASHE.** African diaspora religions configure the world as a web of relationships connecting the living, the ancestors, and the spirits. Each group has a role to play and each group needs the other two, thus the exchanges among them are ideally kept in an active balance, one that is simultaneously dynamic and equilibrating. *Ashe*, a common Yoruba term in Santería and Candomblé (it has similar meaning in other African diaspora religious traditions) can be translated as vital energy or divine energy. *Ashe* flows through the web connecting the living, the dead, and the spirits, thus effecting healing. *Ashe* is present in people and can be raised by many means—especially spirited dancing and drumming. In Haitian Vodou, it is said that no spirits will come and possess the vodouisants unless the gathered group does not first *echofe* the ritual event itself. Accordingly, every ceremony becomes a context for community healing. *Ashe* is also in the juices of healing leaves and the blood of sacrificial animals. Healing through leaves and blood sacrifice necessarily includes reciprocity with plants and animals. Thus, the person who kills an animal may first offer it a bit of food. If the animal agrees to eat, it agrees to be sacrificed. In a similar way, when the chicken, goat, cow or pig has been killed, priests pour libations on its body in exchange for the sacrifice, much as “leaf doctors” leave a few coins on the spot where they collect their healing leaves.

**MAKING WANGA.** African diaspora healers tend to extrude the problems at hand. Healers make models of troubled relationships to “work” with them. For example, an unfaithful husband is made manifest through a male cloth doll. The doll may be stuffed with leaves, powders, coins and, most likely, a piece of paper bearing the name of the offending husband. The work then begins. A length of copper wire is used to tie the husband’s image into a doll-sized chair. A padlock secures the wire. The wife is given the key and instructed to throw it away where no one, including herself, will ever find it. This is called making a *wanga*, a somewhat generic term for charms and talismans in Caribbean culture. The manufacture of the charm articulates and activates the human situation, thus opening the possibility of change. The next step, “working the *wanga*,” brings the spirits into the process. The doll, bound in his chair, is situated to face a mirror. Between the mirror and the doll, an oil lamp burns twenty-four hours a day. The unhappy wife feeds the wick and instructs the spirits to make her husband see himself clearly and thus see how much damage he is doing to his family. She works the *wanga* two or three times a day. Working the *wanga* is one way to heat things up, that is, to raise *ashe*.

There is a rich repertoire of charms in the African diaspora. Protective charms designed to secure a house are common. They are either buried in the yard or hung in the house rafters. One version of what Vodou practitioners call a *gad*

(guard) is an herbal mixture placed under the skin of the upper arm. This particular charm functions as a look-out that warns the person of immanent dangers by inducing a tremor in the arm. Jamaicans talk about the activation of a malevolent charm as “planting” something. Charms of that sort are thought to be capable of remaining maliciously potent for generations. By contrast, there are many charms known in the African diaspora that anyone can make in a minute without the help of a healer, and most are not expected to function beyond the immediate situation. For example, small packets of meaningful leaves in the shoes can “heat up” in the very act of walking. This is yet another way of activating the *ashe* in leaves. About to face a judge, the accused may place honey on his tongue before leaving the house, and once in court, he may memorize the names of the judge and the lawyers, to be used for another sort of *wanga*.

**POISONS THAT HEAL.** A few contemporary African diaspora healers with extensive botanical knowledge may still know how to administer a variety of poisons. Poisoning techniques have been passed down from healer to healer for generations. By the turn of the twenty-first century, these recipes had become quaint memories, but during the time of the slave colonies, poisoning was a powerful weapon, one of the few that slaves had. It was a serious—although exaggerated and politicized—issue throughout the colonial era. When slaves actually used it as an act of resistance, they could and did throw the white population into a headlong panic, which often produced hideous punishments. Gifted healers among the slaves were known to be hanged, shot, and even burned alive—some for no reason other than their suspicious herbal knowledge. It is likely that during the period of chattel slavery most slaves who knew about leaves were likely to know how to concoct poisons. Most did nothing with these recipes. Perhaps, those who did thought of their use as a continuation of a spirit-fueled healing tradition. When slavery is the context and survival is at stake, poisoning could well be seen as a community healing agent.

It is certain that the white colonial population did not think of poisoning by slaves as a positive contribution to the community. During the late eighteenth and the early nineteenth centuries, when the enslaved people laboring in Haiti began their uniquely successful bid for freedom, the colonial population in the Caribbean was already ill at ease in the company of so many angry black men and women. Fear, hatred, and ignorance among the white colonial population fueled the fires of suspicion. Whites had little understanding of African diaspora religious practices. They passed laws that related the making of healing charms with the manufacture of poisons. At times, the punishment for making *wanga* was death. Ironically, the antisuperstition laws in place before the Haitian Revolution remained after liberation; however, in the aftermath of the revolution, the political valence of laws against the making of *wanga* changed: Legislation that resulted from a witch-hunt for poisoners in colonial Haiti was co-opted by politicians who wanted Haiti to appear to the larger world as a “civilized” Catholic country.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN THE ANCIENT NEAR EAST

Distinctions among religion, magic and nature, and rational thought, when referring to an ancient society that did not use those descriptive categories, are ultimately regarded as inadequate by the majority of scholars who study ancient Near East societies. Therefore, the terms "empirical" and "exorcistic" will be used throughout this entry to define the various aspects of the art of healing in the ancient Near East.

**CUNEIFORM SCRIPT AREA: MESOPOTAMIA.** Two different kinds of healers are mentioned in the earliest records: the *azu* (usually translated as "doctor"), found during the first half of the third millennium BCE, and the *ashipu* (usually translated as "exorcist"), also in evidence during the same period, and more commonly after the second millennium BCE. The latter term was derived from the active participle of the root *wshp*: "to conjure." Scholars have tried, without much success, to differentiate these two professions from each other. Texts show that the two roles overlapped, and both types of healers used the same methods, prayers, and exorcism formulas. Scurlock (1999) has recently proposed a satisfactory explanation, however: *ashipu* was similar to a doctor and the *azu* resembled a pharmacist, although the *azu* was also able to perform minor surgical operations. This explanation has been confirmed by P. Abrahams (2003), who has managed to place these two professions in the context of Mesopotamian cosmological thought. The exorcist (*ashipu*) possessed essential knowledge which originated directly from the god Enki/Ea and was given to humans by the goddess Nininsina (literally, "Lady of [the city of] Isin"). He or she warded off evil by uttering formulas and performing rituals and treatments. The skills of the *azu* in contrast came directly from the goddess Nininsina alone (a lesser-ranking but important deity) and from her son Damu.

Evidence of an herbalist tradition exists in cuneiform texts from Ebla, in northern Syria dating from the twenty-

fifth century BCE; the skills of the *azu* emerged from this tradition (in fact, the profession's title is mentioned in the texts). It is reasonable to suppose, however, that the *azu* did not restrict his activities to the therapeutic use of plants, because the presence of small instruments may suggest that he performed surgery (D'Agostino 2003).

Collections of exorcistic texts from this period reveal the beginnings of a rich literary tradition which would continue until the end of Mesopotamian civilization. One line of exorcistic tradition runs throughout the third millennium BCE; from the second millennium BCE onwards, although the previous tradition continued, new trends also developed (Michalowski 1992). In this later literary tradition, the choice of particular material, drawn from an oral legacy and written down, gave rise to the distinct tradition of "academic" knowledge (typical of the schools of scribes and literary specialists), which would eventually take on a life and procedures of its own (Michalowski 1992 and Biggs 1995). Thus, the authority of academic tradition came to define the role of the healer in the second millennium BCE as the preeminent opponent of evil. This role was principally centered upon the figure of the "exorcist" (*ashipu*), a priest who belonged to the temple; while ancient sorcerers and witches were restricted to the negative role of agents responsible for evil, thus excluding them from any role as healers (Abusch 2002).

Ancient Mesopotamians would consider themselves to have had a "happy" life if they enjoyed the favor of the gods (and especially of their personal god), if they had a long life, raised plenty of children, and enjoyed the respect of their fellow citizens (Biggs 1995). They believed illnesses were caused by demons, ghosts, gods, witches, or warlocks. In particular, many illnesses were caused by the "hand" of a divinity or a spirit. The main reason for misfortune or illness, therefore, consisted in falling out of favor with the gods. The sick person was thought to have committed some sin, either deliberately or unintentionally, that had offended the gods. Demons, spirits, and magical spells could also cause illness, but their outbreak in the patient's life was in some way the result of a loss of divine favor, since that was considered to provide absolute protection against every misfortune. In this respect, the life of the individual corresponded to the life of the kingdom. Because loss of divine goodwill resulted in all kinds of misfortune, individual bad luck was linked to the global cosmological picture—as conceived by the Mesopotamian culture—from which were resulting every aspect of life. An example of this context is the cuneiform text "The Worm and the Toothache" (probably referring to the nerve of the pulp canal): the spell consists of only twenty-one verses—two-thirds of them describe the mythological origin and creation of the worm, and only the final seven verses give instructions on reciting the spell, the medicine, and method of treatment. (Biggs 1995).

Naturally, the ancient Mesopotamians knew contingent causes of illness in everyday living, such as wounds, overexposure to the sun or the cold, overeating, proximity to some-

one sick (contagion), or insect bites; still, they used spells and rituals to cure or prevent ailments.

This entry's description of the exorcist relates only those characteristics that are relevant to the modern concept of medicine. Because of their specific character, the potency incantations are the only exorcistic text to be mentioned here, for the inclusion in the ritualistic context of practical remedies (Biggs 1967).

The oldest treatises on medicine are pharmacological texts dating from the third millennium BCE (Civil 1960 and Fronzaroli 1988), but scholars have been unable to identify the plants and minerals mentioned in them, thus preventing deeper study of ancient prescriptions (Biggs 1995). Three kinds of prescriptions exist: lexical texts, which list the names of plants, minerals, and ingredients; descriptive texts, which also describe therapeutic properties; and abstracts, which list the plants' names and specify the parts that should be used for treatment. In addition to these, scholars have also identified a text which provides details of how to preserve the ingredients. The city of Nippur had a central grocery store that stocked rare plants, but the most important center in terms of healing arts was the city of Isin; the temple of the city's patron goddess, Nininsina (or Gula), housed the most important school of medicine in Mesopotamia. Excavations of exorcist rooms, have unearthed collections of pharmacological texts, as well as cuneiforms texts concerning the art of healing. Even these pharmacological texts, however, emphasize the ritual element, as does the wider sphere of exorcistic literature. However, the existence of medical texts without any "magical" prescriptions has been reported from the first half of the second millennium BCE (Finkel 2004).

Contrary to pharmacological texts, the remaining literature that addresses curing physical ailments was written in the second and first millennia BCE. This material includes therapeutic texts and diagnostic texts. (Stol 2001).

The most well-known therapeutic manual takes its title from its opening words: "if there is fever in a person's skull"; the final version consisted of forty-five tablets. This text describes symptoms of ailments, includes prescriptions of the substances to be used in treatment, and explains how to make the required potions.

In addition to the therapeutic manual, a diagnostic manual of five chapters (contained in forty tablets) has also been preserved. This text bears the name of a scholar who lived in Babylon around 1050 BCE (Finkel 1988): he not only systematically catalogued various diagnoses and prognoses, arranging them by type of divination, but he also compiled a handbook on morphoscopy in which the characteristics of healthy people were used to predict outcomes (Böck 2000).

This sort of literature is closely linked to the practice of divination. For example, the treatise on diagnosis and prognosis also contains guidelines for the doctor to interpret the signs which manifest while the patient recuperates.

Indirect evidence on healing arts comes from texts that list penalties for the negligent surgeon within the corpus of

laws, and epistolographic evidence contains many descriptions of the activity of healers (either *azu* or *ashipu*).

It is difficult, therefore, to understand Herodotus's (I § 197; Herrero 1984) claim that there were no doctors in Babylon; instead, it is reasonable to conclude that the Greek historian had misunderstood his source. In the early twenty-first century, many scholars are studying the medical history concerning Mesopotamia, as evidenced by the establishment of *Le journal des médecines cunéiformes*.

**CUNEIFORM SCRIPT AREA: HITTITES (HATTI LAND).** The gap in evidence from Mesopotamia, after the Old-Babylonian period (twentieth through sixteenth centuries BCE) and before the beginning of the first millennium BCE, is filled by the cuneiform texts from Bogazköy (ancient Hattushash), which preserved and continued the Babylonian heritage of medical tradition. Numerous texts of Mesopotamian tradition from the city's archives often contain Hittite or Luwian terms, but the texts were written in Akkadian. Scholars have yet to fully understand the Anatolian medical practices, however, primarily because of the incomplete nature of these texts and the uncertain meaning of some Hittite terms (Burde 1974).

Texts of various kinds often provide details of Hattushash inviting doctors from elsewhere, reflecting the primitive state of health care in the region. A letter from the Hittite king Hattushilish III (r. 1275–1260 BCE) to the Babylonian king Kadashman-Enlil II (r. 1263–1255 BCE) mentions the arrival of two doctors in Anatolia while professional medical help was sought from Egypt, the usual source of doctors for the Hittite court (Edel 1976).

Although the Hittite term for "doctor" is unknown (the texts use both the Sumerian ideogram *a-zu* and the Akkadian *azu*), the profession appears to have been very well organized. Various documents contain the names of several doctors; these healers participated in ritual celebrations in addition to therapeutic activities. In fact, the healer who cared for king Hattushilish III as a young man was not called "doctor"—he was the chief scribe.

As had Babylon law, Hittite legislation also regulated health provision. A notable paragraph in Old Hittite laws required those who had committed an act of violence pay the medical expenses incurred by their victims.

Scholars also have studied details of illnesses suffered by historical figures and public health epidemics. The Hittite king Murshilish II composed a dramatic prayer to the storm god and the land gods, asking them to end an epidemic which had lasted twenty years. In the text, he refers his divination attempts to discover the reason for the gods' anger: he had found out that his father, the king, had promised the gods that he would not attack the Egyptians and then broken his vow. The epidemic began when the first prisoners of war arrived in Anatolia. The admission of guilt (although his father's and not his own) is a central aspect of this prayer, seen as necessary to placate the gods.

**NON-CUNEIFORM SCRIPT AREA: EGYPT** Scholars derive knowledge of ancient Egyptian medicine from a variety of sources, including artistic illustrations, treatises and medical instruments, references in literary sources and, not least, on the examination of bodies preserved by the ancient Egyptians. These sources portray a relatively accurate picture of the illnesses from which the Egyptians suffered and the theories and remedies devised to counteract them.

The oldest surviving manuscript from this period is the Kahun Papyrus, dating from the XIIth dynasty (c. 1850 BCE), which contains a number of gynecological and veterinary treatments (Griffith 1898).

One important medical text, dating from the New Kingdom but containing material originating from the Old Kingdom, is the Edwin Smith Papyrus (Braested 1930 and Bardinnet 1992), which is kept at the New York Academy of Sciences. The text describes in some detail vertebral contusions, dislocations of the jaw, and various fractures (of the shoulder blade, humerus, ribs, nose, and skull); in the forty-eight cases examined a rigorous diagnostic method is applied. Each case begins with the phrase “If you examine someone who has. . .” and then lists symptoms in detail. After examining the sick person, the doctor is advised to state his diagnosis and prognosis, or whether the patient will survive “an ailment which I will treat.” In less fortunate cases, for example, a patient suffering from a severe dislocation of a vertebra with a lesion of the spinal cord, the doctor must recognize that this is beyond his capabilities: “an ailment for which nothing can be done.”

While the Edwin Smith Papyrus concentrates on external traumas, the contemporary Ebers Papyrus describes the vascular system and the causes and development of internal ailments (Wreszinski 1913 and Bardinnet 1992). This treatise demonstrates a rudimentary understanding of the circulatory system, considering it as a network of veins originating at the heart, extending to the organs, and passing through every part of the body.

This system circulated not only blood, but also air, water, sperm, and a bodily substance called *ukhedu*. The concept of *ukhedu* characterizes one of the oldest historical theories for illnesses; it attempts to explain in rational terms the causes of illnesses, old age, and death. In practice, the doctor checked that the circulation was working properly by feeling various parts of the patient’s body. Excess *ukhedu*, would eventually manifest in a patient as pus and blisters, and produce internal disease. Furthermore, the natural buildup of *ukhedu* during the course of life resulted in aging tissues and ultimately in death. In addition, embalmers attempted to preserve corpses by dehydrating the body and draining off bodily fluids; these efforts were necessary to eliminate the *ukhedu*.

For healing preparations, Egyptian doctors used animals, vegetables, and minerals. Acacia, date, juniper, fig, garlic, onion, lotus, honey, milk, wax, arsenic, and other prod-

ucts were often used in their recipes, along with more extravagant substances, such as pelican, hippopotamus, and fly excrement. Such preparations could be delivered in various forms: decoctions, infusions, potions, pills, inhalations, fumigations, suppositories, lotions, and eye-baths.

The ancient Egyptians believed that illnesses—especially infectious diseases, fevers, or other ailments that did not appear to be caused by a cut or a wound—were due to a “blow” inflicted by a god, evil spirits, or the restless dead (Ritner 1993). Hence, Egyptian medicine frequently resorted to magic. This civilization viewed magic and rational methods as complementary rather than contradictory, as is expressed in the opening lines of the Ebers Papyrus: “Magical formulas which act in concert with medication are useful, as likewise is medication that acts in concert with magical formulas.”

The link between medicine, magic and religion is clear, in that the Egyptian term for “magic potion,” *pekhet*, is also used indiscriminately to mean “medical prescription” (Ritner 1993). Religion, magic, and medicine continually intermingled. Through a kind of ritual magical transference, the Egyptians thought particular animals possessed therapeutic values linked to their characteristics; the skin of deer, for example, could cure gout if tied to a person’s foot; a fried fish head could draw out a headache and a pig’s eye prevented blindness. Other substances owed their reputation to mythology, such as the milk of a mother who bore a male child, recalling the goddess Isis and her son Horus. Disgusting substances, especially excrement, also were believed to ward off evil spirits, a frequent suspected cause of illnesses.

The gods could not only send an illness, but they could also cure it. Medicine, therefore, was controlled from the world of the gods, and various gods were considered healers, including Amon, “the doctor (*swmw*) who heals without any remedy” (Zandee 1948); Isis; the deified Imenhotep, architect of the Step Pyramid at Djoser (IIIrd dynasty); and Amenhotep, the son of Hapu (Wildung 1977). Patients often appealed to “Horus-*swmw-nfr*,” or “Horus the good doctor,” whose “word” “repels death,” whose “speech cures the sting of the scorpion” and whose “magic soothes inflammation” (Ritner 1993). The priests of all these benevolent divinities were considered to be the best healers, even if the most important priest-doctors were those connected to two potentially dangerous goddesses, the lioness Sekhmet and the scorpion Serqet (von Känel 1984). A priest of Sekhmet, a goddess who could send plague, is mentioned in the Ebers papyrus alongside ordinary doctors (*swmw*) and “amulet sellers” (*saw*) (von Känel 1984). The latter could be employed by the state; and we know of a “seller of amulets of the king of Upper and Lower Egypt.” The “officials of Serqet” were particularly sought after to heal scorpion stings and snake bites (von Känel 1984). Most of these priest-doctors practiced magic, and they were often enlisted for trips into the desert, where these deadly animals represented a constant danger.

Although Egyptian medicine seems to have been contaminated by magic and many of its treatments do not seem to have been particularly effective, its doctors were good observers and at times their healing approaches worked. Moreover, Egyptian medical knowledge earned an excellent reputation in Asia Minor and Greece; both Hippocrates and Galen attributed much of their knowledge to works they had consulted in the temple of Imenhotep at Memphis.

## HEALING AND MEDICINE: HEALING AND MEDICINE IN JUDAISM

Jewish sacred texts, in particular the Hebrew Bible, Apocrypha (noncanonic, postbiblical writings), rabbinic literature from the late Roman era (the Talmud and midrash), the *Mishnāh Torah* (Repetition of the law; a twelfth-century CE classification of religious subjects), and the *Shulhan Arukh* (The prepared table; a sixteenth-century CE codebook of Jewish law), all touch upon sickness, recovery, and health. Excerpts on health from holy books and their influence on Jewish culture can be arranged readily into the following six subjects:

1. divine healing,
2. health wisdom,
3. visiting the sick,
4. religious law (*halakbah*),
5. folk healing,
6. professional medicine.

**DIVINE HEALING.** In the Bible (c. sixth century BCE), God is the force responsible for both sickening and healing: “I deal death and give life; I wounded and I heal” (*Dt.* 32:39). Accordingly, God inflicts plagues, heals Hezekiah’s intestinal ailment, and tests Job with boils and other misfortunes. The psalmist appeals directly for “rescue” and “deliverance” to God, who is “compassionate and gracious”; other biblical figures seek out God’s prophets, as the woman of Shunem called on Elisha to revive her dead son (*2 Kgs.* 4:8). A certain skin disfigurement (*tsara’at*) is always a mark of divine disfavor (*Lv.* 13). Thus when Moses’ sister Miriam contracts *tsara’at*, he cries out, “O God, pray heal her! [*Eil na r’fah na lah!*]” (*Nm.* 12:13).

Jewish healing prayers follow a biblical model. *Jeremiah* is the source of the ancient prayer recited still in daily Jewish liturgy: “Heal us, O Lord, and we shall be healed” (*Jer.* 17:14). Psalms are recited daily for someone who is critically ill; the *Mi SheBerakh* (May the one who blessed) prayer is sung for “healing, courage, and faith” in front of the opened Torah; late-medieval Yiddish prayers (*tekhines*) written by Jewish mothers ask God for safe pregnancies and well children; and modern prayers—prayer writing continues to be a vital religious activity—request strength and calm, “healing of body and mind.” A prayer’s soothing effect comes not just from the words alone; just as important are davening (a Yiddish term meaning fervent recitation, often while standing and swaying), cadence, melody, chant, and the consoling context of the daily or Sabbath service liturgy, held in communion with clergy, family, and friends.

Except for prayer, Judaism has no required rite for restoring health, nor do the relics, saints, pilgrimages, or exorcisms that are features of other religious traditions. The Jerusalem Temple did not offer treatment directly, as did the contemporaneous healing temples of Aesklepios, even though sick people surely must have come there to offer petitionary and thanksgiving sacrifice. After the Temple was destroyed in 70 CE, the Talmud declared that there is no healing in shrines, perhaps referring to pagan or Christian sites but also precluding Jewish sacerdotal healing (*Abodah Zarah* 55a).

**HEALTH WISDOM.** Jewish religious texts explicitly promote mental and physical health. They take their cue from the *Book of Proverbs*, which itself follows the more ancient tradition of “wisdom literature,” a stream of aphorisms, poems, and fables that give pragmatic guidance on how to live long and successfully. “A man’s spirit can sustain him through illness,” *Proverbs* says, “but low spirits . . . who can bear them” (*Prov.* 18:14). The *Proverbs*-like Apocrypha text *Ben Sira* (*Ecclesiasticus* in the Jerusalem Bible) states, “Better a poor man healthy and fit than a rich man tormented in body” (*Ben Sira* 30:14), and it condemns gluttony and drunkenness. The Talmud encourages bathing and washing after meals, bodily cleanliness being inseparable from spiritual purity (*Abodah Zarah* 20a). The *Mishneh Torah* and the *Shulhan Arukh* have entire chapters on dietetics, exercise, rest, and sexual temperance, through which they elevate practical hygienic advice into religious obligation.

In the opinion of some scholars, dietary laws (*kasrut*) from *Leviticus*, assiduously followed by traditional Jews, were originally intended to promote healthiness. Moreover, they argue, dietary laws together with rules of Sabbath observance, pregnancy, menstruation, penile discharge, childbirth, excretion, cadavers, sexuality, and *tsara’at* constitute a program of public health. The Bible itself makes no such claim. Nevertheless, for millennia observant Jews have thought them to be rules of hygiene. Indeed, it has been said that because of hygienic practices, medieval Jewish populations avoided the worst ravages of bubonic plagues.

**VISITING THE SICK.** Job’s friends sat quietly with him for a week, until he was ready to speak. *Ben Sira* (second century BCE) urges, “Do not shrink from visiting the sick” (*Ben Sira* 7:35). The Talmud (second–sixth centuries CE) made this ancient courtesy into a solemn commandment, grounded on the biblical story of the three messengers from God who came to visit Abraham after he was circumcised. Visiting the sick, the sages state with emphasis, is among the highest religious obligations, and visiting does indeed heal, especially “if they (the visitors) loved him like themselves” (*Midrash Rabbah Leviticus* 34:1). The Talmud declares, “He who visits the sick causes him to live,” and he who does not is “a shedder of blood” (a murderer). Because the Divine Presence “rests above the invalid’s bed,” as he or she wavers between death and life, the sickroom is to be regarded as awesome and sacred. However, the visitor must not come when the sick per-

son is indisposed, lest they be exhausted or humiliated (*Nedarim* 39a). Everyone, rich or poor, must visit the sick, especially if the illness has come on suddenly, and they should “pray for his recovery and depart” (*Mishneh Torah* 14:4:14). The *Shulhan Arukh* adds, “one must visit the sick of the Gentiles in the interest of peace” (*Yorah Deah* 335).

Few other commandments (*mitsvot*) shape Jewish culture as profoundly. Visiting is an imperative for family and friends and among the most important duties for a congregational rabbi. Autonomous visiting the sick (*Bikkur Cholim*) societies, synagogue volunteers, and hospital chaplains ensure that every sick person has company. Traditional rabbis shape their calls mindful of detailed visiting rules set forth in the *Shulhan Arukh*.

**RELIGIOUS LAW (HALAKHAH).** Mainstream Jewish spiritual practice follows laws found in the Bible and the Talmud together with later refinements and corrections. What sets the precept to visit the sick apart is its therapeutic intent. Most rules concerning patients are excusatory; that is, they relieve the sick person of possibly harmful obligations, such as fasting on the Day of Atonement. Preserving or saving someone’s life overrides any other duty. However, when life is not threatened, a broken bone, for instance, medical care might be put off. Centuries of rabbinical commentary (*responsa*) have dealt with other difficulties, like observing commandments during a plague, so there has been an substantial accumulation of legal precedents (medical *halakhah*).

Moral dilemmas in contemporary medical care, notably surrounding abortion, euthanasia, genetic engineering, and prolongation of life, are stimulating interest in pertinent Jewish law. In 1959 Rabbi Immanuel Jacobovitz defined the subject and scope of modern Jewish medical ethics, and subsequently prominent rabbis and physicians have added casuistic (moral) analysis in numerous articles and books on the subject. The premises of Jewish medical ethics are that life is sacred and that all actions must be in accordance with morality in the Talmudic tradition. Ethicists distinguish the Jewish emphasis on the individual’s moral obligations, especially to choose life, from the secular emphasis on the individual’s autonomy, even to choose death. However, medical-ethical dilemmas are as contentious for Jewish ethicists as for their non-Jewish counterparts.

**FOLK HEALING.** Throughout history, Judaism has had a rich tradition of healing folklore. Isaiah treated King Hezekiah for intestinal illness with an application of figs (*Is.* 38:21). According to ancient legend, King Solomon acquired knowledge of healing from God, then wrote a healing text, which was later followed by a school of Jewish folk practitioners (Josephus, *Antiquities of the Jews*, bk. 8, chap. 2). In addition, Solomon was said to be a sorcerer-astrologist who could banish illness demons (*The Testament of Solomon*). Folk belief also has it that the angel Rafael stands guard at night over the sickbed.

The Talmud devotes pages to *materia medica* that came from ancient Babylonia concerning the warding off of de-

mons, the evil eye, and other causes of illness with charms, amulets, potions, and incantations. To cite one Talmudic remedy, “For migraine one should take a woodcock and cut its throat with a white zuz over the side of his head on which he has pain” (*Gittin* 69a). This, the rabbis knew, was magical, but they declared as principle that “nothing done for the purpose of healing is forbidden on grounds of superstition.” By the Middle Ages, however, rabbis came to believe that Talmudic medicine was archaic and counseled their followers not to use it. Nevertheless, it is still published.

According to stories in the Talmud (*aggadah*), certain rabbis were healers. “Give me your hand,” said Rabbi Johanna to Rabbi Hiyya, who was ill. “He gave him his and he raised him” (*Berakoth* 5b). In every generation, even in the early twenty-first century, some teachers (*rebbe*s) have been folk healers and experts in Jewish medicinal lore.

Jewish folklore derives its particularity from the letters, symbols, pictures, prayers, stories, incantations, and passages that come from holy sources. They derive healing power from Hebrew, the language of the Bible and so of God. Hebrew letters and verses are placed in amulets to be worn around the neck, carried in one’s pocket, and placed at sick beds. On their home’s front entry and doorways within, many Jews place a prayer case (*mezuzah*), which contains a parchment scroll with protective biblical sayings. Changing the name of a sick person to Chaim (“life”), Rafael (“may God cure”), or the like and thereby changing his or her identity deflects the divine decree of death. Herbs from Sabbath services or unleavened bread from a Passover Seder can be medicinal. Some folk recipes, such as chicken soup, a common restorative since medieval times, may have had a more rational basis. These are but a few examples of Jewish healing practices that are still prevalent, especially in traditional communities, though marginalized like other forms of “alternative medicine.”

**PROFESSIONAL MEDICINE.** The attitudes of Jewish religious texts toward physicians changed from initial disdain to respect, even reverence. The Bible is scornful; it remarks sarcastically that before King Asa died, he “did not turn to the Lord but to physicians” (*2 Chr.* 16:11). However, the post-biblical text *Ben Sira*, written two centuries after Hippocrates (fourth century BCE), praises physicians. “From God the doctor has his wisdom,” *Ben Sira* says, and “God makes the earth yield healing herbs” (*Ben Sira* 38). Following *Ben Sira*, the Talmud acknowledges that the physician has been “given permission to heal” (*Mishnah Kaddushin* 82a). It allows physicians to set fees and urges people to settle in a town where a physician resides and to consult doctors when they are in pain. Furthermore, it discusses the issue of whether a patient should follow a doctor’s advice when the patient disagrees. With finality, the *Shulhan Arukh* declares that physicians have, “under the rule of saving an endangered life,” not just permission to heal but, more importantly, an obligation, a religious duty to do so (*Yorah Deah* 335).

Since the early Middle Ages, Jews have held Western medicine and physicians in high esteem. Historically, Western medicine stems from the writings of Hippocrates and Galen, and it is based not on divine intervention or superstition but on a rational, book-learned science of observation, experiment, and theory. In the sixth century the otherwise unknown Asaph wrote the earliest Jewish medical text, which intermingles Hippocratic ethics with faith in God. In the tenth century the Moroccan physician Isaac Israeli authored treatises based on Galenic and Arabic medicine that became standard teaching texts throughout Islamic and Christian lands. In the twelfth century the author of the *Mishneh Torah*, Moses Maimonides, who practiced medicine at the court of Ṣalāḥ al-Dīn, achieved such notoriety as a clinician and writer that even for Islamic historians he typifies the remarkable accomplishments of an innovative era of Islamic medicine. Like him, learned Jews, even rabbis, became physicians not only to their own people but also to caliphs, sultans, popes, and Christian rulers. Following this professional tradition, many Jews, then and now, have regarded scientific medicine as a spiritual calling, second only to the work of a rabbi.

Since the Enlightenment, Jews have entered the health professions in greatly disproportionate numbers and have made many important contributions to medical thought and science. Hospitals in the United States created in the nineteenth and twentieth centuries for Jewish doctors and observant patients are now renowned medical centers. In its short existence, Israel has created a universal medical system in which care, teaching, and research are as advanced as any in the world.

The earliest Jewish physicians were inclined to write about professional excellence—to consider, that is, the question of what makes a doctor consummate—and thereby, like Asaph, to blend faith and profession. At a time of no medical licensure, no formal medical education, and no standardized professional standards, Isaac Israeli authored a book of moral and professional maxims, which includes the directive “Be especially concerned with visiting and treating the poor and needy sick for you cannot assume a more rewarding work.” In a medical treatise, Maimonides emphasized that one should consult only the best physicians, meaning those who have thoroughly learned medical science and have extensive practical experience. Later Jewish physicians composed personal oaths, among them the famous Prayer of Maimonides, which though attributed to Maimonides, was written by a prominent eighteenth-century German physician. “Almighty God,” it begins, “. . . inspire me with love for my art and for thy creatures. Do not allow thirst for profit, ambition for renown and admiration, to interfere with my profession.”

**RELIGION AND HEALTH.** The basis of Jewish concern for healing is the belief that healthiness is a spiritual virtue. Jewish attitudes toward the body derive from the belief that the human body-soul, whether a unity or a dyad, is God’s cre-

ation; it must be preserved to fulfill God’s will on earth. Life is sacred; death is evil, although there will be, in some form, afterlife in messianic times. Jewish teaching sanctifies deeds and behaviors more than a transcendent spirit and so does not privilege soul over body; accordingly, Judaism disapproves of self-inducing illness by mortification and asceticism.

Judaism has no overarching healing concept; indeed the etiologic premises of the miracle, scientific medicine, and folklore are irreconcilable. Maimonides offers the only systematic formulation of the relationship of health to Jewish spirituality. His health concepts stem from the translated writings of the ancient Greek writers Aristotle, Hippocrates, and Galen, which he refined; his spiritual beliefs stem of course from the Hebrew Bible and the Talmud; therefore, with respect to medicine and healing, he tried to harmonize the literary heritages of Greece and Israel. A person’s spiritual need, Maimonides wrote, is to acquire knowledge of God, and all actions in life should be directed toward that goal. Consequently, “the purpose of [the] body’s health is that the soul might find its instruments healthy and sound that it can be directed toward the sciences and toward acquiring the moral and rational virtues. . . . On the basis of this reasoning, the art of medicine is given a very large role with respect to the virtues. . . . To study it diligently is among the greatest acts of worship” (*Commentary on the Mishnah*, chap. 5). In other words, good health is necessary, even sacred, in Jewish life but never as an end in itself; rather, it is subordinate to the end of leading a life consecrated to God. Good health makes possible a good life, which for the religious Jew consists of worship, study, and *mitsvot*.

Conversely, Jewish sources suggest that a good life may promote good health or at least emotional well-being. *Proverbs* advises: “Fear the Lord and shun evil. It will be a cure for your body” (*Prov.* 3:7). And if someone feels pain, the Talmud says, “let him engage in the study of Torah” (*Erubin* 54a). Maimonides told an Arab prince that “passions of the psyche produce changes in the body.” To gain “strength of mind,” study philosophy and follow the “admonitions and disciplines of the Law” (*Regimen of Health*). According to Rebbe Nachman of Breslov (1722–1810), “joy and dance,” elements of Hasidic religiosity, relieve distress. The person utterly imbued with faith, in the words of a modern Orthodox theologian, “knows no fear or dread in the full sense of the term . . . [and] vanquishes even the fear of death” (Soloveitchik, 1983).

**SICKNESS AND SPIRITUALITY: CONTEMPORARY DEVELOPMENTS.** How do Jewish healing traditions have relevance in the early twenty-first century for the person who is ill? Many people still find comfort and inspiration in biblical writings, especially in *Psalms*. The Bible voices, acknowledges, and shares the sufferer’s inner storm of anger, dread, pain, shame, bewilderment, and tears, and it holds out hope, order, and coherence. Family, fellowship, prayer, and communal support from congregations and social service agencies mitigate

the lonesomeness, bitterness, and devitalization that often accompany chronic disease. Clergy who are trained in hospitals as pastoral counselors offer solace, perspective, and attentive listening. Jewish medical ethics is a vital field of literature and education and the subject of an ongoing dialogue between physicians and rabbis. Finally, many Jewish practitioners in the healing professions have internalized their spiritual heritage, write about it, and exhibit it in their daily work.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN ISLAMIC TEXTS AND TRADITIONS

In Islamic theology, God created nature, which functions in harmony and unity according to natural law. God also created human beings, who must submit to both God's law and natural law in order to function in harmony and unity in the universe. Therefore human beings are above animals because they alone can worship God and can redeem themselves through piety and good works. When harmony is disturbed by immoral or unhealthy behavior, a virus or microbe, an accident, or a personal or societal catastrophe, physical or mental disease may result. When a person's physical and mental functioning is impaired, he or she is considered sick and should seek treatment. In the Islamic worldview, good health is a sign of both a wholesome lifestyle and divine favor, and the healer or medical practitioner plays an important and highly valued role in the social order by restoring the physical or mental well-being of the patient. The physician must determine the malady and prescribe the remedy, which should be directed at the source, whether a microbe, injury, malnutrition, personal problem, societal disorder, or divine ill favor.

The Qur'an contains many verses that pertain to health and healing and is considered the ultimate guide to good health. Verse 41:44 states, "Say: 'To the believers it [the

Qur'an] is a guidance, and a healing.'" Similarly, according to verse 10:57, "O men, now there has come to us an admonition [Qur'anic revelation] from your Lord, and a healing for what is in the breast, and a guidance, and a mercy to the believers." Verse 26:80 quotes the words of Abraham and makes it clear that God is the ultimate curer of illness: "Lord of all Being who created me, and Himself guides me, and Himself gives me to eat and drink, and, whenever I am sick heals me, who makes me to die, then gives me life, and who I am eager shall forgive me my offence on the day of doom." The Qur'an (2:219; 2:168; 2:180; 5:90) recommends a wholesome lifestyle, forbids intoxicants, and mercifully absolves the ill from fasting during Ramaḍān. Honey is one of many proofs of God's majesty and is the only remedy for ill health in the Qur'an: "Then comes there forth out of (Bees') bellies a drink of diverse hues wherein is healing for men. Surely in that is a sign for a people who reflect" (16:72).

The *ḥadīth*, or sayings and doings of the Prophet collected and compiled after Muḥammad's death, offer extensive commentary on disease and medicine. In a much-quoted *ḥadīth* Muḥammad stated, "God has not sent down a disease without sending down a remedy for it." Bukhari transmitted it. Jabir reported God's messenger as saying, "There is a medicine for every disease and when the medicine is applied to the disease it is cured by God's permission." Muslim transmitted it." (*Mishkāt al-maṣābīḥ*, Vol. III, p. 945). Other well-known *ḥadīth* urge believers to seek treatment: "Usama b. Sharik told that when God's messenger was asked whether they should make use of medical treatment he replied, 'Yes, servants of God, make use of medical treatment, for God has not made a disease without appointing a remedy for it, with the exception of one disease, viz., old age.' Ahmad, Tirmidhi, and Abu Dawud transmitted it." (*Mishkāt al-maṣābīḥ*, Vol. III, p. 947.) According to Tirmidhi, "when God's messenger was asked whether [believers] should make use of medical treatment, he replied: 'Yes servants of God, make use of medical treatment for God has not made a disease without appointing a remedy for it, with the exception of one disease, namely old age'" (*Mishkāt al-maṣābīḥ*, Vol. III, p. 947).

Often, *ḥadīth* medical advice centers on the importance of cleanliness in food, drink, and personal hygiene. In some *ḥadīth* disease is a test, trial, or punishment to be dealt with patiently, and those who die from certain diseases or in childbirth may achieve martyrdom and heavenly reward. The Qur'an explicitly rejects magic, but many *ḥadīth* recommend amulets or other talismans and charms to ward off disease. Belief in the evil eye as a cause of disease and other afflictions is common throughout and beyond the Muslim world.

Both Sunnī and Shī'ī texts stress the value of prayer in healing. In both traditions, Šūfī or mystical texts recommend healing through prayer and other devotional rituals. There are, however, substantial differences between Sunnī and Shī'ī *ḥadīth*. Shī'ī Islam values suffering and martyrdom far more than Sunnī Islam, so the Akhbārī (Shī'ī

*ḥadīth*) literature recommends that the patient suffer through the ailment and seek medical attention only in emergencies.

**GRECO-ISLAMIC MEDICINE.** When Muslims brought Islam to the Byzantine and Sassanid (Iranian) regions, they sought knowledge from the peoples they encountered. The first translators were mostly Christians who translated works from Greek into Syriac and then into Arabic. Persian and Indian medical texts were also translated into Arabic. The formal tradition of Islamic medicine was based on Galen's (129–c. 199 CE) descriptions of elements and humors. The basic elements were earth, fire, air, and water. Each element had a temperament: earth was dry and cold, fire was dry and hot, air was humid and hot, and water was humid and cold. The temperaments corresponded to the humors of the body: blood, phlegm, yellow bile, and black bile. When the humors were in balance, the body was healthy. When the humors were out of balance, the result was disease, which the physician or patient could treat through appropriate food or drink, drugs, or temperature adjustment. Islamic physicians generally distinguished between the body and the spirit or soul (*rūḥ*), and they believed God worked through the *rūḥ* to cure the patient. The physician was to take care to address the state of the patient's *rūḥ* in determining a treatment. While some of the physicians denounced it, astrological medicine was much practiced. Many medical texts had sections on astrological influences on disease causation, and most astrological manuals had sections giving medical advice.

By the ninth century, Muslim physicians were synthesizing and adding to the Greek, Persian, and Indian medical traditions, and healthcare was becoming a major institution. Caliph Hārūn al-Rashīd (d. 809 CE) built the first *bimaristan* (hospital) in Baghdad along the lines of the famous medical institution at Jundishapur. It was soon followed by other hospitals with physiologists, oculists, surgeons, and bonesetters on their staffs. In Cairo the Mamlūk ruler Mansur Qalawun (d. 1290) built the Mansuri Hospital in 1284–1285. The hospital complex had a substantial religious endowment (*waqf*) and served thousands of patients. According to the founding *waqf* document:

The [hospital] is for kings or subjects, old or young, free or slave, male or female. Upon recovery patients shall receive clothing while the deceased shall receive burial shrouds and all funeral expenses will be paid. Funds are allocated for herbalists, surgeons, bonesetters, ophthalmologists, and general practitioners, and for all patients, whether male or female, and their caregivers. Funds are available for beds, bedding, patient hygiene, and general sanitation. . . . Funds are also available for outpatients for food and medicine. (Isa, pp. 86–88)

The Mansuri Hospital had rooms for specialized cases including fevers, eye diseases, and wounds, and a separate wing for women. It contained a kitchen, a dispensary, a laboratory for medicine, a library, and an auditorium where the chief physician lectured his students. The mosque and *madrasah*

(school) that formed part of the complex still stand though the hospital building was replaced in 1920. It was used as an ophthalmic clinic until the 1992 earthquake damaged it. The complex is currently undergoing extensive restoration.

Only a few of the renowned physicians can be mentioned here in order to demonstrate their contributions to the received medical tradition. Abū Muḥammad al-Rāzī (Rhazes; d. 930 CE) was born in Rayy near Tehran but worked mostly in Baghdad. He was the first to describe the clinical symptoms of smallpox as distinguished from measles. He also wrote cheerful essays, such as “Why Ignorant Physicians, Common Folk, and Women in the Cities Are More Successful Than Scientists in Treating Certain Diseases—and the Physician's Excuse for This.”

‘Ali ibn al-‘Abbas al-Majusi, or Haly Abbas (d. 994 CE), the director of the Adud-dawlah Hospital in Baghdad, compiled the *Kitāb Kamil al-Sina al-Tibbiyya* (The complete book of the medical art), also known as *al-Kitāb al-Maliki* (The royal book). This famous text has one volume on theoretical medicine and another on practical medicine and is a concise and well-organized summary of Greco-Islamic medical knowledge.

Abū ‘Alī Ibn Sīnā or Avicenna (980–1037) identified diseases such as meningitis and discovered new remedies, but his greatest contribution was his system of medicine, in which medical practice was combined with physical and psychological factors, drugs, and diets—or “holistic” medicine. His *Canon of Medicine* was translated into Latin and was used more than Hippocrates and Galen in Europe.

Abū ‘Alī al-Hasan ibn al-Haytham (Alhazen; d. 1040) worked mostly in Cairo. He is known for his seven-volume treatise on optics, *Kitāb al-Manazir*, which built on Ptolemy's theories but demonstrated through experimental evidence that in vision light is reflected from an object into the eye, thus reversing the received theory.

Ibn Nafis (d. 1288) studied medicine in Damascus and became director of the Mansuri Hospital in Cairo. His *Mujiz*, a widely used commentary on Ibn Sīnā's *Canon*, contains his famous theory of the pulmonary or lesser circulation of the blood, which was subsequently proved correct.

**CUSTOMARY MEDICINE.** Customary, or empirical, medicine was probably the most widely used type of medical intervention in everyday life. ‘Abd al-Raḥmān ibn Khaldūn (1332–1406), the famous historian and sociologist, carefully distinguished between empirical medicine, Greco-Islamic or humoral medicine, and religious doctrine:

Civilized Bedouins have a kind of medicine that is mainly based upon individual experience. They inherit its use from the shaykhs and old women of the tribe. Some of it may occasionally be correct. However, it is not based upon any natural norm or upon any conformity [of the treatment] to the temper of the humors. Much of this sort of medicine existed among the Arabs. The medicine mentioned in religious tradition is of the

Bedouin type. It is in no way part of the divine revelation. [Such medical matters] were merely part of Arab custom and happened to be mentioned in connection with the circumstances of the Prophet, like other things that were customary in his generation. They were not mentioned in order to imply that that particular way of practicing medicine is stipulated by the religious law. Muḥammad was sent to teach us the religious law. He was not sent to teach us medicine or any other ordinary matter. None of the statements concerning medicine that occur in sound traditions should be considered as [having the force] of law. The only thing is that if that type of medicine is used for the sake of a divine blessing and in true religious faith, it may be very useful. However, that would have nothing to do with humoral medicine but be the result of true faith. (Ibn Khaldūn, p. 387)

For Ibn Khaldūn, the humoral medicine of the Greco-Islamic tradition was scientific and therefore valid; faith, if sincere, might be helpful; and empirical medicine might be useful in a haphazard way.

**PROPHETIC MEDICINE.** Prophetic medicine (*tibb al-nabawi*) developed alongside the formal medical tradition. The authors of prophetic medicine were generally not practicing physicians or scientists but rather ‘*ulamā*’ (specialists of Islamic theological and legal sciences) who worked out “religiously correct” compendiums of medical lore that blended empirical medicine, religious formulas, and sometimes Greco-Islamic ideas. Prophetic medical texts typically list both physical and spiritual diseases (fevers, leprosy, plague, poisonous insect and snake bites, melancholy) and offer remedies drawn from the Qur’ān and *ḥadīth*. Muḥammad b. Aḥmad al-Dhahabī (d. 1348) cites several major Greek and Islamic medical authorities, empirical medicine, and the Qur’ān and *ḥadīth* as his sources. Jalāl al-Dīn al-Suyūṭī (d. 1505), however, based his prophetic medical book on what was known of the medicine of the Arabian Peninsula, the Qur’ān, and the *ḥadīth* but not the Greco-Islamic tradition. Suyūṭī recommended prayers and invocations, amulets and talismans, but did not mention surgery. Much of his medical advice was preventive and recommended moderate habits and the avoidance of intoxicants. Perhaps the most famous of the prophetic medical compendiums, *Medicine of the Prophet* (1998) by Abū Bakr ibn Qayyim al-Jawziyya (1292–1350), has been published in English translation. Its medical advice relies more on piety than on Greco-Islamic medical theory and contains much information on medical beliefs and practices of ordinary people in the fourteenth century.

**MODERN MEDICINE.** Muslim physicians did not hesitate to borrow from European physicians, particularly for unfamiliar diseases. Dāwūd ibn Umar al-Antaki (d. 1599) includes the standard mercury treatment for syphilis used in Europe at the time. Syphilis was unknown in North African and the Middle East until the late fifteenth century or early sixteenth century. Ottoman physicians began translating selected medical works from European languages in the early nineteenth

century. During that century cholera spread from India, where it was endemic, via long-distance transportation to port cities and elsewhere in the Muslim world. In 1831 Mustafa Behcet (d. 1833), head of the medical college in Istanbul, published a treatise on cholera based on an Austrian source that Ottoman authorities distributed free throughout the empire. Ottoman authorities established a quarantine service in about 1832 and had religious leaders publish treatises showing that quarantines were not contrary to Islamic law.

Today Western medicine is well established throughout the Muslim world. In several South Asian nations it is possible to study and be certified in Greco-Islamic medicine. Institutes in Cairo and elsewhere study remedies recommended in the *ḥadīth*, such as “black seed,” to determine their effectiveness in treating various diseases. Inexpensive compendiums of prophetic medicine can be purchased in bookshops throughout the region and may be consulted for informal or alternate treatments. Those with serious illnesses and adequate resources, however, generally prefer to consult reputable specialists trained in the Western medical tradition.

## HEALING AND MEDICINE: POPULAR HEALING PRACTICES IN MIDDLE EASTERN CULTURES

Despite widespread Western misconceptions about technological “backwardness” in the Middle Eastern world, the Middle East is home to thoroughly modern, high-tech, Western-based biomedicine, often delivered in gleaming private hospitals and medical centers throughout the region. Technologies such as coronary bypass surgery, organ transplantation services, and the latest forms of in vitro fertilization are widely available in urban centers. Thus middle- to upper-class Middle Eastern patients can avail themselves of medical diagnosis and treatment services in cities such as Jiddah, Saudi Arabia; Cairo, Egypt; Tehran, Iran; or Beirut, Lebanon, with expectations that the services rendered will be on a par with those offered in the best medical centers in the West.

Bearing this medical modernity in mind, it is also important to acknowledge that popular healing traditions still exist in the Middle East, providing a less expensive alternative to biomedicine among rural populations and the urban underclass, as well as a spiritual connection to Islam and to earlier literate medical traditions in the region. The Middle East is home to a rich medical history and is one of the few regions of the world in which written materials concerning health-related ideologies, practices, and professional standards date back literally five thousand years. Many of these records provide an exquisitely detailed account of the medical systems and accompanying ideologies that gained hegemony in this region through the millennia, as well as the cultural and socioeconomic milieus in which they existed (Gran, 1979; Inhorn Millar and Lane, 1988). Furthermore, these records from the past show that popular healing practices found throughout Middle Eastern countries are deeply embedded in three ancient healing traditions—pharaonic (Egyptian), *yunāni* (Hellenic), and prophetic (Islamic)—all of which gained ascendancy before the rise of Western biomedicine in the region during the nineteenth-century colonial period (Adib, 2004; Inhorn, 1994a). Indeed, biomedicine can be thought of as a historical newcomer to this region of the world. It is not surprising, therefore, that previous traditions live on—not as organized medical systems per se, but rather as numerous syncretic healing philosophies characterized by a multifaceted array of etiological, diagnostic, and therapeutic beliefs and practices regarding the nature of health and illness and the treatment of various forms of sickness.

**HISTORY OF PROPHETIC (ISLAMIC) MEDICINE.** It is these popular healing traditions and their connection to Islam that represent the substance of this brief essay. Although pharaonic medicine and later *yunāni* medicine were extremely important literate medical traditions in this region of the world, this essay begins with a brief history of prophetic (Islamic) medicine, which arose during the period following the Prophet Muḥammad’s death in 632 CE and which still repre-

sents an extremely influential healing tradition throughout the region.

Historically prophetic medicine constituted a quasi-medical “religious medicine” based exclusively (at least putatively) on passages in the Islamic Scriptures (Dols, 1984). After the Prophet’s death, Muslim believers, such as Al-Suyūṭī in his *Tibb-ul-Nabbi* (Medicine of the Prophet), collected everything the Prophet was reported to have said about hygiene, alcohol consumption, circumcision, menstruation, breast-feeding, sanitation, and various diseases and then institutionalized these sayings into a form of medical practice (Gran, 1979).

According to medical historians, however, prophetic medicine was actually a syncretic blend of biblical Jewish medicine as contained in the *Book of Leviticus*; Persian medicine as taught in the famous medical school of Gondeshapur, which was attended by several of the Prophet’s relatives; nomadic Bedouin medicine as practiced in Arabia (particularly in Medina and Mecca) during the Prophet’s lifetime; and Hippocratic-Galenic *yunāni* medicine from Greece. Furthermore, as Manfred Ullman (1978) has argued, many of the *ḥadīth* (sayings and traditions of the prophet Muḥammad), upon which prophetic medicine was supposedly based, were actually inauthentic, prescribing pre-Islamic folk practices that were later reinterpreted using concepts from *yunāni* medicine.

Nonetheless, prophetic medicine acquired great significance during later Islamic history and, in some cases, came to counter and supersede the then powerful *yunāni* medical system, which was suspected as being a science of heathen origin. Prophetic medicine was also popular with the people, for it incorporated traditional concepts and practices from Arab folk medicine, such as the writing of religious sayings in curative amulets, belief in the evil eye, and the practice of cupping (application of heated cups on the skin), all of which continue to be widely practiced in many parts of the Middle East in the early twenty-first century.

By the sixteenth-century, cults of popular Islamic mystics, known as Ṣūfīs or marabouts, began to proliferate in the countries of North Africa. As Peter Gran (1979) points out, the Ṣūfī cults and their shrines flourished in countries such as Egypt because they catered to the spiritual, psychological, and political needs of the lower classes as well as to their medical complaints. Cults also offered medical specialization; for example, some dealt specifically with the ailments of women, whereas others specialized in psychiatric problems, which were usually attributed to spirit possession.

**SAINT VENERATION AND HEALING PILGRIMAGES.** Prophetic and Ṣūfī healing traditions continue to flourish in many parts of the Middle East, particularly in the countries of North Africa. Thousands of Muslim pilgrims make *ziyārāt*, or visits, to saints’ shrines, some large, some small, dotting the urban and rural landscapes of countries like Morocco, Tunisia, and Egypt but also in Middle Eastern countries out-

side the Arab world, including Turkey and Iran. Most of these shrines contain the tombs of dead saints, and some, especially the relatively famous ones, host magnificent mosque-tomb complexes. Most of these shrines are associated in some way with a dead “pious one” (Eickelman, 1998), either a *sayyid* (a descendant of the prophet Muḥammad); a renowned cleric regarded as pious for the quality of his learning; a founder or descendant of a founder of a Šūfī religious brotherhood; or a holy person, male or female, known for exceptional religiosity and the demonstrated ability during his or her lifetime to perform miracles. For the masses of rural and urban poor people who visit these sites as pilgrims—given that healing pilgrimage of this sort tends to be a class-based phenomenon in the Middle East these dead saints are believed to radiate *barakah*, a living form of beneficial power associated with divine blessing, grace, or holiness that is transferable to their descendants, followers, and visitors (Biegman, 1990).

Even though saint worship has always been frowned upon as *shirk*, or polytheism, by more scripturally minded, orthodox Muslims (Doumato, 2000), belief in the miraculous *barakah* of saints, the formation of cults involved in the veneration of such saints, and the subsequent movement of thousands of miracle-seeking pilgrims to and from saints’ shrines are considered to be among the major hallmarks of North African Islam.

**WOMEN, PILGRIMAGE, AND HEALING.** From their beginnings in the tenth century, these cults were involved in healing, especially among the poor and among women. In the early twenty-first century, the poor, and poor women in particular, continue to worship dead, miracle-working saints whose tombs, if relatively accessible, they may visit on a regular basis. Indeed, it is women—not men—who are most actively involved in saint veneration and who are, therefore, the primary participants in the salvation-oriented *ziyārāt* to local and regional saints’ tombs. The essentially “female character” of local pilgrimage in the Middle East (Betteridge, 1983)—and men’s accompanying embarrassment and even disdain regarding this activity—has been noted by a number of scholars working in various regions of the Middle East (Crapanzano, 1973; Doumato, 2000; Dwyer, 1978; Mernissi, 1977; Tapper, 1990).

For women in the Middle East, healing as well as the solution of other difficult life problems is a primary impetus for *ziyārāt* to saints’ shrines. Such healing furthermore may be multifaceted. On the one hand, belief in *barakah* and the abilities of *barakah*-bestowing dead saints to perform miraculous cures, including the restoration of fecundity to the infertile (Inhorn, 1994a), brings hope to those whose health problems seem intractable or who have failed to find relief in other therapeutic venues. In addition, the activities of the pilgrimage itself—including the respite from everyday routine; the exhilaration of travel to a spiritually “magnetic” center (Preston, 1992); the cathartic effects of unburdening one’s “private heartaches” (Tapper, 1990) on a nonjudgmen-

tal but responsive holy one who can be requested to act on one’s behalf; the ability to be part of a sympathetic, experienced community of female sufferers who often congregate at these shrines (Mernissi, 1977); and the ministrations of the living, *barakah*-bestowing *shaiḳhs* who often attend to these shrines and who pray and write healing amulets for suffering pilgrims—are part and parcel of the healing process. Thus even if miraculous cures do not eventuate, the pilgrimage itself may bring relief and psychological relaxation as well as spiritual renewal through contact with divinity.

Furthermore as Fatima Mernissi (1977) has noted, Middle Eastern women’s pilgrimages to holy sanctuaries are “power operations,” means by which subaltern women can seek control over their sexuality, fertility, health, and general well-being in societies that tend to be decidedly patriarchal (Inhorn, 1996). Pilgrimages to saints’ tombs allow women to reaffirm, if only temporarily, control over their lives and their personal well-being through actions that are autonomous from men. Typically, *ziyārāt* to the mosque-tombs of blessed saints are journeys that women make alone, allowing them the opportunity to demonstrate their agency and independence. Even though women’s *ziyārāt* often require money from husbands and, in most cases, permission to travel by husbands or other family members, the pilgrimage typically remains an exclusively female activity, with shrines often serving as protected “female turf” (Betteridge, 1983).

Although women are barred in many ways from formal public ritual practice, including participation in Friday communal prayers at mosques, many of the popular healing rituals and pilgrimages practiced in the Middle East are nonetheless carried out by women within the framework of the Islamic ritual cycle. In many cases, pilgrimages and healing rituals are undertaken during the exact hour of the Friday communal noon prayer—the most important one in the Islamic weekly cycle of thirty-five prayers. This syncretic association of healing practice with Islamic prayer ritual is extremely significant, even though it is disdained by religiously literate orthodox Muslims.

**ISLAM AND POPULAR HEALING.** In the Middle East in the early twenty-first century, opposition to popular healing rituals does not come mainly from biomedical quarters. Islamic religious leaders and groups are increasingly spreading the word that popular healing practices, especially those that involve saint worship, are a form of *shirk*, or polytheism, which is *ḥaram*, or forbidden in the religion. Whereas biomedicine is viewed for the most part as being *ḥalāl*, or compatible with Islamic doctrine, many alternative healing practices are considered *ḥaram* by religiously literate Muslims and conservative Islamists (so-called fundamentalists), who see these practices as being “against God,” “against the religion,” or “like believing in something besides God.” This religious argument is becoming increasingly apparent as a result of the contemporary Islamic revival in many parts of the Middle East and, according to Eleanor Abdella Doumato (2000), has severely restricted women’s healing practices in Saudi Arabia,

regarded as the home of Islam and the site of the annual Islamic pilgrimage, or *hājjī*.

Yet despite official Islamic opposition, popular healing practices continue unabated, attesting to their power and importance in the minds of ordinary Muslims. Under the rubric of *wasfāt baladī* (traditional remedies) or *it ṭibb il-ʿarabī* (Arabic medicine), popular healing in the Middle East comes in many forms other than saint veneration. Given the incredible diversity of the region, the Middle East is home to a rich armamentarium of popular healing practices delivered by multiple types of healers. In Egypt, for example, there are four major categories of traditional healers, including *dāyāt* (lay midwives), who deliver babies and provide many types of “ethnogynecological” care to lower-class women patients (Inhorn, 1994a); *ʿaṭṭārīn* (herbalists), who work with a rich ethnopharmacopeia of herbal and mineral substances and are often skilled ethnobotanists in their own right; *munaggiṣīn* (spiritist healers), who are known for specializing in diagnostic clairvoyance and the treatment of the more difficult, socially mediated causes of ill health (e.g., infertility, impotence), including angered spirits and the sorcery acts of enemies; and *shuyūkh bil-baraka* (blessed *shaiḫhs*), who are typically, but not necessarily, associated with Ṣūfī orders and who bestow their own inherited or acquired *barakah* on patients through faith healing (i.e., laying on of hands, reading of the Qurʾān, writing healing amulets with religious inscriptions, and praying over the afflicted). In the neighboring countries of the Arab Gulf and Levant (Lebanon, Syria, Palestine, Jordan), *ḥukamā ʿarabī* (Arabic doctors) may provide a variety of herbal, spiritual, and other physical remedies for difficult afflictions, such as male infertility and impotence, sometimes operating out of their own clinics and charging high prices for their services.

As suggested by this great variety of popular healers, ethnomedical beliefs about the causes of ill health and its treatment are multifaceted and complex in the Middle East, defying easy categorization. Nonetheless, etiological beliefs about illness range from naturalistic (physical) to personalistic (social), to supernatural (spiritual), as is also common in many other parts of the world. To take one example from the Middle East, Egyptian ethnomedical beliefs about the causes of infertility range from humidity to sorcery and include the possibilities of an open back, a shock, a polluting entrance, an angered spirit-sister under the ground, and the ultimate cause, which is always God’s will. To counter these various etiological possibilities, lower-class infertile women often undertake relentless “quests for conception,” in which they engage simultaneously in arduous ethnomedical and biomedical therapeutic rituals (Inhorn, 1994a). Ethnomedical therapies for female infertility in Egypt include vaginal suppositories with various herbal and mineral substances; cupping on the lower back; vapor sitz baths; cauterization of the skin with a heated rod; sewing of the skin of the lower back; wearing a belt and padlock; countershocking the infertile woman who has been shocked; sorcery nullification; spirit

appeasement; and elaborate rituals for a culture-bound syndrome known in Egypt as *mushāhara* or *kabsa*, which is thought to be the major cause of infertility in women. In short, the ethnomedical treatments for infertility alone in one Middle Eastern country are amazingly diverse and complex, suggesting the richness of popular healing beliefs and practices in this part of the world.

**EXAMPLES OF POPULAR HEALING PRACTICES.** Although it is important to emphasize the rich diversity of popular healing practices in the Middle East, a number of main types of healing practices stand out as particularly relevant and representative of the region. For this reason, they provide notable examples.

**Cupping and cautery.** The practices of cupping and cautery were the most common healing methods employed in pre-Islamic times, according to medical historians (Ullman, 1978). However, with the coming of Islam to the region, the prophet Muḥammad is said to have forbidden cauterization as a pre-Islamic, Bedouin practice of heathen origin (Doumato, 2000; Ullman, 1978). Despite this prophetic denouncement, both cupping and cautery are found widely throughout the Middle Eastern region in the early twenty-first century. Cautery is reportedly practiced in Morocco, Sudan, Yemen, Jordan, Saudi Arabia, and among Palestinian Bedouins in Israel. Although cupping has been reported for other parts of the Middle East as well, it is described much more frequently than cautery in reports on Egypt.

Cupping (*kasr* or *kaʿsāt hawāʿ*) involves two objects—one to be lit (usually a piece of cloth dipped in a flammable liquid, a candle, or a corncob), and one to be used as a sort of suction cup (usually a glass jar, a pottery vessel, a mortar, or a cup). When the vessel is placed over the flame, it extinguishes the flame and causes vapor to rise. Adhered like a suction cup to the patient’s skin, the healing vessel is said to “grab,” “suck,” or “collect” excess cold moisture inside the body, or to “gather” parts of the body that have become divided (e.g., the muscles in an “open” back). Given its perceived efficacy in the treatment of rheumatic, muscular, and gynecological complaints, cupping is widely performed by both lay cupping (*kasr* or *kaʿsāt hawāʿ*) persons and ethnomedical healers such as midwives in countries such as Egypt.

Cautery (*kawī*, *kayy*, *makwa*, *ḥadīd*) involves placing a heated metal object, usually a nail or a small rod much like a branding iron, on the patient’s skin. The procedure is painful, burning the skin and leaving a permanent scar. Cautery may be used directly on the site of a patient’s bodily complaint (e.g., lower back, arm or leg joints), or it may be used on other sites of the body to “tighten” relaxed nerves and muscles. For this reason, cautery is thought to be extremely useful for male infertility and impotence, both of which may be attributed to “weak nerves” in the back (Inhorn, 1994a). In Saudi Arabia, cautery has also been used historically as a favored technique to chase malevolent spirits causing emo-

tional or physical illness out of the body, including spirits causing madness (Doumato, 2000).

**Amulets and evil eye.** As with cupping and cautery, the use of prophylactic and curative amulets dates to pre-Islamic Arabic folk medicine; however, the use of amulets was not denounced by the prophet Muḥammad and was eventually incorporated into prophetic medicine. In the early twenty-first century, amulets are widely used throughout the Middle East for three primary purposes: (1) to prevent the deleterious envy (evil eye) that can destroy objects and lead to illness; (2) to nullify acts of sorcery, which are also thought to cause illnesses such as impotence; and (3) on a more mundane level, to treat physical complaints, ranging from headaches to fever.

Amulets often consist of small pieces of paper, sometimes folded, upon which indecipherable formulas or religious verses have been inscribed by a *shaikh bil-barakah* or quasi-religious male healer. Healers often provide special instructions on how the written amulet is to be utilized (e.g., in bath water, in drinking water, worn next to the body, slept on, stepped over, or burned with incense, which in and of itself is deemed protective against harmful forces). Amulets may also be store-bought, such as small charms made of gold, silver, or other metals, or they may be made of brightly colored pieces of cloth, sometimes adorned with shiny metallic coins.

Throughout the Middle East the most pervasive amulet is the so-called hand of Fatima, a down-turned, stylized, five-fingered hand often made of silver or blue pottery (or both) and often incorporating Qur'anic verses or representations of a human eye. Middle Eastern citizens may adorn their most prized possessions (e.g., homes, automobiles) with the hand of Fatima to ward off the deleterious effects of envy. Wearing a hand of Fatima as a piece of jewelry is thought to prevent human harm and illness.

Belief in the power of the envious glance to cause harm is widespread throughout the Middle East, a region considered one of the “core areas” where evil eye beliefs are found (although they are also found in other parts of the world) (Dundes, 1992; Maloney, 1976). The “evil of an envier” is mentioned directly in the Qur'ān, but the belief in evil eye predates Islam, appearing in both the Bible and in Sumerian texts as early as five thousand years ago (Dundes, 1992).

In the early twenty-first century in the Middle East, there are two recurrent features of evil eye belief and practice that are relevant to a discussion of health and healing. First, children—and particularly more highly valued male children—are believed to be one of the main targets of the evil eye, with their sickness, injury, and even death constituting possible outcomes. Thus, in many settings in the Middle East, belief in the evil eye serves as a primary explanatory model for infant and child morbidity and mortality (Harfouche, 1992). For this reason amulets often adorn the clothing of infants and young children.

Second, given these beliefs concerning child health, it is not surprising that women—and particularly reproductively troubled women incapable of fulfilling their motherhood expectations and desires—are deemed particularly likely to cast the evil eye on children for the simple reason that women deprived of children cannot help but to envy them. Furthermore infertile women are considered to be dangerous to fertile women, especially those who are pregnant, who have demonstrated their reproductive success repeatedly, or who have finally achieved a coveted pregnancy through technological means such as in vitro fertilization.

**Spirit possession and the *zār* cult.** Women who are reproductively troubled and who may be blamed for the evil eye seek refuge in the *zār* cult in some parts of the Middle East. The *zār* is a women's spirit possession cult, found primarily in Egypt, Sudan, and the Arab Gulf or the regions closest to East Africa, where the *zār* cult probably originated. According to Doumato (2000), in the late nineteenth century and early twentieth century the *zār* cult could be found virtually everywhere in the Arabic-speaking world and was integrated into the lives of women of all social classes.

In the early twenty-first century the *zār* is found primarily among the socially marginalized, who seek refuge in a healing fellowship with others who are similarly afflicted. For example, in Arabic-speaking northern Sudan, where *zār* is actively practiced, infertile women suffering from poor self-images are the primarily members of the *zār* cult. Through the *zār* they find a social etiology for their suffering (i.e., harmful spirits), a sense of community solidarity with other similarly afflicted women, and a way to press for demands (e.g., new clothing, jewelry, feasts) through the idiom of spirit possession and the invocation of these spirits through joyful music and dance. Indeed *zār* has been described by some scholars as a proto-feminist challenge to women's objectification and subordination (Boddy, 1989), a way to challenge authority and compensate for exclusion from formal religion in the Muslim world (Doumato, 2000).

Although women's *zār* cults have been suppressed in some Middle Eastern societies by conservative religious forces, the *zār* is experiencing a revival in parts of the Arab Gulf, particularly among socially isolated tribal communities (Doumato, 2000). Furthermore beliefs in harmful spirits and spirit possession are found across the Middle Eastern region, from Morocco to Iran. In Egypt, for example, a class of spiritist healers known as *munaggimīn*, who may be either male or female, specialize in diagnostic clairvoyance and the treatment of angered spirits. They do so either as “possessed” individuals, who use their own spirits to diagnose and treat other spirit-troubled individuals, or as skillful agents of spirit invocation, who make the wishes of others' spirits known, then appease those spirits through communal *zār* rituals or private rituals of animal sacrifice and the provision of gifts to the spirit world.

**FUTURE DIRECTIONS.** As noted at the beginning of this essay, high-tech biomedical therapies such as in vitro fertil-

ization exist simultaneously in the Middle East with popular healing practices such as the *zār* cult. Neither domain has been well studied by social scientists or historians. Healing, both new and old, is clearly a rich area for future scholarship, as suggested by the brief examples provided in this essay. Furthermore, such research is timely, given calls for an “Islamic alternative” to the hegemony of postcolonial Western biomedicine in the region. Although some contemporary Islamists are calling for a return to prophetic-Islamic medicine—with its promotion of dietary and lifestyle changes as well as faith healing through prayer, writing of religious amulets, laying on of hands, and recitation of holy verses from the Qurʾān (Adib, 2004)—it is important to remember that these are among the very practices that have been employed for centuries in popular healing rituals throughout the region. It is fair to conclude that Islam—at least in its more populist form—has always been a major influence on the healing practices, pilgrimages, and rituals that continue, unabated, among the poorer urban and rural communities in the Middle East in the early twenty-first century.

## HEALING AND MEDICINE: HEALING AND MEDICINE IN GREECE AND ROME

In the ancient world there were four models of disease causation. The first viewed disease as retributive, caused directly by a divinity, usually a god or gods. The second postulated a demonic force as being responsible for inflicting disease on individuals. The third explained disease as the result of magic, often brought by sorcerers or magicians. Finally, the ancients ascribed some disease to natural causes. These etiological models were not mutually exclusive. In most ancient societies, in fact, they were complementary. But the treatment prescribed differed according to the perceived causative factors. When gods were assumed to be responsible, a religious response (e.g., prayer, sacrifice, or purification) was required. When demonic causation was assumed, exorcism or divine healing was called for. If illness was attributed to magical forces, counter-magic was expected to be efficacious. If disease was thought to be the result of natural causes, medical treatment was ordinarily sought. Throughout the period of classical antiquity (c. 800 BCE–c. 500 CE), one finds all four models manifesting themselves in different times, often in a harmonious or complementary relationship, as they reflected the changing spirit of the age.

**GREECE.** The earliest Greek literary works that have come down to modern readers are the *Iliad* and *Odyssey*, traditionally ascribed to Homer, who probably lived between about 750 and 650 BCE. Although the historical setting of these epic poems is that of the Trojan War, which the Greeks dated to about 1200 BCE, it is widely held that much of the social and cultural backdrop is that of the Dark Age in Greece (c. 1200–800 BCE). In the Homeric epics the gods play an active role in every area of life, including health and sickness. Apollo sends arrows that cause disease and death

(*Iliad* 1.9–52), whereas *daimones* (unseen supernatural powers) might cause them as well (*Odyssey* 5.394–97). The early Greeks regarded disease as retributive, the result of having offended a god or violated a sacred taboo. Only after the offense was removed, the community purified, and the gods propitiated would the disease be averted. Hesiod (eighth century BCE), an epic poet who was perhaps a late contemporary of Homer, offers an alternative explanation. Diseases are *daimones* that escaped from Pandora's box and move of their own accord throughout the world (*Works and Days* 100–104). Greeks sought healing of supernaturally caused diseases from *iatromanteis*, shaman-like healers. *Iatromanteis* traveled from city to city and purified communities from divine pollution, as in the early sixth century BCE did the Cretan Epimenides, who purified Athens, thus ending a plague that had fallen on the city because a magistrate had committed a sacrilege when he killed several men who had taken sanctuary in an Athenian temple.

But the Homeric epics speak also of an empirical approach to medicine. According to the *Odyssey* a group of physicians existed called *demiourgoi*, who were itinerant members of a medical craft. They relied on their experience and skill to treat wounds, broken bones, and diseases symptomatically by employing traditional treatment that was passed on by apprenticeship. In the sixth century BCE, groups of physicians began to assemble in several cities throughout the Mediterranean. Although they did not train physicians, they offered apprenticeship to aspiring doctors. Associated with one of the best known of these medical "schools," that of Cos, off the coast of Asia Minor, was the physician Hippocrates (c. 460–c. 380 BCE). Although he acquired the reputation as the father of medicine, little is known about Hippocrates. There exist only two contemporary references to him (both by Plato), but he became the subject of much idealized legend after his death.

In the fifth century BCE, Greek medicine began to develop beyond mere craftsmanship into a science that possessed a body of theoretical knowledge. The craftsman or empiric was often skilled in practical knowledge and the application of traditional methods. However, the addition of theory to practice actually created scientific medicine. The physician (*iatros*) attempted to understand disease and its causes in terms of natural processes. To do so he turned to philosophy, from which he borrowed the ability to frame universal formulations. The Hippocratic Corpus is the earliest attempt to provide a theoretical basis for medicine. The collection consists of about seventy treatises, most of which were written in the fifth and fourth centuries BCE. The treatises eschew magical or divine factors in accounting for disease, rather employing naturalistic theories of disease that were taken over from the pre-Socratic philosophers. The best known is the theory of the four humors, which was borrowed from Empedocles.

The writer of *On the Sacred Disease* argues that epilepsy, commonly attributed to divine possession, is not more sacred

than any other disease but has a natural cause. He writes, "There is no need to put the disease in a special class and to consider it more divine than the others; they are all divine and all human. Each has a nature and power of its own; none is hopeless or incapable of treatment" (*On Sacred Disease*, ch. 21). Although the Hippocratic treatises generally espouse a naturalistic explanation of disease, there is no evidence that this approach was regarded as atheistic. Hippocratic writers regarded nature as divine and medicine as a gift of the gods. Nor did they reject appeal to the gods for healing. "Prayer indeed is good, but while calling on the gods a man should himself lend a hand" (*Decorum* 87).

Hippocratic medicine spread rapidly in the late fifth and fourth centuries BCE. But alongside this rational or speculative medicine, which assumed natural causes of illness and sought to heal by natural means, there existed a tradition of religious healing. Those suffering from illness sought divine healing from gods, demigods, and heroes. Initially cures might be sought at the temple of any god or at the shrines of local heroes, but in the fifth century Asklepios emerged as the chief healing deity of Greece. In the *Iliad* Asklepios is the "blameless physician" to whom the centaur Chiron taught medicine. He is said in later legend to have been a god. His cult initially came from Tricca in Thessaly (in northern Greece), but it spread to Epidaurus (in the Peloponnese), which became the most important cult center of Asklepios. It was carried throughout the Mediterranean world to Athens, Pergamum in Asia Minor, Crete, Cyrene in North Africa, and Rome in 291 BCE, where the god was worshiped as Aesculapius.

The temples of Asklepios, known as Asclepieia, attracted large numbers of the sick who sought miraculous healing. At Epidaurus those seeking healing underwent a rite of ritual purification before offering simple sacrifices of cakes or fruit. The focal point of the pilgrimage was incubation, in which pilgrims spent a night in the abaton (inner sanctum) at the center of the temple. Lying on a couch, they would await a dream or vision from the god, who appeared with a caduceus (a staff around which a snake was coiled), which later became the symbol of modern medical healing. The healing process was varied to suit the pilgrim. Asklepios might merely touch the patient, or he might perform surgery or administer a healing drug. Sometimes a serpent or dog would bring healing by licking the wound. Whatever the means, when the incubants awoke the next morning, they expected to have been healed.

That many were cured of their illnesses or physical disabilities is evident from the several tablets, called *iamata*, that were posted at the temple site at Epidaurus, which recorded case histories of pilgrims who had been healed. These testimonials were doubtless meant to encourage pilgrims to trust that they too might experience the god's favor. Some of the testimonials were fictional or based on significant misunderstandings (such as that of a woman who delivered a baby that she thought she had carried for five years), whereas others

were convincing. At this distance in time, to explain fully how pilgrims were healed is impossible; rationalistic approaches are unconvincing. Perhaps many of the pilgrims suffered from chronic diseases that doctors could not successfully treat. Others probably suffered from hysteria that was susceptible of psychotherapy. The Asclepieion at Epidaurus grew over time to become a complex of buildings that included guest houses for pilgrims, gymnasiums, theaters, stadiums, and baths—all of which provided a sanatorium-like setting that offered a peaceful retreat and therapeutic environment for physical healing and recuperation.

Asklepios was both the dispenser of divine healing through incubation and the patron of physicians. Galen (129–c. 210 CE), the great physician and polymath, referred to himself as a servant of Asklepios, who had healed him when ill with a life-threatening abscess. Physicians did not doubt the god's ability to heal in any way he wished, whether miraculously or by natural means. They viewed religious healing as complementary to medicine. When they could offer no further medical help to their patients, they had no objection to their seeking supernatural healing at the shrine of Asklepios. Because Asklepios was their patron, who blessed their efforts as medical practitioners, physicians saw no conflict with his healing supernaturally in temples. They regarded both secular and temple medicine as legitimate means of healing, and they existed in relative harmony, but probably with little contact. The rapid spread of the cult of Asklepios in the fourth century BCE coincided with the decline of the older civic religions, and the cult appealed to the growing individualism of Greek religion. He was regarded as a philanthropic god and had an appeal to ordinary individuals that the great Olympian deities lacked. The poor, who could not afford physicians' fees, sought treatment at his temples. So popular was the worship of Asklepios that more than four hundred temples and shrines were devoted to his worship in the Greco-Roman world.

Following the conquest of the Persian Empire by Alexander the Great (356–323 BCE; ruled 336–323 BCE), foreign cults poured into Greece from Egypt and Asia, brought back by soldiers returning from his campaigns. The Greek world itself was enlarged and now comprised the eastern Mediterranean, including the Hellenistic kingdoms of Macedonia, Egypt, and the Seleucid Empire in Asia. The mystery religions, as they have been called, offered a sense of personal union with the deity that was often formalized in a rite of initiation. Enormously popular during the Hellenistic period (323–30 BCE), they supplemented the official cults that were maintained by the Greek city-states as the focal point of public worship. Many of them offered healing, which adherents of almost any Greek or foreign deity, demigod, or hero might expect. Incubation was the most common means of temple healing, but other forms existed as well. The use of magical practices in Greek medicine, common in Homeric and archaic Greece, did not play a major role from the middle of the fourth century BCE until the second century CE. Although

some physicians might resort to chants, amulets, or sympathetic magic, in general magical practices were the preserve of magicians, not of physicians. Indeed Greek medicine differs significantly from Mesopotamian and Egyptian medicine, which routinely incorporated magical practices.

**ROME.** For the first six centuries of their history (Rome was, according to tradition, founded in 753 BCE), the Romans lived without either rational medicine or physicians. They used native folk remedies, which they supplemented with magic and divination that they inherited from the Etruscans. The *paterfamilias* (the eldest male member of the household, which included slaves and up to three generations) administered folk remedies to his household. A well-known example of such a family practitioner was Cato the Elder (234–149 BCE). According to Plutarch (before 50–after 120 CE),

[Cato] compiled a book of recipes that he used for the treatment of members of his household who fell ill. He never made his patients fast, but allowed them to eat herbs and morsels of duck, pigeon, or hare. He maintained that this diet was light and thoroughly suitable for sick people, apart from the fact that it often produced nightmares, and he claimed that by following it he kept both himself and his family in perfect health. (Plutarch, *Life of Cato* 23)

Cato relied on folk remedies, together with prayers, sacrifices, magical incantations, and rituals, to protect his family, crops, and herds. He was renowned for his advocacy and use of cabbage in medicinal recipes and for his contempt of Greek medical theories and practitioners.

The Romans initially worshiped spiritual powers without defined personalities that they called *numina*. Under the influence of the Etruscans, they came over time to represent *numina* as gods, many of whom they identified with Greek gods of similar characteristics, but animistic elements remained. Roman religion was a state cult, staffed by unpaid priests who carried out formal observances that maintained the *pax deorum* (peace of the gods) and guaranteed the continuing divine favor to the city and its fortunes. The Romans believed that if they neglected to observe formal religious obligations, the gods would send disasters. Hence public disasters like epidemics, droughts, and defeats in battle were explained as being sent from the gods, and great care was taken to propitiate them to avert their anger. The earliest Romans had no specific gods associated with disease or healing, although specific deities might be appealed to if they were thought to be especially concerned with bodily parts or functions. Sometimes, if prayers to Roman gods had failed to produce the desired effect, the Romans introduced foreign deities. Thus in 433 BCE the Romans built a temple to the Greek god Apollo, whom they credited with ending a plague that had lasted for two years. They worshiped him as Apollo Medicus (Apollo the Physician). In 293 BCE, during a pestilence, the Romans consulted the oracular Sibylline Books, which directed them to send a mission to Epidaurus to bring the god Asklepios to Rome. Two years later they did so. According to the legend, Asklepios took the form of a serpent

and boarded the Roman ship, which carried him to Rome, where he disembarked onto the Tiber Island. The Romans built a temple for him and he came to be worshiped as Aesculapius.

The Romans also personified forces like Febris (Fever), which came to be represented as a goddess whose anger might be propitiated for remedies from disease. The Romans believed that every natural function was under the protection of a particular deity. Hence every stage of life, including conception, gestation, and birth was subject to a *numen*, and the protection of the appropriate spirit or deity was sought. Given the dangers of childbearing, which claimed the lives of many women, a Roman matron might appeal to any number of Roman goddesses in childbirth, although through a process of syncretism Juno Lucina and Diana came to replace most of the others. Incantations and magical formulas were often recited, together with the laying on of hands, which was thought to transfer the power of a deity and provide safety in childbearing or healing.

The first physician to practice medicine in Rome was Archagathus, a Greek who settled in Rome in 219 BCE. Although he was initially well received, he relied heavily on surgery and cautery, which damaged his reputation and gained for him the title of *carnifex* (the executioner). Many subsequent Greek physicians were attracted to Rome, where they enjoyed great popularity in a city that had never before had professional medical practitioners. Yet some Romans, like Cato the Elder and the encyclopedist Pliny the Elder (23/24–79 CE,) distrusted physicians and relied on popular folk medicine long after the introduction and widespread acceptance of rational Greek medicine. Pliny included many folk and magical remedies in his influential *Natural History*.

As Rome conquered the Mediterranean world in the second and first centuries BCE, Roman culture underwent many rapid changes owing to Eastern influences and Greek thought. Some Romans abandoned traditional religion for philosophy or skepticism, whereas others supplemented the mechanical and formal civic religion with Eastern religions. The influence of foreign beliefs, such as astrology and magic, spread throughout Italy as soldiers returned from foreign campaigns and slaves were brought to Italy. Although amulets had always been worn to ward off disease and personal disaster, magicians now abounded, selling charms and incantations to exorcize demons or to heal diseases. The belief that certain animals, plants, and precious stones possessed occult properties, which released magical forces through manipulation, influenced healing practices. Astrologers, too, had become popular in Rome by the first century CE, and some physicians began to integrate astrology into their medicine. Galen, for example, held that the condition of patients was affected by the course of the moon and the planets.

However, it was the popularity of mystery religions that more than any other factor produced new forms of popular religious belief. From Egypt and Asia Minor came many cults that offered a personal satisfaction not found in the for-

mal religion of Rome. They were often modified and Westernized by their contact with the Greeks. The most prominent were those of Isis and Serapis from Egypt, Mithra from Persia, and Magna Mater (the Great Mother) from Asia Minor. These cults sometimes offered healing in a supernatural fashion, most commonly by means of astrology, magic, divination, or the use of herbs. Although the cult of Asklepios was introduced into Rome in 291 BCE, it was not until the first century CE that his temple on the Tiber Island came to be a popular healing site. By the second century CE Pergamum in Asia Minor had replaced Epidaurus as the center of healing by Asklepios. Moreover, the nature of the cures performed by Asklepios underwent change. Miraculous healing by the god was replaced by therapeutics that were not in many respects very different from those that a physician might prescribe. Instead of supernatural cures through incubation, Asklepios's priests often recommended practical regimens of exercise, swimming, diet, and purgatives to incubants.

Among the Eastern influences that became prominent in the imperial period was belief in the power of demons. In ancient Middle Eastern cultures like Mesopotamia and Egypt, demons had been an important part of the religious framework, and diseases were often attributed to them. In Greek and Roman culture, belief in the demonic etiology of disease, although always present, was less common, especially after the advent of rational medicine with its naturalistic understanding of disease. But in the mid-second century CE, the mood began to change. Diseases were attributed to demons by an increasing number of people, who believed that they consequently could be cured only by supernatural means. For example, the Gnostics believed that diseases themselves were demons that might be expelled by the use of magical formulas (Plotinus, *Enneads* 2.9.14), a view that was widely held in the late Empire. Hence ritual purification, on which the mystery religions placed much importance, was used to exorcise evil spirits.

**CONCLUSION.** Throughout the history of Greek and Roman cultures, a medical pluralism prevailed. There were always healing cults of various gods and heroes available, including both indigenous and foreign deities. The most significant was Asklepios. The extent of belief in magic, astrology, and demonic activity varied over the centuries of classical antiquity. At all times natural healing, whether by empirics or by practitioners of rational medicine, was an accepted, but not an exclusive, means of healing. Beginning in the fifth century BCE, physicians appropriated constructs of natural philosophy to provide a theoretical understanding of health and disease. Although many physicians considered Asklepios their patron, the medicine they practiced was devoid of religious or magical elements. Many sources besides medical authors attest—usually indirectly but sometimes directly—to this expectation in classical antiquity. For example, the tragedian Sophocles (496–406 BCE) makes one of his characters say, “No good physician (*iatros*) chants incantations over a malady that needs the knife” (*Ajax* 581–2).

Over six centuries later, the greatest Roman jurist, Ulpian (d. 228 CE), when discussing the qualifications necessary to sue for unpaid remuneration for services, says regarding physicians (*medici*), “But one must not include people who make incantations or imprecations or, to use the common expression of impostors, exorcisms. For these are not branches of medicine, even though people exist who forcibly assert that such people have helped them” (*Digest* 50.13.1.3). Neither Sophocles nor Ulpian was implicitly denying that alternative healing practices may have proven efficacious under some circumstances. Furthermore, both make it evident that those who called themselves physicians were not effective physicians or even physicians at all if they engaged in the practices specified. One of the greatest legacies of classical culture was a scientifically based medicine that, irrespective of the enormous changes and developments in its theoretical and practical aspects over the past two and a half millennia, has been the expectation of those in Western cultures who have chosen to consult a physician or surgeon rather than an alternative healer.

## HEALING AND MEDICINE: HEALING AND MEDICINE IN CHRISTIANITY

The four Gospels recount the career of Jesus of Nazareth (c. 4 BCE–c. 29 CE), the founder of Christianity. Jesus is recorded as having performed many miraculous healings, which included restoring to health (among others) the blind, the dumb, the deaf, the lame, and lepers. The Gospels describe Jesus' miracles as signs that provided evidence of his messianic identity, as well as a manifestation of the presence of the kingdom of God and a fulfillment of Hebrew prophecy (e.g., *Mt.* 11:4–5, which echoes *Is.* 35:4–6; 61:1). The *Gospel of John* declares that Jesus himself maintained that his miracles were evidence of his messiahship (*Jn.* 10:37–38). The Gospels differentiate Jesus' miracles from the miracles of exorcists and magicians. Moreover, although Jesus is said to have cast out demons, the Gospels invariably distinguish between exorcism and healing (e.g., *Mt.* 8:16; cf. *Mk.* 6:12; *Acts* 19:12). Nor does it appear that either he or his disciples considered demons to be the cause of disease. One finds several medical conditions described in the Gospels, mostly ordinary diseases or congenital conditions for which a natural cause appears to have been assumed by those who suffered from them. The Gospels distinguish the symptoms of such conditions from those that accompanied demonic possession, which usually manifested erratic or abnormal behavior. Whether those who approached Jesus for healing had already sought assistance from physicians is not indicated except in one incident in which medical treatment had been unsuccessful (*Mk.* 5:24–34).

Outside the Gospels, one finds little reference to miraculous healing in the New Testament. The *Book of Acts* describes a relatively small number of healings that are attributed to Jesus' disciples (*Acts* 3:1–11; 9:33–34; 14:8–10). They belong to the category of "signs and wonders" that confirm the disciples' apostolic credentials (*Acts* 14:3). The diseases healed are natural conditions, and none are attributed to demonic etiology. In the epistles, there are no sicknesses that are either healed miraculously or attributed to demonic causation. The *Epistle of James* (5:13–15) prescribes a rite of healing in which the presbyters of the church anoint the sick and pray for their recovery. But there is no evidence that anointing for healing was employed in the church before the third century, and it is possible that the passage refers to prayers for those who are spiritually rather than physically ill. In fact, the epistles suggest that first-century Christians suffered from ordinary illnesses from which they sometimes recovered gradually (e.g., *Phil.* 2:25–27) and sometimes did not recover (e.g., *2 Tm.* 4:20). They typically did not seem to expect that their diseases would be miraculously healed. The New Testament repeatedly speaks of suffering as intended by God to produce spiritual maturity (e.g., *Heb.* 12:7–11, *1 Pt.* 4:12). Faith and trust in God could transform suffering into a positive experience and nurture Christian graces such as humility, patience, and dependence on Christ (e.g., *Rom.* 5:2–5; *Jas.* 5:10–11; *2 Cor.* 12:7–10). Such suffering includes sickness and disability.

**THE POST-NEW TESTAMENT CHURCH.** Leading Christian writers of the earliest centuries of Christianity for the most part exhibit positive views of medicine. Thus Origen (c. 185–c. 254) considered medicine "beneficial and essential to mankind" (*Contra Celsum* 3.12), and Tertullian (c. 200 CE), who was fond of employing medical analogies in his writings, believed that medicine was appropriate for Christians to use. The theme of Jesus as the Great Physician (*Christus medicus*) was popular in the writings of the Church Fathers, who used the expression in a metaphorical sense to describe him as the savior of sin-sick souls, not as a healer of physical ills. Medical care, far from being rejected by early Christians, was regarded as a model of the care of the soul.

Early Christians regarded disease as a material, rather than a moral, evil that had resulted from the fall. Within the theistic context they had inherited from Judaism, they typically viewed illness as the result of natural, although providential, causes that could be treated by physicians or other healers, to whom they could legitimately have recourse so long as they did not employ pagan religious practices. Christians were encouraged, of course, to pray that God would heal, whether by medical means or without them. When medicine did not avail, they might still seek healing by prayer, but recognized that they were to submit patiently to God's will.

By the late fourth century, there was a marked increase in claims of divine healing. The growing veneration of relics associated with Christian martyrs and the new importance that Christian leaders like Ambrose (374–397) and Augustine (354–430) placed on miracles of healing signaled a major change in Christian approaches to healing. The burgeoning fascination with demonic activity did not, however, preclude a sustained belief by many in naturalistic explanations of disease. For example, Augustine's delight in describing spectacularly miraculous cures (*City of God* 22.8) was not diminished by his assumption of a natural etiology for every case mentioned. Indeed, the rapid spread of hospitals at the end of the fourth century suggests that Christians still sought medical assistance for their illnesses, perhaps resorting to religious cures primarily when physicians had failed them.

From the beginning Christians had exhibited a philanthropic spirit that was evident in their concern, both personally and corporately, for those in physical need. This spirit was in marked contrast with that of the classical world, in which there was little or no religious basis for charity that expressed itself in a personal or organized concern for those who suffered physical distress. Christian concepts of philanthropy were motivated by *agape*, a self-sacrificing love of others that bore witness to the love of Christ as reflected in his incarnation and redemptive work on the cross (e.g., *Mt.* 25:35–40, *Jas.* 1:27). Christians were encouraged to visit the sick privately, and deacons (whose duties largely consisted of the relief of physical want and suffering) were expected to visit the ill.

In the third century, as Christianity grew rapidly in the large cities of the Roman Empire, extensive benevolent work was organized and centered in the local congregation. Minor ecclesiastical orders were created to assist deacons in their charitable work. In Rome, for example, by 251 the Christian church had divided the city into seven districts, each under the responsibility of a deacon and his assisting clergy. According to Eusebius of Caesarea (c. 260–c. 330), the church supported 1,500 widows and others, including the ill, who experienced suffering and want (*Eccles. Hist.* 6.43). Adolf Harnack (1851–1930) estimated that the Roman church at this time spent an amount between 500,000 and 1 million sesterces (Roman coins) each year in support of its charitable ministry. Other churches in the large cities of the Roman Empire spent similar sums on charities, which were administered by bishops or presbyters.

Beginning in 250, the cities of the Roman Empire experienced a major plague that lasted for fifteen to twenty years and reached epidemic proportions. Because the civic authorities did little to deal with the plague, the Christian churches undertook the systematic care of both pagan and Christian plague victims and the burial of the dead, despite the fact that Christians were at the time a persecuted minority. Descriptions exist of the organization of the care of the sick in Rome, Carthage, and Pontus. In Alexandria, a medical corps known as the *parabalani* was formed to transport and nurse the sick under the jurisdiction of the patriarch of Alexandria. Although the *parabalani* are first mentioned in the fifth century, they may date from the time of an earlier plague. During a plague in 312, Christians in many cities in the East performed public medical charity of the kind carried out later by the *parabalani*.

The legalization of Christianity by Constantine in 313 resulted in major changes in the church's administration of medical philanthropy. The role of individual congregations and of the laity declined, whereas that of bishops who administered the charitable programs grew. In the 370s Christians created the hospital (*xenodochium*), a specifically Christian institution that arose out of the philanthropic ideals of the early church. No similar organization existed in the classical world; Roman infirmaries (*valetudinaria*) for soldiers and for slaves on plantation estates were not philanthropic in nature. The hospital often included an orphanage and houses for the poor and aged in a single complex. One of the earliest and most celebrated was the Basileias, founded by Basil the Great, bishop of Caesarea (in modern Turkey), about 372. Hospitals modeled on the Basileias spread quickly in the East and somewhat later to the West. The first hospital in the West was founded in Rome by Fabiola, whose friend Jerome describes how she gathered the sick from the public squares of Rome (where the homeless ill could often be found in the ancient world) and nursed the most seriously ill herself (*Epistle* 77.6.1–2).

Many of the early Christian hospitals were staffed by monks. Monasticism, which originated in the deserts of

Egypt, Palestine, and Syria in the third century, grew out of attempts to deepen the spiritual life by the renunciation of the world and the practice of self-mortification. The founders of the movement were anchorites or hermits who sought solitude in the desert, but by the fourth century anchoritic monasticism had largely given way to cenobitic monasticism in which monks and nuns lived in ordered communities. The creation of the hospital represents the culmination of three centuries of medical philanthropy, during which time the church maintained an extensive program of caring for the sick. During the first two centuries of its existence, the church carried on its medical charity through the voluntary efforts of local congregations, which were supervised by presbyters and deacons. In the third century widespread plagues throughout the Roman Empire led Christians to establish emergency care for the community in the large urban areas. Organized medical attendants began to appear in the early fourth century, and the creation of the hospital followed later in the century.

Christianity had gradually spread in the first two centuries throughout the Roman Empire to diverse peoples who shared a common culture and a knowledge of Greek as a universal language. In the third century, a change began to occur that by late antiquity eventuated in a cultural cleavage between the East and the West. The division of the Roman Empire into eastern and western halves in 395 contributed to this development, with Latin as the common language of the West. After a century and a half of barbarian invasions, the last emperor of the western Empire was dethroned in 476. Already the West was slowly being drawn into an emerging European rather than a strictly Mediterranean ethos, whereas the eastern Empire was developing into the Byzantine Empire. Christianity in the East and West were to follow different courses.

**EASTERN ORTHODOXY.** Eastern Orthodoxy encompasses the largest body of churches that originated in the eastern Mediterranean world. Over time it took on a very different identity from that of the Western (later Roman Catholic) church, and the two separated in a formal schism in 1054. Within modern Orthodoxy are several *autocephalus* (self-governing) churches, with their patriarchs centered respectively in Constantinople (Greek), Antioch (Syrian), Moscow (Russian), and various capitals in Eastern Europe.

Central to the specifically Orthodox approach to healing and medicine has been the concept of *philanthropia* (kindness or love toward others), especially as it was manifested in monasticism. The ascetic tradition was a major force in the eastern Mediterranean from the third century on and an important component in Orthodoxy both in its anchoritic (hermit) and cenobitic (communal) forms. Within Orthodoxy, monasteries have always been regarded as repositories of spirituality, holiness, and wisdom. Ascetics believed that the gospel required that they actively pursue the charitable care of the ill. As previously noted, this motivating force led to the establishment of the earliest Christian hospitals

(*xenodochia*) in the eastern Mediterranean and such groups as the *parabalani* and, later, the *philoponoï* (lovers of labor) and *spoudaioi* (the zealous ones), which also arose in the large cities of the eastern Mediterranean. Composed of lay people who were without medical training and drawn from the lowest class, they flourished in the sixth and seventh centuries, giving assistance to the sick, especially to the urban poor. They bathed and anointed them, but they offered no professional medical assistance. These lay orders were attached to large churches and came to be recognized over time as an intermediate order between the clergy and laity.

The Byzantine Empire maintained a much greater cultural continuity with its classical past than did the West. Because the tradition of medical research and writing continued in the East, monastic physicians were in a position to appreciate classical medicine and to use it. Imperial troubles within Orthodoxy in the seventh century led to a decline of clerical medicine, an anti-intellectualism that remained for centuries, a growing spirit of mysticism, and a new emphasis on the ability of saints to heal. The last had been a continuing aspect of the eastern Empire since the fourth century. Nevertheless, hospitals and healing shrines, as well as physicians and holy men, continued to work in tandem and relatively without tension. In the thirteenth century, as the Byzantine Empire shrank and resources for supporting hospitals declined, sacramental anointing for healing became widespread. All these components continued in diminished form after the Turkish conquest of Constantinople in 1453, including the tradition of clerical physicians and the belief that *philanthropia* is an essential component of the Christian gospel.

**MEDIEVAL CATHOLICISM.** The barbarian invasions of the fifth century (most of them Germanic) brought about the breakup of the Western Roman Empire by 476. The political and social break was definitive and western Europe declined into chaos, poverty, and disorder. Cities declined or disappeared as centers of population, and the preservation and transmission of literacy and learning came to be centered in monasteries. The Germanic settlers brought with them into what had been the Western Roman Empire their folk paganism that threatened to overwhelm traditional medical approaches to illness. Although missionaries to western and northern Europe tried to eradicate these folk practices, many of them were employed as alternatives to Christian practices. Features of late Roman culture, such as the growing practice of healing through the cult of saints and relics, found fertile soil in the cultures that succeeded the dissolution of the empire. Christian missionaries to northern Europe encouraged the adoption of these practices, finding them useful in winning semi-Christianized pagans away from traditional animism. For a thousand years the cult of saints and relics dominated Western Christianity.

Although sacramental healing, especially by anointing, had already become widespread among Christians in late antiquity, it could not compete in popularity with miraculous

healing offered at the shrines of saints. Miracles became part of ordinary life. Most of them were claimed for the healing of a physical affliction. Pilgrimages to these shrines, which had begun in late antiquity, became enormously popular in the Middle Ages and beyond. At some pilgrimage centers, clergy, who had limited knowledge of medicine but access to a good library of medical works, were available to treat medically those who came. Popular too were quasi-medical practices of the kind described in Marcellus of Bordeaux's fifth-century work *De Medicamentis* (On Remedies), which mingled pharmacology, herbal lore, and spells (both Celtic and Roman) to help individuals treat their own illnesses. The church opposed this magico-medical approach, which combined spells and incantations with the occult properties of gems and herbs, and it attempted, not always successfully, to substitute for pagan incantations specifically Christian formulas like the Lord's Prayer and the Creed.

Although many people resorted to folk remedies, a tradition of secular medicine was transmitted from classical antiquity to the Middle Ages. There were two kinds of physicians, secular practitioners and clerical physicians, the latter usually being monks who had been trained by apprenticeship. Hospitals that had survived the chaos of the Germanic invasions became the property of monasteries and several reportedly had very skilled physicians in residence. Educated men continued to read classical medical literature, for medicine was a part of the curriculum studied in monastic schools. Nearly all who received an education in the early Middle Ages were trained in monasteries and became members of the clergy. Gregory of Tours (c. 540–594) was typical of scholars of the early Middle Ages in his credulity regarding miracles. He frequently alludes to the sick whose physicians had failed to heal them but who later found healing at the shrine of Saint Martin. However, he was not opposed to medicine for he regularly consulted medical and pharmacological handbooks. Pope Gregory I (590–604) encouraged the cult of saints and relics, miraculous healing, and the study of demonology, yet had a life-long interest in medicine and retained a personal physician. Both are typical of educated men who found a place in their thinking for both traditional medicine and miraculous healing and for both natural and demonic causality.

Given the fact that the clergy, especially monks, were responsible for much of the medicine practiced, not surprisingly the literature of the period emphasizes medical charity, citing biblical passages that admonish the care of those in need. Benedict of Nursia (c. 480–c. 547) and Cassiodorus (c. 485–580), both of whom founded monasteries in the sixth century, urged physician-monks to take the greatest care of the sick whom they treat. Monasteries, especially those that maintained *xenodochia*, became a refuge for the sick, not merely for Christians but for non-Christians (Jews and pagans) as well. Monks produced medical treatises to advise the poor how to find medically efficacious herbs. Because so many clergy practiced medicine, the church eventu-

ally passed a good deal of legislation to regulate them, for example, to limit the opportunities for avarice among clerical physicians who might be tempted to neglect their spiritual duties for a more remunerative career in medicine. Numerous treatises appeared as well that dealt with medical ethics and etiquette, as their authors (mostly monks) encouraged physicians, whether clerical or secular, to model Christian ideals in their character and medical practice.

As Europe began to change from a largely rural and manor-based society to an urbanized one in the eleventh century, medicine developed into a profession and the clergy's role was diminished over time. The growing sense of professionalism among secular physicians led to the creation of licensure requirements for the protection of the public against incompetent medical practitioners (the first were promulgated by Roger II of Sicily in 1140) and to the organization of medical and surgical guilds for the purpose of ensuring a monopoly of practice. As an authoritative international body, the church routinely extended its jurisdiction over guilds by granting charters and enforcing them.

**PROTESTANTISM.** When Martin Luther (1483–1546) nailed his “Ninety-Five Theses” to the door of the castle church at Wittenburg, he inaugurated not merely a schism, but a very different way of conceiving of humans’ relationship with God. Out of the Protestant Reformation there arose four separate traditions—Lutheran, Reformed (Presbyterian), Anabaptist, and Anglican (Episcopal)—united to a large degree in their basic differences with Rome, but by no means constituting a uniform movement.

Protestants differed from Catholics in their approach to the Christian life. The Catholic tradition saw in the ascetic or reclusive life the Christian ideal, whereas Protestants encouraged a life of active participation in the world. In Catholic thought the world was divided into temporal and spiritual estates. Catholics who desired wholeheartedly to serve God entered holy orders, and they considered secular professions to be of secondary importance. Martin Luther and John Calvin (1509–1564) abolished the distinction between secular and sacred callings. They broadened the idea of vocation (in medieval terms, a call to a contemplative life) by incorporating into it the secular professions. A physician or a nurse might glorify God in treating others medically as much as a priest might do so in caring for souls. The reformers’ desire was to extend God’s redeeming grace into every activity of life.

Given the reformers’ rejection of the medieval superstitions of Catholic saints, relics, and pilgrimages, not surprisingly Protestants also rejected the miraculous healing practices associated with them. The reformers respected medicine, as indeed they did the natural sciences; empiricism in the search for natural causes and the rejection of deductive Scholasticism were regarded as an extension of the theological ideas of Protestantism. There was no tension between faith and medicine in the view of the reformers, who regarded medicine as a gift of God for the healing of illness. Physi-

cians enjoyed a high status in most Protestant countries owing to the Protestants’ respect for learning and the value they placed on the professions as an area for spiritual cultivation. In eighteenth-century Edinburgh, the center of a strong Presbyterian (Calvinist) tradition, the Scots established what became one of the most celebrated medical faculties in Europe.

Because medicine was regarded as a sacred calling, medical literature before the nineteenth century describes the ideals of the profession in terms of religious and moral values. The physician was expected to be educated and a person of impeccable character and behavior. Christians had always seen affinities between the care of the body and the care of the soul. The practice of medicine provided opportunities for the physician to give spiritual counsel and to provide religious comfort, assurance, and admonition. Clergy-physicians played an important role among Protestant ministers from the sixteenth through the eighteenth centuries. In an age in which trained physicians were especially uncommon in villages and rural areas, the Protestant belief in an educated clergy ensured a supply of persons who had both the leisure and the learning to read medical books. John Wesley (1703–1791) took a course in medicine so that as a minister he could be of help to those who had no regular physician. In 1746 he opened a dispensary and in the next year published a lay medical guide, *Primitive Physick*. Clerical physicians were common in colonial New England, where Cotton Mather (1663–1728), a Bostonian minister who himself practiced medicine, called the combination of the care of soul and body the “angelical conjunction.” During an epidemic of smallpox in 1721, many physicians (together with members of the local press) opposed inoculation as a hazard to health and a rejection of divine providence. Mather defended the practice, maintaining that any medical procedure might invite the same kind of objections. He was supported by five other prominent clergymen.

The nature of authority for Protestants is different from that of the Roman Catholic and Orthodox churches. The reformers rested religious authority not on ecclesiastical tradition but on scripture alone (*sola scriptura*). The Bible enjoyed primacy over all human traditions and institutions, even over the church itself. Scripture was the medium of God’s special revelation as it was interpreted with the guidance of the Holy Spirit. Hence it was the touchstone for judging all matters of theology, morals, and practice. However, Protestantism was not a monolithic tradition, and there remained a good deal of diversity between confessional bodies as well as theologians. Protestantism has never had a locus for the definitive formulation of matters of faith and morals like the magisterium (teaching authority) of the Roman Catholic Church. Moreover, the Protestant belief in the priesthood of all believers has meant that much theological controversy has involved individual opinion. Protestants for the most part, perhaps in reaction to the Roman Catholic tradition of natural law, never developed a system of casuistic ethics. Instead,

Protestants made commandment and conscience the twin pillars of ethics. An emphasis of Protestantism historically has been the cultivation of the individual conscience, which seeks to apply biblical principles and specific texts to particular ethical situations. In practice, this has meant that Protestants have been less willing to insist on a single authoritative Protestant position on complex medical-ethical issues that might inhibit the exercise of private conscience. Paul Tillich (1886–1965) called this refusal to absolutize the relative the “Protestant principle.” Thus on questions such as whether suicide always precludes God’s forgiveness (Augustine’s view) or whether abortion is ever justified, there has been some disagreement among Protestants because the biblical evidence is not clear enough to permit a definitive solution.

**FAITH HEALING.** Belief in miraculous healing has always existed in Christianity, sometimes within the mainstream and sometimes on the sectarian fringe of the movement. Although there is little evidence that it was prominent in the first three centuries, by the fourth it had emerged as a significant component of the Christian view of illness. Claims of miraculous healing were ubiquitous in the Middle Ages. The Roman Catholic and Eastern Orthodox churches continue to teach that miraculous healing is an ongoing phenomenon and a demonstration of God’s working in the church. Protestants have historically claimed that miracles ended with the apostolic age. Although they have maintained that God heals in answer to prayer (i.e., as a special providence), they have considered supernatural healing (i.e., healing apart from means) to be rare. In the mid-nineteenth century, however, faith healing became prominent in American Protestantism largely through Methodist and Holiness influences. Some prominent Pietist preachers in Europe (e.g., Christoph Blumhardt in Germany and Otto Stockmayer in Switzerland) and evangelical ministers in the United States (e.g., A. B. Simpson and A. J. Gordon) sought to reclaim a healing ministry for the church.

At the turn of the twentieth century a new movement, Pentecostalism, claimed that the supernatural gifts of the Holy Spirit described in *1 Corinthians* 12 and 14 (particularly supernatural healing and *glossolalia* or speaking in unknown languages) were normative for the church in every age. The movement began in 1901 with Charles Fox Parham, a faith healer, whose teachings spread to Los Angeles, where they led to the celebrated Azusa Street revival. Pentecostalism, which grew rapidly in the first two decades of the twentieth century, taught that Jesus’ death on the cross atoned not only for sin but for disease as well. Hence Christians could seek supernatural healing by the “prayer of faith.” Pentecostalism produced many itinerant healers who claimed to possess the gift of miraculous healing. Some practiced exorcism, regarding demons as the cause of illness. A minority of Pentecostals recognized medicine as an alternative to supernatural healing, albeit an inferior one. The majority rejected it as unfaithful to God’s unconditional promise to heal. In the last third of the twentieth century some Pentecostals modified their categorical rejection of medicine.

Since the 1950s Pentecostal influences, usually without their sectarian flavor, influenced mainstream Protestant and even Roman Catholic churches. The charismatic renewal, as it came to be called, gained widespread influence as it introduced healing, sometimes in a sacramental fashion, to churches that had not traditionally practiced it.

**ROMAN CATHOLICISM SINCE TRENT.** The late medieval corruption of the Catholic church, which led to the separation of Protestants in the sixteenth century, was seriously addressed by the Council of Trent (1545–1563). The Council introduced long-needed reforms and firmly restated every doctrine that had been challenged by the Protestant Reformers. The results of the Counter or Catholic Reformation were a conservative theology, a strict discipline, and a centralization of the church that remained in place until the Second Vatican Council (1962–1965). By contrast, Vatican II opened the floodgates to the liberalization and modernization of the church. Among those practices that were retained after Vatican II was a ban on artificial contraception, which was confirmed by Pope Paul VI in his encyclical *Humanae Vitae* (1968).

Many popular forms of Catholic piety have remained outside the control of the institutional structure of the church. There has existed within the church a tendency, which was not limited to post-tridentine Catholicism, to blur the distinction between officially sanctioned rites and popular practices. The officially sanctioned practices of venerating relics and blessing animals, for example, seemed to many Catholics not very different from popular cults that attributed supernatural healing to statues of the Virgin Mary. Although educated Catholics might consider some manifestations of Catholic piety that syncretized pagan survivals as superstitious, they reflected an important aspect of the Catholic faith. Hence there remained within the larger confines of the church as much a place for supernatural healing as existed within Protestant Pentecostalism. Chief among them was the miraculous healing offered at pilgrimage sites. Lourdes in France, Fatima in Portugal, and Guadalupe in Mexico continued to draw large numbers of pilgrims year after year despite modern advances in medicine that would seem to render them less attractive to pilgrims than in previous centuries.

At the same time post-tridentine Catholicism retained and enlarged its vast reservoir of medical philanthropy. The Sisters of Charity, founded by Saint Vincent de Paul (1580–1660), became a major force in caring for the sick. Catholics excelled in organizing and institutionalizing their medical charities, including hospitals, most of which were maintained by religious orders of women. Similarly missionaries to colonial areas often included a medical component and much of their work focused on the founding of hospitals, leprosaria, and other health-related institutions.

**CENTRAL THEMES IN CHRISTIAN HEALING.** The relationship between Christianity and medicine is a complex one that is marked by a number of relatively consistent themes.

In general, Christians have considered the body as a relative, not an absolute, good. They have viewed health as a blessing given by God, not (as did the Greeks) a virtue. Disease and pain were material, although not moral, evils, the result of the fall of humanity, but they were often used under God's providential care to produce spiritual good. Hence a place existed in God's world for suffering, as many spiritual writers have observed. Few serious Christians could anticipate a future in this life in which bodily affliction would be completely eliminated. In a world of sin, the curse of disease and physical suffering would always be present. Christians anticipated the resurrection of the body, in which illness and death, the final enemy, would be conquered.

The majority of Christians at most times have considered medicine a gift of God, offering relief to sufferers of illness. In nearly every era, miraculous healing has either complemented medicine or, among a small minority who repudiated all medicine as contrary to God's will, replaced it. Most Christians have not considered the use of medicine and the practice of healing through prayer to be incompatible. Believing that God is sovereign over life and death and that God most often works through natural means, they have prayed for healing through the use of medicine or, when it has failed, by miraculous means. When both have failed, Christians have always been encouraged to pray for patient endurance of their suffering.

The New Testament and early Christian literature enjoined Christian care, both on the individual and the corporate level, for those who were suffering from physical ills. Already in the first century, the early church organized a systematic effort to care for the sick through voluntary assistance. It became so successful that it formed the basis for the hospital, created at the end of the fourth century. Medical philanthropy has played a paramount role in Christian charity among Christians of all persuasions. Historically, it has been the greatest contribution of Christianity to health care.

The impulse to philanthropy reflected the conviction that human beings were created in the image of God, which gave to every individual an inherent worth. This, in turn, formed the basis for a respect for life from conception to death, which clearly distinguished the ethics of Christian physicians from the prevailing medical ethics of classical polytheistic pluralism as it does in the twenty-first century from the bioethical consequentialism of secular pluralism.

#### HEALING AND MEDICINE: ALTERNATIVE MEDICINE IN THE NEW AGE

Healing is a profoundly cultural activity. The labeling and treating of a disease reflect a culture's deepest understandings of the causal powers affecting human well-being. For this reason, the notion of orthodoxy pertains to medical systems as surely as it does to religious or political traditions. Ever since the Enlightenment, medical orthodoxy has been defined by a commitment to the causal role of "material" factors in the etiology of disease. Western medical science thus emerged in direct opposition to the pre-Enlightenment worldview within which the church supplied culturally compelling explanations of nonmaterial or spiritual causes of disease (e.g., sin or spirit possession), as well as corresponding strategies for therapeutic intervention (e.g., confession or exorcism). The continual successes of medical science have understandably garnered wide cultural support for its underlying worldview. As a consequence, most educated Westerners have implicitly endorsed a clear-cut division of labor whereby religion continues its age-old practice of the cure of souls, while scientific medicine uses its secular methods for healing the body.

The fact that a wide array of contemporary medical systems continue to espouse theories that defy scientific ortho-

doxy is therefore of particular interest to religious and cultural historians. Popular interest in alternative healing systems, such as holistic healing methods, twelve-step programs, and Asian systems for self-purification, seems to indicate that a fairly large number of Westerners subscribe to beliefs that belong neither to science nor to the more genteel theologies of our mainstream churches. Because these unorthodox healing systems contradict the materialistic assumptions underlying medical science, they are often taken to be propounding irrational understandings of health and healing. Yet, strictly speaking, any healing system is rational insofar as its methods of treatment are logically entailed by its fundamental premises or assumptions about the nature of disease. We might, for example, recognize at least four different types of explanations that could “rationally” be used to describe the cause of disease and, therefore, healing: physiological, environmental, attitudinal or psychological, and spiritual or metaphysical (i.e., caused by the activity of entities or forces that are considered to be both extrasomatic and extrapsychological). Those propounding “metaphysical-cause” explanations of healing are thus not necessarily less rational than those engaged in medical science. They are, however, advancing an ontological claim concerning the existence of causal forces not recognized by contemporary scientific theory.

Alternative healing systems thrive in contemporary culture precisely owing to their unorthodox articulation of a religiously charged interpretation of reality. Indeed, from a cross-cultural perspective it is clear that one of the most important functions of healing rituals is their capacity to induce an existential encounter with a sacred reality. In traditional societies, healing rituals involve participants in the reenactment of cosmological dramas: the shaman is both a healer and mediator between the divine and human realms. And in the case of Christianity, Jesus’ healing was thought to be a sign of his divine nature and has subsequently been institutionalized as a function of Christian proclamation and ministry. Yet, with the gradual divorce of physical healing from the church’s routine activities, this means of introducing individuals to a higher spiritual reality necessarily shifted to “alternative” religious and medical traditions, such as those found in the New Age movement.

**HEALTH AND HEALING IN NEW AGE METAPHYSICS.** The term *New Age* defies strict definition. One can, however, identify many of the basic themes in today’s alternative spiritual practices by tracing their historical origin in a cluster of nineteenth-century “metaphysical movements.” Transcendentalism, Swedenborgianism, mesmerism, Mind Cure, New Thought, Spiritualism, and Theosophy all claimed to have made bold new discoveries concerning humanity’s connection with a higher spiritual order. Their teachings especially appealed to progressive-minded persons who yearned to reconcile their scientific and religious interests within a single metaphysical system.

Common to these nineteenth-century metaphysical movements was their belief in the lawful “correspondence”

between the many dimensions that make up the universe. Closely connected with this doctrine of correspondence was a corollary belief in the possibility of spiritual “influx.” That is, it was believed that when a particularly harmonious relationship or rapport is achieved between two dimensions, energies from the “higher” dimension flow automatically into—and exert positive influence within—the “lower” dimension. Each of the United States’ many metaphysical systems brought a distinct vocabulary to the explanation of these twin doctrines of correspondence and influx. The American public, however, took little effort to discriminate between these metaphysical teachings and gradually blended them together to create a form of unchurched spirituality that might be termed *harmonial piety*. As described by religious historian Sydney Ahlstrom, harmonial piety consists of all forms of belief and practice predicated upon the assumption that physical health, spiritual composure, and even economic well-being flow automatically from a person’s rapport with the cosmos. This harmonial piety, anchored as it was in metaphysical understandings of the correspondence and influx, defined the core commitments of the New Age movement that came into cultural prominence during the 1970s and 1980s. Contemporary systems of alternative healing, such as chiropractic, twelve-step programs, Therapeutic Touch, crystal healing, and sundry holistic therapies, all in some way utilize notions of health and healing born of this metaphysical tradition.

The best example of how the twin doctrines of correspondence and influx gave rise to alternative medicine is the gradual diffusion of mesmerism into the vocabulary of middle-class Americans. Franz Anton Mesmer (1734–1815), a Viennese physician, claimed to have detected the existence of a superfine substance or fluid that had until then eluded scientific notice. Mesmer referred to this invisible fluid as *animal magnetism*, owing to the fact that it is found in all living creatures and seems to respond to the influence of magnets. He postulated that animal magnetism permeates the physical universe. He further conjectured that it forms the medium through which forces of every kind—light, heat, magnetism, electricity—pass as they travel from one physical object to another. If for any reason an individual’s supply of animal magnetism was thrown out of equilibrium, one or more bodily organs would consequently be deprived of sufficient amounts of this vital force and would begin to falter. “There is,” Mesmer reasoned, “only one illness and one healing.” Therefore, because any and all illness can ultimately be traced to a disturbance in the body’s supply of animal magnetism, medical science can be reduced to a set of simple procedures aimed at supercharging a patient’s nervous system with this mysterious life-giving energy.

Mesmer and his followers were intrigued by the fact that their patients routinely entered into a hypnotic-like trance as magnets were passed over their bodies in an effort to induce the inflow of animal magnetism into their physical systems. “Mesmerized” patients fell into a peaceful trance and,

upon awakening, pronounced themselves cured of their physical and emotional ailments. Many mesmerized patients also displayed paranormal mental powers, such as telepathy, clairvoyance, and even communication with the spirit world. Proponents extolled mesmerism as a spiritual technique for producing the very condition of “correspondence” that transcendentalists and Swedenborgians had already claimed makes people susceptible to the influx of the currents of “universal being.” The mesmerists thus succeeded in giving succinct medical expression to the harmonial vision. Illness was understood to be the lack of mental or psychological correspondence with higher spiritual dimension. Healing simply requires the use of physical and psychological techniques for reestablishing this correspondence and thereby permitting the inflow of the subtle energies that impart vitality and progressive movement throughout the universe.

One American mesmerist, Phineas P. Quimby (1802–1866), reasoned that people’s thoughts function something like shunting valves that either connect them with or close them off from animal magnetism, which he variously referred to as “vital force” or “divine spirit.” He concluded that “disease is the effect of a wrong direction given to the mind.” If people think spiritually and optimistically, they remain inwardly receptive to the spiritual world and thereby maintain physical vigor. If, however, they become embroiled in pessimism, materialism, or fear, they fall out of harmony with higher spiritual influences and fall victim to physical disease. Quimby taught thousands of patients that by making appropriate adjustments in their own thoughts they could establish rapport with the very spiritual power that makes for health and overall prosperity. One such patient, Mary Baker Eddy (1821–1910), transformed Quimby’s teachings into Christian Science. Others, including Warren Felt Evans (1817–1889), expanded Quimby’s teachings into what became known as the Mind Cure (or New Thought) movement. The latter advocated not only positive thinking but also the cultivation of certain mystical states to reestablish inner correspondence with higher spiritual realms (and the healing energies that flow automatically once such correspondence is established). In so doing, advocates of Mind Cure and New Thought injected a metaphysical vocabulary into popular American culture that would be rediscovered in the last decades of the twentieth century by proponents of New Age healing systems.

Mesmerism, as with other metaphysical movements such as Spiritualism and Theosophy, was thus a forerunner of the many New Age healing systems proclaiming belief in the causal power of “subtle energies.” Historian Catherine Albanese suggests that belief in the subtle energies of spirit is the most distinctive feature of New Age spirituality. In the New Age movement, to be spiritual is equivalent to being sensitive to subtle energies and responding to them both by cultivating states of inner receptivity and by cultivating mental attitudes that utilize these energies to create bodily and worldly prosperity. The sustained presence of metaphysical

healing systems in the United States thus goes well beyond the explanation typically given by social scientists when they draw attention to the fact that these systems treat the whole person (as opposed to scientific medicine’s tendency to treat relatively isolated biophysical symptoms). Indeed, the ongoing popularity of metaphysical New Age systems is rooted squarely in their ability to bring explicitly religious understandings to the issue of health and healing.

**NEW AGE ENERGY MEDICINE.** The metaphysical notions of correspondence and influx have supported a variety of healing systems based on belief in the existence and healing power of subtle spiritual energies. A perfect example can be found in the emergence of the alternative healing system that has gained the widest following, chiropractic medicine. Its founder, Daniel David Palmer (1845–1913), had studied both Spiritualism and mesmerism before concluding that there is a vital energy at work in the universe that is the ultimate source of the body’s health and vitality. This energy, which he termed *Innate*, is itself a segment of god or the universal intelligence that fills the universe. Palmer reasoned that humans remain in perfect health so long as this vital energy flows from the brain to the various organs of the body. But when the flow of this energy is blocked due to misaligned spinal vertebrae, one or more parts of the body will begin to falter. Palmer, like Mesmer, thus concluded that there is one ultimate cause of illness and one ultimate cause of all healing—the restoration of the flow of subtle spiritual energies. Palmer called his new medical philosophy *chiropractic* from the Greek words *cheiro* (hand) and *praktos* (done or performed). At least nine million persons visit the forty thousand chiropractic physicians currently practicing in the United States. And although the majority of these patients receive little or no instruction about the healing power of *Innate*, chiropractic medicine nonetheless remains a principal source from which millions of Americans have been introduced to the healing power of spiritual energies not recognized by scientific medicine.

A second example of New Age “energy medicine” is the system of Therapeutic Touch. Dolores Krieger, a nursing instructor at New York University and student of Theosophical teachings, working with Dora Kunz, former president of the Theosophical Society in America, developed a healing technique predicated upon the existence of a universal energy underlying all life processes. Krieger explains that this energy, which she refers to by using the Hindu term *prana*, naturally instills a higher spiritual dimension into every living organism. So long as individuals remain inwardly receptive to the inflow of this vital energy they will remain healthy; illness ensues when *prana* is no longer flowing freely into the physical system.

Recapitulating Mesmer’s science of animal magnetism in nearly every detail, Krieger devised a system of practices for nurses to use in their efforts to “channel” *prana* into patients. She explains that healers must themselves become inwardly receptive to the flow of this spiritual energy. New-

comers to the field are guided along an “archetypal journey,” whereby they learn to explore the farther reaches of the psyche. Nurses trained in medical science are encouraged to read books on yoga, Tibetan mysticism, and the relationship between the “new physics” and Eastern religious traditions. The goal is to help them open up their own internal energy centers (referred to as *chakras*, a term drawn from esoteric forms of yoga and largely introduced to Western culture through Theosophy-inspired movements) and to become more receptive to the inflow of *prana* into their own systems so that they might in turn channel it to their patients.

This interest in helping persons release subtle healing energies by opening their *chakras* is common to most forms of New Age medicine. For example, Caroline Myss has synthesized her knowledge of Theosophy, the work of Dolores Krieger, and the trance-channeled wisdom of *A Course in Miracles* into a healing philosophy predicated upon the causal role of the *chakras*. Myss has published several best-selling books and videotapes that explain how each *chakra* is associated with specific emotional issues. By helping people gain insight into their “energy anatomy,” Myss believes they can learn to open their *chakras* and facilitate the flow of the energy needed to sustain physical health, emotional well-being, and sustained growth toward higher levels of spiritual consciousness.

Other New Age energy healers make use of rock crystals. Belief in the healing properties of crystals is frequently associated with shamanic traditions, including those of Native Americans. Western interest in the occult powers of crystals, however, is more directly linked with Baron Charles von Reichenbach’s studies in the 1840s and 1850s. Reichenbach took up the scientific study of Mesmer’s theory of animal magnetism and ultimately devised his own theory concerning the power of quartz crystals to restore the flow of a subtle healing energy throughout the body. Today’s crystal healers are likely to extol the ability of quartz crystals to capacitate and refract the spiritual energies that enter humans through their *chakras*. Many New Age healers combine the use of crystals with various forms of meditation, believing that the crystals amplify the mind’s innate powers to make contact with the higher spiritual dimensions from which spiritual healing energies flow.

**THE HOLISTIC HEALTH AND HUMAN POTENTIAL MOVEMENTS.** Ever since Quimby and the nineteenth-century Mind Cure movement, there has been an identifiable subculture in Western nations that has explored novel systems for integrating the mind, body, and spirit. The 1970s witnessed a revival of such interest as a variety of new systems appeared, all aiming to help persons achieve optimal health and all rife with imagery drawn from Western metaphysical traditions. Many of these systems sought to distinguish themselves from scientific medicine by invoking the notion of “holistic healing.” Part of the appeal of holistic approaches to healing was their pronounced concern for individuals as both physical and emotional beings, in contrast to the depersonalized na-

ture of many medical treatments. Yet many holistic healing systems have gone further still and addressed themselves to the treatment of the body, mind, emotions, and spirit. The introduction of the term *spirit* alongside *body*, *mind*, and *emotions* takes holistic conceptions of healing well beyond psychosomatic models and stakes out a bold metaphysical understanding of reality. In some cases this amounts to little more than a romanticization of the body’s self-regenerative and self-reparative tendencies. Yet in other cases it also includes a bolder ontological claim that the whole of nature is suffused with an immanent spiritual force. And, in still other cases, metaphysical conceptions of the human psyche are invoked to suggest the human system is susceptible to the influx of higher spiritual powers.

Among the best-known spokespersons for holistic healing in the late twentieth century were Norman Cousins and Bernard Siegel. Both offered inspiring visions of humanity’s potential for self-regeneration that broadly hinted at the mind’s susceptibility to influence from metaphysical forces. Cousins, for example, suggested that his studies of the mind’s full potential to avail itself of cosmic healing energies also suggests new directions and new possibilities in future human evolution. Siegel was even more forceful in linking holistic healing with a decidedly metaphysical conception of the human condition. He had cancer patients read books on meditation and psychic phenomena so that they might awaken their own latent abilities to tap into higher healing energies. According to Siegel, we are not far from the creation of a “theophysics” that will demonstrate how all people have a divine energy available to them through a collective unconscious, and if they open themselves to this energy there is no limit to the health and vitality they can express in their lives.

Perhaps the most successful of all holistic health systems is Alcoholics Anonymous (AA) and the many twelve-step programs it has launched. The founder of AA, Bill W., appropriated the psychological theories of both William James and Carl Jung to explain how every person might make inner connection with a higher spiritual power. Describing AA as “a spiritual rather than a religious program,” Bill W. contended that the restoration of personal wholeness is impossible without letting go of our personal will and finding inner harmony with a spiritual power he preferred to describe in metaphysical rather than biblical terms.

There are numerous other varieties of holistic systems that utilize metaphysical explanations of the causal forces responsible for healing: acupuncture, iridology, massage and various forms of “bodywork,” meditation and visualization, Ayurvedic medicine, *shiatsu*, transpersonal psychologies, and New Age shamanism. Many of these might also be described as constituting the Human Potential movement that also has roots in the Western esoteric and metaphysical traditions. Common to these systems is the belief that conformity to societal expectations comes at a price. Modern individuals have lost awareness of their deeper selves and their deeper potentials for creativity and transcendence. Full human health

therefore requires far more than just eliminating illness. It also requires utilizing physical and psychological techniques for promoting awareness of the full range of one's creative powers, including the power for complete spiritual enlightenment and union with the godhead.

**ALTERNATIVE HEALING, ALTERNATIVE SPIRITUALITY.** Most of the alternative healing systems that have attracted popular followings proclaim the existence and causal power of spiritual energies unrecognized by either scientific or religious orthodoxy. Adherents of these groups are typically white, urban or suburban, and have more education and higher incomes than the general population. The impress of secularization has made biblical religion problematic to them, and yet scientific rationality has failed to sustain their general optimism or to meet their desire for experiential connection with the sacred. Alternative healing systems have thrived in a particular cultural niche, appealing to persons who yearn to find spiritual fulfillment while reluctant to join established religious institutions. Their doctrines (myths) and therapeutic techniques (rituals) function much like the initiation rites of archaic religions and mystery cults in that they provide an experiential encounter with a more-than-physical reality. Newcomers are helped to discard a no-longer functional identity and to discover new and unsuspected sources of comfort and power. The existence and continued popularity of New Age healing systems testifies to their enduring capacity to enable otherwise secular persons to symbolize what, at the deepest level of mystery, is the ultimate source and meaning of their lives.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN ĀYURVEDA AND SOUTH ASIA

Āyurveda is one of several traditional medical systems that originate from the Indian subcontinent. It is now represented as the indigenous Indian medical tradition *par excellence*. As is the case with other Indian medical systems, the origins of Āyurveda long predate the formation of an Indian nation and are not necessarily set within its geographical boundaries. In the context of the history of medicine, therefore, "Indian" often denotes quite a large area within South Asia. A second great tradition of medicine, called Siddha, developed in the south of India. It is less well known outside of India, but of similar antiquity and authority to Āyurveda. Other medical systems, originating from countries outside the Indian subcontinent, have been integrated into its cultures and now form part of its medical traditions. The earliest, and perhaps most important of these systems to be imported and acculturated is Ūnānī medicine. Much later, but equally significant, additions were homeopathy and naturopathy. A different development has taken place in the case of Yoga. Here, an indigenous knowledge system has been reinterpreted as the focus has shifted from the philosophical tradition to the health-related aspects of postural and meditative Yoga practice. The developments within the old traditions with their long and varied histories, the addition of new traditions to the established ones, their interrelations and the interweaving of medical thought with a changing religious, political, and cultural climate, all form a rich and complicated pattern of medical and social history. The developments starting in the early twentieth century toward the modernization and professionalization of medicine have brought these and other medical systems into a common frame of health policy and legislation, as health has become the responsibility of the government. Thus, the more recent history of traditional Indian medicine is shaped by health politics. At the same time, the sphere of its influence has widened, as Āyurveda and other traditional medical systems have come to the attention of an international public, taking a position beside other complementary and alternative therapies.

**THE TEXTUAL TRADITION OF ĀYURVEDA.** The Āyurvedic medical tradition has a lively history of more than 2,000 years, during which it has continually developed. This development has been accompanied by continuous textual production, resulting in an enormous corpus of literature. Āyurvedic literature not only makes it possible to reconstruct the history of Āyurvedic thought and practice, it also adds to the general understanding of Indian history from its antiquity to the present. It encompasses a wide range of topics that go beyond simple medical instructions, constructing a complex worldview from philosophical, religious, political, and social perspectives.

Āyurveda's beginnings, as known from early classical Sanskrit treatises, are predated by instances of medical knowledge found in Vedic literature. Āyurvedic tradition postulates a direct lineage with Vedic medicine and refers to its medical system as an appendix to the *Atharvaveda*. Debiprasad Chattopadhyaya, in *Science and Society in Ancient India* (1977), was the first to contest the traditional view that Āyurveda developed directly from the medicine of the Vedas, pointing to strong conceptual and epistemological differences between Vedic and Āyurvedic medicine. Kenneth G. Zysk, in *Asceticism and Healing in Ancient India* (1998), has subsequently shown that Āyurvedic theory generally does not rely on Vedic medicine although Āyurvedic literature uses Vedic imagery and mythology to evoke a sense of continuity with the past and to establish legitimacy in a society dominated by Brahmanic ideology. According to Zysk, the roots of Āyurveda lie in the medical knowledge of wandering ascetics, most notably Buddhist monks. This is corroborated by the fact that Buddhist texts reveal the first glimpses of a systematized medicine similar to Āyurvedic theories expounded in the classical treatises.

The classical era of Āyurveda begins with the medical treatise of Caraka—the *Caraka Saṃhitā*—which is written in Sanskrit and dates to about the first century CE, though its foundations most likely go back to a much earlier time. Caraka (*Sūtrasthāna* 30.28) presents the first systematized medical theory of Indian antiquity, formally dividing medicine into eight branches (Skt., *aṣṭāṅga*):

1. Kāyacikitsā (devoted to general medicine).
2. Śālākya (devoted to the surgical treatment of body parts above the shoulders).
3. Śalyāpahartṛka (devoted to the removal of foreign bodies—surgery).
4. Viṣagaravairodhikapraśamana (devoted to toxicology).
5. Bhūtavidyā (devoted to the treatment of possession by various supernatural beings).
6. Komārabhṛtyaka (devoted to pediatrics).
7. Rasāyana (devoted to the preparation of life-prolonging tonics).
8. Vājīkaraṇa (devoted to aphrodisiacs and treatments relating to virility).

While later texts do not slavishly follow this division into eight general subjects, the term *aṣṭāṅga* thereafter becomes a synonym for medicine. Later works often refer to Caraka, and today the *Caraka Saṃhitā* is part of the curriculum taught in modern Āyurvedic colleges in India.

The *Caraka Saṃhitā* is chronologically followed by the *Suśruta Saṃhitā*, which probably reached its present form around the third century CE. Its most important addition to medical history is its information on surgical operations. These very advanced surgical methods are neither mentioned in the *Caraka Saṃhitā* nor in later Āyurvedic works.

The only other surviving treatise that belongs to this early period is the *Bhela Saṃhitā*, which is quoted in pre-

modern Āyurvedic texts. However, only one manuscript of this work survives and its importance for the development of Āyurvedic thought does not parallel that of the treatises of Caraka and Suśruta.

Chronologically, next to be mentioned is the collection of medical and divinatory texts dated to the sixth century, now commonly referred to as the “Bower Manuscripts.” The manuscripts were found buried close to a monastery situated near the old Silk Route trading stop of Kuqa, which testifies to the presence of Indian medicine in Inner Asia in the early sixth century CE.

A work of major importance was composed by Vāgbhaṭa in the early seventh century. Together with the two older treatises, it is part of the “great threesome” (Skt., *bṛhatrayī*) of Āyurveda. Vāgbhaṭa's treatise, the *Aṣṭāṅgabhṛdaya Saṃhitā* (The heart of medicine), is a summary of medical knowledge, extracting the essence of medicine, as its title suggests, from previous works in an attempt to synthesize, unify, and put into order their contents. This textbook soon gained great popularity and was widely disseminated throughout India and beyond. Foreign translations of the *Aṣṭāṅgabhṛdaya Saṃhitā* were appearing within a century of its composition and copies of the medical textbook are found in abundance in manuscript libraries both in North and in South India. The *Aṣṭāṅgabhṛdaya Saṃhitā* is in many ways the most important Āyurvedic text. Its doctrines are widely regarded as authoritative and form an integral part of modern Āyurvedic education and practice.

Three later works have similar status to that of the “great threesome” and are called the “lesser threesome.” These are the works of Mādhava (c. 700 CE), Śārṅgadharma (c. 1300), and Bhāvamiśra (sixteenth century). Mādhava's work on the causes and symptoms of diseases was widely read and set the pattern for later systematic descriptions of diseases. It is cited by al-Ṭabarī in the *Firdaws al-Ḥikmah*. Śārṅgadharma's compendium is one of the most successful Āyurvedic books ever written, as the great number of copies found in libraries across India testifies. More recently, the pharmaceutical industry has made use of its recipes in the manufacture of Āyurvedic products. Bhāvamiśra's work is innovative in several respects. It is perhaps most noteworthy that he introduced the subject of syphilis to Indian medicine.

Translations of passages in the above-mentioned works can be found in Dominik Wujastyk's *Roots of Āyurveda* (2003). However, this selection of medical works only forms the tip of the iceberg. To give just a few examples, further remarkable works include the numerous encyclopedias and dictionaries containing Āyurvedic material, such as the *Mānasollāsa* (twelfth century), the *Lakṣmaṇotsava* (fifteenth century), the *Āyurveda saukhya* of the *Ṭoḍarānanda* (sixteenth century), the *Vīramitrodaya* (seventeenth century), the *Śivatattvaratnākara* (early eighteenth century), the *Vaidyakaśabdāsindhu* (late nineteenth century), and the *Bṛhannighaṇṭurātṇākara* (late nineteenth to early twentieth century).

Julius Jolly's *Indian Medicine* (1994) is still a useful reference for the Āyurvedic textual tradition. However, Gerrit Jan Meulenbeld's *History of Indian Medical Literature* (1999–2002) offers the most comprehensive and thorough overview. This magnum opus is an invaluable source for Āyurvedic studies and certainly the most important work of its kind to date. Other reference works are written in Indian vernacular languages, as for example the Hindi *Āyurved kā Vaijñānik Itihās* (1975) by P. V. Sharma.

**THE PRINCIPLES OF ĀYURVEDA.** Far from comprising a uniform theoretical body, the various Āyurvedic sources differ considerably in their statements on the fundamental principles of Āyurveda. Given Āyurveda's large and varied literature, and that it is a living and changing tradition that looks back at more than 2,000 years of development, this is hardly surprising. New theories and treatment methods evolved, old ones were mostly recounted with respect, but sometimes openly disputed and sometimes silently replaced. The use of the *materia medica* changed due to the availability of plants and of other resources, and new environments and ways of living changed the basic assumptions of the older texts. Thus, though the sources certainly share common features that make it possible to define them as part of the Āyurvedic medical system, any overall definition of the basic tenets of Āyurveda is necessarily a selective construct. To arrive at more precise and coherent definitions of Āyurvedic theories, research often focuses on a certain period of time or on certain texts. Here, the main sources used to represent the Āyurvedic opinion will be the treatises of Caraka and Suśruta and Vāgbhaṭa's *Aṣṭāṅgahṛdaya Saṃhitā*, with a strong emphasis on the latter text. It should be kept in mind, however, that there exist other versions of the Āyurvedic doctrines presented here, as well as altogether different approaches.

The term *Āyurveda* translates as “the knowledge [Skt., *veda*] of longevity [Skt., *āyus*].” This name points to a fundamental characteristic of Āyurvedic medicine expressed in the classical texts, namely that its emphasis is on establishing ideal conditions for living a long life. Health is not only a goal in itself, but, perhaps more importantly, the means by which to achieve longevity. According to Caraka (*Sūtrasthāna* 1:15), a long life offers the human being the opportunity to fulfill the “four duties” (Skt., *caturvarga*)—namely *kāma*, *artha*, *dharma*, and *mokṣa*. The connections between the *trivarga* (excluding *mokṣa*)—or *caturvarga*—and medical theory are discussed by Arion Roşu in “Études āyurvédiques: Le *trivarga* dans l'āyurveda” (1978). The responsibility to fulfill these duties can be extended to maintaining health: each person is an active participant in establishing the grounds for a long life (or the reverse) by living (or not living) according to certain standards, which are defined in the Āyurvedic texts. The medical manuals not only provide the professional physician with specialized instructions on medical practice, but also offer the general public a wide range of practical advice on different aspects of life. The physician's role is complementary to the efforts made by those afflicted with disease and by the healthy alike. Ideal-

ly motivated by compassion for his suffering fellow beings, the physician's task is to alleviate bodily and mental discomfort and to help restore health through administering medicine or providing other forms of therapy. The other very important part of the profession would be to give advice on the prevention of disease: that is, on how to lead a good and healthy life, broadly understood.

Health is interpreted not only as the absence of illness but as a state of complete well-being. The individual's condition can only be fully understood within the context of society at large and of the person's environment. This has been discussed by Francis Zimmermann in his groundbreaking book *The Jungle and the Aroma of Meats* (1987). Caraka (*Śārīrasthāna* 5.3) defines the connection of humans with nature as one mirroring the other. The microcosmic human reflects the macrocosm of the universe and ultimately of all there is, and vice versa—a concept that already appears at an early stage of Vedic literature as the conceptual basis of sacrifice.

Within the physical body of the human, health is understood as the proper functioning of certain processes that are based on the body's inherent structure of fluids and channels. The Āyurvedic view of the human body differs substantially from the biomedical understanding of anatomy. Thus, the *Aṣṭāṅgahṛdaya Saṃhitā* states that *doṣas*, *dhātus*, and *malas* are the root of the body (*Sūtrasthāna* 11.2). These three Sanskrit technical terms are used to describe the physical and (to a limited extent) the mental processes involved in the causing of health and disease. Their translation presents a set of difficulties, as their literal translation does not fully convey their meaning. The word *doṣa*, for example, is derived from the causative of the verb root *duṣ*, which literally translates as “to spoil” or “to corrupt” (Monier-Williams et al., 1899, p. 488). The negative connotation of something that causes damage is definitely inherent to the understanding of the *doṣas*, but as the above citation of the *Aṣṭāṅgahṛdaya Saṃhitā* shows, they are also positively interpreted as an essential part of the body. Translations often use the term *humor* for *doṣa*, as there are strong parallels (if also differences) between the *doṣa* theory and the Greek humoral system. Generally, a *doṣa* is a substance that flows or circulates within the body and fulfills particular functions within it. Āyurvedic theory usually speaks of three *doṣas*, namely wind (*vāta*), bile (*pitta*), and phlegm (*kapha* or *śleśman*), often also glossed somewhat more glamorously as wind, fire, and water, in analogy to their presumed properties. There are also occasional references to four *doṣas*, most notably in the *Suśruta Saṃhitā* (*Sūtrasthāna* 21.28), blood being added as the fourth. Each of these *doṣas* is located mainly in a particular area of the body, though they can also move around along special channels without causing damage. Thus, *vāta* is mostly situated in the large intestine, *pitta* in the navel, and *kapha* in the chest and above. Their functions are summarized in the *Aṣṭāṅgahṛdaya Saṃhitā* (*Sūtrasthāna* 1.1–3) as follows: *Vāta* gives the body strength, activates speech, body, and mind,

induces the evacuation of the intestinal tract, supports the *dhātus*, and sharpens the senses. *Pitta* regulates digestion, body heat, sight, hunger, thirst, and appetite. It makes the body soft and supple. On a mental level it gives understanding, intelligence, and courage. *Kapha* gives the body firmness and smoothness and holds the joints together. Its psychological quality is patience.

Disease is often defined as an imbalance of the *doṣas*. However, this is only part of the picture and does not represent the full Āyurvedic explanation of how the *doṣas* cause disease, as a closer look at the specifications of the texts reveals. Vāgbhaṭa, for example, uses the metaphor of balance and imbalance, but explains that imbalance denotes a change in quantity as well as the dislocation of a *doṣa*. The quantity of a *doṣa* can both increase and decrease, which leads to various symptoms of disease. The increase of a *doṣa* is a process that evolves in two stages: its accumulation (Skt., *caya*) and its subsequent surge (Skt., *kopa*), in which the *doṣa* leaves its own area. The symptoms for accumulation are different from those for the surge, which causes a graver condition of disease that is more difficult to treat. Thus, the state of the *doṣas*—that is, whether they are increased or decreased, in a stage of accumulation, or in surge—is relevant for treatment, as they require different measures. However, differences in treatment based on distinctions between decrease and increase, accumulation and surge, are so subtle as to nearly justify the sweeping statement that the imbalance of the *doṣas* causes disease.

The second component the *Aṣṭāṅgahr̥daya Saṃhitā* names as the root of the body is the *dhātus*, literally “constituent parts” or “elements.” In a medical context, these are defined as elements or essential ingredients of the body, namely chyle (i.e., food that has undergone the first process of digestion), blood, flesh, fat, bone, marrow, and semen. To this list of seven *dhātus*, hair, skin, and sinews are sometimes added. The *dhātus* are thought to evolve in succession from each other: semen from marrow, marrow from bone, bone from fat, and so on. Confusingly, the *doṣas* are also sometimes called *dhātu*, particularly to denote their positive quality of sustaining the body. This has been addressed by Hartmut Scharfe in “The Doctrine of the Three Humors in Traditional Indian Medicine and the Alleged Antiquity of Tamil Siddha Medicine” (1999), in which he argues that the usage of *dhātu* in lieu of *doṣa* goes back to an older understanding of the *doṣas* found in the Buddhist Pali canon, in which *doṣa* unambiguously denotes a negative force causing disease.

The *dhātus* shape the physical body but also have separate functions that are specified in the *Aṣṭāṅgahr̥daya Saṃhitā* (*Sūtrasthāna* 11.4) as follows: chyle causes the sensation of delight, blood is a stimulant and increases the life force, meat covers the bones, fat regulates the greasiness (for example of the eyes), the bones keep the body upright, marrow fills the bone, and semen is responsible for procreation. Parallel to the *doṣas*, the *dhātus* also can increase or decrease, causing

various symptoms of illness. The increase or decrease of a *dhātu* effects the *dhātu* chain, one *dhātu* vitiating the next, which in turn leads to conflicting symptoms and complicates diagnosis. The treatment of *dhātu*-related illnesses is fairly straightforward in contrast to their diagnosis: an illness that is diagnosed as an excess of blood is countered with bloodletting; an excess of flesh, (e.g., a tumor), with its removal. The decrease of *dhātus* on the other hand, is counteracted with appropriate nutrition, based on the principle that what has been lost should be added again.

The *malas* are called the third root of the body. *Mala* as a medical term denotes any bodily excretion or secretion—that is, urine, feces, and sweat, but also mucus, earwax, and tears. The *Aṣṭāṅgahr̥daya Saṃhitā* (*Sūtrasthāna* 11.5) explains that feces sustain the body, urine evacuates the fluids, and sweat holds the fluids inside. The treatment of *mala*-related illnesses corresponds to the treatment of the *doṣas* in that the *malas* increase and decrease, but also because the *doṣas* are seen as the underlying cause of the increase or decrease of the *malas*.

There are, however, also other forces at work on the body. One central concept is that of *āma*, which is the product of improperly digested food that has turned to poison in the body. As a poison, it vitiates the *doṣas* and the *dhātus* and causes the disruption of their course of flow or development. The descriptions of what the vitiation of a *doṣa* means or of how exactly the disruption of flow is effected are somewhat vague. The general concept is that *āma* can in various ways block the channels through which the *doṣas* are meant to move. Treatment aims at ridding the body of this unwanted substance and consequently focuses on cathartic procedures using purgatives, enemas, and emetics.

It has been mentioned above how the theory of the three *doṣas* affects treatment. An interesting aspect of Āyurvedic medical practice, however, is that treatment is in many cases not necessarily dependent on theory. An infection of the urethra, for example, will commonly be treated with turmeric. In modern Āyurvedic treatment, the identification of the urethra as the site of infection and the understanding of infection are based on modern medical conceptions that do not occur in classical Āyurvedic literature. However, stereotyped diagnosis and treatment disregarding the theory of the individual constitution also forms an intrinsic part of premodern Āyurvedic medicine, as Gerrit Jan Meulenbeld has pointed out in “The Surveying of Sanskrit Medical Literature” (1984; pp. 44–46). A urethra infection can be explained as the symptom of excess *pitta* and the use of turmeric as counteractive to the heat-related *doṣa* because of its cooling properties. This, however, does not influence the primary prescription that pain in the urinary tract should be treated with turmeric.

In short, Āyurveda offers more than one solution to medical problems. While the abundance of often conflicting material on Āyurveda is vexing for the historian or the sociologist trying to delineate Āyurvedic theory, the maxim “whatever works is right” seems to have been sufficient for the

Āyurvedic practitioners who have continued and developed the tradition of Āyurveda from its beginnings.

The best overview of Āyurvedic theory and treatment procedures is probably still Jolly's *Indian Medicine*. Wujastyk's *Roots of Āyurveda* offers a good selection of translated texts pertaining to Āyurvedic principles and procedures and Guy Mazars in *La médecine indienne* (1995) gives a very concise and accessible introduction to Āyurveda. S. K. Ramachandra Rao's *Encyclopedia of Indian Medicine* deals with Āyurvedic theory in more detail. However, for an in-depth understanding of Āyurveda, the primary sources themselves, which are increasingly available in translation, are of fundamental importance.

**THE POLITICS OF ĀYURVEDA.** In 1970 the Indian parliament passed the Indian Medicine Central Council Act (IMCCA), setting up a central council for the indigenous medical systems of Āyurveda, Siddha, and Ūnānī. The council is responsible for laying down and maintaining uniform standards of education and for regulating practice in these systems. It also prescribes the standards of professional conduct and etiquette, and the code of ethics for practitioners of Indian Systems of Medicine (ISM). The IMCCA of 1973 added homeopathy to the list, changing ISM to Indian Systems of Medicine and Homeopathy (ISM&H). Yoga and naturopathy (and a number of local health traditions) are recognized as ISM by the Indian government, but do not receive the same amount of funding and also are not centrally regulated by the Indian Medicine Central Council (IMCC). Yoga was included as a research subject by the Central Council for Research in Indian Medicine and Homeopathy (CCRIM&H), founded in 1969, and naturopathy was added as a research subject in 1978, when the CCRIM&H was divided into separate councils, isolating homeopathy and Ūnānī and coupling Āyurveda with Siddha and Yoga with naturopathy. S. K. Mishra outlines these developments in his article "Āyurveda, Unani, and Siddha Systems: An Overview and Their Present Status" (2001).

Thus, with the IMCCA of 1970, the Indian government for the first time officially recognized Āyurveda, Siddha, and Ūnānī as national systems of medicine, and at the same time it centralized their administration in order to set an all-India standard. The Central Council Act was the result of a series of discussions concerning Indian health policies that were made both before and following Indian Independence in 1947. Paul Brass has pointed out in "The Politics of Āyurvedic Education" (1972) that as early as 1946 a resolution had been passed by the First Health Ministers' Conference, giving recognition to indigenous systems of medicine by recommending that practitioners trained in these systems should be utilized in federal state health programs. State responses were varied, with some giving considerable support to the indigenous systems while others ignored the health ministers' recommendation, preferring modern medicine to the traditional systems. No state government, however, declared Āyurveda or any other indigenous system as its state system of medicine.

Debates on the role and position of indigenous medical systems within Indian health policy have a long history, which is interlinked with colonial health policies on the one side and Indian nationalism on the other. Among the indigenous medical systems, Āyurveda takes the first place (followed by Ūnānī), as measured by the number of its practitioners, institutions, manufacturers, and political bodies. While the well-developed infrastructure testifies to its success, the professionalization and institutionalization of Āyurveda has been a long and troubled process. In the first third of the nineteenth century, British health and education policy started to emphasize support for the modern system of biomedicine. This resulted in the patronage of modern medical colleges and hospitals and ultimately produced a number of practitioners with a medical reputation superior to that of traditional practitioners. The direct effects of British policy on indigenous medicine, however, date to a much later period, when Indians were admitted to the biomedical colleges and health services were extended to the Indian public. To meet the competition of the new system and to show the value of their science, traditional practitioners needed to (re)define the theoretical foundations of their medical system and to formulate their professional identity. In the case of Āyurveda this meant the birth of a new era, as Āyurvedic practitioners had never before organized themselves into one uniform body. The traditional education system, which is still predominant in religious teaching and in other disciplines in India today, had been that of pupilage; that is, the passing down of knowledge from teacher to one or several pupils, from father to son, or from uncle to nephew. This led to the formation of medical lineages or schools, as famous teachers could have quite a large following.

One step toward a modernized Āyurveda, therefore, had to be a break with the educational tradition of pupilage toward an expanded college system, in order to keep up with the growing number of graduates and license holders that the biomedical colleges were producing. Another was to form a unified theory of the Āyurvedic medical system, to present as the voice of Āyurveda at a political and ideological level and to shape the curriculum of the colleges. Following the Orientalist ideology that the "purest" and most original forms of Āyurveda must be found in the oldest texts, it was widely agreed among the advocates of Āyurveda that the traditional Āyurvedic treatises offered a reasonable basis for a common identity and a unified medical system. The goal, then, was to restore and to revive the ancient tradition and its presumed past glory rather than to maintain contemporary traditional practices, which were often labeled "degenerate." Accordingly, a distinction was made between an idealized Āyurveda based on the classical texts, and traditional practice based on later texts and folk medicine. While Orientalist rhetoric may have been a major component in revivalist ideology, it would not be true to say that it was the cause of the decision to present the teachings of the classical texts as the basis of Āyurvedic theory. Traditional families of Āyurvedic practitioners had been using these texts as the

basis of their practice long before official debates on the theoretical foundations of Āyurveda started. However, Āyurvedic practitioners not only made use of the oldest treatises, but also of a multitude of texts that were composed after the classical texts. The wide publication of later Āyurvedic texts, edited from the late nineteenth century onwards by Āyurvedic scholars like Jīvananda Vidyāsāgara Bhaṭṭācārya, Jīvarāma Kālidāsa Śāstri, Dattarāma Kṛṣṇalāla Māthura, and Yādavji Trikamji Ācārya, testifies that such texts were considered important.

Modern Āyurvedists needed not only to overcome sectarian and regional differences (including language barriers and diverging religious identities) in search of a uniform identity, but were also confronted with new educational methods and technology for diagnosis and research introduced to India by the British. The dominant form of Āyurvedic education that developed from this background at the end of the nineteenth century was an integrated or concurrent education system, which included both Āyurveda and modern medical subjects in varying proportions. The basic education in modern medicine was meant to enable students to play a role in public health programs. The question of the proportional distribution of Āyurveda and modern medicine within the curriculum—that is, which system should be the main focus of education and which should be taught as the complementary system—had from the beginning been a bone of contention among the supporters of the integrated system. Furthermore, the concept of the integrated system, as such, received heavy criticism both from biomedical advocacy groups and from other factions within the Āyurvedic movement as having produced practitioners qualified in neither system of medicine. The defects of the integrated system, made apparent by recurring student strikes and low enrollment numbers, and by divisions within its support group, strengthened the case of the rivaling interest group arguing for a *śuddha* (pure) Āyurveda that would be true to its tradition and ideologically free from Western influence.

Charles Leslie has pointed out in “Interpretations of Illness: Syncretism in Modern Āyurveda” (1992) how these issues became increasingly politicized, as the Āyurvedic movement divided into two main advocacy organizations: the Āyurvedic Congress, founded in 1907 and representing the *śuddha* faction, and the Council of State Boards and Faculties of Indian Systems of Medicine, founded in 1952 as a result of a split in the Āyurvedic Congress and representing the integrated view. As a voluntary advocacy organization, the Congress was constituted of individual practitioners and of local, provincial Āyurvedic associations. Its leading personality was Pandit Shiv Sharma. The council on the other hand was a “semi-official agency, whose members include[d] the heads of the Āyurvedic Colleges, the members of the state faculties and boards of Indian medicine, and the directors of Āyurveda in the health administrations of the several states” (Brass, 1972, p. 358). The leading personalities of the

integrated system were Kaviraj Gananath Sen and later Chandragiri Dwarkanath. The council therefore represented the established educational system, which would seem to suggest it was the more powerful organization. However, the members of the Congress also had considerable political influence and powerful support in the central government. Thus, in 1962, Pandit Shiv Sharma was able to exert his influence as the appointed honorary advisor on the decisions made at the annual meeting of Central Council of Health. The resulting Vyas Committee report advised that Āyurvedic education and practice be developed on “purely ayurvedic lines, involving deep and intense study of the Classical Ayurvedic literature including its materia medica and pharmacy” and not to include “any subject of modern medicine or allied sciences in any form or language” (Brass, 1972, p. 360). Although the government of India and the state health ministers ultimately accepted the recommendations of the Vyas Committee, the implementation of the new policy did not proceed smoothly, due to inconsistent policies regarding the use of modern technology, resistance on part of the state governments, and the low enrollment numbers of students.

The debate on the educational system of Āyurveda (and of the other Indian systems of medicine) and its implementation into public health schemes is far from resolved even today. Despite all decisions from the government as recorded in the various IMCC acts, the failure of the Āyurvedists to agree among themselves on the goals to be pursued and on the appropriate standards for education, practice, and research has so far led to the inability of Āyurveda to compete with modern medicine and to fulfill its potential as a national system of medicine.

Overviews and more detailed surveys dealing with the politics and epistemological context of Āyurveda, its eminent advocates and opponents, and the modernization of traditional medical systems in general can be found in Mishra (2001); Gupta (1998); Leslie (1992, 1983, 1975, 1998a); Brass (1972); Jeffery (1988); Shankar (1995); Stepan (1983); Taylor (1998); Zimmermann (1992); Zysk (2001), and Phillips (1990).

## HEALING AND MEDICINE: HEALING AND MEDICINE IN CHINA

In modern Western societies people tend to demarcate disciplines of healing as they divide the self: biomedicine for the body, psychology for the mind, and religion for the spirit. If the popularity of holistic alternative healing systems suggests that these categories do not sit entirely well even with modern Westerners, they are even more inadequate to China. Historically and still today in China, the management of sickness and health is rooted in different views of self, different social and institutional configurations, and different healing traditions.

**PATIENTS: DISORDERED SELVES.** Chinese sources do make distinctions not dissimilar to those of body, mind, and spirit: they speak of the body as physical form. They speak of the person's spirit, of multiple bodily spirits, and of yin and yang souls. People are known to think and to have emotions, and medical sources speak of these states as both normal functions and, when out of balance, illness. These categories, however, are subsidiary in the organization of understandings of health and treatment of disease. Medicinal therapies are ingested for ailments related to emotional excess and to the destabilization or detachment of the body's spirits. Herbal and ritual therapies are applied to prevent attack by animals as well as demons, and to treat gross bodily pathologies. Affects are not only implicated in, they are integral to both the origins and processes of bodily disorders, and to their healing. Major Chinese categories and practices distinguish four modes for imagining the healthy self, and illness as deviation from it: the *resonating* self, the *dissipating* self, the *moral* self, and the *ecological* self.

The resonating self is the mode most characteristic of Chinese canonical medicine, but it also came to powerfully shape everyday Chinese views of the body, and to contribute to nonmedical styles of healing. The core features of this physiology developed in the fourth to first centuries BCE and have remained fairly stable, albeit with elaboration and variation along the way, over the following two millennia. In this view, the person, polity, and cosmos operate as a series of nested microcosms and macrocosms according to the cyclical, dynamic, and complementary principles of yin and yang and the Five Phases. The emperor and his bureaucratic representatives stand at a critical nexus of responsibility for order in these realms. If they do not properly align their behavior to the normative cycles of the cosmos, heaven and earth resonate, producing floods, drought, and epidemics. The people resonate, straying from their socially appropriate roles, even as far as banditry and rebellion. As emperor and officials must match their policies and ritual to cosmic cycles, so must individuals harmonize their activities, whether sleep, work, diet, or sex, to the appropriate phases of the day and year. Discordant activity can produce illness.

Yin and yang and the Five Phases, then, were understood to pattern and resonate through all phenomena. From the Han period (206 BCE–220 CE) the Five Phases mapped,

for example, the seasons, directions, colors, virtues, and musical notes, as well as different aspects of physiology. The last included organ systems, sense organs, affects, the tracts (also translated *vessels* or *meridians*) through which *qi* (pronounced “chee” and also sometimes spelled *ch'i*, here vapor and vitality) flows, and nodal points along them through which *qi* might be affected (see Tables 1 and 2). Physiological patterns could be felt through the pulse, most commonly felt through three spots at the left and right wrists. Changes in one system will manifest in multiple associated registers: in changes in emotion, perception and sensation, color, smell, and discharge of bodily fluids.

In this modality, the integrity of physical structures was considered an essential precondition of health, but intervention was more concerned with alterations that occurred prior to gross corporeal change. Tracts mapped not visible anatomical structures, but felt flows of *qi*. Organs were of interest less for their size, shape, and location than as systems of function for which the physical organs might be considered substrates. Each of the Five Phases and its associated organ system is also linked to every other Phase and organ system through either a “promoting relationship,” such that it is nourished by one system and nourishes another, or a “controlling” relationship, such that it is restrained by one system and restrains another. Thus, excessive or deficient activity in one system can propagate stagnation, repleteness, and imbalance in other systems (see Table 3).

The medium of this resonance is *qi*, which could refer multivalently or in different contexts to air, vapor, breath, vitality, vitality in its yang aspect, and something akin to “the psychophysical stuff and energy” that constitutes all phenomena. Besides resonating, *qi* could also dissipate. The dissipating self was understood as being born with a full endowment of vitality, or “original *qi*,” which dissipates through the course of life. Health and longevity could be enhanced by replenishing *qi*, or by slowing its dispersal. This could be affected most commonly through ingestion of tonifying medicines, a range of “cultivating vitality” practices (see below), or by avoiding particularly *qi*-draining activities. For men, a special focus of concern was the expenditure of the most concentrated essence of yang vitality, semen, in sexual intercourse. Women were particularly vulnerable to the draining of yin vitality, blood, through menstruation.

Despite these sex-specific sources of danger, canonical medicine did not take gender as a fundamental human or medical division. Gender tended to be constructed according to social function rather than biological essence. While femininity was yin and masculinity was yang, both male and female bodies operated according to these principles and the circulation of both yin blood and yang *qi*. Women and men were not absolutely yin and yang, but contingently yin and yang in relation to each other, on a continuum rather than radically distinct. While medical texts did include separate sections on disorders related to the uniquely female functions of gestation and childbirth, it was only in the learned medi-

Yin and Yang Aspects in Physiology						
<b>Yin</b>	Inner, Outward Movement	Upper Ascent	Dorsal	<i>Qi</i> (as Yang Vitality)	Stimulation	Increase
<b>Yang</b>	Outer, Inward Movement	Lower Descent	Ventral	Blood (as Yin Vitality)	Restraint	Decrease

TABLE 1. *Illustration courtesy of the author.*

cine of the Song period (960–1279 CE) that therapies for non-gender-specific disorders came to be constructed on the basis of gender-differentiated bodies. Female physiology was set apart from male here by the dominance of blood (yin vitality) over *qi* (yang vitality), not absence of the latter. While this therapeutic distinction fell out of practice in later centuries, the approach generated attention to menstrual regulation as a basis of health and of the essential social function of fertility, concerns that continue today.

While this cosmos operates according to rationalistic principles of yin, yang, and the Five Phases, it is also both inherently moral and animated. The emperor can provoke disastrous weather and social disturbances through unrighteous behavior, not only by failing to perform rituals and enact policies that are synchronized to the phases of the cosmos. Besides cosmic resonance, the moral self can become ill in retribution for misdeeds. From the Han period, as the spirit world came to be seen as dominated by a celestial pantheon modeled on the human imperial bureaucracy, illness also came to be seen as resulting from celestially administered punishment. Aggrieved spirits could make people ill by directly attacking them, or from medieval times often through litigation in the courts of the afterlife. As in the worldly legal system, punishment could extend to family members, so that for the sources of ailments one might need to address the crimes of a forebear. With the spread of Buddhist ideas, illnesses and other misfortune could also be understood as karmic consequence for the misdeeds of a previous life.

As in most of the world's societies, the self was not conceived as a thing utterly detached from the world around it; it was permeable to and an organically integral part of its environment. The ecological self not only responds to the world through cosmic resonance, it is acted upon by agents, things, and events in its internal and external social, spiritual, and physical environments. The outer world provides nurture, but again poses threats to one's well-being, for example through the stress and violence of interpersonal conflict, improper diet, poisons, and physical attack or accidental injury.

Besides dangerous animals and people, vectors of violence included spirits and ghosts. Although ancestors, when ritually cared for, looked after their descendants, if not attended to they could punish their neglectful offspring. The pores and orifices expose the self to invasion by poisonous

substances, noxious fumes, and demons or ghosts. Prior to the twentieth century, small demonic creatures were understood as capable of infesting the body, sometimes entering as ethereal spirits but taking form within as gnawing insects or worms. With the acceptance of germ theory in the twentieth century, infecting parasites, viruses, and bacteria joined with or replaced this list of external hazards.

This ecosystem extended to the body's internal and numinously populated landscape. Han period texts describe a yin and a yang soul. After the Han, especially but not exclusively in Daoist texts, we find descriptions of three yang and seven yin souls, spirits associated with the various organ systems, and the "three corpse worms." Most of the souls and spirits of the body are responsible for its healthy function, and not unlike bureaucratic officials, can produce disorder if they do not attend to their posts properly. Dreams, often understood as the roaming of the yang soul, are considered an occasion of particular vulnerability. The three corpse worms are demonic agents that are, like the body spirits, born within the person, in this case located in the three cinnabar fields, centers of vitality located in the head, chest, and lower abdomen. These body spirits seek release from their host by his or her death, and expedite this by inciting *qi*-squandering behaviors, such as sexual indulgence, gluttony, and immoderate ambition; by conspiring with external demons to infest the person and bring about illness; and by reporting to the Celestial Jade Emperor on the person's misdeeds so that compensatory time is deducted from their allotted lifespan.

Healthy selves, then, would resonate harmoniously with a properly aligned polity and cosmos, would retain or only slowly dissipate their vitalities, would be morally upright, and would harmonize with both internal and external environments, maintaining strong relationships with good people and spirits, and avoiding dangerous people, spirits, and situations. Selves could be disordered in resonance with cosmic discord; could be weakened by draining vitalities; could face consequences for misdeeds in this or in previous lives, or even for the crimes of their forefathers; and could suffer distress or violence from within or without. These views of the self contribute to organizing approaches to health management, and inform the choices people make among healers and healers' therapeutic recommendations. These choices,

however, are also significantly shaped by social context and by available choices in healing specialists.

**PERSONAL AND SOCIAL CONTEXTS OF HEALTH MANAGEMENT.** Social contexts of health management correspond to spheres expanding from the individual to the family, community, and polity. Structuring these arenas are hierarchical relationships, such as those based on patriarchy and class.

**Self.** From the mid-fourth century BCE we have texts describing methods for cultivating vitality geared both toward slowing its dissipation and toward harmonizing it with the cosmic cycles. Practices included meditation, regulation of breath/*qi*/vitality and its circulation around the body, gymnastic movements for “guiding and pulling” *qi* in the body, retention and recirculation of seminal essence during intercourse in order to prevent the attendant loss of original *qi*, dietary restrictions, and absorption of vitalities from sexual partners or from the outside world. These practices seem to have been widespread among the Han elite, and were associated during that period with Huang-Lao, practices of the mythic figures of the Yellow Emperor and Laozi, and with the pursuit of transcendence. The descriptions of physiology developed through these practices contributed greatly to the canonical medical tradition. In later centuries, while some moderate breathing and dietary practices remained part of the elites’ repertoires of healthcare, more esoteric practice came to be associated with religious Daoists.

From the Han and continuing into the seventh or eighth centuries, Daoist cultivation included the ritual con-

coction of elixirs, the process recapitulating a reverse cosmogony in both the elixir cauldron and in the self. In later centuries, the imagery of this “external alchemy” remained a part of “internal alchemy,” cultivation of vitality primarily through breathing and visualization, without the actual production and ingestion of elixirs. This includes the cinnabar (a mercuric sulfide that also gives East Asian lacquerware its distinctive red) that also stands synecdochically for both elixir and Daoist alchemy.

While women also participated in these practices, it is only from the seventeenth century that texts describing a distinct style of cultivation geared to female physiology and for the guidance of women practitioners appear. These were written by men, and aimed in part at supporting practice by women in the home, and discouraging them from seeking guidance by leaving the home or by bringing in teachers who elite men saw as potentially corrupting. Among its distinctive characteristics, this practice aimed at “beheading the red dragon,” or stopping the menses and returning the body to a prepubescent state.

**Family, community, and state.** As in most societies, the primary locus for managing health in China was the family. The first to care for the sick were usually the adult women of the family, although especially from around the Song period elite men often also took an interest in medical learning and sometimes practiced in an amateur capacity on their friends and families. Women left their natal families upon marriage, bringing with them and exchanging with

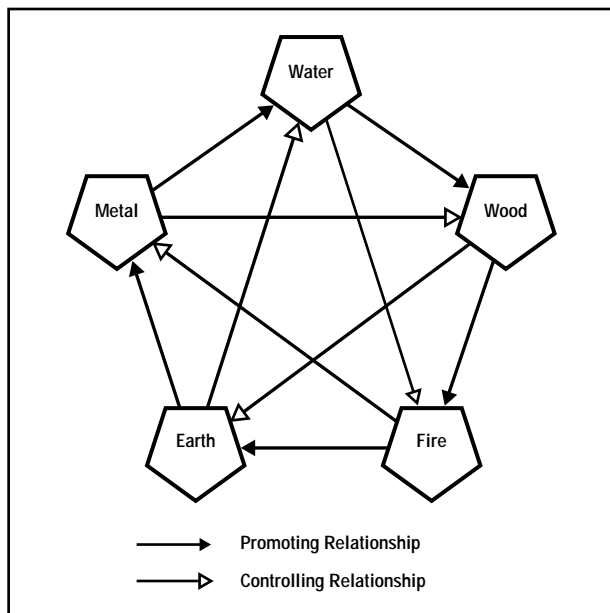

TABLE 3. Illustration courtesy of the author.

their new families practical everyday knowledge about healthcare, including management of diet, methods of massage, herbal remedies, and avoidance of pollution or contagion. With the spread of commercial printing from the eleventh century, some of this household lore, as well as specialist medical works, made their way into publication, increasing the circulation of knowledge about health and healing.

When illnesses seemed to warrant specialist attention, the decision of whom to consult was often made in consultation with members of the extended family and local community. In the large and complex households of wealthier families, which could contain multiple generations, several subsidiary wives, and numerous servants, decision-making could involve negotiation among the preferences of competing parties. In general, elite men of late imperial times (roughly, the fourteenth to nineteenth centuries) seem to have favored the services of elite scholar-physicians, while women tended to prefer the more eclectic and hands-on ritual, massage, moxibustion, acupuncture, and also herbal and dietary treatments of female and other lower-status specialists.

Households and communities were also a basic unit for containing or repelling contagion. When someone was thought to bear a contagious illness, they might be isolated in their room, with their care charged to a specialist healer. Outsiders would avoid visiting a family or village so stricken, and in severe cases members of the family and community might flee the area, leaving the sick behind. The windows, doorways, and circumference of a household might also be ritually sealed to prevent the entrance of plague-spreading demons. Early texts contain references to annual exorcistic festivals for cleansing the community, or in some cases the

palace or capital, of demons responsible for disease. In later periods, for which more is known, other annual festivals, such as the Dragon Boat Festival, also had such apotropaic functions, and special rites could be commissioned to prevent or expel particular plagues.

Monasteries (especially from the fifth century) or local gentry (especially between the twelfth and nineteenth centuries), often with administrative help from officials, would also organize food, shelter, burial, and medical relief for the indigent during disasters. Monasteries also built hospitals with state cooperation in the eighth century. After confiscation of monastery properties in the 840s, these were shifted to state administration. In response to disasters, emperors often granted tax abatements and distributed relief on an ad hoc basis. It became more common in the Northern Song period (960–1127 CE) for officials to distribute medicines during epidemics, and later in the period state-run subsidized pharmacies and hospitals were set up in the capital and in some prefectural seats. Christian missionaries began to set up clinics and hospitals providing Western-style medical care beginning in the nineteenth century. In the twentieth century, the state again became the primary builder of both biomedical and Chinese medical hospitals.

While most healing, healthcare, and disease prevention has always taken place without the aid of specialist healers, extant writings tend to leave better records by and about these figures.

**HEALERS.** Disorders of different types might suggest particular healing specialties, but often a given ailment might be considered susceptible to multiple avenues of attack. Ecstatic and ritual specialists were concerned with expelling demons, with moral management and consequences, and with alignment with cosmic cycles. Canonical medical traditions were concerned primarily with patients' disharmonies and the dissipation of their vitalities, but also sought to buttress defenses against violation by external noxious agents. Experts in esoteric practices of cultivating vitality shared these concerns, good health being prerequisite to higher goals of transcendence, but additionally advised devotees in methods of alchemical refinement and transformation.

**Ecstatic and ritual healers.** Analysis of the earliest surviving written references to disease and healing, from Shang period (c. 1500–1050 BCE) oracle inscriptions, suggests that at this time, in what today is northern China, Shang royalty attributed at least some disease to the dead and to demons. They responded by communicating with and propitiating their ancestors or expelling disease demons through *wu*, often translated as "shaman" or "spirit-medium." As Chinese-writing empires spread, the ecstatic and religious healers of diverse peoples came to be identified in literature as *wu*, the once-respected term taking on senses of exoticism and derogation close to "witch doctor." While in many dynasties through history *wu* enjoyed the court's favor and high status, they came under attack from competitor physicians, from Daoists and Buddhists beginning in the third to fourth cen-

turies, from Confucian officials as early as the Han but especially in the eleventh century, from local gentry between the twelfth and nineteenth centuries, and from the state-building Nationalist and Communist governments in the twentieth century. Despite these periods of suppression, however, ecstatic healers are active in Taiwan and China today.

Priests of the Daoist religion could intervene for parishioners in illnesses produced by litigation from beyond the grave, submitting counter-petitions and countersuits on their behalf. They also guided parishioners in confessing and purifying themselves of their misdeeds, performing exorcisms and communal rituals, and providing talismans for the expulsion of evil spirits for pasting on doorways or for ingesting.

Whereas Daoist cultivation tended to take the health of the whole self, including the physical body, as a precondition for soteriological goals, Buddhists took the illusory nature of the phenomenal world, including bodily illness, as a central tenet. The rigors of monastic practice in fact were known to be hard on health. On the other hand, Buddhists taught compassionate concern for the suffering of others, and introduced new therapeutic and institutional approaches to the treatment of illness. The idea of karmic causality and the provision of medical and disaster relief were mentioned above. Buddhist missionaries introduced South Asian drugs and therapies, including cataract surgery, to China. Buddhists also introduced practices that were applied to prevent or treat illness, including *mudrās* and *mantras*, new types of incantations and rituals, and new approaches to meditation. Certain South Asian ideas about illness, such as the Four Elements, also occasionally appear in Chinese medical texts, notably Sun Simiao's (581–c. 682) *Beiji qianjin yaofang* (Essential prescriptions worth a thousand in gold for preparing for emergencies). Over the long term, however, these do not seem to have fundamentally reshaped Chinese medical approaches to etiology, nosology, diagnosis, or therapeutics.

**Drug sellers.** From at least the Han we also have records of specialized drug sellers. They were sometimes associated with Daoist transcendents, and drugs were stored in gourds or gourd-shaped containers, an image of primordial chaos in Daoism. With the expansion of commerce from the eleventh century, commercial pharmacies and itinerant drug sellers became more widely available as sources of both medicines and medical advice.

**Hereditary doctors, scholar-physicians, and specialists.** The fourth to first centuries BCE saw the emergence of literate medical practitioners who distinguished themselves from other healers with the development of distinctive textual traditions and practices based on the cosmologically resonating and vitality-dissipating models of physiology developed at the same time by cultivating vitality practitioners. They did not, however, entirely eschew ritual therapies or demonic views of disease.

These physicians tended to pass their knowledge and texts to sons or to duly recommended outsiders deemed wor-

thy. Although literate, these were not those family lines with access to the highest levels of office. In the late tenth and eleventh centuries, however, expansion of imperial involvement in producing and disseminating medical texts and in medical relief raised the status of medicine. The period also saw increased socializing between literati and physicians, and literati and official compilation and publication of prescription texts. Between the twelfth and fourteenth centuries, as office became accessible to a larger and more fluid stratum and chances of actual attainment to this coveted status became increasingly rare, pursuit of medicine as avocation and eventually occupation became a socially accepted alternative for elites. Reacting both to the more eclectic practices of hereditary physicians and to the standardized prescriptions of eleventh-century official relief efforts, these scholar-physicians developed styles of medicine based more strictly on canonical texts, such as the *Inner Canon of the Yellow Emperor* (second to first century BCE), and followed more individualized and dynamic approaches to diagnosis and treatment. They focused on the treatment of underlying physiological conditions rather than “superficial” manifestations, and they might, for example, leave the treatment of lumps or lesions to specialists in external medicine. Scholar-physicians employed complex and individually tailored herbal prescriptions, eschewing those therapies that were considered both less subtle and less suitable to their social standing, such as acupuncture, moxibustion, and massage.

These therapies became the preserve of lower-status healers. Besides specialists in particular diseases or therapies, these included shamans, diviners, and other religious figures; itinerant healers; and in general female healers and midwives. Ironically, the stricter segregation of genders in the late imperial period increased demand for female experts. Besides those who practiced a more eclectic mix of skills, female physicians who were trained in their family's hereditary learned medicine also practiced in elite circles, including at court.

In the twentieth century, as “modernity” and “science” came to be broadly valued in China, and as a result of nation-building efforts and anxiety about Chinese culture, indigenous healing practices came under attack as “superstitious.” Both in order to stave off threats to their legitimacy and to make their practices more modern, practitioners experimented with different approaches to reforming Chinese medicine: mapping tracts and disorders onto Western-style anatomical structures and biomedical disease categories; dropping minor surgery from the repertoire of what we know as acupuncture; emphasizing aspects of the tradition that resembled biomedicine in some way; shedding the more elaborate cosmological frameworks; emphasizing the empirical foundations of Chinese medicine; integrating Chinese and Western medical practices; and asserting the scientific legitimacy of a newly emphasized “differentiation of manifestation types” in opposition to Western “distinguishing of diseases.”

For a time it was anticipated that these modern transformations, confusingly referred to as *traditional Chinese medi-*

*cine*, would leave these traditions completely subsumed under biomedical paradigms. The utility of acupuncture would be disproved or explained in relation to nerves and the endocrine system. The active components of individual herbs would be isolated and their efficacy would be identified by biomedical procedures. Complex diagnoses and herbal prescriptions would be eliminated. Instead, the styles of Chinese medicine have proliferated with the revival of respect for the virtuosity of older masters, with the increasing popularity of “complementary and alternative medicine” around the world, and with variations brought about by attempts to adapt Chinese styles of healing to diverse environments. Attempts to test the efficacy of Chinese medical systems in randomized trials have been stymied by their very diversity, by the individual tailoring of much practice, and by the failure of attempts to map Chinese onto biomedical physiology or diagnoses.

Health and illness in China must be understood in relation to Chinese understandings of self. Their management is shaped both by the social context of care, and by the available range of healing resources. While institutions of the last century have tended to support the separation of biomedicine from Chinese medicine, and the dominance of the former and standardizing of the latter, the preferences of both healthcare consumers and providers for eclecticism have kept multiple indigenous traditions alive and changing.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN TIBET

Premodern Tibetan ideas about healing and medicine, like those of other Buddhist societies of Asia, derived from disparate sources. These included local versions of widespread Asian concepts regarding spirit-causation of illness and soul-loss, Indian and Chinese-derived ideas about good fortune and astrological influences, the various major medical traditions of Asia (Āyurvedic, Islamic, and Chinese), and Buddhism itself, with its understandings of the suffering implicit in life within the universe of cyclic existence (*samsāra*) and its body of ritual techniques to relieve that suffering and promote the well-being of its followers. A range of discourses and approaches arose from these various sources and these underlie both popular and elite understandings of illness and healing. This entry covers healing specialists; spirit causation of illness; life-force, soul, well-being, and related concepts; astrology; the Tibetan medical tradition; Buddhist Tantric medicine; Buddhist attitudes toward illness; death and dying; and the effects of modernity.

**HEALING SPECIALISTS.** Depending on how a particular illness is understood, Tibetans may approach a traditional Tibetan doctor (*a mchi*), a folk shaman, spirit-medium or other folk diviner (*lha pa*, *dpa' bo*, *mkha' 'gro ma*, etc.), or a lama (*bla ma*) for assistance. Traditional Tibetan doctors practice a humorally-based medical system closely related to the Indian Āyurvedic medicine. Shamans or spirit-mediums are men or women who act as mediums through which local gods communicate; some also perform folk rituals of healing. Lamas may be monks or lay people but are almost always male. They belong to one of the four main Buddhist traditions or to the Bon tradition, which claims pre-Buddhist origins but is in most respects similar to the Buddhist traditions. All five traditions possess a similar range of divinatory techniques and ritual countermeasures, mostly deriving from the Tantric (Vajrayāna) Buddhism of India. Patients may also try more than one kind of practitioner, and in the contemporary situation both in the People's Republic of China and among Tibetan refugees such medical pluralism is extended to include Western-style biomedicine.

**SPIRIT CAUSATION OF ILLNESS.** Illness can be caused by spirits, typically local deities who have taken offense at some unintentional action. Thus a class of spirits living in streams or trees (*klu*, equated by Tibetan scholars to the Indian *nāga*) may cause boils, skin diseases, or leprosy if their homes are dirtied or polluted, while another class of spirits (*gza'*, equated with Sanskrit *grāha*) cause strokes and partial paralysis if offended. In many such cases, Tibetans will recognize from

the nature of the complaint the kind of spirit involved. A lama or spirit-medium may be consulted to discover the nature of the offense and the best approach for remedy. The remedy may include purificatory actions using empowered water and other consecrated substances, avoiding “dirty” foods, and making offerings to the offended spirit.

**LIFE-FORCE, SOUL, WELL-BEING, AND RELATED CONCEPTS.** A series of folk concepts (*dbang thang*, *rlung rta*) refer to various aspects of health, vitality, well-being, and good fortune. These can be strong or weak, and their loss can threaten illness, misfortune, or death. Probably the most significant of these is *bla*, and Tibetan ideas regarding the loss of *bla* parallel those found in many of the neighboring Himalayan and Southeast Asian peoples (e.g., Thai *khwan*). As elsewhere, there are ritual techniques to recall the *bla* and reintegrate it with the body, and both lamas and the idea that the vitality or “soul” (*bla*) of the human organism may be lost or scattered. Both lamas and spirit-mediums can perform rituals to recover the lost “soul” in cases where illness is attributed to such sources.

Other personal qualities (*tshe* or life-span, *dbang thang* or personal power, etc.) can also be partially or wholly lost. Such loss may be due to spiritual contamination (*grib*) resulting from contact with polluting situations such as death or childbirth. It can also be due to the action of witches or sorcerers. Ideas of loss of health or vitality shade into concepts of spirit-attack, since a weakened vitality can leave a person open to such attack. An important function of the lamas, dramatized in particular through major monastic ritual festivals attended by the local lay community, is to defend the community against spirit-attack. They also maintain the strength and vitality of the community through life-empowerment (*tshe sgrub*) rituals on these and other occasions. Rituals to maintain or recover good fortune may be performed by lay people or lamas.

**ASTROLOGY.** Tibetan astrology derives from both Indian (*dkar rtsis*) and Chinese (*nag rtsis*) sources. The Chinese system, also known as *'byung rtsis* or elemental astrology, is based on the daily variation of five personal quantities in astrologically determined cycles, which are correlated with the five elements (iron, wood, water, fire, air) and the Chinese twelve-animal cycle. The five quantities are *bla* (life-force), *srog* (vitality), *dbang thang* (strength or personal power), *rlung rta* (good fortune), and *lus* (bodily force); *'byung rtsis* can be regarded as a systematized version of folk ideas regarding soul-loss, and good and bad fortune. Printed almanacs, which trace the variation of these quantities and predict good and bad days for various activities, are popularly available.

**THE TIBETAN MEDICAL TRADITION (A MCHI MEDICINE).** The principal textual basis for the Tibetan medical tradition is the *Rgyud bzhi* (Four medical Tantras), which was probably compiled in the eleventh century by the famous physician G'yu thog Yon tan Mgon po [Yut'ok Yönten Gonpo] (1112–1203). While the framework of this text is a dialogue between emanations of the medicine buddha Bhaiṣajyaguru,

large parts of the content are adapted from the Tibetan translation of a well-known Āyurvedic text, the *Aṣṭāṅgahṛdayasambhitā* of Vāgbhata. Other sections indicate borrowings from Chinese and perhaps also Islamic medicine, as well as indigenous Tibetan developments. An alternative textual tradition associated with the Tibetan Bon religion varies only in details.

A series of commentaries were composed to the *Rgyud bzhi*, of which the best-known is the *Vaidūrya sngon po* (Blue beryl) by Sangs rgyas Rgya mtsho (Sanggye Gyats'o; 1653–1705), *sde srid* or regent to the fifth Dalai Lama. A substantial literature of other medical works has also been written by Tibetan doctors and scholars.

Sde srid Sangs rgyas Rgya mtsho was also responsible for the foundation in 1696 of the main Tibetan medical college, named Lcags po ri (Chakpori) after the hill in Lhasa where it was situated. A second college, the Sman-rtsis-khang, was founded in Lhasa by the thirteenth Dalai Lama in the early twentieth century, and the *Rgyud bzhi* system is now taught in more or less modernized versions by training institutions in Chinese-controlled Tibet and among the refugees, as well as in Europe and the United States. There are also many local versions of the Tibetan medical tradition, often passed down hereditarily, also for the most part derived from the *Rgyud bzhi*. Doctors may be lay people or monks. In the past, they were almost all men, but there have been some notable women doctors in recent years, and the profession is becoming increasingly open to women.

The *Rgyud bzhi* texts have been widely studied in the West, often in conjunction with the works of Sde srid Sangs rgyas Rgya mtsho, and many Western presentations of Tibetan medicine are little more than paraphrases of these texts. This material, however, does not necessarily relate closely to current medical practice. While memorizing all or part of the *Rgyud bzhi* remains central to the training process, other texts are also studied, and doctors undoubtedly acquire much of their knowledge and clinical expertise through subsequent apprenticeship with a practicing doctor.

The Tibetan medical tradition today employs the three Āyurvedic *doṣa* or “humors” (*nyes pa*) as basic theoretical and diagnostic categories. The three *nyes pa* are *rlung* (wind; Skt., *vāta*), *mkhris pa* (bile; Skt., *pitta*), and *bad kan* (phlegm; Skt., *kapha*). Thus illness can be understood in terms of one or more of these *nyes pa*, which are residues of the ongoing processes of bodily existence, being present in excessive or inappropriate quantity. The *Rgyud bzhi*'s opening sections link the *nyes pa* to the three poisons of samsaric existence (ignorance, desire, and hatred), thus providing a Buddhist foundation to Tibetan medical theory. The importance of the *nyes pa* can nevertheless be exaggerated. In practice, much of Tibetan medicine operates in terms of the identification of one or another named illness category, each corresponding to a specific mode of treatment, rather than on restoring the system as whole to a state of balance. Diagnosis employs examination of pulse and urine, as well as observation. Pills (*ril bu*),

made of complex compounds of substances of herbal, mineral, and animal origins, are used for healing. Use is also made of diet, and of techniques of cupping and moxibustion.

**BUDDHIST TANTRIC MEDICINE AND DIVINATION.** Tantric (Vajrayāna) Buddhism in Tibet, while centered on the achievement of buddhahood, includes a wide variety of ritual techniques to bring about this-worldly results. In some of these, lamas mediate the powers of Tantric healing or long-life deities (such as Bhaiṣajyaguru, Amitāyus, and White Tārā), conferring healing power on lay followers directly or through empowered substances, often pills (*ril bu*) similar to those used in *a mchi* medicine. Life-empowerment rituals of this kind were regularly performed by most major Tibetan monasteries, forming part of annual community festivals. Consecrated substances, empowered water, and the like are still widely used in cases of illness. They may also be used prophylactically in situations of perceived risk (for example, the selling of sweaters by Tibetan refugees on dirty, polluted Indian streets). Situations of *grib* (pollution, spiritual contamination) may arise from a variety of causes and will often be countered through the use of empowered substances.

Other Vajrayāna techniques derive from the alchemical traditions of eighth- to twelfth-century India, which were closely linked with Tantric Buddhism. In these, complex medical compounds are prepared and further empowered through Tantric ritual. These “precious pills” (*rin chen ril bu*) are expensive, highly valued, and frequently used by lay people either on the recommendation of a lama or *a mchi* or on their own initiative. Ideally, they are taken under ritually-prescribed conditions and accompanied by prayers and *mantra* recitation.

Lamas also have an important role as diviners, again using techniques derived in part from Vajrayāna sources. Divinations (*mo*) are frequently sought in cases of illness in order to ascertain the most appropriate mode of treatment. Other health choices (e.g., the most suitable location for childbirth) may also be made by recourse to divination. In addition, some lay people have a reputation as diviners, and spirit-mediums can also be asked for divination.

**BUDDHIST ATTITUDES TOWARD ILLNESS.** Beyond all this, we can ask about the effects of Buddhist teachings on popular attitudes toward illness and health. Suffering and the transitoriness of life are central themes for Buddhism in Tibet as elsewhere. As in other Buddhist countries, however, most Buddhists in Tibet regard the attainment of Buddhist enlightenment as beyond their reach, at least in their present lives, so lay Buddhist religious practice is focused mainly on future lives and on the performance of morally positive actions that will lead to a good rebirth in the future.

Lay Tibetans are also interested in this-worldly success and prosperity, and this is largely the domain of the various regional and local deities (Yul lha, Sa bdag, Klu, etc). Much lay ritual, such as the widely practiced *bsangs*, fire-offerings of fragrant wood, herbs, milk, butter, yogurt, etc., are directed towards these local gods. Vajrayāna Buddhist ritual tech-

niques give the lamas control over the local gods and spirits, providing the basis of the Buddhist role in village affairs. However, the Buddhist stress on the illusory nature of apparent reality and the inevitability of suffering within *samsāra* undoubtedly serves to relativize Tibetans' attractions to this-worldly matters. As David Lichter and Lawrence Epstein (1983) have noted, most Tibetans look for worldly success but maintain a “slightly ironic detachment” from a happiness that is at best impermanent.

Death and dying are particularly associated with Buddhism, and a consideration of healing should perhaps also encompass how terminal illness is dealt with. The *Bar do thos grol* (*Tibetan Book of the Dead*) texts have become well known in the West, and provide a liturgy based on guiding the consciousness of the dead person through the after-death states. Equally or more significant are the *'pho ba* practices, which are aimed at achieving rebirth in a buddha realm (usually that of Amitābha) at the time of death. These techniques, which have received little study from Western scholars, are often taught nowadays to lay people, and offer dying people a way of dealing positively with the final moments of life.

**THE EFFECTS OF MODERNITY.** The various discourses and modes of healing discussed above were never separate, hermetically sealed modes of explanation. They overlapped and intersected in a variety of ways and continue to do so today. Thus *grib*, spirit attack, and soul loss are not always separable categories, and a particular illness may be dealt with by a combination of *a mchi* medicine, Tantric purificatory rituals, and spirit-medium consultations. In Chinese-controlled Tibet, in traditionally Tibetan areas of Indian and Nepal, and among Tibetan refugees, traditional Tibetan approaches to healing continue to be used situationally, often in combination with ideas from Western medicine (usually known among Tibetans in South Asia as *rgya gar sman*, literally “Indian medicine”).

## HEALING AND MEDICINE: HEALING AND MEDICINE IN JAPAN

This article is confined to healing and medicine among the Japanese. For lack of space, no specific discussion on minorities in Japan, such as the Ainu, Koreans, Chinese, and Okinawans, is included. Neither is the vast variation in practices among the Japanese specifically addressed. Excluded are the medical dimensions of the so-called new religions (*shinkō*), shamanism, and ancestor worship. Numerous new religions mushroomed in Japan after World War II. Although they have many adherents and health-related matters often occupy a central place in their beliefs and practices, their role in health care is limited to their memberships. Once a powerful nonformalized religion in Japan, shamanism used to play a significant role in the health care of the people, but much of it has now been transformed and absorbed into new religions. Consequently, its importance for the general public has been significantly reduced. So-called ancestor worship remains perhaps the most important aspect of the religiosity of contemporary Japanese, including urbanites, regardless of

class. However, the role of ancestors is to look after the living in very general and diffused ways and thus it is not covered here.

**MAJOR CHARACTERISTICS OF JAPANESE NOTION OF HEALTH/ILLNESS/HEALING.** Several major concepts that characterize the notions of health, illness, and healing are: health as an ephemeral state; the importance of the notion of balance, with imbalance leading to illness; the principle of purity (health/balance) and impurity (illness/imbalance); and the importance of the intactness of the body.

Upon birth, one receives a body with all its weaknesses, including one's *taishitsu*, "inborn constitution," and *jibyō*, a chronic illness one is born with. The most commonly recognized *taishitsu* are "strong" (*jōbu*); "ordinary" (*futsu'u*); "weak" (*kyojaku*); "nonenergetic and constitutionally susceptible to illness" (*senbyōshitsu*); "very weak" (*horyūshitsu*); and "extra-sensitive" (*shinkeishitsu*). Others referring only to somatic characteristics of a particular body part include "chilling disposition" (feeling of chill in the stomach and the legs), "tendency to get tired easily," and others.

*Jibyō* means an illness or illnesses that a person carries throughout life and suffers at some times more acutely than at others. The word is written in two characters, the first one meaning "carrying" and the second one "illness." Common *jibyō* are rheumatism (*ryūmachi*), "weak stomach" (*ijaku*), "descended stomach" (*ikasui*), gastritis (*ikeiren*), excess stomach acid (*isankata*), and high/low blood pressure.

Many Japanese are quite aware of their own *taishitsu* and *jibyō*. Parents are especially keen on being watchful over their offspring's departures from health by, for example, not allowing a child with weak *taishitsu* to exert him- or herself. One nurtures the body given at birth rather than trying to conquer and alter it, while constantly monitoring minute fluctuations of the body. Even with the diffusion of jogging and other health care practices from the United States, perfect health is seen as ephemeral and ordinary health is a condition that fluctuates.

This fluctuation is caused by an ever fluid system of bodily balance and imbalance, the latter inviting an illness to take over the body, as further detailed in the section on *kampō*. Bodily imbalance is a state of impurity, whereas its balance/health is assigned the value of purity. The purity/impurity opposition is an important principle that governs daily hygiene and notions of health and illness, as well as contemporary practices of shrines and temples.

Some of the most important early socialization training for Japanese children is to take their shoes off, wash their hands, and, in some families, gargle when they come into the house from outside. The Japanese explain this custom by stating that one gets dirty from germs outside. Although the concept is expressed as "germs" in biomedical terms, it is the symbolic association of the spatial "outside" with culturally defined "dirt." To keep oneself clean and healthy "inside" one's living quarters, one must get rid of this dirt through

cleaning/purification of impurity. Thus, even after Western-style housing, including apartments, were introduced, all homes have a *genkan*, a square or rectangular space at the entrance where people take their shoes off. Many overseas Japanese continue to adhere to this practice wherever they go. The “inside” includes seats on taxis, trains, and buses, where children must take their shoes off if they wish to sit to look out the window. The strikingly white starched covers on the seat of taxis and bullet trains are a symbolic expression of “inside,” and people are expected to treat them as such.

That the welfare of the body is essential to the welfare of the soul is clearly expressed in the two most important and interrelated characteristics of the Japanese concept of the body: the intactness of the body (*gotai*) and nonviolence to the body. Together these notions lead to the Japanese emphasis on the “natural” state of the body or the “natural” course of life.

**PLURALISTIC SYSTEM OF MEDICINE AND HEALING IN CONTEMPORARY JAPAN.** The perspective taken in this article is the folk perspective of everyday health care rather than the institutional or doctrinal perspective of Shintoism and Buddhism—two major institutional religions of Japan. The major characteristic of the Japanese system of medicine and healing is that it is pluralistic. The system includes: *kampō* (the Japanese system of healing with Chinese origin), healing at the religious institutions of shrines (Shintoism) and temples (Buddhism), and biomedicine, of which only the first two are introduced here because they are embedded in religions and the worldview of the Japanese. Their peaceful coexistence, as it were, is striking, since in terms of their basic premise they are contradictory to each other. In addition, despite their basic differences, each absorbed others so that biomedical health care makes room for *kampō* and religious elements. It is the people who adopted these different systems and somehow made them into their own and use all of them simultaneously.

**CHINESE-DERIVED JAPANESE HEALING: *KAMPŌ*.** As with other humoral medicines, traditional Chinese medicine is based on “a system of correspondence,” rather than “a system of causation,” which characterizes biomedicine. For the Japanese traditional medicine of *kampō*, derived from Chinese medicine, the basic premise of medical treatment is restoration of the balance of the body, which then would remove etiologial conditions and therefore pathogens as well. Its basic premise, therefore, is very similar to the Japanese folk’s understanding of health, illness, and healing.

Given the premise, then, treatment is not aimed directly at removing the pathogen, and thus surgery is the polar opposite of the notion of treatment and is actually seen to further aggravate the body’s imbalance. Therefore, despite the prestige and glory accorded biomedicine in Japan, the Japanese have been quite cautious and selective about adopting surgery. For the Japanese, who avoid going outside after taking a bath so as not to shock the body by the cold air and who have not practiced body mutilations for aesthetic pur-

poses (until recently, under American influence), surgery is an extreme form of violence to the body, although its popularity has rapidly increased in the last couple of decades. The enormous hesitancy of the Japanese to adopt organ transplantation relates to this aversion to violence to the body, as well as to the importance they place upon the intactness of the body, both for the living and for the dead; peaceful afterlife is predicated upon the intactness of the body of the deceased.

In contemporary Japan *kampō* comes in all shades, from orthodox practice to mass-produced and prepackaged extracts of herbs to street-corner computer diagnoses. The orthodox *kampō* practice today is a medicinal system developed in Japan after its introduction from China. In a radical departure from biomedicine, *kampō* does not recognize categories of illness. Diagnosis does not consist of labeling the illness. Each departure from health is diagnosed on the basis of the combined total of symptoms the patient experiences and those the *kampō* doctor detects. The sum total, called *shōkōgun*, is carefully evaluated against the sex, age, and constitution of the patient and the climate in which the patient resides in order to reach a proper prescription for treatment. A *kampō* doctor, using auditory, tactile, olfactory, and visual faculties in reading the patient’s condition, prescribes a specific treatment. Its treatment consists of moxibustion (burning of the cones of dried young mugwort leaves), acupuncture, and herbal and animal medicine. In the case of herbs, it is a mixture consisting of a dozen or so, which the patient brews in an earthen kettle for a long time and drinks. Every patient therefore has a unique illness and requires a unique set of treatments.

Even though the American Occupational Forces prohibited moxibustion and acupuncture at the end of the World War II and they went underground, in contemporary Japan not only has *kampō* become enormously popular among laypeople but also the government has supported this system of medicine by financially supporting research in *kampō* and gradually adding *kampō* treatments under health insurance coverage. It exists in a symbiotic mode with biomedicine in that it specializes in chronic illnesses, especially those accompanied by chronic pain; new types of illnesses, including gerontological illnesses; and illnesses resulting from environmental pollution and traffic and industrial accidents, none of which biomedicine has been successful in treating. Its popularity is also in part the result of reaction to the negative side effects of biomedicine.

**RELIGIOUS HEALING: THE ROLE OF TEMPLES AND SHRINES IN HEALTH CARE.** Except for native Shintoism, other religions were introduced from abroad: Buddhism from India via Central Asia, China, and Korea; Confucianism, Daoism, and several other religions from China; and Korean shamanism. These religions have permeated the daily lives of the Japanese; they have become part of their customs without requiring any psychological commitment on the part of the individual to any one of them. Most Japanese subscribe to

more than one religion, often without consciously realizing it. They go through Shintō rituals related to life, such as births and marriages, but most funerals and the rituals related to the deceased are Buddhist. The annual statistics on Japanese religious affiliation consistently list the total membership in various religious organizations as one and a half times the total population of Japan. In other words, over half of the people in Japan belong to more than one religious organization.

The current popularity of temples and shrines in Japan is phenomenal and in fact has been increasing for some time. Many temples and shrines throughout Japan attract literally millions of people a year for a number of reasons, including pure tourism. They go to these religious institutions by tour buses, with friends and families, or alone. Temples and shrines provide healing of illness, promotion of the general welfare of the people, or promise of the fulfillment of wishes.

**Healing of illnesses.** Some temples and shrines are known for their efficacious administration of moxibustion or acupuncture so that it is hard to draw a line between *kampō* and healing at these religious institutions. On the other hand, people go to most of these institutions to purchase amulets and talismans that are thought to have healing power, and they write their prayers/wishes on votive plaques.

Some of these institutions are so popular that bus companies operate regular tour buses that take people to them. The tours for older people target temples and shrines that specialize in illnesses of older people, such as strokes and hemorrhoids. On the other hand, medical and other uses of temples and shrines are by no means confined to the aged. With an increase in the cancer rate, those that specialize in the cure of cancer are visited by people of all walks of life and of all ages. For example, the deity enshrined at Ishikiri Shrine to the northeast of Osaka used to be good for various kinds of boils and growths, but its major appeal at present is its efficacy in treating cancer. Visitors here are not confined to the aged, although young people are fewer because cancer afflicts mostly older people.

A number of temples and shrines are known for their power to guarantee safe and easy childbirth and illnesses related to childbirth, which is not considered illness in itself. A brief description of Nakayama-dera near Osaka shows the role of religion among people in their day-to-day lives. The major hall (*bondō*) of the temple is situated on top of a hill and flanked by numerous *jizō*, the guardian buddha of children, on the hillside. On both sides of this central pathway are separate temples enshrining various buddhas, each specializing in a certain function. One is a temple that specializes in success in the university entrance examination. Another temple enshrines a buddha who specializes in taking care of infants who have temper tantrums, do not sleep, cry at night, or are constitutionally very weak. Another temple, which bears a sign in front for traffic safety and the naming of newborn infants, also houses *Mizuko Jizō* (the *jizō* buddha for aborted fetuses). Inside this temple are many *jizō* for

aborted fetuses, and numerous votive plaques are hung on two wooden structures. Often apologies, such as “Please forgive me/us,” are written and signed by the mother or by the couple. “Please sleep peacefully” is another common prayer on these plaques.

At the top of the hill, in front of the main hall, is a large metal incense burner. People buy bundles of incense, light them, and place them in the burner; many then “scoop” up the smoke with a hand and bring it onto an ailing part, such as the hip, to apply its “healing power.” Visitors, especially women with infants, also purchase white bibs, write prayers and their names and addresses on them, and hang them on a stake around the buddha in front of the main hall. The main hall itself houses two offices. On the right side is a small office where the temple employees sell sashes. Many pregnant women in Japan continue to wear the traditional long white sash (*iwata obi*) over the stomach during pregnancy. After purchasing a sash, a woman would ask the priest of the temple to write a *sūtra* on it. They then take it to their biomedical obstetrician, who writes a character for happiness in red on the sash. On the left is another small office where used sashes must be returned.

The composition of visitors to Nakayama Temple also reflects the complex human network involved in childbirth. Although pregnant women and mothers with young children comprise the core of the visitors, many are accompanied by older women and sometimes by older men. A number of women are accompanied by their husbands, reflecting the recently increased emphasis on the conjugal bond and the nuclear family.

The central focus of the temple is childbirth and matters related to infancy, including easy and safe delivery, the healthy growth of children, and memorial services for aborted fetuses. The temple has long served also as a place for the *shichigo-san* celebration—a celebration marked by a visit to a shrine, usually on November 15, when a child is three, five, and seven years old (*shichigo-san* means seven, five, and three).

**General welfare and prayers for wishes.** Young people may go to temples and shrines less for illnesses than for other reasons; most common are success in entrance examinations and luck in finding a boy- or girlfriend. These wishes are written on votive plaques and hung on a wooden structure provided for them. Similarly, with a strong emphasis on school trips in Japanese schools, one often sees school tours at temples and shrines, with elementary, middle, and high school students flocking to buy amulets, charms, and other souvenirs for themselves and for their families. The youngsters today hang the amulets and charms for protection from traffic accidents on their knapsacks or pocketbooks, just as every taxi and private car, even those driven by young people, has an amulet for traffic safety hanging from the rearview mirror.

One of the most popular uses of shrines and temples in contemporary Japan is for the purification of automobiles on

New Year's Day. With the rapid increase in private car ownership, "my car"—a term borrowed from English and pronounced in Japanese as "mai ka"—is both a popular word and a symbol of a new way of life, symbolizing the new emphasis on nuclear families and the image of young parents with strong conjugal bonds, contrary to the image of the traditional extended family. Despite the modern image of these "my car" owners, who are usually young or middle-aged, all flock to shrines and temples on New Year's Day to have their cars purified. This is the time when the Japanese engage in all sorts of activities to get rid of impurity accumulated during the past year, but the purification of "my car" is a new addition. The purification service includes a purification rite, a prayer, amulets, and bumper stickers. The service has become so profitable for temples and shrines that some of them have constructed extra parking space and other facilities to accommodate "mass" purification rites.

**Goriyaku: "Occupational specializations" of deities and buddhas.** To the Japanese, perhaps the most meaningful feature of the multitude of deities, buddhas, and other supernaturals is their *goriyaku*—the benevolent functions they perform. The lives and fates of these deities do indeed reflect the major concerns of people of the time. Outmoded specializations are often discarded or transformed into new, more meaningful roles. The roles related to childbirth, child welfare, and general matters of illness and health comprise over half of the specializations of temples and shrines in general, indicating that these are perennial concerns of the people. In contrast, functions related to calamities, including traffic accidents, are much fewer in number, and their nature changes over time. For example, natural disasters and fire were major concerns in the past and were reflected in the specializations of deities and buddhas at the time. Contemporary Japanese seem to place more emphasis on luck and success in life. Of paramount importance in the past, the deity of smallpox is no longer meaningful in contemporary Japan, and its function had been expanded to incorporate contagious diseases in general. Likewise, the Deity of Coughing was originally a very popular deity when influenza was a major threat. Since influenza is better controlled in contemporary Japan, the deity is now also consulted for chronic respiratory illnesses, including asthma.

**SUMMARY.** The roles played by religions in contemporary Japan offer an example of how religions remain important in people's lives, including the young, in contrast to a view of unilinear "progression" in which religion is replaced by science. Japan's case is by no means unique, as Americans remain profoundly religious, though not in the same way the Japanese are, and in many postindustrial European countries, such as France and Italy, folk religions—religions as practiced by the folk—remain important in their medicine and healing.

#### HEALING AND MEDICINE: HEALING AND MEDICINE IN INDIGENOUS AUSTRALIA

The indigenous peoples of Australia, the Australian Aborigines, settled the continent more than forty thousand years ago, with some archaeological estimates placing their occupancy at well over fifty thousand years ago. It is most likely that their forebears crossed from Southeast Asia during the Pleistocene period, coming first to the northwest coast and migrating south and east. By the time European explorers and then settlers arrived on Australia's shores in the late eighteenth century, Aboriginal societies, although sharing an economy based on hunting and food gathering, were linguistically and culturally diverse, living across the continent in environments of distinctive ecology and climate. These ranged from inland desert to tropical and temperate coastal zones and alpine regions. Although self-contained for most purposes, neighboring clans gathered for major ceremonies, and localized tribal groupings participated in the trade of goods (such as stone tools, pearl shell, and native tobacco) across hundreds, sometimes thousands, of kilometers.

The health of Aborigines in precolonial times can only be extrapolated from the descriptions of early explorers, settlers, and missionaries, and from knowledge of the traditional diet and lifestyle. It is generally accepted that individuals

were in good health, lean and fit, and that the greatest risks lay in periods of famine, accidents, drownings, fighting between clans, childbirth, predation (by, for instance, sharks or crocodiles), bites by poisonous snakes and spiders, and such diseases or conditions as treponematosi, arthritis, congenital malformations, and some cancers (Webb, 1995). In this context, despite a richly differentiated suite of about 250 languages and local cultural and religious traditions, broadly similar systems of indigenous medical practice and belief—again with local elaboration and variation—developed across the continent and Tasmania.

There are few written descriptions of Australian indigenous concepts of health, what it means, or how it can be maintained. Greater emphasis is given to the causes and treatment of illness. The Kukatja of the Western Desert, as described by Anthony Peile (1997, p. 130), hold that health, in the popular sense, consists of the body being “cold” and “dry,” and, in the spiritual sense, of having the spirit in the area of the navel and the stomach. Such a feeling of “cold” is different from coldness caused by wind, sickness, or sorcery, which makes a person’s spirit shiver. Several authors document ideas of health as encompassing the person and his or her spiritual well-being and home country. Health is also characterized by strength, happiness, and “safety,” in the sense of obeying the laws of the community and being cared for (Mobbs, 1991). In an urban setting ideas of fitness, bright eyes, shiny hair, cheerfulness, looking after one self, and not drinking too much alcohol are all expressed as qualities of a healthy person (Nathan, 1980).

The attributed causes of illness and injury had parallel modes of treatment and response, based primarily on symptoms and severity. All maladies except death by old age or in early infancy were interpreted as the consequence of breaches of social or religious proscriptions and commandments. The women of each language group were the primary keepers of extensive traditional pharmacopoeia—or in English, “bush medicines”—employed to treat identifiable symptoms or injuries that responded to herbal treatment. It is likely that in all communities there were spiritual healers. They were generally men, if the written reports are taken as representative. Their skills were engaged where herbal and other “natural” treatments did not work, or when the causes of the condition were thought to be supernatural in origin, be they malign or angry spirits or human sorcerers able to draw upon extra-human powers.

Almost all premature deaths would have been, and still are in many communities, subject to forensic speculation and inquiry about the cause, the responsible persons or agents, the reasons, and in some cases the appropriate retribution. Each of these domains of illness, bodily harm, healing, and explanation, although diverse and complex, have been described in journals and ethnographies from the late eighteenth century onwards.

**SORCERY.** The figure of the skilled and secretive human sorcerer remains ubiquitous across Aboriginal communities in

the Central Desert and tropical north of Australia, where indigenous language, religion, and concepts of being are still strongly held. These are the communities that were least affected by what many now describe as the invasion and appropriation of traditionally owned lands, the forcible resettlement of Aborigines on missions and government reserves, the “stolen generation” (young children taken from their families to group “homes” for reeducation and Anglicization), massacres, and the devastating impact of waves of infectious diseases. For communities that were not as harshly subject to such violence, suffering, upheaval, and repression of language and culture, indigenous frameworks continue to be powerful sources of explanation and interpretation.

Central Australian groups widely invoke the *kadaitcha* (or *kwertatye*), an Arrernte word meaning “evil person walking about.” The term can refer both to men who are secret killers and to the feathered slippers they wear to hide their footprints and silence their footfall as they track their victims. Among the Aranda/Anmatjirra Central Desert people, illness caused by *kadaitcha* and others who have acquired the requisite knowledge or powers is known as *arrenkwelthe*. *Kadaitcha* executions by “singing,” “boning,” or other dangerous modalities are assumed to be carried out for offenses relating to secret ritual and religious knowledge and ceremonies, desecration or trespass in sacred areas (i.e., those associated with “Dreaming” or creation stories), killings and assaults, or other serious breaches of the social or religious order.

A parallel figure is the *galika* of northeast Arnhem Land in the high northern tropics of Australia (Reid, 1983). *Galika* are individuals who have acquired the power and training to kill by stealth. One of the most detailed descriptions of the way *galika* attack, immobilize, and operate on their victims was given to Lloyd Warner (1958) in the 1930s by community members and by a self-confessed sorcerer who claimed to have killed several people using elaborate and magical “surgery.” Today most people will claim that *galika* come from distant and potentially hostile groups, rather than from within.

*Galika* attacks typically have four phases. First, the perpetrator is believed either to waylay solitary victims in an isolated spot or to draw victims to a secluded location where they will not be disturbed. Second, the *galika* puts the victim to sleep, cuts the body open, removes or mutilates certain organs, and drains away the victim’s blood. The *galika* may insert stones or objects in place of organs or blood. Third, the *galika* induces amnesia in victims to ensure that they are either unable to remember or unable to recount anything about the attack. Fourth, the victim dies, usually within hours or days of returning home.

The source of a *galika*’s power may be tutelage by other sorcerers, or it may come from association with death or the spirits of the dead. The *galika*’s acquired techniques are several, although in this area there are as many reported variations of these weapons or techniques as there are people willing to

talk about them. One frequently mentioned weapon across Australia is a sharpened object, such as a bone taken from a victim's arm, a stingray barb, or a piece of hardwood that has been rubbed with the blood or flesh of a dead body. The weapon is pointed at the victim, with incantations or songs, whereupon the victim slowly sickens and dies. "Image magic" is also designed to "kill a person's spirit." The intended victim's image or name is drawn in a sacred and powerful place, and spells are uttered according to the areas of the body being targeted. Alternately, the *galka* may follow a person, piercing his footprints with a spear or hot object and willing an illness upon him (such as leprosy), which slowly penetrates and "rots" the body. Individuals are usually careful about disposing of hair and nail clippings, excreta, blood, or personal clothing infused with sweat or bodily fluids, since it is believed that a sorcerer who obtains any of these can heat, burn, or bury them to cause a debilitating or deadly condition. In contemporary society it is sometimes held that *galka* can extend their arsenal of weapons by using modified bullets, battery acid, flashlights, or other items with similar spells and effects.

The transgressions or enmities said to provoke attacks of these kinds are broadly similar across Australia, although they differ in detail and description from place to place. All transgressions center on conflicts or acute mistrust between individuals and groups, on breaches of social and religious laws that cannot go unpunished, or on deaths, theft, or violence that must be avenged. For instance, if a man reveals secret religious knowledge that is not his to pass on, or if a woman enters a sacred area or views a religious object without permission or the authority of age and standing in the community, the offender may be punished by sorcery. A failure to honor the webs of ritual and social or economic obligations that exist between tribal groups and individuals may be considered sufficient cause for retribution.

The theft of land, ritual objects or ceremonial body painting designs, trespass on others' sacred sites or the unauthorized use of others' creation myths and songs, are all given as a legitimate reason for seeking revenge, as are personal grievances arising out of broken marriages or adultery. Forbidden or inappropriate love affairs cause serious tensions, especially in societies where marriage and relationships are strictly governed by kin relationships, some of which may be prohibited to the point of actual avoidance of each other by individuals who are related in specific ways. Where betrothals are negotiated between families for their children, and girls are "promised" as marriage partners in infancy (or even before birth), particular tensions will arise if either future partner breaks the agreement by marrying or consorting with someone else. In addition to matters of family and the heart, jealousy over achievements, position, or power may be seen as motivation for the contracting of a sorcerer to cause a serious illness or death.

Everyone can trace grievances, conflicts, or offences in his or her own extended family, recent or longstanding, to

which serious misfortune, illness, or death could ultimately be attributed. Murder, of course, is reason for revenge, either directly by the responsible kin of the deceased or by contracting the services of a skilled sorcerer.

From the point of view of an outsider, it is impossible to say whether *kadaitcha*, *galka*, or other workers of malign magic actually exist or are solely part of an explanatory framework for the misfortunes that strike individuals and constitute an acute threat not only to the sufferer but to family and community. Certainly some individuals have claimed to be sorcerers, have shown sorcery items to inquirers, or have described their feats (e.g., Warner, 1958). A 1993 paper from the Aboriginal Resource and Development Services warned of an increase in sorcery in northern Australia, describing it as a "real" phenomenon, not solely an explanation for misfortune. Whatever the interpretation of sorcery fears and accusations, they do address the *why* of illness and death, not just the *what*.

In contemporary society Aboriginal people are usually familiar with Western medical notions of pathology, injury, pathogens, and organ failure (such as heart disease). Indeed Aborigines today, like many fourth-world peoples, suffer very high rates of degenerative illness (such as diabetes, kidney failure, heart disease, and cancer), familial and intercommunity violence, midlife mortality, alcoholism, and substance abuse. There are far too many occasions in which people are impelled to search desperately for meaning and causation in the early death of a relative from illness or injury, sifting through signs, symptoms, and circumstances for an answer. The bereaved may understand and accept a medical explanation of the proximate cause, such as bleeding on the brain from a blow to the head, injury in a car accident, a crocodile attack, a heart attack, pneumonia, or renal failure, but they still invoke an ultimate cause that relies on their own understanding of the dangerous forces at work in human affairs and the sacred domain. For example, they may consider the cause to be that the dead person was "doomed" by sorcery to be bitten by a snake (Roth, 1903, p. 28). Even in communities where the language and traditional culture have been overwhelmed by white colonization, such beliefs continue to be held in attenuated forms (Clarke, 1999).

Human agency is not the only possible cause of affliction. Misfortune may also be visited directly on a victim as a result of breaches of the conventions and laws surrounding the Dreaming, or those governing sacred places and their resident spirits, religious rituals, and sources of supernatural power, such as key locations or ceremonial objects (Biernoff, 1978; Morphy, 1991, p. 261). Evil spirits are recognized in many Aboriginal language groups by various names: for example, *ju ju* (Warlpiri), *arrentye* (Aranda), and *mamu* (Pitjantjatjara). Most groups also recognize spirits of the dead and spirit custodians of sacred places (Nathan and Japanangka, 1983). A trespasser in a dangerous ("poison") or forbidden location, particularly a person who is not the owner of the area or otherwise authorized to be there, may contract

boils, leprosy, or weakness, may sustain bone fractures, or may even have his or her spirit stolen by the guardian, creation, or ancestral spirit that dwells there (Berndt, 1982).

Similarly, if an uninitiated person approaches too close to or handles sacred objects, whether intentionally or unintentionally, the power inherent in those objects may be released and cause harm, either directly to the transgressor or to those nearby. Epidemics or illnesses may be linked to such a breach. Illnesses may also be linked to the flouting of food taboos related to menarche, pregnancy, and birth. Such food taboos may also be linked to religious occasions and rites of passage, and include the right to eat or proscriptions against eating animals that are totems for a particular clan or extended family (Spencer and Gillen, 1968). Some bush foods are, in fact, poisonous and cannot be eaten at all or unless properly prepared. Women are expected to be particularly careful with their diet in order not to cause birth complications or deformity in an unborn child; mothers may also observe dietary restrictions in the early months of a child's life.

**HEALERS.** Throughout Australia the figure of the traditional healer, called a "clever man," "medicine man," or occasionally "medicine woman" (Bell, 1983; Peile, 1997, pp. 174–175), is a powerful and often reassuring counterbalance or antidote to the threat of inexplicable or life-threatening illness (see Elkin, 1945; Spencer and Gillen, 1968; Warner, 1958). Central Australian healers called *ngangkere*, while having at their disposal the means to inflict death, primarily practice counter-sorcery. *Ngangkere* may remove objects inserted into the victim's body by a sorcerer, restore the lost or disturbed spirit of a person who has been "sung" or "boned," diagnose illness, converse with spirits, read minds, dream travel, see into a person's body, endure psychic terrors, exercise telepathic powers (Elkin, 1945), preside over inquests into deaths, and identify a murderer (Nathan and Japanangka, 1983). The *mabarn* of the Western Desert similarly has the power to cure illness, influence the weather, and chase away evil spirits (Tonkinson, 1982). The source of the *mabarn*'s power is in magical objects that are usually kept in the stomach or, less often, in the arms, thigh, or head and removed when needed for healing activities.

However they work, these healers all have in common extraordinary powers, wisdom, and skills that enable them to diagnose and cure sickness. In Western Desert communities the healers are often sons or brothers of other healers, and it is generally held that they are born with their powers. Such powers are considered to be *djugurdanidjanu* (from the Dreamtime). However, in most areas for which there is written information, an aspiring healer must pass through a form of initiation that may involve isolation, encounters with the spirit world, an experience of being ritually "killed" and revived, transportation to secret and powerful places in dreams, encounters with the dead, and other often frightening experiences (Elkin, 1945; Reid, 1983; Roth, 1903). Powers to heal are associated with certain sites of significance, ancestral beings, or totems. These powers are manifested in the treat-

ment of the sufferer through touch, sucking, massage, and pressure on certain parts of the body, during which the *mabarn*'s own objects of power may be inserted into the patient's body, or objects of sorcery may be removed. The healer's spirit helpers may be summoned to assist in the treatment. An alternate modality is the use of dream travel or dream consultations with spirit beings or helpers.

Treatment sessions are almost always public, with the healer talking to the patient, the family, and onlookers as he works, while explaining, reassuring, and talking through his diagnosis, remedial activity, and insights into the cause and its removal. The *mabarn*'s challenge is to counter the work of the sorcerer (called *djinagarbil* in the Western Desert), the same challenge facing such healers as the *marrnggitj* of northeast Arnhem Land (Reid, 1983), the *margidjbu* of western Arnhem Land (Berndt, 1982), or the *ngangkere* (*ngangkayi*) of the Central Desert. The *djinagarbil* are men who travel from distant places, enter a community in darkness, find the victim (who will usually be away from camp when captured), stun the person, and insert a lethal item into his or her body; the *djinagarbil* then revives the victim, who returns to camp unaware of the attack, then sickens and dies. People in the Western Desert area are also at risk of attacks by malevolent spirits (*marlbu*), and the loss of the *nunu* (soul), both of which may be discerned and treated by a *mabarn*.

Like the *mabarn*, the *marrnggitj* of northeast Arnhem Land has been described as "the reverse of the coin on whose other surface appears the black sorcerer" (Warner, 1958). *Marrnggitj* are generally ordinary members of the community, differentiated only by their possession of special powers acquired through dramatic rites of passage or the patronage of spirit familiars who assist and empower them.

In a 2003 story, the journalist Nicolas Rothwell described an encounter he had with a *maparnjarra* (*mabarn*) in Central Australia. The *maparnjarra* described to Rothwell the experience of dying spiritually and being reborn with the ability to see at night, to receive charged dreams, to roam in other realms, to see a person's spirit, to look inside a person's body, and to project his body through space. The work of healers today, in areas where they still practice, is intertwined with that of Western healthcare providers, some of whom work in tandem with healers, recognizing their powerful influence and standing with their communities—and the faith their communities place in them. The ill or seriously troubled are often pragmatic in their choices of treatment, depending on the symptoms, severity, or duration of the illness. They will try various treatments in both medical systems for relief and recovery, in much the same way that people the world over use both conventional and alternative therapies in the pursuit of good health or a cure for intractable illness, chronic pain, and suffering (Mobbs, 1991). Indeed, in Christianized communities in Australia the boundaries between Christian and indigenous beliefs blur, with the power of Jesus, the Holy Spirit, angels, or the apostles conflated with that of the *mabarn* in the healing quest (McDonald,

2001, pp. 142–146). In fact, the *marrnggitj*, *mabarn*, *ngangkere*, and spiritual healers from other regions “perform several of the functions associated in Western society with the doctor (healing the body), the therapist (healing the mind), the priest (comforting and instilling faith), and the coroner (determining the cause of death)” (Reid, 1983, p. 78).

**OTHER HEALING PRACTICES.** “Bush medicines,” as they are described in English, were, and in some areas still are, used to treat a wide range of injuries and ailments. Most such medicines are derived from the bark, roots, or leaves of plants, but people may also use sea flora or invertebrates, earths and clays, insects, insect nests, charcoal, molds, and fungi. A wide range of remedies exists for the treatment of skin conditions, toothache, bites and stings, wounds, burns, general malaise and pain, and eye, gastrointestinal, and upper respiratory tract infections (Roth, 1903, pp. 38–42; Siggers and Gray, 1991, pp. 43–45). The Warlpiri of central Australia classify remedies as intended for rubbing, drinking, tying, sniffing, chewing, and smoking (blowing the smoke of a burning plant over the patient). One study of Yolngu medicines (northern Australia) documented the indigenous and botanical names, preparation, and application of over one hundred plants (Scarlett et al., 1982).

In general, stewardship of local pharmaceutical knowledge rests with the women of the community, although all community members will be broadly familiar with common medicines and are able to find and use them when needed. Women care for, wash, massage, and minister to the sick. Diane Bell describes how female relatives of a sick Warlpiri person may prepare goanna and witchetty grub fat and red ochre, then massage the patient in much the same way as a *ngangkayi* (traditional healer) might. They may also sing Dreaming songs. According to Bell, women’s health-giving ceremonies, practices, and religious songs give “love, care and power” (1983, p. 161). Women control the collection and preparation of medicines relating to menarche, menopause, pregnancy, childbirth, contraception, abortion, and breastfeeding, all described in English as “women’s business.” In contemporary communities, however, much of women’s knowledge and authority in childbirth and infant care has been usurped by health professionals using Western medicine, and traditional medicines and rituals have become less central.

Not all illnesses are attributed to supernatural causes. It is well understood that some conditions are self-limiting and not serious. Some may be the result of contagion, emotional upset, foods, heredity, old age, predation, pregnancy, neglect (of self or by others), self harm, or even exposure to very hot, wet, cold, or windy weather. Today other risks and threats have emerged in the abuse of alcohol, tobacco, and drugs (including the sniffing of gasoline), as well as in motor vehicle accidents, poor nutrition, poverty, unsanitary living conditions, and family violence. These are all typical of patterns of deprivation and illness suffered by indigenous peoples in many countries, whose land, resources, and identity have been affected by colonization and dispossession.

Aboriginal medical beliefs and practices constitute internally logical and powerful systems of explanation and healing, which both draw upon and reinforce the social and religious orders. Traditional Australian medical practices have been adapted to contemporary realities and have absorbed Western medical ideas and treatments, but in many communities they retain their underlying integrity and force, providing a framework for interpreting and gaining some sense of mastery in an unpredictable and threatening world.

JANICE REID (2005)

**HEALTH AND RELIGION.** Since the mid-1980s, there has been increasing interest in the relationship between religion and health. Consider that a MEDLINE search of all scientific literature on religion or spirituality and health between 1980 and 1982 revealed forty-six articles; between 2000 and 2002, however, that number had increased to 393 articles. Similarly, a PSYCHLIT search of the psychological literature on religion or spirituality between 1980 and 1982 revealed 101 articles; between 2000 and 2002 the number had increased more than tenfold to 1,108 articles. Although much of the research on religion and health has been conducted in the United States, hundreds of studies have also been reported from other areas of the world, including Canada, Great Britain, Australia, continental Europe, Norway and Sweden, India, Israel and other parts of the Middle East, China, Korea, and Japan (see Koenig et al., 2001). Many of these studies found similar relationships between religion and health. Nevertheless, this research, in the United States and elsewhere, has with good reason come under criticism by some researchers, who also question how the findings should be applied clinically.

**HISTORICAL CONNECTION.** Western concepts of health care have their origins in the values and activities of religious organizations. The first large hospital in the Western world was built by the Christian church in the late fourth century CE, and for the next one thousand years the church built and staffed hospitals throughout western Europe and England. The first nurses were members of religious orders—the Catholic Sisters of Charity and, later, the Protestant Deaconesses—and they provided most of the nursing care in Western hospitals till the early 1900s. Many physicians during this time were also clergy, a tradition that carried over into the United States during colonial times.

After the French Revolution at the end of the eighteenth century, however, medicine became more and more separated from religious influences. Despite this trend, many hospitals continued to be affiliated with and supported by religious institutions, both in the United States and western Europe. With the rise of science in the latter half of the nineteenth century, the separation between religion and medicine became complete. In the early twentieth century, Sigmund Freud wrote prolifically about the neurotic aspects of religion, influencing both the field of psychology and medicine. As a result, religion came to be seen within the scientific health-care profession as either irrelevant to health or inimical to it. This was before systematic, large-scale research studies began to objectively examine the relationships between health and religious belief and practice.

**RELIGION VERSUS SPIRITUALITY.** In the late 1980s the term *spirituality* began to be used in preference to the word *religion*, since *religion* suggested doctrine, divisiveness, and institutional power, whereas *spirituality* was seen as more personal and inclusive. For the purposes of this entry, *religion* is defined as an organized system of beliefs, practices, and rituals designed to connect a person to the sacred or transcendent (god, ultimate truth, ultimate reality), and to promote one's relationship and responsibility to others within the context of a faith community. *Spirituality*, on the other hand, is understood as a personal quest to understand the answers to ultimate questions about life, about meaning, and about one's relationship to the sacred, which might or might not lead to religious doctrines, rituals, or a faith community. Because spirituality is such a broad concept, however, researchers have had difficulty measuring it as distinct from religion; thus, most studies have measured spirituality in terms of religious beliefs or practices, and most research that examines the relationship with health has examined religion, not spirituality. For that reason, the word *religion* will be used throughout this discussion.

**RELIGION AND MENTAL HEALTH.** A systematic review of research conducted prior to 2000 identified 724 quantitative studies of the relationship between religion and mental health. Of those, 478 (66%) found a statistically significant relationship between religious involvement and better mental health, greater social support, and less substance abuse. Nearly 80 percent of studies examining the association between religion and well-being reported one or more significant positive correlations between these variables. This was particularly true for optimism, meaning and purpose, and hope in the future. The majority of studies examining the relationship between religion and self-esteem also reported greater feelings of self-worth among the more religious.

Similar associations were also found in studies of mental disorder. Of ninety-three cross-sectional and prospective studies, sixty (65%) found lower rates of depression or depressive symptoms and faster speed of remission from depression among those who were more religious. In fact, at least three clinical trials demonstrated faster recovery from

depression, anxiety, and grief associated with bereavement among religious persons receiving religious-based psychotherapies. These findings came not only from the United States, but also from the Netherlands and Malaysia, and involved not only Christians but also Muslims and Buddhists. Furthermore, more negative attitudes toward suicide and lower rates of suicide among the religious were found in fifty-seven of sixty-eight studies performed during the twentieth century, which is consistent with research showing lower rates of depression and greater well-being.

Greater social support (nineteen of twenty studies), less loneliness, and less substance abuse (drugs, alcohol, smoking; 121 out of 145 studies) have also been documented among the more religious. Greater marital stability, lower delinquency, and more pro-social activities (volunteering, for example) are other common findings. At least 75 percent of research on substance abuse has been in adolescents and college students, whose drug and alcohol use behaviors are likely to affect health over a lifetime. New research conducted since that systematic review has largely confirmed these findings.

This does not mean, however, that religious beliefs and practices are never associated with worse mental health, particularly in individual cases. Religious beliefs and practices can foster rigid thinking and excessive guilt, and may drive some persons away from seeking health-care services that they need. In general, however, data from cross-sectional, prospective, and clinical trial research are increasingly dispelling past notions that religion typically fosters mental or emotional instability.

**RELIGION AND PHYSICAL HEALTH.** The relationships between religion and better mental health, greater social support and marital stability, and lower rates of substance abuse and delinquency, are likely to have physical health consequences. This would be expected, given the well-established connections between psychosocial factors and neurological, endocrine, and immune functioning. Although studies of religion and physical health are less common than those of mental health, a similar pattern of results emerges.

Several studies have examined associations between religion and immune functioning, blood pressure, heart disease, cancer, overall mortality, and disability level. Five studies that examined the relationship between religion and immune functioning all reported associations. Two of these studies were conducted on persons with HIV/AIDS, two in older adults with immune senescence with aging, and one in women with metastatic breast cancer. Whether immune function is measured in terms of interleukin-6 levels, CD-4 and total lymphocyte counts, or natural killer-cell numbers, the findings favor the more religious. Lower serum cortisol levels have also been linked to greater religiousness, which may help to explain the immune findings.

Of twenty-three studies examining the relationship between religiousness and blood pressure, fourteen found lower rates of hypertension or lower blood pressure among those

who were more actively religious. The association appears to be particularly strong for diastolic blood pressure, compared to systolic blood pressure, and therefore may be of special importance given the influence of diastolic hypertension on myocardial infarction (heart attack) and stroke. Consequently, it is not surprising that eleven of sixteen studies examining the associations between religious activity and heart disease found lower rates of myocardial infarction, death from coronary artery disease, and longer survival after open-heart surgery among the more religious. At least one study has found lower rates of stroke among more frequent church attendees.

Of six studies examining cancer, four found lower mortality in the more religious, a finding consistent with the influence of neuroendocrine and immune function on the development and course of cancer. Whether in persons with cancer or other health conditions, survival in general appears to be longer among persons who are more religiously active. Of fifty-two studies examining that relationship, thirty-nine reported significantly longer survival among those who attended religious services more often, prayed more frequently, or demonstrated more commitment to religious beliefs. The effects are particularly strong for religious attendance, even when the effects of social support and the ability to physically attend church are statistically controlled for. In one of the largest studies, involving 21,000 randomly selected persons of all ages across the United States, Robert Hummer and colleagues (1999) found that persons who attended religious services more than weekly survived an average of seven years longer than persons who did not attend services; for African Americans, the difference in survival was fourteen years.

Some criticize these studies by pointing out that people who are sicker are physically less able to attend church services. While being physically disabled can adversely impact religious attendance during the short term, Ellen Idler and colleagues (1997) at Yale found that the effects of attendance on preventing the development of disability over the long run are substantially stronger. Religiousness may impact the perception of disability, so that at any given level of objective physical illness, those who are more religious may be less likely to perceive themselves as disabled, compared to those who are less religious. Perception of disability may be influenced by the optimism, hope, and meaning that people derive from religious beliefs.

**CONCERNS OF CRITICS.** Although critics of the religion-health relationship are few, they are particularly vocal and articulate in their arguments. Richard Sloan and colleagues have stressed that the research linking religion with physical health is weak and inconsistent. They voice ethical concerns about the implications of that research for the practice of medicine. "Should Physicians Prescribe Religious Activities?" (2000) is the title of one such article in which the authors claim that the research is not strong enough to warrant prescribing religion to helpless patients. Instead, they say that health professionals should stay out of the religious lives of patients, emphasizing that health professionals other than

chaplains are not trained to address religious or spiritual issues, and bringing up such issues could make patients feel guilty or feel responsible for causing their own illnesses. In some countries, such as Australia, critics claim that religion is not as important to patients as in the United States. These are important points that require careful consideration.

Advocates in favor of health professionals addressing spiritual issues in patient care counter these claims by saying that while physicians or nurses should never prescribe religion to those who are not religious, there is much they can and should do. In particular, they could take a spiritual history to learn if the patient is religious and how that might affect his or her medical care. If the patient is religious, the doctor or nurse could orchestrate the meeting of the patient's spiritual needs, utilizing the patient's religious resources to facilitate healing. Advocates would agree that most of the research, while consistently showing that the religious tend to be healthier, has not shown that becoming religious for health reasons alone (rather than for religious motivations) is likely to result in better health. Clinical trials demonstrating such an effect do not exist. Therefore, there is little evidence to justify physicians encouraging religious conversion as a route to better health. Even if such evidence did emerge in future research, the ethical implications of health-care professionals promoting religion among those who are not already religious would be legion.

**CONCLUSION.** There is growing evidence of a relationship between religion and better mental health, social functioning, and health-promoting behaviors. Because of the increasingly well-established connections between the emotions, physiology, and body functions, there is every reason to expect an association between religion and physical health. Although research on religion and physical health is growing, and several clinical trials to establish the causal nature of this relationship are underway, the evidence remains largely preliminary at this point and there is much further work to do. The preliminary evidence based on epidemiological findings thus far, however, fits a pattern that investigators have seen for other psychological and sociodemographic factors that have later been proven to influence physical health. Certainly these findings deserve further attention by researchers and they deserved to be studied in more sophisticated ways to demonstrate if and in what circumstances religion may influence health for better or for worse. Cautious and sensible application to clinical practice of what is already known would also seem warranted.

HAROLD G. KOENIG (2005)

**HEALTHY, HAPPY, HOLY ORGANIZATION (3HO).** In 1969, Harbhajan Singh Puri (b. August 26, 1929), now known as Yogi Bhanjan, came to California. A Sikh from India, he started teaching Kuṇḍalinī Yoga and founded the Healthy, Happy, Holy Organization, also called the 3HO Foundation.

Yogi Bhanjan had worked as a customs officer before he moved to North America in 1968. After a brief stay in Canada, he traveled to Los Angeles where he began teaching yoga at the YMCA and the East-West Cultural Center. His classes attracted students, some from the counterculture, who were in the process of seeking alternative lifestyles and higher consciousness.

Several of these early students joined with Bhanjan to establish an ashram (center) in Los Angeles and to found 3HO. Bhanjan encouraged students to become Kuṇḍalinī Yoga teachers themselves and to establish new ashrams. Early ashram sites were established in New Mexico, Connecticut, Massachusetts, Vancouver, and Washington, D.C., as well as a number of California locations. By 1972 there were ninety-four ashrams. Residents practiced yoga, community living, and a healthy lifestyle. Yogi Bhanjan traveled to the new centers, teaching yoga and lecturing at nearby universities and colleges. Some of his students soon began teaching on college campuses as well. Students were typically in their teens or early twenties—the "baby boomer" generation. Most of the early ashrams offered communal housing, and residents often worked together in businesses started by other students.

A few of Yogi Bhajan's Los Angeles students began to study the Sikh religion because of his example, and in 1970 a group traveled with him to India, where some became baptized Sikhs, taking part in the traditional Amrit ceremony, *khande di pahul*, at the Akal Takhār, the seat of the Sikh religion. Yogi Bhajan met with officials of the major Sikh administrative body there and received official recognition. Sikh studies and practices rapidly spread through the ashrams, and students created their first *gurdwara* (place of worship) in Los Angeles in 1972. Devotees began to read the *Gurū Granth Sāhib*, the Sikh sacred text, in translation, and many also began to learn Punjabi and to read Gurmukhī, the script in which the *Granth Sāhib* is written. Bhajan established a ministry for Sikh Dharma. New ministers take vows, which include the worship of only one God, bowing only to the *Granth Sāhib* as the word of God and not worshipping any person or personality as *gurū*. They practice vegetarianism, monogamy, and abstinence from alcohol, tobacco, or drugs (unless prescribed by a physician).

The early and mid-1970s were a period of rapid expansion, but growth tapered off toward the end of the decade. The organization sought to solidify its base, and members focused on deepening their understanding of and their practice of Sikh beliefs and traditions and on creating individual "prosperity consciousness." More members created community-oriented businesses. Others furthered their formal education, several entering the health-care profession. Many married and started families.

In 1973 Harbhajan Singh Puri (his legal name became Harbhajan Singh Khālsā Yogiji in 1976 after obtaining U.S. citizenship) legally incorporated the Sikh Dharma Brotherhood. Regional governing units and a central Khālsā Council were established in 1974 and added to the corporation's legal structure.

Sikh Dharma and 3HO were, and are, separate organizations. Although membership overlaps, there are many 3HO practitioners who are not Sikhs. 3HO sponsors classes in yoga, meditation, and nutrition, as well as summer and winter solstice celebrations, preschools and Montessori schools, and summer camps for youth and for women. Sikh Dharma is incorporated under the laws of the United States as a recognized religion. It consists of congregations, an ordained ministry that has grown to more than four hundred ministers, regional authorities, and the Khālsā Council, its advisory body.

In the 1980s, ashrams were consolidated and many people relocated from urban to suburban or rural locations as new parents sought space and safety for their children. Individuals and families grew more autonomous and communal arrangements less common. Many children of grade-school age went to India for their schooling.

**WORLDVIEW AND BELIEFS.** While the Punjab region of India is the home and major center of the Sikh religion, Sikhs have a history of migration and a strong presence in both

Canada and the United States. They have established *gurdwaras* and a number of support organizations. The Sikh religion is based on the teachings of ten *gurūs*. The first, Gurū Nānak, lived from 1469 to 1539. His was a devotional approach to the divine, an approach that called for meditation on the divine name (*nām simran*) and an understanding of divinity as timeless and beyond all categories or descriptions. Gurū Nānak is often depicted as a gentle mystic, but he was also a practical leader who established a community of believers and discouraged withdrawal from the world. Gurū Arjan (1563–1606), the fifth *gurū*, himself a poet, compiled the hymns of Gurū Nānak and the other *gurūs*, his own compositions, and other writings, creating the *Ādi Granth*, the primal scripture of the Sikhs. The tenth *gurū*, Gurū Gobind Singh (1666–1708), established initiatory rites. Today, those who receive these rites are referred to as the Khālsā ("the pure ones") or Khālsā Sikhs. Gurū Gobind Singh added to and finalized the compilation of writings that Sikhs look to as their living *gurū*. Members of Sikh Dharma have adopted the basic Sikh beliefs and prayers, and many have been initiated into the Khālsā.

Yogi Bhajan's students refer to him as Yogiji and consider him to be the Mahan Tantric, or "Master of White Tantric Yoga." He teaches courses referred to as Kuṇḍalinī Yoga classes and courses in "White Tantric Yoga." Kuṇḍalinī Yoga can be practiced daily and may be taught to the public by 3HO members, but only Yogi Bhajan leads White Tantric Yoga.

In a White Tantric Yoga course people sit in long lines, and each faces a partner. Participants are guided in various physical yoga postures, use deep-breathing techniques, chant mantras, and use *mudrās* (yogic hand positions). White Tantric Yoga is said to purify the consciousness and, in the words of a 3HO teacher, Shakti Parwha Kaur, in *Kundalini Yoga: The Flow of Eternal Power* (1996), to "accelerate the psychological transformation of the individual, dissolving deep-rooted subconscious neuroses" (p. 179).

The goal of the yoga postures and breathing techniques employed in Kuṇḍalinī Yoga as taught by Yogi Bhajan is to raise *kuṇḍalinī* energy, which is said to reside at the base of the spine. It should rise up through the central energy channel of the spine, stimulating energy centers or *chakras*, and over time the practice should culminate in a life of higher consciousness. The yoga is said to cleanse and heal, especially by strengthening the nervous system and balancing the glandular systems, and to empower the practitioner to manage his or her own energy wisely. Additionally, different yoga *kriyas* (sequences of postures, breath, and sounds; in 3HO these are intended to manifest a particular state of mind) are said to perform various practical functions, such as easing stress, enhancing stamina, and improving digestion.

There is a strong group culture with distinctive values and beliefs. Sikhs born in the West have espoused orthodox Sikh traditions and incorporated yogic traditions, but have also included American middle-class norms, New Age per-

spectives, and lingering counterculture values. Values include “keeping up,” empowerment, healthy living, and service in a difficult time of transition. “Keeping up” refers to maintaining a positive attitude and persevering when faced by challenges and adversity, and, in general, 3HO practitioners and Sikh Dharma adherents aim to be proactive in their lives and to control and alter their environments for the better. They seek to maintain fitness, mental clarity, and spiritual awareness through yoga, diet, and avoidance of caffeine, alcohol, and tobacco. The group has retained the New Age idea that the world is moving into the Aquarian Age. Yogi Bhanan says that this is a very difficult transition and urges people in 3HO and Sikh Dharma to strengthen themselves through spiritual and yogic practice in order to survive it and help others to weather it.

**PRACTICES AND RITUALS.** Daily *sādhana* (spiritual practice) is the central practice. It should include prayer, meditation, and exercise. Devotees are encouraged to rise before dawn and give the early morning hours to God. *Sādhana* may be performed individually or in a group, although a group *sādhana* is considered more desirable. It will typically begin with recitation of *Japji* (a prayer introduced by Gurū Nānak), Kuṇḍalinī Yoga, and the chanting of mantras, and then progress through meditation, deep relaxation, and devotional singing (*kīrtan*). People in Sikh Dharma have also established daily and weekly Sikh *gurdwara* services and provide *langar*, a traditional shared vegetarian meal, for all attendees.

3HO sponsors solstice gatherings in New Mexico and in Florida. These provide an opportunity for yoga students from all over the world to gather. Participants focus on spiritual practices and participate in White Tantric Yoga (now presented on video). Since 1987 there has been an Interfaith Peace Prayer Day celebration sponsored jointly by Sikh Dharma and 3HO at the time of summer solstice.

Clothing and naming are important aspects of identity. Members of Sikh Dharma are readily identifiable. They frequently wear white clothing (said to have a pure vibration) and have adopted their own version of Punjabi garb. Both men and women wear turbans, although in the Punjab it is generally only men who wear them. The women sometimes wear a *chuni* (a long flowing scarf) over the turban, for formal attire. Both men and women have taken the last name of Khālsā, and the women, like Sikhs in the Punjab, have the middle name of Kaur (princess) while the men, again like their Indian Sikh counterparts, use Singh (lion).

Sikhs emphasize family life. In the early days, many of their marriages were arranged. Yogi Bhanan suggested a spouse for an individual, or two people asked for approval when they wished to marry. Marriage ceremonies follow the traditional Sikh form.

**GENDER ROLES.** As is the case in many of the new religions, gender roles tend to be traditional. While both genders work, women generally have primary responsibility for the domestic sphere. Though women are said to be nurturing by na-

ture, they are also expected to be strong and to complement the partnership with their husbands. Women are understood to be more intuitive, spiritual, and changeable than their male counterparts. Their role as mothers is said to render women especially creative. They are called *shaktis*, a term referring to the female aspect of divinity, “God’s power in manifestation.” Men are thought to be the more steady and consistent sex. They are expected to be active in the world, although their role as fathers is also emphasized. Both men and women are said to have suffered from aspects of American culture—men from too much pressure to achieve and succeed, and women from a general disrespect for their gender and the tendency of the American media to turn women into sex objects. This treatment is said to have alienated women from their natural spirituality, grace, confidence, and self-respect. Many of the teachings about women were developed at the time of the women’s movement and led to the establishment of the Khālsā Women’s Training Camp, which is intended to offer women a break from routines, with time to focus on spiritual growth and to pursue personal interests. Activities include regular yoga, workshops that enable participants to pursue a variety of interests in fields such as dance, counseling, and religious practices, *gatka* (a martial art), and meditation. Both men and women serve as ministers, as yoga teachers, and on administrative councils, and women hold leadership positions in businesses.

**CONTROVERSIES AND ISSUES.** Historically, there has been tension between older established Sikh organizations and Sikh Dharma. Ethnic Sikhs have criticized the linking of the Sikh religion to yoga. They have criticized the hierarchical nature of Sikh Dharma with its variety of titles and positions. Many question the devotion that Yogi Bhanan receives from his students. Members of Sikh Dharma, in turn, have criticized ethnic Sikhs for bringing caste and politics into their *gurdwaras*, or for laxity in their practices. These tensions were more prominent in earlier years than they are now, however.

Sikhs have experienced discrimination based on their mode of dress. People in Sikh Dharma have successfully gone to court in order to be able to wear the turban in their daily occupations in industries with strict dress codes.

As in other new religions, there have been instances of businesses and individuals indicted for dishonest practices. Yogi Bhanan was accused of sexual misconduct in a suit that was filed in 1986, but the suit was dropped.

**RECENT HISTORY.** Sikh Dharma has evolved and grown since its founding, as has the 3HO Foundation, which now has trained over three thousand teachers living in more than thirty-eight countries worldwide. Although the Indian Sikhs do not have an organized ministry, Sikh Dharma of the Western Hemisphere does, adhering to legal requirements for an organized religion in the United States.

Despite opposition, a group of Sikh American women, seeking to open such opportunities to their gender, performed *seva* (service) at the Golden Temple in Amritsar,

India, in 1996. Karen Leonard reports that the relevant authority (the Shiromani Gurdwara Parbandhak Committee) ruled that women would in the future be allowed to serve such functions as priests and hymn singers (1999, p. 281).

As of 2002 there were major centers in the United States, Canada, and Europe, and smaller ones in other locations. A center for meditation and the training of yoga teachers has opened in India. Larger businesses, begun and operated by Western Sikh entrepreneurs, include a successful security firm and tea and cereal companies. Sikh individuals also thrive as doctors, attorneys, accountants, writers, landscapers, artists, and counselors, and in other occupations. A new generation has reached maturity, married, and started families. Youth are a major focus of attention, with mentoring programs and expanded educational facilities being planned. About one hundred students (grades one through twelve) representing eleven countries attended Miri Piri Academy in Amritsar, India, in 2003.

CONSTANCE W. ELSBERG (2005)

**HEART.** Analysis of the symbolic values attached to the heart shows an unquestionable distance between the heart as a source of biological life and its diverse meanings for the emotional, moral, and religious life. The word *heart* may be specific, but the symbol is as multifarious as the polysemy of the term is rich. The range of meanings of *heart* is, indeed, at once based on a physiological reality (which entails a certain animistic conception of the individual) and on spiritual and mystical meditations—two sources that are intimately linked in most cultures.

It seems certain that the vitalistic conception of the heart as the seat of courage, strength, and life is represented by the presence in a great number of ancient societies of the custom of eating the heart of one's enemy to acquire his strength. Likewise, the notion of the heart as the source of life is the basis of the sacrifice usually practiced by the Aztec and earlier by the Maya. In the Inca empire, for instance, the heart was torn out, still beating, resulting in a copious hemorrhage. The flowing blood was nourishment for the Sun (symbolized by the eagle) and an invigorating drink for Tlaltecuctli, the lord of the earth. The heart was considered the most precious part of the person; therefore it was the offering of life itself, a gift from the gods, that was achieved in the removal of a living heart and by the shedding of human blood.

The great symbolic themes relating to the heart were posed by the ancient Egyptians. It is the principal organ of physical life, and is well described in the medical papyri. It is also the center of emotional life, courage, and spiritual life. Thought, will, and wisdom reside there. The heart thus becomes the very locus of personality, capable of prayer to and love for the gods. But the heart is also man's memory, the witness to the deeds he accomplishes during his life. This is why, after death, hearts are weighed with Maat, the goddess of truth and justice, as a counterweight. The heart has a major role in the judgment of the dead, in which man's fidelity to moral prescriptions and social rules is examined. It is the dwelling place of Sia, the god of understanding, knowledge of the past, and creative imagination. If the dead person is "justified by his heart," if the judgment is in his favor, he then experiences union with the god: "Your heart is Re's heart," says the *Book of Respiration* (2.10), for in man's heart abides "the god who lives" in him, a kind of personal genius who determines the existence and the behavior of each individual. The heart is simultaneously soul, life, thought, witness of man's deeds, and the place where the god resides in order to guide man on this earth and to give an account in the afterlife of his actions. In the human heart, as necessary for life on earth as for survival after death, man may meet the divine.

According to the Egyptians, the gods also have a heart. The stela of King Shabaka, recapitulating an old theology of Memphis, shows that Ptah's heart is the seat of creative activity and the center of his imagination. All that was created by

Ptah (the cosmic demiurge) was thought in his heart and came to life through the intermediary of his creating word.

The heart occupies an important place in the sacred texts of Hinduism, as well as in its techniques of spiritual meditation. The natural symbolism of the heart as the center of life and the psychological faculties appears in the *Bṛhadāraṇyaka Upaniṣad* (3.20–25). The heart is there described as the place where everything that exists takes shape: faith, suprainTELlectual knowledge, ontological truth, speech, and biological life (for "the sperm rests on the heart"). Even though the heart is hardly mentioned in the Vedas, which stress sacrificial ritual and praise of the divine, the outline of a "liturgy of the heart" can be seen in the oldest Upaniṣads. There it is conceived of as central in the activity of the *ṛṣis*, those seers who intuitively perceive the divine and express it in hymns. The heart is the secret place of their inspiration, where hymns are prepared to offer the gods, but it is also the critical authority that monitors the hymns' value. The heart thus becomes the place of divine vision, which is only given by grace to those who practice self-renunciation. It is understood that the heart's knowledge is *satya*, real and true, since it alone can enable one to pass from the unreal and the illusory to the real. Such knowledge is transformative, for it discovers, by means of the heart, the divine immanence within man. In *bhakti*, the heart is the seat of an aspiration to join the god and the center of a desire that "binds man at the level of his heart." Man should also reject the desire of natural and illusory realities in favor of the enjoyment of bliss and union with *brahman*. It is necessary to clear this heart by way of renunciation in order to become "a polished mirror" in which the god can be reflected. "When all the desires he carries in his heart have been cast away, then the mortal becomes immortal and from that time onward he delights in *brahman*," says the *Bṛhadāraṇyaka Upaniṣad* (4.4.7).

The heart is thus the symbol of divine inhabitation in man. Four terms most often define this heart, citadel of the divine, of *brahman*: the grotto (*Mahānārāyaṇa Upaniṣad* 201, 469), the bird's nest (*Hamsa Upaniṣad* 13), the ritual hearth, and especially the lotus, an ancient cosmogonic symbol on which the moralizing values of the pure and the impure, the emotional and the intellectual, are grafted (*Dhyānabindu Upaniṣad* 33–35 and 93). But what lives in this place? An impersonal, transcendent principle, the *ātman* (*Chāndogya Upaniṣad* 8.3.3), which exists and senses; the authority that perceives through the senses and that is the interior light in every human being; or else the image itself of the power of a personal god such as Śiva, Hari, Indra, the Everlasting, the Supreme (*Mahānārāyaṇa Upaniṣad* 269). The heart can thus become, by divine grace, the place for the vision of the god: "The man who is free from desire, all pain having vanished by grace of the creator, sees the Lord and his majesty" (*Śvetāśvatara Upaniṣad* 3.20). Thus the heart is the place of passage from duality to unity, from formlessness to form, from the unreal to the real (*Chāndogya Upaniṣad* 8.1.2–3; 8.3.1–2). The path of the heart, simultaneously one

of meditation and renunciation, of the reversal of passions and desire for union, is thus the route from the carnal to the subtle, from the mortal to the immortal (*Svetāśvatara Upaniṣad* 4.16.20).

The ancient Greek world had a rather undifferentiated psychological knowledge of the heart. In the writings of Homer, Hesiod, and the tragedians, *kardia* designates the place of the soul's life, the affects, the emotions, and the feelings. It is the place of secret thoughts and tactical intelligence. By a process of metonymy, the word *stēthos* (chest) is used in the sense of heart; *thumos* (the breath contained in the chest) designates the ardor that animates the feelings that lie in the heart and the thoughts that are formed there. It is this term, *thumos*, less concrete and more subtle, that predominates in the Classical age, but the philosophers introduced an important distinction. In agreement with doctors and certain philosophers like Empedocles (fifth century BCE), who defined the heart as the seat of thought, the Epicureans and then the Stoics located intelligence there. Chrysippus asserted that the heart is the seat of *dianoia*, the source of language (*Stoicorum vererum fragmenta* 837, 838, 879). In response, Plato developed the theory of a tripartite soul: above the diaphragm is the mortal soul, the *thumos* that inspires good deeds; below are the passions, and the immortal principle of the soul is in the head. Therefore, only the ardor of generous deeds is found in the zone of the heart (*Republic*, book 4). Aristotle, however, situated sensations, sensory knowledge, memory, and imagination in the heart, but not the *nous*, or intelligence. Impossible to locate, the *nous* is not attached to any physical organ (*Metaphysics* 12.3.1070a). With Plotinus, all the metaphorical uses of *kardia* and *thumos* disappear in a distinct shift toward intellectualization, which will counterbalance any Judeo-Christian influence.

In the Bible, the word *lev* (heart) occurs 1,024 times, a frequency that testifies to the multivalence of a term common to the Hebrews and the ancient Semites, for whom the heart was an organ indispensable to life, the place for concentration of all the vital forces. If it beat more or less rapidly with respect to emotions felt, it was because, as the center of knowledge, it was an organ both receptive and active. The heart is the locus not only of the whole psychological and intellectual life but also of the moral life. It is man's interior, or *qerev*: "I shall put my law within them and write it on their hearts," says Yahveh (*Jer.* 31:33). This heart that permits understanding of divine things is, at first, recollection and remembrance of Yahveh's goodness. The expression "ascends to the heart" designates the necessary recollection: "From afar remember Yahveh and that Jerusalem ascends to your heart" (*Jer.* 51:50). The heart is therefore an active center where the ideas and impressions received are transformed into deeds; the heart thinks out man's projects and is the seat of the individual's creative power in the form of consciousness. Not only is the heart the center of moral life, but finally the center of religious life as well. It is the heart that experiences the fear of God and keeps faith to the alliance with

Yahveh: the faithful heart belongs entirely to God, in whom it is fixed (*1 Chr.* 29:18).

During the Hellenistic age, when the Bible proliferated in the Greek translation, the word *kardia*, used to translate *lev*, was weighted with all the Semitic values of the heart and took on a new meaning to the extent that the association between heart, thought, and memory became commonplace. In the New Testament writings, a synthesis between Greek and biblical values of *heart* is achieved. The famous formula defining the ideal community of the first Christians "which has but one heart and one soul" (*Acts* 4:32) associates the new heart promised by Yahveh (*Ez.* 11:19) with a Greek proverb cited by Aristotle (*Nicomachean Ethics* 9.8.2) and used again by Cicero in order to define friendship (*De amicitia* 21.81). *Heart* is thus taken in its metaphorical sense in order to designate man's inner self, the place where his spiritual life is born and develops. But the third-century hellenization of an expression from the Christian faith makes more specific the use of *heart*, which loses its meaning of "understanding." Commenting on the beatitude of pure hearts (*Mt.* 5:8), Origen explains that to see God with the heart means to understand him with the spirit (*De principiis* 1.1.9). For Origen, the heart equals understanding; when the scripture says "heart," this is only a metaphor for emphasizing the "passage from the visible order to the invisible order." A similar Platonism will be developed later, more clearly, in the fourth century by Gregory of Nyssa, who explains the famous passage of the *Song of Songs*—"I sleep but my heart waketh" (5.2)—by bringing up the *psuchē* and the *dianoia* of the soul and of the intelligence in order to explain the word *heart*.

In the West, the term *cor* keeps the sense of the Hebrew *lev*, but Augustine enriches it with his psychological analyses in the *Confessions*. For him, the heart is the place of interiority and religious experience, which defines individuality: "My heart is where I am, such as I am" (*Confessions* 10.3.4). Little by little, however, in the Christian West the word *heart* becomes a simple metaphor for the whole emotional life, while in the East it keeps the meaning of spirit liberated from the passions and the affections and of the place for the understanding of divine things and the love of God.

A fundamental vein of Christian mysticism is that in which the divine heart and the human heart unite in an exchange of love. This mystical view of the heart, which appears in the West around the beginning of the eleventh century, is linked to a spirituality centered on the suffering humanity of Jesus Christ, as if devotion to the divine heart could not exist without an emotional reference to Jesus' heart of flesh and the shedding of his blood, which constitutes tangible proof of the love of a suffering and crucified God. In this heart of flesh, bared by the wound inflicted on the cross, the Christian mystics contemplated the same mystery of God's love, trying to specify its meaning in this heart, which had been pierced although it had already stopped beating. (*Jn.* 19:34). It was undoubtedly Anselm (1033–1109) who, meditating on the passion of Christ, was the first to glimpse

this pierced heart as a revelation of God's love (*Patrologia Latina* 158.761–762).

The same idea is found in the writings of the Cistercian William of Saint-Thierry and of Bernard of Clairvaux (*Patrologia Latina* 183.1072). The emotionally pious individual ponders the wound in the divine heart and, confronted with its proof of God's love, wishes to penetrate it and lose himself in it. Such a desire for union, a desire to respond to God's love, has given rise to numerous mystical experiences: that of Lutgard of Aywières at the beginning of the thirteenth century, who was a "sympathetic" participant in the sufferings of the Passion and who "struck at the very heart of Jesus a tenderness so strong that she was forever strengthened"; or those mystical experiences of the cloistered nuns of Hefta in Saxony. Mechthild of Magdeburg (1207–1282) describes in detail how God put her own heart into his divine one burning with love, the two making but a single heart "as the water loses itself in the wine." God's heart is thus the place of sharing and joy while the mystic, like the apostle John, rests on the very breast of Jesus (*Das fliessende Licht der Gottheit* 2.38).

From this monastery in Hefta, where other nuns shared the devotion to Jesus' heart shown by Saint Gertrude (1256–1334), the custom passed to the Franciscans. The memory of their founder's stigmata and their popular emotional preaching developed a piety founded on the contemplation of the afflictions of the crucified one and his wounded heart. In his *Vitis mystica*, Bonaventure (1221–1274) praises "the good Jesus' heart" and stresses the love, revealed by Christ in his incarnation, that is sensitive to human nature. This wounded heart is the vital and tangible expression of God's blessings. But it is also the place into which the human soul must penetrate "as if into a promised land where he will find sweetness, purity, and even God's love," says Ubertino da Casale (*Arbor vitae crucifixae Jesu*, c. 1320). This desire for union with Jesus' heart is so great that, through many repetitions in the course of these unifying experiences, an exchange of hearts between Christ and the mystic is effected, as in the cases of Lutgard, Catherine of Siena, Dorothy of Montau, and, later, Marguerite-Marie Alacoque. It is a symbolic exchange, of course, in which God's will is voluntarily substituted by a human being for his or her own and which is the sign of a transforming union born of that "new spirit and that new heart" prophesied by Ezekiel (36:26–27). This symbol of Christ's heart replacing that of the mystic represents "the union of the uncreated spirit and the created spirit that is realized by the preeminence of grace," explains Thomas of Cantimpré in the *Life of Lutgard* (*Acta sanctorum*, June, vol. 4, p. 193). The heart is the whole human being, who always wishes to unite more fully with the person of the word incarnate himself perceived in a heart, which is the sign of his love and the center "where all the virtue of divinity is enclosed."

In the Christian East, the "prayer of the heart," from the time of the Desert Fathers to our own time, has combined an ancient technique of breath control with the invocation

of Jesus' name, in order to "make the spirit descend into the heart." By concentrating his gaze on the interior of his heart, one discovers it as the locus of emotional life, desires, and love. Then one must melt one's perceptual and intellectual thoughts there, as if in a brazier, and let them heat up and burn until a cry breaks out in one's heart, a call to Jesus, the unique source of that love. The heart is thus the space where the body and soul penetrate each other and coexist, just as the inhaled air mixes with the very breath of life. The discovery of the heart therefore reestablishes human nature in its original state, before the Fall, in rediscovering the energy of the Holy Spirit given by baptism, and in becoming the temple of God once again. The expression "prayer of the heart" is therefore metonymical, although the method of prayer described appears to link it to a specific respiratory technique. Hesychast spirituality insists on the necessity of asceticism to purify the heart of man, who may then come back to the reason why he was created and discover truth. Man then receives illumination from the sun of justice, whose light shines in his heart, which thus becomes the place where God reveals himself and the place of God's desire, where the created being lets the Lord live, and finally knows *hēsuchia*: the eternal joy of being united with him forever (*Mt.* 17:4).

Exactly this conception of the heart as the place of God's desire and the organ of prayer and knowledge of divine things is found again in Pascal in seventeenth-century France, where the devotion to the Sacred Heart of Jesus proliferated, with such devotees as Marie des Vallées, Jean Eudes, and Marguerite-Marie Alacoque. Indeed, the Pascalian heart is the center of neither the emotions nor the faculties of the soul; it is the place of resolution and adherence. It is will, and through it the individual is defined and expressed. But it is, in addition, the organ that knows an order superior to that of reason: "It is the heart that feels God and not reason: this is what faith is, God susceptible to the heart and not to reason" (*Pensées* 278). Pascal meant that reason is not useless, but that it remains insufficient, for it belongs to the natural order, whereas "the heart has reasons that reason knows not" (*ibid.*, 277). The knowledge of God is not an abstract thought; it emerges from the very existence of man, and it resides in the desire for abundance: "My whole heart reaches out to know where the true good is in order to follow it." For, as Pascal wrote in 1658 in his *Art of Persuasion*, "man discovers the truth of which he speaks inside himself." Thus, in diverse cultures and religious traditions, the heart has the profound value of symbolizing and structuring all of human life, the spiritual as much as the physical.

**HEAVEN AND HELL.** As symbolic expressions found in various religious traditions, heaven and hell suggest polar components of a religious vision: a state of bliss and/or an abode of deity or sacred reality on the one hand, and a state of spiritual impoverishment and/or an abode of evil or demonic spirits on the other. As a spatial referent, Heaven is generally considered to be “above,” informed by the human experience of the sky as the expansive space or dome encompassing the earth and also including the sun, moon, and stars. Just as Heaven is “above” the earth, so then is deity “higher” than the human or earthly plane for those traditions in which Heaven is viewed as the abode of deity. On the contrary, Hell is generally regarded as a realm “below,” a meaning reflected in the derivation of the English *hell* from the Old English, *helan*, with a root meaning of “hide,” “cover,” or “conceal.” Thus, Heaven is often symbolized by light or brightness as a realm of bliss, whereas Hell is characterized as dark or shadowy, a realm of anguish and suffering.

**JUDAISM.** The worldview of the ancient Hebrews, as reflected in the Hebrew scriptures, distinguished between the world above, the “heavens” (*shamayin*), as the dwelling place of Yahveh, and the earth, the two comprising the universe of God’s creation. The creation narrative of *Genesis* 1–3 portrays the heavens and the earth as the whole of God’s creation. Under the earth was She’ol; the ambiguous term *she’ol* was used at times to refer to the grave or tomb itself and at other times to indicate an obscure land of shadows, the realm of the dead. Existence there was understood in largely negative terms, since in She’ol the “spirit” or “breath of life” (*ruah*) through which human beings were endowed by God with life was thought to have departed. Prior to the Babylonian exile of 597 BCE, the dead were not thought of as having an existence in which individual identity was preserved beyond life on earth but rather were conceived as a faceless collective existing in a joyless realm.

With the rise of Judaism in the period following the fifth century BCE, the Jewish understanding of heaven as an ideal relationship of the righteous with God was informed both by intercultural influences and by continuing efforts to unfold the meaning and import of the covenant relationship between the community and God. For example, life after death had been clearly and definitively envisioned by the Zoroastrians of Persia as involving a judgment of individuals at death: the righteous were destined to enjoy forever the presence of God in a realm of unending light, while the unrighteous were condemned to a torturous hell. The Greeks, both in religions such as the Orphic cults and in the thought of major philosophers such as Plato and Aristotle, stressed the immortality of the soul. By the second century BCE, both the resurrection of the dead and an event of final judgment were

affirmed in some circles of Jewish thought. Heaven came to be regarded as the destiny of the righteous, those in vital covenant relationship with God. Multiple heavens (seven or ten) are mentioned in Jewish apocryphal literature and in teachings preserved in the rabbinical tradition. Paradise, a state of spiritual fulfillment in which the covenantal righteous enjoy an ideal relationship with God, is variously referred to as the third of seven or the seventh of ten heavens. Messianic expectations, which developed in the centuries immediately before and following the dawning of the common era, were often associated with affirmations of the resurrection of the dead and a final judgment, with the righteous destined for a heavenly paradise. In association with these developments, a place of punishment, Gehenna, was thought to await the unrighteous after death, though the period of punishment was limited in accordance with the degree of seriousness of one’s transgressions.

Traditional Judaism views the final destiny of humans in terms of the three doctrines of recompense, immortality, and resurrection. Informed by the demand of conscience that virtue be rewarded and wickedness punished, the tradition holds that even if one does not encounter equity during the earthly life, it will nonetheless be met with afterward. The interpretation of the actual form of immortality, however, is permitted wide latitude in the tradition, with deathlessness envisaged as preserving individual identity and awareness (with the attending literal images of Paradise and Gehenna) or, alternatively, as a state that is impersonal and without consciousness. Similarly, resurrection has been understood as a climactic event physically reanimating the dead and including the final judgment of bliss or damnation and also as an eternal event through which the corporeality of the resurrected is transfigured into a pure spirituality.

**CHRISTIANITY.** The cardinal import of heaven and hell as components of the Christian religious vision is clearly evident in the New Testament portrayal of the completion of God’s redemptive activity consummated in the manifestation of a new heaven and a new earth (*Rv.* 21). Not only is heaven envisioned in early Christianity as the fulfilling state of bliss and reconciled relationship with God of which the followers of Jesus are assured, but it is also the abode of the divine, where Jesus dwelled before his earthly life and to which he proceeded following his death and resurrection. Essential to the Christian confidence in a heavenly life after death in which the total uniqueness of human personality is preserved is the concomitant affirmation that God will make possible the resurrection of the dead. This belief is to be distinguished from the Greek notion (especially of Plato and Aristotle) of the immortality of the soul understood as rationality. The reality of hell as the arena presided over by Satan and his angels and as the destiny of the “cursed” was assumed by early Christians and frequently appears in the New Testament writings (e.g., *Mt.* 25:1–46). This teaching has been taken literally by many Christian thinkers through the centuries, though alternative views have occasionally been expressed. Origen (third century BCE), for example, understood

hell to involve not the eternal punishment of the cursed, but punishment of such duration as was necessary to provide for the restoration of all to the presence of God.

In Roman Catholic Christianity hell is deemed to be a state of unending punishment for the unrepentant who die without the grace of God as transmitted through the sacraments. This state is characterized both by absence from God's presence (*poena damni*) and by the suffering of fire and other tortures (*poena sensus*). The Roman Catholic concept of purgatory, defined by the councils of Florence (1439) and Trent (1545–1563), envisions an intermediate state after death during which there is opportunity for the expiation of venial sins and compensatory punishment for mortal sins, thus providing for the ultimate restoration of fellowship with God. This teaching, likely informed by the Jewish notion of Gehenna and the Greek notion of the realm of Hades, is correlative with rituals for the dead (prayers, oblations) intended to assure their full expiation. Salvation is understood in the Roman Catholic tradition to be a process, begun in earthly life and continuing in life beyond death, through which there will ultimately be a realization of the "beatific vision," a heavenly state of full and unqualified awareness of the presence of God, a state of spiritual perfection that cannot be attained during the earthly pilgrimage. The significance and import of the Christian teaching about heaven and hell has nowhere been given more powerful aesthetic and imaginative expression than in Dante's masterful poem the *Commedia* (completed 1321). Eastern Orthodox Christianity, in sharing the teaching that hell is a destiny of eternal fire and punishment awaiting the cursed and unredeemed following the Last Judgment and that heaven is the ultimate destiny of the redeemed, has placed focal emphasis on the resurrection of Jesus as assuring the resurrection of the faithful.

Protestant Christianity, though generally lacking the teaching on purgatory or intermediate states, has retained the traditional Christian teachings respecting heaven and hell, while reinterpreting theological understandings of grace and faith as they are pertinent to salvation. With the dominance of the scientific worldview in the modern era and the theories proffered by the psychological and social sciences, literal and spatial interpretations of heaven and hell have been found untenable by some Protestant thinkers. In terms of theological argument, it is contended that it is contradictory to posit hell as eternal punishment while affirming God as one who is loving and merciful and wills all to be saved and forever seeks the lost. Karl Barth (1886–1968), for example, rejected the entire notion of eternal damnation, and instead maintained that the central message of the church is the election of all of humanity in Jesus Christ. Heaven and hell have been reinterpreted by such thinkers as indicative of qualities of life that are conducive to or detract from the realization of the full potential of persons or, alternatively, as symbols that underscore the fundamental character of the decision of faith, in which the whole of the individual is at stake, and the freedom of that decision, through which one may choose to re-

ject God's presence or seek a full union extending beyond the confines of the earthly life.

**ISLAM.** In the Qur'an and the traditions of Islam are manifold descriptions of Heaven and Hell that are expressive of the centrality of judgment as an aspect of Muslim religious anthropology. Perfect justice, one of the attributes of God, will be disclosed at the Last Judgment following resurrection. God's judgment will be pronounced on the basis of an expansive record of each person's deeds. Overriding the demerits of every believer's evil deeds will be the support provided by the Muslim confession subscribed to from the heart ("There is no god but God, and Muḥammad is his prophet.") That judgment in turn will be followed by the entrance of the believers into Heaven and the relegation of the infidels to Hell. In a manner reminiscent of the Zoroastrian Chinvat Bridge, each person will proceed across the bridge of al-Aaraf following the judgment. This will be a felicitous crossing for the true Muslim but a travesty for the infidel, whose fall from the bridge into the pits of Hell is assured. In accordance with the will of God, Muḥammad will, however, recover some who fall. The portrayals of Paradise in the Qur'an and the traditions are graphically idyllic, in no way lacking the enjoyment of sensuous pleasures and bountiful surroundings:

This is a Remembrance; and for the godfearing is a fair resort, Gardens of Eden, whereof the gates are open to them, wherein they recline, and wherein they call for fruits abundant, and sweet potions, and with them maidens restraining their glances of equal age. This is what you were promised for the Day of Reckoning; this is Our provision, unto which there is no end. (*sūrah* 38:50–54)

Interpreters of the Muslim tradition such as al-Ghazali (d. 1111) have called attention to the accompanying spiritual components of heavenly existence, viewing all other of the manifold pleasures of Paradise to be overshadowed by the ecstatic awareness of being with God. Equally graphic are the Qur'anic descriptions of punishment and torture in Gehenna, as indicated in the following passage:

All this; but for the insolent awaits an ill resort, Gehenna, wherein they are roasted—an evil cradling! All this; so let them taste it—boiling water and pus, and other torments of the like kind coupled together. (*sūrah* 38:55–58)

Traditional Islam adheres to a conviction that the sufferings in Hell will be unending, though there are suggestions of a purgatorial realm from which, after a time, Muslims in need of purificatory restitution to the *ummah* (the Muslim community) will be recovered. Both Heaven and Hell are subdivided into seven regions in Muslim teaching, with an eighth region added to the heavenly realm of the blessed.

**HINDUISM.** The religious symbolisms of heaven and hell as given expression in the religious traditions of India have a distinctive role and significance when contrasted with their multiple meanings within the contexts of the religions of West Asia and Western civilizations. The ancient Vedic liter-

ature (1500–1200 BCE), especially the *Rgveda* (a collection of hymns associated with funeral rituals), portrays a heaven regarded as the realm of the fathers, who proceed there after death in order to be with the gods. As the practice of the funeral rite of cremation gained prominence, Agni, god of fire, was called upon to provide for the purification of the deceased. Yama, who was the first human to die and who was also the god of the dead, oversees the heavenly realm. This realm was associated with the sky and the dead were associated with the stars. Among the gods in the heavenly realm is Varuṇa, god of the high-arched sky and a source of the order in the earthly realm. The welfare of those who have passed beyond death to heaven was associated with their participation in rituals, sacrifices, and offerings to the gods while on earth.

In heaven, the distinctiveness of personal identity is preserved, and, in close communion with the gods, those who have entered heaven enjoy the pleasures and goods they have known on earth, but in full measure. Priests and warriors were portrayed among those who enter the heavenly realm, though there was no comprehensive and systematic indexing of those who do and those who do not enjoy the goods of heaven. Though there is much ambiguity regarding human destiny in the literature of the earliest Vedas, there are suggestions that the fate of those who did not achieve a heavenly state (presumably because of a neglect of proper ritual participation, since no moral tests for entrance into heaven were suggested) is either extinction or relegation to a realm of darkness under the earth (hence, hell). In later elaborate ceremonial works, specifically the Brāhmaṇas composed primarily for the ritual performances of the priests, there was presented a more definitive characterization of heaven as an abode in which were experienced the joys and goodness of earthly existence, but greatly enhanced and without the limitations known before death. The quality of heavenly life was viewed as correlative with efficacious ritual performance on earth since association with the gods of sacramental ritual communion (Agni, Varuṇa, Indra, et al.) was assured. Hell was likewise presented as a realm of retribution for ritual deficiencies.

By the era of the rise of Hinduism proper (third century BCE), a quite different worldview had come to dominate the Indian scene, shaped fundamentally by the philosophical and religious ideas of the Upaniṣads (sixth to first centuries BCE). A cyclical worldview had been given sophisticated expression. The notions of transmigration and reincarnation informed a pervasive understanding of human existence as involving, in cyclic continuity, a series of lives, deaths, and rebirths and had come to dominate a comprehensive interpretation of human existence.

Heaven and hell came to be viewed not as a vision of ultimate fulfillment or destiny, but as intermediate states intermittent with a series of earthly existences in a cycle of births and deaths (*saṃsāra*). One's *karman* (Pali, *kamma*), the reservoir of the consequences of thoughts, words, and

deeds cumulative over the entire series of one's existences, determines the nature of the soul's passage from one earthly existence to another through one of the several levels of heaven or hell, which are thus intermediate states of varying degrees of suffering or relative bliss. In traditional Hindu cosmology, three realms (*lokas*)—heaven, the earth, and a netherworld (sky)—are supplemented by a vision of fourteen additional realms, seven of which rise above the earth ("heavens") and seven of which (or, in some instances, multiples of seven, such as twenty-one) are below the earth.

The goal of the continuing human pilgrimage was liberation and release (*mokṣa*) from the suffering associated with attachment to the samsaric cycle to the unqualified enjoyment and ultimate fulfillment of the bliss of *nirvāṇa*. *Nirvāṇa*, which is held to be resistant to definition but is accessible to experience, has been variously envisioned as the union of the soul (*ātman*) with the ultimate divine reality, *brahman* (Śāṅkara, eighth to ninth century CE, and the school of Advaita Vedānta), or as an unqualified communion of the soul with God (Rāmānuja, eleventh to twelfth century CE, and the school of Viṣṭadvaita). Such fulfillment was to be achieved by the spiritual discipline of one of the pathways (*mārgas*, *yogas*), or some combination thereof, of traditional Hinduism: *jñānayoga* (liberating wisdom), *karmayoga* (actions), *rājāyoga* (contemplative discipline), or *bhakti* (loving devotion, adoration of God, *pūjā*).

The twice-born castes (*brāhmaṇas*, *kṣatriyas*, *vaiśyas*) had fullest access to these pathways of spiritual practice, especially the first three pathways mentioned. The *bhakti* movements in Hinduism stressed a mode of religious life that involved devotional and ritual practices in which adoration was centered on one of the gods of Hinduism, primarily Śiva or Viṣṇu, or one of their *avatāras* (incarnations) or consorts. The rich corpus of Hindu religious literature provided an abundant resource for the edification and inspiration of *bhakti* devotees. The *Bhagavadgītā* (Song of the Blessed Lord; c. first century CE), a portion of the expansive epic *Mahābhārata*, portrays Kṛṣṇa (an *avatāra* of Viṣṇu, the "preserver") as worthy of a devotee's total devotion, while stressing the ideal of responsible yet disinterested action in the world. Some scholars hold that the importance of the *Bhagavadgītā* lies in part in its recognition of the legitimacy of *bhakti* as a pathway to liberation alongside of *jñāna*-, *karma*-, and *rājāyoga*. The other great Indian epic, the *Rāmāyaṇa* (c. fourth century BCE, with the first and last of seven chapters presumed to be later additions), portrays Rāma as another *avatāra* of Viṣṇu worthy of devotional adoration, the accomplished practice of which results in intermediate stays in one of the heavens until the perfection of the practice leads to the perfect bliss of unqualified and unendingly blissful adoration of and communion with God (*nirvāṇa*).

**BUDDHISM.** With the Hindu tradition Buddhism shares a cyclical view of history and of individual existence. The world of time and space and history, the realm of samsaric

cycles, is transitory and constantly in flux. Heaven and hell are seen as parts of that transitory world, as intermediate and temporary states between one earthly existence and another. Death is thus but a transition from one earthly existence through an intermediate level of one of the heavens or hells to rebirth in yet another earthly existence. The attachment of beings to the samsaric cycle, often referred to as the “wheel of existence” and characterized by *duḥkha* (suffering, unsatisfactoriness), is caused by *tr̥ṣṇā* (clinging, grasping, desiring) conditioned by ignorance (*avidyā*) of the Dharma, or the truth of the Middle Path as taught by the Buddha. Though *tr̥ṣṇā*, in the early Buddhism of India and the later Theravāda of Southeast Asia, is the ultimate cause of rebirth, one’s *karman* determines the type and level of rebirth. In this tradition, only the enlightened ones, the *arhats*, are free from the cycle of rebirths to enjoy the equanimity and the bliss of *nirvāṇa*.

The temporary aggregation of the components of ordinary experience (the *skandhas*: form, sensation, perception, dispositions and volitions, and consciousness, including self-consciousness) that prompt the presumption of separate person or self is dissipated at death following the experience of liberation (*mokṣa*). Short of enlightenment, there is no surcease of the continuous round of rebirths. The having-beenness of one life, with its repository of *karman*, leads to the coming-into-being of another life in another realm, though it is denied that any *ātman*, soul or self, as a separate entity transmigrates (known as the Buddhist teaching of *anātman*). Rebirth may occur in any one of the various heavens or hells, and one may be reborn as an animal, again as a human being, or in the *preta* realm, the realm of ghosts.

There is no one completely systematic account of the various hells in the Pali canon, the corpus of Theravāda texts known as the Tipiṭaka. Generally, the realm of *kāmaloka*, of the lower universe of sensuality, includes the various hells and the six lower heavens. The Pali Abhidhamma Piṭaka reports eight “hot” hells below the earth, each involving differing forms of suffering by which the consequences of bad *kamma* are consumed. In addition, there are sixteen minor hells attached to each of these hells. The duration of a passage through any one of these hells is not definitively established, each being correlative with the measure of the evil *kamma* to be consumed. Other Hīnayāna canons preserve more systematic and detailed cosmologies.

The structure of the heavenly realms in Buddhism draws upon non-Buddhist and Hindu sources, though they are reinterpreted within the Buddhist context. The six heavens of the sensual realm of *kāmaloka* are inhabited by the kings and gods who manifest their power through various forms of sensual experience. Included in this group is the Tuṣita Heaven, from which Gautama is said to have come upon entering his last earthly existence in which he experienced enlightenment, as well as the *bodhisattvas* of exemplary compassion and saving power.

The Buddhist heavens of the other two realms, *rūpaloka* (the world of form) and *arūpaloka* (the formless world, often referred to as the world of mind or consciousness), are accessible only by those accomplished in the practice of the discipline of meditation and spiritual endeavors. The heavens of *rūpaloka* are material and are inhabited by the gods who are free from sensual yearnings. They are variously numbered in different lists, in some texts enumerated as thirteen while in other texts listed as being from sixteen to eighteen, distributed in four different groups correlative with four *dhyānas* (modes of meditation). The heavens of *arūpaloka* are likewise structured in four groups, each characterized by stages or levels of meditative attainment. For Buddhism, life in the heavenly realms is not free from involvement in the conditioned existence of samsaric cycles. The ultimate goal of enlightenment and fulfillment transcends even the highest of the heavens.

The *bodhisattva* motif of Mahāyāna Buddhism qualifies the ideas of both heavens and hells in the Buddhism of the “large vehicle.” The *bodhisattvas*, moved by compassion for all beings involved in suffering (*duḥkha*), are beings who have taken a vow not to enter *nirvāṇa* until all sentient beings can do so. They are able to manifest themselves through diverse forms and beings and in any of the realms in which there are suffering beings, even into the depths of the lowest hell, to share their merit with all who are in need of liberation and enlightenment.

In no movement of the Buddhist traditions is this emphasis on the saving power of *bodhisattvas* and Buddha figures more vividly expressed than in the Pure Land schools of China, Korea, and Japan. Central to this popular Buddhist movement is the figure of Amitābha (Chin., O-mi-t’o-fo; Jpn., Amida), a Buddha who has gained inexhaustible merit through countless ages of Buddhist practice and who, as a consequence, possesses infinite saving power dedicated to the salvation of all. This Lord of the Western Paradise responds beneficently to all who invoke his name, assuring them of both protection in earthly life and passage at death to the Land of the Western Paradise, whence their full enlightenment and entry into *nirvāṇa* is assured.

The quest for immortality had developed in Chinese religious Daoism; and with its associated belief in heavens, it made for fruitful interaction with Chinese Buddhism of the Pure Land. A notable figure who did much to extend the influence of Pure Land Buddhism in China was Tanluan (c. 488–c. 554) who had turned to this form of Buddhism after an extended Daoist search for the elixir of immortality. All mortals, he held, could be assured of salvation by faith in Amitābha, given expression through the recitation of his name, thus relying on his saving power.

The dominant Pure Land schools of Japan, the Jōdoshū, founded by Hōnen (d. 1212), and the Shinshū, formed by followers of a disciple of Hōnen, Shinran (d. 1263), attest to the wide appeal of this form of Buddhism, with its inviting vision of the Western Paradise. Pure Land texts, especially

*Saddharmapuṇḍarīka* (Jpn., *Hokekyō*) and the *Sukhāvativyūha*, contain graphic and imaginative descriptions of the Western Paradise: a bountiful land without pain or suffering; abounding in pleasure and beautiful natural surroundings, with flowing rivers and lotus-filled lakes, permeated by pleasant music, adorned by exquisite gems, and where neither a notion of nor a word for hell is to be found.

**CHINESE TRADITIONS.** The aspiration to achieve harmony in society that has characterized all of Chinese religion and philosophy has given to Chinese understandings of heaven a unique aspect. Rooted in the most ancient traditions of China, the worship of Heaven as well as the ruler of Heaven, Shangdi, is evident as early as the Shang dynasty (1532–1027 BCE). During the period of the Zhou dynasty (1027–256 BCE) the worship of Heaven, Tian, was regarded as essential for the maintenance of harmony between Heaven and earth. It is in the Confucian tradition, which formatively shaped the essential character of Chinese civilization through many centuries of relative stability, that a sophisticated articulation is found of the nature and place of Heaven.

Although Confucius's teachings and the Confucian tradition advocated the quest for harmony in human affairs, especially through the five relationships (ruler-subject, father-son, husband-wife, elder brother-younger brother, and friend-friend), as the way to perfect harmony in the cosmos, there is no doubt that basic presumptions regarding Heaven provided an ontological ground for the moral teachings to be manifest in the perfection of the *junzi* (sage, ideal gentleman). The focus was placed on human affairs; human beings should begin by seeking harmony in the relationships that immediately address them. Yet the underlying conviction was that if harmony is achieved in human affairs, harmony with Heaven will be assured. Thus, the full practice of *li* (tradition, propriety) informed by *ren* (human beings in relationship with each other) in the spirit of *shu* (reciprocity) along with the honoring of *xiao* (filial piety) will manifest the kind of *de* (perfect moral virtue and power) that is the ideal of the *junzi*. This is, for Confucianism, the way (*tao*) of Heaven in human affairs, and the very nature and structure of the cosmos as determined by Heaven is such that all will be well if ruler and subject both revere and follow (i.e., practice) this way. Thus, though it appears that the thought of Confucianism can most accurately be characterized as primarily a social ethic, there are nonetheless cosmic and ontological dimensions grounded in its notion of Heaven. The will of heaven (*tianzhi*) is the primary reality and the ultimate basis of Confucian thought. Whatever happens that is not the direct responsibility of human beings is attributed to the will of Heaven.

Unrestrained speculation about the nature of Heaven was not characteristic of Confucian thought, as evidenced in the texts of the Four Books, that is, the *Lunyu* (Analects), the *Daxue* (Great Learning), the *Zhong yong* (Doctrine of the Mean), and the *Mengzi* (Book of Mencius). In certain passages it does seem to be presumed that Heaven is an imper-

sonal force underlying the cosmos, the ultimate source of order and morality. Yet in other passages Heaven is presumed to have the capacity to understand the plight and situation of human beings, indicating a seemingly personal dimension to heaven.

Though Confucian thought was not inclined to speculate about Heaven as a destiny awaiting human beings beyond death, its emphasis on the centrality of the family afforded a natural sympathy with ritual practices of ancestral reverence. Propriety in honoring the ancestors, whose spirits survived death and whose welfare was reciprocally related to that of living persons, became an essential component of *li*. As indicated earlier, both Buddhists who presided over masses for the dead and religious Daoists in China subscribed to a cosmology that included levels of heavens above and hells below the earth.

**JAPANESE TRADITIONS.** There are, in indigenous traditions of Japan, concepts analogous to those of heaven and hell in other religions. The oldest traditions recorded in the *Nihongi* and the *Kojiki* contained only nascent suggestions concerning the possibility of life beyond death, though this itself was associated with the grave. Following the sixth century, Chinese and Buddhist influences contributed to further development of religion in Japan. References are made to a realm beneath, one term for which was Yomi (literally, "darkness"). Though characterized as an undesirable realm from which beings threaten the welfare of the living, it is not clear that it is a repository of the dead. Gods dwell there, but they represent negative powers of death and disease. Later Yomi came to be conceived as a realm of punishment. More definite in later Japanese texts are the notions about a realm analogous to heaven, Ame. This is the dwelling place of the gods, and notable persons are thought to proceed there after death. Ame is a bounteous realm above the earth, made attractive by the presence of trees, flowers, and streams; its beauty is beyond anything known on earth. The importance Ame came to have is underscored by the tradition that Amaterasu, the sun goddess, visited there as well as Izanagi after his failure to recover his wife, Izanami. Japanese Buddhism shared as well the normative Mahāyāna visions of various levels of heaven and hell as intermediate states.

- HEAVEN'S GATE**, a small American UFO cult, achieved worldwide notoriety in March 1997 when the leader and his thirty-eight followers committed mass suicide in Rancho Santa Fe, California. The bodies, dressed in black uniforms and covered with purple shrouds, were found lying on bunk beds and mattresses throughout the group's seven-bedroom mansion. The suicides had been carefully planned, and law enforcement investigators found no evidence of violence or coercion. After ingesting barbiturates and alcohol to induce drowsiness, the members had pulled plastic bags over their heads and suffocated as they fell asleep. Once free of their human "containers," they expected their souls to be lifted up to a spacecraft that would take them to a physical heaven, the Level above Human. There they would be given new androgynous bodies and assume the task of guiding the evolution of life on other planets throughout the universe.
- ORIGINS.** The leader of Heaven's Gate, a sixty-six-year-old man named Do, claimed to be God's sole representative on the planet. Originally he had shared leadership with a woman, Ti, but she died of liver cancer in 1985. Ti and Do met in Houston, Texas, in 1972. Ti, whose given name was Bonnie Lu Nettles (b. 1924), was a registered nurse and a student of metaphysics, including Theosophy. Do, then Marshall Herff Applewhite (b. 1931), was a former music professor and lapsed Presbyterian.
- Applewhite had lost two university teaching positions because of problems stemming from confusion over his sexual identity. In 1965 he was dismissed from the University of Alabama and divorced by his wife following a homosexual affair with a student, and in 1970 he was fired from Saint Thomas University in Houston after his fiancée, a female student, attempted suicide when he broke off their engagement. Applewhite lamented his inability to form a lasting relationship, and though yearning for a soulmate to help him achieve his potential, he contemplated renouncing sexuality altogether.
- Shortly after the Saint Thomas incident, Applewhite began having visions, including one in which he was told

that he had been chosen for a Christlike messianic role. It was during this period that Applewhite met Nettles. Still active in theater circles, Applewhite offered her an exciting escape from an unhappy marriage, and she gave him the confidence and metaphysical knowledge he needed to begin making sense of his experiences. Believing they had known each other in a previous lifetime, they immediately formed an intense, though platonic, relationship, which led to the breakup of Nettles's marriage.

Early in 1973, Applewhite and Nettles left Houston, hoping to free themselves from worldly commitments in order to discover why God had brought them together. The answer came in a revelation six months later: They were the "two witnesses" in *Revelation* 11 who, after being martyred, would resurrect and ascend to heaven in a cloud. Like Jesus, they had come from the Kingdom of Heaven to show humans how to achieve eternal life, and like Jesus they would return in a spacecraft. Jesus had failed in his mission, so Applewhite had been sent to try again, this time with a helper because of the negativity on the planet, which was controlled by Satan.

To become eligible for membership in the Next Level, humans would have to follow the same path Applewhite and Nettles had taken by shedding their attachments to the human level, including their sexuality. The overcoming process would initiate a biological transformation of their bodies that would be completed upon reaching the Next Level, where they would become immortal, androgynous beings. Paradoxically, in light of the mass suicide to come, Applewhite and Nettles claimed that seekers had to board the spacecraft in living, physical bodies. Death would ensure another incarnation as a human.

In April 1975, after much fruitless proselytizing, Applewhite and Nettles recruited twenty-four followers in Hollywood, California. Now with a flock, they called themselves Bo and Peep. Their new group came to be known as Human Individual Metamorphosis (HIM), referring to the transformation of the body brought about by the overcoming process.

Bo and Peep began presenting their message in public meetings, and by the end of 1975, they had over two hundred followers. Most were young, single spiritual seekers with weak attachments to conventional institutions, although some had left families, homes, and careers. Typically they vanished abruptly within days of hearing the message, disappearing so completely that even private detectives were unable to find them. The disappearances made national headlines, and syndicated news stories about HIM appeared sporadically for several months.

**FROM HIM TO TOTAL OVERCOMERS ANONYMOUS.** The group reached its maximum size in the fall of 1975, but membership declined rapidly because the defection rate was high and fewer people were joining. Early in 1976, with about one hundred members remaining, Bo and Peep

stopped recruiting, and the media lost interest in HIM. Bo and Peep inaugurated a new phase called the Classroom, which they compared to astronaut training. Less committed "students" were encouraged to leave, and late in 1976 nineteen were expelled. Bo and Peep changed their names again, this time to Do and Ti, with Ti's name spoken first, indicating her superior position in the "chain of mind" connecting the students with the Next Level.

The Classroom coupled extreme isolation with demanding discipline. Moving every six months, the Class initially lived in remote campgrounds, and later in expensive suburban neighborhoods. Isolation from humans was virtually complete during the camping phase because the Class was supported by a student's trust fund, but members remained insulated even after moving into houses. In 1978, forty-eight members moved into a single house, or "craft," without their neighbors' knowledge. Only certain students were allowed outside and "intercepts" were designated to greet visitors. After the trust fund ran out, some students got jobs waiting tables and doing computer work, but they maintained their distance from other people by identifying themselves as members of a celibate religious order. Not until 1982 were students allowed to call home. Some eventually visited their families, but they divulged few details about their activities and never revealed the group's location.

Everyday life was governed by strict schedules and procedures. The most demanding routine required students to check in throughout the day at a central location in staggered eleven-minute intervals. Arriving two at a time, they would stand prayerfully for one minute, then go back to their business, returning eleven minutes later, and so on until bedtime. This discipline was practiced, with occasional breaks, for months at a time. Procedure manuals prescribed the most mundane activities, from shaving to buttering bread, and each student was assigned a "check partner" to make sure the rules were followed. To help eliminate their humanness, sex and private property were forbidden, and except when sleeping or engaged in "out-of-craft tasks," students wore hooded uniforms that concealed their faces. Lingering human traits were addressed in slippage meetings, a form of mutual criticism. During free periods students studied astrology, worked puzzles, and watched television game shows to exercise their minds. Every night students took shifts scanning the heavens for UFOs.

Early in the 1980s, Ti and Do realized that their students were not, as they had thought, humans who would physically change their bodies into Next Level vehicles. Instead they were members of the Kingdom of Heaven who were temporarily occupying human vehicles for a training mission, which included exemplifying celibacy for humans. This new understanding helped cushion the blow when Ti died of cancer in 1985. Do explained that Ti, having completed her task of getting him started on his mission, had left her vehicle and returned to the Next Level, where she received a new body, like changing clothes. The separation of

self and body escalated in 1988 when Do broached the idea of castration as a way for the males to eliminate the sexuality of their vehicles. Eventually eight men, including Do, had themselves castrated.

In 1988 the Class tentatively resumed proselytizing by mailing a statement by Do to UFO experts and New Age centers. Do elaborated on his belief in Satan by describing a "Luciferian" army of evil space aliens pitted against the Next Level. Subsequent videotapes produced by the Class expanded on Lucifer's activities and announced that the end-time was approaching. But not until 1992, in a *USA Today* advertisement warning that earth's civilization was about to be "spaded under," did the Class stress the urgency of the situation. In 1994 the Class, with only twenty-six students remaining and now calling itself Total Overcomers Anonymous, embarked on a series of sixty-four public lectures to present the message one last time. The group doubled in size, but most of the newcomers dropped out within a few months.

**THE SUICIDES.** Discouraged, Do grew increasingly concerned about Luciferian interference with his mission. After the 1993 assault on the Branch Davidian residence near Waco, Texas, Do worried that the Class might be under government surveillance, so he moved his students to New Mexico, where they began building a fortified compound. However, the project was never completed, and Do began sending students to other countries in an unsuccessful attempt to find a more compatible location for the Class. Proselytizing continued over the Internet, but the main response was ridicule, and Do admitted to growing weary of his mission.

In this context, the Class began discussing the possibility of "exiting" their vehicles, as Ti had done. The discussion was hypothetical at first, but it turned serious in September 1994 when Do asked the students how they would feel about leaving their bodies if this required nothing more than drinking a pleasant-tasting liquid and falling asleep. A few balked, but only one left the Class. In 1996 the Class began posting messages on its website that strongly implied that suicide was imminent. Erroneously, Do had come to believe that, like Ti, he was dying of cancer, and in November the Class liquidated nearly all its possessions.

By 1997 the number of students had dropped to thirty-eight, all of whom would die by suicide along with Do. The Class, now calling itself Heaven's Gate, had rented a hilltop mansion in Rancho Santa Fe, a wealthy suburb of San Diego. While several students still worked at out-of-craft tasks, many now worked "in-craft" for the group's web design business, Higher Source. Neighbors were generally unaware that a religious group lived in the house, and the few outsiders who became acquainted with the students described them as friendly, but reclusive.

Finally, in March, a flashing "RED ALERT!" was added to the group's web page announcing that the moment of departure was imminent. Although the medical examiner was

unable to determine exactly when the suicides began, they appear to have started on March 23, the day after the Hale-Bopp comet—the brightest of the twentieth century—made its closest approach to earth. Do had concluded that Ti was coming back in a spacecraft concealed behind the comet's tail. Given Do's belief that he had been sent to complete the task assigned to Jesus, it may be significant that Easter, symbolizing Jesus' departure, was just seven days away.

Consistent with the group's meticulous attention to detail, the suicides followed a written plan. While some details remain unclear, it appears that the deaths took place over a three-day period, and that Do was among the last to die. In a videotape made just before the suicides, the students overflowed with gratitude toward Ti and Do, relieved and excited to finally be leaving their human containers for the Kingdom of Heaven.

**THE AFTERMATH.** As the largest mass suicide on American soil, the deaths triggered sensational headlines around the world. Most ex-members were shocked by the suicides because only a few were aware that their former classmates no longer believed that a physical body was required to enter the Next Level. Subsequently two ex-members took their lives in hopes of joining the Class aboard the spacecraft, bringing the death toll to forty-one. Although a few ex-members continued to believe that Ti and Do had come from the Next Level, none expressed any desire to carry on the Class. Only another Representative from the Next Level could do that. In their minds, Heaven's Gate ceased to exist when Do and his students exited their vehicles.

## HECATE SEE HEKATE

**HEDGEHOGS.** In the myths and legends of Inner Asia and eastern Europe, the hedgehog enjoys considerable respect because of its amazing wisdom. It is often described as being superior in wisdom even to the apparently omniscient God. Moreover, the hedgehog is sometimes a culture hero, instructing people in the various arts of life such as fire making, agriculture, and marriage customs.

In several cultures, the hedgehog has been thought wise enough to have assisted God in his work of creation. As a Romanian cosmogonic myth tells it, during creation the earth had spread out so far that there was no more room for the waters. God did not know what to do, so he sent the bee to the hedgehog, the wisest of all animals, to ask advice. It refused, however, to help, giving the excuse that God was all-knowing. The bee, knowing that the hedgehog is in the habit of talking to itself, stole back up to it and heard it murmuring, "God does not know that he must create valleys and mountains in order to make room for the waters." The bee hurried back to God with this advice, enabling him to complete his creation. Bulgarians have similar stories. In a Lettish version, God himself tells the hedgehog of his cosmogonic dilemma and obtains advice from it. To reward the hedgehog, God gives it a coat made of needles.

The Buriats have preserved a story about how the Lord of the Earth once visited Khormusta Tengri, one of the gods of heaven. On leaving, the Lord of the Earth begged for the sun and the moon as presents. Hospitality did not allow Khormusta Tengri to refuse, so the Lord of the Earth took the lights of the sky with him and shut them up in a box. The whole universe became dark. Distressed, Khormusta Tengri turned to the hedgehog. Using its profound wisdom, the hedgehog was able to return the sun and the moon to their heavenly orbits. In another Buriat version, the two divine beings are Kān-Čurmasan and Lusat, god of the ocean, with the hedgehog playing the same role.

According to the Buriats, fire making originated with the hedgehog. In the beginning, neither gods nor humans

could make fire; only Hedgehog, who was then a human being, could. One day, a crowd gathered around Hedgehog to hear the secret of making fire. But the young girls, seeing his strange shape, began to laugh, and this angered him so much that he decided to tell his secret only to his wife, and even then only under a promise of silence. But the hawk overheard him explaining the secret and told it to the gods. From the gods humans in turn learned the art of making fire. Later, the descendants of Hedgehog were transformed into hedgehogs. Similar stories are known among some eastern European peoples: According to the Udmurts and the Mari, it is the hedgehog that showed humans and animals how to make fire using stone, steel, and tinder. They also say that the hedgehog instructed people in using the iron plow to till the soil.

The idea that the hedgehog is a clever animal is still alive, too, in the folklore of western Europe. A German folktale tells of a race between the hedgehog and the hare from which the hedgehog, by a trick, emerges victorious.

MANABU WAIDA (1987)  
*Revised Bibliography*

**HEGEL, G. W. F.** (1770–1831), was a German philosopher, the culminating figure in the philosophical movement known as German Idealism. Born in Stuttgart, Georg Wilhelm Friedrich Hegel was given a thorough grounding in the humanities, with strong emphasis on literature and history. From his earliest years he was keenly aware of the cultural disintegration of western Europe—moral and religious, sociopolitical, and intellectual. He felt strongly that he was called to be a scholar and educator who would contribute to the reintegration of German culture, initially through emphasis on religious renewal. Thus, in 1788 he was enrolled in the Lutheran seminary at Tübingen, where, from 1788 to 1790, he studied philosophy and, from 1790 to 1793, theology. From this he turned to political thinking, seeking to analyze the moral prerequisites of an authentic political society. Finally he became convinced that only as a philosopher could he secure the intellectual underpinnings necessary for religious and sociopolitical renewal. From 1793 to 1796 he served as private tutor in Bern, Switzerland, and from 1797 to 1801 he filled the same position in Frankfurt am Main,

Germany. In 1801 he moved to Jena, where he defended his dissertation (*De orbitis planetarum*) and began his professional career at the university.

In 1807 Hegel's first major work, *Phenomenology of Spirit*, was published, and he began a short-lived career as a newspaper editor in Bamberg. From 1808 to 1816 he held the post of director of a *Gymnasium* (secondary school) in Nuremberg, where he published his second major work, *Science of Logic*. In 1816 he was named professor of philosophy at the University of Heidelberg, where, in 1817, he published his third major work, *Encyclopedia of the Philosophical Sciences* (2d and 3d eds., Berlin, 1827 and 1830). In 1818 he was appointed professor in Berlin, where he remained until his death in 1831. The last work by Hegel to be published during his lifetime was *Philosophy of Right*, which appeared in 1821. The bulk of his writings—on art, religion, history of philosophy, and philosophy of history—were published posthumously, based on a combination of his lecture notes and notes taken by his students.

**UNDERSTANDING HEGEL.** It can safely be said that no major figure in the whole of Western philosophy has been more difficult to understand than Hegel; indeed, to understand him is the task of a lifetime. The reasons for the difficulty are many, but they can be summed up, generally, as five: his encyclopedic vision, his enormous erudition, his language, his dialectical method, and his extraordinarily systematic thinking.

**1. Encyclopedic vision.** In a certain sense Hegel's intellectual quest is a continuous act of faith in reason. He seeks to articulate this faith in such a way that reason itself validates its claim that no truth is recalcitrant to it—not in the sense that human reason can, as merely finite activity, discover all truth, but in the sense that given truth, reason can comprehend the rationality of it, that is, the rational necessity underlying even existential contingency. As Hegel sees it, reason is truly reason only if it is ultimately absolute and infinite, that is, if it is absolute Spirit. This absolute Spirit, conceived as concretely real and not as some vague abstraction, will be seen to be God. Human reason is, it is true, finite, but it is reason at all only insofar as it is a sharing in infinite, divine Spirit, whose object is the infinite totality of reality.

**2. Enormous erudition.** Hegel's was a lifetime of intense and insatiable intellectual curiosity; he was not only an omnivorous student but also one who thoroughly enjoyed every intellectual challenge he met, one who did not, however, indulge in intellectual games. What he sought was a knowledge that is not only true but that truly makes a difference in life—not truth simply for its own sake but for the sake of life. He was not a mere technician in the handling of concepts but a thinker who sought rational grounds for a way of life, not merely an intellectual life but a life that is moral, religious, social, and political—in short, authentically human.

**3. Language.** Hegel uses a language that is both allusive and elusive; he uses language to say what only pure thought

can think, and in so doing he stretches language, perhaps beyond its limits, refusing to let grammar be a straitjacket. One must be careful not to read Hegel in such a way as to take his meaning to be what the reader would mean if he or she said the same.

**4. Dialectical method.** Hegel claims that he has not arbitrarily chosen to think and speak dialectically, but that the dynamic character of reality itself demands just this method of dynamic thinking. At the very beginning of his *Science of Logic*, he affirms that to think at all is to think being, but that to think being necessarily entails thinking its opposite, nonbeing, and that to think the relationship between being and nonbeing entails thinking becoming. If is added to this the basic Hegelian contention that what truly rational thought cannot but think to be true cannot but be true, one comes to the conclusion that reality is necessarily dynamic and can be thought truly only in a thinking that is dynamic. Incidentally, the oft-repeated description of the Hegelian dialectic in terms of thesis, antithesis, and synthesis is not Hegel's own description, and in fact is not part of Hegel's mature vocabulary at all.

**5. Extraordinarily systematic thinking.** The comprehensive grasp of any truth implies, for Hegel, the whole of truth; similarly, an adequate grasp of anything Hegel says demands a comprehensive grasp of all he says, which makes for enormous difficulty of comprehension. Strictly speaking, no work by Hegel can be comprehended simply by itself. To understand *Phenomenology of Spirit*, one must see it as an application of the dynamic methodology elaborated in *Science of Logic*, and the latter must be read in light of the progressive development of rational thinking traced in the former. When he writes of morality, of law, of social-political structures, of art, religion, or philosophy, all must be situated in the framework of the systematic structure articulated in *Encyclopedia of the Philosophical Sciences*. Whatever is to be understood must be understood in the dynamic matrix of historical development.

**HEGEL AND RELIGION.** With the difficulty acknowledged of coming to grips with the complexities of Hegel's highly intricate thought patterns, it remains true that no modern thinker has had more influence than Hegel—and that influence is on the increase—on moral, legal, social-political, aesthetic, religious, and philosophical thought. This article confines itself here, however, to Hegel's influence on subsequent religious and theological thinking—both Catholic and Protestant. It is important to note in this connection that, for Hegel, religious consciousness, a uniquely human phenomenon, has characterized human society as far back as any records will take us, and that it has borne eloquent testimony to the progressive sophistication of human consciousness of the divine, known in Hegel's writings as the Absolute.

Historically speaking, that consciousness has manifested itself, initially in its most primitive form, in the deification of the cosmic forces of nature, with mounting refinement through efforts on the part of humankind to portray the di-

vine in plastic, mythic, and poetic form, culminating in what it sees as “absolute religion,” or “religion of revelation,” in which God, the absolute Spirit, reveals himself to the human spirit by taking on human form. Clearly Hegel has in mind here the Christian religion, which he calls, in fact, in his *Lectures on the Philosophy of Religion*, “absolute religion.” It should be noted, however, that, for Hegel, in every form of religion, even the most primitive, religious consciousness is more than a projection on the part of humanity of human ideals; in every form it is a self-manifestation—a self-revelation—of the Absolute, which is spirit and only spirit.

For Hegel, then, religion and revelation are inseparable, but revelation can take progressively more adequate forms—remembering, of course, that in all its forms it is revelation to humankind as thinking spirit. Thus God reveals himself to humankind in nature, but only if humans think of nature in such a way as to receive the revelation. By the same token God reveals himself not only to but also in finite spirit, provided that humans see in finite spirit the necessity of infinite Spirit. God, moreover, speaks to humanity in the words of scripture, not so much, however, in the words themselves as in the story the words tell.

Thus, when Hegel speaks, as he does in *Phenomenology of Spirit*, of a “spiritual interpretation” of Christian teachings—an interpretation sometimes confused with “demythologization”—he is saying that if what revelation says of God is true, grasped as true through the mediation of the inner light of the Spirit, then what it affirms to be true is necessarily true, and this truth can be articulated in reason. Then God speaks to humankind not only in words but in person, in the person who is the Word. Finally, God speaks to humankind in the person of the Spirit who dwells in humans—in the community of believers and in the individual believer. To find where Hegel says all this one must turn chiefly to his *Phenomenology*, chapter 7, “Religion”; to his *Encyclopedia*, part 3, section 3, “Philosophy of Absolute Spirit” (with “additions”); to his *Lectures on the Philosophy of Religion*; to his *Lectures on Aesthetics*; and to his *Lectures on the Philosophy of World History*.

Here it is important to come to grips with the Hegelian concept of the “objectively rational.” When the human spirit affirms what God has revealed, it affirms what is not only true but also necessarily true, even though the affirmation has not been arrived at as the result of a strictly rational (or logical) process of thinking. Thus, what is affirmed is objectively rational. Hegel’s further contention is, however—and this is where he meets the greatest opposition—that given the truth of what is revealed, human reason can see the rational necessity of it. Whatever is true of God is necessarily true, and thus there can be no contradiction between what reason sees and what religion believes, even though it may well be that reason will not see it until faith presents it. Thus, God’s being and God’s activity are identical, the latter as necessary as the former, without prejudice to God’s freedom, that is, his absolute self-determination.

It can be seen from what has been said thus far that Hegel is far more interested in the object of religious affirmation than he is in the subjective character of the affirmation. Nor is he concerned with the affirmation simply as an intellectual act: Much more his concern is with the response of the whole human person to God, who is truth. Nevertheless, he contends that the response is adequately human only if it proceeds from what is most characteristically human in humankind, that is, reason, but not reason conceived in narrowly “rationalistic” terms. Here it is that Hegel has frequently been accused of making the religious relationship far too rational, of being panlogistic, if not pantheistic, of allowing religion to be swallowed up in philosophy. It is true, of course, that he does say that art presents the Absolute in the form of the sensibly perceptible, that religion represents the Absolute in the form of imaginative thinking, and that philosophy renders the Absolute present in its most proper form, that of pure thought, but it remains to be seen whether this, in fact, either dilutes the religious response or renders it no longer religious.

Whether or not Hegel succeeded in what he set out to do is a question that has elicited a variety of answers—depending for the most part on the predispositions of those who seek to answer the question. It scarcely seems open to question, however, that what Hegel intended was not to cancel out either the revelation in which absolute truth is presented, or the faith in which it is received, or the religious life that is consequent on both. When “speculative philosophy” thinks out the content of religious consciousness, philosophy does not supplant religion; it completes religion by thinking its content in the form most proper both to its exalted object and to the human subject, who is essentially rational. As Hegel sees it, it is absolute Spirit that bears witness in the human spirit to absolute truth, whether that be the truth of religion, of morality, of law, or of philosophy. Not only need not every believer become a philosopher, but the philosopher need not—must not—abrogate the faith that is at once the necessary precondition to and the constant underpinning of philosophical reflection.

Although it is true that in the final chapter of his *Phenomenology* Hegel sees “absolute knowing” as the culmination of human spiritual development, this affirmation must be seen against the backdrop of his contention that all human knowledge of truth is the work of absolute Spirit bearing witness in finite form to infinite truth. What philosophy can do, then, is to recognize that the presence of truth—even particular, finite truth—bespeaks the witness of absolute Spirit in human thinking. Both religion and philosophy are finite human activities, but they are more than that; because these finite activities ascend (are elevated) to the infinite object who is God, they are infinitized in the communion of the human and the divine.

Here it is important to emphasize the moral dimensions of Hegel’s thought. Whether the ascent of the human spirit to God be religious or philosophical or both, neither mere

intellectual interest nor fascination with the wonders of nature, nor awe before the extraordinary capacity of the human mind to think, will trigger that ascent; the orientation of the human spirit to God, the Absolute, will be effectively realized only if that orientation coincides with the striving toward moral goodness, in which alone the self-realization of the human spirit can be accomplished. For Hegel thought is not thought in the fullest sense if it is not oriented to the good, not merely in the sense of good thinking but, more importantly, in the sense of good living: It is, he contends, irrational to be immoral. God, then, is the ultimate goal of moral striving, not, it is true, as some vague, indeterminate “moral order” of the universe, but as the concrete, personal foundation for all moral order. Thus, there will be no religion in any significant sense where there is no longing for moral goodness that leads to religious consciousness of God as fulfillment of that longing. This, in turn, ultimately demands that the orientation be not merely emotional, even though knowing God is inseparable from an emotional response to the God who is known, the one God of both religion and philosophy.

**HEGEL AND “HEGELIANISM.”** It would be misleading here not to acknowledge that there has been and continues to be considerable dispute among scholars as to whether Hegel quite literally intended that absolute Spirit, which he sees as the concrete unified source of all thought and of all spiritual activity, and absolute Idea, the unified concrete object of all thought, should be identified with the God of religion. In addition, there has been and continues to be dispute as to whether, no matter what Hegel intended, the God of whom he speaks can legitimately be identified with the God of Christianity. All disputes aside, however, if one is to take Hegel at his word, he quite clearly says that because there is only one God, then the God of philosophy and the God of (Christian) religion are one and the same—if not, then the God of philosophy would be but an abstract God, that is, no God at all.

As late as 1830 (shortly before his death), in the preface to the third edition of his *Encyclopedia*, he indulges in one of his few emotional outbursts against those who take it upon themselves to say that he is not Christian. He also says quite clearly in more than one place that if philosophy is to be true to its vocation, it cannot fail to be theology. Thus, for Hegel, there is no area of philosophical thought that does not have as the goal of its striving the Absolute, or God—not so much, however, as simply an object of contemplation but, more significantly, as an ideal for will, where the ideal is conceived as concrete, personal Spirit. Thus, because philosophical thinking is the activity of the human spirit, the subject matter of philosophy is not, properly speaking, God as transcendent object; rather it is the human spirit in its intimate relation to divine Spirit, without which the former cannot realize in itself all that it is to be human.

It thus becomes impossible to speak in any precise way of the concept of “Hegelianism.” There is a Hegelian con-

tent, call it “absolute idealism” (an idealism oriented to and rooted in the Absolute); and there is a Hegelian method, call it “systematic dialectic.” Those who came after Hegel and were influenced by him can be classified in three groups: Hegelians of the right, of the left, and of the center. To be “Hegelian” at all was to employ to a greater or lesser extent Hegel’s method. The divisions concern the content of Hegel’s thinking and focus primarily on the interpretation of his religious thinking: The “left,” rejecting all that he has to say about God and, above all, about the person of Jesus, makes do with the method, more or less loosely employed; the “right” employs the method to articulate Christian belief; the “center” does the same as the “right” but interprets Hegel’s language in more or less metaphorical ways. The lasting (and growing) influence of Hegel, however, cannot be encapsulated in facile catchphrases.

#### BIBLIOGRAPHY

All the titles of works by Hegel pertinent to his philosophy of religion have been translated into English and are readily available. The most detailed presentation in English of the whole body of Hegel’s thought is Charles Taylor’s *Hegel* (New York, 1975). An extended treatment of the philosophy of religion is contained in Raymond K. Williamson’s *An Introduction to Hegel’s Philosophy of Religion* (Albany, N.Y., 1984). A comprehensive overview of Hegel’s system, emphasizing his focus on God as absolute Spirit, can be found in my book *Hegel’s Concept of God* (Albany, N.Y., 1982). See also Emil L. Fackenheim’s *The Religious Dimension in Hegel’s Thought* (Bloomington, Ind., 1967), an extraordinarily sympathetic account of Hegel’s religious thought by one who shares neither his religious convictions nor his theology. For a convincing portrayal of Hegel’s early thinking, foreshadowing the developed themes of his more mature thought, see Henry H. Harris’s *Hegel’s Development: Toward the Sunlight, 1770–1801* (Oxford, 1972). A landmark work portraying the nearly mystical in Hegel’s thinking is Ivan A. Il’in’s *Die Philosophie Hegels als kontemplative Gotteslehre* (Bern, 1946). For a theologian’s estimate of Hegel’s influence on contemporary theological thinking, see Wolfhart Pannenberg’s *The Idea of God and Human Freedom* (Philadelphia, 1973). A more specifically Christological approach is taken by James Yerkes in *The Christology of Hegel* (Albany, N.Y., 1983). The most extended commentary on Hegel’s *Phenomenology* is contained in Jean Hyppolite’s *Genesis and Structure of Hegel’s Phenomenology of Spirit* (Evanston, Ill., 1974).

QUENTIN LAUER (1987)

**HEIDEGGER, MARTIN** (1889–1976), was a German philosopher. Young Heidegger’s concern with the meaning of holy scripture was matched by his interest in the question of the meaning of being. Raised as a strict Roman Catholic, he studied for the priesthood for two years before deciding to pursue philosophy at the University of Freiburg. After receiving his Ph.D. in 1915, he stayed on at the university to work with Edmund Husserl, the founder of phenomenology. During the years 1916 to 1919, Heidegger came to

find Catholic dogma too rigid and moved toward liberal Protestantism. In the 1920s he appears to have abandoned his faith altogether, yet throughout his life he remained deeply involved with religious and spiritual issues. From 1923 to 1928, he taught at the University of Marburg, where he was a colleague of Rudolf Bultmann, Paul Tillich, and Rudolf Otto. Then he returned to Freiburg to replace the aging Husserl as professor of philosophy. In 1933–1934, while rector of the university, he openly supported National Socialism, but he soon changed his position and began challenging Nazi views in his classes. As a result, he was eventually declared expendable and was sent to work on the Rhine dikes. After World War II, he returned to Freiburg, where he spent the rest of his life teaching and writing as a professor of philosophy. Heidegger's thought can be divided into an early and a late phase. The late phase, the so-called turn, began in the late 1930s. This "turn" was not a radical shift in his thinking but rather the mature expression of insights he had voiced earlier.

**HEIDEGGER'S EARLY THOUGHT.** In his major work, *Being and Time* (1927), Heidegger claims that human existence, or *Dasein*, constitutes the temporal-historical clearing in which beings can manifest themselves, or "be." For Heidegger, being does not mean the metaphysical ground of reality, a role traditionally assigned to God, but instead the finite presencing or manifesting of entities as entities, as things that are. One's ability to use the word is shows that one understands the difference between being (presencing) and entities (things that present or reveal themselves). Because one is constantly understanding and interpreting what it means for oneself and other beings "to be," Heidegger concludes that human existence is essentially hermeneutical. Although one often understand oneself as a thing, such as an ego or thinking subject, Heidegger argues that humans are not things at all. Instead, they are the finite openness in which things, such as subjects and objects, can first manifest themselves, or "be." Each person must decide how to be this openness, whether inauthentically or authentically. As inauthentic, human *Dasein* conceals the fact that it is mortal openness and interprets itself as an enduring thing, like an ego or a soul. Yet, the mood of anxiety can at any time reveal that *Dasein* is not a thinglike substance, but instead finite openness for the being of beings. This revelation invites *Dasein* to halt its flight into distractions and roles that conceal who *Dasein* really is. In the moment of authenticity, *Dasein* resolves to undergo a radical change in its temporal openness. As a result of this change, *Dasein* no longer understands itself as an ego bent on avoiding death, but instead as a finite individual called on to take responsibility for its own limited possibilities and to act in concert with others to promote the community's heritage. Authenticity, then, is not merely a personal matter, but an event that aligns one with the destiny of one's people. For Heidegger, authenticity is a prerequisite for genuine philosophical understanding of being. Influenced by Augustine, Pascal, Luther, Kierkegaard, Dostoevskii, and Nietzsche, he maintains that theoretical knowledge must be

rooted in the personal experience of authentic human existence. Only such experience promotes the fulfillment of Western philosophy: to understand the being of beings.

**HEIDEGGER'S LATER THINKING AND ITS IMPACT ON THEOLOGY.** In *Being and Time*, Heidegger approaches being by analyzing the being (human *Dasein*) who understands being; in his later works, however, he approached being in other ways. For example, he meditated on the role played by language in the self-revealing, or being, of beings. Moreover, he no longer spoke of authenticity in voluntaristic terms, such as "resoluteness," but instead described it as "releasement" (*Gelassenheit*) from will, ego, and subjectivism. This turn in his thinking, which took on a mystical element influenced by Meister Eckhart, revealed new possibilities for a dialogue between philosophy and theology. The idea of releasement, for instance, has clear affinities with the Christian doctrine of grace. Heinrich Ott, a student of both Rudolf Bultmann and Karl Barth, was one of the first to point out the theological implications of Heidegger's later thought. Although the analysis in *Being and Time* of human *Dasein* had been inspired in part by Barth's work on the apostle Paul, Barth rejected Heidegger's philosophy because it overemphasized human understanding and did not properly address the being of God. Bultmann's theology supposedly suffered from a similar problem. But Ott argues that the later Heidegger corrected his early overemphasis on the human and spoke instead of humanity's need to be "appropriated" (*ereignet*) by and for the "event" (*Ereignis*) that "gives" being to us. Preparing for such appropriation requires a thinking that is more fundamental than science, that is, thinking that lets being reveal itself. True thinking discloses that language is not a tool one possesses to dominate entities; instead, one is "owned" by language. Language is the "house of being," the gathering and sheltering that lets entities reveal themselves in their own terms, not merely as objects for human use. In Ott's view, Heidegger's talk of responding to the presencing of entities through language may be analogous to Barth's claim that faith demands a response to the Word of God: Philosophy is to being as theology is to the self-manifesting Word of God.

Heidegger himself always warned of the dangers of misusing his thought for theological purposes. In 1928, he distinguished sharply between philosophy and theology. Much later, he claimed that if he were taken by faith, he would have to give up philosophy. He maintained that Christian faith cannot be fully understood in ontological terms; it must be rooted, instead, in the historical events of Christ's death and resurrection. Hence, he had doubts about the implications for faith of Bultmann's demythologizing. Although indebted to motifs drawn from the Judeo-Christian tradition, Heidegger did not intend to revive it. His call for a return of the gods shows his abiding concern for the sacred, but he denied that being can be identified with God. God is a kind of being, but being, as such, refers to the historically different ways in which entities reveal or manifest themselves. He hoped that, in the current dark time, the "destiny of being"

would bring forth a new world in which the gods would reappear. It is not clear how he could have such hope in being, however, because it lacks a personal dimension. Still, his impact on modern theology has been great. Heidegger's early concern with hermeneutics was transmitted to theology by his student Hans-Georg Gadamer as well as by Bultmann. Furthermore, by offering an alternative to the dualistic understanding of human existence, by calling for a nonobjectifying way of speaking of the holy, and by urging us to remain open for a return of the sacred, Heidegger provided much insight not only for such Protestant theologians as Bultmann, Tillich, Gogarten, Fuchs, Ebeling, and Macquarrie, but also for such Catholic theologians as Karl Rahner.

MICHAEL E. ZIMMERMAN (1987)

**HEILER, FRIEDRICH** (1892–1967), German theologian and historian of religions. Born into a pious Roman Catholic family in Munich, Heiler studied theology, philosophy, Asian languages, and psychology at the University of Munich and received his doctorate in 1917 with a study of prayer that is still a classic, *Das Gebet*. One year later he published *Die buddhistische Versenkung* (Munich, 1918), a study of Buddhist contemplation. His work attracted the interest of the Swedish archbishop Nathan Söderblom, who invited him to Sweden. There he became active in the Lutheran church. In 1920 he accepted a professorship in comparative religion at the University of Marburg, where he remained until his retirement. During the Nazi era he was transferred from the Faculty of Theology into the Faculty of Arts and became its first dean after 1945.

Heiler's book on prayer shows his talent for explaining a central religious phenomenon in a purely inductive way, free of any philosophical presuppositions. Without losing sight of historical relationships, the book provides a phenomenological exposition not only of non-Christian religions but also of the Christian churches and their leaders, whose personalities Heiler interprets within the framework of the general history and phenomenology of religion. This achievement prevails in all of his writings down to his last major work, an introduction to the phenomenology of religion, *Erscheinungsformen und Wesen der Religion* (Stuttgart, 1961).

Heiler's double allegiance to the Catholic church and his new, Lutheran affiliation was never completely resolved, as his correspondence with Söderblom shows. In order to bridge the gap, he founded a high church movement, and he was later consecrated as a bishop in the Gallican succession. As much as he was critical of the historical development of the Roman church, the celebration of the Mass according to the ancient Christian rite remained central to Heiler's spiritual life. This orientation is evident from *Der Katholizismus* (1923; new ed., Munich, 1970), which provoked much controversy, and from two of his later studies, *Urkirche und Ostkirche* (Munich, 1937), on the development of the Eastern rites from earliest times, and *Altkirchliche Autonomie und päpstlicher Zentralismus* (Munich, 1941), on the Roman rite and its centralizing tendencies. His early interest in the modernist movement, which influenced him considerably, prompted him to write a biography of one of its leaders: *Alfred Loisy, 1857–1940, der Vater des katholischen Modernismus* (Munich, 1947).

Heiler had both a liberal attitude and a strong mystical bent. Opposed as much to Bultmann's demythologization as to Barth's radical theology, he saw in Christianity a microcosm of the world of religions in general, and he believed in

the presence of the ever-working *Logos Spermaticos*. His personal piety was shaped by the ideals of Franciscan devotion as he experienced it in relations with his Italian Franciscan friends. Like the medieval Franciscans, he hoped for the *Papa angelicus* who would usher in the age of the Holy Spirit and the one holy church. Toward this end, he worked all his life, devoting numerous articles, many lectures, and his editorship of a journal, *Eine heilige Kirche* (Munich, 1919–1941), to bringing it about.

The ideal of the one church Heiler extended to non-Christian religions as well, for he saw in them manifestations of the same basic religious truths he found in Christianity. He was particularly inclined toward Buddhism, especially the figure of the compassionate Buddha, and toward mystical Hinduism, which is demonstrated in *Die Mystik in den Upanishaden* (Munich, 1925). Eventually he was to defend Sadhu Sundar Singh in a long literary feud with the critics of this convert from Sikhism to Christianity. In both his writing and his teaching, Heiler always emphasized the role of women in religion. His numerous sermons combine wide knowledge of religious history with his very personal faith in the God who manifests himself as love.

Although Heiler was misunderstood in various quarters during his lifetime, many of his ideas were realized after his death. His major books, which demonstrate his philological erudition and which provide an immense wealth of bibliographic sources, will remain standard works in the history of religions and in the study of early Christianity. Taking up and enlarging the promise evident in his first masterwork on prayer, Heiler's later works reflect his ideal of an "evangelical catholicity" and his hope for a synthesis (rather than syncretism) of the world's religions and their highest ideals.

#### BIBLIOGRAPHY

Although a number of Heiler's articles have appeared in English journals and anthologies, none of his books is available in unabridged form in English. *Das Gebet*, 5th ed. (Munich, 1923), was published as *Prayer*, translated and edited by Samuel McComb (1932; reprint, Oxford, 1958), but the translation lacks the extremely valuable footnotes of the original. Likewise, Heiler's book on Sadhu Sundar Singh is available only in abridged form, as *The Gospel of Sādhu Sundar Singh*, translated by Olive Wyon (Oxford, 1927).

There is no biography of Heiler in any language. For a better understanding of the man and his work, two books are recommended: *Die grössere Ökumene: Gespräche um Friedrich Heiler*, edited by Emmanuel Jungclaussen (Regensburg, 1970), and *Friedrich von Hügel, Nathan Söderblom, Friedrich Heiler: Briefwechsel 1909–1931*, edited, with an introduction and commentary, by Paul Mísner (Paderborn, 1981). The latter presents the revealing correspondence of Heiler, Söderblom, and Baron Hügel.

ANNEMARIE SCHIMMEL (1987)

**HEIMDALLR** is a Scandinavian deity who is the watchman of the Æsir, the dominant group of gods. Rarely men-

tioned in Norse court poetry, Heimdallr appears frequently in Eddic poetry. According to *Grimnismál* (st. 13) he lives in Himinbjörg, the "celestial shelter" from which he guards the abode of the gods, happily drinking mead while performing his task. The giant Loki claims (*Lokasenna*, st. 48), however, that Heimdallr was fated to an awful life and will forever stand watch with a muddy back due to his constant exposure to foul weather. According to *Prymskviða* (st. 15), Heimdallr is the "whitest of the gods" and able to predict the future. The eddic poem *Völuspá* mentions that men are called "Heimdallr's children" (st. 1); similarly, the medieval scribe of *Rígspula*, a poem explaining how the classes of society arose from the three sons of a being named Rígr, identifies Rígr as Heimdallr. *Völuspá* (st. 46) also states that Heimdallr will blow his horn to warn the gods of the start of Ragnarök, their last battle against the giants and monsters. This instrument is named *Gjallarhorn* (loud-sounding horn) and can be heard throughout the nine worlds.

Snorri Sturluson (1179–1241) provides some additional details: Heimdallr is great and holy, and is also known as Hallinskíði, a poetic term that also designates the ram (perhaps because both a ram and Heimdallr are known for their horns). Heimdallr was possibly associated with the ram, as Þórr is associated with goats and Freyr with his boar. Heimdallr has a third cognomen, Gullintanni (Golden Tooth), because he had teeth of gold. The function of this brilliant appearance is unexplained. Heimdallr's horse is called Gulltoppr (Gold Tuft), and his home is located next to Bifröst, the rainbow bridge at the edge of heaven that he guards against invasion by the mountain giants. Heimdallr is the ideal watchman: needing less sleep than a bird, he is able to see for a distance of one hundred leagues by day or by night and to hear the grass growing on the earth, the wool growing on the sheep, or any other noise, an ability for which he pledged or hid an ear below the world tree (*Völuspá*, sts. 27–28), just as Óðinn gives up an eye to gain knowledge at Mímir's well.

*Völuspá hin skamma* (Short prophecy of the seeress) ascribes his birth to nine mothers, all giant maidens who bore and breast-fed him at the edge of the world, a tradition confirmed by the poem *Heimdallargaldr* (The magic song of Heimdallr). The nine mothers who are also sisters might, in addition, be the waves of the sea, who give birth to him on the seashore, the "edge of the earth." The tenth-century Icelandic poet Úlfr Uggason describes Loki fighting with the "son of nine mothers" (*Húsdrápa*, st. 2) for the possession of a beautiful *hafnyra* (literally "sea kidney," but meaning "a piece of amber"); Snorri explains that Loki's adversary was Heimdallr and that they fought in the shape of seals for this object, which Snorri identifies with the Necklace of the Brising. Snorri also explains the poetic circumlocution "Heimdallr's head" for "sword," which comes from the fact that a blow from a human head caused Heimdallr's death. It is not clear how this fits in with the tradition of his last fatal fight with his arch-foe Loki at Ragnarök. Another detail strength-

ens the depiction of Heimdallr and Loki as opposing parallels: according to *Völuspá hin skamma*, both are said to have become either figuratively or literally pregnant. Heimdallr was made potent or pregnant with the power of the earth, and Loki ate the half-roasted heart of a witch, from which he became pregnant with the race of ogresses.

Linguistic analysis of Heimdallr's name scarcely elucidates his basic character. The first element is usually identified with *heimr* (homeland, world), a cognate of the English word *home*; the second is a masculine noun *dallr* (of which the feminine equivalent, *döll*, appears as the second component of one of Freyja's names, *Mardöll*). It has been connected with the Old English *deall* (brilliant, bright, proud), and thus may refer to Heimdallr's shining whiteness. This interpretation is supported by another etymology that connects his name with the Old Frisian *hentiacht* (brilliantly luminous). However, Jan de Vries's *Altnordisches etymologisches Wörterbuch* (1961) is probably correct in considering the Old Norse *dallr/döll* as developments of the Germanic \**dalþu-* (blooming, flourishing), with a root appearing also in the Greek word *thállo* (bloom, be luxuriant) and the Gothic *duls* (festival), originally connected with the renewal of nature. According to Gabriel Turville-Petre's *Myth and Religion of the North* (vol. 1, 1964), the Early Modern Icelandic word *dallur* is glossed as *arbor prolifera* (prolific tree) by the nineteenth-century lexicographer Björn Halldórsson. This would point to a special relationship between Heimdallr and the cosmic tree, which is said to be drenched with white mud (*Völuspá*, st. 19), the same substance that Loki says covers Heimdallr's back. This would also corroborate the etymology of *Heimdallr* as "god of the world." Despite these investigations, Heimdallr remains an enigmatic god. In addition to the many Celtic elements of his story, he is like Óðinn in leaving something at the foot of Yggdrasil in exchange for special powers. Like Þórr, he is a defender of the world of the gods and is associated with a male domestic animal; like St. Michael, he will blow his horn at the end of time. Evidently, the memory of Heimdallr had faded by the time the extant sources were composed.

EDGAR C. POLOMÉ (1987)  
ELIZABETH ASHMAN ROWE (2005)

**HEKATE** is best known as the mistress of threatening, restless ghosts because Greek and Roman literature empha-

sized this sensational aspect of her personality beginning in the fifth century BCE (e.g., Euripides *Helen* 569–570). This role led to Hekate's association with magic, which often relied on the cooperation of the ghosts whom she controlled (Euripides *Medea* 397; Horace *Satires* 1.8.33). Later authors followed suit; for example, Shakespeare's *Macbeth* makes her the leader of a band of witches. Her association with ghosts and the darker side of magic also led to her portrayal, in later antiquity, as a threatening and horrible creature who might look like a snake, howl like a dog, and make her meals among the graves (*Papyri Graecae Magicae* IV.2549, 2856–2869).

However, other Greek and Roman sources, some of which go back to before the fifth century BCE, suggest that in antiquity Hekate was usually viewed as a normal, even benign, goddess. Hesiod (*Theogony* 404–492) lauds her as a powerful older divinity who is willing to benefit many kinds of worshipers, including mothers, kings and fishermen. Pindar (*Paeon* 2.73–2.77) describes Hekate as a "kindly messenger." In art she is free of frightening traits; a late-sixth-century BCE votive statuette shows her seated, dressed in the same style as other goddesses (Berlin Staatl. Mus. TC 7729 = [5] #105), and vase paintings show her as a girlish figure carrying torches to celebrate weddings (see Sarien 1992: #44, 45, 46 with commentary).

**OTHER ASSOCIATIONS.** It is likely that Hekate's association with restless souls, and thence magic, arose from two other concerns she held from early times. The first was her interest in girls' transitions from virginity to marriage and in the childbirth and child nurture that follow marriage (Euripides *Trojan Women* 323; Aeschylus *Suppliants* 676; Antoninus Liberalis 29; Hesiod *Theogony* 450–451; scholiast on Aristophanes *Wasps* 804; see Johnston 1999, chapter 6). Girls who died unmarried and women who died without successfully rearing children were considered to have died "untimely" (*aoros*), and their souls were imagined to wander with Hekate, wreaking havoc on the world of the living out of envy and frustration; magicians sometimes invoked these unhappy souls to do their bidding. It was probably also Hekate's association with dying virgins that led to her identification during the archaic period with Iphigeneia, the most famous mythic maiden who died before marriage (Stesichorus fr. 215; Hesiod *Catalogue* fr. 23a 17–26 cf. 23b; Proclus, summary of the *Cypria* 55–64; further at Johnston 1999, chapter 6). Hekate's only other prominent mythic role, as the goddess involved with Persephone's journey to and from the Underworld, similarly connects her with a maiden who dies and "returns" (*Homeric Hymn to Demeter* 24, 52–59, 438–440; Callimachus fr. 466; Orphic fr. 41–42). In addition, Hekate herself is almost always imagined as virginal.

The second role that contributed to Hekate's association with ghosts in Greece was her guardianship of entrances and other liminal places, both civic and domestic, where ghosts were imagined to lurk (Johnston 1991; Johnston 1999, chapter 6). In Greece, shrines or statuettes of Hekate (*hekataia*) were placed at entrances and at the junctions of

three roads (*triadoi*) to seek her protection. “Suppers” (*deipna*) were left for Hekate and ghosts at the junctions, especially on the night of the new moon (Aeschylus fr. 388; Aristophanes *Wasps* 804; Aristophanes *Plutus* 594 with scholia; Demosthenes LIV.39; Plutarch *Greek Questions* 708f; Apollodorus of Athens *Fragments of Greek History* 244 F 110). The polluted remains of domestic purification rites also were deposited at the road junctions (Plutarch *Roman Questions* 280c, 290d; Lucian *Dialogues of the Dead* 1.1); in later antiquity, these were already sometimes confused with the suppers for Hekate, but originally they were distinct (see Johnston 1991). Hekate’s close connection to the road junctions is reflected by her Greek epithet, *trioidios*; her Roman name, Trivia; and her frequent sculptural portrayal, from the classical period on, as a goddess with three heads or even three bodies. Over time, Hekate collected many other epithets that reflected her triplicity; Chariclides (fr. 1) offers a tongue-in-cheek collection of them.

The association of the dog with Hekate, including its sacrifice to her (Euripides fr. 968; Aristophanes fr. 608; scholiast on Aristophanes *Peace* 276), probably began as a reflection of Hekate’s role as birth goddess; birth goddesses commonly received sacrifices of dogs. However, by the end of the classical period the dog also took on Hekate’s frightening nature; bands of howling dogs, imagined to be souls of the dead, followed Hekate on her nightly prowls or heralded her arrival (Theocritus *Idyll* 2.12–13, 2.35–36; Vergil *Aeneid* 6.255–258). These souls that followed Hekate inflicted insanity or night terrors (Hippocrates *On the Sacred Illness* 4.30–33), which explains the worship of Hekate in mysteries that promised, among other things, to cure madness (Aristophanes *Wasps* 122; Pausanias 2.30.2; Dio Chrysostom *Oration* 4.90; Aristotle *Mirabilia* 173; see Johnston 1999, chapter 4).

**ORIGINS AND ASSOCIATIONS IN OTHER MYTHOLOGIES.** Hekate probably originated in Caria, in Asia Minor, whence she traveled into mainland Greece during the archaic period. Her worship in Caria and other places in Asia Minor continued strongly into the imperial period (Kraus 1960), even as it spread throughout the rest of the Greek world. Sources vary considerably on Hekate’s parentage; the most influential source, Hesiod (*Theogony* 409–411), made her the daughter of Titans Asterie and Perses and thus the cousin of Artemis and Apollo (see also scholiast on Apollonius of Rhodes *Argonautica* 3.467). Her name appears to be cognate with Apollo’s epithets Hekatos and Hekatobolos, which suggests that it has something to do with “from afar,” but the meaning is unclear.

Hekate was conflated in cult, myth, and iconography with a number of other goddesses, notably Artemis (Aeschylus *Suppliants* 676; *Inscriptions Graecae* 13 383.125–127), with whom she shared an interest in girls’ transitions and childbirth and the iconographic feature of carrying torches; Selene, the goddess of the moon (Plutarch *On the Obsolescence of Oracles* 416e–f; Johnston 1990, chapter 2); and En-

odia (Sophocles fr. 535), a Thessalian goddess who shared Hekate’s interest in childbirth and in guardianship of entrances (*Inscriptions Graecae* IX 575–576, 578; Johnston 1999, chapter 6; Kraus 1960, 57–83). In the magical papyri, Hekate often was equated with Ereshkigal, the Mesopotamian goddess of the Underworld (*Papyri Graecae Magicae* LXX.4–25). In late antiquity Hekate’s role as a birth goddess and guardian of passages and transitions also led to her appointment as a savior goddess in theurgy, where she was identified with the Platonic Cosmic Soul, which was imagined to divide the material (earthly) realm from the noetic (heavenly) realm. She facilitated the passages of individual souls downward into bodies and upward again for union with the divine, and she sent oracles to the theurgists that taught them how to perform further rituals that would improve their souls (see Johnston 1990).

**HELL** SEE HEAVEN AND HELL; UNDERWORLD

**HELLENISTIC RELIGIONS.** Whereas religion is never a mere reflex of political, economic, and social conditions, there are periods in history when these factors exert a palpably strong influence on religious thinking. The Hellenistic age was certainly such a period. Its early phase, which began with the conquests of Alexander the Great in 334 BCE and continued with the rule of his successors, brought military and political upheaval to many peoples. When Roman imperialism later became the dominating power, there was greater apparent political stability, and the consciousness of a unified world, which Alexander’s victories had furthered, was enhanced. The thought of one world does not necessarily lead to the idea of one God, but it does raise questions about a possible spiritual unity behind the manifold manifestations of religious experience.

Culturally this was a world that gave primacy to the Greek language, and Alexander himself, although a Macedonian, was a fervent disseminator of Greek culture. Within his empire other languages continued to flourish, including Ara-

maic, Hebrew, Egyptian, Babylonian, and Latin, but it was Greek that bore the official stamp of the ruling powers. Alexandria largely replaced Athens as the world's cultural capital, with Pergamum in northwestern Asia Minor as a splendid rival. Alexandria gave a Greek form to its glittering artistic and intellectual achievement, although it harbored several other cultural and religious groups, not the least of which were the Alexandrian Jews. In philosophy, however, Athens retained some of its pristine vigor because it was there that the new schools of Epicureanism and Stoicism first found a footing. In different ways both Epicurus and Zeno, the founders of these schools, were reacting to the broadened horizons created by Alexander's achievements. Even before this the Greek world was no narrow enclave, for Greek colonies had long since spread to Asia Minor and the Black Sea area, to Egypt and North Africa, and to southern Italy, Sicily, Spain, and Gaul. What was new in the Greek dimension of Alexander's conquests was the thrust in an easterly direction to Syria and Palestine, to Persia and Babylon, and through Central Asia to parts of northern India. In the wake of the military thrust, Greek settlements and cities were established in many non-Greek areas. Eventually the force of the population impact weakened, although Alexander's successors continued to hold sway for several centuries. An encounter with very diverse cultures ensued, and the traditional division between Greeks and barbarians underwent radical revision. In terms of religion the resulting counterthrust of Eastern traditions meant that the Greeks received more than they gave.

It was not the brute power of military aggression that brought about the change in outlook. In his *Alexander the Great* (Cambridge, 1948), Sir William Tarn argues that Alexander himself had a dream of the unity and reconciliation of all peoples, but the sources are more faithfully interpreted as recording a prayer by him for the cooperation of Greeks and Persians as ruling imperial partners. Yet the aftermath of his victories brought a realization of the unity of East and West.

**NEW TRENDS IN STATE-SUPPORTED RELIGION.** In spite of the great change in worldview thus effected, the old order was not swept away quickly. In Greece itself the city-states continued to function after the Macedonian conquests, and this meant that the official religious cults espoused by these states were still maintained. Politically, however, the citizens were aware that they were carrying on under the shadow of Macedonian imperialism and that the substance of their political power, particularly in foreign policy, had much diminished. This sense of insignificance must have demeaned the quality of their religious worship. The Athenians continued to honor their patron goddess Athena, especially as Athena Promachos ("defender"), but they knew very well that they were subject now to whatever Macedonian dynast was in power in the area. Such a situation threw the citizens back on their own spiritual resources so that their concerns as individuals counted correspondingly more. In later ages the emphasis on the individual might often seem to be at the very heart of religion, as in A. N. Whitehead's well-known defini-

tion of it: "Religion is what the individual does with his own solitariness." The ancient world, in contrast, viewed religion as something essentially communal that was realized, above all, in public activities arranged by the state. In the Hellenistic age these activities continued to some extent, but in other ways there was a marked focus on the concerns of the individual.

Not that the social urges suffered atrophy: A popular feature of the religious life of this age was the great vitality of the associations or clubs formed by adherents of the various cults, with or without the sanction of the state. While these associations were often allowed the use of sacred premises, their main activities were usually convivial and charitable. They provided good cheer in the way of wine, beer, and banquets and also a good deal of help to needy members. Naturally the religious element was not ignored, and the name of the patron deity normally appears in records of their proceedings. The evidence concerning them derives from a great part of the Greek world. Prominent in this evidence are towns that were centers of trade and therefore rather cosmopolitan in character, such as Rhodes, Delos, and Piraeus (the harbor town of Athens). Abundant testimony has also been forthcoming from centers of the native cults in Egypt, and at that time these cults, especially those connected with Isis, were spreading to other countries. Thus at the end of the first century CE there was a club of this kind attached to a temple of Isis in London.

Emphasis on the importance of the individual came from a quarter that at first sight might seem surprising: the belief in astrology, which was then so fashionable. Its origins were in Babylon, where astronomy had also been pioneered. The Babylonians had shown that the heavenly bodies moved in a fixed order that could be scientifically forecast. Then their astrologers, who were also astronomers (the two fields had not yet diverged), introduced the belief that events in the world were somehow linked to events among the stars. It followed that worldly events could also be prophesied since they too had been ordained beforehand. Under the Roman emperors astrologers were several times banned and expelled; yet many of the emperors themselves had recourse to them. When applied to the individual, astrology meant that everything depended on the personal horoscope, which was based on the exact date and hour of birth and on the planet then in the ascendant and on its relation to the zodiac. The effect of the prognosis could be depressing, even terrifying. In a Greek magical papyrus (found in the corpus of Preisendanz, 13.708ff), the astrologer thus advises his anxious client:

You must enquire, "Lord, what is fated for me?" And he will tell you of your star and the nature of your Daemon [guiding spirit] and your horoscope and where you shall live and where you shall die. But if you hear something bad, do not break into screams and tears. Ask him, rather, to cancel it himself or to change its course. For this god has power to do everything.

Here the astrologer is invoking the aid of religion with his allusion to a god who can change the prognosis. But a

fatalistic acceptance is more often indicated. What is clear, in any case, is that the personal horoscope is the basis of the procedure. The fate of the individual is the center of attention.

A new development that imparted fresh vitality, albeit of dubious sincerity, to the official state worship was the gradual establishment of the cult of the ruler, whether king or emperor. The first clear instance of it in this period was the worship of Alexander the Great as a divine person. In his case it was conspicuously an upshot of religious practices long prevalent in the Eastern countries that he had conquered. In the nations of Mesopotamia the king had regularly been associated with the gods. He had not been defined theologically as a god, but there was an aura of divinity about him. A victory stela of Naram-Sin of Akkad shows him towering above his followers, with a clear suggestion of his superhuman standing. In Egypt, on the other hand, the pharaoh was given an official status of divinity. When alive he was equated with the god Horus, and in death he became the god Osiris, father of Horus. He was also called "the son of Re" (the sun god). The distinctions are well delineated by Henri Frankfort in his *Kingship and the Gods* (Chicago, 1948).

It is significant that the initial divinization of Alexander was associated with Egypt. According to ancient historians he visited the oracle of Amun at Siwa in the Libyan desert some four hundred miles southwest of what was later Alexandria. There, in 331 BCE, an Egyptian priest accosted him as the "son of Amun" in a way that corresponded to traditional Egyptian practice. To be regarded as the son of a god must have appealed to Alexander, and from that moment on he seems to have pressed the idea purposively, demanding obeisance and worship in many countries. Greeks and Macedonians did not take easily to the idea, yet there was a strand within the Greek tradition that allowed the divinization of dead heroes and eventually of living rulers. This contributed to the cult of the dead Alexander in Egypt and, in the time of his successors there, led to the worship of the living king and his queen, a practice started by Ptolemy II and his wife Arsinoë, who assumed the title *theoi adelphoi*, "the brother-sister gods." (The Ptolemaic kings regularly married their sisters.) Less thoroughgoing modes of the ruler cult prevailed in the other regions of Alexander's empire. By gradual steps the Seleucids of Syria and the Attalids of Pergamum eventually followed the practice, although the Attalids were accorded full divinity only after death. The Macedonians were slower still in coming to it, perhaps because of skeptical resistance.

To assess the depth or sincerity of the worship produced by the ruler cult is difficult since it soon came to be a test of political loyalty. In 307 BCE the Athenians paid divine honors to Demetrius Poliorcetes, the ambitious Macedonian soldier-king. Their hymn of praise to him couples him with the goddess Demeter and describes him as the son of Poseidon, god of the sea, and of Aphrodite, goddess of love. Then it contrasts his nearness with the distance of the traditional

gods: "Other gods are far removed or do not listen; or they do not really exist or do not heed us at all. But thou are here with us; we can behold thee, not shaped in wood or stone, but here in person. And thus we pray to thee." In spite of some military successes, Demetrius was a rake and a scoundrel. It may therefore safely be assumed that the fulsome language of the hymn disguised a degree of disgust.

When the Romans took up the ruler cult, Egypt was again influential in the early stages, and there was a measure of continued tradition; yet in Rome itself there had been antecedents in relation to "the divine Julius" (Julius Caesar.) The full-scale cult was at first enacted in the provinces only, but eventually it was insisted on as a test of loyalty. To adherents of the many polytheistic religions there was no problem in this claim, since it merely meant that the divinized emperor was to be added to the variegated pantheon already in existence. Even followers of the mystery religions were not embarrassed by the claim, for the demands of these religions were by no means exclusive. Those in serious trouble were the adherents of Judaism and Christianity, two religions of uncompromising monotheism. "Thou shalt have no other gods before me" may not imply strict monotheism, since the commandment does not necessarily deny the existence of other gods, but rather demands the exclusive worship of Yahveh. By the Hellenistic era, however, Judaism had become unequivocally monotheistic, and Christianity inherited its unbending stance. To upholders of the polytheistic tradition it seemed a form of fanatical intolerance, and it sometimes provoked very harsh reactions.

An aspect of the ruler cult that was more serious than the superficial matter of expressing political allegiance was the whole question of divine incarnation. Was it possible to conceive of the divine taking human form? In early Greek thought it is sometimes suggested that the gulf between human and god is not wide and that an affinity exists between them. In the early fifth century BCE Pindar expresses it thus: "Of one stock are men and gods, and from one mother do we draw our breath" (*Nemean Odes* 6.1). Some of the heroes of Greek mythology were deemed to be offspring of mixed unions, the father being divine and the mother mortal. Herakles is in this category, for his father was said to be Zeus and his mother the mortal Alkmene, daughter of a king of Mycenae. Zeus was not able to achieve union with her until he disguised himself as a victorious warrior.

Rather different is the process by which historical heroes came to be worshiped after death. Their historicity cannot always be demonstrated, but the likely evolution followed from a lively memory of their deeds. One might rephrase Shakespeare to explain the distinctions enacted: "Some men are born divine, some achieve divinity, and some have divinity thrust upon them." The hero worship that developed among the Greeks outside mythology is akin to the second category; it involved outstanding individuals who by their own merit and fame came to be especially honored after death. The triumphant commander who "liberated" or
